# *FORMARIAGE*

. The marriage or, more exactly, the prohibition of marriage of a rustic living in one seigneurie to a rustic living in another is known as *formariage,* from Latin *foris* 'outside' and *maritagium* 'marriage.' By the 13th century, many jurists argued that, even in the absence of other signs of servile status, liability to this prohibition was a strong presumption of serfdom. Sometimes, the restriction on marriages between serfs and free people is also called *formariage,* but "mixed marriage" is the preferred term for these unions. At any rate, serfs who wanted to enter into marriages of either sort could do so by paying fines, also known under the general rubric of *formariage,* to the appropriate lord or lords.

Regional customs differed about who became the lord of children born from marriages between serfs of different seigneuries and whether children of mixed marriages were serfs at all. With regard to *formariage* narrowly defined, some customs favored the claim

of the lord of the father, others that of the lord of the mother, and still others that of the lord of the seigneurie within which the births of the children occurred. Most frequently, these problems were resolved by conventions among lords of neighboring seigneuries to apportion the children according to some simple formula.

A dispensation for a serf to marry a free person was less easy to obtain, because local customs often favored regarding the offspring of mixed marriages as free people. Lords in consequence demanded high fines to obtain the privilege of making mixed marriages. For this and other reasons, popular demands for the abolition of serfdom usually emphasized the desire for freedom of marriage.

# *FORMES FIXES*

. The "fixed forms" of French lyrical poetry of the 14th and 15th centuries developed from dance lyrics of the 13th century and include principally the ballade, rondeau, and virelai. Different strophic structures characterize each form, but all include a refrain. The poetry served to determine the form of the musical setting, although the *formes fixes* were less frequently set to music after Machaut. Deschamps's *Art de dictier* (1392) provides the first systematic listing of the formal characteristics of the *formes fixes* for the late 14th century. The ballade was most favored by Machaut, Froissart, and Deschamps; 15th-century poets favored the rondeau. Later in the 15th century, the single-strophe virelai, renamed the bergerette, enjoyed a brief flowering.

# *FOUAGE*

. The word *fouage* (Lat. *focagium*) meant "hearth tax," but the meaning of "hearth" varied over time and from place to place, as did the way of assessing *fouages*. An important early example of a *fouage* was the money tax in Normandy, where, from the 11th century, the population paid a *fouage* in return for the maintenance of a stable

coinage. In this case, the hearth clearly referred to households, as it tended to throughout northern France. Towns sometimes raised municipal taxes through a *fouage,* often in response to demands from reformers who considered it more equitable than indirect taxes that bore on poor consumers.

As royal taxation developed in the 14th century, the *fouage* became the preferred method of payment in Languedoc, especially between 1340 and 1380. Generally, the towns of a district would agree to pay a lump sum assessed among them on the basis of households. Within these towns, the actual tax might take any form. When it was a direct tax, it tended to be assessed on the value of real property (exclusive of rural fiefs or church lands, which rarely lay within a town's jurisdiction anyway). After the mid-14th century, when war and plague had reduced the number of households, hearth counts in Languedoc lost their connection with actual households and became an administrative device for apportioning taxes among the towns.

The *fouage* best known as a royal tax was that enacted by the Estates General of Languedoil in December 1363 and canceled by Charles V in September 1380. Averaging three francs per household (but graduated from one to nine) and affecting rural lordships as well as towns, this levy paid for the army that scored important victories in the reign of Charles V. It was the ancestor of the royal *taille.*

# FOUCHER DE CHARTRES

(ca. 1059-ca. 1127). The author of one of the principal accounts of the First Crusade and the history of the Latin kingdoms in the Near East, Foucher may have been at the Council of Clermont in 1095 when Pope Urban II announced the crusade and soon thereafter accompanied Étienne, count of Blois and Chartres, as his chaplain on the journey to the Holy Land. In 1097, Foucher's fortunes became linked to those of Baudouin I, who became king of Jerusalem in 1100. Foucher began to compose his *magnum opus,* the *Historia Hierosolymitana,* toward the end of 1101; and it is likely that the end of the chronicle in 1127 marks his death.

# FOUGÈRES

**.** Located on an escarpment overlooking the Nançon River and strategic crossroads,
Fougères (Île-et-Vilaine), an ancient town on the borders of Brittany, has preserved an
imposing feudal castle that dates from the 11th century. The castle occupies a slightly
lower position than the city and is built almost entirely of schist and granite. The
escarpment provides a natural protection for the castle. Additionally, ponds and moats,
with levered bridges, surround the fortress; these once provided water to turn the mill,
whose wheels can still be seen. In the 12th and 13th centuries, the walls of the bastion
measured nearly 20 feet in height, with the towers stretching to nearly 40 feet. Had the
castle been provided with palisades, the summit would have been crenellated. Several
towers were built, and their entrances barricaded by portcullises and mobile panels. Of
those that originally flanked the principal wall, only the Tour du Cadran survives. The
keep was 66 feet in diameter, with excessively thick walls. Its exterior was octagonal, but
its interior was circular. Only portions of the foundations remain.

Fougères (Île-et-Vilaine), city walls.
*Photograph courtesy of William W.
Kibler.*

In the 14th century, the bastion was built up, two stories were added to the Tour des
Gobelins, and other towers were constructed. One of the new towers, Mélusine, housed
an underground dungeon and four hexagonal floors. Two square towers (66 feet by 66
feet), Surienne and Raoul, were added in the 15th century. Also during this period,
openings in walls were adapted or created to accommodate cannoniers and archers.

Despite being taken and razed by Henry II Plantagenêt in 1166, much of the fortress has been preserved through extensive and frequent restorations.

# FOULQUES

. Names of counts of Anjou. From the 10th to the 12th century, an extraordinary line of counts transformed Anjou into a major territorial principality. Because of the prevalence of the name Foulques, the family is sometimes referred to as the Fulconian dynasty. Throughout the 11th century, the Fulconians were able to battle both the Anglo-Norman and French kings for control of western Francia.

The real founder of the dynasty was Foulques I le Roux (ca. 888–941), viscount of the city of Angers. By 930, he had usurped the title of count from his Robertian overlords. Angevin expansion began with his son, Foulques II le Bon (r. 941–60), who married the widow of the count of Nantes. While unsuccessful in exerting control over the region, Angevin counts would continue to claim the Nantais.

Foulques II's grandson, Foulques III Nerra (r. 987–1040), although only seventeen at his accession, soon displayed the qualities that enabled him to create what has been called "the first Angevin empire." The central feature of Nerra's success was his rivalry with the count of Blois. Victories at Conquereuil in 992 and Pontlevoy in 1016 gave Nerra control over the Nantais and ended Blésois ambitions in Brittany. Of more importance was Nerra's drive against Blésois lands in the Touraine, which would culminate in the conquest of Tours by his successor. Elsewhere, Nerra extended Angevin domination into Vendôme, the Gâtinais and Maine, and even Aquitaine. Perhaps Nerra's greatest achievement was the construction of a remarkable system of stone castles that ensured the security of his newly expanded realm throughout the 11th century. Despite a reputation for ferocity, he died not in battle but on his way home in 1040 from the last of three pilgrimages he made to Jerusalem.

The rule of Nerra's grandson, Foulques IV le Rechin (r. 1068–1109), saw a reduction of Angevin power. When Count Geoffroi Martel died in 1060 without an heir, the countship went to Martel's nephew, Geoffroi le Barbu. Foulques le Rechin, the new count's younger brother, received only the Saintonge and Viliers and soon lost these to the count of Poitiers. Allying himself with a coalition of barons disgruntled with Count Geoffroi's incompetence, Foulques seized the countship and imprisoned his brother in 1068. The Angevin barons took the opportunity to advance their own interests. Castles became the hereditary fiefs of their lords as they slipped from the count's direct control. As a result, Angevin power suffered a severe blow. Yet the achievement of Foulques IV

was genuine: he was able to maintain control over Maine in the face of attacks by the Norman duke William the Conqueror and his sons; and by marrying his second son, Foulques le Jeune, to the heiress of Maine, he prepared the definitive union of Maine and Anjou.

This second son, Foulques V (r. 1109–29), began the restoration of Angevin fortunes by bringing the barons to heel and reasserting comital control over all castles. His marriage to the heiress of Maine effectively united the two counties, while his greatest coup was marrying his son Geoffroi Plantagenêt to Matilda, daughter of King Henry I of England. In 1129, Foulques abdicated in favor of Geoffroi to become king of Jerusalem. Geoffroi would use the solid base left to him by his Fulconian ancestors to lay the foundation of the 12th-century Angevin empire.

# FOUQUET, JEAN

(ca. 1420–1481). The most influential painter of the mid-15th century in France, Jean Fouquet infused elements of Italian Renaissance art with his own native French style. He painted a portrait of Pope Eugenius IV (now lost) in Rome before 1447. By 1448, he was working for Charles VII at Tours, and he was appointed as court painter to Louis XI in 1475. He is best known for a book of hours that he illuminated for Étienne Chevalier ca. 1452, fragments of which survive in the Musée Condé at Chantilly. Among the panel paintings that have been attributed to Fouquet are portraits of Charles VII (ca. 1445) and Juvenal des Ursins (ca. 1455), both in the Louvre. Recently, it has been shown that Fouquet was probably not the head of a large, prolific atelier but worked as an independent artist who contributed sporadically to manuscripts from a variety of sources.

# *FOURRIER/FOURRIÈRE*

. The *fourrier* (related to the verb *fourrager* 'forage') was a member of a corps of servants in the household of great lords and prelates who preceded the lord in his travels and arranged for the lodging of his court. The royal fourrière, or corps of fourriers, was

elevated to the standing of a distinct *ministerium,* or *mestier,* of the royal *hostel,* or inner household, at some time between 1257 and 1261, to replace the *chambre*.

# *FRANC-ARCHERS*

. On April 28, 1448, Charles VII issued an *ordonnance* requiring every parish to mobilize at local expense an archer for a militia of *franc-archers*. Such men received 9 *livres tournois* per year and a tax exemption for their participation and as much as 4 *livres tournois* per month when on active duty. Theoretically organized into bands of 500 assembled under four generals, each commanding 4,000 men, the envisioned force of 16,000 infantry would serve for provincial defense and in emergencies as reinforcements for the crown's professional forces. Though never fully mobilized, these reserves played a valuable role in the decisive campaigns of the Hundred Years' War.

Though they had proven valuable in the era of national liberation, the *franc-archers* gradually became havens for tax exemption. Units of ill-disciplined men little interested in military service proved inadequate to the needs of a state permanently at war against foreign and domestic enemies. After 1480, the crown relied on mercenaries and neglected the reserves. Despite sporadic reforms, climaxing in the creation of the legions of Francis I, they were rarely mobilized, and their revolutionary potential for universal military service remained untapped for centuries.

# **FRANCHE-COMTÉ**

. Although the kingdom of trans-Saône Burgundy was absorbed into the Holy Roman Empire upon the death of Rudolph III in 1032, the region continued to have a fairly independent existence until the middle of the 12th century, especially the most western part, which centered on Dôle, Besançon, Vesoul, and Salins. This region became known as the Franche-Comté of Burgundy in the late Middle Ages. The county of Burgundy, as it was called in the 11th and 12th centuries, was ruled for over a century by the

descendants of Otto-William (d. 1026), count of Mâcon and claimant to the duchy of Burgundy.

The independence of the county was such that the German emperors felt compelled to reassert their control over it in the 12th century. When Count Raynald III of Burgundy died without sons, the county went to his daughter Beatrix, whom the emperor Frederick Barbarossa married in 1156, thus claiming trans-Saône Burgundy for himself and his descendants.

Although within the empire, the county continued to have closer cultural ties to France than to Germany. In 1384, Philip the Bold, the Valois duke of French Burgundy, also obtained the county of Burgundy via his wife's inheritance. The duchy and county remained united for a century, the period of Burgundy's greatest glory. After the death of Duke Charles the Bold in 1477, his inheritance was claimed both by the French king and by Maximilian, the imperial heir, who married Charles's daughter. In the ultimate division of the legacy, in 1493, the duchy and county were again divided, the Franche-Comté being subjected to imperial Habsburg rule.

# FRANCISCAN ORDER

. One of the two major mendicant religious groups, the Franciscan order (officially the *Fratres minores,* "little," or "lesser," brothers) was founded in Italy in the early 13th century by Francis of Assisi and had spread by the 1220s to France and especially Paris, where over the course of time Franciscan masters and students became major forces in the lives of the university and the French church.

An ecstatic mystic, Francis of Assisi (ca. 1181–1226) as a young man experienced a radical conversion in which he embraced a life of total poverty, wandering preaching, service to others, humility, and prayer. From 1209, others were attracted to this life, and Francis formed them into a group committed to his ideals. The first rule *(Regula primitiva)* of 1209 is lost, but Pope Innocent III gave his approval to Francis's way of life and to the role of Francis and his followers as public preachers in 1210. At the Fourth Lateran Council (1215), he declared that they formed an already-existing religious order and thus were not affected by the ban on new religious orders passed by the council. The *Rule* of 1221 *(Regula secunda)* and the *Rule* officially approved by Honorius III in 1223 *(Regula bullata)* are the fundamental rules. In forming his ideal of the religious life,

Francis focused on complete poverty, simplicity and humility, and preaching, characteristics that were identified with the "apostolic life" modeled on the lives of Jesus and his disciples. The characteristic that most distinguishes Franciscans from other orders is the insistence from the very founding of the order on complete poverty, not only personal (which was true of monastic orders) but also corporate (which was not true of monastic orders). They were to support themselves by manual labor or by begging, to live in whatever simple lodgings they might find, and to possess neither property nor money. This insistence, fundamental to Francis's vision, later became a point of intense and tragic dispute in the order and the church.

The chapter of 1217, meeting in Assisi, decided to send friars on preaching missions outside Italy and divided the potential mission field into provinces: six in Italy, two (north and south) in France, and one each for Germany, Spain, and the Holy Land. Each province had a provincial minister to supervise the friars, and after the death of Francis a minister general supervised the order. The *Rule* of 1223 called for a meeting of the general chapter every three years, but not until 1239 was this firmly fixed.

Work in the province of southern France went slowly, but by ca. 1220 there were settlements at Mirepoix, Arles, Aix-en-Provence, Montpellier, and Périgueux. In 1222, houses were founded in Draguignan, Nîmes, and Apt. The year 1224 saw foundations in Limoges and Brive, then later at Nice, Bordeaux, La Réole, Saint-Jean-d'Angely, and Le Puy.

The northern province advanced steadily under the leadership of Pacifico, a poet and one of Francis's early converts. By 1218 or 1219, Franciscans were at Paris, and by 1223 there were thirty friars and a convent was being built. After the Paris foundation, houses were started at Le Mans, Bayeux, Vézelay, Chartres, Arras, and Vendôme. Houses were later founded in Nantes, Tours, Rouen, Sézanne (1223–24); Compiègne, Beauvais, and Auxerre (1225); Samur, Angers, and Mirebeau (1226); and Bruges, Ghent, and Ypres (1227). At Francis's death, France was divided into three provinces (France/Paris, Provence, and Aquitaine), with two others soon following, Burgundy and Touraine. In addition to Paris as a major center for study, there were schools for friars in Rouen, Reims, Metz, Bruges, Marseille, Narbonne, Toulouse, and Bordeaux.

Francis's death produced a crisis of definition, for in his last writing, the *Testament,* he had unambiguously insisted yet again on absolute poverty and simplicity for the friars personally and communally. One of Francis's strong supporters, Pope Gregory IX, finally declared the *Testament* nonbinding in its insistence on literal poverty and allowed, in the bull *Quo elongati* of 1230, communities to have buildings, books, furniture, and the like, arguing that they were merely using what others (i.e., ecclesiastics appointed for the purpose or even the pope) owned/ possessed "for" them. Rigorists in the order rejected this "compromise" and looked for leadership to John of Parma (minister general 1247–57), while those who favored Gregory IX's move, the so-called Conventuals, found a leader in Bonaventure, the theologian and mystical writer who was minister general 1257–74. Bonaventure, selected to write the official *vita* of Francis, not only defended the theory of the "use" of possessions, arguing that the friars needed large convents, books, vestments, and the like to carry out their ministry; he also defended the mendicants in their conflict with the secular clergy, led by William of Saint-Amour, over the right of the mendicant orders to preach and hear confessions without regard to parish and diocesan boundaries, arguing that the friars were a new order that combined monastic virtue,

contemplative prayer, and pastoral care of individuals through preaching and hearing confessions. Conflict with local clergy is regrettable, stated Bonaventure, but the friars make up for the defects of poorly prepared clerics. Increased emphasis upon university studies at the expense of manual labor, and thus full participation as masters and students in university life, was justified by Bonaventure as the necessary preparation for preaching. Unlike Dominicans, who from the beginning had been a clerical order dedicated to doctrinal preaching against heresy, the Franciscans began with a model of lay exhortation to moral conversion, not doctrinal preaching in a clerical mode. Recruiting from the university student body and the conversion of university masters like Alexander of Hales to the Franciscan way ensured the increasing place of studies, and of a clerical elite, in the order.

Some Franciscans, known as "Spirituals," found in the eschatological ideas of the Italian monastic Joachim of Fiore (ca. 1132–1202) a prediction that Francis was the harbinger of a new world order of radical spirituality. Peter John Olivi (1248–1298), a friar from Provence who was trained at Paris and taught at Montpellier and Narbonne, was one of the most forceful of these Spirituals. In his writings, which included a commentary on the Book of Revelation, Olivi joined an intense apocalyptic spirituality, foreseeing a cosmic struggle in which a corrupt church would be replaced by a spiritual church, with an acceptance of the doctrine of the "use" of goods, provided that "use" was in all simplicity and only of necessities.

Dissension and debate over the issue of ownership and property continued within and without the order. The Inquisition sought out and punished Spirituals in southern France. In the early 14th century, Pope Clement V sought to balance acceptance of the Spirituals' criticism of laxity in the order with a need for reconciliation and unity. Soon, however, Pope John XXII turned the doctrinal and coercive power of the papacy against the Spirituals and attacked their central beliefs and practices in a series of condemnations that led to the isolation and decline of the Spiritual Franciscans, a struggle that cost each side dearly. In addition, John declared heretical the fundamental doctrine agreed to by all Franciscans, that Christ and his disciples had no possessions. Moreover, he forced the Conventuals to accept full ownership of all they possessed, thus reversing previous papal distinctions between "use" and "ownership." At the Council of Constance (1415), the Observants, a group drawing on Spiritualist traditions of austerity, were granted a certain level of independence within the order, with a separate vicar in each province and a vicar general for all provinces, all serving under the minister general of the order. Pope Martin V reinstated in 1428 the distinction between "use" and "ownership" made by Gregory IX. In 1517, the Franciscans were divided into two independent branches, Observants and Conventuals, each with its own minister general, a division that continues to this day.

Several years after Francis attracted his first converts, Clare (ca. 1194–1253), a young woman from a wealthy Assisi family, sought to join Francis's group. In 1212, she was accepted by Francis as a convert and placed for the moment in a Benedictine nunnery. Clare and another young woman were soon living in the church of San Damiano at Assisi as enclosed female religious, dedicated to asceticism and prayer of the strictest kind. Clare was denied the apostolate to the world that Francis found and that she desired; hers was to be an intense dedication to denial and prayer in a strictly enclosed life. This female branch of the Franciscans became known as the "Poor Ladies of San Damiano," later the "Poor Clares" or "Clarisses." At San Damiano, they lived by manual labor or

alms, fasted, prayed, accepted the rule of perpetual silence, and refused to accept the usual kind of endowments that supported female religious houses. Later, other houses were forced to accept endowments and property for support, but Clare steadfastly refused what she saw as a compromise with wealth. The first house of Poor Clares in France was established in Reims in 1220 by a group of nuns sent by Clare. Another group went to Béziers in 1240, with the support of Louis IX.

Francis also began what became known as the "Third Order," or Tertiaries, for individuals who were drawn to a new spirituality but did not wish to join either the male or female branches of the Franciscans. These people continued to live in the world, might be married with families, but adopted moderate asceticism and sought to live more virtuously and simply, to be regular in prayer and the sacraments, to aid others, to refuse to bear arms or swear oaths, and to promote peace. Tertiaries were formed into local groups with officers and regulations.

# FRANCO OF COLOGNE

(fl. 1260–90). No biographical information has come to light that might clarify who Franco was, why he was involved in music and its notation, or when he wrote the music treatise entitled *Ars cantus mensurabilis,* although it would seem certainly to have been in Paris ca. 1280. This treatise attributed to Franco is one of the most important historical documents concerning polyphony in the western tradition. It established fixed relationships among pitch, rhythm, and written symbol comparable to the development of writing as a means of transmitting language, and the principles of notation that it proposed lasted through the 16th century. Franco's achievement was a high degree of rationalization of the written means for communicating musical ideas by which complex rhythmic and polyphonic relationships could be realized in a purely intellectual manner, could be transmitted in a relatively coherent way in writing, and so could be reproduced with some degree of fidelity distant from their inception. More manuscript copies survive for the *Ars cantus mensurabilis* than for any other 13th-century treatise on music, and

comparisons among these copies indicate substantial homogeneity in transmission. The treatise displays a detachment and succinctness that are uncharacteristic of 13th-century writing in general.

# FRANCO-ITALIAN LITERATURE

. A collective classification given to a sizable corpus of texts of the late Middle Ages, sharing a north Italian provenance. Genre varies widely, including chansons de geste, romance epics, *romans,* chronicles, and hagiography; the common element is linguistic hybridism issuing from varying combinations of Old French interference with several north Italian dialects, especially Lombard. As testimony to the prestige with which French language and letters were regarded, Franco-Italian literature offers a unique area of cultural and ideological contact in the cities, courts, and prehumanist centers of northern Italy.

The largest collection of these works, twenty-five manuscripts, is now in the Marciana Library in Venice; sixteen can be traced to the extensive library holdings of Francesco Gonzaga, duke of Mantua. At his death in 1407, an inventory listed some sixty-seven manuscripts *in lingua francigena.* Numerous manuscripts of French chansons de geste and Arthurian romances were also held by the Este court in nearby Ferrara and may have also circulated among other courts of the region, such as the Scaglieri in Verona, Visconti in Milan, and Da Carrara in Padua. It is likely that many of these works were commissioned by such regional potentates for recitation/reading in their opulent courts, precursors to the great Renaissance courts and the Italian masterworks that they in turn fostered, such as Boiardo's *Orlando Innamorato* and Ariosto's *Orlando Furioso*. Formerly regarded as contaminations of both national languages and literatures, Franco-Italian texts were frequently dismissed as by-products of French works disseminated to the south or as primitive versions of Italian works of the following generations. Scholars now recognize the significant literary and linguistic value of many of these texts, particularly the V4 and V7 *Chansons de Roland, Aspremont, Aquilon de Bavière, Entrée d'Espagne,* the *Attila* of Nicholas of Casola, and the works of Nicholas of Verona, which include the sequel to the *Entrée d'Espagne,* the *Prise de Pampelune*. Among other Carolingian works in the Marciana Franco-Italian collection is a vast compilation known as the *Geste Francor,* which includes *Enfances* texts of Roland and Charlemagne;

*Aliscans, Gui de Nanteuil, Bues d'Aigremont, Foulque de Candie,* and *Doon de Mayence*. Romance works include *Le roman de Troie, La Folie Lancelot, Florimont, Jugement d'amour,* and *Prophécies de Merlin*. Brunetto Latini's *Li livres dou* tresor and Marco Polo's *Devisement du monde* are likewise classified as Franco-Italian.

The process by which these texts were introduced to northern Italy can be described according to the degree of distance between a "parent" text and its Franco-Italian counterpart. One can hypothesize that French jongleurs traveling to Italy diffused, orally and/or in manuscript form, epic and romance material in the latter 13th and early 14th centuries; scribes and artists then transcribed and illuminated manuscripts in the Veneto-Lombard regions and in Bologna. Belonging to this initial phase are *Aliscans* and the V4 *Roland*. Subsequently, Italian authors began to alter originally French texts to varying degrees in form and content, introducing their own material and dialectal usage; within this group of *remaniements* are *Macaire* and the *Roman de Hector et Hercule*. Finally, scholars agree that such works as the *Entrée d'Espagne* and *Prise de Pampelune* were conceived in Franco-Italian and composed in Italy by Italian writers and can be considered autonomous to the extent that no single model text can be identified.

The prestige of French in northern Italy, particularly among the aristocracy and prosperous mercantile bourgeoisie, is expressed by Brunetto Latini, Florentine mentor of Dante. Justifying his choice of language, he writes in Book 1 of the *Trésor* (1. 7): "Et se aucuns demandoit por quoi cist livres est escriz en romanz selonc le langage des François, puisque nos somes Ytaliens, je diroie que ce est por .ii. raisons; l'une car nos somes en France, et l'autre por ce que la parleüre de France est plus delitable et plus commune a toutes gens." ("And if anyone were to ask why this book is written in Romance according to the language of the French, since we are Italian, I would say that it is for two reasons: one, because we are in France, and the other because the French language is more pleasant and more common among all peoples.") In the *De vulgari eloquentia* (1.10.2), Dante, too, extols the French language, because it is easier and more pleasant than the other two Romance idioms, Provençal and Italian. Plurilingualism was a fundamental ingredient in the evolution of the Romance languages and is present to some degree in many documents of the period, as extant multilanguage texts incorporating *oc, oïl,* and different Italian dialects bear witness.

From a linguistic point of view, Franco-Italian, also called Franco-Venetan and Franco-Lombard according to the regional origin of its Italian infrastructure, remains a source of unresolved questions. Some earlier scholars claimed that it was a spoken, living language arising within specific geographical, cultural, and chronological parameters. As evidence, they cited the Venetian chronicler Martin da Canal: "Et porce que lengue franceise cort parmi le monde et est la plus delitable a lire et a oïr que nule autre, me sui je entremis de translater l'anciene estoire des Veneciens de latin en franceis…." ("And because the French language travels throughout the world and is more pleasant to read and to hear than any other, I have undertaken the translation of the ancient history of the Venetians from Latin into French….") Most scholars now agree that it was a purely literary, artificial language fashioned in an area of northern Italy particularly receptive to French letters and language and that it flourished for about a hundred to 150 years. It then disappeared completely, eclipsed by the proliferating Italian dialects, including Tuscan, later adopted as the national language.

The many unsolved questions surrounding Franco-Italian as a language system are complicated by the fact that one is not confronting a unified, codified system, where a single comprehensive lexicon or grammar might suffice. Instead, there are virtually as many Franco-Italian "languages" as there are surviving texts. This is not to say, however, that it is totally random or without its own regulations. There is significant variation, morphologically and syntactically, from one text to another and not infrequently within a single text. Such ubiquitous variation prompted some scholars to argue that Franco-Italian authors were generally either too ignorant of Old French to employ the language properly, or that they wished, intended, and even believed in some cases that their French was correct. Nicholas of Verona declares in the *Pharsale:* "Car çe ne sai nuls home en Paris ne en Valois/Que non die qe ces vers sont feit par buen françois." ("For I know of no man in Paris or in the Valois/Who does not say that these verses are written in good French.") Others argued that such authors were sufficiently competent to use the language correctly but adopted the hybrid Franco-Italian to accommodate linguistically, as well as thematically, their Italian publics. In the case of the *Entrée d'Espagne,* unmistakable and uncommon erudition lends substantial support to the latter thesis. Recent linguistic work reveals that the two principal language systems are not synchronic. The French element, the *langue écrite,* dates back to the earlier French of the chansons de geste and *romans* and is thus anachronistic in its interaction with the then contemporary Italian of the 13th and 14th centuries, which is entered as a *langue parlée.*

Current research likewise stresses the importance of placing both Franco-Italian language and letters within the complex sociopolitical, cultural, and historical contexts in which they developed. Thus, a Franco-Italian Rolandian work of ca. 1325 is likely to effect some alteration of its 12th-century model in narrative material and character presentation, as well as in ideological orientation. Indeed, one of the most pervasive innovations is the elevation of Roland to new, quasihagiographic heroism, while simultaneously undermining Charlemagne's role in the earlier French poems. Archaic epico-feudal mentalities were to be at least partially recast for reception by different publics in different times.

The cultural and intellectual climate of Venetan-Lombard Italy in the 13th century suggests explanations for such change. Site of one of Europe's oldest universities, Padua was also an important Franco-Italian center. The university began as a *studium* ca. 1220, composed of a group of scholars of canon and civic law, joined by grammarians, dialecticians, and rhetoricians migrating from Bologna. It was most notably the scholars of the Trivium who gave rise to the Prehumanist movement in the region, characterized essentially by its enthusiasm for and emulation of Greco-Roman antiquity. Such individuals as Albertino Mussato and Lovato Lovati recovered texts and documents lost for centuries and composed elegant writings in the style of the ancient *auctores*. There is evidence that Dante and Petrarch were in the region at various times and that the *Divina commedia* was known to the *Entrée*'s anonymous Paduan poet. Humanistic traits have been noted in several Franco-Italian texts; scholars trace a direct line between the humanism of Mussato and Petrarch. In the exceptionally active intellectual, artistic, and literary environment of the period, scholars and clerics mingled easily with the nobility and with the less learned but vital sector of the mercantile bourgeoisie. Franco-Italian literature, developed within so fertile an environment and addressed to multiple,

heterogeneous publics, expands and enhances the study of both the French and Italian national traditions.

# FRANÇOIS II

(1435–1488). François II, son of Jean IV's fourth son, succeeded his uncle, Arthur III, as duke of Brittany in 1458. Largely brought up at the court of King Charles VII, he played a modest role in the expulsion of the English from France but was not by choice a soldier, nor did he exhibit outstanding gifts in any other direction.

The poet Jean Meschinot (d. 1491), who served in his household, described the ducal court as a "storm-tossed sea where shipwreck frequently occurred." From the beginning of his reign, although he adopted the independent stance characteristic of the house of Montfort in its relations with France, policy seems to have been made by stronger figures who often manipulated the duke.

Among his advisers, there were always discontented refugees from the wrath of Louis XI. These men exercised great influence. Some, like Tanguy du Chastel (d. 1477), were Bretons who had also made careers in royal service. Others, like Jean, count of Dunois, and his son François, Odet d'Aydie, or Jean de Chalon, were strangers. Two major Breton figures provided continuity: Guillaume Chauvin, chancellor 1459–81, who tried to avoid direct confrontation with the French, and Pierre Landois, treasurer 1460–85, who advocated a more aggressive policy and, on occasion, alliance with England. Increasingly, it was Landois, through his control of the purse strings and ruthless promotion of his family and clients, who came to exercise the most influence. In 1481, his feud with Chauvin came to a head with the arrest of the chancellor, who died in jail in 1484. However, in July 1485 a baronial clique, in league with the French, seized Landois in the duke's presence and hurriedly arranged his execution, for which François later pardoned them.

These faction-ridden last years of his reign were increasingly dominated by the question of his succession and fear of France. The duke's first wife and their young son had died by 1469, and in 1471 François took a second wife, Marguerite, daughter of the count of Foix. She bore him two daughters, Anne and Isabelle, in 1477 and 1478. But by the first Treaty of Guérande (1365), in the absence of a legitimate male heir, succession

should have reverted to the Penthièvre branch of the ducal family, now represented by Nicole of Brittany, whose claim Louis XI had acquired in 1480. In 1486, as the prospect of conflict grew, the Estates of Brittany promised to support the duke's daughters. A French army invaded in 1487 and again in 1488, when it gained an important victory at Saint-Aubindu-Cormier over the Bretons and their English and other allies (July 28). In the aftermath of this disaster, François died on September 9, 1488, leaving Anne (aged eleven) and a group of Breton diehards to continue the struggle with France.

# FRANKS

. The Germanic people known as the Franks expanded their political control out of their original lands of the middle and lower Rhine and in the 6th century created a kingdom that extended over the modern areas of western Germany, the Low Countries, and most of France. Established by Clovis I (d. 511), the Frankish kingdom lasted until the Treaty of Verdun (843) divided it among the three sons of Louis the Pious. It thus gave rise to the medieval kingdoms of both France and Germany. The Franks were always a small minority in their own kingdom, and it is an irony that both France and the French language take their names from the Franks, although there are only a few hundred Frankish words in French and few Franks actually settled in France.

The Franks were a West Germanic people, and the modern Dutch and Flemish languages are direct descendants of Frankish. The Franks (the name means "fierce" or "proud") first appear in historical sources in the 3rd century A.D., as the product of one of the periodic dissolutions and regroupings of Germanic tribal confederations. The late and artificial character of the origin of the Franks left them without a long tribal history, a deficit that was corrected in the 7th century by the myth that they were descendants of Trojans. There also was little cohesion or unity among the Franks, and each of their major branches comprised many subgroups under their own chieftains. The Salian Franks were on the lower Rhine, while the Ripuarians were on the middle Rhine. But there were also many other groups of Franks, among them the Chati, Bructeri, Chamavi, and Amsivarii.

In the later 3rd century and throughout the 5th, the Franks, along with the Alemanni and other Germanic tribes, constantly tested Roman defenses along the Rhine. The Romans generally had the upper hand, and many of the defeated Franks were settled in Roman Germany and northern Gaul as *laeti* (farmer soldiers). The Salians were given land in Toxandria, southwest of the mouths of the Rhine. Many Franks were enrolled in

the Roman army and rose to positions of command. Franks could be found in Roman service in Spain, Egypt, Asia Minor, and Mesopotamia.

During the decline of Roman imperial government in the 5th century, the defenses of the Rhine collapsed and the Ripuarian Franks established a strong kingdom centered on Cologne. The band of Salian Franks around Tournai began to rise to prominence under its leaders, the Merovingians Childeric I and his son Clovis I. Clovis brought all of the Frankish tribes under his dominion, along with the neighboring Alemanni and Thuringians and almost all of Gaul. Although he moved his capital first to Soissons and then to Paris, accompanied by his entourage, few other Franks moved with him. The kingdom of the Franks was ruled by a Salian Frank with his mostly Frankish companions and army, but its population and culture were mixed, with Franks themselves forming only a small part of its ethnic composition, though they were dominant in northeastern Gaul and the lower and middle Rhine.

Thus, the kingdom of the Franks, the ensemble of lands subject to the Merovingian kings, including Aquitaine and Burgundy, must be distinguished from the land of the Franks, Francia, which ran from northern Gaul through the Salian and Ripuarian territories—the regions of Neustria and Austrasia. The small numbers of Franks scattered throughout Neustria soon assimilated with the Gallo-Roman population and left little ethnic imprint on the region's culture, other than the Salic Law and an identification as Franks. The word "Frank" lost its ethnic significance during the 6th century and came to be synonymous with "free man"; in France, it came to denote someone from north of the Loire, a Neustrian. In Germany, the Frankish territories preserved their ethnic identity as Franconia (one of the five German "stem-duchies"), while the heart of Lorraine was Austrasia, the land of the Ripuarian Franks.

# FRAUD, COMMERCIAL

. Definitions of ethical wrongdoing in medieval France varied according to the legal system, canon, civil, or customary law, or royal legislation under consideration. As a rule in matters of trade, town governments and guilds policed weights and measures and ensured quality control of merchandise for export and local sale. There was concerted effort to protect consumers from fraud. In the south of France, where Roman law formulae, such as *sine dolo* and *sine ulla fraude,* appeared in 12th-century documents, a

theory of fraud developed, giving rise to various remedies of justice including restitution and disbarment from the practice of a particular trade.

While Jehan Boinbroke defrauded his employees in northern Douai, in the south of France, Catalan and local merchants occasionally ran afoul of inspection procedures in spice imports. Several instances of saffron fraud can be reconstructed from 14th-century documents. Adulteration of the spice to increase its weight, through wetting or the admixture of extraneous material, was recorded. Municipal officials often chose to make an example of offenders. In France, as elsewhere in medieval Europe, the maintenance of high ethical standards in business was essential to the medieval system of commerce, which was based on mutual faith and trust.

# FREDEGAR

(fl. ca. 642). At some point in the mid-7th century in Burgundy, a chronicler, or chroniclers, assembled a group of six historical works, now known together as *The Chronicles of Fredegar*. The name Fredegar is not found in the medieval manuscripts of this work; it appears first in the 16th century. Historians, however, have kept it as a convenient way to refer to the author, or authors, of this important anonymous source for the history of early-medieval France in the Merovingian period. Fredegar is the most coherent and reliable guide to things Frankish from 591, when Gregory of Tours left off, until 642. A Carolingian continuation of the chronicle is found in some, but not all, of the early manuscripts, and this, too, is an important source for the period up to the first year of Charlemagne's reign (768).

Scholars have focused most intently upon the sixth chronicle (or the fourth book, depending upon how the work is divided), which is Fredegar's original account of his own times. The first five chronicles (or three books) comprise his copying, editing, and interpolating earlier historical works. Fredegar is accurately called a chronicler and not a historian, for though he moves in an orderly chronological fashion his account lacks the comprehensive synthesis of large amounts of material that would elevate him to the company of Bede or Gregory of Tours. His perspective is clearly Burgundian; when he treats matters in that kingdom, he is most detailed and vivid. He also knows a great deal about events in Neustria and Austrasia and, from time to time, adds valuable information concerning Spain, central Europe, and even Byzantium.

# FREDEGUNDE

(d. 597). The most famous of the wives of the Merovingian king Chilperic I, Fredegunde was the mother of Clotar II. The extremely hostile accounts of her by Gregory of Tours and in the *Liber historiae Francorum* have left her with the reputation of being an embodiment of evil, a scheming murderess whose wiles led Chilperic I to commit his worst excesses.

Apparently of low birth, Fredegunde became one of the wives of Chilperic and then rose to the position of queen and chief wife by eliminating her rivals, especially by the murder of Galswintha, which precipitated a long feud with Chilperic's brother Sigibert and his wife, Brunhilde, Galswintha's sister. Fredegunde is blamed for the subsequent assassination of Sigibert, as well as for the torture, murder, and attempted murder of real or perceived opponents, including sons of Chilperic by other wives, Brunhilde and her son Childeric II, as well as bishops, counts, and dukes. After Chilperic's assassination in 584, Fredegunde preserved the kingdom for her son Clotar II during his minority. Despite her evil reputation, Fredegunde was a dominant and capable politician.

# *FREDUS*

. In Frankish law, the *fredus* was the portion of a fine that was paid to the king, either directly or through his representative, or to those who held immunities. This was a payment for the intervention of the government in the resolution of a dispute, not a penalty or a fine. It usually was one-third of the compensation paid to the injured party, though at times it was a fixed sum. In the later Merovingian period, the *fredus* was primarily a source of revenue for the crown. In the Carolingian period, it was often absorbed into the *bannum,* a royal order to do or not to do something on pain of fine.

# FRÉJUS

. Established by Julius Caesar in 50 B.C. and known as the Forum Julii, Fréjus is located in the southeast of France in the department of the Var. From the Roman period, there remain the ruins of a 3rd-century amphitheater, an aqueduct, and some fortifications. A 5th-century baptistery also survives that is significant for several reasons. Formigé's work on the edifice in 1926–27 and 1929–30 demonstrated that the baptistery was erected specifically for the Christian rite. Its style is Merovingian—an octagon built within a square with four rounded apses and four rectangular niches. The floor is of marble, while those of the apses and niches are terra-cotta mosaics.

In the Fréjus baptistery are the only surviving French *dolium* and remnants of a *ciborium*. The *dolium* is a basin built into the floor on the south side, 1 foot 3 inches deep, for a foot-washing ceremony prior to baptism in the Ambrosian rite. The octagonal *piscina* in which the catechumen was immersed is 2 feet 9 inches deep. Only one of the eight columns originally surrounding the *piscina* now remains. From these columns, curtains were hung to protect the modesty of the catechumen. Another curtain divided the baptistery into sex-segregated halves.

The cathedral of Notre-Dame-et-Saint-Léonce, rebuilt by Bishop Riculfus in 975 after the Muslim attack in 915, contained a single nave and one side aisle, which formed the parish church dedicated to St. Étienne. The present narthex dates from the 12th century. The original cathedral dating from the 4th-5th centuries contained a nave and two lower side aisles, a common occurrence in Provence. The cathedral group is completed by a cloister that dates from the 12th and 13th centuries.

# FRENCH LANGUAGE

. Old French had its origin in the colloquial form of Latin brought to Gaul in the 2nd century B.C. as a consequence of the Roman occupation. With the collapse of the Roman Empire in the 5th century, Germanic groups in great numbers began to enter Gaul, among them the Franks, who settled most thickly in the north. The linguistic evolution of the

earlier period, which had included many features shared throughout the empire, gave way to divergence and to the formation of the Romance tongues. The language spoken in Gaul during this period, called Gallo-Roman, gradually underwent considerable dialectal differentiation. By the mid-9th century, two main dialect groups could be found in Gaul: in an area roughly south of the Loire River were the dialects of the Langue d'oc, now called Provençal or Occitan; north of there were the dialects of the Langue d'oïl, the ancestor of modern French.

Stages in the development of the language from colloquial Latin through Middle French are:

> *Late* (or "Vulgar") *Latin:* 2nd century B.C. to 5th century A.D.
> > *Gallo-Roman:* end of 5th to mid-9th century
> > *Early Old French:* mid-9th to end of 11th century
> > *Old French:* 12th and 13th centuries
> > *Middle French:* 14th and 15th centuries

By the Carolingian Renaissance (ca. 800), French and Latin were separate languages, though conscious reform rather than natural linguistic evolution may have shaped the Latin used at the time. In 813, the Council of Tours recommended that priests explain the word of God in the language of the people, that is, in the *rusticam Romanam linguam*. In 842, Charlemagne's feuding grandsons paved the way for the division of his land by swearing the Oaths of Strasbourg. The oaths were recorded by another family member, the chronicler Nithard, and have subsequently become the event scholars cite to mark the beginning of the Early Old French period.

A Latin of record, religion, and learning persisted. In the spirit of the Council of Tours, however, inspirational literature began to appear in the vernacular. The earliest surviving example of a saint's life, the *Séquence de sainte Eulalie,* dates from the 9th century.

In England, for more than two centuries after the Norman Conquest of 1066, French was the language spoken by the group of people surrounding the ruler. At first, their dialect must have reflected Norman usage, but nobles arriving later came from other parts of France. As in France itself, the use of French in imaginative works preceded by far its appearance in official documents, for which Latin was preferred. Although many words of French origin entered English, there is little evidence that French became the language of the people. English borrowings into French are rare before the 17th century.

*Gallo-Roman and Early Old French.* Of the numerous and complex phonological changes that occurred during the early centuries, perhaps the most sweeping were those caused by one or more of the following speech habits: word stress, palatalization, and, beginning in the Early Old French period, vowel nasalization. Along with a tendency to vocalize consonants or to eliminate them without trace, these forces, or their greater impact in Gaul than elsewhere, gave to Old French its distinctive character. They are responsible for the creation of new diphthongs and consonants, as well as for a dramatic loss of syllables. The following discussion offers examples of those changes. (Phonetic symbols employed are those of the International Phonetic Alphabet. Upper-case letters are used for Latin forms. An asterisk denotes an unattested form. Bracketing indicates

unstable sounds that were lost early. The symbol < means "comes from, came from," and > means "becomes, became.")

Two general but highly significant alterations occurred in Vulgar Latin. The Classical Latin distinction in vowel quantity ceded to a system of vowel quality: long vowels closed, high vowels lowered, long and short A fell together, and the Classical Latin diphthongs simplified (except for AU, which was not reduced until the end of the Gallo-Roman period). The second important change was the replacement of the Classical Latin musical, or pitch, accent, by a stress, or tonic, accent. The syllable that received the tonic accent in Latin was retained in Old French, whereas other, weakly stressed syllables tended to be effaced. To that stress system, Germanic speech later contributed its own strong expiratory stress.

Vowels developed according to the degree of stress with which they were uttered. When the strongest degree of stress, called tonic stress, fell on one syllable of a word, other syllables were uttered more weakly. Vowels were altered in measure as they were found in tonic, countertonic (secondarily stressed), or atonic (unstressed) syllables. In most cases, the way in which they developed also depended upon their consonantal environment. Simply put, a group of two consonants (except where the second is an *r* or an *1*) closes a syllable, "checking" or "blocking" a vowel preceding, but just one consonant leaves the syllable open and the vowel is said to be "free."

Diphthongs were created when certain tonic free vowels "broke": ę>*ie* (PED EM]>*pied*); *ɔ/ > uo*(SOR OR]> *suor*); *e>ei*(ME>*mei*); *ɔ> ou*(FLOR EM]>*flour*); later, *ei> oi, uo>ue* and *ou>eu*. By contrast, in tonic checked position and in syllables bearing secondary stress, the same vowels did not diphthongize.

Because final and intertonic syllables were unstressed, their vowels were especially vulnerable to effacement. Although final *a* remained in the form of /ǝ/ (as in Eng. ***about:*** PORTA>*porte*), most other word-final vowels were effaced (PORT[U]>*port*). Most vowels between tonic and countertonic syllables were eliminated (TAB[U]LA>*table,* DEB[I]TA>*dette*); here again, *a* could be more resistant: before an accented syllable *a*>/ǝ/ (ORNAMENTU>*ornement*), which could stand in hiatus with a following stressed vowel (ARMA[T]URA>*armëure*).

A distinguishing feature of French was the alteration of free *a* in a stressed syllable. In that environment, *a* was raised to ę, which later opened to ę in certain situations (MATR[EM]>*mere,* PORTAR[E]>*porter*).

Palatalization, the process by which sounds made with the tongue are altered as the middle or the front of the tongue is lifted toward the hard palate, began in colloquial Latin. The velar consonants *k* (spelled *c*) and *g* are a striking example. The palatalization of *k* and *g* in certain positions in Gallo-Roman resulted in the creation of four new consonants: the fricatives /ts/ (as in Eng. ***bits***) and /dz/ (as in Eng. ***beds***), and the affricates /tʃ/(as in Eng. ***church***) and /dʒ/(as in Eng. *judge*): in CENT(EM), /k/(C)>/ts/; in CANTA(T), /ʃ/ in GAMB(A), G > /dʒ/, and so on. Similarly, in the groups *kl* and *gl,* the loss of the first element after a vowel produced another new consonant, the palatal liquid /ʎ/ (as in Ital. *figlio*). Palatalization also occurred when *e* or *i* before *a, o, u* became /j/ (as in Eng. ***yes***) after a syllable bearing tonic stress; /j/ then palatalized the preceding consonant, as in the new /ɲ/: VINEA>*vigne* (as in Mod. Fr.).

Palatalization affected vowels as well as consonants. It occurred independently in the raising of/u/ (as in Fr. *ou*) to /y/ (as in Fr. *tu*), but other instances were conditioned by

environment and often led to the creation of diphthongs. One such instance is that of tonic free *a* preceded by */k/*. In that position, *a* was raised and then diphthongized (CANEM>*chien*). When */k/* and g in certain positions were effaced, they left /j/ (spelled *i*), which then combined with a preceding vowel to form a diphthong, as PACARE>*paiier*.

Consonant vocalization (the opening of consonants into vowel sounds) resulted in the formation of new diphthongs, as happened when velarized ɫ /ɫ/ in preconsonantal position began to vocalize in the 9th century: a + /ɫ/ > au(ALBA>*aube*); ɛ + /ɫ/ > eu(ILL[U]S>*els*>*eus [eu*x*]*); ɔ +/ɫ/ > ou (FOLL[i]s > fɔs> fous);o+ /ɫ/ > ou(AUSCULTA[T]> *escoute*. A new triphthong, *eau* (BELL[U]S>*beau*), emerged from ɛ + /ɫ/ preconsonantal.

Consonants in a weak position (those at the end of a word or standing alone between vowels) tended to be eliminated. Final M had been lost in early colloquial Latin, and *m* and *n,* which became final later, likewise fell. Final *t* and *d* after a vowel were effaced early. The sounds *p, b, v* final either remained as *[f]* (*CAP[U]>*chef*) or were lost. When intervocalic consonants were lost, the number of syllables in a word was reduced, sometimes through an intermediate situation of vowel hiatus. Intervocalic *p, t, k* and *b, d, g* had already weakened in Vulgar Latin. In Gallo-Roman, *p* and *b* intervocalic were retained as *v* (FABA>*feve*, RIPA >*rive*), but before *o* and *u* they disappeared (TABON[EM]> *taon*), as did */k/* and *g*. Intervocalic *t* and *d* were effaced (MUTAR[E]>*muer,* VIDER[E]>*vëoir*).

Germanic speech habits, too, influenced the development of French. Whereas Latin *h* had already ceased to be pronounced (HABERE>*aveir, avoir*), the *h* in Germanic words was pronounced (haunitha>*honte*), and the Germanic bilabial *w* became *gu* or *g:* WERRA>*guerre,* WARDA>*garde*.

Nasalization, a phenomenon peculiar to French and Portuguese among the Romance languages, did not begin until the Early Old French period. In general, tonic vowels both free and blocked nasalized before the consonants m, *n* and /ɲ/ but countertonic vowels nasalized only in some circumstances. The low vowel *a* nasalized first (as in *tant*), probably in the 10th century, followed by the mid-vowels and eventually the high vowels *i* and /y/ and the diphthongs *ie, oi, ui,* which nasalized toward the end of the 12th century. Nasal consonants also caused diphthongization of tonic free *a* to *ai* (which did not raise to e, therefore: MAN(UM)>*main*) and they prevented certain other developments.

*French in the 12th Century.* Evidence for Old French is contained in a large body of written material of many types, including literary works. Nevertheless, it is not easy to know with precision the exact pronunciation of Old French or the dates and geographical extension of linguistic phenomena. As against the hesitancies of Old French orthographic practice (the same phoneme in the same environment was often represented by different graphies), the rhyme and counting of syllables required by verse are a precious, if not infallible, aid in determining linguistic values.

The preponderance of dialects in the Old French period is a further complicating factor, making it impossible to talk about one Old French pronunciation. The main variants of the Langue d'oïl were Francien and, to its immediate east and much like it, Champenois; to the south were the dialects of Orléans, Bourbonnais, Nivernais, and Berry; others were Anglo-Norman, the dialect spoken in England after the Conquest, and Norman (northwest); Picard, Lotharingian, and Walloon (northeast); Burgundian and Franc-Comtois (southeast); the dialects of Anjou, Touraine, Maine, and Brittany (west);

and those of Poitou and Saintonge (southwest). The dialects were marked by regionalisms and may not have been entirely mutually intelligible. Their corresponding written languages, called "scriptas," were colored in varying degrees by dialectal traits but remained understood by speakers in other areas; the scriptas, therefore, were not faithful records of the dialects. The base of the scriptas was from the beginning Francien, the scripta of the Île-de-France region around Paris, and that was so mainly for political and geographical reasons. Modern French is derived from the Francien dialect. The following description of the Old French (Francien) sound system of the late 12th century nevertheless represents a reliable conjecture:

Consonant phonemes: probably twenty-one: /p/, /b/, /t/, /d/, /k/, /g/, /m/, /n/, /l/, /f/, /r/, /v/, /s/, /z/, and /h/ (in words of Germanic origin) and the new consonants /ɲ/, /ʎ/, /ts/, /tʃ/, /dz/, and /dʒ/. In the 13th century, affricates reduced to their fricative element: /ts/>/s/, /tʃ/ /ʃ/, /dz/>/z/, and /dʒ/ > /ʒ/.

Oral vowels: probably the high vowels /i/, /y/, /u/, and /o/, the mid-vowels /e/, /ę/, /ɔ/, /ø/, and /ə/, and the low vowel /a/. There was a sound longer than /o/ and one longer than /e/. Oral diphthongs: probably six, that is, /ei/ (in an open syllable, as rai-son); /oi/</ei/, /yi/ (nuit); /au/ (from vocalized /l/; /ie/ (chief); /iø/ (Dieu); and the triphthong /eau/ (beaus). By the end of the 12th century, /ai/ had been reduced to /ę/ in a closed syllable, and /ou/>/u/. The diphthongs /ue/, /eu/, and the triphthong /ueu/ became /ø/, spelled eu or œ. There were two nasal monophthongs, /ã/ and /õ/, and two nasal diphthongs, /iẽ/ and /ẽi/.

In the 13th century, /o/ long free>/ø/ (flor>fleur), /o/ checked>/u/ (tor>tour). The first element of the diphthongs /ie/, /ieu/, /oi/, and /yi/ consonantalized, becoming /je/, /jø/, /wę/, and /ɥi/, respectively. The high vowels /i/ and /ø/ nasalized to /ĩ/ and /ø̃/.

The Francien scripta could employ varying spellings to render each of those phonemes, even in the same text, paragraph, or line. For example, the competing spellings ilg, lg, lli, or illi, could appear for the new /ʎ/. Regional scriptas, and dialectal differentiation, added to the variety of graphemes.

*Twelfth-Century Morphology and Syntax.* Classical Latin was a synthetic language, one in which flexions marked relationships between the parts of a sentence. Modern French, an analytic language, expresses those relationships through the use of particles (e.g., prepositions) and fixed word order. Accordingly, in the development of French the Latin cases, which had been reduced to just the nominative (replacing the Latin nominative and vocative) and oblique (replacing the Latin accusative, genitive, dative, and ablative), probably by the end of the Late Latin period, were gradually lost. The two-case system of the 12th century used -s or -z alone to mark both case and number in several classes of nouns:

### Table 1. *Old French Nouns*

|  | A. Masc. | B. Masc. | C. Fem. | D. Fem. |
|---|---|---|---|---|
| Nom. sg | *murs* | *pere* | *rose* | *flors* |
| Obl. sg. | *mur* | *pere* | *rose* | *flor* |
| Nom. pl. | *mur* | *pere* | *roses* | *flors* |
| Obl. pl. | *murs* | *peres* | *roses* | *flors* |

Another class of nouns, both masc. and fem., had a nom. sg. form that was always shorter than its other forms (e.g., *ber—baron, none—*nonain). Adjectives in Old French tended to precede, not follow, nouns, and most agreed with them in gender and in number.

Among other parts of speech, the Old French system of articles (<[IL]LE) resembled the modern paradigm except for a masc. nom. sg. and pl. form, *li*. The definite article was used in general to individualize a substantive; it did not appear with abstract nouns. The indefinite article *uns* (<UN[U]S) was slower to appear. Old French demonstratives included forms for proximate (*cist* or cest; ceste) and distant (*cil* or *cel; cele*) reference. By the end of the 12th century, the proximate forms had become specialized as adjectives, but *cil* and *cele* functioned equally as pronouns and adjectives.

Certain Old French parts of speech had two sets of forms, tonic and atonic. Tonic forms were relatively more autonomous, appearing in stressed position in a phrase—after a preposition, for example. Atonic forms tended to precede stressed forms, such as verbs. Among personal pronouns, the first two oblique forms were represented by a stressed and unstressed series of forms that did not distinguish between direct and indirect objects: tonic: *mei (moi), tei (toi), sei (soi);* atonic: *me, te, se.* The system of possessives, too, was divided into tonic and atonic forms, and in the masc. obl. sg. forms *mien* (tonic) and *mon* (atonic) can be seen the origin of the modern French distinction between pronoun and adjective.

As for verb tenses, of the Latin indicative tense forms, active voice, only the present, imperfect, and the perfect persisted into Old French. A new future form was created from the infinitive+present indicative of HABERE (e.g., *chanter+ai>chanterai*) and a compound future perfect was developed *(j'aurai chanté).* A future-in-the-past that could also be used to describe hypothetical or contingent action, the "conditional," was added, built on the infinitive +the imperfect endings of HABERE: *chanter+oie, -ois, -oit,* etc. The new compound form, the *passé composé,* had mainly present perfect meaning. Thus, in the 12th century Old French had five simple tenses of the indicative: present, imperfect, simple past *(passé simple),* future, and conditional. There were five compound tenses: present perfect, past perfect (formed in two ways, either with the imperfect or the simple past of the auxiliary), a future perfect, and a conditional perfect. The *passé surcomposé* did not begin to appear before the early 13th century.

There were three classes of Old French verbs: I: infinitive in *-er* and *-ier,* II: infinitive in *-ir,* present participle with *-iss;* and, III: infinitive in *-ir, -re, -eir* (>oir). The relatively more distinctive personal endings of verbs made expressed subjects less necessary than in the modern language.

## Table 2. *Old French Present Indicative*

| I. chanter | II. fenir | III. corre |
|---|---|---|
| chant | fenis | cor |
| chantes | fenis | cors |
| chante | fenist | cort |
| chantons | fenissons | corons |
| chantez | fenissez | corez |
| chantent | fenissent | corent |

The simple past presented weak and strong forms. Weak forms included all *-er, -ier,* most *-ir,* and many *-re* verbs. Of the four types of Classical Latin strong perfects, three survived, in altered form, into Old French. Because of the effects of stress, strong forms presented greater paradigmatic variation than weak forms. Syntactically, the simple past was primarily a narrative tense with punctive aspect, but it could also be used descriptively, especially in the earlier period when the imperfect was infrequent. Unlike the modern *passé simple,* the simple past was used in conversation.

Although the imperfect tense had competing dialectal endings in the 12th century, the predecessor of the modern form was common: *vend-eie, vend-eies, vend-ei(e)t, vend-iiens, vend-iiez, vend-eient.*

Of the Classical Latin subjunctive forms, only the present and pluperfect survived into French. The Latin pluperfect subjunctive became the Old French imperfect subjunctive, its endings not very different from the modern imperfect subjunctive.

*Middle French.* Significant vocalic changes of the Middle French period include the continued reduction of diphthongs to simple vowels (there are no diphthongs in modern French). The diphthong *au* reduced to /o/ and the triphthong *eau* reduced to /eo/ very late in this period. Vowels in hiatus were reduced to just their stressed element *(meïsmes>mesmes).* Before a stressed syllable, /ə/ was effaced *(armëure>armure).* In late Middle French, a process of denasalization began, affecting first the vowels that had been the last to nasalize. Other vowel changes occurred, but it was not until the late 16th century that the vowel system of modern French was in place.

The erosion of final consonants continued in Middle French, encouraged by a shift, evident even in the 12th century, from word to group stress, the pattern of modern French. Under that type of stress, groups of words are run together, making a phrase or locution into a unit. As words are linked, some of their final consonants weaken and disappear; that was the case for final plosives and fricatives before a consonant. Even final consonants preceded by another consonant (and thus supported) were generally effaced in this period. Final *r* weakened.

As for the case system, virtually all texts show traces of it, but none uses case systematically or coherently. The nominative inflection had yielded to the accusative with few exceptions.

Middle French literary practice took advantage of old and new forms, as well as of regionalisms. Although leveling of dialectal features in scriptas had begun early, radiating outward from the area around Paris, a common stock of forms, which included regional variants, nevertheless remained available to writers from all areas. Their use was not necessarily a true indication of the writer's own dialect. Regionalisms like the Picard word-final reduction of *-ié* and *-iée* to *-ie* can be found at the rhyme in texts from many regions. The raising of *a* before /ʒ/ or /ɲ/ was an eastern trait that appeared broadly in literary texts in the form of *-aige* for *-age* and *-aigne* for *-agne* (as *Bretaigne* rhyming with *enseigne,* or *couraige* with *sai je*). In this period, it is not unusual to find rhymes between *-eu* and *-ou* (*gracious, gracieux* with *nous*), and *-ui* could rhyme either with *-u* or with *-i,* and both in the same text (*huis* with *lassus, je vi* with *bui*). Rhymes also attest the spread later in the period of such Parisian pronunciations as *-ar* for -er(as in the rhyme *Robert* with *Lombart,* found in the poetry of François Villon).

*Word Order, Sentence Structure, Vocabulary.* Word order in Old French was fairly flexible, owing in part to the two-case system. While the modern French order subject-

verb-complement was common in both prose and poetry, another order, that of complement-verb-subject (+possible additional complement), was frequent, particularly in poetry and in main clauses. Thus, the sentence *Ses barons fist li rois venir* means "The king summoned his barons." In Middle French, as use of the case system declined, word order tended to become more fixed.

Parataxis, or the placing together of clauses or phrases without explicit coordinating or subordinating words, was frequent in verse texts of the Old French period. In Middle French, parataxis became rare. On the other hand, the revival of classical studies and with it a taste for latinizing encouraged many writers of Middle French prose to imitate Latin periodic construction.

Although over the centuries French has borrowed vocabulary from other languages, Old French was overwhelmingly a language inherited from colloquial Latin. The Celtic spoken originally by the Gauls contributed words to French, as *vassal, cheval*. Low Latin, the written form of Latin which persisted throughout the Gallo-Roman and Old French periods, continued to provide words. Germanic words from many semantic groups passed into French, some in the Vulgar Latin period, others in Gallo-Roman: *heaume, guise, garnir, blanc, choisir, fournir, danser, gage, guetter* are but a few examples. In the Middle French period, the desire to latinize brought large-scale borrowing from Classical Latin. Borrowings from Italian became more numerous, reflecting Italy's new cultural ascendancy.

# FROISSART, JEAN

(1337-after 1404). The greatest French chronicler, as well as an outstanding poet and romancer, Jean Froissart was born the year the Hundred Years' War began, to a humble bourgeois family of Valenciennes, which lay then outside the French kingdom. After a clerical education, he entered the service of the counts of Hainaut. All his life, Froissart was a servant of powerful nobles. His ability to please his aristocratic patrons and protectors is his chief characteristic as a man and writer. In 1361, he went to England to become one of the *clercs de la chambre* of Philippa of Hainaut, wife of Edward III. He remained in that service until her death in 1369. His stay in England was interrupted by extensive travels to Scotland, to southern France in the suite of the Black Prince, and later, in the retinue of Edward's second son, Lionel, duke of Clarence (patron and protector of Chaucer), to northern Italy, where Lionel married the daughter of the duke of Milan. After the wedding, Froissart traveled to Rome and returned to England via Hainaut and Brabant. These travels doubtless furnished him with the "pan-European" outlook informing much of his *Chronicles*. The youthful service at the very French court of Philippa imprinted in him a permanent, idealized image of a chivalric "paradise lost" so evident in his romance *Méliador*. After the death of Philippa, Froissart returned to his native Hainaut in search of new patrons. His chief benefactors were Robert de Namur (d. 1392); more importantly, Gui II, count of Blois (d. 1397), who in all probability urged him to work on the *Chroniques;* and Wenceslas, duke of Luxembourg and Brabant (d. 1383), who certainly encouraged his poetry, for he was a poet in his own right. We know that Froissart took holy orders and that, in 1373, he received a benefice in Les Estiennes near Mons. In 1384, he became a canon at Chimay. Sometime later, he received another canonry at Lille. He spent the winter of 1388–89 in Orthez, at the splendid court of another aristocratic man of letters, Gaston Phoebus, count of Foix (d. 1391). He traveled to the Low Countries, and in 1394 he briefly revisited England. Little is known about Froissart's declining years. He died some time after 1404.

   Froissart's main achievement is *Les chroniques de France, d'Angleterre et de païs voisins...,* a history of almost all of western Europe spanning the years 1327 (the accession of Edward III) and ca. 1400 (the death of Richard II). This history, although providing us with an enormous wealth of realistic detail, is written from a distinctive point of view. Like so much of Froissart's poetry, it embodies a frank glorification of an aristocratic, idealized, "international," chivalric life. Up to 1361, his work is a recasting of Jean le Bel's (ca. 1290–1370) *Vrayes chroniques,* which present the first years of the reign of Edward III and the beginnings of the Hundred Years' War. After this date, Froissart follows his own observations, hearsay, and, occasionally, documents. He was certainly conscious of partisan points of view in history and took some pains to ascertain the facts, interviewing eyewitnesses and participants in the events described. He traveled widely to seek out sources and constantly recast the first two books of his *Chroniques* to suit changing political circumstances and the tastes and views of his patrons.

Froissart's *Chroniques* are divided into four books. Book 1 was recast by the chronicler into four redactions. It relates events up to 1369, 1372, or 1377 depending on redactions. After this book, Froissart wrote the independent *Chronique de Flandre,* which relates the disorders occurring in that country between 1378 and 1387. This chronicle was later incorporated into Book 2, which ends with events in 1387; there are two redactions of Book 2. The last two books exist in only one redaction. The third relates events to ca. 1390 and the fourth to ca. 1400.

Froissart's *Chroniques,* an important monument of an elegant and efficient French prose, enjoyed an instant, wide, and lasting success. They were particularly appreciated in England, not only for their pro-English stance (inherited, so to speak, from Jean le Bel), but also for their archaizing, chivalric outlook. The *Chroniques* are a priceless source for the history of the 14th century, especially for the reader who understands the aristocratic vantage point from which Froissart viewed it. One should not expect to find either penetrating explanations of political history or subtle social commentary. Froissart's views were limited by those of his patrons: he never understood the aspirations and growing power of the bourgeoisie. He had nothing but contempt for the peasant revolt of the French Jacquerie of 1358, or for its English counterpart led by Wat Tyler in 1381. His *Chroniques* give us a vivid mirror of the epoch, the distortions of which can be more easily understood through the ideology informing his poetry.

Froissart wrote lyric verse, narrative-didactic poetry, and a long, rhymed Arthurian romance. His lyrical output is considerable: thirteen *lais,* six *chansons royaux,* forty ballades, thirteen virelais, 107 rondeaux, and twenty *pastourelles*. They come to us in the two manuscripts carefully copied under his supervision (B.N. fr. 830 and 831), which also contain his narrative-didactic poetry. He also wrote several *serventois* in honor of the Virgin. Otherwise, all his lyrical poems, most of which were composed before 1372, celebrate courtly love. In lyrical as well as narrativedidactic poems, his unavowed model was Guillaume de Machaut (ca. 1300–77), but Froissart, as far as we know, composed no music.

Of special historical interest because of their historical *realia* are Froissart's *pastourelles*. The lovestruck shepherds sometimes make historical allusions, and under the easily penetrated fictional cover, six of these *pastourelles* celebrate public events, such as the arrival in Paris of Queen Isabeau (1385), or the marriage of the elderly John, duke of Berry, to the very young Jeanne de Boulogne (1389). The *pastourelles* present real affinities between Froissart's lyric poetry and his *Chroniques*.

Much of Froissart's lyric poetry exists in two "redactions," for many of the poems were not only grouped according to their genre, but also inserted (sometimes slightly modified) in narrative *dits* (called also *dittiés* or *trettiés*). The oldest of them is the *Paradis d'Amour* (1,724 lines with five lyric insertions), an allegorical dream vision (in the manner of the first part of the *Roman de la Rose*) in which the poet-lover encounters in the Garden (Paradise) of Love such traditional figures of the God of Love, Plaisance, Hope, Pity, and Sweet Looks. The protagonist tells the story of his love to the God of Love, recites his poems, and meets his ladylove, who makes him a wreath of daisies. To reward her, the poet recites his ballade *Sur toutes flours j'aimme la margerite*. Her touch wakes him from his delightful dream. What is important in this *dit* is Froissart's explicit connection between the love-dream and the ability and capacity for composing lyric poetry.

The *Orloge amoureus* is the only *dit* written in decasyllabic couplets (unlike the others composed in octosyllables). Its 1,174 verses describe the workings of the clock, then a relatively new invention. In all probability, it was the real Parisian clock in the tower of the Palais Royal on the Île de la Cité that Froissart examined in 1368 during his return trip from Italy. The poet systematically compares his love-filled heart with the "subtlety" of the workings of the clock. Thus, the foliot or bar-balance is Fear, the main weight is Beauty, the mother wheel is Desire, the 'scape wheel is Moderation, the striking wheel is Sweet Talk, and so on. Each part of the mechanism corresponds thus to a "well-working," allegorical system of courtly love. The presentation of the workings of the clock is so detailed and exact that the *Orloge amoureus* was cited and partially translated by an English historian of horology. This *dit* is, like the *Chroniques,* a monument to Froissart's unquenchable curiosity concerning the things of this world.

The *Espinette amoureuse* (4,198 verses with fourteen lyric insertions) offers first a long pseudo-autobiographical introduction describing his childhood and stressing the precocity of his love inclination. Then the poet presents a dream vision in which he encounters Juno, Pallas Athene, Mercury, and Venus. Venus makes him a gift of a "[c]œur gai, joli et amoureus" (l. 547). The rest of the *dit* is quite similar to the *Paradis*. The poet-lover encounters his ladylove, they exchange poems, they dance, but after a while the lady must leave because she is to marry someone else. The poet becomes ill and alternates between hope and despair.

The *Prison amoureuse* (3,895 lines with sixteen inserted poems and twelve letters in prose) tells, under the usual allegorical cover, the real story of Wenceslas of Luxemburg, captured in the Battle of Baesweiler in 1371 and awaiting the ransom money to be paid by his brother, the emperor Charles IV. The seven letters written by Rose (=Wenceslas) and five by Flos (=Froissart) present the backbone of the *dit*. They discuss the subtleties of courtly love. We know that the combination of letters and verse-narration was made popular by Machaut in his *Voir dit* (ca. 1362), but whereas Machaut presents a real plot, in Froissart the plot is replaced by two *exempla:* a pseudomythological love story told by Flos and an allegorical vision experienced by Rose, in which we can made out the real story of the imprisoned Wenceslas.

The *Joli buisson de Jonece* is the longest and most ambitious of Froissart's *dits* (5,442 lines, with twenty-seven inserted poems). It is a dream vision that Froissart, aged thirty-five, had on November 30, 1373. In his dream, populated by mythological and allegorical figures, Youth leads him to an allegorical Bush. Awakened, the poet realizes the real danger and turns his thoughts toward the Virgin, whom he praises in a *lai*. She becomes "li Buissons resplendissans" (l. 5,402) and her Son "[e]st li feus plaisans,/ Non ardans,/Mais enluminans" (ll. 5,407–10).

Like the *Orloge,* the *Temple d'honneur* (1,076 lines) does not contain any inserted lyrics. In this allegorical dream, Honor marries his son, Desire, to Lady Plaisance. Froissart calls this poem not a *dit amoureus,* but *trettié de moralité.* Indeed, most of the *trettié* consists of Honor's long moral sermon on love and marriage. It is quite possible that the *Temple* is indeed an epithalamium celebrating a real couple.

Besides these five *dits,* Froissart composed six shorter lyrico-narrative poems. The *Dit dou bleu chevalier* (504 lines) tells, in a complicated metric scheme, the efforts of the poet to console a lovesick knight dressed in blue (the color of fidelity). The *Joli mois de mai* (464 lines with three lyric insertions) is a purely lyrical composition in which the

poet, addressing a nightingale, extolls the beauty of his ladylove. Purely lyrical also is the *Dit de la margueritte* (192 lines): the poet sings the praise of his flower-ladylove. The *Plaidoirie de la rose et de la violette* (342 lines) is a perfect example of Froissart's ability to flatter: these two flowers ask the court of France to decide which of them is more worthy of praise. The court, presided over by "noble et haulte Flour de Lys" (l. 308) and seconded not only by the usual allegorical figures of Prowess, Youth, Sense, Gernerosity, and others, but also by the dukes of Berry, Burgundy, Eu, and La Marche, will some day pronounce a judgment on all flowers, even on Froissart's flower, the daisy.

More apparently autobiographical are the last two *dits* presented without inserted lyrics or mythological allusions. The *Débat dou cheval et dou levrier* (92 lines) shows Froissart returning from Scotland and overhearing a discussion between his horse and his greyhound on the joys and sorrows of their respective existences. The *Dit dou florin* (490 lines) is a debate between Froissart and the last of his coins left from a dissipated fortune. The poet tells us about the eighty *florins* that he received from the count of Foix and, more importantly, informs us that during his stay in Orthez, Froissart read each night, for eleven weeks, a passage of his *Méliador* to the count.

If in his lyric and lyrico-narrative poetry Froissart adheres closely to the literary canons established by Machaut, his verse romance *Méliador* is perhaps more "original," for it is a conscious return to a much earlier tradition. Its other claim to originality lies in Froissart's insertion of seventy-nine lyric poems from the pen of his patron Wenceslas of Luxembourg. While most 14th-century romances are recastings or continuations, usually in prose, *Méliador's* subject is new, though it is composed in the traditional octosyllabic couplets. The romance of more than 30,000 lines (unfinished and with two lacunae) is set in a youthful Arthurian court and could be called the "enfances de la Table Ronde." It depicts the innumerable adventures, chiefly jousting and chance armed encounters, of innumerable knights-errant, but the main plot is easily discernible: Hermione, princess of Scotland, is promised to the knight who proves himself most valiant in a series of tournaments organized by the ladies. Méliador, son of the duke of Cornwell, is an ideal knight-errant. At the end, he wins not only Hermione but also the Scottish kingdom, while his companions win lesser princesses. *Méliador,* begun in the early 1360s and completed only after the death of Wenceslas in 1383, reflects the geography and ideology of Froissart's early service in Great Britain. As a frank glorification of chivalry, with its implied desire to revive it in Froissart's own time, *Méliador* is a powerful link between his poetry and the greatest accomplishment of his life, his idealizing, and "restoratory" *Chroniques*.

# FULBERT OF CHARTRES

(ca 960–1028). Born of humble parents probably in Aquitaine, perhaps Poitou, Fulbert studied at Reims under Gerbert of Aurillac (later Pope Sylvester II), the outstanding master of the day. Fulbert became master of the cathedral school at Chartres in the 990s and served as master and chancellor before becoming bishop of Chartres in 1006. He had a close association with King Robert II the Pious of France, a schoolmate of Fulbert's at Reims. Fulbert was particularly well versed in law and medicine and was familiar with the astronomical works that had been recently translated from the Arabic. Although intellectually conservative (he avoided the new discipline of dialectics), his teaching attracted one of the most dialectical thinkers of the time: Berengar of Tours, condemned for his novel eucharistic opinions.

After the cathedral burned in 1020, Fulbert began a campaign to rebuild it, a project made possible by the generosity of King Canute of England and Denmark, as well as King Robert of France. The new, spacious crypt constructed by Fulbert remains the largest crypt in France and became the basis for all further construction at the site. The new crypt was meant to accommodate the pilgrims who came to venerate the holy relic of the *sancta camisia,* a garment reputed to have been worn by Mary when she gave birth to Jesus; it was enshrined at Chartres from the 9th century forward and is still possessed by the cathedral. Fulbert was an avid promoter of devotion to the Virgin.

Fulbert was also a reformer who campaigned against simony (buying and selling church offices) and clerical marriage. Like most bishops of his day, Fulbert was both a churchman and a feudal lord, and he knew first-hand the tension of dual allegiances. In a

well-known letter to Duke William V of Aquitaine, his long-time benefactor, Fulbert explains the meaning of the feudal oath. But in another, he is highly critical of ecclesiastics who are intent on bearing arms rather than on keeping the peace of the church. In several letters, he rebukes Foulques III Nerra, count of Anjou, for his depredations.

Of Fulbert's sermons, the best known is that composed for the feast of the Nativity of the Virgin Mary, in which he recounts the history of Théophile, a Christian who after selling his soul to the Devil was rescued by the Virgin. Fulbert's legend of Théophile is the subject of Rutebeuf's *Miracle de Théophile*. An excellent latinist and one of the best writers of his day, Fulbert left behind a substantial body of correspondence, some 140 letters, with leading churchmen, including abbots Abbo of Fleury, Richard of Saint-Vannes, and Odilo of Cluny. He also wrote several poems and a few other miscellaneous works.

# G

## *GAB*

. A word from Old Norse *gabba* meaning originally "to mock, to sneer; a mockery, an insult," it became famous through its peculiar usage in the late 12th-century *Voyage de Charlemagne:* "a boast." Attested as early as the 10th century in Provençal and later in Old French texts, mostly centered in the northwest, the word retained its original meanings until the 16th century, when it finally died out. Because of the renown of the *Voyage,* however, modern scholars tend to recognize "boast" as its most frequent meaning. The episode that celebrates it occurs in Constantinople, where, after a copious dinner well supplied with claret, Charles and the peers make extravagant boasts to while away the time, as is their custom (ll. 448–617). The host, Hugon, places a spy in the chambers and learns that his guests, during their amusements, have insulted him. In rage, he calls upon them to perform their boasts. It takes only three of the *gabs* to prove that the French are superior, so Hugon releases them from further obligation and becomes Charles's vassal. The fame of this adventure has left its mark on *Galien restore* and may have inspired the poems of the Vow Cycle.

In southern France, the troubadours adopted the word to express themes of boasting, so that scholars may refer to certain songs generically as *gabs*. Although an identifiable autonomous genre was never constituted, an argument for the existence of a latent narrative genre can be made.

## *GABELLE*

. The term *gabelle* had widespread use in Mediterranean Europe to describe indirect taxes on the sale of merchandise. In France, after the mid-14th century, it came to refer almost exclusively to a royal tax on salt. Originally a seigneurial right like other mineral

resources, salt became an important source of royal revenue after Philip VI's ordinance of March 16, 1341, ordered seizure of salt throughout the kingdom. It was to be stored in royal warehouses and then sold for a profit by royal officials called *gabelliers*. The king established a more permanent administrative structure in 1343, but general hostility to the new tax led Philip to cancel it in 1346–47 in return for grants of war subsidies. The Estates General of December 1355 reimposed the *gabelle* as one of several indirect taxes that soon were canceled because of opposition. It appeared again at Paris in 1358, and the Estates of Languedoc began imposing a *gabelle* on salt after 1359.

The *gabelle,* along with other indirect taxes, became a permanent part of royal finances in December 1360, when the ransom of King John II required heavy regular taxes. Until 1367, it was a 20-percent *ad valorem* tax, but then the crown changed it to a surcharge of twenty-four francs per *muid* of salt.

# GACE BRULÉ

(fl. ca. 1185–1210). The most illustrious early trouvère, born into the lower nobility of Champagne, Gace has been credited with the most extensive corpus of monophonic compositions in Old French. The over eighty texts, the great majority surviving with their melodies, are almost all courtly chansons in a style derived from the Provençal tradition. Their usual theme, persistent but unrequited and despairing love for a socially superior lady, is often interwoven with the theme of poetic and musical creation: loving and singing express each other. Though almost nothing is known of Gace's life, it is clear that his circle included other major lyric poets and that his patrons—Marie de Champagne, first of all—were among the most powerful feudal figures of his time. Textual and melodic evidence shows that he was widely admired and emulated by both contemporary and later trouvères, in Germany as well as France.

# GACE DE LA BUIGNE

(1305?–1384?). First chaplain of John II the Good, whom he followed into captivity in England, Gace composed the *Roman des deduis* between 1359 and 1377 as an instruction book for John's youngest son, the future Philip the Bold of Burgundy. Its 12,210 octosyllabic lines can be divided into two parts: a battle of personified virtues and vices, enlivened by occasional hunting scenes, and a debate over the merits of hunting with dogs as opposed to falconry. The second part is particularly vivid, with frequent digressions from Barthélemy l'Anglais's *Encyclopedia* and Henri de Ferrière's *Livres du roy Modus et de la royne Ratio*. The great popularity of this amalgam of hunting advice and ethical instruction is reflected in twenty-one manuscripts and three early 16th-century printed editions.

# *GAGE*

**.** In credit operations of the Middle Ages, the *gage* was surety given in return for a loan (although occasionally a *gage* over property might be given as a pious gift without a loan being made); it was sometimes used as a means of temporarily raising cash and transferring property to the church's safekeeping, especially by pilgrims and crusaders, often with reversion of all rights over a property to that religious house if the pilgrim died en route. In general, there were two types of medieval *gages*—the *mort-gage* (not to be confused with our modern mortgage) and the *vif-gage*. The interest-bearing and onerous *mortgage* was condemned by 12th-century church councils, which allowed use only of the *vif-gage*. In both transactions, the borrower granted land or other property to the lender in *gage* (Lat. *dono in pignus*), as surety for a loan of a specified amount of cash. By the terms of written contracts for either type of *gage,* the lender enjoyed the fruits of the land or property that had been granted as surety until the loan was redeemed; the term of the loan was usually unlimited and redemption was limited to a certain date or season annually, frequently All Saints' Day. In the *vif-gage,* however, the fruits of the land, or at least a set part of them, served to reduce the amount of the loan so that it was automatically repaid and the land or other property reverted to the original owner after a term of years. In the *mort-gage,* the fruits did not reduce the principal but in effect served as the lender's interest, making the contract usurious and therefore illegal according to ecclesiastics. In northern France, another type of contract, called the constituted rent, in which an individual purchased a set annual income in return for paying an initial sum,

began to replace the *gage* contract after ecclesiastical condemnation; in the Midi, the use of the *mort-gage* continued, although disguised as a *vif-gage* in which the fruits of the land were given as a "gift," rather than as interest, to the lender.

# GAGUIN, ROBERT

(1433–1501). As the son of a poor family, Gaguin's early education was provided by Trinitarian brothers devoted to educating poor children. Subsequent studies in Paris were paid for by Isabel of Portugal, duchess of Burgundy. As leader of the Trinitarians and dean of the University of Paris law school (1483–1500), Gaguin went on diplomatic missions for Louis XI and Charles VIII and assisted in recovering captives from infidel hands for the Trinitarians. He also devoted himself to study and writing and was associated with Guillaume Fichet's early printing ventures. He was the author of *De arte metrificandi* (1473), the humanistic *Compendium de Francorum origine et gestis* (1495), a translation of Caesar's *De bello gallico* dedicated to Charles VIII (1485), and an important volume of correspondence with leading humanists published in 1498. His major work, the *Compendium de Francorum origine et gestis* (1495) is a national history of France in ten books, from Pharamond to Charles VIII's Italian expedition. This immensely successful work went through nineteen editions before 1586.

# GALBERT DE BRUGES

(ca. 1075–ca. 1128). A Flemish chronicler who wrote a gripping eyewitness account of the murder of Charles the Good, count of Flanders, in 1127 and the power struggle involving the Flemish nobility and townsmen that led to the establishment of Thierry d'Alsace as count in 1128. Galbert tells us only that he was a notary in the service of the

count, and thus probably a clerk in minor orders rather than a priest or canon. He wrote his first version on wax tablets, then revised and inserted other material into his detailed description of the events of April and May 1127, then wrote a more general discussion of developments in Flanders in the last half of that year. With the renewal of civil strife between February and July 1128, he composed another diary, one that is less detailed than the first and that he left unfinished, a fact perhaps indicating an early death. His history was evidently unread in the Middle Ages for want of a patron willing to overlook its often hostile portrait of figures in authority. A manuscript, now lost, was evidently kept at Bruges, and copies were made in the 16th and 17th centuries.

# GALIEN RESTORÉ

. A work in the King Cycle that narrates the tribulations of Galien, Oliver's son by Jacqueline, daughter of Emperor Hugh of Constantinople, and the product of Oliver's *gab* during the visit of Charlemagne and his peers. The poem, dated late 13th or early 14th century, combines several chansons de geste with a rhymed version of the *Chanson de Roland:* Galien arrives at Roncevaux when his father is dying, as is Roland, whose death he also witnesses. In Charlemagne's battle of revenge for Roncevaux, Galien plays a major role; victorious, he then goes off to conquer the castle of Monfusain, which houses Baligant's niece, Guimarde, who subsequently becomes a Christian and Galien's wife. However, news reaches him that his mother is again being harassed by her brothers for bearing an illegitimate child, a fact that had earlier driven the young Galien out of Constantinople; Jacqueline is even accused of having poisoned her father. Galien marches against the city, wins a duel against the emir Burgualant, and is crowned emperor: his honor as well as that of his mother (and Oliver) has thus been "restored." Meanwhile, Charlemagne is still besieging Saragossa; when he learns the emir Baligant is coming to the Saracen Marsile's defense, he asks Galien for help. In the ensuing battle, Ogier le Danois distinguishes himself. Galien's grandfather Renier de Gennes is killed, but Galien nearly kills Baligant himself; finally, Charlemagne kills Baligant in a lengthy duel. While Galien returns to Monfusain to spend a peaceful life with his mother, wife, and young son, Mallart, Charlemagne must announce the tragic death of her fiancé to Galien's aunt, Belle Aude, then, at Laon, judge Ganelon, who, after having escaped into the Ardennes, is recaptured by Thierry and drawn and quartered.

The poem (4,911 Alexandrine lines) is preserved only in a 15th-century copy (University of Oregon, Special Collections CB B 54, formerly Cheltenham 26092), where it immediately follows *Hernaut de Beaulande, Renier de Gennes,* and *Girart de Vienne.*

A prose version survives in Arsenal 3351 (15th c.) and in an incunabulum of 1521 by Jehan Trepperel; there also exist two prose renderings exclusively devoted to *Galien restore*, the first in B.N. fr. 1470 (15th c.), the second in an incunabulum by Antoine Vérard (1500) that was frequently reprinted from the 16th century to the 18th.

*Galien* is a chivalric romance that, despite the constant displacement of the action (Vienne, Jerusalem, Constantinople, Genoa, Spain, Monfusain, etc.), is not without literary merit, thanks to the constant presence of Galien in the narration and his overriding intention: the restoration of his family.

# GALLICAN RITE

**.** When Pepin III the Short (r. 751–68) and his son Charlemagne (r. 771–814) established a uniform, Roman-derived liturgy throughout the Frankish kingdom, the older traditions they were replacing came to be known collectively as the "Gallican" rite, though in fact there was no uniform usage throughout the country but rather a network of more-or-less related local practices. The destruction of Gallican liturgical books was so extensive that we no longer possess the complete rite of any one locality and are forced to reconstruct from a small amount of evidence.

The earliest evidence can be gleaned from writers who lived in Gaulish territory, such as John Cassian (d. 435), Caesarius of Arles (d. 542), and Gregory of Tours (d. 594), as well as from the canon-law literature and decrees of ecclesiastical councils. The oldest actual liturgical book, a palimpsest fragment of the early 6th century, is part of a lectionary that contained biblical readings and refrains for the responsorial psalms at Mass throughout the liturgical year. Other lectionary fragments, as well as Bibles with liturgical rubrics and collections of saints' lives for reading on their feasts, survive from the 7th and 8th centuries.

Better known are the sacramentaries, containing the Proper, or variable prayers, of the Mass and other sacramental celebrations. Palimpsest fragments survive from as early as the 6th century, but most informative are the relatively intact sources of the 8th century, the manuscripts known as Missale Gothicum (from Autun?), Missale Gallicanum Vetus (northeast of Paris?), Bobbio Missal (northern Italy), Missale Francorum (near Corbie?), and Stowe Missal (Ireland). These sources show that Gallican prayers were more prolix than those of the Roman liturgy and that there was much more variety from day to day over the course of the liturgical year. They reveal varying amounts of Roman influence,

anticipating the complete romanization of the liturgy that would be in effect by the 9th century. Only one source describes in detail the invariable portions, or Ordinary, of the Gallican Mass—the anonymous *Expositio antiquae liturgiae Gallicanae* attributed to Germanus of Paris but actually dependent on a work of Isidore of Seville. Much less direct evidence survives regarding the chants of the Mass or any part of the Divine Office, though many responsorial refrains are marked in a 6th-century psalter.

As liturgical materials were brought north from Rome to replace the Gallican rite, they were frequently revised and supplemented by Gallican texts and ceremonies. This happened, for instance, in the "8th-century Gelasian" sacramentaries, adaptations of a Roman book that survive only in one manuscript copied in Chelles near Paris. By the 9th century, these sacramentaries were losing ground to the so-called "Gregorian" sacramentaries descended from the archetype known as the "Hadrianum," a manuscript sent to Charlemagne by Pope Hadrian (r. 772–95) but now lost. Some copies include a supplement of non-Roman material (i.e., of Gallican and Mozarabic or Spanish origin), now attributed to the monastic reformer St. Benedict of Aniane (d. 821). By this route, many Gallican texts and practices survived in the medieval liturgy, which as a result was a hybrid of Gallican and Roman traditions. Among the most distinctive Gallican survivals were the episcopal blessings that took place before communion when the Mass was celebrated by a bishop. Many benedictionals—collections of texts for these blessings—still survive (see Moeller). Though absent from the Missale Romanum issued after the Council of Trent (1570), some of them were reintroduced in the reformed Missal issued by Pope Paul VI (1970).

# GALLICANISM

. Doctrine espousing the autonomy of the French church. French defiance of papal authority dates from Carolingian times, but it was during the confrontation (1296–1305) between Philip IV and Boniface VIII that a means of resisting the ultramontane pretentions of the late-medieval papacy was formalized and implemented as doctrine. In such texts as the *Songe du vergier,* royal legists argued that the kings of France drew their

authority directly from God, that they held a unique position of independence within Christendom, and that royal temporal concerns were outside papal jurisdiction. The result of this doctrine was the crown's insistence that the French church exercise independent authority over ecclesiastical appointments, religious courts, and church revenues within the realm.

During the Avignonese papacy and ensuing Great Schism (1378–1417), the French played a complex role. Parisian scholars like Jean Gerson perfected the theory asserting the so-called *libertés de l'église gallicane* and simultaneously supported the parallel doctrine of conciliarism, which called for the council of bishops to limit papal prerogative. French monarchs initially supported the Avignonese popes, but by 1398 they temporarily withdrew obedience from both papal claimants. After the Council of Constance (1414–18) reunified the western church, Valois legists and clerics worked to reconcile their dogma with their institutions. At a 1438 synod, Charles VII issued the Pragmatic Sanction of Bourges, which contained twenty-three articles giving Gallicanism legal form. The papacy consistently opposed this legislation, and it was eventually superseded by the Concordat of Bologna of 1516. In this definitive concession to the French crown, the papacy promised to confirm all future royal appointments to ecclesiastical office. As a result, the tradition of Gallican liberties jointly exercised by crown and clergy lapsed in favor of an emphasis on the independent authority of the crown over the French church.

Medieval Gallicanism left a mixed legacy. Although not tempted to support domestic Protestantism, the crown was isolated from the Counter-Reformation church. France never accepted the decrees of the Council of Trent, and the monarchy often supported Protestant princes during the Wars of Religion. Gallicanism reached its fullest statement in the 1682 declaration of the French clergy drafted by Bishop Bossuet, whose four articles, though repealed only eleven years later, remained the basis of French church-state relations until the 20th century.

# GARENCIÈRES, JEAN DE

(1372–1415). Along with Oton de Granson and the poets of the *Cent ballades,* Garencières represents the new generation of knight-poets who appeared at the end of the 14th century. His surviving corpus includes some fifty poems, almost all love lyrics in contemporary *formes fixes:* ballade, rondeau, *lai,* and *complainte.* They are found in a

single manuscript (B.N. fr. 19139) along with lyric poems by Alain Chartier and Garencières's friend and protector, Charles d'Orléans, whose poetry was much influenced by that of Garencières.

# GARLANDE

. A knightly family of the Île-de-France, the Garlandes appeared in the royal entourage in the 10th century and rose to prominence in the early 12th. At the height of their power (ca. 1112), three Garlande brothers controlled the great royal offices of seneschal, chancellor, and butler.

Paien de Garlande was seneschal in 1101, and his brother Anseau appears in the same office in 1104 and from 1107 until his death in 1118 at the hands of Hugues du Puiset. Two other brothers, Étienne and Gilbert, were respectively chancellor (from 1107) and butler (in 1112). Another brother, Guillaume, succeeded Anseau as seneschal from 1118 to 1220, when Étienne combined that office with the chancellorship and became the prime royal adviser. In addition to his royal offices, Étienne was archdeacon of Paris, dean of Sainte-Geneviève, and, in Orléans, dean of Saint-Samson, Saint-Avite, and the cathedral. His aspirations to a bishopric, however, were foiled by reformist clerics.

Étienne gained the enmity of the queen, Adelaide of Savoy, and in 1127, when he tried to pass the seneschalship to his son-in-law, he lost his royal offices and waged war against Louis VI until 1132, when he regained the position of chancellor. A year later, he gained revenge on the clerical reformers when his clients assassinated Archambaud, subdeacon of Sainte-Croix of Orléans, and Thomas, prior of Saint-Victor. He did not regain his role as chief royal adviser, for that honor now belonged to Suger, abbot of Saint-Denis.

Étienne faded from sight after this time but left his name to a part of the Latin Quarter of Paris, the *pays de Garlande,* bounded by the rue Saint-Jacques, rue de Fouarre, and rue de Garlande. A Guillaume de Garlande was named by Philip II as one of the caretakers of the kingdom during the king's absence on the Third Crusade (1190–91). Louis IX later imprisoned an Anseau de Garlande for refusing to release hostages held against one of his creditors.

*R.Thomas McDonald*

# GASCONY

. Gascony, a large province in southwestern France north of the Pyrénées, had almost nothing to do with northern France during the early Middle Ages. It passed under English rule in the late-medieval period before finally being integrated into the French monarchy in the 15th century. With no clear geographical boundaries other than the Pyrénées in the south and the Atlantic in the west, it did not correspond to a single natural region but was rather a historical creation grouping a collection of counties extending to the Garonne River in the north (the Bordeaux region) and inland to the Languedoc (Toulouse) in the east. Among the best-known counties and viscounties making up medieval Gascony were Armagnac, Bigorre, Comminges, Fézensac, Lomagne, Albret, and Marsan. The present-day departments of the Pyrénées-Atlantiques, Hautes-Pyrénées, the Landes, and the Gers cover most of the territory of medieval Gascony. Ecclesiastically, most of the province lay within the archdiocese of Auch, which broke down into the bishoprics of Bayonne, Comminges, Oloron, Lescar, Tarbes, Dax, Aire, Lectoure, Bazas, and Couserans.

The earliest Gascons (Lat. *Vascones*) were Basques who filtered across the Pyrénées at the end of the 6th century into what had been the Roman Aquitania Prima, eventually settling as far north as the Bordeaux region. The Basque language did not prevail except in a few regions of the Pyrénées; what came later on to be called Gascon was a romance dialect. Gascony formed the southern part of what became the first duchy of Aquitaine created near the end of the 7th century. Saracens overran the province temporarily early in the 8th century, but the Carolingian conquest of the 8th century had more lasting effects. Nonetheless, internal divisions combined with Viking invasions, which struck Gascony as well, in the 9th century weakened the Carolingian government, and toward the middle of the century Gascony emerged as an independent duchy, now separate from Aquitaine, with its capital at Bordeaux. An almost complete lack of documentary evidence makes it difficult to reconstruct the history of the duchy for the next two centuries, yet this was clearly the time when the rise of a dozen regional lordships, such as those of the counts of Bigorre, Armagnac, and Comminges and the viscounties of Lomagne, Oloron, and above all the powerful state of the viscounts of Béarn, took shape and undermined the authority of the duke. In the 1050s, the counts of Poitou/dukes of Aquitaine acquired the ducal title through marriage, forging the great territorial principality of the duchy of Aquitaine-Gascony, centered in Poitiers and Bordeaux. Through the successive marriages of Eleanor, duchess and heiress of Aquitaine-Gascony, to Louis VII of France in 1137, then to Henry Plantagenêt of Anjou in 1152, Gascony passed along with Aquitaine first under Capetian then under English rule. For the next three centuries, the English resisted all efforts of the French to drive them out and maintained their hold on Gascony even when they lost Aquitaine in the north. Only the loss of Bordeaux in 1453 forced them to abandon their holdings to the French kings.

Gascony never proved to be particularly favored ground for monastic foundations in large numbers, yet one should note the success of abbeys, most of them foundations of the 10th to 12th centuries, at Saint-Sever, Sordes, Lescar, Saint-Pe-de-Generes, Saint-

Mont, and Sainte-Foide-Morlaas. Many northern Europeans came to know Gascony because the northern pilgrimage routes to Santiago in Spain traversed the province.

# GASTON PHOEBUS

(1331–1391). Third count of Foix and lord of Béarn. The prose *Livre des oraisons,* written between 1380 and 1383, a collection of thirty-seven prayers imploring God's pardon for the murder of his own son (in circumstances that are still not understood), would not in itself have ensured its author fame. A fine scholar and musician, a gallant warrior and passionate hunter, Gaston III is known chiefly for his *Livre de* chasse, written be tween 1387 and 1391. A genuine treatise of natural science (it was to influence Buffon in the 18th century), nourished with long experience and multifarious memories, it is a profoundly innovative work by a close observer of wildlife who knows how to recreate the exciting atmosphere of the hunting scenes he has lived, thanks to a sense of image and movement. The work was enormously popular, with some forty-four manuscripts extant, about half of which were lavishly illustrated.

# GAUCELM FAIDIT

(fl. 1173–1202). A well-traveled and underappreciated Limousin troubadour, Gaucelm Faidit led an extravagant bohemian life, according to his picaresque *vida* and five *razos*.

Historical documents suggest that he was neither poor nor plebeian. In his far-flung wanderings across France, in Italy, to Hungary, and on crusade, he was in contact with fellow troubadours, like Raimbaut d'Aurenga, and trouvères, like Gace Brulé.

His poetic legacy is considerable. Some fifty-four *cansos* survive, including a *rotrouenge* (probably the only French text composed by a troubadour), in addition to nine poetic debates, two crusade songs, the famous *planh* on Richard the Lionhearted, and perhaps one *alba*. These reveal a discreet poet of *trobar leu* in the Ventadorn style, but with occasional *ric* and *clus* refinements perhaps traceable to his contacts with Raimbaut d'Orange.

# GAUCHER DE REIMS

(fl. 13th c.). "Gaucher de Reims was master of this church for seven years and worked on the arches." This slim information, taken from the destroyed labyrinth of Reims cathedral, is all that is known about this mason. A 1256 document that mentions a certain "Walterius, master of the fabric of the church of Reims" recently has been interpreted as a reference to Gaucher, but this must remain hypothetical. Gaucher has been seen, notably by Henri Deneux, as the designer of the Gothic cathedral of Reims, but he is most frequently credited with the portals of the west façade, which were erected ca. 1252–65. Thus, despite the tantalizing hints offered by texts and the clear archaeological evidence that the cathedral of Reims was the work of several master masons, the contribution of Gaucher de Reims to this monumental project remains enigmatic.

# GAUTIER

**.** *See also* **WALTER**

# GAUTIER D'ARRAS

**.** A contemporary and rival of Chrétien de Troyes, Gautier d'Arras identifies himself in two romances as a writer linked to important political and literary courts: *Eracle* was begun for Thibaut V of Blois and his sister-in-law, Countess Marie de Champagne, then completed and dedicated to Baudouin de Hainaut (if Baudouin IV, probable dates are 1164–71; if Baudouin V, somewhat later). *Ille et Galeron,* begun after *Eracle* but possibly finished before it (ca. 1167–70), praises the empress Beatrice de Bourgogne (d. 1184), for whom he started the romance (Chrétien may allude ironically to Gautier's praise in his prologue to the *Charrette*), The romance was completed for Count Thibaut. The poet may be the same man as the Gautier d'Arras who was an officer at the court of Philippe d'Alsace and signed many documents between 1160 and 1185.

   *Eracle* is a hagiographical romance in octosyllabic rhymed couplets that offers a biography of Heraclius, the Roman emperor who recovered from King Cosdroes of Persia and placed in Jerusalem a piece of the Holy Cross. The first half, probably based on oral legends and popular tales, which Gautier weaves together with as much coherence and *vraisemblance* as possible, tells how Eracle uses his miraculous gifts in the service of the Emperor of Rome: Eracle is a perfect judge of jewels, horses, and women. When the emperor must go away, he places his young and beautiful wife, Athanaïs, in a tower under close surveil lance. The inevitable happens when she falls in love and manages to start a liaison with Paridés. Eracle informs the emperor and convinces him to unite the two lovers. The second half, based on written sources and more historical in orientation, retells the legend of the cross and St. Cyriacus, to whom is dedicated the main church at Provins in Champagne, and Eracle's expedition, after he himself had become emperor, to return the holy relic to Jerusalem. Gautier thus makes available to a courtly public Latin texts and religious legends worked into a narrative whose use of adventure and the marvelous clearly locates it within the domain of romance, as does the importance given to love in the Athenaïs episode (4,319 lines out of 6,593).

   Though apparently part of the *matière de Bretagne, Ille et Galeron* retains the Roman and Byzantine orientation of Eracle, as it retells and transforms the familiar tale of a man with two wives. Chased out of Brittany, the young Ille takes refuge in France. Knighted, he returns and reconquers his family lands, for which he pays homage to Conain, count of Brittany. Ille falls in love with Galeron, Conain's sister. Their love is mutual, but the difference in their social rank poses an obstacle, until Ille's military service elevates him

to the post of seneschal and marriage with Galeron. When Ille subsequently loses an eye (in a tournament according to one manuscript, a battle in another), he fears the loss of Galeron's love, steals away, and fights as mercenary for the Emperor of Rome. Given his prowess, Ille quickly becomes seneschal of Rome and inspires love in Ganor, the emperor's daughter. Galeron, who has searched fruitlessly for her husband, now lives secretly in Rome in the greatest misery. When offered Ganor's hand in marriage, Ille reveals that he is married; only if Galeron cannot be found will he marry Ganor. Just as that ceremony is about to be celebrated, Galeron recognizes her husband. When Galeron assures Ille of her continuing love, they return to Brittany. Their happy life is interrupted when Galeron makes a vow to become a nun, if she survives the difficult birth of a third child. Ille grieves, but is called to fulfill his promise to aid Ganor, now empress and under attack by the Emperor of Constantinople. Ille triumphs, he and Ganor are married in Rome and live happily with their own children and those of the first marriage.

Comparison with Marie de France's *Eliduc,* a *lai* that either furnishes Gautier's model or has a common source, reveals how Gautier has significantly reworked a short tale into an episodic romance whose two parts are clearly related through the key event: Ille's loss of an eye furnishes a crisis that resembles one of the love judgments reported in Andreas Capellanus's *De amore:* can love survive disfigurement? This event and the exploration of Ille's psychology before and after the crisis keep the romance plot squarely situated within the realm of the possible. The marvelous death and rebirth described in *Eliduc* are eliminated, as Gautier d'Arras places his art in the service of mimetic realism. Gautier thus appears as a kind of link between Chrétien and Jean Renart, as Fourrier has suggested. In elaborating the episodes that fill in Ille's story, Gautier demonstrates his ability to reuse materials from a variety of literary traditions (chansons de geste, saints' lives, *Énéas*). A narrator clearly able to please his audience, Gautier d'Arras plays an important role in the development of a romance tradition oriented toward realism, psychological interest, and contemporary life.

# GAUTIER D'AUPAIS

(fl. early 13th c.). The author of *Gautier d'Aupais,* an 876-line tale from the first half of the 13th century in a language slightly tinged with Picardisms, certainly was a minstrel from the Île-de-France. Although he employed the monorhymed laisse characteristic of the chanson de geste, we still find the themes, devices, and formulae of the courtly romances in the "Salut d'amour," in the portrayal of Gautier's infatuation, and in the evocation of his lady's emotion.

*Annette Brasseur*

   [Based on B.N. fr. 837.]

# GAUTIER DE COINCI

(1177/78–1236). Gautier entered the Benedictine monastery of Saint-Médard in Soissons in 1193, was appointed prior of Vic-sur-Aisne in 1214, and returned to Soissons in 1233 as prior of Saint-Médard. He was a prolific writer, whose works include religious songs, two sermons, and four saints' lives, as well as the *Miracles de Nostre Dame,* for which he is most famous. A series of narrative poems on the birth of Mary, the childhood of Jesus, and the Assumption, and a paraphrase of the Psalm *Eructavit,* appear in some manuscripts of the *Miracles* and are sometimes credited to him. The attribution of the *Saint dent Nostre Seigneur,* a poem about a relic discovered at Soissons, which appears in only two manuscripts, is even less certain.

   The *Miracles* (ca. 30,000 lines) are divided into two books organized symmetrically. Each begins with a prologue and a series of seven songs in honor of the Virgin. The first book, begun in 1218 and revised four years later, contains thirty-five miracles and ends with three songs in honor of St. Leocadia. The second book, with twenty-three miracles, was perhaps written between 1223 and 1227. Gautier, who sought to convert the lapsed and strengthen the faith of the believer, intended his collection for an unlearned but aristocratic audience, as he expresses contempt for the *vileins*.

   Gautier found his stories in a collection of Latin Marian legends in his monastery at Soissons. Although this manuscript has been lost, enough of its character has been established to determine the way Gautier treated his sources. He did not follow his model slavishly but sometimes expanded it by resorting to other sources and even drew on events of his own life. In most stories, a sinner is saved by a single redeeming virtue, usually devotion to the Virgin. The final sections of the stories, often satirical attacks on all classes of society, are original and of great interest to modern readers. Gautier was a skilled versifier who made frequent use of rich and equivocal rhymes. The reactions of

modern critics to this material range from enthusiasm to hostility but depend largely on their appreciation of the genre rather than Gautier's treatment of it.

The songs that begin each book are important in their own right, for they are the best examples of religious lyric poetry from the 13th century. Despite his antipathy to secular literature, Gautier's lyric poetry was strongly influenced by the secular tradition. If his musical compositions were not of the first rank, he was nevertheless a musician of considerable skill and refinement.

# GAUTIER DE MORTAGNE

(ca. 1090–1174). Born in Flanders, Gautier spent his career in northern France, principally at Laon. He studied at Reims under Alberic, who himself was a student of Anselm of Laon, perhaps the most influential theologian in the early decades of the 12th century. Gautier had a reputation as a stern schoolmaster, first at Laon, then at the abbey school of Sainte-Geneviève in Paris. Gautier became dean of the cathedral of Laon in 1150 and bishop of the diocese in 1155. His legacy includes letters on various theological subjects to Abélard, Hugh of Saint-Victor, and other leading theologians of his day.

# GAUTIER DE VARINFROY

(**fl.** 13th c.). In October 1253, the bishop and chapter of Meaux appointed Gautier de Varinfroy master mason of the cathedral, agreeing to pay an annual salary of ten pounds but forbidding him to stay more than two months per year at Évreux, where he also directed the cathedral workshop. Gautier's career appears to have been devoted to the restoration and modernization of older buildings: at Évreux, he constructed the triforium and clerestory of the nave above a Romanesque arcade, while at Meaux he converted the four-story choir into a three-story elevation composed of elaborate panels of tracery. Stylistic analysis further suggests that this master mason rebuilt the upper levels of Saint-Père, Chartres, in the 1240s and restored the western bays of the nave and façade of Sens cathedral following the collapse of the southwest tower in 1268. Gautier's insistence on flat, linear effects, his tracery patterns, and pier design remain firmly within the contemporary idiom of Île-de-France architecture, yet his ability to create smooth transitions between new and older forms demonstrates a remarkable sensitivity and stylistic flexibility.

# GAUTIER LE LEU

(fl. late 13th c.). Although it has been suggested that Gautier Le Leu was a student at Orléans and that later he had some association with the Benedictine abbey of Maroilles, we can be certain only that he was a poet and jongleur of the second half of the 13th century who was the most prolific author of fabliaux. He composed eleven fabliaux, of which eight are extant. His compositions vary in inspiration from obscenity and ferocious social and clerical satire (e.g., *Le prestre teint*) to lively character analysis, as in *La veuve*. This poem features a character related to Chaucer's Wife of Bath and to the Vieille in the *Roman de la Rose;* she reacts to her husband's death by grief more over sexual

deprivation than over personal loss, and she quickly and capably sets out to find a replacement. *La veuve* is a small but important contribution to the continuing "Quarrel of the *Romance of the Rose*" that was to rage for centuries in theological and literary circles.

# GAWAIN ROMANCES

. Chrétien de Troyes established Arthur's nephew Gawain (Gauvain, Gavain, and other orthographical variants) as one of the major figures of Arthurian romance. Although he had never made Gawain a hero proper, he had allotted half of the narrative to him in his last romance, *Perceval* (ca. 1180). Whereas the majority of post-Chrétien verse romancers continue to use Gawain largely as a foil or adjunct to the hero, a small number do make him the center of attention and the major protagonist, availing themselves of an opportunity left unseized by Chrétien and others. The author of the *Chevalier à l'épée* (end of the 12th c.) in fact claims that he is writing a romance about Gawain because Chrétien had not done so.

The *Chevalier à l'épée* and the contemporaneous *Mule sans frein* can be seen as a pair for a number of reasons: they are both short (1,206 and 1,136 lines, respectively), are of approximately the same date, appear in the same manuscript (Bern, Burgerbibliothek 354), may be by the same author (who signs himself in the latter as Paien de Maisières), and are characterized by the same humorous and burlesque treatment of conventional romance motifs. In the *Chevalier à l'épée,* Gawain becomes enamored of a young woman, attempts to seduce her but is prevented from doing so by a sword that descends from above the bed, loses her to a stranger knight she sees urinating in the bushes, avenges himself on the latter, and then abandons the girl to her own devices. The *Mule sans frein* relates how Gawain braves all kinds of perils (lions, serpents, dwarfs, a beheading test) to retrieve a bridle for a damsel.

The *Vengeance Raguidel,* probably by Raoul de Houdenc, author of another Arthurian romance, *Meraugis de Portlesguez,* is more substantial. Some 6,182 lines long and dating from the first quarter of the 13th century, it concerns the avenging by Gawain of Raguidel, a knight treacherously killed by the wicked Guengasoain. Although Gawain carries out the vengeance, it is only after forgetting the lance point required to kill the murderer and after a series of sometimes farcical adventures, many of them related to Gawain's various love affairs. The shine is further taken off Gawain's achievement by the fact that he requires the help of another knight, Yder, to avenge Raguidel. Another full-length Gawain romance is the *Atre périlleux* (6,676 lines), dating from the second quarter of the 13th century. In this romance, Gawain finds and kills Escanor, a knight who had abducted Arthur's cupbearer; in the course of the quest, Gawain is confronted with the news of his own death and beheads a devil who had imprisoned a damsel in a

tomb (the episode from which the romance takes its title). In addition to Chrétien's romance, the poet of the *Atre périlleux* knows and alludes to *Meraugis de Portlesguez* and the *Vengeance Raguidel*.

The fragmentary *Enfances Gauvain* (712 lines), dating probably from the 1230s, tells the story of Gawain's birth and childhood. According to this poem, Gawain's parents are Arthur's sister, Morcades, and her page, Lot. The child is entrusted to a knight called Gauvain le Brun, who names it after himself and then sets it adrift in a cask; after the boy is rescued by a fisherman, he is brought to Rome and educated by the Pope. Other versions of this story can be found elsewhere, notably in Wace's *Brut,* the *Perlesvaus,* and the Latin romance *De ortu Walwanii*. Writing the *enfances* of a hero who had already become popular was one way of capitalizing on his celebrity; writing about the hero's offspring was another, and that was the option chosen by Robert de Blois in *Beaudous* (third quarter of the 13th c.). Beaudous's mother conceals his lineage from him so that he must win his own fame rather than bask in his father's reflected glory. Beaudous accomplishes much, wins the hand of a beautiful princess, defeats many of Arthur's famous knights, and is reunited with his father; the romance concludes with the double wedding of Beaudous and Gawain. Robert de Blois is known also for didactic works, such as the *Enseignement des princes,* and there is a strong didactic streak in *Beaudous,* particularly in its presentation of chivalry.

Authors clearly expect their audiences to be familiar with Gawain's basic traits, since they rarely take the time to introduce him. He is in many respects a "preformed" character capable of limited development; he is used by authors rather than investigated psychologically. In this sense, the romances that do choose Gawain as a hero are the exceptions rather than the rule, although he plays extensive roles in most Arthurian verse romances.

A number of characteristics are common to most of these romances. First of all, Gawain is confronted at almost every turn with his own reputation as knight and lover: he is the standard to which all knights must aspire and the knight whom all ladies seek to love. When authors in the 13th century begin to treat these aspects of romance in a gently burlesque or sometimes openly parodic light, Gawain, the courtly knight *par excellence,* is himself burlesqued and parodied as a result. Yet the criticism is affectionate. In contrast to the unrepentant sinner of the prose *Queste del saint Graal* and the vindictive rapist and murderer of the *Prose Tristan,* the Gawain of the verse tradition remains an amiable character and a great if flawed knight. The later verse romances that take Gawain as hero suggest that the popularity of the figure was too strong for the attempts to discredit it in the prose tradition. In the last instance, however, it is the variety of uses to which Gawain is put in French Arthurian literature that is significant: foil, hero, villain, to mention only three. This is testimony not only to the conventional nature of romance but also to the differing uses to which convention can be put by authors with different aims and intentions.

# GEFFREI GAIMAR

(fl. 1130–40). Connected with the court of Hugh of Avranches, earl of Chester, Geffrei Gaimar may also have been acquainted with David the Scot, who became bishop of Bangor (1120–39) upon his return to England from the imperial court in Germany. Through his connections with Hugh, Gaimar was asked by Constance, wife of Ralph FitzGilbert, to translate Geoffrey of Monmouth's *Historia regum Britanniae* (ca. 1136). Gaimar's design was to trace history from Jason and the Golden Fleece to the death of King William 11 Rufus (1100), incorporating a translation of Geoffrey's work; however, the first part was supplanted by Wace's *Roman de Brut,* so that Gaimar's poem survives (in four manuscripts, where it immediately follows the *Brut*) only from the arrival in England in 495 of King Cerdic of Wessex, a relative of Hengist, king of Kent, to the death of William Rufus. This surviving part, drawn up to line 3,594 from a version of the *Anglo-Saxon Chronicle* and thereafter from largely unknown sources, was given the title *Estoire des Engleis* by the scribe of B.L.Royal 13 A xxi (late 13th-c.); its 6,526 lines were composed in octosyllabic rhymed couplets (ca. 1136–40).

Gaimar's narrative qualities are uneven: he is gauche when too close to his source but quite dramatic when he allows himself to indulge in such striking episodes as the story of Havelc (11. 96–819), the first known version of the *Lai of Haveloc,* or the poignant episode of Buern Bucecarle (ll. 2,571–720), meant to explain the Danes' conquest of Northumbria in 866. Gaimar's narration of the Danish invasion under Gormont (ll. 3,239–310) is interesting in its own right, since it differs from that found in the *Gormont et Isembart* fragment or Wace's *Brut;* and the description (ll. 4,861–5,029) of the trial of Count Godwine, earl of Wessex, reveals an aspect of Anglo-Norman law that may have been a model for the trial scene in Marie de France's *Lanval*

# *GÉNÉRAUX*

. With the growth of royal taxation after the mid-14th century, both the French crown and its critics groped their way toward a system that would provide honest and efficient collection of these "extraordinary" revenues without depending on traditional domainal officials. Soon after the introduction of *élus* to supervise collection, we find a board of higher supervisory officials, named originally by assemblies of the Estates and later by the crown. Although they were called by various names, the word *généraux* almost always appeared in their title.

The Estates of December 1355 appointed *générauxsurintendents* to supervise taxes. The next few assemblies named similar officials called *généraux-députés*. In 1360, when the crown established the *aides,* it appointed *généraux-trésoriers* to oversee collection of the funds intended for the ransom of John II. At the end of 1363, when the Estates of Languedoil established the *fouage,* or hearth tax, to finance a royal army, members of the supervisory board were called *généraux-élus*. Finally, when war with England resumed in 1369, a board of *généraux-conseillers* coordinated the administration of taxes.

The three (later four) men who served as "counselors-general" of the *aides* had great authority in the 1370s, being empowered to issue orders in the king's name. Although taxes were canceled in 1380–81, resumption of the *aides* two years later meant the reestablishment of the board of *généraux-conseillers*. In the course of sweeping reforms under the rule of the Marmouset party at court (1388–92), these *généraux* received judicial powers and additional supporting staff. Ordinances of April 1390 and March 1391 began the process of converting them into a body known as the Cour des Aides. This court exercised auditing and judicial functions in matters involving extraordinary revenues *(aides, taille)* much as the Chambre des Comptes had done for revenues emanating from the royal domain. Ordinances of 1388 and 1393, which granted fiscal exemptions to categories of nobles, and enactments relating to other privileged groups, ensured that the *généraux* in the Cour des Aides would play an important role in determining cases involving a person's liability to taxes.

# GENEVIÈVE

(ca. 420–ca. 512). Saint and patroness of Paris. When Attila and his Huns threatened Paris in 451, Geneviève, a woman from nearby Nanterre, urged the populace not to abandon their homes but to pray for deliverance. Attila's bypassing of Paris for Orléans was attributed to her prayers. Ten years later, when the city was blockaded by the Franks, she arranged convoys to bring food down the Seine from Troyes to avert starvation. Through her intervention, both Childeric and Clovis treated captured Parisians leniently. At her death, she was interred next to Clovis and his wife, Clotilde, in a basilica built by Clovis on Paris's Mont-Sainte-Geneviève to celebrate his victory over the Visigoths at Vouillé (507). Her reliquary is now in the church of Saint-Étienne-du-Mont.

*William W.Kibler*

# GEOFFROI

. A succession of Angevin counts named Geoffroi were instrumental in the development of an Angevin state from the 10th to the 12th century. Through their efforts, Anjou became a major territorial principality and gave rise to the Angevin empire of the 12th century.

Geoffroi I Grisgonelle (r. ca. 958–87) succeeded in dominating Nantes, exerted Angevin influence over Maine, acquired Loudun, and married his son to the heiress of Vendôme. Loyal to his Robertian overlords, he died fighting to make Hugh Capet king of France in 987. He was succeeded by his son Foulques Nerra.

Nerra's son, Geoffroi II Martel (r. 1040–60), consolidated Angevin control over the expanded Anjou left to him by his father. While an active campaigner, conquering Tours in 1044, his greatest accomplishments were in statecraft, creating the essential elements of Angevin government. He skillfully combined the tradition of Carolingian public rights with new feudal elements of vassalage and homage. Expanding the network of castles begun by his father, Martel kept his castellans under tight control. For as long as he was married to Agnes, widow of Duke William the Fat of Aquitaine, he was able to exercise considerable control over that region as well. When the marriage ended in divorce in 1052, he was still able to dominate Vendôme and virtually ruled Maine until his death.

At Martel's death, the countship went to his nephew Geoffroi III le Barbu (r. 1060–68), whose rule was a disaster for Anjou. His incompetence and military ineffectiveness soon alienated the Angevin nobility, including his brother, Foulques le Rechin (r. 1068–1109). After an abortive coup in 1067, Geoffroi was deposed and imprisoned by Foulques in 1068. The civil war between the brothers seriously shook comital control over the lords of Anjou.

By the countship of Geoffroi IV Plantagenêt (r. 1129–51), the authority of the count had been much restored. Geoffroi continued the process of bringing his barons to heel. Aside from internal consolidation of comital power, Geoffroi began a phenomenal expansion of Angevin domination by marrying Matilda, daughter of King Henry I of England, in 1128. When Henry died in 1135, Matilda was the sole heiress to the kingdom of England and the duchy of Normandy. Since the throne was seized by Henry's nephew, Stephen of Blois, Geoffroi had to fight for his wife's inheritance. By 1144, he had gained control of Normandy. The submission of England was left to his son, Henry II Plantagenêt. Although Geoffroi had united a vast territory in western France, he ruled each area separately, under its own law. This was to be the model for the Angevin empire of his son.

# GERBERT DE MONTREUIL

(fl. 1220s). A poet at the court of Marie, countess of Ponthieu, to whom he dedicated his *Roman de la Violette* ca. 1220, Gerbert is best known for his continuation of Chrétien de Troyes's *Perceval*. Gerbert's *Continuation* is inserted between the *Second Continuation* and Manessier's conclusion in two Paris manuscripts.

The *Roman de la Violette* (6,654 octosyllables) exploits the same folk motif as Jean Renart's *Guillaume de Dole:* Lisïart de Forez wagers Gérard de Nevers that he can seduce Gérard's ladylove, Eurïaut. By deceit, he discovers that she has a violet-shaped birthmark on her right breast and uses this information to "prove" his success. Thinking her unfaithful, Gérard abandons Eurïaut and weds her only after many adventures and the eventual confession of Lisïart.

Gerbert's *Perceval Continuation* (ca. 1226–30; ca. 17,000 lines) brings Perceval, after numerous adventures designed to show that he is the worthiest knight in the world, to the Grail Castle, where he is about to have the secrets of the Grail revealed to him. However, Gerbert's presumed explanation is replaced, in both manuscripts that contain his poem, by Manessier's continuation and explanation.

# GERBERT OF AURILLAC

(Pope Sylvester II; ca. 945–1003). Gerbert was born in the Auvergne and educated at the monastery of Saint-Géraud in Aurillac. He studied in Spain at the school in Ausona (Vich) and in 970 went to Rome. He was master of the cathedral school of Reims from 972 to 989, with one brief interruption. One of the leading teachers in his day, he numbered among his students Fulbert of Chartres and the future king Robert II the Pious of France. Gerbert's teaching was notable in that he taught the whole range of the Seven Liberal Arts (Trivium and Quadrivium). However, he was especially interested in literature, logic, scientific observation, and mathematics. He established the logical works of Boethius as essential in the syllabus of studies, and he developed astronomical instruments for observation. He was active in support of Hugh Capet for the French crown and participated in the coronation at Reims in 987. Appointed archbishop of Reims in 991 (an appointment never approved by the pope), he held the position for several years before joining the entourage of Emperor Otto III; he was later appointed archbishop of Ravenna. In 999, he became bishop of Rome, the first Frenchman to so serve. As Pope Sylvester II, Gerbert was a vigorous reformer and an opponent of simony and married clergy. Owing to his mathematical skills, medieval tradition saw him as adept in magic.

# GERMIGNY-DES-PRÉS

**.** Theodulf, bishop of Orléans, abbot of Saint-Benoît-sur-Loire at Fleury, and an important intellectual at Charlemagne's court, built a villa at Germigny-des-Prés (Loiret). Only the oratory, consecrated in 806, remains. The small square structure composed of nine vaulted compartments with a central tower has single apses projecting from three sides and a triple apse on the east. The horseshoe arches and decoration show Visigothic influence. The central west apse preserves a mosaic of the Ark of the Covenant surrounded by two pairs of angels that reflects Byzantine inspiration. The architectural eclecticism and theological context of the mosaic represent significant aspects of Carolingian culture.

# GERSON, JEAN

(Jean Charlier; 1363–1429). Theologian, scholar, teacher, translator, poet, mystic, and humanist, Gerson was one of the most illustrious and prolific writers of the late Middle Ages. One of twelve children, he grew up in a pious household in Champagne, the son of an educated artisan. Three of his brothers became monks and another a priest. Although his sisters did not enter religious orders, they formed among themselves an informal religious group devoted to prayer and spiritual exercises. Gerson entered the University of Paris in 1377 and received an arts degree in 1381 from the Collège de Navarre. Subsequently, he studied theology and obtained the doctorate in 1392. Tailoring his sermons to his audience, Gerson gained fame as an orator who could preach with eloquence to both kings and the laity at large. He succeeded his friend and mentor Pierre d'Ailly as chancellor of the university in 1395, taking over the duties in the midst of the Great Schism (1378–1417). Although Gerson opposed the withdrawal of French obedience from the Avignon pope, Benedict XIII, and worked to restore it in 1403, he nevertheless sought a reconciliation between the two contending popes by suggesting that both claimants resign. In 1407, the Roman pope, Gregory XII, indicated a willingness to meet with Benedict and discuss mutual resignation. Gerson was chosen to head the French delegation and facilitate the meeting, which was, however, a failure. With the aim of restoring church unity, Gerson supported a move to resolve the conflict through a church council. The Council of Pisa, held in 1409, was not successful. Although it elected a new pope, Alexander V, this strategy served only to introduce a third contender. The Council of Constance (1415–18) finally put an end to the Schism with the election of Martin V. Writing numerous treatises to justify the work of the council, Gerson was an outspoken proponent of conciliarism, setting out the limitations of papal authority.

Gerson was also strenuous in efforts to eradicate heresy. Critical of the writings of Wyclif and Hus, Gerson was an adviser to Pierre d'Ailly, who served on the commission that condemned Hus to death. Also interested in secular affairs, Gerson openly opposed the Burgundian assassination of the duke of Orléans in 1407, attacking and condemning Jean Petit's *Apologia* for favoring tyrannicide in justification of the Burgundian deed. His position so angered the duke of Burgundy, who had previously been one of Gerson's strongest protectors, that he was prevented from returning to Paris after the Council of Constance. Gerson retired to Lyon, living first at a Celestine monastery where his youngest brother, also named Jean, who became his copyist and editor, was prior, and then at the church of Saint-Paul. During his exile, however, Gerson continued to write as he had before on such subjects as spiritual renewal, church reform, Christian education, and the integration of mystical and speculative theology. His writings have not received extensive attention from historians, although they offer insights into the culture of the late Middle Ages. His work, for example, on the Christian education of the young provides important information on medieval attitudes on children and childhood.

Gerson was also a Latin poet of notable talent and skill. Influenced by Petrarch, his eclogue on the Schism is perhaps the first humanist work produced in France. Other

works include *De vita spirituali animae,* in which he locates ecclesiastical authority in church councils rather than in the pope; *De unitate ecclesiae,* one of twenty-seven extant treatises on the church; *Mémoire sur la réforme de la faculté de théologie,* which outlines his pedagogy; and informal writings on the spiritual life, such as the *Montagne de contemplation.* Although it is often attributed to him, Gerson did not write the *Imitatio Christi.* Among his last writings is a defense of Jeanne d'Arc, *Puella Aurelianensi* (1429).

# *GESTA FRANCORUM ET ALIORUM HIEROSOLIMI-TANORUM*

(ca. 1101). The earliest account of the First Crusade. The unknown author was a knight in the Italian contingent of Bohemund who wrote in simple, rough Latin. He begins with the Council of Clermont (1095) and ends with the Battle of Ascalon (August 1099). The *Gesta* was reworked by Robert le Moine, Baudri of Bourgueil, and Peter Tudebod and was known by most other writers treating the crusade, including Foucher de Chartres and Raymond d'Agiles, both eyewitnesses themselves. The *Gesta* was also read in its own right; it is extant in seven manuscripts.

# GHENT

. Before an abrupt decline after 1356, Ghent (Fr. Gand), a Flemish city at the junction of the Scheldt and Lys rivers, was the second-largest city, after Paris, of me dieval northern Europe, with a population of some 50,000. Ghent was important in commerce by the 8th century and had a thriving textile industry by the 12th. By the 13th century, Ghent was

governed by the Thirty-Nine, three cooptative boards of councilors who rotated annually and were notoriously corrupt, provoking industrial and political unrest. Ghent maintained a generally royalist posture in the conflicts of the French monarchy with the Flemish count Gui de Dampierre; only a small contingent from Ghent joined Bruges and Ypres in defeating the French at the Battle of the Golden Spurs, Courtrai, in 1302.

During the 14th century, Ghent was governed by two boards of aldermen, and the magistracy was open to all social and professional groups. Occupational guilds other than the exclusive merchant organization of the 13th century were legalized, but only after 1360 were the twenty-six seats on the councils apportioned in a fixed scheme among groups of guilds. The government was dominated by oligarchies within the guilds and members of *poorter* (landowner) families. Ghent developed a substantial shipping trade after 1300, particularly in grain shipped from France down the Scheldt and Lys. But the textile industry, dependent on imported English wool, continued to dominate the city at least through mid-century. Ghent was as cripplingly dependent on England for wool for its textile looms as on France for grain to feed its workers. Thus caught in the Anglo-French struggles of the 1340s, the town fell under the domination of the captain Jacques van Artevelde. After his death, Ghent continued its resistance to the new count, Louis de Male.

When Louis's forces stormed the city in January 1349, they installed a regime based on the fullers' guild, which was less inimical to his authority than that of the weavers, who had dominated Ghent in the 1340s without excluding other groups. The weavers had regained power and barred the fullers from the town councils by 1361. Between 1379 and 1385, Ghent waged another war against the count, who had allowed Bruges to dig a canal toward the Lys with the intention of channeling into it south of Ghent and ending Ghent's lucrative control of the French grain supply. This "Ghent War" did not have the support of the rest of Flanders, although the military power of Ghent kept pro-Ghent factions in power intermittently elsewhere. Ghent and Flanders were thereafter ruled by Louis de Male's Burgundian successors, who slowly limited the cities' autonomy. The textile industry of Ghent, which had gone into a severe decline after 1350, revived somewhat in the 15th century. Although Ghent rebelled in 1438 and 1451–53 against Philip the Good of Burgundy, capitulation was inevitable. Philip and particularly his son, Charles the Bold, attempted to control directly the choice of magistrates in the city, leading to further rebellion against his son-in-law and successor, Maximilian of Habsburg. In the 16th century, Ghent and Flanders were part of a Habsburg state.

*David M.Nicholas*

Ghent initially grew up around two monasteries, Saint-Pierre, founded by St. Amand in the 7th century, and Saint-Bavon, also founded in the 7th century and rebuilt in the 10th. A third urban center was dominated by the stone castle built ca. 1000 on the site of what is now the castle of the counts of Flanders ('s Gravensteen). In order to assert his authority over the powerful weavers' guild, Philippe d'Alsace, count of Flanders and Vermandois, strengthened and added to the castle after 1180, upon his return from the Third Crusade, using as models the crusader castles of the Near East. It is deeply moated, and the outer curtain wall, with its twenty-four watch towers, forms an oval measuring approximately 165 feet by 200 feet. These curtain walls, reinforced by powerful rectangular buttresses, most supporting the semicylindrical watch towers, are over 6 feet thick. The only entrance, projecting to the east, is a rectangular châtelet terminating in

two machicolated turrets supported by buttresses. Within the walls are a massive keep, some 100 feet tall with walls over 6 feet thick, and several residences.

The cathedral of Saint-Bavon, built largely in the 16th century on the site of the 12th-century church of Saint-Jean, houses Van Eyck's *Polyptych of the Mystical Lamb* (1432), a masterpiece of Flemish art. Including no less than 248 figures, it is a *summa* of medieval Christian faith, illustrating salvation history from the Fall to the Redemption. The lower panels show the Mystical Lamb, surrounded by angels, upon an altar. On either side, virgins, martyrs, confessors, hermits, knights, and pilgrims approach the altar across a lushly painted landscape. In the upper panels, Christ sits in majesty, with the Virgin, Adam, and a choir of angels to his left and St. John the Baptist, Eve, and angel musicians to his right. The backs of the panels depict the prophets, the sibyls, the Annunciation, St. John the Evangelist, and St. John the Baptist with the donors, Josse Vijd and his wife, Elisabeth Borluut.

The belfry, built in the 13th and 14th centuries as a sign of the power of the trade guilds, rises some 200 feet above the city. The town retains several medieval guildhalls, markets, and private houses, especially along the Quai aux Herbes (Graslei). The charming Petit Béguinage (Klein Begijnhof), founded by Jeanne de Constantinople in 1234, is an important reminder of this popular form of late-medieval devotion.

# GILBERT OF POITIERS

(Gilbertus, Gislebertus, or Gillibertus Porreta or Porretanus; also, less correctly, de la Porrée, 1075/80–1154). Gilbert was born in Poitiers and returned there as bishop in 1141 or 1142. After studying the liberal arts and philosophy with Hilary in Poitiers and Bernard in Chartres, he immersed himself in the study of the Bible in Laon. As Anselm of Laon's disciple, Gilbert participated in the great exegetical undertaking that was to culminate in the formation of the *Glossa ordinaria* in Paris during the middle decades of the century. Gilbert's commentaries on the Psalms (before 1117) and on the Epistles of Paul (perhaps a decade later) owed much to Anselm's glosses and to his use of *quaestiones* and *sententiae* to explore theological and pastoral topics. In addition, Gilbert introduced to scriptural exegesis pedagogical techniques, such as the *accessus ad auctores,* used by grammarians to teach works of profane literature. These methods

influenced subsequent exegetes: Peter Lombard's biblical commentaries, for example, rely heavily on Gilbert's work.

Gilbert returned to Chartres as a canon and by 1126 was chancellor of the cathedral. (There is no evidence to support the claim that he taught in Poitiers.) Though he certainly taught in Chartres, most contemporary testimony associates Gilbert with Paris, where he is reported teaching grammar, logic, and theology and where he helped promote the biblical glosses that were developing into the *Glossa ordinaria.*

In his commentaries (ca. 1140) on the *Opuscula sacra* of Boethius, Gilbert distinguishes between different aspects of a being: that which a thing is *(id, quod est)* and that by which a thing is what it is *(id, quo est).* The resulting attempt to differentiate among persons, natures, attributes, and essences, when applied to Trinitarian issues, led Gilbert to the brink of disaster. In March 1148, after the Council of Reims, Gilbert's orthodoxy was examined on four counts: that God is not "divinity" or divine nature; that the Persons of the Trinity are not "divinity"; that God's properties are not God and are not eternal; that the divine nature is not incarnate. The theologians present at the consistory never got a chance to debate these propositions fully: when it became clear that the curia sided with Gilbert, Bernard of Clairvaux (appointed to the prosecution) drew up a "confession of faith" of sound spiritual instinct (but loose terminology) that he presented to Eugenius III, in effect pressuring the pope to declare either Gilbert or Bernard a heretic. Eugenius sidestepped the maneuver and made some token pronouncements regarding theological language; Gilbert, acquitted of heresy, declared that he "believed whatever Eugenius believed" and promised to correct any offending passages in his writings. No such "corrections" were ever made, to Bernard's chagrin.

# GILDUIN OF SAINT-VICTOR

(d. 1155). The first abbot of Saint-Victor, a house of regular canons at Paris founded by William of Champeaux, Gilduin guided the development of the abbey in its crucial early decades. He developed ties with the king, so that the abbey enjoyed royal patronage, and oversaw the erection of the abbey's first buildings. During his abbacy, a group of distinguished canons brought fame to the abbey as a center of biblical study, theological inquiry, and liturgical creativity, along with dedication to the contemplative ideal and to ecclesiastical reform.

# GILES OF ROME

(Aegidius Colonna; ca. 1243–1316). One of the most outstanding students of Thomas Aquinas, Giles was born at Rome, perhaps of the Colonna family. Contrary to his family's wishes, Giles embraced the religious life ca. 1258 at the convent of Santa Maria del Populo of the Hermits of St. Augustine. Arriving at Paris ca. 1260, he studied and taught there until 1278. He heard the lectures of Thomas during the latter's second period of teaching at Paris (1269–71) and strenuously defended Thomistic teachings against Bishop Étienne Tempier's condemnation in 1277. This dispute with the bishop occasioned Giles's departure from Paris; the bishop's death helped smooth the way for Giles's return in 1285 as master of theology and the first Augustinian friar to hold a chair in theology at Paris (1285–91).

King Philip III of France had charged Giles with the education of his son, the future Philip IV the Fair, for whom Giles composed perhaps his best-known work, *De regimine principum* (1280). By 1282, the work had been translated into French and in the 14th century was translated into Castilian, Portuguese, Catalan, English, German, and Hebrew. The work was an admirable combination of Aristotelian ethics and Christian moral and spiritual teaching.

Giles maintained good relations with Philip, and in the year following his election to the post of prior-general of the Augustinians (1292) Philip granted the order the Grand Convent of the Augustinians in Paris. In 1295, Pope Boniface VIII, with Philip's consent, elevated Giles to the archiepiscopal see of Bourges. But in the ensuing controversy between Philip and Boniface, Giles sided with Boniface, composing the treatise *De*

*ecclesiastica potestate* (1301)—one of the principal sources for the papal bull *Unam sanctam* (1302) and one of the broadest expressions of papal supremacy in the entire controversy.

Following the death of Boniface, Giles returned to his duties in Bourges. He was active in several controversies at the time, among them the disputes with the Templars and with Peter Olivi. He was active at the Council of Vienne (1311–12) and died a few years later in Avignon.

As a teacher, Giles lectured according to the prescribed course of study, commenting first on the Bible and on the *Sententiae* of Peter Lombard; but his greatest love was philosophy. He left commentaries on many of Aristotle's works on logic, physics, and metaphysics, including the Pseudo-Aristotelian *Liber de causis.* His works were held in such high esteem that the general chapter of his order meeting at Florence in 1287 declared that his "opinions, positions, and conclusions *[sententiae]* both written and yet to be written" were to receive the unqualified assent of all Augustinian teachers and students. The Franciscan philosopher William of Ockham went so far as to speak of Giles as the "Expositor" of Aristotle's *Physics.*

Giles was an independent thinker, and though he shared many ideas with Aquinas he disagreed markedly with him on the relationship between essence and existence. For Giles, these are two separate things, the latter not necessarily implied in the former. In this way, he stressed the contingency of all things on the will of God and enunciated a theme that would become one of the hallmarks of later nominalism.

# GILLES DE CHIN

(d. 1137). This chamberlain of Count Baudouin IV of Hainaut has left his trace in history and legend. The literature he inspired records his adventures in the Holy Land, as well as

in his native Hainaut. His effigy is still to be seen in the chapel of Saint-Calixte in Mons, and his exploits are recalled annually by a procession in nearby Wasmes. Gilbert de Mons recorded his deeds in the *Chronicon Hanoniense* (ca. 1195–1221), and Gautier de Tournai celebrated them in a 13th-century poem of which only a 16th-century manuscript remains. A 15th-century prose version is preserved in two manuscripts, one of which, in Lille (Fonds Godefroy 134), is illustrated by the celebrated Wavrin Master. Marks of ownership further identify it with the Burgundian counselor, historian, and bibliophile Jean de Wavrin. Although the anonymous author of this prose version generally follows the earlier poem, he adds contemporary personages to the story and elaborates scenes from contemporary life. The tale belongs to a group that celebrates local heroes, including Gérard de Nevers, Gilles de Trazignies, and Jacques de Lalaing. Copies of all of these were made in the Lille workshop of the Wavrin Master.

# GIRART D'AMIENS

(fl. 1280–1305). A familiar of the courts of Edward I of England and Philip the Fair of France, Girart is known to us only through the prologues of his three lengthy poems. His romance *Escanor* (25,936 octosyllables, with lacunae) was dedicated ca. 1280 to Eleanor of Castile, Edward's queen; *Meliacin* or the *Cheval de fust,* (19,159 octosyllables with twenty-four intercalated lyrics) was composed at the command of Gaucher V de Châtillon shortly after 1285; and *Charlemagne* (over 23,000 Alexandrines; ca. 1303–06) was written for Charles of Valois, brother of Philip the Fair. *Escanor,* perhaps conceived as a sequel to the *Atre périlleux,* is an Arthurian romance whose two main themes are the love affair of Kay and Andrivete of Northumberland and the enmity of Gawain and Escanor. *Meliacin* is a non-Arthurian romance based on the eastern legend of the Ebony Horse (from the *Arabian Nights),* found also in Adenet le Roi's *Cleomadés.* Both poems were inspired by Blanche of France, daughter of St. Louis and daughter-in-law of Alfonso X the Wise of Spain, after her return to France as a widow. *Charlemagne,* extant in three manuscripts but still largely unedited, is presented as a continuation of Adenet le Roi's *Berte aus grans piés.* It has three principal parts: Charlemagne's youth (inspired by the epic Mainet); the exploits of Roland, Ogier, and Naimes, followed by Charlemagne's voyage to the Holy Land; and a rhymed version of the Pseudo-Turpin chronicle.

# GIRART DE ROUSSILLON

. Written anonymously between 1155 and 1180 (probably ca. 1170), this poem in Franco-Provençal consists of some 10,000 decasyllabic lines (with an unusual 6/4 caesura). Preserved in three manuscripts, it features the same 9th-century count of Vienne as do the *Chanson d'Aspremont ("Girart* de Fraite") and *Girart de Vienne. Girart de Roussillon* belongs to the Rebellious Vassal Cycle but uncharacteristically uses the figure of the unjust king not to excuse revolt but to show that, even under the greatest imaginable provocation, a vassal has no right to rebel. King Charles Martel forces Girart to exchange fiancees with him in consideration of release from vassalic duties; he then tries by force to bring Girart back into vassaldom; the resulting civil war ends when God's thunderbolts strike the banners of both armies. It resumes after a murder by some of Girart's relations, whom he refuses, in his pride, to surrender, and leads to appalling slaughter and destruction. Reduced to flight, Girart plots to murder Charles but is converted by a hermit; his long and difficult penance is supported by his wife, who leads him ultimately to the renunciation of secular chivalry and to sanctity.

   *Girart de Roussillon* is remarkable for its insight into human motivation, especially the effects of pride, and for its vividly expressed horror at civil war and its consequences.

# GIRAUT DE BORNELH

(fl. ca. 1162–99). Called *maestre dels trobadors* by the author of his *vida,* this prolific and respected singer traveled to the courts of Spain and participated in the Third Crusade.

Dante later turned to him for a model of the poet of rectitude. The *vida* also suggests that Giraut was a master in another sense: a teacher. Certainly, his lyrics are the work of a poets' poet, at once learned and elegant. In his approximately seventy-six songs of certain attribution, including some fifty love songs and fifteen moral *sirventes,* Giraut is a difficult poet, concise and cerebral. His cold rhetoric and his obsession with style seem to confirm the *vida's* assertions. Giraut was as much at ease in the hermetic style of *trobar clus,* perhaps in imitation of Raimbaut d'Aurenga, as he was in the clear style of *trobar leu,* which he defends in a debate with Raimbaut. His most successful lyric is the religious *alba Reis glorios,* but he also practiced the *planh, tenso,* crusade song, romance, and *pastorela.*

# GISLEBERTUS

(fl. late 1 1th-early 12th c.). The west tympanum of Saint-Lazare at Autun bears the inscription GISLEBERTUS Hoc FECIT, and this sculptor's career can be traced through stylistic comparisons to Autun. Around 1115, Gislebertus assisted the Master at Cluny working on some capitals and the west portal. He was briefly at Vézelay producing sculpture intended for the west tympanum. His major œuvre was at Autun ca. 1125–35, where he carved the Last Judgment of the west tympanum, in the north doorway of which a lintel fragment of Eve remains, and, with assistants, about fifty foliate and historiated capitals. His significance as a Romanesque sculptor arises from the quantity and expressive quality of his work.

# GISORS

. Capital of the Norman Vexin, Gisors (Eure) was the principal base of operations of the Anglo-Normans in their struggles against the Capetian monarchy. A fortress with a double curtain wall was begun here in 1096–97 by the Norman Robert de Bellême on

orders from King William II Rufus. For a century, it was the scene of constant strife until finally ceded by Richard I the Lionhearted to Philip II Augustus by the Treaty of Louviers (1196). Richard then immediately built Château-Gaillard to replace it. The extensive remains of the ramparts (built probably under Henry I), of the 12th-century keep (constructed on an irregular octagonal plan upon a 65-foot motte), and of the three-story Tour du Prisonnier (built by Philip Augustus), dominate the present-day town. It is an impressive example of Norman military architecture.

The church of Saint-Gervais-Saint-Protais, constructed from the 12th through the 16th century, witnessed a succession of styles. The nave is largely Renaissance, but the transept tower (12th c.) and choir (13th c.) are significant Gothic structures in the region.

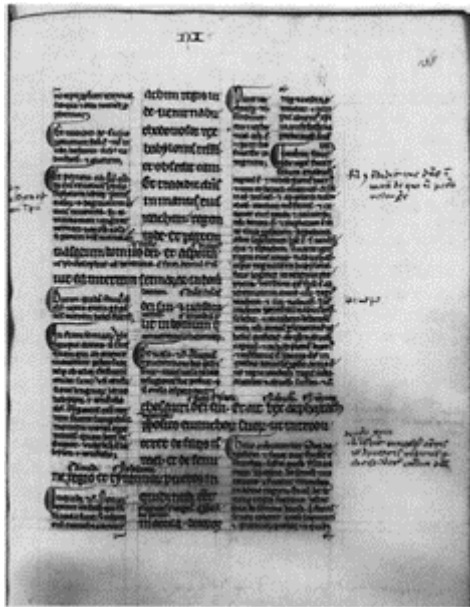
# *GLOSSA ORDINARIA*

. The "Ordinary Gloss" is the name generally given to the commentary on the Bible (and the prologues of Jerome) of which manuscripts were commonly produced ca. 1130–1250 and which contained in effect a digest of the opinions of all the important patristic commentators, as well as some selected "moderns" on any given text. It was a reference work for teachers and students of biblical commentary. Once the text had become established, it was largely stable, laid out with a central biblical text and glosses added in the margins and interlinearly. There is no difference, apart from length, between the marginal and interlinear glosses, and they may change places at will.

Jerome, whose translation is the basis for the *Glossa's* Bible text, is also a major source of the individual glosses, along with Ambrose, Augustine, Bede, Cassiodorus, Gregory the Great, Origen, and their 9th-century editor, Rabanus Maurus. These are the main contributors, but others, especially Carolingian authors, are sometimes quoted on particular words or phrases.

By ca. 1490, it was a commonplace that the Carolingian scholar Walafrid Strabo was the compiler of the *Glossa,* but recent scholarship prefers to credit the Psalter, Pauline


Glossa *Ordinaria*. Biblical text (large text) and gloss (small text) for Daniel 1.1–4. BN lat. 155, fol. 138. *Courtesy of the Bibliothèque Nationale, Pari*s.

Epistles and perhaps the Gospel of John to Anselm of Laon, and the Pentateuch, Jeremiah, and perhaps Joshua to 2 Kings and the Minor Prophets to Gilbert of Auxerre, "the Universal." Anselm's brother, Ralph, may have made the gloss on Matthew. The compilers of the other glosses remain a mystery.

The *Glossa* was taken up by two famous Parisian masters, Gilbert of Poitiers and Peter Lombard. Peter wrote commentaries on the Psalter and the Pauline epistles, which were incorporated into the glossed text as standard (the *Magna glossatura).* Perfecting the characteristic layout, apparently in Paris late in the 12th century, made it the reference tool *par excellence.*

The *Glossa* was printed in many early versions, the first by Adolph Rusch of Strasbourg (1480–81). From the 1495 edition, the *Glossa* was printed together with the postillae of Nicholas of Lyra, and after ca. 1500 an increasing number of interpolations in the printed texts make them unreliable witnesses to the 12th-century versions. The adjective *Ordinaria* was not added to the general term *Glossa* until the 14th century.

*Lesley J.Smith*

# GODEFROI DE BOUILLON

(ca. 1061–1100). Duke of Lower Lorraine, leader of the First Crusade, and first Latin ruler of Jerusalem, Godefroi was the second son of Count Eustache II of Boulogne and of Ide, daughter of Duke Godefroi II of Lower Lorraine. In 1076, the emperor Henry IV refused him the succession to his grandfather's duchy, but Godefroi finally acceded in 1089.

He participated in the First Crusade in 1096 along with his brothers Eustache III of Boulogne and Baudouin, choosing the land route via Hungary. On arriving at Constantinople, he at first refused the requested oath to the emperor Alexios I Comnenos but consented finally after an attack on the suburbs of the city when the emperor cut off provisions for his forces. Though he did not figure as prominently as the other crusading leaders prior to their arrival at Jerusalem, his forces were the first to break in, and he became the compromise candidate for ruler of the Holy City. Refusing the title king, he became the Advocate of the Holy Sepulcher and secured the Latin position in Palestine by defeating an invading relief army from Fatimid Egypt at Ascalon.

Godefroi's rule was brief and made difficult by the ambitions of the other crusading leaders. He also had to deal with the pretensions to rule of Daimbert of Pisa, the first Latin patriarch of Jerusalem. On his death (*July* 18, 1100), he was succeeded by his younger brother, Baudouin, who had founded the first of the Crusading States at Edessa and who took the title king of Jerusalem.

Godefroi's life almost immediately became the stuff of legends. He was one of the three medieval members, with Charlemagne and Arthur, of the Nine Worthies and is the principal hero of the Crusade epics, including the 35,000-line *Chevalier au cygne et Godefroid de Bouillon* (1356), the final reworking of the cycle.

# GODEFROI DE CLAIR

(Godefroi de Huy; d. 1175). A renowned metalworker active in the Meuse Valley during the third quarter of the 12th century, Godefroi de Clair is reputed to have worked for the emperors Lothair II and Conrad III. Although many works have been attributed to him, such as the base of the Cross of Saint-Omer (Saint-Omer, Musée) no documented pieces survive. He may be the goldsmith addressed in a famous exchange of letters between Abbot Willibald of Stavelot and a "Dear Son G," in which the abbot requests objects be delivered that were long overdue and the artist requests payment. Godefroi was a canon in Huy when he died in 1175.

# GODEFROI OF SAINT-VICTOR

(ca. 1125-after 1194). Godefroi of Saint-Victor (not to be confused with another Augustinian canon of the late 12th century, Geoffroy of Breteuil) seems to have studied the Trivium in Paris for some years between 1140 and 1155, when Adam du Petit-Pont was active. By 1160, he had entered the abbey of Saint-Victor, where he received his theological and monastic training. Imbued with the intellectually robust spirit of Hugh and Richard of Saint-Victor, Godefroi found himself forced to leave the abbey under the priorship of Walter, ca. 1180. After Walter's death, Godefroi (ca. 1190) returned and remained at the abbey until his own death.

His liturgical poetry includes verses dedicated to St. Augustine and to the Virgin Mary. Over thirty sermons for feast days survive. Godefroi's major theological works are *Fons philosophiae* and *Microcosmus.* The former, written in 1178, is an elaborate description in verse of a course of study in the liberal arts, Scripture, and theology in Paris, and is much indebted to the program of Hugh of Saint-Victor's *Didascalicon.* The *Microcosmus* contains a moral interpretation of the biblical story of Creation and a consideration of divine grace and will vis-à-vis human desires and emotions. Godefroi develops numerous parallels between human beings (the *microcosmus*) and the created world *(megacosmus).* He strove to give a positive value to nature (as created and as "fallen"), to the human body, to the so-called "mechanical arts," and to classical Roman authors and especially their ethical teaching. This evoked opposition from Walter of Saint-Victor, who brought about Godefroi's tenyear exile to a rural priory. He also wrote on the eucharist and on the symbolic meaning of the parts of Christ's body.

Godefroi's was one of the last voices in the Victorine chorus that sang the praises of what might be styled 12th-century humanism: a protest against the regnant opinion of body-soul dualism and an affirmation of the harmony of nature and grace in Christian life.

# GODFREY OF FONTAINES

(d. 1304). Born near Liège, Godfrey studied at Paris under Henry of Ghent and was a regent master in theology there from 1285 to 1295. He was also canon of Liège, Tournai, and Paris and provost of Saint-Séverin of Cologne. Although elected bishop of Tournai in 1300, he renounced his claims to the episcopate. Both Godfrey and Henry of Ghent actively engaged in the debate between the secular clergy and the mendicant orders, opposing the privileges of the latter. Highly critical of the Augustinian school, Godfrey is generally regarded as an Aristotelian and a Thomist. Although open to Aristotelian thought, he was an independent thinker and differed with Aquinas on a number of issues. Unlike Aquinas, for instance, Godfrey denied the real distinction between essence and existence. No single work sets forth completely either his theology or philosophy; his writings address such subjects as existence, the discord between the mendicants and the secular clergy, and the condemnation by Étienne Tempier, bishop of Paris, in 1277 of 219 theses of the Aristotelian school. Thus, Godfrey's system of thought is integrated with and emerges from his observations on controversial issues of the late 13th century. His major works are his fifteen *Quodlibeta,* composed during his regency and considered a masterpiece in quodlibetical literature.

# GOLDEN FLEECE

. The most successful lay order of knighthood founded in France and the principal model for all later orders of its type, the Order of the Golden Fleece (Fr. *Toison d'or)* was proclaimed in Bruges by Philip the Good, duke of Burgundy, on January 7, 1430. Endowed with statutes composed by Jehan Germain on the occasion of its first meeting in Lille on November 30, 1431, it functioned under those statutes, as amended from time to time, until its last meeting in 1559. The order was the first of the fully neo-Arthurian monarchical type to be founded anywhere for half a century, and its statutes were based on those of the two earlier orders still surviving in 1430: the Garter of England (1344/49) and the Collar of Savoy (1364). The order thus took the form of a cooptative corporate society of nobly born lay knights, or "companions" (at first twenty-five, in 1433 raised to thirty), including a hereditary "Chief and Sovereign" (the duke of Burgundy), four corporate officers (chancellor, treasurer, registrar, and king of arms), a corporate seal, a corporate chapel (in the ducal palace at Dijon) in which each companion had his own stall marked with his arms, and a college of canons (initially equal in number to the companions), whose principal function was to offer up prayers and Masses on the companions' behalf. The companions of the order had obligations both to their sovereign and to one another, in life and after death, and the whole order met in occasional (until 1445, annual) "assemblies," which consisted of a business meeting, or "chapter," a banquet, and religious services. The companions wore at all times a collar composed of metallic representations of the ducal badge of a B-shaped *fusil,* or firesteel, and a flint spewing flames, from which depended an effigy of the golden fleece captured by Jason and the Argonauts.

Like its English model, the Order of the Golden Fleece was founded partly to reward and promote chivalrous behavior among its sovereign's noble subjects (especially loyalty to the crown) and partly to increase the prestige of its sovereigns themselves by portraying them in the image of Arthur or Jason at the head of a company of highborn heroes. It was also intended, however, to secure the active service of its companions and to unite the leading members of the separate and formerly antagonistic nobilities of the various Burgundian principalities in the bonds of fraternity.

# *GORMONT ET ISEMBART*

. An Anglo-Norman fragment of 661 assonanced octosyllables, transcribed in the 13th century and preserved in Brussels, Bibl. Roy. de Belgique, II. 181, *Gormont et Isembart* contains the final episodes of a battle in which the Saracen king Gormont fells every French baron who dares measure swords with him; finally, he is slain by King Louis. Louis, however, ruptures his own midriff and dies several weeks later. The renegade Isembart rallies the Saracens but is killed after four days of a raging battle in which he even unhorses his own father; in the last moments of his life, he reconverts to Christianity.

The whole plot is known thanks to lines 14,053–296 of Philippe Mouskés's *Chronique rimée* (before 1243) and Book 3 of the 1437 German translation of a prose rendering (1405) of a long romance of the 14th century, *Lohier et Mallart.* According to these texts, Isembart (Lohier) is Louis's nephew, who, exiled by court intrigues, abandons his faith and takes refuge in England with the Viking king Gormont. Pushed by Isembart, Gormont lays waste to Isembert's own seigneuries, the Vimeu and the Ponthieu, and burns down the abbey of Saint-Riquier. Since in Geoffrey of Monmouth's *Historia regum Britanniae* (ca. 1136) Isembart already is Louis's nephew, and since the plot is summarized in Hariulf's *Chronique de l'abbaye de Saint-Riquier* (1088), the legend must

have originated in the 11th century, possibly even immediately after Louis III's victory over the Vikings at Saucourt-en-Vimeu (August 3, 881). The poem itself must have been composed between 1140 and 1150, probably in the region southwest of Paris.

# GOTHIA

. The region called Gothia was one of the major divisions of Carolingian and post-Carolingian Gaul, com-prising the coastal region along the Mediterranean from the Rhône to the Pyrénées. It was identical with the earlier Septimania and with the county of Toulouse formed the future Languedoc. The region preserved a strong sense of its Roman and Visigothic past after its annexation by Pepin the Short in the 750s, and it came to be referred to as Gothia as well as Septimania. Its nobles were conscious of being a distinct people, Goths, within the Frankish kingdom, and Visigothic law was observed there for centuries after its incorporation by the Carolingians, under whose rule it was usually a separate administrative unit, as a county, duchy, or march.

In the early Carolingian period, Gothia was frequently linked with the march of Toulouse or the Spanish March, but in the mid-9th century it emerged as a separate march. However, in 924 it was annexed by Raymond III, count of Toulouse, and it remained among the holdings of his successors, who carried the title marquis of Gothia. The population and culture of Gothia soon blended with those of the other Toulousan territories, and by the end of the 11th century Languedoc had emerged.

# GOTHIC ARCHITECTURE

**.** The term "Gothic," first derisively applied by Italian Renaissance writers, is still the accepted designation for the last phase of medieval art and architecture, lasting from ca. 1140 to ca. 1525. The period is usually divided into four parts, based (incorrectly) on the organic model of growth: Early Gothic (ca. 1140–95); High Gothic (ca. 1195–1225/30); Rayonnant (ca. 1225/ 30-ca. 1400); and Flamboyant (ca. 1400–1525).

The development of the Gothic style is usually analyzed in terms of specific elements, such as round or pointed arches, rib vaults, tribune galleries, wall passages and triforia, flying buttresses, elevations, and plans. More important than such constructional features, which can also be traced in Romanesque architecture, was the change in the way builders worked within their architectural vocabularies. Prior to the rebuilding of parts of the abbey of Saint-Denis beginning ca. 1140, builders generally borrowed features, more or less unchanged, from other building projects. Builders in the generations that followed Saint-Denis more and more integrated borrowed elements into the total design. It is the cognitive shift and the increasingly comprehensive design sense, together with the unified architectural space in which the parts are subsumed within the whole, that set Early Gothic apart from Romanesque. The change occurred as a series of experiments, not as an absolute solution. The surviving structures resist easy synthesis and suggest that we must appreciate the staggering variety of experimentation, the excitement of discovery, and the intellectual ferment that resulted in the extraordinary range of Early Gothic architecture; there are as many directions and trends as there are buildings. With the acceptance of a pluralistic approach, we move closer to the reality of the extraordinary variety that characterized the period.

"Early Gothic" is the generally accepted designation for the first phase of the French Gothic style, lasting from its beginning at Saint-Denis, ca. 1140, until the reconstruction of the cathedral of Notre-Dame of Chartres, begun in 1194. The Early Gothic style was initially confined to the areas in and around Paris and those under royal control but quickly lost its Parisian association with the Capetian kings. Architecture ceased to be a craft and became a discipline in the new chevet at Saint-Denis, dedicated in 1144. For the first time, medieval architecture became something other than the sum of a series of parts or sequence of units. The important conceptual shift in the thinking of the second builder at Saint-Denis is that for the first time he faced the challenge of creating an inner spaciousness that fused separate but contiguous units into a single architectural entity. The success of the east end of Saint-Denis lies in the creation and direct expression of a visual logic in the arrangement of every architectural element and a subordination of elements to the unified, total space. In the decade or so following the dedication of the east end of Saint-Denis in 1144, we can find a number of buildings that respond to it in a variety of ways. With few exceptions, the builders react as did builders of previous generations and borrow elements from Saint-Denis in random fashion or attempt to "copy" the east end as they understood it.

The other important achievement of this period is the cathedral of Sens, the first large-scale Gothic space. Detailed analysis of the north wall of the ambulatory at Sens permits us to observe many small changes in the design made during construction, all of them "responses" to Saint-Denis. Sens differs most from Saint-Denis in the large size and ambitious scale of its volumes. The visual logic of the east end of Saint-Denis is explored in varying degrees in other buildings started in the decade 1145–55, such as the cathedrals of Senlis and Noyon, and the new chevet of the abbey church of Saint-Germain-des-Prés in Paris.

The next decade is characterized by experiments in both size and scale, as well as explorations in the creation and application of the system of visual logic that Bony terms the "Gothic grid." Chief among the surviving buildings are the cathedrals of Paris and Laon, four-story elevations that achieve both real and apparent height, respectively. Equally important were the two cathedrals of Cambrai and Arras, now destroyed, massive buildings in which many novel effects of design were explored. The decade also witnessed an increase in the adaptation of Romanesque structural features and solutions to the Gothic vocabulary.

Advanced thinking in the decade ca. 1165–75 is characterized by daring experiments in voiding the wall with

PRINCIPAL CENTERS OF GOTHIC ARCHITECTURE

superposed passages and arcade screens, as in the transept arms of Noyon, the transept chapels at Laon, and the interior of the façade of Saint-Remi at Reims. The period ca. 1175–85 saw those experiments continued but usually on a more modest scale than at Paris or Cambrai, both of which were over 100 feet tall on the interior. Perhaps the most important change that took place in this decade was the systematic application of the flying buttress to the exteriors. The flying buttresses constructed at the lower level of the nave at Notre-Dame in Paris were the first examples to suggest the full potential of the feature. From the moment of their appearance, probably ca. 1175, they had a profound impact on builders and were quickly incorporated at such sites as Mantes, Saint-Remi at Reims, and Canterbury. The evidence suggests that they were added after the fact in a number of other cases, such as the nave at Laon. So profound was the impact of the flying buttress that other structural experimentation for all intents and purposes ceased. The decade ca. 1185–95 saw the continuation of the experiments of the previous de-cade and was again dominated by the flying buttress. The vocabulary of design solutions was broadened and made ever more complex through the sheer number of buildings, large and small, that were undertaken, but no major new features were introduced.

With the rebuilding of Chartres, begun after the fire of 1194, and of Bourges (ca. 1195), the lines of experimentation can be said to have reached two different but equally important ends. Chartres in particular is separated by scholars from Early Gothic and considered the beginning of a new stylistic trend, commonly called "High Gothic." "High Gothic" is the term for what has long been considered the "classic" moment in French Gothic architecture, that series of cathedrals built in northern France between 1195 and ca. 1225/30. In English, the term carries the added connotation of height. By general agreement, High Gothic begins with the reconstruction of Chartres following the fire of 1194 and continues, for some, with Bourges, begun in 1195, or more often with Soissons, now thought to predate Chartres; then Reims, begun after the fire of 1208, followed by the nave of Amiens, begun by Robert de Luzarches 1218–20, and the chevet of Beauvais, begun ca. 1225.

One can argue with equal validity that Chartres, Bourges, and Soissons, along with others usually excluded, represent the final flowering and full variety of possible solutions available to builders after a half-century of extraordinary architectural experimentation. Bony has characterized Chartres as a radical simplification of ideas from a variety of earlier sources. The design of Soissons is another sort of simplification, but one still firmly rooted in previous experiments. In this line of reasoning, Bourges represents the ultimate complexity coming out of these same experiments. In short, all three are the continuation of Early Gothic experiments.

The importance of Chartres has been exaggerated, both because of its identification during the 19th century as the most sacred shrine of the Virgin in France and because of its proximity to Paris. Its stylistic impact is confined largely to Reims; but the latter's importance as the source for the simplified three-story elevation incorporating bar-tracery windows and double tiers of flying buttresses topped by pinnacles is incontestable. As a solution, the design of Reims is less radical than those adopted at Chartres, Soissons, or Bourges. If it is recognized that the elements at Reims constituted refinements to existing techniques and designs, it, too, becomes the product of builders with full knowledge of previous experiments. The only "dislocation" concerns the cathedrals of Amiens and Beauvais, both of which, but most especially Amiens, are usually included in the "High

Gothic" canon. If we recognize, however, that both designs exhibit significant shifts in interest from those of Chartres, Soissons, Bourges, and Reims, even while being influenced by them, then the realization that both herald the new decorative complexity of the Rayonnant becomes possible. Such a reorganization does not privilege them over later Rayonnant solutions any more than over such precedents as Reims; rather, it restores to them a measure of originality.

Thus, it is time to question the whole concept of "High Gothic" and to discard both the deterministic models and concepts of stylistic development based on organic mod els, as well as value judgments that privilege one aspect of a style above another. The continued use of the construct prejudices an understanding of the Rayonnant as a distinct and independent architectural development based on different values. If we discard the notion of the classic moment of the Gothic style in favor of an understanding of early 13th-century buildings continuing the rich tradition of experimentation, then structures previously relegated to the sidelines and excluded from the "High Gothic" assume their places as varied accomplishments in their own right.

Like most stylistic terms, even "Gothic" itself, "Rayonnant" is a misnomer. Chosen in the 19th century because the rose window was seen as typifying the style, it has come to stand for the new direction in Gothic architecture that manifests itself ca. 1225–30. Rayonnant is the result of a variety of experiments that seem to crystallize in and around Paris, but they would not have been possible without knowledge of comparable experiments at Amiens, Troyes, Saint-Nicaise at Reims, and even Royaumont. The Rayonnant is characterized by a new exploration of the applications of geometry in the design of window tracery and the systematic application of the principles of window-tracery design to the entire building, inside and out. Since the design principles are derived from the elegant screens of window tracery, the emphasis is linear and flat, with a sense of apparent fragility and brittleness, together with an incisive analytical elegance. The fragility of window tracery is nevertheless an illusion that results from its linear qualities and thinness: these thin screens of ornament have withstood countless storms since their creation.

The linear complexity leads to an abrupt and systematic change of emphasis. All of the ornament is on these thin screens of tracery; all forms of plasticity are rejected. The compound piers of Reims and Chartres become the attenuated linear piers of the nave of Saint-Denis. The linear value of the piers runs up the wall, every layer of which receives the same unified treatment of incisively carved yet delicate ornament. The substantial wall structures of previous generations have disintegrated into layers of the thinnest possible tracery. Even wall passages cease to convey depth, because their two surfaces are sharply delineated units of surface pattern superimposed in front of one another. Density and mass even disappear on the exterior, as all surfaces are covered with elegant tracery or thinned down by sheets of tracery gables. The buildings become thin, elegant, elongated, and miraculously insubstantial, as at the Sainte-Chapelle in Paris or Saint-Urbain at Troyes. The patterns are rational, logical, and neat—ceaseless explorations of the almost infinite number of possible patterns to be derived from experiments with the geometry of circles, squares, and triangles. Design becomes a logical process in which a series of similar patterns may be repeated and manipulated through a variety of sizes and scales.

In addition to the extraordinary facility of design found in the Rayonnant, other factors must be considered. The development of elaborate patterns of tracery ornament in the later 1220s and 1230s is matched by a decrease in the size and scale of the buildings, which serves to make the patterns visible, just as the broad double aisles and pyramidal elevations of buildings like Paris and Bourges are abandoned in favor of simpler, more concentrated plans that allow the outer windows to be brought closer to the central space. The result is greater light on the interior from larger windows filled with more complex tracery patterns. The period reveals an almost quantum leap forward in the handling of design complexities, as well as in the carving of complex, multifaceted pieces that make up the tracery puzzle. There is a marked preference for hard, fine-grained limestone that lends itself to fine carving, and we can speculate that there must also have been an explosive development in the production of tools capable of producing the detail demanded. Lastly, there are the economic considerations.

Beginning in the mid-1220s, western Europe entered what is termed a "Little Ice Age," when temperatures yearround grew noticeably colder. Lower temperatures wreaked havoc on agriculture, particularly in northern France, where wine production, heretofore a major industry, practically disappeared. Only the cloth-producing towns in the north escaped economic disaster. In this economic climate, it is important to note that, for all of the complexity of tracery and richness of pattern, a building in the "Rayonnant" style actually requires less stone for construction than an Early Gothic building. The difference becomes clear, for example, if we compare a cross-section and elevation of the nave of Saint-Denis with those of Laon. Although the height of Laon is about 80 percent that of Saint-Denis, the nave of Saint-Denis required only about one-third the stone needed to construct a comparable area at Laon. In addition, the Rayonnant structure seems not only lighter and more open but achieves a greater sense of spatial mystery and illusion.

The Rayonnant period also witnessed a shrinking in scale and complexity that not only reflects the economic realities but serves to make the design itself more visible. And some of the designs were becoming, if less complex, hardly less elegant. The church of Saint-Martin-aux-Bois, for example, has a much simpler and more concentrated plan without an elaborate chevet but uses tall, thin windows surrounded by large areas of masonry. Still, through a skillful juxtaposition of height and narrowness, the builder achieved an elegance of statement. The innumerable Franciscan and Dominican churches of the later 13th and succeeding centuries will use these same principles of design. Their compact preaching halls will eschew elaborate chevet plans in favor of simple apses and will have tall, thin windows in large wall surfaces.

Another important aspect of the Rayonnant is the development of distinctive regional styles, both as a reflection of the creative possibilites inherent in the tracery patterns and as a return to structural systems typical of particular areas. It was common in Normandy, for example, to find wall passages in front of the clerestory windows, as in the Norman Gothic chevets at Bayeux and Coutances or in the church at Norrey. But wall passages in front of clerestory windows were even more common in Norman Romanesque churches from Cerisy-la-Forêt and Saint-Étienne at Caen, as well as in occasional Early Gothic buildings like La Trinité at Fécamp. As was the case in other areas,
Elevation and nave section of Saint-Denis. After Dehio.

Elevation and nave section of Laon cathedral. After Dehio.

the traditional structural systems of Romanesque Normandy were updated in the Rayonnant Gothic and outfitted with elaborate tracery patterns in the windows and wall-passage screens to create the distinctive Norman Gothic style.

A similar interest in older structural systems updated and sheathed in complex tracery patterns characterizes the regional styles of Burgundy and Champagne. One thinks of the superposed passages of the apse of Saint-Amand-sur-Fion, which must be a reflection of the design complexity of Saint-Nicaise at Reims, which in turn picks up the lower-level passage in front of windows seen at both Saint-Remi and the cathedral of Reims. Likewise, in Burgundy the distinctive regional variant of Rayonnant Gothic usually includes passages in association with windows, as at Auxerre cathedral, Notre-Dame at Dijon, and the elegant church at Semur-en-Auxois.

In the south, the Romanesque single-nave tradition of Languedoc provided the inspiration for comparable Gothic spatial experiments at Toulouse cathedral, among others. And some of the Angevin experiments with single naves and complex, domed vaults culminates in the extraordinary lightness and openness of Saint-Serge at Angers and Candes, among others, in this particularly experimental region. In short, the regional styles all seem to have more to do with updating older traditions in a climate that favored experimentation in structure and design than with creating styles in reaction to what was emanating from the royal domain.

Discarding the outmoded concept of "High Gothic" and reevaluating Rayonnant Gothic as an equally valid but different approach to design and decoration also permits us to rethink the assessments of previous generations with regard to the last phase of the Gothic style, called "Flamboyant" after the elegant reverse curves used in window tracery that produces patterns resembling tongues of flame. Past generations tended to dismiss the Flamboyant as "decadent" or "baroque." To do so fails to recognize two important aspects of Late Gothic. First, the Flamboyant exists side-by-side with the now conservative Rayonnant. In other words, the Flamboyant is a logical outgrowth of Rayonnant tracery patterns, an outgrowth that does not replace the older patterns but exists with them. More important, in the hands of talented builders the Flamboyant became the means to expand the limits of Gothic illusionism and to question the very tenets of architectural design.

The Hundred Years' War drained the French economy at every level. With resources stretched thin, building activity practically ceased. Many projects were abandoned or languished until the recovery in the late 15th century. Flamboyant tracery patterns began to appear in the last decades of the 14th century, but the major monuments would be created only after the end of the war and would be built in those areas most devastated by battles: Picardy, Champagne, Burgundy, the western valley of the Loire, and Normandy, as well as in Paris itself.

The most identifiable aspect of Flamboyant Gothic is the ogee, or reverse-curve, arch, which first appeared simply as one more variant in the rich Rayonnant vocabulary. But by the 15th-century recovery, the patterns had grown more complex and had begun to be used to impart a sense of dynamics to the lines of the buildings. The ogee arch and the resulting tracery patterns are used to define the style not only because they are so immediately identifiable but because they create a sense of continuous, sinuous movement across the window tracery or around the portals. This dynamism spread to the patterns of vault ribs and even to the design of piers. Abandoning the traditional visual and design limits imposed by the presence of bases and capitals, as well as the volumetrics resulting from colonnettes, the pier could become something dynamic in design with a plan of delicate scallops. The thin vertical lines swirl upward, twisting

dramatically and seeming wildly to sprout vault ribs, as in the ambulatory of Saint-Séverin in Paris.

This extraordinary visual fantasy at the same time is accompanied by the increasingly "realistic" depiction of flora and fauna seemingly copied from nature. Already present in the decoration of the Sainte-Chapelle in Paris, this tendency flourished in the 15th century with the creation of designs based on ever more specific fruits, vegetables, and foliage now filled with exotic and monstrous animals whose realistic treatment belies their fantastic origins. The element of fantasy pervades architecture. In this new order, the transept gables of Notre-Dame at Paris become the dissolving openwork screens of Louviers or the façade of Saint-Maclou at Rouen. Visual limits are challenged by illusionary effects, piers without bases or capitals, vault ribs that sprout from walls, scatter across vaults like unchecked foliage and abruptly vanish into other ribs, piers, and walls.

Architectural space becomes more unified into total volumes but also more visionary and illusionistic. In eastern France and in Champagne, this was achieved by using the hall-church scheme with aisles equal or nearly equal in height to the main nave. But the illusionism might also rely on the tall, narrow proportions found in the Rayonnant, a design favored in Parisian churches. The Rayonnant visual linkage of upper zones that suggested a two-storied elevation became reality in such buildings as Notre-Dame at Cléry (1429–85), a royal church on the Loire, and later in Saint-Gervais (1494–1502) and Saint-Étienne du Mont in Paris (after 1494). Moulins cathedral, formerly a collegial church founded in 1468 for the dukes of Bourbon, repeats this Parisian scheme. In Normandy, the traditional three-story elevation is maintained, but the treatment of the second story as a tracery screen obscures its role as the front of a wall passage, as at Caudebec-en-Caux, Saint-Maclou at Rouen, or the new chevet of Mont-Saint-Michel. The extraordinary illusionism that redefines architectural space is not only international (Prague cathedral was begun by a French architect-builder, Matthew d'Arras), but resulted in a number of striking architectural fantasies: Notre-Dame at Cléry (patroned by Louis XI after 1467 and practically made into his private chapel); the church of Brou (1513–32), reflecting the intense love and devotion of Marguerite of Austria for her short-lived marriage to Philibert of Savoy; the pilgrimage church of Notre-Dame de l'Épine in Champagne (in the works in the 1440s); Saint-Pol-de-Léon (begun in 1429); and the rebuilding of Nantes cathedral (begun in 1434). The Flamboyant is the most neglected period of Gothic architecture because of the prejudices of past generations; but the neglect of these highly original and inventive architectural fantasies is unwarranted. The time has come to discard old conceptions and look anew at Late Gothic architecture.

# GOTHIC ART

**.** The origins and development of French Gothic art are closely tied to architecture. Gothic cathedrals and chapels provided the structural context for monumental sculpture and stained glass. Metalwork, ivories, paintings in manuscripts or on panels, and textiles were the furnishings that complemented and completed both religious and secular architecture. The close alliance between architecture and the visual arts appears in the similarity of design principles based on geometric proportions and in representations of architectural motifs and structures in metalwork, ivories, stained glass, and painting.

The beginnings of the Gothic style in stained glass and sculpture are connected with Early Gothic architecture. The chevet of Saint-Denis (ca. 1144) contained stained-glass windows that not only were integral to the more skeletal structural principles but were also a key el-ement in the aesthetics of light articulated by Abbot Suger. The west façade of Saint-Denis contained a sculptural program that represented a departure from Romanesque aesthetic. Two of the three portals had sculpted tympana (the third had a mosaic), and jamb statues were attached to the vertical supports. The placement of sculpture more logically reflected the vertical and horizontal divisions of the architecture, the figures had more spatial autonomy, and the iconographic program was more comprehensive.

Because of the destruction that Saint-Denis suffered during the Revolution, these new elements are best preserved on the west façade of Chartres cathedral (ca. 1150). The three-portal façade with jambs, tympana, and archivolts shows the new stylistic principles. In the central tympanum, the apocalyptic Christ displays a calm visage, and his body has a three-dimensional unity that softly falling drapery articulates. The jamb figures exhibit a tight columnar shape, but their forms are attached in front of the column

and not confined within its frame, as was the practice in Romanesque sculpture. Above the portals are three stained-glass windows, famed for the beautiful colors of their glass, especially the blue.

The incipient monumentality of these Early Gothic examples of sculpture and stained glass became apparent in all media of French Gothic art in the years just preceding and following 1200. This period in French Gothic art goes by several names, including the "Year 1200 style" and *muldenfaltenstil* (or "damp-fold style") for the clinging drapery folds with characteristic hairpin loops that cover the figures. Monumental sculpture offers many examples of this stylistic phenomenon. Dating from ca. 1170, the west portal of Senlis cathedral, with the death, assumption, and coronation of the Virgin, clearly shows the plastic, three-dimensional quality of figures revealed through the soft draperies and the tender emotional expression. The north-transept portals at Chartres demonstrate a well-

Dormition of the Virgin. Sculpture from the central portal of the west façade of Senlis cathedral. 13th century. *Reprinted by permission of Giraudon/Art Resource, New York.*

developed version of this style ca. 1200. As sculptural workshops moved to different locations, the style extended to many outlying areas, such as Alsace. The Death of the Virgin tympanum on the south portal of Strasbourg cathedral, carved ca. 1225, is one of the most beautiful monuments of Gothic art. The graceful bodies are revealed through clinging drapery, and the expression of contained grief is especially moving.

The Year 1200 style is evident in other media as well. The formal relationships of metalwork and sculpture make the style especially apparent in altarpieces and reliquaries

Adam, sculpture from interior of transept of the cathedral of Notre Dame, Paris. 14th century. *Photograph courtesy of Rebecca A.Baltzer.*

by the goldsmith Nicolas de Verdun. Two of his famous works, the Klosterneuburg Altar and the Shrine of the Three Kings at Cologne, display the supple bodies, plastic forms, and clinging drapery. In manuscript illumination, a famous example is the *Ingeborg Psalter,* possibly made in north France ca. 1190 for the second wife of King Philip Augustus, whom he repudiated immediately after their marriage. The monumental figures stand out almost in relief against burnished gold grounds. They have the elongated faces and draperies that fall in looping folds as they articulate and model the substantial bodies.

The first half of the 13th century was a creative period in French Gothic art. It was the time when the great French cathedrals—Chartres, Amiens, Reims, and others—were being built. Sculpture, stained glass, manuscripts, metalwork, and ivories were all components of the cathedral as a multimedia ensemble. Because of factors of time and economics, however, few of these artistic projects were completed as a unified stylistic entity. In addition, destruction and dispersal of these components through the centuries make total reconstruction of any of these monuments virtually impossible.

Chartres cathedral preserves the most unified example of sculpture and stained glass *in situ*. In both cases, stylistic changes occurred from the early to mid-13th century. While much of the sculpture on the north- and south-transept portals reflects the classicizing Year 1200 Style, some of the sculpture of the south porch, which is closer to 1240, displays a style in which the drapery folds are heavier and more angular. Likewise, the earlier lancet windows of the lower story in the nave are medallion windows with linear rendering of drapery and faces. Newer styles in stained-glass composition appear in the clerestory, chevet, and especially the transept, with rose windows and single figures in lancets.

This period witnessed considerable overlapping of styles. The basic features of the Year 1200 style continued well into the century, as seen in such manuscripts as the *Bible moralisée* of ca. 1230 and the *Psalter of Blanche of Castile* associated with the royal court. The layout with superimposed scenes in medallions and the vestiges of the soft drapery with looped folds reveal connections with the Year 1200 style. The drapery, however, is heavier and more broadly linear in its articulation. In sculpture, the Judgment portal on the west façade of Notre-Dame in Paris also shows the weighty angular drapery. The crisp, heavy drapery style appears with greater uniformity in the well-preserved sculpture of the three-portal west façade of Amiens cathedral, also dated ca. the 1230s.

These new stylistic directions converged with the advent of Rayonnant architecture ca. the 1230s, particularly in Paris. The Sainte-Chapelle, the French court chapel, dedicated in 1248, is an outstanding example of the merging of media. The chapel itself is on a smaller scale and gives the impression of being a reliquary turned outside in. In the upper story, the walls have dissolved into a linear skeleton, leaving the stained-glass panels as the surface elements. These tall, thin windows are composed of scenes in medallions. The figure style emphasizes fine lines, delicate features, and angular drapery. The wall surfaces are painted and gilded with decorative patterns. Sculptural figures of the Apostles are now placed on the interior. Their poses have a swaying contrapposto that is accentuated by the play of V-shaped drapery folds. The focal point of the chapel was a great metalwork reliquary to house the relics of the Passion that Louis IX had acquired. It no longer survives, but representations of it show that it repeated the stylistic features of the chapel's architecture and decoration.

Manuscript illumination connected with the Parisian court reflects similar characteristics. As in the St. Louis Psalter or the Sainte-Chapelle Evangeliaries, the figures are placed under architectural arcades that are painted versions of the Rayonnant style. The figures are animated and elegant, with delicate features and complex, usually linear, patterns of drapery folds.

By the beginning of the 14th century, new stylistic tendencies were becoming established in French Gothic art. These interconnected developments included continuing emphasis on smaller scale; use of softer colors; interest in narrative, especially in

depicting emotional interaction among figures; and depiction of a more concrete spatial setting for scenes.

In sculpture, the monumental encyclopedic programs of large cathedrals were replaced by smaller freestanding figures in chapels or on altars. The most popular subject became the Virgin and Child. Regardless of media—stone, ivory, or metal—the most familiar representation was the Virgin standing in an exaggerated S-curve pose balancing the small infant Christ child on her hip. The delicate, smiling facial features and complex play of drapery folds created a regal but human figure.

The Virgin and Child or other standing saints were frequent themes in stained glass as well, particularly in Normandy, where a number of examples survive. Painted architectural canopies created connections with the structural setting. *Grisaille* glass and more pastel colors infused buildings with a brighter light that helped to define the increasingly linear quality of architectural details.

The interest in artistic narrative increased. Narrative cycles became more extensive, and the scenes often became more densely crowded with figures. The range of subjects also expanded. Devotional practices associated with popular piety broadened the interest in depicting biblical narrative with an emphasis on Christ's life and passion, as well as saints' lives. The popularity of vernacular literature also promoted illustration of these secular themes, often in lengthy cycles for such works as Arthurian romances. All of these subjects were popular in ivory carvings on polyptychs as well as luxury items, such as boxes, combs, and mirrors.

In manuscript illumination, these elements found their fullest expression. Manuscripts of vernacular literature often contained vivid illustrations of the themes recounted in the text. Devotional manuscripts, especially books of hours, became popular. Jean Pucelle, whose œuvre extends from ca. 1320 to 1336, expanded the artistic range of manuscript illumination. In his small book of hours for Jeanne d'Évreux, queen of France, he used a *grisaille* painting technique to endow his figures with a three-dimensional presence characteristic of sculpture. His scenes, such as the Annunciation, began to situate the figures within believable spatial interiors. He also heightened the emotional level, as seen in the grieving spectators at the Crucifixion and Entombment.

By the middle of the 14th century, realism began to replace courtly elegance in the visual arts. This tendency is most apparent in two areas, portraiture and landscape. Charles V (r. 1364–80) gave particular encouragement to the development of portraiture. The king, with his clearly distinguishable features, especially a long, prominent nose, was depicted in many media. Numerous portraits of Charles V are found in illuminated manuscripts in depictions of the presentation of the book to the king. Although fewer panel paintings survive, this medium experienced a revival, and portrait panels, such as the one of John II the Good (r. 1350–64) in the Louvre, are representative of this artistic trend. Sculptural representations include a pair of figures of Charles V and his queen, Jeanne de Bourbon, now in the Louvre. Portraits also became fashionable in tomb sculpture. One of the most outstanding sepulchral ensembles is the portal sculpture, Moses Well, and tomb of Philip the Bold, duke of Burgundy, at the Chartreuse de Champmol at Dijon, dated ca. 1400. The sculptor, Claus Sluter, created figures whose lifelike veracity enhanced powerful subtlety of expression.

Realism of landscape setting was also developed in French painting from around the middle of the 14th century. By the early decades of the 15th century, manuscript illumination placed figures in landscape settings with considerable depth, a sense of aerial perspective, and attention to detail. The calendar miniatures by the Limbourg brothers in the *Très Riches* Heures, one of many luxurious manuscripts illuminated for John, duke of Berry, in the early 15th century, are the epitome of these features. The landscape scenes of seasonal activities not only utilize techniques for showing spatial recession but also are so realistic that they include accurate renderings of the duke's numerous castles.

The Limbourg brothers and Claus Sluter typify another aspect of Late Gothic art in France: the influence of styles and employment of artists from across Europe. The Limbourgs and Sluter came from one major artistic center, the Low Countries; southern Europe, especially Italy, exercised a particularly strong influence in southern France, where the Avignon papacy in the 14th century had encouraged the residence of Italian artists who decorated the papal palace. Paris remained important in late-medieval art, but other regions asserted equally strong artistic traditions. In Normandy, renewed architectural activity after the Hundred Years' War brought a resurgence of stained-glass projects in which realism of figure style and details was manifested in the muted colors of the glass.

Illuminated manuscripts, especially devotional books and works of vernacular literature, remained popular. The development of oil painting and the advent of printing, however, caused a decline in manuscript illumination in favor of panel painting, where realism of spatial perspective could be more fully developed. As economy and trade prospered, commercial centers, such as Lyon, created affluent middle-class patrons who could furnish their living quarters with tapestries as well as metalwork and ivory objects. The detailed realism of late French Gothic art continued into the early 16th century, when the classical influences of the Italian Renaissance brought the art of the Gothic era to an end.

# GOTTSCHALK

(ca. 803-ca. 867/69). Saxon theologian and poet, author of works on predestination that aroused controversy in 9th-century France. Gottschalk was presented by his father, Berno, as an oblate to the Benedictine monastery of Fulda. His boyhood was spent at Fulda, where Rabanus Maurus was abbot, and at Reichenau. In 829, Gottschalk petitioned a church synod at Mainz to be released from his monastic vows, claiming that his profession had not been voluntary and was not binding since there had been no Saxon witnesses present. The synod agreed that Gottschalk could return to secular life but did not agree to return the inheritance given by his father to Fulda. Rabanus Maurus won a reversal of that decision at a synod at Worms. Gottschalk spent the next ten years at Orbais and Corbie, where he dedicated himself to a study of the writings of Augustine. He was ordained a priest in the late 830s, apparently without the approval of the bishop of Soissons, in whose jurisdiction such ordination rested.

During a pilgrimage to Rome in the 840s, Gottschalk taught and preached about predestination in Italy and the Balkans and made visits to Count Eberhard of Friuli and Bishop Noting of Brescia. News of Gottschalk's teachings provoked Rabanus Maurus, who compelled him to return to Francia. In 848, Gottschalk was condemned twice, at synods at Mainz and Quierzy-sur-Oise. The second synod ordered him whipped and imprisoned at the monastery of Hautvillers. His writings were burned, and his ordination to the priesthood was revoked. Gottschalk continued to write, principally on predestination, until his death. A number of influential theologians, including Florus of Lyon, Prudentius of Troyes, and Ratramnus of Corbie wrote in support of Gottschalk's ideas on predestination, although these views were condemned by such important ecclesiastical figures as Amalarius of Metz, Hincmar of Reims, Johannes Scottus Eriugena, and of course Rabanus Maurus. On an official level, Gottschalk's teachings were repeatedly condemned: at the synod of Quierzy-sur-Oise in 853 and at numerous other synods and national councils in the 850s and 860s. An appeal to Rome on Gottschalk's behalf made by Guntbert of Hautvillers in 866 was cut short by the death of Pope Nicholas I.

The theological position that led to this drama is difficult to reconstruct because of the fragmentary nature of Gottschalk's extant writings. It seems to have been a logical derivation from the late writings of Augustine, stressing the point that God had, from eternity, not only foreseen but also predestined either the salvation and dam-nation of every human being. What was absolutely unacceptable to his contemporaries was the conclusion that Jesus therefore died only for the saved, and that the sacraments, even baptism, were not efficacious for all.

In spite of the condemnation of his contemporaries and the increasingly harsh treatment he received, Gott-schalk never renounced his position but continued to write, with increasing complexity, until his death. His later works include speculation on the eucharist, supporting the posi tion of Ratramnus of Corbie over that of Paschasius

Radbertus; two works on the Trinity, apparently aimed against Hincmar of Reims, and lyrical poems that were especially innovative in their use of rhyme.

# GOURNAY-EN-BRAY

. The former collegial church of Saint-Hildevert at Gournay-en-Bray (Seine-Maritime) has a six-bay nave flanked by aisles from the early 12th century (with 13th-c. rib vaults), an 11th-century north-transept arm with an eastern apsidal chapel, and a three-bay chevet ending in a flat wall dating from the 11th century. The chevet windows and south transept were rebuilt in the 13th century. Saint-Hildevert is a rare surviving example of a three-story elevation from the early 12th century in upper Normandy.

# GRAIL AND GRAIL ROMANCES

. The word *gradalis,* of disputed origin, meaning a kind of serving dish, is attested in medieval Latin as early as 718. A well-known definition from ca. 1200 reads: "A *gradalis,* or in the Latin of Gaul *gradale,* is a wide dish, somewhat deep, in which costly foods in their broth are usually set out for the rich with pieces arranged in order *[gradatim]*, one after the other, in different patterns; and in the vernacular it is called a *graalz* [grail]" (Hélinant de Froidmont, 1294). Association of the words for grail with *gradatim* 'by steps, in stages' and the notion of orderly arrangement may originate in a flight of etymological fancy typical of the Middle Ages; but the grail's use in serving food at a rich meal is consistent with the word's earliest occurrences in French, in the decasyllabic *Roman d'Alexandre* (1165–70) and in Chrétien de Troyes's *Perceval,* or the

*Conte du Graal* (ca. 1180), as is the implication that a grail was a rare and costly dish that would nevertheless be known in wealthy households in northern France.

In the *Conte du Graal,* Chrétien seems to play familiarity with grails in general against a particular Grail's extraordinary qualities. Four facts distinguish the special Grail that Perceval first sees at the Fisher King's castle. (1) It is valuable beyond measure, made of gold and studded with rare gems. (2) Along with candelabra and a cutting platter, it appears in a procession (not an unusual event at a banquet), but the procession is headed by a squire carrying an amazing Bleeding Lance. (3) It is not used to serve the diners in the main hall but follows the procession into a room beyond. Meat is served from the platter; the Grail passes by at each course but does not stop at the table. (4) It is accompanied by a bright light apparently emanating from within. Later, Perceval learns about the extraordinary food the Grail contains that makes it a "holy thing" (and that might explain the light): neither pike, lamprey, nor salmon, which one might expect to be served in an ordinary grail, but a consecrated Mass wafer, the only sustenance taken for years by a king, Perceval's grandfather, who lives in the inner room.

The Grail is simultaneously an ordinary and a mysterious object. Mystery arises, in fact, because it behaves or is treated in unexpected ways. One of its functions is to provoke inquiry about what makes it mysterious. Perceval ought to ask questions about where the Grail goes and whom it serves, not about its material nature. It is "holy" because of what it conveys, rather than for what it is; the purpose of the questions is thus to draw attention beyond itself toward what lies hidden from view.

Just as Chrétien's Grail is meant to be the object of questions, so he makes of it as well the object of a quest. The Grail Castle and its inhabitants disappear the morning after Perceval's failure; later, reminded of the consequences of his failure, he resolves to search until he finds it again and can ask the right questions in order to heal the wounded Fisher King and restore the Grail kingdom.

In the wake of Chrétien's unfinished *Conte du Graal,* a series of verse continuations arose, which extend Chrétien's story for over 40,000 lines before giving it a form of closure. The theme of the Grail extends through these romances and into several prose reworkings of the legend as well. A decade or so after Chrétien, Robert de Boron (fl. 1190–1210) is the first to turn this Grail (so named, according to Robert, because it brings pleasure *[<agreer])* into an object that is holy in its own right, the Holy Grail. His writing concretizes associations of the Grail with religious experience that Chrétien leaves poetically implicit. Robert does so by creating a "sacred history" for the Grail and reinforcing its place in Arthurian history by accounting for its presence in Britain. The prose Didot-*Perceval,* written under the influence of the *Second Continuation* as well as Chrétien, is a romance of ambition and failure, for which a Grail quest is an act of atonement; this prose work is the earliest romance to include a successful conclusion to the hero's quest.

The First Continuator, drawing on Chrétien's implication of a quest by Gawain for the Bleeding Lance, elevates the secondary hero to the status of Grail quester; in the endings provided by Manessier and Gerbert de Montreuil, however, the final triumph is reserved for Perceval alone.

Continuing the process of christianization, the *First* and *Second Continuations* identify the Bleeding Lance, ignored by Robert, with the spear of Longinus, thus linking both objects definitively to the Mass. However, the Grail's extraordinary character continues

to elevate its sacramental functions. Hardly a chalice destined for service at an "ordinary" Mass, it figures, in the Vulgate Cycle and subsequently, as Chalice *par excellence,* the central material object in a vision of Christ's own service at the altar as Victim and as Priest. Moreover, the goal of the Grail quest can no longer be a dream of heroic liberation but is a pious search for personal worth and purity. Perceval is replaced as the ideal Grail quester by the flawless Galahad; after Galahad witnesses the extraordinary ceremony, the Grail is removed to Heaven, its appropriate abode.

*Perlesvaus,* another early 13th-century prose romance, incorporates material from Robert de Boron and from Chrétien and the first two Continuators with matter from a wide range of other sources to produce an idiosyncratic and heightened account of the Grail as Mass chalice, the object of the Perceval figure's quest, in which the Crucifixion drama is replayed.

The Grail as a source of plenty is one characteristic that brings its literary manifestations into contact with mythic and folkloric themes and motifs. Among the most evocative and provocative of many possible examples are the *cornu* copia, magic sources of abundance, the vegetative cycle, cycles of destruction and restoration, impotence and fecundity, feminine sexuality. Such resonances enrich the medieval texts poetically, but they do not, in most cases, emerge as a major focus of interest. Nevertheless, they help explain the widespread appeal of the Grail and its continued renewal in literature throughout the Middle Ages and down to the present day.

# GRAMMAR

**.** *See* **LIBERAL ARTS**

# GRAND MASTER

. The position of Grand Master of France, established in 1451, had already existed for a century under other names, the earliest being "sovereign master of the king's household." This personage presided over a household of several hundred people, many of whom were important political figures or influential royal advisers. In the 14th and 15th centuries, when the composition of the royal council often reflected the political mood of the realm more than the king's personal wishes, the king often drew his most trusted advisers from the household. The master of the king's (and dauphin's) household became an important player on the political stage.

*John Bell Henneman, Jr.*

# *GRANDES CHRONIQUES DE FRANCE*

. The official history of the French realm, as kept in French at Saint-Denis from 1285 on, the *Grandes chroniques* presents the history of France as a series of kings' reigns. The first part of the *Grandes chroniques* was the translation, made by the monk Primat ca. 1274, of a Latin chronicle from the early 13th century. This was itself based upon the histories of Aimoin de Fleury and his continuators, Einhard, Pseudo-Turpin, the Astronomer, Suger, Rigord, Guillaume le Breton, and the *Gesta Dagoberti* and the royal Frankish annals, as well as the archival resources of Saint-Denis. By 1285, the *Grandes chroniques* were official.

Anonymous historians continued the text to ca. 1350, using translations of Guillaume de Nangis's lives of Louis IX and Philip III and the chronicles of Géraud de Frachet and Richard Lescot. The chronicle was then continued by outsiders, first by Pierre d'Orgemont, the chancellor of France (to 1384), then by Juvenal des Ursins, archbishop of Reims (to 1402), and finally by the Berry Herald (to 1422). Jean Chartier, a monk at Saint-Denis, wrote the last part of the chronicle (to 1461).

The *Grandes chroniques* are of supreme historical and literary interest, since after 1274 they are contemporary with the events they describe; many manuscripts have survived (the simultaneously-kept Latin chronicle exists only in fragments). They reflect the rich holdings of the library at Saint-Denis, as well as the growth of a powerful tradition of vernacular historical writing under royal auspices.

# GRANDS RHÉTORIQUEURS

. The term "Grands Rhétoriqueurs" is a misnomer, originally used to designate "minor" poets who wrote between Villon and Clément Marot. It has now been more narrowly and fruitfully applied to three closely linked generations of poets from the several duchies and royal territories whose verses appeared between 1470 and 1520, many of whom addressed their works to the others. As a group, they are an important and often neglected link between medieval and Renaissance culture, and their poems reveal important continuity in rhetorical education between the 15th and 16th centuries. They are distinct in their techniques and attitudes from many of their contemporaries.

The list of Grands Rhétoriqueurs has been most recently revised by Paul Zumthor to include the anonymous author of the *Abuzé en court,* Jean Meschinot, Henri Baude, Jean Molinet, Jean Robertet, the anonymous author of the *Lyon couronné,* André de la Vigne, Octavien de Saint-Gelays, Guillaume Crétin, Jean Lemaire de Belges, Jean Bouchet, Destrées, Pierre Gringore, and Jean Marot, of whom the most important are Meschinot, Molinet, Crétin, Lemaire, and Marot.

Artifice is the most obvious feature of these authors' works, and their major difficulty. Favorite techniques include alliteration, *annominatio, amplificatio,* anaphora, and puns. (For example, every one of the thirty-five lines in a ballade by Meschinot begins with plus.) Given the politically subordinate positions of most of these poets at court, they were forced to rely on frozen, ritualized, highly oratorical forms that highlight figures of speech and wordplay. Most works seem written for a ducal court and are openly moralizing and didactic. Favored genres include the doctrinal, *débat,* epistle in prose, and ballade and rondeau in verse. Their works frequently rely on praise, ornament, and hyperbole and are replete with allegorical figures borrowed from the *Roman de la Rose.* This situation was guaranteed, as Zumthor has shown, to alienate the writer from his subject, so that the playfulness of the works often masks an attempt to "repersonalize" the writer's relationship to writing. Yet beneath this brittle and gilded surface, one finds some stunningly "original" compositions that go far beyond courtly games.

In one ballade, Meschinot presents a dialogue between France and Louis XI, in which the following exchange takes place after France identifies herself as "La destruicte France./—Par qui?—Par vous." Tiring of France's reproaches, the king urges her three times to speak more beautifully: "Parle plus beau," to which he must, again three times, hear the same answer, "Je ne puis, bonnement." This skillful use of a refrain can hardly be construed as art for art's sake. The opening of Molinet's *Ressource du petit peuple* (1481–82), from his *Faictz et dictz,* is another striking example of highly rhetorical, moralizing social commentary. Molinet describes the appearance of the *fille de perdicion,*

listing her attributes in a classic example of *amplificatio.* Then are listed her companions, both allegorical and historical villains, followed by an enumeration of the afflictions of the people, "et tant exploitèrent de détestables et excécrables faix que l'hystoire au loing récitée donroit piteuses lermes aux yeulx des escoutans." These two typical examples deploy rhetoric to convey a political message rather than to shore up political hierarchies.

The use of allegory reveals similar subtlety. Traditionally, scholars have stressed the indebtedness of the Grands Rhétoriqueurs to the allegory of the *Roman de la Rose,* but this conclusion seems premature. In Meschinot's *Lunettes des princes,* a work typical of the Grands Rhétoriqueurs, Reason appears to the author in a dream. After he addresses Reason, she recollects her thoughts, which had been devastated by Despair, "Lors elle entra dans son endendement,/Qui vuyde estoit et pillé grandement/Par Désespoir." There, she finds only the bread of faith. Meschinot's somber Reason is a far cry from Jean de Meun's Reason, who had expatiated on the ambiguity of language. This difference, moreover, must be stressed in light of the Grands Rhétoriqueurs' frequent exploitation of linguistic ambiguity itself.

A prime example of how ambiguity was manipulated for moralizing ends is found in Octavien de Saint-Gelays's *Epistre en équivoques, au roy Charles* (1493). Homophonic rhymes bring out a political message as unambiguous as the sounds themselves are the opposite:

> Pour contempler vostre immense justice,
> Faites, pour Dieu, que le fleuve juste ysse
> Çà bas sur nous, vos trèshumbles subjectz!
> Tenuz nous ont, ainsi qu'oiseaulx sus getz,
> Division, simes, discorde, envye:
> Remettez nous, noble seigneur, en vye!

This interest in linguistic play can be traced back to the fabliaux, and Molinet, for example, composed an entire ballade whose rhymes are exclusively based on *-vis/t, -cu(l),* and—*c/çon*. The *Art et science de rhétorique vulgaire* (1524–25) provides examples of double and triple verbal ambiguities.

Perhaps due to their penchant for moralizing, the Grands Rhétoriqueurs did not celebrate chivalric ritual and convention with the wholehearted endorsement of Olivier de La Marche, their contemporary at the court of Burgundy. Generally silent on explicitly political topics, they tend to side implicitly with the Burgundian position in the struggle between Louis XI and Charles the Bold. The condemnation of the ravages of war, as found in the *Ressource du petitpeuple,* for example, makes its point allusively. By comparison, when Jean Lemaire de Belges celebrates the advantages of French over Italian, his "patriotism" remains largely literary and is not transferred to the French royal house that was invading northern Italy at the time.

Among lyrical genres, the Grands Rhétoriqueurs particularly cultivated funeral laments, whose models were the elegy and *planctus*. They do not stress the same subjects as the contemporary and widely popular *danse macabre*. Crétin's *Translation du chant de misere,* for example, points out that rhetoric has never saved its practictioners from death:

Les belles fleurs de Tulle et rhétorique
N'ont point rendu exemptz d'exil mortel
Ceulx qu'ont instruitz.

This reserve regarding death, so different from contemporary popular accounts, shows that the Grands Rhétor-iqueurs, with their rhetorical self-consciousness, could steer between thematic commonplaces and popular stereotypes and still achieve an "original" effect.

The *Arts de seconde rhétorique,* composed in the wake of the poetic works of the Grands Rhétoriqueurs, formalize many of their practices and provide valuable evidence for the intersection of literary theory and practice.

# GRANDSON

. At Grandson, on Lake Neuchâtel in the Swiss canton of Vaud, Charles the Bold, duke of Burgundy, was attacked on March 3, 1476, by 20,000 troops from a score of mostly Swiss towns. Hoping to lure the advancing pikemen into a trap, Charles withdrew his forces in the center. His infantry on the flanks, who should have enveloped the Swiss, misread the maneuver and broke ranks, then fled in panic when they saw another Swiss column approaching. Its losses were relatively light, but in the rout the Burgundian army abandoned considerable booty to the Swiss.

*John Bell Henneman, Jr.*

# GRANGE

. Literally, a barn or farmstead (sometimes fortified), the term "grange" in the 12th century became attached to the large expanses of land forming the agricultural estates of new religious groups, especially the Cistercians, Premonstratensians, and military orders. Such a grange is a large agrarian unit of varying size cultivated under the direct management of its monastic owners, encompassing up to three or more parishes, on which the most up-to-date and rationalized agriculture was practiced in the 12th and 13th centuries. Under optimal conditions, all previous peasant cultivators on grange lands were replaced by a staff of monastic laborers, primarily lay brothers *(conversi)* and hired day workers. The claims of such monks to practice manual labor and found their houses in uninhabited places led most historians until recently to assert that such huge farms resulted from monastic clearance and reclamation; recent studies, however, show that granges were almost always created by repurchase and compacting of smaller holdings previously settled and cultivated by peasants. In many regions, the monastic granges of the Middle Ages became model farms, while their barns were edifices of monumental size.

# GRANSON, OTON DE

(ca. 1345–1397). Born of a noble family in Savoy and killed in a judicial duel, Granson served as a knight under the counts of Savoy and two kings of England. Froissart praised Granson as *banerés et riche homme durement,* Deschamps was his friend, and after his death Christine de Pizan was his ardent encomiast. She admired both Granson's prowess as knight and his service to womanhood, manifested especially in his poetry. Chaucer praised him as "flour of hem that make in Fraunce." During Granson's long service to Edward III and Richard II, he and Chaucer evidently became close friends; each copies

verse by the other. But Guillaume de Machaut was Granson's great model for forms, imagery, and expression. The "Isabelle" he refers to in several poems may be Isabeau of Bavaria, Charles VI's queen. Four manuscript collections have a substantial number of Granson's poems, which have been gathered into an edition that includes ninety ballades, nineteen rondeaux, a virelai, six *complaintes,* a lengthy *pastourelle,* three *lais,* and two *dits amoureux.* The longer *dit,* the *Livre de messire Ode* (2,495 lines), a combination of narrative and inserted lyrics in a dream vision, represents an original development. In general, though, Granson is a skilled amateur whose work is derivative and modest in scope.

# GRATIAN

(fl. early 12th c.). The father of the science of canon law remains a shadowy figure. Most of the scanty evidence suggests that he was a monk, possibly affiliated with the monastery of SS.Felix and Nabor in Bologna. The role of Bologna as the nursery of canonistic science lends this tradition credibility. Gratian participated in the larger scholastic culture that produced Peter Abélard's *Sic et non* and Peter Lombard's *Sententiae*. His *Concord of Discordant Canons,* or *Decretum,* had the same purpose as those theological works, the reconciliation of a diverse and often contradictory heritage of thought through the application of dialectic. This private collection combined conciliar canons, papal decretals (many of them spurious), and patristic texts with Gratian's own comments, or *dicta*. Texts marked for exclusion from lectures, called *palae,* or "chaff," included the so-called Donation of Constantine. In its final form, the *Decretum* is divided into a treatise on law, the *Distinctiones,* a series of hypothetical cases; the *Causae,* including a distinct tract on penance; and a sacramental tract, *De consecratione*. The compilation became the first textbook of canon law at Bologna and Paris. The teachers of canon law brought to the interpretation of this work of disciplinary theology the principles and procedures of Roman law, prbducing a distinctive legal science. Connections between Gratian and the Roman curia are difficult to demonstrate, but students of canon law were presented with a papalist viewpoint on key questions of ecclesiastical structure. Dante would place Gratian in Heaven in the *Paradiso,* as a counterweight to later canonists, some of whom emphasized papal temporal power.

# GREBAN, ARNOUL

(d. before 1473). Author of a well-known *Mystère de la Passion,* Greban was born in Le Mans and studied theology at the University of Paris. From 1450 to 1455, he lived in the cloister of the cathedral of Notre-Dame in Paris, where he was organist and master of the choirboys. It was here that he wrote his Passion play, probably in 1450–52. This work is set in the framework of the *Procès de Paradis,* first introduced by Eustache Marcadé, and its 35,000 lines are divided into four playing days. Despite its variety of styles (sermons, debates, lamentations) and moods (solemn in Heaven, comic in Hell, pathetic in torture scenes), the play exhibits a strong unity. Greban employs many poetic forms and punctuates the action throughout with music. The life of Jesus is presented against the background of a cosmic struggle between the forces of good and evil. This conflict is introduced in the first scenes, where Lucifer rebels against God then out of envy tempts Adam and Eve to fall from grace. Greban's *Passion* was played three times in Paris before 1473. It served as the basis for Jean Michel's Passion play and was adapted for production in a number of other cities.

# GREBAN, SIMON

(d. 1473). Presumed author, perhaps in collaboration with his brother Arnoul, of the *Mystère des Actes des Apôtres,* a dramatization in 62,000 lines of the biblical book of Acts. By a complex interweaving of scenes, Greban presents parallel lives of the Apostles dispersed in many countries. He adds many legendary events and spectacular scenes of miracles, martyrdoms, and shipwrecks. The play had complete performances at Bourges in 1536 and Paris in 1541.

# GRECO-BYZANTINE ROMANCE

. Eloquent witnesses to the renaissance of the 12th century and its desire to explore and integrate the riches of the Orient, along with the treasures of its classical past and the *matière de Bretagne,* the Greco-Byzantine romances explore a variety of settings around the Mediterranean basin. While these romances may differ widely in tone and orientation, they each demonstrate the West's fascination with an exotic and fabulous world, opened up by travel reports and crusades, renewed commercial interests, and desire for political expansion. Among the most important are the anonymous *Floire et Blancheflor, Guillaume de Palerne,* and *Partonopeu de Blois,* Hue de Rotelande's *Ipomedon* and *Protheselaus,* Aimon de Varennes's *Florimont,* Chrétien de Troyes's *Cligés,* and Gautier d'Arras's *Eracle*.

# GREGORIAN CHANT

. The monophonic chant of the medieval Latin liturgy, sometimes known as "plainchant." Although the term is often used for chant compositions from the later Middle Ages, "Gregorian chant" applies specifically to the music for the Mass and Divine Office according to the Romano-Frankish liturgy as it was codified ca. 800. It excludes other regional chant repertoires (Gallican, Milanese, Visigothic, Beneventan, Aquileian, Ravennate), all of which, with the exception of Milanese, or "Ambrosian," chant, finally yielded to Gregorian chant, a repertoire promoted first by the Carolingians and later spread throughout Europe. The epithet "Gregorian" derives from Pope Gregory I (r. 590–604), who was thought to have played a decisive role in the shaping of western chant and liturgy. A connection between Gregory and the music named after him has never been demonstrated, however. The expression "Gregorian chants" *(gregoriana carmina)* does not antedate the mid-9th century, even though a verse prologue found in earlier books of Mass chants attributes the contents to one "Gregorius presul." It has been argued that this prologue was intended to celebrate the work of Gregory II (r. 715–31) and that the text became associated with his more famous eponymous predecessor.

Although the origins of the medieval Latin chant repertoires are clouded in an obscurity that will probably never be penetrated, a process of growth and transformation can be assumed. The "Proper" chants of the Roman Mass (Introit, Gradual, Tract,

Alleluia, Offertory, Communion), which vary according to the season or feast, were undoubtedly introduced singly over a period of time. What is presumably the earliest Mass chant, a responsorial psalm sung between the Scripture readings—predecessor of the musically more elaborate Gradual—existed by the end of the 4th century. Though the custom of singing during the reception of communion dates back to about the same era, a variable cycle of communion chants did not yet exist. The choice always fell on Psalm 34, chosen because of the line "taste and see that the Lord is good." The Offertory chant was probably the last of the Proper chants to be introduced.

A simple explanation of the origin of Gregorian chant is complicated by the existence of a body of music known to modern scholars as "Old Roman" chant. Both share the same texts and the musical traditions are obviously related, but the musical styles rest on different aesthetic foundations. As far as we know, Old Roman chant was sung only in Rome, its oldest witness being a *graduale* copied there in 1071. Scholars have not arrived at a consensus about where and when the Gregorian repertoire received the shape found in the earliest notated manuscripts. Some argue that what we know as Gregorian chant preserves essentially intact the musical repertoire brought from Rome in the late 8th century as part of the Carolingian liturgical reforms and scrupulously guarded by Frankish musicians. Others maintain that the Franks reshaped and adapted the Roman music to their own native idiom. The latter process is difficult to assess in detail, because the earlier Gallican chant, which would presumably have reflected that idiom, disappeared with virtually no trace. Manuscripts from France and elsewhere attest to the uniformity and stability of the Gregorian musical tradition throughout the Middle Ages. Some of the earliest and best manuscript sources of chant originated in French territory: four of the *Sextuplex* manuscripts and several of the earliest notated *gradualia* from the 10th century (Laon, Bibl. mun. 239; Angers, Bibl. de la Ville 91; and Chartres 47). The first and third of these have been published in facsimile in the series *Paléographie musicale*.

The repertoire may be divided into two large categories: chants for the Mass and those for the Office. The Book of Psalms provides most of the texts. The psalm text can be sung in one of three musical forms: (1) direct, (2) responsorial, or (3) antiphonal. Each has more than one possible realization, but in general it can be stated that (1) involves the continuous recitation of the psalm text by a soloist or chorus, (2) calls for a choral response to the solo singing of a psalm, and (3) implies an alternation between the two choral groups, possibly in conjunction with a soloist. These performance practices were also used with nonpsalmic texts, like hymns, chants of the Ordinary of the Mass, and responsories of the Office.

Eventually, the Proper chants of the Mass consisted of a repertoire of about 600 chants for all feasts of the Lord and Sundays of the year (temporal cycle) and for the commemoration of the saints (sanctoral cycle). Some feasts of the saints had unique chants, while others were supplied from the "common"—chants with texts chosen because of their appropriateness to the category of saint (martyr, virgin, confessor, etc.) being honored. Later in the Middle Ages, this core repertoire was expanded by additions of various types: new compositions in the traditional genres for new feasts; tropes, new musical material—usually with text—prefaced to and inserted between phrases of the preexistent Gregorian melody; prosae or prosulae, new texts fitted to already existing melismas; and independent compositions like the sequence, the Aquitanian versus, and

liturgical drama. Although the sequence was at first attached to the Alleluia of the Mass, it later became a virtually independent genre with an accentual, rhyming text set to successively repeated musical phrases (aa, bb, cc, etc.).

The Ordinary of the Mass consists of items sung at the eucharist on a daily, or almost daily, basis. The texts of the Kyrie, Gloria, Credo, Sanctus, and Agnus Dei do not vary according to the seasons of the church year or sanctoral celebrations. Whereas the Proper chants are unique—there is, for example, but a single Gregorian melody for "Resurrexi," the Introit of Easter day—settings of Ordinary chants continued to be composed well into the 12th century and beyond. In fact, most of them seem to belong to later compositional layers. Though some melodies for the Ordinary chants are represented in large numbers of sources, others enjoyed only a restricted geographical distribution.

The three most important musical elements of the Divine Office are antiphons used in conjunction with the weekly chanting of the Psalter, responsories sung after readings from the Bible or the fathers of the church, and hymns. Although the antiphon repertoire is large (1,600 or more items), the number of model melodies to which the texts are set is much smaller, amounting to less than three dozen basic types.

Because of the large span of time during which Gregorian chant (in its broadest sense) was composed, stylistic generalities can claim only limited validity. One of the most readily perceived distinctions rests on the relationship between the text and the degree of melodic embellishment it receives. In the simplest style, syllabic chant, each syllable of text corresponds more or less to a single pitch. In neumatic style, most syllables receive melodic figures of two to six pitches. Melismatic style is the most elaborate of all: melodic decoration takes precedence over the declamation of the text. The degree of melodic elaboration depends to a certain extent on the genre: antiphons for ordinary weekdays are syllabic, while Graduals, Alleluias, and Offertory verses tend to melismatic style. The relationship between text and music need not remain exactly the same from phrase to phrase. Although prevailingly syllabic chants, which tend to be relatively short, do not contain melismatic passages, neumatic and melismatic chants frequently have recourse to syllabic style.

The chant was transmitted orally for many centuries. The earliest surviving books with the chant texts date from the 9th century. These have been collected and published by Dom Jean Hesbert under the title *Antiphonale Missarum Sextuplex.* They lack musical notation and indeed were never intended to contain it. The existence of such unnotated *gradualia,* as books of Mass chants came to be called, testifies to continued oral transmission of the melodies.

One of the characteristics of the Gregorian repertoire is the fidelity of its transmission across the regional types of musical notation in which it was written down. These notational signs, known as "neumes," were created specifically for the purpose of ensuring accurate dissemination of the repertoire. All of the notational systems share the same basic principles despite their diverse graphic configurations. The earliest specimens of notation begin to appear sporadically from about the middle of the 9th century. Most of the regional notations are cursive: two or more pitches are joined to form a single graphic gesture. Some (Lorraine, Breton, Aquitanian) portray the melodic movement as a series of discrete dots. All of the early notations are adiastematic, that is, they do not transmit precise pitch levels but only short-range melodic direction involving two to five discrete pitches. Large and small intervals appear as identical shapes on the page. The

podatus (♩) signifying a rising motion, or the *clivis* (♪) representing a descending motion, could indicate an interval as small as a minor second or as large as a fourth or fifth. The notation did not, moreover, permit the relationship between the last pitch of one neume and the first note of the succeeding neume to be determined.

Some notations incorporated nuances indicating longer rhythmic values and specially shaped "liquescent" neumes, reserved for combinations of consonants *(gn, lm)* or vowels *(au, ui)* that require special care in pronunciation. In addition, expressive nuances could be signified either by letters above the notation or by special neume symbols *(quilisma, oriscus)*. Their exact manner of interpretation is subject to speculation, particularly since most of these special signs disappeared in many regions at an early date.

Certain regional notations began to dispose the notes on the page in a manner that reflected the relative size of the intervals separating them. The next step in the development of this "diastematic" notation saw the line that served as the point of reference become etched more deeply into the parchment. A pitch value, usually F or C, was assigned to it and indicated at the beginning of each line of music.

The better to distinguish the two lines, the lower (F) was drawn in red and the upper (C) in yellow or green. Aquitanian manuscripts employ cleffing other than C or F, and sometimes only a B-flat sign under a line is employed. One of the French regional notations, Norman, developed into "square" notation. Placed on a four-line staff drawn in either black or red, it became the standard chant notation of the Roman Catholic church and has continued in use for printed chant books up to the present time. The same notation was adapted for the earliest polyphonic music.

During this period originated the distinction between the new rhythmic polyphony, *cantus mensuratus,* and plainchant *(cantus planus),* sung in relatively equal note values. Chant was sometimes sung in proportional duration values and notated with symbols derived from the mensural polyphonic notation of the 13th century.

One of the important contributions of Frankish monastic musicians was the development of a music theory that sought to classify the new music that had replaced Gallican chant. This process took some time, and it was not until the middle of the 9th century that the first chant treatise, the *Musica disciplina* of Aurelian of Réôme, was written. Frankish music theory combined Byzantine concepts (a system of eight modes) and ancient Greek theory in an original synthesis. The result could hardly claim to be more than an approximate explanation of a repertoire created without reference to an explicit theoretical foundation.

At the beginning of the 11th century, there developed the concept of the hexachord, an ascending pitch set from C to A that could be duplicated on G and F (in the latter case with B-flat). By means of "mutation," one could move from one hexachord to another and remain within a familiar configuration of steps and half-steps. Guido d'Arezzo (ca. 990–1050) assigned syllables (ut, re, mi, fa, sol, la) to each of the steps of the hexachord as an aid to learning new or unknown chants.

It had long been realized that although chants customarily cadenced on one of four finals (D, E, F, G) some chants moved almost exclusively in the tonal space above the final, and others descended frequently beneath it and used fewer notes above the final. The tonal space was delimited by eight modal scales, four of which were "authentic," corresponding to the first category, and the remaining four were "plagal," corresponding to the second. In the fully elaborated system, each scale was composed of a species of

fifth and a species of fourth. In the case of the authentic scales, both were found above the final; the plagal scales had a fourth below and fifth above the final.

Though recourse to the manuscripts is essential for historical chant studies, the modern editions published by the monks of Solesmes provide a good introduction to the repertoire. The *Liber usualis* is a diverse collection of chants required for the Mass and for parts of the Office. It includes the complete Office of Matins for certain days as well as other miscellaneous items. The *Graduale Romanum* offers Mass chants for all days of the liturgical year including the weekdays of Lent, which are not included in the *Liber usualis.* Particularly useful for study are the *Graduale Triplex* and the *Offertoriale Triplex,* which contain the chants not only in square notation but also the adiastematic neumes of the manuscripts Laon, Bibl. mun. 239 (10th c.) and Einsiedln, Stiftsbibliothek 121 (11th c.) or Saint-Gall, Stiftsbibliothek 358 (9th c.), written above and below the staff, respectively.

# GREGORIAN REFORM

. The reform of the Catholic church named after Pope Gregory VII, one of its most ardent promoters, is customarily defined in terms of the legal and administrative developments that accompanied the rise of the papacy between the papal election decree of 1059 and the First Lateran Council in 1123: the decree proclaimed that the pope was to be elected by the cardinal bishops without lay interference, and the council confirmed the compromise over the lay investiture of bishops hammered out the year before at the Diet of Worms.

Although the most accessible data of the reform comprise a myriad of canonical collections, papal correspondence, polemical tracts, and conciliar documents, it would be a distortion to conclude that the development of the papal monarchy was an end in itself, rather than a response to the spiritual ferment throughout European society that encouraged and even demanded a church that promoted the spirituality described in the

Book of Acts, the *vita apostolica,* both for the clergy and the laity. The spirit of the Gregorian Reform in fact arose in the decades preceding 1059 as Cluniac abbots like Odilo and Hugues de Cluny extended monastic reform, and bishops like Bruno of Toul (later Pope Leo IX) undertook the reform of the secular clergy. With Gregory VII, the spirit of reform came explicitly to include the responsibility for justice throughout Christian society, particularly the subservience of secular matters and temporal rulers to spiritual matters and ecclesiastical overlords. The implications of these convictions led by the end of the century to the calling of western Christendom to crusade by Urban II and to the expectation that diocesan clergy would live the common life (regular canons) in keeping with the monastic *vita apostolica;* in the 12th century, at the Diet of Worms and First Lateran Council, they led to a workable solution to the role of the laity in episcopal elections and to the rise of cathedral schools and subsequently universities for the training of the clergy (Bologna, Paris, Oxford); and in the 13th century, they led to Innocent III bestowing kingdoms as fiefs (England, Hungary, Portugal, Aragon), to the provision of adequate support for local parish clergy and pastoral care (Fourth Lateran Council, 1215), and to the new mendicant orders, the Dominicans and Franciscans, obedient directly to the Holy See, that gave shape and expression to a *vita apostolica* suited to the new urban scene.

The importance of the monastic reform at Cluny in the first half of the 11th century lay particularly in the manner by which a network of monasteries, all looking to Cluny as their head, had come to enjoy the *libertas ecclesiae,* an independence from local lay and even episcopal interference. Over the years, this status was reinforced by papal privileges and protections, forging a natural allegiance between the papacy and the Cluniac movement.

At the same time, there was a serious effort in many places at the local level to introduce something of the monastic ideal into the life of the secular clergy: the buying of church offices, simony, and clerical unchastity (nicolaitism), were effectively condemned in places like Toul under Bruno and Milan under the impact of the Patarenes. But these reforms could only be temporary without a fundamental change in the relationship of the church to the institutions of feudalism, in which ecclesiastical appointments at all levels were considered the prerogatives of emperors, kings, and feudal lords and often distributed to relatives or vassals without due consideration for the worthiness of the candidates. Moreover, the goods and properties of churches and monasteries often became the objects of feudal transactions, alienated from their primary purpose of providing stability and sustenance for monks and clergy. This state of affairs, symbolized by lay investiture of clerical office, became the focus of the contest between Pope Gregory VII and Emperor Henry IV.

The impulse for reform gave rise to major developments in the institutions of the papacy. In essence, the papacy had to circumvent the vested interests of the higher clergy and find ways to support and promote reforming impulses from below, requiring strong and centralized institutions that could respond quickly and decisively. Under Leo IX, the college of cardinals became an important extension of papal bureaucracy, as many were deputized to serve as legates throughout Europe from time to time to promote the papal cause. With Nicholas II, the election of the pope was to be made by the cardinal bishops, excluding the direct influence of either the Tuscan nobility or the German emperor. Under Gregory VII, legates became permanent and certain archbishops were appointed as

primates for each of the regions of Europe to serve as courts of appeals for the legates. Newly appointed arch-bishops were required to journey to Rome to receive the *pallium,* the symbol of their office. The rights and privileges accorded to Cluniac foundations in France were extended to the monastery of Hirsau and its daughter foundations in Germany. Urban II, a monk of Cluny, extended the liberties and exemptions of Cluny to many more Cluniac establishments; and Paschal II extended papal protection to Cîteaux in 1100.

The ideals and ambitions of the reformers spurred the development of canon law. In the *Collection in Seventy-four Titles,* compiled under Leo IX, the precedents set down in earlier collections were reorganized to emphasize the primacy of Rome and the reform program. With the passing of time, subsequent collections became the vehicles for the promulgation of new law, such as the collections of Anselm of Lucca (1083) and Deusdedit (1086), which drew on materials beyond the traditional canons. Gregory VII's own *Dictatus papae* (1075) seems to stand at a crucial point in this regard: a brief listing of twenty-seven propositions concerning the authority of the pope, they read like chapter headings for the later collections: only the pope has the right to be called universal; only he can depose or absolve bishops; only he can create new laws; the Roman church has never erred and will never err; the pope has the authority to depose emperors; the pope alone may use the imperial insignia; the pope ought to be judged by no one; the pope can absolve subjects from obedience to wicked rulers. Although much of this legal program existed only in embryo at the end of the 11th century, it expanded dramatically in the 12th and 13th centuries with the *Decretum* of Gratian (1140) and the later compilations of the Decretists and Decretalists.

The implications of the Gregorian vision of a just Christian society incorporated other projects of the late 11th and 12th centuries: the reconquest of Spain, rapproachment with Constantinople and the crusade in the East, the Peace and Truce of God in European territories, the transformation of chivalry according to religious ideals (the Templars and Hospitalers), and the rehabilitation of marriage as a protection for women and families.

Although the reform was not always and everywhere to achieve its goals, it went a long way to establish the *libertas ecclesiae* against the manipulations of the feudal establishment, and it gave a concrete, institutional expression to the very idea of Christendom.

# GREGORY VII

(ca. 1020–1085). Pope. Born of a humble Tuscan family, Hildebrand, the future Gregory VII, came to Rome at an early age and received his education at the monastery of St. Mary's on the Aventine, where it appears he made his monastic profession. He served as chaplain to the reform-minded Pope Gregory VI and accompanied Gregory into exile in Germany when he agreed to step down to end the gridlock of three claimants to the papal throne. After Gregory VI's death in 1047, Hildebrand was at the monastery of Cluny. In 1049, he met bishop Bruno of Toul, now Pope Leo IX, and returned to Rome in his company. Hildebrand served Leo IX and four succeeding reforming popes in various capacities. In 1073, upon the death of Alexander II, Hildebrand was enthroned pope by popular acclamation and took the name Gregory VII.

Like his predecessors, Gregory first wished to reform the clergy in line with the monastic ideal, eliminating the buying of ecclesiastical offices (simony) and enforcing of clerical celibacy. But Gregory broadened the scope of reform to encompass *iustitia,* that is, justice and the proper governance of all of Christian society. For Gregory, this meant that just as spiritual realities took precedence over temporal realities, so, too, spiritual authority preceded temporal authority; not only the clergy but princes, kings, and emperors were to be obedient to the pope. Gregory sketched out the implications of this conviction in the *Dictatus papae* of 1075.

In France, Gregory largely had his way with the higher clergy through his legate, Hugues de Die, who vigorously pursued the reform between 1076 and 1080. In England, William the Conqueror respected the papal decrees regarding clerical celibacy, although he retained the practice of lay investiture without incurring excommunication. But in Germany, where ecclesiastical office and feudal obliga tion were closely intertwined in the administration of the realm, and indeed, where Emperor Henry III had not only appointed archbishops but even popes, almost immediately a conflict arose between Gregory and Henry III's son and successor, Henry IV. Henry regularly intervened in ecclesiastical affairs; he considered the upper clergy his vassals and invested them with the insignia of their offices. In the wake of papal criticism of his practices, Henry declared Gregory deposed; Gregory proclaimed Henry excommunicated and suspended German bishops. When Henry sought and received absolution from Gregory in the snows of Canossa in January 1077, Gregory's German allies elected Rudolf of Swabia as antiking without Gregory's consent and initiated a civil war in Germany that lasted until

1080, when Gregory once again excommunicated Henry and recognized Rudolf. Henry, in 1082, appointed an antipope. In 1084, Robert Guiscard and the Normans, on whom Gregory had called to relieve Henry's siege of Rome, looted and set fire to a significant quarter of the city and were forced to leave, taking Gregory with them. Gregory died a few months later at Salerno, exhausted.

However much of a failure Gregory's pontificate may have appeared at the time, Gregory nonetheless established with his new papal administration a mechanism for implementing his ideals; and his archenemy, the German emperor, was never to be so powerful again. In the century and a quarter that followed Gregory's death, the pope would muster all of Christendom to go on crusade for justice in the world; several of the kings of Europe would receive their kingdoms in fief from the pope; and the renewal of the church, both laity and clergy, would be encouraged and broadly supported by the central vision of the papacy.

# GREGORY IX

(d. 1241). Pope. When Innocent III died in 1216, his successor, Honorius III (r. 1216–27), maintained a conciliatory policy toward the Hohenstaufen. This changed with the election in 1227 of Innocent's nephew, Cardinal Ugolino, who reigned as Gregory IX. Gregory embroiled the papacy in a long-term confrontation with Emperor Frederick II, his uncle's ward. To prevent Frederick from dominating Rome through his double heritage, imperial and Sicilian, the pope twice found reasons to excommunicate him. Gregory, at the same time, adopted his foe's harsh measures against heretics. This papal policy affected southern France, where in the aftermath of the Albigensian Crusade the Inquisition was entrusted to the new orders of friars, the Dominicans and the Franciscans, not the bishops, with the backing of the Capetian monarchy. (The French crown was the chief lay beneficiary of the repression of the Cathars.) As a cardinal, Gregory had been a friend of St. Francis; but he furthered the clericalization of the Friars Minor by ruling that the *Testament* of their founder, which forbade petitioning the pope to relax the *Rule,* was not legally binding on them. The key legal texts establishing the Inquisition became part

of the canon law in the *Liber extra,* or *Gregorian Decretals,* which were edited by the Dominican Raymond of Peñafort from earlier collections and new decrees. This volume was promulgated by Gregory to the universities in 1234. The bull *Parens scientiarum* (1231) made the papacy the arbiter of institutional and doctrinal disputes concerning the University of Paris.

# GREGORY OF TOURS

(ca. 538–594). Born Georgius Florentius, the man known as Gregory pursued many careers during his fifty-five years of life: monk, author, builder, administrator, ambassador, propagandist, politician, and bishop of Tours. He was descended from rich and influential families on both his father's and his mother's side. Senators and bishops, especially the bishops of Langres and Tours, hung thick on the branches of his family tree. Destined for the episcopacy, he spent his youth in the care of uncles and cousins, all of whom were important churchmen. In 573, he was elected bishop of Tours, one of the most powerful of all the Frankish sees, holding its episcopal throne until his death in 594.

Gregory vigorously performed his ecclesiastical duties and played an active role in both local and national politics, as he himself tells us. His position often demanded that he stand up for Tours against the Frankish kings, especially Chilperic I (r. 561–84) of Neustria. He seems to have found ample time to write. At one point, he grouped his massive literary output into five major works: ten books of *Histories,* seven books of *Miracles* (which include four books on the miracles of St. Martin), one on the *Life of the Fathers,* a *Commentary on the Psalms,* and a tract *On the Office of the Church.*

Most famous for his *Histories,* often improperly called *History of the Franks* (though now scholars are gaining a great deal from his other works as well), Gregory is certainly the first writer in medieval France worthy to be called a historian. The *Histories* were not conceived specifically as a "History of the Franks," but within 200 years of their completion this became their most common name. They are by far our most valuable source for Merovingian Gaul; the Frankish Dark Ages would be even darker without them.

Drawing on the Bible, Eusebius, Jerome, Orosius, Sulpicius Severus, Renatus Profuturus Frigeridus, Sulpicius Alexander, and others, Gregory's first four books cover world history from Adam to his own age. Book 5 begins with an elaborate preface and

completes the work with accounts of Gregory's own times. The overall result is, especially in the later books, frequently confusing. While perceptive and analytical, Gregory often skips from episode to episode without obvious order or structure. Scholars have tried to present Gregory as a beguiling storyteller, or as an advocate for the earlier and sterner rule the Franks had enjoyed under Clovis, or as a provider of a cure for the disorder of his times, or as the sincere author of an artless reflection of the chaos of Merovingian society in general. A more charitable assessment sees Gregory as intentionally presenting history as chaotic: the very nature of secular history, that is, the story of fallen humanity, is chaos; true order and structure are divine.

Gregory's other works treat the divine. Here, critics have viewed him as a credulous hagiographer, devoid of the analytical intellect obvious in the *Histories*. For Gregory, however, there could be nothing more concrete than God's power evidenced in a miracle. Particularly revealing of Gregory, and of the 6th-century Gallic episcopacy generally, is his attitude toward St. Martin. Martin had been bishop of Tours two centuries before, and that city guarded his relics. Gregory saw himself as Martin's successor; Martin was his present guide. Gregory protected Martin's interests and Martin protected Gregory's city. His relationship to the saint is a poignant reminder that, though remembered largely for having been a historian, Gregory was first and foremost a Christian bishop.

# GRENOBLE

. First recorded in 43 B.C. as Cularo, and renamed Gratianopolis, whence modern-day Grenoble (Isère), the city is situated on the confluence of the Drac and the Isère and is surrounded by mountains on each side but the western. Though lacking navigable waterways, Grenoble, with its situation on three Roman trade routes, continued to be a center for trade throughout the Middle Ages. The city was surrounded by an oval rampart, comprising some thirty towers, between A.D. 284 and 293. It was instituted as a bishopric ca. 381, conquered by the Burgundians in the mid-5th century, and annexed by the Franks ca. 543. The Treaty of Verdun (843) saw its acquisition by Lothair, and it was incorporated into the Holy Roman Empire ca. 1032. Grenoble, receiving its first franchise in 1225, was made capital of the Dauphiné in the course of the 13th century and was sold to the king of France in 1349 by the last dauphin of the Viennois, Humbert II (d. 1349).

The cathedral of Notre-Dame (11th-15th c.) is noted for its tabernacle (1445–57) and the magnificent Ciborium, a specimen of ornate Gothic stonework dating 1455–60. The

church of Saint-André (early 12th c.-1236), built originally as the dauphin's palace chapel, is joined to the Hotel de Ville and situated near the ruins of the church of Saint-Jean. The latter's front-entrance carving now decorates the side door of Saint-André. Saint-Laurent (ca. 965) is perhaps the most interesting religious site, due to its antiquity. It was founded as a necropolis upon which the funerary church, the crypt of Saint-Oyand (late 8th-early 9th c.), was built. The capitals of Saint-Laurent date from the 8th century, with work continuing into the 11th. The Benedictines were asked to rebuild the church in 1012. Unfortunately, much of the woodwork and stucco that remained was destroyed in the restorative efforts of the mid-19th century. Two other necropoli are of importance to the Middle Ages. Saint-Antoine is a Merovingian necropolis and the Roman Saint-Ferréol was used continuously up through the Merovingian period.

Opposite the church of Saint-André is the Gothic Ancien Palais des Dauphins. On May 12, 1339, the University of Grenoble was founded by a papal bull. In its collection, the Grenoble museum posesses a Frankish helmet, and the mimicial library houses 12th-century illuminated manuscripts from La Grande Chartreuse.

# GRINGORE, PIERRE

(d. 1538/9). Throughout his life, the Norman poet Gringore (or Gringoire) commented on contemporary problems, amusing and lecturing his public. The twenty-five works attributed to him are predominantly moral writings and plays. Gringore created an enigmatic persona: he was known during his life as Mère Sotte, the character he played in the troupe of fools called the Enfants-sans-souci, but his motto, which appears on a number of his works, was *Raison Par Tout, Tout Par Raison, Par Tout Raison.* Both Victor Hugo (in *Notre Dame de Paris*) and Théodore de Banville put Gringore into their works.

Gringore is best known today for his *sottie,* part of the *Jeu du Prince des Sots et Mère Sotte* (Mardi Gras, 1512). In fast-paced, witty dialogue, Gringore shows how Mère Sotte, disguised as Pope Julius II, attempts to harm the cause of Louis XII by bribing or pressuring Louis's prelates and nobles into supporting the corrupt, bellicose papacy. The *jeu* also includes a *cry* calling all types of fools (the audience) to the play, a morality in which Julius II reappears as the *Homme obstiné,* and a farce to send the audience away laughing. Gringore accomplishes this by showing how women, especially in matters sexual, prefer *Faire* to *Dire.*

Gringore was also the author of a history play, the *Vie monseigneur saint Louis* (ca. 1527). In nine *livres* (6,572 lines), the moral portrait of the most perfect Christian king

evolves in scenes of conflict between St. Louis and powerful enemies—his vassals, the English, and the Saracens—interspersed with episodes portraying the foibles and cares of common people. Gringore is also believed to be the author of the *Croniqueurs,* a satiric play written at the beginning of the reign of Francis I. In addition to writing and performing plays, Gringore was a producer and director of spectacles, such as the *couronnement, sacre, et entrée* into Paris of Queen Claude, on May 9, 1517.

Gringore's nondramatic writings include works of a moral nature, those inspired by contemporary events, and pious works. The best known of the moral writings are the *Folles entreprises,* a long indictment of corrupt prelates and noblemen, the *Fantasies de Mère* Sotte, an adaptation of the stories of the *Gesta Romanorum* glossed by Gringore, and the *Menus propos,* a bestiary of love imitating that of Richard de Fournival. (Gringore often adapted, translated, or paraphrased earlier works.) Most of his œuvres *de circonstance* were provoked by the Italian wars: they include the *Entreprise de Venise,* the *Chasse du cerf des cerfs,* and the *Obstination des Suisses.* Gringore's *Blazon des hérétiques* was the first pamphlet to attack Luther. His pious writings include a translation of the Hours of Notre-Dame.

A conservative who saw every question in a moral light, Gringore epitomizes the strengths and weaknesses of the late 15th century. His purely moral writings now have little appeal, but when his point of view was channeled through the stage he produced works of lasting interest.

# GROCHEIO, JOHANNES DE

(fl. ca. 1300). French music theorist, whose treatise *De musica* is our most important source of information on genre distinctions between medieval French secular music with vernacular texts and instrumental music. Grocheio focuses on the musical practice of Paris, distinguishing broadly between monophonic vernacular music *(musica vulgaris),* measured, or polyphonic, music *(musica mensurata),* and sacred music *(musica ecclesiastica).*

Grocheio divides *musica vulgaris* into *cantus* (vocal music without refrain) and *cantilena* (popular dance music with refrain). There are three categories of *cantus: gestualis, versualis,* and *coronatus. Cantus gestualis* refers to French medieval epic, the

chanson de geste. Grocheio provides more information than any other source about the performance practice of the epic. *Cantus versicularis* refers to French chansons organized by syllable count and rhyme scheme, that is, the songs of the troubadours and trouvères. *Cantus coronatus* refers to particularly distinguished and elevated examples of *cantus versualis,* the *grands chants courtois*.

Under the term *cantilena,* Grocheio provides us with our best descriptions of popular dance forms, distinguishing *rotundellus* (rondeau), *stantipes (estampie),* and *ductia* (carole), the latter two with both vocal and instrumental forms. He provides a useful distinction between dance forms in which all parts of the song are dependent on the refrain (i.e., rondeau) from those that have additional music not dependent on the refrain (i.e., virelai and ballade). The instrumental *ductia* and *stantipes* are articulated by alternating phrases called *puncta* (each with first and second endings) with the refrain and are best played on the vielle.

For polyphonic music, Grocheio discusses the motet, organum, conductus, and hocket, describing a successive compositional process in which first the tenor voice is organized and then upper voices are built one at a time over the tenor.

Grocheio peppers his treatise with fascinating comments on the social functions of musical forms; for instance, girls and youths in Normandy sing rondeaux at festivals and banquets, *stantipes* turn the souls of the rich from depraved thinking, motets are not suitable for common people, who do not understand their subtleties, but should be performed for the learned.

# GUEBWILLER

. Originally a civil *bourg* attached to the nearby abbey of Murbach, Guebwiller (Haut-Rhin) was granted its independence in the 13th century and soon built ramparts, which served the city well against *routiers* in 1376 and Armagnacs in 1445. The church of Saint-Léger is a fine example of early Rhenish style. The Romanesque façade with two dissimilar towers is decorated with Lombard arcading and has a sculpted typanum of Christ enthroned. A porch extends across the entire west side; above it are two levels of arcades, the lower one blind, and a gable with a criss-cross pattern similar to that at Saint-

Étienne, Beauvais. The porch, nave, side aisle, and transept are all late 12th-century; The choir and chevet are 14th-century. An octagonal lantern tower has been reconstructed over the crossing. The now disaffected Gothic Dominican church was begun in 1312. It features a vaulted choir and a high nave with timber roof. The stone choir screen (ca. 1461) is rare for Alsace. In the nave are wall paintings showing the Crucifixion, saints' lives, and the mission of St. Dominic; in the north aisle is a famous fresco depicting the vision of St. Catherine of Siena. The Flamboyant Gothic Hotel de Ville was built in 1514.

# GUÉRANDE

**.** The Breton town of Guérande (Loire-Atlantique) played a role in both the Viking raids of the 10th century and the Breton civil wars of the 14th, but it is best known for two treaties concluded during the reign of Duke Jean IV of Brittany (r. 1364–99). The first treaty, on April 12, 1365, resulted from the Battle of Auray the preceding September. It secured recognition of Jean IV as duke, while his rivals, Jeanne de Penthièvre and her sons, would be his heirs if he were to have no children. She would render homage to Jean, who had promised her certain revenues secured by lands.

The second Treaty of Guérande (January 15, 1381) ended a rupture between the French king and the duke of Brittany over the latter's support of England against France and Charles V's abortive attempt to confiscate the duchy. It provided for Jean IV to seek and receive a royal pardon and do homage in the manner of his predecessors. He was to exclude all English from his council and his military commands and ally himself to the king of France. Royal princes and important Breton personages swore to uphold this treaty.

The city has preserved, nearly intact, its 14th- and 15th-century walls with flanking towers.

# GUERNES DE PONT-SAINTE-MAXENCE

(fl. 1170s). An itinerant cleric born north of Paris and known as Guernes composed between 1172 and 1174 the first and most important French *Vie de saint Thomas Becket* in 6,180 Alexandrines in monorhymed five-line stanzas. An edifying biography and a well-documented chronicle, this masterpiece, written in terse language and pregnant with emotion, extols the saint's life and describes his recent tragic death (1170). With its fastidious care for accuracy (on-the-spot investigations, personal perusal of written sources), this hagiographical poem, full of evangelical echoes and of outstanding literary quality, has indisputable historic importance. The poem has come down to us in six Anglo-Norman manuscripts, only three of which contain the complete work.

# GUERRIC D'IGNY

(ca. 1070/80–1157). Born at Tournai, Guerric was probably educated in the cathedral school there and may have been *magister* in the school before he adopted a solitary life

and entered the Cistercian order ca. 1125. He was chosen abbot of Igny in 1138. He is best known for his fifty-four sermons on the feasts of the liturgical year, which demonstrate a mastery of Scripture. Guerric preached a contemplative theology that emphasized Christ's coming into humans in his "spiritual form," as supernatural guide and life-giving grace. Especially important are Guerric's insistence on Mary's maternal role in this in-forming of Christ in humankind and his presentation of the process of illumination in the spiritual development of the individual.

# GUESCLIN, BERTRAND DU

(ca. 1320–1380). Constable of France. Bertrand du Guesclin, perhaps the most famous French warrior of the Hundred Years' War, was the first of three distinguished Breton noblemen to serve as constable of France during this conflict. Du Guesclin was born into an old but not very wealthy family. In 1353, he succeeded his father as lord of Broons and a year later was knighted. He began serving the French crown at Pontorson as early as 1351, and for the next thirteen years his military career was confined to Normandy, where he fought for the king against the supporters of Charles the Bad, king of Navarre, and Brittany, where he fought for Charles de Blois against Jean de Montfort, the English-backed claimant to the duchy. In 1357, he led the forces that supplied the besieged city of Rennes. In May 1364, he won a great victory over the Navarrese forces at Cocherel in Normandy after feigning a withdrawal that induced his foes to abandon a superior position. In the same period, he also suffered defeats, as the English captured him at Pas d'Évran in 1359, at the bridge of Juigne in 1360, and at Auray in 1364. In this last battle, Charles de Blois was killed and Montfort became duke of Brittany.

With Normandy and Brittany now pacified, Du Guesclin devoted the rest of the 1360s to service in southern France and Spain. Louis of Anjou, brother of Charles V, was royal lieutenant in Languedoc and needed him to lead numerous *routiers* (unemployed soldiers) outside the realm on campaigns in Provence and Castile. His successful expedition to Spain in 1365 was followed by his defeat and capture at Nájera in 1367. In 1369, however, he returned to Spain and reinstalled a pro-French king on the Castilian throne.

Rarely successful at pitched battles, Du Guesclin was adept at handling bands of *routiers* and fighting with their tactics. In 1370, when a *routier* chieftain, Robert Knolles, was leading an English raid into northwestern France, Charles V summoned Du Guesclin and made him constable. The latter then made a private alliance with Olivier de Clisson, a wealthy Breton lord who had fought against him at Auray and Nájera. Clisson brought powerful contingents of Bretons into the French army, and he and Du Guesclin

conquered Poitou and Saintonge in 1371–72. In 1373, they secured Brittany, whose duke had gone over to the English.

For the next five years, the constable led French forces against the English in various parts of France. At the end of 1378, Charles V made the political error of trying to confiscate Brittany. Du Guesclin, one of those charged with implementing this unpopular decision, was reluctant to do so, since many of his old comrades had rallied to the duke. Never popular with the king's nonmilitary advisers, he was nearly removed from office but instead was sent to fight against *routiers* in Auvergne, where he died from an unknown illness (perhaps dysentery) in the summer of 1380 while beseiging the town of Châteauneuf-de-Randon.

Admired by his contemporaries for his military prowess, Du Guesclin earned the titles count of Longueville and duke of Molina. He was buried at Saint-Denis.

# GUIDE MORI

(fl. second half of 13th c.). Monk or priest who composed the most extensive signed *remaniement* of the *Roman de la Rose.* In refashioning the text of Guillaume de Lorris completed by the anonymous continuation, Gui brought about several major changes: he created a second prologue that contains a system of notation indicating additions, deletions, new rhymes, and "restored omissions"; he introduced an eleventh anticourtly vice, Pride; and he recast the Narcissus episode using Robert de Blois's *Floris et Lyriopé* (ca. 1250).

In his reworking of the section composed by Jean de Meun, Gui continued the tendency to transform the *Rose* into a more clerkly and didactic art of love with a linear rather than digressive structure. Gui reduced allusions to pagan mythology while increasing those dealing with the Bible and the church fathers. Gui cut Genius's speech to one-tenth its original length and suppressed many of the bawdy lines describing the taking of the Rose. In a passage inserted into the God of Love's speech, Gui portrayed himself as the third *Rose* author.

The so-called Tersan manuscript, now lost, contained an early version of Gui's *remaniement*. The most complete text is found in MS 101 of the Municipal Library of Tournai. Either Gui or an anonymous editor reinstated many of the verses originally left out.

# GUIBERT DE NOGENT

(ca. 1064-ca. 1125). Perhaps best known for his autobiography, *De vita sua sive monodiarum suarum libri* tres, and a treatise concerning the veneration of relics, *De pignoribus sanctorum,* this Benedictine monk also wrote a popular history of the First Crusade *(Gesta Dei per Francos),* a moral commentary on Genesis, a handbook for preachers *(Liber quo ordine sermo fieri debeat),* and lesser works.

Born at Clermont-en-Beauvaisis in northern France, Guibert was dedicated by his parents to the monastic life. His father died soon after his birth, and he was raised by his mother, who isolated him from other children. As a young adolescent, he entered the monastery of Saint-Germer-de-Fly, where he studied not only the Bible and theology but also classical authors, especially Ovid and Virgil. In 1104, he became abbot of a small Benedictine house at Nogentsous-Coucy. There, he wrote his history of the First Crusade and, in 1115, his autobiography. Guibert's attitudes toward his mother, sexuality and sexual sins, cleanliness, and his (and others') visionary experiences are important aspects of the autobiography, which also offers numerous insights into daily life, education, and social and political history. Guibert's treatise on relics attacks the veneration of a supposed tooth of Christ at the abbey of Saint-Médard, Soissons, but it is not a total rejection of either the cult of the saints or the veneration of relics.

# GUILD

. Economic association of traders or artisans. No direct continuity between Roman *collegia* and French medieval guilds can be established. Frankish drinking associations and Carolingian *caritates* (confraternal organizations) provide a chronological intermediary without demonstrated links to the high-medieval guilds. The medieval guild had a primary economic function, often with a religious or confraternal dimension. Separate spiritual confraternities also existed alongside guilds. The oldest French records survive for the *caritet* of Valenciennes (ca. 1050) and the *gilda mercatoria* of Saint-Omer (late 11th c.).

The guild was essentially an association of tradespeople or merchants grouped to supervise production and guarantee quality of merchandise. Close parallels with the northern European *hansas,* groups of traveling merchants who banded together for mutual protection, can be noted.

In the course of the 13th century, trade guilds multiplied in French towns. Associations of bakers, barbers, drapers, spice merchants, moneyers, silversmiths, and other occupations often were incorporated with statutes and a governing hierarchy in the late 13th and 14th centuries. They might impose entry fees. Strict regulations for promotion from apprentice to journeyman and finally to master developed, and in some artisanal occupations the production of a *chef-d'œuvre* became the criterion for master status. Training and expertise were jealously guarded in some trades, with the passage of skills from father to son, inspiring the criticism of monopolistic practices and hereditary membership by the end of the Middle Ages.

The guilds in France often had a role in urban government. The merchant guilds of northern France contributed to the earliest movements of urban communal autonomy. In Languedoc, representation from merchant and artisanal corporations formed the basis of some consulates. By the end of the medieval era, however, royal influence over guilds and town governments was considerable.

# GUILHEM IX

(William IX, 1071–1126). The first troubadour was also the seventh count of Poitiers, ninth duke of Aquitaine, and grandfather of Eleanor of Aquitaine. One of the few who returned to France after the First Crusade (1096–99), he successfully led a crusading army to Spain in 1120. Contemporary anecdotes recall him entertaining crowds with

jokes, verses, and stories; some sources style him a reckless, violent, sarcastic infidel who earned his excommunication.

Eleven songs survive, one of doubtful attribution. Though often seeming to parody or recast a preexisting tradition, Guilhem's work lays the foundation for later troubadour song, including the love lyric, satire, and *pastorela;* the figures of warrior and lover, boasting and humility, ribaldry and nascent courtliness are all represented. Three songs addressed to his "companions" jocularly compare women to property (horses, fishing holes, woodlands), subject to legal disputes; in three more, the poet, disguised as a fool or madman, claims prowess in both word games and sexual games. Four meditate more soberly on love, using feudal and natural metaphors; these inaugurate in Occitan the vocabulary and topoi of *fin'amors,* among them the nature introduction, with woods and birdsongs inspiring the poet and the paradoxical joy that cures the sick and drives wise men insane. Natural imagery is not confined to the *exordium:* in a middle strophe, Guilhem compares fragile love to a hawthorn branch that trembles at night in the freezing rain, then gleams with sunlight the next day. The same poem includes indoor, domestic scenes. Recalling a "battle" with his lady that ended in mutual desire, he concludes that words are cheap: "Let others brag of love; we have the bread and the knife." A final farewell song recants his youthful frivolity and impiety; throwing off his furs, he relinquishes Poitiers to the care of his old enemy Foulques of Anjou.

Researches into Guilhem's sources of inspiration involve the origins of troubadour poetry itself. In the *pastorela-like* "poem of the red cat" *(Farai un vers, pos mi sonelh),* whose hero feigns muteness (or foreignness) to fool two ladies who abduct him for an eight-day orgy, the words *babariol, babarian* have suggested to some a possible Andalusian-Arabic influence. Guilhem's range of registers is interpreted sometimes as schizophrenia (was he two poets?), sometimes as a progression that invents courtliness in moving from bawdy to idealistic views of love. If his *Farai un vers de dreit nien* mocks distant love:

> Anc non la vi ez am la fort;…
> Quan no la vei, be m'en deport,
> No•m prez un jau:…/
> No sai lo luec ves on s'esta

("I've never seen her and I love her a lot./…When I don't see her, I'm quite happy; /I don't care a rooster./ … I don't know where she lives"), then what was its antecedent? This and the "red cat" song were, he claims, composed while sleeping; the two poems thus suggest dream visions. Guilhem's verse often uses long lines of eleven, twelve, or fourteen syllables (with internal rhyme)—lines seldom used by later troubadours. Studies of his verse forms suggest connections with Latin poetry, the liturgy, the popular round dance, and even epic measures. A fragment of his music is preserved as a *contrafactum* in the 14th-century *Jeu de sainte Agnès;* though doubtless adapted, it shows the melody's filiation with monastic music.

# GUILHEM DE MONTANHAGOL

(fl. ca. 1233–68). Troubadour of Toulouse. Active in the courts of Toulouse, Provence, Castile, and Aragon, Guilhem left seven *cansos,* or love songs; six *sirventes,* or satires; and a *partimen,* or dialogue, with Sordello. His death was lamented in a *planh* by his brother-in-law, Pons Santolh. An orthodox Catholic, Guilhem expressed approval during the Albigensian Crusade for a benevolent correction of the Cathars' errors but not for the violent excesses committed by the crusading army. His statement that chastity begins in love has been seen in the tradition leading to the *dolce stil nuovo* but perhaps means only that love is a necessary precondition of fidelity.

# GUILLAUME

. *See also* **GUILHEM** OR **WILLIAM**

# *GUILLAUME, CHANSON DE*

. Known by a single manuscript in Anglo-Norman dialect (B.L. Add. 38, 663), dated 1225–50, the *Chanson de Guillaume* (3,554 assonanced decasyllables) survives in a reworked and corrupt version. The poem nevertheless preserves many archaic epic traits, a fact that explains the unusual attention it has received since its discovery in the late 19th century and its initial publication in 1901.

The place of the *Chanson de Guillaume* in the development of the epic traditions that make up the Guillaume d'Orange Cycle is important. This poem gives evidence of the mingling of historical traditions relative to Guillaume de Toulouse—e.g., the allusion to the glorious defeat on the Orbieu River in 793—and to his son Bernard of Septimania, nicknamed Naso, with traditions concerning Count Vivien of Tours, lay abbot of Saint-Martin, who died in 851, a victim of betrayal. It is thus at the origin of the cyclic expansion that was to give birth to poems about Vivien and his death at Archamp or Aliscans *(Enfances Vivien, Chevalerie Vivien, Aliscans)*. Traditions relative to Orange, the third element in the makeup of the epic character of Guillaume, are likewise present, but as a subtext: it is only in the later part of the poem ($G^2$) that Orange is substituted for Barcelona as the hero's capital.

The extant version (ca. 1150–75) comprises two parts of different date and provenance. Lines 1–1,980 (known as $G^1$) might have been composed before 1100. Vivien, Guillaume's nephew, is involved in spite of himself in an unequal. battle; his courage inspires the Christian forces, but he is overwhelmed and killed (1–930). A messenger from Vivien reaches Guillaume in Barcelona, and he hastens to the battlefield of Archamp, where he, too, is defeated; he returns to Barcelona with the body of another nephew, Guischard (931–1, 228). Guibourc, Guillaume's wife, comforts the hero and encourages him to return to battle, hiding the defeat from the vassals she gathers for the counterattack. All the Frenchmen are killed or captured in this third battle, except Guillaume and his young nephew, Gui; the hero does manage to kill the pagan leader, Desramé (1,229–980).

In the second and later part ($G^2$), which is frequently in contradiction with the first, Guillaume continues the fight until he kills a second pagan king, Alderufe, while Gui is captured. Guillaume finds Vivien still alive, comforts him as he dies, and then returns to Orange, which is now his capital (1,981–2,213). He announces the new disaster to Guibourc, who urges him to seek help from King Louis (2,214–453). At Laon, Guillaume is initially put off by the king, but his men convince the sovereign while the hero secures the help of the young and powerful Rainouart (2,454–928). Count Guillaume leads his forces to Archamp, where, thanks to Rainouart's extraordinary strength, the prisoners are freed and the Saracens wiped out. Guibourc recognizes Rainouart as her brother, and he is baptized and married to Ermentrude (2,454–3,554).

The primitive nature of lines 1–1,980 is certain; they use the epithet "crooked nose" *(al corb nés)* for Guillaume, draw on the tradition of the siege of Orange, and depict Guillaume's association with Barcelona, a reminiscence of the participation of Guillaume de Toulouse in the conquest of the Spanish March; a refrain of remarkable intensity *(Lunsdi al vespre, Joesdi al vespre, Lores fu mecresdi)* punctuates the action. It makes Vivien an emblem of heroic virtue, whence his authority in the vacuum left when the traditional baronial prerogatives were mocked by Tiébaut and Estourmi.

The character of the second part is fundamentally different, notably in the appearance of Rainouart, who, in heroic-comic vein, nearly supplants Guillaume as hero. It is perhaps the reworking of a poem conceived as a continuation of $G^1$, a poem that might have been the model for both $G^2$ and *Aliscans*. Nonetheless, certain scenes are esthetically powerful, such as that at the gate of Orange in which Guibourc rejects her threatened and fleeing husband until, by his valor, he is able to prove his identity. Furthermore, one must question whether the *Chanson de Guillaume* can be considered

completed with the death of Desramé, when Guillaume is alone and numerous Christians are still held by the Saracens; in this case, the model for $G^2$ and *Aliscans* could have been at least partially linked to the primitive poem.

Crossroads of the formative elements of the Guillaume cycle, a work rich in passages of beauty, the *Chanson de Guillaume* in the state in which it has come down to us is exasperating for its modern editors, caught between the desire to respect the text and that of finding the original. Readers, on the other hand, will find only pleasure in this unforgettable poem, worthy of comparison with the *Roland*.

# GUILLAUME DE LORRIS

(fl. 1220–40). The *Roman de la Rose* of Guillaume de Lorris, a poem of 4,028 lines thought to have been written ca. 1225–40, has always been linked to Jean de Meun's *Roman de la Rose,* a poem more than four times the length of Guillaume's and written as its continuation. It is in Jean's poem that the reader learns the names of the authors of the two works and the fact that Guillaume died before completing his *roman,* which he had written some forty years earlier.

Although Jean de Meun's *roman* became one of the most popular works of the Middle Ages, read and cited extensively through the Renaissance and existing in more than 250 manuscripts, Guillaume de Lorris's unfinished poem has captured the imagination of the post-18th-century reading public and remains a source of lively critical debate.

In a prologue of twenty lines, the author discusses the importance of dreams (with a reference to Macrobius) and establishes the dream narrative of the text itself. In the narrative proper, set in springtime, the dreamer discovers an enclosed garden. On the wall of the garden are portrayed Hate, Felony, Baseness, Covetousness, Avarice, Envy, Sadness, Old Age, Hypocrisy, and Poverty—all characters excluded from the inside of the garden. The Dreamer enters through the only gate, guarded by Idleness, a beautiful lady whose day is spent fixing her hair and face. Inside the garden, the Dreamer meets Merriment and his friends Beauty, Wealth, Generosity, Nobility, Courtesy, and Youth. As the Dreamer makes a tour of the garden, he is stalked by the God of Love and overcome at the Fountain of Narcissus, a spring at the center of the garden whose two brilliant crystals allow one to see all things in the garden. While looking into the crystals, the Dreamer sees a rose, falls in love, and becomes the Lover. The God of Love now

takes his new vassal in charge and instructs him carefully in the art of love. The Lover makes an attempt to approach the Rose but is repulsed by Resistance, the figure in charge of the Rose and the precincts within the hedge around her. Dejected by his failure and miserable from the pains of love, the rejected Lover is approached by Reason, described in Boethian terms as a lady of such lineage that she must have come from Paradise, as Nature would not have been able to make a work of such dimension. Reason reproaches the Lover for his foolishness in becoming acquainted with Idleness and explains that the evil he calls love is really madness. Is it wise or foolish to follow what causes you to live in grief, she asks? The Lover reacts angrily to Reason's advice, arguing that it would not be right for him to betray his lord, Love.

The Lover then seeks consolation from a Friend, who advises him that, though Resistance is angry at the moment, he can be overcome by flattery. With the aid of Openness and Pity, who plead for mercy on the Lover's behalf, the Lover once again gains access to Fair Welcome, who is persuaded to allow him to draw ever nearer the Rose, finally bestowing a kiss. Outraged, Slander arouses Jealousy; Shame, and Fear go to awaken the sleeping Resistance. Angry that he has been duped, Resistance chases the Lover from the Rose, and Jealousy builds a prison to keep Fair Welcome locked up. The Lover laments his misery and stresses that he is worse off now than he was before. The poet returns to the contrasting theme of the brevity of love's pleasures and the eternity of grief that follows. The Lover evokes the Wheel of Fortune, comparing Love's treatment of him to Fortune's own behavior. In the midst of further lamenting, the poem breaks off.

From the beginning, the reader of the *Roman de la Rose* is faced with difficulties in understanding Guillaume's poem. The dream-allegory setting implies multiple levels of meaning, in the medieval sense of allegory as saying one thing and meaning another. Macrobius's *Commentary on the Dream of Scipio* demonstrates the medieval concern for the dream and its relationship to other orders of reality. Moreover, the narrator is not merely the author but also the Dreamer and Lover, who operates in an objective world of personifications. Or are the personifications merely devices for the psychological description of the Lover and the Rose? In this question lies one of the most difficult medieval problems concerning the understanding of character and personality. But beyond these questions of form and meaning lie questions raised by the narrative itself. What is this garden the Lover enters—a kind of paradise involving a beautiful, elite society and a new form of love that transcends ordinary morality? Or is it a society obsessed with its own youth and the pleasures of self-gratification, careful to exclude images of Old Age and Poverty from the inner precincts of its own self-interest? Is this a love beyond Reason's comprehension, or is it the self-de-lusion of youth calling something *amor* that is really *folie?* Is this the meaning of the Fountain of Narcissus for the Lover? Is it really a dangerous fountain that might lead ultimately to death, or are the crystals a gateway to a higher form of love?

Because the poem breaks off with no hint of how it will end, or even how near the end the reader is, scholars have often turned to Jean de Meun's continuation and other texts for help in interpreting Guillaume's formidable ro*man*. It is a poem shrouded in mystery and tantalizingly inconclusive.

# GUILLAUME DE PALERNE

**.** An anonymous Greco-Byzantine romance of the early 13th century, *Guillaume de Palerne* is preserved in a single manuscript, Arsenal 6565. It recounts in 9,664 rhyming octosyllables the adventures of its eponymous hero, who as an infant would have been murdered by his uncle, who wishes to inherit his lands, had he not been aided by a friendly werewolf, which turns out to be the enchanted son of the King of Spain. Raised ignorant of his heritage, Guillaume encounters the beautiful princess Melior, daughter of the Emperor of Rome. After many adventures, he wins her, has his own inheritance restored, and ends the werewolf's enchantment. Influence of the chanson de geste is evident in the style and length of the scenes of combat. An English alliterative version was made in the 14th century, and a French prose reworking by Pierre Durand appeared in the 16th.

# GUILLAUME DE SAINT-PAIR

(fl. 1150–1190). A monk at Mont-Saint-Michel when Robert de Torigni was abbot there (1154–86), Guillaume de Saint-Pair wrote the *Roman du Mont-Saint-Michel*. The poem, in almost 3,800 octosyllabic lines, is divided into three sections, the first two purporting to record the history of the Benedictine monastery, the third describing Mont-Saint-Michel and recounting legends and miracles attached to it.

# GUILLAUME D'ORANGE CYCLE

. The epic cycle of Guillaume d'Aquitaine takes its name from St. Guilhem d'Aquitaine, who was a grandson through his mother of the first Carolingian king, Charles Martel. Named count of Toulouse in 789 by his cousin Charlemagne, Guilhem (OFr. Guillaume) fought for many years against the Muslims, being defeated by them at Orbieu (793) but capturing Barcelona from them in 803. In 804, he retired to the abbey of Aniane. Shortly thereafter, he founded the abbey of Gellone nearby—later renamed Saint-Guilhem-le-Désert in his honor—where he died in 812. Around this saintly hero, there arose in the 12th and 13th centuries twenty-four chansons de geste that fall into two groups: poems devoted to Guillaume himself and those devoted to his father, Aymeri, or other members of his family. The ensemble is known as the Guillaume d'Orange (or William of Orange) Cycle or, alternately, as the Garin de Monglane Cycle, after Guillaume's legendary ancestor. With the exception of the *Chanson de Guillaume,* these poems, grouped in "cyclical manuscripts," constitute the largest and most coherent of the chanson de geste cycles and have much to tell us about the medieval epic.

The manuscript tradition is extensive and attests to both the oral role of the jongleurs and the importance of writing in the elaboration of the poems; ateliers ensured the coherence of the ensemble by creating transitional pieces between the texts. The manuscripts allow us to catch glimpses of earlier redactions and to propose hypotheses on the development of the *geste*. One group, called the "short cycle manuscripts," comprises only poems relating to Guillaume; another group, characterized by the presence of a six-syllable line at the end of each laisse, comprises poems about Aymeri; and the third, called the "long cycle manuscripts," brings together both types of poems. Several manuscript families, the work of three different revisers, can be distinguished; the

families *A* ("short cycle") and *B* ("long cycle") have the most coherent groupings and have been used to prepare the standard editions.

*Poems About Guillaume.* Not counting the *Chanson de Guillaume,* which is not found in the cyclical manuscripts, eleven poems comprise Guillaume's poetic biography. The *Enfances Guillaume* (3,400 lines; 13th c.) tells how Guillaume distinguishes himself from his brothers and wins the heart of Orable. The *Couronnement de Louis,* the *Charroi de Nîmes*, and the *Prise d'Orange,* all closely related and composed between 1150 and 1170, tell of Guillaume's most famous exploits: the wound to the nose by Corsolt, from which the hero received his epithet *al corb nés;* the capture of Nîmes by ruse; the conquest of Orable and her city of Orange. Another ensemble narrates the deeds and passion of Vivien, who will be avenged by his uncle Guillaume and by the giant Rainouart. The *Enfances Vivien* (3,200 lines; 13th c.) tells in a style reminiscent of the adventure romances how Guillaume's nephew Vivien, son of Garin d'Anseüne, is surrendered to the Saracens of Luiserne in exchange for his father, how he miraculously escapes death and succeeds, thanks to help from his family, in recapturing Anseüne. The *Chevalerie* or *Covenant Vivien* (1,918 lines; ca. 1200), much more imbued with epic spirit, explains why Vivien must die in battle. At his knighting, the youthful warrior swears never to retreat a single foot before the pagans and immediately launches a brutal raid into Spain. Desramé of Cordova, the Saracen leader, sets sail to meet him at the field of Archamp. Vivien, fearful of breaking his oath, refuses to send to his uncle Guillaume for help until it is too late. Guillaume joins battle but is soon separated from his nephew.

The end of the battle is recounted in the earliest poem of this group, *Aliscans* (last quarter of the 12th c.). Vivien, overwhelmed by the odds, dies, and Guillaume watches all his companions disappear. He is forced back to Orange, where his wife, Guibourc, allows him to reenter the city only after he has accomplished an act of valor to prove his identity. He seeks aid from King Louis while the Saracens besiege Orange. Helped by the giant Rainouart, Guillaume overcomes the Saracens, and Rainouart, recognized by Guibourc as her brother, marries King Louis's daughter Aelis.

*Aliscans* and its prologue, the *Chevalerie Vivien,* are reworkings of two different narratives: an account of the exploits and death of Vivien, avenged by Guillaume, and a poem dedicated to the stunning revenge of the Christians, aided by Rainouart, over the Saracens. The *Chanson de Guillaume* (ca. 1150), a noncyclic text, also combines these elements but features an older version of Vivien's exploits.

Rainouart's story continues in the *Bataille Loquifer* (4,180 lines; late 12th c.), which exploits, by adding fanciful elements, the heroic-comic vein represented by this character. Most of the poem is devoted to the combat be tween Rainouart and the pagan giant Loquifer, but it also tells of the birth of Rainouart's son, Maillefer, which causes the death of his mother, Aelis. The infant is then stolen by the dwarf Picolet.

Finally, two texts exploit the theme of *moniage,* the hero's renouncing of this world and the adventures that devolve from that choice. The older, the *Moniage Guillaume* (12th c.), of which we have two versions, tells of the hero's rejection by the monks of Aniane, where he had retired to expiate his sins. Instead, he becomes a hermit but is captured by Sinagon of Palerne; finally freed, he returns to his hermitage but must again take up arms to defend his sovereign, Louis, from Ysoré: only then can he end his life in conformity with his wishes. More recent (late 12th or early 13th c.) but placed before the *Moniage Guillaume* in the manuscripts because it tells of events that happened earlier in

Guillaume's life, the *Moniage Rainouart* (7,600 lines) develops comic situations that arise from the contrast between the hero's immense size, strength, and simplicity and the demands of monastic life. The monks, who do not hesitate to betray Rainouart to the Saracens, are even more odious than in the *Moniage Guillaume.* Among the many adventures in the poem, one should note the hero's reunion with his son, Maillefer, who had been taken from him in the *Bataille Loquifer,* and his victory over the giant Gadifer.

The cyclical manuscripts attach two later poems to the Guillaume Cycle, *Foulque de Candie* (16,000+ lines; 13th c.), an independent version of Guillaume's battle at Archamp to avenge Vivien, and *Renier* (late 13th c.), which has as its hero Rainouart's grandson and ties this cycle to the Crusade Cycle.

The creation of such a vast cycle is the result of complex processes. Analysis of the poems and the manuscripts reveals what Tyssens calls two "cyclic nuclei." On the one hand are three tales narrating the early epic career of the hero: *Couronnement, Charroi,* and Prise; on the other, three poems in which Rainouart plays an important role: *Aliscans, Bataille Loquifer,* and *Moniage Rainouart.* Then, isolated poems, such as the *Moniage Guillaume,* or poems composed to serve as prologues to texts already in the corpus—the *Enfances Guillaume* prepares the *Couronnement* and the Prise, the *Chevalerie Vivien* introduces *Aliscans,* and the *Enfances Vivien* the *Chevalerie*—attach themselves to these nuclei.

The problem of cyclical organization must be distinguished from that of the dating of the poems and their relationship to history. The *Moniage Guillaume* predates the *Moniage Rainouart but* is integrated into the cycle after it. And the *Chanson de Guillaume,* which in its first part includes the most archaic matter, remains apart from the cycle.

There exist traces of earlier legendary activity relative to Guillaume. The *Nota Emilianense* (ca. 1065–75) includes among Charlemagne's peers a *Ghigelmo alcorbitanas,* and a *Guillelmus curbinasus* is supposed to have signed the counterfeited charter of Saint-Yrieix (ca. 1090). The hero's characteristic physical trait, at least in one of its two forms, is thus known by the last third of the 11th century. Moreover, a poem on the siege of Orange, now lost, was composed before 1125, since it is alluded to in the earliest *Vita sancti Wilhelmi.*

Guillaume's epic biography derives from three possible historical sources. Guillaume de Toulouse, Charlemagne's cousin, is mentioned in the panegyric of Louis the Pious, composed after 827 by Ermold the Black, and in the *Life of Louis the Pious* by the Astronomer (after 840). Victor over the Gascons in 790, he suffered a glorious defeat in 793 at the hands of the Saracens, who, after burning the outskirts of Narbonne, marched against Carcassonne; in spite of their numerical superiority, they withdrew into Spain. Ten years later, Guillaume took part in the siege and conquest of Barcelona, before retiring from the world and entering the religious life, first at Aniane in 804, then at Gellone (known today as Saint-Guilhem-le-Désert) in 806, which he founded. It is worth noting in passing that the historical Guillaume's son Bertrand was nicknamed Naso. Traditions centering on the count of Toulouse thus lie behind the battle at Archamp *(Chanson de Guillaume, Aliscans),* the "crooked nose," and the withdrawal from the world *(Moniage Guillaume).* Count Vivien, lay abbot of Saint-Martin of Tours, who died fighting the Bretons under Charles the Bald in 851, was the prototype of Guillaume's illustrious nephew Vivien in the *Chanson de Guillaume.* Finally, the tradition of the siege

of Orange may derive from memories of Guillaume I the Liberator, count of Provence, who gained an important victory over the Muslims in 972.

Born of different sources and nourished by events of the 12th and 13th centuries, the poems about Guillaume vary in tone, from the stark heroism of the first part of the *Chanson de Guillaume* to the adventuring spirit of the *Enfances Vivien*. A variety of themes is prominent in the cycle: the unflagging fidelity of the lineage, especially of Guillaume, to the sovereign *(Couronnement, Charroi, Moniage Guillaume);* heroism in the fight against the infidel *(Guillaume, Chevalerie Vivien, Aliscans);* and the relations between love and valor *(Enfances Guillaume, Prise)* and between knighthood and the religious life (the two *Moniages*). The unity of the whole is ensured by Guillaume himself, characterized by the glorious stigmata of his crooked or shortened nose, by the strength of his fists, and by his laughter. By his side, Orable-Guibourc is the guarantor of epic values, who urges her husband to remain faithful to his calling and who will not accept him until he gives proof of his valor. Vivien, the hero of Archamp, is immortalized by his vow, while the giant Rainouart, symbol of brute strength in service of the good, incorporates heroic-comic aspects of which Guillaume himself shows signs.

*Poems About Aymeri.* The chansons about Guillaume's father and brothers for the most part are not as old as those about the hero. There are nonetheless venerable traditions concerning the Narbonnais lineage, as in the Latin prose *Hague Fragment* (ca. 1000), in which Aymeri and his sons Hernaut, Bernard, and Guibelin, as well as Bertrand the Paladin, confront Borel and his sons. The origin of the Narbonne cycle may thus lie in either a tradition of a siege of Narbonne thwarted by the lineage (source of the second part of the *Narbonnais,* for which there once existed an assonanced version) or the story of the conquest of Narbonne by Aymeri, a tradition following in the wake of Roncevaux.

Among the epics having an archaic substratum are *Girart de Vienne* (ca. 1180), in which the trouvère Bertrand de Bar-sur-Aube links an older poem treating Girart's rebellion against Charlemagne to the Narbonne cycle, and *Aymeri de Narbonne* (before 1200), perhaps by the same poet, a tale of conquest and love, relating the capture of Narbonne as well as Aymeri's marriage to Hermenjart. An even more recent version of the capture of Narbonne is found in the manuscript Venice V[4], which integrates the taking of the city with the *Roland* material, situating it between the capture of Saragossa and the punishment of Ganelon.

The *Narbonnais* (early 13th c.) reflects the siege-of-Narbonne tradition; the *Siège de Barbastre* (7,392 lines; late 12th c.), loosely inspired by the capture of Barbastro by the Christians in 1064, also has archaic elements, including echoes of the siege of Orange. The *Mort Aymeri de Narbonne* (4,176 lines; 12th c.) combines, with its story of the hero's final combats, epic tonality with the exotic, in its introduction of the Sagittaries.

The cycle is completed by poems that tell of the founding hero's ancestors or descendants. *Garin de Monglane* (14,000+lines; 13th c.) features Aymeri's grandfather. After defeating Charlemagne in a chess match, the emperor authorizes him to win the fief of Monglane; Garin weds Mabile, who bears him four sons: Hernaut de Beaulande (Aymeri's father), Girart de Vienne, Renier de Gennes (Oliver and Aude's father), and Milon de Pouille. In the 14th century, the poem was reworked and an *Enfances Garin* added. Among poems treating Aymeri's descendants, *Guibert d'Andrenas* (2,406 lines; 13th c.) tells of the conquest of a Spanish city by Aymeri's youngest son; the Prise *de Cordres et Sebille* (2,948 lines; 13th c.) makes Aymeri's grandson Bertrand the lord of

Cordova. In a final step, in the 14th or early 15th century, the epic of *Girart de Vienne,* reworked and amplified with the story of Hernaut de Beaulande's and Renier's youthful exploits, is associated (in the so-called Cheltenham manuscript) in the *Geste de Monglane* with *Galien restoré.*

The historical basis of the Narbonne poems is less easy to determine than that of the epics about Guillaume. Aymeri recalls no specific model; progressively, however, he becomes associated with several early 12th-century viscounts of Narbonne of the same name. Aïmer goes back perhaps to Hadhemarus, a companion of Guillaume de Toulouse who took part in the Barcelona campaign, then fought at Tortose (809–10).

The differences are great from poem to poem. One can find archaic epic motifs (division of the fief among sons, hero's fury, exaggerated vows), but the cycle is dominated by the spirit of the adventure romance, in the sense that love frequently plays an important role. Several figures predominate: Hernaut de Gironde (Gerona, in Catalonia), a savage and impetuous character; Aymeri, a violent young man in *Girart de Vienne* and a family leader urging his sons to bravery in the *Narbonnais;* the mysterious Aïmer, who vows, like Vivien, to never spend the night in a house and to fight the Saracens to the end.

# GUILLAUME DURAND

(ca. 1230–1296). Liturgist, canonlaw scholar, and ecclesiastical judge, Guillaume Durand studied in Paris and Bologna and served in a number of ecclesiastical functions before being chosen bishop of Mende in 1285. Among his legal writings, the *Speculum judiciale* (ca. 1271) is a masterly summation of ecclesiastical juridical practices, the *Speculum legatorum* (1279) analyzes the rights and procedures of legates, and the *Repertorium iuris canonici* is a digest of canon law. Guillaume's most influential work is the *Rationale*

*divinorum officiorum,* which explains liturgical ceremonies for the benefit of both clergy and laity, with special attention to the symbolism of architecture, liturgical vestments and vessels, rituals, and the like. The *Rationale* is divided into eight parts: the church building, orders of clergy (bishop, priest, deacon, etc.), vestments, the Mass, the yearly liturgical cycle, the feast days of saints, *computus,* and calendar. While bishop of Mende, Guillaume produced a revision of the Roman Pontifical (ca. 1293–95) that was used at the papal court and served as the basis of the official text of the Roman Pontifical printed in 1485.

He should not be confused with his nephew, also named Guillaume Durand, who administered the bishopric of Mende in our Guillaume's absence.

# GUILLAUME LE BRETON

(fl. 1220s). The author of a Latin chronicle of the kings of France and a Latin poem on Philip II Augustus, the *Philippide* (ca. 1224), Guillaume was Philip's chaplain and tutor to his illegitimate son. His chronicle (1207–20) continues that of Rigord. (A continuation from 1220 to 1222 is almost certainly not Guillaume's work.) There are eight manuscripts, which represent four redactions (1207–27), but Guillaume's work circulated more widely indirectly, for some of his material was incorporated into the *Grandes chroniques de France*. The *Philippide,* extant in three manuscripts, is more detailed than the chronicle.

# GUILLAUME LE CLERC

(1180/91–after 1238). Among the several poets known by this name in the 13th century, the most important is the Norman Guillaume le Clerc, to whom are attributed the *Bestiaire divin,* the *Besant de Dieu,* the *Livre de Tobie,* the *Treize Moz,* and the fabliau *Du prestre et d'Alison.*

The *Bestiaire divin* (ca. 1210) is an allegorizing bestiary of 4,200 octosyllabic lines that shows considerable borrowing from the *Liber de bestiis et aliis rebus,* attributed to Hugh of Saint-Victor. The *Besant de Dieu* is another moralizing work of some 3,755 octosyllabic lines that evokes the miseries of the century, invokes the aid of God for the church, and deplores the lack of a crusade. It was inspired by a reflection Guillaume had one evening: humankind refuses to accept God's invitation to feast. The besant represents the unused talent that the unworthy servant in the parable (Matthew 25:14–30) renders to his lord. The author through moral edification tries to convince his reader of the evils of money and greed. By following Guillaume's advice, men and women have the capability to double their God-given talents.

Lesser works by Guillaume are the *Livre de Tobie,* based on the Book of Tobit and composed for William, prior of Kennelworth, in the first twenty years of the 13th century; the *Treize Moz,* a moral work dedicated to Alexander, bishop of Litchfield and Coventry (1224–38), that draws heavily on the *De contemptu mundi sive de miseria humanae condicionis of* Innocent III; and the fabliau *Du prestre et d'Alison.*

# *GUILLAUME LE MARÉCHAL, HISTOIRE DE*

. Commissioned by his eldest son shortly after the hero's death in 1219, the anonymous *Histoire* is one of the earliest and most successful secular biographies. Modeled on contemporary hagiographic literature, its 19,214 octosyllabic lines in the Norman dialect of Old French celebrate the lineage, deeds, and exemplary death of one of the greatest knights of the 12th and early 13th centuries. Preserved by a single manuscript (Cheltenham, Phillips 25155), it includes lengthy accounts of tournaments and is a rich source of information about medieval life and chivalry.

# GUIOT DE PROVINS

(fl. ca. 1180–1210). After much success at numerous seigneurial courts, this early trouvère participated in the Third Crusade and then, disillusioned, retired to a monastic life that left him no less disenchanted. Five *chansons d'amour* are attributed to Guiot with reasonable certainty, and late in life he wrote a pious allegorical summing-up, the *Armeüre du chevalier*. His most important work is the 2,686-line *Bible Guiot* (completed ca. 1206), a verbally brilliant and unusually personal satire criticizing feudal figures and mores but directed especially against ecclesiastical powers and monastic orders.

# GUIRAUT RIQUIER

(fl. 1254–92). The most prolific troubadour after Cerveri de Girona, Guiraut Riquier of Narbonne left 105 compositions in all genres, mostly *vers* and *cansos* (love songs). The poems are dated 1254–92 in a section of troubadour MS *C* (B.N. fr. 856), which purports to be a copy of the troubadour's own autograph book. Guiraut began his career in the court of the viscount of Narbonne, traveled to the Castilian court of Alfonso X the Wise, and returned to the courts of Rodez, Comminges, Astarac, and Narbonne, where he died in 1292. In that year, he lamented that he had come "among the last," meaning perhaps among the last of the troubadours. We have the melodies of forty-eight of his songs. The love songs, dedicated to a lady whose name is concealed by the *senhal,* or sobriquet, *Belh Deport* ("Good Conduct"), lack passionate conviction, but his series of six *pastorelas* are a notable development in the genre: he wove them into a continuing narrative in which he encounters the same shepherdess repeatedly over a period of twenty-two years. Among

his epistles are an extended commentary on a *canso* written ca. 1200 by Guiraut de Calanso and a supplication to Alfonso the Wise for recognition of his poetic achievements, with Alfonso's declaration (no doubt written by Guiraut) awarding him the title of *doctor de trobar* ("doctor of poetic composition").

# H

# HADEWIJCH

(fl. first half of the 13th c.). Only sparse information about Hadewijch's life is known to us today, although her works greatly influenced Carthusian spirituality and the *Devotio moderna* movement, in particular Ruusbroec (1293–1381) and Jan van Leeuwen (1314–1378). Hadewijch might have been active in either Brussels or Antwerp as a béguine, living together with other women who became her students or, as documented in her moving letters, her enemies. Her writings, all composed in the dialect of Brabant, were produced probably between 1220 and 1240. Hadewijch's work, now considered one of the most remarkable medieval mystical texts in the vernacular, consists of thirty-one letters, forty-five stanzaic poems, fourteen visions, and sixteen poems in rhyming couplets.

All texts focus on *minnemystiek,* or bridal mysticism. They are characterized by the rhetoric of courtly love poetry and a sophisticated understanding of Christian teachings, which testify to Hadewijch's extraordinary education. The key force in Hadewijch's teachings on mystical transformation is *minne,* or Love, allegorized as a fickle and impatient female teacher. According to N. de Paepe, she represents the human capacity to love God. In focusing on *minne* in a sustained and rigorous fashion, the human soul can achieve a state that facilitates the enjoyment of mystical union with Christ in this life.

# HAGIOGRAPHY

. Term (from the Greek *hagios* 'holy,' hence 'saint,'+*graphia* 'writings') referring to the full range of writings about saints, and, by extension, to the study of such works. These usages are of relatively modern vintage. The Greek word *hagiographa,* by contrast, was used in late antiquity to specify one of the three divisions of the Hebrew Scriptures. Similar usage continued in medieval Latin: Notker the Stammerer (d. ca. 890), for example, used *hagiographi* to refer to the "holy writings" of the Bible. The systematic study and criticism of writings about the saints began in the 17th century with the work of clerics of the Congregation de Saint-Maur and the Société des Bollandistes. It was only then that the term came to refer to this new discipline and its subject matter.

Hagiography can be understood only with reference to the concept of sanctity and to the practice of the cult of saints. For medieval Christians, saints were those "holy people" *(sancti, -ae)* who had posthumously entered the Kingdom of Heaven. Only a limited number of such heroes, however, were officially recognized and celebrated by Christian churches. Admission to this canon was controlled by the ecclesiastical hierarchy, bishops in particular, although the papacy exerted ever more control over the processes of canonization from the 12th century onward. Hagiography played a crucial role in this process, for the very composition and use of a hagiographic text implied that its subject had received institutional recognition.

Saints were venerated long after their deaths and thus long after memory of them had faded. The most common type of hagiography, saints' lives *(vitae),* served to record the actions that had formed and demonstrated their holiness. Excerpts from such Lives were often read out as part of the liturgical celebration of a saint's feast. In the mid-9th century, Bertholdus of Micy described the purpose of hagiography:

> The churches of the faithful scattered through the world celebrate together with highest praise the fame of holy men. Their tombs, which are wreathed in the metals of gold and silver, as well as in layers of precious stones and a shell of marble, now bear witness to their pious memory…. Surely to no less a degree than miracles, which incite the love proffered by the devotion of faithful people, the monuments of letters that are set down on pages also fully satisfy the senses of those who read and hear them. For what has been said and done by the saints ought not to be concealed in silence. God's love provided their deeds to serve as a norm of living for the men of their own times as well as of those years that have since passed; they are now to be imitated piously by those who are faithful to Christ.

The aim of hagiographers was not to produce biography in the modern sense but to portray a saint as an exemplar of the Christian life. Gregory of Tours (d. 594) named a work the *Life of the Fathers* rather than the *Lives of the Fathers* because he deemed most

important the "merits and virtues" common to a single ideal of sanctity rather than the diverse singularities of the lives of his many subjects. Hagiographers used stories, known as "types" *(topoi),* that followed a traditional form and were intended to convey a moral message rather than historically accurate information. Hagiographers borrowed phrases, themes, motifs, even verbatim passages from stories from earlier works, adapting them to the specifics of their story. The traditional and even repetitive character that such use of topoi creates is one of the most striking aspects of medieval hagiography.

In addition to exemplary conduct, the "merits and virtues" described by hagiographers also included the miracles that God performed through the saints. Such miracles occurred not only during the lives of the saints, but also posthumously at their tombs or otherwise in relation to their relics. Posthumous miracles included such visible marvels as cures and exorcisms, as well as invisible acts, like the remission of sins. The devout came to the shrines of saints or prayed to them in search of miraculous intercession. Hagiography recorded these aspects of the veneration of the saints through collections of posthumous miracle stories *(miracula)* and accounts of major events in the history of relic cults (*inventiones,* the ritual placement of relics in a shrine that inaugurated their public veneration), and *translationes* (the transfer of relics from one shrine to another).

The origins of hagiography in medieval France must be sought in the Roman province of Gaul, whose ecclesiastical hierarchy was dominated by members of its elite families. Over this well-born company towered the figure of St. Martin of Tours (d. 397), a military officer who underwent a dramatic conversion to Christianity. The former soldier remained a man of action his entire life, becoming in turn a tireless missionary, a severely ascetic monk, and a capable bishop. Martin was recognized as a holy man in his own day; shortly after his death, his devoted disciple Sulpicius Severus (d. 410) composed a record of his life. The work betrays both the sophistication of a Roman man of letters and the zeal of a religious reformer. Martin's portrait is finely etched with vivid anecdotes recalled by the author himself or by other eyewitnesses. Sulpicius originally intended his work as a guide to the ascetic life for a circle of Gallo-Roman aristocrats who gathered at his home, but it was widely copied and circulated. One of the earliest pieces of hagiography to be composed in what was to become France, this work set the standards for later Latin hagiography and became a virtual mine of topoi.

Over the course of the 5th century, other Gallo-Roman aristocrats, both bishops and hermits, came to be celebrated as saints. An excellent example is provided by the *vita* of Germanus of Auxerre (d. 448), composed a generation after his death by Constantius of Lyon. Writing after the collapse of Roman authority in Gaul, the author sought to provide a model of an efficient and aristocratic bishop who guarded the lives of his flock with charismatic power. An ideal administrator and pastor was thus presented to the contemporary Gallo-Roman elite. The work was written at the request of a bishop of Auxerre and given wide dissemination by another in order to promote the cult of the saint. Hagiography was steadily taking on a public function.

During the 6th century, the Franks tightened their grip on Gaul. The greatest hagiographer of the Merovingian kingdom was Gregory of Tours, who composed eight linked collections of traditions about the saints of Gaul during the last decades of the 6th century. These *libri miraculorum* contained stories of miracles performed by Christian holy people, both during their lives and posthumously at their shrines. The bishop's purpose was above all else pastoral, providing the Roman community of Gaul with a

record of its glorious Christian past that would serve as a comfort and a guide in the more difficult present. His work confirms that the veneration of relics had become central to the practice of Christianity, and one of his goals was to endow the cults of local saints with trustworthy histories. In Gregory's eyes, the most important saintly patron of the kingdom was Martin of Tours, whose shrine lay outside the walls of his own see.

Though saints of Frankish origin were conspicuously few in the works of Gregory, the Franks had largely been converted to Christianity. Venantius Fortunatus (d. ca. 601), bishop of Poitiers, celebrated saints among the women of the Frankish aristocracy. Foremost among them was Radegund (d. 587), a queen who had left her husband and the court for ascetic retirement in the convent of the Holy Cross at Poitiers. Fortunatus composed his memorial of Radegund shortly after her death. Over two decades later, Baudonivia, a nun of the Holy Cross, composed a second *vita*. A short time thereafter, an anonymous nun of Chelles wrote of Balthild, another Frankish queen converted to the monastic life. These two women were probably the earliest female hagiographers in the Latin West.

Throughout the 7th century, male members of the Frankish aristocracy entered the monastic life in increasing numbers, perhaps inspired by the almost military discipline of Columbanian monasticism, while others took up careers in ecclesiastical administration. A new type of saint emerged who was representative of and attractive to this ruling elite. Known to historians as *Adelsheilige,* or "noble saints," they included such men as Sulpicius of Bourges and Eligius of Noyon. The hagiographers who recorded their lives had, like Baudonivia, Frankish names, but their works were still influenced by Gallo-Roman literary models provided by Sulpicius Severus and Gregory of Tours.

The contours of hagiography changed dramatically in the 9th century. Ecclesiastical authorities came to rely increasingly on written documentation for the authenticity of saints and their veneration. In the *Admonitio generalis* of 789, Charlemagne renewed a canon borrowed from an ancient collection that ordered that "the false names of martyrs and the uncertain memorials of saints should not be venerated." Five years later, the bishops whom the emperor gathered at Frankfurt were more explicit: "No new saints should be honored or invoked, nor shrines to them erected on the roads. Only those saints are to be venerated in a church who have been chosen on the authority of their Passion or on the merit of their Life." The "Passions and Lives" in question were hagiographic texts. In response to the perceived need for written documentation for the cults of saints, Carolingian clerics produced many works celebrating the saints of the distant past. Hincmar of Reims wrote about Remi, Hilduin of Saint-Denis about Denis, and Alcuin of York about Vedast, to cite only some of the best-known examples. They were forced to piece together bits of written and oral tradition, along with topoi borrowed from ancient and respected works of hagiography. Few contemporaries, however, were celebrated by the Carolingian church as saints, with the exception of those monks and nuns, such as Boniface and Leoba, who served as missionaries in the Christian borderlands. According to one survey, some forty-five Lives had been composed in Neustria during the 7th century to celebrate contemporary figures as saints. By contrast, only ten Lives of such recently deceased saints were written in the 8th century, and the number dropped to a mere eight in the 9th.

The Carolingian period also witnessed the growth of hagiography concerning the posthumous veneration of saints' relics. Monks compiled collections of miracles

performed at the shrines of such saints as Benedict of Nursia at the monastery of Saint-Benoît-sur-Loire and Richarius at Saint-Riquier. The enthusiasm for relics was not confined to those saints traditionally enshrined in France. Many relics of martyrs were obtained from Italy and Spain, or even other regions of France. Numerous translation accounts survive that document these journeys. Some authors, such as Einhard, described these relics as the objects of what they termed "holy thefts" *(furta sacra),* a topos that suggested that the relics had been carried off to a new home under the inspiration and guidance of the saints themselves.

The Viking raids of the 10th century caused major disruptions in all phases of public life in France. As numerous monasteries were pillaged or destroyed along the riverways, the relics of many saints were moved to new homes. The story of the wanderings of the monks of Noirmoutier, carrying the relics of their patron, Philibert, as they journeyed as far as Tournus in their search for a safer home, is one of the best known. Relatively few Lives of saints, either historical or contemporary, were composed during this period. The most important exception was Odo of Cluny's *vita* of Gerald of Aurillac. Odo portrayed this count as a novel type of saint, the Christian knight *(miles christianus).* Gerald never entered the religious life, but he practiced a life of prayer and asceticism, while using his political and military power to fight injustice and protect the clergy and the poor. An important part of Odo's message was that a noble might lead a life pleasing to Christ by providing for the peace and defending God's church. Gerald was certainly noble, for Odo went to pains to demonstrate (or, quite possibly, to invent) the fact that the count was descended from St. Caesarius of Arles and thus had both senatorial and saintly blood in his veins. Odo himself was also considered to be a saint, and his Life was composed by a Cluniac monk, John of Salerno. In a sense, these two works portrayed the twin faces of an emerging clerical ideal of the relationship between secular and ecclesiastical aristocracies. Both became influential models: Hariulf of Saint-Riquier (d. 1143) had Gerald in mind when he composed the Life of Arnulf of Soissons, and Raoul Glaber (d. ca. 1046) turned to the *vita* of Odo as a model when portraying Abbot William of Volpiano.

The social and political order of France was radically reshaped in the decades ca. 1000. Many monastic communities underwent reform, and the cults of their patron saints came to be renewed. The dominant hagiographic genre in France in the 11th and 12th centuries comprised collections of posthumous miracles attributed to patrons of monastic houses. These works were specific in their geographical scope: they included stories from a single diocese or a single monastic house and its priories. They intended to tell how a saint aided and protected people who came under his or her patronage. As Letaldus of Micy (d. ca. 1010) wrote, "All people should learn these things, for such miracles as were done in the days of our fathers and are still done for us now do not happen on account of our own merits, but through the kindness of piety and the intervention of those fathers who are provided as intercessors for us." These stories provide in their vivid detail a colorful picture of the social fabric and religious practice of France during these centuries. While 11th-century collections contained many stories in which the saints miraculously chastised their enemies with beatings and even death, those of the 12th century came to focus more on the miraculous cures effected at the shrines.

The oldest known literary document in Old French is a brief hagiographic poem, the *Séquence de sainte Eulalie,* which dates to ca. 880. Significant numbers of vernacular

hagiographic works, all in verse, survive from the late 10th, 11th, and 12th centuries; they concern such diverse subjects as St. Léger, a 7th-century bishop of Autun; St. Brendan, an Irish missionary; and St. Mary the Egyptian, a prostitute turned hermit. In general, these works appear to have been performed as a sort of pious entertainment. The moralist Thomas of Chobham exempted jongleurs who performed works about the saints from his general con-demnation of that profession. The masterpiece among these works was the *Vie de saint Alexis,* which told of a wealthy young man who left his family to pursue an ascetic life, only to return years later as an unrecognized holy begger living under the steps of his family house. This poem, dating in its earliest form to ca. 1050 and frequently rewritten in later centuries, prefigured the movement of the *vita apostolica*.

The high Middle Ages witnessed the emergence of a variety of new spiritual movements, each of which was accompanied by the development of new types of sanctity recorded in hagiography. The first important development was the Lives of the hermits and wandering preachers associated with the "new monasticism." Monastic reformers like Robert d'Arbrissel (d. 1117) and Stephen of Muret (d. 1124) intended to return to the ascetic practice of the earliest monks in the eastern deserts. Over the previous two centuries, hagiography had come to focus ever more exclusively on the miraculous powers of the saint, but in the lives of these men hagiographers returned to an interest in the spiritual life and ascetic exercises of saints. The Life of Stephen records how hagiography itself played a role in this process, for the saint required that his monks dine in silence, while one of their number read from the *Lives of the Desert Fathers*.

By the late 12th century, the Cistercian order was producing its own distinctive hagiography in France and elsewhere. These works depicted the lives of such abbots as Bernard of Clairvaux (d. 1153) as spiritual ascents to God in a manner characteristic of Cistercian psychology and spirituality. The influence of the eremitic tradition can also be sensed here, as when William of Saint-Thierry reminisced in his Life of Bernard about a sojourn spent with the saint: "I remained with him for a few days, and as I looked about me I thought that I was gazing on a new Heaven and a new earth, for it seemed as though there were tracks freshly made by men of our own day in the path that had first been trodden by our fathers the Egyptian monks of long ago." The Cistercian monks and saints were thus portrayed as imitators of their ancient predecessors. Cistercians also compiled large collections of miracle stories, but these were not associated with specific shrines; rather, they were intended to convey moral messages. The use of miracle stories—some of which were contemporary, others taken from ancient sources—for didactic purposes in the training of monastic novices had been pioneered at Cluny by Peter the Venerable (d. 1156) but was perfected in such Cistercian collections as the *Exordium magnum* and the *Dialogue on Miracles* of Caesarius of Heisterbach (d. ca. 1240).

In the early 13th century, béguinages came to offer women lives of ascetic spirituality that were not strictly cloistered. This new movement was particularly vibrant in the cities of the Low Countries. By the 1230s, Jacques de Vitry and Thomas de Cantimpré had begun to write an influential series of lives that celebrated béguines and nuns in the region of Liège. Their subjects included Marie d'Oignies, Christina of Saint-Trond, Ivetta of Huy, Margaret of Ypres, and Luitgard of Aywières. In championing this novel approach to the religious life, which combined traditional asceticism with charitable works and teaching, these hagiographers provided a model for late-medieval female

sanctity whose characteristics included strenuous fasting, ecstatic visions, devotion to the eucharist, and service to the urban poor.

The new religious movement that had perhaps the greatest impact on western Christendom was that of the mendicant orders. Although active in France, they did not number many saints among those members who were associated primarily with that country. While Thomas Aquinas and Bonaventure were masters at the University of Paris, the hagiographic traditions about them come, like the saints themselves, from Italy. As preachers, however, the mendicants represented a vigorous attempt on the part of the ecclesiastical hierarchy to reach the urban laity. Preachers needed collections of exemplary stories of a sort different from those produced for monastic novices. Many such collections were gathered for preaching purposes by Flemish and French mendicants—such as Stephen of Bourbon, Thomas de Cantimpré, and Vincent de Beauvais—which made use of hagiographic traditions. The most influential hagiographic compendium, in France as in the rest of western Christendom, however, was the *Legenda aurea,* completed by Jacobus of Voragine, an Italian Dominican, in 1258 and available in French translation by the end of the century.

One major factor in late-medieval hagiography, the development of papal control over canonization, produced a new genre of hagiographic literature, the *processus canonizationis,* which was the record of the official tribunal that investigated a candidate's holiness. A number of such investigations were conducted in France: of Edmond Rich at Pontigny in 1244–45, Louis IX at Saint-Denis in 1282, Louis of Anjou at Marseille in 1297, Dauphiné of Puimichel at Apt and Avignon in 1363, Charles de Blois at Angers in 1371, Urban V at Avignon in 1382 and 1390, and Peter of Luxembourg at Avignon in 1389–90. The frequency of such inquiries at Avignon in the late 14th century can be explained by the dominant position of French clerics in the papal court during its sojourn there. Unsuccessful processes of canonization were undertaken for such French ecclesiasical figures as Robert of Molesme and Étienne de Die. These new procedures also encouraged the composition of more traditional Lives, such as that written by Guillaume de Saint-Pathus about Louis IX, in order to provide evidence of the sanctity of their subjects.

During the 13th and 14th centuries, hagiography composed in French was also taking interesting new directions. Large numbers of verse Lives were composed in this period, some twenty-six of them about female subjects, such as Margaret of Antioch and Catherine of Alexandria. In general, these poets followed the style of contemporary romances, but they also attempted to produce a morally uplifting rival to such secular works. The author of a *Vie de sainte Barbe* claimed, "I want to tell a new kind of story, /Never heard before. /Know that it does not concern Ogier, /Nor Roland, nor Oliver, /But a most holy maiden /Who was very courteous and beautiful." Nor were verse Lives the only hagiography available in French. Collections of miracles performed by the Virgin Mary, the most famous by Gautier de Coinci, began to appear in the late 12th century. The earliest works of French prose hagiography were composed only a couple of decades later. While some were renderings of vernacular verse works, many were translations of Latin texts such as the *Legenda aurea* or the *Lives of the Desert Fathers.* Collections of such texts, called *légendiers,* played a role in the religious instruction of the laity. While most works of vernacular hagiography had their ultimate roots in Latin sources, a few original hagiographic works were composed in French, notably Joinville's highly

personal and moving life of Louis IX and Rutebeuf's poem about Elizabeth of Hungary (d. 1231). Hagiographic influence can also be detected in works of other genres, such as the Vulgate *Queste del saint Graal*.

Over the course of the 15th century, the composition of Latin hagiography declined precipitously in France, as did the official recognition by the papacy of the kingdom's inhabitants as saints. This was in part due to the position of France in ecclesiastical politics during the Great Schism and its aftermath. There were some exceptions to the general lack of new French saints: the Dominican reformer Vincent Ferrer (d. 1419) was canonized in 1455; Jeanne-Marie de Maillé (d. 1414) became the focus of a local cult in Touraine, though the papacy never pursued her canonization. Perhaps the most famous French saint of the period, Jeanne d'Arc (d. 1431), was not officially canonized until the 20th century.

Vernacular hagiography, on the other hand, flourished. Many early printed French books contained Lives of the saints and were produced for a thriving market in devotional works intended for the laity. In the early 16th century, a manual of religious practice directed to a female audience reminded its readers, "Our Lord said that the Kingdom of the Heavens is taken by force and, since you do not require ease of your wicked body, you should put before your eyes the example of the blessed saints who have reached Heaven and who have acted for the love of our Lord…. Read their stories and consider the constancy of the male and female saints." The Reformation brought with it a radical reaction against the cult of saints, which caused Calvinists to spurn such traditional hagiography. The Wars of Religion, however, spawned the composition of collective biographies of both Huguenot and Catholic "martyrs" that owed much to the medieval genre.

# HAIMO OF AUXERRE

(fl. ca. 840–60). Carolingian exegete of the school of the Benedictine house of Saint-Germain at Auxerre, Haimo was the author of widely read commentaries on the Song of Songs, Revelation, and the Minor Prophets, as well as of many sermons. Commentaries on the Pauline Epistles attributed to Alcuin's pupil Haimo of Halberstadt may also be his. Haimo studied with the Irish grammarian Murethach and was for a time the abbot of the monastery of Sasceium. He brought Carolingian biblical commentary to its most successful and influential point; his skillfully woven composite method was passed on through his pupil Heiric to Remigius of Auxerre. Commentaries on some books of the Bible, notably Genesis, are attributed to both Haimo and Remigius. The writings of Haimo of Auxerre published in the *Patrologia Latina* appear under the name of Haimo of Halberstadt. Haimo's biblical interpretation is only now receiving the scholarly attention it deserves.

# HAINAUT

. County in the Low Countries, bordering on Flanders. Medieval Hainaut was an agricultural area, centering on the Scheldt, Sambre, and Dendre rivers. Its only large towns were Valenciennes and Mons. Although its population was Romance, Hainaut was entirely in the empire, and its bonds with France, which bordered it on the south, were thus diplomatic rather than dynastic.

Hainaut's first known count was Reginar "au long col," who founded a dynasty that lasted until after 1040. In 1170, Count Baudouin V of Hainaut married Marguerite, sister of the childless Philippe d'Alsace, count of Flanders. Their son ruled Hainaut and Flanders, beginning a dynastic union that persisted until the death of Countess Marguerite in 1278, when Hainaut passed to her grandson, Jean d'Avesnes. Jean's mother had been the sister of Count William II of Holland; at the death of Florence V of Holland in 1299, a dynastic union of Holland and Hainaut began that lasted until Hainaut was incorporated into the Burgundian state in the 15th century.

After the extinction of the Avesnes line in 1345, Hainaut was ruled by the Bavarian descendants of Marguerite, sister of Count William II and wife of the emperor Louis IV. In 1417, Count William IV was succeeded by his daughter Jacqueline, wife of Jean IV, the Burgundian duke of Brabant; but when she left her husband to marry Duke Humphrey of Gloucester in 1422, the Burgundians invaded Hainaut. With Holland and Zeeland, it was annexed formally to the domain of Philip the Good in 1433.

# HARCOURT

. The Norman barons of Harcourt (Eure) claimed descent from a 10th-century Viking chief. Over the centuries, the branches of this family became connected to all the

important noble houses of Normandy and adjacent regions. Jean II, lord of Harcourt (d. 1302), was admiral of France. His oldest grandson, Jean IV, received the title of count in 1338, but the latter's brother, Godefroi, lord of Saint-Sauveur (Manche), became a chronic rebel against Philip VI and John II of France. The king executed Jean V of Harcourt in 1356 for supporting the party of the king of Navarre against the French crown.

Like many other Norman lords who had been English or Navarrese sympathizers in the 1340s and 1350s, the Harcourts became royalist after 1360. Both Jean VI and his brother Jacques, lord of Montgommery, served the king frequently in war. Jean VII (1370–1452) was captured at Agincourt (1415). His younger son, Louis, was archbishop of Rouen (1409–22). The senior male line of the family ended with Jean VIII's death in battle at Verneuil (1424). The descendants of Jacques, lord of Montgommery, included Jean (d. 1452), archbishop of Narbonne and patriarch of Antioch, whose brother Jacques married the heiress of the Melun family and thus acquired the county of Tancarville. The county of Harcourt itself passed to the house of Lorraine by marriage in 1476.

# HAYNE VAN GHIZEGHEM

(fl. ca. 1465–85). Composer of some of the most successful songs of the late 15th century. First documented in 1457 as a young boy entrusted to the care of the Burgundian court chapel singer Constans van Languebroeck, he appears in the court accounts as a singer and *valet de chambre* from 1467 to 1477, though the style of his music makes it clear that he must have lived for at least another ten years. Of his seventeen songs, all seem to be rondeau settings and are among the most characteristic late examples of that genre. Three had particu-larly impressive careers: *Amours amours* (seventeen sources); *Allez regretz* (thirty sources, setting a poem by Jean II, duke of Bourbon); and particularly *De tous biens plaine* (twenty-nine sources, and providing the musical materials for nearly sixty later works).

# HEALTH CARE

. Standards of personal and communal health were often minimal in rural settings; they evolved most markedly at such model monasteries as Cluny and, later, under the pressures of urbanization. Their elaboration is documented by prescriptions for good living, descriptive vignettes in poetry and prose, fanciful illuminations in manuscripts, and pragmatic ordinances in archives. Throughout, Mediterranean mainsprings of hygienics were supplemented by local notions, and folk wisdom fused with learned medicine. Preservative and preventive concerns ranged from infancy to old age, from diet to environment, and from homebound routines to distant journeys.

A famous vernacular guide, the *Régime du corps,* accompanied Countess Béatrice de Provence in 1256 on her visit to four queens, her daughters. It shows how private hygiene depended on social standing. For courtiers and prosperous bourgeois, aesthetics tended to prevail over genuine hygienics. For example, the shift from whole grains to white bread was more pronounced in France than elsewhere north of the Alps, but mostly because members of the elite found white bread aesthetically more pleasing and something of a status symbol, rather than for the medically sounder reason that rye bread, widely consumed by peasants, made them more prone to ergotism. Similarly, the upper classes avoided garlic, despite its health benefits (it was legendary as a prophylactic), because it was associated with the poor. Their attitudes toward soap and clothing were similarly inspired. Readily available "Gallic" soap was spurned for exotic soaps from Outremer, because these contained oils rather than tallow. The shape, volume, and variety of clothing were often more important than comfort or cleanliness. Nevertheless, frequent changing of clothes was deemed important, and bathing was less rare than is often assumed. Fetor, skin diseases, and parasites were viewed as traits of those who were not only poor but lazy.

Bathhouses, or "stews," were popular enough to number at least twenty-six in Paris under Philip II Augustus (r. 1180–1223). Royal control was maintained by licensing, but it could extend further, as when Louis X (r. 1314–16) ordered new *étuves* built in Provins to keep up with the growing population. The steady influx of newcomers, the persistence of rural lifestyles, and overcrowding caused health hazards that were not addressed systematically. However, the layout of most towns shows that crafts with noxious byproducts, such as tanning and metallurgy, were kept at the edge of habitation. Sewers were installed before 1250 in Paris, and municipal governments enforced poli cies for refuse removal and sanitation, including the daily flushing of butchers' and fishmongers' quarters. By the end of the 15th century, authorities began to charge medical experts with inspections of water and food supplies, assessments of the need to quarantine, and public-health services for the poor.

# HEIRIC OF AUXERRE

(841–ca. 876). A student of Lupus of Ferrières and Haimo of Auxerre, Heiric taught Remigius of Auxerre and was a disciple, if not a student, of Johannes Scottus Eriugena. Heiric was one of the major authors who transmitted the ideas of Eriugena to later generations. He was the first master to cite the *Periphyseon,* and one of his homilies makes use of Eriugena's homily on the prologue to John's Gospel. Heiric may have composed a set of glosses, reflecting ideas from Eriugena, on the *Categoriae decem*. Heiric's *Collectanea* contains a set of extracts from classical authors and a set of questions concerning problems of scriptural exegesis. He represents an important link in the intellectual traditions of the 9th-century schools and exemplifies the combination of interests in classical literature, biblical exegesis, and philosophical questions in that period.

# HELDRIS DE CORNÜALLE

(fl. late 13th c.). Otherwise unknown, Heldris de Cornüalle is the author of the *Roman de Silence* (6,706 octosyllabic lines), which survives in a single manuscript (University of Nottingham Mi. LM. 6). The story is of a count of Cornwall who names his daughter "Silence" to hide her gender, since only sons may inherit property. Nature and Nurture debate, and Silence leaves home disguised as a jongleur; returning, (s)he attracts the unwanted sexual advances of Queen Eufeme. Through Merlin's intervention, the unfaithful Eufeme is executed, and Silence, recognized as female, becomes the new queen of England. The ambiguity of the heroine's gender and its relationship to the power of language have attracted critical attention since Thorpe's edition appeared.

# HÉLINANT DE FROIDMONT

(1160?-1230?). Before becoming a monk at the abbey of Froidmont in Beauvaisis in 1183, Hélinant studied at Beauvais and was a trouvère at the court of King Philip II Augustus. After his conversion, he composed a Latin semiautobiographical chronicle, as well as a series of sermons and letters in Latin. But he is remembered today for his *Vers de la Mort,* written between 1193 and 1197. This popular poem of fifty stanzas, each of twelve octosyllabic lines, uses the rhyme scheme AAB AAB BBA BBA, which Hélinant is reputed to have invented. This meter became popular among other 13th-century poets writing in a similar didactic vein, such as Barthélemi, a recluse at the abbey of Saint-Fuscien-au-Bois, who composed a *Charité* and a Miserere, and Robert le Clerc, who also wrote a poem titled *Vers de la Mort* (Arras, 1269–70). Over sixty works are known to have imitated this meter. Hélinant's message is simple yet powerful. He attempts to convince humankind to abandon, as he has, secular trappings and to think about salvation. Death, he reminds us, is the great equalizer that works ceaselessly at transforming happiness into sorrow. Hélinant then asks Death to go greet the living. The princes of the church and those of secular realms appear in a sort of *danse macabre.* Hélinant enjoins his readers to reject the teachings of ancient philosophers who profess that there is no afterlife. He suggests that humankind, if deprived of hope of a life after death, is no different from the animals. There has to be an afterlife, he concludes, to remedy the lack of justice in the world.

# HÉLOÏSE

(1100/01–1163/64). Héloïse, abbess of the famous monastery of the Paraclete and its six daughter houses, was raised as a possibly illegitimate child in the Benedictine convent of Sainte-Marie of Argenteuil. At the age of seventeen, she continued her studies at her uncle Fulbert's house in Paris, where she was tutored by the theologian Peter Abélard (1079–1142). After a stormy love affair with Héloïse, Abélard offered the Paraclete and its lands as a refuge to Héloïse and her fellow nuns. Pope Innocent II confirmed the donation in 1131. Héloïse left us three letters to Abélard and one letter to Peter the Venerable (ca. 1092–1156). She is mentioned frequently in the cartulary of the Paraclete as a competent and efficient abbess who turned her religious house into one of the most prestigious women's monasteries in France. Its rule stressed the importance of education for all nuns, the unusual relaxation of strict enclosure, and the authority of the abbess over both male and female members of the monastic community.

In Peter Abélard's biographical *Historia calamitatum* and his moving correspondence with her, Héloïse emerges as an articulate and heroic person who equals Abélard in rhetorical sophistication and surpasses him in personal integrity. Her letters reveal a woman of deep love and devotion who remained attached to Abélard with both the bond of friendship and the memory of their earlier passion. Moreover, in her own mind, she was convinced that she had acted throughout the entire affair with disinterested love, devoted only to Abélard, while he had begun with lust only and never achieved her level of disinterested love, even though it was he who had taught her the true understanding of love and friendship.

# HENRI D'ANDELI

(fl. first half of the 13th c.). Henri was probably a native of Andelys (in Normandy) who studied and later wrote in Paris. His poetic compositions include the *Bataille des vins* (ca. 1225); the *Dit du chancelier Philippe,* a funeral eulogy for the chancellor of Notre-Dame of Paris (d. 1236); and the *Bataille des sept arts,* concerning university disputes during the 1230s. He is, however, best known for the *Lai d'Aristote* (ca. 1220), a fabliau that illustrates the triumph of "nature over nurture." This work has Aristotle rebuke Alexander for forgetting reason and becoming a slave to love; thereafter, seized by lust for Alexander's mistress, the great philosopher allows himself to be saddled and ridden in order to win her favors.

# HENRY I

(1008–1060). The third king of the Capetian line, Henry I (r. 1031–60) was the second son of Robert II and Constance of Arles. After the death of his elder brother, Hugh, in 1025, Henry was crowned in 1027 over the objections of his mother, who preferred her third son, Robert. After Henry succeeded his father, Robert and Constance rebelled with the aid of Eudes II, count of Blois and Champagne. Henry received direct support from Robert the Magnificent, duke of Normandy, and indirect support from the emperor Conrad II, a rival of Eudes in Burgundy and Lorraine, to whose daughter Matilda (d. 1034) Henry was affianced (1033). Henry had to give his brother the duchy of Burgundy, but the deaths of Constance in 1034 and Eudes in 1037 left the king more secure.

In the 1140s, Henry maintained the imperial connection by his marriage with another Matilda (d. 1044), the niece of the emperor Henry III (r. 1039–56). After the death of his Norman ally Robert, Henry supported Robert's illegitimate son and heir, William (r. 1035–87), defeating rebellious vassals at Val-ès-Dunes in 1047. Henry also supported the new count of Anjou, Geoffroi Martel (r. 1040–60), against his enemy Thibaut III of Blois (r. 1037–89), who had succeeded Eudes II. He also maintained his rights and control over the French church in the face of the reforming pope Leo IX (r. 1049–54), while avoiding a direct confrontation.

Henry concluded a new marriage in 1051, with Anne, the daughter of the Russian prince Jaroslaw III of Kiev (r. 1019–54). His heir, the future Philip I, was born in 1052, and Henry arranged for his coronation at Reims in May 1059. In his last years, Henry's deteriorating relations with William the Conqueror led him to invade the duchy twice, but he met defeat at Mortemer (1054) and Varaville (1058). Following his son's coronation, Henry arranged for a regency under Baudouin V of Flanders (r. 1035–67), the husband of

Henry's sister Adèle and the father-in-law of William the Conqueror. Soon afterward, the king died prematurely at Vitry-aux-Loges near Orléans (August 4, 1060).

# HENRY I

(1068–1135). As king of England (1100–35), Henry I played a significant role in French warfare and diplomacy, especially after 1106, when he took over the governance of Normandy. Although modern historians have sometimes characterized Henry's rule as harsh and oppressive, contemporaries were struck by Henry's peaceful reign over a land long accustomed to war.

Upon William the Conqueror's death in 1087, Normandy went to Henry's oldest brother, Robert Curthose, and England to the second brother, William II Rufus. Henry inherited 5,000 pounds of silver, out of which he purchased the Avranchin and Cotentin from Robert. King William's invasion of Normandy in 1091 forced Robert to cede captured land, including lands previously sold to Henry. But by 1092, Henry became the overlord of Domfront, which he used as his base to reconquer the Cotentin.

In 1096, Robert pawned Normandy to William and set off on crusade. As Robert was returning in 1100, William was killed in a hunting accident and Henry seized the throne. After trying for a year to capture the crown, Robert agreed to a treaty that recognized Henry as king while Henry renounced most of his Norman possessions. But Robert could not maintain order in Normandy, and when a French bishop wrote requesting help for oppressed Norman churches, Henry received justification for military action. In July 1106, he launched an invasion, and on September 28, in a pitched battle at Tinchebrai, Robert was captured.

Henry could not rest secure in his possession of Normandy. Robert's son, William Clito, also had a claim to the duchy, and Henry also had to contend with baronial revolts and hostile princes. War erupted in 1111 between Henry and Louis VI of France, who allied with the counts of Anjou and Flanders. By 1113, Henry was victorious and Louis was forced to recognize English overlordship in Maine and Brittany. Hostilities resumed in 1116, when Norman barons joined with France, Flanders, and Anjou to revolt in favor of William Clito. With the Flemish count killed in 1119, Henry secured peace with Anjou by marrying his son to Count Foulques's daughter. Defeated both in battle and by the English king's diplomatic skills, Louis complained to the pope about Henry's action, but Calixtus II sided with Henry and by 1120 Normandy was at peace.

Henry's only legitimate son, William, drowned in 1121, reopening William Clito's claim to Normandy. Although Henry suppressed Norman insurrection in 1123–24, Clito's position was strengthened by his marriage to Louis VI's sister-in-law and further enhanced when Louis named him to the Flemish countship. Clito was killed in 1128 while fighting to gain control of Flanders. Henry's second marriage proved childless, and

he named his daughter, Matilda, as his successor. Although Henry's barons swore to support her in 1127, they became disenchanted after Matilda married Geoffroi IV, count of Anjou, especially after the couple demanded Normandy in 1135. Matilda retained possession of Normandy after Henry's death but lost the crown of England to Henry's nephew Stephen of Blois.

# HENRY II

(1133–1189). King of England. The son of Geoffroi IV, count of Anjou, and Matilda, daughter of Henry I of England, Henry II ruled most of western France, yet despite the power at his disposal faced recurrent conflicts with his lord, the king of France, and his own family. Henry amassed his territories largely between 1150 and 1154, gaining Normandy by grant from his father in 1150 and Anjou by inheritance on Geoffroi's death in 1151. A year later, Henry added the duchy of Aquitaine to his possessions when he married its heiress, Eleanor, shortly after her marriage to Louis VII was annulled; in 1154, England came to Henry on the death of his rival, King Stephen. Louis VII of France organized a coalition to oppose Henry's growing power, but without success; the two kings were reconciled by 1154. Relations between them remained cordial for half a decade. In 1158, Louis betrothed his daughter Marguerite to Henry's eldest son (also Henry), and gave his blessing to Henry's attempts to exert control over Brittany, attempts that soon gained overlordship there for the English king.

This amicable relationship ended in 1159, when Henry asserted his wife's claim to Toulouse, whose count was brother-in-law to Louis. Louis stymied the attack by defending the town in person, setting off a wider conflict, which (despite an abortive peace made in 1160) dragged on until 1161. Henry then concentrated on tightening his grip on his continental domain, deposing the duke of Brittany, Conan IV, in 1166 and betrothing the duke's daughter to his son Geoffroi. In 1167, war between Henry and Louis broke out once more, caused mainly by Henry's intervention in a dispute over the county of Auvergne. Peace came in 1169, and Louis betrothed his daughter Alice to Henry's son Richard.

Henry's next serious conflict was with his family as much as his lord. In 1173, Eleanor and Henry's three eldest sons rebelled against him in alliance with Louis; the revolt took two years to put down. War with Louis threatened again in 1177, but the Treaty of Ivry

settled outstanding problems, submitting conflicting claims in Auvergne to arbitration. After Louis's death, Henry acted as a distant protector to his heir, Philip II. Further disputes among Henry's sons, largely over the plans for succession after his death, arose repeatedly from 1182, when a revolt in Aquitaine provided the spark. Adopting an anti-Angevin policy, Philip supported Henry the Young King and later Geoffroi against their father, but both sons died unexpectedly before much could be accomplished against Henry II. Philip went to war with Henry in 1187, demanding (among other things) Richard's marriage to Alice. Henry made a counteroffer: his youngest son, John, would marry Alice and receive all the French fiefs except Normandy, which with England would be Richard's. When Richard learned of this plan, he turned against his father and in 1188 allied with Philip; they made war on Henry in 1189. His health failing, Henry had nothing to gain by a war against his chief heir; he submitted on July 4 and died two days later.

# HENRY III

(1207–1272). In 1216, Henry III, eldest son of King John and Isabelle d'Angoulême, assumed the title king of England, lord of Ireland, duke of Normandy and Aquitaine, and count of Anjou. Even though his father had lost control of Normandy, Anjou, and much of Aquitaine, Henry III continued to press his claims both diplomatically and militarily to all these lands, which he considered his rightful patrimony. Largely unsuccessful, he finally acquiesced to much less in the Treaty of Paris in 1259, though he retained control over Gascony and as duke of Aquitaine was a peer of France. Thus, Henry III continued to be an important baron on the Continent.

Henry was only nine years old when he inherited what was left of his father's feudal empire. His regents were successful in ending the barons' rebellion in England, and Louis of France, son of Philip II Augustus, gave up his claim to the English throne and left the country. When Henry assumed control of the government in 1227, he held England, the Channel Islands, Gascony, and the island of Oléron and continued to try to regain the rest of the lands that he believed belonged to him. His military expeditions of 1230 and 1242 produced no long-term gains, while his diplomatic efforts did not force Louis IX to return the disputed territory. Finally, on December 4, 1259, Henry and Louis signed the controversial Treaty of Paris, in which Henry III recognized Louis's control over Normandy, Anjou, Maine, Touraine, and Poitou, while Henry retained the title duke of Aquitaine, for which he did homage to Louis. Henry's hold over Aquitaine, however, was limited to Gascony and Oléron. Several of Louis's concessions required negotiations over many years before they were useful to Henry. Within Gascony, some lords remained relatively independent of Henry's control. Also, Louis's role as Henry's liege lord allowed Gascons, unhappy with the settlement of disputes in Henry's courts, to appeal to

the Parlement de Paris. This recourse, first used immediately after the treaty's ratification, opened the way for increasing French royal intervention into Gascon affairs.

Henry III can be credited with two changes that strengthened his and his successors' control over Gascony. First, he began the development of a more efficient administration within the county. Second, when Henry gave control of this land to his heir, Edward, he did so with the stipulation that it never be separated from the crown.

# HENRY V

(1387–1422). During his ten years as king of England (1413–22), Henry made himself a major force in French politics. He abandoned the traditional Plantagenêt goal of simply guarding English possessions on the Continent and seriously attempted the conquest of France. The sources of this ambitious policy are found in the conjunction of his personal sense of his rights and his shrewd opportunism, when both Burgundians and Armagnacs invited his intervention in France. Henry astutely negotiated with both sides while preparing the invasion of 1415, which destroyed the illusion that he would merely be a tool of either faction. His brilliant campaign marked the military highpoint of the Hundred Years' War for the English. The capture of Harfleur and subsequent victory at Agincourt left France defenseless, the Armagnacs leaderless, and Henry persuaded that he could become king of France with Burgundian support.

Henry returned to France in 1417 with an army of conquest prepared for a war of sieges and organized to remain and garrison captured territories. In January 1419, the capture of Rouen secured Normandy, and by summer the English threatened Paris itself. Henry's combined strategy of warfare and diplomacy triumphed in the Treaty of Troyes (1420), which arranged his marriage to Catherine of France, designated him as regent for the unfortunate Charles VI, and proclaimed him heir to the throne. There after, Henry consolidated his hold on Normandy, sought taxes to make the French war self-financing, and pressed to the south in the fruitless search for a decisive victory over the troublesome forces of the dauphin, Charles. Despite the birth in 1421 of an heir to the dual monarchy, the future Henry VI, the Lancastrian edifice proved unstable, for it was built on French divisions that precluded a timely reconciliation. Henry remained dependent on the duke of Burgundy, and his army in Normandy came to be viewed as an occupying force

despite his best efforts to win acceptance as the legitimate ruler of the realm and of the duchy.

Henry's premature death of dysentery at Vincennes in 1422 ended a life of unfulfilled promise. However illusory his goals and ephemeral his achievements, he remains a legendary figure in French as well as English history. Neither as cruel as the French remember nor as chivalrous as the English imagine, he was a talented commander who seized a tragic moment in French history to become the most heroic of English monarchs. It would take the Valois a generation to reverse his magnificent accomplishments.

# HENRY VI

(1421–1471). The son of Henry V of England and Catherine of France, Henry VI of England was the unfortunate heir to his father's kingdom and conquests. He was born in fufillment of the hopes of the Treaty of Troyes. Within nine months, the deaths of his father and his grandfather made him the only Plantagenêt ever to be widely recognized as king of France. His uncle John, duke of Bedford, regent in France, could not preserve his throne despite Henry's belated coronation in Paris in the aftermath of that of Charles VII in Reims. By 1436, the reconciliation of Charles with the duke of Burgundy left Henry only the duchies of Normandy and Aquitaine as he came of age.

Henry's reign was marked by an admirable devotion to charity, factionalism in England, and a hopeless entanglement in a France he could neither govern nor abandon. Henry sought to reinforce his French position by releasing the duke of Orléans and by negotiating for an Armagnac marriage during the Praguerie, but his greatest success came later with his marriage in 1445 to Margaret of Anjou. The policy of reconciliation it represented having failed, Henry's reign as king of France ended in the disastrous campaigns of 1449–53, when he lost both his father's Norman conquests and his ancestors' duchy of Guyenne.

Henry's incapacity for government became unmistakable when he went insane in autumn 1453. Thereafter, he was little more than a tool in the hands of others. His formidable wife worked ceaselessly for their desperate cause, but Henry was deposed by Edward of York in 1461. Ironically, Margaret then won support from Louis XI, who felt that any prolongation of the Wars of the Roses would preclude English activity in France. However, neither Louis's diplomacy nor French military assistance under Pierre de Brezé

could salvage the Lancastrian cause. Restored briefly by Warwick in 1470, Henry was murdered shortly after the death of his son Edward at the Battle of Tewkesbury.

# HENRY OF GHENT

(ca. 1217–1293). Known as *doctor solemnis,* Henry was born at Ghent or Tournai and was regent master in theology at the University of Paris from 1276 to 1292. Although he was also canon of Tournai and archdeacon of Bruges and Tournai, he is best remembered for his active participation in the affairs of the university. An outspoken, independent thinker, Henry not only opposed the Averroists in 1277, but he differed with the Christian Aristotelianism of Thomas Aquinas. A proponent of Augustinianism, Henry attempted to restore Augustinian theology to the prominent place it once had held. Henry's version of Augustinian theology, however, was influenced by both Aristotle and Avicenna. For example, Henry proposed that prototypical ideas or essences were eternally produced by God or emanated from Him, but only by a free act of God did any of these essences achieve actual existence. Thus, by appropriating the Avicennan concept of emanation, Henry described a precarious relation between divine ideas, which exist eternally, and the act of creation, a relation that some of his contemporaries and successors regarded as a threat to the Christian doctrine of creation *ex nihilo.* Henry also held that truth could be known only through divine illumination. Although his ideas met with much criticism, his work influenced nominalism, shaping the thought of such notable theologians as Duns Scotus and William of Ockham. Henry was also opposed to the confessional privileges of mendicant orders; so fervent and extreme was his condemnation of mendicants that he was reprimanded in 1290. His principal works are his disputations, including disputations *de quodlibet,* held between 1276 and 1292.

# HENRY OF LANGENSTEIN

(Henry Heinbuche of Langenstein, Henry of Hesse; 1325–1397). An eclectic theologian, scholar, and mystic interested in scientific knowledge, Henry of Langenstein entered the University of Paris in 1358 and became regent master of arts there in 1363. He received the doctorate in theology in 1376. Drawn into the ecclesiastical struggle known as the Great Schism, Henry wrote perhaps the first treatise, *Epistola pacis* (1379), that recommended summoning a general council to resolve this conflict. A later work, *Epistola concilii pacis* (1381), set forth the theory of conciliarism and was addressed to secular princes, giving them implicit authority to summon a general church council. Henry then left Paris, perhaps exiled for his views, and lived at the Cistercian monastery at Eberbach, where he wrote *Speculum animae* (1382), a tract on mysticism. Henry was also keenly interested in the sciences. Before becoming a member of the faculty of theology, he wrote *Quaestio de cometa,* inspired by the comet of 1368, and *Tractatus contra astrologus conjunctionistas de eventibus futurorum* (1368). His theological writings also reveal this interest in the sciences. In 1393, Henry was invited to the University of Vienna to oversee its reorganization. While there, he wrote its constitution, translated hymns into German, and wrote numerous other works, including treatises on the church, a Hebrew grammar, and a vast exegesis on Genesis, *Lecturae super Genesim* (1385). Only a small part of Henry's writings have been published.

# HERALD/HERALDRY

. The term "herald" (OFr. *heralt* or *herau[l]t*) was applied from at least 1170 to men (down to ca. 1300 closely associated with minstrels) who specialized in matters associated with the tournament. From 1170 to 1500 and beyond, heralds were regularly sent forth to proclaim tournaments at various courts, returned with the replies of those challenged, and accompanied their lord, often at first in considerable numbers, to the place appointed for the combat. During the tournament, the heralds would announce the combatants as they entered the field, often praising their past performances, and would discuss their merits with fellow heralds and other specta-tors while each combat was in progress. Their need to be able to identify individual knights gave them a special interest in the cognizances, or "arms," whose use became general among knights between 1160

and 1220, and it is likely that they not merely encouraged the use of such cognizances among those who took part in tournaments but played an important role in designing them and in systematizing their use. From ca. 1250, some heralds kept books or rolls of arms, collected from various sources, to assist them in remembering the hundreds of distinct but often similar arms they encountered in their work, and from ca. 1300 a growing number wrote treatises on the subject. Thus, the word "heraldry" (OFr. *herau[l]die*), which designates the profession of the herald as a whole, came to be used more narrowly to designate the arcane "science" related to the design, description, analysis, and recognition of armorial bearings.

During the later 13th and early 14th centuries, the body of heralds gradually acquired the character of a professional corps, with distinct ranks and jurisdictions granted by the kings and princes who employed them. By 1276, England had been divided into territories presided over by men with the title "king of heralds" *(roi des herauts)* or "king of arms" *(roi d'armes);* a king of the heralds of France (in the narrow sense) is attested in 1318. Within his territory, or "march of arms" *(marche d'armes),* corresponding in France to one of a dozen great principalities or regions, the king of heralds was eventually given the task of overseeing all matters that touched on armorial bearings, nobility, and chivalry. Apprentice heralds were given the title "pursuivant (of arms)" *(poursuivant [d'armes]),* so that "herald (of arms)" became the special title of master heralds who were not yet kings. Like kings of heralds, who took their style from their march, after ca. 1330 simple heralds and pursuivants came to be given special styles at the time of their appointment, the former typically derived from the name of a town, the latter from some device. In 1406, the French heralds were formally united in a college under the presidency of Montjoye, king of arms of the March of France.

Down to 1330, the heralds of all ranks continued to be concerned exclusively with tournaments, but in the 1330s kings began to entrust heralds with diplomatic missions, bearing letters to foreign princes or instructions to ambassadors, and from 1425 they frequently led important embassies. As ambassadors, heralds came to enjoy important privileges and immunities and to constitute an internationally recognized order comparable with the clergy.

# HERBERT OF BOSHAM

(b. ca. 1120). Born in Bosham, Sussex, Herbert studied at Paris under Peter Lombard ca. 1150 and later edited Peter's *Magna glossatura* on the Psalter and the letters of Paul. After his studies, Herbert returned to England and entered the service of King Henry II

Plantagenêt. He was a member of the household of Thomas Becket when Becket became archbishop of Canterbury. Herbert shared Becket's exile to France (1164–70) and was one of the most ardent supporters of Becket's cause before and after the archbishop's death. Herbert was Becket's instructor in biblical and theological matters and wrote a Latin *vita* of the archbishop. Herbert was given a papal commendation to the position of provost in the cathedral of Troyes, but he seems not to have taken it up. He retired to the Cistercian abbey of Ourscamp as a lay resident in his old age.

Herbert of Bosham is known today for his literal commentary on the Psalms, a commentary based on the Latin translation by Jerome known as the *Hebraica,* so named because it was a fresh translation from the Hebrew. Bosham was greatly influenced by Andrew of Saint-Victor, with whom he may have studied and whose works he certainly knew, especially his emphasis upon the literal-historical sense of the biblical text and the use of Jewish sources for understanding that sense in the Old Testament writings. Herbert went beyond Andrew, however, for he was able to read texts in the Hebrew and thus had access to the written Jewish commentary tradition. He was probably the most accomplished Christian Hebraist (excluding converts from Judaism) between Jerome and the Italian humanists, such as Pico della Mirandola. He corrected Jerome's translation where he thought it necessary and recorded a number of Jewish exegetical points in his own commentary.

# HERENC, BAUDET

(fl. first half of the 15th c.) A native of Chalon-sur-Saône, Herenc composed ca. 1425 a refutation of Alain Chartier's *Belle dame sans merci*. This poem, apparently very popular (seventeen manuscripts extant), was known under various titles. In a printed version in the *Jardin de plaisance et fleur de réthorique,* its title is the *Parlement d'Amour*. In sixty-eight octosyllabic octets, Baudet describes a vision of a court of love in which the usual allegorical figures (Hope, Desire, Memory, Sweet Thoughts) condemn the lady for having dishonored "the wise and noble gentleman who is more perfect than any other creature" (f. 152 r°).

In 1432, Baudet composed the *Doctrinal de la seconde rhétorique*. Like other *arts poétiques* of the epoch, it contains a dictionary of spelling (containing some 2,700

words), a rhyming dictionary (6,000 words), and, most important, examples of various genres of lyric poetry, such as *lai, chant royal, serventois, pastourelle, sotte amoureuse,* ballade, rondeau, and *fatras.* Patterson considers the *Doctrinal* to be "the clearest, the most intelligent, and the best arranged treatise between the times of Deschamps and Molinet." In 1448, Baudet composed some ballades for Charles d'Orléans, none of which has survived.

# HERESIES, APOSTOLIC

. Among the most fervent and controversial forms of medieval Christian spirituality was the desire to live the *vita apostolica* ("evangelical life"), modeled on that of the followers of Jesus (Acts 1–4). This generally meant some combination of voluntary poverty, asceticism, manual labor, religious devotion, and preaching. In one sense, nothing could be more orthodox, and many of the most powerful movements of Christian renewal were so inspired. On the other hand, this earliest form of Christianity was too radical for most ecclesiastical structures; indeed, it was impossible for clergy to model themselves too closely on the apostolic life (i.e., living with women, equality of lay and cleric). More troubling, by apostolic standards ecclesiastical wealth and worldly power could be seen as signs of corruption, or worse. In some ways, then, the apostolic life suited laity better, and as such threatened clerical control of religious matters. But ecclesiastical efforts to discipline lay apostolic groups often provoked hostility and even an outright break with the church. In almost every case of an "apostolic heresy," a lay movement started out orthodox in both doctrine and practice but, through a dialectic of conflict with the clergy, came to see the church as the enemy of a true Christian life.

This conflict between lay and clerical interpretations of the *vita apostolica* centered on several interlocking issues, any of which could lead to heresy.

*Poverty.* The Apostles had held their goods in common and renounced any attachment to material well-being. This voluntary poverty, linked to a renunciation of power and status within society ("pauper" meant "powerless"), became the focus of class hostility: on the one hand, aristocrats who voluntarily gave up their wealth and social power drew devoted disciples and followers from among the populace; on the other, institutions that

waxed rich, whether the papacy or a successful monastic reform house, became associated with the corruption of filthy lucre. The stakes involved in poverty, when pushed to ideological extremes by groups like the Spiritual Franciscans, could lead to war of the "poor" against the rich and the clergy.

*Manual Labor.* Linked to poverty both by its social status and by its renunciation of the privileges of power, the emphasis on "earning one's bread by the sweat of one's brow" became a common refrain. Such an approach was not always apostolic—St. Francis and his followers took poverty to full-fledged mendicancy—but it formed the core of many lay apostolic communities, such as the béguines and Beghards. As such, it posed a threat to ecclesiastical claims embodied in the principle of the three orders: if all should labor and pray, what place is there for clerics who prayed full time and lived off the products of layfolk's labor?

*Preaching.* The main purpose of the original Apostles was to preach the gospel. But monks, committed to a cloistered apostolic life, could not preach; whereas the secular clergy, alone licensed to preach, were least likely to live the apostolic life and to espouse apostolic values. Pious laymen and laywomen, such as the Waldensians, bound neither by monastic vows nor by clerical commitments, could attract enthusiastic crowds to their sermons, thereby rousing the envy of a less charismatic clergy. The emergence of the preaching orders solved the need for more apostolic preaching in the face of heretical threats to the church. But the career of the Spiritual Franciscans illustrates how difficult it was to negotiate such a solution in practice.

*Sacraments and Salvation.* In its most extreme form, the apostolic life could lead beyond questions of discipline (preaching, clerical supervision) to that of the church's legitimacy. To some, the very act of living in an apostolic community was the guarantee of salvation; whereas the institutional church, with its sacraments and infant baptism, offered only empty motions with no salvific power. Such an attitude, which was still more extreme than Donatism (a 4th-century heretical movement in North Africa that held that ministers without grace could not validly administer sacraments), clearly took an "apostolic community" over into heresy.

There is little evidence of apostolic "heresies" in the early-medieval period, unless one so interprets such charismatic figures as the "False Christ" of Bourges (described by Gregory of Tours) and Aldebert. The early 11th century saw popular heretical movements and communities that some historians have interpreted as "apostolic"; the 12th century saw the spread of lay communities and movements, first in the preaching of wandering hermits like Henry of Lausanne and Peter de Bruys, later in the Waldensians, Humiliati, and Franciscans. By the 13th century, béguine and Beghard convents had spread throughout much of France and western Europe, providing women and men with an urban form of communal apostolic life. It is arguable that apostolic heresies are the core of most (and of the most successful) medieval popular heresies. On the other hand, they are not found only in "working class" circles; the apostolic ideal inspired some of the most learned thinkers of the high Middle Ages (John Wyclif, Marsilius of Padua, William of Ockham). Apostolic movements are occasionally contrasted with apocalyptic ones, but the original apostolic community was clearly inspired by a sense of the imminent return of Christ, and many subsequent ones were equally so inspired (e.g., Spiritual Franciscans, Hussites). Apostolic movements may in fact represent secondary apocalyptic movements, which, like the original Apostles, formed around an initial

disappointment, looking toward a later fulfillment of eschatological hopes. In some cases, such as the béguines of Provence, apocalyptic hopes may have produced the more extreme forms of lay apostolic life.

# HERESY

. Term derived from the Greek word for "choice" *(hairesis).* In the early church, the term came to indicate leaders or groups who "chose" rather than "received" their teachings about Christ: heresy was associated with pride rather than the humility and submission of the true Christian. But what were the true teachings? In early Christianity, a charismatic messianic movement with a moral rather than theological message, variations in teaching abounded. The first Christian centuries are marked by constant, often vicious, mutual accusations between groups, as the emerging institutional church attempted to enforce discipline under the principles of "one shepherd one flock" (John 10:16) and "there is no salvation outside the church." For the church, orthodoxy emerged victorious because of its direct links to the "apostolic tradition"; less partisan analyses suggest that orthodoxy was merely the most successful heresy (Bauer). Ultimately, the labels "orthodox" and "heretic" are political, applied by those with enough power to assert their will; rarely if ever would "heretics" call themselves that. Support of Christianity by the emperor Constantine (r. 307–37) transformed the situation: he demanded doctrinal and liturgical unity (hence the councils and creeds of the 4th century); and he introduced the use of state power to "discipline" dissidents. In the early 5th century, Augustine developed an ideology whereby errant Christians could be "compelled to enter the church" out of love for their souls, thus justifying official violence against heretics and schismatics.

Arianism alone of theological heresies survived the fall of Rome in the West, largely because the Goths and Burgundians had converted to it in earlier centuries. Thus, the Germanic kingdoms in southern Gaul, Spain, and Italy were ruled by an Arian and ethnic

elite, while the native population remained either Catholic or pagan. After his conversion to Catholicism in the mid-490s, the Frankish king Clovis invoked Arian heresy as a pretext to invade the Visigothic south. But over the next five centuries, despite occasional cases of theological dispute (Adoptionism, Predestination), the church was more concerned with paganism than heresy. The only signs of genuinely Christian dissent come from popular millenarian or apostolic movements that rejected the ecclesiastical hierarchy. The leaders of these groups, like the "False Christ" of Bourges or the prophetess Thiota, arose during periods of need and crisis and used the utopian imagery of imminent salvation and social revolution to mobilize the most basic of urges for liberation from current suffering among the peasantry.

Starting in the early 11th century, documents report incidents of "heretical communities," which, despite some purely elite (canons of Sainte-Croix at Orléans) or popular (peasant Leutard of Vertus) instances, most often seem to have united clergy and laity, aristocrat and commoner alike. The clerics who described these incidents, which range from Lombardy to Aquitaine to Orléans to Champagne and Arras, express alarm at a far-flung and deeply threatening movement. The execution of thirteen canons at Orléans in 1022 by order of King Robert the Pious marks the first time in the Latin church that someone had been executed specifically as a heretic. Despite the tenor of the sources, these earliest heresies are difficult to assess: they may be isolated idiosyncratic instances; they may be part of a larger movement with traveling "leaders." Their prosecution may have been limited to the known case of Orléans; or there may have been widespread, often vigilante, attacks on heretics in which some were killed "merely on account of their pallor" (i.e., they fasted). They may have been influenced by Bogomil preachers from the East, thus expressing dualist tendencies. Many seem to be indigenous movements inspired by some combination of the apostolic life, a rejection of the ecclesiastical and social structures of the day, and a response to the failure of the Peace movement and to the passing of the year 1000. In any case, they all seem marked by strong ascetic tendencies (no meat, sex, or property), iconoclasm (no crucifixes, relic cults, or elaborate liturgies), and a rejection of the ecclesiastical means of salvation (baptism, eucharist).

After the mid-11th century, however, popular heresy all but disappeared for the next half-century. This is explained in part by the appeal of the Gregorian Reform movement within the church, which mobilized great popular support and inspired many potential "heretics" to join. Certainly, the case of the radical and violent Patarines in Italy and that of Ramirhardus, burned as a heretic by the clerics of Cambrai only to be proclaimed a martyr by Pope Gregory VII, illustrate the way in which behavior that would have been deemed heresy by early 11th-century clerics was encouraged by a church dangerously close to Donatism. Perhaps, as well, the more committed "heretical" communities went underground, or, in the case of the hermits, literally into the woods.

Whatever the case, this hiatus was temporary. Beginning in the early 12th century, "heresies" reappeared. These new expressions of religious zeal differ from earlier cases in that they are at once more aggressive and less radical in their rejections of the church. Inspired by a desire for the apostolic life, charismatic preachers, often "returning" hermits, invoked the values of the papally led Gregorian Reform movement—purification of the church and the life of its clergy. But now that the papacy had shifted from its radical reform program into an ongoing struggle with lay rulers over matters like

investiture, these same ascetics, their criticism intensified by a sense of betrayal, found themselves outside the bounds of propriety. In some cases, apostolic preaching led to the formation of new religious orders; in others, the matter of heresy lay closer to hand (e.g., Robert d'Arbrissel); and in some, the criticism of lax clergy moved toward a rejection of the church as an institution (Henry of Lausanne, Peter de Bruys). Generally, the more "orthodox" movements tended to withdraw from society and live in cloistered apostolic communities; the more "heretical" tended to proclaim their criticisms of the church to large, agitated crowds.

The most dangerous and widespread of "heresies" in medieval France was that of the Cathars. Unlike earlier cases, the Cathars developed an independent ecclesiastical structure with bishops, cult, sacraments, and ranks of faithful—the latter divided into auditors, believers, and elect or *cathari* ("pure ones"). The first sign of this alternative church appeared in the Rhineland (1143) and rapidly spread throughout western Europe. Celibate, the elect refused any products of copulation, such as meat and milk. Influenced by Bogomil missionaries from Bulgaria, Cathar doctrine was at once apostolic and dualist, viewing the material world (and hence the God of the Old Testament, who created it) as part of the realm of evil. Jesus had a brother, the fallen angel Satan, with whom he was locked in a deadly battle.

The new sect's absolute rejection of the Catholic church, and its facility at gaining not only actual converts but also a broad base of sympathizers among the population, posed a particularly grave threat. In response to persecution in northern France and Germany, Cathars migrated to the more tolerant south of France (site of open debates between Catholic and Cathar preachers), where they had great success among commoners and lay nobility alike. By the end of the 12th century, they constituted a majority in some regions, and the efforts of the papacy and Cistercian abbots to win back the faithful through preaching failed. Even St. Dominic, whose career began with bringing a Cathar back to the church, and who adopted poverty specifically to debate more effectively with Cathars, failed to bring about lasting results. The papacy was prompted to take extreme actions, including the launching of the Inquisition with the papal bull *Ad abolendam* in 1184 and the calling of a crusade in 1208. It was in the aftermath of this war that the papal Inquisition sought to root out the remaining Cathars systematically. In 1244, some 200 were captured at Montségur and burned; but as late as the 15th century, they were still to be found in the Pyrénées (Montaillou) and the western Mediterranean.

Despite the clear-cut doctrinal aberrations of Catharism (some analysts consider it another religion entirely), the basis of most "popular" heresy, where illiterate commoners play a significant but not exclusive role, in medieval France was the split between the egalitarian tendencies of apostolic Christianity and the hierarchical structure of a wealthy and powerful church tied politically and socially to the dominant aristocracy. This traditional configuration, when undermined by the economic changes of the high Middle Ages—rapid urbanization, monetization, commercialization, rise of an urban proletariat, spread of vernacular literacy—made an anticlerical, communitarian Christianity highly appealing to lay folk from the lower classes. The "textual communities" based on evangelical passages provided structure in a changing world and put forth a critique of the powerful, whether nobles, merchants, or prelates.

In the case of "popular heresies," then, the real issue was not doctrinal but social: a generic Donatism (i.e., lay hostility to clergy deemed insufficiently "pure") could, when

rebuffed by a clergy intent on maintaining both its religious monopoly and its secular interests, drive the laity to reject sacraments altogether. The Waldensians illustrate both the dangers of lay preaching and the use of vernacular Bibles: doctrinally orthodox, their conflicts with secular clergy eventually led the church to view them as "heretics," while they came to view the church as the "Whore of Babylon." The béguines and Beghards illustrate how even a lay, quietistic movement, willing to submit to clerical supervision, could eventually become entangled in ecclesiastical rivalries (friars vs. regular clergy) and the internal logic of its own mysticism. Both groups, like the Franciscans, eventually split into orthodox and heretical sects.

The Capuciati exemplify the intimate mix of politics and religion, of lay religiosity and social revolution. In 1182, responding to an infestation of brigands in the wake of the Plantagenêt-Capetian wars, a carpenter from Le Puy named Durand Dujardin had a vision of the Virgin telling him to form a brotherhood of peace. This confraternity of humble men who wore white hoods *(capuciati),* rapidly grew in number and spread throughout the central and southern provinces of France. Monastic chroniclers praised the movement and admired the piety of these common laymen; and both lay and ecclesiastic nobles supported them. Within a year, the sworn Peace militias of the Capuciati had defeated several armies of brigands, slaughtering thousands. But flushed with success, the Capuciati extended their definition of plunder to include prelates and nobles who exploited their serfs: they served notice that no lord should demand any exaction beyond his legal due and eventually invoked Adam and Eve as proof that all men should be free and equal. The church rapidly turned against them; chroniclers denounced their raging madness and heresy; and the lay nobles allied with the remaining brigands to wipe them out. They did not survive long enough to be condemned officially by the church as heretics, although the papal bull *Ad abolendam* (1184) seems to allude to them.

Along with these popular heresies, the rebirth of intellectual life, particularly at the University of Paris, produced its own strain of learned heresies. The earliest such case may be the teachings of Berengar of Tours, a product of the school at Chartres who used grammar and dialectic to question the nature of the eucharist in the mid-11th century. Peter Abélard's aggressive dialectical approach to Bible and Creed provoked the wrath of Bernard of Clairvaux, who had Abélard's teachings condemned and burned at the Council of Sens (1140). With the absorption of Aristotle in the 13th century, conflicts between reason and revelation, or philosophy and theology, intensified. Siger de Brabant argued for the doctrine of "double truth" (something can be true in theology but false in philosophy) and articulated a dangerous cosmology: the eternity of the world and the unity of intellect of all humanity denied key church teachings on the Last Judgment and the eternity of the individual soul, which will be rewarded or punished according to its deeds.

The 13th century witnessed the great battle between heresy and orthodoxy on all levels. The Inquisition emerged in the aftermath of the Albigensian Crusade, promulgated by the pope and manned by the new preaching orders, the Dominicans and Franciscans (1229–33). Rapidly spreading and developing their techniques (e.g., torture in 1252), inquisitors sought out and persecuted "heresy" in the most remote places, as at Montaillou. Even a (future) pillar of orthodoxy like Thomas Aquinas had his work condemned and burned in 1277. The aggressive approach of the Inquisition seems to have eliminated the more extreme forms of religious dissent, or at least driven them into

hiding. Nevertheless, Waldensian strongholds, particularly in the Massif Central, survived for centuries, providing a welcome soil for the spread of Protestantism in the 16th century.

According to R.I.Moore, the inquisitorial approach derived from "new" bureaucratic elites intent on expanding their power. By rallying society against groups branded impure and dangerous, officials created a sense of beleaguered community that they alone could protect. So successful was this technique that where no real groups existed it was convenient to invent them, targeting marginal groups like Jews, lepers, homosexuals, and single women. The impression that the sources give—that the clergy tried unsuccessfully to restrain rabid mobs infuriated by religious dissidents—may be a mirage. On the contrary, it was the sympathy that apostolic heresies (and even Jews) elicited among the populace that drove the clergy to action against them.

# HERISTAL

. On the Meuse about six miles northeast of Liège, Heristal (modern Herstal) was one of the residences of the Carolingians. The Meuse Valley, a region of many lands belonging to the Pippinid ancestors of the Carolingians as well as to many of their aristocratic supporters, was the center of their early power. Pepin II is sometimes called Pepin of Heristal. It was the principal residence of Charlemagne until 784 and sometimes the site of general assemblies of the Franks, one of which produced the Capitulary of Heristal (779).

# HILDEBERT OF LAVARDIN

(1055/56–1133). Hildebert was born at Lavardin, near Vendôme, but little is known about his early years. In 1091, he was appointed director of the cathedral school at Le Mans, and in 1096 he was elected bishop of Le Mans. Hildebert's ecclesiastical career was fraught with political conflicts. In 1099, for example, William II Rufus, king of England and duke of Normandy, forced Hildebert into exile in England, claiming that the bishop had used his office to launch an attack against William's castle in Le Mans. Hildebert returned to Le Mans in 1100 after William's death. In 1125, he was elected archbishop of Tours. Although much that has been attributed to Hildebert is spurious, he nevertheless left behind a significant body of work that attests to his literary accomplishments. His best-known prose works, however, do not reveal great originality. His *Vita sanctae Radegundis,* for example, is a revision of an account by Fortunatus, whom he credits as his source. *De querimonia et conflictu carnis et spiritus seu animae* is modeled on Boethius's *De consolatione Philosophiae.* More successful as a poet, Hildebert displayed both originality and versatility in his verse. His poems include an account of his exile in England, a eulogy to Berengar of Tours, and descriptions of Rome inspired by his three visits to that city. Using his vast classical knowledge to illustrate religious themes in his poetry, Hildebert is an important representative of the Christian-Latin culture that began to develop at the close of the 11th century.

# HILDUIN OF SAINT-DENIS

(ca. 775-ca. 855/59). Born of noble parents (his aunt was mother of Louis the Pious), Hilduin was abbot of Saint-Denis near Paris from 814 and then became archbishop of Cologne (842–50) and chancellor of the German emperor Lothair I (843–55). Hilduin studied with Alcuin and was among the scholars associated with the court school of Charlemagne. Hilduin in turn was the teacher of Walafrid Strabo and Hincmar of Reims. Hilduin wrote a *vita* of St. Denis, the patron saint of his monastery *(Passio sanctissimi Dionysii),* in which he identified Denis the martyr with Dionysius the Areopagite, who was converted by St. Paul in Athens; moreover, he identified that Dionysius with an author now known as Pseudo-Dionysius the Areopagite, the author of an important corpus of mystical writings. During his abbacy at Saint-Denis, Hilduin translated from Greek into Latin a manuscript of the works of Pseudo-Dionysius the Areopagite that had been sent to Louis the Pious by the Byzantine emperor Michael the Stammerer in 827. This rather rough translation was replaced by one made later in the century by Johannes Scottus Eriugena.

# HINCMAR OF REIMS

(ca. 806–882). Carolingian ecclesiastical leader, canonist, and theologian. Educated at Saint-Denis under Abbot Hilduin, who introduced him to the court of Louis the Pious, Hincmar served as archbishop of Reims from 845 to 882 and as political adviser to Charles the Bald ca. 850–76. Hincmar's consecration as archbishop was contested by his predecessor, Ebbo of Reims, who had been deposed in 835. This controversy was typical of Hincmar's involvement in ecclesiastical politics, which included disputes involving popes Leo VI, Nicholas I, Adrian II, and John VIII. Hincmar was a major presence at the condemnation of Gottschalk at the Synod of Mainz in 848. One of Hincmar's works, *Ad reclusos et simplices,* is a refutation of Gottschalk's views on predestination. His most famous work, *De divortio Lotharii,* is a reprimand to Lothair II about his separation from

Queen Tetberga. Hincmar also wrote against Lothair's appointment of a candidate to the bishopric of Cambrai and generally upheld the rights of bishops in ecclesiastical appointments. Although known mostly for his political activities, Hincmar also wrote a treatise on the palanquin of Solomon (Song of Songs 3:9–10) which seems to comment on a *carmina figurata* of these verses, making use of a good deal of numerical symbolism.

# *HISTOIRE ANCIENNE JUSQU'À CÉSAR*

. Written by an anonymous clerk from Lille ca. 1208–13, the *Histoire ancienne jusqu'à César* was the first universal history in Old French. It covers events from the creation of the world to the invasion of Flanders by Julius Caesar. Based on the historical books of the Old Testament, on Orosius's *Historia adversus paganos,* and on the Old French Romances of Antiquity, the text exists in two versions: at the end of the 14th century, the second redaction suppresses the story of Alexander the Great and adds an extensive account of the Trojan War drawn from Benoît de Sainte-Maure. The *Histoire,* found in over sixty manuscripts, inspired such writers as Christine de Pizan; in many manuscripts, it precedes the *Fet des Romains*. It has been attributed without cause to Wauchier de Denain.

# HISTORIOGRAPHY

. Medieval French historical writing can be divided into two periods. In the 6th through 11th centuries, histories were produced at centers of literacy for various reasons: to continue old works, to imitate historical exemplars, to please a patron, or to assimilate unusual events. Relatively few early works survive, and most are monastic and idiosyncratic in method and content. After the mid11th century, increased literacy and dependence on written texts brought about a revolution in historical writing. Histories continued to be produced for the old reasons, but new circumstances gave rise to new sorts of narratives written for new audiences by new types of historians in both Latin and the vernacular. In this period, a *culture historique,* to use Bernard Guenée's phrase, emerged.

Although there were historians in France before the Franks arrived—e.g., Prosper of Aquitaine (ca. 455) and Sulpicius Severus (d. 410)—French historical writing really begins with Gregory of Tours (ca. 538–594). His *Histories* is a narrative attempt to come to terms with the impact of the Franks on Christian, Gallo-Roman society. Gregory's other works were largely hagiographic, in keeping with his ecclesiastical focus.

The next Frankish histories, the chronicle of "Fredegar" (covering the years 584–642) and the *Liber historiae Francorum* (covering 640–721) appeared after a century's hiatus. The former was composed in Burgundy, probably ca. 658–60; the latter was written ca. 726 in Neustria. Shortly thereafter, the two chronicles came to Austrasia, where they were interwoven and continued to 751 for Charles Martel's brother and nephew; this compilation is the first "official" Frankish history.

Martel's descendants learned the lesson that whoever sponsored history controlled its contents. The *Annales regni Francorum* (covering 741–829) were probably kept at Charlemagne's court, while his descendants maintained the three continuations. The first part (for 741–835) of the West Frankish continuation, the *Annales Bertiniani,* was not official, but the second (for 835–61), written by Bishop Prudentius of Troyes, and the third (for 862–82), by Archbishop Hincmar of Reims, were, as were the *Annales Xantenses* (covering 790–873), which were partly composed at Aix-la-Chapelle by Gerward, the palace librarian. The East Frankish continuation, the *Annales de Fulda,* was official until 882. Also official were the *Historiarum libri quatuor* of Nithard (d. 844), a layman who wrote at the request of Charles the Bald. The learned environment promoted by the Carolingians contributed to the generation of unofficial histories as well. Frechulf of Lisieux (fl. 825–52) and Ado of Vienne (d. 874) both produced universal chronicles that were learned and extensive, and most Carolingian monasteries kept simple annals, even if many just copied annals that came to hand.

Greater learning also led historians to rediscover biography. The classical biographical tradition was imitated in Einhard's *Vita Caroli* (ca. 830/33) and Paschasius Radbertus's *Vita Adalardi* (after 826) and *Epitaphium Arsenii* (ca. 850). Not all biographies were classicizing, however; the *De Carolo Magno* of Notker the Stammerer (ca. 884/87), for example, is a hodgepodge of fantastical and largely ecclesiastical anecdotes. Charlemagne was celebrated in the *Annales gestis Caroli magni imperatoris* of the Poeta Saxo (late 9th c.) and the *Carmen de Karolo Magno* (ca. 801) attributed to Angilbert of Saint-Riquier (both in verse); Louis I appeared in biographies by Thegan (ca. 848), the

Astronomer (after 840), and Ermold Nigel (825–35). The serial biography, the lives of a series of bishops or rulers, was introduced in France ca. 784 by Paul the Deacon in his *Gesta archiepiscoporum Mettensium* (the form is based on the *Liber pontificalis*). It was imitated widely, giving rise to serial biographies of the abbots of Fontanelle (834–45) and of the bishops of Le Mans (832–63), Auxerre (873–76), and Verdun (first redaction ca. 917), among others.

The Viking invasions slowed historical production in France. Reims alone was still active in the 10th century. Flodoard (893–966), the diocesan archivist, wrote a history of the church of Reims and continued the *Annales Bertiniani;* his chronicle was carried forward by the annals of Reims (to 999). Flodoard's work was also a source for Richer de Reims's regnal history of France (ca. 996). Safe from Viking attacks, the historians of Reims documented the chronic political instability of the see, while adding to Hincmar's legacy.

With the Viking threat abating by the 11th century, histories appeared at new regional centers. Saint-Martial in Limoges became active, producing the splendid chronicle of Adémar de Chabannes (988–1035) and annals (to 1060). At Fleury, Abbo (d. 1004) composed a brief serial biography of the popes. His disciple Aimoin wrote Abbo's biography (*Vita Abbonis,* ca. 1005/08), the *Historia Francorum* (a history of the Franks to 654, written ca. 997–99), and Books 2 and 3 of the *Miracula sancti Benedicti*. Helgaud of Fleury (d. 1048) produced a life of Robert II and a history of Fleury, and André de Fleury wrote a biography (ca. 1041) of Abbot Gauzlin. This Fleuriac flurry of history appeared in part to help the monastery claim its independence from the bishops of Orléans. In Normandy, the first historian, Dudo de Saint-Quentin, wrote a serial biography of the first Norman dukes, the *De moribus et actis primorum Normanniae ducum* (ca. 1015–26), concentrating on the conversion of the Normans. A half-century later, Guillaume de Jumièges abridged, secularized, and continued Dudo's work through the Norman Conquest in his *Gesta Normannorum ducum* (1071). Guillaume de Poitiers composed a laudatory biography of the Conqueror ca. 1078, the *Gesta Guillelmi,* using Guillaume de Jumièges as a source. The Conquest inspired the last two histories and probably also encouraged Norman monasteries to begin keeping annals around the same time.

Once established, a regional center might maintain its historiographic vitality for centuries. For example, Saint-Columba in Sens began to keep annals in the 9th century. In the 11th, Odoranus of Sens composed a chronicle, a life of the founder of Saint-Pierre-le-Vif, and a history of that monastery. Around the same time, the *Historia Francorum Senonensis* (1015/34), a chronicle based on the earlier annals of Sens, was created. A century later, Clarius began the chronicle of Saint-Pierre-le-Vif (1108–24). Richer de Sens picked up the Senonais tradition after 1254 with his *Gesta Senoniensis ecclesiae,* while Geoffroi de Coulon continued the tradition at Saint-Pierre with a chronicle (to 1295). These works circulated, spawning new historiographic traditions elsewhere.

By the beginning of the 12th century, this regional pattern was supplemented by broader works. The First Crusade (1095–99), perhaps because it was seen as being triumphantly French, sparked an outpouring of historical writing not confined to any one region. The four surviving accounts of the crusade, the *Gesta Francorum et aliorum Hierosolymitanorum* (ca. 1101), 1101), the *Historia Francorum qui ceperunt Jerusalem* of Raymond d'Agiles (after 1102), the *Historia Hierosolymitana* of Foucher de Chartres

(begun ca. 1101), and Peter Tudebod's *Historia de Hierosolymitano itinere* (before 1111), were read and then reworked, particularly the anonymous Gesta; Baudri of Bourgueil's *Historia Hierosolymitana* (ca. 1107), Robert le Moine's *Hierosolymitana expeditio* (before 1107), and Guibert de Nogent's *Gesta Dei per Francos* (ca. 1108) were all based on the anonymous *Gesta*. The Pseudo-Turpin chronicle, a 12th-century, pseudohistorical, Latin *Chanson de Roland,* was also probably inspired by the First Crusade. Nor did interest in the crusade cease as it receded in time. Raoul de Caen, a Norman-trained cleric, wrote the *Gesta Tancredi* (after 1112) about Norman exploits in the Middle East. Book 9 of Orderic Vitalis's *Historia Ecclesiastica* is devoted to the crusade. Albert d'Aix wrote the postcrusade history of the Middle East (after 1120), as did Gilo and Fulco in their verse history (mid-12th c.).

Regional histories continued to flourish alongside these broader works. Norman writers were still active. Orderic's *Historia Ecclesiastica* is a universal history from Creation to 1141, but Anglo-Norman affairs predominate after Book 2. Orderic also interpolated Guillaume de Jumièges's work. New histories appeared at Bec; Robert de Torigny wrote a *Gesta* of the abbots, added an eighth book to Guillaume de Jumièges, and began a major chronicle based on the universal chronicle of Sigebert de Gembloux (d. 1112). When Robert became abbot of Mont-Saint-Michel in 1154, he reactivated the local annals and commissioned Guillaume de Saint-Pair to write his French *Histoire de Mont-Saint-Michel* (before 1186). This activity was for the most part not directly inspired by the dukes. Instead, it seems that the Norman historiographic tradition was sufficiently vital to generate new works on its own, though Étienne de Rouen's *Draco Normannicus,* a polemical Latin verse history of Normandy, was written specifically to influence the policy of Henry II of England.

Ducal patronage was clearly behind historical writing in Anjou, however, where the first history is a fragment written by Count Foulques le Rechin (d. 1109). Odo of Marmoutier began the *Gesta consulum Andegavensium,* an unofficial work, at roughly the same time. The *Gesta* was reworked under official auspices; the last versions were done by Jean de Marmoutier (ca. 1170), who dedicated the works to Henry II of England. Where dukes led, kings followed. As part of their efforts to establish their house, the Capetians, too, sponsored history. Abbot Suger (1081–1151), author of the Latin *Vita Ludovici grossi regis* and the unfinished *Vita gloriosissimi Ludovici,* had no formal title, but Rigord, writing at Saint-Denis toward the end of the century, was proclaimed royal chronicler for his *Gesta Philippi Augusti* (ca. 1196). His successor, Guillaume le Breton, author of his own account of Philip II, was also an official historian. From the 13th century on, the Capetians made steady use of Saint-Denis, having learned the old lesson about the value of historical publicity.

While it might seem more suitable to keep royal historians at court, monasteries were still better fit to produce history than anyplace else because of their records and libraries; Saint-Denis was a favorite spot for historical research. Consequently, monasteries continued to produce major historical works: the chronicle of Sigebert de Gembloux (a continuation of Jerome's translation of Eusebius); Robert d'Auxerre's chronicle (1181–1211), which came to supplant Sigebert's; Aubri de Trois-Fontaines's chronicle (1227–51); and Guillaume de Nangis's great chronicle (1285–1300), which supplanted Robert d'Auxerre's in popularity, were all monastic productions.

Nevertheless, the schools of the 12th century, the universities of the 13th, and the friars left their marks on historical writing. The *Historia scholastica* of Peter Comestor (ca. 1169), a biblical history, was intended expressly to assist theological study in the schools. Jacques de Vitry (1160/70–1240), author of the *Historia Hierosolymitana abbreviata,* was a student at Paris under Peter the Chanter. Vincent de Beauvais's enormous universal history, the *Speculum historiale* (1244–60), was the typically scholastic project of a university-trained Dominican; Géraud de Frachet (d. 1266), another Dominican, wrote the *Vitae fratrum* and a universal chronicle based on Robert d'Auxerre, which enjoyed significant unmerited success. The famed Dominican inquisitor Bernard Gui was also a historian; his *Flores chronicorum* (1306–31), a universal chronicle, and the *Reges Francorum* (1312 and 1320) were widely read and translated. To the scholastics, that history had its uses was self-evident.

But not only scholastics and monks felt so; the popularity of vernacular history indicates that laypeople agreed. The earliest examples of vernacular history, the *Brut* (now lost) and *Estoire des Engleis* of Geffrei Gaimar (ca. 1140), the *Brut* (ca. 1155) and *Roman de Rou* (ca. 1160–70) of Wace, the *Chronique des ducs de Normandie* (ca. 1170) and *Roman de Troie* of Benoît de Sainte-Maure, are in verse. So were the *Estoire de la guerre sainte* (ca. 1195), an account of the Third Crusade by Ambroise d'Évreux, and the Crusade Cycle: the *Chanson d'Antioche* and the *Chanson des chétifs* (both reworked in the late 12th century by Graindor de Douai) and the *Conquête de Jerusalem* (ca. 1130). Occitan verse was preferred by Guilhem de Tudela for his *Chanson de la croisade contre les Albigeois* (ca. 1212–13). But by the Fourth Crusade, vernacular historians began to prefer prose, since verse, associated as it was with epics and romances, seemed untruthful. Geoffroi de Villehardouin and Robert de Clari, both writing about the Fourth Crusade, were among the first to write in prose, as did Villehardouin's continuator, Henri de Valenciennes. Geoffrey and Robert were laymen as well; vernacular composition enabled significant numbers of laypeople to read and write history for the first time. However, prose history never completely effaced poetic history, for Geoffroi de Paris, writing ca. 1317, composed a chronicle of his own times in verse.

The audience for vernacular history was sophisticated in its tastes. Highly learned works, such as those of Peter Comestor and Vincent de Beauvais, were quickly translated. Classical history also became available in the form of the anonymous *Fet des Romains* (ca. 1213/14), the *Histoire ancienne jusqu'à César* (ca. 1208–13), and the *Histoire de Jules César* of Jean de Thuin (ca. 1240). These works, all prose, were adaptations and translations of the work of classical historians, notably Lucan. Bernard Gui's histories appeared in French ca. 1368 in Jean Golein's translation. But the choice of language did imply a particular audience. It was thus natural for Guillaume de Puy-Laurens, the chaplain of Count Raymond VII of Toulouse but also an envoy to Innocent IV, to write his *Historia Albigensium* (ca. 1273) in Latin to reach an international audience, while it was equally natural for the anonymous authors of the French verse *Chronique de Saint-Magloire* (after 1307) and the *Petit Thalamus de Montpellier,* an Occitan civic chronicle probably begun in the 14th century, to write in the language of their anticipated audiences.

The existence of these separate audiences meant that there was always a need for histories in both Latin and the vernacular. The *Grandes chroniques de France,* created ca. 1274, are Primat's French translation of the Latin chronicle of Saint-Denis; the *Grandes*

*chroniques* were then kept in their own right. But the existence of the vernacular text did not mean the monks stopped writing the Latin chronicle. Indeed, both chronicles might be kept by the same person, as was the case with Jean Chartier's (d. 1464), and both were official. Vernacular writers often based their own work on Latin originals or consulted Latin sources. For example, Jean Jouvencel, writing in 1431, abbreviated and translated the Latin chronicle of Saint-Denis, while Guillaume de Nangis (d. ca. 1300), who wrote his long and short chronicles and biographies of Louis IX and Philip III in Latin, translated the short chronicle into French himself. But Latin writers also consulted and sometimes translated vernacular works. Francesco Pippino (d. 1325) translated the *Livre d'Eracles* (ca. 1230), an unwieldy compendium of Middle Eastern history, into Latin for use in his universal chronicle. Historical writing was greatly enriched by this interplay of traditions and languages.

By the later Middle Ages, the habit of writing history was so deeply ingrained that history was written everywhere. Naturally, in a traditional culture in which the past was normative, it continued to be important to control the presentation of the past. Most courts had official historians, frequently the court archivists. The royal court continued to be a major market for history, hence the seven biographies of St. Louis, by Geoffroi de Beaulieu (ca. 1274), Guillaume de Chartres (before 1282), Gilo de Reims (now lost), Guillaume de Nangis (late 13th c.), Jean de Joinville (1272 and 1298–1309), Guillaume de Saint-Pathus (ca. 1302/03)—in both Latin and French—and an anonymous hagiographer of Saint-Denis (ca. 1297), all composed around the canonization process. Royal chroniclers were regularly appointed, sometimes monks from Saint-Denis and sometimes outsiders, such as Jean Castel (1463–76). Even histories that were not directly commissioned by the royal court were written with an eye to publication there. Guillaume Guiart's *Branche de royaulx lignages,* a verse history of the French kings from Philip II (ca. 1306/07), was researched at Saint-Denis and clearly intended for a court audience. Christine de Pizan (1363-ca. 1429) wrote a prose biography of Charles V, which would have interested the court, as well as other works, such as her verse universal history, with a broader appeal. Likewise, the historical works of Gilles le Bouvier (1386-ca. 1455), the Berry Herald, the *Chronique du roi Charles VII,* the *Histoire de Richard II,* and the *Recouvrement de Normandie,* were probably written with the court in mind; Gilles also kept the *Grandes chroniques* for a time (1403–22).

Nowhere was the desirability of controlling history clearer than in the battle between the kings of France and dukes of Burgundy in the 15th century, which turned into a battle of the historians. Pierre le Fruitier dedicated his *Mémoires* (ca. 1409) to the king of France, although he was probably a Burgundian spy at the court, while Jean Mansel wrote his *Fleur des histoires* (before 1454) for Philip the Good. Both Georges Chastellain (1415–1475), author of a chronicle, and Olivier de La Marche (1425–1502), who wrote memoirs, were appointed official historians to the Burgundian dukes. Enguerrand de Monstrelet's chronicles (before 1453) have a Burgundian point of view; Thomas Basin, exiled bishop of Lisieux, wrote pro-Burgundian biographies of Charles VII and Louis XI (1461–91) However, Matthieu d'Escouchy, Enguerrand's continuator (ca. 1465), was a royal procurer in Saint-Quentin, and Philippe de Commynes, a Fleming, favored in his *Mémoires* (after 1489) the French kings he had come to serve.

Even lesser courts generated histories. Lambert d'Ardres wrote his *Historia comitum Ghisnensium* (ca. 1194) for the seigneur of Guines, chronicling the family's history from

the 10th century. It is particularly valuable for the light it sheds on nobility and family in the 11th and 12th centuries. Baudouin d'Avesnes, grandson of Baudouin IX of Flanders, commissioned the major French prose omnibus in the 13th century that bears his name. Jean d'Outremeuse (d. ca. 1400), author of a historical poem, the *Geste de Liège,* and a prose history, the *Myreur des histors,* was an official of the count-bishop of Liège. Michel de Bernis wrote a chronicle of the counts of Foix (first edition 1429), as the introduction to his inventory of their archives.

It would be a mistake to see all histories of the later Middle Ages as being created totally by patronage. A more cultivated society meant more room for individual expression. The process really begins with Joinville, who began his memoirs of Louis IX before he was commissioned to write. His writing expresses aristocratic values in an age when these seemed increasingly threatened. Jean le Bel's *Vrayes chroniques* (ca. 1357–70), which concentrate on chivalric deeds far from his native Liège, and Froissart's *Chroniques* (1369–1400), inspired by Jean le Bel, similarly illustrate aristocratic ideals—heroism, the glory of war, valor, courtesy—rather than political truths, The *Livre des faits du bon messire Jean le Meingre, dit Bouciquaut* (ca. 1408) and Cuvelier's *Chronique de Bertrand du Guesclin* (ca. 1385) are both moral exemplars, accounts of men widely considered by their contemporaries to have been perfect knights.

The fitting end to this process was the rise of memoirs, the most personal historical works. Memoirs, particularly those of Philippe de Commynes, exemplify the new turn history was taking in the 15th century. Commynes was not the first to write memoirs: he was preceded by Jean de Joinville, Jacques du Clercq (1448–67), Pierre le Fruitier, and Olivier de La Marche, but his memoirs represent something new in France. To Commynes, history was as much moral instruction as a record of the past, an object lesson for the ruler and the citizen. For precisely those reasons, the humanists were urging the teaching and study of history. Commynes's work thus marks the transition from the medieval to the Renaissance view of history.

# HISTORY PLAYS

. One of the primary functions of the theater in late-medieval society was to preserve the memory of significant events by reenacting them in public spectacles. Providing a vivid picture of humankind's origin and destiny, history plays were a mirror in which both the individual and the society found their identities confirmed.

In the Middle Ages, the history of the world was seen as the working out of a divine plan for salvation in a temporal span lying between Creation and Doomsday. In this view, the most important historical events were those recorded in the Bible. Most history plays from the period consequently are dramatizations of biblical events. Because of the centrality of salvation in the medieval concept of history, dramatizations of the life and death of Jesus constitute the most significant group of biblical plays, the Passion plays. These are treated in a separate article.

Much of the Old Testament was dramatized in a lengthy work called the *Mistère du Viel Testament,* a col-lection of plays on biblical subjects brought together by a compiler around the middle of the 15th century. The episodes are placed in Old Testament order from Creation to the Queen of Sheba's visit to Solomon. This historical sequence is followed by a group of individual plays centering on such characters as Job, Tobias, Judith, and Esther. The authors of the plays made frequent use of legendary material to supplement the biblical narratives. The story of Joseph in Egypt, for example, is set against a conspiracy to poison Pharaoh. The plays circulated widely for more than a century, and the whole compilation was printed at least three times in first half of the 16th century. Direct influence has been found in the Passion plays of Troyes and Valenciennes, as well as in the Chester mystery cycle of England.

An unrelated series of biblical plays comes from Lille, where plays were presented on pageant wagons at an annual procession. These short works were staged individually, with new plays being written each year. Unlike the *Mistère du Viel Testament,* the Lille plays contain no legendary material. The playwrights followed the biblical text closely, adding only material found in the standard biblical commentaries, such as those of Peter Comestor and Nicolas of Lyra. The forty-three Old Testament plays include episodes not found in the *Mistère du Viel Testament,* such as the stories of Gideon, Ruth, Elijah, and Ahab. Similarly, the twenty-one New Testament plays from Lille dramatize a number of scenes not found in the Passion plays.

New Testament history after the Passion is dramatized in the *Mystère des Actes des Apôtres,* attributed to Simon Greban. Comprising some 62,000 lines of verse, this play is the longest of those surviving from the late-medieval period. It was staged in 1536 in Bourges and again in 1541 in Paris. Dramatizing events from the Book of Acts, the play also draws upon postbiblical history and legendary material, presenting the Apostles on their missionary journeys and showing their martyrdoms in faraway lands.

The immediate postbiblical era is represented by the *Vengeance de Jésus Christ*. Little known today, the play was staged relatively often in the 15th and 16th centuries. It survives in two manuscript versions and six early printed editions. Its historical basis is the Jewish War of A.D. 66–70 conducted by the emperor Vespasian and his son Titus, which ended in the siege and destruction of Jerusalem. Woven into the plot are the legendary accounts of the trial and death of Pilate and the miracles of Veronica. In an era when spectators sought realism in the portrayal of historical events, the violence and carnage that accompany the destruction of Jerusalem in this play must have attracted large audiences and may have been a reason for its popularity.

Plays based on the lives of the saints cover much of the period between the 1st and the 15th centuries. Though from our point of view such plays are based on legendary accounts, the original audiences saw them as reenactments of historical events. Because the staging of history plays was costly, they were often subsidized from municipal treasuries. As a consequence, many of them portray the life of a town's patron saint. The town of Seurre, for example, staged the life of its patron, St. Martin, in 1496. A play by Guillaume Flamant on the life of St. Didier, bishop of Langres, was staged in that city over a three-day period in 1482. In his search for historical realism, the author devoted half the play to battle scenes in which the Vandals besiege and sack the city and in which a Roman army later destroys the invaders.

Late-medieval contemporary history was dramatized in the lengthy *Mistère du siège d'Orléans*. The work is a detailed and historically accurate account of the defense of the city of Orléans against the English in the siege of 1428–29 and of its ultimate deliverance by Jeanne d'Arc. Writing most likely between 1440 and 1467, the anonymous author was possibly a witness to the events. In any case, he also consulted written accounts of the siege for greater historical accuracy. Though the play is patriotic in tone, its characters are unidealized. Jeanne d'Arc is portrayed as a simple, straightforward young girl; the character of the poet Charles d'Orléans, a prisoner of the English at the time, is consonant with what is known of him from other historical sources. Despite the appearance of many well-known historical figures, the play's major protagonist is the city of Orléans itself.

At the other end of the historical spectrum, we find a play that treats the Trojan War. In the late Middle Ages, the French believed themselves to be descended from Trojans who, like Aeneas, had fled the final destruction of their city. No doubt, this presumed ancestry inspired Jacques Milet to write the *Istoire de la destruction de Troye la grant*. The play is based not on Homer but on a medieval Latin account of the conflict. Though there is no record of its having been performed, the text is rich in stage directions and was almost certainly intended for performance. Its survival in a dozen manuscripts and an equal number of early printed editions suggests that it was widely read as well.

The history plays of the late-medieval period, both religious and secular, were dramatic spectacles that served to define the community, to provide individual and group identity, and to reinforce social values.

# HOCKET

. Primarily a compositional or improvisatory technique that creates an exciting and unmistakable texture in polyphonic music from the mid-13th to the late 14th century, hocket (Lat. *hochetus*) can also refer to an independent piece of music in which that texture is predominant or pervasive. Either the notes of one melody may be alternately sung by two different voices or these voices may alternate short phrases that may be imitative of one another. Also, two or three melodies may rhythmically interlock in such a way that much the same effect of rapid, virtuoso note-by-note alternation occurs. The earliest extant hocketing appears in Notre-Dame two-part clausulae, three-part organa, and conductus, while the earliest independent hocket seems to be the *In seculum* added to the modally notated Madrid Codex.

In spite of Pope John XXII's condemnation of hockets and other musical "frivolities" in 1324–25, they can be found later among Machaut's compositions, French chansons and *chaces,* Italian madrigals and *caccias,* and the liturgical polyphony of the Old Hall Manuscript. In some isorhythmic motets of the Ars Nova, hocketing highlights structural points anticipating repetition of the tenor *talea.* Hockets succumbed to changing musical tastes, metamorphosing into antiphonal melodic imitation by the early 15th century.

# HOMAGE

. Homage originated in the Frankish custom of the *immixtio manuum,* by which the king clasped the joined hands of a follower who promised loyal service. The first example of a great lord performing homage occurred in 757, when Tassilo, duke of Bavaria, commended himself "by his hands" to King Pepin. Galbert de Bruges provides the fullest description of the act when he recounts how in 1127 the Flemish barons were received by their new count: they performed homage by placing their hands in his and sealed the relationship by a kiss; they pledged their loyalty (fealty); and the count invested them with their fiefs.

The practice of multiple homages, by which vassals with fiefs from several lords did homage to each, led inevitably to the development of liege (primary) homage from the 11th century: a vassal declared his first loyalty to the lord from whom he held his most important fief. The circulation of fiefs, however, continued to complicate the chain of loyalty, especially as powerful princes forged new political and military alliances by purchasing the homage of barons and knights and demanding that fiefs, rather than tenants, be considered liege. The multiplication of liege fiefs resulted in reservation clauses by which vassals ranked their fiefs, and consequently their loyalties, in order to prevent misunderstandings.

From the late 12th century, those who performed homage often were required by their lords to submit sealed letters confirming that act; later sealed letters could be sent in lieu of the act itself. In the 13th and 14th centuries, lords with large numbers of feudal tenants periodically conducted inquests of their tenants and fiefs; the resultant "books of homages" furnish invaluable information on the nobility of late-medieval France.

# *HOMME ARMÉ*

. A melody used in at least thirty-eight polyphonic Mass cycles of the years ca. 1460–1600, of which about thirty are probably from before 1520; at least nine smaller works

incorporate the melody. Conflicting modern theories make the early history of *L'homme armé* hard to see clearly. The time is in a simple ABA form, and its text warns of the approach of the armed man with his iron breastplate. Many of the Masses appear to be associated with the Burgundian court's Order of the Golden Fleece, though that can hardly be the origin of them all. Plainly, there was an element of friendly emulation among the composers: elements from the cycle by Guillaume Dufay appear to have influenced those of Antoine Busnoys and Johannes Ockeghem. Ideas from the work by Busnoys are taken over by Jacob Obrecht and Josquin des Prez, and so on. The decisive importance of the tune is as a generating factor in the early history of the polyphonic Mass cycle.

# *HOMME DE CORPS*

**.** Common in the north and east of France, the phrase *homme* (or *femme*) *de corps* (Lat. *homo de corpore; femina de corpore*) is one of many words and phrases virtually synonymous with "serf." Like the other synonyms, it emphasizes certain aspects of serfdom. However, unlike some of the synonyms, such as *villein,* which in the earlier Middle Ages could refer to either a free or unfree resident of a manor *(villa)* and came to be interchangeable with "serf" only in the 12th and 13th centuries, *homme de corps* always seems to have been restricted to the unfree population and to a particularly low stratum of the unfree, those who *de jure* had no right of inheritance or freedom of marriage. Most important, in Marc Bloch's words, "the feeling of…almost physical compulsion is expressed to perfection in the phrase *homme de corps*." An *homme de corps* was an *homme de corps et de chef,* a person whose body (labor and offspring) and head (his punishment for crime) were in the power and gift of another man. Or he was an *homme propre,* a person who was the property of a lord. A medieval abbot of Vézelay, quoted by Bloch, described his power over his serf in a slightly elaborated version of the formula: "He is mine from the soles of his feet to the crown of his head." Yet, despite the impression of absolute power and physical coercibility that the phrase gives, an *homme de corps* was not a slave. He had recognized personal rights and, despite the principles of the learned law, enjoyed strong customary protections of the real property he worked and the chattels he possessed, just as other serfs had.

# HOMOSEXUALITY

. The exuberant homosexuality for which the ancient Gauls, like other Celts, were famed seems to have survived or even increased during the Roman occupation but was dampened by Christian conversion. The Germanic invasions demolished imperial and weakened Christian authorities, and the Germans themselves seem to have practiced pederasty but to have disapproved of effeminacy and adult passivity. Neither Franks nor Burgundians legislated against homosexuality, but the Visigothic code of Reccesvinth (ca. 654) stipulated castration as a penalty. Although the Franks adopted Catholic Christianity with its morality that pilloried as the "crime against nature" all nonreproductive forms of sexual expression, including homosexuality, the later Merovingians, and probably their nobles, indulged their sensual appetites freely.

Considerable sexual license continued under the Carolingians (751–987). An erotic element appears in the circle of clerics headed by Alcuin, the "friend of Charlemagne." Alcuin directed his feelings toward his pupils, even bestowing on one a "pet name" from one of Virgil's *Eclogues*. Walafrid Strabo's affection for Liutger was more specifically Christian, presaging Elizabethan love sonnets. His exiled friend Gottschalk penned a tender poem to a young monk, probably at Reichenau.

During the 9th and 10th centuries, in the rude early castles, knights and squires, often sleeping on pallets in the same room and depending on one another for survival, must have formed erotic attachments, a type of situational homosexuality known to armies. Anglo-Norman nobles were particularly reprimanded for homosexuality.

Pederastic poems were part of the renaissance of the 12th century. Marbode of Rennes (ca. 1035–1123), master of the school of Chartres, loved a boy who loved a beautiful girl who was herself in love with Marbode. Marbode's disciple Baudri of Bourgueil (1046–1130) shifted to more openly erotic poetry, with some verses extolling the moral qualities and others the physical charms of the addressee. Hildebert of Lavardin (ca. 1055–1133) reiterated conventional moralizing arguments against the "plague of Sodom," implying that homosexuality was common in his age, but another of his poems boldly denied that male love is a sin and faulted "heaven's council" for calling it one. Allegorical poetry was less favorable to homosexuality. Alain de Lille's *De planctu Naturae* (ca. 1170) indicted humankind for inventing monstrous kinds of love and perverting Nature's laws. Jean de Meun's sequel to the *Roman de la Rose* (ca. 1270) had Nature's Genius liken practitioners of nonreproductive sex to plowmen who till stony ground.

In the 11th century, with Peter Damian condemning sodomy, the church moved to regulate private conduct. The term *sodomia,* which appeared at the beginning of the 13th century, often covered bestiality, homosexual practices, and "unnatural" heterosexual relations of all kinds. Late 11th-century theologians, who advocated the same penalty for all three, associated what came to be called sodomy with heresy and magic. Scriptural commentators in Anselm of Laon's circle linked heresy and sodomy as forms of sacrilege punishable by death.

Before 1200, southern France became a stronghold of heretical Cathars (Albigensians). Because of their similarity to the Bogomils of Bulgaria, they came to be stigmatized as *bougres,* a term that meant first heretic and then sodomite. Catholic authorities charged them with sexual heterodoxy, claiming that unrestrained sexual

hedonism was part of their cult. The word itself survives to this day in English as "bugger."

In northern France, Chrétien de Troyes, like the troubadours of Languedoc, sang of love—and its clandestine homoerotic culture. In *Lanval,* Marie de France has Queen Guenevere accuse Lanval of homosexuality after he refuses her advances. In Paris, already a center of academic and political life, Jacques de Vitry denounced the students at the university for practicing sodomy. In 1270, Guillot, in his *Dit des rues de Paris,* cited the rue Beaubourg as an area favored by sodomites. Again in the 15th century, the poet Antonio Beccadelli alluded to the continued homosexual practices of the intellectuals in Paris, and the still obscure jargon of François Villon has also been cited as evidence of that Parisian subculture.

Politics have occasioned accusations of sodomy in many epochs, none more notorious than the trial of the entire order of Knights Templar, Europe's great bankers. The first charges of sexual heterodoxy against the Templars date from 1304 or 1305 in the Agenais. Many witnesses, including some whose testimony is suspect, claimed that the order tolerated as sinless "acts against nature" between members, who were accused of the *osculum infame* at their initiations. Philip IV the Fair pressured Pope Clement V to take action against the Templars, and they were arrested throughout France in October 1307. Hundreds of episcopal and royal tribunals tallied the wealth of the order, gathered witnesses, heard testimony, and passed judgment. Eventually, about 120 Templars met their deaths in Paris. Only a few of the many who were accused actually confessed to sodomy, but many more confessed to blasphemy and heresy. The guilt of the Templars remains moot to this day. Some may have been involved in homosexual liaisons, but the political atmosphere and controversy surrounding the investigation made impartial judgment impossible.

Philip IV's daughter, Isabella, with the help of her lover, Mortimer, imprisoned and tortured her sodomitical husband Edward II of England.

Prosecutions for sodomy continued sporadically in late-medieval France. In 1317, Robert de Péronne, called de Bray, was burned, and his brother Jean received an unknown sentence the following year at Laon. Arnaud de Vernioles, a subdeacon of Pamiers, was accused of sodomy as well as heresy in 1323–24 and was consigned to a monastery for life. In 1333, in Paris, Raymond Durant was condemned for sex with his male servants but managed to escape. In 1334, Pierre Porier was burned in Dorche. Guillaume Belleti, in Chambéry, escaped with a fine in 1351. Jacques Purgatoire, charged with violent assault, was burned at Bourges in 1435. If his confession is genuine, Gilles de Rais cannot be labeled a victim. The same is true of Benjamin Deschauffours: since the time of Voltaire, his trial has been seen as a classic example of persecution of homosexuals.

A persistent fear of sexuality and the inability to stamp out its proscribed manifestations even, or especially, within the strictly regulated confines of the cloister plagued medieval society, with its celibate clergy. Albert the Great and Thomas Aquinas condemned sodomites to death, and Lucas da Penna (ca. 1320-ca. 1390) even declared that "if a sodomite had been executed, and subsequently several times returned to life, each time he should be punished even more severely if this were possible…." The medieval state, however, lacked the means of carrying out the mass arrests and executions of homosexuals that were to occur in later periods.

# HONORÉ, MASTER

(d. ca. 1318). A Parisian illuminator active in the last quarter of the 13th century who intro duced a new sense of three-dimensional volume to his figures. A copy of Gratian's *Decretals* (Tours, Bibl. mun. 558) contains a statement that the book was purchased from Honoré the illuminator, and an entry in royal accounts of 1296 states that he was the illuminator for the king and suggests that he illuminated the *Breviaire de Philippe le Bel* (B.N. lat 1023). Records indicate that he was dead by 1318. On the basis of stylistic affinities with these manuscripts, the miniatures of a copy of the *Somme le roi* (B.L. Add. 54180) have also been attributed to him.

# HOSPITALS

. From their origin as guesthouses for pilgrims and almshouses for the indigent, medieval hospitals offered custodial care rather than therapy. The sick poor received special attention when monastic infirmaries were extended beyond the cloister in early Benedictine communities (Fleury, Centula) and until the heyday of Cluny. French hospitals long retained a religious character in their moral and economic dependence on charity as well as in their staffing and administration. A gradual secularization occurred, however, first with the building of the nonmonastic "Hôtel-Dieu," typically near the gate of such new towns as Troyes or Provins. The number of these foundations increased dramatically after 1100 thanks to the inspiration of the Hospitalers of St. John, seigneurial largesse, and bourgeois initiative. The development of universities opened the door to professional medical assistance with visits by doctors and their students and, apparently, the occasional performance of surgery: this was the case for the hospital of

Saint-Esprit in Montpellier, recommended by the pope as a model for all Christendom. By the 15th century, many institutions passed under royal or municipal control and were governed by lay committees. The best-preserved example of this type is the Hôtel-Dieu of Beaune, built between 1443 and 1459 by Nicolas Rolin, chancellor of Burgundy.

If the modern "health-care facility" is focused on the operating room, the heart of the medieval hospice was the sick ward, or *salle*. The great hall was over 300 feet long in the Hôtel-Dieu of Paris and in the one founded at Tonnerre by Marguerite, the wife of Charles of Anjou. While benefactors could claim private quarters, most residents were lodged communally. Two often shared one bed, particularly in the smaller dormitories; curtains would screen each bed in the larger, draftier, and more crowded wards. Some hospitals had isolation wings for contagious patients, the disruptive insane, or children; others, like Saint-Jacques of Valenciennes, turned away incurable patients. Special foundations sheltered lepers, the mentally ill, the old, or, as in the case of the hospice "des Quinze-Vingts" erected by Louis IX in Paris, the blind. In many instances, care and conditions declined from the late Middle Ages on, with the aging of early foundations, the fading of charitable impulses, the overcrowding in epidemics and wars, and— paradoxically—the transition to official control.

# HÔTEL DU ROI

**.** The term *hotel du roi* (Lat. *hospitium regis*) was applied in the period after ca. 1200 to the innermost part of the royal household, or *familia,* comprising those departments (*ministeria* or *métiers*) whose members were still engaged largely in domestic rather than political duties. By 1261, when its organization was first set down in a household ordinance, the *hotel* consisted primarily of six *métiers:* the paneterie, or pantry; the *échansonnerie,* or butlery; the *cuisine,* or kitchen; the *fruiterie,* or fruitery; the écurie, or stable; and (replacing the *chambre* after 1257, though the latter effectively remained part of the *hotel*) the fourrière, or foragery. In 1315, a new department was created, the *argenterie,* under the direction of an *argentier du* roi, to supervise the provision of clothing and furnishings to the king. All of these departments, and such nondepartmental personnel as the chamberlains, chaplains, physicians, ushers, porters, launderers, messengers, and other minor functionaries in the king's personal service (a total of 165 persons in 1291), were initially placed under the immediate supervision of two officers

bearing the title *(grand) maître de l'hôtel du* roi, whose offices were eventually conflated into one. The queen, the king's eldest son, and many lesser princes also maintained *hotels* from the 13th century onward, and they were generally organized along the same general lines as that of the king.

# HOUDAN

**.** The small city of Houdan (Île-de-France), situated at the confluence of the Vesgre and the Option, preserves a 12th-century bkeep, the only remains of the castle of the Montforts. The transformation of the keep into a water tower has complicated the study of its interior. Elements of its unusual plan, however, are still discernible. A round tower approximately 100 feet high and 50 feet in diameter, this keep is flanked by four turrets, each 6 feet 6 inches in diameter, that run the height of the tower. The walls, 12 feet thick, are made of millstone. Conical roofs must have topped the central tower, as they do the turrets. The keep could be accessed only by a door in the north turret situated 20 feet above the level of the soil. This limited and somewhat hidden access encapsulates one of the most striking features of the keep's interior: its complex arrangements for moving from one floor to another. For example, this outer door opens onto a corridor that ends at a stone staircase leading to the first story, a square room whose corners lead to the alcoves of the turrets. This central room, or Grande Salle, served as the lord's. In addition to the corner recesses leading to the turrets, sets of staircases and ladders lead from this room or floor to others. In short, to get from one room to another or into the turrets, one had to pass through the Grande Salle. And it was here that the lord of Montfort resided, since from this vantage he could watch over the comings and goings of all those who entered and in this way could deal with any treasonous activity.

# HUCBALD OF SAINT-AMAND

(ca. 849–930). Music theorist, composer, hagiographer, and author of *De har-monica institutione,* Hucbald was a monk at the abbey of Saint-Amand at Tournai. He studied at Saint-Amand, Nevers, and Saint-Germain of Auxerre, and became a fellow student of Remigius of Auxerre at Fulda. Later, he became director of the school at Saint-Amand, started the school at Saint-Bertin, and helped Remigius to revive the cathedral school at

Reims. Hucbald had access to the major ancient works of learning, notably Martianus Capella, Boethius, and Chalcidius's commentary on Plato's *Timaeus*. His own work, however, is original. Adopting the Greek scale transmitted by Boethius (Greater Perfect System), Hucbald described a second tetrachordal system, different from the Boethian tradition, that is built on the tetrachord of the finals D-E-F-G and that became paramount for the development of medieval modal theory. His concern for practical issues is shown by his method of illustrating theoretical points with examples taken from chant repertoire as sung in the monasteries. Hucbald also devised a letter notation, suggesting its simultaneous use with neumes, to indicate their precise musical pitch.

# HUE DE ROTELANDE

(fl. late 12th c.). Anglo-Norman author of *Ipomedon* (10,580 octosyllabic lines) and *Protheselaus* (12,741 octosyllabic lines). Probably a native of Rhuddhan (Flintshire), Hue lived in Credenhill, near Hereford, when he wrote his two romances for local nobility (*Protheselaus* for Gilbert Fitz-Baderon, lord of Monmouth; d. 1191). *Ipomedon,* the earlier of the two, is concerned with the love of La Fière, princess of Calabria, and Ipomedon, son of the King of Apulia. In *Protheselaus,* the hero is the son of Ipomedon and La Fière; he eventually becomes king of Apulia. *Ipomedon,* the finer work, is remarkable for its treatment of the motifs of the Three Day's Tournament and the rescue of the princess by the hero disguised as a madman. Hue de Rotelande is especially gifted as a comic writer, and *Ipomedon* is thoroughly humorous from beginning to end, the humor ranging from whimsicality to open obscenity. While it is not usually possible to show specific sources for the two romances, both owe a good deal to the Romances of Antiquity, the Tristan romances, and the works of Chrétien de Troyes. *Ipomedon,* which is preserved complete in two manuscripts (London, B.L.Cotton Vespasian A VII and Oxford, Bodl. Rawlinson Miscel. D 913), was adapted on three occasions into Middle English.

# HUGH CAPET

(ca. 940–996). The son of Hugues le Grand, duke of Francia, Hugh Capet is traditionally considered the founder of the third dynasty of French kings, the Capetians, who ruled, through collateral lines, up to and after the French Revolution. Hugh became duke of Francia and Aquitaine in 961, five years after his father's death. Like his ancestors, the Robertians, Hugh had landholdings and an influence over the Neustrian aristocracy that effectively made him more powerful than the king, Lothair I (r. 954–86). From ca. 980 on, the two were in constant conflict. With the deaths of Lothair (986) and Louis V (987), Hugh rose to the throne (June-July 987) and had his son Robert crowned soon after in Orléans (December 987).

Once king, however, Hugh proved as weak as he had been strong as duke: the last Carolingian claimant, Charles of Lorraine, rebelled against him, and only the treachery of Bishop Adalbero of Laon resolved the conflict (991). The treachery of Arnulf, archbishop of Reims, and the papal deposition of his replacement, Gerbert of Aurillac, set in motion a conflict that marred the remainder of Hugh's reign. Although it had started before he took the throne, the castellan revolution reached a peak in many regions of the kingdom at this point, and the impotence of both royal power and local Carolingian political structures (the *pagus*) drove some areas of his kingdom to seek their own solutions to disorder and violence. Among the most famous and consequential of these efforts was the Peace of God. In October 996, Hugh died on campaign near Tours.

Unable to assert the kind of royal authority at least theoretically available to Carolingians, Hugh sought legitimacy in an alliance with the church, both the episcopacy and the reforming monastic movement, and with some of his most powerful neighbors, such as William V of Aquitaine and Richard II of Normandy, who gave support in exchange for still greater levels of autonomy. As a result, the monarchy underwent a shift in the basis of its authority, from the essentially aristocratic Carolingian model to one more dependent on ecclesiastical legitimation and popular support.

# HUGH OF AMIENS

(ca. 1080–1164). Born in the area of Ribemont in northern France, Hugh was successively a student at the school of Laon, monk of Cluny, prior of Saint-Martial at Limoges, prior of St. Pancras, Lewes, and the first abbot of Henry I's foundation at Reading, before being elected archbishop of Rouen by the cathedral chapter. He was a strong believer in the rights of the episcopate, and he attempted to make newly elected abbots take a written oath of obedience to him. During the civil war between King Stephen and Empress Matilda, he was one of Stephen's strongest episcopal supporters, even defending him when he seized the castles of some of the English bishops, and he remained on the king's side until Rouen was captured by the Angevins.

In his youth, Hugh went to Rome to be a clerk in the papal curia, and he later served as legate. He was a vigorous judge in ecclesiastical disputes and a generous benefactor of numerous Norman monasteries. Though his personality remains elusive, he was admired by his contemporaries for his knowledge, for he was the author of several works of theology and (possibly) a defense of Cluny against the at-tacks of the Cistercians. He carried out work on the cathedral at Rouen, and he introduced the feast of the Immaculate Conception (December 8) into Normandy.

*Thomas G.Waldman*

# HUGH OF SAINT-VICTOR

(d. 1141). A leading theologian, biblical interpreter, and mystic of the first half of the 12th century, Hugh was the effective founder of the important school of the abbey of Saint-Victor at Paris. Hugh's place of birth is uncertain—evidence supports both Saxony and the Low Countries, with birth in one and early life in the other area a possibility. He came to the new community of regular canons at Saint-Victor, probably in the early 1120s; by 1125, he was writing and teaching and beginning to gain a wide following among students and peers. Hugh was instrumental in asserting the fundamental need to understand the literal, historical sense of the biblical text before undertaking allegorical and moral interpretation. Indeed, his whole exegetical and theological project was founded on the premise that one must understand history, the unfolding of events in time, as the fundamental category for God's revelation in the history of the Jewish and Christian peoples. Hugh sought contemporary Jewish interpretations for understanding the literal sense of the Hebrew Scriptures, and he inspired others, especially Andrew of Saint-Victor and Herbert of Bosham, to pursue more thoroughly the understanding of Scripture through knowledge of the Hebrew language and consultation with Jewish rabbis. In theology, Hugh composed the first *summa* of theology in the Parisian schools,

*De sacramentis christianae fidei,* thus paving the way for the long series of *summae* that would characterize much of medieval scholastic theology. His mystical writings, especially the two treatises on the symbolic meaning of Isaiah's vision of the seraphim and the structure of Noah's Ark (De *arca Noe morali* and *De arca Noe mystica*) are some of the first attempts to systematize in treatises teaching on the ascetic-contemplative life. *De arca Noe mystica* describes a complex drawing (meant to be used as a focus for meditation) that presented a visualization of the cosmos, the unfolding of the history of salvation, and the stages of the interior spiritual journey of the individual to contemplative ecstasy. His commentary on the *Celestial Hierarchy of* Pseudo-Dionysius the Areopagite *(In hierarchiam coelestem)* was a major moment in bringing the thought of Pseudo-Dionysius into the mainstream of western theology and mysticism. Hugh based his work upon the 9th-century translation and commentary by Johannes Scottus Eriugena, but the interpretation was stamped with his own distinctive understanding of Dionysius's thought, an understanding deeply influenced by Hugh's Augustinian theology and his own view of the function of symbols in the mediation of divine truth to human beings living in a material world. Hugh's encyclopedic learning is reflected in his *Didascalicon: de studio legendi,* that provides a guide for the student of philosophy (Books 1–3) and the Bible (Books 4–6). In this work, Hugh presents the liberal arts as the remedy for the loss of knowledge and goodness in the Fall, while the mechanical arts (e.g., weaving) provide for the resulting weakness of the human body. The section on reading Scripture outlines Hugh's understanding of a sequence of disciplines of study (history, allegory, and tropology), and gives for each discipline the proper order in which to read the biblical books appropriate for that approach to the interpretation of the text. For the student pursuing the discipline of history, Hugh compiled a *Chronicon* with numerous chronological tables and historical aids; for the student of allegory, his theological masterwork, *De sacramentis christianae fidei,* was intended to serve as an introduction. *De scripturis et scriptoribus sacris,* the preface to Hugh's collection of literal comments on the Pentateuch and other Old Testament books (these comments are printed as *Notulae* in Migne), is modeled on the form of the *accessus ad auctores* then being used by the arts faculty to introduce classical authors and by biblical interpreters to introduce their commentaries. The introduction to Hugh's *Chronicon* contains a treatise on the "art of memory," an important contribution to the memory tradition. Hugh's other works include an unfinished series of sermons on Ecclesiastes; short pieces, extracts, and fragments collected into several books of *miscellania;* short contemplative and theological treatises; several letters; and numerous sermons scattered throughout medieval collections and only recently fully identified.

# HUGUES DE BERZÉ

(1150/55-ca. 1220). The knight Hugues de Berzé was born in the Mâconnais and joined the crusaders in 1201 and again in 1220. Near the end of his life, he wrote his *Bible,* a poem of 1,029 octosyllables preaching reform. Inspired by both the certainty of death and the uncertainty of his times, Hugues criticized the three orders of society, drawing on his own experiences in Constantinople. The *Bible,* which is influenced by the *Bible Guiot* of Guiot de Provins, is an example of the beliefs of a pious layman with a considerable breadth of worldly experience. In addition to the *Bible,* five lyric poems are attributed to him in the *chansonniers.*

# HUGUES DE CLUNY

(d. 1109). The monastery of Cluny reached the peak of its popularity and prestige under the abbacy of St. Hugues (r. 1049–1109). A member of the castellan family of the lords of Semur-en-Brionnais, Hugues was originally put by his parents into the cathedral school of Auxerre, where his great-uncle, also named Hugues, was bishop (r. 999–1039). He left the cathedral school when he was fifteen, against his parents' wishes, to become a monk at Cluny. He soon became prior under Abbot Odilo and then abbot.

As abbot, he ruled a tremendously wealthy monastery, by far the biggest landowner in its region, which held its own courts to resolve legal cases and often found itself in

dispute with its seigneurial neighbors. The principle of Cluny's immunity from the bishop of Mâcon, first enunciated in the 10th century, became a principle for which Cluny had to argue strenuously against bishops unwilling to recognize it.

During Hugues's long years as abbot, Cluny reached perhaps the pinnacle of its international prestige. Cluny, which had reformed a number of other monasteries in the 10th and early 11th centuries, was given the direction of a great many more by popes, bishops, and laymen. People as distant as the king of Castile arranged for generous gifts to Cluny. Hugues was asked to lend his assistance to emperors and popes, including being a mediator at Canossa during the Investiture controversy. In his monastery, he sponsored a thorough reworking of Cluniac customaries.

Under Hugues's leadership, the number of monks at Cluny tripled, from about one hundred to 300. Hugues and his brothers established the nunnery of Marcigny in 1055 as a house for the wives and daughters of men who wished to enter the monastery. He sponsored a new and enormous abbey church, called Cluny III by art historians. The church, finished shortly before his death, was the largest church in the West until the late Renaissance.

# HUGUES DE SAINT-CHER

(ca. 1195–1263). Nothing is known of Hugues's origins, except that he was born in Saint-Cher, not far from Vienne in the south of France. He had become a doctor of canon law and a bachelor of theology even before he joined the Dominicans at Paris in 1225, where he studied under Roland of Cremona, the first Dominican to hold a chair in theology at the University of Paris. Hugues soon set upon a vocation that would make him one of the most prominent churchmen of his day. He first served in an administrative capacity as provincial of the Order for France from 1227 to 1229. Subsequently, he took up the posts of master of theology (1230–36) at the university and prior of the Dominican convent of Saint-Jacques (1233–36). After leaving his posts at the university and the convent, he resumed his duties for the next eight years as provincial-general of the Order of Preachers for the French province, while continuing to maintain a lively interest in the scholarly activities of his order in Paris. He became vicar-general of his order in 1240 and attained

his highest administrative post with his selection as the first Dominican cardinal on May 28, 1244.

Hugues played a central role in the study of the Bible and theology in the 13th century. At Saint-Jacques, he assembled a team that produced three works that served as essential starting points for the theologians and preachers of his day: an expanded commentary on the Bible; a version of the Latin Vulgate incorporating a vast series of linguistic notes "correcting" the contemporary version of the text; and the first alphabetical concordance to the Bible. His set of commentaries, known as *Postillae,* use as their starting point the *Glossa ordinaria,* itself a digest of patristic and Carolingian exegesis, and add to it the fruits of the study of the Bible produced from the middle of the 12th century to his own time. His "corrected" Vulgate, the *Correctoria,* gives as full a sense of the literal meaning of the text as was possible for the 13th century, and his *Concordantia* greatly facilitated the task of preaching, allowing a relative novice to find his way around in the Bible without having to commit the entire text to memory.

Hugues began his work on the *Correctoria* as early as 1227, although the latest versions of this work date from his years as cardinal (1244–63). The *Postillae* date from his years as master (1230–36), and his *Concordantia* from 1238–40—a work to which some 500 friars contributed. Although the Bible had been given standard chapter divisions by Stephen Langton at the end of the 12th century, Hugues was the first to introduce subdivisions (a, b, c, d, e, f, g), an essential element for his correctoria and concordance.

His *Commentary* on the *Sententiae* of Peter Lombard, dating from his early years as master of theology, was among the first to employ the form of the *quaestio* in preference to a running commentary. In effect, this form signaled a shift away from simply commenting on Lombard's text to rewriting it, a process that was to reach its perfected form a generation later in the *Summa theologica* of Thomas Aquinas.

Among Hugues's more original contributions to theology was his teaching of the "treasury of merits" that held that the superabundance of the merits and good works of Christ, the Virgin, and the saints are at the disposal of the church, in the office of the pope, to distribute to the faithful. With the articulation of the treasury of merits, the theology of indulgences became integral to the practice of private penance.

As cardinal, Hugues worked closely with three popes and served on papal commissions that heard the controversies over Joachim of Fiore, the posthumous champion of the Spiritual Franciscans, in 1255 and William of Saint-Amour, the most vocal critic of the mendicant orders, in 1256. Hugues's eucharistic devotion is epitomized in the feast of Corpus Christi, which he authorized in Liège while legate there between 1251 and 1253 and which was placed in the calendar of the universal church in 1264 by Pope Urban IV, whom Hugues had served.

# HUGUES D'OIGNIES

(fl. first third of the 13th c.) A goldsmith active in the Meuse Valley and a major proponent of the school of metalwork of Entre-Sambre-et-Meuse, Hugues was a prior at Oignies. He is best known for three documented works: a gold and silver cover of a Gospel book, a reliquary for the rib of St. Peter, and the chalice of Gilles de Walcourt, all now in the treasury of the Benedictine convent of the Sisters of Notre Dame at Namur. His works are characterized by the use of *niello* rather than the use of brightly colored enamels of earlier Mosan metalwork.

# HUGUES LE GRAND

(d. 956). Duke of Francia, son of Robert I (r. 922–23) and nephew of King Eudes, Hugues played a major role in the French kingdom from 923 to his death.

In spite of his father's death in the Battle of Soissons (June 15, 923), Hugues rallied his army and routed that of the Carolingian king Charles III the Simple (r. 898–922). He was, however, passed over by the rebel magnates who elected his brother-in-law, Duke Raoul of Burgundy, to succeed Robert as their candidate for the throne. Hugues remained loyal to Raoul throughout his reign (923–36), all the while consolidating his position in his father's lands between the Seine and the Loire.

He supported the election of Charles's son, Louis IV (r. 936–54), but soon fell out with the young king. Open warfare between the two in the 940s resulted in the intervention of their joint brother-in-law, Otto I of Germany. Condemned and excommunicated by the Council of Ingelheim (June 948), Hugues finally submitted to

Louis in 950. Although friction between the two continued until Louis's death, Hugues supported the succession of Louis's young son, Lothair.

From the accession of Lothair (954) to his own death in 956, Hugues virtually ruled France. To his title of duke of the Franks he added those of duke of Burgundy and of Aquitaine. He left three minor sons: Hugh Capet, duke of Francia and future king, and Otto and Eudes-Henri, successively dukes of Burgundy.

# HUGUES LIBERGIER

(d. 1263). Mason. Although the abbey church of Saint-Nicaise, Reims, is his only known work, Hugues Libergier was one of the most innovative master masons in northern France during the second third of the 13th century. Construction of the church began in 1231, and by Hugues's death the nave, portals, and two façade towers had been completed. While certain details, such as the use of the *pilier cantonné* and tracery patterns, reveal connections to Amiens, Hugues created an original architecture marked by contrasts of rounded and sharpened forms, of smooth mural surface and brittle calligraphic line. The Saint-Nicaise façade, with a screen of seven gables stretched across the portal zone, exercised a fundamental influence on succeeding designs, including the west façade of the cathedral of Reims and the transepts of Notre-Dame in Paris. Hugues's tombstone, preserved at the cathedral of Reims following the abbey's destruction, depicts the master with the tools of his trade: the graduated rod, compass, and set-square. His academic dress recalls the parallel drawn by Thomas Aquinas between the master mason and the professor and testifies to the contemporary appreciation of the cerebral activity demanded by the design process and building.

# HUNDRED YEARS' WAR

. The name posterity has bestowed on the series of Anglo-French conflicts that occurred between 1337 and 1453. Two major issues were at stake: the claim of English kings to be rightful kings of France and the irritations arising from the fact that the king of England, as duke of Aquitaine, was a liege vassal of the king of France. The dynastic claim to the French throne was important to Edward III but was at best tenuous in the 15th century. The feudal status of Aquitaine, regarded by some scholars as the key to the whole conflict, was eliminated by the expulsion of the English from southwestern France in 1453.

The Hundred Years' War in fact comprised three wars of particular intensity, each of twenty years' duration, preceded and followed by lesser conflicts. The "Edwardian" war of 1340–60 was dominated by Edward III of England. The "Caroline" war of 1369–89 was dominated by the military establishment of Charles V of France. The "Lancastrian" war of 1415–35 was dominated by Henry V of England and his brother John, duke of Bedford. Besides these three major conflicts, there was indecisive Anglo-French fighting in the periods 1294–1303,1323–25,1337–39, and 1436–44, in addition to the French campaign of reconquest (1449–53), an abortive English invasion in 1475, and various war scares at other times.

The periods of intermittent conflict after 1294 were marked by fairly easy French victories that gave way to stalemate, but each monarchy also suffered one humiliating defeat at the hands of a supposedly inferior neighbor, Flanders (1302) and Scotland (1314), respectively. These were the first of many other European states to be drawn into the Anglo-French struggle over the course of a century.

In 1340, when Edward III first called himself king of France, the opposing kings assembled large and expensive armies that confronted each other without engaging in decisive action, to the annoyance of taxpayers on both sides of the Channel. A war of succession in Brittany broke out in 1341 and breathed new life into the Anglo-French war. France was weakened by a tradition of not collecting taxes in time of truce, and especially by internal divisions in which important segments of the politically influential classes opposed the government. Edward launched two well-organized campaigns, about a decade apart. The first of these, in 1345–47, produced decisive English victories at Auberoche in the southwest (1345), Crécy (1346) and Calais (1347) in the north, and La Roche-Derrien (1347) in Brittany. The crisis caused by the Black Death then intervened, but the second great campaign began in 1355, when the Prince of Wales ravaged upper Languedoc. In the next year, he defeated and captured John II at Poitiers. France was virtually paralyzed by social strife, political rivalries, and an empty treasury, while her captive king attempted to negotiate a treaty.

Six centuries of historical commentary have failed to give a satisfactory explanation for the French defeats. The noble knights, specialists in the traditional tactics of heavy cavalry, seemed reluctant to appreciate the military value of nonnoble infantry, to adapt to the problems posed by new and more powerful missile weapons, and to place

coordination and discipline ahead of personal glory or the opportunity for booty. Yet neither the nobility nor heavy cavalry was obsolescent in 1350, as some have claimed, and we still await a convincing explanation of the reasons for their shortcomings in the 14th century.

Financial exigencies may have influenced the war in ways that have not received adequate emphasis. For Edward III, it was cheaper to transport quantities of long-bowmen across the Channel than to send an army made up exclusively of heavy cavalry. For the French government in 1357–60, it was financially impossible to assemble a large force and therefore desirable to avoid battle. The pitched battle had been the key to English success. When Edward III, in his final invasion of France (1359–60), failed to bring the French to battle, he had to conclude the Treaty of Brétigny, which gave him possession of all of Aquitaine but was less favorable to him than earlier peace proposals.

The Edwardian war was nevertheless an English victory and a French defeat. When it ended, France was plunged into even greater misery by the ravages of unemployed troops *(routiers)*. This scourge forced people to acquiesce to a much higher level of taxation for military purposes than would have been conceivable a few years earlier. Just as important was the crown's *rapprochement* with the disaffected nobility of the north and west. This

regional aristocracy became the core of a regularly financed French army at a time when England began to face weak and divided leadership.

The war resumed in 1369, when Charles V agreed to accept appeals from Gascon lords who chafed under English rule. The Caroline war of the next twenty years was bitter and destructive but lacked dramatic battles. Bertrand du Guesclin (constable of France, 1370–80) was a master at the tactics of the *routiers*. His close associate and successor as constable, Olivier de Clisson, exerted a strong influence against pitched battles and commanded the respect of the northwestern nobles. Under these two able Bretons, the French regained large amounts of territory while the English squandered resources on expeditions that inflicted great damage without producing strategic results. Yet England did retain key ports in France, like Bordeaux, Brest, Cherbourg, and Calais, while French attempts to carry the war across the Channel in the 1380s did not succeed.

Peace negotiations in 1389–96 produced a prolonged lull in the war but no definitive settlement, and the advantage in leadership swung back to England. The French military elite suffered dreadful losses on crusade at Nicopolis (1396) and became badly divided during the mental incapacity of Charles VI, as the dukes of Burgundy engaged in a power struggle with the Orléans-Armagnac faction. The English reopened the conflict, inaugurating the Lancastrian war in 1415 and winning a crushing victory at Agincourt in October of that year. The weakened nobility of northwestern France was decimated by death or capture. Leaderless Norman lordships were in no position to halt Henry V's subsequent conquest of the region. Supported by Burgundy after the murder of John the Fearless in 1419, Henry in 1420 secured the Treaty of Troyes, which acknowledged him as heir to the French throne. His early death did not immediately change the situation because his able brother, John of Bedford, continued to advance, defeating the French badly at Verneuil (1424) and overrunning Anjou and Maine.

A new stalemate ensued only after the English failed to take Orléans in 1428–29. In stopping their advance, the French found an unlikely group of leaders: the bastard of Orléans Jean de Dunois, the *routier* captain La Hire, the young, rich, and unstable marshal Gilles de Rais, and, most celebrated of all, the teenaged visionary Jeanne d'Arc. Jeanne's presence seems to have had an inspirational effect on French morale and a correspondingly negative impact on the English. Jeanne was involved in several French victories that culminated in the coronation of Charles VII at Reims, but in 1430 she fell into Burgundian hands, and the English, who accused her of heresy and sorcery, had her executed in 1431.

The pendulum of leadership began swinging back in favor of the French after the ouster of Georges de La Trémoille from court in 1433 and the rise of Arthur de Richemont, who had been constable since 1425 and favored a *rapprochement* with Burgundy. The English did not join in the Franco-Burgundian treaty of 1435, and Bedford's death was a blow to Lancastrian unity. Richemont regained Paris in 1436, but after a new stalemate the two sides concluded a five-year truce in 1444. While the French were rebuilding Charles V's system of regular taxes and a salaried army, England began to suffer from problems resembling those that had afflicted France at the turn of the century—princely rivalries around a weak and mentally unstable king, Henry VI. The French mastery of firearms rivaled the earlier English success with the longbow. When the truce expired, French victories at Formigny (1450) and Castillon (1453) sealed their rapid reconquests of Normandy and Aquitaine, respectively.

No treaty ended the Hundred Years' War, but a new Anglo-Burgundian alliance in the 1470s was thwarted by the erratic but skillful Louis XI. England's recurrent internal problems and the permanence of France's restored fiscal and military institutions gave the Valois monarchy strength and stability at last. These factors, and a measure of good luck, permitted the crown to regain control of several important territories—Burgundy (1477), Anjou, Maine, and Provence (1481), Brittany (1491), and Orléans (1498)—and to become a major European power.

# HUNTING AND FOWLING

. Hunting was an essential part of the aristocratic way of life during the Middle Ages. Charlemagne often journeyed between his scattered hunting lodges in pursuit of the sport and was prepared to go directly into the field after hearing Mass. The Carolingian practice of setting aside tracts of land as royal forest, in which the kings exercised a monopoly on hunting, later spread to the nobles, who established their own forests as protected hunting preserves under the weakened French monarchy. The animals hunted in these forests included several kinds of deer, wild boars, wolves, foxes, otters, and hares. While hunting was considered an activity primarily for males, ladies also joined in fowling, and a falcon poised on the wrist became a recognized symbol of nobility. Royal and other large households had professional huntsmen who provided meat for the table, and peasants also hunted for food where not prohibited by aristocratic monopolies over forests, but these practical uses of hunting were not considered as *la chasse,* which so delighted its participants.

Hunting developed a kind of ritual. Literary descriptions can be found from saints' lives to romances, in which hunting sometimes became a literary motif expanded into an elaborate metaphor. In the Tristan legend, for example, the hero reveals his aristocratic training by teaching the huntsmen of King Marc how to divide the slain stag into portions to be borne in triumphal procession at the conclusion of the hunt. This ceremonious "breaking the stag" is included in the two most influential medieval hunting manuals: Henri de Ferrières's *Livres du roy Modus et de la royne Ratio* (ca. 1354–77) and Gaston Phoebus's *Livre de chasse* (ca. 1389). These describe the seasons for hunting, how various animals should be hunted, types of hunting dogs and their care, and how to make the traps and nets used in some kinds of hunting. The prologues emphasize that hunting keeps the body fit and gives familiarity in the use of arms but that it also has the spiritual benefit of occupying the mind so that the hunter is not tempted to fall into sin. Even though many clergy shared the aristocratic enthusiasm for hunting, various learned traditions against hunting merged in Gratian's *Decretum* (ca. 1140) and formed the basis for ecclesiastical sanctions against hunting, but these sanctions proved ineffective.

One section of Henri de Ferrières's manual is a formal disputation between two ladies on the virtue of hunting with dogs as compared to hunting with birds. Later chapters deal briefly with the selection and training of birds of prey used for hunting, but this manual does not have the detail found in the famous book on falconry written by Emperor Frederick II in the early 13th century. References in literature and representations in art confirm the popularity of fowling, along with hunting, as part of the aristocratic way of life.

# HUON DE BORDEAUX

. The chanson de geste of *Huon de Bordeaux* (10,553 mostly decasyllabic assonanced lines) may have been composed between 1216 and 1229 or between 1260 and 1268 at the latest. It is conserved in three manuscripts (Tours, Bibl. mun. 936, 13th c.; Paris, B.N. fr. 22555,15th c.; Turin: Bibl. naz. L. II. 14, MS fr. XXXVI, dated 1311).

Huon and Gérard, sons of Seguin, duke of Bordeaux, do not pay homage to Charlemagne for their fief. Amauri, a traitor, accuses them of rebellion against the emperor. Naimon intercedes and has them both summoned to court. Amauri and Charlot, Charlemagne's son, ambush Huon and Gérard. In the ensuing melee, Huon kills Charlot. The peers intervene, and Huon's life is spared on condition he undertake what appears to be an impossible mission into Saracen land while Gérard watches over their fief. Huon is expected to kill the first pagan he meets in Babylon, to kiss Emir Gaudisse's daughter

Esclamonde three times, and to bring back the emir's moustache and three of his teeth. Huon overcomes many obstacles thanks to his companion, Gériaume, and the fairy king Auberon. After numerous adventures, Huon returns to his fief with Esclamonde, now his wife, only to discover that his brother has betrayed him. Huon is thrown in jail, but Auberon intervenes to free him.

*Huon de Bordeaux* was composed by a talented but unknown author. It is an original and complex poem that successfully renews the genre of the chanson de geste. The author followed the epic literary tradition, using assonance and decasyllablic verse, while at the same time drawing from the romance, especially folk themes and supernatural and fantastic elements. The author must have known a number of French poems, among them the *Chanson de Roland, Fergus,* the *Voyage de Charlemagne, Aye d'Avignon, Ogier le Danois,* and Chrétien de Troyes's *Yvain.*

*Huon de* Bordeaux enjoyed great popularity in France and abroad beyond the Middle Ages. In the 15th century, it was rewritten both in Alexandrines and in prose and was printed many times until the middle of the 19th century.

# HUON DE MÉRY

(fl. first half of the 13th c.). Author of the *Tournoiement Antéchrist* (3,546 octosyllables; ca. 1234–40), Huon is known only through topical allusions in this work. He appears to have been a Norman who participated in the wars against Pierre Mauclerc, duke of Brittany, during Louis IX's minority (1232–35). His poem, contemporary with the *Roman de la Rose¸* is an allegorical psychomachia opposing the forces of God (the Virtues, archangels, and Arthurian knights) and those of the Antichrist (the Vices, pagan gods, and peasants). In the midst of the battle, the narrator himself is wounded in the eye by Cupid's arrow, which eventually drives him to seek refuge in a monastery. The poem includes direct allusions to Chrétien de Troyes's *Yvain* and to Raoul de Houdenc's *Songe d'enfer.*

# HUON D'OISY

(d. 1190). One of the earliest trouvères, Huon was castellan of Cambrai and a member of the upper nobility. He wed the daughter of Count Thierry d'Alsace and was himself lord of Oisy (Pas-de-Calais). He left two poems, both dated 1189. The first is a crusade song in which Huon castigates his nephew, the trouvère Conon de Béthune, for having returned prematurely with Philip II Augustus from the Third Crusade. The second is the *Tournoiement des dames,* which as edited by Alfred Jeanroy has 216 lines (of three, four, six, and seven syllables) divided into eight stanzas of twenty-seven lines each. This unusual and possibly satirical poem recounts a tournament at Lagny in which the participants are all historically identifiable noble ladies of Picardy who are relatives or acquaintances of the poet.

# HUON LE ROI DE CAMBRAI

(fl. 13th c.). A number of texts are identified as the work of Huon le Roi, Huon de Cambrai, or Huon le Roi de Cambrai; these are possibly names for the same 13th-century poet. Huon is known to be the author of several religious compositions, including the *Vie de saint Quentin* (4,000+ octosyllables), dedicated to Philip III, and the *Regrés Nostre Dame.* If the several names designate a single person, he also composed ironic or playful texts on religious orders and even on the alphabet, as well as two better-known works, a fabliau entitled *Le male honte* (an ambiguous title that can mean either "the terrible shame" or "Honte's trunk") and *Le vair palefroi,* a courtly *lai* of 1,342 octosyllables that illustrates how a young woman can escape an unfortunate marriage and find true love with the man of her choice.

# HYMNS

. The hymns sung in France during the Middle Ages have their roots in classical Greek songs *(hymnoi)* associated with liturgical ceremonies, especially of libation and sacrifice, and performed either chorally or monodically with instrumental accompaniment. Eastern Christian sources of the 2nd and 3rd centuries record hymns based on both biblical and nonbiblical texts. In the classical and medieval periods, the term *hymnus* may be found loosely applied to a great variety of religious and secular verse, but by the early Middle Ages in the West *hymnus* was most precisely used for the "office hymn": a Latin chant, on almost any religious subject, whose text was composed of a series of metrically identical (or essentially identical) strophes sung to an unvarying melody repeated with each succeeding strophe. Musical settings of true hymns remained uniformly monophonic throughout Europe until nearly the beginning of the 15th century. Vast numbers of Latin hymns, sequences, and tropes were composed in the Middle Ages; one estimate puts their number at nearly 100,000, of which perhaps 20 percent have been printed. Numerous hymnals, collections of hymns for use throughout the liturgical year, survive either as separate manuscripts or as parts of larger manuscripts. While vernacular hymns appear relatively early in Germany and England, true hymns with French texts are rare until the close of the medieval period.

The earliest allusions to hymns in the Christian West occur in the 4th century and suggest that Gaul played a central role in the development and dissemination of the genre. St. Jerome credits Hilary, bishop of Poitiers (ca. 310–66), with writing a *Liber hymnorum,* which has not survived, though several extant hymns are traditionally associated with his name. Another Gaul, Ambrose, bishop of Milan (ca. 340–97) and a great opponent of Arianism, composed hymns to be sung by his congregation. Four well-known works can be attributed to him with confidence, *Aeterne rerum conditor, Deus creator omnium, Iam surgit hora tertia,* and *Veni redemptor gentium,* with perhaps ten others likely to be Ambrosian.

The church institutionalized the singing of hymns in the first half of the 6th century, in the monastic movements centered in Gaul under the bishops Caesarius and Aurelius of Arles and under Benedict of Nursia. The bishops' closely related *regula* suggest over a dozen different hymns, designated by incipits, for use in services; Benedict's *Rule,* while not specifying particular hymns, declared that one hymn should be sung at each of the eight canonical hours of the daily monastic office and that those sung at the Night Office, Lauds, and Vespers must be Ambrosian. By the 10th century, manuscripts of the Office for secular clergy begin to appear with hymns as well. While some early hymn composers are known by name (e.g., Venantius Fortunatus, bishop of Poitiers ca. 599-ca. 609 and author of *Vexilla regis prodeunt* and *Pange lingua),* the clerics responsible for many popular early hymns, such as *Veni creator spiritus, Ave maris stella,* and *Ad cenam agni providi,* remain anonymous.

Helmut Gneuss has reconstructed the modest original collection of hymns implied by the early monastic rules (which he terms the Old Hymnal I), as well as a more elaborate revision of that first collection (Old Hymnal II), introduced in France and Germany by the 8th century. The Old Hymnal I contained about sixteen hymns, while Old Hymnal II contained about twenty-five, mostly from Old Hymnal I but with some additions and

deletions. Both early versions were replaced, beginning in the 9th century, by a still more elaborate hymnal, probably originating in France, whose earliest form contained thirty-eight hymns (the New Hymnal).

In the centuries that followed, hundreds more hymns, often reflecting strictly local interests, were added to the core collection to provide for all the feast days and special commemorations of the church calendar. Gneuss lists 133 hymns found in English Benedictine hymnals by the 10th and 11th centuries. Chrysogonus Waddell's study of the development of the 12th-century Cistercian hymnal in France reveals how a conservative hymn repertory might fluctuate in response to changes in monastic thinking. Waddell observes the "pioneer" monks of Molesme, who left that monastery to found the abbey of Cîteaux, arriving at their new site in 1098 with their traditional hymnal of over eighty hymns in hand. This collection was soon abandoned in favor of a much-reduced collection of only thirtyfour hymns, which the monks felt was more purely Ambrosian and thus closer to St. Benedict's ideal. When these hymns, amid some liturgical controversy between Bernard of Clairvaux and Peter Abélard, proved inadequate for even the simple services of the Cistercians, a third collection was introduced after 1147 that incorporated all the original thirty-four hymns and twenty-five additional works; none of these was newly composed, but many were anonymously divided, revised, and assigned new melodies and new places in the liturgy.

In the same period, Peter Abélard himself composed over ninety completely new hymns for various occasions that were added to the large hymnal used by the nuns at Héloïse's convent of the Paraclete. In the 13th century, members of the recently founded preaching orders, the Franciscans (including St. Bonaventure) and the Dominicans (including St. Thomas Aquinas), produced new hymns for their own evolving spiritual purposes. As a result of all this activity, a huge body of hymns on many subjects came to exist by the close of the Middle Ages. Joseph Szövérffy, to cite but one example, has compiled 152 hymns written about St. Peter between the 4th and the 16th centuries.

Various poetic meters were used in the composition of medieval Latin hymns, but after the earliest period meters consisted largely of accentual patterns that had developed out of older quantitative classical meters; patterns of stressed and unstressed Latin syllables came regularly to replace the older meters that had been defined by sequences of long and short syllables. Bruno Stäblein lists the eleven most important medieval Latin hymn meters, the commonest being the iambic dimeter line in use as early as Ambrose's compositions. Each hymn strophe contained a series of metrically, or at least syllabically, identical lines. (Hymns written in distichs were the only common exception to this rule.) The number of lines per strophe was not fixed, but within an individual hymn each strophe was constructed like all the others.

The earliest hymnals with music begin to appear in the 11th and 12th centuries. Hymn texts and tunes circulated widely; few hymn tunes are found uniquely linked with particular texts; all hymn texts composed in one meter could in theory be sung to the same melody. Waddell's reconstructed early Cistercian hymnal, for example, contains only nineteen hymn melodies for its thirty-four hymn texts (all but two in iambic dimeter).

Polyphonic hymns proper emerge in France, as in the rest of Europe, only toward the close of the Middle Ages, though certain hymn texts or fragments of texts were earlier used in the composition of motets. Besides a collection of ten hymns for three voices

from the late 14th century, probably composed for the papal court in Avignon, multiple-voice hymn settings begin with the French composer Guillaume Dufay (1397–1474). About thirty of his settings survive, all for three voices; they include versions of *Ave maris stella, Veni creator spiritus,* and *Pange lingua.* Dufay's hymn settings all tend to follow the same pragmatic pattern: an old liturgical melody is adopted with slight elaboration and two new voices composed in rhythmic parallel to the original melody. Dufay was enormously influential in his own lifetime, and much of the history of the polyphonic hymn in the 15th century consists of contemporary composers writing adaptations of his work.

The vernacular religious song in France has a long if tenuous career, but hymns proper appear only in Latin before the 15th century. The earliest traces of religious songs in the vernacular go back to a four-note fragment of text from the late 8th century and a *cantilena* (without music) in honor of St. Eulalie dated to the first third of the 9th century. By the late 12th and early 13th centuries significant numbers of religious sequences, *lais, descorts,* and chansons began to appear, but not hymns strictly speaking. A manuscript (B.N. fr. 964) of 1415 contains the first complete collection of vernacular hymns for the whole cycle of the liturgical year, all based loosely on Latin originals and most in meters appropriate to the old liturgical tunes, as in this version of Ambrose's iambic dimeter *Aeterne rerum conditor.*

> (Aeterne rerum conditor,
> noctem diemque qui regis
> et temporum das tempora,
> ut alleves fastidium.)
>
> Tu, des estoilles Conditeur,
> Des créans durable lumière,
> Crist, Rédempteur et visiteur
> De tous, oy nostre humble prière.

Such "translations" became increasingly common through the 15th century, appearing in books of hours and later in 16th-century printed hymn collections.

# I

# ICONOGRAPHY OF MUSIC

. A subdiscipline of musicology that can be practised in two fundamentally different ways. One can view an artwork as no more than a source of evidence for some question of music history, or one can seek first to understand the work on its own terms and look upon any evidentiary finding as a fragile by-product. The former approach was widely employed at an earlier stage, particularly in pursuit of information on the history of medieval and Renaissance musical instruments and instrumental usage. It resulted frequently in naive error due to an insufficient knowledge of artistic style and iconographic convention. The second approach has gained the ascendancy in recent years as music historians have become more sophisticated in the methodology of art-historical iconography. They remain interested in some of the earlier questions and continue to pursue them in a more cautious manner, but more often they show interest in matters of cultural and intellectual history with a musical dimension. Some of the best examples of musical iconography take a single artwork with musical subject matter and seek simply to explore its meaning in the fullest possible sense. The methodology is that of the art historian, but the music historian adds to this the special insights and knowledge of the second discipline.

In addition to the work of individual musicologists, the development of musical iconography owes much to the organization *Répertoire International d'Iconographie Musicale* (founded in 1971 by a group of scholars led by Barry S.Brook), particularly for the numerous national and international conferences it has sponsored. Mention should be made also of the highly respected journal of musical iconography, *Imago Musicae,* edited by Tilman Seebass since its founding in 1984.

# IDYLLIC ROMANCE

. The idyllic romance *(roman idyllique)* describes the juvenile love of its hero and heroine, whose emotional union is threatened by differences in religious or social background. The variations on this theme include the inappropriate love of a Saracen slave for a Christian knight and the attraction of a lesser noble for a woman of higher rank. Family opposition often leads to separation. Some romances show the departure of the hero to foreign lands, where he proves his worth in combat; others depict the exile of both hero and heroine and their separate struggles against pirates, would-be seducers, and rival knights. However, all ends happily with the reunion and marriage of the couple, once death has overtaken the dissenting parents. The settings of the romances are varied, ranging from a stylized Byzantine or Arthurian background to a more realistic French, German, or Scandinavian context. The plot incorporates traditional themes, including the exile-and-return motif, usually part of the hero's adventures, but sometimes duplicated in the experiences of the heroine. The rivalry between an official and unofficial suitor and the landless knight's achievement on the battlefield, overcoming objections to the young couple's *mésalliance,* are also featured. The idyllic hero's sufferings, based on the Ovidian pathology of love, threaten to keep him from victory. His lady, often indifferent to love at first, also yields to the sweet sickness, sometimes with amusing rapidity. Titles frequently feature the names of both hero and heroine, a device to indicate their equal beauty, worth, and suffering, which has led to suggestions that Chrétien's *Erec et Enide be* labeled an idylic romance.

   *Floire et Blancheflor* (first version, ca. 1160; second version, 13th c.) is a classic combination of the genre's main themes. The hero and heroine, separated by religion but united in the intensity and precocity of their love, are driven apart but reunited through the hero's efforts. Later romances develop the melodrama of the plot, becoming openly parodic in the case of *Aucassin et Nicolette,* which, against a traditional background of exile and reunion, playfully inverts many of the narrative and characterizational conventions of medieval fiction. *Amadas et Ydoine* (1190–1220) plays heavily on the lovesick hero and introduces an atmosphere of magic and the supernatural. Jean Renart's *Escoufle* (ca. 1202) traces the love and separation of Guillaume and Aelis, who had been brought up together at the imperial court. Roughly contemporaneous, *Galeran de Bretagne* by a certain Renaut follows the wanderings of the hero, son of the count of Brittany, who had met and fallen in love with Frêne, abandoned by her mother, fearful that the birth of twins would lead to accusations of infidelity. The anonymous early 13th-century *Guillaume de Palerne* tells of Guillaume's love for Melior and his protection in childhood and in his later exile by a werewolf. *Blancandin et l'Orgueilleuse d'Amour* (ca. 1230) is preserved in five manuscripts, one of which (*A:* B.N. fr. 19152) contains a much curtailed version. The lady's hostility to love, reminiscent of La Fière in Hue de Rotelande's *Ipomedon,* is vanquished by the hero's victory over her pagan enemy, King Alimodes. The work was composed by a "mestre Requis," whom Foerster has identified with the author of *Richars li biaus* (in his edition of the latter). In the 15th century, Jean

de Créquy produced a prose version of the tale. Robert de Blois's *Floris et Lyriopé* (ca. 1250) has the ill-starred Narcissus as the product of his hero and heroine's youthful liaison. *Cristal et Clarie* (ca. 1268), extant in only one manuscript (Arsenal 3516), depicts the hero's quest for a woman he has glimpsed in a dream. There is disputed attribution of the fabliau *Guillaume au faucon* to the author of this romance. *Sone de Nausay* (late 13th c.) depicts the hero's rejection by the girl he had loved, his pursuit of adventure in England, Scotland, and Norway, his marriage with the daughter of the king of this country, and his elevation to emperor. *Floriant et Florete* (ca. 1250–75) reworks in an Arthurian setting the elopement of its hero and heroine. *Eledus et Serene* has its heroine, a rich princess, fall in love with the son of a count who wins her from her official suitor.

In the 14th and 15th centuries variations on the idyllic theme include *Cleomadès et Clarmondine* by Philippe Camus, *Cleriadus et Meliadice, Pamphile et Galatée,* and *Ponthus et Sidoine.*

The *roman idyllique* introduces the poignancy of young love into traditional romance themes, including the hero and heroine's progress toward maturity through the experience of loss and reunion, and their ritual courtship leading to marriage and social integration.

# *IMAGE DU MONDE*

. A hugely popular didactic poem by the otherwise unknown Gossuin (or Gautier) de Metz; the dialect is that of Lorraine. It exists in three redactions of various lengths (from 6,600 to over 10,000 octosyllabic lines), of which the first and shortest, supposedly offered in 1246 to Robert d'Artois, brother of St. Louis, was by far the most widely known (sixty-seven manuscripts). The work is divided into three sections: an introduction to science (twenty-one chapters, including twenty-eight illustrations), geography and meteorology (nineteen chapters, nine illustrations), and astronomy (twenty-eight chapters, nine illustrations). Principal sources are Honorius of Autun's *Imago mundi,* Jacques de Vitry's *Historia Hierosolymitana,* Alexander Neckham's *De naturis rerum,* and Alain de Lille's *Anticlaudianus.* Like other encyclopedists of the period, the author treats such diverse subjects as the Seven Liberal Arts, the four elements, the shape of the earth (round), and celestial and terrestrial geography. His influence can be found in Matfre Ermengaud's *Breviari d'Amor,* in the prose *Sidrac,* and in Jehan Bonnet's *Placides et Timeo.*

# INDULGENCES

. Ecclesiastical actions, usually papal or episcopal, granting full or partial remission of the temporal punishment *(poena),* but not the guilt *(culpa),* due to sins. Indulgences appear in the 11th century, become prominent in the 12th, and thereafter form an important part of medieval religious belief and practice. The substitution of a lighter penance (prayers, almsgiving) for a longer or more severe penance can be found in the Carolingian period and even earlier, but this is not the equivalent of an indulgence, which frees a person from the temporal punishment required after confession of sin and priestly absolution.

The first widespread papal grants of indulgences occurred in connection with the Crusades. When calling for the First Crusade in 1095, Pope Urban II declared an indulgence granting full forgiveness (hence a "plenary indulgence") of all temporal punishment for all crusaders who confessed their sins. This had the effect of declaring that a knight who died on crusade would enter Heaven immediately after death, since he would have no temporal penance to carry out.

By the early 13th century, a plenary indulgence could be gained by contributing money, or even advice, toward the Crusades. Somewhat later, papal decrees allowed individuals to purchase letters allowing a confessor to grant the individual possessing the letter a plenary indulgence at the point of death. By the 14th century, it was possible to obtain a letter authorizing even a layperson to read a formula that decreed forgiveness of punishment *and* guilt (at the point of death).

Not all indulgences were full; many offered forgiveness of a finite time of punishment measured in days or in years. Such indulgences might be gained by going on pilgrimage, contributing to church building, attending a church dedication, visiting a shrine at a specific festival, building bridges, and the like. The Fourth Lateran Council (1215) sought to limit the extent of the forgiveness granted by such indulgences, but the tendency was to expand the occasions for granting and the length of penitential time forgiven.

The 14th century saw the development of plenary papal indulgences in connection with specific years for pilgrimage to Rome ("Jubilee Years"). Boniface VIII decreed a plenary indulgence for all Christians who confessed their sins and made pilgrimage to the churches of the Apostles in Rome in the year 1300 (and every hundred years thereafter). Clement VI shortened the interval between Jubilee Years to fifty, while also predicating the papal grant of indulgences on the idea of the "Treasury of Merits" of Christ, whose sacrificial death provided a superabundance of merits that were to be dispensed to the faithful through the authority of the pope, as God's vicar on earth, in granting full and partial indulgences. The Dominican theologian Hugues de Saint-Cher had already linked indulgences to the theory of a "treasury of merits" built up through the merits of Christ, the Virgin Mary, and the saints and administered by the church. Urban VI, in 1389,

reduced the Jubilee interval to thirtythree years; Paul II, in 1470, reduced it to twenty-five, which is the modern interval. At this same time, papal privileges were being granted to local churches and shrines to such an extent that the journey to Rome finally became unnecessary for gaining a sufficient indulgence.

An innovation with significant impact on late-medieval and early-modern religious life took place in 1476, when Sixtus IV granted a plenary indulgence for souls in Purgatory and declared that it was possible for the living to obtain indulgences for the dead to shorten their time in Purgatory. From the early centuries, Christian belief and practice asserted that alms and prayers offered by the living could be effective in shortening the time that persons might suffer the purifying fires and pains of purgation before entering Heaven. Sixtus, however, claimed that the papal power extended beyond the span of this life to offer the possibility of remission of temporal punishment for sin to those languishing in Purgatory, and to offer this in return for a money payment or a specific devotional act made by a living individual.

# INNOCENT III

(r. 1198–1216). Pope. The period between the death of Alexander III and the election of Lotario dei Seigni as Innocent III in 1198 was comparatively peaceful for the papacy. A series of elderly popes, some members of a party conciliatory to the Hohenstaufen, concentrated on ecclesiastical business, on responding to Saladin's capture of Jerusalem (1187), and on combating the rise of Cathar and Waldensian heresy in southern France. The coronation of Innocent inaugurated a new phase of political activity by the papacy, coupled with further efforts to reform the clergy and launch a crusade.

Lotario, a member of the Roman nobility, had studied theology at Paris and had gained a grounding in canon law. These studies made him a competent theologian, exegete, and preacher; on this traditional basis, he would build new interpretations of old texts, expanding papal jurisdiction "by reason of sin" *(ratione peccati)* into an ability to supervise the princes of Christendom. Lotario's most famous theological work, *De miseria conditionis humanae,* emphasized the brevity and pain of human life; but this may help explain his concept of the clergy, especially the pope, as mediating between God and humanity, able to work for peace and justice, as well as for orthodoxy and reform. Innocent III adopted Bernard of Clairvaux's description of the Roman pontiff as

the "vicar of Christ," which became a key papalist term, replacing an older emphasis on the Roman pontiff as vicar of Peter.

Innocent benefited from a crisis of leadership in both the ecclesiastical and secular spheres. Emperor Frederick I Barbarossa's son, Henry VI, had died young, leaving his son, Frederick, heir to Sicily and to a claim on the empire, as the pope's ward. Philip II Augustus of France and John Lackland of England were at odds, and the English nobility was restive. The Byzantine empire was weak, and the crusader states were under siege. The bishops of France were unable to deal with the Cathars, and the Cistercians were losing the influence they had enjoyed when Bernard was alive.

The Roman pontiff intervened in these situations with adroit and persistent efforts, supported by well-reasoned papal letters. Even the legitimation of a French nobleman's bastard could be the occasion for a declaration, in the decretal *Per venerabilem,* that the French kingdom was not subject to the empire. A dispute over the imperial succession in Germany allowed Innocent to keep the Hohenstaufen weak, while establishing a claim that the pope could review the election of a king of the Romans. Frederick II was supported in Sicily but with an intention of keeping the *Regno* separate from the empire. Efforts to reconcile Philip and John were unsuccessful, as the Capetians gained control of Normandy, and Philip refused to take back Ingeborg of Denmark as his wife. On the one hand, through the imposition of an interdict, Innocent was able to compel John to accept Stephen Langton as archbishop of Canterbury and to become a vassal of the Holy See. On the other hand, Innocent supported his new vassal by declaring *Magna carta* void, helping embroil John in a civil war in which the French intervened.

Innocent's crusading policy had mixed fortunes. A Spanish army defeated the Muslims of Spain and North Africa at Las Navas de Tolosa (1212), but the Fourth Crusade went awry, being diverted to Constantinople by Venice and a refugee prince. The storming and sack of that city in 1204 permanently embittered Byzantine relations with the West, but Innocent, although displeased, agreed to establish a Latin emperor and patriarch there. A less traditional crusade was that against the Cathars, launched by Innocent after the murder of one of his legates by a vassal of the count of Toulouse in 1208. At first, this campaign was led by Simon de Montfort; only after his death would the Capetian monarchy take over, using the crusade to gain control of Languedoc.

A more adventurous policy was implemented in ecclesiastical affairs. Numerous decretals expanded the role of Rome as the arbiter of justice for the clergy. New religious orders, the more mobile mendicant friars, were favored as teachers of sound doctrine in opposition to heresy. Dominic's Order of Preachers (Dominicans) arose in southern France to combat the Cathars; Francis's Friars Minor (Franciscans), dedicated to poverty, arose in urban Italy, which had its own problems with heresy. The secular clergy resented these friars, whose reception of alms diminished the income of parish priests and whose papal privileges undermined old lines of authority. Much of medieval ecclesiology was evolved in disputes over the limits of such interventions in local sees and parishes.

Innocent's last achievement was the great Fourth Lateran Council (1215), which was intended to promote yet another crusade. The assembly legislated for all Christendom. Orthodox doctrine was reaffirmed; preaching was encouraged, even as the proliferation of new orders was discouraged. One canon compelled all believers to confess their sins to their own priests at least once a year, during Lent or Eastertide, and to receive communion, the Easter duty that has remained a part of canon law. These canons and

Innocent's numerous decretals became important parts of the first official collection of canon law, the *Gregorian decretals* (1234).

# INNOCENT V

(d. 1276). Pope. When Gregory X died early in 1276, the first papal election under the provisions of the decree *Ubi periculum* of the Second Council of Lyon (1274) was conducted. The cardinals quickly elected Pierre de Tarantaise, who reigned as Innocent V for fewer than six months. Pierre had become a Dominican in Lyon ca. 1240. He had studied and taught at Paris, composing a well-known commentary on Peter Lombard's *Sententiae.* After helping formulate the Dominican program of studies, twice serving as provincial of France and preaching the crusade for Clement IV, Pierre was elevated by Gregory X to the archbishopric of Lyon in 1272. Made a cardinal in 1273, Pierre took part in the Council of Lyon, preaching the funeral sermon for St. Bonaventure. Gregory had allied himself with Rudolph of Habsburg to diminish Angevin influence on the papacy. Innocent reversed this policy, postponing Rudolph's imperial coronation indefinitely. The new pope did try to continue his predecessor's policy of conciliating the Byzantines, but Charles of Anjou, who had eastern ambitions, pressured him into weakening this effort. When Innocent died, Charles, in gratitude, built his tomb. Leo X beatified Innocent in 1898.

**.** *See* **TRAVEL**

# INQUISITION

**.** In medieval Latin, the term *inquisitio* generally conveyed the sense of investigation or inquest. Charlemagne's agents, the *missi dominici,* conducted inquests; William the Conqueror's survey that produced Domesday Book was an *inquisitio.* Emperor Henry IV encountered opposition from the Saxons when he attempted to conduct an *inquisitio* concerning lost royal rights in Saxony. Thus, the investigation of religious dissent, the practice with which the word "inquisition" has been most closely identified, was in a major sense merely another form of investigation by an authority competent to inaugurate an inquest and carry it out.

Other forms of *inquisitio* included the obligation of bishops to make visitations to the religious institutions of their dioceses and to correct wrongs found during such visitations. Various forms of *inquisitio* were used in the church, usually against erring or criminous clergy, more frequently after 1200. These instances of the term probably echoed older Roman criminal legal procedure, which from the 1st century tended to supplant an older private accusatorial criminal procedure with one in which the magistrate or judge assumed the responsibility for assembling evidence and carrying out a criminal trial. This process was technically known as *cognitio extraordinaria.* In another instance, inquisition might be made into the writings of a scholar accused of error.

With the emergence of formalized and institutionalized papal authority in the 11th century and classical canon law in the mid-12th, other dimensions were added to *inquisitio.* Papally delegated investigators and judges were instituted and in some instances could subdelegate all or part of their judicial authority to others. With the growth of widespread forms of religious dissent, popes urged bishops to investigate heresy in their own dioceses and appointed monastic figures to preach against it. This combination of delegation and appointment was not restricted to matters of dissent, however; popes also appointed preachers of the Crusades and later constituted the Order of Preachers (Dominicans) and delegated judicial authority for other matters as well.

Earlier episcopal attempts to discover heresy were hampered by the survival in many regions of the accusatorial procedure—that is, someone had to accuse publicly those he suspected of heresy. In 1162, however, Pope Alexander III wrote to Henry, archbishop of

Reims, ordering an archiepiscopal inquest into reported heresy in Flanders. The next year, at the Council of Tours, Alexander included a canon indicating that heretics were to be sought out by local ecclesiastical authorities. Another canon, c. 10 of Tours, stated that "it is expedient to discover new remedies for new maladies," and some of Alexander III's other correspondence indicates a concern for the secrecy of heretics and could be considered a rationale for requiring the *inquisitio* procedure in this instance.

As for the laity, Alexander also allowed the procedure of denunciation—that is, accusation without the responsibilities normally incumbent on the accuser. This was a form of the *denunciatio evangelica* that with accusation and inquisition came to be regarded as the three standard means of making a crime known to authorities. Denunciations were to be made by suitable people, synodal witnesses—*testes synodales,* a principle laid out in the well-known decretal of Alexander III, *Ad abolendam* of 1184, which also insisted that the ordinaries (bishops) of dioceses conduct hearings of these special witnesses for the purpose of discovering heresy.

As the perception of the extent and danger of heresy increased, more and more severe penalties were imposed by both ecclesiastical and temporal powers for those convicted. Crusades against heretics were launched, and the use of the inquest increased during the pontificate of Innocent III (1198–1216). In 1199, Innocent III appointed the abbots of Cîteaux and other Cistercian monasteries to hold inquests in Metz in matters of dissent, and in the process of rationalizing the prosecution of criminous clerics, Innocent commanded that they be proceeded against by the *inquisitio* method rather than by accusation. Recent schol arship has indicated how important the changing criminal law of clergy now seems to have been for developments in criminal procedure generally.

In the wake of the Albigensian Crusade, the pope and the king of France collaborated upon the general constitution of inquisitorial tribunals throughout the kingdom, established in the *ordonnance Cupientes* of 1229. *Cupientes* established, as Maisonneuve stated, "the inquisitorial procedure, by virtue of which all vassals and officers of the king were obliged specifically to seek out heretics and accomplices to heresy." In the same year, the Council of Toulouse formalized the episcopal inquisition. With the increasing importance of the mendicant orders, particularly the Dominicans, in the early 13th century, mendicant inquisitors joined mendicant confessors and preachers. After the disastrous inquisitorial experiments of Robert le Bougre in 1233–35, Dominicans began to be used regularly as inquisitors, even in episcopal inquisitions.

Inquisitorial tribunals flourished most effectively in the south of France, but in 1310 Marguerite Porete became the first capital victim of the inquisitors at Paris, followed by the destruction of the Templars in 1316. The case of Jeanne d'Arc in 1431 reflects the increasingly prominent role in the inquisitional tribunals not only of the Dominicans but of the faculty of theology at the University of Paris and continued the close collaboration among episcopal, mendicant, and political authorities.

From the 14th century through the 16th, the faculty of theology of Paris provided most of the inquisitorial activity in France.

# INVESTITURE (FEUDAL)

**.** Investiture was the act by which a lord transferred possession of a fief to a vassal. After homage was rendered, the lord would hand his vassal an object, such as a baton, twig, or turf representing the fief. Knights granting their fiefs to monasteries often did so by placing "twig and turf" on the altar. In other cases, a feudal tenant would divest himself by placing his hands in those of the local bishop, who in turn would invest the recipient. With the spread of written homages from the late 12th century, sealed charters transferring title in effect constituted investiture and often replaced the physical act.

# IRMINON, POLYPTICH OF

. The "polyptich," a multileaved document used from late Roman times through the 14th century, inventoried an estate or seigneurie with tenants, as well as their obligations in kind or in money and services. Irminon, abbot of Saint-Germain-des-Prés, had his survey, the most informative of all those that survive from the early Middle Ages, redacted between ca. 807 and ca. 825, naming approximately 8,000 people residing on the 1,378 farms of the abbey, squeezed into "population islands" surrounded by forests and wastelands. This first comprehensive catalogue treats peasant households *(familia)* in the medieval rather than the classical sense. Cited as units of measurement in the 7th century, *familia,* equivalent to the "hide" in England and the *mansus* in Italy, became generally used in the 8th for a peasant farm. The virtual end of slavery caused the family farm, normally inalienable and inheritable, to become the basic agricultural unit.

Although difficult to read and full of lacunae, Irminon's survey indicates that there were 135 males for every 100 females in the twenty-seven *brevia,* surveys of individual estates held by the abbey, that counted 4,188 males, 3,556 females, with 939 indeterminable as to sex. That ratio was common, except after wars, to most non-European as well as European societies before the 18th century because of high death rates in childbirth and because infanticide of females exceeded that of males. The survey of the landholdings of the Italian monastery of Farfa made between 789 and 822, where males outnumber females by 122 to 100, like other surveys even of late-medieval Europe, almost always provide similar ratios.

In Irminon's polyptich, the average family consisted of 5.75 people, each of whom worked approximately 120 acres. No grandfathers and only twenty-six grandmothers were recorded. Extended lateral families predominated. The 2,006 men and 2,200 boys against 1,975 women and 1,569 girls gives a ratio clearly beneath replacement needs, so that the population must have been shrinking. Marriages were apparently relatively late for females as well as for males, husbands being about nine years older than their wives and many men not marrying at all.

# ISAAC OF STELLA

(after 1100–1169/78). Born in England, Isaac became abbot of the small French Cistercian house of Stella, near Poitiers. Nothing is known of his life before he became abbot, but the nature of his thought and his use of technical theological language strongly suggest that he was a student in the schools of Paris and Chartres. He possibly came to

France ca. 1130 and may have embraced the Cistercian life shortly after 1140, perhaps at Pontigny. Isaac was a strong supporter of Thomas Becket in the latter's conflict with the English king Henry II.

Isaac's writings include two widely read letters: *Letter on the Office of the Mass,* an allegorical interpretation of the liturgy, and *Letter on the Soul,* an important contribution to 12th-century theological anthropology. Fifty-five of his sermons survive. Like other Cistercian sermon collections, this one contains not only actual sermons but also literary works that were never given as sermons, despite the fictions of sermonic style. Several series of sermons suggest that Isaac intended them to be seen as a unit on a specific topic. Sermons 1–5 are a commentary on the beatitudes that presents the stages of the spiritual life. Sermons 7–12, 14, and 15, address the fall and redemption of humans in a systematic way. Sermons 18–26 (on the Gospel parable of the sower) form a theological treatise on the divine nature. All of Isaac's sermons address topics of significance for the monastic life, but they do it from a perspective and with theological language shaped by his formation in the schools, for Isaac is a speculative theologian as well as a monastic embarked on a course of asceticism and prayer. Metaphysical and theological questions concerning the cosmos, creation, and redemption, Trinitarian theology, Neoplatonic influences (via Pseudo-Dionysius the Areopagite and Johannes Scottus Eriugena), the Incarnation, and the ultimate return to God (source of all) through Christ's work of redemption—these and other issues are handled with theological insight directed to the final purpose of guiding individuals on the spiritual path of contemplation.

Isaac left Stella ca. 1167 to establish a small monastic house on the desolate island of Ré, off the Atlantic coast near La Rochelle, that was later taken into the Cistercian order. Isaac died there, perhaps as early as 1169 or as late as 1178.

# ISABEAU OF BAVARIA

(ca. 1370–1435). Queen of France. Born to Stephen, duke of Bavaria, and Taddea Visconti, Isabeau married Charles VI of France on July 17, 1385. Charles VI had fallen in love with her at their first meeting on July 14 and married her without a marriage contract or dowry. Their relationship was troubled by his schizophrenia, which caused him to have an ambivalent attitude toward her. Isabeau was adept at politics, and on July 1,1402, Charles empowered her to deal with government business in his absence, aided by the dukes and whichever counselors she wished, but her prerogative was tempered in April

1403, when a group of royal ordinances attempted to achieve a balance of power among the royal relatives.

In 1405, Isabeau's court was accused of moral corruption and the queen herself was rebuked for instigating extravagant fashions by Jacques Legrand, an Augustinian friar. Until recently, historians have considered her frivolous and, more significantly, involved in an adulterous relationship with her brother-in-law, Louis of Orléans. The accusation of adultery first appeared in the anti-dauphin Paris of 1422–29, as part of an effort to throw doubts on the paternity of Charles VII. The myth found expression in the *Pastoralet,* a poem composed at that time to glorify John the Fearless of Burgundy, recently murdered at the dauphin's command.

Politically, Isabeau was quite unsupportive of Louis of Orléans until late 1404 or 1405, and she opposed John the Fearless until he rescued her from the exile imposed by the Armagnacs (Orléanist party) in 1417. Her objective from 1409 until that time had been to set up her eldest son as a replacement for the king during his periods of illness and thus keep the power to govern within the immediate royal family and away from the warring dukes. In January 1418, viewing the king and dauphin as prisoners of the Armagnacs in Paris, Isabeau formed a rival government with John the Fearless in Troyes. The Burgundian invasion of Paris in May 1418 produced a rapprochement between the king and queen but caused the departure of the dauphin, breaking the familial link that was essential to save the independence of the monarchy. Isabeau played an important role in the negotiations that led to the Treaty of Troyes (1420), and her policy of this period, aimed at protecting the monarchy, was long misinterpreted by historians as anti-French. Isabeau died at the Hôtel Saint-Pol in Paris in 1435.

# ISABELLA OF FRANCE

(1292–1358). Queen of England. The daughter of Philip IV and Jeanne of Navarre, Isabella of France was born at Paris and subsequently became queen of Edward II of England (r. 1307–27) and mother of Edward III (r. 1327–77). Her marriage, which had been under discussion as early as 1298, took place at Boulogne on January 25, 1308. After the execution of Edward's favorite, Piers Gaveston, Isabella played a leading role in mediating between her husband and his nobles (1312 and 1316). A chronicler of

dubious reliability, Jean d'Outremeuse, alleged that Isabella was the one who told her father about the adultery of her sisters-in-law.

In 1321, a refusal to admit her to Leeds castle led to a new round of warfare between Edward II and his uncle Thomas of Lancaster, leading to Thomas's execution in March 1322. In September 1324, war broke out with her brother Charles IV of France, and Isabella was sent to negotiate (March 1325), followed by her son, the future Edward III, who did homage to Charles for Aquitaine and Ponthieu (September 14).

Isabella then formed a liaison with the exiled English rebel Roger Mortimer, refused to return to England, and traveled to Hainaut, where the young Edward was betrothed to the count's daughter, Philippa, whose dowry was used to hire mercenaries. Isabella and Mortimer invaded England on September 24, 1326, and the barons rose in favor of her son. Edward II was captured on November 16 and abdicated on January 20, 1327. In September, he was murdered in prison.

Isabella and Mortimer, made earl of March in September 1328, ruled England, making disadvantageous treaties with France (March 1327) and Scotland (May 1328), but on the night of October 18–19, 1330, the young Edward III seized power in a coup. He had Mortimer executed on November 29. Isabella no longer played a major role, although she regained Ponthieu and Montreuil in 1332 and was suggested as a mediator with France in 1348. She died at Hertford on August 23, 1358.

# ISORHYTHMIC MOTET

. A 20th-century term applied to over 200 works of the 14th and early 15th centuries, characterized by a repeating pattern of rhythms (the *talea*) applied to the tenor. The tenor melody *(color)* is usually a *cantus firmus* borrowed from Gregorian chant. Above it, the phrase structure of motetus and triplum voices recurs at the same point above each *talea* statement. A clear hierarchy of rhythms differentiates the voices: the tenor (and contratenor, a fourth voice common by the mid-14th c.) moves at a slow rate, while triplum and motetus move quickly, exploiting rhythmic contrasts allowed by the Ars Nova notational system. The recurring nature of the form is emphasized through hocket, rhythmic sequences, changes in mensuration, or regular changes in texture.

The earliest examples appear as musical interpolations to a lavish copy of the *Livres de Fauvel* (second decade of the 14th c.). A unipartite plan, with constant rhythmic values in the tenor *talea,* is the most common formal disposition in the earliest works. By the second quarter of the century, bipartite motets with diminution were also cultivated, in which rhythmic values of the tenor *talea* are halved for a second section. Later in the century, isorhythmic motets were commonly written in several sections, with rhythmic values diminishing in a numerical ratio, such as 9:4:3:2 *(Portio nature/Ida capillorum* by

Egidius de Pusieux; 1342), or even 18:12:10:5:9:10 *(Salve virgo/Vita via* by Billart; ca. 1400). Strict isorhythmic *taleae* appear in all voices after ca. 1350.

As in the 13th-century motet, triplum and motetus declaim different poems. Strophic patterns in the poetry are often reflected in the isorhythmic layout, with a new strophe beginning at the same point in each succeeding *talea.* Most 14th-century isorhythmic motets have Latin texts; the many French-texted motets of Machaut are exceptions, polyphonic settings of courtly poetry written before the consolidation of the fixed forms and the development of polyphonic chansons ca. 1340. Otherwise, motets often served as political or polemical works, perhaps celebrating a pope (Vitry's *Petre Clemens/Lugentium siccentur*) or a king (Royllart's *Rex Karole),* excoriating venal officials at the French court (Vitry's *Garrit gallus/In nova* fert), or lamenting conditions during the Hundred Years' War (Machaut's *Tu qui gregem/Plange regni respublica*).

Early 15th-century isorhythmic motets by Franco-Burgundian composers, such as Johannes Carmen, Nicholas Grenon, and Guillaume Dufay, and the forty anonymous isorhythmic motets in the Cypriot-French codex (Turin, Biblioteca Nazionale, J.II.9), continue many of the style traits established in the late 14th century. Royllart's *Rex Karole* (ca. 1375) served as a compositional model for some of these later works; dramatic rhythmic changes in the upper voices (hocket, rhythmic sequences, mensuration changes, etc.) articulate the midpoint or end of each tenor *talea.*

During the 1420s and 1430s, the isorhythmic motet absorbed foreign stylistic influences. Some works written in Italy by Dufay and by his Franco-Burgundian contemporaries display the influence of Italian motets (e.g., Johannes Brassart's *Ave* Maria), while the latest isorhythmic works by Dufay, Brassart, and Johannes de Sarto adopted English features.

Unlike motets of the preceding century, 15th-century works written in France, Burgundy, and at the French court of the Lusignan in Cyprus are almost exclusively sacred in character, mostly on texts venerating the Virgin. Excluding motets that Dufay and his contemporaries wrote for Italian patrons, there are few overt political or occasional references in these works. By ca. 1450, the isorhythmic motet had effectively disappeared as an independent genre, but its structural principles exerted a continuing influence upon late 15th-century motets and upon the increasingly prominent tenor Mass.

# ISSOIRE

. The former abbey church of Issoire (Puy-de-Dôme), dedicated to St. Austremoine, first bishop of the Auvergne, is the largest of a homogeneous group of Romanesque churches found within a twenty-mile radius of Clermont-Ferrand. With a sober architecture of great formal beauty, enlivened by elegant arcading and mosaics of colored volcanic stones, this group is characterized by a powerful "westwerk," a continuous barrel vault over the nave buttressed by quadrant vaults in the tribune, a multiplication of windows in the choir, and an ambulatory with radiating chapels. Most distinctive is the treatment of the crossing: on the interior, the dome on squinches is carried by Carolingian flying screens (diaphragm arches) and buttressed by the high quadrant vaults of the adjacent transept bays; on the exterior, the raised bays form an oblong lantern supporting the tower. The ornate chevet and powerful crypt are among the most beautiful in the Auvergne. The octagonal tower, the heavy façade, and the interior paint are 19th-century, and the famous historiated capitals of the choir have suffered from mutilation and restoration.

# ISSOUDUN

. Originally a Gallic settlement, the fortified site of Issoudun (Indre) played a role in the conflict between the Capetian and Plantagenêt dynasties. Part of Eleanor of Aquitaine's dowry to Henry 11, it was seized by Philip 11 Augustus in 1187. Two years later, Richard I the Lionhearted inherited the territory but ceded it to Philip as part of the Treaty of Gisors. In 1195, one of Philip's officers betrayed him and took control of the tower in Richard's name. Philip attacked Issoudun again later in the same year.

Issoudun has several important medieval monuments: the Gothic church of Saint-Cyr, with a beautiful 14th- and 15th-century stained-glass window of the Crucifixion; a 12th-century belfry, once a part of the city's walls; and an octagonal tower known as the Tour Blanche, built between 1187 and 1195 by Richard the Lionhearted. The tower is located within the castle walls, forming a "spur" in the southeast corner and surrounded on the other three sides by a moat. It had an original height of 99 feet and walls up to 13 feet thick.

# IVO OF CHARTRES

(ca. 1040–1116). An outstanding bishop, reformer, canonist, and theologian, Ivo studied at Paris and with Lanfranc at the Norman abbey of Bec. He became prior of Saint-Quentin, an abbey of regular canons in Beauvais, ca. 1078. In 1090, he was made bishop of Chartres, where he remained until his death. While bishop, he compiled three important pre-Gratian collections of canon law: *Collectio tripartia, Decretum,* and *Panormia.* The *Panormia* was the most influential and was used as a source by Abélard and Hugh of Saint-Victor in their writings. Ivo was directly involved in the marriage dispute of King Philip I, as well as other instances of episcopal rulings on marriage law within the church. He was also involved in the Gregorian reform movement and in the

regularizing of clerical life through the reform of cathedral chapters and the establishment of houses of regular canons. His correspondence of over 300 letters is a valuable source for knowledge of ecclesiastical and secular matters in his lifetime.

# IVORIES

**.** From antiquity through the Middle Ages, ivory was prized as a precious material. Ivory comes from tusks, bones, or teeth of animals. Elephant-tusk ivory is especially valued and was used in the Middle Ages along with whalebone and other materials. The ivory-carving techniques used simple tools similar to those used in woodcarving. In the Middle Ages, ivory was finished by polishing and often painting and gilding. Medieval ivories were also combined with metalwork and jewels.

Carved ivory pieces were used in France throughout the Middle Ages. In the Merovingian period, some ivory carving was essentially a continuation in subject matter, especially religious scenes for liturgical furnishings, from late antiquity in Gaul. Other carvings displayed styles characteristic of Germanic tribes, such as the Franks. Ivory carving was one of many arts that experienced a revival during the Carolingian 9th century. Although production of ivories declined in the turbulent centuries following the fragmentation of the Carolingian empire, ivory carving was continued in French Romanesque art under the auspices of the church. In the Gothic period, ivory carving flourished in France. The Carolingian and Gothic eras were the two outstanding periods for the art of ivories in France.

Ivory: Crozier, 12th century, Florence, Bargello. *Photograph by Alinari/ Art Resources.*

From the Carolingian period, ivories that have survived were produced mainly as liturgical objects. They fall into the same stylistic categories as other art, such as manuscript illumination, that can be associated with either the court or with important abbeys. Many of the ivories were relief plaques used as book covers. As was typical of arts during the Carolingian renaissance, they were modeled on late-classical ivory diptychs and other objects. In ivories associated with Charlemagne's palace school, figures have a plastic monumentality despite their smaller scale. By contrast, the smaller, more animated figures from the Reims school are comparable with manuscript illumination from this center.

In the Gothic period, ivory carving was extremely popular in France. Paris was probably the leading French center producing Gothic ivories. Increased contacts with the East made the valued elephant ivory available in quan tity. A book of occupations, the *Livre des métiers* (1260), lists four categories of ivory carvers: painters and carvers of images, sculptors and crucifix carvers, comb and lantern makers, and those who made knife handles and writing tablets. Other areas in France also were active in the production of ivories, but their portability makes ivory carvings difficult to localize. At the same time, this characteristic made ivories one of the main artistic vehicles in spreading the French Gothic style throughout Europe.

French Gothic ivories can be divided into two basic categories, religious and secular. In both, stylistic characteristics were consistent with other arts, especially sculpture, with which ivory carving has so much in common. Religious ivories included statuettes, especially of the Virgin and Child, portable altars, and liturgical objects, such as pyxes

and croziers. Statues of the Virgin and Child usually depicted the crowned Virgin, either standing or seated, holding a playful Christ child. Faces were elegant and delicate, and drapery was often in complex, V-shaped folds. By the 15th century, under the influence of Flemish art, figures of the Virgin became more realistic and "maternal." Portable altars usually had at least two wings. Under frames of Gothic arches, multiple scenes were carved. Passion cycles were common, or sometimes the Virgin and Child was paired with a Crucifixion scene. Figures were lively,

Ivory: Crucifixion, crozier.
*Photograph by B.Wag. Courtesy of the Walters Art Gallery, Baltimore.*

and the deep relief carving created a play of light and shadow.

The nobility and also the increasingly prosperous bourgeoisie created a demand for luxury objects, including mirrors, combs, boxes, and ivory tablets. Scenes on these objects often depicted themes from romances and courtly lyric poetry. Among favored subjects were a lovers' tryst and the attack on the Castle of Love, with delicately carved roses serving as the weapons. For both religious and secular ivories, the elegant style of French Gothic art found perfect expression through the medium of ivory with its precious qualities and lustrous glow.

# J

## JACOB DE SENLECHES

(fl. 1378–95). French composer and harpist, represented in the Chantilly codex by four complex Ars Subtilior songs. Jacob spent a number of years at the court of Aragon and Castile. In 1383, he appears at Navarre, a harpist in the service of Cardinal Pedro de Luna, the future Pope Benedict XIII. His complex and virtuosic virelai *Harpe de melodie,* notated in one manuscript in the shape of a harp, features irregular canonic imitation in the upper voices. Performance instructions call for the singer to accompany himself on the harp.

## JACQUEMART GIELÉE

(fl. late 13th c.). Author of *Renart le nouvel,* a virulent anticlerical poem (7,862 lines; ca. 1289). Using the characters popularized by the *Roman de Renart,* the Lillois Jacquemart composed an essentially symbolic work in which Renart, as the personification of Satan, seduces humankind through appeals to pride, lust, and gluttony. The secular and regular clergy—and even the mendicant orders—are castigated in traditional terms drawn largely from Huon de Méry's *Tournoiement Antéchrist.*

# JACQUERIE

. The Jacquerie, named for the peasants who led it (popularly termed Jacques), was the greatest of latemedieval French rebellions. In a two-week period during late May and early June 1358, widespread violence broke out in and around the Paris basin, including the regions of Champagne, Brie, Picardy, Beauvaisis, and part of Normandy. While the degree to which the Jacquerie was linked to the concurrent revolt of Étienne Marcel in Paris itself is uncertain, the roots of both movements can be found in the conjuncture of political destabilization, social and economic tension, and the stresses of war.

The Jacquerie was said to have begun as a bloody quarrel between some stonecutters and noblemen, but antagonism soon fueled a rising noted for its cruelty and destruction. Although the Jacques had little in the way of political ideology, their militant rural march, under Guillaume Cale, was most often directed against the property and families of the nobility. The rebels received support from some provincial towns and from Paris but were crushed by a resurgent nobility under Charles of Navarre, who had earlier appeared to sanction the Jacques. Thousands of people lost their lives in an aftermath of brutal reprisals by the nobility, known as the Counter-Jacquerie.

The Jacquerie has traditionally been labeled a "class war" or "social rebellion" because of the basic nature of the conflict—nonnobles vs. nobles. Though most of the rebels were from the lower to middle social ranks, brief alliances that transcended any class distinctions emerged to cover particular political needs; communities that were followers of the malcontent Charles of Navarre, such as Paris, thus tended to support or at least tolerate the rebels as a means of protest against earlier actions of the crown. Similarly, Étienne Marcel temporarily aided the Jacques. The tenuous nature of these connections is evident in their short duration and reinforces the degree to which their political programs were not those of the Jacques.

# JACQUES DE LIÈGE

(Jacobus Leodiensis; ca. 1260-after 1330). Author of the *Speculum musice* and other works on music theory. Little is known about Jacques's life. He has been identified with one Jacobus de Oudenaerde, a canon of Liège and, in 1313, a professor at Paris. Jacques's early education in music was in the theories of Franco of Cologne and later Boethius, whose *De institutione musica* he studied at Paris. It was there that the *Speculum musice* was begun, an encyclopedic discussion of speculative music (five books, in which he draws upon the authority of Plato, Boethius, Isidore, Guido d'Arezzo, and John of Afflighem, as well as Aristotle, Robert Kilwardby, Peter Comestor, Johannes de Garlandia, and Franco of Cologne), ecclesiastical chant (one book, treating both Boethian and Guidonian modal theory), and measured music (one book, describing the genres of discant composition and discussing notation). The last two books of the *Speculum* reveal connections with Liège sources and might have been composed in that city. Book 7 was composed chiefly to refute the teachings of the Ars Nova school on rhythm and notation, vindicating such traditional theorists as Franco of Cologne and Magister Lambertus. Overall, Jacques's work is the most cogent and complete statement of the theory and practice of the Ars Antiqua. The *Speculum musice* was formerly attributed to Jehan des Murs, but many of its doctrines contradict Jehan's teaching.

Jacques de Liège. *Speculum musicae,* ed. Roger Bragard. 7 vols. Rome: American Institute of Musicology, 1955–70.

# JACQUES DE VITRY

(ca. 1160/70–1240). The son of a wealthy bourgeois family in Vitry-en-Perthios near Reims, Jacques studied in Paris at a time when Peter the Chanter, one of the most celebrated preachers of his day, was master of the cathedral school. In 1211, he entered the monastery of Augustinian regular canons dedicated to St. Nicolas in Oignies, not far from Cambrai. Over the next five years, he was close to the lay religious group known as the béguines, whose leader was Marie d'Oignies. During this same period, he became a preacher of crusades, first against the Albigensians in 1213 and then against the infidels in the Holy Land in 1214. His preaching won him the see of Acre on the coast of Palestine. Jacques arrived in Palestine in 1216 and accompanied the armies of the Fifth Crusade at Damietta, 1218–21. Weary of constant strife, Jacques left Acre in 1225 and served Pope Gregory IX in Italy and in the Low Countries over the next three years. In 1228, Gregory appointed him cardinal bishop of Tusculum, and he remained in Rome until his death. Jacques was buried at the monastery in Oignies, where he had begun his ecclesiastical vocation.

Jacques's most significant contribution to the history of the church comprised his collections of sermons intended to serve as models for preachers. One collection, *Sermones dominicales (de tempore),* gives three sermons for each of the Sundays of the ecclesiastical calendar; *Sermones de sanctis* gives 115 sermons for saints' days and special feasts; *Sermones communes et* feriales gives twentyseven sermons for daily use; *Sermones vulgares* (or *ad status*) gives seventy-four sermons addressing social classes and religious groups. The first small collection of such model sermons was compiled only the generation before by Alain de Lille, and Jacques went far beyond them with his collections, particularly in their homiletic illustrations, or exempla, which provide a wealth of amusing and instructive anecdotes.

Jacques also composed a biography of Marie d'Oignies (1213) that helped gain papal approval for the béguine movement and has since become a valuable historical source for the early days of that controversial movement. Several of his letters date from his sojourn in Palestine (up to 1221), and his *Historia Hierosolymitana abbreviata* in three books recounts not only the history of Jerusalem during the Crusades but also, and perhaps more importantly, the new and often controversial religious movements of the day, such as the béguines, the Humiliati, and even the Franciscans (at least in their more colorful manifestations), as they relate to the renewal of the church and to the success of its mission.

Although Jacques's religious vocation took the more traditional form of an Augustinian canon, both his sympathies for the spiritual revival of his day and his talents as an extraordinary preacher place him firmly in the mainstream of the life of the church in the 13th century.

# JARDIN DE PLAISANCE ET FLEUR DE RÉTHORIQUE

.

Printed in Paris by Antoine Vérard between 1501 and 1503, *the Jardin de plaisance et fleur de réthorique* is a compendium of over 630 ballades, rondeaux, and other short lyric poems and narrative segments from the preceding two centuries.

The compiler, who identifies himself only as "L'Infortuné," dedicates his work to King Louis XII and prefaces the anthology proper with the *Instructif de seconde réthorique,* a treatise on poetic art of some 2,000 lines. Three longer works follow this

treatise: the *Doleance de Megere,* written in 1469 by Regnaud Le Queux (whom some argue is the compiler of the Jardin); the *Donnet baillé au feu roy Charles huytiesme,* a brief treatise on Latin grammar composed ca. 1491, perhaps by Le Queux; and the *Chastel de joyeuse destinée,* an anonymous allegorical narrative poem of over 4,000 lines, relating a long quest through lands peopled by recognizable allies and adversaries of Love, ending with a vision of Love's palace, a place of *plaisance,* referring no doubt as well to the *jardin de plaisance,* the anthology in which the work is included. After hearing one of their company recount a debate between heart and eye, the lovers dwelling in the garden begin to create ballades and rondeaux both praising and blaming love and women. The women respond, in verse as well, thus carrying forth an exchange of opinion and sentiment extending over some 600 short lyric pieces. Poetic debates and laments on amorous situations are followed by a series of some thirty ballades and a single rondeau. The work is then slowly brought to an unhappy ending through a series of poems relating the obstacles to love. In the end, dying from love, a knight leaves a confession and testament to other lovers. In the work's final poem, he is called the *Oultré d'amours,* the one wronged by Love.

The *Jardin de plaisance* is ineffective as an overall narrative. Its interest resides in its attempt to define and illustrate in the same volume poetic art of the later Middle Ages and in its selection of poets included in the anthology. Written at the request of students of law, the *Instructif* can thus be seen as a handbook for those wishing to avoid pitfalls in composing occasional poetry. It relates poetry to a rhetorical aim and enumerates defects of style, figures of speech, principles of rhyme and versification, poetic genres, and appropriate levels of discourse for speech attributed to characters in moralities, comedies, chronicles, and other prose genres. By a curious tour de force, the *Instructif's* rules are generally given in the form of the genre being defined. Nearly fifty poets are represented in the *Jardin's* anthology, among them Machaut, Deschamps, Chartier, Charles d'Orléans, Granson, Pierre Chastellain, Jean de Calais, Baudet Herenc, Villon, Meschinot, and Molinet. The anthology gives little attention to the then flourishing Grands Rhétoriqueurs, preferring to present the models of the previous tradition.

**Janice C.Zinser**

*Le jardin de plaisance et fleur de réthorique.* 2 vols. Paris: Didot, 1910 and 1925. [Vol. 1 (1910) is the facsimile edition; Vol. 2 (1925) comprises the introduction and notes by Eugénie Droz and Arthur Piaget.]

# JAUFRE

**.** An Occitan quest-romance of 11,000 lines (octosyllabic rhymed couplets), *Jaufre* survives entire in two principal manuscripts (B.N. fr. 2164 and B.N. fr. 12571). Dated either in the 1170s (Rita Lejeune) or 1205–30 (Paul Rémy), the poem is dedicated to a king of Aragon who was generous with jongleurs and "crowned very young."

Jaufre, son of Dozon, arrives to be knighted at Arthur's weakened court just when Taulat offends Arthur by murdering a knight and vowing to repeat this yearly. Jaufre pursues Taulat, vanquishing evildoers all the way and each time sending prisoners and

witnesses back to Arthur. After three days without food or rest, he angers Brunissen by sleeping in her orchard. The two fall in love, but Jaufre flees her crazed people's attacks. Eventually vanquishing Taulat, he liberates the wounded knight Melian de Monmelior, whom Taulat has tortured monthly for seven years. This frees his subjects, including Brunissen, from lamentations and compulsive rage. After more otherworldly adventures, Jaufre marries Brunissen at Cardoil. Although often parodic of Arthurian material, *Jaufre* reaffirms the power of true piety against giants, felons, lepers, witches, and devils.

# JAUFRE RUDEL

(fl. 1120–48). The troubadour Jaufre Rudel, lord of Blaye in the Gironde, sang of earthly love infused by a mystical quest expressed also through his participation in the Second Crusade. Of his six surviving songs of certain authenticity, Jaufre's most successful *canso* is directed to his love from afar, or *amor de loing,* which gives this lyric its leitmotif and keyword. In this song and in *Qan lo* rius, he voices his yearning for a distant love, diversely interpreted by critics as a woman, the Virgin Mary, God, or the Holy Land. Recent scholarship underlines instead the deliberate ambiguity in Jaufre's fusion of linguistic registers and love objects drawn from both profane and sacred traditions. The legend of his love for the Countess of Tripoli dates from the pseudobiographical *vida* and earlier. It has been echoed in every century since the 13th by authors as varied as Petrarch, Stendhal, Rostand, Browning, Heine, Carducci, Pound, and Döblin.

# JEAN IV

(ca. 1340–1399). Duke of Brittany. Jean was the son of Jean de Montfort, a claimant for the ducal title in 1341. He spent most of his youth in England under the guardianship of Edward III. Following Montfort's capture (1341) and death (1345), Edward helped his widow, Jeanne of Flanders, to maintain their claims. After the Truce of Malestroit (1343), lieutenants occupied parts of Brittany for the English king and his ward. In 1356–57, Jean accompanied Henry, duke of Lancaster, to Brittany and was present at the siege of Rennes.

When negotiations to resolve the disputed Breton succession failed in 1361, Jean returned to Brittany in 1362 and in 1364 won the Battle of Auray, where his rival, Charles de Blois, was killed. The latter's widow, Jeanne de Penthièvre, agreed to peace at Guérande (April 12, 1365) under the aegis of Charles V's representatives. The new duke began a reorganization of his administration and finances, marking a watershed in the duchy's history and giving his reign enduring significance. But his pro-English stance and the presence of a few English counselors proved unpopular. In 1373, he was again forced into exile in England.

An attempt by Charles V to dispossess him (1378) provoked a violent reaction among the Breton nobility, who formed a league and invited Jean to return. After further warfare and the death of Charles V, a second comprehensive treaty was arranged at Guérande (April 4, 1381). Though Jean retained links with England, the failure of the English to return the castle of Brest or to restore fully his lands in England was a longstanding cause of dispute. He rendered moderate aid to the French crown in Flanders in 1383 and in 1386–87 but chiefly pursued policies to enhance an independent and largely neutral stance.

The last twenty years of his reign were also punctuated by a long feud with Jean, count of Penthièvre, Jeanne's son, and his father-in-law, Olivier IV de Clisson (constable of France, 1380–92). In 1387, Jean held Clisson for ransom, and he may have encouraged the murderous attack on him by Pierre de Craon in 1392. In 1395, Philip, duke of Burgundy, arranged a settlement. At the same time, Jean was bound more closely to French interests by the betrothal of his three-year-old heir to Charles VI's daughter, Jeanne de France, in 1392.

Throughout his career, Jean had a tendency to antagonize by an autocratic style of government; however, with increasing wealth, due to financial reforms and the cessation of war, he attracted many able men into his service. His rule advanced ducal authority and prestige and set a pattern for his successors. He was a considerable builder of castles and led a chivalric, courtly life, being especially interested in music. Around 1381, he founded the Order of the Ermine to commemorate his victory at Auray. He was married three times: to Edward III's daughter Mary (d. 1361); to Joan Holland (d. 1384), a step daughter of Edward, Prince of Wales; and in 1386 to Jeanne, daughter of Charles II of Navarre, who gave him four sons and four daughters.

# JEAN IV

(1389–1442). Duke of Brittany. Jean succeeded his father, Jean IV, in 1399. Despite moments of crisis, notably in 1420, when he was held captive for five months by Olivier, count of Penthièvre, in a further twist in the story of the rivalry for the ducal throne after 1341, Jean's reign was less dramatic than that of Jean IV. Internally, the duke's authority was seldom challenged. Taking advantage of the factional quarrels that undermined the French crown and allowed the English to establish their rule in northern France, Jean V normally avoided too close a commitment to any cause and oscillated between an Anglo-Burgundian and a French alliance for many years. This enabled Brittany to avoid the worst consequences of the Anglo-French war. From the vantage point of the early 16th century, the chronicler Alain Bouchart saw Jean's reign as a peaceful golden age.

How far he was personally responsible for this is controversial. Jean V is a shadowy personality when compared with his father or his younger brother, Arthur III (r. 1457–58), who was constable of France 1425–58. The events of 1420 left their mark and encouraged a caution sometimes interpreted as timidity. Recent research shows that the economic advantages of neutrality were not as great as once assumed. Nevertheless, the consolidation and strengthening of the administration begun by Jean IV continued, ably directed by Jean de Malestroit (chancellor, 1408–43) and outstanding financial officers like Jean de Mauléon (*trésorier de l'épargne,* 1405–44). Reform of the army began in 1424–25, and Brittany made diplomatic contacts with many powers in western Europe, especially to promote trade. The ceremonial aspects of ducal rule received new emphasis by a coronation service (1401), reorganization of the household along Burgundian lines (1405), adoption of the title *Dei gratia* in the ducal style, continuing appointments to the Order of the Ermine, and the issue of a gold coinage. When he died, Jean V was exposed "in his royal habit" in imitation of French royal practice. By his marriage to Jeanne de France, he had three sons and four daughters; the future prosperity of his house seemed ensured.

# JEAN BELETH

(fl. 1135–82). Little is known about the life of Jean Beleth. He witnessed a charter in the diocese of Chartres in 1135; was a student of Gilbert of Poitiers in Paris ca. 1141; composed a commentary on the liturgy, the *Summa de divinis officiis,* between 1160 and 1164; and was associated with the church at Amiens in 1182. He is best known for his *Summa,* which stands as the second of three important medieval treatises on the liturgy, the others being those by Amalarius of Metz (9th c.) and Guillaume Durand of Mende (13th c.). His work reads like a report of his lectures, dealing with sacred times, places, and objects from a largely historical point of view. Like many of his contemporaries, Jean is fond of dividing even the smallest of his topics into threes. His reputation as an expert on the liturgy has led to the attribution of many sermons to Jean, although only a few of them are considered authentic.

# JEAN D'ANDELYS

(fl. early 13th c.). During the later 12th century, a series of projects at the cathedral of NotreDame, Rouen, realized the northwest tower (Tour SaintRomain) and two new façade portals and launched construction of the four western bays of the nave. However, on April 8, 1200, a fire swept through the city devastating the cathedral. The reconstruction, liberally supported by Jean, duke of Normandy, and Pope Innocent III, was directed by Jean d'Andelys, mentioned as "mason, master of the works" in 1206/07.

Jean incorporated the 12th-century nave piers that had survived the fire and set the new choir atop the Romanesque foundations. His nave was planned as a fourstory elevation, including a gallery, in the manner of the cathedrals of Arras, Laon, or Paris; although adopting such modern Gothic features as pointed arches and linear articulation, it retained the imposing heaviness typical of Norman architecture. By 1214, Jean d'Andelys had been succeeded by Enguerrand (Ingelrannus), who, along with the later master Durand, abandoned the galleries to create a three-story nave.

# JEAN DE CHELLES

(fl. 13th c.). Jean de Chelles is mentioned by name only in the honorary inscription at the base of the south-transept façade of the cathedral of Paris *(Anno D[omi]ni MCCLVII mense Februario idus secundo [h]oc fuit inceptum Christi genit[ri]cis honore kallensi lathomo vivente Johanne magistro).* On the strength of this evidence, however, he is viewed as the designer of Notre-Dame's north-transept façade, built between ca. 1247/50 and 1257. This original and influential frontispiece combined a screen of gables across the portal, inspired by the west front of Saint-Nicaise, Reims, with the glazed triforium and enormous rose-in-square window derived from the Saint-Denis transepts. Jean's architecture is characterized by its tone of metallic preciosity as well as by its subtle tensions and contrasts, as individual forms achieve a limited independence within a crisply framed rectilinear grid. Attempts have been made to credit Jean de Chelles with the construction of the nave and choir chapels of Notre-Dame adjacent to the north transept, the south transept of Saint-Denis, the royal chapel at Saint-Germain-en-Laye, and the choir of the cathedral of Le Mans, although in the absence of positive documentary proof these attributions must remain speculative.

# JEAN DE FÉCAMP

(ca. 990–1078). An Italian, Jean accompanied his uncle William of Volpiano when the latter came in 989 to reform the abbey of Saint-Bénigne in Dijon. In 1028, Jean was named abbot of Fécamp, which William had reformed in 1006. He wrote an important contemplative treatise, which has survived in three distinct forms: *Confessio theologica* (before 1018), *Libellus de scripturis et verbis patrum* (1030–50), and *Confessio fidei* (ca. 1050). Inspired by the Bible and the church fathers, Jean was a Christ-centered mystic who believed that Jesus was healer and support to sinners. He was also the author of several Latin poems and corresponded with both William the Conqueror and Pope Leo IX.

# JEAN DE GARLANDE

(Johannes de Garlandia; ca. 1195ca. 1272). Born in England, Jean first studied at Oxford shortly after 1200 and went to Paris in 1217 or 1218, first to complete his studies and then to teach. At Paris, he lived in the Clos de Garlande, from which he derives his name. At the close of the Albigensian Crusade, the papal legate Romain Frangipani commissioned him to teach at the newly formed University of Toulouse (April 2, 1229), together with the Dominican master Roland of Cremona. Jean remained at Toulouse for only a few years. He may have returned to England during the 1230s but in any case was again teaching in Paris by 1241.

Jean's interests ranged primarily over the field of literary studies: etymology, rhetoric, grammar, and poetics. One of his earliest and best-known works, the *Parisiana poetria* (ca. 1220; revised a decade later), was a treatise on the art of poetry in the tradition of Matthieu de Vendôme and Geoffroi de Vinsauf. In this work, he stresses the place of both verse and prose composition in the arts curriculum. From this same period comes his *Dictionarius,* perhaps the first word book to be so entitled. Jean also wrote a brief verse commentary to Ovid's *Metamorphoses,* the *Integumenta Ovidii,* giving interpretations sometimes moral, sometimes scientific or historical, to the fables. Like many of his works, the *Integumenta* presupposes a vast general knowledge of the subject and is not intended for the novice.

Jean was also concerned about the moral formation of his students and wrote several works with that aim, among them the *Morale scolarium* (1241), an admonition on the values and habits of the ideal scholar, and the *Stella maris* (ca. 1249), in praise of the Virgin Mary as a paragon of Christian virtue and action. A later work, *De triumphis ecclesiae* (ca. 1252), is a polemic against pagans and heretics, based on his earlier experiences in Toulouse.

Jean had a prominent reputation in the 13th century. But though his promotion of lay piety was in keeping with the contemporary mission of the Dominicans and Franciscans, his resistance to Aristotelian studies and to the new emphasis on logic in the curriculum bespeak a conservatism more in keeping with the schools of the 12th century than with the universities of the 13th.

Jean must not be confused with the musician of the same name, listed hereunder as Johannes de Garlandia.

# JEAN DE MEUN

(Jehan de Meung; 1235/40–1305). Born at Meung-sur-Loire, Jean Chopinel (or Clopinel) obtained the Master of Arts, most likely in Paris. He dwelt for much of his adult life in the capital, where from at least 1292 to his death he was housed in the Hotel de la Tourelle in the Faubourg Saint-Jacques. Jean's works exhibit a rich classical and scholastic culture. Among the works he translated into French are Vegetius, *De re militari,* dedicated to Jean de Brienne, count of Eu; Boethius, *De consolatione Philosophiae,* dedicated to Philip the Fair; and the correspondence of Abélard and Héloïse. He also claims two additional translations, which are not extant: versions of Giraldus Cambrensis, *De mirabilibus Hiberniae,* and of Aelred of Rievaulx, *De spirituali amicitia.* More likely than not, Jean was also the author of the satirical *Testament maistre Jehan de Meun* and *Codicile maistre Jehan de Meun.*

But Jean is best remembered as the second author of the *Roman de la Rose,* an allegorical narrative begun by Guillaume de Lorris. This masterwork has survived in over 250 manuscripts. It also had twenty-one printed editions from 1481 to 1538. The *Rose* was translated partially or *in toto* during the medieval period once into Dutch, twice into Italian, and three times into English—the first English fragment is attributed to Chaucer. Jean de Meun influenced Dante, Boccaccio, Machaut, and Froissart; he played a crucial role in the formation of both Chaucer and Gower. Jean's section of the *Rose* became the subject of the first great literary quarrel, at the beginning of the 15th century. Jean de Meun was the first recognized *auctor* and *auctoritas* in French literary history, and his book the first true French classic, glossed, explicated, quoted, indexed, anthologized, and fought over—treated as if it were a masterpiece from antiquity.

Guillaume de Lorris wrote his *Roman de la Rose,* 4,028 lines left unfinished, in the early 1220s. In the decade 1264–74 Jean de Meun brought Guillaume's text to a conclusion. Jean's *Rose,* some 17,722 lines, does not merely complete the earlier poem: he grafts a totally original sequel onto it.

The God of Love comes with his army to succor Guillaume's forlorn Lover. First, False Seeming and Constrained Abstinence slay Foul Mouth, permitting the Lover to speak with Fair Welcome. A pitched battle occurs between the attackers and the defenders of the castle, ending in a truce. Finally, Venus leads a victorious assault, flinging her torch into the sanctuary: the castle bursts into flames, and the Lover wins the Rose.

The action and the allegory no longer play a primary role, as they did for Guillaume de Lorris. They serve as supports, and pretexts, for discourse: exhortations from Reason and Friend to the Lover, False Seeming's confession of his true nature to the God of Love before he is admitted into the army, the Old Woman's exhortation to Fair Welcome, Nature's confession to her priest, Genius, and Genius's exhortation to the army before the final battle.

The God of Love refers to Jean's book as a *miroër aus amoreus* (1. 10,621). It is, in one sense, a *speculum* or anatomy, a medieval encyclopedia, treating all knowledge,

including ethics, economics, cosmology, astronomy, optics, alchemy, and the university. The knowledge in the *speculum,* however, is granted unity and coherence by means of its inclusion under the category of love, which Jean expounds in all facets, both good (sex and reproduction, friendship, justice, the love of reason, one's neighbor, and God) and bad (lust for money, enslavement to Fortune, clerical celibacy, and the hypocrisy and deceit that exist between false lovers and false friends).

That the *Roman de la Rose* is didactic no one denies, but the precise nature of the message, the world vision that Jean de Meun wishes to instill, is subject to controversy. Most scholars believe that Jean transforms and refutes Guillaume de Lorris's *Rose,* that he derides, undermines, and destroys the ideal of *fin'amors* at every turn. One school of thought argues that Jean counters *fin'amors* with a call to procreation, to free love in the service of cosmic plenitude. Another school proposes that Jean treats all his characters, with the exception of Lady Reason, with irony and that his philosophy conforms to orthodox, Augustinian Christianity. The reason scholarly opinion differs so strikingly, why it is so difficult to pin down the author's personal doctrine, lies in the fact that Jean de Meun has chosen to exploit a unique version of narrative technique, quite different from that of his predecessors. Jean distinguishes himself as author from the dreamerprotagonist of his story, proclaimed to be Guillaume de Lorris, thus creating a first level of irony and distance. Second, the dreamer-protagonist, Fair Welcome, and Genius listen to and approve or disapprove of the lengthy discourses listed above, all of which are also presented with comedy and irony. Speakers have a proclivity to contradict themselves, and to cite texts from antiquity that refute rather than support their position. There is no foolproof method for determining which, if any, of the discourses are to be given greater weight than the others; which, if any, carry Jean's own conviction. Readers must judge each of these delegated voices in turn, analyzing the facts and rhetoric, to come to their own conclusions. The result, perhaps intended by Jean de Meun, is a state of doctrinal indeterminacy, in which the Lover and the audience are offered a sequence of philosophies and worldviews. The Lover, in the end, decides—he opens the sanctuary with joy—but the reader-audience is not obliged to applaud his decision. The indeterminacy remains, part and parcel of Jean's text and of a certain late Gothic mentality of which he is the first outstanding master.

Less controversial are the texture and ambience of Jean's imaginative world, a domain in which he is as great an innovator as in narrative technique. Compared with Guillaume de Lorris, Jean is a master of truculent vulgar speech, material detail, and picaresque naturalism. He shifts the audience's perspective from top to bottom, from rose petals to what they hide. A generation before Dante, three generations before Chaucer, Jean juxtaposes lofty and humble registers of style. Scenes, images, and speech once reserved to the fabliaux or excluded from polite letters altogether are now included in a serious work of art, alongside the sublime.

Jean's demystification of courtly love assumes several forms. His characters underscore the role of money in the erotic life, that so often the opposite sex is an object to be purchased, bartered, or exchanged for money or other commodities. The process of reification, and perhaps of antifeminism, is crowned by Jean de Meun's transformation of the woman-rose into a piece of lifeless architecture, a sanctuary, which the Lover pries open with his pilgrim's staff.

Still more striking is the role the author applies to manipulation and duplicity. Speech serves two purposes: to instruct and to trick. All people can be divided into knaves and fools, masters and slaves, deceivers and deceived. The deceivers create illusion by hiding behind masks; it is not easy for the Lover, Fair Welcome, or anyone else to distinguish appearance from reality, the mask from the flesh, the literal bark from an allegorical kernel. The author tells us that, since the end of the Golden Age, dissimulation, violence, and evil are part of the human condition and that we must learn to cope with them. Throughout the *Rose,* he implicitly urges the Lover and the audience to go beyond appearances and seek the truth, to open our eyes and rip aside the mask of falsehood. Knowledge can then lead to action. Some of Jean's characters remain passive, blind, impotent. Others, including the Lover, attain a measure of freedom, becoming masters not slaves, adults not children.

Jean's is a world of comedy. Several of his characters embody comic archetypes derived from the classics of ancient Rome. They are rigid, mechanical, obsessed with their narrow concerns. Furthermore, the narrative line, such as it is, constitutes the triumph of young love over old constraint. In spite of the blocking figures, Venus's torch burns and the story ends, as comedies must, with the couple packed off to bed. Whatever Jean's doctrine, whether for good or ill, the victory of our animal nature is achieved in a denouement of erotic explosion and the exaltation of life. It is for this reason that many scholars, especially in France, associate Jean de Meun with the awakening of humanism, the rebirth of reverence for antiquity, lust for life, and the revaluation of art that are hallmarks of the 12th- and 13th-century renaissance.

# JEAN DESCHAMPS

(fl. 13th c.). From the inscription on a memorial, we learn that Jean Deschamps began the cathedral of Clermont-Ferrand in 1248 and was buried with his wife, Marie, and their children outside the north portal of the church. Further, Jean Deschamps was hired in 1286 as the head master *(le premier maistre)* of the workshop of Narbonne cathedral, where he labored until 1295. However, based on careful analysis of these edifices, it appears likely that the two texts refer to different, but possibly related, masters.

Jean Deschamps of Clermont may also have been the designer of the choir of the cathedral of Limoges (begun ca. 1265–70). His architecture, connected closely to such major projects in and near Paris in the 1230s and 1240s as the nave chapels of Notre-Dame and the new work at Saint-Denis, combined brittle grids of tracery with undecorated wall surfaces to produce buildings of restrained elegance. Jean Deschamps's activity at Narbonne, confined to the chapels of the north aisle and the transept, lacks a clear "personality," but the approach to pier and tracery design does not reveal close ties to Clermont.

# JEAN D'ORBAIS

(fl. late 12th-early 13th c.). To Jean d'Orbais has often been attributed the design of Reims cathedral, begun in 1211, where he served as master mason for approximately a decade. One version of the labyrinth inscriptions declared that he began the choir *(encommencea la coiffe)* of the cathedral, and the sketch of his image may show him in the process of laying out the groundplan of the hemicycle. If Jean was the first cathedral master, his architecture can be appreciated as a brilliant blend of tradition and innovation. His plan and features of his elevation, such as the linkage of triforium and clerestory,

were influenced by the late 12th-century abbey of Saint-Remi, Reims. At the same time, the introduction of bar tracery in the windows of the cathedral was arguably the most important innovation in 13th-century European architecture, for it formed the basis for new effects of complex linearity, textural consistency and contrast, and countless compositional experiments.

*Michael T.Davis*

# JEAN LE BEL

(d. ca. 1370). The *Vrayes chroniques* of Jean le Bel is a valuable source for the Hundred Years' War and the Flemish wars of the 14th century. Born in Liège of a patrician family, Jean became a canon of Saint-Lambert. As his contemporaries noted, his clerical career did not prevent him from living like a great noble; Jacques de Hemricourt has left us a portrait of a man with a large retinue, who held court like the bishop himself, wore costly clothing, and thoroughly enjoyed himself doing so.

Jean claims in his writing to have undertaken his chronicle to correct the "false" history of a minstrel, but Jean d'Outremeuse tells us that he wrote at the request of Jean de Beaumont. He wrote in French "prose," primarily from his own experience, which included personal service during Edward III's Scottish campaign of 1327, and probably also from reports by Jean de Beaumont and other members of his circle. He seems to have written all the material up to 1357 sometime during that year and then made additions afterward. He was interested primarily in wars and deeds of chivalry, rather than in politics, like Froissart, who both used Jean's chronicle as a source and continued it, but he is a more careful historian than Froissart, deeply concerned to tell the truth as he saw it. Apart from Froissart, only his compatriot Jean d'Outre meuse and Cornelius Zantvliet seem to have known his work.

# JEAN LE LOUP

(fl. early 13th c.). Jean Le Loup served as master mason of Reims cathedral for sixteen years. Several scholars have proposed him as the first of the Reims architects (1211–27), while others have situated his activity in the 1230s and 1240s. Two of the transcriptions of the cathedral labyrinth add that Jean began the portals—but do they refer to the north transept or an early version of the west façade? In the absence of further information, Jean Le Loup, like his fellow masters at Reims Gaucher de Reims and Adam, must remain a name without an identifiable œuvre.

# JEAN RENART

. *See* **REALISTIC ROMANCES**

# JEANNE D'ARC

(ca. 1412–1431). The most heroic of France's saints, Jeanne d'Arc was born to a peasant family in Lorraine. At thirteen, Jeanne began hearing the "voices" (of SS. Michael, Catherine, and Margaret) that inspired her. In February 1429, she persuaded a Valois captain to provide an escort for her dangerous journey to the court of Charles VII. At Chinon, Jeanne convinced the king of her divine mission to defeat the English and to assist at his overdue coronation. After formal inquiry into her orthodoxy and chastity, she was given a commanding role in a relief force for Orléans and led reinforcements into the besieged city on April 29. She inspired counterattacks that compelled the English to abandon the siege on May 8. A month later, her army's decisive victory at Patay ensured Valois control over the Loire Valley and destroyed the myth of English invincibility. The subsequent campaign that brought Charles to Reims for a triumphant coronation on July 17 was the high point of Jeanne's meteoric career.

Now a political force, Jeanne became a recognized leader of the court faction favoring renewed war over negotiations with the Anglo-Burgundians. Failure in war soon destroyed her influence. When she was defeated and wounded in an ill-considered assault on Paris in September, Charles arranged a truce and disbanded his army. Though her family had been ennobled, Jeanne was politically isolated and left the court in the spring to bolster Compiègne's resistance to a Burgundian siege. She was captured there on May 24, 1430, and, to his eternal discredit, abandoned by Charles. Jeanne's cross-dressing, claims to divine guidance, and success had aroused suspicions of sorcery, but her subsequent trial and execution for heresy were acts intended primarily to discredit the Valois cause. In response to an accusation by representatives of the University of Paris, her Burgundian captors delivered her for trial at Rouen under the direction of Bishop Pierre Cauchon. Eloquent in testimony and steadfast when threatened with torture, Jeanne submitted only when weakened by illness and faced with execution. Sentenced to a life of imprisonment and penance, she relapsed and was condemned. Courageous to the end, she insisted on her innocence and asked the executioner to hold the cross high so she could see it through the flames. Jeanne remained a controversial figure, and in 1456 Charles VII arranged the annulment of her conviction mainly to clear himself of a suspect association.

Shrouded in myth and exalted by unceasing artistic glorification, Jeanne endures as a figure inspiring even the most skeptical. Her historical importance could be narrowly construed: she was essentially a military figure whose inspirational leadership and ephemeral battlefield success helped restore the prestige of the Valois dynasty, ensuring its survival but not its eventual triumph. Few, however, would restrict themselves to such a reductive assessment. Jeanne's courageous example and her martyrdom assure her an enduring role in modern life, not unlike that played by Roland in the Middle Ages. She has become a symbolic figure emblematic of many and varied hopes. Above all, she is the symbol of 20th-century France at war with both itself and its German invaders. In the late 19th century, the "Maid of Orléans" become a popular heroine who inspired generations of French conservatives in the struggle against the secularism of the Third Republic and reminded all Frenchmen of the need to regain the lost provinces of Alsace and Lorraine seized by Germany in 1870. This popular devotion led to her canonization in the aftermath of the First World War and final confirmation that her greatness transcends if not defies historical analysis.

# JEANNE DE CONSTANTINOPLE

(ca. 1200–1244). Countess of Flanders and Hainaut. The older daughter and successor of Baudouin IX of Flanders and emperor of Constantinople, Jeanne became countess when her father died on crusade in 1205/06. Philip II Augustus of France used her long minority to remove much of the threat that he had perceived from Flemish power. The regency lasted until Jeanne was married at Paris in 1212 to Ferrand of Portugal. Allegedly to counteract English influence in Flanders, the crown prince Louis occupied Aire and Saint-Omer before Jeanne and Ferrand were permitted to assume their inheritance. Ferrand quickly allied with the pro-English party in Flanders but was captured by the French at Bouvines (*July* 27, 1214) and kept in prison until 1227. Jeanne was forced to accept the control of a group of Francophile Flemish nobles. There was some easing of tensions in the 1220s; but to gain the release of Ferrand, to whom she seems genuinely to have been attached, Jeanne had to agree to the Treaty of Melun (1226), which provided an enormous indemnity and subordinated the counts of Flanders to the French crown. Ferrand fought the nobles who had caused his wife trouble during his captivity and forced the count of Holland to do homage to Flanders for Zeeland west of the Scheldt. He died in 1233, and his infant daughter did not live to maturity. In 1237, Jeanne married Thomas of Savoy. She died on December 5, 1244, and was succeeded in Hainaut and Flanders by her sister Marguerite.

# JEANNE OF BURGUNDY

. Two women named Jeanne of Burgundy, both born in the 1290s, reigned as queens of France in the first half of the 14th century. The older Jeanne was the daughter of Mahaut of Artois, a second cousin of Philip IV, and of Otto IV, count of Burgundy. In 1306, she married the king's second son, who ascended the throne ten years later as Philip V. Two of their children, both daughters, lived to adulthood. The older, another Jeanne, married Eudes IV, duke of Burgundy, and the younger, Marguerite, married Louis I of Flanders. Mahaut's title to the county of Artois was hotly contested, and Jeanne's husband, daughters, and sons-in-law became involved in this dispute, which split the French royal family. Queen Jeanne died in 1330 at about the age of forty, the year after she had succeeded her mother as countess of Artois.

Jeanne's rival in Artois, her cousin Robert, was a close friend of Charles IV (r. 1322–28) and Philip VI (r. 1328–50), but Philip finally broke with Robert after Jeanne's death,

when the county passed to her daughter, the duchess of Burgundy. Philip was extremely close to Eudes IV of Burgundy, who was his brother-in-law. Eudes's sister was the second Jeanne of Burgundy (a granddaughter of St. Louis through her mother, Agnes), who had married Philip of Valois in 1313. After Philip became king in 1328, the queen was a highly influential figure in royal politics. She and Philip corresponded frequently when they were separated, and he delegated important authority to her.

Devoted to all that was Burgundian, Jeanne is said to have strongly disliked people from northwestern France, especially Normans. For much of Philip VI's reign, Burgundians had considerable influence at court, while men of the west were seriously underrepresented. The disaffection of the northern and western nobility, a significant political factor in the reigns of Philip VI and John II, may have been related to the influence that this remarkable queen was able to exert on the policies of her husband and the attitudes of her son.

# JEANNE OF NAVARRE

(1273–1305). Queen of France. The daughter of Henri III of Champagne and Navarre and Blanche of Artois, granddaughter of Louis VIII, Jeanne inherited her father's lands in 1274. Plans for her to marry the heirs, first of Edward I of England and then the king of Aragon, failed after problems in Spain led Blanche and Jeanne to seek asylum with Philip III. In May 1275, Blanche put Navarre under Philip's protection and affianced Jeanne to one of his sons. Raised at the French court, Jeanne was declared of age on May 17, 1284, and on August 16 married Philip IV the Fair, who on October 6, 1285, succeeded his father as king. Jeanne was closely involved with the administration of Champagne and Navarre, but Philip effectively controlled them.

Jeanne was a popular queen, and Philip was devoted to her. In 1288, he deferred until after her death collection of money owed for the defense of Navarre. In October 1294, he appointed her regent of France if he died before their eldest son came of age. Her name was associated with Philip's in important acts, and she accompanied him on his grand tour of the Midi in 1303–04. She showed independence in supporting the Franciscan Bernard Délicieux and accepting gifts from citizens of Béziers, whose orthodoxy and loyalty were suspect. She pressed the prosecution of Guichard, bishop of Troyes, accused of cheating her and her mother (and later charged with killing Jeanne by sorcery). A woman of considerable culture, she commissioned Joinville's *Vie de saint Louis;* Ramon Lull and her confessor Durand de Champagne dedicated works to her, and Raymond of Béziers began for her his translation of *Kalila et Dimna.* She was godmother of Enguerran de Marigny's wife, and Enguerran was the officer in charge of Jeanne's pantry before joining Philip's service in 1302.

Jeanne bore Philip four sons and a daughter before dying on April 2, 1305. In her lavish testament, she used 40,000 *livres parisis* and three years' revenues of Champagne, assigned her by Philip, to endow a hospital at Château-Thierry and the Collège de Navarre in Paris. Having rejected burial at Saint-Denis, the royal mausoleum, she was interred at the Franciscan church in Paris.

# JEHAN BODEL

(d. 1210). A trouvère from Arras in the second half of the 12th century and one of the most prominent writers of his time. Jehan Bodel's life is only sketchily known—neither the date nor the place of his birth has been established with accuracy.

Jehan Bodel had strong links with the city of Arras and its surroundings. He introduces himself as a minstrel in his *Congés:* he was a member of the Arras minstrel and burgher brotherhood and contributed to the rapid expansion of this society. Stanza 40 of the *Congés* suggests that he was a familiar of the Arras *échevinage,* or town council, to which he was presumably attached. Elated by Foulque de Neuilly's preaching, he was about to follow Baudouin of Flanders, the future conqueror of Constantinople, to the Holy Land, when he began to suffer from the first signs of leprosy. In 1202, he withdrew to a leprosarium in the Arras region, most likely at Grant Val near Beaurains, where he died, according to the death-roll of the brotherhood, between February 2 and June 16, 1210.

Jehan's work has only gradually unveiled its secrets. Long underestimated, it now appears as one of the richest, most original *œuvres* in medieval literature. Because he tackled various genres simultaneously, the chronology of his works is difficult to establish. He is one of the earliest writers of *pastourelles* in *langue d'oïl;* five have been ascribed to him. Such narrative lyrics had already been composed by troubadours, but the Arragese minstrel left his mark upon the genre. Within a conventional framework, he proved original in his skilled composition in a wide range of prosodic structures and in the impression of truthfulness he gives due to subtle characterization and concrete details taken from peasant life.

Slightly different in inspiration were his one fable and eight fabliaux, those merry tales that give full scope to the imagination of an artist aiming at entertaining a noble audience at the expense of the middle class, peasants, women, and churchmen. If not as incisive as

Gautier le Leu's, Jehan's fabliaux evince acute observation and a rich experience of the life of Picard peasants and merchants. The genre, free enough to encompass risqué tales and cautionary fables, appealed to this storyteller keen on Gallic mirth: *Jehan Bodiax, un rimoieres de flabiax,* as he called himself.

His versatility led him to widen the scope of his writings. A connoisseur of chansons de geste, he soon realized that the Saxon wars, a landmark in Charlemagne's reign, were a fit subject for a vast epic, and by 1180 he undertook the composition of the *Chanson des Saisnes,* which his disease prevented him from completing. Four drafts of this work are extant, the shortest one known as *A* (4,337 lines) and the longest as *T* (8,019 lines). Analysis shows that later writers tried to bring the unfinished poem to completion after the 12th century. The first 3,307 lines of *A* provide us with a text as close as possible to what Jehan's original work may have been. Here, we can recognize the innovator at once by his art and literary theories as well as his idea of history. In keeping with the Roland tradition of the chanson de geste, he foregrounds Charlemagne but also humanizes the God-chosen emperor, whose character underwent further transformation with the continuators. Nor is Jehan's inspiration purely epic: with the amours of Baudouin, the young Frenchman, romance is woven into the martial narrative, while the comedy peculiar to fabliaux creeps into the episode of Saint-Herbert du Rhin. The poem synthesizes all the components of the author's craftsmanship: a scholarly minstrel, fascinated by history and committed to his times, both an observer of reality and a visionary, but first and foremost a poet capable of breathing life into whatever he portrayed.

Jehan dealt once more with an epic subject in the Jeu *de saint Nicolas,* a semiliturgical drama produced during the *grand siège,* or convention, of the Arras brotherhood, between 1194 and 1202. As in the *Chanson des Saisnes,* the background is the war of Christians and heathens. After an initial victory by the king of Africa's Saracens, the only survivor of the Christian host eventually ensures the triumph of his party, thanks to the protection of the saint; the king and his men convert to Christianity. The Jeu is a chanson de geste in miniature. Yet once more, the narrow frame of the genre, the dramatized miracle play, bursts under the poet's creative power. "Throughout the play," Albert Henry writes, "sacred and profane, sublime and comic, marvellous…and realistic elements are to be found side by side." In this powerful and original work, a masterpiece of medieval dramatic literature, is reflected the multifarious personality of an author who showed as much sincerity in praising Auxerre wine as in extolling the crusade.

Disease turned Jehan into one of our great lyric poets. When obliged to withdraw from the society of his contemporaries, he wrote a long supplication to his friends and benefactors in his farewell poems (Congés), composed in 1202. Taking up the stanzaic form of Hélinant de Froidmont's *Vers de la Mort,* he bade a pathetic farewell to the world in forty-five octosyllabic stanzas. The regret of bygone joys, rebellion against and resignation to his misfortune, faith in God, gratitude to those who harbored him "half sound and half rotten"—all the themes of a new genre are to be found here. A work of harrowing sincerity, the *Congés* stand, in the early 13th century, as the first example of "ordeal lyricism" to be found in so many poets from Rutebeuf to Verlaine.

A teller of spicy stories, the author of a chanson de geste, a skillful dramatist, a lyric poet, and a critic (in the prologue to the *Chanson des Saisnes,* he puts forward a

classification of the three principal poetic genres), Jehan Bodel tackled most contemporary forms and achieved creativity in each.

# JEHAN BRETEL

(ca. 1200–1271). A wealthy cloth merchant and banker of Arras, Jehan Bretel was also an active member and occasional leader of the poetic circle there, the Confrérie des

Jongleurs et des Bourgeois d'Arras. He is sole author of seven lyrics but is known primarily for his *jeux-partis,* of which he co-composed over ninety. His preferred partners in these compositions include Adam de la Halle, Jean de Grieviler, and Lambert Ferri.

# *JEHAN DE PARIS, ROMAN DE*

. Two manuscripts (B.N. fr. 1465 and Louvain G 54) contain this prose romance (ca. 1495) inspired by Philippe de Beaumanoir's *Jehan et Blonde.* The anonymous author recounts the success of the King of France over the King of England, as both seek the hand of a Spanish princess. The text, written in Lyon, contains references to the marriage of Charles VIII and Anne of Brittany.

# JEHAN DES MURS

(Johannes de Muris; ca. 1300-ca. 1350). Jehan was one of the most important music theorists of the later Middle Ages. His works on musical proportion and mensural notation remained authoritative for two centuries and were more widely distributed than those of any other theorist after 1200. Jehan's works on mathematics and astronomy, such as the *Opus quadripartitum* numerorum, were less influential than his musical writings. Considerable doubt remains as to the titles and authentic versions of Jehan's works. Four treatises are almost certainly authentic, all dating from the 1320s. The *Ars nova musice* (or *Notitia artis musice*) of 1321 stresses in its first part that only the theorist has sufficient wisdom to teach. The second book of the *Ars nova,* entitled *Musica practica,* discusses musical time, measurement, and nota tion. The *Quaestiones super partes musice* (or *Compendium musicae practicae*) is based largely on the *Ars nova.* The third work, *Musica speculativa secundum Boetium,* is notable for its mathematical methods, such as the use of theorems, in the study of music and became a standard textbook in eastern European universities in the 14th and 15th centuries. Other texts attributed to Jehan include the *Libellus cantus mensurabilis,* written for a nonacademic audience, and the *Ars contrapuncti.* The form, terminology, and theories of Jehan's writings were widely adopted by later writers. Jehan himself built on the style of Franco

of Cologne, using Aristotelian concepts and methods of exposition and proof. By not writing on plainchant and by not using the traditional lore about music's utility and classification, Jehan set a precedent for later writers to focus more on the practical problems of contemporary music.

# *JEU D'ADAM*

. The only extant manuscript of this early vernacular biblical play was copied in southwest France in the second quarter of the 13th century, though the original language was mid-12th-century Anglo-Norman. The play's Latin title, *Ordo representacionis Ade,* has a liturgical flavor, and its three vernacular episodes—the Fall, Cain and Abel, and the Prophets of Redemption—are framed by Latin lections, responsories, and prophecies. Moreover, the Latin stage directions, which prescribe not only costume and decor but movement, formal gesture, and manner of speaking, are reminiscent of church service books. The stage direction *ad ecclesiam* has traditionally been taken to indicate a performance outside the church building, but may designate a lieu, or stage location, opposite the synagogue referred to in the stage direction *de sinagoga*. In this case, a performance inside the church would be possible.

The long episode of the Fall (590 of the 944 lines) may be divided into three parts. The first and third, formal in tone and highlighted by choral interventions, are separated by the lively dialogue of the Temptation sequence. In the first part, Adam and Eve, clothed respectively in red and white, are joined in marriage by the Salvator, vested in a dalmatic and referred to thereafter as Figura. (God the Son, the figure of his father [Hebrews 1:3], usually replaces the Father as Creator in art before 1200.) God establishes the relationship of Adam and Eve to each other and then to himself as Creator and feudal overlord; he reminds them that they have free will and gives them Paradise as their fief. In the second part, demons running about the platea, or central playing space, usher in the rare scene of Satan vainly tempting Adam to disobey his lord. Next comes the justly celebrated temptation of Eve by the now flattering and soft-spoken "infernal Don Juan." Eve mimes listening to the advice of an artificial serpent before picking and eating the fatal apple. The last part of the Fall comprises lamentations by Adam, the Expulsion from Paradise, and more lamentations on earth. It ends with Adam and Eve being led off by rejoicing demons to a cacophonous welcome in Hell.

Cain and Abel, representing respectively the wicked who will be damned and the righteous who will be redeemed, are followed by a procession of prophets who foretell the coming of the Redeemer. The play, which is incomplete, breaks off in the scene of Nebuchadnezzar and the fiery furnace. The *Jeu d'Adam* exhibits a wide range of language registers and versification; vivid characterization, especially of Eve and Satan; and a subtle mixture of prophecy, biblical allusions, feudal terms, and internal cross-

references. It is one of the most frequently edited, translated, studied, and performed plays from medieval Europe.

# *JEU-PARTI*

. The occasional joc-partit, or *partimen,* of the troubadours blossomed into a 13th-century trouvère corpus of almost 200 *jeux-partis,* about half preserved with music. The earliest are due to Thibaut de Champagne, whose renown no doubt contributed to the genre's success among the poet-musicians of Arras, especially Jehan Bretel and Adam de la Halle. In six alternating stanzas of identical form and of the courtly chanson type, two poets debate a dilemmatic question, normally concerning amorous behavior and often playful as well as reflective of bourgeois circumstances, posed by one of them in the first stanza; then, in separate *envois,* they ask two judges for their verdict, which is never recorded.

# JEWELRY AND METALWORKING

. As early as the 5th century, the working of precious and nonprecious metals became a leading craft in Gaul. Through contact with peoples from central Asia during the period of migration, the Germanic tribes learned the art of working refined metals. However, the processes used were not always an improvement over earlier Gallo-Roman ones. The earlier *trempe* technique, for example, in which hot metal was dipped in cold water to give the object rigidity, gave way to the *recuit* process, which consisted of heating metal objects several times while letting them cool down between each heating. On the other hand, the development of soldered joints between different metals, metal plating, and inlaying allowed the forging of sturdy, reliable weapons that were largely responsible for Frankish military successes. In this period, iron was still a rare and precious commodity, reserved almost exclusively for military and court use. Most early metalwork therefore

consists of the weapons and objects of personal adornment that have been found in large numbers accompanying aristocratic burials of the period.

In jewelry making, early Frankish craftsmen worked most frequently with the *cloisonné* process, which consisted of setting jewels in tiny compartments formed of gold bands or strips soldered to a metal baseplate. The objects thus executed are a combination of primitive and refined ornamentation, good examples of which can be seen in the treasure of the Christian queen Arnegund (d. ca. 565), discovered in a tomb in the church of Saint-Denis. Gold- and silversmiths had high social standing in early-medieval cultures; compensation in silver for the murder of a serf was thirty sous, forty for a carpenter, fifty for a blacksmith, but as much as a hundred for a gold- or silversmith.

A model early metalworker was St. Éloi (ca. 588–660), who was born in Limoges and apprenticed there to the master of the mint. After creating two royal thrones of gold and precious stones for Clotar II, he was made head gold-smith of the royal mint at Marseille. After Clotar's death in 629, his son Dagobert I continued to patronize Éloi, naming him bishop of Tournai and Noyon as well as making him one of his chief ministers. Now wealthy, Éloi founded a monastery at Solignac and a convent for women in Paris. With his canonization, the bishop-goldsmith became the patron saint of silver-, gold-, and blacksmiths.

By the 11th and 12th centuries, iron was more generally available, thanks largely to imports from west Africa, and forges could now be found in most rural villages. Although iron was still used primarily for military purposes (weapons and armor for both men and horses), its greater abundance permitted the production of sturdier farming implements, and these led to a revolution in agrarian techniques and productivity during this period. Particularly significant was the development of the wheeled plow, with coulter, share, and moldboard, which allowed farmers to till the heavy soils of northern France efficiently for the first time. Steel, an iron-carbon alloy, is mentioned for the first time in a text from Anjou dated to 1177. By the end of the 12th century, the blacksmith and the miller were the backbone of the typical village hierarchy.

In jewelry making, the process of enameling was rediscovered in the early 12th century, with the *champlevé* technique now predominating, and became widely used for large jewels, brooches, rings, sword handles, and belt buckles. In spite of attempts by the church to limit ostentatious display, ornamental jewels became more and more refined. Noble men and women alike frequently placed a band of metal or a braided ribbon decorated with pearls and precious stones *(couronne)* on their head. The rising bourgeoisie of the northern cities, frequently as rich and powerful as the noble classes by the 13th century, sought to imitate the nobility in their finery.

Religious devotional practice introduced the rosary, whose beads were made of gold, bone, ivory, coral, mother of pearl, or amber. Enamel, having become too commonplace, fell out of fashion, while diamonds, pearls, and gold and silver decorations were preferred. Upper-class men and women had hands full of rings, and both sexes wore belts, necklaces, bracelets, and metal bands on their head.

The development in the 13th century of guilds led to high degrees of specialization among the metalworking crafts. Knife makers, for example, were divided into two guilds: the cutler and the gold, wood, or ivory handle maker. Toward the end of the Middle Ages, bills of Parlement in 1429 show that goldsmiths were forbidden to work with silver

and that distinctions were made between those who worked with various percentages of precious metals.

# JEWS

. Jews settled in what is now southern France in antiquity. New settlements took place in the course of the Middle Ages, although many parts of northern France did not see significant Jewish immigration until the 11th or 12th century. At its height, immediately before 1306, Jewish population reached at least 100,000 (in a total population of 9–12 million) with the vast majority concentrated in the south but with significant settlements in Champagne, Burgundy, and the Île-de-France. Northern French (Tsarfati) Jewry had its strongest ties to the Rhenish communities to the east and provided the pool from which Jews migrated to England after the Norman Conquest (1066). Southern Jews in Languedoc and Provence were in touch with the political, social, economic, and cultural life of other Mediterranean communities, especially in Spain and northern Italy.

A great cultural division distinguished northern Jewry from southern, especially in the centuries after 1096, the period that saw massacres of Jews in the Rhineland and elsewhere in the north in the wake of the Crusades. Society in the north was for the most part provincial, even parochial; there were few large towns. Northern Jews even before the period of the Crusades were noted for their brilliant exegesis of the Bible and for legal(istic) learning in general. Rashi (Rabbi Solomon ben Isaac; 1040–1105) and his followers loom large in this story. Northern Jews also developed a notable martyrocentric self-image, expressed particularly in liturgical poetry. Southern Jews mastered these genres as well but were renowned for their interest in secular subjects, such as philosophy, in the tradition of the Spaniard Maimonides (Moses ben Maimon; 1135–1204). Southern Jews were also well known for their lyric poetry, and southern society in general for its greater cosmopolitanism based on a vibrant urban culture in the coastal cities.

In the Carolingian period, the Jews of the south enjoyed considerable autonomy, and their leading citizen, the so-called *nasi* (loosely translated as "king"), came from a family of considerable influence with Christians and Jews. Later legends told how the Jews of the Narbonnais had supported Charlemagne in his military engagements with the Muslims, and the evident prosperity of the southern communities was supposed to have

originated in Charles's gratitude for their support. Jews, however, came under increasing pressure in the 12th and 13th centuries, at first mainly in the north, later in every region where the authority or even influence of the Capetian rulers of France reached. Believing that Jews ritually murdered Christian children, Philip II Augustus expelled his Jews from the royal domain, the Île-de-France, in 1182 but allowed them to return in 1198. From 1198 onward, they were placed under an ever-growing list of restrictions as to occupation, residence, and social and commercial interaction with Christians. By the 13th century, they were confined largely to the business of moneylending.

In 1240, the crown investigated the Talmud at the behest of the pope to determine, among other things, whether it blasphemed Christianity. Two years later, twenty-four cartloads of copies of the book were consigned by royal order to the flames. Philip IV, believing that Jews endeavored to obtain pieces of the eucharistic host in order to desecrate them, put further restrictions on Jewish activities. In 1306, he arrested and seized the property of Jews all over the kingdom and then expelled them. His son Louis X readmitted them for a term of twelve years in 1315, and thousands returned. After anti-Jewish riots associated with a popular movement for crusade (1320) and the rumors of a plot between Jews and lepers to poison the wells in France at the behest of the Muslim ruler of Granada (1321), many Jews were persecuted and fled. Not until 1359 was a reduced number of Jews allowed to return to do business and be taxed. The period of their sojourn was marked by unceasing popular animosity and increasing acts of violence. They were expelled definitively in 1394.

Throughout the period of their settlement in France, Jews governed themselves in internal matters. They had courts that settled disputes over marriage, contracts, ritual law, and so forth. Each community, if of a sufficient size, leased or owned communal sites and buildings, such as synagogues, schools, baths, ovens, and cemeteries. In relations with Christians, however, and in criminal matters, Jews were subject to the jurisdiction of the king or of those lords who had *dominium* over them. Despite the progressively stricter restrictions on residence, it is incorrect to speak of the ghettoization of French Jewry. Jewish neighborhoods almost always had some Christian residents. Nonetheless, Jewish solidarity, reinforced by Christian restrictive legislation on contacts with Christians, was exceptionally strong. Conversion to Christianity, even in times of great violence, seems to have been rare.

# JOHANNES DE GARLANDIA

(fl. ca. 1240). An influential music theorist associated with the University of Paris, Johannes is the author of two treatises, *De plana musica* and *De mensurabili musica,* in which he offers important discussions of the Notre-Dame polyphonic repertoire, the systemization of musical intervals, and the codification of the rhythmic modes. His long-enduring system of musical intervals divides consonance and dissonance into "perfect," "imperfect," and "medial" categories. With respect to Notre-Dame polyphony, which he categorized by style as organum, copula, or discant, his treatment of the six rhythmic modes and their notation addressed one of the major innovations of this repertoire.

# JOHN, DUKE OF BERRY

(1340–1416). The son of John II the Good of France and Bonne de Luxembourg, John was born in the castle of Vincennes on November 30, 1340. His father named him count of Poitou in 1356, but when this territory was ceded to England by the treaty of 1360 John became duke of Berry and Auvergne. During the years 1360–64, he was one of the hostages sent to England after the release of his father from captivity.

In 1369, John was charged with guarding the western frontier to keep the English contained within Poitou, and his brother Charles V reassigned him this county as an incentive to recover it from the English. His ineptitude at military strategy soon became clear. In 1374, Charles V's attitude toward John changed, perhaps because of a distaste for his private life. In October, when arranging for the succession, Charles V ordered that John not be one of his son's guardians if the dauphin, the future Charles VI, should succeed to the throne as a minor. Despite some rapprochement between the brothers in 1375 and 1376, John never regained Charles's full confidence. With the accession of Charles VI in 1380, however, John was officially accorded a place in the government and began to act as mediator between his two surviving brothers, the dukes of Anjou and Burgundy.

In November 1380, John was named royal lieutenant-general in Languedoc, where his officers and his policies soon made him unpopular. He rarely visited the Midi personally, and his lack of direct involvement produced near-anarchy in the province. When the king resolved to go to the south in person in 1389, John resigned his lieuten-ancy. The details

of John's political behavior, especially in the years following the assassination of his nephew Louis of Orléans in 1407, show him to have been unethical, unreliable, and selfish. Despite this evidence, contemporaries viewed him as gregarious, eloquent, and philanthropic. He did show both consistency and determination in his ecclesiastical policy, being the French prince most committed to ending the papal Schism.

After April 1404, as the king's sole surviving paternal uncle, John enjoyed a prestigious position and important role at court, serving as mediator between the Burgundian and Armagnac parties, particularly after the murder of the duke of Orléans. He was married twice: in 1360 to Jeanne d'Armagnac and, after her death, in 1389 to Jeanne de Boulogne. He died in Paris on June 15, 1416, leaving no male heirs.

*Richard C.Famiglietti*

One of the greatest patrons in the history of art, John was an inveterate collector—of books, dogs, castles, tapestries, jewels, and *objets d'art,* whether antique or contemporary. If he overtaxed his people, as has been claimed, it was to transform his immense wealth into works of art. Probably the best-known work commissioned by him is the unfinished *Très Riches Heures* (Chantilly, Musée Condé), illuminated by the Limbourg brothers and Jean Colombe. The famous calendar illuminations in this manuscript picture some of the duke's seventeen castles: Lusignan, Dourdan, Hotel de Nesle, Clain, Étampes, Saumur, the Louvre, and Vincennes. Another favorite castle, Mehun-sur-Yèvre, dominates the Temptation of Christ scene. Other works illuminated by the brothers include the *Très Belles Heures de Notre Dame* (B.N. lat. 3093) and the *Belles Heures* (New York, The Cloisters). They also contributed a miniature of the duke setting off on a jour ney in the *Petites Heures* (B.N. lat. 18014) and some scenes in *grisaille* for a *Bible historiale* (B.N. fr. 166). Another famous book of hours associated with the duke is the *Grandes Heures* (B.N. lat. 919), commissioned in 1407 and completed in 1409. Unfortunately, its original sixteen large miniatures, possibly by Jacquemart de Hesdin, who had illuminated the *Heures de Bruxelles* (before 1402) for the duke, have been lost. The list of artists contributing small miniatures reads like a who's who of the day, including the Boucicaut and Bedford Masters, as well as the Pseudo-Jacquemart. Other artists in the duke's employ were his master architect Gui de Dammartin, André Beauneveu, and Jean de Cambrai, who sculpted the duke's tomb.

John's extensive library included thirty-eight chivalric romances, forty-one histories, as well as works by Aristotle, Nicole Oresme, and Marco Polo. His secular books were outnumbered by religious works, especially prayer books: fourteen Bibles, sixteen psalters, eighteen breviaries, six missals, and fifteen books of hours. Of the over 300 illuminated manuscripts in the duke's library, some one hundred are extant today. Most of the other objects in his collections are known to us only through the extensive registers he caused to be kept after 1401.

# JOHN I LACKLAND

(1167–1216). King of England. The youngest son of Henry II and Eleanor of Aquitaine, John acceded to the English throne in 1199, after the death of his brother Richard. He was immediately confronted with the difficulty of securing English control over Maine, Anjou, and Touraine against the claims of his nephew and rival for the crown, Arthur I, duke of Brittany. The struggle ended in victory for John; as set out in the Treaty of Le Goulet in May 1200, he was acknowledged heir to all continental possessions of his father and brother in return for his recognition of the king of France as his overlord. But following his marriage later that year to Isabelle d'Angoulême, her spurned fiancé, Hugues X de Lusignan, appealed to Philip II Augustus for redress, and the French king summoned John to appear before his court. When John refused, Philip declared forfeit his continental possessions and launched an assault upon Normandy. John's efforts to retain hold of Normandy were thwarted by the defection of the Norman barons to Philip, and in December 1203 he returned to England to reconsider strategy and gather his resources. But Philip's capture of ChâteauGaillard, a key stronghold, in March 1204 dealt a major blow to his plans, and the rest of Normandy quickly fell, followed by John's remaining possessions with the exception of portions of Aquitaine. In an expedition in 1206, John regained Poitou, and he spent the following eight years plotting his return to the Continent to take back the rest of his former lands, during which time he built up a key alliance with the Holy Roman emperor Otto of Brunswick. In 1214, he launched his attack from Poitou while Otto invaded from Flanders. But John soon found his expedition collapsing for lack of support, while his hopes were dealt a final blow with the defeat of his allies at the Battle of Bouvines in July 1214. All that now effectively remained to the English crown in France were the lands of Gascony in the southwest.

Whether due to ill fortune or to his own incompetence, John's reign proved the turning point in the efforts of the French kings to break up the Angevin empire and extend their control over the territories of France. In addition, as a consequence of John's defeat at Bouvines the Capetian dynasty emerged as the strongest in Europe, a position it would maintain for another century.

# JOHN II THE GOOD

(1319–1364). King of France, 1350–64. The elder son of Philip VI and Jeanne of Burgundy, John became heir to the throne when his father succeeded to it in 1328. In 1332, John married Bonne de Luxembourg, daughter of the king of Bohemia. Before she died of plague in 1349, Bonne bore him nine children, among whom were the future Charles V and Jeanne, who married Charles the Bad of Navarre.

In the early campaigns of of the Hundred Years' War, John's first important command was at the abortive siege of Aiguillon in 1345. He was much attached to his mother and to the strong Burgundian faction in French politics, with which she was aligned. When Philip VI finally tried to mollify the dissident northwestern nobility in the 1340s and reduce the role of Burgundians, John remained linked to the latter in opposition to his father.

John's accession to the throne in 1350, soon followed by the summary execution of the constable Raoul de Brienne, revived the old tension between the Valois monarchy and the northwestern nobles. Leadership of the opposition passed to the Évreux branch of the royal family, headed by Charles of Navarre, who engineered the murder of the new constable, Charles of Spain, in 1354. After two provisional settlements with his dangerous son-in-law, John finally lost patience and arrested Charles in April 1356, executing several of his Norman allies and plunging northwestern France into civil war.

John also attracted criticism for his style of government, which gave great responsibility to the heads of administrative bodies, who tended to be men of modest social origins. Their continuity in office contrasted with that of the royal council, which frequently changed in composition as John had to appoint representatives of political factions rather than trusted men of his own choosing. Reformers on this council resented their lack of control over the administrative bodies. Bourgeois reformers, led by Parisians, harbored personal and political resentments against these royal officials. Noble reformers had an agenda based on class and geography as well as governmental philosophy, while clergy were found in both camps.

These opposition groups both played a role in the Estates General of 1355, but their failure to generate needed revenues provoked the king into policies that alienated both groups during 1356. In September, with an army consisting of his own noble supporters, John II met defeat and capture at the hands of an Anglo-Gascon army at Poitiers. For the next four years, he was a prisoner in England, trying to negotiate a treaty that would secure his release, while his son Charles struggled to preserve some authority for the monarchy in Paris.

As the bourgeois reformers showed increasing hostility to the nobles, and as the nobles became disillusioned with their erratic leader Charles the Bad, the crown managed to recruit important dissident nobles and rebuilt its power around a new coalition. This realignment occurred during the last six years of John's reign, but historians differ as to whether he or his son deserves credit for the royal recovery. Released for a large ransom under the terms of the Treaty of Brétigny in 1360, John had to contend with the violence of thousands of unemployed soldiers. After considering a crusade to lure them away, he secured from the Estates in December 1363 an important new tax, the *fouage,* to finance an army to restore order. Continuing unresolved problems with England were

complicated when the king's son Louis, a hostage for his father's ransom, broke parole and fled. John returned to captivity in England and died there in the spring of 1364.

# JOHN OF SALISBURY

(ca. 1115–1180). John was born in Old Sarum, England, and entered a clerical career as a young man, studying in the schools of Paris from 1136 until the mid-1140s. There, he heard lectures by Peter Abélard, Robert of Melun, William of Conches, Thierry of Chartres, Gilbert of Poitiers, and other masters of the day. He then traveled to Rome, where he entered the service of the pope. In 1148, he attended the synod at Reims where Gilbert of Poitiers was tried for heresy, a trial that John recounts in his *Historia pontificalis*. In 1153–54, he returned to England, where he served as secretary to Theobald, archbishop of Canterbury, and to his successor, Thomas Becket. John was part of one of the most striking public conflicts of royal and ecclesiastical power in the 12th century, that between Becket and King Henry II Plantagenêt of England. Becket's exile to France took John of Salisbury there as well. John was present in Christ Church cathedral, Canterbury, when Becket was attacked, but he fled the scene before the actual murder. In 1176, John was consecrated bishop of Chartres and died there in 1180. He knew well the worlds of episcopal patronage, education in the schools of Paris, the papal and royal courts, and the web of personal and professional friendships woven by the exchange of letters. Each of these circles influenced his life and writings.

The *Metalogicon,* a spirited defense of the Trivium, with emphasis upon the discipline of logic, is a valuable resource for understanding the world of the 12th-century schools and lists the masters with whom John studied. His *Policraticus* combines political theory, a handbook for government, criticism of court life, and a program of education for courtiers. In the *Historia pontificalis,* John offers a history focused on the papal court from the Synod of Reims (1148) through the year 1152. Among his other writings are a *vita* of Anselm of Bec and a brief *vita* of Becket, probably meant to serve as preface to a collection of the murdered archbishop's letters. Some 325 of John's letters survive.

# JOHN THE FEARLESS

(1371–1419). Duke of Burgundy. The son of Philip the Bold, duke of Burgundy, and Marguerite of Flanders, John the Fearless was born at Dijon on May 28, 1371, and named count of Nevers in 1384. In 1396, to aid the king of Hungary against the Turks, he led the Franco-Burgundian contingent of the expedition now called the Crusade of Nicopolis. When John inherited Burgundy in 1404, he gave the county of Nevers to his brother Philip. On August 31, 1404, John's daughter Marguerite married the duke of Guyenne, heir to the French throne.

In 1405, John became involved in French politics by opposing the new tax promoted by the duke of Orléans. At the death of his mother on March 21, 1405, John inherited the county of Flanders and found himself at war with the English after they attacked his port of Sluys. His desire to besiege the English stronghold of Calais was thwarted when Louis of Orléans influenced the royal council to refuse him aid. From this point on, a bitter hatred developed between John and Louis. John's tactics were impetuous, risky, and brutal. His demands for reform were made to gain the support of the people, and he was clearly interested more in personal gain than in the kingdom of France or true governmental reform. Because Louis threatened his interests on too many fronts, John had him assassinated in 1407. In his official justification for this act, presented by Jean Petit in Paris on March 8,1408, John claimed that he had saved the monarchy because Louis had been planning to have the king and his heirs killed in order to take the crown for himself. John received the king's pardon, but the Orléans family was unwilling to accept the decision. The ensuing conflict, called the quarrel of the Burgundians and the Armagnacs, dominated French politics even after John's own assassination at Montereau on September 10, 1419.

# JOINVILLE, JEAN DE

(1225–1317). Joinville's *Vie de saint Louis,* a French prose memoir by a powerful aristocrat, is one of our most valuable accounts of noble society in the 13th century. Joinville's father was seneschal of Champagne, an office he inherited. In 1248, he decided to take part in the Seventh Crusade and thus met St. Louis, becoming a close friend. The two endured captivity together, then Joinville served as royal steward at Acre (1250–54) before returning to France. Joinville began his memoirs of the king in 1272, just after Louis's death, but undertook the second part (composed 1298–1309) when Jeanne of Navarre, wife of Philip IV, requested it.

Joinville's narrative has many virtues. As an important noble, he advised the king during the crusade; as a warrior, he fought in it. Although a close friend, Joinville, unlike other biographers of Louis, respected but was not overawed by the king and sometimes disapproved of his actions, particularly when Louis's saintliness conflicted with what Joinville perceived to be his duties as king, aristocrat, and layman. Louis's decision to go on crusade in 1270 was one such occasion, but there were others. Joinville felt free at the time to speak his mind and records a number of salty interchanges between himself and his ruler. He was also candid about his own prejudices; he defended aristocratic privileges and was contemptuous of bourgeois upstarts. His observations are vivid, and his frankness makes the *Vie* delightful reading.

Joinville's work was overshadowed in his own day by Guillaume de Nangis's biography of Louis; of the three extant manuscripts, only one is medieval, a copy of the presentation manuscript of 1309.

# JONAS OF ORUÉANS

(before 780-ca. 843). Frankish theologian. Born in Aquitaine, Jonas became bishop of Orléans in 818, after its previous bishop, Theodulf, was compromised in the revolt of Bernard of Italy, nephew of Emperor Louis the Pious (r. 814–40). Jonas was involved in the political crises of Louis's reign and in several synods, including the assembly held in Paris in 825 to discuss the problem of image worship in the East and the Paris reform synod of 829. In connection with the synod of 825, Louis the Pious charged Jonas and Archbishop Jeremiah of Sens with preparing for Pope Eugenius II an extract of the council's decrees, which clarified the ways that 9th-century Carolingian views on images and their worship differed from those espoused by the papacy and the Byzantine court.

Jonas's writings also include the treatise *De institutione regia,* composed for Pepin of Aquitaine (d. 838), on the duties of monarchs and the role of bishops in the temporal sphere; *De institutione laicali,* written for Count Matfrid of Orléans, purportedly to explain the obligations of marriage; and *De cultu imaginum,* completed after 840, which defended the cults of relics and the Cross as well as the presence of artistic representations in churches.

# JONGLEUR

. Professional performers best known for propagating the chansons de geste, jongleurs also performed more mundane acts, such as acting, doing stunts, dancing, and bear baiting. Since the jongleurs normally sang the works of another and belonged to a lower class, they are regularly distinguished from the trouvères, who by definition "found," that is, created themselves, the songs they sang and did not participate in the other aspects of the jongleurs' art. Deriving from Old French jogleor, itself from Latin *joculator* 'jokester, comedian,' the form *jongleur* dates from the 16th century and is a contamination of *jangler* 'to chat, to gossip.'

The jongleurs' trade apparently emerged about the 8th century, although attestation of the word itself occurs only in the 9th. The church early on recognized the danger of uncontrolled histrionics during holy festivities, but since jongleurs also recited saints' lives ecclesiastical authority began to favor them, and some few acquired prestige. As a rule, however, their low social class made them outcasts, so that they were often rejected and prohibited from participating in the church services.

The 13th century has been labeled the golden age of the jongleur, when he was both respected and admired. Handsome rewards accruing to some attracted recruits from among artisans and peasantry, sometimes including women. Jongleurs amused the common folk by enlivening their fairs, saints' days, and other popular events. Occasions to seek their services abounded: return from battle, dubbing of knights, marriages, funerals. Along with their tales, songs, and acrobatics, they brought dancing, to the consternation of moralists. Jongleurs were often consid-ered a necessary touch of elegance in aristocratic courts. They traveled from castle to castle seeking hospitality and employment. Those permanently hired in the courts were called *ménéstrels*. Typically, the court was seated around the banquet table, and as the meal began a jongleur might recite a romance or announce the serving of the courses. But these were preludes to the core of the contribution, which came after dinner with instrumental music, community singing, and acting.

Jongleurs were rarely paid with money. Their salary consisted above all of food and drink, after which ranked clothing. A lord and his guests occasionally would shower the performers with rich gifts in order to outdo each other. Only then could a jongleur pay off the debts he had accumulated at the tavern or satisfy his family with capon and wine.

In the 15th century, the jongleur art broke up into specialties. Lower status came to those who emphasized acrobatics and prestidigitation; musicians and poets rose in prestige.

# JORDAN FANTOSME

(fl. late 12th c.). Author of an Anglo-Norman verse chronicle of some 2,065 lines recounting the barons' revolt against King Henry II Plantagenêt and the incursions into northern England of William the Lion's Scottish irregulars in 1173–74. Most likely, he should be identified with the Jordanus Fantasma who was a pupil of Gilbert of Poitiers in Paris and a clerk at Winchester. Jordan, writing in late 1174 or 1175, is an important contemporary witness to the events described, particularly on the Scottish front. Jordan's *Chronicle* is preserved in two manuscripts, Durham Cathedral Library C. iv. 27 and Lincoln Cathedral Library 104. The poem is divided into 217 laisses; the versification is both experimental and highly original.

# JOUARRE

. The ancient city of Dividorum, in Brie near present-day Meaux, was the site of a prestigious Benedictine abbey for women founded during the Merovingian era, one of the oldest religious foundations in the Île-de-France. Like many old foundations, Jouarre had a series of small churches but never a single large abbey church. Important vestiges of the rectangular crypt (second half of the 7th c.) are preserved behind the 15th-century church. Its two rows of porphyry and jasper columns, surmounted by white

Jouarre (Seine-et-Marne), plan of monastery. After Rousseau.

marble capitals, are noteworthy. In the crypt are also found Merovingian sarcophagi with foliage and cockleshell decorations. The most notable is that of St. Agilbert, 7th-century bishop of Paris. At the head of the tomb is carved Christ in Majesty, while on the two sides dead souls raise their arms in prayer.

All that remains of the 12th-century Romanesque church is the bell tower. The nearby crypt of St. Ébrégésile contains additional Merovingian sarcophagi.

### JOUFROI DE POITIERS

. An anonymous mid-13th-century romance of some 4,600 rhymed octosyllabic couplets, *Joufroi* recounts the amorous and knightly exploits of an aristocrat who closely resembles the great troubadour Guilhem IX of Aquitaine. A long central episode is dependent on *Flamenca,* while others follow the hero's travels across western France and England. Dubbed knight by the King of England in a manner reminiscent of Chrétien de Troyes's *Cligés,* he returns later to seduce the queen and ends up in a fabliaulike situation, which typifies the tonguein-cheek humor of the romance. A second particularity is the chatty narrator, who ostentatiously interrupts the tale to seek comments from the audience and especially to relate his own unsuccessful experience with love. The text exists in a single incomplete manuscript (Copenhagen Gl. kgl. Saml. 3555, 82).

# JOURNAL D'UN BOURGEOIS DE PARIS

. The *Journal d'un bourgeois de Paris* provides a highly personal account of Parisian history from 1405 to 1449. It needs to be read together with other contemporary accounts of French life, such as those by the Menagier de Paris, Nicolas de Baye, Clément de Fauquembergue, and Pierre de Fenin. The work presents many puzzling features, including both its title and author. Modern scholars call it a "journal," following Denis Godefroy in 1653. All six surviving manuscripts lack the opening pages of the work, and in some manuscripts overly critical passages have been scraped away rather than simply crossed out. Internal evidence suggests that the author had some connection to the university, but its piecemeal, anecdotal composition and the author's idiosyncratic use of Latin phrases reveal that he was little interested in the categories of sacred history and therefore probably not a professional theologian. His loyalties seem to lie first with the city of Paris rather than the French nation.

Besides detailed reports on epidemics, the weather, and agricultural products, the *Journal* contains a sobering account of Jeanne d'Arc from 1429. She appeared to the author as one of many religious personalities claiming heavenly inspiration. He was dismayed that Jeanne did not renounce her mission after the university apprised her of her theological errors. Though he generally sides with the Burgundians, his description of her execution is deeply moving, and he tells how the executioner raked back the fire to expose *sa pauvre charogne* ("her poor carcass") to the crowd. The *Journal* also recounts the composition of the mural pictures of the *danse macabre* at the church of the Holy Innocents, which served as a model for later artistic versions.

# *JUGE-MAGE*

. Judicial officer in Languedoc. The development of Roman law in Languedoc in the 12th century prepared the way for an administration of justice dispensed by trained jurists distinct from the other functionaries of secular government. With the installation of royal authority in 1226, this judicial administration received organization and a hierarchy of judges, at the head of which appear senior judicial officers in attendance upon the courts of the seneschals. The earliest of these officers, bearing the title *judex senescalli,* appear in the seneschalsy of Beaucaire in 1240 and in that of Carcassonne in 1253. By 1256, the judge of the seneschal of Beaucaire had assumed the *name juge-mage (judex major senescalli).* The title was adopted at Carcassonne in 1269 and subsequently in the seneschalsies of Toulouse, Rouergue, and Quercy. *The juge-mage* possessed appellate jurisdiction over the courts of the *juges-ordinaires* and also the exercise of immediate jurisdiction in cases of high justice or of unusual importance in the seneschalsy. He served as a principal counselor to the seneschal and might on occasion act as lieutenant of that officer.

# *JUGE-ORDINAIRE*

. Judicial officer in Languedoc. The title *of judex ordinarius,* deriving from Roman legal procedure, entered the administrative framework of the French monarchy in the 14th century through the usages of ecclesiastical justice. In the definition of the church, it denoted a judge possessing full competence over cases falling within the area of his authority, as the bishop within his diocese. It came, in the secular sphere, to designate judges of the courts of first instance within the royal seneschalsies of Beaucaire,

Carcassonne, Toulouse, Rouergue, and Quercy. Although these courts of the *viguiers* existed from the early 13th century, the title *judex ordinarius* was not applied until the establishment in the 1250s of a superior position, that of the *judex major (juge-mage)*. By 1350, the larger subordinate courts were recognized as the seats *of judices ordinarii*. The *juges-ordinaires* exercised full competence within their districts but were subject in extraordinary cases to the appellate jurisdiction of the *juge-mage* and in general cases to that of the judge of criminal appeals.

# JULIANA OF MONT-CORNILLON

(1193–1258). Founder of the feast of Corpus Christi, Juliana was born at Retinne near Liège to wealthy parents. Orphaned at the age of five, she was educated at a hospice for lepers in Mont-Cornillon, where she became prioress in 1222. As her anonymous biographer recounts, Juliana's life was marked by numerous crises that forced her to leave the hospice in 1242 and again in 1247–48. Together with a few trusted women friends, she spent the remaining years as a wandering béguine, a Cistercian nun, and finally a recluse. In 1246, Juliana and Prior John composed the Office for Corpus Christi; on June 6, 1247, the feast was celebrated for the first time in Liège; it was officially endorsed in 1264 by Pope Urban IV, with a new Office composed by Thomas Aquinas. A local cult in Juliana's honor was authorized by the Vatican in 1869.

Juliana's *vita* displays few individualistic traits besides her difficult life circumstances and accounts of her *caritas*. Although descriptions of extraordinary mystical feats are lacking, Juliana's spirituality follows generally the paradigmatic pattern of holy women of her era, especially in the form of prolonged and extreme fasting, intense devotion to the eucharist, visualizations of Christ's Passion, and reverence for the priesthood. It is therefore hard to establish how accurately Juliana's biographer captured this remarkable woman.

# JUMIÈGES

. Founded ca. 654 by St. Filibert, the abbey of Notre-Dame de Jumièges (Seine-Maritime) is today a splendid ruin, its fantastic skeleton defining the skyline by the Seine. Despite being abandoned (14th c.), sacked (16th c.), and used as a quarry (18th c.), much of Notre-Dame, along with its neighbor, Saint-Pierre, and other ecclesiastical buildings survive.

Jumièges (Seine-Maritime), Notre-Dame, nave ruins. *Photograph courtesy of Whitney S.Stoddard.*

A murky history of the early abbey reveals significant ties to the Carolingian dynasty. In 841, Vikings burned the town. Eventually, the dukes of Normandy funded the reconstruction of the abbey churches of Saint-Pierre (completed 990) and Notre-Dame (1037–66) on their original 7th-century sites. Although the adventures of William the Conqueror postponed the dedication of Notre-Dame for a year, to 1067, the Conqueror brought English land and monastic ties to the abbey. The signature of austere, imposing strength common to other Norman buildings is particularly indelible at Notre-Dame. Free from embellishments and figural sculpture, variations in pierced and blind arcades highlight the sides of the western octagonal towers. A single, plain portal and great

barrel-vaulted tribune projects one bay between the towers. Within the now roofless nave (which was originally timber and painted), a three-story elevation with arcade, triforium, and clerestory marches on alternating rectangular compound and columnar piers. Only the west wall of the transept tower records its original great height. Apart from the northwest wall of the north transept, very little of the transept arms survives. The east end was rebuilt in the 13th century (1267–78), but archaeological evidence suggests that the 11th-century transepts ended in apsidal chapels and the choir had an ambulatory with-out radiating chapels. A few figural capitals are in the abbey museum.

A passage and chapter house join Notre-Dame and Saint-Pierre. The western wall and two bays of Saint-Pierre date to the 10th century, and the rest of the structure is 13th-century. A second-story wall passage at the west end and rectilinear east end contains the long, aisleless nave. Of conventual buildings at Saint-Pierre, the 12th-century chapter house, lodgings, and cellars remain.

Founded at the beginning of the 12th century, the parish church of Saint-Valentine held relics of its patron saint from Jumièges. A façade pierced by six windows leads to the six-bay nave with plain arcade, clerestory windows, wooden roof—all Romanesque— and 16th-century choir. The nearby church of Yainville belonged to the monks of Jumièges and shares its 1 1th-century date. Although comparatively small, the church shares an imposing central tower and solidity with Notre-Dame.

# JUVENAL DES URSINS

**.** The name Juvenal des Ursins was assumed by the sons of Jean Jouvenal (1360–1431), a prominent official of Charles VI and Charles VII. They claimed descent from a Neapolitan branch of the Orsini family of Rome. The new name appeared by 1410 and had completely supplanted the old one by 1438. Jean Jouvenal's origins cannot be proved. He came from Troyes, studied civil law at Orléans, was *prévôt des marchands* in Paris (1389–1400), and served as royal lawyer in the Parlement and councillor of Charles VI and of the dukes of Berry, Burgundy, and Orléans. His important role in quelling the Cabochien uprising of 1413 won him the post of chancellor to the duke of Guyenne. He remained Guyenne's councillor after his replacement as chancellor in 1415.

Jean was a high official in the Cour des Aides (1415–18) but left Paris when it fell to the Burgundians in 1418 and joined the cause of the dauphin (later Charles VII). Thereafter, he held high positions in the parlements of Poitiers and Toulouse. He acquired a barony by 1407 and was knighted by 1420.

Jean Jouvenal and Michelle de Vitry had eleven children who survived infancy, four of whom attained prominence. Jean (1388–1473), best known as the author of a chronicle

of the reign of Charles VI, was bishop of Beauvais (1432–44) and Laon (1444–49) and then archbishop of Reims (1449–73). He headed the papal commission that pronounced the rehabilitation of Jeanne d'Arc in 1456 and produced a treatise on the duties of the chancellor of France. His brother Guillaume (1401–1472) was a longtime chancellor of France (1445–61 and 1465–72). Michel (b. 1409), served as *bailli* of Troyes; Jacques (1410–1457) held positions in the Parlement de Paris and Chambre des Comptes, was treasurer of the Sainte-Chapelle and archbishop of Reims (1444–49), and finished his career as patriarch of Alexandria with administration of the bishoprics of Poitiers and Fréjus.

# K

# KING CYCLE

. Charlemagne is at the center of the chansons de geste: many of the surviving epics can be grouped around him and even more so around the other rulers of the Carolingian dynasty, fused by time within the person of Charlemagne. Nevertheless, such terms as "King Cycle" or *geste du roi* remain problematic, since the poems about Charlemagne were never systematically grouped in a cycle like those of Guillaume d'Orange. The Charlemagne legend was brought together only later in the hybrid combinations of chanson de geste and verse chronicle composed by Philippe Mouskés in his *Chronique rimée* (completed in 1243) and by Girart d'Amiens in his *Charlemagne* (early 14th c.), and in the Franco-Italian epic cycle of MS Venice XIII (ca. 1350), David Aubert's *Croniques et conquestes de Charlemaine* (completed in 1458), and the Old Norse *Karlamagnús saga* (ca. 1250). The emperor and his peers figure in the chansons primarily thanks to the paramount importance of the *Chanson de Roland,* which furnished to later poets a stereotypical stock of heroes; the catastrophe at Roncevaux forms the backdrop for the organization of the cycle. Compared with other historical figures celebrated in the chansons de geste, however, Charlemagne's mighty personality, his prestige as emperor and king, and the fact that so many events of his life were well known to later generations greatly increased audience interest. Soon after the beginning of the 12th century, legendary stories about the emperor's youth, his pilgrimage to the Holy Land and travel to Constantinople, and his dispute with Ogier and wars against the Saxons were circulating in the form of chansons de geste. Only the epics about his youth constitute a more or less autonomous group, the other legends being simply integrated into the songs about the heroes of Roncevaux. The Latin Pseudo-Turpin chronicle (ca. 1140) already contains, in addition to an exaltation of the military and political service of the suzerain, the story of Ganelon's high treason in betraying Charlemagne's rearguard in the Pyrénées as he was returning from Spain. The influence of the Pseudo-Turpin is felt even later in a series of romanticized poems, such as *Aspremont, Gui de Bourgogne,* and *Otinel.* Within the King Cycle, it is the Spanish expedition and, to a lesser degree, the acquisition of the relics of Christ's Passion by the abbey of Saint-Denis that form a further point of departure for poetic treatment. There is, however, no cohesion among the poems, many of which show centrifugal tendencies and resist a systematic grouping.

Charlemagne's birth is the subject of Adenet le Roi's *Berte aus grans piés* (ca. 1275), which narrates the romantic circumstances that led to the conception of the son of Pepin the Short and Bertha (a Hungarian king's daughter), the future Charlemagne. His youth is

related in the fragment *Mainet* (late 12th c.), in which Bertha is poisoned by a servant whose daughter resembled Bertha so much that she could take her place with Pepin in the marital bed and conceive Heudri and Rainfroi (who later poison Pepin). Forced to flee, the young Charles changes his name to Mainet (diminutive of *magne*) and enters the service of the pagan king Galafre of Toledo, whom he helps to win a decisive battle; he obtains the hand of the king's daughter, Galienne, who is baptized and becomes his wife. In the lost *Chanson de Basin* (or *Couronnement de Charlemagne*), preserved in the *Karlamagnús saga* and in Middle Dutch and Middle High German adaptations, the youth Charles, summoned by an angel to go out and steal with the nobleman-turned-thief Basin, overhears a conspirator explaining to his wife the plan to prevent Charles's coronation; he brings down the conspiracy on the occasion of the dedication of the cathedral of Aix-la-Chapelle.

Although the historical Charlemagne was in diplomatic relations with the court of Byzantium, legend allows him also to make a pilgrimage to the Holy Land and travel to Constantinople, as in the *Voyage de Charlemagne,* in which he transports the relics of the Passion to his abbey, Saint-Denis. In *Simon de Pouille,* the Holy Land is the setting for the adventures of the old duke, Simon, of Aymeri of Narbonne's lineage (complete only in B.L.Royal 15 E VI of the 15th c.; 5,100 lines); in this poem, Charlemagne is a remote, prestigious figure, too old to take up arms himself but always willing to help his barons in danger. The liveliest characters in the poem are the converts: Synodos, Emir Jonas of Babylon's seneschal and lord of the castle Abilant; the shipmaster Sorbarrés, who assumes the name Simon the Convert, after Simon de Pouille, when he becomes a Christian; and Jonas's daughter Licoride, who marries Synodos at Saint-Germain-des-Prés at the end of the poem.

The first part of *Fierabras,* whose action takes place in Italy and Rome and revolves around the relics of Christ's Passion, is known today as the *Destruction de Rome* (probably mid-13th c.), preserved in two manuscripts and a fragment. Italy is likewise the setting for Charlemagne's fight against the pagans in *Aspremont* (late 12th c.). The poem is also called the *Enfances Roland,* because Roland forces the emperor to knight him on the battlefield after he has distinguished himself against the pagans and won his sword, Durendal. In the decisive battle, Turpin carries the True Cross, and the emir Agolant is felled by Claron, Milon's son, for the whole clan of Girart de Roussillon has come to fight against the pagans despite its feud with Charlemagne. *Otinel* is another italianate poem of the King Cycle. It deals with the conversion of Otinel, a daring Saracen messenger sent by the pagan emperor Garsile, who, having sacked Rome, has established himself in the fortress Atilie in Lombardy. Otinel's mission is to summon Charlemagne to submit to Garsile and renounce Christianity. Otinel hopes to use this opportunity to avenge his uncle Ferragu, slain by Roland, and comports himself so outrageously at Charlemagne's court that Roland challenges him to a duel, during which Otinel, winning, is suddenly enlightened by the Holy Spirit. Charlemagne offers him his daughter Belissent in marriage with Lombardy as dowry, but Otinel wants first to prove himself an exemplary Christian knight at the siege of Atilie, where he indeed shows himself stronger than Roland, Oliver, and Ogier. Otinel then weds Belissent and becomes king of Lombardy.

The war waged by Jehan in the swashbuckling romantic *poem jehan de Lanson* (first half of the 13th c.; 6,330 Alexandrines in the most complete manuscript) also takes place

in Italy. Jehan, Ganelon's nephew, has obtained from Charlemagne a duchy in southern Italy but converts to paganism; the ungrateful vassal then plots with Ganelon and Alori against his benefactor, after which the latter exiles Alori for murder but Jehan offers him hospitality. Charlemagne sends Roland and the twelve peers against the traitors; although Roland kills Jehan's father, Nivard, the peers are in great danger but are saved thanks to the artifices of the magician Basin of Gennes. This poem makes many borrowings from the *Quatre fils Aymon* and *Maugis d'Aigremont;* Basin, its real hero, is clearly an avatar of the popular and valiant magician Maugis, cousin of Aymon's sons. Among poems having the wars in Italy as subject, *Ogier le Danois,* which takes place in upper Italy from line 3,366 to 9,039 (in a poem of 12,346 lines), should also be mentioned.

Charlemagne's war against Widukind's Saxons was reflected in the lost *Guiteclin de Sassoigne* of the second half of the 12th century, of which only traces remain in the *Karlamagnús saga* and the Middle Dutch *Gwidekijn van Sassen* (late 14th c.); Jehan Bodel's incomplete *Chanson des Saisnes* (late 12th-early 13th c.) represents a courtly as well as satirical reworking of the story.

*Aiquin ou la conquête de la Bretagne par le roi Charlemagne* (late 12th-early 13th c.; preserved only in an incomplete 15th-c. manuscript, B.N. fr. 2233) narrates Charles's reconquest of Brittany from the Saracen Aiquin while returning with Roland's father and Naimes from a military expedition against the Saxons. Roland, Oliver, Ogier, and the other peers are still too young to participate, although the poem alludes to young Roland's deeds in *Aspremont* and underscores his Breton birth.

In the *Entrée d'Espagne,* composed by a Padovan poet in the early 14th century, Charles, having successfully fought the giant Ferragu, must besiege Pamplona; he has a falling out with Roland because of the latter's unauthorized conquest of the city of Nobles, following which Roland leaves the French camp in a huff. This incomplete poem was continued ca. 1343 in a much purer French by Nicholas of Verona in the *Prise de Pampelune* (also called *Guerre de Spagne*), in which the action continues until after Charlemagne's return from Roncevaux. Between the conquest of Pamplona and the battle of Roncevaux is *Gui de Bourgogne* (first quarter of the 13th c.; preserved in two copies of the same century), an epic with moralistic intent in which the young knights around Gui, whom they elect king of France, are pitted against the old peers surrounding Charles, and Gui in particular against Roland. The action comes to a head at the siege of Luiserne, the last pagan stronghold besides Saragossa. Competition between the armies of "the young" and "the old" barons before Luiserne is so fierce—and the poet does not hide his sympathy for the younger generation—that Charlemagne wishes Luiserne could sink into the sea to end this rivalry. The poet's creative verve gives the stock epic features the charm of novelty, and the vivacity of his dramatic sense carries much of the poem.

The epilogue of the battle of Roncevaux is developed in two poems. *Gaidon* (1230– 34; three manuscripts) is a hybrid between the King and Rebellious Vassal cycles. It begins after Ganelon's punishment, which takes place in Spain, where the hero, Thierry (surnamed Gaidon because a jay [OFr. *gai*], once perched on his helmet), is victorious over Pinabel. Because of the intrigues of Ganelon's clan and his own pitiful weakness, Charlemagne neglects those who are loyal to him, among whom are Naimes, Ogier, and Thierry-Gaidon; the latter is pushed into a lengthy feud with the emperor, in which the young knights side with Gaidon while their fathers fight for Charlemagne, as in *Gui de Bourgogne*. However, Gaidon continuously seeks reconciliation and finally succeeds

after defeating the implacable traitors. *Anseïs de Carthage* (ca. 1230–50; four 13th-c. manuscripts and several fragments), a chivalric poem in which heroism and love are intertwined, narrates the tragic theme of the loss of a country because of a woman. Charlemagne has regained Spain, and Carthage (=Cartagena) is given to the young Breton knight Anseïs. An embassy led by the old Ysoré de Conimbre (=Coimbra) suggests to Anseïs that he marry Gaudisse, Marsile's daughter, in order to end the war. However, Anseïs seduces Ysoré's daughter Lentisse, and Ysoré goes over to Marsile, who renews the war. Gaudisse falls in love with Anseïs, is baptized, and marries him, while Ysoré and Marsile die in prison and Charlemagne of old age.

A last poem, *Macaire ou la reine Sebile,* deals with an old Charlemagne who has taken a young wife, Sibile, who, according to Alberic des Trois-Fontaines (mid-13th c.), was the daughter of King Desiderius of Lombardy. The Middle High German chronicle of Weihenstephan (14th c.), a Spanish adaptation (manuscript of the 14th c., imprint of 1532), and a Dutch chapbook, the *Historie vander coninghinnen Sibilla* (Antwerp: Willem Vorsterman, ca. 1538) make her the daughter of Emperor Richer of Constantinople. Though not found in the chansons de geste of the King Cycle, Charlemagne's death is treated in the Guillaume d'Orange Cycle, as in the first branch of the *Couronnement de Louis* and especially in the unpublished Franco-Italian *Mort Charlemagne* (Oxford, Bodl. Canonici 54; 13th c.). The British manuscript narrates basically the same events as the *Couronnement,* but where the latter only mentions Charlemagne's death as having occurred while Louis was on pilgrimage to Rome, the *Mort Charlemagne* actually describes his death, foretold to him by an angel during a visit to Saint-Gilles-de-Provence, where he was forgiven, thanks to divine intervention, his mortal sin of having engendered Roland with his sister Berthe.

# KNIGHTHOOD

. Since 1066, the English word "knight" has been used as the equivalent of the Latin *miles* and the French *cheval(i)er. Miles* had been used from before 500 to ca. 950 to designate a soldier or military retainer of any sort, but after 950, both *miles* and *chevalier* were used especially to designate a particular type of mounted warrior, the professional heavy cavalryman who fought with the expensive armor and weapons traditionally used by Frankish nobles—helm, mail coat, lance, sword—and normally served as a vassal in the retinue of a prince or lesser noble. This type of warrior had apparently arisen under the Carolingians, but it was not until the second half of the 10th century that the vassalic cavalrymen began to emerge as a distinct and increasingly hereditary social category in France, forming a stratum of rural society between the noble landlords and their peasant tenants. Unlike the former, most *milites* in 10th- and 11th-century France came from undistinguished lineages, held little or no land, and possessed no rights of jurisdiction, but unlike the peasants they retained their full rights as freemen, were not tied to the soil or subjected to the jurisdiction of manorial courts, and served their noble lords (in whose households most of them lived) in capacities that were regarded as relatively honorable.

The basic definition of the knight that emerged between 950 and 1000, that of a fully equipped professional heavy cavalryman of free condition, was to change little before 1500, but the status, the number of men who enjoyed it, and the ideology and honor associated with it were to change tremendously during those same five centuries. The 11th century, which saw the creation of a new regime based on the possession of castles and armed retinues, naturally saw a rapid expansion in the number of knights, who were now called upon to garrison castles. It also witnessed the general adoption of the stirrup and the long Byzantine shield and the development both of the massed charge with couched lance and of the form of mock war called a *torneamentum,* or tournament. Finally, in the second half of the century, growing numbers of the nobility, who thought of themselves as warriors and fought in precisely the same way as knights at the head of a company of their knightly vassals, adopted the title *miles* as the formal designation of their social condition. By 1220, virtually all adult members of the old nobility not destined for the clergy assumed the title "knight" when they came of full age and were given the equipment characteristic of knighthood in the rite of *adoubement.* Thus, formal knighthood (Lat. *militia,* OFr. *chevalerie*) united the whole military class.

A social gulf nevertheless continued to exist between noble and nonnoble knights in most regions before ca. 1180, when the two social strata began to merge into a single noble estate. By that date, the great majority of simple knights in France were provided with fiefs and resembled nobles in being landlords, if only of a fraction of a village. The knightly class also benefited from the development of social ideologies that assigned a high function to the status of knight. The first of these, developed between 1025 and 1160 by clerical theorists, tended toward the identification of the body of knights with the second of the three "orders" into which God had divided Christian society, and to assign to knights as such both the military and the governmental functions originally assigned to this theoretical order of "fighters," an order previously identified with the nobility alone. Thus was created the idea of a sacred "order of knighthood" transmitted by knights, and the simple ceremony of *adoubement* was gradually altered under its influence into an elaborate rite of ordination. Between 1170 and 1200, an alternative but not incompatible ideology was developed in the new genre of the romance, in which knighthood was associated with the virtues of the courtly noble whose principal goal was to win honor for himself.

Inspired by these exalted ideas of their profession, in the half-century or so after 1180 the simple knights of France gradually usurped the distinctive attributes of their noble lords, including a dynastic surname and coat of arms, a seal, the personal prefix "lord" (Lat. *dominus,* OFr. *sire* or *messire*), and a fortified residence. By 1270, the king forbade his knightly subjects to dub anyone not of knightly ancestry and declared null the effects of such actions performed by anyone other than himself. The knights and their descendants thus came to form, with the descendants of the princes and castellans, a new and much larger noble estate, so closely identified with knighthood that it was more often called the *chevalerie* than the *noblesse*.

A surprising result of this development was a steady decline, especially after 1250, in the proportion of the male members of this knightly nobility who actually assumed the status and burdens of knighthood. The growing cost both of armor and of the ceremony of *adoubement* placed impossible strains on the finances of the sons of many petty knights, and as their social status was now securely based on descent more and more minor nobles decided to postpone indefinitely their admission to knighthood and remained esquires for most or all of their lives. The absolute number of knights in France declined from a high of perhaps 40,000 in 1180 to between 10,000 and 5,000 in 1300, between 5,000 and 3,000 in 1350, and about 1,000 in 1470, and the proportion of the royal army composed of knights fell from 16 percent in 1340 to 11 percent in 1382 and 3 percent in 1461.

The tradition of receiving knighthood on coming of age around twenty-one was preserved in the middle and especially the upper nobility down to ca. 1500, with the odd result that a status that before 1180 had been associated primarily with petty warriors in the service of nobles was associated between 1300 and 1500 primarily with the heirs of those same nobles. Knights continued to serve in battle with the latest armor, the price of which continued to escalate, down to 1500, and knight banneret and knight bachelor continued to be recognized as pay grades in the royal army down to 1438, but after 1400 knighthood came to be seen less as a professional than as an honorific status.

# KNOLLES, ROBERT

(ca. 1325–1407). One of the most famous leaders of the English Free Companies during the early Hundred Years' War. Knolles rose from the lower ranks of the army, as the English military leaders soon recognized his prowess, knighted him, and constantly requested his assistance in military adventures.

Nothing is known about Knolles's birth, although it is certain that he was not a noble, nor is there anything known about the date or reason for his military muster. He had attained a prestigious reputation as a soldier by 1351, when he fought in the Combat of the Thirty, during which he was captured by the French. In 1356, he led an English force of more than 800 men, which, after the victory at Poitiers, pillaged the coast of Normandy. In 1358, Knolles again commanded a force in France; during the next two years, it sacked the suburbs of Orléans, controlled forty castles in the Loire Valley, and even threatened the pope at Avignon, for which he earned 100,000 crowns in French booty. Knolles joined Edward III on a successful *chevauchée* that pillaged France in 1359–60, ending only with the signing of the Treaty of Brétigny (1360).

Knolles continued fighting through the 1360s, mostly in Brittany. In 1370, he again undertook a *chevauchée* in France, but although this raid succeeded in destroying much of the countryside, at Pontvallain his rearguard was annihilated and he retreated into Brittany. Knolles's military activity then diminished, although he again led *chevauchées* in France in 1379 and in 1380.

In 1380, Knolles retired to a wealthy life in London. Only twice did he come out of retirement to lead English armies: during the 1381 Peasant Revolt, when he was asked to be the leader of the defense of London, and in 1385, when he led a relief force on Damme. He died, an old man, in 1407.

# L

## LA CEPEDE, PIERRE DE

(Ceppede, Cypede; fl. first half of the 15th c.). Marseillais author of a prose romance in French (possibly from an Occitan source), *Paris et Vienne* (1432), about the lovers Vienne, heiress to the Dauphiné, and Paris, her father's vassal, who triumph over adversity through their constancy and valor. The many editions and translations before 1700, including Caxton's, attest to the romance's popularity.

## LA CHESNAYE, NICOLAS DE

(fl. late 15th c.). Author of a 3,650-line allegorical play probably written before 1500, *La condamnation de Banquet,* that shows the fate of seven *bons vivants* who overindulge in food and drink. During the feasting first at Supper's place then at Banquet's, ten terrible maladies, including Gout, Colic, Apoplexy, Jaundice, and Epilepsy, attack and eventually kill most of the revelers. Finally, Supper and Banquet are tried and condemned by Experience. This morality differs from others in the genre by its focus on the physical rather than the moral effects of unwise behavior. A stern warning against excess, it is also a lively and humorous portrait of latemedieval feasting.

# LA HIRE

(ca. 1390–1443). Étienne de Vignolles, called "La Hire" for his temper, was a constant but undisciplined supporter of Charles VII. He fought at many major Valois defeats (Verneuil, 1424; the Battle of the Herrings, 1429) and victories (Orléans, 1429; Tartas, 1442). His chief military achievement was to maintain an army in the field regardless of the cost to those whom he nominally served. Often, this meant that his troops were little more than bandits, but his close association with Jeanne d'Arc has cloaked this ignominy and ennobled an otherwise ruthless personality. *Bailli* of Vermandois after 1429, he died in Montauban in the presence of the king.

# LA MARCHE, OLIVIER DE

(1425/29–1502). Chronicler and poet of the court of Burgundy. His prose writings, including the *Mémoires* and several treatises and letters on the house of Burgundy, celebrate the splendor of latemedieval chivalric ceremony. La Marche helped supervise court festivities, and he describes them at length, especially the 1454 Pheasant Banquet and celebrations in honor of the Order of the Golden Fleece recorded in an epistle from 1500. His highly personal chronicle of the dukes of Burgundy, written for Philip of Habsburg, duke of Burgundy and grandson of Charles the Bold, covers the period 1435–88.

Among his verse, two works are of special note. The *Parement et triomphe des dames* (1493) enumerates allegorically the aspects of a noblewoman's costume. The *Chevalier délibéré* (1483), a conventional, moralized allegory of human life—written in honor of Charles the Bold and published by Vérard and translated into Dutch, Spanish, and English—explores the theme of death. The narrator undergoes symbolic adventures, encountering Hutin, son of Gluttony, the hermit Understanding, and Age. He witnesses several combats and retires to his bed, where he muses on the battles of life.

# LA SALE, ANTOINE DE

(1385/86–1460/61). Illegitimate son of a celebrated Gascon mercenary, Bernard de La Sale, Antoine served for most of his life at the court of Anjou, performing administrative and military duties for Louis II, Louis III, and King René. He traveled extensively, especially in Italy. From 1435 to 1446, he served as tutor to Jean de Calabre, René's young son. During this period, he wrote *La Salade* (1440–44), a prose pedagogical treatise that touches on, among other subjects, geography, history, rules of protocol, and military tactics. It is preserved in one complete manuscript (Brussels, Bibl. Roy. 18210–15) and two early printed editions. Incorporated in it are two earlier works by La Sale, sometimes edited separately: *Paradis de la reine Sibylle* and *Excursion aux Iles Lipari.*

In 1448, La Sale entered the service of Louis de Luxembourg, count of Saint-Pol, as tutor to his three children. For his pupils, he composed *La Sale* (1448–51), a second pedagogical treatise, this time in the form of exempla taken from classical and Christian authors to illustrate such virtues as prudence, moderation, justice, pity, and abstinence. This prose work of 167 chapters is extant in two manuscripts (Brussels, Bibl. Roy. 10957, revised by the author's own hand, and Bibl. Roy. 9287–88).

La Sale also composed works of fiction and historiography: Jehan *de Saintré* (1456), *Floridan et Elvide* (1456), *Adicion extraicte des chroniques de Flandres* (1456), *Réconfort a Madame de Fresne* (1457), and *Des anciens tournois et faictz d'armes* (1459). The most important of his works is *Jehan de Saintré,* preserved in ten manuscripts. This substantial prose romance, in which some have wished to see a *roman a clef,* tells of a young page whose love for the Dame des Belles Cousines, coupled with his own natural merits, leads him to become a great knight. When Jehan is away at a tournament, the lady comes to an abbey, where she is seduced by its worldly abbot. The hero himself is beaten by the abbot but eventually has his revenge. The work is an important description of the life of the nobility in the later Middle Ages, gilding its underlying decadence with a still courtly vocabulary. Critics are divided as to whether it promotes or condemns late-medieval chivalry, whether it advances an aristocratic or a bourgeois ideal.

Several works occasionally attributed to La Sale—*Cent nouvelles nouvelles, Quinze joyes de mariage,* and *Livre des faits de Jacques de Lalaing*—are no longer widely believed to be by him.

# LA TOUR LANDRY, GEOFFROI DE

(ca. 1330–ca 1405) Prime among 14th-century lay moralists who wrote to ensure the practical, moral, and religious education of their targeted readers, mostly women, is Geoffroi de La Tour Landry, who in 1371–72 wrote his prose *Livre du chevalier de La Tour Landry pour l'enseignement de ses filles.* The prologue states his aims: to teach his daughters the art of storytelling *(roumancier)* and how to conduct themselves and tell right from wrong. The text has 142 chapters and 150 exempla. Each chapter expounds principles of good education and courtesy, comments on a particular vice or virtue, and gives one or two exempla. These, taken from the Bible and from the chronicles of France, England, Greece, and other lands, sometimes refer to contemporary nobles and events. Often profane and realistic, they are developed like a *conte* and take place in the world of the court or the bourgeoisie.

# LA VIGNE, ANDRÉ DE

(ca. 1457–ca.1515). Late-medieval poet and playwright. Born between 1457 and 1470 in the port city of La Rochelle, La Vigne was in the service of Marie d'Orléans from ca. 1488 until her death in 1493, when he became secretary to the duke of Savoy. In 1494, in an effort to attract a more powerful protector, he presented a work to King Charles VIII, the *Ressource de la Crestienté.* This poem is a dream allegory in which the king, in the personage of Magesté Royalle, is shown as the protector of Dame Crestienté, who is in peril. Impressed with La Vigne's talents, Charles appointed him historiographer of his military expedition into Italy to conquer the kingdom of Naples (1494–95). The resulting chronicle, the *Voyage de Naples,* is an eyewitness record of the events of the Italian campaign. Like the *Ressource,* it is written in alternating verse and prose.

In May 1496, La Vigne was invited to the town of Seurre in Burgundy, where he was commissioned to write a play on the life of St. Martin, patron of the town. Within five

weeks, he had completed not only the *Mystère de saint Martin,* comprising more than 10,000 lines of verse, but also a comic morality play, the *Aveugle et le boiteux,* and a farce, the *Meunier de qui le diable emporte l'âme en enfer.* The mystery play was written to edify the people with scenes from the holy and devout life of their patron saint. To this end, there are sermons, miracles, and conversions, as well as scenes set in Heaven and Hell. The play is also a rich tapestry of daily life, showing people of all sorts and conditions engaged in their daily tasks. La Vigne portrays this milieu from a variety of stylistic perspectives. He sympathetically treats family difficulties and explores the psychology of suffering; he satirizes the abuses of the powerful, the faults of the clergy, and the venality of the merchant class; he depicts the bombast of braggart soldiers and the antics of drunken messengers. All these strands are woven together in a seamless dramatic action in which the playwright deftly alternates affective and comic scenes for maximum effect.

Toward the end of the century, La Vigne collected a number of his early works in the *Vergier d'honneur.* In 1504, he brought suit against Michel Le Noir, a Parisian printer, to stop an unauthorized edition of this work; the Parlement de Paris issued the injunction. Before the death of Charles VIII in 1498, La Vigne had been appointed secretary to the queen, Anne of Brittany. He remained in this capacity until her death in 1514. His later works included epitaphs for his patrons and other panegyric poems. He wrote two other plays, the *Sotise a huit personnages,* attacking the abuses of his day, and the *Moralité du nouveau monde* against the abolition of the Pragmatic Sanction, as well as political poems. In the *Louenge des roys de France,* for example, he supported Louis XII in his quarrel with the pope. Francis I in the year of his accession (1515) named La Vigne his historiographer and charged him with writing the history of his reign. Since only a few pages of the chronicle were completed, La Vigne is thought to have died shortly after.

# *LAI,* NARRATIVE

**.** In addition to the twelve *lais* by Marie de France, over twenty Old French texts, the majority of which are anonymous, can be classed as *lais: Amours, Aristote, Conseil, Cor, Desire, Doon, Espervier, Espine, Graelent, Guingamor, Haveloc, Ignaure, Lecheor, Mantel, Melion, Ombre, Nabaret, Narcisus, Oiselet, Piramus et Thisbé, Trot, Tydorel, Tyolet, Vair Palefroi.* Problems of classification exist, as the term *lai* is found with

reference to texts not normally regarded as *lais* (the fabliau *Auberee* appears in one manuscript as the *Lais de dame Aubree*), and the *Lai d'Aristote* has many of the features of a fabliau. Several Old French texts mention *lais* that have not come down to us. A manuscript discovered in Shrewsbury School lists sixty-seven *lais,* most of which are unknown. No clear definition of a *lai* can be given, but in its widest sense the term designates a short narrative in verse. The expression "Breton *lais*" sometimes used to designate the entire corpus, is best reserved for poems that present an amalgam of love and adventure, such as *Desiré, Doon, Espine, Graelent, Guingamor, Melion, Tydorel,* and *Tyolet*. These *lais* often seem to be related to Celtic stories, and it is also possible that they were written under the influence of or in reaction to the *lais* of Marie de France, who has been seen as the inaugurator of the genre in French.

*Melion,* for example, tells, like Marie de France's *Bisclavret,* of the transformation of a human into a wolf. Melion's wife, who is presented as the daughter of the King of Ireland but who clearly has nonhuman features, requests a piece of the meat of a stag encountered on a hunting trip. To oblige her, Melion is transformed into a wolf by a magic ring, but on his return with the meat he learns that his squire and his wife have left for Dublin. The story then tells of Melion's difficult but successful pursuit of his wife and the ring he needs to regain human form. *Espine* relates the adventures of the illegitimate son of the King of Brittany and the daughter of the boy's stepmother by another husband. The two youngsters are brought up together and fall in love at an early age. The main event of the *lai* is the account of the night spent by the hero at the Perilous Ford, where he defeats a knight in red armor and takes his horse, which is such that it does not require food and will disappear when its bridle is removed. He encounters two further knights and finally returns to court with his beloved, who has been miraculously transported to the ford to witness his prowess. The lovers are married, and they retain the horse until the girl removes its bridle out of curiosity, whereupon it disappears.

In comparison with the *lais* of Marie de France, *merveilleux,* or supernatural, elements are generally more in evidence in these *lais,* and there is less emphasis on the birth, nature, and problems of love. But they share with Marie's *lais* many of the themes and the aristocratic per-sonnel: brave and handsome knights and wise and beautiful maidens. The stories are set against a background of the ideals and tensions of courtly society. In *Melion* and *Tyolet,* King Arthur plays a prominent role.

Two of the *lais, Narcisus* and *Piramus et Thisbé,* are adapted from tales by Ovid and can be called *Lais* of Antiquity. Some *lais* have a strong didactic intent *(Conseil, Espervier, Ignaure, Trot)*. In *Conseil,* a lady who cannot choose among three suitors puts her problem to a knight, whose ability to assess the suitors' characteristics and explain the nature of true love is such that the lady accepts and eventually marries him rather than one of the suitors. *Oiselet* discusses the nature of *courtoisie* and *vilenie* by means of a talking bird that inhabits a garden owned by a wealthy peasant; the peasant is incapable of understanding the values of the noble knight from whom the house and garden had been purchased.

Other *lais* have fundamentally humorous themes and resemble the fabliaux. In *Cor,* a messenger presents King Arthur with a magic drinking horn from which only husbands with faithful wives can drink without spilling the contents. In *Mantel,* a youth offers Arthur a mantle that fits only women who have not been unfaithful. The horn and the mantle prove the widespread infidelity of the ladies at court. *Nabaret* pokes fun at a

jealous husband who has married a woman of superior rank. *Lecheor* reduces the whole of knightly aims and activities to the search for sexual gratification. In what is probably the best *lai* of the entire corpus and one that fits into none of the above categories, Jean Renart in the *Lai de l'ombre* presents a verbal duel between a handsome knight and a lady well equipped with arguments to counter his offer of love. Composed from the second half of the 12th century until probably late into the 13th, these *lais* vary in quality, but they represent the earliest form of the short story in French literature.

# *LAI-DESCORT*

**.** The *lai-descort* is an independent lyric piece treating the same themes and occurring in the same *chansonniers* as the *canso* and the *grand chant courtois.* Developed in the late 12th or early 13th century, it distinguishes itself from the *canso* on strictly formal grounds: by the variable length of verses and stanzas within the individual text. The *lai-descort* tends to be slightly longer than the *canso,* though the number of stanzas rarely exceeds twelve. Musically, the *lai-descort* is complicated, with a new melody for each stanza. In contrast to the canso, it uses few melismas, each syllable corresponding to a single note. Though possibly originating in the south, the genre was practiced simultaneously by both trouvères and troubadours. In the north, it often served as a vehicle for religious expression. In the 14th century, at the hands of Guillaume de Machaut in particular, the structure of the *lai-descort,* or simply lai, became more rigid, with stanza divisions into halves and quarters and with the final stanza formally identical to the first. The *lai-descort* should not be confused with the narrative *lai* or the Arthurian *lais* integrated into certain prose romances, nor with the *Lais* ("Legacies") of François Villon.

# LALAING, JACQUES DE

(ca. 1420–1453). Born to a noble family still known in Belgium, Lalaing was a model of Burgundian knighthood, according to the *Livre des faits de Jacques de Lalaing* (1470–72), variously attributed to Georges Chastellain, Jean Lefèvre de Saint-Remy, and Antoine de La Sale. It can be compared with two other heroic biographies produced in Burgundy at about the same time, the *Livre des faits de Gilles de Chin* and *Gillion de Trazenies*. In all these works, fiction mixes freely with reality. At the tournament of the Fontaine des Pleurs near Chalons-sur-Saône in 1450, Lalaing took on twenty-one challengers. He was killed by a cannonball at a siege near Ghent in 1453.

# LANCASTER, DUKES OF

. The first two dukes of Lancaster played prominent roles in France during the Hundred Years' War. Edward III's second cousin Henry of Grosmont (1310–1361) was created duke in 1351, some years after leading a brilliant campaign against the French in Aquitaine. Arriving at Bordeaux on August 9,1345, he took Bergerac two weeks later, defeated a French army at Auberoche on October 21, and captured La Réole by November 2. These victories reversed the tide of war in the southwest and stripped Languedoc of its forward defensive positions. A decade later, Lancaster was back in France, campaigning successfully in Normandy and Brittany in 1355–57.

In 1359, Henry's daughter Blanche married John of Gaunt (1340–1399), Edward III's fourth (and second surviving) son. When her father and sister died of plague, Blanche inherited vast possessions and Edward created John duke of Lancaster in 1362. John's first leading military role came in the summer of 1369, when he took several thousand men to Calais and ravaged northern France and upper Normandy. Although he did not bring the French to battle, his expedition did force them to give up hopes of attacking England.

In the next five years, Lancaster was extremely active, retaining more soldiers in that time than any other English commander in the 14th century. His principal French expedition was in 1373, when he marched south from Calais in August with a large force, ravaging Picardy and Vermandois. By the end of September, he had passed through Champagne, but the French avoided battle. With colder weather approaching, the alternative to retreat was to pass across the rugged hills and swollen rivers lying between the Seine and English Aquitaine. When he reached Bordeaux near the end of the year, he

had lost half his army in a five-month campaign that achieved few military objectives. He would serve again in Aquitaine, but his main concerns after 1373 lay outside France.

# LANFRANC OF BEC

(ca. 1010–1089). Born into a good family in Pavia, Lanfranc was educated in that city and more generally in northern Italy. He left Italy for France while still a young man and made his reputation as an itinerant teacher in the area around Avranches. In 1042, he entered the new monastery at Bec (founded 1041); he was abbot of Saint-Étienne, Caen, in 1063; in 1070, he was made archbishop of Canterbury. He had a dual reputation, first as a teacher and scholar and later as a brilliant administrator and leader.

His scholarship falls into two periods, before and after his entry into Bec. The earlier works, no longer extant, are on the Trivium; after 1042, he devoted himself to theology, writing commentaries on the Psalms and Pauline epistles that circulated widely. About 1063, he wrote a treatise *De sacramento corporis et sanguinis Christi,* against the opinions of Berengar of Tours's *De eucharistia,* and to which Berengar replied in *De sacra coena.* Berengar's ideas caused widespread antagonism and were finally condemned by Pope Gregory VII in 1079. The issue centers on the changes taking place in the bread and wine of the eucharist in order for them to become the body and blood of Christ. Both Berengar and Lanfranc believed in the Real Presence, but they differed on the necessity and type of any change in the elements, Berengar insisting that no material alteration was needed and Lanfranc arguing for outward identity concealing inner grace. The question was compounded by difficulties of language: no clearer statement of the central issue was to be possible until the introduction of Aristotelian notions of substance and accident in the 13th century.

Lanfranc's leadership of the school at Bec made it into one of the most famous of its day, and pupils included Anselm of Bec, Ivo of Chartres, and Guitmund of Aversa (later Pope Alexander II). He was a valued counselor to Duke William of Normandy (the Conqueror) despite having declared William's marriage invalid.

Lanfranc was a great holder of synods (in 1075, 1076, 1078, 1081), which he used to promulgate canon law, and he was the first to create separate courts of ecclesiastical jurisdiction. His legal turn of mind (he seems to have practiced or at least studied civil law in Pavia) was coupled with a traditionalist viewpoint, so that his outlook reminds us of Carolingian attitudes and practices rather than any innovation. The collection of canon law, the so-called *Col-lectio Lanfranci,* which Lanfranc brought to Canterbury from Bec, has an old-fashioned cast, in contrast to the *Collection in Seventy-Four Titles*

*(Diversorum patrum sen-tentiae)* or Ivo of Chartres's *Panormia* and other legal works, the new breed of legal collections that it seems Lanfranc preferred to ignore.

As archbishop of Canterbury, Lanfranc replaced many Saxon bishops with Normans, to the displeasure of some in the English church, but in doing so he increased ties with the Continent and with Gregory VII's reforms, with which, at least in the area of the moral reform of the church, he was largely in sympathy. Lanfranc rebuilt the church at Canterbury and established its library. He reestablished many of the old monastic privileges and lands.

# LANGRES

. Located fifty miles northeast of Dijon in northern Burgundy, Langres (Haute-Marne) is a fortified town on a spur of land dominating the surrounding plain. In the Middle Ages, Langres served as an advanced, northern fortress for Burgundy. The cathedral of Saint-Mammès is late Burgundian Romanesque in the process of becoming Gothic.

Saint-Mammès was begun after the Early Gothic choir of Saint-Denis (1140–44) and after the start of Sens, the first Early Gothic cathedral. Indeed, parts of Sens are Romanesque, with its ambulatory of groin vaults, which were changed to Gothic ribbed vaults in the late 1140s. Langres is different; it has a Burgundian Romanesque elevation of nave arcade, triforium, and clerestory derived from that of Cluny III, Paray-le-Monial, and Autun. Instead of the vaults being pointed barrels and springing from above the clerestory windows, as at Cluny III and other Burgundian churches, the vaults of Langres are four-part Gothic ribbed vaults that spring from a much lower point in the elevation, from just above the bottom of the clerestory windows. Thus, the greater verticality of the Cluniac churches gives way to a less soaring interior at Langres.

The plan of Langres seems to have been derived from that of Paray-le-Monial, the early 12th-century Cluniac priory. Originally, the nine-bay ambulatory probably had three apsidioles like Paray-le-Monial. These were destroyed in the 14th century when five Rayonnant chapels were added. Short, aisleless transepts are also reminiscent of Paray-le-Monial. However, the six-bay nave and flanking aisles, all vaulted with four-part ribbed vaults, contain the relatively wide interior spaces. The elevation is straight Burgundian Romanesque, with fluted pilasters serving as responds. The Roman-type

Corinthian capitals and pilasters animate the piers and triforium area, like the Roman gate in the city. Ribbed vaults resemble those of the Gothic Cistercian abbey of Pontigny.

Langres seems to have been started in the middle of the 12th century and built slowly over the remaining decades of the century. A kind of baroque exuberance manifests itself in the ornate capitals and friezes.

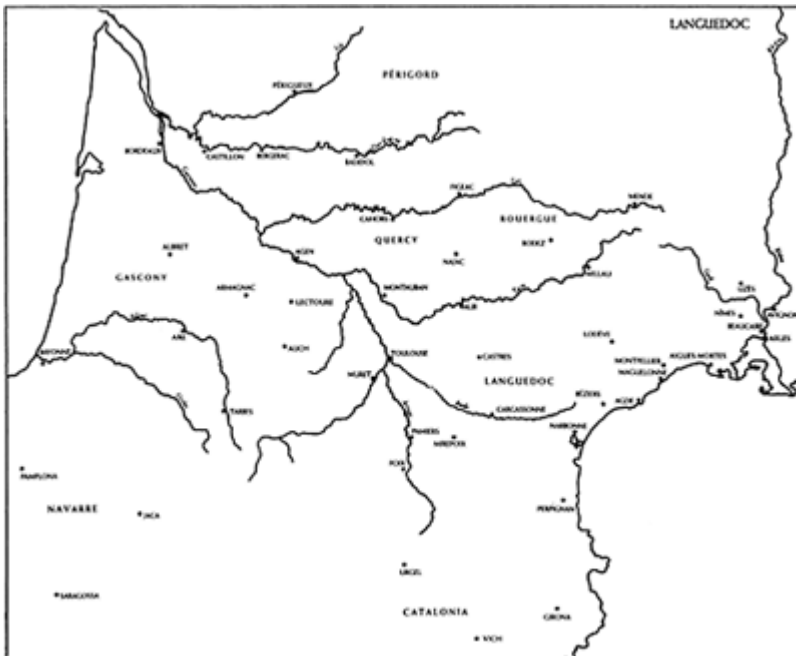
# LANGUEDOC

. The provinces in southern France that came to be recognized in the Middle Ages as the region of Languedoc formed one of the principal territorial units assembled under the kings of France. The extent of this medieval Languedoc was far wider than that of the later administrative province of the 17th and 18th centuries. Neither did it comprise, however, the totality of the linguistic region of the Langue d'oc (Occitan). Though the Langue d'oc may strictly be said to have extended across the county of Angoulême and the Auvergne, the territories of Languedoc commenced south of the River Dordogne, in the mountains of Auvergne and Burgundy. They were re flected in the five great seneschalsies—Beaucaire-Nîmes (extending north to Viviers and Le Puy), CarcassonneBéziers, Toulouse, Quercy, and Rouergue—through which the kings administered them from the 13th century. Throughout the Middle Ages, this region retained an identity based on culture and customary law. Only in the 13th century, however, after prolonged and brutal contact with the people of the north, do the first references occur to the region as an entity distinct and its people as distinguished by their language *(homines nostri idiomatis, videlicet de nostra lingua)*. In the 14th century, finally, residents of Carcassonne could refer casually to their region as the *patria* and speak of plans to travel north, *in Franciam*.

With the end of the Roman Empire and the subsequent advance of the Franks under Clovis I, the region fell by the 8th century into two zones: the northern, including the Rouergue, Toulousain, and Albigeois, incorporated into the Frankish kingdoms as part of the territory of the dukes of Aquitaine, and the southern, known as Septimania and extending from the Pyrénées to the Rhône, part of the kingdom of the Visigoths. The Arab invasions that destroyed the Visigothic kingdom reached Septimania in 718, and the area remained under Islamic control until 759, when Pepin III conquered it definitively for the Frankish realm.

Under the empire of the Carolingians, counts were appointed in Septimania and southern Aquitaine, and in the period that followed the decline of imperial authority in the 9th century their successors competed to form the comital dynasties of Languedoc. The most successful of these, the house of Toulouse-Rouergue, came eventually to dominate most of the territory between the Rhône and the Garonne; its downfall in the

13th century marked the end of the effective independence of Languedoc. The prominence of the family began with Fredelon, a Frankish noble confirmed as count of Toulouse by King Charles the Bald in 849. Although his successors suffered a temporary eclipse by the end of the century, they had recovered their possessions and had added the counties of Rouergue, Quercy, Nîmes, and Albi. The second half of the 10th century marked in Languedoc, as elsewhere in France, the disintegration of the central and public authority maintained generally on the level of the county. The possessions of the house of Toulouse broke apart in 919 on the death of Count Eudes, whose eldest son, Raymond, succeeded as count of Toulouse while his brother Ermengaud became count of the Rouergue. In the 11th century, there appeared the first features of what became the regime of feudalism in Languedoc.

The precise nature of Languedocian feudalism poses problems that are yet debated. The older evaluation of such historians as Paul Dognon and Pierre Timbal that the institutions of feudalism in the south scarcely merited the name, Languedoc remaining "practically ignorant of even the concept of feudal law," has been challenged; for Pierre Bonnassie, the historian of the Midi and Catalonia, the practices of feudalism and vassalage appeared in Languedoc in a form quite pure by the beginning of the 12th century. While it is certainly unwise to assume a monolithic definition of feudalism, it is clear that in Languedoc feudal institutions developed more slowly and in a more nuanced


form than that which they took in the north. Two essential features of the prefeudal regime—commerce and a relatively viable circulation of money, and the prevalence of the allod, land possessed in full proprietorship—remained more firmly fixed in the south than elsewhere. These factors both retarded the appearance and diluted the rigor of

feudalism in its early stages. Later, the evolution of the customs of Languedoc, particularly their testamentary provisions favoring free distribution of properties, limited the effectiveness of the military aspect of feudalism. By the end of the 12th century, nevertheless, undeniably feudal institutions were in place in Languedoc; certainly, the view of Dognon that even then the power of the count of Toulouse rested on the number of his allods and not on the number of his vassals cannot be maintained. It is significant, nonetheless, that the northerner Simon de Montfort felt it necessary immediately after his conquests to redefine and establish, through the statutes of Pamiers, rigorous feudal obligations for his southern vassals.

Two other features emerged in the 12th century that gave to the society of Languedoc its distinctive physiognomy: customary law based on the Roman codes and the spread of the heretical doctrines known as Catharism. Unlike Catalonia, where Roman legal traditions, maintained by the Visigoths, remained alive, north of the Pyrénées the disorders of the 10th century brought their influence to an end. The reemergence of Roman law in the 12th century can be traced, first in the former region of Septimania, then in the Rouergue, and finally in the Toulousain, through the appearance of advocates *(magistri, causidici)* and of notaries public. The adoption of Roman law, which these and other institutions announced, became established in the 13th century. Promoted by the royal administration and by that of Alphonse of Poitiers, whose interests were served by defining a coherent legal system, and by the creation of great centers of study at the universities of Toulouse and Montpellier, Roman law was accepted as the custom of the Midi. In 1251, an ordinance of Blanche of Castile formally recognized the custom of *droit écrit* as the binding legal system of Languedoc.

Conjointly with the emergence of Roman law came economic expansion and the rise of municipal self-government. This latter, achieved sometimes at the cost of violence (as at Béziers and Nîmes), most often through mutual agreement, appeared typically in the form of governments directed by urban consuls representing the dominant merchant class. The consulates in turn, beginning with that of Arles in 1131, provided ready vehicles for the spread of Roman law. They coincided as well with the growth of the heterodox beliefs of Catharism.

It is possible that Catharism owed its success in Languedoc, as in Lombardy and Catalonia, to the precocious urbanization of the region. Its faith did indeed find a favorable milieu among the artisans, merchants, and notaries of many towns. The indulgent attitude of the Cathar ministers toward commercial activities and usury, as well as their ability to serve as intermediaries and repositories for moneys exchanged, made them attractive to the merchant classes. The causes of the success of Catharism, however, are complex. Its appeal cut across socioeconomic lines, affecting both the nobility and the peasantry. Its greatest sphere of influence within Languedoc was limited to the region of Carcassonne, Albi, part of the Toulousain, and the region of Foix. Major urban and commercial centers, such as Cahors, were barely touched. Clerical laxity may also have prepared the way for Catharism, but it, too, was not unique to those few areas of Languedoc in which the Cathars took root. Catharism in Languedoc, as elsewhere Waldensianism or the movement of the béguines, represented an alternative for those who aspired to a more apostolic conception of the Faith. As such, the weapons that defeated it were not the crusades or the Inquisition but the message and spirituality of the mendicant orders, particularly the disciples of St. Francis. Before its disappearance,

however, the persistence of Catharism led Languedoc into a new phase of its history and to unification with the crown of France.

The political history of Languedoc in the century and a half preceding the Albigensian Crusade is dominated by the revival of the house of Toulouse, whose territories from the Quercy to the Rhône were once again united by Raymond IV in 1093, and its struggles against the ambitions of the dukes of Aquitaine to the north and the counts of Barcelona to the south. It is possible, as the Catalan historian Ramon d'Abadal y Vinyals has contended, that the counts of Barcelona entertained no grand design of creating a trans-Pyrénéan principality. Their advance, however, especially after their acquisition of the counties of Provence, Millau, and the Gévaudan in 1112, convulsed the politics of Languedoc. It enabled the lords of lower Languedoc, particularly the Trencavels, viscounts of Albi, Carcassonne, Béziers, and Nîmes, to maintain practical independence of Toulouse. It required the continuous efforts of the able counts of Toulouse Alphonse-Jourdain and Raymond V to withstand the pressure from Catalonia and Aquitaine until the peace of 1190. In 1209, the Albigensian Crusade descended upon Languedoc.

The murder of a papal legate and the inability of the established institutions to deal with Catharism precipitated the initial crusade; the disunity of the great families of Languedoc permitted its success. While Raymond VI of Toulouse stood aside, his sometime vassal Raymond-Roger Trencavel was swept away and his counties occupied by the crusaders. It is not just, however, to ascribe the later triumphs of the northerners under Simon de Montfort to their opponents' ineptitude or the inefficiency of southern feudalism. The military structures of Languedoc consistently placed superior armies in the field, and these armies operated as was expected of medieval hosts. The martial genius of Simon de Montfort and his unorthodox and aggressive tactics at Castelnaudary (1211) and Muret (1213) allowed him briefly to triumph. Ultimately, though the domination of the Montforts was defeated, it prepared the way for the advance of the monarchy under Louis VIII, to whom Amaury de Montfort ceded his rights in 1224.

The final phase of the history of medieval Languedoc begins with the military promenade of Louis VIII in 1226. The Trencavel domains were absorbed and henceforth administered by royal seneschals at Carcassonne and Beaucaire. Rebellions in 1240 and 1242 failed to shake the royal au-thority, and when Raymond VII of Toulouse died in 1249 he was succeeded by his daughter, Jeanne, and son-in-law, Alphonse of Poitiers, brother of Louis IX of France.

Despite occasional unrest caused by the work of the ecclesiastical Inquisition, Languedoc experienced an era of growth and prosperity under royal rule in the 13th century. The careful policy of Louis IX and Alphonse of Poitiers, respecting local custom and promoting the establishment of *droit écrit,* facilitated the integration of the region into the domains of France. Toulouse, Narbonne, Béziers, Cahors, and other cities enjoyed economic prosperity. The consular regimes, although their independence might be circumscribed, as at Toulouse and Nîmes, were respected, as royal policy encouraged control of the cities by the merchant classes. Agitation by the artisans and trades, nevertheless, increased during the century. Violent upheavals, as at Cahors in 1268–70, were restrained for a time by the establishment of the system of *échelles,* which grouped the artisanal classes into several ranks or grades and accorded to each a position within the consulate. Notwithstanding these concessions, tensions increased into the 14th century; even a small town like Roujan could report in 1320 that the consuls had

mistreated the leader of the *populi minuti* and had held him captive with the connivance of the royal bailiff.

The 14th century saw the decline of the general economic prosperity of Languedoc, the breakdown of the social peace maintained by the *échelles* and of the political peace maintained by the royal government. The devastation of the Hundred Years' War was felt most severely in Quercy, Agenais, and the Rouergue, where free companies and mercenary bands added to the destruction. Crop failures, including massive famines in 1332, 1335, 1351, and 1374–76, occurred with increasing frequency and led to the final crisis of medieval Languedoc. The famine of 1374–76, which exacerbated social tensions in the cities, combined with increased demand for taxes by the royal government and the machinations of Gaston Phoebus, count of Foix, to produce an explosion of urban revolts that swept Languedoc from 1378 to 1382. Riots directed against the consuls, the rich, the agents of royal government, and the king's lieutenant the duke of Berry, occurred at Le Puy, Montpellier, Clermont-l'Hérault, Alais, Nîmes, Narbonne, and Béziers. These were followed by the great peasant revolt known as the rebellion of the Tuchins, which was not suppressed until 1384.

In the 15th century, Languedoc recovered something of its economic vitality. Its loyalty to the crown survived the crises of the previous century and preserved for the dauphin Charles a base of support during the 1420s. The last great independent fiefs, the counties of Foix and Armagnac, passed to the family of Albret and Navarre and were united to the crown with the accession of Henry IV.

# LANGUEDOIL

. The term, which appeared only at the end of the Middle Ages, describing that part of France where Old French was spoken: the region of the Langue d'oïl north of the linguistic frontier formed, roughly, by the Cevennes and the Dordogne River. South of that frontier lay the Langue d'oc, where Occitan was spoken. The two regions became subject to many fiscal and administrative distinctions during the Hundred Years' War, and for convenience historians often refer to the Estates General of Languedoil to describe assemblies that did not include representatives of the southern districts.

*John Bell Henneman, Jr.*

# LAON

. Laon (Aisne) is dramatically situated atop a fish-hook-shaped plateau overlooking the flat plains of northern France. A natural fortress and lookout point, the site has been inhabited since Neolithic times and is identified with the *oppidum* Bibrax mentioned by Caesar. A fortified point in the northern line of defense against barbarian invasions and, later, Viking raids, Laon became the main

Laon (Aisne), Notre-Dame, west façade. *Photograph courtesy of Whitney S.Stoddard.*

redoubt for the region and one of the favored residences of the Carolingian kings. The 12th-century keep was torn down only in the 1830s. The diocese was created by St. Remi in the late 5th century, but the first mention of a cathedral church is in a poem by Alcuin. The Carolingian church was renovated by Adalbero in the 10th century and damaged during the civil unrest of 1112. The present Gothic cathedral was begun ca. 1155. In addition, Laon had a Benedictine abbey, Saint-Vincent; an Augustinian priory, Saint-Jean; and an important Premonstratensian abbey, Saint-Martin, as well as a Templars church, a leprosarium, and a number of parish churches. Of the medieval churches, only the cathedral, Saint-Martin, and the Templars church survive.

The Gothic cathedral of Notre-Dame was completed in five major periods of construction, between ca. 1155 and ca. 1225. The plan of the first church called for a shallow chevet of three bays surrounded by an ambulatory, hardly enough space for the large numbers of clergy occasioned by prosperity from wine production. Projecting transept arms with two-storied eastern chapels open from the dramatic lantern tower. The long nave ends in the first attempt to rethink the meaning of the façade as an entrance into the church in the 12th century. It was the plan of the two identical transept arms, opening from the crossing, with their large rose windows, that suggested to the builder the repetition of the plan of the nave for the new chevet, both highlighted by their huge rose windows.

Laon is one of the first Early Gothic buildings with a four-story elevation, including arcades and aisles, vaulted galleries connected by platforms across the transept façades, a wall passage that also continued across the transept arms, and clerestory windows. The

nave and chevet were covered by nearly square sexpartite vaults, while the transept arms had rectangular quadripartite vaults. Laon cathedral was planned with seven towers, two each on the west façade and both transept façades, as well as the central lantern tower that provides the focus of the interior space. In its measured regularity and expansiveness, as well as its four-story elevation, Laon achieves the appearance of large size and scale, even though it is only about 75 feet tall.

The west façade is characterized by a dramatic interplay of projections and recessions, of porches and doors, arches and windows, that culminates in the enormous rose window and the façade towers that shift from square to octagonal plan. Any sense of the heaviness of walls or buttresses is hidden by pinnacles and gables. The design is enhanced at all levels by sculptural decoration, beginning with the three portals. That on the south contains the oldest sculpture, a cut-down tympanum of the Last Judgment with two archivolts of angels. Additional archivolts and a new lintel showing the Separation of the Saved and the Damned were added when the sculpture was installed ca. 1195–1200. The present statue-columns, like those of the other portals, were created by Geoffroy-Dechaume during the 19th-century restorations.

The central portal is devoted to the Coronation of the Virgin, with the Tree of Jesse, angels, and prophets in the archivolts. The present lintel was created by Geoffroy-Dechaume. From the standpoint of both style and iconography, the most interesting portal at Laon is the north portal of the façade. The tympanum, through careful design, manages to combine the theme of Virgin as the Seat of Wisdom with the Adoration of the Magi, even as the sculptor explores a new sense of spatial expansiveness in the composition and placement of figures. The archivolts show angels, the Triumph of the Virtues over the Vices, and prefigurations of Salvation. The lintel shows the Annunciation, the Nativity, and the Angels appearing to the Shepherds.

Each of the portals is framed by a deep porch topped by a gable with figure sculpture, the subjects of which enhance the portals. For example, above the Last Judgment portal stands St. Michael flanked by two seated angels; above the central portal is a giant Virgin and Child flanked by angels. This suggests that the traditional, but unfounded, identification of the central gable figure above the north portal as St. Proba should be reconsidered; the scene may be the Assumption of the Virgin.

Four ranks of archivolts flank the two lateral lancet windows of the façade and extend the iconographic program to include the Liberal Arts, together with Architecture, Medicine, and Philosophy, flanked by dragons and foliage (north window), and a Creation cycle flanked by eagles and foliage above the Last Judgment portal on the south. Tying the whole façade together are the numerous bands of foliage ornament, punctuated by corbels and consoles, used both to emphasize and to conceal shifts in planes and changes in level. Like the highly colored and

movemented linear values of the façade design, the use of sculptural ornament reaches an unprecedented degree of complexity and richness.

The abbey church of Saint-Martin at Laon, second in rank in the Premonstratensian order, dates like the cathedral from the 12th century. It was begun shortly after 1150 on a plan that has often been compared with that of early Cistercian churches. That is, it consists of a flat chevet of two bays, a projecting transept with three contiguous eastern chapels on each arm, and a nine-bay nave. The original plan called for rib vaults only in the chevet and transept chapels; a campaign in the later 12th century increased the height of the transept so that it could be vaulted at the same level as the nave, at which time flying buttresses were added. The superficial resemblance to a Cistercian plan ends when one examines the plan of the chevet in detail and notes that it included three altar niches, a distinctive feature of the Aisne Valley region. Indeed, all of the details of design and structure, from capitals and keystones to wall techniques and exterior moldings, make a strong case for the regional vocabulary. In the end, it is only the plan of the transept and its chapels that might have come from a Cistercian source. Even the richness of the 14th-century façade design argues for the predominance of local traditions.

Two other 12th-century religious structures survive in Laon, the Templars church and the chapel of the epis-copal palace, which also has a 13th-century gallery opening to the

north of the cathedral. In the absence of precise documents, the style of the Templars church, an octagonal central-plan structure, suggests that it was constructed ca. 1140–50. While the entrance porch dates a little later, its tribune was added only in the 14th century. Opening to the east of the central octagon is an altar area consisting of a groin-vaulted straight bay and an apse. The central octagon is covered by a ribbed cupola.

The bishop's chapel belongs to a tradition of twostoried chapels, reaching at least as far back as the Caro-lingian chapel at Aix-la-Chapelle. The Laon chapel is built on a square plan with a projecting eastern apse. The lower story is groin-vaulted, and its four central supports are square piers with half-columns; the upper story is ribvaulted with a taller center bay resting on four columns. Despite the mix of vaulting techniques, the structure is homogeneous and was built in a single campaign shortly after 1150 by the same builders working in the adjacent cathedral shop.

In the course of urban renewal in the area adjacent to the south side of the cathedral façade, the remains of the early 13th-century hospital came to light, one of the few surviving 13th-century hospitals known.

# LAPIDARY

. A treatise offering descriptions or allegorical interpretations of precious and semiprecious stones. Medieval French lapidaries fall into two categories: those, deriving ultimately from pagan tradition, which describe the appearance, formation, and properties of stones, and those of the Christian tradition, which include allegorical interpretation. Both traditions are represented by texts in prose and verse. A third type, describing the powers of stones engraved with figures, usually astrological, is much less common.

French lapidaries of the first type are based on a Latin text traditionally attributed to Marbode, who became bishop of Rennes in 1096; some posit as their source a treatise compiled by a King Evax of Arabia. Lapidaries in this tradition list up to sixty stones. The oldest surviving version dates from the early 12th century, making it one of the earliest examples of French translation from the Latin. The entry for each stone includes

not only a physical description but also an account of its special properties. Of the sapphire, for example, we are told that it is blue, that it is very precious, and that the best specimens come from Africa; it protects those who carry it from bodily harm or imprisonment, it can cure various ailments, and it is much used by necromancers. The magical and curative properties of stones are an important aspect of lapidary tradition, which teaches that God placed special powers in words, herbs, and stones.

The Marbode tradition is also represented, though less directly, in a prose lapidary of the mid-14th century, falsely attributed to Jean de Mandeville. This text is the only medieval French lapidary to be printed in the 15th and 16th centuries. Lapidary material additionally appears in encyclopedias, such as Jean Corbechon's *Livre des propriétés des choses* (1372), a translation of the *De proprietatibus rerum* of Barthélémy l'Anglais.

The allegorical lapidaries represent a different tradition. Though sometimes drawing on the Marbode tradition, they also rely on biblical exegesis and patristic writings. Lapidaries of this type are limited to stones mentioned in the Bible or in the writings of the church fathers. A common pattern is to focus on the twelve stones figuring in the breastplate of Aaron (Exodus 28:17–20). The stones and precious materials appearing in the walls of the Heavenly Jerusalem (Revelation 21:18–21) are another important source. The earliest French allegorical lapidary is a verse text of the early 13th century. A prose version dating from the 14th century is dedicated to an unspecified King Philip, probably Philip VI.

The allegorical lapidaries describe the appearance and properties of stones but add to that an explanation of each stone's religious significance. Topaz, for example, is said to be yellow, to come from Arabia and the Orient, and to change its appearance according to the phases of the moon; it cures various ailments and protects the chastity of those who carry it. In addition, we learn that it signifies the ninth order of angels and the celestial kingdom; kings should gaze upon it in order to remind themselves that spiritual glory far outweighs the honor and glory of this world.

Lapidary lore also appears in literary texts. The most celebrated stones in medieval French literature are the crystals in Guillaume de Lorris's *Roman de la Rose;* the same text also describes the powers of precious stones worn by Richesse, the personification of wealth. In Nicole de Margival's *Dit de la panthère d'amours,* the presentation of a gold ring set with an emerald occasions a description of the properties of gold, emerald, and diamond, which become allegories for aspects of the love relationship. Thus, while no "lapidary of love" exists as counterpart to Richard de Fournival's bestiary of love, lapidary material does appear in the love poetry of the French Middle Ages.

# LARCHANT

. The 13th-century church of Saint-Mathurin at Larchant (Seine-et-Marne) is notable for two reasons. The first is the consistently high quality of the work, which is attributable to the fact that the church belonged to the chapter of Notre-Dame in Paris, which provided the builders. Second, its role as a pilgrimage site associated with cures for madness is commemorated in a 15th-century wood statue of St. Mathurin healing St. Theodora, afflicted daughter of the emperor Maximilian. The large broad chevet was built at the end of the 12th or early 13th century, while the Virgin Chapel is close to the Rayonnant work in the nave of Saint-Denis. The aisleless nave is notable for its breadth and its double layers of windows, although it has been in ruins since the 17th century.

# LASSAY

. Textual evidence from the 11th century attests to the construction of a fortress at Lassay (Bas-Maine) that seems to have been larger than the present structure. Built on a bank of granite, the fortress probably incorporated the square in front of the present château. Built of granite and covered by a slate roof, the castle was heavily damaged in 1417 during a siege by the English and was dismantled by Charles VII in 1422. In 1457, Jean de Vendôme obtained authorization from the king to rebuild the castle. The fact that the reconstruction took only a year testifies to the viability of the original structure. The keep, destroyed probably during the events of 1417–22, was not rebuilt.

The castle's bastions rise from the base of the rock, and its towers rise to a height of approximately 43 feet. Two entrances, one for pedestrians and the other for carriages, open on the north side and are equipped with levered bridges. Although no trace of a portcullis exists, hinges from moving panels and the latch bar have survived. The north façade, a vulnerable point of the castle, was later accommodated with openings for artillery.

# LATE EPIC

**.** The late narrative poems in chanson de geste form, sometimes called *chansons d'aventures,* extended the life of Old French epic, with significant modifications, well into the Middle French period. The turning point between earlier and later forms of the epic is difficult to fix, but it may conveniently be placed near the middle of the 13th century. With works like *Huon de Bordeaux, Maugis d'Aigremont,* and *Vivien de Monbranc,* the epic texts began to increase in complexity and length, became relatively rigid in form, and showed preference for elements that were less important in earlier epic works, such as love intrigues, comedy, the quest, and the non-Christian supernatural. Like earlier epics, the poems of this period share a fund of names, episodes, motifs, and even formulae. The last original work composed in chanson de geste form was probably the *Enfances Garin de Monglane* (15th c.; the octosyllabic version of *Lion de Bourges* is from the 16th). Numerous verse and prose reworkings continued throughout the 15th century, and the prose versions were widely diffused in printed form from 1478 on, some at last becoming staples of the 19th-century popular literature series known as the Bibliothèque Bleue.

The late epics retain many of the formal aspects of the chanson de geste, including clear laisse division, epic meter (the strongly caesural rhyming Alexandrine is almost universal), formulae, and performer's asides (anticipations and résumés of the action and commentary on it, appeals for money, and so on). Nico van den Boogaard showed the continuity of techniques associated with oral transmission for *Tristan de Nanteuil,* but such techniques are to be found in the group generally. Some texts show a marked tendency to end the laisse with a proverb or sentential commentary on the action.

Much of the action is that found in earlier French epics and indeed throughout all epic literature. The later chansons display examples of heroic solidarity in combat and great if sometimes misplaced concern for knightly conduct. They also spend considerable time on various forms of love, with occasional realistic and comic aspects, and, in the wake of *Huon de Bordeaux,* include magic, monsters, the otherworld, and other preternatural phenomena. Their characters are drawn from several walks of life, not only from the military elite; their heroes are complex beings, shown in a variety of situations and sometimes exhibiting ambiguous moral stances. Comic elements occur, and even predominate, as, for example, in sections of *Baudouin de Sebourc* (ca. 1330–50; 25,778 lines). This combination of fairly traditional form with new content has led Léon Gautier, François Suard, and Robert F.Cook to treat the late epics as belonging to a unified chanson de geste genre, although Gautier thought them degenerate, immoral, and trivial ("ils n'ont de l'épopée que la forme"). Cook follows Jean Subrenat in calling the late texts simply "la chanson de geste de l'époque gothique" and with Suard pleads for their full integration into studies on the genre.

On the other hand, Suard and William Kibler have brought out macrostructural differences between the earlier texts and the later. Kibler finds close parallels between the episodic and agonistic structure of the later texts and the structure of "romance" as defined by Northrop Frye. This has led him to propose treating the 14th- and 15th-century epic or quasiepic texts as a separate genre of broad popular appeal, under the name *chansons d'aventures*. Such a classification has the advantage of lifting the cloud of

reproach dating from Gautier's time and allowing empirical work on the late poems to proceed without reference to an idealized concept of French epic.

The works involved are more numerous than is usually stated; Kibler counts twenty-nine chansons dating from the 14th and 15th centuries, including the reworkings of older subject matter *(remaniements)*. The addition of epics in Franco-Italian dialect would bring the number up to well over thirty late epic poems that we know to have been in circulation from St. Louis's time to about the end of the Hundred Years' War. This means that 20–25 percent of all medieval French texts in chanson de geste form are "late."

The adventures in the *chansons d'aventures* are stereotyped—kidnapings, treachery, sea voyages, sieges—and usually cyclical: a character is separated from family or beloved, travels (often incognito), and undergoes trials before the inevitable reunion. In turn, the chansons are woven into further cyclical sequences in which the adventures of heroes and heroines are given in succession. Several of them indeed represent prefaces or sequels to earlier works. Along with the expansion of the Guillaume d'Orange Cycle, largely through the creation of a sort of subcycle of adventures for the Monglane family, and the rewriting and loosely conceived filling-in of the Crusade Cycle, there is development of the Nantueil Cycle in the long *Tristan de Nantueil* (mid-14th c.; 23,361 lines) and a small cycle centered on Huon de Bordeaux. Poems with no cyclical attachments also exist.

The late epics, as usually conceived, are immense, with a mean length of about 19,300 lines. The longest is the *Chevalier au cygne et Godefroid de Bouillon* at 35,180 lines; *Lion de Bourges* has 34,298, the revised *Ogier le Danois* about 31,000, and *Baudouin de Sebourc* nearly 26,000. The shortest text considered complete is *Aubéron,* at 2,456 lines; *Florence de Rome* has 4,562 and *Hugues Capet* has 6,381; but some texts *(Ciperis de Vignevaux, Bâtard de Bouillon)* may be incomplete, and the subtexts of the Monglane group are nearer the 2,000–3,000-line length common in earlier works. The huge *Chevalier au cygne* is in fact a 14th-century reworking of the poems of the Crusade Cycle. In such a work, as in *Tristan de Nantueil* or the continuations of *Huon de Bordeaux,* episode and branch are not easily distinguishable, which reminds us that the late works were not necessarily intended or received as wholes.

This in turn raises the questions of the way these chansons were meant to be presented and the form in which they were known to their audiences. Their texts include clear signs of oral transmission in a traditional sense, and although it is sometimes claimed that these must represent only archaizing window dressing, nothing indicates that oral performance of literature died out abruptly in France with the coming of courtly romance. It is likely that the late epics were both recited (perhaps read aloud) and read silently by individuals. Their versification probably responds to traditional concern for a listening audience and cannot be dismissed as merely facile any more than the earlier formulaic texts are merely cliché-ridden. The audience itself has not been identified, but some of the narratorial asides are addressed to a socially mixed group.

# LATIN LYRIC POETRY

. High-medieval Latin poets studying, working, and writing primarily in France produced a distinctive group of secular personal poems whose sophisticated treatment of style, ideas, forms, and voice won admirers and imitators in the courts as well as in the schools, in the vernacular as well as in Latin. The topic, however, presents many problems of definition, since within medieval Latin culture it is often difficult to separate secular from ecclesiastic, personal from professional, lyric from letter, or France from England.

Despite its popular, personal, and secular traits, this lyric always belonged to the written culture of the schools and always existed in written form. The practice of light poetry accompanied the mastery of Latin, and many high-medieval authors regret the "trifles" *(nugae)* they wrote in their younger years. In the later 11th century, poets already speak of sending and receiving poems both as single texts and in small groups; they also speak of public recitations of poetry. In fact, variants indicate that secular lyric could circulate both as performance and as text. Written copies, often made at first on wax tablets because they were cheap and easily corrected, attained permanent form in authorized copies (such as that of Baudri of Bourgueil), regional collections (such as that of Saint-Omer), and general anthologies (such as those at Oxford). These poetic practices brought criticism, approval, and betterment for the text; amusement, friendship, and favor for the poet; renown, identity, and authority for patron or institution.

Multiple sources for this lyric can be found. Horace and the satirists on the one hand and Ovid on the other had been adapted to the new requirements of the Christian educational system, and they were being widely read in high-medieval France—especially at Orléans, the school most known for its humanist study of the *artes*. A second source lay in Carolingian culture, where secular lyric was written by and for members of the courts of Charlemagne and his successors and where literacy in general and lyric in particular functioned as symbolic markers of power. In a different arena,

religious lyric practices offered the secular Latin poet both popular and learned forms (such as the Ambrosian stanza and the sequence, respectively) as well as a cultural rationale for formal experimentation. In one sense, there is thus a continuous tradition in France of secular Latin poets' renewing a genre of playful and personal school poetry that can be traced back to the 4th-century poet Ausonius writing in Bordeaux—though those acts of renewal themselves are significant. In the hands of the new poets, however, such trifling texts became highly successful vehicles for serious treatments of formal, psychological, literary, moral, or political topics.

For the sake of convenience, one can divide the high-medieval secular lyric poets into four "generations." The discussion that follows will give special attention to leading figures of "satire" and "love," the two lyric modes that brought the most prestige and reward. A first generation appeared in France during the last decades of the 11th century led by Marbode of Rennes, praised as the "King of Eloquence," who wrote an extensive body of secular poems while schoolmaster and chancellor at Angers from ca. 1067 to 1096. His collection includes love poems, satires, epigrams, stylistic exercises, personal laments, and poetic letters. Some of his most daring ventures into secular topics and techniques were suppressed in the early 18th century and have become known only recently. The speakers of his love poems return repeatedly to the power and anguish of their desire for young women and men—the latter topic widely treated during this first generation—and it is clear that Marbode's great achievement lies in the depiction and exploration of human nature. Hildebert of Le Mans (or Lavardin) wrote only a small amount of secular poetry, but both his command of Latin poetry and rhetoric and his Christian humanism were widely admired and imitated throughout the 12th century. Others, such as Godefroi of Reims, Raoul of La Tourte, and Baudri of Bourgueil, also made important experiments in Romanesque poetics. Although these poets remain relatively unknown today, their efforts led to a cultural reevaluation of a "modern" secular personal poetry written in Latin.

The texts of the second generation of poets writing during the early decades of the century, when Reformist pressure was greatest in France, have been less well preserved than those of the first. How interesting it would be to see the love songs that Abélard wrote ca. 1120 and that were still being sung decades later; the fervor, eloquence, and learning of his extant religious lyric suggest that they must have been of high quality. Yet even such infamous love lyric was ignored by anthologists. Of the extant love poetry from this second group, that of Abélard's student Hilary of Orléans claims perhaps the most serious attention.

Born and educated in Orléans, Hilary became ca. 1105 a cleric attached to a convent in Angers; his complaint (with an Old French refrain) to Abélard about refusing to teach disobedient students establishes Hilary's presence at the abbey of the Paraclete ca. 1125, and he apparently taught in various schools, including Orléans, for the remainder of his life. In about a dozen love poems, found in a unique manuscript, he uses plain style and simple form, building his songs with rhymed quatrains. Lavishly praising the beauty of beloved nuns and young men, Hilary adopts the position of a humble servant, even describing himself as a feudal vassal on his knees with hands joined. He speaks from the same position in some of his letters, offering *servitium* to those above him, a fact that implies that his originality lay in the ambiguous overlap between sexual and material desires.

Satires began to change during this second generation, with respect to both the poet's persona and his target. The few extant poems in leonine hexameters by Serlo of Bayeux, for instance, announce a new direction with their combination of specific personal content and broad institutional critique. Writing from ca. 1095 to ca. 1115 while archdeacon of Saint-Étienne, Serlo profited under the patronage and suffered under the power of Anglo-Norman rule. In his poems, he details his position outside the ecclesiastic hierarchy, which he bitterly satirizes for gluttony, greed, and debauchery, thus exploiting the Reformist agenda for his own purposes. Serlo's satirical voice (adapted in part from Roman models), which speaks without authority as it speaks against authority, finds a parallel in the more successful works of Peter the Painter, a canon at the monastery of Saint-Omer in Flanders during the first decades of the 12th century. Though he emulates at times cathedral-school satirists in England and France, Peter differs in the subject and object of his satire. He is more conscious than Serlo of his role as an artist and "grammarian man" *(vir grammaticus)* seeking fame and fortune, and he aims at a wider secular target, which includes bad poets *(ioculatores)* on the one hand, ladies and their lovers on the other.

A new satirical form blossomed during the third generation of secular poets in the hands of Hugh (Primas) of Orléans, who stands above the rest in terms of quantity, quality, and influence. Born ca. 1093 and first educated in Orléans, Hugh wrote from the early 1130s to the early 1160s while teaching at schools and serving ecclesiastic magnates at Amiens, Sens, Beauvais, Orléans, Reims, and Paris. Twenty-four poems can be ascribed to him with reasonable assurance, some of which were transmitted, altered, expanded, and imitated by a large number of subsequent poets. The first of the great "Goliardic" poets, Hugh wrote of "wine, women, and song," as well as of dice games, patrons, and books; with biting humor and clever wit, he satirized arrogant ecclesiastics, parodied authoritative texts, and mocked himself. Such topics and tones created the persona—often equated with the person of a learned and irreverent "wandering student" *(clericus vagans)*—that has had enormous appeal for medieval and modern readers. If we look at the texts instead of through them, though, we see a clerical author well established within the French cathedral culture, who completely mastered the demands of both metrical and rhythmic verse, and who displayed great talent and pleasure in the art of rhyming. Contemporary appreciation of the achievements of speaker and writer can be measured by the nickname "Primas" (i.e., ecclesiastic dignitary), which his fellow schoolmen allegedly gave him and which both he and the manuscripts use.

Love lyric continued to be written in this period, in learned and popular forms. Many of the latter remained anonymous and appear scattered throughout anthologies of the 13th century, if they were recorded at all. But we do know well a famous poet of the period whose poems of love and friendship follow the learned forms used by Marbode. Serlo of Wilton, born in England ca. 1110, came to France for schooling, and wrote poetry ca. 1130–60 while teaching in Paris, until he abandoned the schools to spend the remainder of his life as a monk. Using hexameters and distichs, often and variously linked with rhyme and ornamented with rhetorical figures, Serlo wrote almost fifty poetic letters, epigraphs, praise poems, complaints, and epigrams. In many, the speaker addresses or discusses friends and lovers, male and female, and establishes a forceful textual presence with his witty manipulation of language. The confession and display of sexuality seems at

times extraordinarily candid, producing a sincere presence that appears to have repelled the few critics who have approached these intriguing and well-crafted poems.

A fourth and final generation of secular poets followed, some of the most famous exercising their talents outside France. Many fine poets, such as the Rheinlander known only as "the Archpoet," were born and employed abroad but received their education and poetic models in France. Yet even the two dominant French lyric poets, Peter of Blois and Walter of Châtillon, spent a considerable amount of their career in courts outside modern France. By the end of the 12th century, the Latin clerical culture had become so homogeneous and "universal" that class or regional identities mattered much less than they had at the beginning.

The rhythmic poems by Peter of Blois, which Walter of Châtillon himself praised, had been presumed lost until recently. Circumstantial but persuasive evidence now suggests that a group of sixteen formally and topically coherent metrical love songs at the beginning of the famous Arundel anthology belong to him; the dozen Christmas songs and satires that follow may be his as well. Born ca. 1135 and educated in France, Peter spent his career as a letter writer and diplomat in the service of Anglo-Norman magnates in Sicily and England before retiring to the monastery and dying ca. 1200. His Arundel poems stand out for their formal virtuosity; the presence of stanzas, refrains, and complex rhyme structure signals a strong influence by vernacular court lyric; yet vocabulary, style, and concepts belong to the school culture. Peter's sophisticated poet-lover treats art and love as natural, serious, and significant activities, a view common in vernacular lyric but rare in Latin poetry.

Walter of Châtillon was the most productive, important, and influential secular Latin lyric poet of the 12th century, composing more than fifty satires, love songs, and hymns. Born ca. 1135 at Lille, he studied and taught in France during the early part of his career, then became associated with the brilliant humanist court of Henry II of England; when Thomas Becket was murdered (1169), he left for posts at Châtillon and then Reims, dying of leprosy ca. 1200. His dozen or so love poems include *pastourelles,* nature poems, and a paean to Love. But despite his constant borrowing from Ovid, Walter was not a love poet, and both tone and form signal his distance from that material. In most of his poetry, in fact, he attacked as satirist and moralist all forms and agents of cupidity. In his earlier poems, he built lively stanzas from the short rhythmic verses (predominantly seven or eight syllables) of the vernacular tradition, often adding a refrain. For his later pieces, he turned to the "Goliardic measure" that the Archpoet had used with such success in the 1060s and that featured long rhythmic verses, simple four-line stanzas, a "Goliardic" speaker similar to that of Hugh Primas, satire, and frequent parody. Walter invented a successful variant by substituting an *auctoritas* for the final line: a hexameter or pentameter taken from a classical or "modern" author—including himself. Widely imitated and anthologized during the 13th century, Walter's poems mark the end of great high-medieval secular personal poetry by signaling the institutional pressures to harmonize the products of the human imagination with a new orthodoxy.

This minor genre does not carry minor significance for an understanding of 12th-century Latin culture, for it affords a privileged view of human and humanistic aspects otherwise difficult to see. By content, the genre portrays, examines, and publicizes the psychological, economic, and social costs imposed upon its own members by the institutional demands. By form, it reveals the centrality, commodification, and ambiguity

of wit, since its performative value lay in the demonstration of an ability to manipulate language and form that, when successful, brought authority and employment. There is much to be gained from a comparative study of these Latin versifiers and the troubadours and trouvères, with whom they overlapped and interacted.

# LATIN POETRY, CAROLINGIAN

. Though Charlemagne reigned from 768 to 814, Carolingian Latin poetry spans the period from 747 (the advent of Pepin the Short and the *Carmina* of Boniface) to 877 (the death of Charles the Bald and the *Eclogues* of Radbod of Utrecht). A capitulary from Charlemagne, the *Epistola de litteris colendis,* issued in 787 for the education of the clergy, characterizes the poetry of the period. Practice in the classic *litterarum studia* was to perfect the composition of poems in praise of the Trinity, Jesus, the Virgin, the saints, holy cities, holy rivers, or ancient Germanic legends. School exercises, called *dictamina,* practiced and perfected according to the rules of the Trivium and Quadrivium, were to serve the study and preaching of Scripture.

Poets of the Roman Empire were models for those of the Holy Roman Empire. A script, Carolingian minuscule, was developed for copying the texts of the classical authors. Charles imported palace preceptors to teach the rules of classical prosody in the

palace school at Aix-la-Chapelle. From England came Alcuin and Moduin, named respectively "Flaccus" (Horace) and "Naso" (Ovid) at the imperial court. Charles invited "Pindar" (Theodulf of Orléans) from Spain, and "Homer" (Angilbert) from the old Frankish territories. Paul the Deacon, Peter of Pisa, Paulinus of Aquileia—all three from Lombardy—and a small group from Ireland, including Clement and Dougal, round out the first generation of Carolingian poets.

The *dictamina* of Alcuin and Theodulf incorporate Virgilian, Horatian, or Ovidian quantitative half-lines; but the lines are often stamped with an accentual metric, and scansion is impeded by Carolingian pronunciation of Latin (e.g., *periclum* for *periculum*). For example, *Aeneid* 1.531, resounds in Alcuin's *Verses on the Saints in the Church of York*:

> Est antiqua, potens bellis et corpore praestans,
> Germaniae populos gens inter et extera regna,
> Duritiam propter dicti cognomine Saxi

("Among the peoples of Germania and the foreign powers, there is an ancient race, strong in war and sturdy in body, called Saxons on account of their hardness"); but the *-iae* in *Germaniae* must be scanned as one syllable to make the hexameters work. Theodulf's verses on Palm Sunday,

> Gloria, laus et honor tibi sit, rex Christe redemptor,
> Cui puerile decus prompsit osanna pium….

("Let glory, praise, and honor be to You, O Christ, King and Redeemer. Children utter a loyal and well-turned 'Hosanna' to You…"), are still chanted in the liturgy of Palm Sunday; but the music does not indicate whether *cui* is pronounced as one syllable or two. It is not important that classical Latin was a "foreign language" to the Carolingian poets; they developed a latinity of their own. Poems composed in acrostics, *carmina figurata,* abecedaria, and aenigmata show the skill and pleasure that Charlemagne's court and the monastic schools took in intricate combinations of letters and in Teutonic-Latin semantics.

Some exquisite pieces came out of this period. In liturgical use today are the anonymous *Veni, creator spiritus* and *Ave, maris stella,* and Paulinus of Aquileia's *Ubi caritas et amor, Deus ibi est*. Something close to Germanic alliteration permeates the anonymous *Debate Between Winter and Spring* over the proper time for the cuckoo to sing:

> Ver quoque florigero succinctus stemmate venit,
> frigida venit Hiems, rigidis hirsuta capillis.
> his certamen erat cuculi de carmine grande

("Spring comes, girdled even in a garland of flowers. Winter comes, completely covered by frozen, frosted hair. Both were to debate a great debate over the song of the cuckoo.")

Walafrid Strabo has some magnificent lines on the cultivation and care of roses: *Iam nisi me fessum via longior indupediret.* An epic, the *Waltharius,* evidences the power and compression of Carolingian poetry:

> At vir Waltharius missa cum cuspide currens
> evaginato regem importunior ense
> impetit et scuto dextra de parte revulso
> ictum praevalidum ac mirandum fecit eique
> crus cum poblite adusque femur decerpserat omne….

("Having thrown his spear, the manly Walter ran at the king more savagely with a drawn sword, and attacked. The [king's] shield was ripped away from his right side, and [Walter] struck a huge and awful blow. The [king's] thigh with the hough all the way to the foot, he [Walter] cut off completely….")

Guido d'Arezzo, the 11th-century Benedictine, used the following verses of Paul the Deacon's *Hymn to John the Baptist* to derive the notes of the "great scale":

> UT queant laxis REsonare fibris
> MIra gestorum FAmuli tuorum,
> SOlve polluti LAbii reatum sancte Johannes.

When compared with the dearth of Latin poetry in the Merovingian period (ca. 482-ca. 751), the poetry of this period deserves the name "Carolingian renaissance." When compared with the brilliance of 12th-century Latin poetry, however, this same poetry may appear unengaging.

# LATIN POETRY, MEROVINGIAN

**.** The term "Merovingian" not only suggests Christian imperial influence from Ravenna but describes a transition that occurred in the Latin poetry composed in France from ca. 482, the beginning of the reign of Clovis I, until after 751, the advent of Pepin I. At the time that the last of the native, Gallo-Roman rulers was ceding power to the first of the Merovingians, Clovis I (r. 482–511), native Gallo-Roman poetry was in decline. The Gallo-Latin poets of this period, Virgilius Maro and Theodofrid, are generally cited and then ignored.

Both "Merovaeus" (Gmc. "Merewig"), the legendary founder of the line, and the best-known poet of the period, Venantius Fortunatus, immigrated from Ravenna to the north of France. "Merovingian Latin poetry" refers primarily to that of Venantius (540–600), who continued the tradition of occasional poetry that preceded 482:

> Fortunatus ego hinc humili prece voce saluto
> (Italiae genitum Gallica rura tenent)
> Pictavis residens, qua sanctus Hilarius olim
> natus in urbe fuit, notus in orbe pater.

("I, Fortunatus, here greet you in the speech of humble entreaty/[Rustic Gaul keeps me, Italian born] /Now living at Poitiers, the city where St. Hilary was born long ago,/ Father Hilary known all over the world.") But he also introduces the rhythmic poetry that followed:

> Vexilla regis prodeunt,
> fulget crucis mysterium
> quo carne carnis conditor
> suspensus est patibulo….

("The battle standards of the King march forth,/The sacred sign of the Cross shines./On it, the founder of the flesh hung/In the flesh, suspended on the crosspiece….") The disparate qualities of Merovingian latinity blend in the rhythms of Venantius Fortunatus. His occasional pieces retain the grace of the old Gallo-Roman style of Ausonius (310-ca. 393) *(natus in urbe fuit, notus in orbe pater);* he effaces his personal voice within the requisite formality *(Italiae genitum Gallica rura tenent)*. In his rhythmic hymns, he imports imperial legalities from Byzantium by way of Ravenna *(conditor, baiulat),* adopts a warlike spirit from the Sicambrian tribal culture of Clovis I *(vexilla regis prodeunt),* stamps the verses with the meters of St. Ambrose, the teacher of Theodosius *(fulget crucis mysterium),* and converts the Roman sense of military duty into the Christian sense of militancy for Christ:

> Pange, lingua, gloriosi proelium certaminis

> et super crucis tropaeo dic triumphum nobilem,
> qualiter redemptor orbis immolatus vicerit….

("Sing, my tongue, of a glorious battle for the prize;/Speak out a noble triumph about the trophy, the cross:/How the Redeemer of the whole world conquered, by being slain….") *Pange, lingua* would appeal to Christian-Frankish nobles; its sacred septameter, or "Roman Marching Rhythm," stamped into *Pange, lingua, gloriosi proelium certaminis,* would recall the glory days of Roman *imperium*. The iambic tetrameters or octosyllabics in *Vexilla regis prodeunt* imitate the chaste rhythms and images in the hymns of Ambrose of Milan, now in the Frankish antiphoners.

True to the Byzantine-Latin style of the *kallos* (poems of the "beautiful," called *laudes* in Latin), Venantius composed stylized panegyrics of persons, cities, countrysides, and rivers. Like Ausonius, Venantius declaimed the pieces in the presence of the persons or places, while he was traveling from Mainz to Cologne to Trier on his way to the royal city. His occasional *epithalamia* and epitaphs were written for the marriages and deaths of patrons. As bishop of Poitiers at the end of his career, Venantius formed a close friendship with a group of noblewomen and especially with Radegund, wife of Clotar I, who had retired from the savagery of the court into monastic life at the nearby abbey of Sainte-Croix. Venantius's *De excidio Thoringiae* is a celebration of the destruction of the kingdom of Radegund's father, and he versified the narrative of the murder of King Chilperic's fiancée, Galswintha. From Poitiers also came *Vexilla regis prodeunt* and *Pange, lingua*.

The strange poet of Toulouse known as Virgilius Maro or Virgil of Toulouse gives various examples of the *rhythmi* practiced in Gaul, and Theodofrid, abbot of Corbie, has some anthologized verses on the six ages of the world, but the *rhythmi* of Venantius Fortunatus dominate Merovingian Latin poetry.

# LAURENT D'ORLÉANS

(d. ca. 1325). A Dominican friar and confessor of King Philip III, Laurent completed the *Somme le roi* in 1280 at the king's request. Preserved in about a hundred manuscripts in French, in translations into Flemish, English, Italian, Provençal, and Catalan, and in several incunabula, this lengthy prose work is essentially a treatise on the vices and virtues, drawing on Hugh of Saint-Victor, Guillaume Peyraut's *Summa virtutum,* and the anonymous *Miroir du monde*. It is divided into five sections, on the Ten Commandments, the Twelve Articles of Faith, the Seven Deadly Sins, Virtue (in general), and a treatise on the Seven Virtues derived from the Seven Gifts of the Holy Ghost. This final section, twice as long as the other four combined, also includes a commentary on the Lord's Prayer.

# LAVAL

. The lordship of Laval (Mayenne) in the county of Maine in northwestern France dates from the mid-11th century. The male line of the original seigneurial family died out in 1213, and the heiress, Emma, married Mathieu II of Montmorency. Their son, Gui VII de Laval, married Philippa, heiress to the important Breton lordship of Vitré, in 1239, thus establishing the house of Laval-Montmorency as an important dynasty in Breton feudal politics. Gui VII died in 1267 while accompanying Charles I of Anjou on his conquest of the kingdom of Sicily. Gui VIII (r. 1267–95) and Gui IX (r. 1295–1333) served kings Philip III and Philip IV on their military campaigns. The family's position in Brittany grew stronger when Gui X married Béatrix, daughter of Duke Arthur II, and his brother Foulques married the heiress of the important barony of Rais (Retz). Gui X died in the Battle of La Roche-Derrien in 1347. His daughter Béatrix married Olivier IV de Clisson, future constable of France, while his two sons succeeded to the lordship successively as Gui XI and Gui XII. The latter (d. 1412) was an important royal commander until Charles V's attempted confiscation of Brittany (1379), after which he served Jean IV and Jean V of Brittany. The Montmorency male line died out with Gui XII, whose daughter Anne married a prominent Breton, Jean, lord of Montfort, Gael, and Lohéac. He took the name Gui XIII but soon died, leaving Anne to administer the family lands for their young son,

Gui XIV (d. 1486), during whose long reign Charles VII erected Laval into a county. A younger son, André, lord of Lohéac, became admiral of France in 1437 and in 1439 succeeded his third cousin Gilles de Rais as marshal.

# LAVILLETERTE

. The little church at Lavilleterte (Oise) is an almost perfectly preserved country church of the mid-12th century. The nave is flanked by single aisles; all are covered by rib vaults, as are the projecting transept and the simple, flat chevet. The sturdiness of the construction perhaps accounts for the remarkable homogeneity of the structure.

# LAW AND JUSTICE

. To speak of French law is to speak first of the end of the Carolingian state in the late 10th century and the rise of the Capetian kings of France, laboriously establishing their authority in the area around Paris and slowly extending their domain throughout the 11th and 12th centuries. During this period, the customs of feudalism, a legacy of the Carolingians, governed the king's relations with the lay nobility of his domain and with the great ecclesiastical lords—the bishops, abbots, and priors—who were part of the feudal system. The bailiffs of the lay and ecclesiastical lords administered the law that regulated the lives and activities of the agricultural population, law that was embedded in the body of manorial customs that had also come from the distant Carolingian past. During this period, the reviving economic activity of western Europe produced towns that in France would create a new area of law.

It is difficult, therefore, to speak of French law before the 13th century, and by then three other legal systems had become prominent in France and would contribute in various ways to the development of French law. The first of these was the revival of Roman law in Italy in the late 11th and 12th centuries. By the middle of the 12th, this revival, based on renewed interest and study of Justinian's *Corpus iuris civilis* of the 6th century, had spread into southern France. It did not become the sole legal system of southern France but provided important concepts and systematic structure as the

customary law became a written law. Along with Roman law came the notary, who as a paralegal agent had a recognized authority to create in writing juridically authentic documents that were accepted in legal disputes as proof, whether they concerned loans, business contracts, marriage agreements, wills, property matters, or a dozen other subjects of legal conflict.

The earliest important center for the study of Roman law in France was Montpellier, where legal scholars like the Italian jurist and glossator Placentinus were at work in the 1160s. In the early 13th century, the Bolognese jurist and professor Francis Accursius produced a gloss on the body of Roman law, a commentary recognized as so complete and superior to all others that the jurists who produced commentaries after Accursius would be called "postglossators." By 1260, Montpellier was the site of a university with a law faculty and students, many of whom as graduates became judges and administrators in southern France as it gradually came under control of the French crown in the 13th century. In coming into the service of the French king, they brought a legal mentality formed by the concepts of Roman law that would influence in many important ways the further development of French law.

A second system of law arose in the 12th century when Gratian, a monk of Bologna, compiled the largest collection of canonical decrees and texts then assembled, a collection that has carried the popular name of the *Decretum*. Gratian's complete Latin title translated into English is *A Concord of Discordant Canons*. Gratian's collection, inspired by Justinian's codification of Roman law, established the view that as the Roman emperor had been the supreme source of Roman law, so was the pope the supreme legislator for the church and its legal sphere. Canon law dealt with the regulation and ordering of the clergy, the church, and the Christian population of Europe, since the pope claimed exclusive jurisdiction in all matters touching marriage, wills, and areas, such as education and heresy, that concerned the spiritual life of the church.

Canon law, using Roman law principles, terminology, and procedure, soon demonstrated that it was capable of much growth. Later popes added collections of decrees to the *Decretum,* and canon law, like Roman law, became the subject of study in the universities. A large and growing number of young men who chose a clerical life found the study of canon law a key to a successful career in the church. Not only did they enter the administrative and legal services of popes, bishops, and abbots, but they found a large and attractive area for their talents in the service of the kings and lesser rulers of Europe, who could use their literacy and legal training in governmental offices. In France, they found numerous positions of employment in the king's household and in his treasury and accounting department, and especially in the chancery, which issued royal correspondence and helped to frame the king's legislation. Most of all, they entered the Parlement de Paris, the great royal law court, serving as judges, as staff assistants, and in judicial capacities. They brought the influence of both Roman and canon law into the field of royal justice and lawmaking.

The economic development of the 11th and 12th centuries produced a third area of legal activity as the old Roman cities, commercially depressed for centuries, now, along with newly founded towns, established autonomous urban governments with independent judicial institutions. These towns developed a legal system, neither feudal, Roman, nor customary, that administered the legal needs of the urban population and managed often complex relations with the church and the monarchy. Rigaudière has shown how these

towns used *avocats-conseillers* to counsel them and to conduct their legal business, many on a permanent basis and others occasionally. These counselors usually held degrees in law, and the number engaged in this kind of work increased steadily from the 13th century through the 15th and beyond. Trained as they usually were in Roman law, they provide a striking example of the use and influence of Roman law in the development of French institutions.

While the 12th century produced the great revival of Roman law and the origins of canon law, only in the 13th century did French customary law come to be written; Roman and canon law provided the inspiration for this activity. Customary law varied from one region of France to another, and the writing of such law took place within regional or provincial boundaries. The results were *coutumiers,* collections of laws, legal customs, ways of holding court and doing justice. Their content was as much procedural as substantive law. The first of these to appear was the *Ancien coutumier de Normandie* in the early part of the 13th century. By the middle of the century, a larger and more complete collection for Normandy appeared under the name of the *Grand coutumier de Normandie,* a volume whose contents would remain applicable for centuries. Pierre de Fontaines, a royal administrator and *bailli* of Vermandois, produced ca. 1258 a *coutumier* for that area called *Conseil a un ami*. The unknown author of the *Livre de jostice et de plet* (1260) addressed the area of Orléans, and the *Établissements de saint Louis* (ca. 1270), far from being an official or royal compilation, contained two anonymous treatises for the Orléannais and the region of Touraine-Anjou.

The most important legal treatise written in medieval France was the great collection of customary law made by Philippe de Beaumanoir ca. 1283, the *Coutumes de Clermont en Beauvaisis*. Beaumanoir became the *bailli* of the count of Clermont in 1279, his first important position, and his book must be considered the result of all that he learned in holding the courts of the count, observing cases in nearby courts, and in frequently attending the Parlement de Paris. He cited more than one hundred cases from his judicial experience to support the rules and precedents that he discussed. And whereas the earlier *coutumiers* contained quotes and texts from Justinian's *Corpus,* comparing Roman with French customary law, Beaumanoir was the first to achieve a successful merging of the two. He believed that for laws to be valid and just they must be made by great counsel, for the common profit of the realm, and for reasonable cause. The idea that laws should be for the common profit is also found in canon and Roman law.

The extent to which Roman and customary law confronted each other in 13th-century France is further illustrated in the work of Jacques de Révigny, the most prominent of the professors in the law school at Orléans. The formal teaching of Roman law at Orléans represented its farthest penetration in northern France, and Révigny was deeply concerned with the connection between the two legal systems. Writing in the 1270s, he gave much attention to the similarities and differences between the two laws and expressed his views in his commentaries on various Roman laws, distinguishing custom from the Roman statute and trying to reconcile the two.

While these developments were taking place in French law, the French king's role as lawmaker or legislator slowly came into prominence. No legislation has survived from the early Capetian kings. Louis VII was the first to issue ordinances, when in 1144 he banished the relapsed Jews from the kingdom and in 1155 established the Peace of God for ten years. Both measures were made with heavy church sponsorship. Apart from the

famous ordinance of 1190, providing for the administration of the realm, Philip II Augustus did little more than change succession rules for fiefs and increase the widow's dower in her deceased husband's property. And these two ordinances applied only to the royal domain, not to the entire kingdom.

The king's power to make laws binding on all of his subjects slowly increased through the 13th century. Ideological support came from the study of Roman law, which in its general attitude toward political power revived the image of the prince who was supreme in his legislative authority and by analogy elevated the sovereign power of a king to make laws for the entire realm. Beaumanoir paraphrased the texts of the Code and the Digest in arguing that what pleases the prince is to be held as law or, moving as he could to the feudal context, that as each feudal lord is sovereign in his particular lordship so is the king sovereign over all. But while Louis IX issued ordinances and his son Philip III issued more, the legislation of these kings concerned only the area of public law, the principles and problems of governmental administration. None of their lawmaking addressed the domain of private law, whereby the inhabitants of France sued and were sued in the courts of the king. Certain kings encouraged the further collecting of local customs. Even here, little was accomplished. Philip III sponsored the compilation of the customs of Toulouse, and Philip V in the early 14th century pushed other projects of this kind. Not until the 16th century would progress be made on a complete *coutumier* for all of France.

The greatest progress in medieval French law came in the 13th century. This progress, which concerned procedure as much as legal doctrine, affected justice as much as law. In this century, the judicial duel received the first setback in its long history. Sometimes called "the judgment of God," the judicial duel was the system by which two litigants reached judgment through physical combat. The Burgundians and the Bavarians used it in the 6th century, and though it does not appear in Salic law there are incidents of the practice in Gregory of Tours's *Liber historiae Francorum*. It either subsided or disappeared during the Carolingian period, because legal procedure was more organized and proof consisted of written documents and witnesses. With the disappearance of the Carolingian state in the 10th century, its legal system vanished or weakened and its former territories became counties, duchies, and other feudal lordships, each with its own court in which the judicial duel as a way of settling legal disputes revived and became more frequent.

More is known about the judicial duel in the 13th century because the authors of the *coutumiers* described it in detail for the first time. One could appeal from the "false judgment" of an ordinary tribunal to judgment by combat in the belief that God would give victory to the party who had right on his side. If the combatants were members of the noble class, they would use the weapons of the noble class, the lance and the sword. If the dispute was between a lay noble and a cleric, the latter would be obliged to find a "champion" to fight for him since the clergy were forbidden to shed blood, and the weapons would be nonnoble, that is, the staff and the shield. This would also be the case in battle between a noble and a nonnoble. No vassal could appeal his lord to judgment by combat except in an accusation of crime. Only in the 13th century, when we know most about the judicial duel, did restrictions on its use appear. Beaumanoir listed seventeen cases in which combat could not be used to decide a legal dispute. The resistance to this method of trial came in part from the rising class of professional lawyers in France.

Louis IX was the first king of France to abolish the judicial duel; the occasion for his action was the trial of Enguerrand de Coucy in 1259 on charges of having killed two young clerics. The king ordered an *enquête,* or investigation, to decide the matter, using witnesses and depositions. The baron, through his counsel, argued that he should not have to submit to such process when the accusation touched his person, his honor, and his heritage. Determined to give severe justice for the seriousness of the crime, the king referred to an ancient right of Merovingian kings to put to death without judgment. He knew that he could not do that and sentenced the baron to heavy fines and three years in the Holy Land.

As the result of this case, Louis IX issued an ordinance prohibiting trial by combat throughout his domain in all disputes, and in place of battle he ordered the *enquête,* or proof by witnesses and written instruments. His prohibition of the judicial duel displeased much of the feudal nobility. His son Philip III permitted trial by combat to resume. His grandson Philip IV the Fair kept the prohibition for civil cases but permitted battle in criminal and capital cases. France would wait until the mid-14th century for trial by battle to be finally abolished.

Louis IX also raised to a level of standard procedure the use of the appeal in legal disputes. The ability of a litigant to question the rightness of a judgment in one court and to remove it to a higher court for reconsideration can be found in the Roman Empire and in Salic law. Charlemagne provided for it in a capitulary of 805 whereby one could complain of a judgment and procure letters from the royal palace that would lead to a judicial review of the original decision.

When the Carolingian empire disintegrated, the counts, dukes, and other great lords did not encourage processes from their feudal courts to proceed in appeal to the king's court. And in the early stages of the French monarchy, the king was not strong enough to command his great vassals to let cases proceed upward to his court. But gradually, through the 12th century and into the 13th, the evidence for systematic appeals from lower jurisdictions to the king's court slowly increased until, with the appearance of the earliest records of the Parlement de Paris in the reign of Louis IX, one can see the practice firmly established. The multiplication of appeals was the major reason for the rapid growth of judicial business in the Parlement de Paris in the late 13th century. The vast new urban class as well as the greatly enlarged lower nobility embraced the opportunity for a more certain justice. A remnant of the distant past remained in the 13th-century appeal, when the appellant did not appeal his earlier adversary but rather the earlier judges, or the tribunal, who in giving a bad judgment became the reason for the appeal and the new adversary.

As cases of appeal multiplied, so did the rules governing them. An appellant could not choose the court but was directed by regulations to the next highest tribunal. In 1298, the Parlement de Paris addressed this problem in prohibiting cases from coming directly to it that should first be tried in the court of the *bailliage* or *sénéchaussée*. It also sought to reduce the number of judicial levels cre-ated by the seigneurial class, which often exhausted the resources of the appellants before they could reach the highest court. Could one appeal from a judgment of the Parlement de Paris? It answered this question in a general ordinance of 1303, recognizing that it could review its own decisions in a process of emendation.

French law had reached a significant level of growth and sophistication by the early 14th century, largely through the suppression of the judicial duel, the transformation and elaboration of the appeal, and the institution of the *enquête* as the system of proof. Louis IX must receive major credit for these accomplishments. But French law, so far as legal doctrine was concerned, had become an amalgamation of the revived Roman law, with influences from canon law and the great body of customary law.

The working of this amalgamation can be seen in contractual obligations, a field of legal activity that grew at a remarkable rate in the 13th and 14th centuries. The revival of towns and economic activity in the 11th century, a much larger commercial class produced by the new urban centers in the 12th and 13th, and the striking population growth of the same period were basic factors behind the noticeable rise in contractual activity. Beaumanoir in his great law book gave prominent space to contract, and it is a subject that illustrates how Roman law, canon law, and customary law contributed to the theoretical and practical aspects of this field of legal doctrine. Those who judged and those who counseled in cases on contract knew that the language of a contract and its clauses must be clear, so that the business or object sought in the agreement was made certain and could be determined beyond doubt when the need arose. These qualities of the contract made it valid and could in litigation ensure forced execution if required.

A second requirement of the contract as a legal instrument was that the object of its provisions must be possible. If the thing agreed upon did not or could not exist, the contract was invalid. An example without intent of fraud is the agreement to deliver a horse that, unknown to its owner, is already dead. An example involving fraud is the promise to sell a thing that he knows does not belong to him.

The third quality of a valid contract required that it be lawful, that its provisions not go against legal concepts or ideas that were considered mandatory. The most complex of the three conditions, in Christian Europe it played to a more moral than juridical viewpoint. Roman law had taught that the law could not be set aside by the agreement of parties, that a contract made *contra bonos mores* was tantamount to being made *contra legem*. Adopting this view, the medieval church taught that an oath that put the soul or the life of a Christian in peril could only nullify the obligation that it was supposed to enforce. The postglossators of the 13th century and the canonists came together in supporting the view that a contract was invalid if it tended to defeat a law made for the public utility *(utilitas publica)* but its validity was not harmed if it worked against a law that concerned only private utility *(utilitas privata)*.

The books written on customary law in the 13th century promoted the view that "agreement conquers law," but they recognized at the same time that the only agreements that should not be kept were those made against Holy Church or the common profit, or against good customs *(contre bonnes meurs)*. In this way, customary law supported basic legal concepts that came originally out of Roman and canon law. Customary law also had its own view of "public order" in its treatment of inheritance. The widow whose dead husband's property was sold to satisfy his debts to the king could reclaim parts to fulfill her dower.

# LAY ORDERS OF CHIVALRY

**.** Between 1325 and ca. 1470, many associations were formed in western Christendom in which membership was restricted to laymen (and more rarely laywomen) of noble birth. As the more important of these bodies were also restricted to men who followed the profession of arms as knights or esquires, and bore the corporate title "order," all such societies came to be loosely designated by the generic term "order of chivalry" *(ordre de chevalerie).* To distinguish them from the older orders of monk-knights like the Templars and Hospitalers, on which some of them were partially modeled, the latter-day societies of lay knights may be termed collectively "lay orders of chivalry."

Four types of true lay order, endowed with corporate statutes intended to govern the lives and activities of members, were founded in our period. (1) The "confraternal order" differed from the normal lay confraternity only in being restricted to nobles and thus had elected officers. (2) The "monarchical order" differed from the confraternal type primarily in having a presidency attached on a permanent and hereditary basis to the crown or, more rarely, dynasty of its princely founder; it gave its president (variously titled "sovereign," "prince," or "chief") powers comparable with those of the "master" of one of the religious orders of knighthood. (3) The "fraternal order" was essentially a temporary society of brothers-in-arms, loosely modeled on the confraternity but intended to exist only for the duration of a particular campaign or crisis. (4) The "votive order" was a temporary society of knights who collectively undertook a vow to accomplish some enterprise *(emprise)* of arms within a specified period of time, typically a year or two. Lay orders of all types commonly took their name from the badge, or *devise,* worn by their members, but some were named after their patron saint. Orders of the first two types were created at least partly to promote chivalrous behavior and activities, but those of the second type, modeled more or less directly on the fictional society of the Round Table, were intended primarily to promote and reward loyalty and service to the crown of the prince-president among the members, usually called "companions."

Orders of all four types were founded in France. Among the confraternal orders, the most important were the Dauphinois Order of St. Catherine (founded ca. 1335), the Barrois Order of St. Hubert (1422), the Comtois Order of St. George de Rougemont (ca.

1440), and the Angevin-Provençal Order of the Crescent (1448). The only monarchical orders certainly established in France before 1578 were the Company of Our Lady of the Noble House of Saint-Ouen (known from its badge as the Company of the Star), founded by King John II as a rival to the English Order of the Garter in 1352, dissolved as a true order on his death in 1364, and completely defunct by 1380; the Order of the Golden Shield, founded by Duke Louis of Bourbon in 1365 and dissolved on or by his death in 1410; the Order of the Ermine, founded by Duke Jean IV of Brittany in 1381 and dissolved as a true order on his death in 1399; the Order of the Golden Fleece, founded by Duke Philip the Good of Burgundy in 1430; and the Order of Messire St. Michael the Archangel, founded by Louis XI in 1469, long maintained in disregard of most of its statutes (which were almost identical with those of the Golden Fleece), and suppressed in 1790. Among the handful of fraternal orders now known are those of the Tiercelet or Young Male Falcon (1377/85), of the Golden Apple (1394), and of the Hound (1416); the votive orders now known include those of the White Lady with the Green Shield of Marshal Boucicaut (1399), of the Prisoner's Iron of Duke Jehan de Bourbon (1415), and of the Dragon of the Count of Foix (ca. 1415).

In addition to the true orders, a number of French princes created what are best termed "pseudo-orders," which were essentially elite bodies of retainers lacking in any corporate statutes or activities. Most prominent among these were the Order of the Belt of Esperance, established by Duke Louis of Bourbon in 1365 and maintained into the 16th century; the royal Order of the Broom-Pod *(Cosse de Geneste),* created by Charles VI ca. 1386 and maintained until his death in 1422; and the Order of the Camail or Porcupine, created by Duke Louis of Orléans ca. 1394 and maintained until 1498.

# LE FÈVRE (DE RESSONS), JEAN

(ca. 1320–ca. 1390). Translator of the *Disticha Catonis, De vetula,* the *Lamentationes Matheoli,* and a selection of liturgical hymns (B.N. fr. 964) into French. Le Fèvre's *Livre de leesce* (1380–87) is a point-by-point refutation of the *Lamentationes*. He also wrote the *Respit de la mort* (1376), in which his knowledge of the Paris courts is seen, and the *Épistre sur les misères de la vie* (unedited) as well as a now lost *Danse macabré*. A translation of the *Ecloga Theoduli* may also be his. Born in Ressons-sur-le-Matz, near Compiègne, Le Fèvre spent his adult life in Paris, where he was royal *procureur* before the Parlement de Paris.

# LE FRANC, MARTIN

(ca. 1410–ca. 1461). Born in Normandy, Martin Le Franc was provost of Lausanne and later, following a persuasive Latin letter on the nature of eloquence that he wrote to the future Pope Felix V, papal secretary. His Latin erudition and original thinking secure his place among 15th-century humanists. Between 1440 and 1442, he composed the *Champion des dames,* a didactic allegorical poem of some 24,000 octosyllabic lines. In it, Le Franc shows himself to be the ally of Christine de Pizan in the persistent Quarrel of the *Roman de la Rose* and perhaps even the adversary of Alain Chartier, author of the *Belle dame sans merci.* Franc Vouloir is the ladies' "champion," whose lessons and battles finally defeat Malebouche of Jean de Meun's romance. In 1447–48, Le Franc wrote another didactic work, the *Estrif de Fortune et de Vertu,* apparently inspired by Petrarch's *De remediis utriusque fortunae.*

# LE MANS

. A prehistoric site and perhaps capital of the Gallic Cenomani, Le Mans (Sarthe) was the ancient capital of the county of Maine. It lies in western France between Normandy and the Loire Valley on an important trade route. A major center since Roman times, when it was known as Vindonum, Le Mans was evangelized in the late 3rd century by St. Julien, to whom its Gothic cathedral is dedicated. When the Roman Empire began to disintegrate, the center of population removed from the surrounding plains to the central hilltop and a great wall (late 3rd-early 4th c.) was constructed around the upper town.

This wall survives in large part and has recently been disengaged along much of its perimeter. In the Middle Ages, Le Mans was a center of the Norman-Angevin dynasty and a favorite city of Henry II Plantagenêt.

In the 9th century, an important Carolingian cathedral was built in the upper town. This was replaced in the 11th century by a new cathedral building in Romanesque style, parts of which survive today—the side aisles of the nave and important parts of the transept, the latter subsequently remodeled. A contemporary text records the consecration in 1093 and details the construction campaigns of the 11th century. Major fires in 1134 and 1137 greatly damaged this Romanesque structure, and reconstructior was undertaken first in the choir, then in the transept, and finally in the nave. In 1158, the new building was consecrated. The present nave and lower wall of the transept belong to this phase of construction. The original 11th-century choir, as well as its reconstruction after the fires of 1134 and 1137, was limited in its eastern extension by the great Gallo-Roman wall. In the 13th century, this choir must have been considered excessively modest, since the construction of vast Gothic cathedrals had been undertaken in many of the great cities of northern France. In November 1217, Philip II Augustus authorized the destruction of a large section of the venerable Gallo-Roman wall so that the choir could be rebuilt on a vastly larger scale beginning ca. 1221. The new choir was consecrated, and most likely completed, in 1254, since monks at the neighboring monastery of La Couture were authorized as

Le Mans (Sarthe), Saint-Julien, chevet.

of 1252 by the cathedral chapter to use the quarry at Bernay just west of Le Mans, which had previously served as the principal source of stone for the new cathedral. Seen from the great marketplace immediately to the east and below, this choir is one of the most magnificent structures of Gothic Europe. In addition to the cathedral, Le Mans is rich in medieval monuments from the Romanesque and Gothic periods, such as Notre-Dame-du-Pré, the former abbey church of La Couture, and the former Cistercian abbey of L'Épau.

# LE MOTE, JEAN DE

(La Motte; fl. mid-14th c.). A poet and composer, Le Mote was active in the Low Countries and England and probably spent time in Paris. Gilles Li Muisis, writing in 1350, names Le Mote with Guillaume de Machaut and Jean de Vitry among the prominent composers of *biaus dis*. His extant works include an elegiac dream vision, the *Regret Guillaume comte de Hainault* (dated 1339), written for the daughter of the dead count, Queen Philippa of England, and two works written in 1340 for Simon de Lille, goldsmith to King Philip VI: a continuation of the romances of Alexander, the *Parfait du paon,* and a religious vision, the *Voie d'enfer et de paradis*. None of his music is extant, and though his long works contain intercalated ballades, a single independent lyric survives, a ballade response to Philippe de Vitry. Vitry had criticized Le Mote's poetry for its bizarre use of names, and Le Mote defends his practice while praising his attacker.

# LE PUY

. The volcanic peaks rising from the Auvergnat plain create a dramatic setting for the town of Le Puy-en-Velay (Haute-Loire). This site had religious significance in Roman times, when a temple of Diana may have preceded the church. By the 6th century, Le Puy

was the bishopric of Velay. The cathedral dedicated to the Virgin was a major pilgrimage center located on one of the main roads to

Le Puy (Haute-Loire), chapel of Saint-Michel. *Photograph courtesy of William W.Kibler.*

Santiago de Compostela. In 1254, Louis IX's gift of the Black Virgin, obtained while on crusade in the Holy Land, enhanced the religious significance of Le Puy.

The most notable architecture in Le Puy is the cathedral of Notre-Dame, which, along with its subsidiary buildings—cloisters; baptistery, or chapel, of Saint-Jean; and chapter house, or Salle des Morts—formed a fortified complex in the Middle Ages. The present cathedral was built in the 11th and 12th centuries. The earlier part of the structure is the simple cruciform plan formed by the apse, transept, and two eastern bays of the nave. At the east end is a staged tower similar to the one at Saint-Martial, Limoges. The crossing has an octagonal dome, and the nave bays are vaulted with octagonal domes on squinches. In the 12th century, the nave was extended to form a substantial crypt porch over the sloping site.

The cathedral has several features that indicate Moorish influence. The imposing west façade with its steep steps leading to the deep porch has striped ashlar masonry, cusped arches in the blind arcades, and wooden doors with Cufic inscriptions. The construction of the squinches and the carving of about a hundred capitals also display Moorish stylistic connections.

Several frescoes survive in the cathedral and cloisters. Two chapels in the apsidal niches of the north transept have paintings of the three women at Christ's sepulcher and the martyrdom of St. Catherine. Lunettes with the Virgin Enthroned and the Transfiguration are visible in the porch. The Salle des Morts just east of the cloisters

contains a Crucifixion that fills the lunette of the south wall. Although they are by various artists, all the frescoes

Le Puy, Notre-Dame, cloister.

are from the first half of the 13th century and reflect Italo-Byzantine stylistic features.

# LEFÈVRE, RAOUL

(d. late 1460s). A member of Philip the Good of Burgundy's circle, the Picard Raoul Lefèvre is the author of two romances based on classical materials, the prose *Histoire de Jason* (ca. 1460), which uses the *Ovide moralisé* and *Histoire ancienne jusqu'à César* as

sources, and the *Recueil des histoires de Troie* (ca. 1465), based on Boccaccio's *De genealogia deorum.* These works reflect the interest in classical and humanistic subjects at the Burgundian court. Not only did Philip the Good institute the Order of the Golden Fleece (1430), but he also commissioned a series of tapestries celebrating the deeds of Jason and Hercules, the two heroes of Lefèvre's romances. Lefèvre's works were printed by Colard Mansion (1475–76) and translated into English and printed by William Caxton between 1469 and 1477.

# LEGAL TREATISES

**.** Feudal or customary law existed throughout the Middle Ages. In the course of the 12th century, however, there occurred a revival of Roman law that, after its beginnings at the law school in Bologna, spread from southern to northern France. Everywhere, Roman law penetrated into the schools. In the south of France, where customary law had always been strongly influenced by Roman law, a vernacular summary of the legal Code of Justinian, known as the Codi, was made available in the mid-12th century to the laity and judges of Provence.

Two schools, Orléans and Montpellier, developed slowly into leading law schools in the 13th century. Orléans had already produced a useful treatise on Roman law in the 12th century, the *Corpus legum per modum institutiones,* which demonstrated an understanding of Justinian's *Codex.* Montpellier's law school dates from 1160, when Placentinus, who had been educated in Bologna, established himself there.

Although both schools offered a curriculum in canon and civil law, the two most important scholars in these fields did not belong to these institutions. Guillaume de Montlauzun (d. 1343), a Cluniac, wrote commentaries on canon law and the *Sacramentale* (ca. 1317), in which he explains theology to lawyers. Jean Faure discussed civil law in the *Breviarium* (ca. 1325–30), which is a summary of Justinian's *Codex,* and the *Lectura* (ca. 1335–40), a commentary on four books of the *Institutiones,* law textbooks designed for school use.

The *Livre de Jean Roisin* is a practical compilation based on Roman legal ideas that sets out in some 120 chapters the rights of the citizens of Lille. It grew out of acts and charters dating back as far as Philippe d'Alsace (r. 1168–91) but is first mentioned only in 1349.

# *LEGENDA AUREA*

. The collection of saints' lives known as *Legenda aurea,* or *Golden Legend,* was the most copied text in the Middle Ages, surviving in more than 1,000 manuscripts and translated into nearly all the vernacular languages of western Europe. It was among the first books printed in France in the 15th century and, by William Caxton, in England. Originally titled *Legenda sanctorum alias Lombardica hystoria,* the *Legenda aurea*—its name attests to its popularity—was composed in Latin ca. 1261–67 by Jacobus of Voragine (Jacques de Varazze; 1228/30–1298). Jacobus, a Dominican and archbishop of Genoa, sought to provide a collection of easily understood texts that would serve to inspire the devotion of the laity. Relying most probably on Vincent de Beauvais's *Speculum historiale,* Jean de Mailly's *Abbreviatio in gestis et miraculis sanctorum,* and Bartholomew of Trent's *Liber epilogorum in gesta sanctorum,* Jacobus chose to add numerous accounts of marvelous and miraculous deeds. His work consists of 182 chapters and follows the order of the liturgical calendar. It reflects the encyclopedic tastes of its age and includes numerous eastern saints' lives as well as western lives written originally in Latin in the early Middle Ages but frequently translated or reworked in the vernacular. The *Legenda aurea* itself was translated into French a number of times, the best-known translation being that by Jean de Vignay; there are three independent Occitan versions. The popularity of the *Legenda aurea* diminished in the 16th century, criticized by reformers for encouraging devotion to the saints rather than to God.

# LEGRAND, JACQUES

(ca. 1360–ca. 1418). A member of the Augustinian order, Legrand is the author of the *Sophilogium* (1398–99) and Latin sermons denouncing the corruption of religious and secular authorities. He was also active in the Armagnac faction after the assassination of Louis of Orléans (1407). He is best remembered as the author of the French *Archiloge Sophie* (ca. 1400), dedicated to Louis of Orléans, which treats questions of rhetoric, poetics, and spelling; and the *Livre de bonnes* meurs, dedicated to John, duke of Berry. The *Livre,* a treatise on Christian morality, is divided into five parts, which discuss vice and virtue, the clergy, kings and the nobility, the common people, and death and the Judgment Day.

# LEO IX

(1002–1054). Pope. Born of Alsatian nobility at Egisheim, Bruno, the future Leo IX, was educated from an early age at Toul, by Bishop Berthold. After entering an ecclesiastical career, he accompanied the emperor Conrad II on campaign in Lombardy in 1025 and became bishop of Toul by imperial appointment in 1026. Known for his piety and intelligence, Bruno set out to reform the church in his diocese and took advantage of imperial privileges to achieve his goal. After twenty-two years at Toul, Bruno was elevated to the papal see by his cousin, Henry III, at Worms in 1048. He was the second of four German churchmen so elevated by the emperor.

Taking the name of Leo IX, Bruno immediately set out to reform the church throughout Europe. He traveled widely and spent barely six months in Rome after his coronation. In 1049, he made the first of several trips north of the Alps, heading first to Reims, the principal see of France, where the bishops and abbots of the realm were gathered for a synod. There, he demanded an accounting from suspected simoniacs, those who had bought their ecclesiastical office. Prelates who thought it more discreet not to attend the synod were immediately deposed and excommunicated. Leo enforced his policy for the German realm in a synod held a few weeks later at Mainz.

The following year, at a great synod held in Rome shortly after Easter, Leo took aim at what was considered the other great clerical abuse of the time, clerical incontinence. Scandalized by the sexual mores of many clergy and fired by the monastic ideal, Leo pronounced celibacy to be the norm for the clergy and called for a boycott of priests and deacons who violated this norm.

Leo also dealt with the heresy of Berengar of Tours over the eucharistic presence of Christ and the controversy with Michael Cerularius, the patriarch of Constantinople, over differences in liturgical practice (and implicitly the dignity of Rome), especially the use of leavened or unleavened bread in the eucharist. The Eastern Schism is traditionally dated from this controversy.

Although Leo's reign was marked by many successes, it ended on an ignominious note: in 1053, he led an expedition of Swabian troops to southern Italy to resist the encroachments of the Normans, who crushed the papal army at Civitella and captured Leo. He remained under virtual house arrest near Bari until April 1054. Gravely ill, he returned to Rome just weeks before his death.

Leo IX brought to the papal court some of the most outstanding clerics of his day, among them Hildebrand, the future Gregory VII; Humbert of Silva Candida, his legate to Constantinople; and Peter Damian, a champion of the monastic ideal. It was while Leo was on the papal throne that the cardinal clergy of Rome became more than liturgical functionaries and that the laws of the church were compiled in support of the reform in the *Collection in Seventy-four Titles (Diversorum patrum sententiae)*.

# LÉONIN

(Leoninus; fl. 1154-ca. 1201). Anonymous 4's epithet *optimus organista* ("the best singer/improviser/ composer/compiler/notator of organum") assured Léonin a significant place in music history long before any convincing identification of the person was suggested. Since he was responsible for the new polyphonic repertory of the cathedral of Notre-Dame in Paris in the decades after its founding in the 1160s, his place was evidently among the dignitaries of its ecclesiastical hierarchy, but the familiar use of the Latin diminutive of his name, as "Magister Leoninus," in the theoretical treatise of Anonymous 4—the only source for information on his considerable musical achievement—long seemed to belie this. Anonymous 4 credited Léonin with the *Magnus liber organi de gradali et antifonario* some one hundred years after its compilation, a fact that recommends cautious use of his testimony and the need for independent verification. Three major manuscript sources (*W1, F,* and *W2*) confirm a repertory of organum that fits Anonymous 4's description of a *Magnus liber organi,* and the melodies of the plainchant that form the basis of that organum match notated plainchant sources used at Notre-Dame. Still, this does not clarify what Léonin's role may have been in making such a book. *Optimus organista* suggests a youthful man in full voice, while the diminutive implies a beloved elder whose practical contributions may have been overshadowed by his administrative usefulness—two very different "portraits" of the individual. It may not have been so much by his initiative as by his approval that modal rhythm became the primary innovation of the Notre-Dame School, and there is no certain evidence that such rhythm was subject to systematic theoretical or notational principles during his lifetime.

Archival evidence only recently brought to light establishes a probable identity for Anonymous 4's Magister Leoninus as Magister Leoninus presbyter, a canon active in the affairs of the cathedral during the late 12th century and a Latin poet whose hexametric Old Testament commentary, *Hystorie sacre gestas ab origine mundi,* was long praised after his death. There is, however, no document, except possibly the treatise of Anonymous 4, to substantiate the involvement of Leoninus presbyter with music at all, a striking omission given the significance of the *Magnus liber organi* and the stature of the

poet. Thus, while the search for independent, corroborating evidence continues, the hypothesis that Léonin, known also as Magister Leoninus presbyter, was responsible for the vanguard of virtually a new era in music with the *Magnus liber organi* should remain compelling.

# L'ÉPINE

. Commemorating a miraculous appearance of the Virgin, the church of Notre-Dame-de-l'Épine (Marne) was established as a pilgrimage goal in the early 13th century; its popularity reached an apogee in the late Middle Ages, when it attracted the interest and devotion of French monarchs, including Charles VII and Louis XI. Construction of the present edifice advanced in a complex sequence of campaigns. The eastern bays of the nave, begun ca. 1405/

L'Épine (Marne), Notre-Dame, plan.
After Chauliat.

10, the transept, and western portions of the choir of ca. 1440 were built in a Late Rayonnant style; the façade, probably inaugurated in the mid-1450s under master mason Florent Bleuet, introduced a Late Gothic Flamboyant vocabulary of decoration. The radiating chapels, ambulatory, and apse were erected from 1509 by Rémy Gouveau, Guichart Antoine, and Antoine Bertaucourt. L'Épine's architectural significance lies not in formal inventiveness but in its masters' skillful combination of structural and compositional ideas from contemporary northern French buildings as well as 13th-century models, particularly the cathedral of Reims. In its plan, with an ambulatory and radiating chapels, three-story elevation, and twin-towered façade, L'Épine was conceived as a cathedral in miniature.

# LEPROSY

. Paradox marks the subject of leprosy in medieval France. Though the object of universal dread, the disease was not as widespread as modern images suggest. The symptoms and causes were moralized not only by preachers but also by poets from Béroul to Rutebeuf and in such romances as *Ami et Amile;* yet they were also discussed in rational and scientific terms by medical authors. Physicians urged and applied caution in diagnosis, even if their belief in contagion perpetuated unnecessary fears.

Confirmed patients, officially cast out with funerary rituals and barred from towns, nevertheless roamed the streets freely until they became too numerous or unruly. Lepers were legally "dead to the world" according to a sweeping principle in the Beauvaisis, but local regulations on their property and marital rights varied widely. Deeds of charity, from the foundation of lazar houses to the saintly heroics of Louis IX, contrast with outbursts of popular intolerance. Accused of poisoning wells, lepers at large were attacked by mobs during plagues and sheltered ones were burned under Philip V, who seized their communal assets for his depleted treasury.

Leprosy peaked in France in the 13th century; in the early 1200s, Jehan Bodel and Baude Fastoul poetically bewailed their exile from Arras, where several *maladreries* could have housed them by the end of the century. After 1350, the disease declined markedly for reasons that are not yet fully clear but that included improved diet and hygiene, mortality in epidemics, isolation, and more accurate identification—in which physicians played an increasing role.

# LÉRINS

. A small island (now known as Saint-Honorat) in the Mediterranean, just off the French coast at Cannes, Lérins was the site of a monastery founded ca. 410 by Honoratus, who had traveled east on pilgrimage and returned to found a monastic community. The monastery at Lérins combined a community under an abbot with isolated cells for hermits. A major center for monastic training, it provided both monastic leaders and monk-bishops for the church, such as Caesarius of Arles, Hilary of Arles, Vincent of Lérins, and Lupus of Troyes. According to tradition, St. Patrick was trained at Lérins before embarking on his mission to Ireland. Lérins had a strong tradition of intellectual as well as ascetic training, thus presaging the role that later monastic communities would play in preserving and transmitting classical and Christian culture to the Middle Ages and beyond.

# LESCUREL, JEHANNOT DE

(d. 1303). A trouvère credited with thirty-three chansons, ballades, rondeaux, and dits, preserved with music, written to honor several ladies whom he describes with conventional attributes, Lescurel was hanged in Paris in 1303 with several other men for crimes committed against both religious and lay women.

# LESSAY

. A magnificent example of Romanesque architecture, the Abbatiale de la Trinité in Lessay (Manche) was founded in 1056 by a Norman baron, Thurstin Haldup. A certificate of 1080, confirming the foundation and ownership, constitutes the first reference to this Benedictine abbey, built probably at the turn of the century. The church features the first known occurrence of cross-ribbed vaulting in France. Whether this type of vaulting developed in France at this time or was imported from England, after the style of the cathedral of Durham (1093), has been a matter of debate.

One of the most striking traits of the church is its spirit of spacious grandeur effected by three-story columns that rise from the ground to the ceiling without interruption. The nave comprises seven bays with broad arcades. The choir precedes an apse in cul-de-four illuminated by two-story windows. A single stone slab serves as the high altar. To the right of the choir, a baptistery occupies a 15th-century chapel. A circular gallery surrounds the entire church. The typically Romanesque exterior is less original.

The abbey was destroyed in 1356 by Charles the Bad. Reconstruction from 1385 to 1420 meticulously followed the original plan of the church. During World War II, the church was again severely damaged. A comprehensive restoration project, begun in 1945, took twelve years.

# LETTERS OF REMISSION

. The stern justice of late-medieval France was somewhat mitigated by the granting of pardons. Pardons were expensive, with chancery fees alone costing over ten *livres tournois* by 1550, so that only individuals with financial resources and political influence normally obtained them. Individuals charged with capital crimes, such as murder, obtained pardons by requesting the king, chancellor, or other high chancery official to order the notarial preparation of a description of the crime and any extenuating circumstances. This draft was reviewed in council or chancellery and issued as a letter of pardon *(lettre de rémission),* which then had to be ratified by the royal court with jurisdiction over the case. The process of ratification involved a series of hearings and investigations to ensure the accuracy and propriety of the pardon letter. A sort of plea bargaining resulted that often provided for modified punishment and compensation of victims before the case was closed. Most pardon letters were registered in chancellery, where 58,300 are still to be found in the Trésor des Chartes (58 percent of registers after 1300). However unreliable they may be as a statistical indicator of criminality, they comprise an invaluable source of anecdotal information, providing marvelous vignettes of late-medieval France.

# *LEYS D'AMORS*

. Attributed to Guilhem Molinier, the *Leys* is the art of versification for Occitan poetry drawn up in the 14th century by the *Consistòri de la Subregaya Companhia del Gai Saber*. This group, organized at Toulouse by seven troubadours in the early 14th century, was dedicated to preserving Occitan poetry and the values of *fin'amor*. Theirs was a last-ditch attempt to keep alive a dying art. With French victory in the Albigensian Crusade, love poetry in Occitan was disappearing in favor of moral and didactic works, and works in French. At the *Consistòri's* inaugural meeting on May 1,1324, its chancellor, Guilhem Molinier, was commissioned to draw up a Code of Poetry, which seems to have been

established by 1341. The *Leys* went through successive stages, in both prose and verse. The final stage, in three prose books, was published by Anglade. The first volume is a history of the founding of the *Consistòri,* combined with a treatise on ethics (the nature of God and love, the moral virtues); the second and third include an extensive grammar (phonology, morphology, syntax, with some poetic samples) and an art of poetry (versification, rhymes, and numerous examples of the principal literary genres). The influence of the *Leys* was extensive, well into the 16th century, particularly in Catalonia, and it is credited with keeping Occitan alive as a poetic medium until the end of the Middle Ages.

# LIMUISIS, GILLES

(Gilles Li Muisit, 1272–1353). Chronicler and poet. Born into a powerful middle-class family from Tournai, Gilles Li Muisis entered the Benedictine monastery of Saint-Martin in Tournai as a novice in 1289; he later served as its seventeenth abbot. According to some accounts, Gilles studied at the University of Paris. In 1300, he accompanied the abbot Gilles de Warnave to Rome on the occasion of the great pardon instituted by Boniface VIII. Elected abbot of Saint-Martin in 1331, Gilles restored discipline and financial stability to the institution. When blindness overcame him in his late seventies, he dictated his memoirs to Jacques Muevin, his successor. Two cataract operations performed in 1351 restored Gilles's eyesight but hastened his demise.

In his Latin prose chronicles, four volumes of *Tracta*tus, Gilles documents his years at Saint-Martin and his first-hand knowledge of Tournai and the county of Flanders. His *Méditations,* a didactic poem composed in French, is a survey of the worldly estates designed to correct the vices of clerical and lay readers. It shows the influence of the Reclus de Molliens and the *Roman de la Rose,* read as a satire of contemporary manners and customs.

# LIBER FORTUNAE

. An anonymous treatise on Fortune that its author claims to have composed in prison in the year 1345. He seeks to reconcile the dilemma of Fortune and Divine Providence, by making Fortuna the daughter of God. There follows a display of the banal knowledge a typical cleric possessed, codified according to sins, vices, virtues, and so on. The author knew the *Roman de la Rose,* Boethius's *De consolatione Philosophiae,* the *Disticha Catonis,* the *Somme le roi* of Laurent d'Orléans, the *Elucidarius,* and a goodly number of proverbs. The author's effort to sign his work with an acrostic is a failure. The text, surviving in two manuscripts and a fragment, is some 4,000 rhymed octosyllables in length and evinces both a mediocre style and a poverty of original thought. When the author discovers that he has begun to repeat himself, he brings the poem to a close.

*John L.Grigsby*

Grigsby, John L., ed. *The Middle French* Liber Fortunae. Berkeley: University of California Press, 1967.

# LIBER SANCTI JACOBI

. A compilation of five texts, with prefatory letter and addenda, devoted to the cult of the Apostle James the Greater. The texts appear to have been independently composed and then brought together at some time after 1137 and before 1173. The twelve extant manuscript copies contain the compilation entirely or in an abridged version and range in date from the 12th century through the 18th. The earliest manuscript, probably from the early 1140s, is in the Cathedral Archives of Santiago de Compostela. It is uncertain whether or not an earlier exemplar of the compilation existed, and it has not been possible to establish the identity of the authors or compilers of the work.

The compilation was originally called the *Codex Calixtinus* after Pope Calixtus II (r. 1119–24), whose name appears as the author of the prefatory letter and other parts of the texts. This attribution was rejected as early as the 16th century, however, and a more accurate designation for the compilation would be the *Pseudo-Calixtine Compilation*. The name *Liber sancti Jacobi (Livre de saint Jacques, Book of St. James)* was adopted by the early 20th century, a choice suggested by the contents of the manuscript and the incipits of Books 2, 3, and 5. The compilation has also been called *Jacobus* in current literature, a name appearing in some of the manuscript copies.

The Compostela manuscript opens with the Pseudo-Calixtine prefatory letter and is followed by Book 1, which contains the liturgy for the three main feasts of St. James with accompanying monophonic music and notation. Book 2 recounts twenty-two miracles of St. James dated from 1080 to 1135. Book 3 gives confusing versions of the arrival of the relics of the saint in Spain. In Book 4 is found the legendary account of the campaigns against the Saracens in Spain waged by the emperor Charlemagne (r. 780–814), which includes the famous story of the ambush and death of Charlemagne's nephew Roland.

Known as the Pseudo-Turpin, because it was falsely attributed to Archbishop Turpin of Reims (753–800), this component has a separate manuscript tradition, with well over 200 copies extant. Book 5, referred to as the *Pilgrim's Guide,* provides information for pilgrims traveling from France to Santiago de Compostela to visit the shrine of James. Book 5 ends with a colophon that states that the manuscript "was written in many places, namely in Rome, in the region of Jerusalem, in France, in Italy, in Germany, and in Frisia, and chiefly at Cluny"; it is, however, unclear whether the colophon refers to Book 5, the entire compilation, or some other part of the compilation. The addenda following Book 5 include polyphonic songs with musical notation, an Alleluia and fragments of a Mass, a false papal bull attributed to Pope Innocent II (r. 1130–43), and seven additional miracles, two of them dated 1139 and 1164.

# LIBERAL ARTS

. The Seven Liberal Arts were the corner-stones of a classical education in the Middle Ages. The basic three, known as the Trivium, were grammar, rhetoric, and logic or dialectic. After mastering these, a student was ready to proceed to the Quadrivium, which comprised arithmetic, geometry, music, and astronomy. The grouping was established as the core of Christian education in the *Institutions* of Cassiodorus and the writings of Boethius. Their Latin names were all grammatically feminine (Grammatica, Rhetorica, etc.), so when they came to be personified in literature and art they were naturally represented as women.

Between 410 and 439, the North African Martianus Capella wrote *De nuptiis Philologiae et Mercurii,* in which Philology, accompanied by her handmaidens the Seven Liberal Arts, marries Mercury, the god of eloquence. This mixed verse-prose text, in which the Liberal Arts are first presented as female personifications, was enormously popular in the schools for the next millennium. Grammar is a Roman physician, succoring the young; Dialectic has a serpent concealed in her sleeve, as a clever counsel must conceal a crucial point; Rhetoric is armored with her decorative skills; Geometry is a traveler, measuring roads and distances; Astronomy is winged and carries an inlaid

metal book; Arithmetic emanates rays; Music has a stringed instrument. Commentaries were written in the 9th century by Dunchad, Johannes Scottus Eriugena, and Remigius of Auxerre, and in the 12th by Bernard Silvestris among others.

In the Carolingian period, two of Charlemagne's court poets, Theodulf of Orléans and the anonymous *Hibernicus exul,* wrote verses on the Liberal Arts, which have sometimes been considered as sources for artistic depictions, possibly in Charlemagne's palace at Aix-la-Chapelle. One of the most widespread brief descriptions of the Liberal Arts occurs in the account of Charlemagne's Spanish campaign ascribed to Archbishop Turpin of Reims (Pseudo-Turpin), a text that first appears in Latin ca. 1138 and was rapidly translated into French and most of the other vernaculars of Europe. In this text, the Liberal Arts were depicted in Charlemagne's palace at Aix-la-Chapelle. The Pseudo-Turpin does not describe the pictorial images but lists the subdivisions of each subject, with some brief interpretation. Grammar and its subdivision orthography teach one to write down words correctly and then to understand what is written, as church lectors must do. Music is the art of David and the angels; the four lines of a staff signify the cardinal virtues, Prudence, Justice, Fortitude, and Temperance, and the eight notes the beatitudes. Dialectic teaches us to discern right from wrong. Rhetoric teaches us to speak suitably, calmly, and beautifully. Geometry measures spaces, such as cities, fields, and army camps. Arithmetic counts things. Astronomy, here conceived as astrology, tells about lucky and unlucky hours for doing things. Though not depicted, necromancy, or magic, is also discussed briefly. At about the same period, Baudri of Bourgueil (1045–1130) described the chamber of Countess Adèle of Blois, where the decoration included statues of Philosophy, Medicine, and the Seven Liberal Arts surrounding the bed.

Hugh of Saint-Victor's *Didascalicon: de studio legendi* (before 1141), a general introduction to the disciplines necessary for the study of Scripture and theology, presents the Liberal Arts as the remedy for the loss of knowledge and goodness in the Fall, while the mechanical arts compensate for the resulting weakness of the human body. The *Didascalicon* was accompanied in many manuscripts by schematized diagrams of the Arts. But Hugh did not restrict learning to the usual seven. Like the Seven Deadly Sins, the Arts acquired hangers-on and subdivisions. The *Didascalicon* also discussed medicine, magic, and practical arts.

The longest and most carefully integrated 12th-century study of the Liberal Arts was the *Heptateuchon* of Thierry of Chartres (1141), designed to organize learning for the ultimate purpose of understanding philosophy. All seven Arts, even arithmetic and geometry, were useful in understanding the nature of God in different ways. In the late 12th century, Godefroi of Saint-Victor composed an 800-line *Fons philosophiae,* an allegorical dream vision inspired by Hugh, in which philosophy and theology are the crowning intellectual experiences of human life; the Liberal Arts are described at the beginning of the quest.

Alain de Lille's *Anticlaudianus* (ca. 1179–83) describes the Liberal Arts constructing the chariot of Nature. Alain also wrote a short *Rhythmus de incarnatione Christi* on the Incarnation, which defines the usual laws of Nature viewed through the Seven Liberal Arts.

Two closely related 13th-century poems describe the *Mariage des sept arts*. One is by Jehan le Teinturier d'Arras and the other is anonymous. In both, the poet lies in bed and dreams that he is in a flowery meadow where he sees seven beautiful maidens. The

eldest, Grammar, is the mother of the others. She announces her intention to marry *un serjant Dieu* called Faith; her daughters follow her example. Rhetoric chooses Alms, a persuasive advocate; Logic chooses Penitence, uns *hardiz avocat;* Arithmetic chooses Confession, who counts sins; Geometry chooses Abstinence, defined as measure; Astronomy chooses Love, who pierces through all the heavens to God; and Music chooses Prayer to praise God. In the anonymous version, Logic, here called Dialectic, chooses Alms, and Rhetoric chooses Obedience. More surprisingly, Astronomy is replaced by Theology. The lady Physic, accompanied in Jehan's version by Theology, appears, and after some discussion the suitors are summoned to celebrate the nuptials.

In the mid-13th century, Gossuin de Metz wrote a popular encyclopedic work in octosyllabic rhyming couplets, *Image du monde,* which was illustrated with forty-six figures referred to in the text. Some manuscripts also illustrate the Liberal Arts; unusually for the tradition, the figures are male. Grammar, as usual, holds a whip, or is accompanied by a male teacher who holds it. Rhetoric is shown as a male cleric arguing, with a ruler or sealed document in his hand. Henri d'Andeli framed his witty analysis of the quarrel between the Arts and the new disciplines of Philosophy and Theology (the ancients and the moderns) at the University of Paris in the verse *Bataille des sept arts* (ca. 1259). Grammar and the traditional literary arts as taught in the schools of Orléans, aided by Donatus, Priscian, Virgil, Ovid, and other authors, do battle with the new university curriculum taught at Paris: Philosophy, Theology, Medicine, and Law, aided by Aristotle and Boethius. The Paris faction is marshaled under the banner of Dialectic, assisted by Rhetoric, elevated (or reduced) to business-letter writing *(ars dictaminis).* The other Arts find practical applications for their traditional skills: Arithmetic counts supplies; Geometry measures encampments and troop movements; Music entertains the army; Astronomy casts the horoscope for the battle. Logic wins, but Henri begs the question by pointing out that, ultimately, no triumph of language is possible without Grammar.

The images in Charlemagne's and Adèle's palaces have not survived, but others have. The best-known images of the Seven Liberal Arts are the figures on the west façade at Chartres (1145–50), where full-length female figures with attributes alternate with male scholars. The traditional figures are unlabeled but are usually assumed to be those used by Thierry of Chartres: Priscian for grammar, Aristotle for dialectic, Cicero for rhetoric, Boethius for Arithmetic, Ptolemy for Astronomy, Euclid for Geometry, and Pythagoras for Music. Personifications of the Liberal Arts also appear on cathedral façades at Auxerre and Sens and on figures around a window in the west end of Laon; the figures in the rose window on the north side have been restored. The gable of the north-transept portal of the cathedral at Clermont-Ferrand shows the Arts as male figures. At Le Puy, there are 15th-century female figures of Grammar, Logic, Rhetoric, and Music in the sacristy. The figures that once stood beneath the Last Judgment at Paris have been destroyed. Those at Loches no longer survive, and the figures in the archivolt of the north portal at Déols were destroyed in 1830.

Manuscript illustrations of the Arts are surprisingly uncommon; few texts of Martianus are illustrated, and no tradition develops. Only a scattering of Martianus manuscripts are illustrated at all, and only a handful of those are French. One 9th-century illustrated French manuscript of Martianus survives (B.N. lat. 7900A) and another from ca. 1100 (Florence, Bibl. Mediceo-Laurenziana MS San Marco 190). Arts also occur in a manuscript from the 11th century, accompanied by verses on the Arts (B.N. lat. 3110);

from the 12th, possibly Arras, Bibliothèque de la Ville 599. None of the philosophical studies of the Arts have illustrations, and the only illustrations to the Arts in Alain de Lille's *Anticlaudianus* occur in the German translation. Occasionally, as in Pierpont Morgan MS 222, Boethius is shown with Philosophy and the Seven Arts. Only the *Image du monde* of Gossuin has a traditional picture cycle, which also appears in the Rothschild Canticles and the *Virgiet de solas*.

In other decorative arts, a late 12th-century Limoges enamel casket survives in the Victoria and Albert Museum in London, showing figures of the Arts, Philosophy, and Nature in roundels. Rhetoric is a male, holding scales, but the other Arts are female.

*The Seven Liberal Arts in Education: Grammar.* The way in which students learned basic Latin changed little throughout the medieval period. The grammars of Donatus (Major and Minor) and Priscian, followed by moral proverbs of the *Distichs* of Cato and the fables of Aesop, Avianus, and Phaedrus remained the core texts; as part of the collection sometimes called the *Auctores octo,* they lasted into Renaissance printed editions, supplemented by two 12th-century texts by French authors: Alain de Lille's *Parabolae* and the collecton of anecdotes called Moretus, usually ascribed to Bernard. More recent texts, working specifically with biblical Latin, included studies of words and constructions. The most widely used were by Bede and Alcuin.

In the late 12th century and early 13th, metrical grammars intended for students having advanced beyond Donatus appeared. The two most popular were the *Graecismus* of Eberhardt of Béthune (1212) and the *Doctrinale de puerorum* of Alexander of Villa Dei (1199). The same period saw the more speculative and philosophical grammars of the Modistae, whose inquiries into the nature of language, the modes of being, understanding, and signifying *(modus essendi, intelligendi, et significandi)* were widely read in the 13th and 14th centuries. Chief among them were Peter Helias, Jean de Garlande, and Peter of Spain. Their theories were revived among linguistic philosophers of the 17th and 18th centuries and again among modern-day French and American theoreticians of language, such as Lacan, Derrida, and Jakobsen.

*Dialectic, or Logic.* Cassiodorus and Martianus Capella both treated dialectic, basing their work on Aristotle, and the Dialectic and Rhetoric that Alcuin composed for Charlemagne and his court had a modest circulation from the 9th through the 11th century, but until the 12th century the core text remained Boethius, *De topicis differentiis.*

*Rhetoric.* Rhetoric changed and developed, especially from the 12th century on. While Cicero and the *Rhetorica ad Herennium* (thought to be by Cicero as well) continued to be read and commented on, new texts also appeared. Important French authors include Thierry of Chartres, Matthieu de Vendôme, and Jean de Garlande. Geoffroi de Vinsauf, despite his name, was English, but his *Poetria nova* (ca. 1200) circulated widely in glossed manuscripts in France as well as the rest of Europe. From the late 12th century, prose writing was taught especially through the art of official and unofficial letter writing, the *ars dictaminis.*

*Arithmetic.* Classical arithmetic included number, ratio, and proportion and continued to be studied from such authors as Boethius and Cassiodorus. The introduction of Arabic numerals, which spread slowly from the 13th century on, made computation easier but did little to change the study of numbers. The innovative work was done in the 13th century, when the *Elementa* of Jordannes described experiments with weights and

measures, and the practical mathematical treatises of Fibonacci (Leonardo of Pisa) culminated in the Fibonacci series for determining the convergence of a series of ratios.

*Geometry.* Geometry was studied in Boethius's translation of Euclid and, from the 12th century, in the *Practica geometriae* of Hugh of Saint-Victor. In the 10th century, Gerbert of Aurillac (the future Pope Sylvester II) incorporated practical surveyors' manuals into the study of geometry. Practical geometry also included treatises on the use of measuring instruments and overlapped with astronomy in the treatise on the use of the astrolabe (known from the 10th century) and the equatory of planets. Jordannes and Fibonacci also wrote geometry texts. The geometry of construction and sculpture found its most interesting expression in the *Sketchbook* of the 13th-century designer Villard de Honnecourt.

*Astronomy.* Astronomy followed the system of planetary relationships worked out in Plato's *Timaeus,* which was known in Latin translation, and the *Almagest* of Ptolemy. Martianus Capella's Book 8 also provided a good discussion of astronomy. Astronomical calculations were necessary for figuring the dates of Easter; Bede's table continued to be used, and others were developed. Gerbert of Aurillac wrote a treatise on the astrolabe. In the 1130s, Bernard Silvestris incorporated astronomical material into his *Cosmographia,* as did Thierry of Chartres in his *Heptateuchon,* and later in the century Alain de Lille discussed astronomy at length in the *Anticlaudianus*. William of Moerbecke translated Aristotle from the Arabic versions, and practical school texts were written in the 13th century by John of Sacrobosco.

*Music.* Boethius's *De institutione musica* remained the chief textbook throughout the Middle Ages. His discussion, like that of Martianus Capella, was based largely on Pythagorean number symbolism and stressed harmonics. Gregorian chant developed fully in the Frankish kingdom in the 8th century and was written in neumes, which appeared at varying heights and in different shapes above the words, but with no staff lines or clear indication of exact pitch or duration. The alphabet letters taken from Paul the Deacon's *Ut queant laxis* hymn to John the Baptist by Guido d'Arezzo in the 11th century gave the tones ut, re, mi, fa, sol, la, from which the modern scale developed. These could be written on a staff to indicate regular intervals and duration, and by the 13th century neumes had become obsolete.

# LIBRARIES

. The history of libraries in the early Middle Ages is bound up with the decline of the urban schools and educated civic elite characteristic of Roman culture and the emergence of the monastic community and the household of the bishop as centers of intellectual activity in Christian culture. The conversion of intellectuals like Jerome, Augustine, Paulinus of Nola (from Bordeaux), and Sulpicius Severus, the biographer of Martin of Tours, to a monastic or clerical life in the 4th and 5th centuries, together with their use of classical literary culture, shorn of reference to Greek and Roman religion, ensured the continuation of a learned book culture. The fact that Christianity was a religion based on a text, with the consequent need to interpret that text, contributed as well to an emphasis on a literate, book culture for the clerical and monastic elite.

The development of libraries required material resources (a supply of prepared animal skins for parchment; ink, pens, and other writing tools; binding supplies), skilled scribes and artisans to use these resources, the ability to bring these resources and skills together at one place, and the opportunity to obtain exemplars from which to copy texts. The first Christian missionaries to northern Europe brought a foreign language and a foreign religion. Soon, however, the clergy of the bishop's church and the monks in new abbeys were in need of books for liturgical services, collections of sermons, writings of the "authorities" of earlier centuries like Augustine or Jerome, and commentaries on Scripture. Young boys being trained for monastic or clerical service needed instruction in grammar, rhetoric, music, and the other Liberal Arts. Classical poets were copied and imitated; the art of letter writing flourished. All required that books be borrowed and copied and that manuscripts be preserved. Some clue to the nature of early-medieval libraries at a monastery or cathedral can be gleaned from the works cited by an author

resident there, but citation from a copy of the full work itself rather than a *florilegium,* or collection of extracts, is not always demonstrable.

With the rise of the Carolingian monarchy and especially during the reign of Charlemagne, new impetus was given to learning, literary culture, books, and libraries. Charlemagne brought a literary-theological scholar from England, Alcuin, to head the palace school. Charlemagne and his successors patronized monasteries and their libraries. The library at the abbey of Saint-Denis, near Paris, had donations from Charles the Bald and perhaps Charlemagne himself, as well as an important Greek manuscript of the works of Pseudo-Dionysius the Areopagite given by Louis the Pious (B.N. gr. 437), who received it from the Byzantine emperor. Charlemagne favored "standardizing" texts of Scripture, the liturgy, and canon law, which meant bringing exemplars from Italy, having them copied, and distributing the copies. The disintegration of the Carolingian empire and Viking and other raids took a toll on books and libraries, but a revival of studies, and libraries, came in the late 10th and 11th centuries, although the rarity of book lists from the period makes reconstruction of holdings difficult. Evidence suggests that the abbeys of Cluny and Saint-Benoît-sur-Loire, among others, had extensive libraries and that they carefully regulated the lending of their books outside the local community. The letters of Peter the Venerable make it clear that Cluny lent books and requested loans from others. Monks also traveled to copy manuscripts: in the late 12th century, the abbot of St. Albans in England wrote to the abbot of Saint-Victor at Paris to ask if a monk might be sent to Saint-Victor to copy some of the works of Hugh of Saint-Victor that were not in the English abbey's collection.

With the growth of cathedral schools in the 11th and 12th centuries, libraries began to develop in these institutions as well. Bishops collected books for the library; scholars and masters bequeathed their personal libraries; patrons donated manuscripts or funds for copying. While archbishop of Reims, Gerbert of Aurillac (the future Pope Sylvester II) asked a friend to copy Caesar's *Bellum Gallicum* for him, and he sought other classical manuscripts at Rome. The library of the cathedral of Chartres was the beneficiary of many bequests of books; ca. 1150, Thierry of Chartres left fifty volumes from his private library, and John of Salisbury, who died as bishop of Chartres in 1180, left his books to the cathedral.

The abbey of Saint-Victor, one of the leading schools of Paris in the 12th century, quickly amassed a significant library through donations and copying. The cathedral of Notre-Dame, Paris, received the library of Peter Lombard, including his set of volumes of the glossed Bible *(Glossa ordinaria)* and Gratian's volume on canon law.

With the growth of the universities and their colleges, new libraries for masters and scholars came into being. The library of the Sorbonne, Paris, originated as the library of a house for poor scholars, established by Robert de Sorbon. Others followed his example of donating books, and by the 13th century the library had over 1,000 volumes. Recent detailed analysis of catalogues of the Sorbonne collection gives a new sense of its development and innovations, such as the division of the library ca. 1292–98 into a large library of chained books, made up of those books most frequently needed by masters and scholars for reference, and a smaller library that continued to lend books to individuals. In 1321, Sorbonne regulations required that the best copies of each work owned by the college be kept in the chained library; the college also required an adequate pledge be deposited when a book was borrowed.

Patronage by kings and nobles had always played an important role in the development of monastic and cathedral libraries, but in the later Middle Ages they were also important as book collectors themselves. Notable French royal and noble bibliophiles were John II the Good, Charles V, John, duke of Berry, and Philip the Bold and Philip the Good, dukes of Burgundy. John II purchased or commissioned manuscript books of religious and secular varieties; he commissioned a translation of the Bible into French and a translation of Livy into French by Pierre Bersuire. His son Charles V took great interest in the royal library and had it installed in a tower of the Louvre. Charles enlarged his collection by purchase, commission, and sometimes confiscation of the library of a defeated enemy. Surviving records give details of purchases of materials for the making of books, binding costs, and payments to illuminators and booksellers. Like his father, Charles had numerous Latin works translated into French for his library, including classical literature, histories, and philosophy.

John, duke of Berry, brother of Charles V, was his equal as a bibliophile and accumulated one of the most important medieval personal libraries. He had an extensive collection of classical literature in Latin and in French translation, but essentially no Greek literature. The duke commissioned numerous works, including some of the most exquisite books of hours of the later Middle Ages. He was also part of a large gift-exchange network among the members of the aristocracy, who presented each other with sumptuous illuminated manuscripts.

Philip the Bold, duke of Burgundy, began one of the great collections of the northern regions, purchasing many devotional texts, histories, and miscellaneous treatises from Parisian booksellers. His descendants continued to enlarge the collection with, among other things, a copy of the works of Christine de Pizan and translations of Boccaccio's De-*cameron*. The library of the dukes reached its zenith under Philip the Good, who enriched the collection through inheritance, exchanges of gifts, commissions, and purchases. The additions ranged over classical literature, vernacular translations, religious texts, and even books on the Near East.

One cannot close a discussion of medieval libraries without noting developments that greatly facilitated the availability and the ready use of books. The *pecia* copying system for "farming out" the copying of manuscripts by parts greatly speeded up the production of manuscripts for the use of scholars at the University of Paris and elsewhere. This innovation had consequences primarily in the realm of availability, supply, and price. However, another innovation, the development of indices, concordances, and other "finding tools" for the Bible and the works of major authors, facilitated the task of locating passages and "authoritative" citations. What had in the past required feats of memory or the possession of *florilegia* with extracts from the church fathers could now be accomplished by consulting a subject index or a concordance keyed by a standard system of reference marks to pages in a text. Comparing the *Quattuor libri sententiarum* of Peter Lombard, the *Sic et non* of Abélard, or the *Glossa ordinaria* to the Bible, with their full quotations of patristic authorities on each question or each passage of Scripture, to the new "finding tools" of the 13th century underscores the difference that the latter made. The Lombard and his generation sought to "digest" the past (represented by quotations from "authoritative texts") in textual form on the page, reconciling citations from texts as they were presented. The university masters of the 13th century worked out a new way to approach texts in their entirety, but with an ability to interrogate them in a

new, more detailed way. It should be noted, also, that in the 14th century the library of the Sorbonne had lists of books in other libraries in Paris, apparently for the use of members of the college who might want to consult books not in the Sorbonne library.

# LIBRI CAROLINI

. The official Carolingian rebuttal to the iconodulist Second Nicene Council (787). Completed in 793 by Theodulf of Orléans, the treatise is divided into four books of chapters attacking *acta* by the eastern council, based on a Latin translation of the council's Greek decrees that had been prepared earlier in Rome. Despite the care taken over the contents and wording of the Carolingian response, evident from the erasures and rewriting still visible on the extant, original manuscript of the *Libri,* the document was never promulgated. The decision not to do so resulted probably from the Carolingians' realization, only after Theodulf had begun his work, that Pope Hadrian I approved of the Second Nicene decrees. The pope's views were made evident in his reply to the Carolingian *Capitulare adversus synodum,* a list of chapter headings to be included in the *Libri Carolini* that was sent to Rome most likely in 792. Once the response to the *Capitulare* had been received, the *Libri* were more or less finished, but under the circumstances Charlemagne did not wish to set himself against Hadrian by presenting him with the treatise.

The Latin rendering of the council's decrees available to Theodulf was flawed at numerous points. Above all, it consistently used the word *adoratio,* which implies the type of worship owed to God alone, to translate references in the Greek to an inferior kind of reverence that the Byzantine iconodules believed was justifiably bestowed on works of art. But although such errors led Theodulf to misunderstand aspects of the eastern position, his teachings in the *Libri Carolini* merit attention in their own right and reveal in their author a carefully developed, highly Augustinian conception of the role

and nature of the Christian artistic image, its relation to the spiritual realm, and indeed of the entire world of matter to the sacred.

# LIÈGE

**.** Liège owes its founding to St. Lambert, bishop of Maastricht, who was martyred (705/06) in an oratory he built here on the banks of the Meuse. His successor, St. Hubert, impressed by miracles, moved the bishopric here from Maastricht ca. 717. Under the powerful Bishop Notger (r. 972–1008), Liège became one of the ecclesiastical principalities of the Holy Roman Empire ca. 980, and the cathedral school that flourished here made Liège the leading intellectual center in the West until it was supplanted by Paris in the 12th century. Liège was granted a communal charter in 1185. In the course of the 13th century, the trade guilds gained considerable power, including the right of self-representation on the city council, which was resented by the nobles and upper classes. In August 1312, the nobles attempted to wrest back power, but their entire armed party was burned in the church of Saint-Martin (the "Male-Saint-Martin"), and in February 1313 the trade guilds and laborers were granted political equality. Privileges were revoked in 1408 after general uprisings in the northern communes, and in 1467–68, during the Burgundian domination of the Low Countries, Charles the Bold ruthlessly sacked and burned the town. After the fall of Burgundian power, Liège was rebuilt under Érard de la Marck (r. 1506–38).

The art of working copper and brass originated in the 11th century at neighboring Huy and led eventually to the establishment in Liège of a flourishing school of liturgical metalwork during the 12th and 13th centuries. The baptismal font by Renier de Huy (fl. 1107–18) in the church of Saint-Barthélémy in Liège is an important example of the earlier, more sober Romanesque style. The font is supported by twelve half-figures of oxen, symbolic of the Apostles, and includes five scenes in high relief, centering on Christ's baptism. Godefroi de Huy employed the more complex *champlevé* technique of enameling his many reliquaries. Nicolas de Verdun, who created the reliquary of Our Lady for the cathedral of Tournai (1205), marks the transition to Gothic style. In the later

Middle Ages, Liège's tradition of fine metalworking led to its becoming an important center for the production of armor.

Because of its importance as an intellectual, artistic, and ecclesiastical center, Liège is rich in medieval churches and monuments. The Gothic cathedral of Saint-Paul, founded in 969, was constructed largely in the 13th century. Its treasury contains the gilded silver reliquary of St. Lambert (1512) and the reliquary of Charles the Bold in gold and enamel, offered in atonement for his attack on the city. Saint-Barthélémy, with its massive twin-towered façade in Rhenish Romanesque style, contains the celebrated baptismal font by Renier de Huy. Sainte-Croix, founded by Bishop Notger in 969, is a fine example of Rhenish Romanesque style (ca. 1175). Saint-Denis, founded by Notger in 987, preserves the oldest Romanesque tower in Belgium but was largely rebuilt in the 15th century.

# LIMBOURG BROTHERS

(fl. late 14th-early 15th c.). Three brothers (Paul, Jean, and Herman), nephews of the painter Jean Malouel, came to Paris from Nijmegen in the Low Countries as youths to serve as apprentices under a goldsmith but had to leave because of the plague. Imprisoned on their way home in 1399, they were ransomed by Philip the Bold, duke of Burgundy, for whom they illuminated a Bible, now lost, between 1400 and 1404. They may have been in the service of John, duke of Berry, by 1405; for him, they produced their most notable works: miniatures in the *Très Belles Heures de Notre Dame* (B.N. n.a. lat. 3093), a miniature of the duke of Berry embarking on a journey in the *Petites Heures* (B.N. lat. 18014), some scenes in *grisaille* for a *Bible historiale* (B.N. fr. 166), the illuminations of the *Belles Heures* (New York, The Cloisters), and, most notably, miniatures in the *Très Riches Heures* (Chantilly, Musée Condé), which remained unfinished in 1416, when all three brothers and their patron appear to have died in an epidemic.

Their miniatures, particularly in the *Très Riches Heures,* are representative of the height of the Interna-

Annunciation, *Les Belles Heures de Jean, Duc de Berry.* The Cloisters Collection, 1954 (54.1.1, fol. 30) *Courtesy of the Metropolitan Museum of Art, New York.*

tional Gothic style in France, combining courtly elegance, sumptuous coloration, and a mixture of fanciful and remarkably naturalistic landscape settings. Although attempts have been made to define the style of each of the brothers, these have not always been successful, and they are generally regarded to have participated collectively on their productions.

# LIMOGES

. Founded by the Gauls as an *oppidum* overlooking the Vienne River, Limoges (Haute-Vienne) became a crossroads of major highways during the Roman period, when it was known as Augustoritum. With the invasions of the 4th century, the population center shifted eastward toward the cathedral of Saint-Étienne, which became the hub of the *cité,* the bishop acting as the primary authority and protector of the town. The abbey of Saint-Martial was founded with the support of the Carolingian monarchy in 848 at the saint's tomb site, and a second urban agglomeration, the château, soon developed under the control of the abbot and the viscount of Limoges, a vassal of the duke of Aquitaine. This division was formalized by the Treaty of Paris of 1259, by which Louis IX ceded the château to England while the episcopal *cité* remained under French control. Throughout the Middle Ages, Limoges was wracked by rivalry, even open warfare, between its constituent halves. The devastating sack of the *cité* by Edward, the Black Prince, in 1370 during the Hundred Years' War was perhaps Limoges's darkest hour.

Saint-Martial and the cathedral were the premier edifices of the city. The abbey was one of the great monastic centers of medieval Europe, known particularly for its contributions to the development of liturgical music. Rebuilt after a fire of 1053 and destroyed in 1794, Saint-Martial adopted the choir plan with an ambulatory and radiating chapels and vaulted superstructure seen in elite Romanesque churches, such as Saint-Sernin, Toulouse, and Santiago de Compostela. The cathedral of Saint-Étienne belongs to the Gothic period: its western tower was erected ca. 1240 above an early 11th-century porch; the choir was begun ca. 1270 by Jean Deschamps, master mason of Clermont cathedral, or a close follower; the transept and eastern bays of the nave were realized in the early 16th century. In contrast to the northern French pattern of the cathedral, the hall-church scheme of Saint-Pierre de Queyroix (late 13th-early 14th c.) and Saint-Michel-des-Lions (14th-15th c.) looks to architectural traditions of southwestern France.

Medieval Limoges is best known for its exquisite enamels. From the 11th century on, products of the city's workshops, ranging from large reliquaries and liturgical utensils to delicately wrought jewelery, were exported throughout Europe.

# LIMOUSIN

. The Limousin, a large, thinly populated county in northern Aquitaine, was of minor importance in the history of medieval France. Bounded by the counties of Berry and La Marche in the north, Poitou and the Angoumois in the west, Auvergne in the east, and Périgord and Quercy in the south, it corresponded approximately to the modern departments of Haute-Vienne, Corrèze, and Creuse. A hilly region of generally poor soils, the Limousin could sustain only a scattered population; its capital, Limoges, was its only town of any size. Inadequate roads and its location left the region relatively isolated from the main currents of medieval French life, and its principal rulers, the viscounts of Limoges, never became politically powerful, being subject to the authority first of the dukes of Aquitaine and then of the kings of France.

The medieval county descended from the tribal territory of the Celtic Lemovices conquered by Caesar in the 1st century B.C., with Limoges as its capital. Christianization began in the 3rd century, though in the 11th the monks of Saint-Martial of Limoges launched a spectacular campaign claiming that their patron saint was the apostle to the Aquitanians, having been sent there by St. Peter himself. In early times, Limoges became an episcopal see in the archdiocese of Bourges. After the era of the Germanic invasions, the Limousin formed part of the first duchy of Aquitaine; then, after the century of Carolingian rule from the late 8th century to the late 9th, the newly created vis-counts of Limoges came under the authority of the counts of Poitou/dukes of Aquitaine until the early 12th century. The Angevins controlled the Limousin in the later 12th century through the marriage of Eleanor, duchess of Aquitaine, with King Henry II of England. In the 13th century, the Capetians conquered it and absorbed it into their royal domain. The Limousin was the site of several famous monastic houses, including Solignac, Beaulieu, Uzerches, Vigeois, Tulle, Grandmont, and Saint-Martial of Limoges. Grandmont, founded by Étienne de Muret in the early 12th century, became the mother house of a new monastic order that spread widely in France and gained the favor of the Angevin kings in particular. Saint-Martial, a Cluniac dependency after the mid-11th century, is well known through the survival of a large part of its magnificent manuscript library of the 10th-12th centuries, the richest of its kind in southwestern France. A number of these manuscripts are of incomparable value for the study of illumination and liturgical drama. Troubadour poetry also flourished in the Limousin, which boasted an unusual number of poets among its native sons, the most famous perhaps being Bernart de Ventadorn. The renown of Limoges enamels, however, overshadowed all other arts during the 12th and 13th centuries, when the industry reached its greatest heights and made the town the most important production center in Europe.

# LINEAGE AND INHERITANCE

. Medieval nobles took much of their identity from their lineage, those from whom they descended and from whom they had inherited their power and property. One's lineage was a selected group out of all the people one might find in one's family tree, for nobles normally identified only with those ancestors from whom they were descended in the male line, unless at some point the inheritance had gone through a woman or unless one of the male ancestors had married a woman from a much more powerful family.

This agnatic tendency is clearest among royal families and those of the upper nobility. In the 11th and 12th centuries, a lineage's self-identification became closely linked with the hereditary castle, and it became common for the oldest son to inherit the castle and most of his parents' property. Daughters were given dowries, but younger sons were, if possible, not given any land that would be permanently alienated from their older brother's inheritance. An emphasis on male inheritance, however, was well established long before primogeniture became normal practice in the 12th century. In the turbulent 9th and 10th centuries, while men trying to establish a strong position took power and authority from wherever they could find it, whether from their wives, their allies, or their lords, they always intended to pass that authority on to their sons.

Women were a vital component of the continuity of an agnatic lineage. They brought land, prestige, and sometimes princely names to the lineage of men lucky enough to be able to marry wives socially above themselves, as most ambitious medieval men tried to do. Choice of a suitable marriage partner was a complicated decision that might cement an alliance, join warring factions, or create a dynasty. Men always considered their wives to some extent as outsiders, but to their sons these same women were an integral part of their lineage.

The Romans had had a testamentary system, which assumed that a man would leave a will. He was legally supposed to leave a certain minimum of property to his relatives but could dispose of the rest as he wished. From the 8th century on, however, written testaments were rare. They began to be common again only in the 13th century. Medieval men and women assumed that their relatives, in particular their children, would inherit all their property. If they wanted to dispose of some of it elsewhere, say as a gift to a church, they would normally make such a gift during their own lifetimes rather than after their deaths via testament. The force of custom, rather than written law, in determining

inheritance meant that in the high Middle Ages there was always ambiguity over the nature of property rights: on the one hand, a man could do with his own property what he liked; on the other, he was expected not to do anything that would disrupt his lineage's inheritance.

# LISIEUX

. The diocese of Lisieux (Calvados) was the last founded in Normandy and the only one without a local bishop-saint. The city was an important Gallo-Roman center and seaport on the Touques River even before the arrival of Christianity. Traces of the 3rd-century city walls were found during the rebuilding after 1944. Of the known medieval abbeys and churches in and around Lisieux, only the former cathedral of Saint-Pierre and the Flamboyant church of Saint-Jacques survive.

Saint-Pierre, which dates from the 12th and 13th centuries, was begun during the episcopacy of Arnulf, who had served on the crusade of 1146. Its nave is one of the first Gothic structures in Normandy, although Gothic elements are confined to features of style, columnar supports, pointed arches, and attempts to accomplish the new spatial organization. The technique and structure are typically Norman and have little to do with Île-de-France experiments in lightening the wall. The nave was followed by the transept and straight bays of the chevet near the end of the 12th century; the elegant turning bays, ambulatory, and side radiating chapels announce the Norman regional style of Gothic. The axial chapel was rebuilt under Bishop Pierre Cauchon, now remembered only as one of the condemning judges of Jeanne d'Arc.

The plan of the church consists of an eight-bay nave, flanked by aisles, a projecting transept with eastern aisles and a handsome lantern tower, and a deep chevet with ambulatory and three separated radiating chapels. The elevation has three stories throughout: arcades and aisles, subdivided arcade units open into the unfloored roof space above the aisle vaults, and single clerestory windows. In spite of details associated with the Gothic style, the elevation is a common Norman one updated from Romanesque precedents. Prior to its systematic scrapping after the Revolution, the richly decorated central portal of the west façade was one of the rare sculpted Early Gothic portals in

Normandy. The remainder of the façade, including the lateral portals, dates from the 13th century; the south tower is a 17th-century recreation of the original design.

The Flamboyant parish church of Saint-Jacques was begun in 1496 by Guillaume de Samaison and completed in the 1550s. Unfortunately, the original interior decoration, consisting of the elegant Flamboyant stained-glass windows and rich painting on the vaults, all disappeared in 1944. After many years of restoration work, only the skeleton of the original church remains.

# *LIT DE JUSTICE*

. Term originally used to describe the paraphernalia of the king's seat in the Parlement de Paris; by the 15th century, it also designated particularly important royal sessions of this court. Its institutional significance was recognized when, in April 1485, Charles VIII declared that in the Parlement de Paris "and nowhere else is held and must be held our *lit de justice*." As early as 1318, the space where the king sat in the Parlement was referred to as a *lit,* and its imposing features are depicted in a copy of a drawing showing the trial of Robert d'Artois in 1332. The elements of the *lit* (draped backdrop, covering, canopy, and pillows) were similar to those of ordinary beds *(lits)* used for sleeping and ceremonial purposes. Although the parliamentary *lit* was not yet connected terminologically with royal dispensation of justice, Charles V was said to be "holding his justice" when he issued an *ordonnance* on majority in the Parlement in 1375. By 1387, official records of the court referred to the *lit de justice,* used in that year at the trial of Charles of Navarre and regularly set up when the king visited the Parlement (even though records of the court's proceedings did not always mention it). In 1396, a clerk of the court, doubtless influenced by current usage, extended the name by metonymy from apparatus to session, writing that the *lit de justice* was held when Charles VI attended the court to solicit advice concerning a pardon.

The *lit de justice* was soon an established institution: in 1404, Christine de Pizan praised Charles V for holding "the *lit de justice,* in cases reserved for him to decide." Official records applied the term to sessions held in 1413 at which reforming measures

pressed by the Cabochiens were registered and then revoked. Contemporaries applied it to the trial of the duke of Alençon at Vendôme in 1458. The sessions termed *lits de justice* were not novel: earlier kings had visited the Parlement to register important *ordonnances* and for important trials. In the new usage, the term designated the most solemn and formal of the king's visits, distinguished from those made to attend pleadings and seek counsel. In the 16th century, it came to be associated particularly with sessions when the king imposed registration of unpopular legislation. Although evidence is sparse for the late 15th and early 16th centuries, the *ordonnance* of 1485 and the declarations of such officials as Claude de Seyssel show that the institution's significance was not forgotten and go far to explain the reappearance of the term to designate solemn royal sessions of the Parlement in 1527 and later years.

# LITURGICAL BOOKS

**.** Liturgical books contain the prescribed texts and rubrics for the conduct of worship, including the celebration of the Mass, the observance of the Divine Office, and the administration of the sacraments. Chief among the numerous medieval types are the Lectionary, a descendant of the *Comes,* which contains excerpts *(pericopes)* from Scripture to be used as readings in the daily liturgy of the Mass; the Breviary, which in the 12th and 13th centuries emerged as a single volume incorporating all of the texts of the Divine Office; and the Sacramentary and Pontifical, discussed below.

The earliest forms of Christian worship used the Bible as the primary text and were organized around freely created formulae. By the 3rd century, however, there is evidence of written formulae for the eucharistic celebration, and following the Edict of Milan (313) a process of increasing systematization of the liturgy begins. The first collections to appear, the *libelli missarum,* were small booklets containing prayers for the Mass. Out of these developed the Sacramentaries, the most important of which were the Leonine, the so-called Gelasian (*Vat. Reg.* 316), and the Gregorian. Reflecting the medieval practice of providing a book for each minister, not each liturgical act, the Sacramentary contained the texts required for the presider only; the directions for the performance of the liturgy were found in separate volumes known as "Ordinals *(ordines Romani).* Ordinals accompany both the Gelasian and Gregorian Sacramentaries. It was only in the 12th and

13th centuries that the *ordines* and the Sacramentary were fully merged into a single volume, the Pontifical.

The history of the Sacramentary from the 7th century to the 11th provides witness to the attempts to base liturgical practice throughout Europe on the Roman model, a step encouraged by the Carolingian kings. Yet the shape that the liturgy assumed was from the beginning influenced by local "uses," or variants of the Roman Rite. For example, the Gregorian Sacramentary, which Pope Hadrian I sent Charlemagne in 785–86, contained services for the papal feasts only; Alcuin took on the task of completing and supplementing it by incorporating local uses. One must speak, therefore, of a Romano-Frankish and even a Romano-Germanic liturgy.

Following the period of Pope Gregory VII, the northern influence on Roman liturgy diminished significantly, though by no means entirely. Gallican and Germanic influences are to be found in the most significant and authoritative texts of the time, including the Pontifical of Guillaume Durand (ca. 1293–95), which became the basis for the printed edition of the Pontifical of 1485. The official books that emerged out of the rigid unification of liturgical practices in the Council of Trent were also direct offspring of these Romano-Frankish and Romano-Germanic sources.

# LITURGICAL COMMENTATORS

. Throughout much of the Latin Middle Ages, exegetes wrote interpretations of the liturgy, most frequently either to instruct the clergy in the meanings of the texts and music of the Mass and Office or to defend particular theological positions, especially regarding the sacraments. One of the only surviving witnesses to the liturgy of the Gallican church is the commentary of the Pseudo-Germanus, now known to have been written in the 7th century, after the time of Isidore of Seville (d. 636), whose writings are one of its sources. A significant body of early Carolingian commentaries was written apparently for didactic purposes, including works by Leidradus of Lyon (d. 813), Angilbert of Saint-Riquier (d. 814), Magnus of Sens (d. 818), Theodulf of Orléans (d. 821), and Jesse of Amiens (d. 836). Contemporaries of Amalarius of Metz (d. ca. 850), the most important liturgical commentator of the early period, and the following generation constitute a second wave of Carolingian commentators: Agobard of Lyon (d. 840), Rabanus Maurus (d. 842), Walafrid Strabo (d. 849), Florus of Lyon (d. 860), and Remigius of Auxerre (d. 908).

Although the 10th century did not produce significant numbers of commentators—the Pseudo-Alcuin's *De divinis officiis* (before 950) is an important exception—the numbers swelled once again in the wake of the Gregorian reform movement of the later 11th century, with Humbert of Silva Candida (d. ca. 1064), Peter Damian (d. 1072), John of

Avranches (d. 1079), and Bernold of Constance (d. 1100); the date of the much copied *Liber quare* remains in doubt, but its earliest source dates from the late 11th century.

Reform, which brought increasing emphasis on the education of priests, helped to inspire the many liturgical commentaries written in France and northern Europe during the 12th century. In addition to the extensive discussions of Rupert of Deutz (d. 1129), *Liber de divinis officiis;* Honorius of Autun (fl. first half of the 12th c.), *Gemma animae, Speculum ecclesiae,* and *Sacramentarium;* Hugh of Saint-Victor (d. 1142), *De sacramentis christianae fidei;* Jean Beleth (d. ca. 1180), *Summa de ecclesiasticis officiis;* the anonymous Pseudo-Hugh of Saint-Victor, *Speculum de mysteriis ecclesiae* (ca. 1160); and Robert Paululus (d. after 1180), *De ceremoniis, sacramentis, officiis et observationibus ecclesiasticis,* are shorter litur-gical commentaries found in the writings of Petrus Pictor (fl. ca. 1100), Sigebert de Gembloux (d. after 1112), Odo of Cambrai (d. 1113), Ivo of Chartres (d. 1116), Pseudo-Alger of Liège *(De sacrificio missae);* Hildebert of Lavardin (d. 1133), Drogo of Laon (d. 1135), Isaac of Stella (d. 1169/ 78), and Stephen, bishop of Autun (d. 1189) *(Libellum de sacramento altaris),* as well as the *Libellus de canone mystici libaminis,* sometimes attributed to Richard the Premonstratensian (of Wedinghausen?).

Liturgical commentators of the 13th century, most of whom either studied or taught in Paris during some period in their lives, wrote the liturgical *summae* that organized earlier material for teaching and studying in the schools: Sicard of Cremona (d. 1215), Pope Innocent III (d. 1216), Praepositinus of Cremona (d. 1210), William of Auxerre (d. 1231), Guy of Orchelles (d. ca. 1230), Alexander of Hales (d. 1245), Hugues de Saint-Cher (d. 1263), Albert the Great (d. 1280), and Gilbert of Tournai (d. 1284). The culmination of these efforts was the great *Rationale divinorum officiorum* (1285–91) by Guillaume Durand, bishop of Mende (d. 1296). Liturgical commentaries written in the 14th and 15th centuries are less studied than those of earlier periods. Although the importance of liturgical commentators is increasingly recognized, many treatises, including the *Rationale* of Durand, do not yet exist in critical editions.

# LITURGICAL DRAMA

. From the beginning, the liturgy of the medieval church had many dramatic characteristics, but ceremonies that might be called dramas in their own right developed only in the 10th century. One of the first steps in this development was the insertion of tropes into the liturgy. These were short chanted texts that sometimes took the form of dialogues. The Easter trope *Quem quaeritis* represented the dialogue between an angel and the three Marys at the tomb of Christ; the earliest surviving text (ca. 923–34) is from the monastery of Saint-Martial at Limoges. Though at first the trope was only sung, by the end of the century we find it embedded in a short play, the *Visitatio sepulchri,* in which the events of Easter morning were acted out. Some versions of the Easter play include a scene in which Peter and John race to the tomb. Others add a scene in which the risen Christ appears to his followers. These plays were usually inserted into the liturgy at the end of Matins, and, in keeping with the character of the service, they were sung in Latin.

A similar trope sung during the Christmas liturgy was at first a simple dialogue between the three shepherds and the midwives at the manger. This trope, too, became part of a short play, the *Officium pastorum,* though it was never as widespread as the Easter play. Associated with the feast of Epiphany, the *Officium stellae* reenacted the visit of the Magi to Bethlehem and seems to have had a much wider extension than the shepherds play. Some versions of the Magi play add the character of Herod, a few making him the center of the action. These were also sung in Latin, usually at the end of Matins.

Though works of this kind continued to be performed in churches and monasteries all over Europe throughout the Middle Ages, some dramas of a liturgical nature were played outside the context of the liturgy. The richest collection of these is the so-called Fleury playbook, a 12th- or 13th-century manuscript from the monastery of Fleury near Orléans, today called Saint-Benoît-sur-Loire. Of the ten plays included, four are highly developed versions of the Christmas and Easter plays, in addition to four St. Nicholas plays, a *Conversion of St. Paul,* and a *Raising of Lazarus,* The sophistication of these works suggests that they were conceived as theater independent of ritual, rather than as embellishments of the liturgy.

# LITURGICAL LANGUAGES

. The most important liturgical language in medieval France was Latin. This was true in the Gallican liturgy of the Merovingian period, and it remained true when the Roman liturgy was imported and adapted by the Carolingians. Ecclesiastical Latin was in many respects different from the language of Cicero and other classical writers, yet the literary culture of ecclesiastical Latin was relatively uniform throughout western Europe, from Ireland, Spain, and northern Africa to Poland and Hungary. Spoken Latin, however, differed in pronunciation and vocabulary under the influence of local ver-nacular languages. By the late Middle Ages, Latin speakers from different parts of Europe did not always find it easy to understand each other. The diversity of pronunciations survived into the early 20th century, when Pope Pius X mandated the use of the Italianate "Roman" pronunciation in the entire Roman Catholic church.

There must have been a time when Christians in the area we now call France worshiped in Greek, the language of the earliest Christian writers of the area, such as Irenaeus, bishop of Lyon (r. ca. 178-ca. 200), who was born and raised in Asia Minor and educated in Rome. But from the time of Hilary, bishop of Poitiers (r. 353-ca. 367), the Gallican church seems to have been uniformly Latin-speaking, and little trace of its earlier Greek period survives in the liturgical sources. The use of the Greek Kyrie eleison in the Mass, Office, and processional litanies was widespread throughout the East and West; the option of using Greek for the readings and Creed of the Easter Vigil is more likely of Roman origin. In the rite for the dedication of churches, the ceremony in which the bishop wrote the Latin and Greek alphabets on the floor is apparently of Gallican origin.

In the Carolingian period, scholarly interest in Greek led to the limited introduction of new Greek elements into the liturgy. Most notable was the *Missa Graeca,* the Ordinary of the Mass sung in Greek. Greek words were also commonly used in the early tropes and sequences, giving an impression of greater erudition than their authors actually possessed.

Few early-medieval Christians knew Hebrew; most of the Hebrew words that survived in the liturgy came by way of Latin translations of the Bible: *Sabaoth* (in the Sanctus; cf. Isaiah 6:3, Romans 9:29), *Adonai* and *Emmanuel* (in the O antiphons of Advent; cf. Exodus 6:3, Isaiah 7:14), *Alleluia* and *Amen* from the Psalms and other liturgical passages (e.g., Deuteronomy 27:15–26). Some of Jesus's own sayings, preserved in the Gospels in the original Aramaic, were also quoted in the liturgy (notably Matthew 27:46 and Mark 15:34 in the Passion readings, Mark 7:34 at baptism). Only in the high Middle Ages did such theologians as Andrew of Saint-Victor (d. 1175) and Nicolas of Lyra (d. 1340) learn enough Hebrew to study the Bible in the original language, though their work had little impact on the liturgy.

French was little used in the medieval liturgy proper, though vernacular glosses on the psalms and other texts doubtless played a role in the way the liturgy was experienced and understood. On the feast of St. Stephen (De-cember 26), the day of the Christmas Octave devoted to the deacons, it was customary to chant the Epistle of the Mass with farses, or tropes, that paraphrased the Latin text in French. Ecclesiastical condemnations of polyphonic music, most notably the *Docta sanctorum patrum* of Pope John XXII in 1322,

may imply that ribald French motets were sometimes sung in liturgical contexts. The most important uses of French, particularly in the later Middle Ages, were in the two areas where laypeople had extensive contact with the liturgy: in preaching, though written sermon texts circulated more often in Latin, and in books of hours and other prayerbooks, in which the public liturgy was adapted for use in private prayer and personal devotion.

# LITURGICAL YEAR

. The Christian liturgical year consists of two interacting cycles. Most feasts of the sanctoral cycle fall upon fixed dates, commemorating either the date of a saint's death (*dies natalis*—the "birthday" into heaven) or the anniversary of some other event, such as the dedication of a church or the reburial (translation) of relics. The more important temporal cycle contains mostly movable feasts, which fall on a different date each year, commemorating events in the life of Jesus or in salvation history. As it was celebrated in the Latin Middle Ages, the temporal cycle can be subdivided into several smaller cycles:

(1) *The Paschal cycle*

a. *Easter, Ascension, Pentecost.* The core of the Paschal cycle is the fifty-day period from Easter Sunday to Pentecost, the only part of the Christian liturgical year that is undeniably descended from a Jewish antecedent—the fifty days from Passover to the Feast of Weeks. Because the Resurrection was also commemorated every Sunday, Christians early felt the need to abandon the linkage between Easter and the Jewish date of Passover, so that the annual feast of the Resurrection could always be celebrated on Sunday. By the 3rd century, those few Christians who still celebrated Easter on the Jewish Passover were ostracized as heretics. Even among the majority, however, there was much disagreement on the question of how to calculate the date of Easter Sunday, and to this day the Eastern Orthodox churches differ with Catholics and Protestants on

this issue. The complex astronomical calculations involved constituted the medieval science of computus, on which many treatises survive.

By the 5th century, the fortieth of the fifty days, always a Thursday, was being specially marked as the day of Jesus's Ascension or return to Heaven (cf. Acts 1:3), though earlier liturgies did not clearly distinguish the Ascension from the Resurrection.

b. *Lent.* Already by the 4th century in most places, Easter was preceded by a forty-day Lent (Quadragesima), during which new converts (catechumens) were prepared for baptism, Christians under penitential discipline (penitents) were expelled from the church, and Christians in good standing practiced fasting and other penances. Because fasting was not permitted on Sundays, however (and in some places also on Saturdays) the actual method of calculating the forty days varied at different times and in different places. The Gallican rite may perhaps have followed the most common custom of beginning Lent on a Monday; by the Carolingian period, the Frankish kingdom followed the Roman calculation of Lent, beginning on Ash Wednesday.

The Lenten period received much of its structure from the ceremonies that were held for adult converts preparing for baptism on Easter. These included (1) lengthy readings of the Scriptures with sermons expounding their meaning *(apertio aurium);* (2) the teaching of the Lord's Prayer, the Creed, and sometimes other texts that would have to be recited from memory prior to baptism *(traditio symboli);* and (3) prayers and exorcisms to free the converts from the power of evil *(scrutinia).* An early practice that was widely used in the West, including at least parts of France, had three such services on the last three Sundays of Lent, marked by Gospel readings with strong baptismal symbolism: the Samaritan woman at the well (John 4:1–42), the blind man healed by washing in a pool (John 9:1–41), the raising of Lazarus (John 11:1–44). But at Rome, these ceremonies with their Gospel readings and parallel communion antiphons were shunted off to weekdays by the 7th century, to make room for a new organizational principle in which the readings and other liturgical texts focused on the patron saints or relics of the stational church—the building (a different one each day) to which the pope and the Roman populace went in procession to celebrate the eucharist. This reorganized Roman Lent was the one adopted in the Frankish kingdom during the Carolingian period. But because each locality had its own church buildings and its own ancient traditions, the choice of stational churches and processional routes to them obviously had to be determined locally.

c. *Holy Week.* The week leading up to Easter, Holy Week, commemorated in detail the events of Jesus's Passion, death, and burial. The classic medieval shape of this week represents a hybrid of differing Gallican and Roman traditions. In the Gallican rite, as at Jerusalem, the Sunday before Easter was Palm Sunday, commemorating the triumphal entry of Jesus into Jerusalem (Matthew 21:1–17). Holy or Maundy Thursday commemorated the Last Supper with the institution of the eucharist and Jesus's washing of his disciples' feet (John 13:1–20), reenacted in the Mandatum or Maundy. Good Friday was the day of Jesus's death, when Gospel accounts of the Passion were read and relics or images of the Cross were venerated. Holy Saturday night was the time of the great vigil service leading up to Easter morning, at which a candle was blessed with a lengthy hymn of praise, twelve readings were heard, the catechumens were finally baptized, and the eucharist was celebrated, all closely following the pattern of the Jerusalem liturgy.

The original Roman tradition, best known from the sermons of Pope Leo the Great (r. 440–61), was more austere. The Sunday before Easter was Passion Sunday; on this day, the Passion readings of the Gospel were begun, and they were continued on Wednesday. Thursday was the day for the reconciliation of penitents who had been expelled from the church at the beginning of Lent. Friday featured the Solemn Intercessions, ten prayers for all members of the church as well as for those outside it. Saturday was the day the catechumens recited the Creed, proving they had memorized it *(redditio symboli).*

With the romanization of the Gallican rite, these two traditions were merged. The Sunday before Easter incorporated both the palm procession and the reading of the first Gospel Passion (Matthew), but the name Passion Sunday was moved back to the Sunday before, creating a season of Passiontide that was more solemn than the earlier part of Lent, marked particularly by the veiling of all religious images until Holy Thursday. The Passions of Mark, Luke, and John were read on Tuesday, Wednesday, and Friday, respectively, while Holy Thursday came to include a Mass for the blessing of chrism to be used at the baptisms on Holy Saturday, the Reconciliation of Penitents, a Mass commemorating the Last Supper, and a foot-washing Maundy. Good Friday combined the Solemn Intercessions with the adoration of the Cross. The Easter vigil, which gradually moved from the evening to the morning of Holy Saturday, absorbed both Roman and non-Roman practices, the latter including the starting of a new fire and an elaborate blessing of a candle. After twelve readings from the Old Testament, the new converts would be baptized, putting on long white robes as they emerged from the water. Before the Gospel, they sang the Alleluia in alternation with the priest, suggesting the new song of Psalms 95 and 97 (English 96 and 98). For the first time, they were permitted to stay past the Offertory and to receive communion.

d. *Easter Week.* In the ancient Roman liturgy, the week following Easter focused on the newly baptized converts, who were called *infantes,* newborns in the faith. They assembled daily for further instruction and did not remove their white robes for eight days until the following Sunday (Low Sunday), when the papal liturgy was celebrated at the church of St. Pancras, a child saint. For this reason, the week after Easter became known as the Easter Octave, and the Sunday after Easter came to be known as *Dominica in albis,* and also *Quasimodo,* from the first word of the introit chant ("Like as newborn babes…")…."). Though baptism of adults became rare in the Middle Ages, the readings, chants, and prayer texts of this week, with their frequent references to the milk and honey of the Promised Land, remained in the medieval liturgy.

e. *Additions to Pentecost.* A vigil similar to the one on Holy Saturday was celebrated the day before Pentecost, providing another opportunity for baptisms and empha-sizing that Easter and Pentecost mark the beginning and end of the fifty-day period. The parallel with Easter was expanded when, by the 7th century, the week following Pentecost came to be celebrated as the Octave of Pentecost, a kind of eight-day extension of the feast. In the 9th century, by a further development, the Sunday after Pentecost began to be celebrated as Trinity Sunday. Later, the Thursday after Trinity Sunday became Corpus Christi, promulgated by Pope Urban IV in 1264; it was further expanded with a procession and its own octave in 1318.

(2) *The Nativity Cycle*

The other half of the temporal cycle revolved around Christmas, the feast of Jesus's birth, December 25. The feast originated in the West, with a variety of factors

contributing to the choice of date, and by the late 4th century it was being adopted in the East as well. The corresponding eastern feast, January 6, came to be reinterpreted in a variety of ways—as the feast of Jesus's baptism (at Constantinople) or of his first miracle at Cana (in Egypt)—but in the West it was linked to the visit of the Magi to the infant Jesus. The originally brief period of preparation focused on the Annunciation (Luke 1:26–38), but by the 6th century the celebration of this event had been moved to March 25 (the presumed date of Jesus's conception, nine months before Christmas). In the West, this permitted the development of a more extended preparatory period, Advent, lasting five or even six weeks in a kind of second Lent. With the romanization of the liturgy in the Carolingian period, however, the number of weeks was stabilized at four.

By ancient custom, the days after Christmas were used to celebrate the feasts of important saints whose dates of death were unknown: the first martyrs St. Stephen (December 26) and the Holy Innocents (December 28), and St. John the Beloved Disciple (December 27). Two other feasts commemorated saints known to have died during this period, Pope Sylvester I (December 31), and later St. Thomas Becket (December 29). The eighth day, January 1, was celebrated as the Octave of Christmas, with something of a Marian emphasis, in Rome; but in the Gallican rite, as in the East, it was the feast of the Circumcision and naming of Jesus on the eighth day after his birth (Luke 2:21). In this case, it was the Gallican theme of Circumcision and naming that predominated in the medieval period. By the high Middle Ages, the Christmas Octave had become a period of much revelry among the younger clergy. Ritualized role-reversals were popular, with each rank taking over the liturgy for one day. Thus the feast of St. Stephen, a deacon, belonged to the deacons, and the feast of St. John to the priests. On Holy Innocents' day, the acolytes elected one of their own as Boy Bishop (Episcopellus), who even had the right to mint special coins for the occasion. The nadir of this period was the Feast of Fools or Feast of the Ass (variously celebrated on January 1, 6, or 13), which belonged to the subdeacons. The solemn procession featuring a donkey was among the less offensive customs of this day, which extended even to drunkenness, the singing of lewd songs, cross-dressing, and the theft of eucharistic vessels. The more responsible members of the clergy, constantly looking for ways to rein in such juvenile antics, found an effective tool in liturgical dramas that reenacted stories from the Bible.

The Nativity cycle ended on February 2, the fortieth day after December 25, which commemorated both the Presentation of the Infant Jesus in the Temple and the Purification of the Virgin Mary after childbirth, events that are recorded together in Luke 2:22–38. The custom of distributing blessed candles for the procession on this day led to the popular name Candlemas or *Chandeleur*.

(3) *The remainder of the temporal cycle*

a. *"Ordinary time."* Early on, a variety of systems were used to designate the Sundays throughout the year (nowadays often called "Ordinary time"), those that fell outside the periods of Advent through Epiphany or Septuagesima through Pentecost. The simplest one prevailed, in which the Sundays were numbered after Epiphany (between two and six, depending on the date of Septuagesima) and after Pentecost (between 24 and 28, depending on the dates of Pentecost and the First Sunday of Advent). In some places, the second period was counted as Sundays after Trinity rather than after Pentecost. The liturgical texts for the last Sunday after Pentecost or Trinity emphasized eschatological

themes, as this was regarded as the end of the liturgical year, with Advent marking the beginning of the next year.

b. *Ember days.* The four seasons of the year were marked by *Quatuor Tempora* (the "four times"), whose Latin name was corrupted in the vernaculars to Quatember or Embertide. The Wednesday, Friday, and Saturday in each of these weeks was a fast day, recalling an early Christian practice of fasting every Wednesday and Friday. At an early date, the Friday fast was extended through Saturday, which was marked with a vigil Mass during the night leading to Sunday morning, reminiscent of the vigil Masses of Easter and Pentecost. The sermons of Pope Leo the Great tell us that each Ember week was announced the preceding Sunday, and that the Saturday Mass was always celebrated at St. Peter's. It soon became common to schedule ordinations during these weeks: because the ordaining bishop and the candidates were expected to fast, it was convenient to hold the ceremony during a period when everyone was fasting anyway. The practice of holding ordinations during a Saturday vigil Mass also paralleled the celebration of baptism during the Easter and Pentecost vigils. For centuries, there was disagreement as to exactly when to celebrate the Ember weeks, but by the Carolingian period three of them had become linked to other periods that were characterized by fasting: the first week of Lent (with readings recalling biblical personages who fasted forty days in the desert), the Octave of Pentecost (marking the resumption of fasting after the rejoicing of the fifty-day Paschal period), and the third week of Advent (picking up Annunciation themes left over from the earliest form of this pre-Christmas period). The other Ember Week, following the seventeenth Sunday after Pentecost, fell in September, picking up themes of harvest, the Old Testament Fast of the Seventh Month (Leviticus 23:26–43), and parallelling the fasts observed in the eastern church around the feast of the Holy Cross (September 14).

c. *Rogation days.* In times of plague, earthquake, famine, and other hardships, it was a common Christian practice to hold a penitential procession, complete with the chanting of litanies, repetitive prayers invoking God and the saints. Such processions were sometimes repeated on the anniversary of the original event and thus became annual observances. Two such periods became established in the medieval calendar. The Greater, or Roman, Rogations, held on April 25 (coincidentally the feast of St. Mark), were first celebrated, according to a questionable report by Gregory of Tours, by Pope Gregory the Great when a plague was devastating Rome. The Lesser, or Gallican, Rogations, attributed by most sources to the 5th-century bishop Avitus of Vienne, was authorized by a Council of Arles in 511 and thereafter spread throughout Europe. It was celebrated on the three weekdays before Ascension Thursday, except at Milan, where it was moved to after the Ascension (inspired by Matthew 9:14–15). The liturgical books for these days preserve a great number of processional antiphons and litanies that may be survivals of Gallican chant.

# LIVERY, BADGES, AND COLORS

. From an early date, the members of royal and noble households were paid a regular allowance, or "livery" (OFr. *livrée*), of food, drink, and clothing. In both France and England, the term "livery" came to be applied especially to the clothing distributed, whether by a lord or by a corporation like a confraternity. By ca. 1300, many confraternities distributed liveries of one or several fixed colors, which constituted a sort of uniform for wear on festive or official occasions, and between 1350 and 1400 this practice spread gradually to royal and noble households in France, England, and adjoining regions. By 1300, many confraternities had also adopted distinctive cognizances, often of a quasiheraldic nature, and some of these, at least, took the form of metallic jewels or brooches similar to those distributed to pilgrims at shrines. Comparable ensigns, called *devises* in French and "badges" in English, were first adopted by kings and princes only in the 1360s and soon distributed by them (and after 1370 by growing numbers of barons) not only to household servants but to various classes of retainer and ally as a mark of political adherence. This development seems to have been inspired largely by the distribution of similar badges to the companions of the monarchical orders of knighthood founded between 1347 and 1360, and, like the knightly badges, those distributed as livery were sometimes accompanied by a short inscription or "motto," also called *devise* in French.

In France, after a period of experimentation under Charles V, a revolutionary system of livery colors and badges was introduced into the royal court of Charles VI in 1362, under which all members of the court were constantly dressed in costumes of particular colors and bearing particular badges and mottoes, chosen by the king and his counselors at some point in every year. Some of these badges, like the white winged stag and the sprig of broom, were used continuously, but many others were employed only for one or

two years. This system was continued on a reduced scale under Charles VII, and although it was finally abandoned by Louis VI in 1461, the use of livery badges and colors continued into the next century among the nobles of the kingdom. After ca. 1370, livery badges and colors were commonly worn by soldiers and displayed on the long tapering flags under which they fought, the standard and guidon, and these gradually displaced the armorial banner as the principal form of military flag.

# LOCHES

. Commanding the Roman roads from Tours, Angers, and Orléans, Loches (Indre-et-Loire) was fortified by the 6th century, according to Gregory of Tours. This

Loches (Indre-et-Loire), central keep.
*Photograph courtesy of William W.Kibler.*

fortress was destroyed by Pepin the Short in 742 but was soon rebuilt. It came through marriage into the possession of Count Foulques I le Roux (ca. 888–941) and was reinforced by Foulques III Nerra (r. 987–1040) in the 11th century. When their descendant Henry II Plantagenêt became king of England in 1152, he added three large semi-circular corner towers to the fortifications. The castle was captured from Richard I the Lionhearted by Philip II Augustus after a year's siege and used as a state prison. In the 15th century, Loches became the official residence of Agnès Sorel (ca. 1422–1450), Charles VII's favorite. The 11th-century tower, a rectangle 82 feet long by 43 feet wide with walls 9 feet thick, is one of the earliest and finest examples of a stone keep; it was here that the chronicler Philippe de Commynes, among many others, was incarcerated. Of the original double curtain walls and broad moat (35–40 feet), only one wall still stands. In the 14th century, the Governor's Tower was built, and the entrance was reinforced with a moat and drawbridge. In the 15th century, the curtain walls were joined to the keep by the Tour Neuve. Like the Tour du Prisonnier at Gisors, it has two stone-vaulted levels and a third, timbered story.

# LODÈVE

**.** The former cathedral of Saint-Fulcran in Lodève (Hérault) was dedicated to a bishop who died in 1066. The present building dates from the 13th and 14th centuries, but the presence of Gallo-Roman materials in the substructure attests to its antiquity and to the probability of a Carolingian origin. With a length of 165 feet, the interior includes a nave of three bays with ribbed vaulting, bordered by aisles that join chapels from the 14th and 15th centuries. The choir, the most remarkable feature of this building, forms a large, impressive space composed of two bays and a polygonal chevet in nine sections with an abundance of tall windows. The western façade features a superb Gothic rose window and two turrets displaying corbeling and machicolations. Some 188 feet tall, the enormous belfry has doubled bays, which in the upper story are adorned with statues of SS.Fulcran, George, Flour, and Amans and the bishop of Lodève.

# LONGPONT

**.** The ruins of the abbey church of Longpont (Aisne) present the most striking example of Cistercian architectural rigor in a High Gothic style. The abbey, founded in 1132 by Gérard and Agnes de Chérisy, was highly favored by the bishops of Soissons and the other nobility of the region. A first provisional chapel was replaced after 1144 by a new church founded by Count Raoul de Vermandois. (The remains of this structure have been detected in a geomagnetic survey, but the site has never been excavated.) Beginning in the last decade of the 12th century (James) or the first decade of the 13th (Bruzelius), the older structure was replaced by the present church, consecrated in the presence of Blanche of Castile and Louis IX in 1227.

The scale of the 13th-century church reflects the renown and wealth of the abbey. Peter the Chanter retired to Longpont from Paris shortly before his death in 1197, and the tomb of the Blessed Jean de Montmirail attracted numerous pilgrims after his death in 1217. The medieval tombs in the abbey church, recorded by Gagnières, presented an important series of ambitious Gothic sculptural compositions.

Although the church has often been described as an example of the decadence of 13th-century Cistercian architecture, it has been demonstrated that the proportional system is identical to that of the buildings associated with Bernard of Clairvaux in the 12th century, such as Fontenay. This indicates that principles of architectural simplicity in the Cistercian order were based on internal proportions as well as on general austerity. The principle of austerity was

# LORDSHIP

. *See* **SEIGNEUR/SEIGNEURIE**

# LORRAINE

. A province on the northeastern frontier of the French kingdom, Lorraine takes its name from the state created in 855 for Lothair, the second son of the emperor of the same name. Lotharingia, as it came to be called by the 10th century, comprised the northern third of the middle kingdom set up in 843 by the Treaty of Verdun, which divided the empire of Charlemagne among his three grandsons. It included the watersheds of the Meuse and the Moselle rivers as well as the bishoprics (reading from north to south) of Cologne, Liège, Cambrai, Verdun, Metz, Toul, Strasbourg, Basel, and Besançon.

This region, the heart of the old Frankish homeland, was a major crossroads for east-west and north-south movement and became a region of conflict between the kingdoms of the West Franks (later France) and the East Franks (later the Holy Roman Empire and Germany). The name Lorraine was, by the 12th century, to be restricted to the southern part of the original realm, centered on the bishoprics of Verdun, Metz, and Toul. At about the same time, the town of Nancy became the chief residence of its rulers and was to remain so until the area was officially joined to France in the 18th century.

Rivalry for this rich and strategic region began with the death of King Lothair, its first ruler, in 869. In 870, the Treaty of Meerssen divided the realm between the dead ruler's uncles, Charles the Bald of France (r. 840–77) and Louis the German (r. 840–76). Both Lorraine and the empire were briefly and ingloriously reunited under Charles the Fat between 884 and 887, after which Lorraine retained its identity, with the whole region falling eventually to the East Frankish ruler Arnulf, who reestablished it as a distinct state for his illegitimate son Zwentibold (r. 895–900).

The 10th century saw Lorraine's magnates grow more independent, and they were able to use their geographical situation to advantage by playing off the eastern and western monarchs against each other. This was made easier as the French Carolingian rulers, losing ground in their own realm to the rival Capetian family, sought to regain authority by taking over Lorraine. Even before Zwentibold's death in 900, Charles the Simple had invaded the kingdom at the invitation of its magnates. Crowned king of Lorraine when its lords refused to accept the election of Conrad I in Germany, he held off the German ruler Henry I until after 922, when the French magnates rose against him and took him prisoner. His rival in France, King Raoul, had to concede Lorraine to Henry with the exception of the bishopric of Besançon, which was definitively separated from Lorraine at this time.

Henry I transformed Lorraine into a duchy, which he granted to Gilbert (Giselbert), count of Hainaut, in 925. But the new duke proved disloyal to Henry's son, the emperor Otto I, and in 939 called in Louis IV of France, only to be killed in battle the same year. Otto was eventually to entrust Lorraine to his own brother Bruno, archbishop of Cologne (r. 954–65). It was Bruno who (ca. 960) divided the duchy into Lower (northern) and Upper (southern) Lorraine. The former was granted to Charles, brother and rival of King Lothair and opponent of Hugh Capet in 987; the latter went to Frederick I, count of Bar.

In spite of many attempts during the 11th century to reunite the two duchies, they remained separate. Lower Lorraine, in the course of the 11th century, was transmogrified into the duchy of Brabant after being ruled by such noteworthy figures as Godefroi II le Barbu (d. 1069) and Godefroi IV de Bouillon (d. 1100), the hero of the First Crusade and the last of his line.

In 1046, Emperor Henry III bestowed Upper Lorraine on Albert (Adalbert) of Alsace, who founded a line that

**DUKES OF LORRAINE**

ruled in uninterrupted male succession until 1431. Upper Lorraine (henceforth referred to simply as Lorraine) during this time increased its contacts with the French kingdom, with Duke Simon I (r. 1115–39) becoming the vassal of the counts of Champagne for at least part of his lands and with Ferri III (r. 1251–1304) promoting a communal movement by issuing charters modeled on that of Beaumont-en-Argonne. The disintegration of imperial power after the death of Emperor Frederick II (1250) made this movement easier.

In the 14th and 15th centuries, the dukes of Lorraine found themselves confronted with the growing power of the Valois dukes of Burgundy, who had united that duchy to the south of Lorraine with a growing agglomeration of power based on Flanders to their north. The alliance of the Burgundian dukes with the English in the last phase of the Hundred Years' War created in Lorraine the sort of tensions that gave rise to the career of Jeanne d'Arc. In 1431, the year of her execution, Duke Charles II (or I if one does not count the 10th-c. Charles) died with no male heir. This marked the beginning of a disputed succession between the houses of Anjou and Vaudémont. Charles the Bold, duke of Burgundy, and the last of the great independent feudal figures in France, also entered the succession dispute. Having failed to get the emperor Frederick III to recreate a "middle kingdom" in his favor, Charles was killed while attacking Nancy in 1477. The

death of the last Angevin claimant, Duke Nicolas, having already taken place in 1473, the house of Vaudémont came to power in the person of Duke René II (r. 1473–1508). He was the ancestor not only of the ducal line until 1738 but also of the house of Guise and of the rulers of Austria after 1780.

# LORRAINE CYCLE

. The Lorraine Cycle of chansons de geste consists of four branches preserved in some fifty manuscripts and fragments. The core of the cycle, *Garin le Lorrain* (16,617 lines), was composed in the late 12th century and provides the lineal and thematic superstructure of subsequent poems. Set in the reign of Pepin the Short, the story relates the bitter rivalry between two feudal houses: the worthy Lotharingians (from Lorraine), led by Garin and his brother, Bégon, engage in perpetual struggle with the treacherous Bordelais (from the region of Bordeaux), led by Fromont de Lens and Bernart de Naisil. Succeeding branches prolong the conflict, extending the feud to the children of Garin and Bégon as well as their children's children. Throughout the remarkably lengthy and brutal war, which appears to have no basis in historical fact, Pepin emerges as a weak and avaricious ruler whose efforts often lead to further strife.

Nineteen surviving manuscripts attest to the success of *Garin le Lorrain* in the Middle Ages. Several manuscripts attribute the poem's composition to a certain Jehan de Flagy, who is now believed to have reworked earlier versions. The first 1,000 lines of *Garin* relate the exploits of Duke Hervis de Metz, father of Garin and Bégon and champion of Charles Martel. The greater portion of the text, however, is devoted to the Lorraine-Bordelais feud, which culminates in the deaths of Garin and Bégon. Generally faithful to the early epic tradition, *Garin le Lorrain* is distinguished by its extraordinary geographical precision.

The first continuation, *Gerbert de Metz* (14,795 lines early 13th c.), is never separated from *Garin* in the nineteen extant manuscripts. Here, a new generation of Lotharingians and Bordelais wages war with increasing ferocity. Garin's son Gerbert initially sets out to avenge his father's death with the help of his cousins Hernaut and Gerin, but the mighty feud degenerates into savagery, as Lotharingians and Bordelais alike engage in acts of barbarity, including mutilation, disinterment, and the murder of children. The poem concludes with the death of the Bordelais Fromondin.

The sequel to *Gerbert* comes down to us in two versions, *Anseïs de Metz* (14,597 lines; 13th-14th c., four manuscripts) and *Yon, ou La vengeance Fromondin* (6,672 lines; 13th c.; one manuscript). *Yon,* the earlier of the two, is noted for its incorporation of events and characters from *Raoul de Cambrai*. Both *Yon* and *Anseïs* relate the acts of retaliation that follow Fromondin's death as well as the murder of Gerbert de Metz. Whereas *Yon* ends with Ger-bert's demise, *Anseïs* narrates at length the wars of vengeance conducted by Gerbert's son and his allies.

One branch continues the cycle in reverse chronological order by recounting the early exploits of the Lotharingians' illustrious ancestor. *Hervis de Metz* (10,521 lines; three manuscripts), composed after *Gerbert* and probably before its sequels, portrays the father of Garin and Bégon as the son of a noblewoman and her bourgeois husband. Before establishing his status as duke of Metz and Lorraine, the young Hervis passes through a series of romance like adventures, including the purchase and wedding of a beautiful slave who is in reality the Tyrian princess Biatris. *Hervis* is the only poem in the cycle that does not pertain directly to the Lotharingian-Bordelais feud.

The enduring success of the Lorraine Cycle is indicated by the survival of three prose redactions, including the early 16th-century reworking by Philippe de Vigneulles. Fragments in Middle Dutch demonstrate that the cycle was also known in the Low Countries.

# LOTHAIR I

(795–855). King of Lotharingia and emperor. The eldest son of Emperor Louis the Pious (778–840) and Irmengarde, Lothair I is remembered chiefly for his role in dismembering the empire constructed by Charlemagne. In 817, Louis the Pious sought to ensure the empire's unity after his death by promulgating the *Ordinatio imperii*. This divided the Carolingian territories into kingdoms for Lothair I and his brothers, Pepin of Aquitaine (800–838) and Louis the German (804–876), while leaving Italy under their father's nephew, Bernard. Lothair, who was made co-emperor, was granted the largest, central realm, including Aix-la-Chapelle and Rome. After his father's death, he was to exercise supremacy over his brothers and Bernard.

Difficulties emerged in 817 with the revolt of Bernard, who died after being blinded as punishment. Italy was transferred to Lothair. In 823, the birth of another son, Charles the Bald, to Louis the Pious (by his second wife, Judith) forced the emperor to modify his plans for the inheritance by allotting to Charles lands earlier assigned to his half-brothers.

Lothair revolted in 830, and again in 833 with the help of his brothers Louis the German and Pepin. While their father emerged victorious and in 834 confined Lothair to Italy, the remaining years of Louis's reign saw continued political unrest.

Upon Louis's death in 840, Lothair I proclaimed again the *Ordinatio imperii* and turned against his surviving brothers, Louis the German and Charles. The power struggle among those rulers led to the Treaty of Verdun (843), dividing the Carolingian territories into separate kingdoms for Louis, Charles, and Lothair. This testified to the end of the ideal of a united empire, though Lothair retained the imperial title.

Lothair was in conflict with one or both brothers most of the rest of his life. Upon his death in 855, his lands were divided among his sons, Louis II (d. 875), Lothair II (d. 869), and Charles of Provence (d. 863). Louis II alone was left the imperial crown, which he had received in 850.

# LOTHAIR I

(941–986). The last significant Carolingian king, Lothair I was the son of Louis IV and Gerberge, sister of the emperor Otto I. He succeeded his father in 954 with the support of Hugues le Grand, who dominated the scene until his death in 956. Hugues's place was taken by Archbishop Bruno of Cologne, Lothair's maternal uncle, who kept a balance between the young king and his first cousin and greatest potential rival, Hugh Capet, the son of Hugues le Grand. From Bruno's death (965) until that of Otto I (973), Lothair kept close ties to the German court.

The rest of his reign was occupied principally in attempts to gain control of Lorraine at the expense of Otto's successors. This policy was opposed by Archbishop Adalbero of Reims and his factotum Gerbert of Aurillac (later Pope Sylvester II), and they looked to Hugh Capet, Lothair's most powerful vassal, for support.

Lothair died in the midst of these tensions on March 2, 986, leaving his throne to his young son, Louis V, whom he had taken care to have crowned in 978 during his own lifetime.

# LOUIS, COUNTS OF FLANDERS

. Louis I de Nevers (r. 1322–46), also known as Louis de Crécy, showed himself a loyal French vassal through a turbulent reign, when the powerful Flemish cities generally opposed him. His clumsiness in limiting the privileges of Bruges at Sluis ignited the rebellion of maritime Flanders in 1323, which most of the county except Ghent joined at some point. Only with the help of King Philip VI was Louis able to end the rebellion in 1328. As tensions heightened between France and England in the mid- 1330s, the English used a wool embargo to try to force a change of position on Louis de Nevers. The cities were caught between their count's French allegiance and their need for the wool. After Jacques van Artevelde took power in Ghent in January 1338, Louis de Nevers fled to the French court. Except for two brief periods, he remained away from Flanders until his death at the Battle of Crécy in 1346.

Louis II de Male (1330–1384) was the son and successor of Louis de Nevers and last count of the house of Dampierre. In 1347, the year after his accession, he married Marguerite, daughter of Jean III, duke of Brabant, and by 1349 had ended the rebellion of Ghent. The disputed succession of his father-in-law in Brabant after 1355 involved Louis in a costly war. His fiscal demands placed serious burdens on the cities. To protest Louis's inability to control piracy, the German Hanseatic League, which controlled much of Flanders's foreign supply, blockaded Flanders, and Louis had to agree to the Germans' demands in 1360.

Forced by the strength of representative institutions in Flanders to consult with the cities before levying taxes, Louis had recourse to ruinous devaluations of the coinage, contributing to rampant inflation. A talented administrator who strengthened and professionalized the central court, he confirmed the privileges of numerous small towns throughout Flanders, particularly their right to make textiles that did not imitate those of the great cities, and gave charters to foreign merchants allowing them to maintain resident colonies at Bruges. He favored Bruges over Ghent, and when he allowed Bruges to dig a canal that would cut into the Lys River south of Ghent, challenging the latter city's monopoly on shipping from France, Ghent began a civil war that would last until 1385. Louis died on January 30, 1384, and was succeeded by his son-in-law, Philip the Bold, duke of Burgundy, who in fact had been directing policy in Flanders from 1382.

# LOUIS, DUKE OF GUYENNE

(1397–1415). The eighth child of Charles VI and Isabeau of Bavaria, Louis became their eldest surviving son in 1401 and was named duke of Guyenne, the title by which he was generally known though he was also dauphin. He was called upon to play a central role in the government at an early age because of his father's mental illness.

In December 1409, the queen had Louis removed from her guardianship. He was empowered to summon the council and preside over it when the king and queen were absent, but these sessions were bound by restrictions regarding the execution of important decisions. John the Fearless, duke of Burgundy, Louis's father-in-law, was named his guardian at this time. All of John's decisions in this capacity were subject to royal approval. Louis quickly developed a spirit of independence. In 1412, he disregarded Burgundy's advice and guided the drafting of a treaty with the duke of Berry. Early in 1413, Louis finally decided to take action against Burgundy, based on incriminating information he had been promised. To prevent this, Burgundy fostered the Cabochien uprising in Paris. When the Cabochiens fell and Burgundy fled, the duke of Guyenne was determined on revenge, but his anger was diverted when the Armagnac party sought to diminish his influence. To alarm them, Louis commanded Burgundy to return to Paris. The queen considered this a dangerous move and had him countermand the order, but John the Fearless continued toward Paris, withdrawing only when the king himself spoke out against him. A royal campaign against Burgundy in 1414 culminated in a long and unsuccessful siege of Arras. Negotiations with John began, but the king's mental health worsened. Louis prolonged the negotiations for a final treaty, which he imposed on Burgundy's ambassadors in February 1415. They ratified it before receiving contrary orders from their master.

During 1414 and 1415, Guyenne greatly increased the number of his household officers in an attempt to form a political party that would be neither Burgundian nor Armagnac. In April 1415, he sent the princes of the blood away from Paris, and the king named him captain general of all the frontiers to prepare against an English invasion. He could not, however, prevent the fall of Harfleur to the English in September. Neither Louis nor the king was present at the defeat of their army at Agincourt in October. Louis himself died in December without leaving children. The kingdom then became, more than ever, a victim of the struggle between the Burgundians and the Armagnacs.

# LOUIS, DUKE OF ORLÉANS

(1372–1407). The second surviving son of Charles V of France and Jeanne de Bourbon, Louis played a role of great importance during the reign of his brother, Charles VI. His assassination in 1407 caused a war that raged through the rest of Charles's reign and had repercussions lasting well beyond.

Louis was called count of Valois as early as 1375–76. In September 1385, he prepared to leave France to marry Marie, the child queen of Hungary, but Sigismund, son of the emperor Charles IV, took her by force for himself. In 1386, Louis received from his brother hereditary title to the duchy of Touraine and the counties of Valois and Beaumont. In the same year, France began negotiations to marry him to Valentina Visconti, daughter of the ruler of Milan, who came to France as his bride in 1389. On June 4, 1392, Charles VI gave Louis the duchy of Orléans in place of Touraine.

Louis's possession of Asti, as part of Valentina's dowry, drew him into Italian politics, but he went to Italy himself only once during his life, in February and March of 1391. A plan in 1393–94 for him to be infeudated by the Avignonese pope Clement VII with the kingdom of Adria, consisting of the papal states in central Italy, came to nothing.

After the onset of Charles VI's schizophrenia, Louis developed a rivalry with their uncle, Philip the Bold, duke of Burgundy, as both struggled to control royal policy. Their conflict escalated to alarming proportions in 1401, and despite an official settlement of their differences by arbiters in January 1402 they continued to outmaneuver one another. In 1403, Louis prepared for a military expedition to Lombardy to resolve a crisis in Milan and perhaps to pave the way for a return to Rome of the Avignonese pope, Benedict XIII, who was to bestow upon him in return, so it was said, the imperial crown. He abandoned the project, however, early in 1404 while with the pope in southern France. After the death of Philip the Bold (April 27, 1404), Louis was more successful in his quest for riches and power. For the fiscal year of October 1404 to October 1405, he received over 400,000 francs from the king. The proclamation of a new tax in 1405 turned the populace against him, and John the Fearless, Philip's son, became his new rival. Louis was able to keep the royal council full of his partisans, and he worked against John's interests on so many fronts that John finally had him assassinated on November 23, 1407. Louis was considered charming, cultivated, and an eloquent orator, but his cleverness was tainted by a selfish unscrupulousness.

# LOUIS I THE PIOUS

(778–840). King of the Franks and emperor. Louis the Pious, Charlemagne's third son by his second wife, Hildegarde, was named king of Aquitaine at the age of three. In 806, the *Divisio regnorum* arranged for the succession by dividing the empire among Charlemagne's legitimate sons, Charles the Younger (d. 811), Pepin (d. 810), and Louis. No plan was then announced concerning the imperial title bestowed on Charlemagne in 800, but with the deaths of his brothers, Louis became co-emperor in September 813. He inherited the entire empire upon Charlemagne's death in January 814.

In ca. 794, Louis married Irmengarde, who bore him Lothair I (795–855), Pepin of Aquitaine (800–838), and Louis the German (804–876). She died in 818, a year after Louis the Pious had proclaimed the terms of his sons' inheritance in the *Ordinatio imperii*. An effort to ensure the empire's unity after his death, the document provided that while each son would exercise royal authority over a portion of the Carolingian territories Lothair I would receive the most important lands, including Aix-la-Chapelle and Rome, and he was immediately named co-emperor. After his father's death, he would exercise supremacy over his brothers. Bernard, a nephew of Louis the Pious, would retain the throne of Italy given him by Charlemagne, but he, too, would be subject to Lothair.

Tensions among aristocratic groups aroused by Louis's program of ecclesiastical reforms and disaffection with his plans for the succession underlay the political strife that marked the second half of his reign. The first threat to the emperor's authority came in 817 with a revolt by Bernard, who died after being blinded as punishment. Lothair I was then given Italy to rule, and Louis did penance for Bernard's death at Attigny in 822. More significant for the succession, in 823 Louis's second wife, Judith, gave birth to Charles the Bald (d. 877). In provision for Charles's inheritance, lands previously assigned to his three half-brothers were designated for him to rule. This revision to the *Ordinatio imperii,* in addition to tensions among court factions, precipitated rebellions in the early 830s by Lothair I, his supporters, and his brothers. In 833, Louis the Pious was forced from the throne. Although he regained power in 834 and confined his eldest son to Italy, until Louis's death in 840 the empire remained in turmoil. Its unity survived only until the Treaty of Verdun (843) divided it into separate kingdoms for Lothair I, Louis the German, and Charles the Bald.

Louis the Pious deserves a better reputation than he has generally enjoyed, especially for his efforts to maintain the empire's unity. More clearly than Charlemagne, who initially made no provisions for the imperial succession, Louis held a vision of the office of emperor as a permanent institution in the West. Moreover, it was during his reign that there occurred the true flowering of the Carolingian renaissance begun by Charlemagne.

Under Louis, monastic reform was extended throughout the realm, artistic production surged in volume and quality, and religious thought reached a new, high level in writings by such churchmen as Rabanus Maurus and Amalarius of Metz.

# LOUIS VI THE FAT

(1081–1137). Son of Philip I and Bertha of Holland and king of France from 1108 to 1137, Louis seems known as much for his corpulence as for his limited, though successful, gain of control over his patrimony, the Île-de-France. Inheriting chaotic political and feudal challenges to royal power, Louis overcame the robber barons and the feudatories' conservative defiance of his nascent challenge to their localized authority. After the death of his first wife, Lucienne de Rochefort, Louis wed Adelaide of Savoy in 1115, who bore him his heir, Louis VII, in 1120.

Louis realized the need to establish his own position in the Île before he could extend royal claims beyond what is traditionally, if erroneously, known as the French royal domain. Toward the close of his reign, he intervened with unprecedented success in the south of France. The marriage of his son and heir, the future Louis VII, to Eleanor, daughter of the duke of Aquitaine, was a sign less of the duke's status than of the rising position of the king. Louis's interference in Flanders and Normandy was less blessed.

If Louis's success in extending his power outside the Île-de-France was ambiguous, his reform of the royal administration was not. The struggle to remove major administrative offices from the hands of their hereditary holders was difficult but eventually triumphant. Louis replaced the old administrative hierarchy with new men drawn from the lower nobility and clergy from the domain. Notable among these new administrators was Abbot Suger of Saint-Denis (1081–1151), the first in a line of great statesmen and royal advisers drawn from the ranks of the clergy, a line that ended with Richelieu, Mazarin, and Fleury. Louis was also the first great royal patron of communes, most of them in and surrounding the royal patrimony.

Louis VI, then, consolidated his power within his ancestral homeland and made its administration more amenable to the royal will, thus laying the foundation upon which his successors would build the French monarchy as a dominant power in western European medieval history.

# LOUIS VII

(1120–1180). King of France. Crowned in 1137, Louis, the son of Louis VI, continued his father's expansion of royal power, extending his authority beyond the Île-de-France. He cleverly utilized marriage alliances and relations with the French church and with the papacy as instruments of royal policy, notably during the second half of his reign.

Louis's reign to ca. 1152 was not auspicious, characterized by blundering relations with important barons and with the church, a failed marriage to Eleanor of Aquitaine, and an inept crusade. Pacaut, the most perceptive historian of his reign, argues that its unhappy first fifteen years were due primarily to the king's youth and lack of training for the kingship, to which he became heir only upon the death of his older brother. Certainly, these years were marked by impetuosity and bad judgment; but Louis grew to his responsibilities and passed the monarchy to his son, Philip II Augustus, with enhanced prestige and power.

That the monarchy survived the first half of the reign indicates some political ability on the part of the king and his advisers; his domain was surrounded by powerful and dangerous neighbors, the most threatening of which was Normandy (by 1154 united with Anjou), the kingdom of England, and the duchy of Aquitaine. Henry II of England, his continental possessions vastly augmented by his marriage to Eleanor of Aquitaine, Louis's first wife, posed a threat, but he was distracted by internal problems and perhaps uninterested in pushing hostilities with Louis, his feudal overlord, to the point of serious conflict.

Pacaut explained that Louis depended upon cooperation with the church, with the nobility, and with the territorial and administrative base of the Île-de-France to maintain, and eventually to enhance, the royal authority. There were faltering beginnings toward converting the rights of the monarch as feudal overlord to the rights of the king as sovereign, from the powers of the king as a private source of authority to the king as a public authority figure. At the close of his reign, the court was dominated by the relatives

of his third wife, Adèle (his second wife, Constance of Castile, had died in childbirth), the counts of Champagne and their entourage. His son by Adèle, Philip II Augustus, associated in the rule of France in 1179, here began his political experience. The kingdesignate was now introduced to his need to grow in cunning and in manipulation of family relationships in order to enhance the royal authority. Louis VII was not a great king, but he was a successful one.

# LOUIS VIII

(1187–1226). King of France from 1223 until 1226, son of Philip II Augustus, and father of Louis IX. Though a sickly child, nearly dying in 1191, Louis became an ambitious and able soldier, who energetically assisted his father in military activities. (For his prowess, Louis was described by Nicolas de Brai as Louis the Lion.) In 1212, he seized the towns of Aire and Saint-Omer from the rebellious count of Flanders, Ferrand, and in 1215–16 he gathered a large army for an expedition against England.

In 1224, after becoming king, he invaded and took Poitou from the English, and the following year he tried unsuccessfully to conquer Gascony. Perhaps his greatest military victory was against the Albigensian heretics in Languedoc. Beginning in 1218–19, when still prince, Louis continued to fight against the Albigensians as king; in 1226, with papal and comital support, he attacked Languedoc, conquered Avignon, and forced the rest of the south to submit to his rule. He died soon after, on November 8, 1226, leaving the throne to the child Louis IX under the regency of his mother, Blanche of Castile.

# LOUIS IX

(1214–1270). King of France and saint. The son of Louis VIII, Louis IX came to the throne as a child in 1226. He spent his early years as king under the tutelage of his mother, Blanche of Castile. Many northern barons resented the assignment of the regency to a woman, let alone a foreigner. Others resented the growing authoritarianism of the crown during the preceding fifty years, the reigns of Philip II Augustus and Louis VIII. Many baronial families in the west nursed grievances from the period of the conquest of the Plantagenêt fiefs in the early years of the century. And in the south, local notables remained unreconciled to the French regime established in the wake of the Albigensian Crusade. These resentments periodically broke into rebellion: the late 1220s and early 1230s saw the crown confronting shifting alliances of northern barons (including the count of Brittany, Pierre Mauclerc) in defense of aristocratic interests. In the opening years of the 1240s, nobles and townsmen in the southwest and Languedoc banded together with the support of the Plantagenêt king of England to undo the conquests of the previous half-century. The crown defeated all these movements. The credit for the early successes goes largely to Blanche of Castile, but gradually in the 1230s her son became the effective ruler of the kingdom.

Married in 1234 to Marguerite of Provence, who came to dislike his mother, Louis remained devoted to Blanche and responsive to her political advice. Only in one matter is there evidence of political disagreement between mother and son: Louis's decision in late 1244 to take the crusader's vow. Despite Blanche's objections, Louis fulfilled the vow after almost four years of preparation that included commissioning *enquêteurs,* or special investigators, to identify the perpetrators of injustices in his government. In addition to the goodwill that these investigations produced, the information allowed Louis to improve the machinery of government by retiring or reassigning certain of his administrators. At the same time, he worked hard to encourage national and international support for his venture and to build a port, Aigues-Mortes, in the south of France for the embarkation of his army, estimated at 15,000–25,000 men.

Louis departed for the Seventh Crusade in 1248, leaving his mother as regent; his wife accompanied him on the expedition. After wintering in Cyprus, he began the invasion of Egypt in May 1249. The crusaders captured the coastal city of Damietta, and then, after a considerable respite, they began the invasion of the Egyptian interior late in the year, continuing into the early months of 1250. Daily running up against fiercer opposition, they were decisively defeated in April at Al-Mansura; Louis and the remnants of his army were captured. After difficult negotiations, the king and his men were ransomed, and many, including the king's two surviving brothers, Alphonse of Poitiers and Charles of Anjou, took ship for Europe. The king and a small group of crusaders, spent the next several years in the Christian states of the Holy Land helping to rebuild fortifications and to formulate effective strategies against the enemy.

The queen-mother died in November 1252. Although he learned of her death in the spring of 1253, it was not until a year later that Louis was persuaded by the steady stream of information that reached him from France that conditions there necessitated his return. Landing at Hyères, not far from Marseille, in July 1254, he began immediately to transform the governance of his realm. Convinced that his failure on crusade was the

result of his own sinfulness, and translating this conviction into a decision to live up to his notion of the ideal Christian ruler, he set about restraining the excesses of the Inquisition, reintroducing the *enquêteurs,* reforming the administration of the city of Paris, and, most far-reaching, undertaking a thorough overhaul of royal administrators in the provinces. Louis ceaselessly traversed the realm to hear petitions and do justice personally. Traditional institutions of rule, like Parlement, were improved in their organization and were leavened by his commitment to equity. He worked hard, too, to execute a severely restrictive policy toward the Jews that was in part intended to encourage them to convert.

In the late 1260s, Louis committed himself to another crusade. After considerable preparations, he departed in 1270. His wife remained in France. Following a brief stop-over in Sardinia, the army, perhaps 5,000–10,000 strong, launched its attack on Tunis. Before the city could be taken—and in the event it never was—the king died (August 25, 1270). He was succeeded by his son, Philip III. As his bones were being transported to their final rest at Saint-Denis, miracles began to be reported. A few years later, the canonization process began in earnest. In 1297, the former king was raised to the catalogue of saints as St. Louis Confessor.

# LOUIS X

(1289–1316). King of France. Later known as *le Hutin,* the Quarrelsome, Louis was the eldest son of Philip IV the Fair and Jeanne of Champagne and Navarre. Affianced to Jeanne of Burgundy and Artois before 1300, Louis was married to Marguerite of Burgundy, a granddaughter of Louis IX, on September 23, 1305. At his mother's death in 1305, he became count of Champagne and king of Navarre. During Philip's reign, Louis was dominated by his father, and his stature was compromised when the adultery scandal of 1314, shortly before he ascended the throne, resulted in his wife's imprisonment. Louis's desire to secure annulment of his marriage and replace Marguerite with a suitable wife led him to press for the election of a pope to nullify his marriage. Simultaneously, he began wooing Clemence of Hungary. Marguerite's death in April 1315 was suspiciously fortuitous, and Louis married Clemence on July 31, 1315. Perhaps because of his marital problems, Louis did not begin using the great seal of France until April 1315, and he was not crowned until August 3, four days after his marriage to Clemence.

Like his personal problems, the political difficulties that Louis inherited from his father dominated his brief reign. Confronted by alliances of subjects discontented by the

monarchy's financial policies and infringement of traditional rights, Louis issued numerous charters and dispatched reforming officials in an attempt to satisfy the allies' demands. Hostility toward his father's unpopular ministers, especially Enguerran de Marigny, was galvanized by Louis's uncle Charles of Valois and led to Marigny's execution in April 1315. Conflict with Flanders continued; the French army of 1315 came to be known as "the muddy host" because of its ignominious retreat in the face of ruinous storms.

When Louis died on June 5, 1316, Clemence was pregnant. But before dying the king declared the legitimacy of the daughter, Jeanne, whom Marguerite had borne him in 1312. The succession thus remained unclear, since there was no legal bar to Jeanne's accession. Clemence's son, John I, lived for less than a week, and the throne passed to Louis's brother Philip.

# LOUIS XI

(1423–1483). The eldest son of Charles VII, Louis XI was raised in isolation from his father, and their subsequent animosity made Louis XI a political force long before he ascended the throne. Charged with the defense of Languedoc in 1439, he fell under the influence of rebellious nobles and joined the Praguerie. He was soon forgiven, but the continuing animosity between Louis and Charles seems to have increased after the death of Louis's wife, Margaret of Scotland, in 1445 and Louis retired to his apanage of the Dauphiné in 1447. There he began an apprenticeship for the throne by reforming provincial government. A disobedient remarriage to Charlotte of Savoy completed the family breach, and Louis fled the realm in 1456.

Louis began his reign in 1461 by ambitiously seeking to expand his authority both abroad, through the invasion of Catalonia, and at home, with his vengeful dismissal of his father's advisers and foolish rejection of previous allies. He barely survived the subsequent *Guerre du Bien Publique* and the indecisive Battle of Montlhéry in July 1465, but the rest of the reign was marked by a remarkable ability to learn from his mistakes. Henceforth, Louis handled his domestic adversaries by isolating and destroying each in turn and sought international success through diplomacy rather than war.

By judicious gifts and appointments, Louis reconciled himself to his father's advisers, Dunois and Chabannes and such dangerous peers as the duke of Bourbon. He isolated his brother Charles of France by the award of the apanage of Guyenne. Louis supported first the Lancastrians and then the Yorkists to prevent English intervention in France, subsidized Swiss resistance to Burgundy, and supported Angevin ventures in Italy to

secure the southwest. The birth of a son in 1470 (the future Charles VIII), the death of his brother Charles in 1472, the destruction of remaining Armagnac strongholds in 1473, the execution of the count of Saint-Pol in 1475—all these combined to secure Louis's domestic authority.

Thereafter, Louis concentrated on Charles the Bold, duke of Burgundy, who, at Péronne in 1468, had humiliated him by extorting a guarantee of the independence of Flanders. Charles's death in 1477 was Louis's greatest stroke of good fortune. The remaining years of the reign were devoted to the acquisition of Burgundian territories. In these same years, Louis's annexation of Anjou and inheritance of Maine and Provence virtually completed the territorial unification of modern France before his death.

Louis's successes came as a fulfillment of his predecessors' policies. Ugly and socially isolated from his peers, Louis's rejection of medieval courtly behavior, dress, and ritual later endeared him to 19th-century romantics but in his own day alienated many whose help he needed. Louis was not some sort of "New Monarch" but rather an idiosyncratic medieval king whose breaches with convention often proved self-defeating and whose greatest successes came through the traditional means of diplomacy and warfare made possible by the military and fiscal reforms of his less colorful father.

# LOUVIERS

. Called Loveris in the 9th century, Louviers (Eure) became the seat of the dukes of Normandy; in 1197, it was ceded to the archbishopric of Rouen. The church of Notre-Dame, begun in the late 12th or early 13th century, was extensively remodeled in the 15th. The choir with its flat east end, the nave, and side aisles with triforium and clerestory reflect the original design. A second pair of aisles was added in the 15th century, along with the Flamboyant south porch and north tower (unfinished). The exquisite lacework carving of the porch, with its pinnacles and pendant keys, is more reminiscent of goldsmith's work than of

Louviers (Eure), Notre-Dame, south porch. *Photograph: Clarence Ward Collection. Courtesy of Oberlin College.*

sculpture. The late-medieval stone statuary of the interior is also remarkable.

# LUÇON

. Luçon (Vendée) first appears in the documentary record in the late 830s as a dependency of the abbey of Saint-Philibert of Noirmoutier. By the 11th century, the fortified village included a parish church of Saint-Philibert and, more importantly, a Benedictine abbey of Notre-Dame. Burned by the count of Poitiers in 1068, the abbey was restored between 1091 and 1121. The Romanesque fabric survives in the north transept, but the main body of the church was raised in campaigns of the 13th (transept, beginning of choir), 14th (nave), and late 14th-early 15th (remainder of choir, sacristy) centuries. With the elevation of Luçon to episcopal rank in 1317, Notre-Dame was designated as the cathedral of the see. While the flat east wall of its choir follows the

cathedral of Poitiers, the three-story elevation, which includes a dark triforium and capacious tracery windows, adopts the Rayonnant style of architecture of northern France, perhaps in emulation of other southern cathedrals, such as Bayonne or Bordeaux.

# LUITGARD OF AYWIÈRES

(Luitgard of Tongres; 1182–1246). Born into a wealthy family, Luitgard entered the monastery of Sainte-Catherine at Saint-Trond at the age of twelve. Twelve years later, she was elected prioress but chose instead to leave for the Cistercian monastery at Aywières. After a long life of exemplary holiness, Luitgard died among her fellow sisters on July 16, 1246. She eventually became the patron saint of Flanders. Several *vitae* of Luitgard exist, the most notable being composed by Thomas de Cantimpré three years after her death. Luitgard's life was filled with an extravagant array of visions and miracles. The visions include highly abstract apparitions of light, concrete personal admonitions by Christ and by angelic messengers, political and ecclesiastical messages (e.g., asking her to fast for seven years because of the Albigensians), and contacts with souls in Purgatory. Among her miracles are such physical phenomena as levitation, profuse sweating and crying, ecstasies, healing with spittle and the laying on of hands, prophecy, and raptures.

Illiterate and unable to speak French, Luitgard nonetheless contributed powerful images to the growing movement of christocentric mysticism: Christ urges her repeatedly to drink directly from his bleeding wound and receives her heart in his own. Luitgard's *vita* offers remarkable insight into the flourishing communities of spiritual women and their mutual influence on each other. Marie d'Oignies, for example, is present at her deathbed and predicts Luitgard's miraculous activities from beyond the grave. A Cistercian nun, Sybille de Gages, composes a poem in her honor; Luitgard's spirit frequently appears to other nuns in visions.

# LUPUS OF FERRIÈRES

(Servatus Lupus; ca. 805–862). A leading literary figure of the Carolingian renaissance. Born into a family with strong ecclesiastical ties, Lupus entered the Benedictine monastery of Ferrières in the 820s and was appointed abbot in 841 by Charles the Bald. He studied with Rabanus Maurus at Fulda (ca. 828–36) and soon showed his ability as an author of Latin prose. He was especially known for his correspondence with many important political and ecclesiastical figures, among them Charles the Bald, Einhard, Hincmar of Reims, and Paschasius Radbertus. His letters, collected by his most famous pupil, Heiric of Auxerre, were widely read and copied. The school under Lupus at Ferrières was a center of study and copying of Latin texts, including works of classical antiquity, especially Cicero. Lupus served as an adviser to Charles the Bald, attended over a dozen ecclesiastical synods, and wrote several saints' lives and a treatise in support of the predestinarian views of Gottschalk of Orbais.

# LUSIGNAN

. The castle of Lusignan, near Poitiers, which was fortified ca. 950, gave its name to a family whose members were to become kings of Jerusalem, Cyprus, and Lesser Armenia (Cilicia), as well as counts of La Marche and Angoulême. Situated where Poitou, Saintonge, Angoumois, and the Limousin meet, the Lusignan holdings, although nominally subject to the counts of Poitiers (later dukes of Aquitaine), offered the family opportunities to rise to political prominence during the 11th and 12th centuries.

Three sons of Hugues VIII achieved particular importance. In 1180, Gui de Lusignan married the heiress of the the kingdom of Jerusalem, and he ruled that crusader state from 1185 to 1192 despite losing the capital after the disastrous Battle of Hattim in 1187. Richard the Lionhearted, during the Third Crusade, compensated Gui for the loss of Jerusalem by giving him the newly conquered island of Cyprus, to which his brother Amaury succeeded in 1194. The Lusignans retained Cyprus, but the title of king of Jerusalem passed to the Hohenstaufen family between 1205 and 1268 following the marriage of the heiress, Isabelle (Gui's stepdaughter), to the emperor Frederick II.

In France, the third brother, Hugues IX, had become count of La Marche and sought to join it to Angoulême by betrothing his son and heir, Hugues X, to Isabelle, heiress of Angoulême. This plan was disrupted when Hugues's lord, John, king of England and duke of Aquitaine, married Isabelle himself in 1200, triggering the celebrated conflict that culminated in the seizure of John's French fiefs by Philip II Augustus. After John's death in 1216, Hugues finally did marry Isabelle. Their sons, the unpopular half-brothers of Henry III of England, were resented by the English barons, while the refusal of the Lusignans to render homage to Louis IX's brother Alphonse of Poitiers was a source of Anglo-French conflict in Aquitaine until the defeat of Henry III at Taillebourg in 1242. The turbulent Lusignan family finally sold their rights to La Marche and Angoulême to Philip IV in 1303.

Their cousins ruled Cyprus until 1474 and Lesser Armenia until 1375, while regaining the virtually empty title of king of Jerusalem in 1268. Although Acre was lost in 1291 and Armenia conquered by the Mamluks of Egypt in 1375, the Lusignans in Cyprus maintained these titles in the vain hope that the crusading movement would be revived.

# LUXEMBOURG

. The territory of Luxembourg, part of the duchy of Lorraine, became a distinct political entity in 963 under Sigefroid d'Ardenne. It remained in the imperial orbit until the end of the 12th century, almost completely disintegrating during the long rule of Count Henri IV l'Aveugle (r. 1136–96). His daughter, Ermesinde (r. 1196–1247), whose first husband was the count of Bar, was mainly French in culture and outlook. She and her son Henri V (r. 1247–81) did much to restore the integrity of the county of Luxembourg. Henri's two sons, Henri VI and Waleran, lord of Ligny, died at the Battle of Worringen in 1288, contesting Limbourg against the duke of Brabant. Waleran's descendants, the French branch of the family, were counts of Ligny and Saint-Pol. One of them, Waleran III, served as both Constable and Butler of France in the early 15th century under Charles VI. Another, Louis de Luxembourg, was executed for treason by Louis XI in 1475 after serving as constable.

The older branch of the Luxembourgs had a more glorious future. Of Henri VI's sons, Henri VII (d. 1313) was elected emperor in 1308 and Baudouin became archbishop of Trier. In 1309, Henri VII turned Luxembourg over to his son, Jean l'Aveugle (d. 1346),

and the next year made him king of Bohemia. Among Jean's children were the emperor Charles IV (r. 1347–78) and a daughter, Bonne, who married the future John II of France. Although she died before she could reign as queen, Bonne was the mother not only of Charles V but also of Louis I of Anjou, John of Berry, and Philip the Bold, duke of Burgundy and founder of the Burgundian state in the Low Countries.

Wenceslas I (1334–1383), the son of Jean l'Aveugle by his second wife, received Luxembourg from Charles IV in 1353. The emperor raised it to the rank of a duchy in 1354, and Jeanne, wife of Wenceslas, inherited Brabant the next year. Subsequently, he ruled as duke of Brabant and Luxembourg until his death without children. Luxembourg then passed successively to his nephews the emperors Wenceslas II and Sigismund, sons of Charles IV. They rarely appeared in Luxembourg and were chronically short of money. As early as 1388, Wenceslas II pawned the duchy to his nephew Jost of Moravia, who turned it over for awhile (1402–07) to Duke Louis of Orléans. A niece of the emperors, Elizabeth of Goerlitz (d. 1451), held the duchy after 1411 amid growing disorder and the counterclaims of her cousin Elizabeth, Sigismund's daughter. She finally sold her rights to the duke of Burgundy, Philip the Good, who took over Luxembourg in 1443, incorporating it into the Burgundian Netherlands.

# LYON

. Situated at the confluence of the Saône and Rhône, Lugdunum was the capital of Celtic Gaul. Julius Caesar's base camp for the conquest, it was made capital of Roman Gaul in 27 B.C. The five great Roman roads across Gaul—toward Aquitaine, the Atlantic, Rome, Arles, and the Rhine—originated from Lugdunum, and the city held the monopoly for the wine trade of the whole province. A powerful mercantile city, Lyon was also one of the earliest Christian centers in Gaul and the site of the martyrdom of many early Christians in A.D. 177. After the Carolingian era, and for most of the Middle Ages, Lyon was ruled by its bishops; bridges were built over the Saône and Rhône. It was attached to the crown early in the 14th century and was declared a commune in 1312. Its location and commercial importance were at the origin of a semiannual fair created in 1419 by the future Charles VII; after 1463, thanks to the patronage of Louis XI, the fairs were held four times annually and Lyon became one of the leading economic centers of France.

Prosperity brought the construction of many churches and abbeys throughout the Middle Ages, of which the most important are the Gothic cathedral of Saint-Jean and the Franciscan church of Saint-Bonaventure. Saint-Jean, site of the two councils of Lyon (1245 and 1274), was begun in 1165 but not completed until the late Middle Ages. The first campaign of construction (1165-ca. 1180) consisted of the lower parts of the aisleless chevet, aisle chapels flanking the choir, and the east walls of the transepts. The lowest section of the apse has an arcade supported by channeled pilasters that recall the

decoration of Cluniac Romanesque churches in Burgundy and monuments in Vienne. By the end of the 12th century, the vaults of the chapels and the clerestory of the choir were completed; the vaults of the choir were finished in the 13th century. The choir is three stories—arcade, triforium, and clerestory—and is considerably lower than the nave.

Work progressed slowly through the 13th century on the transepts, the crossing, and the four-bay nave with sixpart vaults. Unusual for the 13th century is the alternating articulation of piers relating to the six-part, ribbed vaults, which is reminiscent of Sens cathedral, which was begun in 1140 and mostly completed by 1200. However, treatment of the clerestory windows is similar to that of monuments in the Île-de-France of the 13th century. Flying buttresses animate the exterior of the nave. The transept arms became towers flanking the crossing.

The 14th-century façade with its two towers is Rayonnant in style, with steep gables filled with stone mullions. The ornamental surfaces recall the Rayonnant transepts of Notre-Dame in Paris.

The church of Saint-Bonaventure, dedicated to the saint who died at the Second Council of Lyon (1274), has preserved its primitive Franciscan plan, with its simple architecture and large central area open to preaching.

# M

# MACHAUT, GUILLAUME DE

(ca. 1300–1377). The greatest French poet and composer of the 14th century. Machaut's narrative *dits* set a style in poetry that would predominate in France and England through the 15th century; his lyrics, many set to music, established and popularized the *formes fixes;* his *Messe de Nostre Dame* is the earliest surviving polyphonic setting of all movements of the Mass Ordinary by one composer; his strong interest in manuscript production made him a prime force in creating an awareness of the artist as a professional figure.

Born near Reims, Machaut probably received a university education in Paris. After his studies, he served from ca. 1323 to the late 1330s as personal secretary and clerk to Jean l'Aveugle of Luxembourg, king of Bohemia. In 1333, Jean procured a canonry at Reims for Machaut, whose name appears regularly in the records of Reims after 1340. With Jean's death in 1346 at the Battle of Crécy, Machaut did not lack for patrons. He composed his *Remede de Fortune* for Jean's daughter, Bonne of Luxembourg, who was also the mother of two of his most important patrons, Charles, duke of Normandy (later Charles V), and John, duke of Berry. Machaut praises Charles in his *Voir dit* (1363–65) and probably composed his last major poem, the verse chronicle *Prise d'Alexandrie* (ca. 1369–71), at his instigation. Machaut dedicated his *Fonteinne amoureuse* to the duke of Berry, and one of the most elaborate manuscripts of Machaut's collected works bears the duke's signature. In the early 1350s, Machaut established an important association with Charles the Bad, king of Navarre, whose family had hereditary connections with Champagne and who had married a daughter of Bonne and King John II. Although he apparently continued to cultivate royal patrons, no major works by Machaut are known after the Prise, and public records do not speak of him again until his death in April 1377.

Most of Machaut's poetic and musical production can be dated to the period after he settled at Reims in the late 1330s until ca. 1370. He composed some 420 lyric poems, most in the *formes fixes* of *chant royal* (eight extant), ballade (239), rondeau (seventy-seven), virelai (forty), and *lai* (twenty-three). He also wrote twenty-three motets, nine *complaintes,* eight long and four shorter *dits amoureux,* a poem of comfort and counsel *(Confort d'ami),* the *Prise d'Alexandrie,* as well as a *Prologue* that introduced his late complete-works manuscripts. In total, Machaut produced some 60,000 lines of verse. He set about 140 of his lyrics to music, providing polyphonic settings of forty ballades, twenty-one rondeaux, four *lais,* one virelai, and twenty-three motets and monophonic settings for one ballade, sixteen *lais,* thirty virelais, one *complainte,* one *chant royal,* and

two miscellaneous lyrics. The manuscripts also include music for his famous Messe *de Nostre Dame* and a textless three-voice hocket.

Machaut's earliest narrative poem, the *Dit du vergier* (late 1330s; 1,293 lines), is an allegorical dream vision in the tradition of the *Roman de la Rose*. It is a first-person account of an encounter with the God of Love, who together with six youths and six maidens appears to the narrator in a grove. In three lengthy speeches, the god discourses on love and promises to help the narrator in his own amours, if he proves worthy.

The *Jugement du roy de Behaigne* (late 1330s; 2,079 lines) narrates a love debate and its resolution by Jean l'Aveugle. The allusions to this poem and the large number of extant manuscripts (twenty) are evidence that this was the most popular of Machaut's works. The question debated is who suffers more, the knight whose lady has taken a new lover or the lady whose beloved has died. Jean decides in favor of the knight, then entertains both parties at his castle of Durbuy for a week. Elements of verisimilitude and the participation of a historical king bring a new air of realism to the *dit amoureux*.

*Remede de Fortune* (ca. 1340; 4,300 lines) is arguably the best and most influential French love poem of the 14th century. The Lover/Narrator tells of his long but silent love service to his lady. To pass time, he writes poems in the *formes fixes* about his love and circulates them anonymously, until one day a *lai* comes into his lady's hands. When she asks him who had written it, he is unable to speak and retreats in despondency to the Park of Hesdin, where he delivers a lengthy *complainte* against Love and Fortune. In response, Lady Hope appears and tells him that both Fortune and Love had treated him as well as could be expected. Encouraged by Hope, the Lover finally

Guillaume de Machaut composing a lyric, *Remede de Fortune.* BN fr. 1586, fol. 26. *Courtesy of the Bibliothèque Nationale, Paris.*

goes to his Lady's château and declares his love. Although they exchange rings, the Lady, prompted by the need for discretion and secrecy in love, later ignores him, and the poem ends on an ambiguous note. *Remede de Fortune* is an important didactic poem, serving as a manual for courtiers and providing a poetic and musical model for each of the *formes fixes*. Among the last and best of a line of French love poems that integrated lyrics with narrative, it also provided a model for the nonmusical narratives of such poets as Froissart, Granson, and especially Chaucer.

The *Dit du lyon* (2,204 lines), with the action set on April 2, 1342, is sometimes thought to be the original of Chaucer's lost *Book of the Lion*. The narrator comes onto an

island, where he encounters a friendly lion; the lion leads him through a wasteland into a grove, where they are received by a noble lady and her retainers. Here, the narrator observes the love experience of the lion, who is harassed by the persecution of hostile beasts whenever his lady takes her gaze from him. The narrator intercedes on behalf of the lion before returning to his manor.

In *the Jugement du roy de Navarre* (1349; 4,212 lines), Machaut returns to the love debate of *Behaigne* and this time pronounces, through the person of Charles the Bad, king of Navarre, in favor of the Lady. Much more than a simple love debate, the poem is a complex commentary on the role of a poet and poetry in society. An important prologue evokes the Black Death.

The *Dit de l'alerion* (1350s; 4,814 lines) is a bird allegory that presents extensive analogies between birds of prey and women, between hawking and *fin'amors*. The Narrator/Lover tells of four raptors he has acquired, loved, and lost: a sparrowhawk, an alerion (a type of large eagle), an eagle, and a gerfalcon. Like the *Remede,* it is a didactic treatise on love; unlike that poem, it incorporates exempla drawn from historical and literary sources to make its points.

The *Fonteinne amoureuse* (1360–62; 2,848 lines) is a dream vision in which Machaut offers advice to his patron, Duke John of Berry. One night, the Narrator overhears a Lover bemoaning the fact he must go into exile (in actuality, John went to England in 1360 as a hostage after the Treaty of Brétigny) and be separated from his Lady. The next day in a garden, the Narrator and the Lover fall asleep near a fountain and are visited by Venus, who brings the Lady to comfort her suitor and assure him of her fidelity. The two men awaken and return to the castle; several days later, the Lover crosses the sea, but with joy in his heart.

In his last and lengthiest *dit amoureux,* the *Voir dit* (1363–65; 9,009 lines with intercalated prose letters), Machaut gives a pseudoautobiographical account of an affair with a young admirer, Toute-Belle. A sort of epistolary novel in verse, the work is more likely a fiction than an account of a real affair, though many early scholars sought to see in it a *roman à clef*. It is notable for its verisimilitude and for its apparently parodic depiction of *fin'amors*.

The shorter *dits* include the *Dit de la Marguerite,* the *Dit de la Fleur de Lis et de la Marguerite,* the *Dit de la Harpe,* and the *Dit de la Rose.*

In addition to his *dits amoureux,* Machaut composed two other long poems: *Confort d'ami* (1356–57; 4,004 lines) and *Prise d'Alexandrie* (1369–71; 8,886 lines and three prose letters). The *Confort,* incorporating many exempla, was written to console Charles the Bad, who had been taken prisoner by John II in April 1356. The *Prise* is a verse account of the career of Pierre de Lusignan, king of Cyprus, which culminated with the capture of Alexandria in 1365.

Machaut's musical works fall into three genres: motets, settings of fixed-form lyrics, and Mass. Fifteen of Machaut's motets set French texts, six set Latin texts, and two mix French and Latin. The earliest date we have for a work by Machaut is the Latin motet *Bone pastor Guillerme/Bone pastor qui/Bone pastor,* written for the occasion of the election of Guillaume de Trie as archbishop of Reims in 1324. Most of the remaining motets, dated before ca. 1350, celebrate *fin'amors*. The invective against Fortune in Machaut's most popular motet, *Qui es promesses/Ha Fortune/Et non* est, was known to Chaucer. The last three of Machaut's motets appear to relate to political events of the late

1350s. Formally, the motets use isorhythmic designs based on chant tenors and are evenly divided among bipartite designs with diminution and unipartite designs. Three motets are based on secular tenors in virelai or rondeau form, one of which, *Lasse comment oublieray/Se j'aim mon loyal/ Pour quoy me bat mes maris,* sets a 13th-century dance song, the complaint of a *malmariée.*

Machaut is unique among 14th-century composers in his cultivation of the difficult *lai* with music. Although most of the musical *lais* are monophonic, their great length, demanding a half-hour or more in performance, requires an attention to formal balance and development unprecedented in medieval music.

The composition of polyphonic songs based on the *formes fixes* of ballade, rondeau, and virelai, began probably in the 1340s. Several experimental early works give the impression that Machaut was decisive in the development of this new musical style. The mature works, with a highly melismatic text carrying voice accompanied by textless tenor and contratenor, remained standard through most of the 15th century. A small core of works, mostly ballades, circulated widely, reaching Languedoc, Italy, and the empire, especially the popular *De petit po, De Fortune me doy plaindre,* and *De toutes fleurs.* The learned enumeration of mythological characters in the *Voir dit* double ballade *Quant Theseus/Ne quier veoir* and the clear musical setting-off of the refrain are characteristics imitated in later 14th-century ballades.

Machaut's Mass, formerly thought to have been composed for the coronation of Charles V at Reims on May 19, 1364, is now considered to have been composed for a foundation made by Guillaume and his brother Jean for services to commemorate their deaths. The Mass appears to have been performed regularly at these services at the cathedral of Reims until after 1411.

Machaut stands at the culmination of a movement in French literature marked by a growing interest in the manuscript presentation of an author's works. Several manuscripts, prepared at various stages of Machaut's career, collect his complete works, carefully organized into sections by genre, most usually retaining the same order from manuscript to manuscript, with new works added at the end of each series. In general, it appears that each genre is arranged in chronological order. Such complete-works manuscripts had an influence on later poets, such as Froissart and Christine de Pizan; the transmission of musical works after Machaut, however, was confined largely to mixed anthologies.

The Machaut manuscripts are often elaborately illuminated, and the series of illustrations for a given narrative poem was in many cases doubtless determined by the author. The several artists who illustrated Machaut's manuscripts include figures known for their work on manuscripts of kings John II and Charles V. Unfortunately, the original owners of these volumes, except for a posthumous collection belonging to the duke of Berry, have not been conclusively identified.

# MACROBIUS, INFLUENCE OF

**.** The commentary by the early 5th-century Latin grammarian Macrobius on the *Somnium Scipionis* from Cicero's *De republica* (Book 6) was one of the most pervasive texts for the transmission of Platonist ideas into the Middle Ages. Itself strongly influenced by Plato and Plotinus, Macrobius's text considers the world as three main Ideas: the Good (or the One, *Tagathen*), the Intelligence *(Nous),* and the Soul *(Psyche).* The Soul contains all individual souls, which descend into bodies made of matter *(hyle),* separating themselves from the First Cause and losing memory of their origins. They can return to the Soul only by the exercise of four sorts of Virtues: political, purifying, contemplative, and exemplary.

Christian theology has always been strongly attracted by Platonist views, and a number of heresies have been merely the incorrect weighting of the division between body and soul as good and bad, which Platonism contends. But the Platonism was rarely direct from the source. In the Middle Ages, as especially in the strong Platonism of the 12th-century Chartrians, the ideas came through Chalcidius's translations of parts of the

*Timaeus,* from his commentary on it, and from Macrobius's commentary on the *Somnium Scipionis,* Apuleius's *Golden Ass,* and Boethius's *De consolatione Philosophiae.*

# MAGIC

. The terms *magica* and *ars magica* were used in medieval Europe primarily for operations that explicitly or implicitly invoked the aid of demons. In the late Middle Ages, a second type of magic, "natural magic," came to be recognized, which relied instead on "occult virtues" within nature; these virtues were inherent in certain herbs, gems, animals, or verbal formulae and could be exploited by those who knew the effects they could produce. While these latinized Greek terms were used chiefly by those with formal education, vernacular words, such as *sorcellerie,* partly overlapped with them in their significance, although the vernacular terms usually referred more unambiguously to maleficent forms of magic.

Magical formulae occur in some medieval medical writings. Magic remedies of antiquity were passed down to the Middle Ages in such writings as the *De medicamentis liber* of Marcellus Empiricus of Bordeaux (ca. 400), a collection of medical *experimenta.* The author's epithet derives from his concern not to ground his work in medical theory but merely to list formulae that he or others have found effective. His *materia medica* includes a wide range of objects with occult virtues: herbs, gems (sometimes enhanced with magical characters), and the bodily parts of animals (bat's blood, mouse's brain, wolf's liver). He tells how a person who has gone bald from bewitchment can restore his hair by rubbing the bald spot with rough linen, then applying a compound of ashes from a lizard, purple wool, and paper, mixed with oil, but in this case the affliction is more obviously magical than the cure. Elsewhere, he recommends procedures for transferring disease to animals; a person suffering from toothache, for example, should spit into the mouth of a frog and implore the frog to assume the toothache. Alternatively, a toothache may be cured by reciting the incantation *Argidam, margidam, sturgidam* seven times under a waning moon, on Tuesday and Thursday. Some of his prescriptions involve ritual observances: the goat's blood collected to treat a stone should be collected by naked boys, and the person who kills the goat must be chaste.

While Marcellus's work is only partly magical in character, and of interest mainly for its illustrative value, Marbode of Rennes's *Liber lapidum seu de gemmis* was a specifically magical compilation of considerable importance, which remained for generations an influential source of information on the occult properties of gems. Marbode probably composed the work in the late 11th century, before becoming bishop of Rennes. He wrote in Latin hexameters, intending his work for a small circle of friends. (Further publication would defile the mysteries: *Nam majestatem minuit qui mystica*

*vulgat.*) Marbode admitted that herbs have great power, but the virtues of gems are greater. Some people may question their powers, but only because powerless imitation gems have misled them. The sapphire, for example, preserves a person from fraud, envy, and terror and can release a captive from prison. An amulet made of gagates ("jet") works against dropsy, while fumigation with this stone is effective against both epilepsy and demons. Indeed, gagates can even counteract magical illusions and incantations. Magnetite, which Circe used *in praestigiis magicis,* can be used to test the fidelity of one's wife: place it against her head while she is sleeping, and if she has been chaste she will embrace you, while if she has committed adultery she will tumble from the bed. A burglar can force all occupants from a house by sprinkling burning coals on the floor and then adding crushed magnetite.

Through the 12th century, medieval writers relied heavily on Isidore of Seville's *Etymologiae* for discussion of magic and its various forms: Rabanus Maurus (in his *De magicis artibus*), Hincmar of Reims, John of Salisbury, and others drew from Isidore, and the survey of magic at the end of Hugh of Saint-Victor's *Didascalicon* stands in this tradition of antimagical literature. Hugh says that magic is "false in what it professes, mistress of every iniquity and malice, lying about the truth and truly harming souls, seduces them from divine religion, promoting the worship of demons, encouraging the corruption of morals, and impelling its followers' minds to every crime and wickedness." He then goes on to divide magic into its branches: *mantice* includes necromancy and divination by the four elements, *mathematica* is the use of horoscopes and other divinatory devices, *sortilegium* is casting of lots, *maleficium* uses demonic incantations and ligatures ostensibly for healing, and *praestigium* deceives the senses by demonic art.

Perhaps the most important theorist of magic in medieval France was William of Auvergne, a theologian and then (from 1228 to 1249) bishop of Paris, who discusses magic extensively, especially in *De universo* 2.3.18–25, and *De fide et legibus* 24 and 27. William presents himself as a pioneer in this area, claiming with slight exaggeration that he has found nothing relevant in earlier writers. What surely is true is that he is the first important theorist in the high Middle Ages to articulate a conception of magic allowing for natural as well as demonic forms. He is also important because in his early years he read widely in the writings of the magicians and astrologers themselves and thus had a clear idea what they were attempting to do.

Like other writers, William recognizes that a great deal of magic is demonic. He tells of one necromantic experiment entitled the Major Circle, in which demon kinds from the four cardinal directions come with retinues of horsemen, musicians, jugglers, and so forth. Another such experiment produces a phantom castle. The magicians may claim they are invoking good spirits, but William is convinced that the angels used are fallen ones, demons who live in the sublunary air and in desert regions (to which magicians often have recourse). He tells how magicians have young boys gaze into mirrors or other reflective surfaces, and after conjurations have been recited some such mediums (perhaps as few as one out of ten) will see apparitions. Plato explained this effect in terms of the soul being turned back on itself so that its own power of divination is enhanced, and William conceded that explanations of this sort were possible, yet he inclined to suppose that demons were generally at work in such magic.

William is more original in recognizing a natural magic—"the part of natural science that is called natural magic" (*De universo* 2.3.21) as an alternative to the demonic sort.

Natural magic works with materials rare in Europe but common in and around India. Some substances, however, are presumably available domestically. Magicians kill animals when they are in heat, for example, hoping to extract powerful love potions from their bodies. William cites Pliny's example of the fish called *echineis* or *remora* that can cause a ship to cease moving, and he tells how the gem and herb called heliotrope can make a person invisible. He includes under the heading of natural magic what he calls the *sensus naturae,* which corresponds roughly to extrasensory perception (by which a woman can detect her beloved when he is two miles away, or a dog can identify a thief amid a crowd).

William holds that natural magic is in itself harmless; indeed, God should be glorified for such wonders. Yet it can be used for illicit ends, and in early Christianity it was condemned because it seemed to involve the work of gods and thus led people into idolatry. More fundamentally, he holds that many techniques ascribed to natural magic cannot in fact work unless demons intervene: images, characters, and incantations have no effect in themselves, and if they have efficacy it is only as signals to demons. Words can work only by means of their material (air), their form (sound), or their signification, and William discounts all these possible explanations for the natural efficacy of incantations; air, for example, can kill people only if it is infected with venom from toads, dragons, or plague. (He does grant that names of God seem to have exceptional efficacy, although he says the magicians use a corrupt substitute for the Tetragrammaton.)

Furthermore, William disputes many claims about magic and says that if magic were as powerful as some have claimed any magician could hold the world at his mercy. Yet his skepticism is at times tempered by recollection of the wonders natural magic can accomplish. He doubts that mercury is effective against demons and incantations, until he recalls that a crab suspended in the air deters underground moles and that peony expels demons from possessed people.

Yet many of the pretended accomplishments of magic are mere trickery, exemplified by the use of magic candles that can make a house appear to be filled with serpents, and by illusions comparable with fantastic dreams. Demons often use trickery, as well as the occult powers in nature, in aiding magicians; thus, the demonic entourage produced by "Major Circle" is merely an illusion, seen only by those inside the magic circle, and the horses that appear leave no hoofprints. Practitioners of natural magic sometimes also deceive people with mere illusions.

Thomas Aquinas discussed magic in various places but most importantly in *Summa contra gentiles* 3.101–05. He tells how magicians make use of herbs and other objects, verbal formulae, figures and characters, images, sacrifices, and astrological observations to discover hidden treasure, foretell the future, open doors, become invisible. Yet he believes the means employed are not a sufficient cause for the effects attained, which require the intervention of demons. The magicians are typically criminal persons using these arts to perform such offenses as adultery, theft, and murder. Elsewhere, however, Thomas deals with the occult virtues in nature in a way that is less hostile and examines the ways in which astral influences can underlie such virtues. While he does not speak of the use of these occult virtues as "natural magic," as other writers did, he manifests an interest in such phenomena and a willingness to acknowledge that many extraordinary effects could be accomplished by means within the natural order.

Nicole Oresme's writings on magic illustrate one possible stance that a late-medieval philosopher and scientist might adopt. Oresme wrote about magic in his treatise De *configurationibus qualitatum et motuum,* in a treatise of 1370 devoted chiefly to astrology, and in a series of *Quodlibeta* on the wonders of nature appended to the treatise of 1370.

Much of the effect of magic he attributes to deception and self-delusion. Yet certain types of magic can have real effect: sometimes, it influences the spirits and senses of the beholder but at other times affects external objects directly. It does so by means of virtues inherent in the magicians' herbs, gems, incantations, and other such means. Unlike such writers as Marsilio Ficino, Oresme does not attribute such magical virtues to the accumulated influence of the stars; instead, he attributes them to the "configuration," or physical qualities, of the objects and formulae used. If incantations have real magical effect, it is because the physical quality of the sound, both the words and the melodies, produces these extraordinary results. Unlike Avicenna and Algazel, he did not acknowledge the direct power of mind over matter, but he did acknowledge the indirect power of the mind: the imagination may be so distorted that it affects the body, which in turn has influence on the air and on other bodies around it. The eye in particular serves as a medium for the transmission of corrupt influences from the imagination, and this effect works most powerfully when a physically and mentally corrupt old woman casts an evil eye on the tender body of an infant.

Oresme is generally skeptical about demonic magic, which he calls *nigromantia.* Here, too, deception and self-delusion play an important role. Nigromancers (or necromancers) commonly use impressionable young boys as mediums; they make these boys stare into polished surfaces in hopes that they will see demons, and often the apparitions cause the mediums to go blind. The nigromancers themselves often show facial distortion and mental alienation during their invocations; they prepare them-selves with fasting, and they operate by preference at night, thus encouraging disturbance of body and mind and predisposing the imagination toward delusion. Demonic apparitions may also be caused by melancholy. Repeatedly, following his 13th-century predecessor Witelo, Oresme insisted on finding natural rather than demonic explanations for observed wonders, adding in explanation that "it is better to say this than to ascribe [the effect] to demons." He was aware that Alkindi and Algazel denied that any magic was the work of demons, ascribing it instead to a kind of natural radiation, or to the imaginative powers and virtues of the soul. Yet Oresme himself did not take this extreme position. Even if grudgingly, he admitted that certain effects of magic are so unnatural that they can only be the work of malign or benign spirits. Magicians may succeed in invoking demons. They do not coerce demons; if demons come, it is only with God's permission and with the intention of deceiving their invokers. Magicians' incantations may allure or repel demons, as David's playing on the harp relieved Saul by dispelling demons.

Oresme seems to have interviewed some people who claimed to have magical powers. He tells how he received permission to speak with an accused sorceress, whom he found terrified to the point of incoherence. Again, he tells how certain incantations that magicians perform have never succeeded when he was present. And when he argues that no one can meddle in these arts without incurring some evil, he appeals not only to authority and reason but also to experience.

# MAGNIFICAT

. One of the three New Testament canticles used in the liturgy, the Magnificat (Luke 1:46–55 with closing doxology) is sung at the climax of Vespers accompanied by the censing of the altar and on high feasts by the ringing of bells. The monastic rule of Aurelian of Arles (d. 551) assigned the Magnificat to the morning office, but the Benedictine *Rule* contains the first reference to its definitive place at Vespers in both the monastic and the secular practice of the Middle Ages. The incantation was not originally attached to the Magnificat but to the verse from Psalm 141 ("Let my prayer be set forth in your sight as incense"), which preceded it.

Like the psalms of the Office, the Magnificat is associated with an antiphon. Besides the antiphons whose texts are drawn from the canticle itself, a large number of antiphons are extracted from the Gospel pericope read at the Mass of the day. These antiphons, together with those for the "Benedictus" canticle of Lauds, are identified by the rubric *in evangelio* in medieval antiphoners. Gospel antiphons exist for Christmas, Epiphany, all of the days of Lent and Paschaltide through Pentecost week, the Sundays after Pentecost and the feasts of saints mentioned in the Gospels. Some of the oldest sources (the antiphoners of Compiègne and Hartker) contain antiphons from Jeremiah during the last two weeks of Lent. The antiphons for Advent are more eclectic in their textual sources, concluding with the O antiphons prescribed for the days preceding Christmas Eve. The antiphons for Saturday Vespers during the summer and fall derive from the concurrent Old Testament readings of the Office.

The elaborate tones to which the Magnificat is sung are probably Frankish (or later) creations designed to enhance the solemnity of the canticle. With the same end in view, some cathedral and monastic choirs "triumphed" (from Latin *trium fare* 'to say three times') the Magnificat antiphon: singing it (1) before the Gloria Patri, (2) before the Sicut

erat, and (3) at the conclusion of the canticle. The practice could be further amplified by repeating the antiphon or a portion thereof between all the verses of the canticle.

# MAILLART, JEAN

(d. 1327). Member of the chancelleries of Philip III and Philip IV the Fair between ca. 1286 and 1316 and canon of Tournai after 1311. Maillart completed his *Roman du comte d'Anjou* in 1316 after working on it for many years. It is preserved in two manuscripts (B.N. fr. 765 and fr. 4531), and the poem comprises 8,156 lines of octosyllabic rhymed couplets in the standard edition. In spite of its title, the romance recounts the tribulations of the count of Anjou's daughter, who is driven from home by his incestuous advances. She works as a seamstress but is eventually wed to the count of Bourges. Yet another folklore motif has her husband's jealous relatives use an intercepted letter to inform him that his wife has given birth to a monster; a second false letter condemns her and her beautiful son to death. Eventually, the truth is revealed and the moral lesson is drawn that virtue and faith in God will triumph over evil. The theme of the incestuous father is also found in *Belle Helaine de Constantinople, Lion de Bourges,* and Philippe de Beaumanoir's *La Manekine.*

# MAIMONIDES, INFLUENCE OF

. Moses Maimonides, who was born in Cordova, Spain, in 1135, and died in Cairo, Egypt, in 1204, was the greatest medieval Jewish theologian and one of the most

important medieval Aristotelians. The later Latin scholastics called him Rabbi Moyses instead of the *quidam* ("a certain person") that they generally used for contemporaries, thus showing the esteem in which they held his opinions.

With the exception of the Hebrew *Mishneh Torah,* his codification of Jewish law (introduced by a *Sefer ha-madda,* or "Book of Knowledge," which treats important physical and metaphysical topics), Maimonides's works were written in Arabic. He is most famous for the *Dalalat al-Ha'irin* ("Guide to the Perplexed"), known to scholastics as *Dux neutrorum*. Here, Maimonides discusses at length the problem of the relationship of the God of Aristotle and the philosophers to the God of the Old Testament and the relationship of reason to faith. He maintains not only that God's revelation in the Bible and the Averroistic interpretation of Aristotelian thought are compatible but that the Bible already contains in it the germs of natural reason, from which the Greek philosophic tradition develops. The second important point that Maimonides raises is that of "negative theology"; he explains that when God is named or described, these words have only a causal significance, saying nothing about God but only about that which he causes to exist. Both points can be readily found in many Latin scholastics in French schools and universities of the later Middle Ages.

William of Auvergne (ca. 1180–1249), who worked along the lines of the Platonizing thought of Augustine, Boethius, and Anselm of Bec, was most interested in the ideas of the newly accessible Muslim and Jewish Aristotelian tradition. His work helped prepare the way for the synthesis of Albert the Great and Thomas Aquinas. He must be credited with introducing Ibn Gabirol (Avicebron) and Maimonides to thinkers in medieval France, although he does not mention Maimonides by name, presumably because he knew him to be Jewish. Vincent de Beauvais (ca.1190-ca.1264) uses the *Dux neutrorum* a number of times in his *Speculum naturale,* particularly for the cosmology of the first chapter of Genesis. Maimonides was read by Alexander of Hales (ca. 1185–1245), who quotes him not by name but as *quidam expositor, licet non sanctus.* After 1230, Maimonides is quoted increasingly by name, apparently first by Roland of Cremona, who was trained at Toulouse ca. 1230–34. Aspects of Maimonides's thought were condemned in Giles of Rome's *Errores philosophorum,* but this did not keep Albert the Great and Thomas Aquinas from using his ideas for the development of their philosophical systems. Albert in particular is intent on only using him as a *philosophus,* and he is evidently straining his intentions when he calls Maimonides's system *prophetia naturalis.* It is in the context of the "natural" proofs for God's existence that Thomas Aquinas seems to have been thinking of Maimonides in the formulation of his "third way." Systematic and extensive use was made of Maimonides's *Dux neutrorum,* and especially of the aspects of his "negative theology," by the German theologian and mystic Meister Eckhart (ca. 1260-ca. 1328), who was often in Paris. At the end of the Middle Ages and in the Renaissance, Maimonides was still being used by such scholars as Giovanni Pico della Mirandola, Michael Servet, and Jean Bodin.

# *MAINMORTE*

. When a peasant tenant died without a direct heir living in his house and ready to assume his tenancy and debts, his property was said to have fallen into "dead hands" *(manus mortua)* and thus reverted to his landlord. In most cases, the heirs living away from home or collateral heirs paid a tax in order to assume possession of the deceased's personal and landed possessions: they forfeited the best animal or, more often, negotiated a cash payment. Although *mainmorte,* along with the *taille* and marriage tax, have been traditionally regarded as characteristic of "serfdom," recent French scholarship has considerably downplayed the servile nature of those taxes. *Mainmorte,* in fact, was similar to the feudal relief in that it represented the landlord's consent to an irregular succession.

*Mainmorte* is mentioned frequently in the 12th century, when landlords attempted to discourage the emigration of their tenants to new lands and into towns. But it was the newly wealthy townsmen who most strongly resented restrictions on the disposition of their property, and perceptive lords invariably abolished or commuted *mainmorte* in the community franchises of the late 12th and 13th centuries. By the 14th century, those still subject to *mainmorte,* mostly residents of small villages or tenants of conservative lords, were stigmatized as being socially inferior.

# MANDEVILLE, JEAN DE

(d. 1372). Composed at Liège ca. 1357 by an otherwise unidentifiable English knightvoyager, Mandeville's *Voyages d'outre-mer* was the most popular secular book of its day, surviving in over 250 manuscripts and some ninety incunabula, including

translations into Latin, English, Danish, Dutch, German, Italian, Spanish, Czech, and Irish. Of the three distinct versions, the earliest was certainly composed in French on the Continent. An "insular" version, done ca. 1390 in England, is a Middle English classic, whose anonymous author is sometimes considered the "father" of English prose. The *Voyages* popularized the newly discovered wonders of the East, including much fabulous material, and gives a lengthy description of the Holy Land. Mandeville compiled the work at third hand from French translations by Jean Le Long of Saint-Omer (d. 1383) of genuine Latin travel accounts from the early 14th century. Le Long's translations of five Latin travel accounts are found together in several manuscripts, of which the best known is the *Livre des merveilles* (B.N. fr. 2810), copied ca. 1400 for the duke of Burgundy. Mandeville also drew liberally from Vincent de Beauvais's *Speculum naturale,* Marco Polo's *Devisement du monde,* Gossuin de Metz's *Image du monde,* and Brunetto Latini.

Though filled with fabulous accounts, the *Voyages* relates in a simple and unselfconscious prose the sum of medieval knowledge of the world. It explains, for example, why the world is round and incorporates many other accurate observations. Through the centuries, it has been alternately praised for its style and richness and damned for absurdities and plagiarism. The author has on occasion been confused with a Liège physician, Jean de Bourgogne, and with the writer and notary Jean d'Outremeuse. Mandeville is also credited with a French prose lapidary found in 15th-century manuscripts and early printed editions.

# MANEGOLD OF LAUTENBACH

(ca. 1045?-before 1109). Manegold of Lautenbach enjoyed a long and varied career that earned him a reputation both as a "master of the modern masters" and as a firm defender of the reforming policies of Pope Gregory VII. Originally from Bavaria and known as the *Teutonicorum doctor,* Manegold seems to have established himself, ca. 1060, as a master in Paris, where one of his disciples was William of Champeaux. Like his contemporary Lanfranc, Manegold traveled from place to place earning his livelihood as a teacher; but unlike his contemporaries, he enlisted the talents of his daughters as instructors. From

this early period of his career, Manegold produced commentaries on the Psalms and Matthew.

By ca. 1082, he had entered the convent at Lautenbach in the Haut-Rhin (near Guebwiller), where he published ca. 1085 two substantial pamphlets. The *Liber contra Wolfelmum* is a tract on the proper Christian approach to pagan learning and a critique of the support of the emperor Henry IV given by Wolfelm, bishop of Cologne; the *Liber ad Gebehardum* vigorously supports the papal cause in the controversy between emperor and pope. As this region was a stronghold of the emperor, Manegold seems to have found it expedient to absent himself from Alsace for a few years, and we find him at this time in the small Bavarian town of Raitenbuch. By 1094, Manegold had returned to Alsace, where he established, with the patronage of Buchard de Geberschwihr, a house of regular canons in Marbach, south of Colmar. The special privileges accorded Manegold by Pope Urban II did not endear him to the emperor, and in 1098 Henry IV imprisoned him for a time; but within a few years (ca. 1103) Manegold had once again assumed his post as provost of Marbach, where he seems to have remained until his death.

# MANSE

. Historians define a manse (Lat. *mansus*), particularly for the early Middle Ages, as a farmstead with house, associated buildings, fields, rights in common and forest, and so on, of sufficient size to support one peasant family, varying in acreage with the productivity of the soil. In the classical definition of the Carolingian manor or villa, this peasant holding is often contrasted to the lord's reserve, the demesne *(mansus indominicatus),* on which peasants from the surrounding manses were expected to labor; in later documents, the old reserve, or demesne, itself appears to have been called a "manse" or "capmanse" perhaps after it had been cut up into peasant-sized holdings. Even for the early period, there are difficulties with such a definition because of the variability of family size and level of subsistence. For instance, if several days of labor services were owed to the lord by a member or several members of such peasant families, they may have been fed by the lord on those days; subsistence may have been possible on some manses only when agriculture was supplemented by the products of forest, river, and sea. Although the family generally appears to have encompassed only two or at most

three generations and several servants, there are also occasional indications that brothers may have held manses in common for some periods. Frequently, even in the classic Carolingian villa, manses are found that may have been large enough to support three or four families; however, some of those families may also have had rights in other manses. In the later period, in addition to the manses in compact villages, there were additional isolated manses located in the interstices between villages; these owed no services to a lord on his reserve but were held as allods by free peasants.

*Constance H.Berman*

# MANSION, COLARD

(ca. 1425-after 1484). Copyist of manuscripts and bookseller in Bruges. Mansion is first mentioned as a supplier of books to Duke Philip the Good of Burgundy and Louis de Gruuthuse, bibliophile and host to Edward IV during his exile from England. In 1471–73, Mansion was dean of the Guild of St. John, a corporation of booksellers in Bruges, of which he was also a founding member.

Circumstantial evidence strongly suggests that Mansion and William Caxton were for several years partners in a printing press. No other printers of their day were also translators, providing their texts with original prologues and epilogues. There are some technical similarities in their imprints, and they translated and printed some of the same texts.

Mansion's printing of the French version of Boccaccio's *De casibus virorum illustrium* (1476) was illustrated with nine handsome copperplate engravings, the earliest in any book. His imprint of the *Ovide moralisé* (1484) was apparently a financial failure, which caused him to give up printing.

# MANTES

. The collegial church of Notre-Dame at Mantes (Yvelines) was founded by the Montmorency family. The present church was begun with the west façade ca. 1165. The plan was dramatically revised 1175–80, when the wall of the second story was reduced by more than half its thickness as a consequence of the incorporation of the flying

buttress. That the nave of Notre-Dame in Paris was the source of this feature is confirmed by the interior el-

Mantes (Yvelines), Notre-Dame, north side. *Photograph courtesy of Whitney S.Stoddard*.

evation of Mantes, which clearly shows the Parisian aesthetic. The main part of the work was completed ca. 1200, although the buttress design was revised again, ca. 1225–30. Two of the western portals survive but without their statue columns and, in the case of the center portal (the Coronation of the Virgin), badly mutilated. The north door (the Three Marys at the Tomb and Christ in Majesty) is the earliest; the south door was rebuilt 1285–1325, during which time radiating chapels were added to the original plan. The building underwent two drastic restorations in the 19th century, although much of the original early 13thcentury roof structure survives.

# MANUSCRIPTS, HEBREW ILLUMINATED

**.** The fate of the books of the "people of the book" in medieval France was not a happy one. The "burning of the Talmud" in the Place de Grève on June 6, 1242, was a large-scale destruction of Hebrew books of all kinds. Tractates of the Talmud were certainly among the many volumes consigned to the flames, but illuminated manuscripts for public

or personal liturgical use were not spared. Thus, though the Jews were avid consumers of books, we are left with only a fragmentary remnant of what is presumed to have existed. The surviving illuminated manuscripts produced by and for Jews indicate the magnitude of the loss of 1242: though relatively few in number, they can rival the best of the productions of the Latin manuscript workshops of the High Gothic. At the same time, such works remind us that the cultural production of medieval French Jewry was rich, almost as if in defiance of the difficulties under which it flourished. They also testify to the pervasiveness of literary culture among the Jews. Books were not restricted to the elite or to synagogue functionaries, as is evinced by the considerably cruder and more provincial manuscripts that have survived.

A variety of books were illuminated: liturgical works, legal codes, miscellaneous volumes, and presumably marriage contracts as well. The Scroll of the Law itself, read in the synagogue, was required by the legal tradition to remain unadorned, but the majority of surviving French illuminated manuscripts are liturgical—festival prayer books and manuals for the home ritual of Passover. In all of these, the pervasive themes of the Jewish tradition, as dictated by those texts, are illustrated in a distinctively French style. Stylistic content reflects the influence on the illuminations of shifting Jewish demography: manuscripts bear evidence of the assimilation of stylistic conventions from northern and northeastern France, England, and the Germanic lands. The figures depicted in some are replete with the courtly contrapposto of certain Paris schools, or with the stylized hair, beards, and drapery typical of the workshop of Master Honoré. Some examples are so fine that researchers have been moved to assert that they were in fact illuminated by Christian artisans, a view that has both its supporters and detractors among prominent scholars in the field.

Initially, the Hebrew manuscripts may seem surprisingly similar in their iconography to Latin manuscripts. The details seem to devolve from a Christian rather than from any distinctively Jewish milieu. We see a bare-headed Moses, a Solomon bedecked in the trappings of a medieval French monarch, an Aaron whose priestly garb is the typical dress of a medieval French Jew, haloed angels. A depiction of the three Hebrews before Nebuchadnezzer and in the fiery furnace is remarkably similar to a scene from the chronicle of the life of St. Denis (Paris, Bibliothèque Sainte Geneviève 782, fol. 129v); the clothing is the typical "biblical" garb in which figures in Latin Bible illustrations appear, and the architecture is Gothic.

These manuscripts, however, are not mere offshoots of or borrowings from the Christian tradition of illumination. The very fact that the clothing of the figures is the typical garb of Latin Bible illumination is unremarkable in a Christian context, but interesting here. That these clothes are based in some cases upon contemporary Jewish dress heightens the association of the viewer with the figures. The Jews were not merely a minority in medieval France. They were a minority viewed with a mixture of fascination and hostility as the remnants of the ancient Jews. They were occasionally despised, sometimes envied, usually misunderstood. In times of active persecution and relative toleration alike, they felt both ambivalence and defiance toward the majority culture. When "read" against the historical background, the iconography of these works reveals the desire to utilize traditional motifs and even motifs from the dominant Christian culture to protest the circumstances in which the artists and their patrons find themselves and to express eschatological hopes, often for triumph over the persecutors.

In the magnificent *Mishneh Torah* in the Kaufmann collection in Budapest (Budapest, Academy of Sciences, Kaufmann A 77/I–IV), illuminated most probably in Lorraine in the late 13th century, motifs familiar from Christian iconography are used by the Jewish artist in relation to the text in ingenious ways. Samson, the Bible's preeminent Nazirite, appears rending the lion in juxtaposition to the Laws of the Nazirite; a depiction of David harping is juxtaposed with the text's description of the instruments used in the Jerusalem Temple. The Sacrifice of Isaac, with the ram substituting for Isaac, appears immediately following the section of the Code dealing with "sacrifices of substitution." Adam and Eve are represented in the section of the book dealing with trusts and deposits, as theirs was the first violation of the law that prohibits the use of an object entrusted for safekeeping. Such "in-jokes" and other scholarly plays indicate that the patron and the illuminator of this manuscript shared the learned culture of northern French Jewry. The unexpected figure of Judah Maccabee in full knightly armor on the folio describing the rabbinic "chain of tradition" may represent a covert reminder to Jews that their ancient heroes were both sages and military leaders—that there was a "knightly virtue" and "courtesy" both in the study of the Torah and in the battle fought in the name of God. Medieval Jews certainly viewed crusaders as "false knights" for the massacres they inflicted upon innocent Jewish communities. Judas Maccabee, here juxtaposed with the "heroes" of rabbinic culture, is the example *par excellence* of the Jewish "true and perfect knight."

A northern French miscellany of the late 13th century, now in the British Library (Add. 11639), has several series of full-page illustrations of biblical themes, some exquisitely drawn and colored. Though the book has been rearranged over time, so that the illuminations now appear random, one series in particular may be "read" as a unit that forms an iconographic parallel to the dynastic-messianic-eschatological-thrust of an *Avodah* (one of the liturgical texts recited on Yom Kippur, the Day of Atonement) written by Yose ben Yose; the text figures prominently in the manuscript. The *Avodah,* which describes the service of the High Priest in the Jerusalem Temple on Yom Kippur, may have had special significance for a priestly patron. A similar theme is to be found in the magnificent Pentateuch now in the Bibliothèque Nationale, illuminated at Poligny ca. 1300 (B.N. Heb. 36, fol. 283v), in which a full-page miniature of a menorah has, intertwined in its branches, depictions of a number of the same themes found in the British Library miscellany. Here, since the design is a sort of "shorthand," the dynastic-messianic-eschatological theme is more explicit.

What is most telling about these manuscripts is not their quality or style, or even their iconography, but the fact that they are effectively the sole relics of medieval Jewish material culture. The marks of use that they bear offer proof that they were handled familiarly and often. In a given manuscript, the dedication inscription may testify that the book was offered as a wedding present from a bride to her groom, a second layer of "testimony" may be the wine stains on the pages containing the liturgy for the Sanctification *(Kiddush)* of the holiday over wine, and a third layer may be the marks and deletions of the censor. These volumes have traveled through both joy and sorrow; they provide an eloquent metaphor for the situation of the Jews as a minority culture in medieval France.

# MANUSCRIPTS, PRODUCTION AND ILLUMINATION

. Throughout the Middle Ages in France, various centers were major producers and decorators (illuminators) of manuscripts. These were books handwritten on prepared sheep- or calfskins (vellum or parchment). Until the 13th century, manuscripts were usually produced in the scriptoria of monasteries by monks and nuns, frequently copying earlier examples. In the Gothic period, book production increasingly shifted to urban centers, and books were written and decorated by lay scribes and illuminators, sometimes several working together in workshops. By the 15th century, book dealers or publishers might farm out the book to artisans working separately. At the same time, secular texts, often translated into or written in the vernacular as opposed to the Latin of earlier manuscripts, became increasingly popular among the aristocracy and wealthy bourgeois.

During late antiquity and the Merovingian period, it became customary to enlarge and decorate capital letters beginning major sections of the text. These initials might be decorated with abstract or geometric forms like those found on barbarian metalwork or with whimsical zoomorphic elements made up of animals, fish, and human limbs, as in some Merovingian commentaries on the books of the Bible produced at the monastery at Luxeuil in the 7th century. Inhabited initials, made up of plant forms with animals and humans clambering around in the branches, became prevalent in the Carolingian and Romanesque periods. The "historiated" initial, containing scenes, usually incidents from the Bible, was another Carolingian invention that remained popular throughout the Romanesque and Gothic periods. Miniatures (so called after the *minium,* or red ink, used in their underdrawings) served as pictorial illustrations to the text. They might be full-page frontispieces to the manuscript or major divisions within it, or partial-page illustrations introducing chapters or the relevant portion of the text.

Beginning in the mid-13th century, introductory capital letters began to sprout tendrils, branches, and leaves into the margins around the text, eventually surrounding it and, together with the repetitive strokes of the script and painted horizontal bars, filling out the block of the text (line endings) enhancing the decorative effect of the entire folio. These border decorations then began to serve as a habitat for marginal scenes, cavorting animals, strange hybrids (marginalia, or drolleries), and eventually additional scenes expanding or commenting on the subject matter of miniatures on that or a facing page. In the second half of the 15th century, the foliate borders were often painted illusionistically, depicting flowers and other objects as though they were three dimensional, casting a shadow against a solidly colored background.

Because of liturgical and devotional requirements, different types of manuscripts had a greater currency during different periods of the Middle Ages. During the Carolingian period, Gospel books and full Bibles were produced for imperial use. The Carolingian illuminators, under the influence of early Christian manuscripts, developed lavish copies of the Gospels, particularly at the courts of Charlemagne and of Charles the Bald, containing a tabulation of concordances between the Gospels (Canon Tables), portraits of the Evangelists inspired by late-antique or early Byzantine painting, and a variety of decorative title pages. The most lavish of these is the *Codex Aureus* of St. Emmeram produced for Charles the Bald (Munich, Bayerische Staatsbibliothek Clm 14000), completed in 870, with numerous gold and purple title pages and a text written entirely in gold. Full copies of the Bible were produced at Saint-Martin at Tours, with pictorial frontispieces, perhaps some emulating lost early Christian models, while others, such as representations of Christ in Majesty, were Carolingian inventions. These frontispieces, perhaps programmatic in their selection, introduced selected books of the Bible. The *Vivian Bible made* for Charles the Bald (B.N. lat. 1) contains eight such frontispieces. The tradition of illustrated Bibles continued in the Romanesque period in volumes that were often large in scale, some with full-page frontispieces, others with decorative or historiated initials opening each book.

Books for the celebration of the Mass, Sacramentaries that later evolved into the Missal, were also developed during the Carolingian period. The most sumptuous of these is a *Sacramentary* made for Archbishop Drogo of Metz (B.N. lat. 9428) containing elaborate historiated or pictorial initials introducing the texts for major feast days and a remarkable series of ornamental folios leading up to a decorative crescendo at the beginning of the Canon of the Mass.

The Psalter, consisting of the Psalms of David, became the most commonly used book for private devotions from the early Middle Ages until the 14th century. With the later addition of Canticles, hymns, a Litany of the Saints, and other prayers, this book formed the basis for the celebration of the Divine Office, which consisted of the eight canonical hours during the day. Psalters were frequently decorated with prefatory scenes from the Old and New Testament, and the eight divisions of the text, corresponding to the eight hours of the day at which they were to be recited, would be introduced by historiated initials. The *Psalter of St. Louis* (B.N. lat. 10525) contains seventyeight prefatory miniatures.

Transformations of and further additions to the Psalter resulted in the formulation of the book of hours, named after the eight canonical hours during the day in which a section was to be recited. This transformation took place from the 10th to the 13th century, and by the 14th the book of hours supplanted the Psalter as the most popular devotional book. The basic text was the Hours of the Virgin, supplemented by other Hours, such as the Hours of the Cross, as well the Seven Penitential Psalms, an Office of the Dead, prayers to saints, excerpts from the four Gospels, and a calendar indicating the principal feast days of the liturgical year. It became customary to illustrate these books with miniatures depicting the infancy of Christ, the story of his crucifixion, representations of saints, and, for the calendar, scenes of the labors of the months and signs of the zodiac. One of the most remarkable 14th-century books of hours is the minute (3⅜ inches by 2⅜ inches) *Heures de Jeanne d'Évreux,* queen of France (New York, The Cloisters), with miniatures and marginalia attributed to Jean Pucelle executed

in *grisaille* between 1325 and 1328. In the 15th century, the most famous book of hours is the one produced for John, duke of Berry, known as the *Très Riches Heures* (Chantilly, Musée Condé), begun by the Limbourg brothers before 1415 and finished by Jean Colombe ca. 1485.

# MARBODE OF RENNES

(ca. 1035–1123). An important representative of the humanistic revival of the early 12th century in the Angers region, Marbode was born at Angers and remained in the cathedral school there as pupil, teacher, and by ca. 1067, master. Among his pupils was Baudri of Bourgueil; he was acquainted with Hildebert of Lavardin, bishop of Le Mans (1096– 1125) and Tours (1125–33). Marbode was elected bishop of Rennes in 1096 but retired to Angers shortly before he died.

Marbode's best-known works in the Middle Ages were his hexameter lapidary, written between 1067 and 1081, and his treatise on rhetoric, *De ornamentis verborum*. Over a hundred manuscripts of the Latin text of the lapidary survive. The earliest of the four verse translations into French was by Philippe de Thaün; there are also at least five French prose translations, as well as versions in Spanish, Italian, Provençal, Irish, Danish, and Hebrew.

The *Liber decem capitulorum* (1102) opens with a discussion of subjects that Marbode considered suitable for writing about. The chapters treat time, harlots, good women, old age, fate, the pleasures of the flesh, true friendship, good death, and bodily resurrection. Some of his shorter and lighter verses are addressed to nuns and girls at the convent of Le

Ronceray at Angers. He also composed hymns and poems on saints, usually in leonine hexameters. The only prose works to survive are his letters and a sermon on St. Florent.

# MARCABRU

(fl. 1130–49). Little can be said for certain about the origins of the troubadour Marcabru. Relying in part on the lyrics, his two *vidas* are probably right to describe him as an early Gascon singer of low birth. Evidence in the songs ties him to courts in southern France and Spain, where he was evidently a jongleur. In some fortytwo surviving lyrics, Marcabru is preoccupied largely with social satire and moral allegory. He vehemently denounces a decline in societal mores. One *vida* also describes him as "maligning women and love." But it is still debated whether Marcabru's many pronouncements on love in society are entirely negative or rather idealize love along the lines of a Christian or courtly model. His voice is raw and bitter, his images original and forceful, his language aphoristic and difficult. He is sometimes read as a precursor of the *trobar clus* school. Aside from his thirty-two *sirventes,* his lyrics include the romance *A la fontana del vergier,* the crusade song *Pax in nomine domini,* and the *pastorela Autrier jost' una sebissa.* Marcabru's thematic and stylistic influence on subsequent troubadour song was massive and pervasive.

# MARCADÉ, EUSTACHE

(d. 1440). Author of a mystery play, the *Vengeance Nostre Seigneur,* and presumed author of the *Mystère de la Passion,* both from Arras. Marcadé studied theology and law at the University of Paris and was an official at the Benedictine abbey of Corbie near Amiens. He was later dean of the faculty of ecclesiastical law in Paris. It was Marcadé who gave the mystery plays their vast dimensions. The *Passion* (25,000 lines) required four days for playing and the *Vengeance* (14,000 lines) three days. He also introduced to the Passion play the theological framework of the *Procès de paradis,* a debate in Heaven between Mercy and Justice, during which God decides to become man. Marcadé's *Passion* celebrates the birth of the church by emphasizing the primacy of Peter. His *Vengeance* shows the origin of the Diaspora by dramatizing the destruction of Jerusalem by the Roman emperor Titus.

# MARCEL, ÉTIENNE

(1310–1358). A prosperous Parisian draper who, as *prévôt des marchands,* led a rebellion against the monarchy in 1357–58. Born into a less wealthy cadet branch of a large and influential family, Marcel was successful in business, a supplier for the royal household, and a respected figure in Paris by the late 1340s. He was elected *prévôt* in 1354. Connected by kinship or marriage to many Parisians who had gained wealth and sometimes ennoblement in royal service, risking disgrace and destitution for corrupt practices but often regaining royal favor, Marcel was perhaps too cautious or too honest to follow their example, and he increasingly resented these rich royal officers from his own circle.

In December 1355, the Estates General met in Paris, and Marcel became the spokesman for the towns of Languedoil, as the assembly worked out an ambitious plan to raise a large tax to support the army, in exchange for governmental reforms and a return to stable currency. Marcel and the Parisians were then staunch supporters of John II in his campaign against the kings of England and Navarre, who had claims to the French throne and sought to partition the realm. By May 1356, however, the tax plan was failing, and without adequate revenues for his troops John II resumed manipulating the currency and restored to power the officials he had agreed to dismiss. These actions caused Marcel to break with the king, no longer providing him with Parisian troops. When John met defeat

and capture at Poitiers in September, he had no bourgeois troops but relied solely on nobles.

In the last months of 1356, Marcel seems to have become a partisan of Charles the Bad, the rebellious king of Navarre. An inflammatory Navarrese partisan, Robert Le Coq, dominated the Estates that met after Poitiers, and the urban representatives, led by Marcel, lent at least tacit support to his demands. In December, Marcel organized his first large Parisian street demonstration against the government. He made frequent use of such intimidating tactics in subsequent months.

The Estates obtained a sweeping ordinance of reform in March 1357, but when they failed repeatedly to deliver the taxes needed to prosecute the war, the government ceased to feel bound by the reforms. Marcel and the Parisian crowd became increasingly intimidating, and in February 1358 they murdered two military commanders in the presence of the dauphin Charles, thereby alienating the nobles who had originally spearheaded the reform movement. Marcel and his followers became increasingly radical in their hostility to nobles and gave some support to the Jacquerie of late May. The dauphin, meanwhile, left Paris in March and began to rally noble support. Marcel failed in his effort to organize a league of towns to oppose them, and Paris became increasingly isolated. At the end of July, one of the citizens murdered Marcel, paving the way for the dauphin's triumphant return to the capital.

# MARCH

. As a defense against external threats to the Carolingian realm, Charlemagne (r. 768–814) established along its frontiers special regions known as marches (Lat. *marca, marcha).* Some of these areas aided the assimilation of rebellious tribes into the Carolingian kingdom, as did the Saxon March, formed in the northeast in the 770s. Other marches included the March of Brittany, to help in the subjugation of the Bretons, the March of Spain, to protect Frankish territories from incursions over the Pyrénées, the March of Friuli, bordering the southern Slavonic regions, and a March of Bavaria.

Each march was organized on a military basis. The "count of the march" (Lat. *comes marcae,* whence "marquis, marquess"), who possessed important military skills, served as commander of the troops stationed there and headed the area's government. His presence, together with that of his garrison, was meant to guarantee the march's stability as well as provide ready forces to deal with problems beyond its boundaries.

# MARCO POLO

(1254–1324). Italian-born author of the *Devisement du monde,* a Franco-Italian prose description of his voyages to the East, which included Persia, Armenia, Turkestan, China, Indochina, India, and the Middle East. Between 1270 and 1295, Marco followed the lead of his father and uncle, who in the 1260s had journeyed as far as the court of Kublai Khan on the border of Cathay. The first westerner to traverse the whole of Asia, he spent much time at the court of Kublai and in his service as ambassador. The *Devisement,* essentially a travel account based on personal observations, is nevertheless filled with fabulous descriptions and legends garnered on his voyages. Marco aimed to instruct and entertain an aristocratic audience, which explains why his work has been given little credence by scholars. However, it can still be profitably consulted for its geographical descriptions, and more especially for its accounts of oriental religions and politics.

# MARGIVAL, NICOLE DE

(fl. late 13th or early 14th c.). Author of the *Dit de la panthère d'amours,* the earliest known French poem that combines first-person narrative with a series of lyric insertions composed by the narrator. In addition to citing several songs of Adam de la Halle, the *Roman de la Rose,* and Drouart la Vache's adaptation of Andreas Capellanus's *De amore,* Nicole includes his own corpus of *forme fixe* compositions. The *Panthère,* a rich synthesis of Old French literary traditions—bestiary, lapidary, art of love, allegorical dream vision, lyric forms—was an important influence on Guillaume de Machaut. Nicole is also the author of a *Dit des trois morts et des trois vifs,* an often-used format for a poem warning of the inevitability of death; and he may have composed an art of love, the *Ordre d'amours.*

# MARGUERITE

(1202–1280). Countess of Flanders and Hainaut. Marguerite, sometimes known as Marguerite of Constantinople, where her father Baudouin IX was emperor for a short time, succeeded her sister Jeanne as countess in 1244. Her first marriage, to the Hainaut nobleman Burchard d'Avesnes, was declared invalid by the pope, but her children from it disputed her legacy with the children of her second marriage, to Guillaume de Dampierre, a nobleman of Champagne. Civil war between them erupted in 1244, when she succeeded as countess, and continued until 1257. Marguerite had inherited a substantial debt from Jeanne and added substantially to it, creating antagonism by taxing and borrowing heavily. In 1270, she demanded arrears on a money fief owed to the counts by the English kings, which led to a commercial war won by the English. Marguerite and her son and co-ruler, Gui de Dampierre, tried in 1275 to replace the government of Ghent, which Ghent appealed to the Parlement de Paris as a violation of its charter. Marguerite abdicated in favor of Gui on December 29, 1278. Her most notable accomplishment may have been the abolition of serfdom in 1252 in all lands under the countess's direct control.

# MARGUERITE D'OINGT

(ca. 1240–1310). Marguerite was born to noble parents in the French Beaujolais region. By 1288, she became prioress of the Carthusian monastery of Poletains at Lyon. Although she was never canonized, a popular cult in her honor flourished until the Revolution, and she was revered as blessed. Marguerite is the only medieval Carthusian woman writer known to us. The *Pagina meditationum,* a response in Latin to a visionary experience during Mass, interweaves liturgical sections with reflections on Christ's Passion and the Last Judgment. In a remarkable passage, Marguerite develops the image of Christ as a woman undergoing the suffering of labor. The *Speculum,* written in Franco-Provençal and dedicated to Hugo, prior of Vallebonne, describes three visions and their meaning. In the first, Christ shows her a book with white, black, red, and golden letters symbolizing his suffering. In the second, the book opens and reveals a vision of Paradise and the heavens, whence all goodness emanates. In the third, she is shown the glorified body of Christ and meditates on its meaning for Christian spirituality. Marguerite's final work is the biography of Beatrice of Ornacieux (ca. 1260–1303/09), a stigmatized nun at the charterhouse of Parmenie, whose cult was recognized by Pope Pius IX in 1869. Also written in the vernacular, the biography stresses Beatrice's intense mystical experiences, including frequent apparitions, the gift of tears, severe acts of penance to ward off the Devil, and eucharistic visions and miracles. Marguerite's christocentric mysticism includes not only Carthusian but also Franciscan and Cistercian elements. Some letters by Marguerite also survive.

# MARGUERITE OF FLANDERS

(ca. 1349–1405). Duchess of Burgundy. Daughter of Louis II de Male, count of Flanders (r. 1346–84), and Marguerite, daughter of Duke Jean III of Brabant, Marguerite was married first to Philippe de Rouvre, duke of Burgundy, who died in 1361, and thereafter in 1369 to Philip the Bold (1342–1404), duke of Burgundy since 1363. Her dowry included Artois and the county of Burgundy from her paternal grandmother, Marguerite d'Artois, and Flanders and Rethel from her father. To get this attractive match, Philip's brother, King Charles V of France, had to return to Flanders the towns and castellanies of Lille, Douai, and Orchies, which had been surrendered to the crown in 1305. Marguerite succeeded her grandmother in 1382 and her father in early 1384, and her husband ruled her lands through her. In 1390, her aunt, Countess Jeanne de Brabant, designated her with Philip as her heirs. In 1391, Marguerite willed her lands to Philip on grounds of their son's immaturity and the skill with which Philip had governed her inheritance. In fact, she survived him by a year, and Flanders passed to that same eldest son, John the Fearless. She and her husband were patrons of the arts, and she frequently acted as regent during his absences. Between 1371 and 1391, Philip and Marguerite had at least eleven children, of whom seven survived into adulthood. Their diplomatic marriages would establish the foundations of the Burgundian power of the 15th century.

# MARGUERITE OF PROVENCE

(ca. 1221–1295). Marguerite was the eldest of four daughters of Count Raymond-Berenguer V of Provence. In 1234, at the age of twelve or thirteen, she became queen of France by her marriage to Louis IX. The wedding and her coronation as queen were celebrated at the cathedral of Sens. Eleven children were eventually born to the couple. The marriage was difficult in a number of respects. From the beginning, Marguerite resented and was resented by her mother-in-law, Blanche of Castile; yet she admired Blanche's influence with Louis. She tried to achieve the same position with her son, the future Philip III, but provoked her husband to intervene and have the young Philip's ill-

considered oath to obey her until the age of thirty quashed. Though Marguerite by no means lacked in courage or ability (e.g., she successfully preserved order in Damietta in Egypt in 1250 at a particularly difficult moment in her husband's first crusade), Louis almost always ignored her political advice.

After the king's death in 1270, Marguerite became a more active political figure. She was particularly exigent—to the point of raising troops—in defending her rights in Provence, where her husband's brother, Charles of Anjou, maintained his political authority and control of property after his wife's (her sister's) death, contrary to the intentions of the old count, who had died in 1245. Philip III had his hands full in restraining her. Only his death in 1285 and Charles of Anjou's in the same year resolved the situation. At the behest of the new king, Philip IV, she accepted an assignment of income from Anjou as compensation for recognizing the preeminent rights of Charles of Anjou's heirs in Provence. Her last years were spent in doing pious work, including founding in 1289 the Franciscan nunnery of Lourcines, which eventually became a focal point of the cult of her late husband, Louis. Although she does not seem to have testified for her husband's canonization, Marguerite was active in the propagation of his memory: her confessor, Guillaume de SaintPathus, for example, wrote an important and reverential biography of the king. Marguerite died on December 30, 1295, nearly two years before the process of canonization was completed.

# MARGUERITE PORETE

(d. 1310). Biographical information about Marguerite Porete comes from inquisitorial documents, which tell us that she was a béguine from Hainaut. Quite possibly, she was a solitary itinerant who expounded her teachings to interested listeners. She wrote the *Mirouer des simples ames anienties* in Old French sometime between 1296 and 1306. Since there is no indication that someone else wrote the text of the *Mirouer* from the author's dictation, we can surmise that the author wrote the treatise herself and that she was well educated.

The text received approvals from three orthodox church leaders, one of whom was Godfrey of Fontaines, a scholastic at Paris between 1285 and 1306, who also counseled the author to use caution in her expressions. Approval was not universal, however, and the text was condemned and burned in the author's presence with the orders not to spread her views under threat of being turned over to the secular authorities. Marguerite was arrested at the end of 1308 and remained in prison for a year and a half before being condemned to the flames as a relapsed heretic. Despite the condemnation, the *Mirouer* apparently enjoyed widespread popularity, for in addition to copies made of the text in Old French it was translated into Middle English, Italian, and Latin.

The *Mirouer* is a dialogue among allegorical figures who represent the nature of the relation between the soul and God. The fundamental structure of the discourse is grounded in traditional Neoplatonic philosophy, and courtly language is used to express theological abstractions. The *Mirouer* is a theological treatise that analyzes how love in human beings is related to divine love and how the human soul by means of this relation may expe-rience a lasting union of indistinction with God in this life. The *Mirouer* is also a handbook, or "mirror," that aims to teach the "hearers of the book" about themselves and how to attain union with God.

# MARIAN ANTIPHONS

. Antiphons honoring the Virgin Mary, many with texts from the Song of Songs, that originated in the Divine Office but were often used for separate votive services or commemorations from the early 13th century on. The daily choice of Marian antiphon varied among churches, but the *Salve regina* was sung on Saturday everywhere and was adopted for daily singing by the Cistercians in 1218 and the Dominicans in 1250. In 1246, the Franciscans introduced a seasonal distribution of four commorative antiphons at Compline that was taken over into Roman use and still survives today: *Alma redemptoris mater* from Advent to Purification, *Ave regina* from Purification to Wednesday of Holy Week, *Regina caeli* from Easter Day to the Saturday after Pentecost, and *Salve regina* from Trinity Sunday to the Saturday before Advent. The sources of local French liturgies indicate that Marian antiphons could be sung at various times of the day (e.g., after Lauds or Terce or at the conclusion of a procession) and in various locations in the church: before an image or statue of the Virgin, in the choir, or in a private chapel. In the later Middle Ages, Marian antiphons provided *cantus firmi* for motets; these were often intended for private devotions, as part of votive services commissioned by individual donors.

# MARIE DE FRANCE

(fl. 1160–1210). Recognized today among the major poets of the renaissance of the 12th century, Marie de France was equally admired by her contemporaries at court, according to the testimony of Denis Piramus in his *Vie seint Edmunt le rei.* Three works of the period are signed "Marie" and are usually attributed to the same author: the Lais, the *Fables,* and the *Espurgatoire saint Patrice.* In the epilogue to the *Fables,* the author adds to her name *si sui de France* (1. 4). This is probably an indication of continental birth, a fact to be remarked if, as seems likely, she was living in England. A number of identities have been proposed for Marie, none of which can be established with certainty: the natural daughter of Geoffroi Plantagenêt (and half-sister of Henry II), abbess of Shaftsbury (1181–1216); Marie de Meulan or Beaumont, widow of Hugues Talbot and daughter of Waleron de Beaumont; and the abbess of Reading (the abbey where the Harley 978 manuscript may have been copied). Identifying her literary patrons is equally problematic. The *Lais* are dedicated to *vus, nobles reis* (1. 43), who may be either Henry II (1133–1189), the most likely candidate, or his son, Henry the Young King (crowned 1170, d. 1183). The Count William named in the *Fables* has been linked to a number of prominent figures, including William Marshal, William Longsword (the natural son of Henry II), William of Mandeville, William of Warren, William of Gloucester, and Guillaume de Dampierre.

Marie's works can be dated only approximately with reference to possible patrons and literary influences. The works themselves suggest that Marie knew Wace's *Brut* (1155) and the *Roman d'Énéas* (1160), an undetermined Tristan romance, classical (notably Ovid) and Celtic sources, but not the romances of Chrétien de Troyes. The *Lais* are therefore dated between 1160 and 1170, the *Fables* between 1167 and 1189, and the *Espurgatoire* after 1189 and probably between 1209 and 1215, since its Latin source, the *Tractatus de purgatorio sancti Patricii* (in the version of Hugh or Henry of Saltrey), has been placed no earlier than 1208.

Five manuscripts contain one or more of Marie's *lais;* only Harley 978 contains a general prologue, which presents the twelve *lais* that follow as a collection specifically arranged by the author (the same manuscript also contains a complete collection of the *Fables*). Marie appears to be the initiator of a narrative genre that flourished between about 1170 and the late 13th century. About forty narrative *lais* are extant. The lyric *lai,* which flourished from the 12th to the 15th century, seems to be an unrelated form.

The prologues and epilogues that frame each of Marie's tales refer to the *lais* performed by Breton storytellers in commemoration of past adventures truly lived. Celtic and English place-names and personal names corroborate Marie's claimed sources: four *lais* take place in Brittany, three in Wales, two in both places, and one in an undetermined *Bretagne*. Marie did not simply write down orally circulating stories. Her artfully crafted compositions combine the written traditions of Latin and vernacular writings with the legendary materials of Celtic and popular tales. While it may be impossible to untangle historical reference and literary topos in Marie's repeated claim to retell well-known *lais bretons,* her indications suggest a process of transmission that begins with an adventure heard by Bretons, who then compose a *lai,* sung with harp accompaniment. Marie has heard the music and the adventure, the latter perhaps told as a prelude to the song. She then tells us the adventure in rhymed octosyllables, the form used also in the *Fables* and the *Espurgatoire,* elaborating simultaneously its truth, or *reisun* (cf. the *razos* in the Provençal lyric tradition). The title itself, carefully designated in each case and sometimes translated into several languages, guarantees the authenticity of the process.

The general prologue opens with a traditional exordium on the obligation of writers to share their talents and then cites the authority of Priscian to describe the relationship between ancient and modern writers: do philosopherpoets hide a *surplus* of meaning to be found later in the obscurities of their writing, or do later, more subtle poets add it to their predecessors' works? Scholars have variously interpreted these verses (9–22): we are drawn into the problem of interpretation at the very moment the subject of glossing is introduced by Marie's authorial persona. She then explains the nature of her project: not a translation from the Latin as many have done, but something new, demanding hard labor and sleepless nights, the writing down in rhyme of those adventures commemorated in *lais*. Hoping to receive great joy in return, Marie then offers her collection to an unnamed king. She names herself in the following verses, printed by modern editors as the prologue to *Guigemar* (ll. 3–4) but set off in the manuscript only by a large capital indicating a new section (*G*l).

The twelve *lais* that follow in Harley 978 are *Guigemar* (886 lines), *Equitan* (314), *Fresne* (518), *Bisclavret* (318), *Lanval* (646), *Deus amanz* (254), *Yonec* (558), *Laüstic* (160), Milun (534), Chaitivel (240), *Chievrefoil* (118), and *Eliduc* (1184). As indicated by the considerable variations in length, the *lais* offer great diversity, but they also operate as a collection unified by the themes of love and adventure. Indeed, they seem to invite exploration as an openended set of theme and variations, in which Marie reveals the complexities and varieties of human experience, without trying to contain them within the confines of any single doctrine of love. Heroes and heroines, all noble, beautiful, and courteous, are individualized not by psychological development but by the situations in which they find themselves. Consider the two short anecdotes that constitute *Laüstic* and *Chievrefoil.* Both involve a love triangle: married couple plus lover. *Chievrefoil* relates an episode in the story of Tristan and Iseut, a secret reunion of the lovers vouchsafed during one of Tristan's returns from exile. Whereas Marc here remains ignorant of the tryst, the husband of *Laüstic* discovers his wife's nocturnal meetings with her lover. Although their affair remains innocent, limited to their mutual gaze across facing windows, the angry husband puts an end to their meetings by trapping and killing the nightingale the lady claims as reason for her nightly visits to the window. When the lady sends to her lover the nightingale's body wrapped in an embroidered cloth, along

with a messenger to explain the events, he has a golden box made, adorned with precious stones. The nightingale's body is placed in it, and the reliquary accompanies him wherever he goes—hence the name of the *lai: laüstic* is the Breton word for *russignol* in French, *nihtegale* in English (ll. 3–6).

The emblem that thus closes the *lai* figures the end of the lovers' meetings, though it may also suggest the triumph of continued love, however impossible to realize: optimistic and pessimistic readings of the ending are both possible. The emblem of *Chievrefoil* also testifies to the enduring nature of Tristan and Iseut's love: just as the hazelwood dies (so it was thought) if the honeysuckle growing around it was cut away, so the two lovers would die if separated: *"Bele amie, si est de nus: ne vus sanz mei, ne jeo sanz vus"* (ll. 77–78). But while that phrasing is negative, what we see realized in this episode is the reunion of the lovers thanks to the piece of hazelwood that Tristan prepares as a signal to Iseut, so that the queen will know he must be hiding in the woods near the route of her cortege. Whereas the emblem of *Laüstic* ends the lovers' meetings, *Chievrefoil's* emblem initiates Tristan and Iseut's reunion, as it symbolizes their love. And just as the repetition of characters, scenes, and situations in Laüstic and *Chievrefoil* creates doubles, echoes, and contrasts in positive and negative variations at all levels of the text, so the tendency to present and explore different combinations of the same materials characterizes the links between the *lais* and invites readers to analyze their interactions. The arrangement of twelve *lais* in a collection considerably increases the potential for meaning, however elusive that meaning remains in the beautiful obscurities of Marie's text, and begins to give her *lais* the weight and proportion we normally associate with romance.

The brevity of most *lais* limits their plot development to a single anecdote or episode, although in the mid-length and longer *lais,* especially *Guigemar and Eliduc,* there may be a fuller elaboration as the characters' love develops through a series of episodes. The type of adventure that appears in the *lais* differs somewhat from that of romance: it does not involve a quest, even in the longer récits; the hero is more passive and his experience leads to private fulfillment and happiness; no special relationship exists between the hero's destiny and that of his society.

While some *lais* have marvelous and folktale elements that recall their Celtic sources (e.g., *Guigemar,* Yonec, *Lanval*), others remain realistically placed in the courtly world of the 12th century (*Equitan,* Fresne, *Milun, Chaitivel*). All explore the intersection of two planes of existence, where otherness may be magically encountered or simply introduced by the new experience of love. Although efforts to thus categorize the *lais* often remain problematic, leading to overlap, omissions, and the like, they do respond to the sense of intertextual play that links the *lais* across echoes and contrasts.

Marie's art is as carefully crafted as the precious reliquary she describes in *Laüstic*. The economy and brevity of her style are enriched by the subtlety of her narrating voice. Her use of free indirect discourse, in particular, allows her to merge her voice with that of her characters, while maintaining the distinctness of both. Marie's literary art, sustained throughout the collection of twelve *lais,* joins her work to that of the philosopher-poets, described in the general prologue as worthy of glossing and interpretation.

The twenty-three extant manuscripts of Marie's *Fables,* two of which are complete with prologue, epilogue, and 102 fables, attest their popularity. Marie claims to translate from the English of King Alfred's adaptation from Latin. No such translation is known, and Marie may have invented a fictitious source. Her fables derive from the Latin

*Romulus* in combination with other traditions: some details bring her collection closer to the Greek fables than to the Latin; evidence of oral tradition is also apparent. Hers is the first known example of Old French *Isopets*. Each short narrative (eight-124 lines) leads to an explicit moral lesson. This framework of moral and social values provides an underlying unity for the diversity of the fables. The political stance is basically conservative, reflecting an aristocratic point of view, but also shows concern for justice available to all classes: social hierarchy should be maintained for the sake of harmony; people should accept their place, as well as their responsibilities. Marie's concern for justice in terms of feudal loyalty between lord and vassal is demonstrated in a number of fables; elsewhere appears a more specific regard for mistreatment of the poor, as in Fable 2, *De lupo et agno,* in which the wolf invents a series of false accusations to justify killing the lamb. Marie's moral targets the abuse of rich robber barons, viscounts, and judges who exploit those in their power with trumped-up charges.

Extant in a single manuscript, the *Espurgatoire* combines in its over 2,000 lines a variety of materials, romanesque, hagiographic, and homiletic. In addition to various anecdotes, the principle narrative concerns the proselytizing efforts of St. Patrick, thanks to whom an entrance to Purgatory for the still-living has been established in a churchyard, in order to strengthen belief in the afterlife. After suitable prayers and instructions, many have descended to witness the tortures of the damned and the delights of the saved. Not all have returned from the perilous journey. The greater part of the story follows in detail the preparation and descent of the knight Owein. Through a series of diabolical torments, Owein is saved each time when he invokes the name of Jesus. Upon his return, he is confirmed in his knightly career, now purified and dedicated to saintly pursuits. The *Espurgatoire* offers one of the earliest vernacular examples of the same visionary tradition that inspires Dante's *Commedia*.

# MARIE D'OIGNIES

(1177–1213). Mystic and one of the founding mothers of the béguine movement. Testimonies of her life were recorded by Jacques de Vitry (ca. 1215) and Thomas de Cantimpré (ca. 1230/31).

Born in Nijvel (Brabant), Marie was married at the age of fourteen but did not consummate her marriage. Together with her spouse, she practiced the *vita apostolica* and cared for the sick. At the age of thirty, she retired to a cell at the Augustinian monastery of Aiseau-sur-Sambre and gained in stature as a spiritual healer and holy woman. According to her pupil Jacques de Vitry, Marie's spirituality was characterized by eucharistic devotion and christocentrism. She lived a life of strict asceticism, abstained from sleep and food, and frequently experienced visions, ecstasies, and trances. Her death was an example of a saintly *ars moriendi,* surrounded by miracles; most noteworthy perhaps is her feat of three days of incessant chanting and scriptural exegesis performed during ecstasy. Jacques de Vitry stressed Marie's allegiance to the church by structuring her *vita* in two parts: Part 1 records the outline of her life's journey towards holiness and aspects of saintliness; Part 2 describes her interior life according to the seven gifts of the Holy Spirit. As with other texts of this genre, it is difficult to distinguish between Marie d'Oignies as a prototype (exemplum) and her individuality and original contributions to medieval spirituality.

# MARIGNY, ENGUERRAN DE

(ca. 1275–1315). Chief minister of Philip IV from 1311 until the king's death on November 29, 1314, Marigny was hanged on April 30, 1315, because of the enmity of Philip's brother Charles of Valois, who wielded great influence over the new king, Louis X. Accusations of financial dishonesty could not be proven, and he and other members of his household and family were convicted on trumped-up charges of necromancy. His power had been immense; he was considered "a second king in France." The *Livres de Fauvel,* attributed to Marigny's chaplain Gervais du Bus, is a scarcely veiled commentary on the overmighty minister and the miseries he was believed to have inflicted on France.

Marigny was a member of the petty nobility of Normandy. His father was a royal officer; his cousin Nicolas de Fréauville was the king's confessor before becoming a cardinal; his brother Philippe, successively archbishop of Sens (1309) and Beauvais (1313), served King Philip in the affairs of Guichard, bishop of Troyes, and the Templars and participated in the judgment of his brother. No theorist or legist, Marigny was a practical man who increased his own fortune as he worked for the king, whose household he entered after serving the king's wife, Jeanne of Champagne and Navarre. In 1304, he was the royal chamberlain, a position that brought him into close contact with the king and enabled him to influence policy; before May 1308, he was made a royal councilor; he was governor of the Louvre; he directed the rebuilding of the royal palace in Paris. His financial acumen, demonstrated early on, led Philip to give him complete control of the kingdom's finances in 1314. He was instrumental in persuading Philip to abandon his vendetta against the memory of Boniface VIII and to accept the assignment of Templar property to the Hospitalers. Preferring negotiated truces to armed conflict, he averted war with the Flemings in 1313 and 1314, having obtained Lille, Douai, and Béthune for France in 1312.

# MARMOUSETS

**.** The political faction during the reign of Charles VI that opposed the king's uncles, John of Berry and Philip the Bold of Burgundy, is known to historians as the "Marmousets." This term of derision, meaning "little boys," hence people of no account, was used in the Middle Ages to describe parvenus and upstarts. The Marmousets consisted of two groups who had been prominent in the service of Charles V—financial officers, some of whom were from obscure backgrounds, and military commanders, some of whom were from old and distinguished families.

Although linked politically to Louis of Anjou (d. 1384), the brother of Charles V, and Louis of Orléans (d. 1407), the brother of Charles VI, the Marmousets did not have a powerful princely patron but were led by Olivier de Clisson, constable of France. Other important members of the group were Bureau de La Rivière; Jean Le Mercier; Jean de Montaigu; Pierre de Chevreuse; Pierre "le Begue" de Villaines; Jeannet d'Estouteville, lord of Charlemesnil; Guillaume de Melun, count of Tancarville; Nicolas du Bosc, bishop of Bayeux; Pierre Aycelin, cardinal of Laon; and Guillaume des Bordes.

In 1388, when Charles VI was twenty years old, Clisson and the Marmousets persuaded him to dismiss from his council the uncles who had ruled during his minority and for the next four years they dominated royal policy, promoting reforms and a

generally more frugal government. The king, however, was emotionally unstable, and when he suffered an attack of mental illness on an expedition to Brittany in 1392, the royal dukes quickly regained power and dismissed Clisson, Le Mercier, and La Rivière from the government.

# MARQUIS/MARQUISATE

. The title "marquis" (OFr. *marchis* or *marquis,* Occitan *marques*) was coined in the early 9th century to describe the counts who had been placed in command of the new multicounty border districts, or "marches," created by Charlemagne. Under Charlemagne himself, these officers were commonly designated by some descriptive phrase, but under his son Louis the Pious three distinctive titles began to be used to designate them: *praefectus marcae* or *limitis* ("prefect of the march" or "border"), *dux* ("duke"), and *marchio* ("march man" or "marquis"). The last of these titles, first attested in 828, was used after 850 with increasing frequency by the West Frankish chancery, along with its adjectival equivalents *marchisus* and *marchensis.*

In the 10th century, the marches that survived were converted into hereditary principalities, but the princes who ruled them and other comparable dominions continued to employ the title *marchio* and its variants, along with the titles *princeps* ("prince"), *comes* ("count"), and in most cases *dux* ("duke"), in various combinations, in reference to the same dominion. The wives and widows of these princes were usually styled *comitissa* ("countess"). This usage persisted until the period 1060–1120, when one by one the princes of France abandoned the title *marchio,* or "marquis," in respect to their French principalities, in favor of either *dux* or *comes.* Between 1120, when the count and marquis of Flanders abandoned the title, and 1504, when a new marquisate was erected in Provence, there was no dominion bearing the title "marquisate" (Lat. *marchionatus,* Fr. *marquisat*) subject to the king of France.

# MARRIAGE, CLANDESTINE

. According to medieval canon law, the heart of a valid marriage was consent, expressed in the oaths exchanged between the principals. This meant that if a man and woman swore to be true to each other and then proceeded to consummate their union, they were indeed married, even if their wedding was unwitnessed. Such a marriage was termed "clandestine." But the church greatly preferred witnesses, because a clandestine marriage could easily lead to disputes if one or both of the parties later claimed they were not really married at all. Therefore, although clandestine marriages were recognized, and those who had taken part in them could not proceed to marry anyone else, such persons were nevertheless expected to undergo penance to make up for having entered into marriage in an illegal manner.

*Constance B.Bouchard*

Sheehan, Michael M. "Choice of Marriage Partner in the Middle Ages: Development and Mode of Application of a Theory of Marriage." *Studies in Medieval and Renaissance History* 11 (1978):1–33.

# MARSEILLE

. Founded ca. 600 B.C. by Greek traders, Marseille quickly became one of the most important centers for Hellenic commerce in the western Mediterranean. Within a century, Marseille had established colonies of its own, becoming a rival of Carthage. With the expansion of Roman power, the Marseillais served as faithful Roman allies while preserving their autonomy. In 476, the city came under the control of the Visigoths, and then the Burgundians, Ostrogoths, and finally, in 536, the Franks.

Throughout the 5th century, Marseille enjoyed an active trade with the East, North Africa, and Spain and had sizable resident colonies of Greeks, Jews, and Syrians. By the late 6th century, Lombard attacks and internecine rivalry among the Merovingian and then the Carolingian Franks resulted in a prolonged decline for the city. It was only after 972, when the Muslims had been forced from the region, that Marseille began to recover its former economic activity. At the same time, the monastery of SaintVictor of Marseille became one of the leading forces for Christian reform.

In the 13th century, after short-lived experiments in self-government, Marseille was ruled by the house of Toulouse and then in mid-century by Charles of Anjou as count of Provence. In this period, the city's trade flourished until the Muslims reasserted their control over the Levant. In the 1440s, René d'Anjou again restored the city's commercial prosperity, which continued after Provence was incorporated into the French kingdom in the 1480s.

*Stephen Weinberger*

The original crypt of the basilica of Saint-Victor in Marseille was carved out of the rock in the early 5th century, when an abbey was founded here by St. John Cassian. His

monastery played an important role in early Christendom and was burned several times by invaders. The present building, constructed for the most part after 1201, encloses the 5th-century crypt as well as an 11th-century crypt built over it. The transept and square apse were added by Pope Urban V in 1363, as well as the battlemented curtain wall that surrounds the abbey. The old cathedral of La Major stands a little north of the Vieux Port over vestiges of a 4th-century baptistery. Of the 12th-century church, there remain the transept with its ribbed dome; the apse, of Provençal type, with a ribbed semidome; and a Romanesque altar dedicated to the Virgin Mary.

# MARSHAL

. By the end of the Middle Ages, the marshal had become one of the highest-ranking military officers in France. Before the Crusades, the *mariscalus* had been a monastic officer responsible for provisions. The office became secular by the 11th century, when records from the reign of Henry I tell of a royal marshal whose responsibilities included the provisioning of the military. At this early date, the duties of the office do not appear to be standardized, since during the reigns of Philip II Augustus and Louis VIII the marshal was only an inspector of the royal stables, without responsibilities. It was not until the 14th century that he gained his military command duties, when Philip VI appointed two marshals as second in command of the French army below the constable. Throughout the Hundred Years' War, the marshals held command in the French military organization. Helped by a provost and some lieutenants, they were responsible for recruiting captains, inspecting the troops, and organizing the pay for the army. Perhaps their most important responsibility was keeping order among the soldiers and sitting in judgment over them. Marshals were also responsible for deciding ransoms and carrying out executions. They could also sit in parlement or in council and could be used as diplomatic envoys.

The marshals of the late Middle Ages were an inept group. Leadership quality was often poor and several of-ficeholders failed in their responsibilities. Marshal Arnoul d'Audrehem fell into the hands of Edward, the Black Prince, at the Battle of Nájera in 1367; marshals Jean le Meingre II dit Boucicaut and Pierre de Rochefort were captured by the English in 1415 and 1419, respectively. In 1453, Marshal Philippe de Culant was forced to resign the office in disgrace. At other times, political rivalries and jurisdictional overlaps of military officers prohibited unified military command.

# MARTIAL OF LIMOGES

(fl. ca. 250). Saint, missionary, bishop of Limoges. According to Gregory of Tours, Martial of Limoges was one of the seven missionaries active in Gaul ca. 250. Later, a brief *vita* presented him as a disciple of the Apostle Peter, but the cult remained unexceptional until the end of the 10th century, when in conjunction with the Peace movement Martial became one of Gaul's foremost saints. A new story of his origins emerged in which he became Peter's younger cousin, companion of Jesus, towel holder at the Last Supper, witness to the Ascension and Pentecost, and spectacularly successful missionary to all of Gaul. The great success of this legend and the sensational consecration of a new, pilgrimage-style basilica at Limoges in 1028 inspired the monks to promote Martial to the status of apostle. Under the leadership of Adémar de Chabannes, they produced an elaborate apostolic liturgy; but on the day of its inauguration, August 3, 1029, the ceremony was interrupted by a Lombard prior, Benedict of Chiusa, who crushed Adémar and the monks in public debate. Adémar, however, composed forgeries and fictive narratives in which Pope John XIX and various church councils supported his cause; about a century later, the monks of Saint-Martial successfully redeployed these works and established Martial's apostolicity for the next nine centuries. There was a major ostention of the relics in 1388, and by the 16th century the tradition developed— still alive today—of carrying the relics through the city every seven years.

# MARTIANUS CAPELLA

(fl. first half of the 5th c.). Between 410 and 439, Martianus Capella wrote his *De nuptiis Philologiae et Mercurii.* This non-Christian allegorical treatise, an encyclopedic work on the Seven Liberal Arts, was to have a widespread influence in the Christian schools of the late Middle Ages, as a source for teaching the Trivium and Quadrivium. The *De nuptiis* is in nine books, the first two describing the allegorical marriage and each of the next seven dealing with one of the liberal arts. In timehonored tradition, Martianus drew his material from a variety of earlier sources, chiefly Apulaius, Varro, Pliny, and Euclid. This (to us) derivative method only heightened its status in the Middle Ages.

Martianus had three clear "vogues": the first was among the scholars of the Carolingian renaissance centered on Charles the Bald. Johannes Scottus Eriugena and Remigius of Auxerre wrote commentaries on Martianus, and it is through Remigius's commentary that the *De nuptiis* became so influential. The second group of admirers were 10th-century Italians, like Notker of Saint-Gall, Rather of Verona, and Luitprand of Cremona. Finally, Martianus was one of the cosmographical authors most admired by the 12th-century Chartrians, like Alexander Neckham (who wrote a commentary), John of Salisbury, and Thierry of Chartres.

Of Martianus himself, little is known, except that he was a Roman citizen who spent most of his life at Carthage. One Victorian scholar, D.Samuel, describing the *De nuptiis* as a "mixture of dry traditional school learning and tasteless and extravagant theological ornament, applied to the most incongruous material, with an absolutely bizarre effect," illustrates the extant to which Martianus's work, with its interweaving of fact and fiction, has become foreign to our sensibility, although some earlier Christian writers, such as Cassiodorus and Gregory of Tours, similarly disliked this hybrid style.

# MARTIN OF TOURS

(ca. 316–ca. 397/400). Martin of Tours was born at Sabaria in Pannonia (today Szombathely, Hungary). Much of his youth was spent in Italy, at Pavia, where his father, a Roman army officer, was posted. At about age fifteen, he joined the army but became increasingly attracted to Christianity. While assigned to Amiens, Martin gave half his

cloak to a beggar, who the next night revealed himself in a dream as Christ. Martin was baptized soon after this episode, and at some time after 339 he won release from the Roman army at Worms. He then returned to Italy to see his parents and while there ran into difficulties with the Arians, eventually finding respite as a hermit on the island of Gallinara (now Isola d'Albenga) in the Tyrrhenian Sea. After Hilary of Poitiers returned from exile, Martin joined him (ca. 360) in Poitiers and then founded at Marmoutier the first monastery in Gaul. Acclaimed bishop of Tours by the populace, but against his will, he was consecrated July 4, 372.

Although bishop, Martin lived as a monk, establishing a small hermitage outside of Tours at Ligugé. Considered the founder of monasticism in France, he was known for working miraculous cures and for at least two miracles in which he resuscitated the dead. Martin was also involved in many political and ecclesiastic struggles during his lifetime. He died at Candes, most probably in 397, although some have argued for the year 400. At his death, his body was claimed by the citizens of both Poitiers and Tours, with the relics finally coming to rest in Tours. His cult was popular throughout the Middle Ages, and the small chapel built over his tomb was rebuilt and enlarged a number of times. Martin's *vita* was written by his friend Sulpicius Severus. An account of his miracles was composed by Gregory of Tours.

# MARY, DEVOTION TO

. Over the course of the medieval period, devotion to the mother of Jesus became a focus of Christian belief and practice, affecting liturgy, theology, art, and personal piety. Although Mary is mentioned infrequently in the canonical Gospels, with the exception of the birth-infancy narratives, Christian tradition soon developed a special place for her in literature, devotion, and thought. The apocryphal 2nd-century Greek *Protoevangelium of James* supplies Mary with a biography that makes her a dedicated virgin in the Jerusalem Temple, fed by angels, assigned the sacred task of weaving cloth for the Temple, and, at the end of her service, at age twelve, betrothed to a pious elderly man, Joseph. This same source provides a *vita* of Mary's parents, who are given the names Anna and Joachim.

The early life of Mary and her miraculous conception by Anna were frequent subjects for illuminations in late-medieval books of hours, such as the magnificent *Hours of the Virgin* in the *Grandes Heures* of John, duke of Berry.

By the 5th century, Mary was hailed in Christian liturgy and doctrine as *theotokos* (Mother, or bearer, of God), a title confirmed by the Council of Ephesus in 431. Liturgical hymns praised her virginity. In letters and treatises, the monk and Bible translator Jerome argued for Mary's virginity not only before but during and after Jesus's birth ("perpetual virginity"), a view that became dominant in patristic and medieval thought, although opposed in Jerome's time by Helvidius and others. Only gradually did Mary receive recognition in the dynamics of salvation beyond her role as the virgin mother of Jesus and exemplar of the Christian woman dedicated to lifelong virginity. First in the Greek-speaking East, then in the Latin-speaking West, there began to develop the idea of her ability to intervene miraculously to benefit those who gave her special devotion. The legend of Theophilus—5th-century Greek, translated into Latin at the Carolingian court in the 8th century, and versified in French by Rutebeuf as the *Miracle de Théophile* in the latter part of the 13th century—told of a man who, Faust-like, sold his soul to the Devil, only to repent and ask Mary to deliver him from eternal damnation. This she does and is celebrated as the redeemer of captives and helper of the oppressed. This and many similar legends did much to spread the idea of Mary as intercessor and miraculous deliverer.

The special devotion to Mary first flowers in the late 11th and early 12th centuries and can be traced in France in a number of ways: in the collections of Marian miracles; in the prominence of relics, clothing especially, associated with Mary; in the number of churches, particularly cathedrals, dedicated to her; in liturgical texts and innovations as well as popular poetry; in iconographic developments in sculpture and illuminated manuscripts; and in theological treatises and debates.

Relics of the Virgin were primarily clothing, milk, or "separable" body parts, such as teeth or hair. The cathedral of Notre-Dame at Chartres possessed perhaps the most famous Marian relic in France: her tunic, or dress, donated by Charles the Bald in 876. Found unharmed in the crypt after fire destroyed the nave and choir in 1194, it was the focus of pilgrimage and devotion throughout the Middle Ages and remains so today. Laon had a fragment of Mary's clothing and perhaps some of her hair; a convent at Soissons possessed a slipper that was the focus of a healing cult briefly in the mid-12th century. Other sites claimed Mary's milk, a tooth, her belt, and the like.

Chartres, Soissons, and Laon were also foci of another 12th-century Marian phenomenon: the collection of accounts of miracles associated with the relics of a shrine. When Laon cathedral burned in 1112, a group of canons was twice sent on tour to raise money for rebuilding. Taking a collection of relics that included a fragment of Mary's clothing and perhaps strands of her hair, the canons stopped in cities and villages to invite prayers for Mary's intercession and offerings for rebuilding her church at Laon. The miracles and cures on these tours were recorded by Herman, a canon of the cathedral, in *De miraculis sanctae Mariae Laudunensis*. A collection formed at Soissons recorded miracles associated with a slipper. Similar collections were produced at Coutances and Rocamadour, the latter a Marian shrine without a relic but with a miracle-working statue from the 12th century onward. After the fire of 1194 at Chartres, the cathedral clergy, like those at Laon, took relics around the countryside. The miracles were recorded in a book;

the contributions helped rebuild the cathedral. The Latin text of the miracles from Chartres was versified in French by Jean le Marchant (ca. 1262) as the *Livre de Notre Dame de Chartres*. The Latin collections of Marian miracles associated with local shrines and relics were combined with other generalized, less-localized miracle stories, and with Marian prayers, chants, poems, and the like to form *Mariales* that were meant to be read publicly or privately on Mary's feast days. These *Mariales* were soon translated into French, a notable example being Gautier de Coinci's *Miracles de Nostre Dame*. Jean de Garlande produced a versified collection of Marian miracles, the *Stella maris,* in 1248–49, while Vincent de Beauvais included a collection of her miracles in his *Speculum historiale*. In the 13th and 14th centuries, collections of Marian miracles provided a rich source of exempla for Dominican and Franciscan preachers.

Several iconographic representations of Mary became widespread and influential "types": the seated Mother and Child; Mary enthroned with Christ in Heaven (the Triumph and the Crowning of the Virgin); the standing Mother and Child; the sorrowing Mary holding the dead body of Christ. Each reflected a doctrinal or devotional attitude. The seated mother holding the child Jesus represented, from the 5th-6th centuries forward, the *theotokos*. It is Mary's awesome role as "birthgiver" of the incarnate deity that dominates this mode of representation. Numerous wooden cult statues took this form in medieval France, e.g., at Rocamadour. A striking example in monumental sculpture is in the tympanum of the right portal of the west façade of Chartres (ca. 1145–55).

The representation of Mary enthroned with Christ in Heaven, found in monumental sculpture of the late 12th and 13th centuries as well as in panel paintings and carved ivory panels throughout the later Middle Ages, emphasizes not maternity but two other themes: regal and triumphant power in a cosmic framework and the association of Mary with the bride and Christ with the bridegroom of the Song of Songs. Although some verses from the Song of Songs had long received a Marian interpretation and the feast of the Assumption had readings from the Song, it was not until the 12th century that the entire Song was given a symbolic interpretation, taking Mary as the bride, earlier interpretations had seen either the church or the individual soul as the bride. The overriding point is Mary's appearance as a woman with her adult son in a position of regal power in Heaven, an image drawing on ideas from courtly romance as well as royal ideology and shaped by the theological concept of the "bride of Christ" in Song of Songs commentaries. Sculpted tympani on the façades of the cathedrals of Senlis (ca. 1170) and Paris (ca. 1210–20) and the north-transept portal of Chartres (1205–10) depict Mary in this trumphant mode and have associated scenes from the death and resurrection-assumption of the Virgin.

The standing Mary with Jesus exemplified by the trumeau statue of the south portal of the cathedral of Amiens (ca. 1250), the *Vierge dorée,* presents Mary as the loving mother playing with her child, thus reflecting her deep human tenderness, connected in devotional piety with her love of all humankind, as shown in the numerous collections of Marian miracles that emphasize devotion to her as the loving mother.

A final widespread image type, the weeping Mary holding the crucified body of Christ, reflects a new 13th-century piety focused on Christ's suffering, Mary's sorrow, and the sorrowing response of the faithful; it was a piety developed especially in Franciscan and Dominican circles. In poetry, the popular *Stabat mater shows* a similar point of view, describing Mary's sorrow as she views the Crucifixion and then the yearning of the believer to share her sorrow.

The medieval church recognized five Marian feast days: Conception (December 8), Nativity (September 8), Annunciation (March 25), Purification (February 2), and Assumption (August 15). In addition, Saturday was especially dedicated to her. The feast day of the Assumption is predicated on an early legend that recounts an angelic vision foretelling Mary's death and then describes the gathering of the Apostles, her death, funeral, burial, and, three days later, the raising of her body by angels to Heaven, where it is reunited with her soul. So Mary was seen to have a special status: not only the virgin mother of Christ, but also, like him, present bodily in Heaven.

The doctrine of the Assumption passed readily into medieval theology and devotion. The doctrine of her Immaculate Conception, which asserts that Mary, unique among humans, was conceived by Anna and Joachim without Original Sin, was controversial, being vehemently rejected by Bernard of Clairvaux, Albert the Great, Thomas Aquinas, and Bonaventure. In the 13th century, the Franciscan theologian Duns Scotus argued in favor of the doctrine; generally, Franciscans favored it while Domini-cans opposed it. Popular devotion tended to support it.

Poetry dedicated to Mary found a ready place both in and outside the liturgy. The popular Marian hymn *Ave maris stella* probably dates from the 8th century. Mary, called "Star of the Sea," is described as the virgin mother and Gate of Heaven and is the helper of humans, delivering them from disaster, illness, and oppression through her motherly influence over Jesus. The prayer *Ave Maria,* based on Luke 1:28 and 1:42, appeared first in the Little Office of the Blessed Virgin and then found more general use in the 12th century. The popular *Salve regina* was used in the liturgy at Cluny ca. 1135 and soon found use among the Cistercians and later the Dominicans. The gifted sequence writer Adam of Saint-Victor extolled Mary in theological and poetic paradoxes. In prose, hundreds of sermons praised Mary and explicated her theological significance, devotional importance, and maternal-queenly role.

The prayers to Mary composed by Anselm of Bec had a lasting and determinitive impact on Marian devotion and theology. He spoke of her maternal aspect as both vehicle of the Incarnation and the embodiment of motherly forgiveness and graciousness; he also used the language of courtly romance and queenship to stress her benovolence and status as "redemptrix," as he titled her.

From the 12th century onward, patterns of Marian devotion appeared that utilized repeated formulaic prayers, much on the model of the monastic repetition of the 150 Psalms each week, the repetitive recitation of the Lord's Prayer in devotion or penance, and antiphonal praises to Mary. These prayers were finally reduced to a brief formula consisting of the *Ave Maria,* with inserted *Glorias* and the Lord's Prayer. Finally, a pattern of 150 *Ave Marias,* in fifteen groups of ten each ("decades"), with a focus of meditation for each decade came to be an accepted pattern, with the prayers counted by means of a string of beads that came to be known as a rosary. The association of the origin of the recitation of the rosary with the Dominicans and Dominic is not supported by recent research.

# MARY, LITURGICAL VENERATION OF

. Although they all originated in the East and were instituted in Rome in the course of the 7th century, the four great Marian feasts of the church year were well on their way to being firmly established by the late 8th century in what is now modern France: the Feast of the Purification, February 2; the Annunciation, March 25; the Assumption, August 15; and the Nativity of the Blessed Virgin, September 8. January 1, the Feast of the Circumcision and the Octave of Christmas, was also a day for Marian veneration. Already by the 8th century, *Ordines romani* XV and XX testify that an elaborate procession for the Purification was known north of the Alps. Processional antiphons sung at the three other major feasts in manuscripts from the 9th and 10th centuries prove that these feasts had processions, as well as a repertory of chant texts, prayers, and readings. The series of four seasonal Marian antiphons sung regularly at Compline from the 13th century were taken from the repertory of elaborate antiphons composed to frame the performance of of the Magnificat (Luke 1:46–55), sung at Vespers to a series of tones.

Increasing Marian devotion from the 9th century led also to a greater number of celebrations in her honor: major Marian feasts came to be celebrated with Vigils and Octaves, and a votive Mass for the Virgin was instituted in most places for Saturdays throughout the year. With the founding of Cluny and the establishment of an ever larger network of affiliated houses during the 10th century, it became traditional to celebrate a commemorative Office of the Virgin on Saturdays, in conjunction with her Mass, so that Saturday, from first Vespers on Friday until Compline on Saturday evening, was consecrated to the Blessed Virgin in monasteries throughout France. Ordinals and customaries from the 11th century reveal the adoption of the "Little Office of the Virgin" as well, which included a full cycle of hours and was said each day, alongside the *opus Dei.* During this same period, great numbers of hymns, tropes, and sequences were composed for upgraded Marian feasts, embodying a history of the rise of Mary's cult in

France in their texts. The intense devotion of the Domini cans and Franciscans to Mary led to greater standardization of texts and music for her celebration from the 13th century onward. Votive Masses for the Virgin, the singing of the Magnificat at Vespers, and the Marian antiphons at Compline served to provide both opportunity and inspiration for later polyphonic music dedicated to her honor.

# MARY MAGDALENE

. Mary of Magdala (Mary Magdalene), a female follower of Jesus in the Gospels, received a medieval *vita* that offered a major expansion upon her appearance in the Gospel narratives. She was venerated especially at two popular French pilgrimage shrines: the Benedictine abbeys of Vézelay and of Saint-Maximin at Aix-en-Provence.

In the Gospels, Mary of Magdala is among the women who travel with Jesus in his ministry (Luke 8:1–2; cf. Matthew 27:55–56), and Jesus is said to have cast seven devils out of her (Luke 8:2 and Mark 16:9). She is present at the Crucifixion (at the foot of the Cross with the Virgin Mary [John 19:25] or looking on from afar with other women [Matthew 27:55–56 and Mark 15:40–41]). She is named among the women who go, after the sabbath, to the sepulcher where Jesus was buried (Matthew 28:1; Mark 16:1; Luke 24:1–10). She is the first to encounter Jesus after the Resurrection (John 20:1–19). These incidents provided the basic narrative of a woman cured of demonic possession who followed Jesus, was present at his death, and was the first to see him resurrected. Indeed, on the basis of the passage in John 20, she is called "the apostle to the Apostles."

In the patristic and early-medieval periods, other Gospel narratives involving Jesus and women were associated with Mary Magdalene. The unnamed woman identified as a sinner (and thus important for the later persona of the Magdalene) who bathes Jesus's feet with her tears and anoints them (Luke 7:30) and the unnamed woman who anoints his head (Matthew 26:6–13) were both identified with Mary Magdalene. She was also identified with Mary of Bethany, the sister of Lazarus and Martha. Not only the name

made this identification possible; Mary of Bethany also anoints Jesus's feet and wipes them with her hair when Jesus visits in her home (John 12:13).

This identification with Mary of Bethany provided Mary of Magdala with a family closely associated with Jesus, for he visited in their home and he raised Lazarus from the dead. The medieval *vita* of Mary extended this family. Mary's rich and noble parents possessed the castle of Magdala and its lands. Mary was betrothed to young John the Evangelist. When he forsook her to follow Jesus, she entered a life of prostitution. Later, cured of demonic possession by Jesus, Mary dedicated herself to his service and became the prototype of conversion, devotion, humility, penance, and contemplative prayer (the latter signified by Mary sitting peacefully at Jesus's feet listening to him while Martha, active, prepares a meal [Luke 10:39–42]).

Following Jesus's ascension, persecution forced Mary, Martha, and Lazarus to flee in a boat, which arrived at Marseille on the south coast of France. Lazarus became bishop of Marseille; Mary became a renowned preacher. Later, she went to Aix-en-Provence and embraced the life of a hermit dedicated to extreme asceticism and prayer. She was fed by angels and allowed her hair to become the covering for her body emaciated from ascetic discipline. (This later ascetic career may owe much to a conflation with the *vita* of St. Mary the Egyptian, a reformed prostitute who went into the desert to perform radical acts of asceticism and penance.)

Veneration of Mary Magdalene at Vézelay seems to have begun in the mid-11th century, when an account of the 8th-century "translation" (by pious theft) of her relics from her tomb in Aix, deserted in the wake of Muslim attacks, was drawn up. Papal confirmation of the possession of her relics by the monks at Vézelay followed. The famous Romanesque church was consecrated by Pope Innocent II in 1131–32; St. Bernard preached the Second Crusade there in 1146.

The monks of Saint-Maximin in Aix retaliated in the late 13th century with the assertion that the monks of Vézelay had taken the wrong body several centuries earlier; Mary's relics were in fact still in the crypt of the abbey church. The presence of these relics, then the site of miraculous cures, was promoted with vigor, and veneration of Mary Magdalene shifted from Vézelay to Aix.

The elaboration of the medieval *vita* of Mary Magdalene and the theft and veneration of her relics at two different sites illustrate two common elements of the hagiographical literature and devotional practice of the medieval period.

# MASS, CHANTS AND TEXTS

**.** The Mass (Latin *missa*) was the term commonly used in the Middle Ages to designate the eucharistic sacrifice that is the principal religious service of Christianity. The service has its origins in the Last Supper of Jesus Christ, described in the three Synoptic Gospels. The term appears as early as the 4th century (St. Ambrose, *missam facere*).

The most basic division within the Mass is that between its first part, the Fore-Mass or Liturgy of the Word, and the sacrificial rite proper that follows. For the early church, these are called the Mass of the Catechumens and the Mass of the Faithful, since the Catechumens, those undergoing instruction before baptism, were dismissed before the onset of the sacred mysteries. The Fore-Mass consisted at first only of an initial greeting from the presiding priest or bishop, readings from Scripture, a discourse (homily or sermon) on the readings, and concluding prayers. This is obviously a service of instruction, altogether appropriate for Catechumens. There were three readings rather than the medieval two: an Old Testament reading, one from an Epistle or the Acts of the Apostles, and one from the Gospels. There were no chants until the later 4th century, when a psalm, the apparent ancestor of the medieval Gradual, came to be a regular feature of the Fore-Mass. Its verses were chanted by the lector and answered by a congregational refrain. A second psalm, the Alleluia psalm, came by the early 5th century to be sung in the church at Jerusalem after the Gradual psalm, as prelude to the Gospel; it was not taken up immediately in the West.

After the dismissal of the Catechumens, the eucharistic rite began with the "prayers of the faithful." Next, the elements of bread and wine were brought in, and the presiding priest said the eucharistic prayer over them. The medieval Latin version of the prayer is present already in the *De sacramentis* of St. Ambrose of Milan (d. 397). Present also in the 4th century was the chanting of the Sanctus and the Lord's Prayer, which formed the high points of a dialogue between celebrant and faithful, sung in all probability to the same simple tones employed in the Middle Ages (see Levy). During the distribution of the eucharist, a communion psalm was sung, generally Psalm 33 (34), with its Verse 8 as congregational refrain: "Taste and see that the Lord is sweet."

Western liturgical sources from the late 5th to early 8th century are sparse, but with the document *Ordo romanus I* we have a highly detailed description of the papal Mass from ca. 700. *Ordo romanus I* is one of the earliest of many *ordines romani,* all existing exclusively in Frankish manuscripts, that not only describe the papal Mass but show how it was imitated and adapted throughout the Carolingian realm in the late 8th and early 9th centuries. The medieval Mass, outlined here in Table 1, is virtually complete in the papal Mass of *Ordo romanus I.*

Table 1. *The Mass-Prayers, Readings, Chants*

| Chants | | Prayers and readings |
|---|---|---|
| Proper | Ordinary | |
| **Fore-Mass** | | |
| Introit | | |
| | Kyrie | |
| | Gloria | |
| | | Collect |
| | | Epistle |
| Gradual | | |
| Alleluia-tract | | |
| (Sequence) | | |
| | | Gospel |
| | Credo | |
| **Mass of the Faithful** | | |
| Offertory | | |
| | | Preface |
| | Sanctus | |
| | | Eucharistic prayer |
| | | Lord's Prayer |
| | Agnus Dei | |
| Communion | | |
| | | Postcommunion |
| | (Ite missa est) | |

The distinction between Proper and Ordinary chants, of doubtful application to the ecclesiastical song of the early church, is now of fundamental importance. The texts of the Proper chants relate to a particular feast day so that they change more or less daily, while the texts of the Ordinary chants are the same for every Mass. All the Proper chants of Table 1 are present in *Ordo romanus I,* with the exception of the Sequence, a poetic extension of the Alleluia, that the Franks added in the 9th century. The Introit consisted of an antiphon, a melodious chant of moderate length and elaboration, that was sung as a refrain to a psalm chanted while the pope (later bishop or abbot) processed down the nave of the church to the sanctuary. At Rome, the singing of the Introit and the other Proper chants was the responsibility of the *schola cantorum,* a group of skilled clerical musicians; similar organizations were established in the principal ecclesiastical centers of Francia already before the end of the 8th century. After the declaiming of the Epistle, a member of the *schola* stood on the steps of the ambo to chant the Gradual (called *responsum in Ordo romanus I*). It was starkly different from its 4th-century psalmodic ancestor, consisting in a highly elaborate refrain sung by the *schola* and an equally elaborate single verse sung by the soloist. This was followed by the singing of the Alleluia, or during penitential seasons the Tract; the Alleluia consisted of a rhapsodic refrain sung by the *schola* before and after a solo verse, while the Tract was unique in that it consisted of a series of psalm verses sung to a florid melody without any sort of

refrain structure. This group of chants associated with the readings were exceptional in that they accompanied no liturgical action; they were simply listened to by the attendant clergy and congregation.

A celebration of Mass in late 15th-century Paris. B.L. Add. 18192, fol. 110. *Courtesy of the British Library.*

The Offertory was sung as the gifts of bread and wine were presented to the celebrant; it consisted of an elaborate refrain and two or three verses of similar musical complexity; within a few centuries the verses would be dropped with only the refrain retained. The Communion, finally, sung during the distribution of communion as in the early church, closely resembled the Introit with its melodious antiphon sung as a refrain to a chanted psalm (both Introit and Communion would eventually lose most of their psalm verses).

The chants of the Ordinary also were mostly in place at the beginning of the 8th century in Rome; only the Credo, which would follow some three centuries later, was absent. The Kyrie eleison, sung immediately after the Introit, is a radically shortened form of litany that was earlier recited as part of the prayers that concluded the Fore-Mass. Next came the Gloria in excelsis, an ancient hymn that takes its first words from the angelic salutation to the shepherds at Christmas. A comparatively late entry into the Mass, its use was subject for a number of centuries to restrictions; it was limited, for

example, to Christmas, or to Masses where a bishop presided. The Sanctus, as in the early church, concluded the Preface, the introductory portion of the eucharistic prayer. The Agnus Dei, finally, sung during the fraction of the host, was introduced only in the time of Pope Sergius I (r. 697–701). Its text, "Lamb of God, who takest away the sins of the world," was adopted as a deliberate act of theological defiance against the Byzantine empire, which recently had forbidden references to Christ as a lamb. (The Ite missa est, intoned by the celebrant to signal the end of Mass, later took on the character of an Ordinary chant when it began to imitate the melodies of the Kyrie.)

While this early-medieval papal Mass (and its Frankish adaptations) retained the essential shape of its 4th-century counterpart, its overall aspect differed dramatically. Aside from the pomp required by the movements of the pope and his retinue, the dominating impression is that created by the nearly continuous choral and solo singing of the *schola cantorum*. The melodies of the Mass Proper, while probably not precisely those we know from the early 10th-century Frankish manuscripts of Gregorian chant, were comparable in format and dimension. The melodies of the Mass Ordinary were simpler than their later counterparts; but still they were sung by the *schola* as discrete musical events, whereas they had originated for the most part as simple congregational contributions to the dialogue with the celebrant. He, too, ceded much of his earlier role as the aural focal point of the ceremony. He continued to exchange greetings with the attendant clergy and people, and he chanted the Preface and Pater noster; but he recited the eucharistic prayers (the medieval Canon) in a subdued tone, and by the end of the 8th century in complete silence. Solemn Mass at the beginning of the 8th century was well on its way to being dominated by ecclesiastical music, a process that would be completed in the late Middle Ages.

The texts, and quite possibly the music, of the Mass Proper achieved their first maturity close in time to the copying of *Ordo Romanus I*. We have the texts in unnotated Frankish graduals from ca. 800 (and their melodies from notated graduals of ca. 900), and we know that the texts existed in Rome in the first half of the 8th century because they appear in the so-called Old Roman graduals, manuscripts that represent the Roman liturgy before its transmission to Francia in the second half of the 8th century. In earlier centuries, the Proper chants had simply been psalms and the first chant books had been psalters, so that clearly a period of intense composition and organization was required to produce the complex system of texts that makes up the early-medieval Mass Proper. Liturgical and musical historians long assumed this period to be the time of Pope Gregory I (590–604), but it appears more likely now to have been the heyday of the *schola cantorum,* the later 7th and earlier 8th centuries.

The essential trait of the Mass Proper is the provision of an appropriate set of chants for each day of the annual cycle, something one might take for granted today, but an innovation in a time when the more normal expectation was a day-to-day selection of antiphons and psalms from an existing repertory. The majority of the new texts were chosen from the time-honored source of the Psalter, but they were short apposite passages, removed from their original context and frequently reshaped to create a workable vehicle for a musical composition. And many texts were fashioned from other biblical sources, for example, evocative lyrics from the prophetic books for the newly created season of Advent, and colorful Gospel narratives for the communion antiphons of the Christmas and Paschal seasons. As for the melodies, one can only assume that this

project of textual revision and creation went hand in hand with a similar musical process. What remains a question of the most profound difficulty, however, is how closely these melodies match those in the earliest notated Frankish graduals of nearly two centuries later.

Two major developments altered the external aspect of the Mass in later centuries: the accumulation of tropes and the growth in prominence of the Ordinary. Tropes—preludes, interludes, and postludes of text and music—were freely added to chants of the Proper and Ordinary with the exception of the Credo. They were obviously a creative outlet for active clerical poets and musicians at a time when the core repertory of the Mass was complete. Common already among the 9th-century Franks, troping reached its climax in the great Benedictine monasteries of the 11th century, such as those belonging to the French order of Cluny. The Ordinary, in addition to accumulating tropes, was the beneficiary of numerous new and more elaborate melodies. Both manifestations can be seen as different aspects of a process that at once gave the Ordinary an eminence it had not previously possessed (nor deserved, modern liturgical scholars would say) and allowed it also to share to some extent in the essential characteristic of the Proper, as certain tropes and melodies became associated with particular feast days, or at least classes of festival. In the late Middle Ages, the rise of the polyphonic Ordinary succeeded in eclipsing even the musical significance of the Proper. France was foremost in this movement that created one of the great monuments of western music, the Cyclic Mass, a unified composition in five movements: Kyrie, Gloria, Credo, Sanctus, and Agnus Dei. Guillaume Dufay of Cambrai (d. 1474) was the central figure in establishing the genre.

# MASSELIN, JEAN

(d. 1500). Cleric, lawyer, and historian. Masselin was a canon at the cathedral of Rouen, doctor of civil and canon law, and *officialis* of the archbishop of Rouen when he was chosen to represent the *bailliage* of Rouen at the Estates General that convened at Tours between January and March 1484. His lengthy journal of the proceedings of the Estates, one of the most valuable sources for the history of medieval representative assemblies, remains Masselin's claim to fame, although he later served with distinction as dean of the chapter of Rouen.

# MATFRE ERMENGAUD

. Author of the *Breviari d'Amor,* an Occitan encyclopedic work in rhyming octosyllabic couplets, dated 1288, preserved entire (35,600 lines) in twelve manuscripts from Languedoc, Toulouse, and Catalonia. The author, otherwise unknown, was a native of Béziers and drew upon the earlier *Image du monde*.

Organized as a "Tree of Love," Matfre's encyclopedia popularizes theology more than science. Beginning at the roots with the Trinity, he discusses angels, demons, the zodiac, and the planets. He provides a cursory account of the natural world. Under "Natural Law," he discusses the proper way to worship God. A section on sin offers portraits of greed and duplicity drawn from contemporary society: the castle lord, the lawyer, the apothecary, the merchant, the gambler. Under "The Love of God," he summarizes the articles of faith and the life of Christ, then several saints' lives.

In the last 8,000 lines, the "Perilhos tractat d'amor de las donas," Matfre uses 266 quotations from troubadour poetry (including his own) to support his precepts. Through imaginary dialogue with Love's followers and critics, he answers questions and objections. The impulse to love, natural but potentially dangerous, must be managed wisely. Ladies should be honored; good love must not be criticized. A 138-line verse letter to his sister, explaining the symbolism of a Christmas capon, follows the *Breviari*.

# MATHEUS DE SANCTO JOHANNE

(fl. 1365–89). French composer in the service of King John II during his captivity in England from 1356 to 1359, at the same time as composer Pierre des Molins. Matheus served Louis I of Anjou in 1378 and Pope Clement VII at Avignon from 1382 to 1386. His works, which influenced Philippus de Caserta, show remarkable independence of voices and sophisticated rhythmic proportions.

# MATILDA

(Maud; 1102–1167). Countess of Anjou and claimant to the English throne. After 1121, Matilda was the only surviving legitimate child of Henry I, king of England and duke of Normandy. After the death of her husband, Emperor Henry V of Germany, in 1125, Matilda was reunited with her father, whose barons swore to support her as his heir. In 1128, Matilda married Geoffroi Plantagenêt, count of Anjou.

In 1135, conflict arose between Matilda's father and husband over Normandy. Matilda and Geoffroi were in rebellion when Henry died in December, and this may have contributed to Matilda's loss of the English crown to her cousin Stephen of Blois. Between 1139 and 1148, Matilda was in England, fighting unsuccessfully for the throne, although she did win the right of succession for her son Henry II (r. 1154–89). Matilda

then returned to Normandy, where she assisted in the routine business of ducal, and later royal, government.

Although English chroniclers saw Matilda as arrogant and unsuited to rule, she won the approbation of continental writers. A patron of letters, Matilda received dedications from the historical writer Hugues de Fleury and the poet Philippe de Thaün. Upon her death, she bequeathed money to construct a stone bridge across the Seine near Rouen. She had also been a generous patron to Cistercian and Augustinian monasteries but above all to the Benedictines of Bec-Hellouin.

# MATTHEW OF AQUASPARTA

(ca. 1240–1302). Bonaventure's most famous disciple, Matthew was a gifted Franciscan leader rather than an original theologian or academic. He was born in Aquasparta, near Todi, and became a Franciscan ca. 1254. By 1268, he was studying theology in Paris under John of Peckham and was later Franciscan regent master there. He also taught at Bologna. In 1278–79, he followed John of Peckham as *lector sacri palatii* in Rome, and his ecclesiastical rise continued in regular fashion: he was minister-general of the order in 1287, cardinal in 1288, and cardinal-bishop of Porto and Rufina in 1291, carrying out various missions for Boniface VIII.

Matthew's academic strengths are his clarity of mind and of expression. Largely following and developing Bonaventure (and therefore Augustine) in his thought, he nevertheless gives a lucid restatement of some of the most difficult issues. His own opinions are most evident in the theory of knowledge. However, like Bonaventure, he is Franciscan in believing that the end of human speculation is not knowledge but love of God.

His writings, which were not widely circulated even in his own time, include biblical commentary, a *Sententiae* commentary, quodlibetal questions, disputed questions, and sermons.

# MATTHIEU D'ARRAS

(d. 1352). Born in northern France, Matthieu d'Arras was in Avignon when hired by Emperor Charles IV to design and build the new cathedral of Prague. He supervised the construction of Saint-Vitus from the laying of its foundation stone on November 21, 1344, until his death, completing eight choir chapels together with the corresponding arcades of the main vessel to the height of the triforium. Although nothing is known of Matthieu's other buildings prior to Prague, his plan for the cathedral reveals a strong influence from Narbonne, the most monumental of recent French episcopal projects. Matthieu's work is often branded as traditional and overshadowed by that of his successor, Peter Parler, yet his piers anticipate Late Gothic design in their compact prismatic forms and reduction of capitals to thin moldings. The subsequent activity of his workshop at the abbey of Sázava, the Celestine church at Oybin, and the Cistercian house of Skalice contributed significantly to the spread of the Gothic style throughout Bohemia.

# MAURICE DE SULLY

(ca. 1120–1196). Maurice had a strong episcopal career, culminating in his project to rebuild the Carolingian cathedral of Notre-Dame in Paris, which led to the cathedral we know today. It was begun, but not finished, in his lifetime.

Born at Sully, near Orléans, of humble parents, Maurice was a student of Peter Abélard. By 1147, he was canon and subdeacon of Notre-Dame and master in the cathedral school. Famed for his preaching, he became bishop of Paris in 1160, on the

death of Peter Lombard. He made strenuous attempts to reform his diocesan clergy, and was a friend, adviser, and delegate to Louis VII and Philip II Augustus. In the great tradition of scholar-bishops, he tried to continue his studies. His *Sermons on the Gospels* (1168–75), the oldest original prose extant in French, are also among the finest. They were later translated into Latin and English. He also wrote a treatise on the canon of the Mass.

Maurice began the rebuilding of Notre-Dame in 1163 (it was consecrated in 1182); he also rebuilt the episcopal palace. In 1196, he retired to the abbey of Saint-Victor, where he died in the same year.

# MAYOR OF THE PALACE

**.** The *maior domus,* "first man of the house," that is, of the palace, was originally the manager of the household and estates of the Merovingian kings. By the early 7th century, he was effectively the head of the royal government, a sort of chief of staff, while also representing the interest of the great noble families, to one of which he belonged. As the Merovingian kings weakened in the mid-7th century, the mayors of the palace became virtual heads of state. In 751, the mayor Pepin the Short overthrew the Merovingian dynasty and arranged for his own election as the first Carolingian king of the Franks.

Mayors were originally estate managers of great landowners, and a *maior domus* supervised the other mayors. At first, the Merovingians had their own *maior domus* to manage all royal estates and revenues, as well as the household. His close association with the king led to his gaining political powers, such as appointing and directing counts and dukes, presiding over the royal court, and commanding the army. He came to be a virtual prime minister for the king. The three Frankish kingdoms of Neustria, Burgundy, and Austrasia frequently had separate administrations headed by their own mayors of the palace, who were from the regional aristocracy and tried to make the office hereditary. Mayors like Ebroin of Neustria and Grimoald of Austrasia occasionally even attempted to install their own sons as kings. The victory of the Austrasian mayor Pepin II at Tertry in

687 led to the single mayorality for all of the Frankish kingdoms, held by a Carolingian, which presaged the establishment of the Carolingian dynasty.

# MEALS

**.** In households of comfortable means throughout the medieval period, it seems to have been customary in France to eat two meals each day: at or before midday, a principal meal, called *disner* (the Latin *coena* or *prandiuni*), was prepared, and toward the end of the day a lesser meal, called *souper* (or *merenda*). At the midday meal, all possible dishes might be served in two or more courses or servings, and, if the occasion lent itself, a proper formal ceremonial at table and in serving could be followed. The evening meal consisted, as the name suggests, primarily of lighter fare, such as sops (in which bread or toast was used to absorb a semi-liquid preparation) and pottages (any preparation whose basis was a broth), these being served with less formality and in fewer courses than the earlier meal. In religious institutions, the same two meals, *disner* and *souper,* were normal as well, although among the poorest in urban and rural communities little evidence exists. Peasants working their fields were likely unwilling to take much time for a substantial midday meal. To these two main meals may have been added two others, depending upon the social circumstances of the individual household: a *desjeunee (jentaculum)* and a light collation at bedtime.

Meals in comfortable households normally were eaten at trestle tables, set up for the purpose, spread with a cloth, and dismantled after the meal. Optionally, a long lap cloth at the edge of table functioned as a napkin to wipe fingers and lips. Standard table settings included a valuable container of salt; round pattens of bread *(trancheors),* to hold bits of food as they were eaten; goblets, perhaps shared between two diners; spoons and occasionally knives, a small knife being a personal possession that most individuals brought to a dining table. In formal circumstances, a fanfare announced meals with a summons to wash (the phrase was *corner l'eaue*); because fingers were the primary utensils at a meal, and because platters and bowls of food served more than one guest, cleanliness was emphasized. Collections of *contenances de table* legislated proper behavior of diners in refined society. The amount of service provided to diners varied greatly according to the affluence of the household. Personnel might be responsible for

highly specialized functions in the kitchen and hall, such as concocting sauces or carving the master's meats.

By the late Middle Ages, the *Menagier de Paris* and Chiquart's *Du fait de cuisine* show that the sequence of dishes in a formal meal on a meat day *(jour gras)* was more or less fixed as follows: boiled meats (with sauce), preserved meats (with sauce), a puree of greens, pottages (broths or stews), an *entremets* or diversionary preparation (possibly a figure molded out of meat- or pea-paste, possibly a *tour de force* involving a fire-breathing animal or fowl), roast meats and roast fowl (with sauce), wheat porridge *(fromentee)* with venison, pasties, more stews, a rice dish *(blanc mangier),* another *entremets,* cold dishes (jellied meats, galantine), fruit, mulled wine (hippocras or claret), and spiced candies *(dragees).*

To some extent, the sequence of dishes in a meal was determined by medical doctrines on the digestibility of different foodstuffs and their faculty for opening or closing the stomach. Principles in this doctrine held that those foods that were readily digested should be eaten first in a meal in order not to block the passage out of the stomach and so cause a corruption of the food already digested there; and further that those foods functioning as aperitives of the stomach or as digestives should be taken at the most suitable times. Boiled meats, having the warm and moist quality of the human body, should be served in the initial course; roasts and venison, both being relatively drier in nature, should be consumed later in a meal; hippocras and candies were universal digestives, considered central to any dessert.

The relative importance of the two regular meals might vary depending upon the events of the day. In particular, the exertions of a tournament made it advisable that the midday meal be somewhat less heavy than normal, and that *souper* be correspondingly more substantial.

The church's rules on fasting during penitential seasons and on certain days of the week (usually Wednesday, Friday, and Saturday) led to the development of menus from which the meat of four-footed animals, and their products (such as milk and grease), were absent. Such lean meals, with their dependence upon peas, poultry, fish, and almonds (the latter, like modern American peanuts, ground, substituting for milk and butter), came to occupy a large place in the diet of the period. Because meat was the dominant foodstuff in the meal in an aristocratic or wealthy bourgeois household, professional cooks had to maintain two distinct sets of menus in their repertoire, a meat menu and its lean counterpart.

# MEAUX

. Originally an *oppidum* of the Gallic Meldi tribe, Meaux (Seine-et-Marne) was made a bishopric in the 4th century; capital of Brie, it lay within the jurisdiction of the counts of Champagne, who granted it a charter in 1179. Along with the rest of Champagne, Meaux

was reunited to the French crown in 1285. During the Hundred Years' War, the city saw the crushing of the Jacquerie in 1358; although the town was burned, the cathedral was somehow spared. There are remains of the Gallo-Roman city walls, and recent archaeology has revealed a number of early churches. The cathedral of Saint-Étienne, begun ca. 1180, was continued in various Gothic styles into the 16th century. Its triportaled façade (14th-16th c.) is pure Flamboyant, but 13th-century sculpture from the earlier campaign was successfully reemployed in the central (Christ in Majesty) and south portals (dedicated to the Virgin). Only the north tower was completed. The north-transept portal has a 12th-century statue of St. Stephen, and both portals contain bas-reliefs showing scenes of his life. The south transept, both interior and exterior, is a beautiful example of Rayonnant Gothic. Below its enormous rose is a delicately carved openwork triforium that opens onto the lancet windows. The interior consists of a lofty, welllighted nave with impressive double side aisles, transept, and Rayonnant Gothic chancel with double ambulatory and five apsidal chapels, built by an architect inspired by Soissons.

The adjacent rectangular chapter house, with its four corner turrets, is a rare example of 13th-century capitular architecture. Thought to have been originally the chapter's tithe barn, it is a three-story rectangular structure, consisting of a cellar, a ground floor with ogival vaulting, and an upper room with wooden ceiling, which is reached by a covered exterior staircase (15th c.). Nearby, the episcopal palace (15th-17th c.) preserves a 12th-century chapel.

# MEDICAL PRACTICE AND PRACTITIONERS

. The image of premodern medicine is skewed to the extent that our evidence is scriptural rather than material and discursive or demonstrative rather than factual. It remains difficult to do justice to the varied group of men and women who catered to the health needs of most people and who were far less marginal throughout the Middle Ages than their modern counterparts. They ranged from herbalists to bath attendants and from midwives to miracle workers, but in France their protagonist, as the successor to the Roman *medicus,* was the *mège (metge, metgesse)* or *mire (miresse).* Together with popular medicine in general, this figure was eclipsed, more completely than the analogous *læce,* or "leech," in England, by the learned physician or doctor and his Latin writings.

The sources from the first two-thirds of the medieval millennium are meager, yet they reveal some persistent characteristics of French medical practice. A disproportionate prominence of royal patients, the influence of imported healers and Mediterranean

traditions, and a preference for palliative therapy over more aggressive intervention: all these features are personified by the physician who attend to Theuderic I of Austrasia, the son of Clovis. Anthinus, a Byzantine exile sent to Metz by the Ostrogothic king Theodoric, left prescriptions that are nutritional rather than medicinal. When native practitioners first became literate, they drew on classical traditions not only through Gallo-Roman schools, as at Marseille or Autun, but also through monastic infirmaries. By the 10th century, as we learn from a personal appeal by Charles the Simple and a heralded visit by Bishop Adalbero of Verdun, the oracle and mecca for health seekers was the center of Salerno, where cures as well as care revolved around a "regimen," or dietary governance. The propagation of Salernitan wisdom, even across the Channel, was aided by emanations from Chartres and by such individuals as the monk Baudouin, French physician to Edward the Confessor.

Until close to 1100, the majority of acute and chronic ailments that demanded more intense attention seem to have been treated by monks, faith healers, good Samaritans, and part-time practitioners. A rising demand for more specifically trained and dedicated "professionals" is reflected in the 12th-century complaint by the Welsh visitor Giraldus Cambrensis that the wandering monks of Cîteaux and Clairvaux treated the populace "not with fresh drugs, selected syrups, or medicines compounded according to the art, but only with collected and assorted herbs of the fields, as if this would seem to be something unusual." A contemporary, the satirist Guiot de Provins, clearly differentiated unschooled practitioners, the *medicus* and the apothecary, from the physician who had been academically trained at Salerno or Montpellier and who commanded a higher honorarium.

A literate instruction in health care was virtually inaccessible to anyone outside the clergy. Members of this class, however, faced ethical problems when they wished to apply their schooling, particularly to lucrative transactions, surgical treatments, and such unseemly activities as gynecol-ogy or even diagnosis by uroscopy. The practice of medicine by clerks was initially proscribed at church councils on French soil (at Clermont in 1130 and at Tours in 1163) and formally prohibited in 1219, but, paradoxically, it remained more prevalent—and far more physicians held prebends or church benefices—in France than elsewhere until the 15th century. As further ironies, even here the secularization of medicine was the result less of ecclesiastical restrictions than of incorporation in the universities, and it did not preclude the special deference that academically trained physicians showed to clerical prerogatives in their refusal to treat the critically ill before they had gone to confession.

As the professionalization of medicine evolved in the university, it accentuated the social ranking of practitioners on the basis of literacy. The teaching of the art became paramount, and the title of "doctor" appeared more coveted than those referring to healing. Nevertheless, the exercise of the art remained the object of school statutes that required experience as an integral part of training, of many scholastic writings devoted to diagnostic techniques and therapeutic procedures, and of the professors' careers and communal actions outside academe. Once they had gained control of instruction, the incorporated physicians aimed for the regulation of all practice by means of licensing. An avowed concern with the public welfare as well as a drive for control, if not for monopoly, culminated at Paris between 1332 and 1352 in a bitter campaign of the faculty against two dozen unlicensed practitioners. On account of their Latin book learning and

their practice with oral advice rather than with manual intervention, doctors deemed themselves above surgeons, unlike in Italy; the distance was more pronounced in Paris than at Montpellier.

Even within the craft of surgery, there was a stratification based as much on education as on activities. In his *Livre des métiers,* the *prévôt* of Paris under Louis IX, Étienne Boileau, distinguished between the *barbier-clerc,* or surgeon-barber, "of the long robe" and the lowlier *barbier-laic,* or barber-surgeon, "of the short robe." The former, who seemed as much at ease in the royal court as downtown, claimed greater respectability on account of their knowledge of medical theory; their ambitions gained momentum after 1295, when Lanfranc of Milan introduced academic surgery to Lyon and to Paris; and they were recognized as a faculty by King John in 1356. Most illustrious among these master surgeons were Henri de Mondeville and Gui de Chauliac, distinguished by their books no less than by their care of kings and popes. A larger group was that of the barber-surgeons, whose chief customers were merchants, sailors, and other travelers; from 1311 on, they were allowed, after examination by four sworn masters, to provide such health-related services as cupping and bloodletting; incorporated in Paris since 1361, in 1372 they received from King Charles V permission to extend their activities to the treatment of "boils, tumors, and open wounds if these are not mortal."

Documented practitioners, whatever their educational level, were naturally concentrated at noble courts and in urban centers. Their services, less often as providers of care to the community than as expert witnesses at trials, examiners of alleged lepers, and inspectors of health conditions, were engaged by municipalities mainly from the 15th century on, later than in Italy. Such services may not have received generous compensation, and bourgeois patients were perhaps not the most profitable ones. While doctors to notables could accumulate considerable fortunes, urban practitioners appear to have been of modest average means. One may be surprised to learn that in Paris the majority of them paid low taxes, and in Toulouse one-half were characterized as "poor devils."

# MEDICAL TEXTS

. With the rise of the universities in the 13th century, an increasing number of medical texts become available to students and scholars along with such classics as Avicenna's *Canon,* Galen's *Ars parva,* and Hippocrates's *Aphorismi* or *Pronostica.* The great majority of authors of medical texts were conferred degrees by the University of Montpellier, where the best medical teaching among all nineteen French universities was available. The broad body of known medical texts reveals the most common preoccupations of both the authors and readers. They can be divided as follows: (1) commentaries dealing with problems of medical doctrine; (2) practical books, such as diets written for an individual, *Consilia* with diagnosis and prescriptions for certain illnesses, and *Experimenta,* such as Arnaud de Villeneuve's *Tractatus de diversitatum infirmitatum,* which recorded various types of diseases witnessed by a doctor; (3) general treatises, including such encyclopedias as Ricardus Anglicus's *Micrologus* and Bernard de Gordon's *Lilium Medicine;* (4) treatises dealing with one medical specialty, such as *De pulsibus, De febribus* (14th-c. plague literature belongs to this category); and (5) texts related to antidotes and medications.

Medicine and surgery were one and the same discipline until the 13th century. One of the most influential medical treatises of the period, Henri de Mondeville's *Chirurgie,* composed in Latin and then translated in an abridged form (B.N. fr. 2030), treats not so much of surgery, as the title might suggest, but of potions, ointments, cosmetic treatments, and recipes for treating specific ailments. The official surgeon of King Philip IV, Henri had studied at Montpellier and often exercised his trade on the field of battle. Only with the *Chirurgia magna* of Gui de Chauliac (1300–1368) do we encounter a medical text devoted purely to surgery. Gui studied at Montpellier and practiced at Avignon, where he was the doctor to three popes, Clement VI, Innocent VI, and Urban V. His work was translated into French in the 14th century, as well as into Occitan, Dutch, Middle English, and Hebrew; it was first printed at Venice in 1498. Jacques Despars, who practiced medicine in the entourage of Philip the Good of Burgundy, devoted thirty years (1432–53) to the *Commentarius in Canones Avicennae,* his *summa* of the medical knowledge of the 15th century, which included quotations from Greek and Arabic writers, problems of doctine, and practical examples.

Although over 80 percent of all medical texts were written in Latin, some practical texts dealing with health, hygiene, or the plague were composed in the vernacular, in both verse and prose: among the more important are the anonymous 13th-century Anglo-Norman *Novele chirurgie,* Jean Falco's *Notables déclaratifs sur le Guidon,* and Jean le Lièvre's *Petit traictié sur le fait du nombre de la déclairacion des vaynes qui sont assises*

*sur le corps de la personne.* Along with these should be mentioned Jean Sauvage's *Trésor des povrez* or *Réceptaire de Jean Sauvage,* a 14th-century verse and prose translation of Pierre d'Espagne's *Thesaurus pauperum.* It is a compilation of remedies of all sorts and provenances.

# MEDITERRANEAN TRADE

. The Romans bequeathed a Mediterranean trade network to medieval southern France. Salvian, Caesarius of Arles, and Gregory of Tours mentioned Syrian, Jewish, and Greek merchants in Mediterranean French towns in the 5th and 6th centuries, indicating a persistence of international trade, though of what volume and importance is not known. In addition, ships with Mediterranean goods—oils, wines, pottery—made their way to Brittany and Britain. Coins minted in Provence have been found as far afield as Sutton Hoo. The succeeding centuries witnessed a decline in French Mediterranean trade, but some international exchange may have continued under Charlemagne, who recognized Viking ships, initially mistaken for Jewish, African, or British merchant vessels, off the Mediterranean coast of France. Diplomatic exchanges, if not actual trade, existed between Charlemagne and the Abbasid caliph Harun-al-Rashid.

Little evidence survives for 10th- and early 11th-century French Mediterranean trade. With the 11th century, however, coastal shipping can be documented, and by the end of the century, merchants of such towns as Montpellier were recorded in the Levant. Mediterranean trade overall revived substantially in the 11th century under the leadership of the Italo-Byzantine towns of Italy. The Genoese and the Pisans established commercial hegemony over the Mediterranean coast of France during the mid-12th cen tury. The Rhône town of Saint-Gilles was the center of Italian trading efforts in southern France. In exchange for products of the East, Europeans could offer expensive spices and fabrics, raw materials, wool cloths, iron for military purposes, wood, and slaves.

During the Third Crusade, Conrad de Montferrat granted tax exemption and free circulation to bourgeois of Saint-Gilles, Montpellier, Marseille, and Barcelona in return for aid against Saladin. Gui de Lusignan accorded similar privileges at Saint-Jean-d'Acre and elsewhere within the Latin kingdom of Jerusalem. However theoretical these concessions, given the recent loss of territory, they represent the beginning of commercial emancipation from Italian domination. The 1220s witnessed a series of treaties of nonaggression and commerce among towns of Languedoc and Provence. The great natural port of Marseille became a hub of wide-ranging trade among southern France, the

ports of Bougie and Ceuta in North Africa, and the Levant. Exports of northern French and Flemish cloth, along with substantial credit activities in the form of money-exchange contracts, underlay the Levant connections out of Marseille. Reexport of eastern products, silks in particular, was directed to North Africa. The heyday of Marseille came to an end with its conquest by Charles I of Anjou in 1262. From that date until at least the mid-14th century, it was Montpellier, trading out of the French port of Aigues-Mortes, that would dominate western trade with the Levant.

French Mediterranean trade underwent numerous changes in the later 13th and 14th centuries. In the western Mediterranean, southern French trade linked Montpelliérains and Marseillais with outlets in Majorca, Naples, Sicily, and Sardinia. North African contacts moved farther east to Algiers and Collo once the Aragonese were implanted at Ceuta. In the eastern Mediterranean, crusading losses on the Syrian mainland meant that trading activities were forced back on the islands of Cyprus and Rhodes. Additional eastern Mediterranean trading destinations included Armenia, Alexandria, and the Byzantine empire. Papal prohibitions of trade with the infidel did not hinder southern French Mediterranean commerce, but this trading network was further disrupted with the breakup of the Mongol empire in Asia beginning in the 1330s.

Economic problems in the 14th century, the Black Death, and the Hundred Years' War occasioned decline in French trade. The Italian towns remained strong competitors, as did the Majorcans and the Aragonese, particularly from their expanding port of Barcelona.

# MEHUN-SUR-YÈVRE

. The little town of Mehun (Cher) on the Yèvre just north of Bourges, has three medieval monuments: the remnants of John, duke of Berry's castle, illustrated in his *Très Riches Heures* in a miniature by Paul de Limbourg; the collegial church of Notre-Dame; and the Porte de l'Horloge, a vestige of the 14th-century ramparts. An older castle was sumptuously rebuilt between 1367 and 1390 by John, and here he received important artist friends, among them the writer Froissart, the Limbourg brothers (miniaturists), and the sculptor and architect André Beauneveu, who worked on the reconstruction under the general direction of Gui de Dammartin. Built on a trapezoidal plan, Mehun was distinguished by its light and airy Gothic upper level, which may have inspired Chambord. John bequeathed the castle to his grandnephew Charles VII, who was crowned (1422) and died (1461) here. Charles was visited at Mehun-sur-Yèvre by Jeanne d'Arc in 1429–30.

The Romanesque church of Notre-Dame, built in the form of a horseshoe, was begun in the 11th century. A Flamboyant chapel was added in the 15th century.

# MELUN

. The town and viscounty of Melun (Seine-et-Marne) in the Île-de-France produced a noble house that rose to prominence in 14th-century France. Tracing their ancestry to the 10th century, the viscounts of Melun were well established by the early 13th. Adam II (d. 1217) accompanied the future Louis VIII on several campaigns, and his brother Jean became bishop of Poitiers. Adam III (d. 1247) left four sons, two of whom successively held the vice-comital title, while a third, Simon, became lord of La Louppe and Marcheville and was a marshal of France before being killed at Courtrai in 1302. Simon's brother, the viscount Adam IV (d. 1304), had four sons, two of whom, Guillaume and Philippe, became archbishop of Sens, while the oldest, Jean I, enhanced the family's fortune by marrying the heiress to the Norman lordship of Tancarville.

The children of this marriage brought the family to the height of its prestige. They were associated with the reforming party in northwestern France. The oldest son, Jean II, viscount of Melun and count of Tancarville (d. 1382), was a royal chamberlain and

prominent military commander under kings John II and Charles V. His brother Adam, lord of Château-Landon (d. 1362), was first chamberlain and a leading royal adviser. The third brother, Guillaume (archbishop of Sens, 1345–76), was perhaps the dominant figure in the royal council between 1359 and 1374. Raymond Cazelles called him the "Richelieu of the 14th century." Guillaume IV, who held the family titles for over thirty years until his death at Agincourt in 1415, was a leading figure in the court faction known as the Marmousets, which inherited much of the program of the earlier reforming party. Guillaume IV, who was also butler of France, left no male heir. His daughter Marguerite married into a cadet line of the Harcourt family of Normandy.

# *MENAGIER DE PARIS*

. A rich householder of Paris ca. 1394 composed for his young wife a prose work on how to achieve a successful and happy marriage. Incomplete, this treatise provides moral teaching with accompanying exempla and practical instructions on the supervision of the household. Also included is detailed information on gardening for both flowers and vegetables, the care of dogs and horses, falconry, the hiring and mangement of servants, and cooking (which comprises marketing, devising menus, and many recipes). The *Menagier* is in the genre of educational treatises for women and sheds light on late-medieval bourgeois life and the tradition of the popular tale. It survives in three manuscripts.

# MENDICANT ART AND ARCHITECTURE

. From the time of their founding in the early 13th century, the Dominican and Franciscan orders played an important role in France. Paris, especially the university, was a major center for both orders, and both also benefited from royal pa-
Toulouse (Haute-Garonne), Dominican
church, section, elevation and
isometric. After Duret.

tronage, but the mendicants could be found throughout France. Several difficulties are encountered, however, in studying their impact on French art and architecture. Because of their mendicancy and vows of poverty, their conventual structures and furnishings, which emphasized function and simplicity, did not conform to particular stylistic characteristics. The orders did not produce their own art but rather relied on secular artisans. And finally, they preferred urban centers, where many of their buildings and possessions have been destroyed or dispersed. Despite these limitations, several approaches provide insight into their influence on late-medieval French art.

Because so many mendicant structures have been destroyed, knowledge of French mendicant architecture is based on a few surviving buildings, primarily in southern France, and on plans and drawings. For example, none of the four Dominican churches in Paris is extant, but plans reveal that the major church of the Jacobins had parallel naves supported by center piers.

This type of plan recurs in one of the most impressive surviving mendicant churches in France, the Dominican church of the Jacobins in Toulouse. In this late 13th-century edifice, the long nave of six rib-vaulted bays is supported by central columns and terminates in a polygonal choir. Although other double-nave Dominican churches were built in France, as at Agen, the Dominicans and Franciscans favored simple structures with a large single nave that either had a flat roof or was vaulted, as in the now destroyed church of the Cordeliers (Franciscans) at Toulouse.

In some cases, royal patronage promoted more elaborate architecture. In 1295, Charles II, count of Provence, entrusted to the Dominicans a foundation dedicated to St.

Madeleine at Saint-Maximin. The church, built during the 14th century, had a long nave with double aisles, a po lygonal apse with two diagonally placed chapels, and a three-story elevation reminiscent of Gothic architecture in northern France. French mendicant architecture, though it lacks common stylistic features, reflects the way in which the demands of function, practicality, and patronage were adapted to a particular situation.

Although the mendicants stressed simplicity and poverty, their churches were furnished with appropriate devotional paintings, sculpture, and other objects. Unfortunately, because few of these art forms have survived *in situ,* direct evidence for the character of visual arts associated with the French mendicants is limited. The Franciscans and Dominicans had a great impact on popular piety and the iconography of devotional art that it inspired in the later Middle Ages. Their influence is apparent in French manuscript illumination, especially in liturgical and devotional books whose usage indicates Franciscan or Domini-can connections. The late 13th-century north French *Psalter and Hours of Yolande de Soissons,* for example, shows Franciscan inspiration in miniatures of St. Francis preaching to the birds, the magus kissing the Christ child's foot, and the image of the Tree of Life. Many French manuscripts from the 13th century on utilize similar iconographic motifs. The illumination of the *Belleville Breviary* of ca. 1325, produced for a Dominican, is associated with Jean Pucelle. The complexity of the didactic imagery, including three lost miniatures that can be reconstructed from a prefatory explanatory text, may reflect the Dominican mission of teaching and explicating theological issues. The cycle representing the articles of faith was the model for illustration in several other French devotional manuscripts. The mendicants thus had a pervasive and diverse influence on French art, architecture, and iconography in the late Middle Ages.

# MENTAL HEALTH

. In medieval scholastic theory and in everyday practice, functional intelligence and "normal" behavior enjoyed greater latitude than today, yet their impairment was also

extended to disease categories that ranged from lovesickness to rabies and from incubus to epilepsy. The understanding and treatment of aberrations readily fell in the realm of religion because of the affinity between mind and soul, the moralization of conduct, and the mysteries of mental processes. Nevertheless, physicians and laypeople recognized the role of natural factors, including a person's history, environment, and bodily condition—primarily soundness of the brain and balance of the humors. Somatic and psychological considerations shaped most rules of mental hygiene and explanations of dementia. The *frénésie* of Robert de Clermont, son of Louis IX, was attributed to blows he received on the head during a joust. The decline of Charles VI into *manie* was blamed on excess humidity inherited from his mother, troubles with his nobles, and an ensuing excess of black bile.

Dynastic streaks of madness were paralleled by more widespread disorders, as suggested by mass hysterias in 9th-century Dijon, recurring episodes of St. Anthony's Fire *(le mal des ardents),* and the misery of pilgrims to a hundred shrines. Mental maladies ranked high among the reasons for visiting the tombs of St. Martin and other prominent healers. Early specialists in miraculous psychotherapy, led by St. Acaire and St. Mathurin, received competition from such aptly named saints as Aimable at Riom (Auvergne) and Front and Mémoire at Périgueux. Pilgrimages appear routinely in the poignant dossiers of the insane, who, after being convicted of a major crime, were granted a royal pardon.

Attitudes toward the mentally ill in medieval France appear to have been more relaxed and humane than in other regions and in later France. There is far less evidence of confinement in "fool's cells" than, for example, in Germanic lands. The mentally ill were considered best served by family care; if they became *furieux,* they could be tied or locked up only with official permission. For the indigent, cities not only founded hospitals but also subsidized clothing and other expenses, even for pilgrimages and votive offerings, as evident in the accounts of Lille. Communal care of the mentally ill was further provided by special fraternities, such as that of St. Hildevert at Gournay.

# MERCHANTS

. In the Roman world, mercantile activities were stigmatized. In medieval France, after the Frankish conquest, the few references to merchants cite primarily foreigners: Syrians,

Greeks, Jews. There are few details regarding an indigenous merchant community. Under the Carolingians, the Rhadanite Jews were still a factor, and along with them one finds mention of palace merchants purveying supplies to the itinerant royal court. At Aix-la-Chapelle under Louis the Pious, there was mention of residences of merchants. By and large, the fate of merchants was that of towns under the Carolingians: little accommodation was made for either.

Pirenne and later historians have linked the urban revival and the growth of a merchant class in the late 10th and 11th centuries to the recovery of international trade in Europe. As has been demonstrated by Lestoquoy and Espinas for northern French towns like Arras, long-distance commerce and the settling down of the itinerant merchants were not the only causes of the reemergence of towns. Demographic growth of the local, previously agricultural, community furnished candidates for the merchant class. Northern French merchants were actively patroniz-ing the Champagne fairs by the end of the 12th century, while their high-quality wool cloths joined Flemish products as premier French exports in the Mediterranean world. Southern French merchants followed in the footsteps of Italians to participate in this trade. Merchant wealth led to the acquisition of real estate in town and countryside, as well as to marital alliances with the increasingly impoverished nobility.

Merchants and artisans were sufficiently numerous and powerful to be politically active in the 11th century in communal revolutions in such towns as Le Mans and in the 12th century in the establishment of southern French consulates. The political activities of merchant elites received the positive endorsement of the French kings from Louis VI through Louis VIII. The financial needs of Louis IX and his conservative stance on usury led to a more exploitative attitude. By the reign of Philip IV, the urban autonomy of French mercantile communities had fallen victim to the expansion and intrusion of royal government, but the basic alliance between bourgeoisie and king would survive the Middle Ages.

# MEROVINGIAN ART

. The term "Merovingian art" should refer to all the arts produced in the territories dominated by kings of the Merovingian family from Clovis in the late 5th century to the deposition of the last Merovingian king by the Carolingian, or Arnulfing, family in 751.

In art-historical writing, however, the term's use is commonly both contracted and expanded. It is contracted by restriction to the architecture, sculpture, and painting produced for Christian purposes, material dating primarily from the 7th and 8th centuries, and by the exclusion of much of the metalwork of the 6th century, relegated to the "migrations arts." On the other hand, the term is expanded to connote an artistic style distinct from the developed Carolingian court styles with their more classicizing appearance, even if the work in question dates from the early 9th century, so that some of the best-known examples of "Merovingian illumination" date from the second half of the 8th and even from the early 9th century.

Not even one surviving intact building can be confidently termed Merovingian. The only likely candidate is the baptistery of Saint-Jean in Poitiers, a central-plan structure richly decorated with colored masonry patterns and elements of Roman architecture, such as pedimental gables and "Corinthian" capitals and pilasters; but the date of the building remains controversial, and it may well be earlier or later than the Merovingian period. Some fragments of Merovingian masonry, like the elaborate carving and coursing of the 7th-century wall at Jouarre, clearly testify to a high level of craftsmanship. Literary sources, especially the writings of Gregory of Tours, make it clear that many churches were built and often richly decorated. The most famous example is the church of "La Daurade" in Toulouse, elaborately covered with gold and figural mosaics; one of the more intriguing is Gregory's reconstruction of his own church of Saint-Martin at Tours after its destruction by fire in 558, whose painted decoration Venantius Fortunatus described at length ca. 590. Many Merovingian cathedrals and other churches, including that of Paris, survived for centuries, being generally replaced with large Romanesque and Gothic churches in the later Middle Ages.

In contrast to the dearth of surviving architectural works, abundant sculpture survives from the Merovingian period. Among the best-known works are three 7th-century sarcophagi from the monastery of Jouarre, which show a high standard of ornamental carving and epigraphy for the tomb of Abbess Theodechilde, and elaborate and inventive Last Judgment and theophanic Christ images on the tomb of Bishop Agilbert. The early 7th-century sculptures of the "Hypogée des Dunes," or Memoria of Abbot Mellebaudis, at Poitiers, an underground burial chamber and chapel, are a rich mixture of ornamental and figural carvings, the latter including perhaps the remains of a monumental Crucifixion group as well as fragments of carved sarcophagi. The importance of sarcophagi as a locus for carving, and for devotion, is clearly a direct inheritance from the late Roman and early Christian period; carved stone and plaster sarcophagi with primarily ornamental decoration, often with apotropaic significance, were produced in great numbers during the period.

Merovingian painting survives only in the form of manuscript illumination; all the mural paintings attested by literary sources have been lost. It seems likely that most of the books were produced at such great monastic scriptoria as Luxeuil and Corbie, originally founded as part of the Irish missionary activity on the Continent in the 7th century, as well as at Laon and other centers not yet identified. In comparison with contemporary Irish and Anglo-Saxon illumination, the Merovingian works often seem simple and even clumsy, dominated by simple color schemes and for the most part decorated with zoomorphic and vegetal patterns derived from late antiquity, and especially applied to initial letters and to framing of text pages. Whereas most decorated insular books of the

period are liturgical or altar books, however, surviving Merovingian manuscripts are commonly doctrinal works, commentaries on Scripture, encyclopedias of Isidore, and even secular law books—library rather than altar books, in other words, whose decoration at any period is generally less elaborate, painstaking, and costly.

A notable feature of Merovingian art was the production of magnificent gold and jeweled metalwork for ecclesiastical purposes. Techniques and styles developed for luxurious secular objects during the "Migration" period, especially garnet and enamel *cloisonné* work, were adapted for use in chalices, croziers, crosses, and reliquaries. Among these the most notable include the small fragment of the large cross made by St. Eligius, metalworker and bishop of Noyon in the 7th century (B.N., Cabinet des Médailles), and the slightly later reliquary casket made by Undiho and Ello for the priest Teuderigus (Saint-Maurice-d'Agaune, Treasury). The association of these works with known artists bears witness to the high prestige of this form of artistic work, a prestige clearly inherited from pre-Christian Frankish traditions.

# MEROVINGIAN DYNASTY

. The first dynasty of kings to rule over the Franks became known as the Merovingians. Their realm included not only most of modern France but western Germany and the Low Countries. The first Merovingian to rule over this area was Clovis 1 (r. 482–511), and the last was Childeric 111, who was overthrown by the Carolingian mayor of the palace Pepin the Short in 751. The Merovingians are considered to be the "first race" of French kings, and their long retention of an old Germanic aristocratic hair fashion led to their being called "the long-haired kings." Their reputation is one of cruelty, violence, immorality, and fraticidal warfare. The term "Merovingian" is also applied to the period of Frankish history from 482 to 751, as well as to the culture and civilization of the lands under the control of the Merovingians.

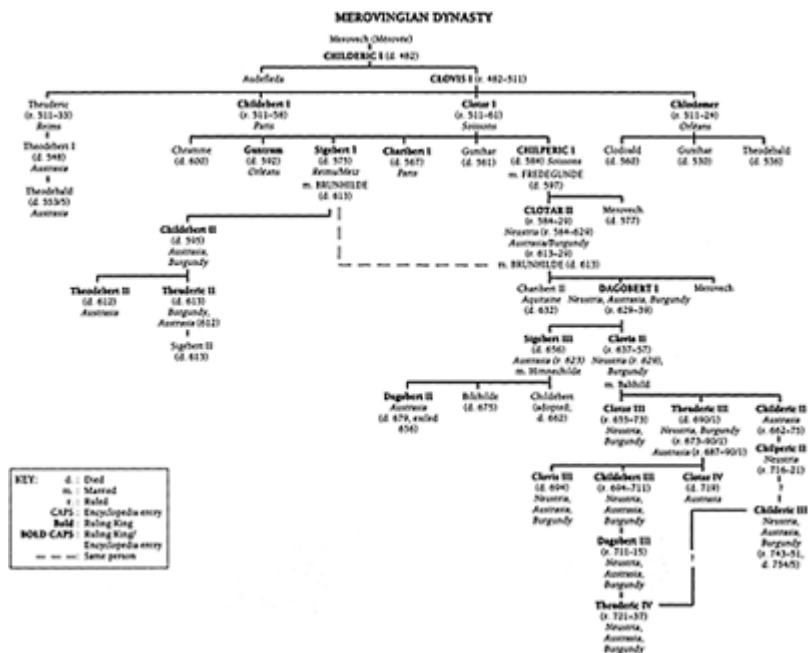
The Merovingians were named for Merovech, a semilegendary figure who was the father of Childeric I. Their origins are as chieftains of one of the many bands of Salian Franks living to the west of the lower Rhine, with their own center around Tournai and Cambrai, along the modern frontier between France and Belgium, in an area known as Toxandria. It is likely that all of the Salian chieftains were related, and their power would

have been that of priest-judges. The Merovingians became true kings by two means. Childeric I, and perhaps Merovech before him, was an active ally of the Roman Empire and was himself a Roman official. He would thus have been influenced by Roman concepts of kingship. The takeover of the Roman administrative structure of Gaul by Clovis I put him in the legal position of the Roman emperor there. Thus, from the beginning of the Frankish kingdom, there were in theory no constitutional restrictions on the power of the kings. The only limitation on their will was the willingness of their subjects to tolerate their actions. Merovingian kingship was, as it has been said, "absolutism tempered by assassination."

It was Clovis I who made the spectacular rise from being the leader of the Salian Franks around Tournai to becoming the founder of the Frankish kingdom. By warfare, deceit, and treachery, he unified all of the Frankish tribes under his authority and conquered northern Gaul after his defeat of Syagrius in 486 and southern Gaul after his defeat of the Visigoths in 507. He also established his dominion over the Alemanni and the Thuringians. By the end of his reign in 511, Clovis ruled over a kingdom stretching from Germany to the Atlantic to the Pyrénées, in which the Franks were only a small minority within a largely Gallo-Roman population. Clovis adopted the Roman administrative structure intact, and he worked closely with the Gallo-Roman aristocracy of his lands. The differences between Frank and Roman were further reduced by his conversion to orthodox Christianity.

These characteristics were continued after Clovis by his sons, Theuderic, Chlodomer, Childebert I, and Clotar I. In accordance with Frankish custom, they received equal portions of their father's lands. Although there were then four independent Merovingian kingdoms, there was only one kingdom of the Franks. The next half-century saw the conquest of the Burgundian kingdom by the sons of Clovis (534), but it also witnessed vicious warfare within the family that led to the extinction of the lines of three of the brothers and the reunification of the Merovingian kingdoms by Clotar I from 558 to 561. At his death, however, there was another quadripartite division of the kingdom among his sons, Charibert I, Sigibert, Guntram, and Chilperic I. Another half-century of bloody warfare among the Merovingians ensued, and it was Chilperic I's son Clotar II who again reunited all the kingdoms (613). During this second major division, the four great distinct regions of the Frankish kingdom emerged: Neustria, Austrasia, Burgundy, and Aquitaine. They were to have a strong sense of identity as well as yearnings for autonomy. From time to time, Austrasia received a son of the Merovingian king as an autonomous ruler. Yet with or without their own kings, Austrasia, Neustria, and Burgundy usually had their own royal administration under the direction of a mayor of the palace.

Clotar II and his son Dagobert I continued to rule in the strong Merovingian tradition, but the rising power of the aristocracy, led by mayors of the palace, was already evident. After the death of Dagobert in 639, the position of the Merovingian kings declined rapidly, and they fell under the domination of the aristocracy and the mayors of the palace. Merovingian reigns tended to follow the pattern of a weak or sickly king's death at an early age, leaving minor heirs under the tutelage of the magnates. The unification of the Frankish kingdom by Clotar II had the accidental effect of eliminating relatives as fellow kings, who in the past had served as guardians of such heirs. In addition, the Merovingians often married low-born women who

MEROVINGIAN DYNASTY


lacked powerful kinsmen who might have provided support for the queen and her children on such occasions. Generous land grants to favorites, especially aristocrats, had, moreover, steadily reduced the material resources, and thus the power, of the kings.

The Merovingian kings after Dagobert I are traditionally seen as puppets of the mayors of the palace, as "do-nothing kings" *(rois fainéants)*. It is true that the Merovingian decline tempted ambitious mayors like Ebroin of Neustria (d. 680) and Grimoald of Austrasia (d. 656) to plot to put up their own sons as kings, but aristocratic rivalries and strong loyalties to the Merovingian dynasty thwarted these efforts. Some of the later Merovingians were not mere puppets. Childeric II of Austrasia (r. 662–75) was important enough to be murdered in a vendetta, and for a time Theuderic III (r. 673–90/91) actually did rule rather than merely reign.

However, from the victory of the Austrasian mayor Pepin II in 687, the future of the Frankish kingdom was in the hands of the Pippinid-Carolingians. Charles Martel ruled without a Merovingian king on the throne from 737 to his death in 741, but the absence of a legitimate king provided an excuse for rebellions. Carloman and Pepin the Short were obliged to restore a Merovingian, Childeric III, to the throne in 743, but by 751 Pepin was secure enough to depose Childeric and arrange his own election as king of the Franks, thus ending the Merovingian dynasty and inaugurating that of the Carolingians. The Merovingians did not die out. They were forcibly removed in a *coup d'état*.

# MESCHINOT, JEAN

(ca. 1420–91). Born in the region of Nantes, this soldier-poet has been characterized as a "Grand Rhétoriqueur Breton," belying the theory that such poets came from humble origins. An impoverished nobleman, Meschinot served five dukes of Brittany, notably Pierre II and Arthur III, although he was official poet for François II, celebrating his marriage with Isabelle de Foix in 1471. His political poetry, in particular twenty-five ballades against Louis XI exchanged with Georges Chastellain at the time of the Guerre du Bien Publique, shows him to have been a *poète engagé*. His principal work, the *Lunettes des princes* (1461–65), is not, as has been suggested, a breviary for princes but rather a meditation on spiritual salvation for the noble soul, every human's most precious possession, regardless of station in life. The spectacles *(lunettes)* in question are given to the poet by Reason in order better to read a book on Conscience she gives him. This poem of 3,076 verses with a short prose interlude consists of a brief autobiographical opening and the poet's long dialogue with the four cardinal virtues: Prudence, Temperance, Fortitude, and Justice. It reflects the late-medieval taste for *miroirs* and *parements* but perhaps also the popularity of the earlier *Traité des quatre vertus* by the Pseudo-Seneca (Martin of Braga). Boethius is an immediate source for the poet's reflections. Although little-read today, the *Lunettes* is preserved in four manuscripts, and twenty-two editions printed between 1493 and 1539.

# *MÉTAYER/MÉTAYAGE*

. *Mérayage* is the agricultural regime apparently imported from Italy that became increasingly predominant in the French Midi in the later Middle Ages; it is comparable with *fermage* in the north. Small plots (fields, gardens, orchards, vineyards), medium-

sized farms, and large holdings (monastic granges or the demesne land of large estates) all came to be cultivated under *métayage*. Contracts for *métayage* were established for a set term during which tenant farmers *(métayers)* cultivated land by sharecropping rather than for fixed annual rents. Like those holding land for rents (under *baux à cens*), and unlike the dependent peasants attached to the manses of traditional estates, *métayers* had no hereditary rights to the land, although rental terms could be relatively long: twenty to thirty years, a tenant's lifetime, or even several lifetimes. Under *métayage,* the owner generally provided a farm with farmstead, livestock, equipment, seed, and sometimes even food for the start-up year; the tenant agreed to maintain the farm, equipment, and buildings in good condition and to split both income and expenses of a holding in a set proportion (often half and half, hence *métayage*) with the owner. Actual proportions due to owner and *métayer* varied widely, depending on the quality of the land involved and on the availability of land and labor locally; instances are recorded for southern France in which no *métayer* would take up offers of even 19/20ths of the produce of extremely poor land. The institution of *métayage* has often been heralded as indicative of the transformation of lords into city-dwelling rentiers, but this interpretation is now being questioned. In periods of improving yields, a division of output must have appeared advantageous to owners, who were obviously anxious to profit from in-creased production on their land. Owners must still have had to supervise their holdings closely to assure themselves that they were actually getting their share of the produce. This may explain why such sharecropping agreements were often eventually transformed into leases for fixed rents, either in money or in kind. In addition to their use for land cultivation, contracts of *métayage* were widely used for animal husbandry.

# METZ

. An important center of Frankish power on the Moselle River, Metz (Moselle) was the capital of Austrasia and the center of power of the Arnulfing-Pippinid ancestors of the Carolingians. It also was the principal city of the kingdom of Lorraine and later of the duchy of Upper Lorraine.

Divodurum, the capital of the Celtic tribe of the Mediomatrici, was a heavily romanized and substantial city with temples, aqueduct, baths, and amphitheater, located in the later Roman province of Belgica Prima. With its strong walls, it survived the invasions of the 5th century and became renowned for its many churches and

monasteries. After the division of the lands of Clotar I among his sons in 561, the region that was soon to be called Austrasia was allotted to Sigibert I, who eventually made Metz his residence. Thereafter, strong feelings of autonomy usually meant that Austrasia had its own king residing at Metz, with a palace and royal administration under a mayor of the palace. The bishop and mayor of the palace represented the powerful Austrasian aristocracy, and the Arnulfing-Pippinid family dominated both offices.

Bishop Arnulf and the mayor of the palace Pepin I were leaders of the opposition to Sigebert's wife, Brunhilde; Pepin's son Grimoald, mayor of the palace at Metz (d. 656), attempted to place his own son on the Austrasian throne. Pepin II conquered Neustria in 687 and began the family's domination of the entire Frankish kingdom. The Pippinids were aided by their control of the bishopric of Metz, not only with Arnulf (d. 626) but with Chlodulf in the mid-7th century, Chrodegang (d. 766), Angilramn (d. 791), and Drogo (d. 855), and also by the support of allied aristocratic families in the Meuse-Moselle region between Metz and Verdun.

The Carolingians stressed their ties to Metz by promoting the cult of their ancestor, Bishop Arnulf. Charle-magne had his wife, Hildegard, and several of their children who died in infancy buried in the abbey of Saint-Arnoult (Arnulf), which was also the final resting place for Louis I the Pious. When Charlemagne's kingdom was divided by the Treaty of Verdun (843), Metz was made capital of Lotharingia. In the 12th century, Metz declared its independence from the dukes of Lorraine and set itself up as a city-state ruled by a chief magistrate chosen from among the wealthy patrician families.

The cathedral of Saint-Étienne in Metz is 13th-century, the result of reconstruction in Gothic style that united two earlier churches. The two flanking towers, one of which serves as the town's belfry, were begun at this time but not completed until the 15th century. The height of the nave (138 feet) is striking, second only to that of Beauvais. It is lit by a remarkable ensemble of stained-glass windows, installed from the 13th century to the 20th. The large 14th-century rose on the west façade is the work of Hermann of Münster.

Other medieval churches include Saint-Pierre-aux-Nonnains, reputedly the oldest surviving church in France, having been founded in the 7th century as a Benedictine abbey church; Saint-Maximin (late 12th c.); the octagonal church of the Templars (early 13th c.); Saint-Martin (13th-15th c.); and Saint-Eucaire, with its handsome 12th-century bell tower and 13th-century façade.

# MÉZIÈRES, PHILIPPE DE

(1327–1405). Born in Mézières in Picardy, Philippe was a soldier of fortune, then an advocate on the diplomatic and political levels of a crusade to regain Jerusalem for Christendom. He founded the chivalric Order of the Passion of Jesus Christ, was chancellor of Cyprus under Peter I, was a citizen of Venice, knew popes Urban V and Gregory XI and was a friend of Petrarch, and served as counselor to Charles V of France from 1373 until 1380, when he withdrew to the convent of the Celestines in Paris. Here, he wrote the major part of his work, in both French and Latin prose, remaining at the convent until his death. His first known work is the Latin *vita* (1366) of his spiritual adviser, Peter Thomas. He wrote on the feast of Mary's Presentation at the Temple, achieving celebration in the West of this originally eastern feast. Three of his treatises depict the order he had founded: *Nova religio milicie Passionis jhesu Christi pro acquisicione sancte civitatis Jherusalem et Terre Sancte,* extant in two versions written in 1368 and 1384, respectively, but copied together in the only surviving manuscript; the *Sustance de la chevalerie de la Passion de Jhesu Crist en françois* (ca. 1389–94); and the *Chevalerie de la Passion de Jhesu Crist,* written in 1396 shortly before the Battle of Nicopolis. The *Livre sur la vertu du sacrement de mariage* (1384–89) contemplates the mystical union of Christ with the church and the human soul and includes the famous exemplum of "patient Griselda," translated by Philippe from the Latin of his friend Petrarch. The *Songe du vieil* pèlerin, an allegorical pilgrimage finished in 1389, points out the evils of the world and suggests remedies. His 1395 letter to Richard II of England urges the king to wed Isabella of France as a means to European peace. All of Philippe de Mézières' major works urge the social and political stability of Europe necessary for his long-sought but never to be realized crusade.

# MICHAULT, PIERRE

(late 15th c.). A poet attached to the court of Burgundy, Michault composed the *Procès d'honneur féminin,* a judicial allegory; the *Dance aux aveugles* (1464), a variation on the *danse macabre* featuring the blind Cupido, Fortune, and Atropos; the *Doctrinal du temps present* (1466), a moralized satire in prose and verse modeled on the *Doctrinale* of Alexander of Villa Dei; and the *Complainte sur la mort d'Ysabeau de Bourbon.* These works reflect important variations on standard 15th-century themes: the quarrel between the champions and detractors of women, the dance of death, court life.

*Earl Jeffrey Richards*

Michault, Pierre. *Œuvres poétiques,* ed. Barbara Folkart. Paris: Union Générale d'Éditions, 1980.

# MICHEL, JEAN

(d. 1501). Author of a *Mystère de la Passion* played at Angers in 1486, Michel practiced medicine in that city, serving for a time as doctor to the dauphin, infant son of Charles VIII. He was also a regent of the University of Angers. Michel based his Passion play on Days 2 and 3 of Arnoul Greban's *Passion,* expanding them to four days and 30,000 lines. Thus, the work treats only the adult life of Jesus from baptism to death, omitting both his childhood and the Resurrection. In addition, Michel suppressed the *Procès de paradis,* affirming that the Incarnation had been decided from all eternity. Stressing the moral aspects of the story, he amplified the sermons of Jesus and expanded the roles of three principal characters: Mary Magdalene, Lazarus, and Judas. He incorporated the oedipal legend associated with Judas, in which he kills his father and marries his mother. The other two roles exemplify the importance of repentance for the sinner. Michel's *Passion* continued to be played to the mid-16th century and was sometimes "completed" by the addition of Days 1 and 4 from Greban's play.

# MIÉLOT, JEAN

(fl. 15th c.). Translator, copyist, illuminator. A native of Gueschard in Picardy, near the residence of the dukes of Burgundy at Hesdin, Miélot was later canon of Saint-Pierre in Lille and, from 1449 to 1467, honorary secretary of Duke Philip the Good. This appointment followed his translation for the ducal library of the *Miroir de la salvation humaine* (1448), the first of a series of translations that included not only such religious texts as the *Vie et miracles de saint Josse* (1449) or the *Sermons d'un Franciscain sur l'oraison dominicale* (1457) but also, shortly after the Pheasant Banquet (1454), several crusading texts, such as the *Advis directif pour faire le voyage d'oultremer* and a *Description de la Terre Sainte* by the Dominican missionary Bouchard, and certain classical texts, such as the *Romuléon,* a Roman history by Roberto della Porta of Bologna (1465) and, for Charles the Bold, the *Épistre de Cicéron a son frère Quintus* (1472). He was also a calligrapher, on occasion an illustrator, and a director of a workshop in Lille that prepared manuscripts of these translations, which, it has been suggested, contributed to the development of French prose.

# MIGRATIONS ART

. The term usually used to refer to art produced by and for the "new peoples," primarily Germanic, who entered the former territory of the Roman Empire as federate allies, mercenaries, raiders, and ultimately as settlers. In France, the migration of new peoples on a large scale is a phenomenon primarily of the 5th century, prior to the establishment of dominant Frankish power throughout most of the country, and the conversion of the Franks to Christianity, ca. 500. By convention, however, "migrations art" refers to ornamental metalwork primarily of non-Christian function and subject matter down to the 7th century. Furthermore, it has become clear that this migrations art is by no means a collection of tribal artistic traditions but rather the product of considerable interchange among Germanic peoples and between the new settlers and indigenous inhabitants; migrations art was not brought to the former Roman territories by new settlers but created there.

The bulk of the migrations art consists of weapons and objects of personal adornment, such as pins, brooches, and buckles, which have been recovered in vast numbers from graves of the period. Important artistic work must also have been undertaken in building (such as royal and aristocratic halls), in wood sculpture, and especially in textiles; that the medium of metalwork alone has survived in quantity gives it undue importance. In addition, the concentration upon elaborate metalwork does not indicate that only portable arts were produced because the artists and their patrons were nomadic. Nonetheless, this metalwork is characteristic of the period, and the great luxury objects played a major role in displaying social patterns and status. Archaeologists and art historians have organized the metalwork of the 5th to early 7th centuries according to technical and stylistic criteria and have concentrated attention on the objects using gold and jewels rather than the far more numerous examples in iron and bronze. Most objects fall within the categories known as chip carving, Polychrome Style, Style I, and Style II. All of these terms are used for objects produced and found from Scandinavia to Italy and from Spain to the Black Sea basin, and for none of them does France appear to have been the most original or productive center, although it certainly participated actively in the development.

Chip carving developed along the eastern borders of the Roman Empire, including the Frankish regions of the lower Rhine, in the late 4th century, in connection with cast-bronze objects made for soldiers; it involved handchiseling of abstract patterns into the metal. The starting point of the tradition is Roman in both design and tech-

nique, and the bulk of the material, executed in base metals, was used widely throughout the military class. In contrast, the Polychrome Style, developed in eastern Europe by the 4th century, used red garnets, glass, and other colored gems set onto gilt backgrounds as small separate cells, or cloisons, often surrounded with gold granulation and filigree. Patterns are primarily abstract or geometric, and the emphasis on precious materials ensures that this class of objects has royal and aristocratic associations. The greatest French examples of this technique are the sword fittings and other objects from the tomb of Clovis's father, Childeric I, last pagan Frankish king, a tomb excavated at Tournai in 1653 and usually dated to 481. Here, the color is restricted to the red garnets, now set closely together to make whole fields of red divided only by thin sheets of gold. This polychrome *cloisonné* style continued well into the 6th century in such luxury objects as the disc brooches founded in the tomb of the Christian Queen Arnegund (probably died ca. 565) excavated in the church of Saint-Denis.

Style I and Style II metalwork focuses upon animal forms. Style I clearly developed in northern Europe, perhaps in Scandinavia and England, in the early 6th century and spread rapidly across France and the Continent. It primarily used compact animals and animal parts, which were treated in a progressively more abstract and decorative manner. Style II now seems likely to have developed in Lombard Italy in the late 6th century, whence it rapidly spread northward into Germany and France. It essentially involves the combination of animal forms with complex ribbon-interlace patterns of Mediterranean origin. Both animal styles were used not only in the decoration of commonplace objects in base metals but also in combination with polychrome *cloisonné* techniques in a series of objects of stunningly inventive virtuosity, examples of which are again provided from Arnegund's burial. Ultimately, such decorative styles were adopted for Christian art in reliquaries and other sacred objects of high status.

# MILITARY ARCHITECTURE

. Both the castle complex and urban defenses in medieval France relied upon strong walls and gateways designed to prevent entrance to enemies and ensure access for allies. River towns and ports had fortified bridges and special defenses. *Bastide* towns, fortified towns of French origin, were forms of military architecture on the grand scale of the urban landscape. Designs of temporary defensive or offensive war machines, technological innovations, and social and economic factors all affected the construction of these works.

During the 12th and 13th centuries, building techniques and weapons improved due to the increased exchanges between cultures and technological advances in metallurgy. More town walls and castles were made of stone, and designs of defensive fortifications aspired to incorporate the idea of effective counterattacks.

In the first half of the 13th century, advances in the design and construction of main gateways included the addition of flanking towers and added height to three or four stories in total. Portcullises, machicolations, meurtrières, and two-leaved doors helped to defend the gateway passages. A system of shod-iron portcullises operated by ropes and pulleys stood in front of the door, and machicolations opening out into the vault or roof of the gateway stood either between the portcullis and the door or in front of the portcullis. The gateway held two or three sets of these defenses, with an additional machicolation at the gate itself. Such protection deterred surprise attacks and allowed inspection of those entering.

Fortified bridges from the 13th century were protected on the far side by a barbican or tête-du-pont. At Tournai, a fortified bridge protected the curtain walls on either side of the River Scheldt. The surviving Pont des Trous is a three-span covered bridge, pierced by loopholes on both sides and defended by a strong square tower at either end. At Cahors, the enormous six-span Pont Valentré has a tower at each end and a third tower over the middle of the bridge. A fortified gateway in each tower is defended by an embattled parapet, and the two end towers also have machicolations.

In the early 13th centuries, new fortified towns called *bastides* were planned in southwest France and in England and Wales. The prototype of the *bastide* was Montauban, founded in 1144 by Alphonse-Jourain, count of Toulouse, to guard the road to Toulouse. Its grid plan with market square was copied by princes, counts, and minor lords throughout the 13th century. Many *bastides* held strategic positions on the frontiers

of principalities, especially on the border between the county of Toulouse and the duchy of Aquitaine, but the main purposes of the *bastides* were to attract population to the frontiers and to provide the founder with a political base.

# MILLENNIALISM

. Literally, millennialism (also millenarianism, chiliasm) refers to the belief, expressed in the book of Revelation, that Christ will establish a 1,000-year reign of the saints on earth before the Last Judgment. More broadly, millennialists expect a time of supernatural peace and abundance here on earth. Both usages reflect the eschatological belief that at the end of time God will judge the living and the (resurrected) dead. This belief in ultimate divine justice has provided the solution to the problem of theodicy for countless generations of Christians suffering under hardship and oppression.

In most early forms, millennial beliefs were anti-imperial, even antiauthoritarian: as the messianic vision of Isaiah 2:4 depicts, the instruments of war and domination will be beaten into instruments of peace and prosperity. Apostolic Christianity demonstrates all of the key traits of apocalyptic millenarian groups: the rhetoric of the meek versus the powerful, of the imminence of the Lord's Day of wrath and the coming Kingdom of Heaven; the shift from a disappointed messianic hope (Crucifixion) to a revised expectation (Second Coming or Parousia); a following among common, working people; the rituals of initiation into a group preparing for and awaiting the End; the fervent spirituality and radical restructuring of community bonds; and the prominence of women visionaries.

As Christianity evolved from a charismatic cult on the fringes of society into a self-perpetuating institution eager to live in harmony with Rome, the hopes of apocalyptic millenarianism embarrassed church leaders who emphasized that Jesus's kingdom was "not of this world." With the advent of imperial Christianity, millenarianism was pushed to the margins of acceptable Christian thought.

As a result, as early as the 2nd century, two of the principal themes of medieval millennialism emerged: the use of chronology to postpone the End, thus encouraging patience, and the transformation of the Roman Empire into a positive force. The former teaching invoked a sabbatical millennium that would come in the year 6000 after Creation; ca. A.D. 200, the first Christian chronology placed the Creation in 5500 B.C.,

thus providing a buffer of 300 years until the year A.D. 500. The latter interpreted Paul's reference to an obstacle to the "man of iniquity" (2 Thessalonians 3:4) to mean that as long as the Roman Empire endured, the Antichrist could not come. This proRoman eschatology would, after the mutual conversion of Rome to Christianity and Christianity to imperialism, produce the myth of the Last Emperor, a superhuman figure who would unite all of Christendom, rule in peace and justice for 120 years, and finally abdicate his throne.

But both these approaches merely delayed the problem: despite pagan and Christian belief in *Roma eterna,* the empire (especially in the West) was doomed; and, coincidentally, the year 6000 grew inevitably closer, transforming an antiapocalyptic chronology into an apocalyptic one. Jerome and Augustine reoriented Latin thought on the millennium in two ways. Jerome introduced a new set of calculations, which placed the Creation in 5199 B.C., delaying the year 6000 another three centuries. Augustine went farther, arguing that no historical event or chronology can be intepreted apocalyptically and that the millennium was not a future event but already in progress— the millennium began at the time of Jesus. To explain why the evils of war, hatred, injustice, and poverty continued unabated, Augustine introduced the concept of the Two Cities: a heavenly city, the celestial Jerusalem, where the millennium was already manifest, and the terrestrial Babylon, the time-bound city of violence and oppression in which the millennium was not visible.

Augustine's opposition to millennial thought so dominated the theological writings of the early Middle Ages that many historians think that it actually disappeared. But there are signs of its presence, both in the activity of antiecclesiastical prophets like the "False Christ" of Bourges described by Gregory of Tours (*Histories* 10.25) and in the antiapocalyptic uses of chronology. In the 8th century, Bede and Carolingian historians shifted the dating system again, this time to *anno Domini*.

It is surely no accident that Charlemagne took up the imperium in the absence of a legitimate emperor in Byzantium, and thus assumed the role of continuator of the Roman Empire, on the first day of the year A.D. 800, or 6000 *annus mundi*. With the apocalyptic dimension of the deed eliminated from the documentation, modern historians have analyzed this pivotal moment in western history without any awareness of its background. It has gone down in history as the Coronation of the year 800, not 6000 *annus mundi*.

Charlemagne's coronation contributed two essential elements to European millennialism. He "transferred" the empire, with all its apocalyptic and millennial freight, to the West, and he shifted the chronological hopes for the Apocalypse from 6000 *annus mundi* to the year A.D. 1000, a date at once millennial (the end of the sixth age, dawn of the sabbatical era) and Augustinian (the end of the millennium of the church). Germany and France of the year 1000 illustrate the two directions of millennial symbolism: whereas the emperor Otto III manipulated every aspect of the imperial variety of millennialism (*renovatio imperii Romani,* opening Charlemagne's tomb on Pentecost of 1000), King Robert II the Pious of France, second ruler of a new and still uncertain dynasty and excommunicate in 1000, presided over a kingdom marked by the social turmoil of the castellan revolution. Here, apocalyptic and millennial symbols were generated from below, especially in the earliest popular religious movement of the Middle Ages, the Peace of God. This conciliar movement, which mobilized huge crowds

at open-air revivalist gatherings in the collective pursuit of God's peace on earth, may have been the earliest sustained millenarian movement that joined all levels of society. It appeared in two waves, each in the decades before the millennium of the Incarnation (1000) and the Passion (1033), first south of the Loire, then throughout France.

When the year 1000 passed without the Parousia, there was a sea-change in millennial hopes. The period after the year 1000 saw much vaster millennial movements, often approved by ecclesiastical authorities—popular crusades, Joachites, Flagellants, the Peace Movement. Some of these movements were broadly based, militant, and hostile to ecclesiastical authority, the wealthy, and Jews, thus bringing out the most revolutionary elements of millennialism.

But the more documentable, and in some ways more surprising, aspect of medieval millennialism was its use by lay and ecclesiastical elites to buttress their own authority. Starting with the Gregorian Reform in the 11th century, papal reformers used apocalyptic imagery both to attack their enemies as Antichrist and to wrap their own efforts in messianic promises. Similarly, royal and even comital courts used eschatological prophecy as propaganda. Dynastic publicists often painted their patrons in the imagery of the Last Emperor—the Norman William the Conqueror consciously used themes from Revelation (his crown, his Doomsday book) to buttress his conquest of England. Supporters of Thierry d'Alsace, count of Flanders, responding to the seemingly apocalyptic civil war of 1127–28, disseminated prophecies claiming that Thierry's (Carolingian) dynasty was the last barrier to Antichrist.

Millennial hopes and ambitions reached new levels as a result of the work of Joachim of Fiore (d. 1202). Joachim was the first theologian to reject Augustine and return to a notion of a future earthly age of bliss. Joachim revitalized every aspect of medieval millennialism: within decades of his death, prophecies attributed to him began to circulate that people identified with current events, mystical numerology, Franciscans and Dominicans, Holy Roman emperors, and popes all became elements in vast and evershifting predictions of imminent apocalypse. Chronological calculations fixed on 1250, then 1260 as the beginning of the new age; the Franciscan order split over interpretations of Joachite prophecy, one branch becoming inquisitors, the other, revolutionary millenarians; angelic popes and messianic emperors (some dead but returning), vied among lay and clerical constituencies for a following. In France, the imagery of millennialism continued to influence political discourse throughout the remainder of the Middle Ages. The catastrophes of the 14th century—the Hundred Years' War and the Black Death—renewed fervor for the final, divine intervention.

The hopes and expectations of the Christian Apocalypse offered the outlines of a powerful if ultimately impractical, and hence suicidal, ideology of social revolution to the peasants and the urban poor of France in the later Middle Ages. The thousands of shepherds, or Pastoureaux, who swept through the French countryside in 1251 and again in 1320, were convinced that they were God's chosen instrument to free the Holy Land, thus bringing about the Parousia. While none ever reached the Holy Land, they traveled in bands throughout the kingdom of France, amazing some with their piety, all the while slaughtering clerics, Jews, and university intellectuals. Similar apocalyptic ideas regarding the election of the poor to usher in God's kingdom motivated other popular insurrections and probably inspired the great Jacquerie of 1358.

Modern historians, limited by the nature of the documentation, tend to emphasize "political" or imperial millennialism in their analyses. The presence and strength of popular and revolutionary millennialism, rarely reported except by hostile clerical sources or by later spokesmen eager to downplay millenarian origins, are more difficult to assess. If one limits oneself only to explicitly millenarian groups, the numbers are few; if one identifies such groups by their patterns rather than their or others' claims about them, they are far more numerous. Given how dangerous even proimperial millennialism could be (e.g., Spiritual Franciscans or John of Roquetaillade), the prominence of conservative millennialism in medieval thought may testify to the ineradicable nature of its appeal to the populace at large. In short, millennial beliefs and aspirations must be ranked among the most profound and versatile of medieval ideologies of social change.

# MILLS AND MILLING

. Taken to mean the mechanical devices and processes utilized in the preparation of foodstuffs and manufactured goods, mills and milling experienced notable technical

developments during the Middle Ages. The forces that stimulated technological innovation and the full impact of that innovation upon medieval industry, economy, and life are matters of debate, but what can be shown here is the variety of mechanisms and their uses, as well as their ingenuity. French millers clearly made significant contributions.

Roman Gaul doubtless received the full range of ancient milling technologies, including not only human- and animal-driven grinding and crushing machines, used, respectively, to make flour and oil, but also the water-powered grain mill employing a vertical axle that in turn moved the flat-rotating grinder. Nowhere was this latter machine used more effectively than in the 4th century at Barbegal, near Arles, where a concentration of sixteen grinders, each driven by its own wheel, produced what is now reliably estimated to be nine tons of flour in a twenty-four-hour day. The continued and expanded use of water-powered grain mills is traceable through the Merovingian, Carolingian, and subsequent medieval periods in France, in some cases displaying an intensity of industrialization more pronounced than elsewhere in Europe. Nothing in the 9th-century sources compares, for instance, with the eighty-four mills at work on the monastic properties of Saint-Germain-des-Prés at the time of Abbot Irminon (r. 800–25) or the fifteen mills ordered to produce the flour for 450 loaves of bread per day in Abbot Adalhard of Corbie's statutes of 822.

Among the innovations relating to water-powered mills was their location not just on streams, or near streams and fed by sluices, but also as floating mills anchored in riverine currents or tidal estuaries, as stationary mills built over sluices through which tidal pools were drained, and as bridge mills constructed normally on pilings associated with the arches and cutwaters of a bridge. All of these variations are to be found in Europe by the 12th century, with France showing particular adaptability, the most fully documented examples being bridge mills, origins of which can be traced there back to the 11th century (e.g., Jumièges, ca. 1020; Angers and Mayenne, 1028) and the earliest illustrations of which appear, however schematic or fanciful, in French manuscripts (e.g., the *Légende de saint Denis,* 1317).

Major innovations are also to be seen in the utilization of water-powered machinery in processes other than grinding grain. Crucial here is the translation of the rotary motion of the wheel into reciprocating motion, as of a hammer, vertical or recumbent, made possible by cams located on the horizontal axle of the vertical water-wheel. This is first indicated in an architectural plan produced for the abbot of Saint-Gall ca. 820, in which the hammers adjoin a brewery and thus are seemingly intended for use in the preparation of the malt (beer mash). The earliest documentary references to working beer mills anywhere are from mid-9th-century France (e.g., Évreux, 862; Vaux-sur-Somme, 867); hammers are not always specified (grinding was a practical, if less efficient, alternative in the reduction of the malt), but water power is clearly indicated by the hydrographical context of the relevant entries in the documents. Pounding action is undoubted in the fulling and hemp mills that appeared during the 11th century in the manufacture, respectively, of cloth and cordage in Italy and France, as at Lérins (1040); in the tanning mills, for crushing the bark, that made their appearance in the 12th century in France, as at Charment, near Paris (1138); and in the metallurgical industry. The latter experienced the first certain use of water-powered hammers and bellows, also operated by cams, by the 13th century in Sweden (1224), France (the Dauphiné, 1226), and Germany (ca.

1270). Other uses of water power to which French millers significantly contributed include wood sawing (first documented at Évreux, 1204; first illustrated by Villard de Honnecourt, ca. 1235) and paper making (in Italy and Spain, late 13th c.; in France, at Troyes, 1338).

Worthy of note here is the appearance in medieval Europe of the windmill, perhaps from eastern origins or, certainly in its distinctive western form, as an independent invention. This consisted of wind vanes set vertically upon a horizontal axle that was geared to the vertical axle and the working parts, all located, until the early 15th century, in a structure that could be pivoted upon a post to face the wind. Such mills are now identifiable in mid-12th-century England and were at work by the early 13th century grinding grains in France, as at Arles (1202). Not to be ignored in the tradition of medieval European and French milling is a simpler but geographically adaptable kind of water mill employing a horizontal waterwheel whose vertical axle turned the grinder without the intervention of gears. Notable, too, are distinct improvements throughout the period in the design of manually operated devices, such as flat-rotating grinders, edge rollers, cranked or treadled whetstones and lathes, water-raising mechanisms, and hoists for heavy materials.

The technical variety and advances in medieval milling and related machinery are clearly discernible. The ingenuity involved is admirable. And both of these are nowhere more evident than in France.

# MINING AND METALS

. France possesses no preciousmetal resources and little copper. Iron ores are abundant, and there are regional deposits of lead, zinc, and coal. All of these were exploited during the Middle Ages.

Evidence for ironworking exists from Merovingian France onward. By the reign of Charlemagne, Frankish iron weapons and armor were so famous that exports had to be forbidden. Decorative ironwork was also widely praticed, as on the hinges and scrollwork of the western portals of Notre-Dame in Paris (13th c.). At Liège, we find from the late 14th century evidence of blast furnaces blown by water-powered bellows. Gunpowder

weapons made of iron came to join traditional weapons as the major product of the iron industry.

Bronze, a mixture of copper and tin, is a prehistoric alloy much used in medieval Europe for artistic purposes. Although dependent on imported raw materials, French artisans excelled in bronze castings, especially in bells, which remain one of the highest expressions of this art. From the 15th century, bronzework was dominated by the demand for cannons, which are cast by the same technique as bells.

Brass, a metal sometimes confused with bronze, is an alloy of copper and zinc; it is much more difficult to produce. France's abundant supplies of calamine (zinc carbonate) made it a center for brass production. Noteworthy in the French-speaking world was the city of Dinant, across the imperial frontier in the Meuse Valley. *Dinanderie* products were highly famed until the industry was dispersed in the sack of 1466.

Lead was widely used in the Middle Ages. In sheets, it served for roofing and guttering, while it could be cast into decorative objects from baptismal fonts to small medallions. Common pewter, an alloy of lead and tin, was frequently used for tableware. Lead bullets and shot, along with cast iron, replaced stone pellets as the preferred missiles in firearms in the 15th century. France's lead resources were among the best of any European region.

In the 12th century, the coalfields in the Low Countries near Liège began to be worked. Here, and in the val-leys reaching westward to Charleroi and Mons, the technical pinnacle of medieval coal exploitation was reached; workings extended beneath the local water table, giving rise to sophisticated pumps and drainage tunnels. Coal was shipped via river barge to distant markets, but by the late 15th century it was also consumed locally as a metallurgical fuel.

The absence of precious metals had an effect on French legal history relating to mining. Roman law had regarded mineral rights, especially to precious metals, as an imperial monopoly, to be consigned in return for royalties. England and the empire followed Roman precedent. Yet France's minerals, especially coal and zinc (the latter unrecognized as a metal during this period), were unmentioned by the Roman legists. Astute feudal lords, such as the dukes of Burgundy and counts of Hainaut, asserted their claims in the absence of royal prerogatives, but by the 15th century the crown was asserting some measure of regalian right over minerals.

# MINTS

. The control of mints was in theory a royal prerogative in medieval France, but the early-medieval kings gradually lost control of the monopoly of minting. The Edict of Pîtres of Charles the Bald in 864 represents a last attempt to enforce royal control over minting; thereafter, bishops, abbots, dukes, and counts minted their own coinage. In spite of efforts by such kings as Louis IX and Philip IV, there remained between thirty and forty baronial silver coinages in medieval France in the early 14th century. Some, such as the Melgorian coinage of lower Languedoc, enjoyed wide regional circulation and considerable stability of precious-metal content over many centuries. By 1300, the royal Tournois and Parisis coinages were nonetheless the dominant systems of exchange in the kingdom.

Mints, whether baronial or royal, suffered the vicissi tudes of fluctuating precious-metal supplies and changing royal and baronial politics, which led frequently to the debasement of coinage. Gold and silver coin were minted under the Merovingians; a monometallic silver standard persisted from the Carolingian period until the reintro duction of gold coinage in the 13th century again created a bimetallic royal monetary system.

Coinage profits were generated on several levels. Some precious metal was accumulated at the mint in the discards of the refinement process. The political authority in charge of the mint received a percentage of the coins struck, perhaps one of each twelve deniers, as seigniorage. The costs of processing were generally deducted from the precious-metal stocks at acquisition.

By the 14th century, mints had a complex administrative hierarchy and trained technical personnel. Mintmasters, guardians, and officers were charged with supervisory responsibilities; moneyers and workers designed and minted the actual coins. Once the precious metal had been sufficiently purified, according to the standard of fineness in use, minting was divided into two technological processes: the creation of dies or molds and the striking of coins. A Chambre des Monnaies was created by ordinance in 1348 as an advisory group to the Chambre des Comptes or the king's council for royal coinage.

# MIRACLE PLAYS

. Miracle plays are dramatizations of two types of religious narrative material: miraculous events performed by the Virgin Mary in response to requests from a believer in difficulty,

or episodes from the life of a saint during which miraculous events occur. Plays called *miracles* were especially popular in France during the 13th and 14th centuries, a period that corresponds not only with the growth of the cult of the Virgin Mary, but also with the increase in the number of religious *confréries* and trade guilds, which were largely responsible for performing these plays. Miracle plays had a double attraction: they were religious works set in the real, secular world, and they were in essence dramatic, since by definition their action led to a theatrical, supernatural climax.

Miracle plays in France form a bridge between liturgical drama and the mystery plays. Latin liturgical drama included miracle-type plays, such as the *Iconia sancti Nicolai,* on which legend vernacular plays were later written. After the 14th century, many so-called mystery plays were based on material, like saints' lives, that in the previous century would have been called *miracles* by their authors. Thus, the label "miracle play," both then and now, corresponds not only to a type of dramatized material but also to a period.

The great majority of surviving miracle plays come from the 14th century, but two 13th-century texts, and a few from the 15th and 16th centuries, have also come down to us. Jehan Bodel's Jeu *de saint Nicolas* (Arras; 1194–1202; 1,538 lines) is arguably the best and most original of all miracle plays. It dramatizes one of the several legends associated with the saint—his power to protect, and even multiply, any treasure entrusted to him—but sets the action in a crusading context. The Saracen king who announces that his treasure is to be guarded merely by a statue of Nicolas is testing the claims of the only survivor of a Christian army that his forces have been shown defeating. The thieves, whose attempt to steal the treasure is thwarted by the brusque intervention of Nicolas, appear as the cheating, drinking, gambling, and argumentative habitués of an Arras tavern. The play, which has provoked many studies, is complex and many-layered: serious yet comic, epic yet grotesque, exotic yet realistic. Rutebeuf's *Miracle de Théophile* (Paris; ca. 1260; 660 lines), a more uniform, poetic, even literary play, dramatizes the legend of Théophile, who sells his soul to the Devil in order to regain a bishopric he once turned down.

The collection of plays known as the *Miracles de Nostre Dame par personnages* (Paris; 1339–82; forty plays of 1,000–3,000 lines each), preserved in one fine illustrated manuscript (B.N. fr. 819–20) is all that survives from the 14th century. A new play was performed each year, early in December, by the Confrérie Saint Éloi, the patron of the Guild of Parisian Goldsmiths, probably in the Guild Hall. The collection illustrates the remarkable versatility of the miracle-play format: almost any secular narrative that involves a man or woman who prays to the Virgin and who overcomes an obstacle in an unexpected manner can be incorporated into a *Miracle de Nostre Dame par personnages*. The variety of sources used by the authors of these plays is enormous; in every case, the text is the dramatization of previously nondramatic narrative material. Thus, although many plays are based on saints' lives *(Étienne, Panthaléon, Ignace, Valentin, Laurent, Alexis),* or on wellknown legends associated with the Virgin Mary, often drawn from Gautier de Coinci *(L'enfant voué au diable, Labbesse enceinte délivrée, La nonne qui laissa son abbaye, Le paroissien excommunié),* many others derive from secular literature, such as epic *(Ami et Amile),* romance *(La reine de Portugal, Robert le diable, L' impératrice de Rome, Le roi Thierry),* or historical romance *(Berthe femme du roi Pépin, Le baptême de Clovis, La reine Bautheuch et ses fils)*. In one instance, the *Enfant* ressuscité, the play is based on a "real" documented recent miracle.

Each year for much of the 14th century, the Parisian Goldsmiths saw a dramatization of one of the most popular tales of their time. The diversity of the sources, however, is belied by the homogeneity of the collection. Every one of the plays follows the same pattern; some authors no doubt contributed several works; certainly, the authors were familiar with the texts that had preceded theirs. In addition to the normal narrative framework of any miracle play, the *Miracles de Nostre Dame par personnages* have a number of elements in common: a sermon (either before the play proper or incorporated into the action); frequent prayers to the Virgin; scenes set in Heaven in which Notre Dame urges God to intervene in the predicament of some one who prays to her, even if that person is the most wicked sinner; scenes in which Notre Dame descends to Earth, accompanied by angels (occasionally including St. Éloi) who sing a rondeau. Other frequently recurring scenes show childbirth, imprisonment, and tortures. The quality of the texts is variable: some are poorly constructed, provide little character development, and fail to integrate the traditional elements in a convincing manner; but others, such as the *Enfant ressuscité* and the *Femme sauvée du bûcher,* are vivid examples of almost realist drama. The collection as a whole provides a remarkable picture of life in 14th-century France.

Several of the *Miracles de Nostre Dame par personnages,* had they survived independently from the collection, would now be considered as mystery plays, especially the saint plays, such as *Saint Valentin.* This fact underlines the somewhat arbitrary nature of labels as used both now and at the end of the Middle Ages. Few miracle plays survive from the 15th century; one rare exception is the play about a pregnant abbess and her miraculous delivery, found among the processional plays from Lille. But critics have not failed to note the relatively short texts, under 2,000 lines, preserved in early 16th-century printed editions, that in their scope, subject matter, and treatment resemble the Goldsmiths' miracle plays. These include the *Miracle de saint Nicolas et d'un Juif,* the *Chevalier qui donna sa femme au diable,* the *Femme qui se voulut abandonner au péché,* and the so-called *Mystère de saint Christofle.* The original versions of these plays were undoubtedly composed long before they were printed and probably should be attached to the corpus of surviving miracle plays.

# *MISSI DOMINICI*

. The Carolingian system of royal messengers, generally referred to by the Latin term *missi dominici,* developed under the early Carolingian mayors of the palace but was first exploited by Charlemagne (r. 768–814). During his reign, these king's representatives made regular visits throughout the kingdom as a means of linking local government and the central administration. This was one way in which Charlemagne sought to maintain control over the wide-ranging territories under his authority, for which he had only a rudimentary political organization that relied heavily on local powers.

Not a separate class of officials, the *missi* were chosen from lay and ecclesiastical magnates, usually counts and bishops, more rarely abbots. Each group of *missi,* including both a layperson and a churchman, was assigned to cover a defined area, the *missaticum,* where they exercised the royal authority on the king's behalf. They might investigate the conduct of government officials in the region (especially if abuses by them had been reported), transmit new royal decrees to local magnates, hear new oaths of allegiance to the sovereign, and assist local counts in the administration of justice.

By the end of Charlemagne's reign, four journeys a year to a given *missaticum* was the norm, so that the obligation to undertake the trips represented a significant commitment of time away from the other duties of the *missus* as a member of the secular or ecclesiastical nobility. This problem, together with the large size of the area for which a group of *missi* was responsible and the difficulty of enforcing its decisions on local magnates, limited the system's effectiveness.

# MOISSAC

. (Tarn-et-Garonne). The fame of the former Benedictine abbey of Saint-Pierre at Moissac, a major stop on the route to Santiago de Compostela, rests with the sculpture of

the south portal and with the late 11th-century cloister, one of the oldest and most complete Romanesque cloisters in France.

Alternating single and double marble columns carry the seventy-six capitals of the four cloister galleries; the pointed arches and upper walls are a 13th-century restoration. On the piers are marble reliefs of Abbot Durandus de Bredon, first Cluniac abbot of Moissac, and nine Apostles. Reliefs and capitals are related to contemporary Toulousan ateliers at Saint-Sernin and the cloister of La Daurade.

The Romanesque church was consecrated in 1063. The domed church of the following century was reconstructed after the Hundred Years' War in the southern Gothic style. On the exterior, the lower walls are Romanesque; the upper, in brick, are 15th-century.

Moissac (Tarn-et-Garonne), sculpture of the prophet Jeremiah. *Photograph courtesy of Rebecca A.Baltzer.*

The dates of the west tower and the famous south portal have not been satisfactorily determined. The projecting porch—with representations on its lateral walls of Avarice and Luxuria, Dives and Lazarus, the death of the evil rich man and his torture in Hell (west wall); the Annunciation (Gabriel is replaced), the Visitation, and scenes from the

infancy of Christ (east wall)—was presumably added during the abbacy of Roger (1115–31), whose statue flanks the central porch.

An apocalyptic vision of the Second Coming fills the huge tympanum: the Majestic Christ, enthroned and crowned, holding the Book of Life on his left knee, his right hand raised in blessing, dominates the entrance to the Heavenly Jerusalem. Symbols of the four Evangelists and two elongated seraphim form a framing mandorla; twenty-four Elders strain to regard the central vision. The figures are in high relief; the carving is crisp, precise, and vigorous. Flanking the doorway are St. Peter, patron saint of the abbey, and the prophet Isaiah. On the central face of the trumeau are three pairs of lions and lionesses, their bodies crossed in a vertical "triple-x" composition. On the west lateral face is St. Paul; on the east, the most elegant figure in all of Romanesque art, the prophet Jeremiah unwinding his scroll. The cusped trumeau and jambs, as well as the regality of Christ and the Elders, recall the exoticism of Islamic Spain; the richness of pose and the details of robes, crowns, and book are solidly within the Languedocian tradition.

# MOLINET, JEAN

(1453–1507). Molinet was born at Desvres in the Pas-de-Calais and studied in Paris. He became court historiographer for Charles the Bold, duke of Burgundy, in 1475 after the death of Georges Chastellain, his protector and the previous historiographer. In addi-tion to compiling the official chronicles for his patrons, Molinet wrote verse and prose in many forms: plays, a prose adaptation of the *Roman de la Rose* with moral commentary, occasional poems, religious and allegorical pieces, *débats,* and some obscene verse. Like his fellow Rhétoriqueur poets, he played with etymologies and puns, described marvels, and used allegory and mythological allusion as moral examples. In a poem to the Virgin, all the words in each of the five stanzas of *huitains* begin with the appropriate letter of her name: M, A, R, I, E. What we tend to see as tricks and excesses were derived from the Rhétoriqueurs' conviction that the physical world is an analogue of the spiritual; what

we view now simply as convention, for them was necessary commensurability. Even the individual letters of the language had significance. Both Maurin and Zumthor point to the worldview of these poets, essential for understanding their work.

# MONASTIC RULES AND CUSTOMARIES

. The first monks lived either as solitaries or under the direct supervision of an *abba* ('father'). This seems to have been the case with the first known European monastic house, Marmoutier, established in 361 by Martin of Tours. As monasticism developed into a permanent institution, the charisma of a spiritual master was supplemented by written legislation regulating the common life in the monastery. As de Vogüé has shown, the earliest sources of such monastic guidelines (Pachomius, Basil, Augustine), all written ca. 400, exercised a decisive influence on the subsequent tradition. Quotations from them appear in later monastic rules, which also borrow among themselves to a striking degree. This reflects the eclectic nature of monastic establishments until the triumph of the *Rule of St. Benedict* in the 9th century.

About 300 monastic rules were written between the end of the 4th century and last half of the 7th. The majority provide no more than the barest suggestions for the regulation of life within the monastery. They vary considerably in length and detail, from the succinct *De ordine monasterii* (by Augustine, or from his circle) to the enormous *Rule of the Master,* whose ninety-five chapters legislate on every conceivable aspect of monastic discipline. (Benedict's *Rule* is little more than one-third the length of the Master's.) The *Rule for Virgins* (ca. 534) by Caesarius of Arles is the first rule written for female religious. Its prescriptions for the Divine Office are thought to reflect the lost tradition of Lérins, an island monastery off the coast of Provence near Cannes, founded ca. 410 by Honoratus.

The origin of the monastic customaries coincides with the activity of Carolingian reformers, led by Benedict of Aniane (d. 821), to impose the *Rule of St. Benedict* everywhere in the Frankish empire. The customaries make specific, detailed applications of the *Rule* to the circumstances present in a single monastery or a group of monasteries. They not only interpret and supplement the directives of the *Rule* but can actually alter Benedict's careful equilibrium, as happened with the large quantity of liturgical obligations required by the customs in force at Cluny. A common customary imposed the influence of the great monasteries like Cluny, Saint-Benoît-sur-Loire, and Cîteaux on daughter houses. The monastic customaries can profitably be studied as a source of information on contemporary social and cultural life.

# MONASTICISM

**.** From its origins in the Egyptian desert in the second half of the 3rd century, monasticism quickly spread throughout the Roman Empire. By the 4th century, the *Lives of the Desert Fathers* were being read in the West, and monasticism soon became established there. The semilegendary figure of Martin, Roman soldier, bishop of Tours, and founder of Marmoutier, the first known monastic house in Gaul at the end of the 4th century, was influential in the spread of Frankish monasticism. Although early Egyptian monasticism had emphasized the eremitic life, hermits were rare in Gaul, where monasticism was normally of the cenobitic sort, in which a group of brothers lived together under the direction of an abbot.

Monasticism from the beginning emphasized separation of the individual from secular society, putting him into a setting where prayer and contemplation of God would be his chief concerns. Humility and obedience to the abbot, who himself was expected to be humbly obedient to God, responsible for the souls of the monks entrusted to him, was stressed in all monastic rules. Monks were expected to live in common, with no individual property. They deliberately gave up normal secular pleasures, from sex to red meat to fine clothing, in order to concentrate on the world beyond.

The Merovingian period saw a great variety of monastic practices. Martin's foundation of Marmoutier continued to influence many new houses. The 5th-century

foundation of Lérins, in Provence, followed a rule that went back to Cassian. Luxeuil, founded at the end of the 6th century by Irish monks—who had themselves been influenced by monks from Tours fifty years earlier—was another house whose customs, called the *Rule of Columbanus,* were widely imitated. Also influential was Saint-Maurice of Agaune, in the Burgundian Alps. The *Rule of St. Benedict,* written for the monks of Monte Cassino in Italy in the first half of the 6th century, became widely adopted in Gaul. The Life of St. Benedict, written by Pope Gregory I (r. 590–604), did much to popularize this *Rule*. Throughout the 7th and 8th centuries, Benedict's *Rule* was adopted at an increasing number of French houses, replacing the other rules in circulation, including the so-called "mixed" rules, which took elements from several. The combination of strictness with flexibility in Benedict's *Rule* made it both appealing for those looking for a holy way of life and adaptable to a variety of situations. The Benedictines, or Black Monks (so called from the color of their habits), became by far the most common form of the institutionalized religious life in this period.

The Merovingian period witnessed the foundation of a large number of monasteries, the majority, indeed, of all French houses founded before the 11th century. Kings, lords, and bishops all established communities of monks that would receive gifts of property from other wealthy individuals. Most of the monks were settled in existing churches at the edges of the old Roman provincial capitals. The churches, and hence the communities of monks, were most commonly dedicated to a local saint, often one martyred when trying to spread Christianity to a pagan population under the late empire, such as Saint-Marcel of Chalon or Saint-Valérien of Tournus. Other basilicas had been rededicated to a local bishop buried there, such as Saint-Germain of Auxerre or Saint-Remi of Reims, by the time monks were settled there. Still other Merovingian monasteries were founded in what had once been a hermitage, such as Moûtier-Saint-Jean in the diocese of Langres, and were dedicated to the first holy hermit who had lived there. Houses for monks greatly outnumbered those for nuns.

Many of these Merovingian foundations remained small, and some seem to have sheltered monks only intermittently. By the 8th century, however, virtually every French episcopal city had one major monastery, which was in constant if low-level competition with the bishop throughout the rest of the Middle Ages. Such a monastery was usually located just outside the city walls, though sometimes it was slightly farther away. The competition between bishops and monks—expressed in everything from quarrels over monastic immunities to attempts to build more elaborate edifices than the cathedral church—was especially marked if, as at Tours, Auxerre, or Reims, the monastery could claim the influence, or even the body, of an early sainted bishop whom the bishops themselves treated as a font of their spiritual authority.

Founded in large numbers in France in the 6th and 7th centuries, monasteries experienced serious setbacks in the 8th century. Muslim attacks devastated many monasteries, especially in the south but as far north as Burgundy. Both laypeople and bishops seized monastic property as their own; a number of monasteries had received enough generous gifts over the years that a layman was tempted to take the office of abbot and the revenues. Many of the smaller urban and suburban monasteries founded in the Merovingian period remained empty of religious men from the 8th century to the 12th.

Starting in the final years of the 8th century, however, a number of ruined or deserted monasteries were refounded or reformed, usually at the initiative of kings or bishops. The scholar Alcuin, at Charlemagne's court, advocated monastic renewal, and the monk Benedict of Aniane promoted adoption of the *Rule of St. Benedict*. This *Rule,* which had been slowly spreading through France for three centuries, was ordered adopted at all Frankish houses at the Council of Chalon in 813. Louis the Pious even hoped that the monastery of Inde, near Aix-la-Chapelle, would become a royal "model" monastery, which monks from every monastery in the Frankish kingdom would visit, to promote regularity and uniformity. Although his plan was ultimately unsuccessful, the commentary on Benedict's *Rule* composed for Inde by Benedict of Aniane was widely imitated. A house's *consuetudines* would spell out additions and modifications to St. Benedict's slim set of regulations.

Between the 5th and the 9th centuries, French monasticism underwent key changes, from being a form of religious life established in tiny houses at the margins of a predominantly urban society, to being the carriers and continuators of Roman culture in large, agriculturally oriented communities. Benedict's *Rule* had assumed that a monastery would be a family, of maybe a dozen or a score of monks, but by the 9th century it was not uncommon for a monastery to have a hundred or more monks and many servants, and the abbey church to be surrounded by a whole complex of workshops, guest houses, an infirmary, administrative offices, rooms for laborers, and the like. Such a monastery might become one of the largest landowners in its region. Although houses that had adopted Benedict's *Rule* continued to follow its chief outlines, in stressing humility, obedience, and common property, such French houses were no longer the small, withdrawn group of brothers that Benedict had envisioned but rather important economic entities in their own right.

○ Other religious orders
● Female religious houses

In the second half of the 9th century, there again began to be new monastic foundations in France, for the first time in some 150 years. Many of these were founded not on the outskirts of the old Gallo-Roman cities but in the countryside, although they quickly became miniature civic centers in their own right, as small boroughs grew up around them. The monks provided a living, whether by paying wages or buying goods, to a whole group of laypeople established near their gates. Cluny, founded in 909 by the duke of Aquitaine, is the best known of these late Carolingian foundations.

By the 9th and 10th centuries, although the fundamental monastic goals of humility, obedience, common property, and separation from ordinary life remained, monks had taken on a new and central role for broader society. Monastic schools were and continued to be, until the 12th century, the chief places to receive an education, in spite of the establishment of cathedral schools under Charlemagne. Increasingly, the manual work that Benedict had recommended to his monks had been replaced by work copying manuscripts in the scriptorium or by additional prayers and Masses. Monasteries became intermedi-aries between the secular world and the supernatural. Monks prayed within the cloister for the world outside the cloister walls. When laypeople gave the monastery gifts, which they did with increasing frequency, they specified that they wanted to win the friendship of the saint to whom the house was dedicated. This friendship was often made

concrete in prayers and Masses that the monks performed or in lists of lay friends in a book of commemoration. Laypeople were frequently buried at the monastery, near both the saint and the monks. At Cluny, prayers for the dead took a major proportion of the monks' day, and manual labor essentially disappeared.

Although the monastic reaction to the secular world, whether in the time of the Egyptian desert fathers or in the Carolingian period, had always been withdrawal, this reaction meant that monks as a group had much better relations with the world's lords than did members of the secular clergy. Bishops and priests, who saw their duty as conversion of the world rather than withdrawal from it, tended to see the princes who ruled this world as at least potential rivals, whereas the monks sought their friendship and hoped that they would be helpful in areas in which the monks themselves did not care to participate.

If the 9th and early 10th centuries were a period in which the large, wealthy monastery became an established part of society—wealthy overall, even though the monks were individually poor—it was also a period in which the monasteries continued to face threats to their integrity. The Viking incursions in the west of France, the Magyar invasions in the east, and the continuing raids of Muslim pirates in the south ruined a number of monasteries and sent their monks fleeing. Burgundy, where Cluny was located, experienced attacks from all three of these "barbarian" groups. Powerful laypeople and even bishops were still tempted with some frequency to take over the direction and the revenues of a monastery.

In response, the monasteries tried to band together. Benedict of Aniane had been abbot of most of the existing monasteries of Aquitaine at the beginning of the 9th century, and such associations were revived in the late 9th and 10th centuries as a form of protection. Affiliations of prayers were formed among monasteries within a region. A house that had been ruined or lost the regularity of its life might have the abbot of another house become its abbot as well, until the monastic life was fully reestablished. In some cases, two houses might be permanently affiliated under the same abbot, although this practice was less common.

Toward the end of the 10th century, such affiliations became the most common way for a ruined or dissolute monastery to be reformed. A layman or bishop who controlled such a monastery would ask the abbot of a house of undoubted holiness of life to send him a group of monks to reestablish the regular life, sometimes under their own abbot, who would bring with him the *consuetudines* and liturgical practices of the house where he had been trained, or sometimes under the continuing direction of the reforming house. In different parts of France, different monasteries took the lead in this reform movement. In Burgundy, Cluny, which in its initial three generations had reformed houses primarily in southwest France and in Italy, now became the chief source and model for reform. Gorze played a similar role in Lorraine, as did Montmajour in Provence, Marmoutier in western France, and Brogne in Flanders.

From the 8th through the 11th century in France, Benedictine monasticism was the most visible form of the religious life. It was virtually the definition of a holy and devout way of living, even though most houses followed the *Rule* slightly differently during these "Benedictine centuries." During the 11th century, however, French Benedictine monasticism began to receive its first competition in several centuries. These new forms of institutionalized religion gradually spread north from Italy. Hermits appeared in

French forests for the first time since the Merovingian period. Secular canons, small groups of priests who had collectively served some urban churches or castle chapels, began to be replaced by regular canons during the 1050s and 1060s. These regular canons, often called Augustinian canons because their rule was based on a letter originally sent by St. Augustine to his sister, combined the collective life and property of monasticism with the dedication to improving the Christian life in the broader world of parish priests and secular canons.

These new forms of the religious life continued to develop and spread throughout the 11th and 12th centuries; most small urban and suburban monasteries, many of which had had no monks for several centuries, were taken over by regular canons, and in absolute numbers they probably outweighed the Benedictines by the end of the 12th century. But monasticism also continued to flourish. Houses like Cluny were still prosperous and followed their rules and customs as closely as they always had. Some houses, like Chaise-Dieu, founded in the middle of the 11th century on eremitical principles, ended up adopting the Benedictine *Rule*. But for some people, both would-be religious and laypeople who wanted to support the religious life, the Black Monks no longer represented the fullest expression of spirituality. These people turned instead both to such groups as the hermits and regular canons and to the new forms of monasticism.

French monasticism in the 11th and 12th centuries included both Benedictine monks and, for the first time since the early 9th century, monks who followed a rule not based on Benedict's. Among the new foundations where Benedictine monasticism was practiced were Tiron, founded in 1109, and Savigny, founded in 1112; both were in the west of France. But the most influential of the new monastic orders of the high Middle Ages was the Cistercian order, founded in a conscious effort to return to a more literal observance of the *Rule of St. Benedict*. The Cistercians originated at Molesme, itself a house founded in 1075 by monks seeking a rigorous form of monasticism. When Robert, the abbot and founder, decided that even Molesme was not rigorous enough, he and some of the brothers instead moved to the New Monastery of Cîteaux. From the time of Cîteaux's foundation in 1098, the monks deliberately set out to restore Benedict's simplicity in food and clothing and his inclusion of manual labor. While the Cistercians, or White Monks, rejected many of the addi-tions that had been made to the *Rule,* such as the *consuetudines* of Cluny or of Benedict of Aniane, especially the liturgical elaboration, they also made modifications of their own. Cistercian customs forbade the reception of children (oblates) and made provision for *conversi,* adult converts, mostly from lower social classes, without the Latin education to be able to become full choir monks. These *conversi* ended up doing a major part of the monks' agricultural labor.

Additionally, the Cistercians created for the first time a truly permanent, institutionalized form of affiliation among monasteries, in which all new Cistercian foundations—and indeed any older houses affiliated with the order (as was Savigny in 1147)—became the daughter house of an already existing Cistercian monastery. The abbots of the daughter house and of the mother house were supposed to visit each other every year, and the abbots of the entire order met in an annual chapter general at Cîteaux, where regulations were passed in the interests of maintaining unity among the houses.

The Cistercians proved enormously popular. Converts flocked to the order, and knights and nobles made gifts, especially those lords lower on the social scale than those who had supported the Benedictines. From five houses in Burgundy in 1115, the

Cistercians by the middle of the 12th century rapidly spread to include hundreds of houses across Europe. The monks' agricultural organization via the grange system, which produced compact estates; their reliance on *conversi* rather than tenant or hired labor; the holiness and simplicity of their life, which attracted large numbers of gifts; and their willingness to lend money against principal all made the Cistercians an extremely wealthy order. The monks' use of *conversi* was copied by other monastic orders, and their annual visitation and chapter general were ordered established for all monks by the Fourth Lateran Council of 1215.

As the Cistercians were becoming established, other new forms of monasticism, not based on the Benedictine *Rule,* were arising in France. The most successful was the Carthusian order, established in the 1080s by St. Bruno on a combination of eremitic and cenobitic elements: each monk had his own cell, but the cells were grouped in a single community. Other new orders of non-Benedictine monks included Grandmont, founded on the principle of extreme poverty ca. 1100, and Fontevrault, founded at the same time by Robert d'Arbrissel, with the purpose of combining apostolic preaching, monks, and nuns in one house.

In the 13th century, monasticism, hitherto the preeminent form of the religious life, began to receive its first serious challenge, in the form of the friars. The Dominican and the Franciscan orders, both of which appealed especially to the culture of the newly developing cities, soon outcompeted the monks. Although the monastic houses founded before the end of the 12th century continued for the most part to flourish, there were far fewer monastic foundations in the 13th century than in the 12th. Only houses of nuns, rare throughout the early and high Middle Ages, multiplied during the late Middle Ages. In this static period, many of the intellectuals who might once have become monks went instead to the universities, and powerful members of secular society almost never sent their sons into the cloister.

In the 14th and 15th centuries, French monasticism went into a slow decline. The austerity that had been the goal throughout the Middle Ages was given up at more and more houses; as one example, meat, earlier reserved for the ill, was eaten several times a week. Communal property was increasingly replaced by the practice of allowing monks and nuns to have a certain amount of money of their own, for their own purchases and expenses. The close, fatherly relationship between an abbot and his monks became much more distant, as the abbot usually left the monastery for a nearby establishment of his own. Increasingly, abbots were not even elected by the monks but were appointed by the popes; bishops and cardinals, even secular magnates, might become titular abbots. By the time of the Reformation, many monasteries housed only a handful of monks.

# MONIAGE GUILLAUME

. A late 12th-century chanson de geste, extant in two redactions, of which the incomplete shorter version (*Moniage I;* 934 assonanced decasyllables) postdates the longer (*Moniage II;* 6,629 assonanced decasyllables). The poem recounts Guillaume d'Orange's edifying final days, in which he renounces the world after the death of his wife, Guibourc, in order to expiate the sins committed during his knightly career. The text's origin is controversial: there perhaps was a lost original, and the Sinagon episode appears clearly to have come from a different poem; local legends (e.g., Ysoré's tomb in Paris) have also been suggested. But the real source of the *Moniage* is to be found among historical memories of Count Guillaume of Toulouse's retirement to the monastery of Gellone in the year 806. The shorter version is preserved in two manuscripts, both incomplete; the longer version is found in seven manuscripts, of which two are complete.

The *Moniage* demonstrates that, between the chivalric values of the epic hero and the hypocritical practices of the monastic community, Guillaume's status as hermit allows him, without renouncing his glorious past, to strive for perfection. The poem makes the hero a holy personage, sanctioned by miracles but still physically powerful. He can face his enemies in the monastery itself or take up arms to defend the kingdom, as he does in the combat against the giant Ysoré.

If the *Moniage* satirizes monastic life, it also cultivates the ideal relationship, asserted by Thomas Cabham, between *gesta principum* (the deeds of princes) and *vitae sanctorum* (the lives of saints), between epic and hagiography.

# MONTAIGU

. Jean, lord of Montaigu-en-Laye and vidame of Laonnais, then "over fifty" years old, was executed at Paris in October 1409. He had risen to a position of great influence through service to the crown. His family, originally from Montaigu-en-Laonnais, first became prominent with his father, Gérard de Montaigu (d. 1391), a royal notary who was ennobled in 1363, served as a royal secretary and keeper of the archives (Trésor des Chartes) for many years, became a *maître des comptes* in 1390, and was a knight and royal councillor when he died.

The family was connected to two important prelates who owed their positions to royal service, Ferry Cassinel, archbishop of Reims, whose sister married Gérard, and Jean de la Grange, cardinal of Amiens, whose niece married Jean. Jean entered royal service as a secretary of Charles VI in the 1380s. Like Cassinel and La Grange, he was associated with the Marmousets and was dismissed from court when the royal uncles ousted them from power in 1392. By May 1393, however, he had resumed his post, and in 1396 he became a councillor of the king, commissioned to oversee the receipt of funds destined for the household expenditures of the king, queen, dauphin, and the duke and duchess of Orléans. In 1398, he was knighted and became a royal chamberlain and *maître d'hôtel of the* queen. He became captain of the Bastille in 1399 and from 1402 until his death was sovereign master of the king's household. Jean and his wife founded a Celestine convent near Marcoussis castle, which Cassinel had given him in 1388. His political influence and ostentatious wealth finally angered John the Fearless, duke of Burgundy, who engineered his destruction.

His brother, a younger Gérard (d. 1420), succeeded his father as custodian of the Trésor des Chartes and became a royal councillor and *maître des comptes*. Bishop of Poitiers by 1404, Gérard moved to the see of Paris in 1409. He served for about five years as the duke of Berry's chancellor (until 1409) and also received a pension from Louis of Orléans. In November 1413, he became president of the Chambre des Comptes.

A third brother, Jean, was evidently named after his brother, a custom sometimes observed in medieval France. He was elected bishop of Chartres in 1390, transferred to the archbishopric of Sens in 1406, and served as a royal councillor and ambassador. In disgrace after the execution of the elder Jean, he became a supporter of the Orléanist faction. In 1413, after the flight of the Burgundians from Paris, he was president of the

Chambre des Comptes for a short time. By 1415, he was a councillor of the king and the duke of Guyenne. He was killed at Agincourt in October of that year.

# MONTAUDON, MONK OF

(fl. 1194–1210). After becoming a monk at Vic near Aurillac (Cantal), then prior of an abbey perhaps located at the place called Montaudou near Clermont-Ferrand, the Monk of Montaudon left the cloister to become a troubadour. In addition to a number of more conventional *cansos,* or love songs, we have among the poems he wrote from 1194 to 1210 a series of witty debates with God; a satirical gallery of troubadours in the tradition established by Peire d'Alvernhe; four *enuegz,* or lists of annoyances, and one *plazer,* or list of pleasures. The genres of the enueg and plazer were inspired by Bertran de Born but took their definitive form in the hands of the Monk and were later imitated by poets who wrote in Italian, French, Portuguese, Catalan, and English, including Shakespeare (Sonnet 66).

# MONTEREAU

. The castle of Montereau-faut-Yonne (Seine-et-Marne), at the confluence of the Seine and Yonne rivers about 49 miles southeast of Paris, was a site of a settlement that already existed when the Romans invaded. Eudes II of Blois built a wooden donjon there ca. 1015–20. A stone castle, completed by 1228, replaced this construction and was held in

fief from the archbishopric of Sens by the counts of Champagne. Through the marriage of their heiress to Philip IV of France, Montereau passed into the royal family. The castle covered the surfaces of two small islands at the center of the confluence and was joined to the three adjacent river banks by long wooden bridges.

Montereau is best known as the site of the assassination of John the Fearless, duke of Burgundy, on September 10, 1419. The dauphin, later Charles VII, had invited John to come and discuss a final agreement to end the French civil war. They met on the bridge connecting the castle to the town. According to a prearranged plan, John was assassinated while he knelt at the dauphin's feet as the conference began. The fact that part of the bridge was a draw-bridge that could be raised from the town's side prevented immediate retaliation by Burgundian men-at-arms garrisoned in the castle. The duke's assassination is of paramount historical importance, for it drove a greater wedge between the dauphin and the royal government and ultimately left the kingdom without the support needed to defeat Henry V of England.

# MONTFORT

**.** The lords of Montfort-l'Amaury (Seine-et-Oise) near Mantes were descended from a 10th-century count of Hainaut. Of no more than local importance before the 13th century, the family became prominent internationally when Simon IV (ca. 1150–1218), who first held the title of count, became a leader of the Albigensian Crusade. After defeating the count of Foix near Castelnaudary in 1212, Simon crushed the king of Aragon and a coalition of southern lords at Muret in September 1213 and for a time secured the county of Toulouse. Then the tide turned against him and he was killed before Toulouse in 1218. His younger son, Simon (1206–1265), married Eleanor, a sister of Henry III of England, became earl of Leicester, and died in battle after leading a major baronial revolt in England. The older son, Amaury VI (1192–1241), failed to regain his father's position in Languedoc but served as constable of France the last eleven years of his life. Amaury's great-granddaughter Yolande married Arthur II, duke of Brittany, in 1294. The county of Montfort passed to a cadet line of the Breton ducal house that won control of Brittany in 1364.

# MONTIER-EN-DER

. Site of a Benedictine abbey *(montier)* founded by St. Berchaire in 672 on the banks of the Voire, Montier (Haute-Marne) is the capital of the area of Champagne called Der, from the Celtic word for the oak trees that dominated this plain before the monks harvested them in the Middle Ages. The abbey church and most of the town were destroyed in World War II but have been admirably restored. The oldest portions of the original church dated to the 990s. The sober Romanesque nave consists of eight semicircular bays resting on low rectangular pillars. The Gothic chevet (ca. 1220), which has four levels, is a marvel of Champenois design: large arcades on twin columns, surmounted by a tribune with paired arches separated by a colonnette and oculus, in turn surmounted by a triforium with triple trilobed arcatures, and finally a row of clerestory windows separated by colonnettes.

# MONTLHÉRY

. The fortress of Montlhéry (Seine-et-Oise), just south of Paris, was built in the early 11th century and became a serious threat to the authority of the early Capetian monarchy. Philip I, who said that it "has made me old before my time," arranged for his younger son to marry the daughter of the lord of Montlhéry in 1104, and Louis VI acquired the tower a few years later. When his castellan was murdered by a rival lord, Louis had to regain Montlhéry by force in 1118.

Centuries later, on July 16, 1465, Louis XI fought a battle near Montlhéry against the rebellious magnates known as the *Ligue du Bien Publique*. He overcame his adversaries but missed the chance for a decisive victory and retired to Paris, leaving the magnates in a position to secure a favorable negotiated settlement.

Nothing remains of the infamous 11th-century château, although the site is occupied by ruins of later constructions: fortification walls that date from the reign of Philip II Augustus (1180–1223) and a donjon of the 14th century.

# MONTMAJOUR

. The former Benedictine abbey of Montmajour (Bouches-du-Rhône) originally consisted of two churches, Saint-Pierre and Notre-Dame. Built at the end of the 10th century, only Saint-Pierre exists in its original form. Notre-Dame was reconstructed in the late 12th century, at which time the cloister, conventual buildings, and a chapel dedicated to the Holy Cross were also constructed. The abbey began to decay as early as the 14th century.

A rock-hewn edifice, Saint-Pierre offers an example of a primitive monastery. One of its most unusual features is a wooden cornice that trims the flat-stoned roof. A rectangular vestibule features barrel vaulting. Although structurally awkward, the nave is not devoid of harmony and el

Montmajour (Bouches-du-Rhône), abbey. *Photograph courtesy of Whitney S.Stoddard.*

egance. It consists of three Romanesque bays, covered by a vault of different types of stone, that give way to a triumphal arch of the choir and an apse in cul-de-four. Twelve columns support foliated and interlaced capitals. Adorned with an interlaced pilaster, the corridor between the two chapels provides access to a cave in which, according to tradition, the first monks dwelled. In a recessed vault is a stone chair called the "Confessional of St. Trophimus," (d. ca. 280), where the saint is said to have hidden during Roman persecution.

Because of the slope of the hillside, Notre-Dame has an upper church and a lower church on separate levels. With a polygonal-shaped exterior, Notre-Dame was rebuilt at the end of the 12th century, replacing an 11th-century structure. The crypt is composed of a vast transept with apsidioles and an apse surrounded by an ambulatory with radiating chapels. The apse has a rectangular bay with barrel vaulting. Quadrilobed in plan, the chapel of Sainte-Croix features a narthex, a high cupola, and vaulting in cul-de-four. One door carries an inscription that falsely attributes the construction of the chapel to Charlemagne.

# MONTMORENCY

. The castellany of Montmorency, north-west of Paris, became the seat of one of France's most influential noble dynasties. The family had originated around Sens, where two of its members held the archbishopric, but after their ouster from this region in the 10th century Bouchard I le Barbu established himself near Paris on the Île-Saint-Denis. From there, he threatened the holdings of the abbey of Saint-Denis until King Robert II (r. 996–1031) intervened and installed him at the *castrum* of Montmorency some distance away.

From this base, the family grew steadily in importance. Bouchard's son Aubry (Alberic) and his grandson Thibaut were constables of France, and another grandson, Hervé, became butler of France. Mathieu I (d. 1160) and Mathieu II (d. 1230) also both served as constable. The second wife of Mathieu II was Emma, heiress to the lordship of Laval in the county of Maine. A son of this marriage succeeded to Laval as Gui VII (d. 1267); Montmorency went to the older son, Bouchard V (d. 1243), who served Louis IX at the Battle of Taillebourg (1242). The Laval branch of the family became politically important in Brittany as well as Maine after Gui VII married the heiress of Vitré.

The senior line of the family continued to produce men who held high positions in the royal government and women who married into the great lineages of Normandy and the Île-de-France. Mathieu IV (d. 1304) was admiral and grand chamberlain. Jean I (d. 1325) served French kings in wars in Flanders. Among his children were Charles de Montmorency, marshal of France, and Jean, bishop of Orléans. In virtually every generation after 1300, the head of the family was a royal councillor and chamberlain. At length, in the mid-16th century, Montmorency became a duchy and peerage.

# MONTMORILLON

. Montmorillon (Vienne) is located on the Gartempe River in Poitou. La Hire (ca. 1390–1443), companion-in-arms to Jeanne d'Arc, received the seigneurie of Montmorillon from Charles VII on January 7, 1438, and was originally buried here.

In 1093, the bishop of Poitiers gave the chapel of Notre-Dame to the abbey of Saint-Savin-sur-Gartempe. The crypt of the church constructed later houses a 13th-century Romanesque fresco that some sources claim to be the first representation of St. Catherine's "mystical marriage" to Christ. Others contend that it represents the intercession of the Virgin Mary on behalf of the church. Modifications of this second theme since its first appearance in the 9th century, and a representation of the legend of St. Catherine at Alexandria, would then be the causes for the confusion between the two themes.

A 12th-century frieze on the western front of the church of Saint-Laurent, formerly the abbey church of the Augustinian canons, shows the Childhood of Jesus. The most remarkable of the scenes is the Flight into Egypt, in which the Holy Family is trailed by James, who was, according to apocryphal sources, the son of Joseph from an earlier marriage.

The Octogone and Maison-Dieu of Montmorillon were both begun in the first quarter of the 12th century. The Octogone was originally constructed to serve as a sepulchral chapel. At the end of the century, a second chapel was built above it, and the first was all but abandoned, being used for an ossuary.

# MONTPELLIER

. Montpellier, first noted in documents of the 10th century as a rural site, is located close to the Mediterranean in Languedoc. By the late 11th century, a bustling town of artisans and merchants had developed under divided political allegiance to the bishop of Maguelone and local lay lords of the Guilhem family. The king of Aragon and Majorca would replace the Guilhem as seigneurs in the 13th century. The king of France made his influence felt in the south increasingly after the Treaty of Meaux-Paris (1229), which brought Languedoc under Capetian domination following the Albigensian Crusade. In 1293, Philip IV the Fair purchased the episcopal quarter of Montpellier, and in 1349 Philip VI would acquire the seigneurial sector from the bankrupt Majorcan king James III for 120,000 *écus*.

The economic heyday of Montpellier was the 13th century. Northern French and Flemish cloth, dyed scarlet in Montpellier, was exported throughout the Mediterranean world. Spices, drugs, sugar, and silks of the East were imported by Montpelliérains and sold on the local markets or transshipped to centers of demand throughout the western Mediterranean basin and northwestern Europe. Montpellier grew to about 40,000 inhabitants by the early 14th century. Immigrants from Italy, Spain, and central France

joined newcomers from the immediate hinterland. In the period 1250–1350, in conjunction with Aigues-Mortes, the major port for Levantine trade, and with Lattes, Agde, Collioure, and other smaller outlets to the sea, Montpellier acted as a fulcrum of trade and finance between the Mediterranean world, the Champagne fairs, and Paris. After the mid-14th century, Montpellier experienced a sharp demographic, economic, and political decline, occasioned by the Black Death, changes in the overall European economy and in Mediterranean trade, and, if one is to believe Petrarch's commentary, by its incorporation into the French kingdom.

Montpellier was celebrated throughout the later Middle Ages for its schools. A medical school, founded by the year 1000, most likely by Jewish or Arab physicians, was incorporated in 1221, and a university uniting it with schools of law and the arts was chartered by Pope Nicholas IV in 1289. Petrarch studied here before going on to Bologna. The present-day school of medicine is located in the converted 14th-century bishop's palace.

A Benedictine abbey was founded in Montpellier by Pope Urban V in 1364. The abbey church, which became the cathedral of Saint-Pierre in 1536 when the diocese of Montpellier was formed, dates in part from the 14th century, although much today is 19th-century neo-Gothic reconstruction. Designed by the Avignon architects Bernard de Manse and Bertrand Nougayrol, it consists of a wide nave without side aisles, but with side chapels in the Languedoc manner. Its unsculpted fortresslike façade has two towers and an awkward porch carried on two thick columns.

# MONT-SAINT-MICHEL

. In the bay off the border between Normandy and Brittany, the fortified monastery of Mont-Saint-Michel surmounts a 250-foot tall rock island surrounded by ocean and quicksand. Although a sacred site had occupied the island since the 8th century, the conventual buildings result from a period of over 500 years of construction, with the fusion of monastic and military architecture as the goal.

According to the annals and chronicles of Mont-Saint-Michel, in 708 the archangel Michael came in a vision to Aubert, bishop of Avranches, and told him to build a church on the summit of Mont-Tombe. The first in what was to be a series of ecclesiastical structures took the form of a hollowed-out circular cavern. By the 9th century, the site

had become an established pilgrimage center. After the period of Viking invasions, the agreement of Saint-Clairsur-Epte (911) placed the site in Viking hands. In 965, Richard I, duke of Normandy, replaced the canons with thirty Benedictines and appointed Maynard of the abbey of Saint-Wandrille as abbot. Norman funds initiated several building campaigns.

In 1023, Bishop Hildebert leveled the top of the mount to construct a larger church upon the first cavernous structure and turned the earlier sanctuary into a crypt. The earliest parts of the crypt include the north and south walls and two arches of the central arcade and west wall. In order to support the northwest aisle wall and nave piers of the Romanesque church, the antechamber to the west was built.

With granite from Brittany and the nearby Isles of Chausey, over the course of the 11th and 12th centuries and into the 13th the church came to completion. Its largely Romanesque plan included a seven-bay nave with side aisles, bulky compound piers, transepts with apsidal chapels, a large crossing tower, and a two-bay east end with simple apse. The three-story elevation had a wooden roof. In the later 12th century, Abbot Robert de Torigny added towers to the west front that totally collapsed in 1618; in 1780, three of the seven bays of the nave were pulled down. The 1 1th-century choir fell in 1421 but was rebuilt in Flamboyant style later in the 15th century by Abbot Guillaume d'Estouteville. An image of the 11th-century church prior to the demise of its east and west ends can be found in the *Très Riches Heures* of John, duke of Berry (fol. 195v.).

In the early 11th century, Abbot Roger II (r. 1106–22) initiated the first set of conventual buildings on the north side of the rock. Under Guy de Thouars, Bretons laid siege to Mont-Saint-Michel and destroyed Roger's buildings. Fears of future invasions together with payment from Philip II Augustus led to the more strongly fortified construction of the monastic buildings known as the "Merveille." During the abbacy of Jourdain (r. 1191–1212) the new monastic plan was initiated and made vertical. Over the period from 1203 to 1264, storage rooms, guest hall, monks' dormitory, refectory, and cloister were stacked on top of one another in three stories on the north face of the rock. The first story held the cellar and almonry, the second level held the *salle des chevaliers* and part of the dormitory, and the third story held the cloister and the refectory. Most of these monastic buildings survive, along with the abbot's lodgings and terraces with gardens south of the church.

Due to fires and attacks, little evidence of earlier domestic architecture survives, although their changing locations are known. In the 12th century, houses occupied the steep rocks to the east of the abbey. Eventually, the town came to occupy its present position on the south side of the mount. Houses from the 15th and 16th centuries remain.

Mont-Saint-Michel, nave. *Photograph courtesy of Whitney S.Stoddard.*

Until the mid-13th century, the abbey alone was fortified. In 1256, with financial help from St. Louis, walls were built to circle the town, but the present fortifications are largely 15th-century, a product of the Hundred Years' War. The abbey played a heroic role in the early years of the 15th century, holding out against the English for over thirty years, in spite of Abbot Robert Jolivet's capitulation in 1419. During the French Revolution, the abbey was secularized, and it was used as a prison from 1793 to 1863. Recognized as a public monument in 1874, the abbey church and other buildings were restored.

# MORAL TREATISES

. The 13th century saw a considerable production of vernacular moral treatises tailored both to the laity and to those in religious life. Edmond of Abingdon's *Mirour de seinte Eglyse* (1230–40) is a series of prose sermons compiled into a treatise intended to guide religious in meditation in the mode of Hugh of Saint-Victor. The French version of the English *Ancrene Riwle* and the *Vie de gent de religion,* both written near the end of the century, are theological treatises intended to instruct religious.

From the middle of the 12th century, the *Elucidarium* inspired a series of treatises aimed at the laity. Gillebert de Cambres's verse *Lucidaire* was the earliest, followed by the *Lumere as lais* (1266–67) of Peter of Peckham, a much longer work that also relies on the *Quattuor libri sententiarum* of Peter Lombard. More elementary in tone, despite its learned source, is the slightly earlier *Dou pere qui son filz enseigne*. The anonymous *Miroir du monde,* sections of which antedate 1279, consists of four parts: a treatise on virtue, another on the Seven Deadly Sins, ten paragraphs on the precepts of wisdom, and a confession manual. The first two parts were used by Laurent d'Orléans in his *Somme le roi,* composed in 1280 at the request of Philip III the Bold. Jean de Journy's *Dime de penitence* is a confession manual written in 1288.

The few surviving treatises in Occitan are similar and roughly contemporaneous. The *Repentir du pécheur,* written in the second quarter of the 13th century, introduces its confession of sins with a prayer to the Virgin. Raimon de Castelnou's *Doctrinal,* from the second half of the century, is a poetical catechism intended for public recitation. Matfre Ermengaud's *Breviari d'Amor* (1288) is an encyclopedic work broader in scope than the others mentioned here, but its section on the love of God treats the works of mercy, the articles of the creed, and the petitions of the Pater Noster, as well as confession.

# MORALITY PLAYS

. The morality play was one of the major dramatic genres in France during the late Middle Ages. The term *moralité,* long used to designate a moral teaching or doctrine, was applied in the 15th century to plays that taught moral lessons by means of allegory. Though references to allegorical plays survive from the late 14th century, the earliest extant *moralité* was staged at the Collège de Navarre in Paris in 1427. About seventy morality plays written between that date and 1550 have come down to us.

A morality play may be generally defined as an allegorical drama in which the protagonist is required to make a moral choice between good and evil. The plays, however, vary greatly in scope and style. They range from fewer than 200 to more than 30,000 lines. A few have only two or three characters; the longest has more than eighty. Some morality plays, like *Homme Pécheur,* present a single human character who alternates in choosing between good and evil. Others, like *Bien Advisé et Mal Advisé,* have dual protagonists, one good and one bad. Some plays, like *Homme Juste et Homme Mondain,* present the human protagonists on the journey of life from birth to death and confront them with a full range of personified virtues and vices to choose among. Others, like the *Blasphémateurs,* treat only a single vice and cover a short period of time. These four plays bear a superficial resemblance to the Passion plays in that they are quite lengthy, probably requiring several days to perform, and their staging includes both Heaven and Hell with the usual complement of angels and devils. They are essentially different from the Passion plays, however, because their plots are allegorical fictions rather than historical representations. The staging of Hell differs also in that the morality plays show the torments of the sinners inside Lucifer's lair rather than just the Hell-mouth entrance as in the Passion plays. In *Bien Advisé et Mal Advisé,* for example, Hell is depicted as a kitchen in the house of a great lord. Here, sinners are forced to partake of an infernal banquet where every dish is liberally seasoned with sulfur and *sauce d'enfer*.

Some morality plays also bear a superficial resemblance to farces, either in the scenes that provoke laughter or in those that portray the trickery and deception involved in a life of sin. Here, too, though both genres represent fictional worlds, there is a fundamental difference. Dull-witted farce characters are laughable because they are the butt of tricks

played by others for material gain. Clever farce characters are comic because they are prisoners of their own venality. If tricks are played in morality plays, it is because evil characters are trying to lure the human protagonists into sin and damnation. The latter do not have to play tricks to gain some paltry material advantage; they need only yield to temptation in order to have all the worldly possessions they desire. When farce characters gain something through deception, they are not punished. They live in an essentially amoral world governed by folly. Morality-play characters know full well that every action has moral consequences. Those who act virtuously will be rewarded, but those who choose vice will be punished. The world that the morality play represents is ordered, governed by reason, in which there is always a higher power to reward the good and punish the wicked. Indeed, a character named Reason, representing the human ability to distinguish good from evil, appears in a number of morality plays, such as the *Lymon et la terre* and the *Théologastres*. Her function is to guide the protagonist into the path of virtue.

Many morality plays have protagonists who are universalized individuals of the Everyman type. They go by such names as Humanity, Humankind, or Sinful Man. Many others present main characters who exemplify vices—e.g., Poison Tongue—or stages in life. In the latter category are several plays from the 16th century dealing with the problems of youth, especially the children of wealthy bourgeois. The parents in the *Enfant ingrat,* for example, ruin themselves financially in order to give their son every advantage. Morality plays that deal with individuals, whatever the scope, may be termed personal moralities. Some plays, however, deal with the moral condition of particular groups within society and thus have protagonists who personify institutions. These may be termed institutional moralities. One such play is the *Moralité des trois états réformés par Raison,* which shows that institutions as well as individuals can become corrupt when they lose the guidance of reason. Another institutional morality is *Envie, État et Simplesse,* which provides an example of institutional reform by having State expel Envy from his company.

Virtually all morality plays are personification allegories in which ideas and psychological traits are represented as characters on the stage. Their names range from the designation of common virtues and vices like Charity and Pride, or conditions like Poverty, to more fanciful appellations like Ashamed-to-tell-his-sins. One of the principal attributes of these nonhuman characters is that, with few exceptions, they always represent the static concept of their name and therefore never develop or change as would a human character. A few morality plays lack personification of this sort, and they may be called interpretive allegories. Their characters are all human, but the spectator is expected to interpret the play in an allegorical sense. The epilogue to the *Moralité de Pyramus et Tisbee* explains that Pyramus can be understood as the son of God and Thisbe as the human soul. Similarly, André de La Vigne's *Aveugle et le boiteux,* which has the appearance of a farce, can be interpreted as an allegory of the ungainly pairing of soul and body. When the two beggars are miraculously cured, the blind man (soul) accepts God's grace and the cripple (body) rejects it.

There is, finally, a fundamental difference between the morality plays and the dramatic works of later centuries. Renaissance playwrights and their successors fell under the influence of Aristotelian theories concerning the imitation of the physical world, but the authors of morality plays worked largely with Platonic notions of mimesis. If the

morality-play protagonist lacks the finely drawn psychological traits of the tragic hero, it is not because medi-eval playwrights were inept but because they had a different goal. Influenced by a persistent medieval Platonism, they found greater dignity in plays that imitated the "real" world of ideas and concepts than in those that imitated the ephemeral world of material things.

# MORAT

. Charles the Bold, duke of Burgundy, at war with a league of Swiss towns in 1476, led his army from Lausanne to besiege the stronghold of Morat (Murten), twenty miles west of Bern. His divisions were poorly positioned and unable to support each other when attacked by a Swiss column on June 22. For the second time in four months, the Swiss defeated the Burgundian army, this time with great slaughter. The battle cost Charles control of Savoy and precipitated the collapse of Burgundian power in the next seven months.

# MORIENVAL

. The abbey church of Morienval (Oise) is a Frankish foundation just north of Paris. The present church is primarily an 11th-century Romanesque structure with a rib-vaulted ambulatory dated ca. 1122. It has three towers, one at the west end and two flanking the apse. A Carolingian flying screen spans the nave with transverse ribs and heavy piers. The groin-vaulted aisles have carved capitals that reflect Byzantine influence. The later ambulatory utilizes diagonal ribs and slightly pointed transverse arches. Although the vaults show experimental construction techniques, they represent important early stages of the Gothic rib-vaulting system.

# MOTET (13TH CENTURY)

**.** A musical-poetic genre composed upon a fragment of plainchant. The motet is readily identified by its stylistic and notational differentiation of the tenor from the upper part(s). An upper part, the motetus (or motellus), was notated *cum littera* (texted and in single notes), and the tenor, which carried the plainchant, was notated *sine littera* (untexted and in ligatures subject to modal rhythmic interpretation). The tenor plainchant melisma is the structural foundation of the motet. Throughout the 13th century, tenors develop from simple, literal repetition to more complex patterns, such as the rondeau, but it is the relationship of the upper parts to each other and to the tenor that changed most radically.

In the closing years of the 19th century, Wilhelm Meyer demonstrated that the origin of the motet lay in the discant clausula of the Notre-Dame School. The upper voice (the duplum) of a clausula was notated in rhythmically significant ligature patterns (several notes joined together in one notational symbol) because it had no text. Melodic comparisons of clausulae and early motets showed that many were in fact melodically the same. Thus, when a text was given to the existing duplum of a clausula, the ligature patterns used to notate this part, now called the motetus instead of the duplum, were converted into notation to set individual syllables of text, making use mostly of single notes without rhythmic significance. Meyer thus was able to demonstrate that motets arose from the practice of poetically texting the upper part(s) of clausulae, and this explained the uneven number of syllables and irregular rhyme patterns of the poetry, unlike any other poetry of the time.

For many early motets, a newly composed third voice, the triplum, was added, to which the same text was applied. Such three-part (in rare cases, four-part) compositions with rhythmically organized tenors and a single text for both upper parts are known as conductus motets. Only a few conductus motets have French texts, the repertory being predominantly in Latin. A three-voice motet with one text for the motetus and another for the triplum is called a double motet. Double motets may be completely Latin, completely French, or they may be bilingual, usually with a Latin motetus and a French triplum. The same principles may be applied to triple motets, in which typically a fourth voice, the quadruplum, with its own text, has been added to a double motet. The same language almost always occurs in all parts, and most triple motets are in French.

The largest extant source of the second half of the century for motets is the Montpellier codex, with over 300: triple motets (all French but one in Latin), double motets with Latin moteti and French tripla, Latin double motets, French double motets (some with secular tenors), and a few motets for which the composer is identified as Pierre de la Croix and for others as Adam de la Halle. The use of French texts for tripla or for both tripla and moteti of motets possibly arose in the 1230s. Fifty French-texted motets are included in the *Manuscrit du roi,* which is known primarily as a source for trouvère and troubadour chansons and was inscribed ca. 1250.

It is generally thought that the vertical coincidence of phrase endings among the parts is stylistically earlier than a staggering of phrase endings. An early motet demonstrating the vertical coordination of phrase ending is the three-part conductus motet *Homo quo vigeas/Et gaudebit*. To form the motet, the duplum has been given the text *Homo quo vigeas* and a triplum newly composed in note-against-note style. Staggered phrase endings occur especially in double motets, such as *Ypocrite pseudopontifices/ Velut stelle firmamenti/Et gaudebit*. Another double motet that has staggered phrase endings, *O Maria virgo /O Maria maris stella/In veritate,* rhythmically contrasts the parts by setting the tenor in the fifth rhythmic mode, the motetus in the first, and the triplum in the sixth. The end-rhymes of the text for *Beatis nos adhibe/Benedicamus Domino* rhyme with each syllable of the tenor. It is actually an organum prosula that was used in the liturgy as a replacement for or trope to the *Benedicamus Domino*. Like *Beatis nos adhibe,* many of the earliest motet texts maintain a tropic relationship to the text of the tenor from which the clausula has been derived.

The part notation that became the norm in the second half of the century—separate columns of staves for the upper parts with the tenor running along the bottom of the page—led to the abandonment of score arrangement in practical sources. In later 13th-century sources, page turns are sometimes arranged to coordinate with all the parts, indicating that the singers could perform from the manuscript. There is a rhythmic distinction between the long, breve, and semibreve, and rhythm-specific ligatures with modified shapes are introduced. Rests indicated by lines of definite lengths replace the ambiguous rests that had been determined by modal context.

Trends in the continental repertories of motets at the end of the 13th century included a number of other significant developments. The Petronian triplum—after Pierre de la Croix—is characterized by virtuoso declamation of a French text and subdivision of the breve into more than three semibreves, each carrying its own syllable of text. Pierre's own *Aucun vont sovent/Amor qui cor vulnerat/ Kyrieleyson* is a good example. Secular *cantus firmi* were introduced, and binary rhythm is seen in motets like *Amor potest conqueri/Ad amorem seqintur*/[Tenor] in the Montpellier codex. Some late 13th-century French motets tended toward accompanied song, much like *Pucelete bele et avenant/Je languis des maus d'amours/Domino* and some motets of the *Fauvel* manuscript.

# MOTTO/DEVISE

. The adoption and use by individual nobles in late-medieval France of a distinctive aphoristic phrase of the type known in Italian and English as the "motto" and in French as the *devise* was probably derived in part from the much earlier use of war cries, or *cris de guerre*. From at least the 12th century, princes and barons in France, as in other parts of Latin Christendom, made use in battle of a distinctive rallying cry. Such cries took a variety of forms, from the simple name of the family *(Châteaubriand!)* through a call for aid to the lord in specific terms *(Louvain au riche duc!)* to an invocation of the patron saint of the dominion (the *Montjoie Saint-Denis!* of the kings of France or the *Notre-Dame de Bourbon!* of the lords of Bourbon) to an exhortation in the most general terms (the *Passavant li meillor!* of the counts of Champagne and the *Place a la banniere!* of the lords of Coucy).

The use of *devises* or mottoes as distinct from cries dates only from the 14th century and was closely associated with the adoption of those figurative cognizances called "badges" in English from the same period. In fact, the earliest mottoes were closely associated with badges, whose significance they often helped to explain, and although the French term *devise* was employed by contemporaries to designate both badges and mottoes separately, and has come to be used in ordinary language especially to designate the latter, scholars now restrict both it and its English derivative "device" to a composition including both a badge and a motto set on or next to it. Ephemeral devices of this sort were employed from ca. 1330, but the first stable devices in Europe seem to have been those of the monarchical orders of knighthood founded by kings and by sovereign dukes in France and the empire between 1347 and 1470. The earliest stable devices were the garter of the English Order of the Garter, bearing the famous motto *Hony soyt ki maly pense* (1346); the sword of the Cypriot Order of the Sword, with its motto *Pour loyauté maintenir* (1347/59); the love-knot of the Neapolitan Order of the Knot, with its changeable motto Se *Dieu plaist/Il a pleu a Dieu* (1352); and the belt bearing the motto *Esperance* and the golden shield bearing the motto *Allen* created by Duke Louis of Bourbon in 1366 and 1367. The last two may have been the first stable devices in France proper, though they were anticipated by several years by the device adopted at some time between 1352 and 1362 by Amadeus, the "Green Count" of Savoy: a love-knot similar to that of the Neapolitan order, usually accompanied by the motto Fert. This motto was also among the first, if not the first, to be used independently of a figural badge.

Promoted in the royal court of Charles VI from 1382, the use of mottoes, typically short and more or less cryptic, spread rapidly among the nobles of France in the last third of the 14th century and enjoyed its greatest vogue in the 15th and 16th centuries. After 1420, indeed, the use of a badge without some sort of motto was rare in France. The use of independent mottoes grew steadily, however, to the point where most great families

employed one and commonly displayed it, along with or in place of their *cri de guerre,* as part of their armorial achievement, usually below the shield. In some cases, the motto actually alluded to the figures on the shield of arms whose basic design was common to the whole lineage: thus, the *Sustenant lilia turres* of the Simiane family of Provence, whose arms were semé of lilies and towers. In addition to, or in place of, such familial mottoes, many nobles adopted one or more personal mottoes, some for short periods and some for life. The most famous personal mottoes of this period are those of the four Valois dukes of Burgundy, who bore respectively *Moult me tarde, Je le tiens, Aultre n'aray,* and *Je l'ay emprins*. In general, the use of mottoes before 1500 closely paralleled the use of both badges and devices. Together, badges, mottoes, and devices formed a loosely structured system of cognizances, which, because of its close association with the traditional heraldic system centered on the arms and crest, is now described as "paraheraldic."

# MOULINS

. Moulins (Allier) originated in the late 10th century as a small settlement of millers who served the needs of the nearby village of Yzeure. Because of its strategic location on the Allier River and at the intersection of Roman roads, Moulins became a favored seat of the lords, later dukes, of Bourbon. An early 15th-century belfry, the Jacquemart, and a concentration of imposing houses in half-timber work and stone testify to the prosperity enjoyed by the town during the heyday of the dukes of Bourbon, from the late 14th century to the early 16th. Portions of the ducal château also survive, including the late 14th-century donjon and the Italianate corps-de-logis added under Pierre II and Anne of Beaujeu ca. 1500.

The collegiate church of Notre-Dame, erected with ducal sponsorship on the site of an earlier chapel, is the city's major monument of the late Middle Ages. Built between 1474 and the early 16th century, it consists of a restrained two-story elevation that may be related distantly to contemporary Parisian architecture. However, Notre-Dame's chief glories are the stained-glass windows of the
Moulins (Allier), Notre-Dame, plan.
After Deshoulières.

chapels, which showcase their aristocratic and bourgeois donors and the splendid triptych ordered by Pierre II and Anne of Beaujeu for the chapel of the Conception and painted by the Master of Moulins in 1498.

# *MOUVANCE*

**.** Fiefs were often said to "descend" or "move" (Lat. *movere*) from the person who had granted them and whose permission consequently was required for any abridgment of the fief or its service. Since unauthorized alienations could be met with confiscation, the prudent acquirer of a fief, particularly an ecclesiastic, obtained the approval of the lord in whose *mouvance* it was.

From the 13th century, wealthy princes attempted to increase their influence and prestige by purchasing the *mouvance* of important fiefs and by establishing *mouvance* over allodial lands newly converted into fiefs. When the county of Bar-le-Duc, for example, which consisted of various allodial and feudal lands, was compelled by Philip IV in 1301 to become a fief held from the crown, it entered the royal *mouvance* and henceforth was known as the *Barrois mouvant,* to distinguish it from the rest of the county located in the German empire.

# MOZAC

**.** The Benedictine abbey of Saint-Pierre in Mozac (Puy-de-Dôme), founded in 681 by St. Calminus and his wife, St. Namadie, was one of the richest in France until the Reformation, thanks to the transferral here of the relics of St. Austremoine, patron of Auvergne, in the 8th century. The present church, built for the most part during the 12th century in the Romanesque style of Auvergne, incorporates an 11th-century tower on the western façade. The nave and side aisles date from the 12th century and the choir and wooden choirstalls from the 15th. In the treasury is the reliquary of St. Calminus, the largest 12th-century Limousin enamelwork reliquary preserved in France (ca. 1168). It consists of fourteen enamel plaques: on the ends are depicted St. Austremoine and Mary holding the Child Jesus. Within the church, the capitals are the finest examples of Romanesque sculpture in Auvergne. One in particular, that representing Christ's Resurrection, is notable as an important visual source for 12th-century clothing and military equipment.

# MULTIPLE-REFRAIN SONGS
## *(CHANSONS AVEC DES REFRAINS)*

**.** Unlike the *chanson à refrain,* where a single refrain reappears at preestablished intervals, the roughly one hundred extant songs with multiple or variable refrains consist of an indeterminate number of stanzas, ranging from two to eight, each followed by a different borrowed or cited refrain (intertextual repetition). The appearance of each refrain entails a metrical and melodic break, since all stanzas are sung to the same melody and have the same rhyme scheme, while each refrain has its own melodic phrase and versification. Nonetheless, the refrain is often integrated into the stanza through a transitional line announcing it. More than one-third of all *chansons avec des refrains* are classified as *pastourelles*.

# MURBACH

. The Benedictine abbey of Murbach (Haut-Rhin) in the Vosges was founded in 727 by St. Firmin and splendidly endowed by Count Eberhard d'Eguisheim. Among its benefactors was Charlemagne, and its abbots were all princes of the Holy Roman Empire. It had the distinction that only members of noble families could join, and its monks were knights as well. Only the east end of the massive, late 12th-century pink-sandstone abbey church of Saint-Sixte survives: choir, transept with twin towers, and flat chevet, flanked by two two-storied chapels. The decoration of the transept and chapels, as at nearby Guebwiller, is of Lombard arcading.

# MURET

. During the early years of the Albigensian Crusade, Simon de Montfort, a castellan from the Île-de-France, ousted Raymond VI, count of Toulouse, from his lands. Peter II, king of Aragon, intervened in 1213 to support the Occitan lords against the crusaders from northern France. Peter and his allies besieged the town of Muret (Haute-Garonne) on September 10, 1213. Montfort arrived with a much smaller force, hoping to break the siege. Although badly outnumbered, he displayed superior tactical skill in maneuvering his cavalry reserves, who changed formation, charged up a hill, and won a superior position. Montfort then won a decisive victory. The king of Aragon was killed, and the hitherto strong Aragonese political ties to southern France lost their importance.

# MUSIC THEORY

. Systematic reflection on the art of music in the West had its origin in the ancient philosophical tradition that considered mathematical knowledge propaedeutic to the study of philosophy. Ancient mathematics was divided into four disciplines ordered according

to two basic divisions of quantity, multitude and magnitude. *Arithmetica* formed the science of multitude *per se,* while *musica* was the discipline treating multitude in ratios; *geometrica* was the subject considering fixed (immobile) magnitudes, and *astronomia* formed the science of magnitude in motion. This fourfold division of mathematical knowledge, the Quadrivium, was transmitted into the Middle Ages by Boethius's *De institutione arithmetica* and *De institutione musica,* and through this foundation a science of rational, systematic reflection on the art of music was established. Cassiodorus's *Institutiones* and Isidore of Seville's *Etymologiae* are two further works of late antiquity that aided in establishing this tradition of musical reflection for the Middle Ages.

As a subject preparatory to philosophy, *musica* stressed "knowing," immutable knowledge in the philosophical sense. That knowing arose from the science of mathematical ratios and from the physical reality that the most basic musical intervals, the consonances of the fourth, fifth, and octave, have their scientific foundation in these ratios. The senses were mistrusted as determinants of musical structures or as the basis of value judgments. The philosophical hero of mythic status was the ancient Greek Pythagoras, who by divine guidance discovered the musical ratios in a smithy. The technique of manipulating the ratios to derive musical systems, or pitch collections, was developed by disciples of Pythagoras, and the application of the ratios to a scientific instrument, the monochord, became the means of determining for the senses an empirical reality based on rational reflection. But the efficacy of rational musical reality was not only revealed in sensual consonance; it was also present in the structure of the universe *(musica mundana)* and in the physical and psychological structure of the human being *(musica humana).*

Boethius's mathematical treatises began to be studied in France during the early 9th century, in monastic communities devoted to the realization of a liturgy that was largely sung. No necessary affinity existed between the rational musical system of antiquity and the practical reality of daily singing the Divine Office and Mass. Nevertheless, the scholar and cantor—often the same person—began to demand a degree of congruence between knowing and doing. During this period, two musical traditions are evident: *cantus* and *musica,* or the art of singing and the discipline of musical theory. Tension between music as a performing art and music as a theoretical discipline is evident in the earliest theoretical and historical sources, yet each played a crucial role in shaping the other during the Middle Ages.

Two traditions are found in the earliest truly medieval theory. On the one hand, a collection of texts associated with the anonymous *Musica enchiriadis* (late 9th c.), while aware of the rediscovery of Boethius and his mathematical basis for musical thought, presents a theory of music largely independent of the ancient tradition. The language of these texts tends toward the qualitative rather than the quantitative, and the myth associated with the collection is that of Orpheus and his inability to bring the mysteries of music into the clarity of day, rather than Boethius's story of Pythagoras and the rational numbers founded on hammers. Basic terminology of these texts is firmly rooted in liturgical practice rather than ancient theoretical tradition, and the linguistic root of much terminology is clearly Byzantine Greek. The tonal and notational system found in these texts is independent of the system transmitted by Boethius. On the other hand, such theorists as Aurelian of Réôme and Hucbald of Saint-Amand had read and somewhat mastered the tradition discovered in Boethius, Cassiodorus, and Isidore and had begun

the process of bringing together *cantus* and *musica* in treatises that would form the basis of subsequent musical thought. Many anonymous texts originating sometime between late antiquity and the Carolingian period lie behind these first treatises with named authors, and much terminology found therein seems to be drawn from the same sources as *Musica enchiriadis*.

One of France's most important contributions to the development of musical theory during the Middle Ages is found in the tonary. An important link between the *cantus* and *musica* traditions, the tonary presented a collection of antiphons, and often other chants, of the Office and Mass ordered according to the eight tones for singing the psalms. The fundamental bases for subsequent theoretical discus

*Musica* points to the three Boethian levels of music: *Musica mundana, Musica humana, and Musica instrumentalis*. MS Pluteo 29, I, facing fol. 1. *Courtesy of Biblioteca Mediceo-Laurenziana, Florence.*

sions of the musical modes is found in these documents. The earliest extant tonary, found in the *Psalter of Charlemagne* (B.N. lat. 13159), originated at the abbey of Saint-Riquier in the late 8th century. A further crucial tonary is that of Metz, known as the *Carolingian Tonary,* which was probably compiled ca. 830 in Metz (preserved in four manuscripts, 9th–11th c.). Perhaps the most important document of this genre is found in the manuscript Montpellier, Bibliothèque de la Faculté de Médecine, H. 159, a source that originated in the abbey of Saint-Bénigne in Dijon, probably under the influence of the monastic reformer William of Volpiano (d. 1031). This source, employing both neumatic notation and an alphabetic notation with roots in the musical system found in Boethius, organized and recorded all the chants of the Mass according to their mode and liturgical genre. Odoranus of Sens (d. 1046) compiled an important tonary, and the *Tonale sancti Bernardi* documents the Cistercian chant reforms.

Monastic houses throughout France were the centers of musical thought during the 10th and 11th centuries. The abbey of Fleury, judging from the number of theoretical works copied at that abbey around the time of Abbot Abbo (ca. 940–1004), played a notable role in copying and transmitting theoretical works ranging from Boethius to contemporary anonymous treatises. At Fleury, *musica* continued to be taught within the context of the Quadrivium, and both the speculative and practical aspects of music were addressed. Cathedral schools likewise became important centers for the study of *musica*. The cathedral school of Reims, when Gerbert of Aurillac (d. 1003) was master, was an important center for the study of mathematics in general and, within that context, Boethius's *De institutione musica*. But as musical theory became more directed toward problems of musical practice, the intimate relation between music and the remaining mathematical disciplines became strained, and ultimately the separation of music from the other three disciplines forms one of the primary causes of the decline of the Quadrivium during the 11th and 12th centuries.

Four broad topics form the core of musical theory in France from the 9th through the 11th century. (1) For an author, the definition of a tonal system or basic collection of pitches within which music takes place sets the fundamental principles. The Greater Perfect System of Greek antiquity, with the added pitch from the synemmenon tetrachord (b-flat), emerges as the predominant system. The system of *Musica enchiriadis* nevertheless remains in the background of musical thought throughout these centuries, and basic terminology from this complex of texts became integrated into the system inherited from antiquity. The basic systems were taught as abstract collections of pitches and tetrachords, then demonstrated empirically in the division of the monochord. (2) Explanation of the tonal organization of liturgical melodies within the system developed into the medieval theory of the eight modes, four authentic and four plagal. Early theoretical discussions of the modes were based largely on the vocabulary and organization of tonaries. In the course of the 10th and 11th centuries, the theory became more systematic and the modes were explained as species of the octave. (3) Elementary theory of polyphony, that is, organum, formed a part of several treatises, although polyphony never occupied as significant a place in medieval theory as description and analysis of monophonic liturgical melodies. (4) Finally, speculative reflections concerning nonempirical music, from musical mythology to pure mathematics to music of the spheres, continued to form a significant portion of theoretical thought.

Important developments in Italian theory occurred in the early 11th century. The *Dialogus de musica,* formerly attributed to Odo of Cluny, was written around Milan, and Guido d'Arezzo in four treatises developed a concise practical alternative to *Musica enchiriadis,* codified advances in staff notation, and developed a system of solmization. In the late 11th and 12th centuries, these texts were transmitted to France and subsequently exercised critical influence in French musical thought and practice.

*Ars Antiqua, Ars Nova.* By the 12th century, the harmonic issues of early-medieval theory had been for the most part resolved: a system based on the periodic octave; a theory of consonance organized around the fourth, fifth, and octave; a theory of the liturgical modes systematized on four finals; and an elementary theory of organum or polyphonic voice leading were all set to be recapitulated in later treatises. The all-pervading issue of subsequent musical reflection became the organization of time in music, or the fundamental principles of rhythm. Giving rise to this issue was the rapid development of polyphony during the 11th and 12th centuries and the necessity of bringing some order to two or more voices singing at the same time.

In the late 11th and 12th centuries, intellectual life began to shift from rural monastic centers to urban cathedral schools, which subsequently evolved into the medieval universities. Paris became a center of both intellectual and musical activities during the 12th and 13th centuries, and the musical accomplishments of central France during the period subsequently became known as the Ars Antiqua, a musical movement that witnessed the first great flowering of a polyphonic repertoire with a rational rhythmic foundation. The most outstanding musical theorists of the 13th century, Johannes de Garlandia and Franco of Cologne, were active in Paris, where both *magistri* were probably associated with the University of Paris. Following scholastic traditions of thought, Johannes de Garlandia divided music into genre, species, and divisions in two treatises, *De plana musica* and *De mensurabili musica*. Johannes presented a systematized treatment of rhythmic theory organized around rhythmic modes and defined the three styles of measured polyphony as discant, copula, and organum. Franco of Cologne's *Ars cantus mensurabilis* was widely circulated throughout western Europe during the 13th century; while reflecting scholastic terminology, Franco's work was a thoroughly practical treatise that extended the rational order of rhythmic notation from the various species of organum *(sine littera)* to the texted motets *(cum littera)*.

Two remarkable monuments in the history of musical thought grew out of the scholastic culture of Paris during the late 13th and early 14th centuries: Jerome of Moravia's *Tractatus de musica* and Jacques de Liège's *Speculum musice*. The Dominican Jerome of Moravia, in what amounts to a musical *summa,* sought to review as thoroughly as possible the contemporary state of musical thought, drawing on sources as disparate as Boethius, Isidore, Guido, Johannes Affligemensis, al-Farabi, Richard of Saint-Victor, Hugh of Saint-Victor, Johannes de Garlandia, Franco of Cologne, and others. Jerome continued the tradition of discussing music within the context of the Quadrivium, presented the basic theory needed for performance of liturgical chant *(musica plana)* and offered a thorough collection of texts treating the new rhythmic practices *(musica mensurabilis)*. The earliest extant treatise developing the theory of rhythmic modes, *Discantus positio vulgaris,* is in fact preserved in Jerome's *Tractatus*. Jerome's musical *summa* is preserved in only one manuscript (B.N. lat. 16663), willed to the Sorbonne by Petrus of Limoges in 1304.

The precedent established by Jerome was followed and even expanded by Jacques de Liège, a canon from Liège active in Paris during the early 14th century. Jacques's *Speculum musice* is the largest surviving medieval musical treatise, consisting of seven books (521 chapters) treating every conceivable topic and drawing on virtually every known source. The scholastic nature of the work is evident in the first book, where Jacques draws not only on Boethius in setting the philosophical foundations of the study of music, but on Aristotle, Robert Kilwardby, and Peter Comestor as well. After systematically treating systems, consonances, melodic genres, division of the monochord, solmization, and the modes, Jacques, in the seventh book, turned his attention to the measured music of his time and railed against the musical practices of the 14th century. The conservative Jacques, placing contemporary practices in sharp contrast to the traditional mensural forms and practices of the 13th century, became an important early witness for a historical consciousness within the tradition of music theory. The works of Jerome and Jacques offer eloquent testimony to the wide variety of musical texts available in Paris during the 13th and 14th centuries and to the influence of scholastic culture's demand for the universality of knowledge.

The contrast in style and content between the *summae* of Jerome of Moravia and Jacques de Liège and the carefully wrought treatise of Johannes de Grocheio reflects the stylistic shift in music itself between the Ars Antiqua and the Ars Nova. Johannes de Grocheio explicitly rejected the quantitative, philosophical nature of past theoretical reflections and attempted to develop a musical theory based on empirical observation refined by rational organization. The basis of his work, now known by the title *De musica,* was not ancient authority or even mathematical speculation but the musical life that he experienced in Paris at the beginning of the 14th century. He divided music into *musica vulgaris,* the everyday music of the city; *musica mensurata,* the composed music of musician-scholars; and *genus ecclesiasticum,* the music of the church. His perceptive descriptions of genres within these categories, sometimes offered with commentary on poetic form and social function, transforms his iconoclastic discourse into an invaluable historical record of contemporary musical life.

More representative of the French tradition of musical reflection are the works of two early 14th-century *magistri artium* at the University of Paris, Jehan des Murs and Philippe de Vitry. Both of these scholars were expert in the mathematical disciplines, and their fame and reputation extended well beyond music and music theory. Jehan des Murs's *Musica speculativa secundum Boetium* seems to have functioned as a text in the university curriculum, and his *Opus quadripartitum numerorum,* dedicated to Philippe de Vitry, summarized the state of arithmetical knowledge. The *Notitia artis musice* (formerly known as *Ars nova musice*), remains his most significant theoretical treatise. Written ca. 1320, this work offers a clear, rational approach to the question of duple and triple division of rhythmic values and extended the application of duple and triple divisions to every level of rhythmic organization—*maximodus, modus, tempus,* and *prolatio*. Shortly after Jehan des Murs's work, Philippe de Vitry codified imperfect (duple) mensuration, established the minim as the divisor of the semibreve, and even opened the possibility of dividing the minim into semiminims. The practical clarity of Philippe's thought is most readily seen in his *quatre prolacions,* the four signs that became universally recognized as the fundamental time signatures. The rational, quantitative organization of time in the art of music offered by Jehan des Murs and

Philippe de Vitry sets forth the basic principles of rhythmic notation and practice that persisted in western music until the 20th century.

The political instability of the 14th century in France makes it difficult to trace clear developments in musical thought following the first flowering of the Ars Nova. Johannes Ciconia's theoretical works, while written in Padua around the turn of the 15th century, nevertheless reflect French musical thought. Ciconia's broad background in the mathematical disciplines is discerned from his *De arithmetica institutione,* a purely mathematical work cited in his *Nova musica* but since lost. Probably influenced by the ancient theoretical tradition of Liège as well as traditional French musical theory, Ciconia's *Nova musica* is an extended treatise treating traditional theoretical topics, including *musica speculativa,* according to ancient authorities as well as both French and Italian theory of his own day. Ciconia's rhythmic theory draws on the theories of both Jehan des Murs and Marchetto of Padua. His *De proportionibus,* while treating the practical problem of rhythmic proportions, extends his treatment of proportions beyond those normally discussed in rhythmic treatises and closes the work with discussions that are clearly speculative.

Two contemporaries of Ciconia, Egidius de Murino and Philippus de Caserta, are significantly less speculative and thus anticipate the empirical and practical trends of the 15th century. Egidius's *De motettis componendis* offers a practical guide to constructing motets, and Philippus's *Tractatus de diversis figuris* concerns itself wholly with note forms developed in Avignon ca. 1370.

*The 15th Century.* The medieval theoretical tradition has been defined in large part by its relation to the Quadrivium and its association with speculative as well as practical thinking. A clear departure from that tradition is seen in the theoretical texts of Johannes Tinctoris, the most prolific and accomplished theorist of the 15th century. Tinctoris's twelve treatises return repeatedly to practical problems and specifically to practical problems of musical works written after ca. 1450. Tinctoris looks disparagingly at both music and music theory of the centuries immediately preceding his own and thus represents a fundamental shift in the nature of musical thought. His descriptive analyses of music contemporary to himself are brilliant, but these analyses strike out on new paths. The medieval tradition has essentially ended before Tinctoris, and his works represent the first great flowering of Renaissance theory.

# MUSICA ENCHIRIADIS

. An anonymous treatise written in northern France in the second half of the 9th century, *Musica enchiriadis* was one of the most widely read and influential treatises before the *Dialogus in musica* (Pseudo-Odo) and Guido's *Micrologus*. The work is preserved in over forty manuscripts. Two further treatises, *Scolica enchiriadis* and *Commemoratio brevis de psalmis et tonis modulandis,* are so closely associated with *Musica enchiriadis* in their theory and in the manuscript tradition that they should be considered essentially one with it. While several names have been associated with the text in various branches of the manuscript tradition, none can be conclusively identified as the author of any of these treatises.

A tonal system built around disjunct tetrachords with semitone in the central position (T-S-T) lies at the core of the musical theory of *Musica enchiriadis*. The system thus repeated itself at the interval of a fifth rather than the octave of the traditional, Boethian system handed down from Greek antiquity. The terminology of the system relates directly to musical practice in both the names of notes (protus, deuterus, tritus, and tetrardus) and the names of the tetrachords (graves, finales, superiores, excellentes). A primitive musical notation, *dasia* notation, using transformations of the Greek *prosodia daseia* sign was used in musical examples within these theoretical texts. Although the notation never seems to have been used extensively in practical sources, *dasia* notation represents one of the earliest forms of interval-specific notation.

*Musica enchiriadis* and its related texts provide some of the earliest and most extensive witnesses of polyphonic singing in the West, and the text offers clear

theoretical foundations for voice leading in simple (two-voice) and compound (three- and four-voice) organum.

During the 10th and 11th centuries, with the renewed interest in Boethius and a mathematically based tonal system repeating at the octave, the influence of *Musica enchiriadis* waned. Yet the broad influence of the treatise may be seen in the negative comments of such theorists as Herman the Lame and in the parallels between *Musica enchiriadis* and Guido's *Micrologus*.

# MUSICAL INSTRUMENTS

. Although today we are accustomed to think of musical instruments mainly in terms of concert or dance music, they played far more varied and important roles in earlier centuries. Instruments served the nobility as the very symbol of their authority; they were essential to the military; they were a frequent companion of the tellers of tales and legends; and they served their traditional recreational purposes as accompaniment for song and dance. Literary references like the following suggest that a sonic kaleidoscope enlivened French villages, courts, and countryside throughout the Middle Ages:

> The joglars began their tale, one took his instrument and played and the other sang with his mouth…. Whoever knew new fiddle tunes, or *cansos, descorts,* or *lais,* as best he could gave it a try…. One played harp, another a fiddle; one a flute, the other a whistle; one played a giga, another the rote; one said the words and another the notes; one [played] a pipe, another a panpipe; one the bagpipe, the other a shawm; one the mandora, and the other struck the psaltery with one string…. Two hundred joglars, good fiddlers, got in tune with each other, two by two they sat scattered about on the benches, and fiddled the dance, not missing a note… [*Flamenca,* mid-13th c.].
>
> When I see unfurled among the orchards banners of yellow, violet, and blue, the neighing of the horses soothes me, and the songs the minstrels sing as they go fiddling from tent to tent, and the trumpets and horns and clarions clear; then I want to compose a *sirventes* for Count Richard to hear [Bertran de Born (1140–1215)].

Few musical instruments survive from the period. Our knowledge of them comes from written and pictorial records, and we can only guess at what sounds they made. Furthermore, their shapes and presumably their sounds changed over the centuries, as

they strove to fill the needs of the ever-changing society, and so we can speak only generally of medieval musical instruments. They exhibited a wide variety, and from medieval iconography we also know that, though they can be categorized by type and name, there was no standardization of size, shape, or design. Though no instruments could be considered exclusively "French"—most appear to have been adopted by all of the European countries—some instruments do appear in French sources more frequently than others, as the quotations here, drawn exclusively from French sources, will demonstrate.

Medieval Europe inherited the comparatively simple musical instruments developed during Greco-Roman times: trumpets for warfare and heraldry, plucked harps and lyres to accompany song, and a small pastoral flute. During the Carolingian era in secular centers all over Europe, new instruments were developed as part of feudal society and the beginnings of the courtly traditions celebrated in troubadour and trouvère lyrics. The introduction of many new instruments resulted from the Crusades, which brought Europeans in contact with Arabic and Byzantine musical cultures. The variety of medieval instruments can be seen in Machaut's *Remede de Fortune* (ca. 1340), which by no means includes all of the instruments known to have been popular at the time:

> And after the meal you should have seen
> The musicians arrive,
> All combed and comfortably attired.
> They played various harmonies.
> For there all in a circle I saw
> *Violle, rubelle, guiterne,*
> *Leü, morache, micanon,*
> *Cytolle, et le psalterion,*
> *Harpe, tabour, trompes, nacaires,*
> *Orgues, cornes, plus de dis paires,*
> *Cornemuses, flajos, chevretes,*
> *Douceinnes, simbales, clocettes,*
> *Tymbre, la fleüste brehaingne,*
> *Et le grant cornet d'Alemaingne,*
> *Flajos de Scens, fistule, pipe,*
> *Muse d'Aussay, trompe petite,*
> *Buissines, eles, monocorde*
> *Ou il n'a c'une seule corde,*
> *Et muse de blef tout ensemble.*
> And it certainly seemed to me
> That such a melodious sound
> Had never been perceived or heard….
> And whatever could be played
> With finger, pick, or bow [I heard]
> In perfect harmony there in the little park
>
> [ll. 3959–88].

Machaut paints a vivid picture of all the instruments playing together, but such an event is unlikely. It is certain that all of the instruments he lists were in use, but they would not have performed simultaneously; the order in which they are listed in the poem has more to do with the poetic needs of line scansion and colorful image than implications of musical ensemble. The poet has mixed together kinds of sounds indiscriminately, but in reality the ensembles in which they played were rigidly set according to types.

The classification of musical instruments in the Middle Ages was different from that of today. Rather than thought of in terms of sound mechanism and material type, such as bowed strings, brass, etc., during the late-medieval period they were divided into two discrete groups according to volume: *haut* and *bas*. Those instruments with loud or shrill sound, *haut,* were considered separate from those whose sound was soft, bas, and it was in these groups that they were played. Various combinations were possible within each group, but at no point would the instruments of one group perform in the company of the other. In general, the loud instruments were those used out-of-doors, with the military, or for festive occasions where loud sounds added to the excitement, such as weddings, tournaments, or large feasts. In this group were the trumpets, drums, bagpipes, and a reed instrument known as a shawm. The soft instruments were those that would generally accompany songs and included the voice itself.

Machaut names three percussion instruments as part of the loud ensemble: *tabour,* a large field drum; *nacaires,* a pair of small kettledrums that usually hung from the waist of the drummer; and *simbales,* cymbals. Those were usually found in the company of various sizes of trumpets: some described only as large and small, and others with special names, such as the *buissine,* a large, straight trumpet whose sound is usually described as "bright," "noisy," or "shrill." Trumpets were used in the military, to sound signals and rally the troops throughout a battle; they also added to the color and excitement of festivals and tournaments and lent pomp to civil and religious processions. Trumpets often signaled the changing of courses during large festive banquets, and they are occasionally recorded as having played during Mass at the elevation. But their most frequent duty was as a symbol of nobility, a tradition common to all of Europe, in which pairs of trumpets with banners preceded noblemen through the streets as they went about their official duties, and it was the presence of the trumpets that clearly marked the importance of the noble they accompanied.

To the loud ensemble of percussion and brass instruments were added two woodwinds: the shawm, or *chalumeau,* a loud predecessor of the modern oboe, and the *cornemuse,* a bagpipe. Both instruments came in several sizes. From the time of their introduction to Europe from the East in the 12th century, shawms in the alto and tenor ranges were popular, and in the late 14th century a bass instrument known as the bombard (probably because it resembled a cannon) was added. A great variety of bagpipes is depicted in the iconography: with one or two chanters (melody pipes) in various sizes, with one or two drone pipes, and with no drones at all. Shawms and bagpipes are also occasionally found along with trumpets and drums in military scenes, tournaments, and jousts. But whereas the trumpet had a severely limited range of notes, both shawm and bagpipe could play most of the chromatic scale and therefore were capable of melodies as well as fanfares and heraldic sounds. Two or three shawms, sometimes with bagpipe, are often present in scenes with dancing, and during the 15th

century a fairly standard dance ensemble was made up of two or three shawms with a slide trumpet (the slide trumpet was replaced by a trombone at the end of the century).

Of the soft instruments, the *vielle,* or fiddle, is most often mentioned in the performance of many kinds of music. The medieval fiddle was a bowed instrument with four or five strings and is found in the iconography in sizes from soprano to bass. Many of the paintings and sculptures show that it had a flat bridge, suggesting that it could only sound several strings together, but there are also representations of a rounded bridge, which means that some fiddles could have performed single-line melodic passages. The fiddle and another bowed instrument, the smaller three-string rebec, or *rubelle,* were adopted from the East sometime in the late 11th century. Prior to that in Europe, all string instruments were plucked, and of these there was a great variety of sizes, shapes, and numbers of strings.

Principal among the plucked strings were the harp, gittern (or *guiterne*), and lute (leü). The harp could have from ten to twenty-five strings; the gittern could have from three to five, either in pairs or single strings; and the lute usually had five pairs. The *cytolle,* a small instrument resembling the gittern, had strings of metal, whereas the lute, the gittern, and usually the harp were strung with gut, which produces a softer sound. Gittern, *cytolle,* and lute were plucked with a plectrum, as was harp on occasion. Another member of this group was the psaltery *(psalterion),* having from ten to twenty metal strings stretched across a wooden sound box. The psaltery came in a number of shapes, it was either plucked with a plectrum or hammered. All of these instruments were seen to be the proper media of the jongleurs and were associated with accompaniment of song and dance.

Less frequently mentioned, but also among the *bas* group associated with the minstrels is the hurdy-gurdy, a string instrument sounded by a turning wheel. A two-player version of this instrument, the organistrum, is often depicted in the hands of church elders on Gothic cathedral tympana, but it is not clear what function it played, if any, in church music. The organ was also a member of the soft group. This term referred not only to the larger church instrument but also to the small portable organ held in the lap, which served as a melody instrument for minstrels.

The soft winds included flutes, flageolets, recorders, and the buzzy reed instruments *cromorne* and *douceinne*. The bagpipe was also sometimes included in the list of *bas* instruments, indicating that one variety of that instrument was suitably modulated in volume to play along with the other members of the soft group. It is probably this type of bagpipe referred to by the 12th-century troubadour Peire d'Alvernhe: "This verse was made to the bagpipe at Puivert with everyone playing and laughing."

Not only were the *haut* and *bas* instruments kept apart for performance purposes, but by and large they were assigned to different classes of performers. Players of trumpets, drums, and shawms were a special group of servant musicians who specialized in those instruments and played only in those groups. They were usually employed by the civic government and assigned specific tasks.

The soft instruments, however, were played by nobles and peasants, masters and servants. Though it is difficult to ascertain if certain instruments were favored by certain social classes, iconographic and literary evidence indicates that until the end of the 14th century most of the soft instruments were played by all classes. It is entirely possible that the music played on them was somewhat different, but we have no information about the

repertory of the lower classes. Aristocrats did play these instruments, and their servant entertainers, the minstrels and jongleurs, were also expected to be proficient at several of them.

Beginning in the early 15th century, musical instruments and their playing techniques experienced an important change. As polyphonic music grew in popularity among the noble classes, courtly music required instruments that could play single lines (that is, without drones) and had fairly large ranges that included chromatics. Instruments like bagpipe, hurdy-gurdy, and the flat-bridged fiddle that played drones, and those with a limited range incapable of the new repertory, were less favored by the upper classes and ultimately became associated with the common folk. Some instruments adapted to the new requirements. For example, playing technique for the lute changed from plectrum to fingers in order to facilitate the execution of multiple lines and chords. Other instruments that could easily accommodate this new repertory and especially those that could play multiple lines, such as organ and clavichord, grew in popularity, and new instruments with larger ranges, such as the violin and viol, were developed.

# MUSICAL NOTATION (NEUMATIC)

. The notation used for Gregorian chant and early polyphonic music beginning in the 8th or 9th centuries. The term is derived from the Latin word *neuma,* which referred at first to a short melodic unit but came to be applied to the notational symbols expressing it. In its earlier stages, neumatic notation did not indicate exact pitches but only the number of notes and their relative upward and downward movement. A single note of higher pitch, for example, the *virga,* might take the shape of a slanted stroke like a somewhat lengthened acute accent; a lower single note, the *punctum,* might be written as a dot. A group of two ascending notes, the *podatus* (or pes), could be written as a longer stroke than the *virga,* commencing with a hook or a shorter horizontal stroke (the style of

neumes varied considerably from region to region, while maintaining a basic familial relationship). Neumes of from one to three notes were common and those of four or more relatively rare. They were written over the text of the chant—later and by a different hand, one concludes, from frequently encountered spacing discrepancies. If deficient because of its vagueness about pitch, neumatic notation served as an effective memory aid to those who were accustomed to sing the chants by heart and was capable of recording subtle nuances of performance. For example, liquescent neumes, variant shapes of the basic neumes, signaled a less straightforward mode of vocalization (not clearly understood today), made necessary by textual peculiarities like double consonants. There were also the "Romanian letters," small letters written in close proximity to the neumes, which could indicate rhyth

mic nuances: t, for example, standing for *trahere* ("to draw out"), and *c,* for *celeriter* ("quickly"), suggesting a slower or faster singing of the affected notes.

   Theoretical writers of the 11th century lamented the loss of these subtleties as neumatic notation sacrificed them in its quest to indicate pitch more precisely. The exact notation of pitch was no secret to their predecessors; Carolingian theorists had employed both graphic and alphabetic systems that clearly represented the pitches of short musical examples. These systems were cumbersome, however, compared with the simple addition of neumes to a texted page. Early in the 11th century, in any case, the neumatic notation of Aquitanian manuscripts indicated exact pitches by an expedient known as heightening or diastemmatry. These Aquitanian neumes, written for the most part as separate dots or short strokes for each note and lacking the cursive forms of other neumatic styles, were placed on the page as if on an imaginary graph; while a single drypoint line was inscribed to serve as a basic reference point. Not much later, inked lines began to be drawn in the neumations of several regions; generally, *f* was indicated by a red line and the *c* above it by a yellow line. It was only a matter of time until two more lines were added to create the standard medieval four-line staff. The staff was not particularly hospitable to the graphic eccentricities of the various neumatic styles, and by the 13th century they had coalesced into just two types. The square notation found in modern chant books developed from the French neumes of north-central France. This notation came to be employed throughout France, England, Italy, and Spain; a distinctly different style was common in Germany and to the east, the *Hufnagelschrift,* so called from its *virga,* which has the appearance of a horseshoe nail.

There are three major points of dispute about the early history of neumatic notation. The first involves the date of the first chant books to employ it throughout. It had long been assumed that these were the earliest such books preserved, two graduals and a cantatorium dating from ca. 900. Recently, however, Kenneth Levy has argued that a fully notated gradual must have existed in the time of Charlemagne (d. 814). The second debate has to do with origins. The dominant notion for several decades was that the neumes developed from the classical accents (acute, grave, circumflex, etc.); competing theories see their source elsewhere, for example, in the punctuation of Carolingian manuscripts or in cheironomy, the gestures employed by a cantor directing a group of singers. The third area of controversy is that of the genealogical relationships of the regional neumatic styles. The various French types play a key role in this because of the obvious antiquity of Paleo-Frankish neumes from Picardy and Hainaut and their purported relationship to the later Breton and Lorraine neumes. Kenneth Levy, again, has recently advanced original views on both the origins and genealogy of neumes.

What remains uncontroversial about neumatic notation is its immense significance as the source from which the notation of all western music derives. It can fairly be said to be one of the principal "inventions" of the European Middle Ages.

# MUSICAL NOTATION (12TH-15TH CENTURIES)

. During the late 12th and early 13th centuries, square notation became the predominant type of notation in most of western Europe for plainchant (for which it is still used today), secular monophony, and both liturgical and secular polyphony. There are three basic note shapes. The *virga* has a broad, square notehead, and the descending stem is a slender vertical downward extension. The *punctum* differs only by not having a stem. A diamond-shaped "rhomboid," created by setting the nib at a ninety-degree angle, was used to inscribe a descending series of notes, called *currentes* or *coniuncturae.*

Single Notes *(figurae simplices)* of Square Notation.

By the mid-13th century, these three basic notational shapes for single notes acquired temporal significance, the *virga* becoming a long, the *punctum* a breve, and the rhomboid a semibreve, the ancestor of the modern whole note.

Two or more notes linked in the same figure drawn without lifting of the pen comprise a "ligature," a feature of musical notation retained through the 16th century. Ligatures were for melismatic music, that is, melodic lines without text (*sine littera* notation). If a text were given to such a melodic line, the ligatures would be broken up to allow the association of pitches with syllables (*cum littera* notation).

The interpretation of a piece of music preserved in square notation may vary according to its genre, the date at which it was written, and its geographical or cultural point of origin. Modal notation, which originated probably within the Notre-Dame School, organized ligatures into configurations that graphically represented patterns known as "rhythmic modes," a continuous stream of long and short notes. In order to notate more complex rhythms in modal notation, extant sources indicate numerous changes and refinements, some that died out and some that gradually led to a more reliable style of notation, called Franconian after its primary spokesperson, Franco of Cologne. Franco's description of this new notation, the *Ars cantus mensurabilis* (ca. 1280), had such authority and wide circulation that it contributed greatly to a notational standardization by which any piece of rhythmic music could be read, not only in the Parisian circles in which these notations and genres arose but throughout western Europe.

Franconian notation, the earliest true mensural notation, established distinctive graphic elements denoting specific rhythmic values that could either stand in place of a unit within a mode or stand alone and always, unequivocally indicate the same rhythm, both in texted and in melismatic music. Franconian rhythm depends upon equal pulses, each the value of the perfect long, which then could be subdivided in a variety of ways. In succeeding composition, notation, and theory, ever smaller note values were grouped in different ways and in different numbers, always subdividing the equal pulses of the larger note values. Petronian notation (after Pierre de la Croix), which seems to have succeeded Franconian quickly, primarily describes the division of the breve into as many as seven semibreves. To give an idea of the extent to which this process affected western music, by the 16th century it was the semibreve, or *tactus,* that had become the measure of this equal pulse, which was divisible by minims, semiminims, and fusae, known today as half, quarter, and eighth notes.

In Petronian notation, the rhythmic values of the fast semibreves, all equivalent in appearance, were resolved according to certain rules. In France, further revision of Franco's system in the early 14th century resolved the ambiguities of Petronian notation and at the same time allowed for an enormous flexibility in the notation of rhythm. This Ars Nova notation is usually associated with Philippe de Vitry and Jehan des Murs. By means of an additional symbol, the minim (an ascending stem was added to the rhomboid shape of the semibreve), short note values could be indicated precisely and unambiguously. With the admission of duple meter and the rational organization of the entire notational system, the exploitation of the new rhythmic possibilities became a preoccupation of 14th-century composers. The "classic" state of Ars Nova notation, represented in the musical works of Philippe de Vitry and Guillaume de Machaut and in the theoretical treatises of Jehan des Murs, began to expand in the course of the 1370s.

By the late 14th century, symbols and note shapes multiplied, allowing the notation of rhythmic complexities to a point not again approached until the 20th century.

In the 15th century, the plethora of notational symbols was reduced, but often, especially in the sacred and ceremonial compositions of such composers as Dufay, Ockeghem, or Busnoys, proportional mensural complexities added a level of number symbolism and signification to the music that only recently has begun to be studied. In addition, the increased utilization of paper instead of parchment led to the creation of hollow note shapes—"white" notation—less apt to penetrate the more fragile surface of the page. The result is closer to the appearance of modern musical notation than the earlier, "black" notation.

# MUSICAL PERFORMANCE PRACTICE

. There is only sketchy evidence of the way in which music was performed during the Middle Ages. It was not the custom to provide directions for performance on the music itself, as in the present century, perhaps because the practices themselves were so commonplace that no one felt the need to write them down. A great deal of latitude was given to the performer concerning aspects of performance, such as tempo, amount and placement of ornamentation, use of instrumental accompaniment, and in some repertories even the actual rhythm of the melody. Some information can be gained from theoretical treatises, literature, and iconography, but in many areas we have an unclear impression of the practices.

The vast majority of sacred music during the Middle Ages was monophonic (single-line) chant, which was entirely sung either by a soloist or by the choir in unison, or by a combination of the two, depending on the service and the item. In the 9th century, a practice arose of providing sacred music with additional lines, hence polyphony. This was performed in a variety of ways, depending upon the type of polyphony and the occasion. In some works, a soloist, or perhaps a small group of soloists, sang a highly ornate top line, accompanied by from one to three others who sang a slower-moving lower line. Other polyphonic compositions, in which the parts were relatively equal, were performed by soloists on each line. On festive occasions, polyphonic sections in either of

the above styles were inserted into choral performances of otherwise mono-phonic chant, taking the place of those lines assigned to the soloist.

By the 13th century, this had given rise to special two-, three-, and four-part settings of liturgical items, and the composition of independent sacred compositions called motets, for performance by soloists during services on special occasions. Most of the sacred polyphony remained the domain of soloists until early in the 15th century, when it was sung by small choruses (six to twelve singers) that developed in some of the larger French churches, such as the cathedral at Cambrai and Notre-Dame in Paris.

Yet another practice that appears to have been carried into the Middle Ages from antiquity was *alternatim* performance: an alternation between two choirs for performance of repetitive items, such as sequences and psalms. This

A *joglaresse* dancing and playing bells, early 12th century. BN lat. 1118. *Courtesy of the Bibliothèque Nationale, Paris.*

performance concept was quickly adapted to include polyphony; at times, it took the all-vocal form of an alternation between polyphonic and monophonic sections, but it could also include sections performed on organ, alternating with either monophonic or polyphonic vocal sections. At such times, the organist might perform rapid treble variations built on the chant.

Scattered references are found to the use of instruments, usually trumpets, in the liturgy, but these are always on special occasions and usually involve fanfares at the elevation. The more common use of instruments in the church was in processions before and after services. There is reason to believe that until the mid-16th century the organ was the only instrument regularly accepted in the celebration of the liturgy.

The largest early secular repertory known is that of the troubadours and trouvères from the 12th and 13th centuries. The rhythmic interpretation of this repertory, like that of early chant, remains controversial, but it is generally accepted that they were solo songs, sometimes sung to improvised accompaniment on instruments like fiddle, harp, or lute. When accompanying solo songs, the instrumentalist, sometimes the same person as the singer, would provide a prelude and postlude, add interludes between verses, and sometimes play decorated versions of the melody as an accompaniment to the song to enhance the performance.

French secular polyphony—motets and chansons—dates from the late 13th century. Recent studies have presented evidence that in general this repertory was also the domain of singers performing one to a part. In some of this repertory, each part has text— sometimes the same poem and sometimes separate poems—but in a substantial part of the repertory vocal performance would have required one or more lower voices to vocalize without text while the poem was sung in the highest voice(s).

Instrumental performance of the secular repertory was also a possibility, either by an ensemble made up solely of instruments, or by instruments in combination with voices, either doubling the voices or substituting for them. Icono-graphic and documentary evidence indicates that the instruments most frequently associated with courtly life were lute, harp, and fiddle, but Guillaume de Machaut (d. 1377) states in his *Voir dit* that one of his songs may be performed on organ, bagpipes, or other instruments. In two other works, he lists dozens of instruments and implies that minstrels properly entertained on all of them. It is not clear whether they were all equally suitable for polyphonic music, but it does suggest that there were few distinctions about appropriate and inappropriate instruments in courtly secular music.

Except for a small number of dance pieces *(estampies),* no known repertory was written specifically for instrumental performance. Until the end of the 15th century, the instrumental repertory associated with courtly life consisted of the vocal music, improvised performance mostly of dance music, and, beginning in the early 15th century, a combination of written and improvised performance of music for the *basse danse,* in which one or two performers improvised while one instrumentalist played a composed tenor line.

# MYSTERY PLAYS

. During the 15th and 16th centuries, the French term *mystère* was frequently applied to dramatic representations of sacred history and lives of the saints. The word derives from the Latin *ministerium* and was a synonym of *métier,* meaning craft or trade. It was also used to designate a liturgical office or service. In a dramatic context, it had the meaning of representation or act and was thus analogous to the Italian *sacra rappresentazione* and the Spanish *auto sacramental*. One of the earliest occurrences of the term in this sense is found in the letters patent by which Charles VI established the Confrérie de la Passion (1402) and granted its members the right to play *misterres, tant de saincts comme de sainctes, et mesmement [le] misterre le la Passion.* Over the next two centuries, the term *mystère* appears in the titles of a number of biblical and saint plays, such as Jean Michel's *Mystère de la Passion* and Jean Molinet's *Mystère de saint Quentin*. The term was also applied to the mimed scenes that were staged along the procession routes of noble entries. Gradually, the term was generalized and applied to other types of serious drama. When in 1548 the Parlement de Paris banned the playing of *mystères sacrés* in that city, the staging of *mystères profanes* was permitted to continue.

# MYSTICISM

. Word now most often used for what would have been called "contemplation" *(contemplatio)* in the medieval Latin tradition. In its narrowest meaning, mysticism involves a personal experience of the unmediated presence of Absolute Reality or, to use the Christian designation, God. Such an experience is described in the literature of religious traditions throughout the world.

Much modern writing on mysticism has focused on "mystical experience," the direct, personal experience of the immediate presence of the divine, which often results in a mental state in which the person is unaware of the ordinary world and aware of only the divine presence ("ecstatic mysticism"). Mystics often describe a process, called the "mystical way," with a variety of stages leading up to the mystical experience. These descriptions generally concern disciplines for the body and the mind to prepare an

individual for "mystical experience," as well as with visions, voices, and other extraordinary phenomena that occur as persons follow discipline. Some interpreters, and some mystics, contend that visions and other extraordinary phenomena have little or nothing to do with "mysticism" and can be misleading. If, however, "mystic experience" includes a spectrum of experiences that relate variously to the transcendent divine, present in unmediated mystical experience in one mode but present in a different, mediated form in voices and visions, then "mysticism" must embrace the whole spectrum of experiences recorded by those who have good claim to be counted among the mystics.

Though the Christian tradition draws upon scriptural passages to support interpretations of the mystic way and mystic experience, Jesus is not presented as the archetypal mystic; rather, as one Person of the divine Trinity, he becomes the object of the mystic's experience.

Fundamental lines of Christian mysticism were laid down in late antiquity. Five mystics and theologians had more influence than others on the medieval tradition in France: Origen of Alexandria, Pseudo-Dionysius the Are-opagite, John Cassian, Augustine of Hippo, and Gregory the Great. Origen set an important pattern for later biblical exegetes and mystics by taking the relationship of the Bride and Bridegroom in the Song of Songs as a "drama" symbolic of the union between Christ and his church or God and the soul. While Origen paid more attention to this imagery as symbolic of ecclesiastical ideas, he did pursue the symbolism of the mystical experience through the nuptial and erotic imagery of the Song. In this, he was followed by such mystics as Gregory of Nyssa in the Greek East and, much later, Bernard of Clairvaux in the Latin West.

Pseudo-Dionysius the Areopagite claimed to be the 1st-century convert of Paul at Athens but seems to have been a 6th-century Syrian monk. His writings combined Neoplatonism and biblical imagery, stressing on the one hand the material world as a set of partial symbols of the divine realm and on the other an "ascension" from immersion in the material world to a purely spiritual and immaterial apprehension of the divine presence in the "divine darkness" of "unknowing."

Cassian was a monastic author whose Conferences, a summary of the teachings of Egyptian desert mystics-ascetics, exerted a decisive influence on Christian spirituality.

Augustine, a great theologian and bishop of the late 4th and early 5th centuries, also combined Neoplatonic philosophy and biblical thought to produce an understanding of the spiritual path as an ascent from the material world, through the world of mind, to a momentary glimpse of Absolute Reality, understood as pure light, beheld in a trembling glance. Augustine's *Confessions* were an enduring personal account of a spiritual journey from Mani-chaeanism, through Neoplatonism, to Christianity.

Gregory the Great, more than any other author, sums up the Christian spirituality of late antiquity and transmits it to the medieval period. His commentary on the book of Job, *Moralia in Iob*, has sections that are miniature treatises on the mystic way. Gregory's characterization of the contrast between the "active life" of engagement in the world and the "contemplative" life of withdrawal for asceticism and prayer was widely influential, as were his description of the mystical experience as a glimpse of the "unbounded light of divinity" and his conception of the way in which the soul makes a "ladder" of itself to "ascend" from experience of the external world of sense, to the in-terior world of mind, to the transcendent world of spiritual realities and the "unbounded light" that is God.

As late antiquity gave way to the Middle Ages, the spiritual traditions sketched above were preserved, but little applied or developed. The spirituality of the 6th century to the 11th focused first on missions and expansion, then on the establishment and regularization of the monastic and clerical life. Within monasteries, emphasis was not so much on personal spirituality as on public celebration of the liturgical hours and the Mass. One sees much evidence of "spiritual reading" and reflection on Scripture and earlier authors but little evidence of ec-static mysticism. However, as the 11th century progressed and reform movements began to gain ground, the spiritual life and the mystical quest began to claim more and more interest.

One of the first "schools" of mysticism to flourish in medieval France was that of the regular canons of the ab-bey of Saint-Victor at Paris. Two 12th-century canons were among the leading mystical writers of the whole medieval period: Hugh of Saint-Victor and Richard of Saint-Victor. Hugh was one of the first persons in the West to write treatises that offered systematic instruction in the mystic way. According to Hugh's theology, the first humans had been immediately aware of the divine presence and had also been able to perceive the outward, material world as a symbolic manifestation of God's power, wisdom, and goodness. With the Fall, humans lost the inward sense of divine presence and the ability to discern fully the cosmos as symbolic of the divine. In Hugh's powerful image of the "three eyes" with which humans had been created, the Fall produces varying degrees of "blindness": the "eye" of the intellect (which sees God and spiritual things) is totally blinded; the "eye" of reason (which knows the self and those things within the self) is partly blinded; only the "eye of the flesh" functions fully and leads one to a deceptive relationship with the external world of matter. A major aspect of the salvation of human beings is the restoration of the immediate inward awareness of the divine, the "eye" of the intellect. Hugh's treatises on the symbolic meaning of the Ark of Noah and Isaiah's vision of the Lord and the Seraphim (*De arca Noe morali* and *De arca Noe mystica*), and also his treatise *De arrha animae* are complex explorations of the stages by which the soul recovers the immediate awareness of God through discipline of mind and body and the concomitant gift of divine grace. Hugh defines four stages, which correspond to a classic pattern in Christian mysticism: awakening, purification, illumination, union. Each is divided into three degrees, yielding a twelvestage way. Awakening is divided into stages of fear, sorrow, and love; Purgation, into patience, mercy, and compunction; Illumination, into thinking, meditation, and contemplation; Union, into temperance, prudence, and fortitude. These twelve stages outline advancement in discipline, insight, and experience, culminating in the transformation of the self and experience of God. In *De arrha animae,* Hugh uses the theme of the Bride and Bridegroom from the Song of Songs to develop a long dialogue on the role of love in relation to the world, the self, and the divine, with a focus on the soul's yearning for a unique experience of the divine in intimate relationship, even union. One of the striking aspects of Hugh's spirituality is the use of a visual diagram to present it; his treatises on Noah's Ark describe and use for meditation a drawing that shows in the form of a mandala both the unfolding of the cosmos and history from Christ and the return to union with Christ through the twelve stages of mystical ascent.

Hugh was also crucial in the introduction of the thought of Pseudo-Dionysius the Areopagite into the mystical and theological traditions of the West. His commentary on Pseudo-Dionysius's Greek *Celestial Hierarchy made* that work accessible to his

contemporaries and explored such important themes as the role of symbols, the nature of anagogical ascent, and the "divine darkness" in mystical experience (so important in Dionysian thought). Like almost all medieval mystics, Hugh gave attention to the relation of loving and knowing in the mystical quest, concluding that both play central roles but that ultimately it is the "embrace" of love and not the act of knowing that unites the soul with the divine in ecstasy.

Hugh's successor, Richard of Saint-Victor, was interested in the dynamics of development and psychologcal processes. Like Hugh, he depended heavily upon visualizations and personifications to convey his message. In *De arca mystica,* the Ark of the Covenant and its two Cheru-bim are given a symbolic interpretation that incorporates Richard's understanding of six levels in the epistemological structure of the mystic quest. Contemplation—"behold-ing" or "apprehending," not analyzing, the object of atten-tion—is possible at all levels of knowing, but contemplating God occurs only in the highest two. Richard offers a complex analysis of the six levels of knowledge (two each for sense, reason, and intellect) including states of mystical ecstasy; he also offers a detailed analysis of the epistemology of prophetic visions; and he presents an analysis of possible ways of entering (or "triggering") the experience of "alienation of mind" or "ecstasy" in which the individual becomes unaware of the external world and the self and is aware only of God and spiritual realities. Richard continued and expanded Hugh's use of Pseudo-Dionysius in his writings.

A second school of 12th-century mysticism was Cis-tercian, led by Bernard of Clairvaux but developed by other monks, including William of Saint-Thierry and Isaac of Stella in France and Aelred of Rievaulx and John of Ford in England. Just as the Cistercians saw the cloister as a school for the love of God, so their spirituality focused to a great degree on the nature of the mystic's love of God and the reciprocal effect of that love on the individual. Bernard's earliest work, *De gradibus humilitatis et superbiae* reveals the Cistercian revision of Benedictine foundations as Bernard comments on Chapter 7 of Bene-dict's *Rule*. Cistercian spirituality was shaped in fundamental ways by deep reflection on the bridal imagery of the Song of Songs, transformed for Bernard and others into powerful imagery of the deep union between the self (the soul) and the divine (Christ) in mystical experience. Bernard's eighty-six sermons on the Song of Songs comprise his greatest contribution to the literature of mysticism. William of Saint-Thierry wrote treatises on theological and mystical topics, as well as a commentary on the Song of Songs.

The emergence among the Victorines and Cistercians of intense focus on the nature of the mystic way and experience, and the expression of that way and experience under the symbolism of the marriage bond between two individuals, reflects a new conception of the mystic experience. In the writings of Augustine and Gregory the Great, the mystic experience was primarily a "beholding," usually expressed impersonally in terms of a vision of light. With the 12th century, the mystical experience is conceived in terms of personal and intimate imagery: the relationship between two individuals in the nuptial embrace. Thus, the imagery of love is given full expression in symbolic form in the embrace of the marriage chamber, although the mystics insist that the imagery and experience are purged of all bodily associations and refer to a spiritual union of soul and Christ.

In the 12th century, other movements for monastic and spiritual reform, such as the Carthusians and Premon-stratensians, also developed interpretations of the mystic way. A good example is the *Scala claustralum* by the Car-thusian Guigo II (d. 1188). In analyzing what he calls "spiritual exercise," Guigo introduces the idea of a ladder that will raise a monk from earth to Heaven. Guigo's ladder has four rungs: reading, meditation, prayer, and contemplation. In this, he owed no small debt to some of the formulations of Hugh of Saint-Victor. Reading, for Guigo, is a careful consideration of Scripture; meditation is a focused search, by reason, for some truth; prayer is primarily petitionary prayer seeking something of God; contemplation is "a certain elevation of the mind above itself, suspended in God, tasting the joys of eternal sweetness." The scheme demonstrates again, in different language, the movement from outer, to inward, to transcendent realities.

With the advent of the mendicant orders in the 13th century came new centers for pursuing ascetic life and contemplative prayer. The Franciscans were influenced by the mystic experiences of their founder, Francis of Assisi, and his devotion to the poor, suffering, crucified Christ. Francis was an extraordinary ecstatic visionary who received, near the end of his life, the stigmata, the presence on his body of the five wounds of Christ, which confirmed for medieval men and women that he was totally conformed to Christ in his life. Franciscan mysticism was given a definitive shape in one of the classics of medieval mystical literature, Bonaventure's *Itinerarium mentis in Deum*. Bonaventure was a Franciscan master lecturing at the University of Paris when he was elected master general of the order in 1257, which was at the time struggling over the true meaning of poverty and other issues. He went for a time of spiritual reflection to Mount Alverna, east of Florence in Italy, where Francis had received the stigmata. While meditating there, Bonaventure realized that the spiritual path of return to God was adumbrated in Francis's vision when he received the stigmata: he had seen the Crucified (Christ) in the form of a six-winged Seraph. Through this image, he understood that the return was accomplished through the humility of the suffering Christ, through burning love of the Crucified, and through six stages of "ascension" from the material world, through the inner world of the mind, to the transcendent world of divine reality. The result of this insight was the *Itinerarium*. Bonaventure here drew upon the six levels of knowing/contemplating as outlined by Richard of Saint-Victor, infusing them with a Francis-can celebration of the divine presence in the world, in the self (through the *imago Dei*), and in the realm of spiritual reality, all considered in light of the significance of the poor, suffering Christ, the emblem of divine self-giving love.

The other major mendicant order, the Dominicans, initially made less of mystical experience, although personal prayer and instruction in ways of praying were both important in the development of a Dominican spirituality. *St. Dominic's Nine Ways of Praying,* accompanied in the manuscript tradition with illustrations showing the nine postures for prayer rooted in the founder's practice, is an example of such instruction. Thomas Aquinas made a theological place for mystical experience in this world and the vision of God *(visio Dei)* in Heaven, but he laid little stress on the former. Just before his death in 1274, he had a profound mystical/visionary experience of Christ, after which he ceased dictating the text of his *Summa theologica* (it was completed by another Dominican) and declared that, next to his vision, all he had written was but straw. However, the real flourishing of mystical experience within the Dominican order

occurred in the Rhineland with Meister Eckhart and his disciples Tauler and Suso. Eckhart developed a distinctive mystical way that incorporated ideas of total detachment, emptying the self, and the "birth" of the divine in the soul. Eckhart also evidences a significant development within the Dominican order: the pastoral care of convents of women, both Dominican nuns and others. This involved the friars in the spiritual direction of women who were involved in their own unique kind of spiritual development, often at odds with male patterns of spirituality, especially in the prevalence of visionary experiences, emphasis upon female bodiliness, and a devotional focus on the eucharistic host (as Christ's body). The literature of female spirituality and mysticism receives treatment in another article.

In the late Middle Ages, Jean Gerson (1363–1429) stands out as a figure who combined distinguished leadership as chancellor of the University of Paris, involvement in the ecclesiastical and political aspects of the Great Schism, acute contributions to the development of late-medieval scholastic thought, and a deep sense of the mystical dimension of Christian theology and life. Like his contemporary Nicholas of Cusa, Gerson was drawn to the idea of the coincidence of opposites as a key to understanding and also looked to the mystical writings of Pseudo-Dionysius the Areopagite as significant for guiding one on the way toward an experience of divine presence. Gerson wrote numerous treatises, both technical and "popular," on mysticism and the mystic way. He reached an unusually wide audience, for he wrote and preached in both Latin and French.

# N

# NÁJERA

. Battle of Hundred Years' War. Following the ouster of Peter the Cruel from the Castilian throne in 1365 by his French-backed half-brother, Henry of Trastamara, and an army of *routiers* led by Bertrand du Guesclin, Peter sought assistance from the English in Aquitaine. Edward, the Black Prince, agreed to mount an expedition in support of him, and early in 1367 Edward invaded Spain with English, Gascon, and Breton troops. Henry's forces included such French commanders as Du Guesclin and Arnoul d'Audrehem. The armies met at Nájera, a few miles south of the confluence of the Najarerille and Ebro rivers in northeastern Castile, on April 3, 1367. The English gained tactical surprise and managed to surround and defeat Du Guesclin's vanguard. Henry's Castilian main body soon fled in disorder and the Anglo-Gascon victory was complete.

# NANCY

. Founded in the 11th century by Gérard d'Alsace to be the capital of his newly established duchy of Lorraine, Nancy was a small *bourg* composed essentially of the ducal castle and a few monasteries. A fire in 1228 destroyed the town, but it was quickly rebuilt, then surrounded by ramparts in the 14th century, of which only the Porte de la Crafte remains. Nancy was the scene of an important battle between the Burgundian and Swiss armies at the beginning of 1477. Having seized Lorraine from Duke René II in 1475 because it lay between his territories of Bur-gundy and Flanders, Charles the Bold, duke of Burgundy, suffered two serious defeats at the hands of the Swiss in 1476, and local opposition began to oust Burgundians from Lorraine. Against advice, Charles was determined to take the offensive immediately and regain Nancy. He besieged it in November, but the inhabitants gave stubborn resis tance until a Swiss army advanced to their relief at the beginning of January. On January 5, 1477, the Swiss inflicted another

terrible defeat on the Burgundians and Charles met his death. His body was found in an icy pond, half eaten by wolves. After his victory over Charles, Duke René rebuilt and enlarged his ducal palace, which had largely fallen into ruins. The present palace, which houses the Historical Museum of Lorraine, is a combination of Flamboyant and Renaissance styles.

# NANTES

. A settlement has existed since the Bronze Age in southeastern Brittany at the tidal limit of the Loire at its confluence with the Erdre. Condevincum was the *civitas* capital of the tribe of Namnetes. Christianity arrived in the late 3rd century, when the town was also enclosed by walls. The cathedral built by Bishop Felix (r. 549–82) is described in a poem by Venantius Fortunatus. Under the Franks, Nantes was part of the March of Brittany, whose most famous holder was the legendary Roland. In 843, the city was sacked by the Vikings, then overrun by the Bretons. The Vikings returned from ca. 920 to 933, but thereafter Nantes remained part of medieval Brittany.

In the 10th and 11th centuries, the counts of Anjou vied with those of Rennes for control. Following the death of Count Mathias (1103), his brother Alain Fergent united Rennes, Nantes, and the other Breton county, Cornouaille, as duke of Brittany (r. 1084–1113). In Nantes, where the duke was later represented by a seneschal, provost, and receiver, he shared rule with the bishop. Bishop Brice (r. 1112–39), adopting an independent Gregorian stance, even sought confirmation of his episcopal rights from Louis VI of France (1123). After the Plantagenêt period of domina-tion in Brittany (ca. 1156–1206), the bishops of Nantes reasserted their rights. Disputes with the duke were frequent, arising particularly from the exercise of regal right during episcopal vacancies. A compromise was reached in 1268, but under Guillaume de Malestroit (r. 1443–62) and Amaury d'Acigné (r. 1462–77) the quarrel violently reerupted.

Until the Breton civil war (1341–65), the inhabitants had little say in government. But the need to involve citizens in all aspects of administration during and after the war allowed them to bargain for privileges. In 1420, Duke Jean V conceded that they could elect ten or twelve bur-gesses and two proctors to represent them, and the community was born. At the same time, the city was transformed physically: the Roman walls had been extended in the early 13th century to enclose sixty-two acres; they were extensively rebuilt again between 1436 and 1487.

Other major public works included the reconstruction after 1434 of the cathedral of Saint-Pierre-Saint-Paul, built atop a 6th-century crypt that had been reconstructed in the mid-11th. The cathedral houses the exquisite tomb of Duke François II and Marguerite de

Foix by Michel Colombe (1499) and has more than a hundred bas-reliefs depicting the story of the Old Testament and parts of the New. The church of Saint-Michel was begun in the 13th century, as was the convent of the Cordeliers, and enlarged in the 14th and 15th. A choir school built for the study of psalms and chorales, the Psalette, dates from the end of the 15th century. The Duke's Castle, constructed in the 10th century over part of the Gallo-Roman wall, was rebuilt in the 13th century and again in 1466 under François II (r. 1458–88); the bridges over the Loire were a constant source of expenditure.

The population of Nantes, living in seven parishes, may have reached a peak of 15,000. The city was a trading rather than industrial center; control of the wine and salt traffic on the Loire can be traced from Carolingian days. Nantes, with Rennes and Vannes, was an administrative center of the duchy. This created wealth and employment. A university was founded in 1460, and the presence of the ducal court encouraged a burgeoning cultural life.

# NANTEUIL CYCLE

**.** One of the lesser-known epic cycles, the Nanteuil Cycle comprises five poems composed between the end of the 12th century and the middle of the 14th: *Doon de Nanteuil, Aye d'Avignon, Gui de Nanteuil, Parise la duchesse,* and *Tristan de Nanteuil.*

The eponymous hero of *Doon de Nanteuil* is identified by the author of Gaufrey, a 13th-century chanson de geste, as one of the twelve sons of Doon de Mayence, thus linking this first chanson to the Rebellious Vassal Cycle. The poem, dating to the end of the 12th century, is preserved only in the 220 nonconsecutive lines copied in the 16th century by Claude Fauchet from a 13th-century *remaniement* by Huon de Villeneuve. The 19th-century scholar Paul Meyer reconstructed the sketchy plot: war breaks out between Doon and Charlemagne; Doon's son, Bérart, is killed by Duke Naime's son, sent as ambassador by the emperor; Doon has to leave Nanteuil and finds refuge in Apulia, where Charles attempts to reach him.

Doon's offspring are the protagonists of the other poems in the cycle. *Aye d'Avignon,* composed between 1195 and 1205, survives in only one complete manuscript (B.N. fr. 2170); two fragments, from two different manuscripts, are also preserved. In 4,132 assonanced and rhymed Alexandrines divided into 179 unequal *laisses,* the author of *Aye d'Avignon* endeavors, superficially, to link his poem to the *Roland* and alludes to episodes from the *Quatre fils Aymon*. There is also evidence that he was familiar with Jehan Bodel's *Chanson des Saisnes* and with the Guillaume d'Orange Cycle. At the same time, the techniques of the romance permeate his poem.

*Gui de Nanteuil* was composed after *Aye d'Avignon,* of which it is the continuation, and probably before 1207. One almost complete manuscript survives from the 14th century (Montpellier, Fac. de Méd. H 247); another 14th-century manuscript contains a less satisfactory version (Venice, Bibl. Naz. di San Marco fr. 10), and there is also a fragment of 350 lines (Florence, Bibl. Naz. II, IV, 588). The version of the chanson preserved in the Montpellier manuscript has 2,913 rhymed Alexandrine lines.

Gui, the son of Aye and Garnier, goes to Charlemagne's court and is made standard-bearer, which causes spite among Ganelon's relatives; one of them, Hervieu, accuses Gui of murder. Aiglentine, daughter of King Yon of Gasco-ny, falls in love with Gui. The traitors manage to put Gui on bad terms with the emperor, who supports Hervieu for the princess's hand. Gui captures her and flees. Charles and Hervieu set out in pursuit and lay siege to Nanteuil, where Gui and Aiglentine have found refuge. Ganor and Aye come to Gui's rescue, and Hervieu is killed. Peace is made with Charlemagne, who attends the wedding of Gui and Aiglentine.

In addition to *Aye d'Avignon,* the author was familiar with some episodes from the *Quatre fils Aymon* and was also strongly influenced by romance.

*Parise la duchesse,* composed after 1225 and probably before the middle of the 13th century, is preserved in only one manuscript (B.N. fr. 1374; 3,105 assonanced Alexandrines). Parise, sister of Gui de Nanteuil, is exposed to the hatred of Ganelon's relatives, who accuse her of poisoning her husband's brother, Beuve. She is persecuted and exiled to Hungary, where she has a son, Hugues. He is raised at the royal court of Hungary. After many years of suffering and adventures, Parise meets up again, in Co-logne, with her son and with Raymond de Saint-Gilles, her husband. The traitors are caught and executed. This poem is cast in the traditional epic mold but includes many nonepic elements, notably the part played by the bourgeois and the adventures of a woman with her son. The main goal of the chanson is to entertain. It is superficially linked with *Aye* and *Gui* and shows the influence of *Gaidon, Quatre fils Aymon, Doon de la Roche,* and possibly of an older version of *Boeve de Haumtone*.

*Tristan de Nanteuil,* the last poem of the Nanteuil Cycle, draws some material from the previous poems of the geste and is directly linked to *Gui de Nanteuil.*

## *NARBONNAIS*

. The *Narbonnais,* a 13th-century chanson de geste of 8,063 rhyming decasyllables, combines two traditions. The first relates how Aymeri, who considers personal valor to be the basis for acquiring power or land, sends his six older sons away from Narbonne to achieve their preordained functions in life. Sent to Charlemagne's court, Bernard becomes his private adviser, Hernaut his seneschal, William his standard-bearer; Bueves is to win Gascony, Garin Lombardy, and Aïmer Spain, which he will never manage to

conquer from the Saracens. The second part reworks an assonanced *Siège de Narbonne,* of which a fragment has survived. The plot is complicated and culminates in the sufferings of Guibelin, Aymeri's youngest son, who is destined to have the fief of Narbonne: imprisoned, the young man is crucified but saved by his father.

The *Narbonnais* is thus a composite text in which moments of epic intensity alternate with the heroic-comic (Hernaut's rages) and the fantastic (Isembart and his black, horned warriors). Revisers have introduced modifications, given their own cyclical propensities: thus, B.N. fr. 1448 reduces the poem to 303 lines *(Département des fils d'Aymeri)* to serve as a prologue to the *Enfances Guillaume,* whereas the "Great Cycle" manuscripts (those combining poems about Guillaume with those about Aymeri), insert the *Enfances Guillaume* at the beginning of the poem and make no mention of Charlemagne's death, so as not to contradict the *Couronnement de Louis.*

# NARBONNE

. In 118 B.C., Rome established the colony of Narbo Martius in southwestern France for war veterans, and it soon became a flourishing seaport. In 27 B.C., a senatorial province, known as Gallia Narbonensis, was created here by Emperor Augustus. In all Gaul, Narbonne was second only to Lyon in population. In A.D. 413, the Visigoths took Narbonne. In 719, the city fell to the Mus-lims but was won from them by Franks under Pepin the Short in 759. During the Carolingian period, Narbonne was the capital of the province of Gothia.

From the 9th to the 14th century, Narbonne remained the largest Mediterranean seaport within the kingdom of France. Its vital economic position and the authority of its archbishops made Narbonne a key to Languedoc. Viscounts of Narbonne appear from 821. Rivalry between the secular and ecclesiastical lords intensified in the 11th century, particularly after the accession of the vigorous archbishop Wifred (r. 1019–79). By the 12th century, Narbonne was a co-seigneurie; the archbishops retained jurisdiction over the western half of the city, the viscounts generally over the eastern half and the *bourg.* Narbonne reached the peak of its political power during the remarkable reign of Viscountess Ermessinde (r. 1137–92), who played an aggressive role in the struggles between the counts of Toulouse and Barcelona, often as an ally of the latter. After 1226, the temporal independence of the viscounts and archbishops was circumscribed by the power of the royal seneschalsy of Carcassonne.

The earliest clear reference to the commune and consulates of Narbonne is in 1209. By 1221, consuls functioned in both the *cité* and the *bourg,* and rivalry, sometimes violent, between these two districts remained a constant feature of the society of Narbonne. Until the 14th century, *cité* and bourg retained separate consular regimes. In 1309, a long

dispute over jurisdiction ended with a *pariage* between the king and viscount. Both consulates were placed under the king's hand and merged in 1338.

Despite early problems with the Inquisition, Narbonne does not appear to have been heavily tainted by Cathar heresy. As at Béziers, the inquisitors recorded few pursuits for Catharism but later serious problems with Spiritual Franciscans and béguines. The economic and political importance of Narbonne declined rapidly in the 14th century, as its prosperity, built on commerce, eroded under pressure of competition from Montpellier and elsewhere, compounded by a shifting and silting of the mouth of the Aude River. The archiepiscopal province of Narbonne was reduced in 1317, and the dynasty of the viscounts ended in 1424.

*Alan Friedlander*

The present city contains many medieval buildings, among them the basilica of Saint-Paul-Serge (12th-13th c.), the church of the Franciscans, Notre-Dame-de-Consolation (14th-15th c.), and the Archbishop's Palace (13th-14th c.). Saint-Paul-Serge, built on the site of a 4th-century cemetery established by Constantine, houses interesting early Christian sarcophagi.

The cathedral of Saint-Just is the most prominent medieval edifice in Narbonne. Although the current cathedral dates to the 13th century, its history goes back much farther. After the Peace of Constantine in 313, a modest church was erected and subsequently destroyed by fire in 441. In that year, Bishop Rusticius laid the first stone of a new edifice. Completed in 445, the cathedral was dedicated to St. Genes, martyr of Arles. In 782, the church was reconsecrated to the Spanish martyrs Justus and Pastor, two young brothers scourged and beheaded under Emperor Diocletian in the 4th century. The edifice fell into ruin, and reconstruction, under the direction of Archbishop Téodard, commenced in 890. Excavations undertaken in the 1940s revealed the construction to be relatively modest in proportions: 181 feet long and 66 feet wide, consisting of an unvaulted nave extended by a transept and a chevet. Its lopsided belfry still exists.

In 1272, the first stone of the present buidling, sent from Rome by Pope Clement IV, was laid. Built by Jean Deschamps (1286) in the Gothic style of the Île-de-France, the cathedral of Saint-Just features a vast choir with ambulatory and polygonal chapels. By 1354, however, the building reached the city's ramparts and could expand no farther, so no nave or transept was ever built. Stained glass in the triforium bays and in the chapels dates to the 13th and 14th centuries.

A cloister joins the fortified Archbishop's Palace to the cathedral. The palace façade includes three towers dating from the 13th and 14th centuries.

# NAVAL POWER

. The naval and maritime history of medieval France dates from the Roman occupation of Gaul. Roman vessels utilized the rivers and coastal waters to transport merchandise and military personnel. The early Franks developed fleets for use in trade and war. Their vessels were propelled by oars and probably a single square sail. Charlemagne used a fleet against the Slavs, Saxons, Avars, and others. Because of their Italian interests, the Franks also maintained a small Mediterranean fleet in the 9th century.

The Vikings, who settled in Normandy, influenced the construction of large sailing warships. The Norman invasion of England in 1066 was possible only because Duke William organized a large fleet of Viking-style ships with a single square sail. He shipped horses across the Channel for use by knights in battle against the Anglo-Saxons.

The marriage of Eleanor of Aquitaine to Henry II of England stimulated trade between Gascony and northern Europe after 1154. The English possessions in France led to Anglo-French warfare in the 13th and 14th centuries. The French pieced together a navy for use in the Atlantic and the Channel, often hiring Genoese galleys to fight the English, especially in the Hundred Years' War (1337–1453). France also built a naval base and shipyard, the Clos des Galées, at Rouen. While the French used galleys in warfare, their Castilian allies fought with tall sailing ships that used their advantage in height to rain arrows and stones on their enemies.

Naval power in the Middle Ages did not make possible command of the seas. The ships were few, poorly provisioned, and difficult to keep at sea for long periods, given navigational techniques and weather. The French lost a major naval battle to the English at Sluys in 1340 but were raiding England's south coast in the following few years. In 1350, the English defeated a large Castilian fleet in the Battle of L'Espagnols-sur-Mer off the southeast coast of England, but the Castilians won an important battle off La Rochelle in 1372, a victory that aided the French reconquest of Poitou.

France eventually won the Hundred Years' War, driving the English from all but the port town of Calais by 1453. French fleets consisted mainly of merchant vessels recruited for royal service. Galleys were built or hired to fight, but by the 15th century these were replaced by large sailing ships over a hundred feet in length with carrying capacities of up to 1,000 tons. These included carracks with one or two square sails on a main and foremast and a lateen sail on a mizzenmast. Caravels carried two lateen sails, later a square sail, and were important for Atlantic seafaring.

Ships throughout the medieval period were armed with a combination of weapons. Early open rowing or sailing boats could serve as platforms for shooting arrows or throwing spears. Ships were sometimes used as amphibious assault vessels. During his crusades, Louis IX had towers built on ships so they could be used to bridge town or castle walls adjacent to the water. These evolved into fore-castles and aftercastles, which became integrated into a ship's lines over the next two centuries. Topcastles were added to the masts. Guns and cannon appeared aboard ships as they developed in the 14th

century. By the early 16th century, gun ports were cut into the hull of a ship so that heavy cannon could be carried lower in the vessel for better stability.

Heading the French navy was an admiral who often was an Italian or an important French noble. The crown long avoided building ships at its own expense and preferred to employ foreigners or rely upon merchant vessels for military service. Advancing technology, however, finally required purpose-built men-of-war with cannon, and these in turn prompted the establishment of a royal navy with a professional officer corps in the 16th century.

# NECROMANCY

**.** Term widely used in the later Middle Ages for the conjuring of demons with the intent to harm enemies, to secure the favor of powerful individuals, to learn future or secret things, to gain wealth, to succeed in romantic exploits, or to create illusions. Necromancers (or "nigromancers") typically stood inside magic circles and recited conjurations, otherwise known as "adjurations" or "exorcisms" and often virtually identical to the exorcisms used for expelling demons; frequently, they used fumiga-tions, astrological symbols, and other elements of the as-tral magic that had been imported from Arabic culture. They often combined these techniques with image magic—piercing wax images with needles or melting them over fire. Necromancy seems to have been chiefly a clerical form of magic, but clergy who engaged in it appear often to have done so for clients, and frequently these clients were public figures of some prominence.

Important trials for necromancy occurred in France during the early 14th century. In any particular case, it may be questioned whether necromancy was in fact being practiced, whether the charge was a fiction cynically used to attack political adversaries, or whether it expressed the sincere but erroneous apprehensions of potential victims. What we can say is that necromancy was studied (manuscripts survive giving detailed guidelines for conjuring "malign spirits") and surely at least sometimes practiced by members of a kind of clerical underworld.

An important early trial for necromancy was that of Bishop Guichard de Troyes, who was alleged to have used such magic to kill Queen Jeanne in 1305 and was tried on this charge 1308–15. He was said to have consulted both a sorceress and a friar skilled in necromancy. When the friar succeeded in conjuring a demon, the bishop paid the demon homage and heard how they should proceed. All three went in disguise to a hermitage, where they baptized a wax image in the queen's name and then pierced various parts of the image. The queen fell ill, and her physicians could not treat her. But even when the bishop had the sorceress repeatedly pierce the image, the queen still did not die. Exasperated, the bishop broke the image asunder, trampled it, and cast it into a fire, whereupon the queen expired.

Further trials involving the crown occurred in succeeding years. In 1315, Enguerran de Marigny was charged with using image magic, in part to harm Louis X, although his defenders said the magic was intended rather to gain the king's favor. In 1316, Cardinal Francesco Caetani engaged the services of a cleric and a former member of the Templars, who professed expertise in necromancy and who assured him that with the proper equipment and sufficient time they could conjure a demon who would teach the secrets of alchemy; when they informed against Caetani, they charged him with wishing to harm the king and others.

Under Pope John XXII (r. 1316–34), there was a series of cases involving necromancy ostensibly directed against the pope. Bishop Hugues Géraud of Cahors, who was being investigated for simony and other corruption, was tried in 1317 for trying to kill John and his close associates by importing into the papal palace at Avignon wax figures baptized in their names. In the following year, John ordered an investigation of several men, mostly cler-ics, who allegedly used books of necromancy to invoke evil spirits while standing in circles. By such means, the pope reported, they could ruin people's health, or they could make demons captive in mirrors and other objects so that they might inquire about past or future events. In 1320, the Visconti of Milan were charged with using nec-romantic image magic against Pope John. Not all the trials for necromancy were political in nature, however. The Carmelite Pierre Recordi confessed in 1329 that he had used wax images and made sacrifices to the Devil for the sake of having sex with women (or, if they refused, doing them harm). A notary named Geraud Cassendi at Carcas-sonne in 1410 and a priest of Tournai ca. 1472 were accused of invoking demons for the same purpose.

The charge of necromancy recurred sporadically in later decades. When Charles VI became mad in the 1390s, more than one individual was charged with using image magic or other techniques, evidently necromantic, to harm him. Around the turn of the century, concern with necro-mancy and related arts preoccupied French theologians; the theological faculty at Paris condemned these arts in 1398, and four years later Jean Gerson incorporated the *conclusio* of the Paris theologians in his treatise *De erroribus circa artem magicam*. In 1406, two members of a clerical necromantic conspiracy against Pope Benedict XIII and the king of France, inspired by fear of "diabolical spirits," disclosed the plot to the pope.

While necromancy usually involved a command of Latin and a knowledge of ritual forms expected only among the clergy, the basic concept of invoking demons is found at times among laity as well. For example, one Johanneta Charles was tried at Geneva in 1401 for conjuring a demon to determine the circumstances of a theft. And a trial in the diocese of Soissons in 1460 disclosed that a priest had gone to a sorceress for means to

bring vengeance upon his enemies. She had him baptize a toad and feed it a consecrated host. Then she tore the toad to pieces and from it made a poison that caused the enemies to perish.

Yet the cases that attracted most attention were those involving collaboration of clergy and prominent public figures. In 1440, Gilles de Rais, who as marshal of France had fought alongside Jeanne d'Arc at Orléans, was tried for consulting necromancers, most importantly a Florentine priest called François Prelati, in an effort to regain his squandered fortune.

# NESSON, PIERRE DE

(1383-before 1442). One of the more important late-medieval poets of death. Nesson is known principally for two works: the *Paraphase sur Job* or *Vigiles des Morts,* later published by Vérard, is a powerful and stark meditation on death and human vanity; the *Lai de guerre,* an answer to Alain Chartier's *Lai de paix,* expounds on the political thinking of his patroness, Marie de Berry, widow of John, duke of Berry.

# NEUSTRIA

. The northwestern part of Gaul during the Frankish period. There really were two Neustrias. Mero-vingian Neustria stretched from the Loire to the Meuse; Carolingian and post-Carolingian Neustria was smaller, comprising the area between the Loire and the Seine, excluding Brittany. The name appears ca. 642 and is of uncertain etymology, but it designated the western lands of the kingdom, whereas "Austrasia" designated the eastern

lands. In contrast to Austrasia, Neustria was predominantly Gallo-Roman in population, and the form of Latin spoken there, affected by Celtic and Germanic influences, came to be called "Langue d'oïl," the ancestor of modern French. "Languedoil" also came to refer to the region of Neustria, distinguished from southern France ("Languedoc") by its language and its use of unwritten, customary law influenced by Germanic practices. In France during the high and late Middle Ages, a "Frank" generally meant a Neustrian and "Francia" meant Neustria. As the region that gave birth to the French language and formed the power base of the Capetian dynasty, Neustria was in many ways the birthplace of France.

The first Neustria, with its chief royal residence at Paris, was the kingdom given to Chilperic I upon the death of Clotar I in 561, and it passed to his son Clotar II and grandson Dagobert I. It generally dominated Frankish politics from the mid-6th to the late 7th century. The rise of the Austrasian Carolingians ended this first Neustria.

The threat of attacks from Brittany led Charlemagne to recreate a second and smaller Neustria as a subkingdom for his son Charles, and this second Neustria maintained its existence as a kingdom or subkingdom through successive partitions of royal land in the 9th century. The need for an adequate defense against the Vikings led Charles the Bald to grant Neustria as a march to Robert le Fort, and the region continued to be held by his descendants, King Eudes, King Robert I, Hugues le Grand, and Hugh Capet, with their capital at Paris. From the 930s and 940s, the title of marquis of Neustria came to be overshadowed by that of duke of the Franks *(dux Francorum),* given to Hugues le Grand by Louis IV. Both titles were extinguished when Hugh Capet became king in 987 and Neustria ceased to form an administrative unity within the kingdom.

# NEUWILLER-LÈS-SAVERNE

. All that remains of the once fortified Benedictine abbey of Neuwiller (Bas-Rhin), founded in 723, is the church of Saint-Pierre-et-Saint-Paul. An early church was enlarged in the 9th century to welcome the many pilgrims attracted by the relics of St. Adelphus,

bishop of Metz. The oldest part of the structure is the crypt. Two superimposed chapels in the chevet are 11th-century. The flat Romanesque east end, with rectangular side chapels and transept, was reconstructed in the 12th century. The choir, transept, and east bay of the nave are Romanesque but with later rib vaulting; the rest of the nave and side aisle are 13th-century Gothic in the style of neighboring Champagne. The choir, crossing, tower, and first bay of the nave are decorated with Lombard arcading. The portal of the north façade contains a sculpted tympanum showing Christ with his hand raised in blessing.

# NEVERS

**.** One of several stations called Novidium by the Romans, Nevers (Nièvre) became a bishopric under Clovis (506). Later, it was the capital of the Nivernais, the countship of which was held by several eminent families, including the dukes of Burgundy and the house of Clèves.

The cathedral, Saint-Cyr-et-Sainte-Juliette, represents every period of medieval French architecture. The building is unusual in having an apse at both its east and its west ends. Of the original Romanesque structure (begun ca. 1028), only the west apse and transept remain. Devastated by a fire in the early 13th century, the nave was reconstructed in the Gothic style of the Île-de-France. In the trefoil-arched triforium, colonnettes rest on lively carved human figures. The chevet, with choir, ambulatory, and seven radiating chapels, was rebuilt after another fire in the early 14th century. At the same time, work was begun on the tower. The church was consecrated in 1331 and finished in the 15th and 16th centuries with the addition of Flamboyant lateral chapels, the southern portal, and the completion of the tower.

The Romanesque church of Saint-Étienne, begun under Count Guillaume I of Nevers, became a Cluniac priory in 1068. Constructed mostly between 1083 and 1097,
Nevers, Saint-Étienne, plan, isometric section and long section. After Duret.

Nevers, Saint-Étienne, nave.
*Photograph courtesy of Whitney
S.Stoddard.*

Saint-Étienne is mature Romanesque, contemporary with both the pilgrimage group of churches, such as Conques and Toulouse, and the beginnings of Cluny III.

The east end of Saint-Étienne is three-storied: arcade, triforium arcade, and clerestory with its semidome considerably lower than the nave. In the nave, five bays in length, the elevation has an arcade surmounted by a gallery, vaulted with half-barrel vaults. This format resembles Conques, Toulouse, and churches in Auvergne, but in Saint-Étienne a clerestory is inserted between gallery and nave barrel vault. Thus, direct light into the nave from clerestory windows, a feature adopted in the 11th century in Burgundy, transforms the usual Romanesque elevation.

The multiple planes established by the rounded responds, the square matrix of the piers, and the columnar supports of the nave arcade all give a unity to the interior surfaces. Verticality is emphasized by the nave responds, which extend up through gallery and clerestory and support the capitals from which the transverse arches and the barrel vaults spring.

A dome, supported by squinches, crowns the crossing of the single-vessel transept. To stabilize the cupola and support the crossing tower, diaphragm arches separate nave from transept arms and arms from choir. This treatment of the crossing area is influenced by such churches as Clermont-Ferrand, Issoire, and Saint-Nectaire in the Au-vergne, which is southwest of Burgundy.

This creative amalgam of architectural forms derived from the pilgrimage churches, Burgundian structures, and the unusual vaulting of the crossing from Auvergne points up the importance of geography in Romanesque architec-ture.

Also in Nevers stand the porch of the early 12th-cen-tury church of Saint-Sauveur (destroyed in 1838) and the chapel of the convent of Saint-Gildard.

# NICOLAS DE VERDUN

(fl. late 12th c.). A metalworker, goldsmith, and enameler active in the last quarter of the 12th century, Nicolas de Verdun was one of the most original and important artists of his generation. Although his name indicates that he was born in Verdun and elements of his style suggest that he was trained in the Mosan region and northern France, his works are international in scope and demonstrate a wide-ranging interest in and knowl edge of both contemporary Byzantine art and western styles. His three most famous surviving works, all of which are different in style, are the Klosterneuburg altarpiece, originally an ambo, inscribed with his name and dated 1181, at Klosterneuberg, Austria; the Shrine of the Three Kings, dated to the 1190s, in Cologne cathedral; and the Shrine of the Virgin, dated 1204, in Tournai cathedral. His son is mentioned as a glass painter at Tournai in the early 13th century.

# NICHOLAS OF CLAMANGES

(of Poillevain; ca. 1360–1437). Nicholas was educated in the Collège de Navarre, Paris, where he gained an excellent knowledge of Latin literary tradition and developed his own

elegant style. By 1393, he was rector of the University of Paris, a man of learning, with a talent for friendship. He traveled to Avignon to pursue a career at the (anti)papal court and in 1397 was secretary to Benedict XIII. Until the last years of his life, he continued to be involved with the antipopes, and although he pressed for a solution to the western Schism, his life was blighted by his associations. In 1432, he returned to the Collège de Navarre, where he remained, writing, until his death. Nicholas is best remembered for 151 extant letters combining elegance and Christian learning.

# NICOPOLIS

**.** The Battle of Nicopolis (September 25, 1396), between Crusaders and Ottoman Turks, was one of the greatest military disasters encountered by French cavalry in the 14th century. Under Bayazid I (r. 1389–1402), the Turks had captured Nicopolis, a Bulgarian fortress on the Danube, in 1393. Sigismund, king of Hungary, appealed to the West for assistance against the Turkish advance. England and France agreed to a joint crusading expedition, to be led by the dukes of Burgundy, Orléans, and Lancaster, but after a series of delays these three experienced princes dropped out. The expedition of 1396, largely a Burgundian project, was led by the duke's inexperienced son, John the Fearless, then count of Nevers. Although accompanied by some of the most prestigious French military commanders, John was unable to maintain a unified command and was too readily influenced by younger lords who placed personal glory ahead of strategic objectives. After some minor victories, the crusaders approached Nicopolis, where the French rejected Sigismund's prudent battle plan and insisted on leading a cavalry charge. Inflicting many casualties at first, they were lured into an ambush and crushed by the Turks, who thereby secured for centuries their position in the Balkans. A few of the most notable French leaders were held for ransom, but most were massacred.

# NIEDERHASLACH

. An abbey was founded at Niederhas-lach (Bas-Rhin) in the 6th century by St. Florent and converted to the Benedictine *Rule* under Louis the Pious in the 9th century. The present church of Saint-Florent, begun in 1274, was burned except for the choir in 1287; reconstruction was completed ca. 1300–85.

The exterior is notable for its three-level rectangular tower—an Alsatian feature— dominating the western façade. The lower level frames the sharply arched portal; the second level has a small but delicate rose window; and the upper level is composed of two immense blind windows. The portal sculptures (ca. 1310) are related to those of western portals of Strasbourg cathedral. The pure lines of the interior are characteristic of Rayonnant style. The stained-glass windows (ca. 1360–75) of the nave are among the most beautiful in Alsace.

# NÎMES

. The ancient Celtic and Roman city of Nîmes in southern France was joined to the kingdom of the Franks in 754. By 900, it formed a viscounty under the counts of Toulouse. The marriage of its heiress Gauziane (ca. 956) to Bernard-Aton II, viscount of Albi, united Nîmes to the fiefs of the family later known as Trencavel. In 1130, a division of their patrimony separated the viscounty of Nîmes, under Bernard-Aton V, from the other Trencavel domains. During the dynastic struggles that followed, Nîmes capitulated to Raymond VI of Toulouse, to whom Bernard-Aton VI ceded his rights in 1184. In 1214, Simon de Montfort, first commander of the Albigensian Crusade, entered Nîmes without struggle, and in 1226 Nîmes became a royal city, thereafter administered by a viguier under the seneschal of Beaucaire-Nîmes.

The social history of Nîmes is dominated by the precocious development of its consulate and the influence of the knights of the Arena. As early as the 6th century, the Roman amphitheater had been transformed into a fortress. By 1100, it was equipped with a moat, towers, and chapels dedicated to SS. Martin and Peter. The knights of the Arena, *milites castri Arenarum* (numbering thirty-one in 1100, approximately a hundred in 1226), held their lodgings within the fortress as fiefs of the viscount for whom they guarded the city. In 1155, four knights of the Arena appear as the first consuls of Nîmes. In 1198, they were joined by four burghers, whose privileges were ratified by Count Raymond VI. Raymond's subsequent attempts to restrict these privileges led to the rebellion of 1207, which saw the burghers occupy the city and murder the count's *viguier* in his palace. The alliance formed then between the burghers and the knights brought

Nîmes its greatest degree of civil autonomy and represents the height of its consular regime. In 1226, the knights of the Arena were dispersed by Louis VIII; their consulate was suppressed definitively in 1353. Nîmes's prosperity declined during the crises of the 14th century. Its region was devastated most severely by the rural revolt of the Tuchins in 1382.

# NIORT

**.** In Roman times, a "new ford" (Novum Ritum) over the River Sèvre, Niort (Deux-Sèvres) is the site of a castle built by Henry II Plantagenêt and his son Richard the Lionhearted. Only the twin-towered keep, joined by a 15th-century building, remains. The Flamboyant Gothic church of Notre-Dame was built by Berthomé between 1491 and 1560. The spire of its impressive bell tower soars to over 250 feet.

*William W.Kibler*

# NITHARD

(d. after 843). The most detailed information about the division of the Carolingian empire in 840, upon the death of Louis the Pious, and the first years (840–43) of the reign of Charles II the Bald, is found in the contemporary *Histories* of Nithard. Nithard's mother, Bertha, was a daughter of Charlemagne, and he served his cousin Charles the Bald, both in court and at war, and wrote at the king's suggestion. Much of his work was a glorification of the Franks and a justification of Charles's actions, especially his wars against his older brother Lothair.

# NOBILITY

. One form of nobility or another dominated the society of Gaul and France from the Bronze Age to the Revolution of 1789. Most scholars now believe that the nobility of landed magnates that presided over the western Frankish kingdoms between ca. 620 and 1200 (designated *potentes, proceres, magnates,* or *principes* as commonly as *nobiles*) was formed in the 6th and early 7th centuries by the fusion of the premigration nobility of the Frankish and other Germanic tribes who settled in Gaul with the remnant of the Roman senatorial nobility already established there. The united nobility of the later Merovingian and Carolingian eras had no privileges enshrined in law, but its members were distinguished from inferior orders not only by the possession of villa-estates and the luxurious lifestyle their income made possible but by the rights of lordship they exercised over their extensive households, free tenants, and clients and by the virtual monopoly they enjoyed over the higher offices of the palace, the provincial administration, and the church. During the first seven centuries of Frankish rule, the nobility remained a small group closed in principle to any but the descendants of its original members. In practice, it was probably not completely closed, for the united nobility of the Frankish kingdom abandoned both the patrilineal structure and the surnames characteristic of the Roman senatorial *gentes* in favor of the amorphous and shifting "sibs" of the Germans, which were marked only by sets of latinized German "leading names" and traced their noble ancestry as much in female as in male lines. This arrangement must have permitted the occasional admission into the nobility of both men and women with only one noble parent of either sex. Kings could and regularly did confer rank within the nobility by granting the temporary tenure of a high office or "dignity" (*honor* or *dignitas*), such as those of duke, count, and bishop. During the civil wars of the 9th century, the leading nobles succeeded in making the guberna-torial dignities hereditary in principle in a single lineage, thereby depriving the king even of the power of promotion and demotion except in extraordinary circumstances. Between ca. 987 and 1193, the kings of France conferred no important lay dignities outside of their own immediate family.

The emergence first (between ca. 850 and ca. 950) of hereditary duchies, counties, and viscounties and then (between 990 and ca. 1100) of hereditary castellanies carved from their territories, changed both the nature of noble power and the structure of the noble kin group, for the transmission of these dominions to sons by primogeniture soon led to the reemergence of patrilineal "houses" that normally took both their identity and (from ca. 1050) their new, hereditary surname, from the dominion held by their chief. The indivisibility of the family dominion (derived from its official origin or feudal condition or both) tended to affect the transmission of all other patrimonial property in noble houses, and not only daughters but younger sons of nobles tended to receive much smaller shares of their parents' estate than had been the case before 1000. After ca. 1150, the patrilineal surname was increasingly reinforced by a patrilineal emblem, the "arms."

The years between 1180 and 1220 witnessed an even greater change in the structure and more particularly the size of the nobility of France. The much larger class of simple knights that had emerged between 950 and 1050 and had recruited most of its members from ignoble free-men rather than the lesser nobility, succeeded in usurping most of the privileges and attributes usurped in the previous century by the castellans, in closing itself to persons not descended from knights, preferably in the male line, and in being recognized as the lowest stratum of the emerging noble "estate." By 1180, most knights had become petty landlords of the manors they had received in fief from their noble lords, and the members of the old nobility, who had always thought of themselves as warriors as well as rulers, had come to identify with the newly developed ideology of knightliness, or "chivalry," and had adopted the custom of receiving *adoubement* to knighthood on coming of full age. The rise of the knights increased the number of noble persons in France from perhaps 5,000–10,000 in 1180 to perhaps 200,000 in 1220 (about 2 percent of the total population) and converted the nobility into a status group defined on the basis of descent from knights of any rank. In consequence, from ca. 1220 to ca. 1500 the nobility was more often referred to as the *cheva*-lerie, or "knightage," than the *noblesse,*

The period between ca. 1220 and ca. 1370 saw the emergence of the legal definition, distinctive tenurial obligations, fiscal privileges, and representative institutions that together converted the newly expanded nobility into a juridical "estate" of society. At first, membership in the new nobility was acquired immediately by any nonnoble or *roturier* who secured for himself either the status of knight or possession of a noble fief; but provincial courts, dominated by nobles, came to deny noble status and most of its attendant privileges not merely to those *roturiers* who themselves acquired noble fiefs by purchase or marriage but to their heirs unto the third generation. Louis IX ruled, contrary to long-established usage, that only the king had the right to confer knighthood on a man not descended from knights. This decision led logically to the conferral of the right to receive knighthood, along with the other rights currently characteristic of noble status, by formal letters of ennoblement *(lettres d'anoblissement),* a practice initiated by Philip IV ca. 1290. The average number of such letters of ennoblement issued annually rose from 1.5 in 1308–14 to ten in 1316–22, and fluctuated between five and nearly forty between 1322 and 1350, in response to the pressures of the war with England. Thereafter, it tended to grow as long as the war continued, and from 1372 whole categories of people— typically the mayor, *échevins,* and councilors of a town—were simultaneously ennobled to secure or reward their loyalty to the crown. In the 14th century, nobility came to be sought by rich bourgeois and civil servants both for the honor and for the growing number of privileges it entailed—though in the same century the liabilities of noble status were also increased. In the majority of provincial customary laws, growing numbers of which were committed to writing from ca. 1200, all those who were recognized as noble either by birth or by royal ennoblement were subjected to special rules regarding succession to property (movable and immovable), wardship, payment of debts, and eventually taxes.

Although all nobles in late-medieval France had certain rights and obligations in common, the nobility remained a stratified estate. From ca. 1200, juridical distinctions were drawn on four distinct bases: (1) the extent of the judicial power or "justice" a noble exercised over his nonnoble subjects; (2) the nature and standing of the most important dominion a noble held; (3) the level of the newly crystallized feudal hierarchy on which

that dominion was held in fief; and (4) the nobleman's personal military status. Stratification lines were drawn first between the mass of petty manorial lords with only low or middle justice on the one hand, and the much smaller group of lords with high justice on the other. Among those with high justice, called *seigneurs haut justiciers,* the line was drawn between the lesser lords without a proper castle and the greater lords with one or more, and among the latter the line was usually drawn between "castellans" and "barons." Barons were in their turn divided on the basis of their tenurial status into barons of principalities and barons of the realm, and on the basis of whether or not they possessed a dignity into "simple" barons and greater barons, or "princes" *(princes).* Among the princes who were barons of the realm, a distinction was drawn between those who were not and those who were peers *(pairs)* of the realm, holding their principalities as *pairies,* and enjoying extensive privileges.

All but the last of these statuses were developed and transmitted with little or no royal control down to 1296, but from 1193 the kings of France occasionally conferred countships by donative enfeoffment, primarily upon their own sons, and between 1296 and 1314 Philip IV laid the groundwork for the later practice of conferring all of the other dominical statuses, both by regranting existing dominions in fief and by "erecting" new castellanies, baron-ies, viscounties, counties, duchies, and *pairies* by a legal process usually involving the consolidation of several existing dominions of lower rank. Around 1300, dukes and other peers of France typically had annual incomes in excess of 10,000 *livres tournois,* and most lesser counts and greater viscounts had incomes in excess of 1,000 *livres;* the vast majority of nobles below the rank of castellan had incomes between one and fifty *livres* a year. Since the latter group made up roughly 99 percent of the nobility, the average noble income was not high.

# *NOËL*

**.** The modern French word for a Christmas carol and Christmastide itself, *noël* was commonly used in late-medieval France as a joyous acclamation; associations with the Christmas season date from the 13th century. In the late 15th century, *noël also* came to

denote a strophic poem dealing with the events surrounding the Nativity, usually imitating French or Latin models. *Noëls* were sung, often as *contrafacta,* with the word *noël* a frequent refrain. The earliest literary collection was compiled during the reign of Charles VIII (1483–98), and *noëls* remained popular during the 16th century. Some Latin motets by 15th-cen-tury Franco-Burgundian composers feature *noël* refrains set in a distinctive rhythmic sequence, such as Nicolas Grenon's isorhythmic motet *Nova vobis gaudia* (ca. 1420).

# NOGARET, GUILLAUME DE

(ca. 1260–1313). A native of the region of Toulouse, Nogaret was a professor of law at Montpellier in 1282. By 1295, he was a member of Philip IV the Fair's council in Paris. In 1301, Philip ar-rested Bernard Saisset, bishop of Pamiers, on charges of treason and prepared to try him in his royal court. Pope Boniface VIII forbade him to do so and, in 1302, issued the bull *Unam sanctam,* which declared that all who refused to obey the Roman pontiff would be excluded from salvation. In response, Nogaret publicly charged Boniface with heresy and other crimes and appealed him to a trial before a church council. To execute his plan, Nogaret took an armed guard into Italy in the late summer of 1303 to seize Boniface and return him to France for such a trial.

Face to face with the pope in his native village of Anagni, Nogaret doubted the success of his mission and fled, leaving a shaken pontiff who died a few weeks later. The "attempt" at Anagni became the most famous episode in Philip's campaign to free his monarchy from church control, and it gave Nogaret an enduring fame and notoriety. But Nogaret also played the major role in Philip's crushing of the Templars, the confiscation of Jewish wealth and their ultimate expulsion from France, and several other schemes, all designed to create a centralized secular monarchy.

# NOIRLAC

. The Cistercian abbey of Noirlac (Cher), founded by St. Bernard's cousin Robert de Clairvaux, is first mentioned in 1136. After difficult beginnings, the abbey flourished following a generous gift in 1150 from Count Ebbes V of Charenton. The white-stone church, measuring 195 feet in length and having eight bays with aisles, transept, and two-

bay chevet, was constructed between 1150 and 1250 and shows the transition in Cistercian architecture from Romanesque to Gothic. In the austere Cistercian manner, there is no sculpture on the capitals or façade and no stained glass.

The conventual buildings, grouped south of the church in typical Cistercian fashion, include cloister, chapter house, and the monks' dortoir (with a wooden ceiling), refectory, and warming room *(chauffoir)*. The particularly harmonious chapter house (late 12th c.) has six bays spanned by ogival vaulting resting on polygonal pillars. The rectangular cloister (125 feet by 109 feet), although much mutilated, still preserves its six-part vaulting, which requires alternating strong and weak supporting columns. Structurally, this is solved by colonnettes dividing the arches into two lancets surmounted by an oculus. Its rich ornamentation, including sculpted capitals with floral motifs, contrasts with the austerity of the church.

# NORMANDY

. The medieval duchy of Normandy dates from the early 10th century, when the king of the Franks granted territory in the lower Seine Valley to the Viking chieftain Rollo (or Rolf), who had settled with his followers around the city of Rouen. In the century that followed, Normandy (i.e., "Northmannia," the lands of the Northmen) gradually expanded until it stretched east of the Seine to the River Epte and west to the Atlantic shore of the Cotentin. The area ruled by the Norman dukes conformed roughly to the diocesan boundaries of the ecclesiastical province of Rouen, which had been drawn in the days of the Roman Empire. Political, ecclesiastical, and economic development accompanied this expansion, so that by the mid-11th century a dynamic and coherent state had emerged in this corner of northwestern France. In 1066, the duke of Normandy conquered England, laying the foundations for a cross-Channel realm that fused Norman customs and language with Anglo-Saxon, marking a turning point in the history of both the French duchy and the English kingdom. But the Normans did not restrict their ambitions to France and England. In the 11th and 12th centuries, Norman adventurers

sought their fortunes and carved new kingdoms in southern Italy and Sicily and in the Holy Land. In the long view, however, it was the conquest of England that had the greatest impact on the duchy, placing Normandy at the center of the rivalry between the kings of England and France for the rest of the Middle Ages.

The initial stages of Norman settlement in France are obscure. According to Norman tradition, the Viking leader Rollo met King Charles III the Simple at Saint-Clair-sur-Epte in 911 to accept baptism, perform homage, and be-come the first duke of Normandy. This version of the duchy's foundation is shrouded in legend. A charter dated 918 indicates that the king granted to Rollo and his men only some unspecified territory around Rouen, most likely hoping to pacify Rollo's band and to use them as a bulwark against rival French lords and other Viking groups. Grants in 924 and in 933 gave royal sanction to Norman expansion west to the Vire River and then to the sea, but royal concession meant little in this period: the Viking counts of Rouen had to extend their authority gradually over the territory that would become Normandy through an interplay of alliances and force. The new duchy that took shape in the 11th century enjoyed important strategic and commercial advantages, controlling the lower Seine, the gateway to Paris, and facing the English Channel, with easy access to the political and economic world of the northern seas.

The newcomers adopted the French language and religion; they intermarried with the French and with other Scandinavian settlers. Rollo's son and successor, William Longsword, entered the treacherous world of Frankish

politics, performing homage to three successive kings and taking sides in the petty wars of territorial lords. Expansion and assimilation received a setback when he was

assassinated in 942 by the count of Flanders, and two years later the Normans faced a two-pronged attack by King Louis IV and Hugues le Grand, duke of the Franks. In the 960s, the counts of Anjou, Flanders, and Blois-Chartres attacked the province with King Lothair. But the Normans of Rouen resisted these aggressions, and during the reigns of William Longsword's son Richard I (r. 942–96) and grandson Richard II (r. 996–1026) the duchy emerged as a permanent territorial entity whose institutions and traditions fused its Scandinavian and French heritage. By the turn of the century, the six bishoprics under Rouen's authority were reestablished and active and important monasteries were restored. Both Richard I and Richard II encouraged this ecclesiastical revival, inviting respected churchmen from outside Normandy to participate in the recovery and reform of churches in their duchy. During the reign of Richard II, the secular administration also took shape. A network of counts and viscounts emerged, bound together by ties of kinship and by their common allegiance to the duke.

Richard II was followed as duke by his sons Richard III (r. 1026–27) and Robert the Magnificent (r. 1027–35). Robert's untimely death returning from pilgrimage to Jerusalem threw the duchy into political disorder, as rival lords and kinsmen opposed the succession of his illegitimate seven-year-old son, William (r. 1035–87). But the young duke survived his minority and overcame his opponents, most notably in 1047 at the Battle of Val-ès-Dunes, in 1054 at the Battle of Mortemer, and in 1057 at the Battle of Varaville. In 1063, Duke William became lord of Maine, pressing the claim of his son Robert Curthose, who had been betrothed to the sister of Count Herbert of Maine. Three years later, on October 14, 1066, William defeated Harold Godwinsson at the Battle of Hastings and seized the crown of England.

The conquest of England enriched the Norman aristocracy, since the new king rewarded his supporters with the lands and titles of the defeated Anglo-Saxon nobility. Their new lands were not to be plundered as war booty but were instead to be held conditionally, in exchange for a specified number of knights to serve the king. This principle of contractual military tenure, the underpinning of feudalism, had existed in the duchy before 1066, but after the Norman Conquest knight service came to be assessed more precisely and systematically in William's lands on both sides of the Channel. The conquest of England thus brought wealth to Normandy, as well as more exact definitions of vassalage and military obligations.

The 11th century was the heyday of Norman expansion to the south and to the north, although this was the work of independent adventurers rather than a ducal program. In southern Italy and Sicily, Norman mercenaries led by Robert Guiscard (d. 1085) carved out a state from Byzantine and Muslim holdings. In the next century, this Norman kingdom of Sicily became a rich and cosmopolitan realm during the reign of Robert's nephew Roger II the Great (d. 1154), one that fused Muslim, Byzantine, and Latin traditions under the Norman rule. Warriors from Normandy also fought Muslims in Spain and in the Holy Land, where the fall of Jerusalem to the First Crusade (1095–99) brought the creation of four crusader states, including the Norman principality of Antioch, whose first ruler was Bohemund, a son of the same Robert Guiscard. Although these conquests in the Mediterranean had little impact on the duchy itself, the Normans in Normandy boasted of the exploits of their fierce cousins in the south, and a few Norman churches received presents that their members sent back from Italy.

When William the Conqueror died in 1087, the realm was divided between his two eldest sons, Robert Curthose, who received Normandy, and William Rufus, who became king of England. To finance his participation in the First Crusade, Robert entrusted the duchy to his brother in 1096 for a loan of 10,000 marks of silver. When Robert returned in 1100, William II Rufus was dead and their younger brother, Henry I, had seized England and was prepared to fight for Normandy. The subsequent fratricidal war divided the Anglo-Norman aristocracy until Henry took Robert prisoner in 1106 at Tinchebrai. England and Normandy were thus again united under Henry I, who kept his older brother captive for twenty-eight years. The government of Normandy under Henry I became more elaborate and more centralized, as royal justice extended its scope and as the first Norman exchequer kept systematic account of royal revenues, but when Henry died in 1135 with no surviving male heir anarchy broke out. Both the kingdom and the duchy were contested between Henry's daughter, Matilda, and her first cousin Stephen of Blois. Although Stephen won the throne, civil war continued for nineteen years. In 1141, Matilda's husband, Geoffroi d'Anjou, invaded Normandy and spent three years crush-ing King Stephen's party in the duchy before he was received in Rouen as duke of Normandy. In 1150, Geoffroi passed the ducal title on to his seventeen-year-old son, Henry Plantagenêt. When Geoffroi died in 1151, Henry inherited Anjou as well, and he acquired Aquitaine and Poitou by marriage in 1152. The following year, King Stephen acknowledged the young Plantagenêt as his heir in England. To King Henry II (r. 1154–89), therefore, Normandy represented only one small part of his vast cross-Channel collection of principalities.

Ever since the reign of William the Conqueror, the French kings had tried to undermine the unity of the Anglo-Norman realm. Philip I had supported Robert Curthose in rebellion against his father, and Louis VI had backed William Clito, Robert's son, against Henry I. The Angevin empire of Henry II represented an even greater threat to the French monarchy, and Louis VII (r. 1137–80) and his son, Philip II Augustus (r. 1180–1223), resolved to dismantle it. Henry II's son Richard I the Lionhearted (r. 1189–99) managed with difficulty to check the ambitions of the French king, building the famous Château-Gaillard upstream from Rouen on the Seine and defeating the royal forces decisively at Courcelles in 1198. But Richard's younger brother, John Lackland, succeeding him in 1199, was no match for the determined and resourceful Philip Augustus, who soon found a legal pretext to invade

Normandy. Since the English king technically held his French lands as the French king's vassal, John was bound by feudal law to come to Philip's court when summoned. When, in 1202, John defied Philip's order to appear in court to answer charges, his disobedience justified confiscation of his fiefs. Philip attacked Normandy that year and by 1204 had wrenched the duchy from the English crown. Anjou and most of the rest of John's French lands soon followed suit. Lords who held lands on both sides of the Channel had to forfeit their domains on one side or the other, and the severance of England from the Continent received its final seal with the defeat of John's allies in 1214 at the Battle of Bouvines.

England refused to acknowledge the French conquest of Normandy until the Treaty of Paris in 1259, but the Normans themselves adjusted to the new order. During the 13th century, peace under the Capetians brought prosperity to the duchy, although increasing royal taxation rankled townsmen. Rebellion broke out over this issue in the next century, leading King Louis X to issue the Norman Charter of 1315, which guaranteed against excessive taxation and promised the duchy a sound currency. The Norman Charter was later seen as a symbol of political liberties and rights—in effect, Normandy's Magna Carta.

The 14th century also witnessed the resumption of the Anglo-French rivalry in the Hundred Years' War (1337–1453). For Normandy, the war began in earnest in 1346, when Edward III of England invaded the duchy at the invitation of the Norman lord and rebel Godefroi de Harcourt, his army laying waste to the countryside of the Cotentin and making its way to Caen, which suffered a three-day sack. By the 1350s, the English and their allies held the major castles between the Orne and the Vire, and Godefroi confirmed the English king's commitment to conquest by bequeathing his Norman lordships to him. In the next century, after Henry V's defeat of the French at Agincourt in 1415, the English redoubled their efforts to take Normandy. By spring 1418, all lower Normandy was in their hands; Rouen surrendered in January the follow-ing year, after a seige of

almost six months, and the rest of Normandy then fell swiftly. The English occupation of Normandy lasted for thirty years, during which time the Normans were taxed heavily to support the English war effort. By the 1430s, however, the English position was beginning to slip. The brief career of Jeanne d'Arc, burned in 1431 in the marketplace of Rouen, inspired a groundswell of French patriotism, and twenty years later, by August 1450, all Normandy again belonged to the French.

A pattern of conquest and assimilation runs through the history of medieval Normandy. The Scandinavians who created the realm in the 10th century lost much of their Norseness in the following 150 years, conquering England in 1066 as Christians, speaking French and observing French customs, yet they remained aware of their own distinct origins. Under the Conqueror and his heirs, the Norman duchy and the English kingdom were at times united, but gradually the Normans of England became more English as the Normans of France became more French. The conquest of Normandy by Philip II Augustus in 1204 confirmed this growing trend of separation, placing the duchy directly under the French crown and forcing the Anglo-Norman aristocracy to choose one side of the Channel or the other. By the Hundred Years' War, the English king's declaration that Normandy was his rightful legacy was in fact the thin excuse of a foreign power to invade—and the Normans, after four centuries, were prepared to defend their right to be French.

# NORMANS IN SICILY

. In 1016, Norman pilgrims returning from the Holy Land disembarked at Bari, then in revolt against the Byzantine emperor. Hiring themselves out as mercenaries, first to one and then to another side in the wars waged between and among Byzantines in Apulia and Lombards in Campania, both of whom were threatened by Arabs in Calabria and Sicily, they enriched themselves and invited their friends and relatives to join them from Normandy, where many lesser nobles had landless younger sons.

Of the Normans who came south, twelve brothers of the Hauteville family gradually got the upper hand, finally annexing the principality of Capua in 1078. William Iron Arm, Drogo, and Humphrey had conquered northern Apulia. William was elected count of all the Normans in Italy, a position inherited by Drogo in 1046. Their younger brother Robert, surnamed Guiscard ("wily"), a virtual brig-and in Calabria, where he and his followers maintained themselves by pillaging the inhabitants, succeeded Humphrey as count in 1057. Robert and his youngest brother, Roger, completed the conquest of southern Italy by capturing Bari, the last Byzantine stronghold, on April 16, 1071. The Byzantines could not effectively resist them because most of their army had to face the Seljuk Turks, who crushed them at Manzikert in August of that year.

In 1053, at Civitate, the Normans captured Pope Leo IX, who had opposed their encroachments on the papal states. Pope Nicholas II used the Normans as allies against local enemies as well as the German and Byzantine emperors. He made Robert Guiscard a duke and his vassal in 1059. The Norman-papal alliance bore fruit in 1084, when Robert responded to the appeals of his suzerain and routed the emperor Henry IV, who was besieging Pope Gregory VII in the Castel Sant' Angelo in Rome. Robert himself died in 1085, during a three-year campaign against the Byzantines and Venetians, during which he seized Avelona and Durazzo and penetrated as far as Thessaly. By that time, his brother Roger had nearly completed the conquest of Sicily, which he had invaded from Calabria, seizing Messina in 1061. Noto, the last Arab outpost, fell to him in 1091.

During the First Crusade, Robert's oldest son, Bohe-mund, seized Antioch and took the title of prince in the face of Byzantine claims to the city. Hostility between the Hautevilles and Constantinople undermined cooperation between crusaders and Byzantines. Antioch remained a Latin principality until 1287. Roger's younger son, Roger II of Sicily (r. 1105–54), inherited Apulia in 1127 from his cousin, Bohemund's son William, and added Capua and Naples (1139) and Abruzzi (1140). In 1130, he received the crown of Sicily at Palermo from the antipope Anacletus II. Roger continued his father's policy of romanizing the Orthodox and protecting Greek, Arab, Jew, and Lombard in his French-speaking court, which promulgated documents in Arabic and Greek as well as in Latin. He combined Arab and Byzantine autocratic law, taxes, and bureaucratic traditions with Norman feudalism. Normans came to Sicily from England, the other most developed Catholic monarchy of the 12th century. The institutions of each kingdom influenced the other's, but the Sicilian realm was more advanced. Its economy was more monetized, its trade more valuable, its cities larger and richer, and its culture

more sophisticated. Roger II occupied Malta and Tripoli and made Tunis pay him tribute. He divided his diverse kingdom into judiciarates.

Under Roger's son William I the Bad (r. 1154–66), domestic revolts and governmental ineptitude caused the loss of Roger's African conquests. His successor, William II the Good (r. 1166–89), supported Pope Alexander III against the German and Byzantine emperors. Both Wil-liams sought to dominate the Mediterranean from Tunisia and the Adriatic from their possessions at Corfu, Durazzo, and Cephalonia.

William II's marriage to Joan, the daughter of Henry II of England, proved childless, and his death was followed by civil war. His preferred successor, his aunt Constance, was married to Henry VI, soon to become emperor. Her half-brother, Roger II's illegitimate son Tan-cred, seized the throne and ruled with the support of Norman barons, but at his death in 1194 Henry VI dispossessed his son William III, bringing an end to the Haute-villes' rule. At the death of Henry (1197) and Constance (1198), their child, Frederick II, inherited the throne under the guardianship of Pope Innocent III. The population and prosperity of Sicily continued to grow until the 1190s. Roger II was the richest sovereign in Catholic Europe, and William II's revenues rivaled those of the king of England. En route to the Third Crusade, Richard the Lionhearted wintered in Sicily with his cousin Tancred. Along with Spain, Sicily became the chief conduit of Arabic knowledge to the West. Roger II and his successors patronized translators of Jewish and Arabic works into Latin. Its Jew-ish physicians and Arabic learning made the old Lombard capital of Salerno Europe's leading medical center, considered by some to be the oldest university. St. Benedict's abbey of Monte Cassino, on the border between the *Regno* and the papal states, and the Basilian monasteries of southern Italy, were centers of learning. To Monte Cassino came Constantine the African, a monk who translated treatises by Greek and Arabic doctors into Latin. Nowhere else did Arabic, Greek, and Latin culture coexist together in such peace and toleration, and no kingdom contributed more to the cultural renaissance of the 12th century. Roger II and his ministers, such as his grand-admiral, George of Antioch, endowed churches built in the Arabo-Byzantine style peculiar to the island, although the Gothic style predominated later with the cathedrals at Palermo and Monreale. The court of Frederick II (r. 1197–1250) witnessed the culmination of Norman scholarship.

# NOTARIES

. Notaries existed in medieval France primarily in the south in the high and late Middle Ages, as a result of the written law tradition inherited from the Romans. Au thorized by a variety of political authorities—royal, municipal, episcopal, papal—notaries operated as registrars of public and private law transactions given legal validity by their office. Notaries recorded minutes or drafts of instruments in registers, some of which have survived by the dozens, even hundreds, in such towns as Perpignan, Manosque, Marseille, Toulouse, and Montpellier for the late Middle Ages; other towns, like Narbonne, are not favored with the survival of notarial registers from the medieval era. When called upon, the notary would draw up an extended form of a transaction, filling out formulaic abbreviations, which abounded in the minutes of the registers.

Notaries, strategically positioned on busy squares and streets, attracted as clientele a cross-section of the urban population, who sought written records of last wills and testaments, sales and rentals, emancipation, acquittal, apprenticeship, litigation, and other business and legal engagements. Age and residency requirements protected access to the profession. Paralegal instruction or apprenticeship in the notariate was governed by statute in such towns as Marseille and Tarascon. Thoroughly professional and essential to the process of business and law, notaries gar-nered a certain social standing in medieval southern France.

# NOTRE-DAME SCHOOL

. When Maurice de Sully became bishop of Paris in 1160, he launched the construction of the cathedral of Notre-Dame, which was largely completed by 1250. An abundance of polyphonic music for the Masses and Offices of major feasts of the liturgical year was

created during this period to enhance the ceremonies at the cathedral. This musical repertory developed in two phases. The first involved the compilation of the *Magnus liber organi* by Léonin, named by the music theorist Anonymous 4 as the earliest member of this school. This new polyphony, the most advanced music then devised, introduced modal rhythm into segments of the polyphony known as discant clausulae, which were composed in note-against-note style to the plainchant melismas, in contrast to the lengthy and mellifluous lines improvised or composed to the syllabic sections of the chant. The innovation of a musical notation for these clausulae proved a turning point in western music. The clausulae grew in importance, as composers explored ways to expand, extend, and notate increasingly complex rhythms; numerous independent clausulae apparently intended to substitute for the original sections in the *Magnus liber organi* survive in the Notre-Dame sources *W1* and F. Some of these clausulae may have been a factor in the *abbreviatio* ("abbreviation" or "revision") of the *Magnus liber organi* that Anonymous 4 attributed to Pérotin, whom he called *optimus discantor.*

The second phase consisted of revisions and additions introduced by Pérotin, whom Anonymous 4 named as Léonin's successor. It is probable that the notation if not much of the music of the *Magnus liber organi* itself was revised and that new organum was added over time, so that the three extant versions of the *Magnus liber organi* reflect three layers, all of which apparently postdate the *abbreviatio* attributed to Pérotin. The version in the Florence manuscript *(F)* may be closer to the liturgical practice of Notre-Dame and is both larger and later than that in *W1*. Craig Wright has proposed, therefore, that the version in F may be closer to Léonin's *Magnus liber organi* and that dissemination from Paris was selective rather than additive, as had previously been thought. Anonymous 4 also implied a distinction between the two phases that is valuable in understanding their musical styles. Léonin's polyphony is predominately two-part organum, whereas Pérotin's is generally discant in two, three, or four parts. This liturgical polyphony quickly spread throughout Europe, notably in England and Spain, and manuscript fragments in other northern regions indicate an even wider diffusion. As it spread, however, the spirit of innovation that had imbued its formation was increasingly swept up in the vernacular tide that began in the early 13th century, culminating in the French-texted motet that dominated the second half of the century.

According to Anonymous 4, Pérotin also composed four- and three-part polyphony for the Graduals and Alle-luias of Masses for Christmas, Easter, and the Nativity of the Virgin Mary, and several conductus. The notational and rhythmic innovations of Pérotin and 'his colleagues in the cathedral were probably the basis of the earliest systematic theoretical writings on the rhythmic modes, those attributed to Johannes de Garlandia, which formed the "key" by which Friedrich Ludwig in the early decades of the 20th century unlocked an understanding of the obscure notation of the Notre-Dame organa and clausulae.

# *NOVAS*

. Occitan term (meaning "novel, story, argument") that described a range of works, including a late 12th- or early 13th-century discussion of amorous casuistry by Raimon Vidal, *the Judici d'amor* (1,698 octosyllabic lines), the 13th-century courtly romance *Flamenca* (more appropriately called the *Novas de Guillem de Nivers*), Arnaut de Carcassès's courtly tale *Novas del papagai* (309 octosyllabic lines), and a 14th-century piece of Catholic propaganda, *Novas de l'heretje* by Izarn (approximately 800 Alexandrine lines).

# **NOYON**

. Located due west of Laon, Noyon (Oise) lies just outside the 12th-century boundaries of the royal domain and just over sixty miles north of Paris. Here, Charlemagne was crowned king of the Franks and Hugh Capet was elected the first Capetian monarch in 987. Noyon, centered in the Oise River basin, is surrounded by rich agricultural land. Traffic into the Seine via the Oise and on the two major routes north and south from Paris to Flanders, and east and west from the channel ports to the fairs of Champagne, made the location of Noyon of paramount importance. Taxes imposed on goods entering and leaving Noyon augmented the treasury of the chapter and the all-important bishop-counts.

The kings of France usually backed the bishop-counts of Noyon. Louis VII made five visits to Noyon, and Philip II Augustus confirmed the city charter in 1181. The chapter,
Noyon (Oise), plan of Notre-Dame.

consisting of sixty-nine canons, with vast holdings that included mills, vineyards, and forests, was closely associated with the building campaigns for the cathedral. The body of St. Éloi, a 7th-century bishop, was a prize possession of the chapter of Noyon and greatly augmented revenue.

Between 1145 and 1150, following a fire of 1131, a decision was reached to construct a new cathedral. By 1155 or 1160, the five radiating chapels of the choir were completed and a decade later the ambulatory and choir were finished. These early campaigns consisted of a four-story elevation: nave arcade, gallery, blind triforium (no passageway),

and clerestory. These campaigns were conservative in design when contrasted with the daring elegance of the Saint-Denis choir (1140–44).

By 1185, the upper choir, the unusual transepts, and the first bay of the nave were completed. The transepts have an arcade of windows above a blind arcade, a triforium with inner passageway, a gallery with passageway, and a clerestory with exterior passageway under embryonic flying buttresses. Reversing the gallery and the triforium is a design detail of extraordinary quality. Blocks of stone extend from exterior to interior walls stabilizing the solidity of the structure, as Norman master masons had done. The nave of Noyon emphasizes the alternation of piers and columns to support the six-part vaulting system, which was replaced in the 13th century by four-part vaults.

The exterior of Noyon, with its rounded aisleless transepts and its choir with radiating chapels and flanking towers and massive western towers, is quite different from the cathedral of Sens and the choir of Saint-Denis. Indeed, Noyon is very unlike all other Early Gothic cathedrals. It possesses an intimacy of scale, consistency of forms, and, especially in the design of the transepts, moments of great creativity.

Until recently, little was known about the monumental sculpture of Noyon except the presence of a fine seated Virgin and Child, badly damaged in 1918. However, in a 1992 article Charles T.Little connected stylistically three other life-size, seated figures to the Noyon Virgin and Child: Moses (The Cloisters, New York), Prophet (Lugano, Baron von Thyssen-Bornemisza Collection), and upper torso of John the Baptist (?) (Duke University). All these statues are distinguished by heavy, swirling folds that reveal contours of arms, elbows, knees, and legs. In style, they display marked similarities to the sculpture of the west portal of Senlis (ca. 1170). Further, Little, in a photomontage, has successfully placed this sculpture in the south-transept portal of the cathedral.

# NUNNERIES

. Throughout the early Middle Ages, religious women had many fewer opportunities for the clois-tered life than did men. Nunneries were far outnumbered by male monasteries, and most nuns had not entered the religious life as children, as had the oblates in houses of Benedictine monks. Rather, the majority of nuns had taken the veil as widows, although there were always a certain number of girls, usually from wealthy families, who joined such houses. Although in the early Middle Ages, both in Britain and on the Continent, double monasteries were sometimes found, where a male monastery and a

nunnery might be joined under the direction of a single abbess, such institutions tended to become male-only houses.

In the 11th and early 12th centuries, while every French town was surrounded by houses for monks, there might be only one nunnery in a region. Such a nunnery could, however, become an important center for women's intellectual life, and most women writers of this period were nuns. As the new monastic orders began to spread in the 11th century, nunneries were founded specifically to take the wives of men who had decided to enter the cloister; Marcigny, affiliated with Cluny, was such a house, as was Tart, established for the wives of Cistercian converts. But many women's religiosity had to be channeled in other directions before the end of the 12th century; women might establish themselves in small cells attached to male monasteries or decide to follow wondering preachers. Robert d'Arbrissel, for example, had a large group of women followers whom he was persuaded to make settle down as nuns at Fontevrault.

But religious houses for women began to multiply in the 13th century, including Benedictine nunneries but also establishments for canonesses and for such new orders as the Poor Clares, the female wing of the Franciscan order. Because the women of such orders were expected to follow a strict cloistered life, it was sometimes hard to distinguish them from more traditional nuns. By the end of the Middle Ages, there were many more nunneries than monasteries in France.

# O

# O ANTIPHONS

. These antiphons, sung with the Magni-ficat at First Vespers on the days preceding Christmas, are so named because they all begin with the exclamation "O." In the Middle Ages, they were sometimes known as the "great antiphons" *(antiphonae maiores)*. The texts, charged with Old Testament messianic symbolism, begin with a divine epithet that is elaborated by subsequent phrases and end with an invitation beginning *veni* ("come"). The coherence of the basic group of seven found in medieval antiphoners *(O sapientia, O adonai, O radix jesse, O clavis David, O oriens, O rex gentium, O Emmanuel)* is attested by the acrostic formed by the first letters of the divine epithets read in reverse: ERO CRAS ("I will be [here] tomorrow"). All of the texts are sung to a solemn melody in the second mode, which is not used outside this group. The number of O antiphons grew to as many as twelve in some sources, with the addition of other texts *(O virgo virginum, O Thoma Didyme)* to the original seven. The starting date of the cycle, which had to conclude on De-cember 23, depended on the number of antiphons traditional in a particular locale.

A 7th-century Roman origin has been proposed by Callewaert, who traces their dissemination through England to the Continent. The Venerable Bede (d. 735) is said to have sung the antiphon *O rex gloriae,* a piece modeled after the O antiphons of Advent, on his deathbed, and in the late 8th century the English poet Cynewulf paraphrased the antiphons in *The Christ*. Alcuin (d. 804) lists ten O antiphons in his *De laude Dei*. Amalarius of Metz devoted a chapter of *De ordine antiphonarii* (837) to a discussion of these antiphons, but neither his ordering of the chants nor that of other French sources conforms to the arrangement suggested by the acrostic. Since Amalarius's antiphoner has been lost, the antiphoner of Compiègne (B.N. lat 17436), from the last third of the 9th century, represents the first appearance of the O antiphons in a liturgical book. Here, as elsewhere, they are entered as a group, not distributed according to the days on which they were to be sung.

These antiphons drew the attention of several medieval commentators on the liturgy (Berno, Jean Beleth, Honorius of Autun, Guillaume Durand, Reinerius of Liège), and their solemn singing at the close of Advent broke to a certain degree with the penitential character of the season. The honor of intoning them before the Magnificat was reserved to dignitaries of the monastery or cathedral chap-ter. At Fleury, *O clavis* was assigned to the cellarer; at Rouen, it fell just as appropriately to the cathedral treasurer. In some

places, these officials had to provide a treat for their colleagues when it was their turn to sing the O antiphon.

# OCCITAN LANGUAGE

**.** The indigenous language of roughly the southern third of what is now France. Occitan is not "a dialect of French" or of any other language. Like the other Romance tongues, it is derived from the spoken form of Latin that spread throughout the Roman Empire. After the conquest of Gallia Cisalpina, or northern Italy, completed shortly after 200 B.C., Rome soon extended its influence across the Alps into Gallia Transalpina. At that time, southern Gaul was inhabited by peoples whose languages are little known to us, notably Ligurians in the southeast, in the southwest tribes referred to variously as Iberians, pre-Basques, or Aquitanians, and an overlay of Gauls throughout the area. A few Greek colonies had been established along the coast beginning ca. 600 B.C.

The Roman military penetration of Qccitania began ca. 125 B.C., when Roman forces were called on to repel a Celtic attack against the Greek colony of Massilia (now Marseille). Around 120 B.C., a Roman colony was founded farther west along the coast at Narbomie, which gave the name Gallia Narbonensis to the coastal territory between the Alps and Pyrénées, forming a link between Italy and the Roman provinces of Hispania. It was from southern Gaul, later known simply as Provincia, that in 58 B.C. Julius Caesar launched his conquest of "all Gaul." Latin gradually spread through Gaul, where Gaulish, a language of the Celtic family, became extinct by the 5th century A.D. (except, possibly, in Brittany).

The Occitan language developed its distinctive features from around the 5th to the 8th century. Texts of that time were written only in Latin, but we can suppose that by the 8th and 9th centuries religious works, such as hymns, religious dramas, and sermons (as recommended by the Council of Tours in 813), were being produced in spoken Occitan. Isolated Occitan words and expressions begin to appear in the late 10th century in oaths of fidelity written in Latin. The earliest known text entirely in Occitan, the *Boeci,* a Limousin fragment of the life of Boethius adapted from a Latin original, probably dates from shortly after the year 1000. Also from ca. 1000 dates the Occitan refrain to an *alba* (dawn song) otherwise written in Latin. The *Canço(n) de santa Fe* (probably written in Languedoc, in or near Narbonne) dates from the mid-11th century, followed by other

religious works. Admixtures of Occitan occur in 1 1th-century Latin documents, and the first non-literary document entirely in Occitan, an act of donation, dates from 1102, followed by sixteen other documents before ca. 1120. Though French has earlier texts, Occitan has more documents from before 1200 than any other Romance language, probably because of active municipal life and commercial exchanges. The first known troubadour, Guilhem IX, must have begun to produce his verses shortly before 1100, since he was born in 1071, but the surviving manuscripts of troubadour poetry date only from the 13th century on. The Early Occitan period is generally considered to extend from ca. 800 to 1000, Old Occitan from 1000 to 1350, and Middle Occitan from 1350 to 1550.

In the Middle Ages, Provincia gave its name to Provence, which eventually became the southeastern province of the French kingdom, roughly bordered by the Alps, the Mediterranean, and the Rhône and Durance rivers. The corresponding adjective, *provincialis,* or "Provençal" in its modern French form, became used ca. 1280 for the language of southern France. However, it was not the first such term for that language. *Lengua romana* or *roma(n),* meaning roughly "vernacular language," was used much earlier, and *lemosi(n),* derived from the province of Limoges, came in ca. 1200, while *lenga d'oc,* derived from the distinctive affirmative particle oc, came into use ca. 1290.

The term "Provençal" (which American scholars tend to pronounce /pRovàsál/ as in French, though some prefer the anglicized version /pr vénts l/) began to predominate in the 16th century and was given further impetus by the late 19th-century literary revival centered in Provence known as the *felibrige* movement and by the translations and essays through which Ezra Pound made the troubadours into an important influence on 20th-century poetry. Today, however, most scholars consider that "Provençal" should be reserved for the dialect of the southeast, and that "Occitan" (attested from ca. 1300 under the form *occitanus*) is the most appropriate overall term for this language, whose identity history has cast into confusion by denying it a national state.

From the preliterary period until ca. 1200, Occitan was the chief language of everyday communication in Occitan territory. Latin was known to all educated persons and was spoken, at least on formal occasions, by clerics and intellectuals, but as a written language it was increasingly displaced by the vernacular. In the 12th century, French remained a foreign tongue, compared by at least one troubadour to the barking of dogs. But beginning with the French penetration of Occitania under the guise of the Albigensian Crusade in the early 13th century, the Occitan language has been in almost constant recession. Although Occitan persevered as the standard administrative and judicial language into the 15th century, the prestige of the conquering French culture and the centralizing linguistic tendencies of the Renaissance monarchy and of all subsequent French regimes have fragmented Occitan into a scattering of oral "patois." Almost all of the several million speakers of its various dialects are now bilingual in French, and most inhabitants of Occitania know nothing of the Occitan language. Occitan speakers today fall into two chief groups: inhabitants of remote villages and mountainous areas, and a small number of intellectuals largely connected to Languedocian universities. In the 1980s, Occitan entered the "program" of the French *baccalauréat* and is now studied in certain universities as both a living and a medieval language. Literary expression continues to be torn between the Provençal dialect in the late 19th-century tradition

established by poets like Frederi Mistral, and Languedocian, notably as codified by the Institut d'Estudis Occitans in Toulouse.

Because the romanization of southern Gaul began so early and was nearly complete, the form of Latin that came to be spoken in Occitania, the linguistic territory of Occitan, was more conservative, that is, closer to the language of Rome, than in most other areas of the empire. In addition, Occitania was less affected than northern France by the Germanic influence that spread through Gaul in the 5th and 6th centuries, primarily by the Visigoths (particularly in Aquitaine), Burgundians, and Franks, who at times controlled all of what is now France and more.

Still, Occitan and French have enough in common, owing mainly to the common Celtic influence, to be generally considered the two main components of the Gallo-Romance family. That family also includes a group of "Franco-Provençal" dialects around Geneva, Mâcon, Lyon, Saint-Étienne, and Grenoble, which comprise a separate language showing linguistic traits of both Occitan and French. (Gallo-Romance, according to many scholars, also includes the scattered Rheto-Romance areas of Switzerland and northeastern Alpine Italy.)

Occitania is usually divided into three groups of dialects. The southwestern group, Gascon, lies roughly between the Pyrénées, the Atlantic, and the Garonne River. Gascon, considered a separate Romance language by a few specialists, includes the geographical curiosity of Aranais, spoken in the Aran Valley on the southern slopes of the Pyrénées, adjoining the Catalan domain. The southern Occitan dialects are (1) in the southeast, Provençal, whose border runs roughly from the Alps slightly north of Menton, west to include Digne and Orange, across the Rhône, then south to include Nîmes and the Rhône delta; and (2) in the central south, Languedocian, whose large area includes Montpellier, Béziers, Narbonne, Carcassonne, Toulouse, Albi, Agen, Cahors, Rodez, Aurillac, Mende, and nearby points. The northern Occitan dialects are (1) Limousin in the areas of Limoges, Périgueux, and Tulle; (2) Auvergnat in the center of the Massif Central, including the areas of Clermont-Ferrand and Le Puy; and (3) Alpine Provençal from slightly west of the Rhône (including Privas and Valence) east along the Isère River and on farther east to encompass the Piedmontese slopes of the Alps.

Looking at a different set of linguistic traits, however, one can also attach Languedocian to Gascon and Provençal to the northern Occitan dialects. Further debate is fueled by some Occitanists who prefer to attach Occitan and Gascon to Catalan as a "Occitano-Romance" family; it is certainly true that Occitan and Catalan, at least in the Middle Ages, are far closer to each other linguistically than to French and Spanish.

An area of mingled French and Occitan dialect, known as the "Crescent," includes parts of the provinces of La Marche and Bourbonnais, north of Limoges and Clermont-Ferrand. Debate continues as to whether the Occitan domain once included, or at least influenced and was influenced by, southern Poitou, especially since the work of the first troubadour, Guilhem IX of Aquitaine and VII of Poitiers, shows several traits of Poitevin, which can be considered his native tongue.

Medieval Occitan is known through a wealth of deeds, charters, oaths, troubadour poetry, and other literary texts, as well as through treatises on the language, beginning ca. 1200 with Raimon Vidal de Besalú's *Razos de trobar*. These contemporary treatises, like the documents, the troubadours' use of rhyme, and other evidence, reveal greater linguistic standardization than in the French of that period. It is usual to speak of literary

Occitan as being a koine, a supradialectal language of general communication. Although the Occitan koine accepts some traits of various dialects, its origin lies probably in Languedoc.

Medieval Occitan shares some phonetic characteristics with French but is closer to Catalan and Italian. Since it has a fairly strong expiratory stress affecting at least one syllable in most words, intertonic and posttonic vowels usually fall (DELICATUM>*delgat* 'delicate'), except that *a* remains (rather than being weakened as in French): MIRABILIAM>*meravelha* 'wonder.' Stressed *e* and *o* tend to diphthongize less than in French and only in certain phonetic contexts and dialects (MEUM>*meu, mieu* 'my'; FOLIAM>*folha, fuelha* 'leaf), though more frequently than in most other Romance idioms. Vowels are, at least in the Middle Ages, not perceptibly nasalized before a nasal vowel. The Vulgar Latin prosthetic vowel before *s*+consonant remains as *e* (SCHOLAM>*escola* 'school').

Intervocalic consonants or consonants that become word-final generally do not drop, though they are often altered in various ways. Notably, single intervocalic unvoiced consonants generally become voiced : RIPAM>*riba* 'shore,' VITAM>*vida* 'life,' AMICAM>*amiga* 'friend' (f.), PRESENTEM (with /s/)>*presen* (with /z/) 'present.' Some consonants become palatalized in certain positions; for example, *g* before *e* or *i* (SIGILLUM > *sagel* 'seal') or, dialectally, before *a* (*amija,* also reduced to *amia,* for *amiga*). The initial sounds /g/ and /k/ are palatalized to /dʒ/ and /tʃ/ before *a* only in northern Occitan (CANTUM>*can, chan* 'song').

Unlike the case in French, intervocalic *n* that becomes word-final can optionally drop without leaving any trace (FINEM>*fi(n)* 'end'). Many consonants vocalize in certain positions (e.g., ALBAM>*alba, auba* 'dawn'), though not always following the same patterns as in French; the result is a series of diphthongs and triphthongs that is even richer than in Old French. The combination CT has two principal dialectal outcomes, /tʃ/ and /jt/: NOCTEM>*nuech, nueit* 'night.' The behavior of certain groups, notably those ending in /j/ and /w/, is complex and in some cases surprising: BRACHIUM>*bratz, bras* 'arm,' DEBUIT>*dec*'he/she owed.'

The consonant *h,* whether derived from Latin or Germanic *h,* is not pronounced and there is no Occitan version of French *"h* aspiré" (however, *h* is used in various combinations representing the affricative /tʃ/ and Gascon *h,* derived from Latin *f,* represents a strong /h/ sound).

Occitan vocabulary is almost entirely derived from Latin, without the influx of Germanic and Arabic words that marked French and Spanish, respectively. The few Germanic words are largely widespread Romance borrowings in the expected semantic areas, denoting colors (BLANK>*blanc* 'white'), military objects (HELM>*elm* 'helmet'), geography (BUSK>*bosc* 'forest'). There is also the usual assortment of learned terms derived from Greek: *filosophia, propheta*.

The "classical" (late 12th-c.) literary language contains the following twenty-five consonant phonemes: /p/, /t/, /k/, /b/, /d/, /g/, /ts/, /tʃ/, /dz/, /dʒ/, /f/, /s/, /ʃ/, /v/, /z/, /ʒ/, /r/, /rr/, /l/, /ʎ/, /ʎ/, /m/, /n/, /ɲ, ŋ/. The vowels were /i/, /y/, /e, ɛ/, /a/, /a, ɔ, o/, /u/ (there were no / ø/ and /œ/ as in French), and semivowels were /j/, /w/, and /ɥ/. Combinations of these yield about sixteen distinct diphthongs and four triphthongs. All of these categories contain more phonemes than in Old French. As in Old French, authors and scribes render these sounds in varied and confusing ways, and modern editors use different conventions

to represent the medieval spellings and pronunciations. On the whole, the modern reader with a basic knowledge of the Old Occitan spelling can make a pretty good attempt at pronouncing as the troubadours did. However, it takes some sophistication to determine the location of tonic stress, and often only a knowledge of etymology can distinguish between the open and closed *e* and *o.*

Like Old French, Old Occitan has a two-case declension of nouns and adjectives that is most prominent and regular in masculines: *murs, mur, mur, murs* 'wall' (cited in the conventional order: nominative singular, oblique singular, nominative plural, oblique plural). Some feminine nouns follow a similar pattern (*flors, flor, flors, flors* 'flower'), but most merely distinguish singular and plural: *domna* 'lady,' *domnas* 'ladies.' A number of masculine nouns and a couple of feminine ones show shifting stress, a changing number of syllables, or both: *bar, baro(n), baro(n), barons* 'noble.' Several other patterns exist, while some nouns and adjectives are invariable.

The verb system has forms corresponding to the active and passive voices; the indicative, subjunctive, conditional, imperative, infinitive, and participial moods; the future, present, imperfect, preterit, future perfect, compound past, pluperfect, and past anterior tenses; three persons; and two numbers. Verbs can be divided into three conjugations, characterized by the thematic vowels *a, e,* and *i.* The most idiosyncratic feature is perhaps the "strong" preterits, which follow patterns like, for *penre* 'to take,' *pris, prezist, pres, prezem, prezetz, preiro(n).* The large number of irregular verbs—on the whole, the most frequently used ones—pose a continuous challenge to the reader.

Further challenges are word order, which is fairly free given that the functions of most nouns, adjectives, and verbs within a sentence are adequately revealed by their endings, and the plentiful use of masculine, feminine, and neuter personal pronouns, whose forms and functions often overlap in ways that give room to the interpreter's imagination. Naturally, with the license encouraged by the constraints of rhyme and syllabification, poetry is harder to interpret than prose, which is closer to the presumed but irretrievable language of everyday life in medieval Occitania.

# OCKEGHEM, JOHANNES

(ca. 1420–1497). FrancoFlemish composer, active mainly in France. According to recently discovered documents, he was born in SaintGhislain, a village near Mons in the Belgian province of Hainaut. His career is first traced in Antwerp, where he was a singer at the church of Notre-Dame in 1443/44. From 1446 to 1448, he was singer in the chapel of Charles I, duke of Bourbon, at Moulins. He became a member of the French royal chapel under Charles VII ca. 1450 and continued to serve that institution under Louis XI and Charles VIII. Named as first chaplain in 1454, he was subsequently cited as master of the chapel (1464) and counselor to the king (1477). In 1459, Charles VII, who was hereditary abbot of Saint-Martin of Tours, appointed Ockeghem to the important post of treasurer of SaintMartin. Sometime before 1472, possibly in 1464, he was ordained a priest at Cambrai. The only journey he is known to have undertaken outside France and the Low Countries is one to Spain in 1470. In 1484, he revisited his native country when he and other members of the royal chapel traveled to Damme and Bruges in Flanders. He eventually retired to Tours, where he died on February 6, 1497.

Among his pupils may have been Antoine Busnoys, a cleric at Saint-Martin of Tours in 1465 and subsequently singer in the chapel of Charles the Bold, duke of Burgundy. Busnoys honored Ockeghem in his motet *In hydraulis,* calling him the "true image of Orpheus." At Cambrai, Ockeghem met Guillaume Dufay, his greatest musical contemporary, who in 1464 entertained him at his house. The Flemish music theorist Johannes Tinctoris dedicated his treatise on the modes (1476) jointly to Ockeghem and Busnoys, and in his treatises on proportions and counterpoint he cited Ockeghem as "the most excellent of all the composers I have ever heard." In his last treatise, *De inventione et usu musicae* (ca. 1481), Tinctoris describes him not only as a distinguished composer but as the finest bass singer known to him.

Ockeghem's personal appearance and manner, as well as his musicianship, were often praised by his contemporaries. Guillaume Crétin wrote a *Déploration sur le trespas de feu Okergan,* praising his "subtlety" and calling on his mourning colleagues, led by Dufay and Busnoys, to sing his music, including his "exquisite and most perfect Requiem Mass." The poet Jean Molinet also wrote a *déploration* on his death, which was set to music by Josquin des Prez, the great master of the next generation of French composers. An *epitaphium* for Ockeghem by Erasmus of Rotterdam was set by Johannes Lupi in the 16th century.

Ockeghem composed in all genres, but his most important works are his fourteen Masses. A single Credo and only five motets by him are known, but they are each highly individual works. Twenty-two secular songs, all but one in French, come down to us. The exception is a Spanish song, probably a memento of his visit to Spain.

In his time and throughout subsequent centuries, Ockeghem was renowned for his contrapuntal skill, especially in canonic writing. His masterpiece in this technique is his *Missa prolationum,* consisting almost entirely of double canons at all intervals within the octave, and in four different "prolations" (meters) simultaneously. Almost legendary in his time was a thirty-six-voice canon mentioned by Crétin and others, the identity of which remains controversial. His Requiem Mass, which may have been written on the death of Charles VII (1461), is the earliest surviving example of its kind.

The most distinctive features of Ockeghem's music are its varied, unpredictable rhythms and long-breathed, overlapping phrases. Its texture of equally important though highly independent melodic lines and its exploration of the bass register are progressive features, but in many respects its unpredictable, "mystical" character, which virtually defies analysis, evokes a Late Gothic spirit rather than displaying the clarity of the emerging Renaissance style of his contemporaries.

# OCKHAM, WILLIAM OF

(William Occam; ca. 1285–1347). Born in Ockham in Surrey, England, William entered a Franciscan convent at an early age. In 1306, he was ordained subdeacon at Southwark in London and began his education at Oxford, where he lectured on Peter Lombard's *Sententiae* from 1317 to 1319. John Luttrell, the chancellor at Oxford, opposed Ockham's views. Pope John XXII called him to Avignon in 1323/24. A committee investigated Ockham's works and censured fifty-one propositions but did not formally condemn him. In 1327, he met Michael of Cesena, the minister-general of the Franciscan order and leader of the Spiritual Franciscans. Cesena requested Ockham to examine John XXII's constitutions on Franciscan poverty. Ockham declared them full of error and the following year fled Avignon with Cesena and others. He was excommunicated in 1328. He joined the emperor Louis of Bavaria in his dispute with the pope and in 1330 settled at the Franciscan convent in Munich. In 1331, Ockham was expelled from the order and sentenced to imprisonment. He died in Munich in 1347, still under Louis's protective care.

Ockham's writings fall into three stages corresponding to his major residences: Oxford (1306/07–23), Avignon (1323–28), and Germany (1330–47). At Oxford and Avignon, his writings include his commentary on the *Sententiae,* later published in two parts: the *Ordinatio,* his lectures on the first book, and the *Reportatio,* comprising notes taken at his lectures. He also composed commentaries on Aristotle's *Organon; Summa logicae,* his

major statement on logic; seven quodlibetals; and treatises on the Body of Christ, on the eucharist, and on predestination. After his departure from Avignon in 1328, he wrote works against the Avignon papacy, the chief ones being *Opus nonaginta dierum,* about papal errors regarding poverty; *Dialogus inter magistrum et discipulum* (1333–47); eight *quaestiones* on papal authority (1340); and a treatise on the respective powers of emperor and pope (ca. 1347).

Ockham was principally a theologian, vigorously exploring the philosophical limits of each epistemological, logical, or metaphysical issue, often to see more clearly the theological application. He rejected the older Platonic Realism and the *via antiqua* of the Aristotelians to pursue a *via moderna,* a path of demonstration and the near-autonomy of faith. He insisted upon a method of economy of explanation, later termed "Ockham's razor." With the nominalists, he contested the reality of universals and affirmed the fundamental reality of particulars for the human mind. His own solution to the relationship between universals and particulars is often called "conceptualist" instead of "nominalist," because he viewed concepts not merely as creatures of the mind but rather as entities identical with the abstractive cognition by which the mind considers individual objects in a certain way. With Duns Scotus, he asserted the utter transcendence and unique necessity and freedom of God in contrast with the contingency of all else, including so-called natural and moral laws. He argued the distinction between God's absolute power and that of his ordained power, manifest in his decrees, by which God limits himself to operate within ordinations he established. Ockham also contributed to medieval and early-modern political theory and ecclesiology. He influenced conciliarism, and his theological legacy reached to Pierre d'Ailly, Gabriel Biel, and Martin Luther. He attacked the wealth of the church, challenged the notions of papal infallibility and plenitude of power, upheld the right of imperial election apart from papal interference, and conceded to the emperor the responsibility to depose a heretical pope. He maintained that the papacy was not established by Christ, that the general council was superior to the papacy, but that the pope possessed an ordinary executive authority unless he were heretical.

# ODILO

(961–1049). One of the long-lived abbots of Cluny who helped establish the monastery's authority and prestige (r. 994–1049), Odilo was from a noble family of Auvergne, son of a couple named Berald and Gerberge. Odilo's brother Berald became provost of Le Puy. Odilo himself had been a canon at Brioude, in Auvergne, before coming to Cluny. As prior of Cluny, he governed the house during the final years of his predecessor, Maiolus. In the final years of Odilo's own life, his prior and eventual successor, Hugues, similarly governed for him.

Under Odilo, Cluny reformed a number of monasteries to a regular life, especially in Burgundy. Some, like Paray-le-Monial, became Cluniac priories; others, like SaintGermain of Auxerre and Saint-Bénigne of Dijon, retained their own abbots while following Cluniac customs.

# ODO

(d. 944). Cluny first became an important monastic center under Abbot Odo (r. 926–44), who was from an aristocratic family, probably of the region of Berry. In his youth, he had served in the household of Duke William I the Pious of Aquitaine, Cluny's founder, before becoming a monk at Saint-Martin of Tours. Later, he moved to the stricter monastery of Baume, where Berno was abbot, a house founded by disciples of Benedict of Aniane. Berno also became abbot of four other houses, including Cluny when it was founded in 909, and upon his death Odo was chosen to succeed him at Cluny. In the 12th century, the Cluniacs considered Odo rather than Berno their true founder.

As abbot, Odo took over the direction of eleven houses, most located some distance from Cluny. The most important of these was Romainmoutier, in the trans-Saône kingdom of Burgundy, but his reforms also included houses in Auvergne and southern France, in the west (Tours), and even in Italy. Some of these houses were governed again in later generations by their own abbots, but some stayed under the direction of Cluny's abbot. In all cases, the purpose was to restore the monastic life to regularity, by ejecting

dissolute monks if necessary, and to make sure that future monks followed Cluniac customs. As well as his reforms, Odo is well known for his *vita* of Gerald of Aurillac, which became a model for the holy life a layman might follow without becoming a monk, yet acting as an important protector of monks.

# ODO OF DEUIL

(d. 1162). A monk of Saint-Denis who succeeded the famous Suger as abbot in 1152. Odo's reputation is due mainly to his chronicle of the unsuccessful Second Crusade. He served as chaplain to Louis VII on this expedition, and his *De profectione Ludovici VII in orientem* is a firsthand account of events from the time Louis took the cross in 1146 until he sailed from Adalia to Antioch in March 1148.

# OGIER LE DANOIS

. *See CHEVALERIE OGIER*

# OLORON-SAINTE-MARIE

. The exterior of the church of Sainte-Croix (begun ca. 1070) in Oloron-Sainte-Marie (Pyrénées-Atlantiques) is disappointing: the defensive-looking tower is heavy, the walls and chevet visibly remodeled, and the doorway a ruin. The Romanesque interior, however, is intact: nave of three bays with side aisles, short transept, apse, and two

apsidal chapels. Notable are the octagonal cupola, ribbed in a stellate pattern, and the rich carving of the sanctuary capitals.

The former cathedral of Sainte-Marie (begun ca. 1102) is essentially Gothic: the nave and side aisles are 13th-century; the pentagonal choir, ambulatory, and five radiating chapels were reconstructed in the 14th. The iconography of the celebrated sculpture of the Romanesque portal has been variously interpreted. Remarkable are the marble Deposition of the tympanum, the chained captives of the trumeau, and the wealth of contemporary and anecdotal detail (musical instruments, daily occupations, culinary customs) in the images of the archivolts.

# ORBAIS

**.** The Benedictine abbey of Saint-Pierre, Orbais (Marne), was founded in the later 7th century by St. Réole, archbishop of Reims. Construction of the present church was inaugurated ca. 1165, and the initial project, which realized the five radiating chapels and hemicycle piers, may have envisioned a four-story elevation influenced by Laon and Noyon. Modified into a three-story scheme during the second campaign, ca. 1195, the straight bays and upper levels of the choir were indebted primarily to Saint-Remi, Reims, and the new work at Soissons cathedral. The bar tracery of the clerestory windows of the nave, of which only a single bay remains, was adopted ca. 1220 soon after its appearance at the cathedral of Reims. Although not an innovative structure, Orbais reflects the contemporary developments in northern France, and its combination of such features as the linkage of triforium and clerestory and bar tracery anticipate later compositions of the Rayonnant period of Gothic architecture.

# ORCIVAL

. The 12th-century pilgrimage church of Notre-Dame at Orcival (Puy-de-Dôme) was constructed in a single campaign out of grey volcanic rock and is distinguished by its austerity and gravity. The church lies at the foot of a hill that constrains it on the west side. As a result, the primary portal is on the south side of the church and the nave is shorter than it should have been in proportion to the rest of the building. Crossed by a transept, it has a semicircular chevet and an ambulatory with four radiating chapels and is preceded by a narthex. Three diaphragm arches support a square cupola over the crossing. A crypt extends beneath the sanctuary.

Orcival (Puy-de-Dôme), south flank, 12th century. *Photograph courtesy of Whitney S.Stoddard.*

Almost every column in the church is crowned by a foliate capital. A noteworthy exception depicts a usurer tormented by demons. The church houses a celebrated Virgin reliquary in silver-gilt wood (12th c.).

# ORDERIC VITALIS

(d. ca. 1142). A monk of mixed Anglo-Norman parentage, Orderic Vitalis joined the monastery of Saint-Évroult, in Normandy, ca. 1085. The other monks found his Saxon name, Orderic, barbaric and renamed him Vitalis. His fame is due to his *Historia ecclesiastica*. This work covers the history of Normandy, England, and northern France from the late 11th century to 1141 and is one of the best sources of information on Anglo-Norman society.

Chibnall, Marjorie. *The World of Orderic Vitalis.* Oxford: Clarendon, 1984.

# ORESME, NICOLE

(ca. 1320/25–1382). A writer known mainly for his mathematical, scientific, and economic treatises and for his vernacular translations of Aristotle. Educated in arts and theology at the Collège de Navarre in Paris, Oresme was in 1356 appointed its grand master. During this period, his long association with the royal family began; he may have been tutor of John II's son, the future Charles V.Partly because of his royal connections, Oresme obtained church offices, becoming canon at Rouen (1362), canon at the Sainte-Chapelle (1363), dean of the cathedral of Rouen (1364), and bishop of Lisieux (1377).

Oresme's writings demonstrate his wide learning. His mathematical and scientific works, such as *De proportionibus proportionum, De configurationibus qualitatum et motuum,* and *De commensurabilitate vel incommensurabilitate motuum celi,* are important for their treatment of fractional exponents, their graphic representation of mathematical functions, and their sophisticated discussions of mechanics and astronomy. Oresme also used his learning, in such treatises as *Contra judiciarios astronomos, Livre de divinacions,* and *De causis mirabilium,* to attack the "misuse" of science, especially by the astrologers.

Certain of Oresme's works were written explicitly for the royal family. His economic treatise, *De mutationibus monetarum,* was composed during the 1350s for John II. In the late 1360s, Charles V asked Oresme to translate the Latin versions of four Aristotelian texts, the *Ethics,* the *Politics,* the pseudo-Aristotelian *Economics,* and *De caelo et mundo.* Oresme's vernacular translations helped to create a flexible French prose and to expand the French vocabulary, introducing as many as 1,000 new words.

Oresme has often been seen as anticipating modernity: in certain ways, his astronomy foreshadows Copernicus, Galileo, and Kepler, and his mathematics Descartes; his economics may anticipate Gresham's Law. But Oresme is perhaps most impressive in his ability to summarize and synthesize logically and intelligently, all the while advancing the important theories of his age.

# ORGANUM

. During the 12th century, improvised and composed or notated vocal polyphonic music began to take on a distinct stylistic change that ultimately divided it into two types. In discant, one or more parts were added mostly note-against-note to a plainchant melody, possibly moving in parallel motion but often in contrary motion with it; in organum, one part embellished with many notes each note of the plainchant, thus slowing it down considerably and making it, at its most ornate, unrecognizable. The limitation to which organum, described as an "infinitely flexible" art, was subject was that there could be but one performer of the added part, and therefore it would have been impossible to coordinate adequately between two or more singers. Organum was an almost perfect medium for virtuoso solo singing and improvising, in contrast to discant, in which interaction among singers (one to a part), a sense of ensemble, was the primary requirement. The singer of the plainchant played a role of support by sustaining each note of the chant until he coordinated the next one with the soloist, and organum that survives in notation is always in score so that the correlation of the two parts can more readily be seen.

These two different styles of polyphony, discant and organum, were nevertheless generically called "organum," and thus the polyphony for the Graduals, Alleluias, and Responsories of the Notre-Dame repertory are termed "organa," including the organa for three and four parts. Theorists of the 13th century who discussed "measurable music" *(musica mensurabilis)* divided this generic organum into three categories, most often discant, copula, and organum, the last being called *organum purum* or *organum in speciali*. These are not three types of pieces of music, however, but the three styles or musical textures that could be found within the polyphony for a Gradual, Alleluia, or Responsory. In time, genres became categorized as species of discant—e.g., the motet— and there seem to be such ties between copula and hocket that need further elucidation. The *Magnus liber organi* for the cathedral of Notre-Dame in Paris was, in its original form, apparently mostly in organum style, since its compiler, Léonin, was called *optimus*

*organista.* Léonin's successor Pérotin, called *optimus discantor,* possibly revised much of the *Magnus liber organi,* replacing many of the passages in organum style with discant; and he composed the two known *organa quadrupla,* which were for the Graduals of the Masses of Christmas and the feast of St. Stephen of the day following. These organa are in discant style, because the three embellishing parts are rhythmically and melodically coordinated in the manner of discant.

# ORIFLAMME

. A forked-tongue scarlet banner embroidered with golden flames, the Oriflamme was believed to have originated as Charlemagne's standard; it represented a flaming lance with which he could save the Holy Land from the Muslims. Hugh Capet later deposited it at the monastery of Saint-Denis, where it remained largely unheralded until Louis VI used it as his royal standard in battle in 1124 against Henry I of England. A century later, Louis IX received the Oriflamme from the abbot of Saint-Denis before going on his crusades. Although traditionally to be unfurled only in the face of enemies of Christianity, by the 14th and 15th centuries the Oriflamme had become the military standard of the French kings. It appeared frequently on the battlefield during the Hundred Years' War. It was present both at French victories, as at Mons-en-Pévèle in 1304 (where it was nearly destroyed), Cassel in 1328, and Roosebeke in 1382, and at defeats, like Crécy in 1346, Poitiers in 1356, and Agincourt in 1415. After 1418, the use of the Oriflamme diminished, and it was returned to the monastery of Saint-Denis.

# ORLÉANS

. Ancient city situated at the crossing of the Loire closest to the Seine, the place called Cenabum was the chief trading post of the ancient Carnutes. By the early 4th century, it had become the Roman Aurelium, the seat of a Christian bishop. Subjected to the full impact of the Germanic invasions because of its location, Orléans was defended against Attila in 451 by Aetius and by its bishop, St. Aignan. Clovis I took the town in 498 and convened the first Gallic council of the church there in 511. It became the capital of one of the Merovingian successor states, had an important colony of Syrians and Jews, and was the site of a series of church councils.

Talented bishops, such as Jonas and the poet Theodulf, made the Orléanais a center of the Carolingian renaissance, to which the oratory of Germigny-des-Prés still bears witness. The town's site on the Loire made Orléans vulnerable to Viking raids, against which it found defenders in the Robertian family. With the accession of Hugh Capet as king in 987, Orléans became a royal city and its bishop, Arnulf, proved one of the Capetians' chief supporters.

Under the first four Capetians, Orléans rivaled Paris as a center of royal government. Philip I (r. 1060–1108) established a royal mint there. The seat of a royal *prévôté* and then a *bailliage,* Orléans received a communal charter in 1137. A commercial crossroads, it witnessed an outbreak of heresy in 1022 and developed as a distinguished center for the study of law. Granted university status in 1306 by Pope Clement V, its school attracted distinguished scholars from all over Europe.

After 1344, Orléans became the apanage of a series of royal cadets, first Philip (d. 1375), the younger son of Philip VI, and then (after 1392) Louis, the brother of Charles VI. Until his assassination in 1407, Louis led the anti-Burgundian faction in French politics later known as the Armagnacs. His son Charles d'Orléans, the noted poet, was taken at Agincourt in 1415 and remained a captive in England until 1440. When the English attacked his lands, they were defended by his illegitimate half-brother Jean, comte de Dunois, and Jeanne d'Arc first achieved fame when the English had to raise the siege of Orléans in 1429. Charles d'Orléans lived to sire a son, Louis, who became king of France in 1498.

Orléans, Sainte-Croix, 10th-century
plan and current plan. After Nivet.

As a result of the Hundred Years' War and the Wars of Religion, little remains of Orléans' medieval architectural heritage. The cathedral of Sainte-Croix is almost entirely

a 17th- and 18th-century structure; only the churches of Saint-Pierre (12th-13th c.) and Saint-Aignan (15th c.) retain their medieval character.

# ORLÉANS CAMPAIGN

**.** The English defeat at Orléans marks the decisive campaign of the Hundred Years' War. After their victory at Verneuil in 1424, English armies pushed steadily southward from Normandy and subdued Maine by 1428. In October 1428, the earl of Salisbury secured bridgeheads across the Loire above and below the city of Orléans, beginning a siege that threatened Valois control of the Loire Valley. Salisbury was killed in November but was quickly replaced by Suffolk and Talbot. French failure to cut off an English supply train at the Battle of the Herrings, February 12,1429, seemed to confirm the doom of the Valois citadel.

Jean de Dunois, in command of the garrison, contemplated surrender, but a relief force led by Jeanne d'Arc entered the city on April 29, restoring both supplies and courage. A week later, the French counterattacked and the English withdrew in panic. Revitalized Valois forces inflicted a major defeat on English arms at Patay, June 18, 1429, and, emboldened by this success, Charles VII traveled to Reims in July for the coronation that confirmed his title. The failed seige, heroic defense, and brilliant counterattack proved to be the turning point of the war. After Orléans, the English remained permanently on the defensive.

# OURSCAMP

. The Cistercian abbey of Ourscamp (Oise) is one of the largest monastic complexes remaining in northeastern France. Founded in 1129 by Simon de Vermandois, bishop of Noyon, the abbey prospered from its first years and became a well-known foundation. Four bishops of Noyon were buried in the abbey church. Ourscamp founded two daughter houses, Beaupré and Froidmont, and accepted a third, Mortemer, when it affiliated with the Cistercian order. The monastery now presents an imposing façade with two monumental 18th-century wings, which conceal behind them the ruins of the medieval church.

The first small church at the site was dedicated in 1134. Beginning in 1154, this modest structure was replaced by a much larger church. After the Revolution, most of the second church was destroyed, but the entrance bay and the east wall of the transept survive. The remains indicate that the building had a two-story elevation with ribbed vaults. Drawings made of the abbey prior to its demolition indicate that the vaults were supported by flying buttresses; one such buttress survives encased in later masonry at the west end of the church on the north side. The architectural details indicate that, although the church was not consecrated until 1201, most of the structure was erected by the mid-1160s. The flying buttresses were integral to the design from the outset.

In ca. 1234, the eastern end of the church was replaced by a new choir with ambulatory and radiating chapels erected in a simplified version of the Rayonnant style. Although the new choir retained the two-story elevation of the nave, and matched the height of the earlier vaults of the 12th-century church to the west, its forms were much lighter and more delicate. Large windows in the clerestory and in the radiating chapels once flooded the new chevet with light. The Rayonnant choir was deliberately transformed into a picturesque ruin in the mid-19th century by the removal of the outer chapel walls and the webbing of the rib vaults.

# OUTREMEUSE, JEAN D'

(1338–1400). Notary and master historian of Liège, Jean has left its story in three distinct versions: a relatively short and sober *Chronique en bref,* which may constitute his notes for the more extensive works; a highly romanticized, unfinished poetic text, the *Geste de Liège,* in the form of a chanson de geste (some 53,000 Alexandrine lines extant!); and the three-volume *Myreur des histors* in prose. The latter may originally have been projected for four volumes. His *remaniement* of the chanson de geste *Ogier le Danois* in four books has been lost. Also in four books, his immense lapidary, the *Trésorier de philosophie naturelle des pierres précieuses,* contains practical information on cutting and polishing gems, as well as descriptions in alphabetical order of 256 stones. The French version of Jean de Mandeville's *Voyages* has been incorrectly attributed to Jean d'Outremeuse.

# OVID, INFLUENCE OF

. When the name of the sophisticated Roman poet of the Augustan age is mentioned in conjunction with medieval France, most scholars think of the *Ovide moralisé,* a text from the first half of the 14th century. In fact, Ovid's works—from the mainly mythological miracles narrated in the *Metamorphoses* to the early erotic elegiacs—were copied, imitated, glossed, and interpreted throughout the Middle Ages. While the 12th century is often referred to as an Ovidian era *(aetas Ovidiana)* the majority of the principal surviving Ovid manuscripts were copied from the 9th to the 11th century. Dozens of *Metamorphoses* manuscripts with commentaries, however, survive from the 12th and 13th centuries.

The prodigious influence of Ovid as a model in 12th-century imaginative literature is obvious in troubadour, Goliardic, and Latin school verse; in the early Romances of Antiquity; and in the works of Chrétien de Troyes (who himself claims to have translated the *Ars amatoria*) and other French romances; and it can be perceived in minor works like the Latin *Love-Council of Remiremont (Veris in temporibus sub Aprilis idibus),* a

12th-century poetical debate, and the *De vetula,* a pseudo-Ovidian tale. More specifically, it is through complex love metaphors that Ovid's presence may be gauged in narratives like the Old French *Roman d'Énéas,* an anonymous, free mid-12th-century adaptation of Virgil's *Aeneid.* In Chrétien de Troyes's *Cligés,* both the psychological penetration of the extended love analyses and the irony derive from Ovid's elegiac poems. The same holds true for a poignant text like Marie de France's *Guigemar,* one of her brief *lais* that is unquestionably suffused with Ovidian imagery.

Ovid's daringly original poetry, at once cosmological in scope and trivial in grasp, dominates western vernacular tradition. For Chaucer, he was "Venus' Clerk"; the notion of romantic love, which arises from the medieval idea of courtly love, goes back in large part to the Roman poet's conception of the mutually transforming power of this human emotion. Ancient Ovidian stories, such as those of Pyramus and Thisbe, Narcissus, and Philomela, help to establish the new narrative medieval genre in the vernacular: they were adapted into Old French, then appeared in German, Dutch, Italian, and early English versions. The vogue continued into Renaissance art and poetry.

While reworkings of Ovid's multifaceted *Metamorphoses* began before the Carolingian period, the most ambitious and elaborate treatment is found in two anonymous French translations, which were then vigorously amplified into Christian exegetical moralization, the *Ovide moralisé.* This 72,000-line poem, with its complex web of allegorical interpretation, may be said to attempt a reconciliation of the *Metamorphoses* with orthodox Christian doctrine. It is in this special dress that Ovid reached Boccaccio, Chaucer, Gower, Christine de Pizan, and numerous other later poets. Indeed, Pierre Bersuire, one of Ovid's translators (from the Old French back into Latin), calls the *Metamorphoses* a bible of pagan gods.

## OVIDE MORALISÉ

. A poem of some 72,000 lines in octosyllabic couplets, composed between 1316 and 1328 by an anonymous cleric, probably a Franciscan. The language suggests that the writer was of Burgundian origin. The poem survives in nineteen manuscripts, one of which contains only a fragment.

The *Ovide moralist* is a translation and paraphrase of Ovid's *Metamorphoses,* augmented by extensive commentary on the Ovidian text. The commentary offers moral, allegorical, and theological interpretations of Ovid's tales. Each tale of the *Metamorphoses* is translated and then expounded, the division between tale and exposition usually signaled by an interjection like "Now I would like briefly to expound the meaning of this fable." The expositions are rarely brief, however: they are typically as long as the paraphrases of the Ovidian narratives themselves. Plainly, the exegetical function takes precedence. The *Ovide moralisé* in effect presents a vernacular synthesis

of sacred and secular exegetical traditions. The sources of the poem, aside from the *Metamorphoses,* are the Bible, biblical commentary, Ovidian commentary of the 12th and 13th centuries (e.g., the allegorical commentary by Arnulf of Orléans, the *Integumenta Ovidii by jean* de Garlande, and many anonymous glosses), Ovid's other works (Heroides, Fastes), the tradition of mythography from late antiquity and the earlier Middle Ages (Servius, Fulgentius, Hyginus, Vatican mythographers), as well as medieval Homeric lore *(Ilias Latina, De excidio Trojae historia).* The *Ovide moralisé* also incorporates French material: for the tale of Pyramus and Thisbe, the poet inserts a version in Norman French, which he acknowledges as the work of another; and for the tale of Philomela, he uses a version that he attributes to a "Chrestiiens li Gois," whom some scholars identify as Chrétien de Troyes.

There are many reasons for the popularity of this poem among medieval readers, not the least of which was the vernacular access that it gave to a tradition of classical learning. Later vernacular poets, among them Guillaume de Machaut, Eustache Deschamps, Geoffrey Chaucer, John Gower, and Christine de Pizan, derived mythographic information from this French poem. At least three French prose abridgments were made during the 15th century, including one printed by Colard Mansion of Bruges in 1484; another of these prose versions was translated into English prose by William Caxton in 1480. The *Ovide moralisé* also found a learned audience. The Benedictine monk Pierre Bersuire used it for the second redaction (1342) of his Latin prose *Ovidius moralizatus* (originally Book 15 of his *Reductium morale\* an important mythographic reference into the early 16th century. By any account, the *Ovide moralisé* is the most extensive and influential medieval French treatment of Ovid.

The poem's method of commentary is a mixture of learned exegetical tradition and popular didacticism. The *Ovide moralisé* is most indebted to learned tradition in its allegorical approach to pagan myth: since late antiquity, Neoplatonist exegetes had interpreted mythical or fabulous narratives as allegorical "covers" for moral or philosophical truths. The *Ovide moralisé* combines such moral readings with theological interpretations of Ovid's text, discovering signs and symbols of Christian history and spirituality in Ovid's text. The poet never implies that Ovid himself was a Christian. Rather, he exploits the Pauline doctrine that "all that is written is for our instruction." He suggests that it is God who puts divine meaning in all writing, that Ovid told the stories, and that a good and inspired exegete like himself can discover the moral and spiritual profit that these stories contain. Thus, for example, the story of Phaeton (*Metamorphoses* 2.1–328) is treated as follows. First is the narrative itself, with some amplification of details; then a historical explanation of the Phaeton myth interpreted as the memory of a summer heat that devastated Ethiopia; then a euhemeristic explanation of Phaeton himself as an astronomer whose writings were destroyed and who threw himself off a high mountain. The fall of Phaeton is then compared with that of Lucifer, so that the Phaeton myth is read as moral advice against the dangers of pride in great undertakings. But the interpretation shifts to a theological theme. The palace of the sun is the throne of glory, where the holy Trinity sits. The sun is Christ; the chariot represents Christian doctrine; the horses are the Evangelists; the driver is the pope, who must not aspire to that office through ambition. Phaeton is also read as the Antichrist, who tries to corrupt humanity but is foiled by God.

In this pluralistic system of interpretation, we have the textual attitude of Neoplatonist mythography, where the text is seen as polyvalent, that is, capable of yielding up many meanings. The popularity of the *Ovide moralisé* lies largely in the poet's success in adapting the critical system of moral mythography to vernacular literary interests in Ovid's stories. The poem at once provides a comprehensive rendering of Ovidian lore and elaborates a moral justification for such pagan fictions.

# OVIDIAN TALES

. Throughout the Middle Ages, Ovid was read, glossed, imitated, and translated. It is not surprising that the 12th century, the *aetas Ovidiana,* should have produced, among other works based on Ovid, French versions of some of his *Metamorphoses.* Those that survive, all from the second half of the century, are *Piramus et Tisbé, Narcisse,* and *Philomena,* corresponding, respectively, to *Metamorphoses* 4.55–166, 3.339–512, and 6.426–74; in addition, a fragment of some 120 lines of a hitherto unknown 13th-century rival version of *Piramus* has recently been published. Like the related Romances of Antiquity, these brief stories tend to elaborate the feelings of the characters in long lyric and dramatic monologues and dialogues, based on Ovidian writings on love but having no equivalent in the immediate source. They tend to reduce the role of the pagan gods and (except for *Philomena)* the idea of metamorphosis. All are written in couplets of octosyllabic lines, though *Piramus* has some *vers libres* in the added monologues.

*Piramus,* which expands Ovid's 112 hexameters into some 920 lines as published, is preserved in three independent manuscripts as well as in the influential early 14th-century compilation *Ovide moralisé,* whose author used the poem instead of translating the metamorphosis himself. (Via a later prose version of the *Ovide moralisé,* the poem indirectly influenced several authors, including Shakespeare and Théophile de Viau.) Freely and with fine lyrical monologues and dialogues, Piramus retells the story of the young Babylonian lovers separated by their parents and imprisoned in neighboring houses; through a chink in the wall they converse and agree to meet by Ninus's tomb under a mulberry tree; Tisbé arrives first and is frightened away by a lion, which bloodies a veil she lets fall; Piramus draws the wrong conclusion, stabs himself, and dies in the arms of Tisbé, who commits suicide with the same sword. Ovid's metamorphosis of the mulberries' color is omitted. The French poem, unlike Ovid, motivates the separation of

the lovers by a quarrel between their fathers, a detail that probably underlies the *Romeo and Juliet* story.

*Narcisse,* just over 1,000 lines long and preserved in four manuscripts, develops Ovid's story of the youth who scorns the love of the nymph Echo and many others, one of whom prays that he himself may suffer unrequited love. Seeing his reflection in a pool, Narcisse falls in love with himself, wastes away, and dies. The French poem concentrates narratively and psychologically on the anonymous girl, giving her a name, Dané, and letting her take the place of Echo (whose role is reduced to echoing Narcisse's cries). Dané, like Tisbé, decides to die after Narcisse. This poem, too, is written in a richly rhetorical style, with far more emphasis on motivation than in Ovid's version.

In his prologue to *Cligés,* among other Ovidiana he claims to have written, Chrétien de Troyes mentions the subject of *Philomena.* This work appears to survive only in the *Ovide moralisé,* where it is attributed to "Chrestiiens li Gois." The story (1,468 lines), related with all Chrétien's psychological insight and technical skill, tells of the illicit love of King Tereus for Philomena (Philomela in Ovid), sister of his wife, Progné. Having persuaded their father, King Pandion, to let him take Philomena over the sea to visit her sister, Tereus rapes her and cuts out her tongue to prevent her accusations; she embroiders her story on a tapestry that she sends to Progné. The latter rescues Philomena, kills her own son, Itis, and serves his cooked body to her husband. When Tereus seeks to avenge himself, he is miraculously transformed into a hoopoe, Progné into a swallow, and Philomena into a nightingale. The story is reasonably close to Ovid but, again, much expanded, especially in the physical description of Philomena, in analysis of feelings, and in dialogue.

The three surviving tales and the *Piramus* fragment no doubt represent a small fraction of the production of such poems, reworkings of the *Metamorphoses* in the romance style of the 12th century.

# P

# PALEOGRAPHY AND MANUSCRIPTS

. Before the invention of the printing press and movable type in the 15th century, books were hand-produced by scribes trained to copy literary texts, documents, or both. The scribes in many cases would also add minor decoration consisting of running titles, penwork initials, and headings in red and other colors. In the most elaborate volumes, scribes were assisted by illuminators who executed intricate initials, borders, and miniatures and frequently used gold leaf for dramatic visual effect.

The format, script, decoration, and binding of manuscript books depended upon their date and place of origin as well as upon their function within society. Volumes intended for use by a community of monks in 9th-century Tours would differ significantly from those written for a university student in 13th-century Paris.

The disintegration of the Roman Empire in the West saw the rise of "national hands" across Europe. These hands, tied to geographical locations, gradually superseded the widely used Roman system of scripts. In Merovingian Gaul, the local scripts were derived ultimately from the later Roman cursive, or running hand, used for official documents, but with an admixture of letterforms from the more formal bookscripts also used in the Roman Empire.

Among the monastic or cathedral scriptoria (writing places) that produced a distinctive French national hand is the abbey of Luxeuil in Burgundy. Founded ca. 590 by the Irishman St. Columbanus, Luxeuil was one of the most influential centers of Merovingian culture in the 7th and 8th centuries; its scriptorium produced fine manuscript books in a spidery style of writing today termed "Luxeuil minuscule." The first illustration reproduces a leaf of a manuscript of St. Augustine's *Sermons* copied at Luxeuil in the second half of the 7th century (Beinecke 481, no. 2). The minuscule script retains many features of its cursive models: letters were often run together; the words and sentences were usually not distinguished by spaces or by punctuation. Luxeuil minuscule differed from Roman cursive, however, in that the sprawling loops of the earlier running script were replaced by neatly clubbed shafts on such letters as *b, d,* and *I;* the Roman cursive was subdued into a style of writing suitable for copying Latin manu script books. Other distinctive types of French national hands developed at the monasteries of Corbie and Laon and the convent at Chelles.

Latin translation of Aristotle for the university student in Paris, third quarter of the 13th century. Yale Medical Historical, MS 12, fol. 261. *Courtesy of Yale University.*

During the period of Charlemagne (r. 771–814), a new script evolved that is now called "Carolingian minuscule"; during the late 8th and the 9th centuries, it gradually superseded the local styles of writing throughout France. Although the precise origins of the script are still subject to debate, its development and eventual acceptance were related to cultural and historical phenomena affecting the production of manuscripts: the interest of Charlemagne and Alcuin, the abbot of Tours, in promoting Christianity; Charlemagne's commitment to the advancement of education and scholarship; the political advantage of employing a single script and model for books throughout the empire.

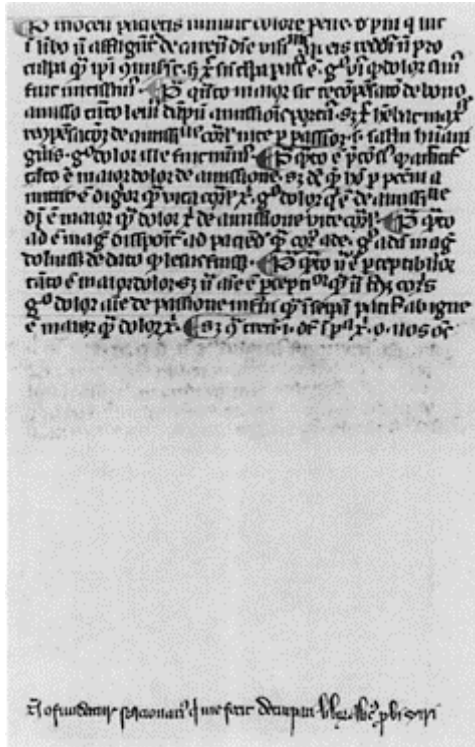
The second illustration (above left) reproduces a page from a manuscript containing the *Capitularies* of Charlemagne, of his son Louis the Pious, and of Charles the Bald (Beinecke 413). Produced in northeastern France ca. 873, it is an impressive example of well-developed Carolingian script and book production. The text and decoration are neatly arranged on the page, with broad margins and welldefined interlinear spaces; the decorative initial and the elegant capitals used for headings help the reader to focus attention on the beginning of the chapter. The script itself is easy to decipher, especially

when compared with Luxeuil minuscule: Carolingian letterforms, well proportioned and uniformly written, sit firmly on the text line; regular word division and clear punctuation enhance legibility. Whether the texts being copied were biblical, liturgical, or patristic, the standardization of graphic conventions and book production ensured that every Carolingian manuscript would be intelligible.

The Carolingian empire did not endure past the 9th century; yet Carolingian minuscule survived in France well into the 12th century, as it continued to be the preferred style of writing in monastic book production. The script, however, changed and developed over time, so that its overall appearance and individual letterforms were significantly altered in the 11th and 12th centuries. Illustration (bottom left) shows the late, transitional stage of Carolingian minuscule; Beinecke 414 is the second part of a two-volume Bible produced in Aquitaine or Limousin in the early 12th century. The script appears to be compressed laterally, so that letterforms are taller, less round, and more oval. Ascenders, as in the letters *b, d,* and *l,* have short horizontal finishing strokes added to their tops. Words are frequently abbreviated, so that more text is accommodated on each page. As in the earlier phase of Carolingian script, distinct portions of text are signaled by rows of calligraphic capitals. Fine polychrome initials are a hallmark of this final stage of Carolingian book production.

Before ca. 1200, monks in monasteries produced most of the manuscript books, transmitting texts from one generation of readers to the next; in the period ca. 1200–1500, book production shifted to professional workshops associated with wealthy patrons or to stationers who marketed university textbooks. In both instances, there was increasing demand for books in the vernacular languages as well as in Latin.

The university at Paris was a main center of textbook production throughout the later Middle Ages. As the university prospered, large numbers of students required texts for study. University books copied in Parisian workshops differed significantly from books written in monasteries in the preceding centuries; the layout, script, and method of production all changed to meet the needs of the students and teachers who used the books. Two 13th-century manuscripts from Paris illustrate the dramatic transformation of medieval books and the way that they were produced.

The works of Aristotle in Latin translation were standard texts in the university curriculum at Paris; after 1255, many were required reading. Illustration (opposite right) reproduces a fine Aristotle manuscript, attributed to Paris in the third quarter of the 13th century (Yale Medical Historical 12). The text of Aristotle occupies a narrowly defined central space; the remainder of each leaf has ample margins ready to receive notes and diagrams. Attractive historiated initials begin each treatise; paragraph marks in red or blue denote internal divisions. The text is written in a Gothic bookhand that developed from the late Carolingian minuscule. The lateral compression noted earlier in the 12th century (bottom left) is now pronounced, with letterforms often touching and joined together. The fusion, or "biting," of letters is characteristic of formal Gothic script. The oval shape of such letters as *o* has become more angu


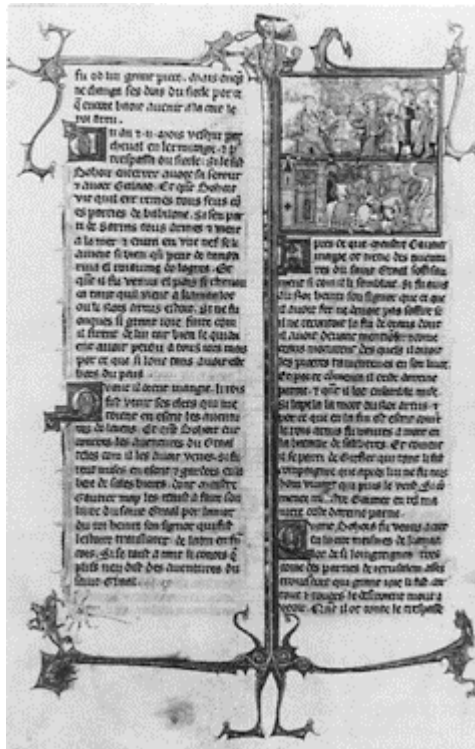
Pecia manuscript of St. Thomas
Aquinas with scribe's note, Paris, ca.
1270. Yale MS 207, fol. 46. *Courtesy
of Beinecke Library, Yale University.*

lar and compact. The annotations surrounding the text were written by at least two
individuals in less formal styles of Gothic writing that are characterized by cursive
elements and an abundance of abbreviations; both of these features allowed the script to
be written more rapidly and permitted the commentary to be squashed into the margins
close to the relevant passage being discussed.

Because of the increased demand for inexpensive university books in 13th-century
Paris, special bookdealers, or university stationers, developed a system of mass
production for selected works. In the pecia, or piece, system of transcribing manuscripts,
the stationer's "fair" copy (exemplar) of the text was divided into numbered pieces, each
of which could be rented out to individuals for copying. The system helped to guarantee
accuracy, since every new manuscript was made directly from the stationer's exemplar,
and accelerated book production, since several scholars or scribes could copy from the
one complete work at the same time.

Among the many works copied and marketed according to the *pecia* system were
those of St. Thomas Aquinas (ca. 1224–1274), a Dominican friar who was master of

theology at the University of Paris. Aquinas's commentary on Peter Lombard's *Sentences* was composed ca. 1254–56 but was probably revised later in his life. On page 693 is a portion of Aquinas's commentary from a manuscript of the third book, produced in Paris ca. 1270 (Beinecke 207). Recent scholarship has proven that this manuscript was transcribed from an exemplar of the stationer William of Sens, who lived and worked on the rue Saint-Jacques; this shop, conveniently located down the street from the Dominican house of studies, assumed a significant role in the dissemination of Aquinas's works. Beinecke 207 bears internal evidence that it was a product of the *pecia* system. The lower edges of some leaves contain notes where the scribe recorded the number of the piece just completed; most of these numbers, however, were trimmed when the volume was bound or rebound. In addition, the manuscript contains a remarkable statement by the scribe in the lower margin, just below an unsightly erasure: *Nota confundatur stacionarius qui me fecit deturpari librum alicuius probi uiri* ("Take note! Confound the stationer who made me disfigure the book of some worthy man.")



Arthurian romances in Gothic script (Vulgate version), late 13th century. Yale MS 229, fol. 272v. *Courtesy of Beinecke Library, Yale University.*

The scribe blamed the stationer for the sloppy appearance of the erasure and superimposed corrections.

In 13th-century Paris, the everyday spoken language was French rather than the Latin language used in the Bible, liturgical texts, and philosophical discourse. Although it is still debated at what precise time vernacular language was regularly used, it is clear that secular texts were being composed in French and transcribed and illuminated in manuscript books by the mid-13th century. It was during the later Middle Ages that a wealthy and literate lay audience, fascinated by the Arthurian and other romances, created a demand for deluxe manuscripts of vernacular prose and poetry.

A splendidly illuminated volume of the Arthurian romances, produced in France in the late 13th century, graphically illustrates the type of expensive book produced by professional scribes and artists in a secular context (below left; Beinecke 229). The French text was copied in an elegant Gothic bookhand, with several small decorative initials to demarcate text divisions. What is most remarkable about this genre of manuscripts is the number of beautifully painted pictures throughout the volume that visually re-

French translation of Augustine's *De civitate Dei (The City of God),* ca. 1400. Yale MS 215, fol. 145. *Courtesy of Beinecke Library, Yale University.*

create the narrative account. For readers already familiar with the text, it would be possible to follow the story through the images without actually reading the prose. The Beinecke manuscript alone contains more than 160 miniatures and historiated initials.

By the mid-14th century, there was a great demand for manuscript books of Latin texts that had been translated into French. The audience for these volumes comprised primarily members of the court, aristocrats who could afford elegantly written and illuminated texts of classical and medieval authors. This genre of French manuscript was generally produced in folio format on parchment of excellent quality and transcribed in distinctive styles of Gothic script characterized by a variety of cursive letterforms. Because of the combination of letterforms from more formal Gothic scripts (as illustrated in Plate 6) with cursive features derived from the chancery, the spiky styles of French Gothic script are often termed "bastard" *(bâtarde)* or "hybrid."

Among the many Latin texts rendered into French was St. Augustine's monumental *De civitate Dei.* Beinecke 215 (opposite right) contains the complete work in four volumes, originally bound as two. Produced in a Parisian workshop ca. 1415, it is illustrative of manuscripts popu lar among the French nobility during the 14th and 15th

centuries. The spiky style of Gothic script seen here is characterized by decorative shading of such letters as the tall s and loops on *d, h,* and *I.*

The tradition of transcribing and illuminating vernacular literary manuscripts flourished throughout 15th-century France to the extent that hundreds of copies still survive today of the popular French works, such as the *Roman de la Rose* and the texts of Christine de Pizan. Many of these manuscripts were copied in an elegant grade of *bâtarde* script with fewer cursive features, a style associated with deluxe book production of the Burgundian court and often termed *lettre bourguignonne.* The overall appearance of the script is calligraphic, though it exhibits some of the prickly aspects of Gothic cursive script.

Beinecke 226 (opposite) is a beautifully illuminated copy of Julius Caesar's *Commentaries,* translated into French by Jean de Chesne. The script, regular and relatively devoid of loops on tall letters, retains many features of the formal Gothic bookhand but also incorporates selected cursive features. The manuscript is a large luxury book containing ten half-page and three smaller miniatures. Lettre *bourguignonne,* as illustrated here, survived into the 16th century as a popular choice for deluxe manuscripts.

# PAMIERS, STATUTES OF

. During the Albigensian Crusade, in late November 1212, Simon de Montfort, having become viscount of Carcassonne, held an assembly of prelates and barons at Pamiers for the purpose of establishing his rule and the basis of authority in his new domains. The results, forty-six articles and a brief rider, are known as the Statutes of Pamiers. The statutes aim primarily to accomplish three goals: to strengthen the church against heresy;

to reconstitute strict feudal obligations between Simon and his vassals; to apply to all persons the testamentary practices of the custom of Paris *(usus Francie circa Parisius),* which favored the eldest heir and eliminated the southern custom of joint succession or equal division, especially of noble fiefs upon whose service Simon relied. The Statutes of Pamiers, particularly their most radical provisions transplanting into the Midi elements of northern customary law, did not survive the Montforts. Except for the obligations of certain noble families, they were abandoned by Louis IX and Alphonse of Poitiers.

# PARAY-LE-MONIAL

. Paray-le-Monial (Saône-et-Loire) is a Romanesque priory belonging to Cluny III, the mother church of the Cluniac order, and located some 13 miles west of Cluny. The design of Paray-le-Monial is based directly on that of Cluny III, yet the sizes are vastly different: Cluny was originally 609 feet long and 97 feet high, with nave, four aisles, two aisleless transepts, choir, and five chapels radiating from an ambulatory, while Paray-le-Monial is 206 feet long and 71 feet high, with nave, two aisles, one aisleless transept, and three radiating chapels.

Paray-le-Monial, abbey church, plan,
early 12th century. After Losowska.

Paray-le-Monial (Saône-
et-Loire), Notre-Dame,
nave. *Photograph
courtesy of Whitney
S.Stoddard.*

The interior spaces of the two monuments are similar: tall, narrow naves capped by pointed barrel vaults and strengthened by pointed transverse arches. The interior elevation of Paray-le-Monial consists of a pointed nave arcade, a blind triforium of three recessed arches separated by fluted pilasters, and a clerestory with three windows framed by arches. The precocious nature of the structure is stated by the clerestory and pointed barrel vaults supported by thick walls but no flying buttresses.

The unusual feature of Paray-le-Monial, as well as of Cluny, is the use of Roman decorative elements, fluted pilasters, that appear on nave piers capped by Corinthiantype capitals, which also decorate the triforium and clerestory. This use of the classical order with base, shaft, and capital is based on Roman monuments, such as the gates at Autun. In spite of this influence, the Romanesque master mason violated the Roman classical proportions by attenuating the pilaster, especially on the nave arcade.

Light plays a strong role in the nave of Paray-le-Monial by the clerestory and more dramatically in the east end, with light admitted in four vertical levels and four planes in space. Light penetrates the choir in three windows in

Paray-le-Monial, Notre-Dame, ambulatory. *Photograph courtesy of Whitney S.Stoddard.*

the upper wall, separating the forechoir from the choir, in the nine clerestory windows beneath the semidome, in the high windows of the ambulatory, and in the five low windows in each of the three radiating chapels.

The west towers and narthex of Paray-le-Monial are an earlier, smaller campaign than the church proper, with the south tower earlier than the north one. The west end dates from the second half of the 11th century; the church proper was constructed in the early decades of the 12th.

Sculpture at Paray-le-Monial consists of floral capitals throughout the church, and geometric and abstract ornament on the two transept portals.

# *PARENS SCIENTIARUM*

. This papal bull, issued in 1231 by Gregory IX, was a major step in establishing the independence of the corporation of masters vis-à-vis the bishop of Paris and the chancellor of the cathedral school of Notre-Dame in Paris. After earlier papal statements giving support to the masters in regulating the lives and duties of masters and students, *Parens scientiarum* made much clearer the freedom and right to self-regulation of the corporation of masters. The chancellor was obliged to bestow the license to teach *(licentia docendi)* upon anyone the masters judged worthy; the masters' right to regulation of teaching conditions, clothing, and the like was recognized, and the right to suspend classes in certain situations was confirmed. The publication of *Parens scientiarum* followed the return to Paris of masters and students after the cessation of classes and scattering of students and masters after riots in 1229.

# *PARIAGE.*

When two lords agreed to share the administration of certain lands belonging to one of them, and to divide the nonlanded revenues equally, they drew up a contract called variously in Latin a *conventio, pactio,* or *pariagium.* The party furnishing the land often simply "associated" *(associare)* the other over his land. In either case, the terms of association were stated with precision. *Pariages* were common from ca. 1150 to ca. 1300 and are best known in the royal domain, Champagne, Burgundy, and the Midi.

*Pariages* could serve several purposes, but we know most about the agreements between powerful secular lords and ecclesiastics, who usually furnished the land and preserved the contracts in their archives. Economic interests prevailed when a monastery desired to develop raw land into new villages by attracting colonists more willing to settle under an enlightened secular lord than a monastic one. The Cistercians often resorted to *pariages* in the 13th century when they were unable to find sufficient lay converts to work their lands. Where villages already were shared by two lords, *pariages* simplified the administration under a single mayor responsible to both parties.

*Pariages* also served political and military purposes. Louis VII and Philip Augustus extended royal influence southward by *pariages,* and Philip IV consolidated his grip on the Midi by forcing bishops and abbots to accept *pariages,* whereby they created common courts and jointly appointed judges. The modern principality of Andorra continues to embody the medieval *pariage* established in 1278 by the count of Foix and

bishop of Urgel to end their longstanding dispute; today, their successors, the president of France and the bishop of Urgel, share the administration of that principality.

# PARIS

. The development of the actual site of Paris began with the Celtic settlement on the island in the River Seine known today as the Île-de-la-Cité. The Roman city, known as Lutetia or Lutece, grew up on the left bank, where vestiges of the Roman baths and arena can still be seen. The site, a large natural basin ringed by hills and close to the confluence of the Marne, the Bièvre, and, farther downstream, the Oise, was on one of the major north-south Roman roads. Lutece was a major market center for agricultural goods grown in the swampy lowlands, the *marais,* running in an arc around the north side along the old course of the Seine.

The late-antique city consisted of three parts, the Île-de-la-Cité, fortified to protect the commercial docks; the old Roman quarter on the left bank, where the forum was enclosed behind protective walls; and the newly established commercial quarter on the right bank, also behind walls. Bridges connected the three sections. Archaeological finds indicate that the Île-de-la-Cité may have been divided even then between the religious sector to the east and the seat of secular power, site of later royal palaces, to the west. Christianity reached Lutece in the 3rd century with the arrival of Denis, the Apostle of Gaul and first bishop of Paris. Tradition and practice suggest the earliest church was outside the Roman city, perhaps on the site of the first Christian cemetery, later Saint-Marcel. The discovery in 1964 during excavations in front of the present cathedral of Notre-Dame of the bottom of a glass cup with the chi-rho indicates the presence of a church on the site by ca. 360, about the same time that the Roman name, Lutece, was replaced by the place-name Paris, derived from the old Celtic tribe of the Parisi.

By the early 6th century, four churches made up the cathedral group, including the basilica of Saint-Étienne, whose western foundations have been excavated under the square in front of Notre-Dame, the baptistery of Saint-Jean-le-Ronde (destroyed) to the north of Saint-Étienne, the church of Saint-Denis-du-Pas (destroyed) east of the

Paris (Seine), plan of early medieval
sites. After Périn et al.

present cathedral, and Notre-Dame under the chevet of the present cathedral. The
foundations of Saint-Étienne are generally said to be 6th-century, although a late 4th-
century date has recently been proposed because of the five-aisled plan and its
resemblance to similar plans found in early Christian Rome. Excavated marble columns
and a capital suggest a late 4th- or early 5th-century date, with possible Theodosian
models in Constantinople and Milan.

The most important event in the early history of Paris was the arrival of Clovis and the
Franks. Beginning shortly after his accession to the kingship in 481 or 482, Clovis began
systematically moving the power base of the Franks from Tournai to the south, first only
as far as the River Loire but later as far as Bordeaux and Toulouse. In 507 or 508, Clovis
was named consul by the emperor Anastasius and established his capital at Paris. The
first king of the Franks to adopt Roman Christianity, Clovis set about building a church to
serve as the royal necropolis. Dedicated to the Holy Apostles, in imitation of
Constantine's burial church in Constantinople, the church later came to be known as
Sainte-Geneviève, after its most famous interee. Clovis died and was buried in the Holy
Apostles in 511; his daughter Clotilde was buried at his side in 531. His queen, Clotilde,
died at Tours in 544 but was buried in Paris at the side of her husband. Of this early

church we have no trace, nor were any tombs of the royal family positively identified among the many investigated during the destruction of Sainte-Geneviève in the 19th century.

The situation is similar for the other Merovingian structures known either from texts or from archaeological evidence. The Musée Carnavalet survey lists some thirty-five to thirty-eight Merovingian religious sites identified within the limits of the modern city of Paris; yet because of later rebuilding, not one has been fully recovered in plan. We know, however, that Saint-Étienne was a five-aisled building some 118 feet wide with a probable length of 165–200 feet extending under the nave of the present cathedral of Notre-Dame. Saint-Étienne was largely rebuilt in the 6th century, reusing marble capitals and columns possibly from an earlier structure on the site.

A similar situation exists for the abbey of Saint-Vincent/ Sainte-Croix, now Saint-Germain-des-Prés. Founded by Childebert after his 542 campaign in Spain, the church was dedicated December 23, 558, the day the king died. St. Germain, bishop of Paris, was buried there in 576. Excavations in the 19th century recovered Merovingian sarcophagi on the site, marble capital and column fragments, and the foundations of apsidal chapels in the end walls of the transept arms. Excavations in the 1960s demonstrated that the present nave, aisles, and transept were built directly on the 6th-century foundations. Of the original chevet plan, we have no trace. Most of the other Merovingian churches are known only from documents or from archaeological finds, usually sarcophagi and burial goods, occasionally architectural fragments.

The 6th century saw the establishment of most of the important Parisian abbeys, which included, in addition to Holy Apostles/Sainte-Geneviève and Saint-Vincent/Saint-Germain-des-Prés, Saint-Marcel, Saint-Martin (later Saint-Martin-des-Champs), and the church of Saint-Denis, now Saint-Pierre de Montmartre. In addition, the oldest parishes were all established in the course of the 6th, 7th, and early 8th centuries, as were a number of churches beyond the walls. The importance of the city as a trade center is marked by the establishment of the Lendit fair under Dagobert I (d. 638). It is estimated that the population of Paris was 20,000–30,000 by the 8th century. In the later 8th century, the rise of the Carolingians marked a shift in the center of power. The future of Neustria and of the Paris region lay with the Robertian family of counts, who became the principal representatives of public authority under the 9th-century Carolingians.

Settlements on major waterways were particularly vulnerable to Viking attacks in the 9th century, and Paris was victimized more than once. Eudes, the Robertian count of Paris, won great prestige for his vigorous defense in 885–86, when the Vikings failed to take Paris despite a long siege. Soon thereafter, Eudes won elevation to the kingship, and his family remained thereafter the principal rival of the Carolingians in the West Frankish kingdom, gaining the throne permanently with the accession of Hugh Capet in 987.

The rise of the new Capetian monarchy, while it returned the political center of gravity to Neustria, did not immediately bring renewed importance to Paris. The ruling family had several centers of power in the Île-de-France, and Robert II (d. 1031), who was preoccupied with the conquest of Burgundy, made Orléans his principal base. Even within Paris, the Capetians had rivals. Only in the last years of the reign of Henry I (d. 1060) does the charter evidence suggest that Paris was becoming the center of the royal estates and religious foundations. Yet Henry and his son Philip I had their authority further circumscribed by the rise of powerful castellans who held important strongholds

in the vicinity of Paris and chose not to reside in Paris for long periods. Influential monasteries and the area's commercial importance probably had more to do with the growth of Paris in the 11th century than did the monarchy. The shift of power under the Carolingians and the difficulties of recovery in the early years of Capetian rule are marked by the absence of major building between the late 7th and early 12th centuries. The texts mention important repairs and some rebuilding after the Viking devastation, but there is little indication of either new foundations or new building activity until the reconstruction of the nave of Saint-Germain-des-Prés in the first half of the 11th century, which is the only surviving example of Romanesque architecture in Paris.

The pacification of the Île-de-France by Louis VI and the greater profitability of the royal domain increased the prestige and effectiveness of royal government and with it the importance of Paris, especially after Louis VI took up residence there ca. 1130. The presence of royal government became an important factor in the city's expansion during the 12th century. The religious establishments, with their increasingly important schools and the continuing expansion of trade, maintained their demographic impact. The schools and the retail establishments that served them accounted for much of the growing population of the left bank, while the merchant community occupied the right bank, expanding rapidly beyond the limits of the old city. In addition, the Capetians found Paris a strategic point from which to check Angevin power to the west and the aspirations of the house of Champagne to the east. Under Louis VI (d. 1137) and during the long reigns of Louis VII (d. 1180) and Philip II Augustus (d. 1223), Paris experienced an unparalleled period of growth and expansion that far surpassed any previous epoch in the city's history. Indeed, the period sets the character of all future growth into the 19th century: rather than tear down and rebuild the old parts of the city, the tendency was always to expand in new directions, to build in new areas, and to push agriculture farther out. This policy is exemplified by Louis VII's grant of lands on the right bank to the order of Knights Templar, whose new "Temple" became their European headquarters and the center of their banking operations. From this time until the end of the 13th century, the royal treasury was housed in the Temple's keep. The round church, built ca. 1140, and the impressive keep were destroyed after the French Revolution.

Paris, Saint-Pierre de Montmartre,
plan. After Sauvegeot.

Although it was under Louis VI that the building boom in Paris began, little remains prior to the reign of Louis VII. The records and charters are filled with important royal

donations from Louis VI, such as the foundation in 1112 of Saint-Victor with William of Champeaux, one of the great teachers of his day, as its head, and the refoundation of Saint-Pierre de Montmartre as a house for nuns in 1134. Saint-Victor is destroyed; but Saint-Pierre de Montmartre, dedicated in 1147, survives in part.

Traditionally the site of at least one large non-Christian temple, Montmartre is also associated with the spot where St. Denis suffered martyrdom. A chapel dedicated to St. Denis no doubt existed on Montmartre by the 6th century. The property passed to Louis VI and his queen, Adelaide of Maurienne, in 1133 and was refounded as a community for nuns the following year. The nave was completed after the church's dedication in 1147, and the main apse was rebuilt ca. 1170, perhaps to increase the space around the burial site of Queen Adelaide, who had retired to the community in 1153 and was buried there in 1154. In 1435, the nuns were forced to abandon the convent, ruined by the Hundred Years' War.

The original plan of Saint-Pierre consisted of a fourbay nave, flanked by aisles, a slightly projecting transept, and a three-apse east end with a tower constructed above the bay preceding the apse on the north side. Despite the damages, rebuildings, and restorations, the original threestory elevation, including main arcades, subdivided and articulated openings into the roof space over the aisle vaults, and low clerestory windows, can still be seen in the eastern bays. Rib vaults were used in the transept and main-apse bays. The capitals of the church are of particular interest, beginning with the reused Merovingian marble columns and capitals against the west façade and in the main apse flanking the altar.

The oldest surviving part of the abbey church of Saint-Martin-des-Champs is the tower on the south side of the chevet, which dates probably from shortly after the abbey was given to Cluny in 1079, while the chevet itself is generally dated to the abbacy of Hugues I (1130–42). The plan of the chevet, the only surviving ambulatory and chapel scheme in Paris earlier than the chevet of Saint-Denis, is very complex and highly irregular, because the two rows of supports appear to have been aligned with each other without regard for the peripheral wall. This would also explain the extreme irregularity of the vaults. Many of the capitals appear to have been recut in the 19th century and are now noticeably smaller than the piers on which they sit. In style, these capitals have few counterparts in Parisian 12th-century sculpture, other than the second-story capitals in the chevet of Saint-Germain-des-Prés, which are much closer in date to 1150. The elevation of the hemicycle is only two-storied, with small but deeply splayed windows above the richly molded arcades. The broad woodroofed nave of Saint-Martin is probably contemporary to the only surviving monastic building on the site, the beautiful mid-13th-century refectory that now serves as the library for the Conservatoire des Arts et Métiers.

The peace and prosperity resulting from the efforts of Louis VI led to an increase in the number of monks at Saint-Germain-des-Prés, which in turn meant the need for a larger liturgical area. Coupled with the desire to remind the king of their illustrious history as a royal necropolis and recipient of royal patronage, especially in the face of the efforts of Abbot Suger at Saint-Denis, the monks commissioned the rebuilding of their chevet on a new and much larger plan with four straight bays and a hemicycle surrounded by aisles and ambulatory and a series of five radiating and four rectangular chapels. One of the most interesting features of the original design is the way that it highlighted the Merovingian marble shafts set in the center of each opening in the second story. This

deliberate, prominent reuse of Merovingian marbles parallels that at Saint-Pierre de Montmartre, Saint-Denis, and, if old accounts are trustworthy, Sainte-Geneviève and Saint-Marcel. It must have served to emphasize both the antiquity of the foundations and the continuity of their religious life.

The chevet of Saint-Germain-des-Prés is also noteworthy for the sensitive handling of the architectural elements that reflects the three distinctive spaces of the structure: chapels, ambulatory, and choir space. It should probably be understood as a reaction to the new chevet at Saint-Denis (dedicated in 1144), as well as a statement of the importance of Saint-Germain-des-Prés as a royal foundation and necropolis. The new chevet must have been finished by the mid-1150s, even though the solemn consecration was accomplished by Pope Alexander III only in the spring of 1163, by which time the new royal tombs for the Merovingian founders must have been placed in the new chevet. The new 12th-century chevet at Saint-Germaindes-Prés was accompanied by a new sculpted portal, the lintel and capitals of which are still in place, added to the old west tower.

1150s. Designed at prodigious scale, no doubt as a reflection of the prestige of the capital and the wealth of the cathedral chapter, the new church dwarfed the earlier cathedral group. The double-ambulatory scheme without radiating chapels, like the enormous length of the chevet east of the crossing, was clearly intended to surpass in size and scale any previous Romanesque or Gothic structure in the region. Perhaps it is this very size that caused construction of the east end to proceed slowly, although in an orderly fashion. The chevet was finished only after 1177, perhaps even after 1182, sometime after the nave had been begun. The original elevation marked a significant increase in height over any previous Gothic building, although there is evidence that it may not have been initially planned to reach the present height of nearly 100 feet. The elevation had four stories; the double side aisles and single aislewidth vaulted galleries above them were succeeded by round oculi filled with carved tracery that gave into the gallery roof space and, finally, clerestory windows. The prevailing architectural aesthetic is an expression of thinness without depth, of surface without mass, that is uniquely Parisian. In spite of the vast height of the new chevet, there is no evidence that the first builder intended to use flying buttresses to brace the upper structure against wind pressures. In fact, that may well explain the slowdown in construction just as the clerestory was reached.

However, flying buttresses were certainly part of the scheme devised by a second builder for the newly enlarged and expanded nave. And it is likely that it was this second builder who actually completed the main vaults of the chevet, which may have been beyond the capabilities of the first builder. The second builder increased the width of the nave over that of the chevet and made the wall both physically thinner and more open than had his predecessor. His scheme in fact depends on flying buttresses, the external bracing system that is the visual hallmark of Gothic cathedrals. Although the flying buttresses of the nave of Notre-Dame de Paris may not be the first examples, they are unquestionably the most influential, the ones that proved the efficacy of the system. By the time the nave was nearing completion in the late 1190s, flying buttresses had become standard features in the schemes of countless Gothic structures.

The west façade of Notre-Dame was undertaken ca. 1200 and may represent yet another aggrandizement of the earlier plan. It has long been recognized that not only was it started before the last bays of the nave were constructed but that it contains in the south, or Sainte-Anne, portal sculpture that was prepared for a west-façade scheme beginning in the 1150s but that was placed in the present façade only ca. 1210. The most famous sculptural feature of the façade, the gallery of kings—representations of the kings of France from Merovingian times to the early 13th century—may be a commemoration of the victory of Philip II at the Battle of Bouvines in 1214, after which he was known as "Augustus." Thus, the façade of Notre-Dame might equally be read as the triumphal arch of Philip Augustus.

The three sculpted portals of Notre-Dame were probably undertaken simultaneously. Although the sculpture was badly damaged during the French Revolution—all of the statue columns in the three portals and all of the kings in the gallery were destroyed— enough original material remains for us to determine that the figure of Christ and one of the flanking angels in the tympanum of the center portal had to be replaced ca. 1230. While work was still continuing on the towers of the west façade, work began again in the chevet and nave, ca. 1225/30. The decision was made to enlarge the clerestory windows downward in order to increase the interior light. The main effort of this undertaking, however, was the systematic replacement of the earlier flying buttresses by new ones that abutted the wall at a higher level.

Almost on the heels of the rebuilding of the flying buttresses and enlargement of the clerestory windows came the construction of the first chapels between the buttresses of the nave and the decision to extend the transept arms by one bay on each side and to add sculpted portals. The

north side was begun ca. 1246/47 by Jean de Chelles, who also began the south in 1257/58 but was shortly succeeded by Pierre de Montreuil. The elaborate tracery screens and enormous rose windows, the latter in imitation of the rose of the west façade, are clearly in the Rayonnant style. Work continued with the addition of lower chapels on the nave and ultimately around the chevet, as well as with the decoration of the interior by means of the choir enclosure and the transept interiors late in the 13th and into the 14th century.

The present church of Saint-Julien-le-Pauvre, dating from ca. 1170, is the sole surviving 12th-century parish church in Paris. Its three-apse east-end plan, with a tower over the south bay before the apse, is close to the plan of Saint-Pierre de Montmartre but lacks the transept. The church was founded in the 6th century, and its plan type is representative of the conservative tradition found in Paris under Louis VII. In spite of its old-fashioned look, the details indicate that it is contemporary with the upper level of the east end of the cathedral. Construction of Saint-Julien dragged on slowly; the upper parts of the east end may not have been completed before ca. 1210, and construction was finally abandoned ca. 1250. The present façade wall dates from the mid-17th century.

Other sites known to have been founded in the Merovingian period were rebuilt under Louis VI and Louis VII, marking the reestablished prosperity of the city. Further indications of conditions in the city are provided by the transfer of the Grève market to Les Champeaux, approximately on the site of Les Halles, and the concession of the Grève port to the newly established "Marchands de l'Eau" in 1141. Most scholars of Paris believe that the wall on the north bank was rebuilt farther out, perhaps in the first half of the 12th century, to protect the city's commerce; but no archaeological evidence has been found. But the most famous indication of conditions on the Cité is the petition by the monks of Saint-Barthélémy/Saint-Magloire to exchange properties with the king. The Cité, they alleged, was too crowded for the monks to live in peace. Thus, in 1138, they moved to the chapel of Saint-Georges beside the Rue Saint-Denis and began to build their new convent, dedicated to St. Magloire. Their bucolic peace, however, was to be short-lived.

If the ages of Louis VI and Louis VII were devoted largely to the rebuilding of monuments, which would include the old royal palace on the Cité (now the Palais de Justice), then the age of Philip Augustus marks the beginning of what we might term civic projects. Under Philip, Paris truly came into its own as the capital of a strong monarchy and the center of a flourishing French civilization. In 1183, Philip ordered the reconstruction of the great market center, later known as Les Halles, to support the growing mercantile community. Some years later, he began the task of paving the city's more important streets and squares. When he left on crusade in 1190, Philip underscored the importance of the capital by naming six bourgeois of Paris to take charge of royal finances, auditing accounts at the Temple. At about the same time, he ordered the fortification of the city by the construction of walls regularly punctuated by defensive towers. More than three miles of new city walls encircled the sprawling suburbs to the north and the old Roman areas to the south. Protected by the new fortress, the Louvre, to the west and by fortified bridge heads within, the town, now encompassing more than 620 acres, was for the first time unified. The left bank was still underpopulated, and grapes could still be grown on the slopes almost to the Seine. Still, this side of the city was rapidly changing, as the schools of Saint-Victor and the nucleus of the university

began to attract students from all over Europe. The intellectual leadership of Paris was sealed with the incorporation of the masters and students as the University of Paris, beginning with recognition of the rights of students by Philip Augustus in 1200 and culminating with papal recognition in 1209/ 10. Indeed, at Philip's death in 1223, Paris was a rich, flourishing walled city, Europe's foremost administrative and intellectual center, a position that it maintained through the next century. The renowned cultural and intellectual brilliance of Paris in the age of Louis IX (r. 1226–70) was in fact the creation of his grandfather.

This period also marked a time of brilliant achievements in music. A movement dubbed Ars Antiqua by modern scholars and associated in its earliest stages with composers at Notre-Dame, saw the first development of a large repertory of rhythmically measured polyphonic music. Both the repertory—including the genres organum, conductus, and motet—and the body of music theory describing the music had enormous and lasting influence on the subsequent history of music in the West. Paris maintained

Paris, Sainte-Chapelle. *Photograph

its leading role into the 14th century with the further musical innovations of Ars Nova. Paris was also a center of activity for minstrels. The statutes of the Confrérie de Saint-Julien des Ménétriers was signed by thirty-seven *ménestrels* and *ménestrelles* in 1321.

Royalty and bourgeoisie alike hired minstrels on the Rue aus Jogleurs, located off the rue Saint-Martin midway between the churches of Saint-Merri and Saint-Nicolas.

The coming of age of Louis IX in 1233 marks the beginning of the Rayonnant style in Paris, perhaps best represented by the splendid new royal chapel, the Sainte-Chapelle, which Louis built in the Cité palace to house the collection of relics, including the Crown of Thorns, bought from the Latin emperor in Constantinople in 1239 and 1241. From the conception of the project, the Sainte-Chapelle was viewed as a gigantic reliquary. Built between 1241 and 1246, possibly by an architect brought from Amiens, the chapel was consecrated in 1248. On the one hand, it is but the latest in the series of two-storied royal chapels that begins with Charlemagne's chapel of Aix-la-Chapelle; on the other, it marks a significant departure from previous chapels. Lavish interior painting makes the stone architecture look more like metalwork than building. The setting of paintings on glass in the wall recalls the incorporation of cameos and enamels on gilded reliquaries. The statues of the Apostles, their billowing draperies painted to resemble rich silks and brocades, the hemlines studded with jewels, set against the piers in the upper chapel are the quintessential examples of the new court art of Paris associated with the age of Louis IX.

The lower chapel has a secondary row of thin columns set away from the wall so that it could be vaulted without the ribs resting directly on the floor. The effect is to create an interior network of delicate architectural members screening the wall, itself richly decorated with tracery and moldings that seem to peel back layers of ornament to reveal the stained-glass windows. But it is in the upper chapel that the stained glass makes its most dramatic effect. The tall, narrow proportions of the jewellike windows, nearly 50 feet tall, negate any feeling of mass and contribute to the transcendental, ecstatic sense of space. The relics were displayed in a giant gilded and jeweled reliquary above and behind the altar, a shrine within a shrine.

Although no other monument quite equaled the splendor of the Sainte-Chapelle, it set new standards of design in architecture, sculpture, painting, and stained glass that dominated French art for more than a century. Branner termed it the "Court style," but it is really the art of Paris and is not limited to the court, as is demonstrated by the new transept façades of Notre-Dame and many other nonroyal projects in the city.

Louis IX continued some of the ambitious urban projects of his grandfather, including enlarging the markets and, as early as 1240, granting permission for construction beyond the city walls on the right bank. The draining of the surrounding swamps continued with the construction of the Fossés-le-Roi in 1260, and vegetables replaced grain as the principal crop. The king reorganized the administration of Paris in 1261, dividing authority between the royal *prévôt,* who exercised the king's authority and jurisdiction from the Châtelet on the right bank, and the *prévôt des marchands,* who served as the leader of the bourgeois and merchant community. The crown and bourgeoisie collaborated in promoting their common interests in the local economy, regulating the many trades that were represented by guilds of various kinds. These measures, intended to protect consumers from shoddy products and skilled craftspeople from ruinous competition, eventually had a stultifying effect on economic growth, and after the disastrous plagues of 1348 and later, they were relaxed in many ways. The royal archives (Trésor des Chartes) and the chancery, then the judiciary (Parlement) became established bodies requiring more officials and transacting more business.

The fame of the university and its teachers attracted more and more students from afar. The left bank proliferated with privately endowed residential colleges and convents for students and with the houses of the new mendicant orders, maintained for those members who studied and taught in Paris. The preeminence of the city was sealed on the one hand by the university, on the other by Louis IX himself. The process begun by Louis VI's decision to settle in Paris was completed in the age of Louis IX; the role of Paris as the capital, as the seat of national government, dominated by Parisian bureaucracy, was completed in the 13th century.

In the 14th century, Paris grew to a population, estimated from the surviving fiscal registers, of over 80,000, a quarter of whom may have been students. Royal administration grew apace in both size and organization and provided documents concerning households, taxpayers, and tithes. By 1352, nearly 80 percent of the city's taxpayers and taxable wealth was on the right bank, which remains today the financial center of the city. Great lords, both lay and ecclesiastical, acquired houses in Paris as their business and capital increased. Corporate bodies like towns and monasteries often had to maintain representatives there for extended periods. Later examples of some of these structures remain: the Hôtel de Sens (1475–1519) and the Hotel de Cluny (1485–98), for example. The houses of noble and bourgeois families engaged in royal and city bureaucracy proliferated, although traces of only a few now remain: the portal of the Hotel de Clisson, built by the king's future constable after 1371, or the Tower of John the Fearless (ca. 1400), all that remains of the residence of the dukes of Burgundy.

The bourgeoisie of Paris began to produce families of great wealth, among them the Arroude, Barbette, Bourdon, Coquatrix, Marcel, de Pacy, Pizdoue, and Sarrazin. Such families grew wealthy practicing a trade, but they also were speculators who stockpiled goods in anticipation of shortages. In addition, some of them became moneychangers, farmed royal offices or municipal taxes, or became purveyors to the growing royal household. Prominent Parisians sometimes gained important positions in the royal government, especially in areas of finance. Others studied law and served in the Parlement. By the 14th century, some of those who had won royal favor were receiving patents of nobility.

Despite the growth of sedentary organs of the royal government, the kings themselves maintained an itinerant style of life until the mid-14th century. When not on crusades or other military campaigns, they generally resided at favored monasteries or royal manors, most of them in the region around Paris and close to forests with good hunting. John II the Good finally began to alter this pattern, spending more time in the royal palace on the Cité than had his predecessors. Charles V also spent much time in Paris but preferred to reside on the right bank, either in the Louvre or his new Hotel de Saint-Pol. The latter was also the favored residence of Charles VI. In the 15th century, by contrast, the kings were often absent from Paris. Charles VII did not set foot there from the Burgundian occupation of 1418 until the expulsion of the English conquerors in 1436. Even thereafter, he preferred the Loire Valley as a residence, and so did his son, Louis XI (d. 1483), who had been born in that region and harbored a dislike for the Parisians.

Despite considerable loss of population from the Black Death of 1348–49, the right bank had acquired such a large population outside the walls of Philip Augustus—some fifty-one streets by 1300—that Étienne Marcel, *prévôt des marchands* (1354–58), in 1356 began construction of a new wall, which was continued by Charles V. With the 430 acres

added by this wall, Paris now covered 1,084 acres. An integral part of the new wall was the construction of six small fortresses at the gates. The most important of these was the one on the eastern side, known as the Bastille Saint-Antoine, whose captain was an important figure in the defense of the city.

The once-close collaboration between the king and the Parisian bourgeoisie was marred by intermittent conflict from the early 14th century. What generally triggered popular uprisings was royal fiscal policy, especially as it concerned the currency. The first explosion of opposition occurred in 1306. Fifteen years later, when the crown sought a tax in peacetime to standardize weights and measures and buy out nonroyal coinage rights, the king's advisers blamed the Parisians for the plan's rejection and even talked of moving the capital to Orléans. A sharply deflationary reform of the currency in 1343 provoked new opposition from the poorer classes.

Parisian hostility to the monarchy reached revolutionary proportions in the next decade. The crown's tampering with the alloy of the currency was but one of the factors in this crisis. Étienne Marcel was a major player in a complex political drama involving both a movement for governmental reform and the personal animosities of the great bourgeois families. Those who had grown rich in royal service were the special targets of Marcel's party. He supported the Jacquerie of 1358 largely because of his hostility toward former members of the Parisian bourgeoisie who had won noble titles. Marcel's Parisians and the Jacques in the countryside introduced an element of class conflict that split a reforming party already disorganized by the fickle, self-seeking adventurism of its putative leader, Charles the Bad, king of Navarre (r. 1332–87). The future Charles V successfully recruited to his cause most of the noble reformers and regained Paris in the summer of 1358, when Marcel was murdered.

Charles V (r. 1364–80), a great patron of the arts, had the most important architects, sculptors, and painters working on his projects. His most famous undertaking, directed by Raymond du Temple, was the rebuilding of the Louvre that effectively changed its character from stern military fortress to sumptuous royal residence at the height of the Hundred Years' War. Its famous spiral staircase, decorated with statues of royalty, was the wonder of his contemporaries; but all that remains are contemporary descriptions and, quite plausibly, the statues of the king and queen now in the Louvre. Charles V also rebuilt the palace on the Cité, which had been remodeled earlier in the century by Philip IV the Fair, the Bastille Saint-Antoine, and the castle at Vincennes.

Class interests were apparent again in 1382, when a new uprising in Paris, that known as the Maillotins, resisted the imposition of the *aides,* indirect royal taxes that bore mainly on the urban populations. Charles VI's government punished this rebellion severely and abolished the office of *prévôt des marchands*. Although the behavior of Charles of Navarre had wrecked his credibility as a leader of reformers, he and his family, the Évreux branch of the royal house, made one enduring contribution to the cause

Paris, Saint-Séverin, ambulatory.

of reform by endowing the Collège de Navarre at the University of Paris. Established early in the 14th century and patronized by successive members of the Évreux family, this institution produced a series of brilliant intellectuals who attracted others to a circle of reformers that wielded influence in three successive reigns after 1350. Eloquent preachers associated with this circle espoused such causes as a stable coinage, lower taxes, honest government, and (unusual for this period) the suppression of noble violence against unprotected peasants.

When competing princely factions (Burgundy vs. Orléans and then Armagnac) disrupted French politics in the early 15th century, it was John the Fearless, duke of Burgundy (r. 1404–19), whose success in posing as a reformer won over the Parisian bourgeoisie and important elements at the university. The next major uprising in Paris, that of the Cabochiens in 1413, led to a major ordinance of reform, but the excesses of the rebels antagonized most of the princes, and the ordinance did not survive the suppression of the uprising. The duke of Burgundy, isolated politically by this incident, had to flee Paris, but his forces regained the city in 1418 and massacred his rivals. His murder the following year pushed his son into alliance with England, and the Treaty of Troyes (1420) recognized Henry V as heir to the French throne. During the lifetime of this alliance (to 1435), Paris remained under Anglo-Burgundian control. Charles VII's troops finally recaptured the city for the Valois monarchy in 1436, but several more decades would pass before Paris regained its former stature as the undisputed political and intellectual center of the realm.

The difficulties imposed by the economic hardships of the Hundred Years' War in Paris are illustrated by the parish church of Saint-Séverin on the left bank. The west end and first three nave bays date from the mid-13th century. The church was enlarged laterally to the south in the 14th century because there was no room to expand to the east. The property was acquired in 1445, but construction was delayed by the need to rebuild the nave. The chevet foundations were laid in 1489, but the east end was not finished until ca. 1520, and it is the work of the 15th century that governs the character of the church. Its broad double-aisled plan, at first the result of lack of space to expand longitudinally, came to resemble the double-aisled plan of the cathedral after the 15th-century rebuilding. It is a broad, laterally expansive space that is filled with light, even with the added nave chapels. The restrained Flamboyant of the east end, with its extraordinary piers that contribute to the dynamic sense of movement, sets the conservative tone characteristic of Late Gothic architecture in Paris.

An analogous situation exists for the church of Saint-Germain l'Auxerrois, another old foundation, located on the right bank near the western port of Paris and adjacent to the Louvre. Engulfing an eastern tower of the first half of the 12th century, a 13th-century chevet, and a west portal, it was almost entirely rebuilt in the first half of the 15th century. With tall aisles and a low central vessel consisting simply of broad arcades and clerestory windows, Saint-Germain also has a sense of lateral expansiveness and architectural restraint, What decoration that does exist is concentrated in the window tracery or in the Burgundian-style porch added 1435–39.

Broad, expansive spaces are found in other Parisian churches of the 15th century, even in those like Saint-Laurent, Saint-Médard, and Saint-Merri, with its elegant Flamboyant façade, that do not have double-aisled plans. The one Late Gothic church in Paris that returns to an emphasis on the vertical, the parish church of Saint-Gervais/ Saint-Protais, located adjacent to the Porte de Grève and behind the Hotel de Ville, is frequently attributed to the most prodigious architect working in the late 15th and early 16th century, Martin Chambiges, who is known to have worked on the Hotel de Ville. The church was begun in 1494, but the nave was not constructed until after 1600. Yet the interior is remarkable for the uniformity and continuity of the first design and for the restraint of the window tracery, as well as for its tall, narrow proportions that look back to nearby Notre-Dame rather than to its immediate 15th-century predecessors. When the Renaissance style is introduced in Paris, with the remodeled chevet of Saint-Nicholas-des-Champs or the extraordinary church of Saint-Eustache, which challenged even the cathedral in its grandeur, it will be, interestingly enough, characterized by the tall, narrow proportions of Saint-Gervais, which itself has a famous Renaissance façade, rather than the more laterally expansive spaces of the early 15th century.

# PARLEMENT DE PARIS

. As the central law court of the French monarchy from 1250 to its suppression by the French Revolution in 1790, the Parlement de Paris grew slowly out of the medieval tradition that the king was the source of justice. The early Capetian kings could provide justice only for those of the royal domain, but with the expansion of the royal domain in the 12th and 13th centuries, and with the increase of royal authority and pres tige, ecclesiastical and secular lords as well as towns and lower nobility brought disputes before the king for a more certain and impartial justice.

By 1250, the king's court, which had always moved with him in his travels, became resident at Paris, and a professional body of clerical and lay specialists in law gradually appeared to administer justice in the king's name. The great success of this law court came from Louis IX's decision to allow appeals from the lower courts of *bailliages* and *sénéchaussées,* administrative subdivisions of France established by Philip II Augustus after 1190. The greater part of the Parlement's work would henceforth involve appeals rather than cases in original jurisdiction.

In 1278, Philip III the Bold issued the earliest surviving regulations for operation of the Parlement, and in the following half-century the court assumed most of the organization and procedure that it would retain for the remainder of the medieval period. It found its physical habitat within the royal palace at the western end of the Île-de-la-Cité in Paris. Its personnel accomplished their work within three judicial departments, the Grand'Chambre, the Chambre des Requêtes, and the Chambre des Enquêtes.

The Grand'Chambre was the original Parlement from which the two other chambers emerged. It was also called the Chamber of Pleas, for the great cases of the realm were pleaded there. It also heard pleas involving the death penalty and criminal cases involving corporal punishment. It directed and gave oversight to the work of the other chambers, but its most important responsibility was the issuance of the final legal decree, or *arrêt,* in all cases.

The Chambre des Requêtes heard petitions from persons who wished to initiate suits in the Parlement. If this chamber granted permission to cite one's adversary before the court, letters were issued to this effect and a commissioner was sent to the locality of the dispute to gather testimony and to create a file of written documentation, which was brought back as an *enquête* to the Grand'Chambre.

The Grand'Chambre examined the materials of the *enquête* to determine that the investigation had been properly conducted and then sent it to the Chambre des Enquêtes for extended examination and judgment. There was no pleading in this chamber; litigants never appeared before it. The written documentation of the case was thoroughly discussed and analyzed by the masters and returned with their conclusions to the Grand'Chambre. There, the masters of the Grand'Chambre decided upon final judgment in the case and then issued it as a definitive *arrêt,* or decree. From the mid-13th century, secretaries, or *greffiers,* of the Parlement kept records of its decisions, called the *Olim,* and in the 14th century and thereafter they produced series of records of most of the Parlement's work.

# PARTHENAY

. Capital of the Gâtine, Parthenay (Deux-Sèvres) is the site of a castle that dominates a wide bend in the River Thouet. In the Middle Ages, Parthenay was an important stopover on the pilgrimage road to Santiago de Compostela, at the juncture of the roads from Thouars and Angers. One can still enter the city from the north along the picturesque medieval Rue Saint-Jacques, after crossing over the 13th-century Pont Saint-Jacques and through the Porte Saint-Jacques. Parts of the 12th-century ramparts and three towers of the 13th-century stronghold remain. The city was given to Richemont, constable of France, in the 15th century and passed, after his death in 1458, to Dunois.

The 12th-century church of Sainte-Croix and the church of Notre-Dame-de-la-Couldre, with its splendid portal in Poitevin Romanesque style, are further reminders of Parthenay's role in the medieval pilgrimage to Santiago. At nearby Parthenay-le-Vieux, the 12th-century church of Saint-Pierre, founded by monks from Chaise-Dieu, possesses a beautiful façade in Poitevin Romanesque style. The tympanum carving of Samson and the lion, the cat heads (representing devils) along the cornice, and the carved animal capitals are all worthy examples of Romanesque sculpture.

*William W.Kibler*

# *PARTONOPEU DE BLOIS*

. Written probably ca. 1182–85, *Partonopeu de Blois* is an enormous romance whose popularity is attested by its many medieval imitations, translations, and adaptations. Ten manuscripts feature three forms of the romance: V(Vatican, Palatinus latinus 1971) ends after 10,358 lines, with the marriage of Partonopeu and Melior, followed by the romancer's promise to continue his story, if his lady so commands; *A* (Paris, Arsenal 2986) reworks that ending to eliminate any continuation; and five manuscripts offer selections from the Continuation (only Tours 939, with 14,493 lines, contains both the Anselot and the Sultan Margaris episodes).

The anonymous romancer combines elements from classical, Celtic, and oriental matter to shape the story of Partonopeu of Blois, the nephew of Clovis, king of France, and Melior, empress of Byzantium. Like the fairy mistresses of Celtic *lais,* Melior arranges to lure thirteen-year-old Partonopeu to Chef d'Oire (modeled on Constantinople), where she plans to keep him secretly for two and a half years, until he can be knighted and presented to her barons as a suitable husband. Partonopeu enjoys the pleasures of love with Melior each night, on condition that she remain invisible to him (the Cupid and Psyche story with sex roles reversed). But betrayal follows, and, once she has been seen, Melior's magic powers are destroyed. Seeking death in the Ardennes Forest, Partonopeu is discovered by Urraque, Melior's sister, who persuades him with false news of Melior's pardon to go to Salence. There, Partonopeu recovers his health and prepares for the three-day tournament arranged by Melior's barons to choose her

husband. Winner of the tournament, for both his prowess and his beauty, Partonopeu is finally married to a forgiving Melior.

The Continuation offers two unsuccessful love stories, and the narrator tells us that he could write yet another book about the goodness of his lady, Passe-Rose. His desire to win her love motivates the entire romance project and appears in many personal interventions, when he compares the characters' love story and his own. This lyric persona of the narrator, one of the major innovations of *Partonopeu,* begins with the springtime opening evoked in the prologue. The genealogy that follows, linking the French monarchy to Trojan ancestors, establishes the narrator in the clerkly tradition of romance writing as well. Chansons de geste, Romances of Antiquity, *lais,* Chrétien de Troyes's romances, contemporary travelogues, bestiaries, school debates—the author of *Partonopeu de Blois* exploits and reinvents all the literary and historical resources of his day. Reflecting the medieval view of fabulous Byzantium, where goods, peoples, religions, and cultures meet in a rich mix, this romance fuses the real and the marvelous, combines fantasies of the East and lessons on contemporary French politics, as it prolongs the pleasure of a love story skillfully told and enticingly opened to the public's desire for more. A measure of its success can be calculated by the translations of *Partonopeu* into English, Spanish, German, Icelandic, Dutch, and Danish between the 13th and early 16th centuries.

# PASCHASIUS RADBERTUS

(ca. 790–865). Born near Soissons, Paschasius Radbertus was raised in a women's monastery.there by Theodrada, sister of Adalard and Wala of Corbie and cousin of Charlemagne. He entered the monastery of Corbie ca. 820, assisted in the founding of Corvey in Saxony in 822, and was ordained deacon. He was elected abbot of Corbie in 844. An active church leader, Radbertus attended the councils of Paris (847) and Quierzy (849), where he signed the condemnation of Gottschalk. Following a dispute in the abbey of Corbie, he resigned the abbacy and moved to Saint-Riquier (Centula) in 851 but returned to Corbie before his death. Paschasius Radbertus wrote the *vitae* of Adalard and Wala and local saints; commentaries on Psalm 44, Lamentations, and the Gospel of Matthew; and important treatises on theology and the Virgin Mary. He is most famous

today for *De corpore et sanguine Domini,* the first Latin treatise on eucharistic theology. The work was written (831) for the Saxon novices of Corvey and revised (844) for Charles the Bald. The second edition is in direct response to his fellow monk, Ratramnus, as is the defense of Mary's perpetual virginity in *De partu Virginis.* Radbertus's eucharistic theology, which strictly identifies the historical body of Christ with the sacrament of the altar, was influential in the later definition of Transubstantiation at the Council of Trent. However, the most popular work of Paschasius Radbertus in medieval France was *Cogitis me,* a letter on the Assumption of the Virgin Mary written under the name of Jerome. In other sermons on the Assumption and in his life of the Virgin Mary, Radbertus shows the importance of the influence of apocryphal literature, such as the *Protevangelium of James,* on the development of medieval Christian thought.

# *PASSION DES JONGLEURS*

. An anonymous narrative poem in octosyllabic couplets from the late 12th or early 13th century recounting the events of Christ's last days. Based largely on the biblical accounts, the poem also draws on the apocryphal *Gospel of Nicodemus* for such episodes as the Descent into Hell. Recited publicly by jongleurs, the poem served as the principal source for the early Passion plays. Its popularity is attested by some twenty-six extant manuscripts.

# *PASSION DU CHRIST*

. A 10th-century inspirational poem of 516 lines that includes Christ's Passion, beginning with the events of Palm Sunday and concluding with Pentecost. Its language, difficult to localize, is remarkable for its many heterogeneous forms. The work survives in a single

manuscript (Clermont-Ferrand 189), which also contains the only extant text of the *Vie de saint Léger.*

# PASSION PLAYS

. Dramatizations, often on a large scale, of the life and especially the Passion of Christ, performed throughout France during the late Middle Ages. The essential elements in any mystery play called a "Passion" were the events of Holy Week, starting with Christ's entry into Jerusalem and concluding with his resurrection and appearances; but many later plays extended this portrayal of Christ's life backward, adding first his public life, then his nativity and childhood; some include Old Testament episodes, especially the Creation and the Fall. These longer "cyclical" Passions were often placed within the framework of the *Procès de paradis,* the trial in Heaven in which God finally accedes to the requests of Mercy to send his son to earth to save fallen humanity.

Passion plays were based on numerous sources, including, in addition to the Bible, Gospel commentaries, and apocryphal gospels, especially the *Gospel of Nicodemus,* the *Legenda aurea,* and the *Meditationes beatae Mariae.* But the most important source of the earliest plays was a widely circulated narrative poem, the *Passion des jongleurs,* which provided a lively account of the events of Holy Week and whose numerous passages of dialogue lent themselves easily to dramatization.

The earliest complete Passion play, the *Passion du Palatinus,* dates from the end of the 13th century, and Passion plays were still being written as late as 1549. More than a hundred performances of Passions are recorded from the late 14th to the late 16th century, in all parts of France. The later plays tend to be much longer than the early ones, the shortest being about 2,000 lines and the longest about 60,000. The earliest plays were performed in one session (one *journée,* or day); some took four or eight; the longest were spread out over twenty to twenty-five *journées* of about 2,000 lines each. This increasing length is due not only to the inclusion of pre-Passion Week material but to the expansion of secondary episodes, the increase in the number of minor characters, more explicitly didactic passages (sermons, prayers), and the introduction of popular or comic elements (devils, torture scenes, fools). Whereas the earlier texts are content to show the public the events upon which its faith is founded, later texts show a greater urge to explain or moralize.

In spite of the frequency of recorded performances, barely a dozen complete or nearly complete texts survive. A new text was not necessarily composed for each performance, and manuscripts often circulated among towns in a given region. Several of the surviving texts are related to others; this suggests that the normal practice was to revise, often considerably, an existing Passion play rather than write an original one. Thus, only seven Passion plays have survived, and even among these critics have traced varying degrees of

influence and filiation. The most satisfactory way of grouping French Passion plays is according to a mixture of chronology and province of origin.

The *Passion du Palatinus* (Burgundy, late 13th or early 14th c.; 2,000 lines), the oldest complete Passion, dramatizes only the events of Holy Week and is heavily based, especially in the first half, on the *Passion des jongleurs;* but it has an unusual Harrowing of Hell and includes lengthy lamentations by the Virgin Mary and the three Marys. Except for these lyrical passages, the play is fastmoving and depends much on mime. The system of mnemonic rhyme used in other 13th-century plays and in all other Passion plays is absent here. Variants of the text are found in the 15th-century manuscript of the *Passion d'Autun* and in the *Fragment de Sion*. Though it clearly influenced several later plays, the view that the *Passion du Palatinus* was the single source of all Passions is contradicted by the recent discovery, in the Leiden University Library, of a fragment of a different version of the Crucifixion, also dating from the late 13th century.

The Passion play in the Paris Sainte-Geneviève Library, usually referred to as the *Passion Sainte-Geneviève* (Paris, ca. 1380; 4,500 lines), though covering largely the same events as the *Passion du Palatinus,* reveals little direct influence of the latter. Its text, often based closely on the Bible and on the *Gospel of Nicodemus,* has episodes not in *Palatinus:* the raising of Lazarus, Lazarus's account of his visit to Hell, the Veronica episode, and the allegorical debate between Ecclesia and Synagoga. The manuscript that preserves this text contains other religious plays and is probably the repertoire of a *confrérie.* The Confrérie Sainte-Geneviève du Mont is a more likely candidate than the Parisian Confrérie de la Passion. A fragment of a revision of the *Passion Sainte-Geneviève* has also been found in Troyes.

The *Passion de Semur* (Semur-en-Bourgogne; 9,000 lines; two days) survives in a manuscript of 1488, the last in a series of reworkings of an original text that goes back probably to the early 15th century. General resemblances and textual echoes encourage some critics to see the influence of the *Passion du Palatinus,* also Burgundian. The present revised text is divided into two days, though earlier versions were not. The first day includes the Creation and some other Old Testament episodes, the marriage of the Virgin Mary, and the Nativity and ends with the temptation of Jesus. Day 2 takes us from the summoning of the Apostles, through several of Jesus's miracles, the events of Holy Week, concluding with Jesus's appearances to his disciples. The most notable feature of the *Passion de Semur* is its wide range of register; juxtaposed to sermons, Latin hymns, and allegorical episodes are scenes of comedy and great vulgarity, the most striking example of which is the character of Rusticus, a transformation of one of Noah's sons, who reappears at regular intervals throughout the play and engages in foul-mouthed conversations with wellestablished Passion play characters.

The *Passion d'Arras* (Arras, 1430–40; 25,000 lines; four days), usually attributed to Eustache Marcadé, is the first to extend over four long days and to use the framework of the *Procès de paradis*. It uses no Old Testament material. Day 1 deals with the nativity and childhood of Christ, Day 2 with the public life, Day 3 with the Passion, and Day 4 with the Resurrection and Ascension. The length of the text is due mainly to the author's natural prolixity, to sermons, and to the expansion of secondary episodes. The surviving manuscript also contains a three-day *Vengeance* play, which would sometimes have been performed after the *Passion d'Arras*.

The *Passion* by Arnoul Greban (Paris, ca. 1450; 35,000 lines; four days) is probably the best-known French Passion play, often considered the masterpiece of the genre. Its style is more lyrical than that of most others and its structure the result of careful planning; Greban eschews the extremes of popular and vulgar elements and achieves a greater uniformity of tone. It is arguable, however, whether this makes Greban's play the best Passion play or merely an exceptional one. It is also unusual in that it has survived in three complete and virtually identical manuscripts and a number of fragments—it is extremely rare to find more than one copy of any mystery play. The fame of Greban's work was established early. Abbeville borrowed it in 1452, Jean Michel adapted it in 1486, and a revised version was performed several times in Troyes ca. 1490. Greban's play is held by some critics to be influenced by the *Passion d'Arras;* textual resemblances are few, but the four-day pattern, the *Procès de paradis* setting, and the selection and ordering of episodes are common to both. Greban, however, starts with a brief dramatized prologue, showing the Creation and the falls of Lucifer and of Adam; Day 1 proper begins with the *Procès de paradis,* leading into the Annunciation, the Nativity, and, the childhood of Christ. Day 2 includes the sermons of John the Baptist, Jesus's public life, his entry into Jerusalem, and his arrest. Day 3 shows the Crucifixion up to the setting of the guards at the tomb. Day 4 deals with the Resurrection and Ascension.

Jean Michel's *Passion* (Angers, 1486; 30,000 lines; four days) is a revision and expansion of Greban's Days 2 and 3, and most of Greban's text of these two days is preserved intact or with superficial change. Despite the impression of derivativeness, Maurice Accarie has shown what a thorough reworking Michel has carried out. His expansions, additions, new sermons, and especially his prologues reflect major innovations. The main difference is that Michel seeks to replace Greban's continuing emphasis on the visual (his first line reads, *Ouvrez voz yeulx et regardez!* "Open your eyes and behold!") with his own stress on explanation, commentary, and moral and spiritual didacticism. The principal vehicle he uses to this end is the character of Mary Magdalene, the repentant sinner, whose sins (her *mondanité*) and repentance (the anointings) are especially elaborated. She and several other normally secondary characters, like Judas and Lazarus, are given detailed "biographies" that underline Michel's moral message. Michel's Passion play was influential not only because its approach reflected better the spirit of its age but be cause it was the first to be printed; no manuscript survives. The number of copies available enabled it to become known far beyond its province of origin. It was used, in conjunction with Greban's Days 1 and 4, as the basis of a text performed in Mons in 1501; and later in the 16th century it was plundered in such distant places as Valenciennes and the Savoy.

The *Passion d'Auvergne* (Clermont-Ferrand, 1477; seven days of about 1, 500–2, 000 lines each) bears no relation to the Marcadé-Greban-Michel group. Originating in a southern province where many working-class people still did not speak French, it has a structure and an approach to the Passion material that are original. Although only three of the seven days have survived, the manuscripts and archival evidence enable us to reconstruct a detailed picture of the complete play, which was performed in 1477 on six successive Sundays preceding Whitsun and on Whit Monday. Each day's performance was short compared with the Greban-Michel *journée,* probably between 1,500 and 2,000 lines, and would have taken hardly more than three hours. Day 1 depicts John the Baptist

and the Temptation of Christ; Days 2 and 3, Christ's public life; Days 4 and 5, the Passion proper; Day 6, the Resurrection; Day 7, the Ascension. The play is distinctive in that it has several violent and vulgar scenes, especially during the Crucifixion; a comic episode written in the lower Auvergne dialect; and, most important, an unusual treatment of the Virgin Mary. Each surviving day ends with a meeting between Jesus and his mother, regardless of whether the traditional sources allow for such a scene. Thus, at the end of Day 5, after the Harrowing of Hell but before the Resurrection, the Virgin Mary is miraculously raised to Heaven to see Jesus. Local archival material suggests that a version of this play was performed not only in 1477 but in 1452 and at the very beginning of the 16th century, perhaps reflecting a custom, attested elsewhere, of performances every twenty-five years.

No original Passion plays have survived from the 16th century. Frequent performances are recorded well after the middle of the century, but the texts, to judge by those that have come down to us, were heavily derivative. The so-called *Passion cyclique* (Paris; 55,000 lines; six days), printed by Geoffroy Marnef in 1507, is a compilation based on Jean Michel's four days, preceded by a *Conception* partly attributed to Greban and followed by Greban's Resurrection, a similar type of text to the one used at Mons in 1501. Of the two texts usually called the *Passion de Valenciennes*, the earlier (Valenciennes, 1547; 45,000 lines; twenty-five days) and the later (Douai, 1549; 40,000 lines; twenty days), though more carefully reworked than the Marnef edition, are both freely based on Marcadé, Greban, Michel, the *Actes des Apôtres,* and other sources.

Passion plays were organized and staged no differently from other mystery plays. If the earliest dramas were put on by *confréries,* later plays required the cooperation of a whole village or town. The expense and the planning were such that a performance of a Passion play was an exceptional event for a town to undertake. A remarkable spectacle designed for public entertainment, it confirmed, illustrated, and explained the Christian faith better than any church service or sermon. The organization involved such a wide range of participants—intellectuals to compose and copy the text, bourgeois and priests to act the main roles, artisans to build and paint the theater and props, and almost everyone to watch it—that the performance emphasized the social cohesion of the community. Moreover, it was often inspired in part by commercial aims, attracting merchants and paying spectators from nearby towns. Passion plays in late-medieval France were neither simply religious plays nor a literary genre; they were major public events, with far-reaching social implications.

# *PASTOUREAUX*

. In Flanders and northern France in 1251, bands of rustics called *pastoureaux* ("shepherds") began to join together under the inspiration of a leader known as the Master of Hungary, a man of obscure origins who claimed to have the blessing of the Virgin Mary. The bands marched under the banner of the Triumphant Lamb. No trustworthy estimate of their number exists, but it was large; and such evidence as there is suggests that shepherds contributed only a fraction to the composition of the bands as finally constituted. Their avowed purpose was to go to the Holy Land to help Louis IX in his crusade. At first tolerated, even encouraged, by the government of Louis's mother, Blanche of Castile, the bands began to threaten local and royal authorities in Rouen, Paris, and Bourges, among other places, ultimately doing violence against prelates, the rich, and Jews. The royal government succeeded in suppressing them in the summer of 1251.

There is no direct filiation between the *pastoureaux* of 1251 and the second movement that bears the name in 1320, but there are striking parallels. Again, throughout the north of France in the aftermath of the great famine (1315–17), people responded eagerly to the call of Philip V for a crusade. When the expedition was not mounted, bands of rustics coalesced around popular leaders, some of whom seem to have been renegade priests, to do the job on their own. Violence ensued. Paris saw angry mobs attack the Châtelet, the seat of the royal *prévôt* of Paris. And greater violence followed in the wake of the arrival of the *pastoureaux* in other towns in the southwest and south. More than one hundred Jews were killed in Toulouse alone before the uprising was suppressed. Those *pastoureaux* who escaped across the Pyrénées were dispatched by the Aragonese army.

# *PASTOURELLE/PASTORELA*

. Medieval lyric genre that developed in the 12th century in Occitan *(pastorela),* flourished during the 13th in French *(pastourelle)*, and was imitated in Latin, German, Italian, Galician-Portuguese, Castilian, English, Welsh, Gascon, and Franco-Provençal; it survives in folksongs in various languages. The word means "shepherdess," by synecdoche "poem about a shepherdess"; the French form reveals linguistic influence from Occitan in the retention of the s (cf. French *pâtre* 'shepherd') and in the treatment of the stressed vowel (cf. French *pasteur*).

In the most frequent type, a male speaker narrates his encounter with a young woman, often a shepherdess, and his attempt to seduce her. The prototype by Marcabru, *L'autrier jost'una sebissa,* combines elements that are found in medieval Latin compositions and in scattered analogues in other languages (in Chinese, in the Romance of the *kharjas,* perhaps in French); the dialogue follows the man's increasing efforts at hyperbole, and ends with the girl mocking him in his defeat. The context of Marcabru's other satires invites reading the man as a symbol of the decadence of courtly culture (perhaps as a figure of Guilhem IX, the first troubadour), and the girl as a representative of sound peasant morality. Marcabru's tone evolved quickly into the erudite libertinage of Walter of Châtillon's Ovidian *pastourelles*. The French poems, many of them anony-mous, run the gamut from sexual farce to rape. In the late 13th century, Guiraut Riquier created a series of *pastourelles* in which he meets the same shepherdess six times over a period of more than twenty years, and the genre entered the *dolce stil nuovo* with Guido Cavalcanti and Dante. In the *serranillas* of the *Libro de buen amor,* Juan Ruiz turned the shepherdess into a folkloric wildwoman of autochthonous strength.

Related forms include the augmented *pastourelle,* in which the cast of characters is increased by adding a peasant lover who often drives the narrator away; the *bergerie,* in which the narrator encounters peasants dancing or quarreling; and the *pastoureau,* in which he talks with a shepherd.

# *PATHELIN, FARCE DE MAISTRE*

. Written in the 1460s, *Pathelin* is the earliest of the many farces surviving from the late-medieval period. It is unusual in both its length and its complexity. The play's 1,600 octosyllabic lines make it twice as long as any other farce and three times longer than the

average. Whereas most other farces are constructed around a single trick, the anonymous author of Pathelin has woven an intricate web of mutual deception. Pierre Pathelin, a down-and-out pettifogging lawyer, purchases cloth on credit from Guillaume the clothier, who cheats him on the price. Guillaume's attempt to collect his money is thwarted by Pathelin, with his wife's complicity, in an inspired scene of comic delirium. Because Guillaume has also cheated his shepherd on his wages, the latter kills and eats a number of the sheep. Accused of the slaughter, the shepherd hires Pathelin to defend him in court. The latter deceives the judge by having the shepherd reply "Baa" to all his questions. Finally, when Pathelin asks to be paid, the shepherd dutifully replies "Baa" to all his entreaties. The theme of trickster tricked *(a trompeur, trompeur et demi)* is thus exemplified several times over.

The length of the play allows the author to develop the characters to an extent not possible in other farces, and some have called *Pathelin* the first comedy of character. The play's comic dimension derives also from its clever situations, its telling gestures, and especially its verbal acrobatics. In such a tissue of deceptions, the words of the characters are like the gold they promise in payment: empty of meaning and devoid of reality. The playwright's satire is far more radical than a simple attack on the venality of merchants and lawyers; it puts into question language itself and its ability to convey the mutual trust on which society depends.

# *PÂTURAGE.*

Use of pasture for domestic animals in the forest and common lands of a village; the word also refers to the grazing lands themselves. Originally public rights vested in Carolingian officials, rights to *pâturage* came to be part of the seigneurial or banal rights of lords, who began in the central Middle Ages to exact fees for or to limit use of and access to such grazing lands. Such pasture rights also included rights to graze animals on fallow, to allow pigs into the forest to eat acorns and other nuts, to collect bedding for animals, and other forest uses essential to the village economy. Pasture lands (generally, *pascua* in Latin) should not be confused with meadows (Lat. *prata,* Fr. *prés*), which were much more valuable holdings in particularly well watered, sometimes even irrigated, locations along streams, where they would produce multiple cuttings of hay each summer.

# PEACE OF GOD

. A popular conciliar movement combining lay and ecclesiastical legislation on the
regulation of warfare and the establishment of social peace, the Peace of God has been
considered the first popular religious movement of the Middle Ages.

The practice of holding peace councils began in the late 10th century in southern
France, in Auvergne, Aquitaine, and Rouergue. During an initial phase of strong
enthusiasm, it spread rapidly through most of France and survived in some form until at
least the 13th century. The early councils typically took place in large open fields to
which relics of saints had been ceremonially paraded. The *seniores* (high nobility,
bishops, abbots) would proclaim peace legislation designed to protect civilians, such as
unarmed clerics, peasants, merchants, pilgrims, and women, from the violence and
expropriations of the warrior class of lords, castellans, and knights. This proclamation
often took the form of an oath, sworn on relics by the fighting classes in the presence of
the assembled crowd.

The peace movement's almost messianic expectations (regulating warfare through
collective voluntary commitments), generated enthusiasm at the councils themselves but
in the long run failed to eliminate the violence of the landholding and weapon-bearing
classes. As a result, despite the initial determination to hold peace councils at regular
intervals of five years, the practice gradually declined. By the later 11th century, more
effective and long-lasting movements, such as papal reform, the communal movement,
and the Crusades, replaced the Peace of God at the center of European concerns. Each of
these later developments deployed characteristic elements of the Peace (collective oaths,
sanctified violence) to more limited and effective ends. All of them share with the Peace
elements that suggest they are all part of a larger social transformation at work in the 11th
and 12th centuries—the importance of an informed and active public, autonomy of
popular initiatives, and collective religious enthusiasm.

# PEER/PEERAGE

. The term "peer" (Lat. *par,* OFr. *per, pair*) was applied in the 11th century in the region between the Seine and the Meuse to all co-vassals in their capacity as suitors to the court of their lord. In recognition of the vast and increasing difference in wealth between greater and lesser vassals, the legal terminology of a growing number of courts began to draw a distinction early in the 12th century between two classes of peers, and by 1150 the title "peer" had come in some dominions to be restricted to a small number of greater vassals, between six and twelve in number, most commonly twelve. By 1200, this usage was normal in northeastern France, and the status of peer had been converted into a dignity permanently and exclusively attached to the possession of one of the six to twelve fiefs (always counties, viscounties, or castellanies within a principality, and knight's fees within a castellany) that had been recognized as parial fiefs or "parities" (Lat. *paritas, parria, perreria,* Fr. *pairie*). The parities of principalities were normally either selected from or "identical" with the fiefs that in the same period came to be regarded as "baronies" of the principality. The principal privilege of parial status was the right to be tried in all cases touching either the person or parity of the peer in a court in which at least some members of the relevant corps of peers or "peerage" were present.

The peerage of France as a whole seems to have been created on the model of the peerages of the principalities in or shortly before 1202. Its early history is obscure, but there is reason to think that Philip II Augustus, probably invoking the legend of the "twelve peers" attributed to the court of Charlemagne, called the historical peerage into being—possibly to deal with the judgment of his most dangerous vassal, John, king of England, duke of Normandy and Aquitaine—and that he deliberately selected the twelve original parities from among the baronies of the realm. These included six lay (the duchies of Burgundy, Normandy, and Aquitaine or Guyenne, and the counties of Toulouse, Flanders, and Champagne) and six clerical (those held by the archbishop of Reims and the bishops of Laon and Langres, Beauvais, Châlons, and Noyon). Of these twelve, however, two, the duchies of Normandy and Aquitaine, were almost immediately declared confiscate, and although the latter was legally restored in 1259 it was again declared forfeit in 1294; Toulouse was definitively annexed to the royal domain in 1274 and Champagne in 1285. For most of the century, the effective number of peers was thus no higher than ten, and in 1294 it was reduced to eight—six clerical and two lay.

It was in these circumstances that Philip IV in September 1297 inaugurated the practice of conferring peerships by creating or "erecting" three new parities: Anjou, Artois, and Brittany. Philip's successors continued to erect new lay parities, down to 1424 exclusively for members of the royal house, and after 1305 the number of lay peers

fluctuated between six and ten. After 1318, parial status lost its strict attachment to a major fief, and some peers secured parial condition for almost all of the lands they held from the crown. The peers also secured the exemption of all of their parial lands from the jurisdiction of all courts save the Grand'Chambre of the Parlement de Paris sitting as a "Court of Peers," so that parities constituted vast immunities within the structure of royal administration.

# PEIRE CARDENAL

(ca. 1180–ca. 1272). One of the most prolific troubadours and the longest-lived, Peire Cardenal composed *sirventes,* or satires, on moral and religious subjects. He left some ninety-six poems. Born in Le Puy, he was employed as a clerk by Raymond VI of Toulouse and frequented the courts of Les Baux, Rodez, Auvergne, and (according to his *vida*) of Aragon. He may have died in Montpellier.

As a satirist, Peire is distant from Marcabru but closer to Bertran de Born, whom he imitated in a number of compositions, sometimes equaling the sting of Bertran's invective, on other occasions echoing his technique of martial description the better to express his disapproval of Bertran's eagerness for combat. Peire imitated the metrical and musical form of preceding compositions in at least 80 percent of his own songs, exploring the possibilities of an increasingly strict sense of contrafacture with impressive technical inventiveness.

As a moralist, Peire praises good actions and blames the bad but laments that he is understood by no one, as though he spoke a foreign language. He tells a fable, *Una ciutatz fo,* in which rain falls on a city and drives everyone mad except one man who has been sheltered; when he goes out into the street, he sees that everyone else is crazy, but they think him mad and drive him away. Thus, worldly spirits reject the man who hears the voice of God. In a few poems, Peire criticizes the worldly love sung by other troubadours and anticipates the *dolce stil nuovo* with his claim that *fin'amors* is born in a *franc cor gentil,* "a noble, gentle heart."

During the extended period of the Albigensian Crusade (1209–29), Peire expressed vigorous anticlericalism at the expense of Dominican inquisitors and severely criticized the French army led by Simon de Montfort. He did not, however, defend the cause of the Albigensians, regarded as heretics by the church, but rather championed the political

cause of the counts of Toulouse, whose lands were invaded by the crusaders. In his religious poems, he expresses an orthodox belief in Catholic doctrine.

# PEIRE D'ALVERNHE

(fl. ca. 1150–70). Praised by his biographer as the best troubadour before Giraut de Bornelh and later hailed by Dante (*De vulgari eloquentia* 1.10) as one of the *antiquiores doctores* of Romance lyric expression, Peire d'Alvernhe saw himself as ushering in a new kind of poetry, or *vers entiers*. A practitioner of the obscure style, Peire was one of the first to use the term *clus* in a technical sense. His legacy consists of twenty songs, including a prayer, a crusade song, a *tenso* with Bernart de Ventadorn, and a satirical poem about his contemporaries, *Cantarai d'aquestz trobadors.*

# PEIRE VIDAL

(fl. ca. 1187–1205). Son of a furrier in Toulouse, the troubadour Peire Vidal led a colorful life. According to the *vidas,* he had his tongue cut out by the husband of his first lady, was banned from Marseille by the husband of a second on account of a stolen kiss, and was chased and mauled by dogs, as he, disguised as a wolf, tried to enter the castle of a third. The biographer reports that Peire married a Cypriot princess, which made him think that he had a legitimate claim to the Byzantine empire. Though undoubtedly based more on poetic metaphor than on fact, such stories convey the spirit of this often whimsical troubadour, who was constantly on the move, spending time in places as far away as Spain, Italy, Hungary, and Malta. Peire's surviving work consists of approximately fifty *cansos* and *sirventes,* for twelve of which melodies have been preserved. His protectors included Barral de Baux, with whom he exchanged the *senhal*

*Rainier,* Raimon V of Toulouse, Alphonso II of Aragon, and Boniface of Montferrat. It would appear that Peire made a collection of his own songs, which he arranged in roughly chronological order.

# *PÈLERINAGE DE CHARLEMAGNE.*

*See VOYAGE DE CHARLEMAGNE A JÉRUSALEM ET A CONSTANTINOPLE*

# PEPIN

. Frankish leaders of the Carolingian family. Among Charlemagne's ancestors, three named Pepin were especially distinguished by their political authority among the Franks. Pepin I of Landen (Pepin the Old or the Elder; d. ca. 640) founded the family of the Arnulfings or the Pippinids, later known as the Carolingians, through the arranged marriage of his daughter, Begga, to Ansegisel, the son of Arnulf of Metz (d. ca. 645). Pepin was named mayor of the palace *(major domus)* of Austrasia by the Merovingian king Clotar II of Neustria (r. 584–629), for having assisted the monarch to unite the kingdoms of Austrasia and Neustria. During his mayoralty, the office grew into the most powerful position in the Frankish territories, equaling or surpassing the royal throne in importance.

After the murder of Pepin's son and successor, Grimoald in 656, the Pippinids lost control of the Austrasian mayoralty; but in 687, Pepin II of Heristal, duke of Austrasia and Grimoald's nephew, led the Austrasian army to victory over the Neustrians and became mayor of the palace in both regions. From this post, he gradually strengthened his authority over all the Merovingian kingdoms, through his support of the church, manipulation of ecclesiastical posts, and military campaigns.

Pepin III (the Short; d. 768) and Carloman I (d. 754), grandsons of Pepin II, each inherited half the Frankish territories on the death in 741 of their father, Charles Martel, mayor in the united realm. The two brothers cooperated closely in governing their lands; in 743, they together placed another Merovingian, Childeric III, on the royal throne, empty since 737. In 747, however, Carloman felt called to a religious life and abdicated; Pepin became mayor of the entire kingdom. Having deposed Childeric, a move supported by Pope Zachary I, Pepin was acclaimed king in November 751. During a visit to Francia in 754, Pope Stephen II anointed the new monarch along with his wife and sons, Charles (later Charlemagne; 742–814) and Carloman II (d. 771). In recognition of the hope that

the new monarchy would protect the Roman church, the pope used the occasion to name Pepin and his sons "patricians of the Romans."

As ruler of the Franks, Pepin III oversaw reform of the secular government and, with the aid of the Irish missionary Boniface, of the ecclesiastical organization. His efforts in the latter regard, especially, provided the foundation for the cultural and intellectual revival known as the Carolingian renaissance, under Pepin's son Charlemagne.

# *PERCEFOREST*

**.** Middle French prose romance composed ca. 1337–44 for Count William I of Hainaut, perhaps by an author attached to the monastery of Saint-Landelin at Crespin in Hainaut. This immense work, divided into 531 chapters in six books (it will fill some 6,000 to 7,000 octavo pages when fully edited), treats the history of Britain from Alexander the Great to King Arthur. It exists complete in only one manuscript (Paris, Arsenal 3483–94), compiled by the scribe David Aubert in 1459–60 for Philip the Good, duke of Burgundy. Three other partial manuscripts survive, all from the third quarter of the 15th century, as well as two 16th-century printed editions. The romance was translated into Italian and Spanish in the 16th century.

Unlike many prose romances of its time, *Perceforest* is not an adaptation of an earlier verse romance but presents new materials, though incorporating traditional themes and motifs. After a brief geographical excursus on the island of Britain, the anonymous author traces its history from its founding by the legendary Brutus after the fall of Troy, as recounted in Geoffrey of Monmouth. The romance proper begins with Chapter 15 of Book 1 and is marked by inventiveness, exuberant style, and complex interlacing. The first three books tell of England before Julius Caesar's conquest. The author links England to the glories of Alexander the Great, who arrives in Britain at the beginning of the romance with two companions, Bétis and Gadifer, whom he appoints kings of England and Scotland, respectively. Together, they overcome the evil superstitions of the magician Darnant. Bétis, after slaying Darnant and freeing the forests of the island from his curse, takes the new name Perceforest and is crowned king of Britain by Alexander.

In Book 2, Gadifer and Perceforest each organizes his twelve best knights into teams to free the island from chaos and superstition and bring it to culture and chivalry. It ends with the creation of Perceforest's Franc Palais, in which are displayed the shields of the knights who have distinguished themselves. Book 3 relates twelve tournaments held at the Chastel aux Pucelles, each won by the suitor of the girl from whom it was held.

In Book 4, Caesar conquers Britain and destroys the courtly civilization that had been so painstakingly established by Perceforest. This tragedy is overcome, however, as civilization is gradually restored in Books 5 and 6. Book 5 narrates a second series of twelve tournaments, organized by the daughter of King Gadifer to teach the art of chivalry. In Chapter 12 of Book 5, the author traces the ancestry of King Lot of Orkney. He goes on to recount the arrival of Joseph of Arimathea in Britain and alludes frequently to the Arthurian Grail materials. Book 6 tells of the christianization of Britain, before and after the Danish and Saxon invasions, by Gallafur, the grandson of both Gadifer and Perceforest. The final chapter of this final book tells of the adoration of the Holy Grail and recounts the episode of the *roi mehaingne* ("maimed king") in close imitation of the *Queste del saint Graal*.

The didactic themes of the romance are the fragility of civilized life and the importance of religious renewal. The author seeks to show that the gains of civilization, represented by chivalry, religion, and political stability, are constantly being menaced by threats of war and invasion. Between the paganism of Alexander and the Christianity of Arthur are many vicissitudes, but after each trial Britain is able to pick itself up again and continue, refortified, on the road to becoming a civilized Christian kingdom.

# *PERCEVAL CONTINUATIONS*

. Chrétien de Troyes's *Perceval,* or the *Conte du Graal* (ca. 1181–90), which breaks off in mid-sentence, inspired a series of four continuations within the following half-century. Of the fifteen manuscripts containing Chrétien's poem, eleven have one or more of the continuations, and in most there is no break indicated and the handwriting of the continuations is identical to that of Chrétien's work. The most common pattern, found in six manuscripts, is to have Chrétien's *Perceval* followed by the *First Continuation,* the *Second Continuation,* and the *Manessier Continuation*. In two manuscripts, the *Gerbert*

*de Montreuil Continuation* is intercalated between the *Second Continuation* and *Manessier*.

Composed in the late 12th century, the *First Continuation* (also known as the *Pseudo-Wauchier Continuation* or *Gawain Continuation*) exists in three distinct versions, ranging from about 9,500 lines to 19,600. All three, however, tell essentially the same story, centering the action on Gawain, Arthur's nephew, whose adventures in search of the Grail castle were being recounted when Chrétien's poem was interrupted. It opens with Gawain's defeat of Guiromelant, who is spared at the urging of Gawain's sister Clarissant, who loves him. When Arthur weds Clarissant to Guiromelant without obliging him to retract his charge of treason against Gawain, his nephew leaves court in a huff and rides to the Grail castle, where he observes a Grail procession that differs in important details from that described by Chrétien. Most significantly, he sees a bier covered by a silk cloth; there is a body in the bier and a broken sword upon the cloth; he who can perfectly mend the sword would know all the secrets of the Grail castle. But Gawain falls asleep and fails. The next morning he rides off to Escavalon to do battle with Guinganbresil, who had accused Gawain of treason for killing his lord. But before combat begins, Arthur arrives and makes peace by marrying his granddaughter to Guinganbresil. At this point are interpolated the adventures of Sir Carados, which form essentially an independent romance bearing no direct relationship to the Grail quest. It includes a beheading game similar to that in the English romance Sir *Gawain and the Green Knight,* an enchanted serpent that attaches itself to Carados's arm, and a chastity test with a magic drinking horn. Later in the romance, Gawain, mysteriously returned to the Grail castle, learns that the Bleeding Lance was the one with which Longinus pierced Christ's side at the Crucifixion. Once again, he fails to mend the sword and falls asleep before he can hear the other secrets of the castle. The following morning, he awakens beside the sea and discovers the land to be once again green and fertile. The final episode involves Gawain's brother Guerrehet in an adventure with a swan-drawn boat, in which is found a corpse with the broken end of a lance sticking in his chest that only Guerrehet can remove.

Although it effects a smooth transition from Chrétien's text, the *First Continuation* soon charts new territory: it loses track of the Gawain-Perceval parallel pursued by Chrétien to concentrate on Gawain and his brother Guerrehet; it christianizes the Grail and Bleeding Lance; and it stresses the magical aspects of the story at the expense of Chrétien's psychological realism.

The 13,000 lines of the *Second Continuation* (also called the *Wauchier de Denain Continuation* or *Perceval Continuation*) were composed in the last decade of the 12th century by Wauchier de Denain, known for his free translation of the *Vitae patrum* for Philippe de Namur (r. 1196–1212). Attention shifts back to Perceval's adventures. After defeating the Lord of the Horn, Perceval plays chess on a magical chessboard and falls in love with a maiden who will return his love only if he brings her the head of a white stag; she lends him her dog for the hunt, but the head and dog are stolen from him. Seeking to recover the head and dog, Perceval meets with a long series of adventures, in which he slays a giant, defeats a White Knight, and fights Gawain's son, the "Fair Unknown," to a draw. After a brief interlude with his lady, Blancheflor, Perceval must continue the quest. He returns to his mother's castle ten years after having first left it; there, he sees his sister for the first time and learns how his mother had died at his departure. With his sister,

Perceval returns to the hermit uncle he had met in Chrétien's romance, who gives him a lesson on repentence. He finally recovers the stag's head and dog and sets out to return them to the maiden. En route, he encounters another maiden, who gives him her magic ring and white mule to lead him to the Grail castle. But he turns aside to attend a tournament at Proud Castle, where Arthur and his knights will also be. Perceval in disguise defeats all of Arthur's greatest knights, culminating with Gawain. Diverted by the tournament from reaching the Grail castle, Perceval must return the ring and mule. The poem continues with Gawain's adventures for several thousand lines, including an encounter with his son, Guiglain, the "Fair Unknown," before returning to Perceval, who finally reaches the Grail castle and joins the two pieces of the broken sword, leaving just a tiny nick; the *Second Continuation* then breaks off before the Fisher King can explain the meaning of the Grail symbols.

Like the *First Continuation,* the *Second Continuation* seeks to avoid closure by multiplying adventures and introducing new themes and motifs; even more directly than its predecessor, it insists on the Christian significance of the Grail, which has become the vessel into which Christ's blood flowed at the Crucifixion.

Most manuscripts continue immediately with Manes-sier's *Third Continuation* (ca. 11,000 lines), composed between 1214 and 1227 (or between 1233 and 1237, according to Corley) for Jeanne de Constantinople, count-ess of Flanders and Hainaut, the grandniece of Philippe de Flandre, for whom Chrétien wrote his *Conte du Graal.* Manessier's continuation begins with the Fisher King's explanation of the Grail mysteries: the Lance is that of Longinus; the Grail was used by Joseph of Arimathea to catch Christ's blood; the trencher covered the Grail so that the Holy Blood would not be exposed; the sword had been broken when the traitor Partinial of the Red Tower slew the Fisher King's brother, and in his grief the Fisher King crippled himself with the broken pieces. Perceval sets out to avenge the Fisher King and soon joins up with Sagremor, whom he helps to defeat ten knights. The story continues with Sagremor's adventures, and then Gawain's, before returning to Perceval, who in a chapel battles the Devil himself, in the form of a detached hand and black arm, and finally defeats him by making the sign of the cross. He overcomes other demons and, eventually, in the company of the Coward Knight, triumphs over Arthur's knights at yet another tournament. Perceval finally reaches the Red Tower and slays Partinial, then hastens to inform the Fisher King, who is immediately healed and discovers that he is Perceval's maternal uncle. Perceval returns in triumph to Arthur's court but is soon summoned to reign after the Fisher King's death. He restores the land in seven years, then retires to a hermitage, where he lives another ten years, sustained only by the Grail. When he dies, the Holy Grail, Lance, and trencher accompany his soul to Heaven and will never again be seen on earth.

Manessier finally brings to a close the adventures of the Grail, stamping them with a religious tone even more marked than in the earlier continuations: demons assume a real presence as physical adversaries of the hero; Perceval retires to a hermitage and eventually becomes a priest; religious symbolism pervades the whole. It has been suggested that Manessier's continuation influenced the long version of the *First Continuation* in its treatment of the Grail as a relic of the Last Supper and Crucifixion.

In addition to the four continuations, two manuscripts offer a preface of 1,282 lines, composed late in the 13th century, of which the first 484 lines are called the *Elucidation*

and the rest *Bliocadran*. The former is a rhymed "table of contents" to the Grail story; while the latter tells of the death of Perceval's father and brothers in pursuit of chivalry.

# PÉRIGUEUX

. Périgueux (Dordogne), the capital of old Périgord, resulted from the union in 1240 of two contiguous cities: Gallo-Roman Vésone, an early episcopal see, and Puy-Saint-Front, a bustling commercial center that had developed around the tomb and monastery of Saint-Front, the apostle of the Périgord. Vésone was the principal *oppidum* of the Gallo-Roman Petrocores, who gave their name to the medieval city and province. Under the Romans, the city became one of the most beautiful in Aquitaine, with temples, a forum, villas, baths, and an arena. Although the Roman town was overrun by the Alemanni in the 3rd century, and later by Visigoths, Franks, and Vikings, it retains many impressive Roman ruins. In 1360 Périgueux was ceded to the English, but it soon rallied to the cause of Charles V, and it
Périgueux, Saint-Front, plan. After
Secret.

Périgueux (Dordogne), Saint-Front.

Stoddard.*

was from Périgueux that Bertrand du Guesclin launched his raids against English
strongholds in Guyenne.

Architecturally significant are the domed churches, Saint-Étienne-de-la-Cité and Saint-Front. The origin and chronology of this distinctive type of church architecture are controversial. Returning crusaders have been credited with the inspiration, and the former cathedral of Saint-Étienne-de-la-Cité is usually considered the prototype.

Despite the loss of its western tower-porch and two domed western bays, Saint-Étienne is striking for the purity and harmony of its simple geometric forms. The present western bay is an original 11th-century construction; its broad pointed arches, supported by massive piers, carry a hemispherical dome on pendentives. Blind arcades, once surmounted by open passageways as in the eastern bay, relieve the severity of the nave walls. The design of the elegant eastern bay, lit by a triplet of windows in each wall, dates from the second quarter of the 12th century. After the Huguenot destruction of 1577, this bay, with its high cupola, was rebuilt following the original plan. The structure, nevertheless, remained truncated, and in 1669 the former monastic church of Saint-Front became the cathedral of Périgueux.

Saint-Front, celebrated for the exotic profile of its domes and lanterns, was almost entirely reconstructed by Abadie and Boeswillwald in the 19th century. The cathedral is composed of two churches. To the west are the remains of the "old church" of Bishop Frotaire (consecrated 1047), which had succeeded that of the 6th century built over the tomb of St. Front. The spacious new domed church was largely built after the fire of 1120, although some have attempted to date its earliest bays to the 11th century. Greek-cross in plan and surmounted by five domes, it was oriented toward the tomb of St. Front; the beautiful bell tower, largely restored on the exterior but conserving much of its interior configuration, marked the juncture of the two churches. The new church acquired its eastern orientation with the addition of apsidioles, a 14th-century Gothic chapel, and Abadie's apse. The lapidary gallery of the Musée du Périgord contains capitals, corbels, and decorative sculpture that survived the 19th-century restorations.

# *PERLESVAUS*

. Dating from the early 13th century, perhaps from its first decade, *Perlesvaus* is a French Arthurian prose romance that reworks the story of Perceval, with the hero renamed Perlesvaus (explained as *perd-les-vaus,* or "lose the vales" of Camelot). The work, also known as the *Haut livre du Graal,* is preserved in three manuscripts (Bodl. Lib., Hatton

82; Brussels, Bibl. Roy. 11145; Chantilly 626) and two fragments, as well as a 14th-century Welsh translation.

Divided into eleven branches, and running to more than 10,000 lines of printed prose in the Nitze-Jenkins edition, *Perlesvaus* offers a dense and complex narrative that emphasizes in particular the adventures of Gawain, Lancelot, and Perlesvaus. The first two fail in their Grail quests: Gawain sees the Grail but does not ask the question; Lancelot finds and enters the Grail castle, but, owing to his sinful love for the queen, the Grail does not appear; Perlesvaus, in Branch 9, eventually succeeds. His success consists, however, of his liberating the Grail castle; there is this time no Grail procession, and since the Fisher King is now dead the anticipated Grail question is not asked.

The spirit of the work is militantly religious, and the intense action is characterized by liberal bloodshed, often in the interests of Christianity and often to hasten the process by which the New Law supplants the Old. The pervasive symbolism of the romance is generally explicit, as when the author announces that a certain damsel represents Fortune; elsewhere, symbolic meanings may be indicated, effectively but without subtlety, by the names borne by characters, such as Perlesvaus's mother Yglais (suggesting "Church"; cf. Fr. *église*), and the Fisher King Messios ("Messiah").

Colophons in two manuscripts claim that the *Perlesvaus* had its origin in the "Island of Avalon," assumed to be Glastonbury; its modern editors describe it as "Glastonbury propaganda," doubtless related to, if not inspired directly by, the purported 1191 discovery of Arthur's and Guenevere's bodies at Glastonbury abbey.

An original and important recasting of the Grail material and a masterpiece of early French prose, the *Perlesvaus* was soon overshadowed by the great 13th-century Vulgate Cycle. Its continuing appeal is indicated, however, by the fact that it was printed twice during the 16th century (1516 and 1523) as part of an Arthurian trilogy that also included the Vulgate *Estoire del saint Graal* and the *Queste del saint Graal*.

# PÉROTIN

(Perotinus; fl. late 12th-early 13th c.). Because he composed liturgical vocal polyphony at Notre-Dame for two, three, and four parts (each part sung by a soloist) and employed the rhythmic modes, sophisticated devices of repetition and voice exchange, unprecedented length, and important notational innovations, Pérotin was the most significant musical

figure of the early 13th century. His achievements profoundly influenced the course of Western music. The music theorists Johannes de Garlandia and Anonymous 4 mention "Magister Perotinus," but only the latter lists seven of his musical compositions and chronologically places him as "the best discantor" among other singers, composers, and notators working in Paris from the late 12th to late 13th century. Anonymous 4 credits Pérotin with the polyphony found today at the beginning of each of the three major extant Notre-Dame sources (*W1*, F, and W2): the Graduals *Viderunt omnes* and *Sederunt principes,* both for four voices, and adds to the list threepart polyphony for the Alleluia *Posui adiutorium* and Alleluia *Nativitas,* and three conductus, the three-part *Salvatoris hodie,* the two-part *Dum sigillum,* and the mono-phonic *Beata viscera*. On the basis of stylistic affinity with these works, several other works in the Notre-Dame sources have been credited to him. Anonymous 4's statement that Pérotin made many clausulae and edited, revised, or shortened Léonin's *Magnus liber organi* has led many to attribute to him one or more of the series of independent discant clausulae that survive in *W1* and *F*.

Petrus, succentor (subcantor) of the cathedral ca. 1207–38, has been proposed as the most probable identity for Anonymous 4's "*Perotinus optimus* discantor," partly because responsibility for the daily services at the cathedral would have fallen to the succentor rather than the cantor, whose post had become largely administrative. Petrus' dates seem to correlate with Anonymous 4's description of Léonin's *Magnus liber organi,* which he stated was in use until the time of Pérotin, while Pérotin's "book or books" were used in the cathedral of Notre-Dame in Paris up to Anonymous 4's own time, probably the 1280s. Hans Tischler and others have maintained, however, that Pérotin lived ca. 1155/60–1200/05, largely on the basis that ordinances issued in 1198 and 1199 by Odo de Sully, bishop of Paris, sanctioned performance of three- and fourpart organum at Notre-Dame during Christmas Week. That Pérotin's composition of the four-part polyphony for *Viderunt omnes* and *Sederunt principes* might have elicited these decrees can only be conjectured. The dating of Pérotin's polyphony is particularly important to a history of the musical style of the period. If it dates generally before 1200, that would mean that the rhythmic modes and their notation as well as the discant clausula and consequently the early motet were well advanced at the very beginning of the 13th century.

# PERPIGNAN

. Founded in the 10th century, Perpignan (Pyrénées-Orientales) became the capital of Majorca from 1276 to 1344; it was later incorporated into the principality of Catalonia, in which it was second in importance only to Barcelona. It was here that King Philip III the Bold died while at war with Peter III of Aragon. In the 13th and 14th centuries, Perpignan was an important center of the textile industry. The Palace of the Kings of Majorca, begun in 1276 in Catalan Gothic style on a rectangular plan, is eloquent testimony to the wealth and prestige of Perpignan. It opens onto a large central courtyard with, on two sides, arcades supporting elegant loggias. A third side has superimposed chapels of the 14th century with 15th-century murals. Further witness to the military importance of the town is the Castillet, an imposing rose-brick fort with machicolations and battlements erected in 1367 and enlarged in 1483. The citadel dates from the 16th century.

The cathedral of Saint-Jean was begun in 1324 in Catalan Gothic style but completed only in 1509. It has a broad aisleless nave and a spacious apse with polygonal radiating chapels. Within these are a series of 15th- and 16th-century altar frontals in Catalan style. The earlier church of Saint-Jean-le-Vieux, begun in the 11th century, has a spacious nave from the early 13th century. The Ro-manesque sculpture on the main portal, with its elegant statue of Christ, is noteworthy.

# PERSONAL NAMES

. Among the aristocracy in medieval France, one's personal name was an integral part of one's identity. The name attached the person firmly to a group of relatives. Between late antiquity and the end of the 11th century, a person had only one name, that given at baptism. In the late 11th century, when noble men and women began to adopt *cognomina,* so that someone who might previously have been known simply as "Milo" might now be known as "Milo of Noyers," the personal name was still the person's chief identification. The *cognomen* was not a last name in the modern sense. If a loconym, as most were, it changed if a noble changed his residence and was held by everyone living in the same place, whether or not they were related. Throughout the 12th century, someone might appear in some charters with a *cognomen* and in other charters without it.

In the early Middle Ages, both Roman and Germanic names were in circulation among the aristocracy; a secular lord sometimes had a Germanic name while his ecclesiastical brother had a Roman name. Whatever type of name a person was given, it seems in most cases to have been either the name or a variation of the name of a close relative. Until the 9th century, Germanic names commonly had two elements; parents could recombine elements of their own and their relatives' names in assigning names for their children. For example, at the end of the 8th century, the noble couple Witburgis and William, ancestors of the dukes of Aquitaine, named two of their children Witcher and Helimburgis. The recombination of name elements resulted in an enormous number of personal names in circulation.

From the 9th to the 12th centuries, noble children were generally given complete names that identified them with close relatives. No generalized naming "rules" obtained, even within a single lineage, but a child was much more likely to be named for some people than for others. In most cases, parents chose the names of people they had known personally, rarely related more distantly than an aunt or uncle.

In by far the majority of cases, at least through the 11th century, both boys and girls were given names identifying them with their father's side of the family. Only if the mother's lineage was more important than the father's were any of a couple's boys named for her male relatives. Girls, too, were routinely named for their fathers' mother, sisters, and aunts. Among the upper aristocracy of the 9th and 10th centuries, the only group whose naming patterns can be clearly discerned, girls were almost never named for their own mothers. New women's names nevertheless constantly entered noble lineages, for even if a woman did not name a daughter for herself, each of her sons might name a daughter for her. In the 11th and 12th centuries, however, it became more common for a man to name a daughter for his own wife, or even in some cases for that wife's mother, an unheard-of practice earlier.

The oldest children were named the most assiduously for relatives. The oldest boy was generally named for his father or paternal grandfather. As a result, many lineages consisted of men all having the same personal name, or an alternation of two names, if boys were named for grandfa-thers with names different from their fathers'. The father's or grandfather's name, an integral part of the lineage's inheritance, was important enough that it was usually given to another son if the oldest died. Younger sons might be named for their paternal uncles or great-uncles or, if he was a particularly important man, for their maternal grandfather. In some cases, younger sons might also be named for important allies. Less powerful members of the aristocracy commonly named their sons, often even the oldest ones, for their lords rather than their own relatives. These lords may often have served as godfathers. The oldest girl was most commonly named for her father's mother; her sisters were named for their paternal aunts and great-aunts and, increasingly in the 11th and 12th centuries, for their own mother or maternal grandmother. Children destined for a clerical life were frequently named for relatives already in the church.

The decision what to name a child could be a difficult one for medieval parents. With no set rules to follow, all parents had to decide individually what names to give their children, names that would identify them with close relatives at the same time as they were an integral part of the children's own identity.

# PETER COMESTOR

(ca. 1000–1178). Born in Troyes, Peter became in 1147 dean of the cathedral there. Sometime before 1159, he went to Paris, where he studied under Peter Lombard and later taught theology. He became chancellor of the cathedral of Notre-Dame between 1164 and 1168. He died in 1178 and was buried at the abbey of Saint-Victor. Although known primarily for the *Historia scholastica,* Peter wrote other works, including some 150 sermons, the *Summa de sacramentis* (based on Peter Lombard's *Senten*tiae), some *quaestiones,* and commentaries on the Gospels, as well as glosses on the *Glossa ordinaria,* on the *Magna glossatura* of Peter Lombard, and perhaps on Lombard's *Sententiae*. The *Historia scholastica,* used in the schools and later in the university curriculum, was a narrative presentation of biblical history from Creation through the life of Jesus. Peter here sought to counteract what he saw as the destruction of the connected literal-historical sense of the text through the practice of a spiritual exegesis that tended to divide the text into brief "fragments" for symbolic interpretation. Peter not only drew upon traditional patristic authors for the historical sense; he also used Josephus's *Jewish Antiquities* and the commentaries on the *Octateuch* by Andrew of Saint-Victor. In a practical way, Peter continued the emphasis on reading Scripture according to the literal-historical sense that had been established at the abbey of Saint-Victor by Hugh of Saint-Victor.

# PETER DE BRUYS

(d. ca. 1140). Peter de Bruys seems to have been a priest from the area of Embrun (Hautes-Alpes), who, deprived of his office, took to idiosyncratic preaching. He moved from his parish of Embrun through Languedoc and farther west. Peter's antiecclesiastical message attracted large crowds. The sources of his ideas are unclear, although they may be related to those of the Bogomils. He died at Saint-Gilles, near Nîmes, thrown into a fire in which he was burning crucifixes.

The beliefs of Peter's followers, the Petrobrusians, are known to us from the *Tractatus adversos Petrobrusianos haereticos* of Peter the Venerable and the *Introductio ad theologiam* of Peter Abélard. Believing in the spiritual unity of the church, they rejected what they saw as the merely external. Hence, they denied sacraments, especially infant baptism and the Mass, prayers for the dead, church buildings (*all* places belonged to God), veneration of crucifixes (as recrucifying Christ), the authority of the church (as having no foundation), and a large part of the Bible, especially the Old Testament. Although they rejected these external things as encumbrances, they did not, unlike many sects of the time, embrace apostolic poverty. Petrobrusians took a literalist view of the Gospels as depicting historical events, such as the Last Supper, that could have no greater value through reenactment.

The Petrobrusians believed in direct action: they forced monks to marry, abused priests, ate meat on fast days, and burned crucifixes. Unsurprisingly, Peter's teaching was frequently condemned, as at the Second Lateran Council (1139).

# PETER LOMBARD

(ca. 1100–1160). The "Master of the Sentences," born and educated in Novara, Lombardy, arrived in Paris via Reims (ca. 1135) with a letter of recommendation from

Bernard of Clairvaux to Abbot Gilduin of Saint-Victor. While he apparently never taught at the abbey, Peter did preach there, and he maintained close ties with Saint-Victor throughout his life.

The Lombard soon made himself a reputation as a formidable theologian. By 1142–43, he had the dubious distinction of being named by Gerhoch of Reichersberg as a dangerous innovator; in 1148, he was summoned by Pope Eugenius III to the Consistory of Reims to help judge the orthodoxy of another innovator, Gilbert of Poitiers, whose christology Peter found lacking. Teaching at Notre-Dame by 1143, he was a canon by 1145 and steadily rose in rank (subdeacon by 1147, deacon by 1150, archdeacon by 1157). In 1158, his years of service were crowned by his election as bishop of Paris; this honor was short-lived, as he died in 1160.

The earliest works of the Lombard are his commentaries on the Psalms (before 1138) and on the epistles of Paul (by 1142). Though Herbert of Bosham reports that Peter meant them for his personal edification only and that he never finished them, they were swiftly and widely circulated, often even replacing the marginal-interlinear glosses for the Psalms and epistles in the *Glossa ordinaria*. Known as the *Magna glossatura,* they became the most frequently cited works of Scripture exegesis in the Middle Ages. Peter based his two commentaries on a close reading of Anselm of Laon's glosses and Gilbert of Poitiers's biblical commentaries. He kept the *Glossa's* patristic and Carolingian base, took over Gilbert's organization scheme and hermeneutic principles, and consistently worked out doctrinal positions and current theological issues in connection with the scriptural text.

Even more central to the history of medieval theology and philosophy is the Lombard's *Quattuor libri sententiarum,* or the *Sententiae*. Sentence collections proliferated in the 12th century, as theologians strove to systematize and professionalize their field. Peter Lombard's *Sententiae* (1155–57) became an instant and enduring success throughout Europe (legislated into the theological curriculum of the University of Paris in 1215) and remained without serious competition until replaced by the *Summa* of Thomas Aquinas in the 16th century. It was second only to the Bible in importance in theological training; hundreds of theologians wrote commentaries on the *Sententiae*. The reasons for its success have recently been set forth in a effort to restore the luster to the Lombard's tired reputation. Its comprehensive coverage of topics, logical order, lack of dependence on or promotion of any elaborate philosophical system, sensitivity to the need for clarity and consistency in theological language, and readiness to address controversial issues while acknowledging contemporary consensus, all ensured the utility of the *Sententiae* to generations of theologians and philosophers. In addition, Peter's christology avoided many of the semantic pitfalls that plagued contemporary theologians; his Trinitarian views were solemnly ratified at the Fourth Lateran Council in 1215.

# PETER OF CELLE

(d. 1182). Born in the early 12th century in Aunoy-les-Minimes, Peter probably studied in the schools of Paris before entering the monastery of Montier-la-Celle, where he eventually became abbot. While Peter was at Celle, John of Salisbury visited him and dedicted the *Policratus* to him. In 1162, Peter was made abbot of the monastery of Saint-Remi in Reims, and in 1180 he became bishop of Chartres.

A supporter of monastic reform and strict observance of the monastic rule, Peter corresponded with leading monastic figures of his day and was appointed by Pope Alexander III to mediate quarrels and press for reform. He had an especially close relationship with the Carthusian house of Mont-Dieu and was a promoter of the Carthusians. He supported Alexander III in the dispute over papal succession. Some 175 of Peter's letters survive, in addition to ninety-six sermons and a number of treatises. His letters reveal him as involved in many of the major events and crises of his day, including the Becket affair, while his sermons and treatises address matters of theology, worship, clerical responsibility, and the monastic life.

# PETER OF POITIERS

(d. 1205). Master in theology at Paris from ca. 1167, successor (1169) to the chair in theology held by Peter Comestor, and chancellor of the schools of Paris from 1193. Peter of Poitiers (to be distinguished from another contemporary Peter of Poitiers, a regular canon of the abbey of Saint-Victor at Paris) was a leading figure in the Parisian schools in the last third of the 12th century. A student under Peter Lombard and a strong supporter of the Lombard's theology when it came under attack in the last decades of the 12th century, Peter of Poitiers was a determined advocate of the usefulness of dialectics in theology. He was also influenced by the Victorine tradition, represented by Hugh and Richard of Saint-Victor, Peter Comestor, and Peter the Chanter, that emphasized both historical study and the importance of biblical allegory. Four of Peter's works reveal these influences and also Peter's distinctive contributions to theological, historical, and exegetical-homiletic studies in the schools of Paris.

Peter's *Sententiarum libri quinque* (probably before 1170) is modeled directly on the dialectical method as used by Peter Lombard in his *Quattuor libri sententiarum* and also draws upon its content. Peter's work is not, however, a commentary on the Lombard's but is his own formulation of a "compendium of theology" to instruct those who are beginning the study of Scripture. Peter's faithfulness to the Lombard's thought earned him the distinction of being included with the Lombard, Gilbert of Poitiers, and Abélard as one of the "four labyrinths of France" in Walter of Saint-Victor's antidialectical polemic.

Three of Peter's works on scriptural interpretation deserve mention. *Allegoriae super tabernaculum Moysis* explicates the four senses of scriptural interpretation (history, allegory, tropology, and anagogy) and presents a detailed allegorical interpretation of the materials, construction, associated objects, and other aspects of the Tabernacle of Moses. *Compendium historiae in genealogia Christi* is a work of historical explication in service of biblical exegesis. By means of a grand genealogical schematic, with accompanying text, extending from Adam and Eve to Jesus Christ, Peter sketched out the essentials of biblical history for beginning students. Tradition held that he was the first to draw genealogical "trees" on animal skins and hang them on classroom walls in order to instruct students. Finally, *Distinctiones super psalterium* is part of a move within the schools to make resources for biblically based preaching more accessible to students and preachers. The *Distinctiones* takes a word from a psalm and gives a set of meanings, the *distinctio,* all supported by references to other passages of Scripture. Thus, the reader had ready at hand a compendium of many symbolic interpretations of such words as "bed," "fire," or "stone." Some manuscripts present the work as a continuous prose text; others have a schematic structure, with the "key word" in the margin and a series of red lines connecting with the meanings. Such a handbook would be of great use to preachers searching for allegories, and Peter's book is similar in its intent to Peter the Chanter's *Summa Abel* and Praepositinus of Cremona's *Summa super psalterium.*

# PETER OF POITIERS

(of Saint-Victor; d. after 1216). Not to be confused with Peter of Poitiers, chancellor of the cathedral of Notre-Dame in Paris, or Peter of Poitiers, secretary to Peter the Venerable, this Peter was a regular canon of the abbey of Saint-Victor at Paris charged with the responsibility of hearing confessions, especially of students in the schools. Essentially nothing is known of his life. About 1215, he wrote a *summa confessorum,* or handbook for confessors, entitled *Compilatio praesens,* to guide priests in administering the sacrament of penance. Peter of Poitiers frequently used the works of Peter the Chanter and cited his *Summa de sacramentis,* thus making Peter of Poitiers one of the masters and ecclesiastics who may be counted in the "circle of Peter the Chanter." Peter's *Compilatio praesens* was part of the literature of handbooks for confessors that became necessary after the Fourth Lateran Council decreed, in canon 21, that every person should commune once per year and should confess to a priest before communing. An introduction, conclusion, and other additions to the text were provided by James of Saint-Victor several years after Peter completed his work.

# PETER RIGA

(ca. 1140–1209). Born in Reims and later canon in the cathedral there, Peter composed one of the most popular versified Bibles of the Middle Ages. Entitled *Aurora,* this work went through three successive versions, in which Peter continually expanded the contents. In its final form, the poem comprised over 15,000 verses, most in couplets but with rhymed hexameters for the Acts of the Apostles, Song of Songs, and Job. It combines versified texts, narratives, and commentaries on texts, demonstrating Peter's skill as a poet and his ability to put both narratives and commentary into verse. *Aurora* was immediately used by other poets in their works: Jean Malkaraume utilized passages in his versified Bible; Macé de la Charité translated it for his French Bible; in England, it was used in the Middle English *Cursor mundi* and by John Gower in *Vox clamantis*. Peter also wrote *Floridus aspectus,* containing an "art of poetry" and a collection of poems based on biblical texts.

# PETER THE CHANTER

(d. 1197). Born near Beauvais, Peter studied at Reims and by ca. 1173 was a master in theology in the schools of Paris. In 1183, he was named chanter of the cathedral of Notre-Dame in Paris. Peter was judge delegate for the pope on a number of occasions, including the divorce trial of Philip II Augustus (1196). He was elected dean of the cathedral of Reims in 1196, but he became ill and was unable to take the position. He entered the Cistercian abbey of Longpont as a monk and died there.

As a teacher in the schools, Peter exerted a remarkable influence on both students and peers. He was at the center, with Peter Comestor and Stephen Langton, of what Beryl Smalley (following Grabmann) called the "biblical moral school," a group of masters in the late 12th-century schools who followed the emphasis on biblical study developed at the abbey of Saint-Victor by Hugh, Richard, and Andrew of Saint-Victor.

While most masters of the day commented only on the Psalms and Gospels, Peter, like Stephen Langton, commented on all the books of the Old and New Testaments. Moreover, Peter was critical of those masters who devoted themselves to seeking out details of the text and its interpretation rather than focusing on the important matters of moral teaching and behavior.

In addition to his lectures on Scripture (which were taken down as *reportationes by* his students), the Chanter devoted much of his time to lecturing and disputing on moral questions; he found the 12th-century church desperately lacking when compared with gospel injunctions and Paul's teaching. Dedicated to testing present practice against the straightforward teaching of Scripture, he was, however, a realist who saw that seriously embracing scripturally based reform could lead to criticism of accepted practices in the church of his day. He raised and resolved hundreds of moral "questions," which were incorporated in his *Summa de sacramentis et animae consiliis.* The questions, with numerous exempla to illustrate situations and conclusions, were grouped according to the sacraments of the church (baptism, confirmation, extreme unction, consecration of churches, the eucharist, and penance). All systematization seems to have given way in the section on penance, for it is a vast collection of case after case for analysis and resolution. Peter's *Verbum abbreviatum* is also directed toward moral concerns, this time with copious citations of passages from "authorities" (Scripture, Christian writers, classical authors) and exempla to discourage vice and promote virtue. Although Peter was recognized as a preacher, no sermons have survived. He was tireless in his devotion to ecclesiastical duties and to the work of a master in lecturing on Scripture, posing questions for resolution through disputation, and providing in his writings the outcome, in a text, of his labors in the classroom.

# PETER THE VENERABLE

(1092/94–1156). Born into the noble Montbossier family in Auvergne, Peter was dedicated by his mother as a child oblate to the Cluniac monastery of Sauxillanges, where he was educated. He became a monk of Cluny not long before 1109. Four of his six brothers also entered ecclesiastical careers; one became archbishop of Lyon while the other three were abbots of Vézelay, La Chaise-Dieu, and Manglieu. Peter served as prior of Vézelay and of Domène before being elected abbot of Cluny in 1122. He proved to be a skillful administrator of a vast monastic organization comprising over 1,000 dependent monasteries and priories; he was also an influential ecclesiastical leader, had scholarly interests, and was a strong defender of Cluniac customs against Cistercian criticisms. His extensive correspondence with notables throughout the western church (193 extant

letters) is a rich source of information about various matters, both ecclesiastical and secular, including the world of learning and spirituality. Although Peter and Bernard of Clairvaux were in opposition on matters of monastic discipline and practice, they remained friends throughout life, as their letters reveal. Peter's health was never good, and he probably suffered from malaria on several occasions and from chronic bronchitis.

Peter's election to the abbacy of Cluny came at a time when the order needed a firm hand, following the disastrous abbacy of Pons de Melgeuil and the brief four-month abbacy of Hugues II. Monastic discipline was lax; finances needed attention; the large sprawling Cluniac order needed an effective leader. Peter rose to the occasion. He began to enforce a more strict discipline, attended to finances, and traveled often to deal with problems within the order. He was moderate in demands, conservative in outlook, conciliatory in approach, and thoughtful in controversy. Peter became enmeshed in the controversy between Cistercians and Cluniacs, which was marked by heated exchanges on both sides. Peter's Letter 28, a response (if not directly, at least in effect) to Bernard of Clairvaux's *Apologia ad Guillelmum* as well as the general Cistercian attack on Cluniac laxity in discipline and departure from the *Rule* of St. Benedict, is a carefully reasoned defense of the Cluniac way of life and offers one of the best sources for understanding both the conflict and the Cluniac point of view. Peter was no idle defender of the *status* quo, however; he actively reformed and strengthened Cluniac discipline.

Peter wrote against both heresy (the Petrobrusians *[Tractatus adversos Petrobrusianos haereticos]*) and non-Christian religions (Judaism *[Adversos Judaeorum inveteratum duritiem]* and Islam *[Epistola de translatione sua; Summa totius haeresis Saracenorum]*). After a journey to Spain in 1142, he commissioned a translation of the Qur'an, the first into Latin, and other Arabic texts, so that he might better understand Islam in order to refute it with reason rather than force. In writing against Judaism, he respected the Hebrew version of Scripture and argued without special pleading from Christian Scripture, i.e. the New Testament.

In addition to his numerous journeys in France, Peter traveled to England (1130 and 1155), Spain (1142; perhaps 1124 and 1127), and Rome (1139 [Lateran Council], 1144, 1145, 1147, 1151–52, 1154). He extended the hospitality of Cluny to Peter Abélard after Abélard's condemnation at Sens in 1140. Peter the Venerable wrote to Héloïse a sensitive letter giving a detailed account of Abélard's last days. In addition to the works mentioned above, his writings include sermons, liturgical texts (including an Office of the Transfiguration), hymns, and a treatise recounting holy lives *(De miraculis)*. He was an exemplar of the best of the Benedictine tradition.

# PHILIP I

(1052–1108). King of France, 1059–1108. The son of Henry I (r. 1031–60) and Anne of Kiev, Philip was crowned king on May 23, 1059, and was still a child when his father died the following year. Baudouin V, count of Flanders (r. 1035–67), Philip's uncle by marriage, administered the royal government until Philip attained his majority in 1066. In that year, Baudouin's son-in-law, William the Conqueror, duke of Normandy, seized the throne of England.

During the next twenty-five years, Philip strove to assert his control over the royal domain and to expand it. He acquired Corbie, the Gâtinais, and the French Vexin; developed the system of *prevôts* to administer his holdings; and saw the central administration transformed from a curial to a palatial system, as the great officers of the crown and local castellans replaced the major territorial lords and prelates in validating royal acts. As reform swept the church, the king was under increasing pressure to forgo investiture of clergy and the profits of simony, while the ecclesiastical controversy surrounding Berengar of Tours (condemned in 1080) attested to new intellectual vigor in the kingdom. Philip also was able to exploit the conflicts among William the Conqueror's sons to acquire Gisors in 1090.

After 1092, everything focused on the scandal arising from the king's repudiation of his wife, Queen Bertha, and his bigamous marriage with Bertrade de Montfort, the fourth wife of Foulques IV, count of Anjou. Excommunications and absolutions alternated between 1094 and 1104, when Philip finally achieved normal relations with the papacy. During this time, his son, the future Louis VI, took more and more responsibility for ruling and for defending the Vexin against the attacks of William II Rufus of England (r. 1087–1100). The crown acquired another addition to the royal domain with the purchase of the viscounty of Bourges in 1101. Philip died at the end of July 1108 and was interred in the abbey of Saint-Benoîtsur-Loire (Fleury).

# PHILIP II AUGUSTUS

(1165–1223). King of France, 1180–1223. Philip II was the first great architect of the medieval French monarchy. Building upon the accomplishments of Louis VI and Louis VII, he began the process of converting feudal into national monarchy, expanding the crown's political and geographical influence, by his death in 1223, far beyond what they had been at his accession in 1180.

As was common in the case of kings ascending as children to the throne, Philip was initially dominated by powerful relatives, in his case the influential and wealthy ruling family of Champagne. His early struggle to assert royal influence was supported by his father's rival, Henry II of England, who denied himself the pleasure of taking advantage of the fifteen-year-old king's apparent weakness. A few years later, Henry probably wished that he had not been so honorable, since Philip utilized the traditional patricidal conflict traditional in the Angevin family against his former protector. This policy saw the French king triumphant over his father's ancient adversary and his sons by 1204, when the luckless King John saw the Angevin territories in France dissolve. By the end of his reign, Philip II had increased his territory nearly fourfold. The English loss of territory north of the Loire augmented the French ruler's lands, but he also added to his acquisitions by the forfeitures of contumacious vassals, by political duplicity, by cleverly arranged marriages, and by manipulation of the confusion over land possession arising from the Albigensian Crusade. Philip Augustus was not a great military leader; he was an astute politician.

Philip was the founder of the centralized bureaucratic state. He chose bourgeois administrators, as well as men from the lower nobility, to run his kingdom, men whose primary loyalty was to their king rather than to their class or to their families. Their offices were remunerated by salary rather than farmed. Philip used feudal rights to enhance his royal position; in his reign, the authority of the king began shifting slowly from his rights exercised as feudal suzerain to his rights exercised as sovereign; he was becoming less a private, feudal lord than a public figure of authority. This obviously contributed to a decline in the functional importance of the feudal structure (it was never a feudal *system*), as did the growing commutation of lordvassal relationships from mutually exchanged personal obligations into money payments. The administrators of Philip's domains, *baillis* and *prévôts,* were essentially estate managers, men with wide-ranging fiscal, judicial, military, and other responsibilities. Philip's financial administration improved greatly, his policies based upon the model of his newly conquered province, Normandy. He also made Paris what we moderns would call the capital of France.

Philip Augustus was, then, the monarch under whom French monarchy became more a practical than a theoretical concept. His domain, larger than the fief of any vassal, was to remain the dominant power base in France in succeeding generations. As Luchaire wrote, at Philip's death "the [Capetian] dynasty was solidly established, and France founded."

# PHILIP III THE BOLD

(1245–1285). King of France, 1270–85. As a boy, Philip appears to have been easygoing and easily influenced, especially by his mother, Marguerite of Provence. As a king, he was dominated at the outset by the counsels of Pierre de la Broce, a former adviser of his father, Louis IX. Later, he came under the influence of his uncle Charles, count of Anjou. Philip became king while on crusade to Tunis with his father, who died of illness during the siege of the city. Philip is the first king whose regnal years begin with the burial of his predecessor rather than the coronation of the new king, which in his case was delayed until 1271.

Although most scholars regard Philip's reign as a hiatus in the development of the monarchy, it was marked by important events. The death, childless, of his uncle and aunt, Alphonse of Poitiers and Jeanne de Toulouse, in 1271 on the way back from crusade brought their vast holdings in the south of France into the royal domain despite the importunities of Charles of Anjou, who coveted the fiefs. The acquisition of these lands by the crown sealed the ascendancy of the French in Languedoc. Philip carried on an active foreign policy. With the support of Charles of Anjou, he briefly put forward his candidacy to the imperial throne. He made efforts to draw neighboring German principalities under French influence. He aggressively defended Capetian family interests in Castile and Aragon. And he intervened with military success in Navarre when a succession crisis there in the mid-1270s threatened French interests.

Philip was drawn into war in Spain again toward the end of his reign when the Aragonese supported the rebellion of the Sicilians against Charles of Anjou (the Sicilian Vespers, 1282). Charles's pleas for support and the blessing of the pope led to the French crusade against Aragon, an ill-fated expedition across the Pyrénées in 1285, in which the French were routed. During the retreat, Philip III himself died.

Philip was married twice: first (1262) to Isabella of Aragon, who died in 1271 on the return from the crusade to Tunis. She was the mother of Philip's son and successor, Philip IV the Fair. In 1274, Philip III married Marie de Brabant, whose party at court was responsible for bringing an end to the influence of Pierre de la Broce; charged with treason, he was executed in 1278. Philip the Fair seems always to have had a strong dislike of Marie, about whom Pierre had spread ugly rumors. These included allegations that she and her party wanted to displace the children of her husband's first marriage by her own in the line of succession and that she had even poisoned Philip IV's older brother as part of her plan. No such conspiracy was ever proved, however, and the succession

proceeded smoothly even under the difficult circumstances of the crusade against Aragon.

# PHILIP IV THE FAIR

(1268–1314). King of France, 1285–1314. Philip expanded royal power within the kingdom and dominated the ecclesiastical and secular affairs of western Europe. The grandson of St. Louis, whose canonization he achieved in 1297, he imitated and attempted to surpass Louis's achievements. Served devotedly by a series of powerful ministers, he imposed his own stamp on governmental policies, instituting widespread consultation of his subjects, issuing a host of reform charters, canceling and returning taxes when the causes that prompted them ceased, and subordinating to his authority the dukes of Aquitaine/Guyenne (also kings of England) and the counts of Flanders. Attentive to matters of conscience and believing in his role as God's minister, he upheld Christian orthodoxy against Pope Boniface VIII and the Knights Templar, appealing to a general council against the pope and destroying the Templars; he obtained papal bulls forgiving him for sins he feared he might commit; he magnified the importance of the royal power to cure; in 1306, he expelled the Jews from France. Anxious to establish the full legitimacy and the glory of the Capetian house, he encouraged the reinterpretation of the Capetians' history. Upholding the highest standards of morality and publicizing his own scrupulosity, in 1314 he presided over the trial and execution of two knights charged with adultery with his own daughters-in-law, thus casting doubt on the legitimacy of his grandchildren.

Born between April and June 1268, while Louis IX was still ruling, Philip, second son of Philip III the Bold and Isabella of Aragon (d. 1271), had a troubled childhood, dominated by the scandals that erupted at court after his father's marriage in 1274 to Marie de Brabant, suspected of poisoning Philip's elder brother, who died in 1276, shortly before the death of his third brother. In 1284, Philip was knighted and married to Jeanne, heiress of Champagne and Navarre; he became king in 1285 after his father's death on a crusade against Aragon. Having extricated himself from the ill-fated venture, Philip avoided conflict for nine years, but in 1294 he precipitated war against the mighty Edward I of England, duke of Aquitaine/ Guyenne. Settled in 1303, the fruitless episode strained the kingdom's finances and led to manipulation of the currency. It resulted in the marriages of Philip's sister Marguerite to Edward in 1299 and of his daughter Isabella to Edward II in 1308; the latter union would give Edward III grounds for claiming the throne of France. The war also initiated a conflict with the Flemings, Edward I's allies and Philip's subjects, which, settled in 1305, broke out again in 1312 because of the harsh peace terms Philip imposed. Clerical taxation imposed for the war occasioned Boniface VIII's controversial bull *Clericis laicos* in 1296. From then until Boniface's death in

1303, Philip and the pope were locked in sporadic but bitter struggles involving the limits of secular jurisdiction over ecclesiastics. In the spring of 1303, Philip presided over assemblies in Paris that charged Boniface with heresy and immorality; in September 1303, the pope was violently attacked in Anagni when Philip's minister Guillaume de Nogaret summoned him to submit to the judgment of a council. Clement V, the Gascon-born cardinal who became pope in 1305, was more to the king's liking; he granted Philip many privileges and in 1311 accepted the suppression of the Knights Templar, the crusading order whose assets Philip had seized in 1307, again because he believed them guilty of heresy and immorality.

Philip failed to achieve some of his ambitions. He never succeeded in placing a relative on the imperial throne; his visionary scheme after his wife's death in 1305 to become ruler of the Holy Land was abortive. The power he exercised within the kingdom led, at the end of his reign, to the formation of leagues of disgruntled subjects protesting his fiscal and monetary policies and demanding the restoration of old customs; his eldest son and successor, Louis X (r. 1314–16), issued numerous charters to pacify them, and he sacrificed Philip's minister Enguerran de Marigny and other officials to their princely enemies at court. Philip used his three sons and his daughter to advance his own goals. Isabella married Edward II of England; Louis married Marguerite, daughter of the duke of Burgundy; Philip's wife, Jeanne, brought to the crown the county of Bur-gundy; Jeanne's mother, Mahaut of Artois, offered a dowry of 100,000 *livres* to persuade Philip to accept another daughter, Blanche, as the wife of his youngest son, the future Charles IV. The imprisonment of Marguerite and Blanche for adultery in 1314 was the first of a series of tragedies suffered by Philip's direct descendants. Because of the death of Louis X's posthumous son, John I, the product of a second marriage, the throne passed to Philip V (r. 1316–22); because he left no male heir, he was succeeded by Charles IV (r. 1322–28), at whose death without male heir the rule of the direct Capetians ended and the crown passed to the house of Valois.

# PHILIP V THE TALL

(1290/91–1322). King of France, 1316–22. Known as Magnus and *Le Long,* Philip succeeded his brother Louis X and Louis's posthumous son, John I, in 1316. Second son of Philip IV the Fair and Jeanne of Champagne and Navarre, Philip in January 1307

married Jeanne, daughter of Count Otto of Burgundy and Countess Mahaut of Artois. Because of a marriage contract concluded with Philip IV in 1295, Jeanne brought to France the county of Burgundy, held of the empire. From 1307, Philip was count of Burgundy and in 1311 was made count of Poitiers, but he had little power until Philip IV died. Louis X increased Philip's apanage and in August 1315 revoked Philip IV's deathbed restriction of Poitiers to male heirs. At Louis's death, Philip was in Lyon pressing for the election of a pope. As "first brother of the king" he received pledges of fidelity before returning *to* Paris for a second funeral service for Louis, which enabled him, as possible successor, to be present at a ceremony of interment. A solemn agreement regarding the succession, concluded on July 16, 1316, made Philip regent. It was vitiated by the birth and death of Louis's posthumous son in November 1316, and Philip was crowned on January 9, 1317.

Philip was a popular king. His wife had been cleared of adultery charges, and the couple had four daughters, and a son who died in February 1317. Philip showered his wife with property, including in September 1318 full rights to the county of Burgundy. During his reign, Philip instituted reform of central and local administration, reclaimed alienated crown lands, pacified the leagues that had disrupted Louis X's reign, received the homage of his brother-in-law Edward II of England, and achieved peace with Flanders. In 1321, he made an unprecedented, far-seeing, though finally abortive effort to secure the realm's financial support for reforming the coinage and weights and measures and for recovering crown lands.

Philip died on January 2/3, 1322, after a wasting illness. In the absence of a male heir, the crown passed to his brother, Charles of La Marche.

# PHILIP VI

(1293–1350). First Valois king of France, 1328–50. The son of Charles of Valois (brother of King Philip IV the Fair) and Marguerite, daughter of Charles II of Naples, Philip did not become an important figure until he inherited the counties of Valois, Anjou, and Maine from his father in 1325. By that time, the reigning monarch was Philip's first cousin Charles IV, who had no son or surviving brother. When Charles died at the end of January 1328, he left a pregnant queen, and the French magnates named Philip of Valois regent, with the understanding that he would become king if the queen gave birth to a daughter.

When a daughter was indeed born on April 1, Philip VI became king. He was crowned at Reims late in May, and then, at the behest of an important supporter, Louis I of
