## EDITOR IN CHIEF

**Pam J. Crabtree**

Associate Professor of Anthropology  
New York University

## ADVISORY BOARD

**Mario Azevedo**

Professor of Epidemiology and Biostatistics  
Professor of History and Scholar-in-Residence  
Jackson State University

**R. Hunt Davis**

Professor Emeritus of History and African Studies  
University of Florida

**Laura Lee Junker**

Associate Professor of Anthropology, Director of  
Graduate Studies  
University of Illinois at Chicago

**Eloise Quiñones Keber**

Professor of Art History  
Baruch College and The Graduate Center of the City  
University of New York

**S. M. Ghazanfar**

Professor of Economics Emeritus  
University of Idaho

## CONTRIBUTORS

**Charles W. Abbott**, Ph.D., is currently revising his dissertation on Nigerian hometown associations and ethnic unions toward a book. His chapter “Nigerians in North America: New frontiers, old associations?” appears in the edited volume *The New African Diaspora in North America* (Lexington Books).

**Olutayo Charles Adesina**, Ph.D., teaches at the Department of History, University of Ibadan, Nigeria. He is the author of “The Underground Foreign Exchange Market in Ibadan during Devaluation,” in *Money Struggles and City Life: Devaluation in Ibadan and Other Urban Centres in Southern Nigeria, 1986–96* (2002), and “Teaching History in Twentieth Century Nigeria: The Challenges of Change,” in *History in Africa: A Journal of Method*, vol. 33 (2006).

**Massoud Abdel Alim** is a writer, editor, and trainer for Fortune 1000 companies. He has an M.S. and M.B.A. and has written for many business and medical publications. He has lived in the Arab world and is especially interested in Islamic history.

**Mark W. Allen**, Ph.D., is associate professor of anthropology in the Department of Geography and Anthropology at California State Polytechnic University, Pomona. His most recent publications include coediting *The Archaeology of Warfare: Prehistories of Raiding and Conquest* (University Press of Florida, 2006) and “Hillforts and the Cycling of Maori Chiefdoms: Do Good Fences Make Good Neighbors?” in R. Reycraft and J. Railey (eds.), *Global Perspectives on the Collapse of Complex Society* (University of New Mexico Press, 2007).

**Miguel Arisa** is finishing his doctoral studies in art history at the Graduate Center, City University of New York. He teaches at Technical Career Institutes and is a regular lecturer at the Cloisters and a docent at the Metropolitan Museum of Art, New York.

**Rose Aslan** is a graduate student in Arab and Islamic civilizations at the American University in Cairo, Egypt. Her research interests include Sufi hermeneutics, Qur’anic exegesis, and Islamic theology.

**Peri Bearman** is associate director of the Islamic Legal Studies Program at Harvard Law School. She founded the journal

*Islamic Law and Society* and is an editor of the *Encyclopaedia of Islam*, New Edition, and coeditor, with Rudolph Peters and Frank E. Vogel, of *The Islamic School of Law: Evolution, Devolution, and Progress* (Cambridge, Mass. 2005) and, with Wolfhart Heinrichs and Bernard G. Weiss, of *The Law Applied: Contextualizing the Islamic Shari'a* (I. B. Tauris, 2007). An article by her hand on Islamic law in contemporary application appears in Oxford's *Encyclopedia of the Modern World* (Oxford University Press, 2008).

**Kirk H. Beetz**, Ph.D., emeritus, has published over two dozen books and more than 900 articles. His books span topics from endangered mammal species to children's literature, including *Exploring C. S. Lewis' "The Chronicles of Narnia"* (2000). His recent writings have focused on the history and culture of ancient Japan.

**Anne Berthelot** (Docteur ès Lettres) is professor of French and medieval studies at the University of Connecticut. She specializes in Arthurian literature with a comparatist approach. She has published several books on this topic, including *King Arthur and the Round Table* and, more recently, *La Légende du roi Arthur*.

**Amy Hackney Blackwell** has degrees in history from Duke University and Vanderbilt University and a J.D. from the University of Virginia. Her books include *Mythology for Dummies* (2002), *LSAT for Dummies* (2004), *The Everything Irish History and Heritage Book* (2004), and *Essential Dictionary of Law* (2004). She has contributed to the *Encyclopedia of World Nations and Cultures* (2006), *Alternative Energy* (2006), and *Chemical Compounds* (2006).

**Robert Bollt**, Ph.D., (University Hawai'i at Mānoa, 2005), specializes in the archaeology of East Polynesia. His concentration is on the Austral Islands, where he found and excavated the earliest-known site to-date. He is the author of *Peva: the Archaeology of an Austral Island Settlement* (Bishop Museum Press, 2007). He has also excavated sites in Hawai'i and the Marquesas. Primary interests include Polynesia material culture (mainly lithics), and patterns of long-distance exchange among islands, which is achieved by using geochemical sourcing analyses to trace stone tools to their geological source of origin. He also enjoys experimental archaeology, especially adze making. Additional interests include Polynesian subsistence strategies, human-environment relations, sociopolitical transformation, and warfare.

**Scott D. Briggs** is a freelance writer, essayist, and critic who has been active in the professional, amateur and small-press literary fields for more than 20 years, specializing in horror, fantasy, and science fiction literature; film; and rock and roll, pop, alternative, and modern classical music. He has written essays for upcoming critical anthologies on the

popular authors Thomas Harris and William Peter Blatty for McFarland & Co. and essays and reviews for various publications and music and arts journals, including *Necronomicon Press*, *NY Arts Magazine*, and *The Big Takeover* music magazine.

**Flordeliz T. Bugarin**, Ph.D., currently teaches cultural anthropology and archaeology at Howard University. She has written articles on children in the archaeological record, African studies, and historical archaeology.

**Gregory R. Campbell** is professor of anthropology at the University of Montana, Missoula. He is the author of numerous works about indigenous peoples of North America.

**Alice V. Clark**, Ph. D., is associate professor and coordinator of music history and literature at Loyola University New Orleans. Her scholarship, which focuses on aspects of the medieval motet, appears in *The Journal of Musicology*, *The Journal of Musicological Research*, and *Plainsong and Medieval Music*, as well as collections such as *Fauvel Studies*, and she has contributed an article on the medieval motet to the *On-line Reference Book for Medieval Studies* (the-orb.net).

**Julia Marta Clapp** is pursuing her doctorate in art history at the Graduate Center, City University of New York. Her research interests include modern and pre-Columbian Latin American art.

**Leah A. J. Cohen** is an independent writer and editorial consultant with a master's degree in geography from the University of Florida. She specializes in Africa area studies and food security. She was a senior author for the *Encyclopedia of African History and Culture*, volumes 4 and 5 (2005).

**Justin Corfield**, Ph.D., teaches history and international relations at Geelong Grammar School, Australia. He is the coauthor of *Historical Dictionary of Cambodia* (2003) and has written extensively on Asia, Australia, and European colonial history.

**Arden Decker** is a Ph.D. candidate in the history of art at the Graduate Center, City University of New York. Her research interests include Mesoamerican art as well as modern and contemporary art of Mexico.

**Kathryn M. de Luna**, M.A., teaches and is completing her doctorate in African history at Northwestern University. Her research uses alternative sources, particularly the reconstruction of dead languages, to elucidate early African economic, social, and political life.

**Haig Der-Houssikian**, Ph.D., is professor emeritus (2003), linguistics, at the University of Florida, Gainesville. His research and publication interests are in morphology, Creolization, and sub-Saharan Africa.

**Kathryn Dickason** is a graduate student in religious studies at New York University. Her previous projects have explored medieval religious women, heretical movements, and hagiographies. She is currently engaged in art historical research centered on the performative and liturgical functions of religious iconography in the Middle Ages.

**Prof. Dr. Detlev Ellmers** is now retired. From 1971 to 2002 he was director of the German Maritime Museum at Bremerhaven. He is author of studies in maritime archaeology and maritime history.

**Karen E. Flint**, Ph.D., teaches African history at the University of North Carolina, Charlotte. She is the author of several journal articles and an upcoming book on the history of health and healing in Southeastern Africa (Ohio University Press).

**Alessia Frassani** is a Ph.D. candidate at the Graduate Center of the City University of New York. Her research interests include the art and civilizations of ancient Oaxaca and issues surrounding the cultural interaction between the Old and New Worlds.

**J. J. George** is working on his Ph.D. at the Graduate Center, City University of New York. His research area is pre-Columbian art and architecture.

**Mohammad Gharipour** is visiting lecturer at Southern Polytechnic State University and a Ph.D. candidate at the College of Architecture at Georgia Institute of Technology. He has published extensively in magazines, journals, encyclopedias, and monographs. His area of expertise is architecture and garden design in Islamic countries.

**S. M. Ghazanfar**, Ph.D., is professor of economics (1968-2002, emeritus, 2002) at the University of Idaho, Moscow; he continues to teach occasionally (2005-06, 2006-07) as adjunct faculty. His recent books include an edited volume, *Medieval Islamic Economic Thought: Filling the "Great Gap" in European Economics* (Routledge-Curzon, 2003) and *Islamic Civilization—History, Contributions, and Influence: A Compendium of Literature* (Scarecrow Press, 2006). He also contributed to the 2001 PBS television documentary *Islam: Empire of Faith*.

**Sebastian Guenther**, Ph.D., is associate professor at the Department of Near and Middle Eastern Civilizations, University of Toronto, Canada. His research focuses on classical Arabic literature and the intellectual history of Islam. His most recent publications include the edited volume *Ideas, Images, and Methods of Portrayal: Insights into Classical Arabic Literature and Islam* (Brill 2005), contributions to the *Encyclopaedia of the Qur'an*, and "Medieval Muslim Thinkers on Educational Theory" (*Comparative Education Review* 50.3). He is currently writing a book on Islam's classical philosophies of education.

**Kenneth R. Hall**, Ph.D., is professor of history at Ball State University, teaching assorted courses in Asian and comparative world history. His publications include *Maritime Diasporas in the Indian Ocean, 960-1775* (Brill, 2006); *Structure and Society in Early South India* (Oxford, 2001/2005); *Maritime Trade and State Development in Early Southeast Asia* (Hawaii, 1985); *Trade and Statecraft in the Age of the Colas* (Abhinav, 1980/1997); *The Origin of Southeast Asian Statecraft* (Michigan, 1975), and the extended study of "An Economic History of Early Southeast Asia" in the *Cambridge History of Southeast Asia* (1992).

**George Hambrecht** is a doctoral candidate at the CUNY Graduate Center in New York City. He has published in *Archaeologica Islandica* and the *Stanford Journal of Archaeology* and has papers in press in an upcoming volume of *Historical Ecology*.

**Jean Shepherd Hamm**, Ph.D., is assistant professor in the Clemmer College of Education at East Tennessee State University. She holds bachelor's and master's degrees from Radford University and a doctorate from Virginia Tech. In addition to her work training future teachers, her interests include writing, history, literature, and women's studies.

**Muhammed Hassanali** is an independent scholar of Islamic studies in Cleveland, Ohio. He has contributed to *Encyclopedia of Antislavery and Abolition* (Greenwood 2006) and to *The Greenwood Encyclopedia of Love, Courtship, and Sexuality through History* (Greenwood forthcoming).

**Angela Herren**, Ph.D., teaches pre-Columbian art and architecture as an assistant professor in the Department of Art and Latin American Studies at the University of North Carolina at Charlotte. A specialist on painted manuscripts from central Mexico, she completed a 2005 dissertation entitled "Portraying the Mexica Past: A Comparative Study of Accounts of Origin in Codex Azcatitlan, Codex Boturni, and Codex Aubin."

**Bret Hinsch** received his Ph.D. in history and East Asian languages from Harvard University and is currently professor of history at Fuguang University in Taiwan. He is author of *Women in Early Imperial China* (Rowman & Littlefield, 2002).

**Rasheed Hosein**, ABD, is currently the director of outreach for the Center for Middle Eastern Studies at the University of Chicago and an instructor of Arabic language and literature for the Graham School of General Studies at the University of Chicago. His dissertation topic is Thaqif and Quraysh in the late Jahiliyyah and early Islamic periods (AD 590-750).

**Charles B. Hutchison**, Ph.D., is an assistant professor at the University of North Carolina at Charlotte. He is the author

of *Teaching in America: A Cross-Cultural Guide for International Teachers and Their Employers* and the forthcoming *Teaching Diverse and Urban Learners*, and the recipient of Recognition and Key to the City of Boston. His articles have appeared in several journals, including *Phi Delta Kappan*, *Intercultural Education*, *Cultural Studies of Science Education*, and *School Science and Mathematics*. He also has significant international educational experiences. He teaches and provides professional development workshops in science education, urban education, and international and cross-cultural education.

**Suhail Islam**, Ph. D., teaches world and comparative literature and Asian studies at Nazareth College of Rochester. He wrote “Bengal Famine,” which appeared in *The Historical Companion to Postcolonial Literature* (Edinburgh University Press, 2005). A chapter entitled “The Wretched of the Nations,” written with Syed Hassan, appears in the book *Genocide, War Crimes, and the West: The Culture of Impunity* (Zed Books, 2004).

**Dolly Jørgensen** is currently a Ph.D. candidate in history at the University of Virginia. She has worked for over 12 years in environmental engineering consulting and has researched environmental issues in the medieval period, including forestry management and urban sanitation.

**Keith Jordan**, ABD, M.Phil., is a Ph.D. candidate in pre-Columbian art history at the Graduate Center of the City University of New York. He is currently finishing his doctoral dissertation, entitled “Stone Trees Transplanted? Central Mexican Stelae of the Epiclassic and Early Postclassic and the Question of Maya ‘Influence.’”

**Laura Lee Junker**, Ph.D., is a professor in the Department of Anthropology at the University of Illinois at Chicago and an adjunct curator at the Field Museum of Natural History in Chicago. She specializes in the archaeology of historic period Southeast Asia, with archaeological projects in the Philippines, Laos, and Vietnam. She is the author of *Raiding, Trading and Feasting: The Political Economy of Philippine Chiefdoms* (University of Hawaii Press, 1999) and the coauthor of *Forager-Traders in South and Southeast Asia: Long Term Histories* (Cambridge University Press, 2002).

**Bashir A. Kazimee**, AIA, is professor of architecture at Washington State University. He is the author of *Place, Meaning and Form in the Architecture and Urban Structure of Eastern Islamic Cities* with Rahmani (Edwin Mellen Press, 2003). His collaborative project “Sustainable Development: A Comprehensive Urban Regenerative Proposal for Pullman, Washington” was awarded the global IAA/UN Gold Medal by the International Academy of Architecture in 1996.

**Nam C. Kim** is a doctoral candidate in the Anthropology Department at the University of Illinois at Chicago. Hold-

ing M.A. degrees in anthropology and political science, he is currently conducting archaeological fieldwork in Vietnam on the relationship between warfare and the rise of complex societies. He is coauthor of “Social Violence and War” (with Lawrence Keeley) in the *Encyclopedia of Archaeology* (Elsevier Publications, 2007).

**Christian Lange**, Ph.D., is lecturer in Islamic studies at the School of Divinity, University of Edinburgh. He is the author of *Justice, Punishment and the Medieval Muslim Imagination* (Cambridge University Press, 2008).

**Russell M. Lawson**, Ph.D., is associate professor of history and chair of the Division of General Studies at Bacone College in Oklahoma. He is the author of *Science in the Ancient World* (2004), *The Land between the Rivers: Thomas Nuttall’s Ascent of the Arkansas, 1819* (2004), and *Passaconaway’s Realm: John Evans and the Exploration of Mount Washington* (2002, 2004).

**Marcos Martín-Torres**, Ph.D., is lecturer in archaeological science at the Institute of Archaeology, University College, London. He specializes on the scientific analysis of archaeological remains from medieval and early modern metallurgical activities. He has coedited *Archaeology, History and Science: Integrating Approaches to Ancient Materials* (Left Coast Press, 2007).

**Katelin Mason** is a graduate student of Islamic studies with research interests in medieval intellectual history and philosophy. She completed her M.A. in Hinduism and Islam at George Washington University (2006) and a B.A. in Middle East studies, also at GWU (2003). She currently works at Harvard University Fine Arts Library’s Aga Khan Collection in acquisitions for Islamic and European language material.

**Renee McGarry** is a student in the Ph.D. program in art history at the City University of New York Graduate Center. Her research interests include Aztec sculpture of the natural world and religious manuscripts from the post-Conquest period.

**Elizabeth Morán**, Ph.D., teaches African, Mesoamerican, and Caribbean art history at Christopher Newport University. She has recently received an NEH award to participate in the Summer Institute Oaxaca: Crossroads of a Continent, Oaxaca City, Mexico.

**Penny Morrill**, Ph.D., teaches pre-Columbian and early colonial Mesoamerican art at Hood College, Frederick, Maryland. She has an essay, “The Queen of Heaven Reigns in New Spain: The Triumph of Eternity in the Casa del Deán Murals,” in a Brill anthology, *Woman and Art in Early Modern Latin America* (2006). She has authored several books on modern Mexican silver: *Mexican Silver: 20th Century Handwrought*

*Silver Jewelry and Metalwork* (4th edition, 2007), *Silver Masters of Mexico: Héctor Aguilar and the Taller Borda* (1996), and *Maestros de Plata: William Spratling and the Mexican Silver Renaissance*, a catalog for a traveling exhibit (2002–2004).

**Caryn E. Neumann**, Ph.D., teaches history in Ohio Wesleyan University's Black World Studies Department. She is a former managing editor of the *Journal of Women's History*.

**Daniel S. Nicolae** is a fellow at Edinburgh University's Islamic and Middle Eastern Studies Department. He is the coauthor of *Lehrbuch des Klassischen Syrisch* (Harrassowitz, 2008).

**Lisa Niziolek** is a Ph.D. candidate in anthropology at the University of Illinois at Chicago. Her research interests include craft specialization, pottery production, pre-state societies in the Philippines, Neolithic Ireland, and the geochemical analysis of archaeological materials.

**Tanure Ojaide**, Ph.D., teaches at the University of North Carolina at Charlotte, where he is the Frank Graham Porter Professor of Africana Studies. He specializes in African and pan-African literatures, art, and folklore. In addition to winning many literary prizes for his poetry, he has many scholarly publications, including *Poetic Imagination in Black Africa* (1996), *Poetry, Performance and Art: Udje Dance Songs of the Urhobo People* (2002), and with Joseph Obi, *Texts and Contexts: Culture, Society, and Politics in Modern African Poetry* (2004).

**Penelope Ojeda de Huala** is a Ph.D. candidate in art history at the Graduate Center of the City University of New York, where she studies pre-Columbian to contemporary art of Latin America. Her research focus is Guatemala and Peru, particularly the enduring thoughts and practices of indigenous cultures as manifested in art.

**Sophie Oosterwijk**, Ph.D., is currently a lecturer in history of art at the University of Leicester and honorary editor of the journal *Church Monuments*. She has published widely on medieval childhood, which was the subject of her Ph.D. thesis and of her forthcoming monograph with Brepols Publishers.

**Michael J. O'Neal**, Ph.D., is a writer who lives in Moscow, Idaho. He is a frequent contributor to reference and educational books, including *Lives and Works: Young Adult Authors* (1999), *The Crusades* (2005), and *America in the 1920s* (2006).

**Dianne White Oyler**, Ph.D., teaches African history at Fayetteville State University. She is the author of *The History of the N'ko Alphabet and Its Role in Mande Transnational Identity: Words as Weapons* (2005) as well as articles in the refereed journals *Research in African Literature*, *the Mande Studies Journal*, and the *International Journal of African Historical Studies*.

**Sharon Pruitt**, Ph.D., currently teaches art history at East Carolina University's School of Art and Design. Her research interest includes both African and African American art and culture. She contributed essays to the following books: *African Studies: A Survey of Africa and the African Diaspora* (Carolina Academic Press, 1993), *Introduction to Kenya: An Interdisciplinary Approach* (Carolina Academic Press, 1993), *Issues in Contemporary African Art* (International Society for the Study of Africa at Binghamton University, 1998), *Contemporary Textures: Multidimensionality in Nigerian Art* (International Society for the Study of Africa at Binghamton University, 1999), *Black American Intellectualism and Culture* (JAI Press, Inc., 1999), *A Century of African American Art: The Paul R. Jones Collection* (Rutgers University Press, 2004), and *Engines of the Black Power Movement: Essays on the Influence of Civil Rights Actions, Arts, and Islam* (McFarland and Company, Inc., 2007).

**Babak Rahimi**, Ph.D., is assistant professor of Iranian and Islamic studies at the University of California, San Diego. He is the author of numerous articles on Iran, Iraq, and Turkey; he is also completing a book project, titled *Between Carnival and Mourning: Muharram Rituals and the Rise of the Early Modern Iranian Public Sphere, 1587-1666 C.E.*

**Andrew Rippin**, Ph.D., F.R.S.C., is professor of Islamic history and dean of the faculty of humanities at the University of Victoria, Canada. He is author of *Muslims: Their Religious Beliefs and Practices* (third edition, Routledge, 2005) and *The Qur'an and Its Interpretative Tradition* (Ashgate, 2001).

**Bradley Skeen**, M.A., has taught at the University of Minnesota, Webster University, and Washington University. He is a specialist in magic, religion, and philosophy in late antiquity and has contributed to research in that field in *Die Zeitschrift für Papyrologie und Epigraphik*, among other journals.

**John Soderberg**, Ph.D., is the managing director of the Evolutionary Anthropology Laboratory at the University of Minnesota. His research focuses on the links between religion and urbanism in early medieval northern Europe.

**Ilicia Sprey**, Ph.D., teaches Asian and European history courses in the Department of History, Saint Joseph's College, Indiana. As a medievalist, she has written on intercultural, diplomatic, social, and economic relations in the premodern world and is the author of *The Ancient World: Civilizations of the Near East and Southwest Asia* (M. E. Sharpe, 2007).

**Alan M. Stahl**, Ph.D., is curator of numismatics at Princeton University. Among his numismatic publications are *The Merovingian Coinage of the Region of Metz* (Louvain-la-Neuve, 1982), *The Venetian Torneseello: A Medieval Colonial Coinage* (American Numismatic Society, 1985), and *Zecca: The Mint of Venice in the Middle Ages* (John Hopkins Univer-

sity Press, 2000). He has also written extensively on medieval Venetian history.

**Tom Streissguth** is a freelance author, editor, and journalist who has published more than 70 nonfiction and reference books. His most recent titles include *Clay v. United States*, *Genghis Khan's Mongol Empire*, *Library in a Book: Hate Crimes*, *Eyewitness History: The Roaring Twenties*, and the *Greenhaven Encyclopedia of the Middle Ages*.

**Ananda Cohen Suarez** is a Ph.D. student at the Graduate Center of the City University of New York, specializing in pre-Columbian and colonial Latin American art history. She is particularly interested in cross-cultural encounters, vernacular religious art, and manuscript production in the early colonial Americas.

**Tina L. Thurston**, Ph.D., teaches archaeology at the University at Buffalo, State University of New York's Department of Anthropology. She works regularly in northern Europe, studying the development of Iron Age and early medieval states and the meanings of continuity and change in cultural landscapes. She is the author of *Landscapes of Power, Landscapes of Conflict: State Formation in the South Scandinavian Iron Age* (Kluwer, 2001) and recently edited *Seeking A Richer Harvest: The Archaeology of Subsistence Intensification, Innovation and Change* (Springer, 2007).

**David W. Tschanz**, Ph.D., has degrees in history and epidemiology and works for Saudi Aramco Medical Services in Dhahran, Saudi Arabia. He is the editor of the military history journal *Cry "Havoc!"* and was contributing editor of *COMMAND* magazine, specializing in medical military history. He is currently at work on his seventh book.

**David Vallilee** is an independent scholar.

**Julie-Ann Vickers** is completing a Ph.D. in medieval Italian history at the University of Cambridge, United Kingdom. Her thesis looks at monastic forgery in southern Italy during the central middle ages.

**Lawrence Waldron**, M.F.A., is an associate professor and doctoral candidate at the City University of New York, specializing in non-Western fields of art history and culture. He has presented and published various articles on the art and culture of the pre-Columbian Caribbean and Southeast Asia.

**Alasdair Watson**, B.A., is an Arabic linguist and translator. He is currently studying for his master's degree in translation studies at Edinburgh University, Scotland.

**J. Tia Wheeler** is a Ph.D. candidate at the University of St. Andrews. Her specialization within medieval Islamic history is interaction between the Middle East and Central Asia.

**Shana Worthen**, Ph.D., currently teaches history of technology at the University of Arkansas at Little Rock. Her essay "On Mills and Meaning" was published in *Wind and Water in the Middle Ages: Fluid Technologies from Antiquity to the Renaissance*, ed. Steven A. Walton (ACMRS, 2006).

**Bailey K. Young** is professor of history at Eastern Illinois University and co-director of the Walhain Castle Excavation Project in Belgium. His recent publications include articles on Merovingian archaeology in *Ancient Europe 8000 B.C.-A.D. 1000. Encyclopedia of the Barbarian World*, edited by Peter Bogucki and Pam Crabtree (Charles Scribners' Sons, 2004); "Rites funéraires et stratégie politique: le cas des tombes royales", in L. Baray, ed., *Archéologie des pratiques funéraires. Approches critiques* (Mt. Beuvray Archaeological Center, 2004); and "Le Tennessee Valley Authority: de l'archéologie de sauvetage à une politique de longue terme" in Jean-Paul Demoule (ed), *L'archéologie préventive dans le monde. Apports de l'archéologie préventive à la connaissance du passé* (La Découverte, 2007).

**Almaz Zewde**, Ph.D., currently teaches education and social change and several interdisciplinary courses at Howard University, Department of African Studies. She has authored book chapters and journal articles on African health and development issues. Her research synthesizing works on African development discourse is due within the next few years.

## VOLUME I

Hip ornament (Nigeria, as early as the 15th century)	5	Red coral (Britain, ca. 1500)	49
Blown-glass perfume sprinkler (Egypt or Syria, 14th century)	6	Stone-paste cup in the shape of a harpy (Iran, late 12th or early 13th century)	52
Jadeite earspool (Maya culture, Guatemala, 550–850)	8	Painted wooden lion's head (architectural element; Qasr Ibrim, Nubia; seventh to 10th centuries)	57
Bronze mirror (China, Tang Dynasty, eighth century)	9	Lintel 17 from structure 21 at Yaxchilán (Maya, ca. 600–800)	62
Saxon brooch (Britain, seventh to ninth centuries)	11	Pavilions on the banks of a river (color on silk, China, Ming Dynasty, 1368–1644)	66
Gold armlet or anklet (Syria, 11th century)	14	<i>The Mosque of Delhi and the Iron Pillar</i> (watercolor on paper, India, 13th century)	68
Painted ceramic mask of Tlaloc (Aztec culture, Mexico, ca. 1325–1521)	23	Model of Muhafiz Khan's mosque (India, 1492) in Ahmedabad (artist rendering dating to 1838)	69
Porcelain model of a granary (China, 13th century)	26	Yellow sandstone capital with figures representing Luxury and Lust (Spain, ca. 1175–1200)	74
Man with pruning hook climbing palm tree (detail of a manuscript page, Spain, 1220)	31	Fragment of a balustrade (Iran, late 13th to early 14th centuries)	78
Page from an herbal manuscript (Iraq or Syria, 13th century)	36	Wall painting of the martyrdom of the saints (Coptic, Wadi Sarga, Egypt; sixth century)	87
Amulet (Coptic Egypt, ca. 200–800)	44	Masked male figure (ceramic with paint, Maya culture, Mexico, 700–900)	92
Stone owl (Aztec culture, Mexico, ca. 1325–1521)	45		
Pipe with bluebird (Mexico, ca. 1100–1400)	46		
Limestone <i>guanyin</i> , the Bodhisattva of Compassion with 11 heads (China, Tang Dynasty, ca. 703)	48		

Album leaf: Pomegranate (ink and color on silk, China, ca. 1200–1340)	97	Children playing in a garden (color on silk, China, possibly Ming Dynasty, 1368–1644)	174
<i>Virgin and Child with Saints Louis of Toulouse and Michael</i> by Lucca di Tomme (tempera on panel, Italy, before 1362)	102	A musical toy from a copy of al-Jazari's treatise on automata (opaque watercolor, ink, and gold on paper; Syria, 14th century)	178
Tile (stone-paste painted overglaze with luster, China, Seljuk Dynasty, 13th century)	107	Jade figure of an eagle warrior (Aztec, Mexico, ca. 1325–1521)	188
Ceramic ewer (Iran, ca. 1200–1230)	109	Standing female divinity (Angkorian Period, Cambodia, 12th century)	196
Rahu, lord of the planets (gilt copper alloy inlaid with colored glass ornaments, Tibet, ca. 1400)	116	Charter of King John, May 9, 1215	202
Zodiac sign of Aries the Ram (Italy, 1473)	118	<i>Fujiyama from Okitsu</i> , by Yoshida Hiroshi (woodblock print, Japan, 1928)	224
Astrolabic quadrant (Damascus, Syria, 1333–34)	121	Clothing patch (leather, cloth, gilt, and paint; Egypt, ca. 250–650)	241
Sandstone frieze from the first cathedral at Faras (Sudan, seventh century)	129	Four-cornered hat (camelid fiber, Peru, ca. 600–850)	243
Carved stone inscription of Jalal al-Din Khwarazm-Shah, marking a military campaign (Tabriz, Iran, 1230)	138	Oval buckle with dragon (jade or soapstone, China, ca. 1279–1368)	245
Cupboard door (wood, carved ivory, and marquetry; Egypt, second half of the 13th century)	143	Leather shoe and model for a foot (Britain, late 14th century)	247
Wall relief (carved limestone with pigment, Maya culture, Mexico, ca. 750–850)	146	Man's cape (silk velvet on a gold brocade ground, Italy, ca. 1480)	248
Fragment of a wall with a relief bodhisattva (Tang Dynasty, China, ca. 618–907)	148	Kumari vest (multicolor silk embroidery in brick and chain stitch on yellow silk damask; Nepal, 15th century)	250
Stone doorway with the arms of the counts of Chazay (France, ca. 1450–1500)	150	African elephant ivory waste from a British workshop (15th century)	252
Foundation stone (carved marble with traces of paint and gilding, Islamic Egypt, 15th century)	153	Female standing figure (slip-painted ceramic, Huastec culture, Mexico, ca. 100–600)	255
Pottery plate with a deer glyph (Cholula, Mexico, ca. 1200–1521)	160	Ivory throne leg (Eastern Ganga Dynasty; Orissa, India; 13th century)	257
Calendar showing the month of November, with saints' days (France, 1495–1505)	164	Funerary sculpture of a double-courtyard residential compound (molded earthenware with green glaze, middle Ming Dynasty, China, ca. 1450–1550)	259
A candle clock from a copy of al-Jazari's treatise on automata (opaque watercolor, ink, and gold on paper; Syria, 14th century)	167	Cattle jaw (Britain, late 10th century)	260

Stone-paste jar painted in black under turquoise glaze (Syria, late 12th to early 13th centuries)	262	Beaker showing a complete narrative cycle from the <i>Shahnameh</i> , the Persian Book of Kings (Kashan, Iran, late 12th century)	379
Carved wooden panel depicting Chaucer's "Pardoner's Tale" (Britain, ca. 1410)	270	Corbel in the form of an angel holding a shield with the arms of the Grocers' Company (London, 1466)	394
<b>VOLUME II</b>			
Ceramic funerary urn (Zapotec style, Mexico, ca. 250–750)	282	Stone sculpture of Tlazolteotl, a goddess associated with fertility (Huastec culture, Mexico, ca. 900–1521)	419
Tomb of the Sufi saint Shaikh Salim Chishti at Fatehpur Sikri, India (watercolor on paper, 15th to early 16th centuries)	285	Children at play (China, ca. 1368–1644)	421
Mortuary figure of a female dancer (earthenware with three-color lead-silicate glaze, Tang Dynasty, China, first half of the eighth century)	286	Medieval illumination showing a family group (France, ca. 1275–99)	423
Funerary badge (Britain, ca. 1376)	287	Ceremonial ring showing sacrificial victims (Nigeria, as early as the 15th century)	431
Tombstone (marble, Iran, 12th century)	289	A Buddhist procession of three musicians and one dancer (stone, Song Dynasty, China, 10th–11th centuries)	434
Male mask (Japan, early 16th century)	297	<i>Spring Festival on the River</i> (ink and color on silk, China, 18th century)	434
Black limestone mask (Santiago Ahuizotla, Mexico; 150 B.C.E. to 700 C.E.)	316	Stone sculpture of Durga Mahishasuramardini (Orissa, eastern India; 13th century)	435
Alms box for donations to the poor (Britain, 15th century)	326	Pilgrim badge of Saint George and the dragon (ca. 1400s)	437
Silver penny of Ethelred II (minted in Lewes, England; 1003–16)	329	Condiment tray (Egypt, ninth century)	441
Soapstone bowl of a kind associated with girls' initiation rites (Strait of Georgia culture, British Columbia, ca. 1–900)	341	Lime-paste vessel in the form of a lion (white stoneware with ash glaze; Khmer, Thailand; Angorian Period; 12th–13th centuries)	443
A hornbook (Britain, 15th century)	346	Copper alloy cauldron for cooking (Britain, 1200s or later)	448
Bronze head of the king of Ife, with a beaded crown and plume (Yoruba culture, Nigeria, ca. 12th–14th centuries)	356	Flask (rock crystal with enameled gold mount, Egypt, Fatimid Dynasty, mid-10th century)	450
Gold pendant with a miniature portrait of a Mayan ruler (Mexico, ca. 600–1521)	362	"Challenging the Iranians," from a <i>Shahnameh</i> (Book of Kings) by Firdawsi (opaque watercolor, ink, and gold on paper; early 15th century)	462
Kublai Khan (1215–94) and his empress enthroned (ink on paper, Mughal Dynasty, India, 1596)	365	Painting of a stream flowing through a bamboo forest by Wang Fu (China, 1410)	472
The coronation of William I, Westminster Abbey, London, Christmas Day, 1066	374		

The Savernake horn (ivory, England or Scotland, 1325–50)	474	watercolor, and gold on paper; Iran, 15th century)	557
Clay figurine of woman seated at loom (Maya culture, Mexico, ca. 500–900)	482	Bronze lamp (Coptic, ca. 500–1000)	562
Spindle whorl (ca. 500)	486	Oil lamp (unglazed earthenware, Southeast Asia, sixth to 11th centuries)	565
Chest made of iron plates, used as a safe for the storage of important civic documents, valuables, and the City of London Seals (Britain, early 15th century)	510	Oil lamp with six spouts (Britain, 12th century)	567
Objects from the Nihavand find (Iran, 11th to 12th centuries)	517	Candlestick (brass inlaid with copper, silver, and black organic material; Afghanistan; ca. 1150–1200)	570
Kilga, a support for a water jar (12th century)	522	Ceramic vessel with glyphic text (Maya culture, Guatemala, 400–550)	574
Stone pipe in the form of a squatting figure (Paint Creek, Ross County, Ohio, North America; Mississippian Period, 1200–1500)	525	The Hurbuck hoard of knives and tools (Anglo-Saxon, ninth to early 10th centuries)	580
Standing Bhaishajyaguru, the medicine Buddha (cast bronze with gilding, Korea, ca. 668–800)	528		
Late Saxon/Norman woman's skeletal feet (Britain, 11th–12th centuries)	531	<b>VOLUME III</b>	
Outdoor scene of a mad dog biting a man, from an Arabic translation of <i>De materia medica</i> by Dioscorides	533	The Shenute Codex (Egypt, seventh century)	589
Pottery jug in human form (Wadi Sarga, Egypt, fifth to seventh centuries)	538	Luster-painted ceramic tiles with inscription in Kufic (Kashan, Iran, ca. 14th century)	597
Stone cup, Mixteca/Pueblo style (Mexico, ca. 900–1521)	540	Folio from a Khamsa of Amir Khusrau Dihlavi (ink and color on paper, Sultunate Period, India, 1450–1500)	605
Pillow (stoneware with white slip under transparent colorless glaze, Northern Song Dynasty, China, ca. 1056)	542	Leather belt with keys belonging to the doorkeeper of the Star Chamber, an English law court at the Palace of Westminster (Britain, ca. 1500)	607
Late Saxon Shelly ware pitcher (ca. 900–1000)	543	Ceramic tombstone of a <i>qadi</i> , an Islamic judge (Kashan, Iran, ca. 1270)	609
Table (molded, pierced, and glazed ceramic; Syria, late 12th to early 13th centuries)	546	Stone bust of Quetzalcoatl, a god associated with the Aztec creation myth (Mexico, ca. 1325–1521)	622
Badge showing huntsman with bow and hunting horn (British, late 1300s)	554	A leaf from William Caxton's edition of Geoffrey Chaucer's <i>Canterbury Tales</i> , printed at Westminster in 1476 (Britain)	632
King Khusraw and Princess Shirin in the hunting field, by Nizami (ink, opaque		The Persian epic hero Rustam (stone paste painted with enamel, Iran, 12th century)	637

Gold pendant (Mixtec culture, Mexico, 1100–1520)	654	Rattle (slip-painted ceramic, Maya culture, Mexico, 700–1000)	747
Bronze water pot (Kamakura Period, Japan, 13th century)	657	Bronze zither (China, Ming Dynasty, 1368–1644)	749
Knight on horseback, the earliest hollow-cast pewter figure known in England (Britain, ca. 1300)	659	King David playing the psaltery (detail of a manuscript page, Italy, 1473)	752
Canteen (brass with silver inlay, Syria or northern Iraq, 13th century)	661	<i>King Khusraw Parviz Listens to Barbad the Concealed Musician</i> , illustration from a manuscript of the <i>Shahnameh</i> (Book of Kings) (Iraq, ca. 1300)	754
Archer figure (inland Niger Delta region, Mali; 13th to 15th centuries)	692	Jade figurine of Tlaloc, the rain god (Mixtec culture, Mexico, ca. 1200–1521)	763
Warrior figure (ceramic with slip and paint, Remojadas culture, Mexico, 600–900)	694	Sandstone stela depicting Matsya, the first incarnation of Vishnu (central India, ninth century)	765
Chain mail shirt of riveted iron rings (Britain, 13th century)	699	Ivory pyxis carved with pastoral scenes (early Byzantine, possibly Egypt, sixth century)	773
Battle between Kay Khusraw and Afrasiyab, from a copy of the <i>Shahnameh</i> (Book of Kings) by Firdawsi (opaque watercolor, ink, and gold on paper; Gilan, Iran; 1493–94)	701	Nomad bridle bit (Russia, ninth to 10th centuries)	776
Gold ring with feline head in relief (Mixtec, Mexico, ca. 1200–1521)	719	Reins guide fitting for a horse harness (Viking, Sweden, ninth to 10th centuries)	779
Jade phoenix ornament (China, Liao Dynasty, 10th or 11th century)	720	Pastoral scene from a manuscript of the <i>Divan</i> (Poems) by Sultan Ahmad Jalayir (ink, color, and gold on paper; ca. 1400)	781
Bronze figure of the seated Buddha (central India, Gupta Period, fifth century)	721	Terra-cotta tile with crouching figures (Harwan, Kashmir, ca. fourth to fifth centuries)	787
Brass basin inlaid with silver and gold (Cairo, Egypt, or Damascus, Syria, ca. 1320–41)	725	Part of a silk panel used as a sleeve ornament on a tunic (Akhmîm, Upper Egypt, eighth century)	795
Manilla, an open bracelet traded as currency in Western Africa (12th–18th centuries)	731	Peddler offering wares to a mother and her children (ink on silk, Yuan Dynasty, China, 14th century)	799
Gold coin (Tughlug Dynasty, India, 1325–26)	736	Oyster shells with traces of paint (Britain, 13th century)	801
Pottery money box (London, 1300s)	738	A curb bit for a horse; the manufacture of horse equipment was a skilled trade in medieval Britain (late 13th to early 14th centuries)	802
Silver penny of King Alfred (Britain, ca. 886–99)	738		
Silver dirham coin (Anatolia, 1242–43)	740		
Drum (brass, originally inlaid with silver; Syria or Egypt; 15th century)	745		

Page from a manuscript of Dioscorides' <i>De materia medica</i> (possibly Baghdad, Iraq, 1224)	803	Model of the Church of the Holy Sepulchre (Bethlehem, late 17th century)	892
The seal of the Hospital of Saint Mary Magdalene, London (ca. 1500)	816	Pilgrim bottle (Syria, ca. 1330–1350)	893
Head of a deity (tuffa stone, Aztec culture, Mexico, 1100–1400)	831	Pewter pilgrim badge of the head of Thomas Becket (Britain, 14th century)	904
Vishnu with consorts (stone, Pala or Sena Dynasty, India, 12th century)	835	Gold tanka of Sultan Qutb al-Din Mubarak Shah I (Delhi Sultanate, India, 1318)	907
Bronze Buddhist altarpiece (Sui Dynasty, China, ca. 587)	839	The Chaucer astrolabe, the earliest-known European astrolabe (Britain, 1326)	928
Altar frontal (polychrome silk and natural linen embroidery on natural linen, Germany, ca. 1380)	842	<i>The Wonders of Creation and the Oddities of Existence</i> , page from a manuscript (Egypt or Syria, ca. 1375–1425)	933
Folio from a Koran (ink and watercolor on parchment, North Africa, ninth century)	849	Brass trumpet, thought to have been used for signaling ship to ship at sea (14th century)	949
Scenes from the life of the emperor Ming Huang and his favorite concubine, Yang Kuei-fei (Japan, ca. 1565–1608)	861	Mountain and river landscape (ink on silk panel, Ming Dynasty, China, 1368–1644)	971
Silver medallion struck to commemorate the establishment of order in the city of Baghdad (Iraq, 937)	866	Abduction by boat, from a manuscript of the <i>Khamsa</i> (Quintet) by Amir Khusraw Dihlavi (opaque watercolor, ink, and gold on paper; Afghanistan; ca. 1496)	975
<i>Rock bridge at Tiantai Mountain</i> (ink and color on silk, China, 1178)	872	Leather whip (Britain, 11th century)	985
Old London Bridge, as it would have appeared during much of the medieval period (ca. 1500)	875	Dinar of Sultan Al-Malik al-Zahir Baybars (Alexandria, Egypt, 1268)	987
		Eleven-headed Kannon (Japan, 13th century)	997
		Male stone figure (Sierra Leone, Guinea, as early as the 15th century)	1008
		Seal of the Picot family (mid-14th century)	1021
		Fritware bowl, painted with an enthroned ruler and his attendants (Kashan, Iran, 1187)	1027
		Stone ball game yoke (Aztec culture, Mexico, ca. 550–1150)	1036
		Ladies playing double-sixes (Song Dynasty, China, 10th to 11th centuries)	1037
		A bone ice skate (Britain, 12th century)	1040
		Glass gaming pieces (Islamic Egypt or Syria, 13th century)	1042
<b>VOLUME IV</b>			
Stone serpent (Aztec, Mexico, ca. 1325–1521)	884		
An image thought to be of Shiva (Kashmir-Smast caves, Mardan, Pakistan, ca. seventh through ninth centuries)	886		
Silver Buddha on a bronze lotus base (Borneo, Indonesia, eighth or ninth century)	887		
Pilgrim badge from Walsingham showing the Annunciation (Britain, 14th century)	890		

Ceramic vessel in the shape of a jaguar (Maya culture, Mexico, ca. 950–1200)	1049	A trophy head representing a powerful defeated enemy (Benin Kingdom, Nigeria; 15th to early 16th centuries)	1116
Red clay jar with green and blue glaze used to store hazardous or precious ingredients (Beauvais, France, ca. 1500)	1053	Wooden slit drum decorated with scenes from a battle between two cities (Mixtec culture, Mexico, ca. 14th century)	1122
Luster-painted pottery jar (Syria, late 13th century)	1055	Ceramic vessel in the form of a trophy head (Huastec culture, Mexico, ca. 900–1200)	1124
Fragment of a multicolored woolen rug from a tomb at Qasr Ibrim, Egypt (Coptic period, fourth to sixth centuries)	1059	Bone figure of a knight (Britain, mid-14th century)	1130
Fragment of a textile panel (camelid fiber and cotton, Peru, ca. 600–850)	1061	The Burghead Bull (Burghead, Morayshire, Scotland, seventh century)	1132
Tapestry (China, Ming Dynasty, 1368– 1644)	1063	The siege of a Turanian stronghold by the forces of Kai Khusraw, from a <i>Shahnama</i> (Book of Kings) by Firdawsi (opaque watercolor, ink, and gold on paper; Persia; 15th century)	1137
Ribbon (tablet-weave gold metal thread, Great Britain, ca. ninth century)	1065	Shield (wood, shell, and resin; Mexico; 1200–1500)	1148
Tiraz textile fragment (silk tapestry weave on plain-weave linen, Islamic Egypt, 12th century)	1067	Knife (Inca culture, Peruvian Andes, 1300–1560)	1149
Calendar page (October) (Belgium, ca. 1510)	1077	Iron sword guard (Japan, ca. 1400)	1151
Pottery vessel (Cholula, Mexico, 1200– 1521)	1086	Viking battle-axes and spears (Britain, ca. 840–1020)	1152
<i>The Story of the Silk Princess</i> (wooden panel painting, Xinjiang Province, China, sixth century)	1088	Armor (forged steel, Turkey, 15th to 16th centuries)	1154
Baltic amber beads (Britain, 1400s)	1091	Weight for measuring gold dust (Ghana, Côte d'Ivoire, as early as the 15th century)	1159
Blue-and-white brush rest with Arabic inscription (Jiangxi Province, southern China, as early as 1506)	1093	Steelyard weight (Britain, 13th century)	1164
Ceramic model palanquin (Colima culture, Mexico, ca. 200–600)	1100	Mold-pressed glass weight (eastern Mediterranean, seventh or eighth century)	1166
Earthenware model of a cart with bullock and human figures (China, sixth century)	1103	Ostrakon with Coptic inscription (Egypt, ca. 250–650)	1169
Palanquin rings (gilt copper alloy, Cambodia, 13th century)	1104	Shell ornament with series of Mayan hieroglyphs incised on the interior (ca. 600–800)	1171
Horseshoes (Britain, 12th century)	1106	<i>Daoist Scripture of Constant Purity and Tranquility</i> , in standard script (ink on silk, Yuan Dynasty, China, ca. 1292)	1173
Headstall (Granada, Spain, late 15th or early 16th century)	1108		

Bone writing tablet and leather case of a type typically used as a notebook for jottings (Britain, 14th century)	1176	Illuminated opening page from a manuscript of the Hadith, concerning the life of the prophet Mohammad (ink, watercolor, and gold on paper; Iraq or Iran; 12th to early 13th centuries)	1180
Pen box (brass inlaid with copper, silver, and black organic material; Iran; 13th century)	1178

# Preface

Welcome to the *Encyclopedia of Society and Culture in the Medieval World*, a four-volume set that provides comprehensive coverage of the medieval world from the fall of Rome in 476 to the start of the Renaissance in approximately 1500. For coverage before the fall of Rome, readers are urged to consult our companion set, the *Encyclopedia of Society and Culture in the Ancient World*.

## SCOPE AND ARRANGEMENT OF THE SET

The *Encyclopedia of Society and Culture in the Medieval World* contains 71 separate entries, each devoted to a specific cultural or societal topic. Of these 71 entries, 14 cover “major” topics with longer, more in-depth coverage than the standard entries. The entries are arranged in alphabetical order by topic; readers may consult the Contents page for a listing of these topics.

Each entry includes a discussion of the topic from the perspective of the following centers of civilization:

- Africa
- The Americas
- Asia and the Pacific
- Europe
- The Islamic World

Readers will note that there is some overlap in this list because of the inclusion of the Islamic world as a separate center of civilization. During the medieval era, Islamic rule extended not only throughout the region of the modern Middle East but also across most of northern Africa and into southern Europe, especially the Iberian Peninsula. Because the Islamic world is so often studied as a separate

entity, we decided to treat it as such in this encyclopedia. Entries devoted to Europe and Africa will thus not discuss Islamic-ruled regions.

## ENTRY DETAILS

Each entry begins with an introductory essay that outlines the major developments on a given topic in the medieval world. Following that introduction are separate essays on the topic from the perspective of the named centers of civilization. At the end of the main text of each entry is a list of “see also” references to related entries, followed by a further reading list of books, articles, and Web sites on the topic.

## OTHER ELEMENTS

In addition to the main text, the encyclopedia incorporates sidebars on topics that do not fit neatly into the central discussion as well as key primary source excerpts scattered throughout the set. These primary source documents appear at the end of each entry. Our goal in identifying and including these primary sources is to facilitate additional comparative study between cultures on a given topic. Readers may consult the List of Primary Source Documents in the front matter for a guide to the individual sources found in the encyclopedia. The set also features more than 240 maps and illustrations. The front matter lists these maps and illustrations.

Aside from detailing the maps, illustrations, and primary source documents, the front matter includes a section about the set’s advisers and contributors and a general introduction to the medieval world by Dr. Pam J. Crabtree of New York University, who served as the editor in chief of the encyclopedia. At the back of the set readers will find a glossary of key

terms, a general bibliography, a chronology by region, and a general subject index.

### **ACKNOWLEDGMENTS**

In addition to Dr. Pam J. Crabtree and the members of the advisory board, we wish to thank the numerous scholars, journalists, and writers who contributed to this work. At Facts On

File, Claudia Schaab provided essential guidance throughout the project. A special note of thanks is due to Paul Halsall, who operates the Internet History Sourcebooks. This Web site supplied many of the primary source documents included in the encyclopedia.

—NEIL SCHLAGER AND MARCIA MERRYMAN MEANS,  
PROJECT MANAGERS

# Introduction

The medieval period, or Middle Ages, is, as its name suggests, a period of time that falls between the ancient and modern worlds. The Middle Ages began with the decline and fall of the Western Roman Empire in the fifth century C.E. and ended with the voyages of discovery, including Columbus's discovery of the Americas, about 1,000 years later. While 17th- and 18th-century scholars saw the medieval period as a "dark age," modern research has shown that the medieval era was a dynamic period of social, political, and economic changes that laid the foundation for the modern world.

The decline and fall of the Western Roman Empire took place over more than a century. In the early fourth century the Roman Empire was split into the Eastern Roman Empire, with its capital in Constantinople, and the Western Roman Empire, with its capital in Rome. By the early fifth century barbarian tribes from outside the Roman world began to cross the Rhine-Danube frontier and attack portions of the Western Roman Empire, sacking Rome itself in 410 C.E. At about the same time the Roman legions abandoned the province of Britannia (Britain), never to return. In 476 C.E. the last of the Western Roman emperors, Romulus Augustus, was deposed by the Germanic leader Odoacer. This date marks the end of the Western Roman Empire. Beginning in the fifth century Germanic tribes, including the Franks, Visigoths, Ostrogoths, Angles, and Saxons, established smaller kingdoms within the former Western Roman Empire. The Eastern Roman Empire, on the other hand, continued as the Byzantine Empire until the very end of the Middle Ages. It was overthrown by the Ottoman Empire in 1453.

The European voyages of discovery in the late 15th and early 16th centuries mark the end of the Middle Ages. Columbus's discovery of the Americas led to a period of intensive contact between the Eastern Hemisphere and Western Hemisphere. New World crops such as the potato revolutionized agriculture in the Old World, and American tobacco spread

rapidly throughout the Eastern Hemisphere. European colonists introduced diseases such as measles to the Americas. Because the Native American populations had no immunity to these new diseases, many North and South American peoples were decimated by them. The discovery of the Americas also led to an intensive period of colonization of the New World by Europeans beginning in the early 16th century with the Spanish colonization of Mexico. Thus the end of the Middle Ages is conventionally dated at 1500.

## SOURCES OF INFORMATION FOR THE MEDIEVAL PERIOD

Scholars have used a variety of sources of information to study the Middle Ages. Traditional medieval studies have been based on historic texts, including documents, literature, and inscriptions. However, not all medieval societies produced written records. As a result, archaeologists, scholars who study material remains from past societies, are playing an increasingly important role in medieval studies. Other important sources of information on medieval societies include art and architecture.

### DOCUMENTARY RECORDS

Written records, ranging from parish registers and land grants to histories, geographies, inscriptions, and accounts of saints' lives, have always provided information on life in the Middle Ages. However, the quantity and quality of written records vary greatly by time and place. In the Americas the Mayan peoples of Mesoamerica kept extensive written records. The decipherment of these Mayan glyphs has provided valuable information on the political history of Mayan cities. However, most other regions of the Americas did not keep written records at all. In southeastern Europe, Byzantine

historical sources provide a continuous record from the end of the Roman world through the Middle Ages. China, India, and the Middle East also have extensive historical records for most or all of the Middle Ages, whereas historical records for medieval Africa are quite limited. For western and northern Europe the historical picture is also incomplete.

For the former Western Roman Empire written sources for the fifth and sixth centuries are very limited indeed. The number of written records is so limited that the term “dark age” can be used appropriately in describing western Europe at this time. In regions of northeastern Europe, such as Scandinavia and Poland, which were outside the Roman Empire, Christianity and literacy were not introduced until about 1000. In these regions the first half of the Middle Ages is essentially prehistoric. Written records are limited to accounts written by outsiders, such as Ahmad ibn Fadlan’s Arabic account of the Viking fur traders he encountered along the Volga in 922. As a result, archaeology has come to play an increasingly important role in the study of medieval societies, especially in Europe.

### ARCHAEOLOGICAL EVIDENCE

Archaeologists use material remains, such as tools, buildings, and burials, to study how people lived in the past. These remains include artifacts, features, and “ecofacts.” Artifacts are portable objects that were either made or modified by humans. Artifacts can range from complex objects such as Viking swords to simpler materials such as cooking pots. Features can be defined as nonportable artifacts. Buildings, such as houses, castles, and mosques, are features, but so are simpler structures, such as trash pits and boundary ditches. Some archaeologists use the term *ecofacts* to describe materials that are not made or modified by people but that can provide information on medieval environment or subsistence. For example, animal bones and seeds recovered from archaeological sites can tell much about medieval diets, while pollen can cast light on the medieval climate. Since written records are so limited for early medieval Europe, archaeology is a primary source of knowledge concerning early medieval life.

Even in regions where written historical sources are plentiful, such as the Byzantine Empire, China, and India, archaeology can play a role in our understanding of medieval society. During the Middle Ages most people were illiterate. Knowledge of reading and writing was limited to the political and religious elites. For this reason, written documents tell us about the lives of kings and saints but very little about the day-to-day lives of farmers and serfs. Written documents speak about political history, giving the names of kings and the dates and locations of battles, but they impart much less detail about clothing, houses, and diet. Thus, archaeology is playing an increasingly important role in the study of all medieval societies throughout the world.

Medieval archaeology is a field of study that has developed in the past 50 years. In Europe and many other parts of the world modern cities are situated atop the remains of medieval towns and cities. The medieval remains lie under modern buildings and are usually inaccessible to archaeologists. In Europe the devastation caused by World War II made many of the medieval cities, such as medieval London, accessible to archaeologists for the first time. Today, in many parts of the world, archaeologists explore medieval remains in urban centers in advance of urban reconstruction. While medieval archaeology was born in postwar Europe, it has spread to many other regions on the world during the past 50 years. Today medieval archaeologists explore ancient cities in India, towns in medieval sub-Saharan Africa, and sites associated with the Crusades in the Middle East.

### ART AND ARCHITECTURAL HISTORY

Art and architectural historians have always played an important role in the study of medieval societies around the world. The modern landscape features many buildings, including castles, temples, and houses, that were built in the Middle Ages. Some survive as ruins, while others have been in continuous use since the medieval period. Detailed studies of these buildings can tell us a great deal about medieval technology and the ways that it changed through time. In addition, the study of religious buildings, such as temples, mosques, cathedrals, and monasteries, can help us understand medieval religious practices. Many of these religious buildings house priceless examples of medieval art, including paintings, sculpture, and smaller objects like reliquaries (decorated containers for sacred relics). Studies of these sacred objects can tell us about the nature of the crafts that were practiced in the medieval world.

### BEYOND THE “DARK AGES”

When we think of the Middle Ages, we conjure up images of the Black Death, or bubonic plague; Viking raids; and bloody battles. Many people also imagine that the medieval period was an era of stagnation in science and technology. It is no wonder that the medieval period is sometimes erroneously referred to as the Dark Ages. While Viking raids and infectious diseases were certainly a reality of medieval life, the medieval period cannot be seen as an era of technological stagnation. Sophisticated shipbuilding techniques allowed the Vikings to settle Iceland and Greenland and to explore the Atlantic coast of Canada. Medieval inventions such as the cannon and plate armor transformed the nature of warfare. New architectural techniques allowed medieval architects to construct castles and cathedrals. These important developments in shipbuilding, pyrotechnology, metalworking, and architecture laid the foundations for the modern world.

## ► **adornment**

---

### **INTRODUCTION**

Throughout history, people have used adornment to make themselves beautiful, express religious or political sentiments, or identify themselves as members of particular groups. Medieval people used jewelry, cosmetics, and hairstyles to adorn themselves.

In the Islamic world adornment filled the dual roles of decoration and coverage. The Koran dictated that men and women should dress modestly in public, covering their bodies and heads. The veil became a symbol of class status; high-class women covered their hair and often their faces, while servant women left their hair uncovered. Islamic women used many different types of veils and full-body coverings. Some left openings for eyes, while others masked the wearer's eyes completely with mesh. Islamic men wore turbans.

Although they were covered in public, at home Muslims shed their concealing garments and revealed the makeup and jewelry that they had carefully selected. Women used cosmetics to keep their skin white, their eyebrows dark, and their cheeks and lips red. Men were allowed to wear perfume at home and in public. Women could wear perfume only at home. Women wore a large amount of gold jewelry set with jewels. Men, however, were not allowed to wear gold, but they could wear silver rings.

In Africa people wore jewelry made of shells, beads, fabric, and other items. Beads could be made of metal, coral,

glass or stones such as jasper and cornelian. Many of these items came to Africa from the Indian Ocean region. People made these beads into necklaces, collars, bracelets, anklets, and chest panels. Decorations could signify rank or status; for example, among many peoples, chiefs and their families wore much more elaborate jewelry than common folk. In West Africa cowrie shells were particularly valued in jewelry and were used in rings, necklaces, belts, and headdresses. Ivory and metals such as gold and copper were used in ornaments worn by the rich and powerful.

African people also used their own bodies as artistic canvases. People across the continent arranged their hair in elaborate styles, sometimes decorating their hair with shells or other objects. They painted their bodies with designs that held symbolic meanings. Many Africans cut designs into their skin to leave decorative raised scars that showed they had come of age, reached particular milestones in life, belonged to certain groups, or conformed to the local ideal of attractiveness.

Throughout Asia people wore jewelry as decoration and as a mark of wealth and status. In China people wore elaborate jewelry made of gold, silver, and stones such as turquoise and opals. Metalsmiths used casting, beating, and granular techniques to make hairpins, decorative combs and hair ornaments, bracelets, earrings, necklaces, and other items. Floral motifs were very common in medieval Chinese jewelry. Gold and gemstone jewelry was also popular in India, and Indian jewelry fashions spread through much of Southeast Asia. In

Thailand people liked to wear jewelry made with glass or ceramic beads, cornelian, agate, amethyst, diamonds, and other stones. The wealthier the individual, the more expensive the jewelry he or she could wear.

People in India drew designs on their skins with henna to mark special occasions such as weddings. Many Asian and Pacific peoples tattooed themselves to make themselves more beautiful or to show status or membership in groups, though tattooing was a mark of shame in China and Japan. In China and Japan women used white makeup to lighten the skin on their faces. A pure white face with deep red lips was considered the ideal for aristocratic women at the imperial court in Kyoto.

People in the Americas made jewelry out of feathers, shells, jade, and other items. The Maya and other Mesoamerican peoples were highly skilled at working metal, creating necklaces, bracelets, and other more exotic items such as lipspools, earspools, and nose rings that they wore in large holes in their faces to make themselves look attractive or fearsome or to express spiritual connection to the gods. American peoples also painted their faces and bodies with designs for ceremonies or battle.

Medieval Europeans devoted a fair amount of time, energy, and money to adornment. They thought smooth white skin was beautiful, so women in particular used skin creams and avoided the sun if they could. Both sexes used pigments to enhance their lips, cheeks, and eyes. Women wore their hair long and arranged into fashionable hairstyles. Some women bleached their hair to make it blonde. Men might curl or braid their hair. Many men in northern Europe wore mustaches and beards, which they sometimes arranged in interesting shapes.

Jewelry was a popular form of adornment. At the Byzantine court both men and women wore gold jewelry set with stones or decorated with mosaics. Many people wore reliquaries, cross-shaped boxes that held holy relics. In western Europe the most common types of jewelry were rings and brooches. Celtic metalsmiths produced jewelry formed in elaborate patterns, such as interwoven knots, animals, and ships. People who had gone on pilgrimages to the Holy Land would advertise this fact by wearing metal badges on their clothing or affixing scallop shells to their hats. A gentleman might also add a weapon or piece of armor to his ensemble to show everyone his military prowess.

## AFRICA

BY CARYN E. NEUMANN

Adornment is a personal statement to others. By dressing the body in jewelry or perfumes or modifying the body with

## AFRICAN BODY ART

African people of the medieval era practiced a range of body art. According to the norms of the culture, men and women would color or scar their skin. In common with other African adornments, scars designated status. In common with some clothes, tattoos provided protection.

Medieval Africans may have blackened the area around the eyes and lips to follow their society's idea of beauty. Both men and women of the Fulani of West Africa painted themselves white, red, and yellow. Unlike skin painting, which is used with jewelry and clothing to enhance beauty, tattoos among the Fulani appear to have been strictly protective. Triangles tattooed at the corners of the mouth were thought to protect against the feared "evil eye" of malevolent humans.

Scarification is a form of art that requires an expert hand. The technique of scarification has changed little over time. A man or woman makes a small cut with a razor or thorns and uses a foreign substance, often charcoal, to irrigate the wound. The wound is then allowed to heal. During healing, raised scars become visible.

Scars showed tribal identity as well as personal achievements. The Mursi of East Africa was one group that engaged in scarification. The scars on the arms and bodies of Mursi men were a record of feats of bravery in battle or outstanding skill at hunting. The marks, arranged in typically African geometric patterns, enhanced the social prestige of the wearer. The Bumi men of the Omo Valley in East Africa adorned their faces with scar patterns, presumably to indicate personal achievement. For women scars symbolized fertility. They showed that she bore children or had the strength to withstand the pain of childbearing. The arrangement of teardrop-shaped scars around a central point was typical. The absence of skin decoration is telling. With expert practitioners beyond the financial means of many Africans, scars showed social status.

piercing, scarification, tattoos, or hairstyles, an individual communicates important information. Social status, familial position, financial standing, and group identity are just some of the personal information that medieval Africans communicated through adornment. Much of this information

became lost when it was translated through European eyes. Medieval travelers and adventurers lacked the social awareness to understand African adornment as more than just body decoration.

In medieval African adornment an object or design did not stand alone. It was meant to be viewed in the context of clothing, hats, hairstyles, and other adornments. Africans specialized in assembling elements of power and display. Creating a totally adorned body, magnified by layers of beads and fabrics and visually enriched by the juxtaposition of ornate geometric motifs sometimes combined with similar patterns in torso scarification and elaborate hairstyles, expressed wealth and status among medieval Africans. Display elements, reflecting a family's wealth, included beads and cowrie shells as well as belts, fibers, and reflective surfaces. Power elements, often acquired over long periods, included horns, claws, skulls, and hair and created surfaces charged with special powers.

Evidence indicates that beads made from metal, stone such as jasper or carnelian, or glass were traded across the Indian Ocean to Southern Africa starting before 1000 C.E. The beads were then exchanged throughout Africa, adding to their value as items of wealth and status. However, beads were known to Africans who did not engage in transoceanic trade. The earliest examples of African medieval adornment are tin and stone beads from the Nok culture of central Nigeria around 300 C.E. Excavations at Igbo Ukwu in eastern Nigeria, dated to about the ninth or 10th century, have found not only crowns, breastplates, pendants, ornaments, anklets, wristlet, and chains but also tens of thousands of beads once worked into elaborate necklaces. These glass beads were not manufactured locally but obviously were acquired through trade, perhaps for slaves, ivory, or spices.

*Hip ornament; Nigeria, as early as the 15th century* (National Museum of African Art, Smithsonian Institution, photograph by Franko Khoury)

Several stone figures discovered in the sacred city of Ife, Nigeria, depict human figures that date from 800 to 1000 C.E. The best known of these objects shows a bare-chested Yoruba man sporting a heavy collar of beads and bracelets that suggest he held high rank. Other figures, presumably sculptures of rulers, show dignitaries wearing coronation insignia. These items include large collars of beads, tumbling strands of bead necklaces, an abundance of bead bracelets and anklets, and toe rings. In some cultures, such as the Yoruba, the accumulation and distribution of beads was the prerogative of the ruler. In kingdoms such as the Owo, histories of chiefs begin with recounting how many strands of beads were given by the king to a man granted a title. Beads on the ankles and arms and around the neck, along with sashes of jasper or coral beads, allude to the rank of chief in the social hierarchy.

For centuries beadwork formed the primary type of personal adornment and the apex of artistic expression in Africa. Beads were given high aesthetic value because they were thought to unite four qualities: hardness, brilliance, geometric patterns, and color. Glass beads were most popular in the southern Africa, while the people of Central and East Africa preferred ivory beads. Beaded objects indicated information about the wearer in societies like the Kete people. Colored glass beads were combined with cowrie shells to cover sashes and belts, creating a dazzling visual display. A West African woman acquired beaded-fringe panel necklaces, beaded collars, long multicolored strands of beads, and beaded leather pouches throughout her lifetime. Thus the items functioned as insignia of her social status and her connection to her family and ancestors. They also communicated information about her personality and marital status. Richly beaded capes in abstract patterns characteristic of Africa were worn by the married women of the Ngwane of South Africa.

Cowries also were used as adornment. These white shells of the *Cypraea moneta* came to Africa from the coasts of Bengal and the Maldives, islands in the Indian Ocean. They were used as both currency and decoration. No other material equaled the popularity of cowries in West Africa. The value of the shells was derived from their shape, which suggests the female sexual organ and, by extension, the aesthetic and social value of the woman herself. The structure and color of cowrie shells also suggest the human skeleton, thereby equating the shell with the most beautiful of earth's creations. The shape of cowries makes them ideal for ornamental artifacts and for very intricate geometric patterns. They were attached with wax to hard supports such as wood or metal as well as sewn onto leather or fabrics. The shells were also threaded to make jewelry and used in headdresses, rings, belts, and necklaces as well as to form sparkling overlays for masks.

*Blown-glass perfume sprinkler; Egypt or Syria, 14th century* (Los Angeles County Museum of Art, the Madina Collection of Islamic Art, gift of Camilla Chandler Frost, Photograph © 2006 Museum Associates/LACMA)

Medieval Africans believed that ivory objects of adornment imparted the powerful life force of the elephant. Ivory's light color, luminous warm patina, and surface irregularities or patterns (natural or induced and heightened by soil, wear, or color) made it enormously popular in central Africa. Items made of ivory acted as vivid punctuation points against dark skin tones or abundant dark hair.

Like ivory, metal objects of bronze, copper, iron, gold, or silver symbolized prosperity. The luster of the metal added a glow to an assemblage. The weight of metal adornments altered the gestures of the wearer while augmenting the body's contours. Metal adornments created a geometry that could be echoed by the patterns incised in the wearer's skin. Although metal was used all over the African continent, copper appears to have been more highly valued than any other precious metal among the Dogon and Bambara of West Africa because of its ability to change color. Humidity in the air turns copper from red to green, while heating it to red hot in the presence of oxygen turns the metal black.

Political status was indicated in the medieval era by a profusion of gold and copper ornaments and regalia. Akan chiefs,

queen mothers, and their attendants also wore much metal jewelry. Gold pectoral disks, known as *akrafokonmu* ("soul people's neckwear" or "soul washer's badges") were created from cast, repoussé (patterning formed in relief), or gold-leaf-over-wood techniques. The disks were worn by favorite slaves and commoners who had distinguished themselves. The wearers would be sacrificed at the king's grave on his death.

Adornment that extended the shape of the head, in the form of hairstyles or head shaping, pervaded medieval African society. The Nok wore elaborate hairstyles with intricate buns, tresses, and locks along with a seeming excess of beads around their necks, torsos, and waists. The body adornment appears to have indicated rank. Head shaping took place throughout Africa as a part of spiritual beliefs or to enhance the beauty of an individual. Some groups saw people with elongated heads as possessing more wisdom than those with naturally shaped heads. The process of head shaping in the medieval era has been lost. However, it is likely that it has some similarities with modern head shaping. A newborn's skull is malleable enough to be molded. A soft wrapping, perhaps made from tree bark, was placed around an infant's head within a few weeks after birth. A tighter wrapping of a rope or a basket was placed over this wrapping. This process was continued for about six months until the shape of the skull was permanently altered.

Medieval Africans also changed the color of their bodies. The Akan, a West African forest people, viewed gold and copper as possessing both aesthetic and spiritual value. An Akan copper cosmetic box has been found that once contained pomade made of shea butter mixed with gold dust that was rubbed on the skin. Medieval African cosmetology did not permit a gradual change from one color to another. Accordingly, cosmetic adornments showed sharp contrasts between the black color of the body, red, and white. Other colors were apparently rarely used. Black showed the energy of life, while white represented birth, and red indicated the time between birth and death. Body designs, in common with bead designs, were typically geometric.

## THE AMERICAS

BY JULIA MARTA CLAPP

There are several ways to learn about adornment practices in the period before European contact. First, we may study the artifacts that archaeologists have unearthed. Second, we may study the ancient art of a particular region and look at the adornment of the figures depicted. Third, we can learn from the objects that were buried with the dead. Any of these approaches used on their own will not offer a complete picture, so they are best considered together.

A quick survey of art from the Maya civilization in the Classic Era (ca. 200–ca. 900 C.E.) reveals a Mayan taste for abundance of personal ornamentation. For example, stela 31 from the city of Tikal depicts a warrior draped in lustrous jewelry and ceremonial garb. He wears an elaborate feathered headdress (or helmet) that covers his chin. Around his neck are circular discs that are likely shell gorgets. A figure in stela 4 from Machaquilá, Guatemala, depicts a figure in similar garb, wearing wrist and ankle ornaments as well.

Necklaces were common in the art of the Maya, and nearly every depiction of a figure includes a large, multistranded necklace. Headdresses were also depicted frequently; ornate headdresses are one of the most recognizable aspects of Maya art. The Maya wore plugs (also known as spools or flares) in their ears and lips. Plugs are large discs that are worn in the lip or ear and stretch the skin. Earspools and lipspools were probably the most common articles of adornment worn in the Americas during this era.

Jade and shell were popular materials for articles of personal adornment. One Maya artifact, a shell pendant from Jaina (ca. 600–ca. 800 C.E.), is only about 3 inches high, but it clearly depicts a figure sitting with a fish that is covered in hieroglyphic text. At one time this pendant was inlaid with jade, although the jade has since been lost.

Teotihuacán is now especially known for the masks archaeologists have found there. Although we don't have a great deal of knowledge about the citizens of Teotihuacán, we can gather some clues from the masks. For example, a censer mask (ca. 500–ca. 650 C.E.) depicts an abstracted face with earspools and a nose bar, an ornament traditionally worn by elites or by deities.

Metalworking was a large part of artistic production in Mesoamerica during the Classic Period, and ancient pre-Columbian people put this skill to great use for luxury goods. At the time of the Spanish conquest European invaders destroyed much Aztec art, but some jewelry and other objects of personal adornment have survived. The Aztec were masterly in their ability to create intricate, detailed design from gold. One Aztec lipspool in the shape of a serpent's head includes a protruding forked tongue. In addition to earspools and lipspools the Aztec also wore nose ornaments. One 16th-century gold piece, in particular, is flat and pressed into a U-shape, which art historians have identified as an abstracted butterfly. Archaeologists also have found a string of gold and silver round beads of varying sizes that may have been made as early as the 14th century. Other beads were made in the shapes of particular animals, such as snails.

In addition, archaeologists have found intricate rings. A gold ring from the Postclassic Period (ca. 900–1521 C.E.)

represents the god Xipe Totec. The ring is ornately carved with the god's face, and he wears his own nose and ear ornaments and headdress with bells attached. Aztec wore not only round spools in their ears but also earrings that dangled in a manner similar to that of earrings worn today. One pair from the 15th century depicts a bird's face (possibly an eagle) protruding from a circular band. From the bird's beak hang several rows of dangling bells. Aztec wore adornments made from materials besides gold. Like other pre-Columbian Mesoamericans, Aztec also made use of jade and turquoise to beautiful effect. In addition to earspools, lipspools, rings, and nose ornaments, archaeologists have also found bracelets, pendants, and pectorals.

There are far fewer representations of human beings in art from this period in Native American history than there are from other parts of the Americas, so information about jewelry and adornment is dependent on archaeological excavation. The Mississippian culture (ca. 750–ca. 1500 C.E.), which inhabited the eastern, midwestern, and southeastern United States, made gorgets out of shell with incised images. Warriors would have worn them. In one, a warrior in an active pose with arms and legs extended holds a club and the decapitated head of an enemy. Gorgets were also found in burial mounds from the era. From the Mississippian burials gorgets are plentiful and the most common type of adornment that archaeologists have found. Historically, Native Americans from the eastern part of the current United States built mounds over burial tombs and filled them with rich offerings, especially articles of adornment.

During the Mississippian Period copper and marine-shell items were considered to be the most valuable materials. Although it was primarily the elite who owned objects made from them, ornaments of shell and copper were also popular in trade. These were primarily made into beads, pendants, and gorgets.

The use of earspools, lipspools, and headdresses of varying styles had widespread use throughout the Americas prior to the Spanish conquest and were equally common in North America. Sculptures of high-status citizens of the Mississippian civilization confirm this: One of a crouching figure (ca. 1200–1350 C.E.) shows a man wearing earspools and a necklace, and he has his hair tied in a topknot on the crown of his head. Another sculpture depicts a man in ceremonial costume wearing a headdress, shirt, and sash, with marks around his eyes. In later centuries, after sustained contact with Europeans, Native Americans were widely known to have practiced tattooing or body painting. Historians and archaeologists believe that it is likely that this was carried out during the Mississippian Period as well, which pigmented art objects such as the costumed figure suggests.

Before Spanish colonization in South America, natives worked adeptly with gold. Interestingly, gold was not an especially valuable material for native South Americans, though it was for the invading Spaniards in the 16th century. The value of a given object instead would have been located in its symbolic meaning and the quality of its craftsmanship.

One of the most astonishing and rich discoveries of the 20th century was the tomb of an ancient ruler from Sipán. The excavation revealed treasures of the Moche civilization, which inhabited the coastal plains of Peru from the first to the eighth centuries. Like many such discoveries, the excavation of Sipán was initially jeopardized by widespread looting, though many of the stolen goods have since been recovered. In the tomb archaeologists found many varieties of hollow beads that were made by soldering (joining with heat) two pieces of metal together. The beads were produced in a variety of shapes and sizes. One of the most impressive is nearly 5 inches in diameter and depicts a human head, its eyes made of lapis lazuli (a blue stone that the Moche acquired from Chile) and silver. The face has wide eyes; a broad nose; large, round ears; and carving that represents hair hanging over its forehead.

A pair of earplugs from Sipán is a typical example of the tomb's riches and is similar in shape to modern-day cuff links. A flat, oval gold base is inlaid with turquoise and shell. The inlay is created of many very small pieces, which—like a mosaic—form the image of a zoomorphic figure with a bird's

head, running and holding an object. Similar ear ornaments depict people, ducks, deer, and other figures.

Other objects found at Sipán were earrings; nose ornaments (for a pierced septum); a crown; masks; a headdress; bracelets; a painstakingly beaded pectoral made of white, pink, and green shell beads; a hammered, fitted gold plate that covered the wearer's entire face below his nose (probably designed as a burial ornament only and not worn in life); bells; and other astonishingly beautiful objects. It is important to remember that the treasures found at Sipán were meant for the wealthy and elite only; such a discovery gives us little understanding of everyday adornments worn by the nonelite.

Much later artisans from the Chimú Period (ca. 11th–13th centuries) made gold earspools similar to those found at Sipán. These are round like coins and were created by hammering flat sheets of the metal. The spools depict a figure with upraised arms, which is also bedecked in jewelry and a headdress as well as separate, dangling pieces that are attached on small rings. Metalworkers from this period were skilled at creating such designs that had separate parts and that were made of a gold alloy; gold was mixed with other metals to increase its strength. Since the Moche Period, South Americans had been mixing gold, silver, and copper, but they were skilled at making these alloys appear to be pure gold.

Most of the artifacts that have survived from the Caribbean islands are objects of ceremony or ritual, rather than articles of adornment. However, from the Dominican Republic (on the island of Hispaniola) archaeologists have found a beaded necklace made of semiprecious stones. The beads are still strung together, and they are fairly uniform and smooth. The amulet represents a mythical, anthropomorphic creature. Such ornament was added to daggers, scepters, or amulets carved of stone, shell, or jadeite. In Taino societies in the Greater Antilles and the Bahamas only the cacique, or ruler (and his wife or wives), wore jewelry.

Pre-Columbian Taino societies also adorned their skin with body paint, especially for religious ceremonies and battle. They painted their bodies with ink made from plants and clay. In addition, paint could be applied with a stamp. From the Dominican Republic is such a ceramic stamp in the shape of a bearlike animal adorned with a geometric pattern. Although stone, shell, and wood were the most popular materials used for much Taino craftsmanship, they were also skilled in beadwork. A belt (ca. 1530 C.E.) from the Greater Antilles is constructed from cotton, red and white snail shells, black seeds, pearls, glass, and obsidian. The beadwork is geometric and precise. In the center of the belt is a figure, which mostly consists of a simplified head with open mouth and teeth and wide eyes, flanked by earspools and hands.

## ASIA AND THE PACIFIC

BY CARYN E. NEUMANN

The history of Asian art gives little emphasis to the so-called minor arts associated with adornment. Textiles, jewelry, and body art have undergone little study from either the technical or historical standpoints. Few pieces of jewelry are dated, leaving considerable chronological gaps in the narrative. Nonetheless, certain patterns based on style, design, and technique do emerge that can be viewed in the context of political developments. As is evident from excavations and records, the applied and decorative arts played an important part in everyday Asian life of the medieval era.

Ornamentation with jewelry was probably the most popular type of adornment in Southeast Asia of the Middle Ages. Extant images from the region reflect Indian influences and an excess of riches. The bas-relief figures on famous monuments are sumptuously adorned with an abundance of jewelry worn in direct contact with the skin, fastening draped costumes, and adorning intricate hairstyles. Bracelets, chest pendants, head ornaments, belts with buckles, rings, and necklaces cover these images. Like Indian jewelry, most of the jewelry from Southeast Asia was gold. Pieces were molded, forged cold in the form of stamped or embossed sheets, or constructed from a clay or bronze core wrapped in a sheet of gold. The jewelry helped signify rank. Semiprecious stones enhanced the simplest as well as the most intricate shapes of rings and buckles.

Gold has never been abundant in Thailand. However, a few small mines in scattered locations produced enough of the precious metal to explain the wealth of gold artifacts discovered from the medieval period. Most gold came to Thailand through trade. As a valuable commodity, gold was generally used only for religious or royal objects. Many Thai artisans used niello (a black-colored alloy). The process of creating niello is thought to have come to Thailand from India in the 12th century. The object decorated with the amalgam had to have a silver content of at least 95 percent for proper adhesion. Artisans used chisels to etch designs.

The niello amalgam was made of lead, copper, and silver, which were heated to form a compound. Sulfur was added, and the mixture was allowed to cool and harden. The compound was crushed to a powder and mixed with soldering flux pressed into etched areas on the object. The object was then smoothed with sand and polished by rubbing it with soft charcoal. Gold could also be wiped on to silver areas to make gold flowers on silver vines.

In Thailand bead necklaces and beaded ornaments were in fashion from the ancient period up to the 11th century. The Thais used beads made from cornelian, agate, garnet, and

amethyst as well as colored glass and glazed ceramic. Gold and silver ornaments appeared in Southeast Asia during the period of Indian-influenced civilization from the first to the fifth centuries. Following the Indian style, Thai jewelers favored nine gems: diamonds, rubies, emeralds, topaz, garnet, sapphires, moonstone, zircon, and cat's eyes. The Indian tradition was followed in Thailand by the Mon culture from the sixth to the 11th centuries. Gold ornaments of the period included rings, earrings, necklaces, and pendants. The common motif of Mon jewelry was a dot design. Semiprecious stones were applied to some pieces. The royal fascination with gold continued with the rise of the Sukhothai kingdom in the 13th century and through the modern period.

In China the Tang Dynasty (618–907) experienced a flourishing of metalworking. Once used principally as inlay and decoration on bronze objects, gold and silver began to be used in all the innovative shapes and beautiful designs that had been exclusive to bronze. Elaborate eighth-century gold hairpins have been discovered in Guangzhou at the Huangdigang archaeological site. A tomb dating to 760 at the Hansenzhai site in Xi'an disclosed gold filigree and beaded hairpins set with turquoise and opal and in the form of birds with outspread wings. Other hairpins with openwork ornaments were recovered from a tomb at the Huijiacun site in Xi'an and dated 848. Chinese metalwork from this period was either cast or beaten. Granular work was used sparingly and, for the most part, only on jewelry. By the mid-eighth

*Bronze mirror; China, Tang Dynasty, eighth century* (Freer Gallery of Art, Smithsonian Institution, gift of Charles Lang Freer)

century granular work became favored for hairpins and other hair ornaments. Other jewelry pieces were worked in filigree and set with semiprecious stones. Floral patterns, either as a blossom or a spray, confined to a circular or oval center were one of the most common design elements.

Japan has a long history of fascination with the painted face. The fashion for white makeup came from China in the seventh century. When Japanese culture blossomed in the Heian Period, stereotyped white face makeup had already become an attribute of beauty for aristocratic women at the imperial court in Kyoto. It would remain so for the rest of the medieval era. A white face with red lips stylized the appearance, eliminating any individualism and elevating the wearer above the ordinary. The Chinese supplied the women of the imperial court with white lead-based makeup that proved extremely damaging to the skin. The red for the lips, obtained from the flowers of the safflower plant, apparently came from China in about 610 B.C.E.

The Ainu women of Japan practiced tattooing. The significance of the decorations was closely linked to the Ainu religion and to their social structure. A full tattoo was a status symbol for a married woman. Female specialists performed the tattooing process in several stages over a period of years. Powdered charcoal was rubbed into cuts made in the skin with small sharp knives. The result was a blue-black tattoo tapering at the sides of the mouth that made the lips appear double in size. The areas around the eyebrows were also decorated with wavy lines, and the hands and forearms were adorned with various patterns.

While body art in other regions became associated with high status, tattooing in medieval Japan was linked with low social status. From the sixth century onward tattooing was used as a form of punishment. As in China, marks were made on the foreheads or forearms of criminals to set them apart from the rest of society. In some regions a criminal was tattooed with the character of a dog or a stripe. In some eras the lowest class of grave diggers and menial laborers were also distinguished from the rest of society by a tattooed caste mark called an *eta*.

Southeast Asia used gold in ornament before the Chinese did so and continued this practice through the medieval era. In Java the facial orifices of the dead were covered with rings and tiny sheets of gold until the seventh century, while Filipinos continued this practice until the 14th century. At the same time the use of rings and ear ornaments (broken rings with or without a bulge near the cleft with wire coiled in a double spiral) was widespread at all levels of society throughout the region. Javanese and Balinese people, according to surviving monuments, wore an abundance of jewelry in direct contact with the skin, to fasten draped

costumes, and to adorn elaborate hairstyles. Bracelets, chest pendants, head ornaments, belts with buckles, rings, and necklaces made of gold and precious stones helped signify rank in the Pacific islands.

## EUROPE

BY AMY HACKNEY BLACKWELL

The efforts medieval Europeans made to adorn themselves were determined by time, place, and social status. For most Europeans adornment was a simple matter. The poor did not have ready access to warm water or jewelry, so for them adornment might consist of a quick splash of water and brushing the crumbs off their clothes. For the wealthy, however, adornment was a serious business. At the Byzantine court and in other royal environments, people would cover themselves with gold and jewels in all the latest styles.

Bathing habits varied tremendously in medieval Europe. Although the peasantry generally did not bathe very often, many Europeans did wash themselves regularly. Some Irish people during the early medieval period appear to have bathed and combed their hair daily. The Anglo-Saxon people of Britain did not bathe their whole bodies frequently, but they did wash their faces, hands, and feet daily, and many people owned their own wash basins. In the 13th and 14th centuries wealthy people typically bathed once a week. Europeans of all ranks used lotions and unguents to keep their skin soft and prevent chapping. Olive oil, lanolin, and butter made good lotions and sometimes were mixed with herbs to make them smell nice. Many people oiled their hair as well. Europeans kept their teeth clean by rubbing them with twigs or chalk. Some Viking men apparently carved decorative grooves into their teeth and filled them in with red or black pigments.

Throughout medieval Europe people prized smooth white skin. The most common means of maintaining a white complexion was staying out of the sun, an option that was unavailable to peasants, who typically labored under a hot sun and thus had darker skin than members of the aristocracy, who generally avoided both labor and the sun. Women (and some men) used various colored substances to enhance their appearances. In Ireland, for example, berries from the alder tree made a good red pigment for cheeks and lips. Other natural pigments were used to darken eyebrows or as eye shadow. Many people used soot or kohl, a substance made from the heavy metal antimony, as an eyeliner or mascara. Honey was said to make lips firmer. Most refined Europeans valued smooth hands and neat fingernails. In Ireland women sometimes dyed their fingernails red.

Medieval women wore their hair long. Irish poets sing the praises of women with hair long enough to touch the grass. In

much of Europe golden hair was considered the most beautiful, and women were known to bleach their hair to achieve the fashionable light color. Ingredients in hair color recipes included saffron, eggs, chamomile, henna, and calf liver. People used combs made of ivory, wood, or bone to keep their hair tangle free. Hairstyles varied from place to place but often involved braids, which kept hair in order and lent themselves to various arrangements. Some women let their braids hang over their shoulders, and others wound their braids around their heads. A popular arrangement was the ram's horn, in which the braids were twisted into circles on the sides of the head. Another style was achieved by gathering the braids into a mass held at the back of the head in gold netting called a *crispine*. Women could add false hair to their own to make their braids longer. They sometimes braided ribbons or gold thread in their hair. On top of their hair women sometimes wore veils, flower wreaths, or circlets of gold. Starting in the 13th century wealthy women in western Europe continued to wear elaborate hairstyles, but they often hid this work entirely under pieces of cloth that covered their heads and necks.

Men's hair and beards were also the focus of much attention. Men in western Europe typically wore their hair long. They might let it fall loose over their shoulders or arrange it in braids. Depictions of men in the *Book of Kells* and other illustrations show elaborately curled and arranged hairstyles that must have been executed by skilled hairdressers. Viking men usually wore their hair long in various styles, often designed to fit under the conical helmets they wore in battle. Western European facial hair fashions varied throughout the medieval period. Beards and mustaches were very common, especially in Britain, Ireland, and Scandinavia. Some men wore mustaches without beards. Irish men sometimes wore their beards forked into two points.

At the Byzantine court and among wealthy Byzantine households, jewelry and adornment were ubiquitous and complicated. Both sexes wore jewelry made of gold, often set with precious stones. Sapphires and emeralds were the most commonly used gemstones, though rubies and diamonds were also popular. These stones were polished smooth but uncut because jewelers of that time did not know how to cut facets into gems. Pearls were extremely popular, and women who could afford them wore strands of pearls around their necks or wrists. Women liked to wear large earrings of gold and gems and gold bracelets. Most people used pins to secure their cloaks around their necks and shoulders, and these pins could be very rich and ornate. Some jewelry was decorated with mosaics, designs formed by piecing together tiny fragments of colored stones into patterns. Many people wore reliquaries as jewelry, usually as pendants on chains. Reliquaries were small crosses decorated with gold wire or set with gems; they were designed as

*Saxon brooch; Britain, seventh to ninth centuries* (© Museum of London)

hollow boxes intended to contain holy relics, such as splinters from Christ's cross or the finger bones of saints.

The famous empress Theodora was known for her elaborately jeweled headdresses, which were made of gold and liberally encrusted with pearls and gemstones, with several strands of pearls dangling down to her shoulders. In one portrait she wears a heavy gold collar on top of her cloak. The collar is set with numerous emeralds and pearls, with large tear-drop-shaped pearls hanging from the bottom edge.

Byzantine women wore elaborate hairstyles, similar to those worn during the late Roman Empire. They would wear braids entwined with pearls, affixing the arrangement with pins decorated with carved heads. Some women wrapped their heads in turbans decorated with tiny pearls or gems. Byzantine men wore their hair short and shaved their faces until about 900, when beards became fashionable.

A Byzantine emperor would often wear a cloak extravagantly decorated with jewels, gold, and elaborately embroidered designs. The most lavish part of this cloak was a rectangular or square panel called a *tablion*, which was covered with embroidery depicting a significant image, such

as the face of Christ. Only the emperor could wear a purple cloak. People with money would invest in “jewelry” for their garments. Clothing could be decorated with tiny pearls and gems, or with sheets of gold hammered flat and sewn to the cloth. A nobleman wore a long oblong scarf across his chest and around his waist. The scarf, called a *lorum*, was encrusted with pearls, gems, and embroidery in silk, wool, and gold thread.

Even the soldiers of Byzantium decorated themselves. Members of the imperial Varangian Guard wore metal helmets with bull’s horns on either side, like the helmets worn by Vikings. They attached ornamented metal brooches to their mail shirts and carried swords and spears decorated with gold and silver inlays.

In western Europe the girdle, or belt, was an important piece of adornment for both men and women starting in the early medieval period. Women wore clothes that showed off their waists, and on top of their dresses they wore loose girdles that showed off their status. A wealthy woman’s girdle was woven of gold or silver thread and studded with metal ornaments, enamel, and jewels. Many medieval stories feature ladies awarding their girdles as prizes to brave knights. The girdle was also useful for carrying important items. Women often tied their purses to their belts, and the lady of a house was identifiable by the bunch of keys she wore on her girdle. Garters were an important form of decoration as well. Noblemen sometimes wore garters made of gold as a way of showing off their rank.

In the early medieval period western Europeans did not wear a great deal of jewelry. From the sixth through the 12th and 13th centuries the most popular forms of jewelry were brooches and rings, which could be made of gold, silver, and gems. People covered their arms and necks with clothing, so necklaces and bracelets were impractical. Brooches, however, were important because they could be used to fasten cloaks and garments, and some were extremely elaborate. Celtic metalsmiths, in particular, were known for their ornate knot designs. One of the best sources of information on early medieval jewelry comes from the Sutton Hoo burial ship, the grave of King Raedwald of East Anglia, who died around 625. Artifacts found within the grave include brooches and buckles made of silver and bronze, silver dress pins, fragments of embroidered cloth, shoulder clasps made of gold and decorated with garnets, a sword with cloisonné decorations on the hilt, and a bronze full-face helmet. Many of the metal pieces were decorated with intricately intertwined lines and images of animals, including birds of prey and wolves. The metalwork and textile decorations all suggest that the people of Sutton Hoo had contact with traders from other lands, from Scandinavia to Byzantium and even Syria.

Viking metalsmiths from around the year 1000 also made intricate jewelry. Pendants depicting Thor’s hammer were a popular decoration; one good example is a hammer found on the island of Bornholm, Denmark, now in the Danish National Museum in Copenhagen. Viking smiths made gold rings with woven or braided patterns or decorated with pearls. People closed their cloaks with brooches decorated with ships, horses, dragons, panthers, and other images.

As pilgrimages to holy sites and the Holy Land became popular in the 12th century, people adopted a fashion that let them show everyone where they had been. A person who had visited the Holy Land would place a scallop shell in his hat. Shrines sold badges that were associated with their particular saints. These badges were made of metals such as brass or pewter. They were either pinned or sewn onto clothing.

During the 1300s and 1400s accessories and cosmetics became more elaborate. Most men of the time chose to shave their faces completely, although some continued to wear beards and mustaches. They began to wear their hair chin length and parted in the middle. In France men oiled their hair to make it smooth and rolled the ends around pieces of fabric. Women plucked the hair to make their foreheads appear taller. They also plucked their eyebrows, either into thin lines or completely off so that they could paint new eyebrows higher, thus furthering the effect of an elongated face.

Men and women continued to wear rings and brooches. Gloves were very fashionable, and sometimes people cut holes in the fingers of their gloves to let their rings show. People of this time loved perfumes, and they often carried scents with them in pomanders—hollow metal balls that held sponges soaked in scent. They might also carry a roasted orange studded with cloves, which would help keep away of-fensive odors. Fashionable men carried heavily ornamented daggers. Gentlemen would often wear pieces of their armor along with their ordinary clothing as a way of showing off their military prowess.

## THE ISLAMIC WORLD

BY ROSE ASLAN

According to the Koran, both Muslim men and women are commanded by God to be modest in their behavior and dress. It was common practice for Jewish and Christian women in the pre-Islamic era to wear head coverings, so it was not radical for Islam to make wearing a head scarf compulsory for women. A verse in the Koran defines how Muslim women should behave and dress in public: They “should lower their glances, guard their private parts, and not display their charms beyond what [it is acceptable] to reveal; they should let their head scarves fall to cover their necklines.”

One of the reasons that Islam encouraged modesty was that some polytheist women in the Arabian Peninsula would wear clothes that revealed their chests. Women were required to wear modest clothes for their own protection and to avoid harassment. In the medieval period throughout the Islamic world women, both Muslim and non-Muslim, overwhelmingly dressed in clothes that covered most, if not all, of their bodies; thus, adornments were mainly displayed at the home and at private celebrations with other women. As is true in modern times, men were forbidden from wearing adornments such as gold and silk, but women were permitted to wear them.

Islamic art from the medieval period, especially murals in places such as bathhouses, tapestries, and illuminations in manuscripts, depict women wearing a variety of adornments. Most often slave women and courtesans are seen wearing luxurious ornaments, sometimes without a head covering, while married women are seen covered in long veils, which sometimes swathe their faces. While lower-class women and slaves often would not cover or only partially cover their hair, it was the rule for middle- and upper-class women to always cover their hair. The veil was essentially a class symbol that gave honor and status to the woman who wore it; in fact, it was considered shameful for women to reveal their faces in public except under special circumstances, such as during mourning rituals.

There are many names in the Arabic language for veils, all of which denote a slightly different style. Women wore many different types of veils, such as a *niqab* or the burqa (also spelled burka), both of which completely covered the face except for the eyes and came in a variety of colors, including blue, black, pearl, gray, white, and light colors. The *niqabs* would often have decorations, such as silk embroidery or colored borders. Another type of face veil was made of a black mesh or net; yet another consisted of a dark cloth that would cover the face below the eyes as well as a goat-wool or horsehair net that hung from the top of the head to just below the eyes.

Another style of women's headdress was a narrow, pointed cap from which hung a veil, which was popular in Turkey during the Ottoman Empire (beginning in 1281), though it is not clear if this was worn only by women at the court or by common women as well. Various other caps of different shapes with attached veils were worn by women.

Men in the Arab world always wore a turban in public, which was popular even before the advent of Islam. Little is known about how the turban looked during the time of the Prophet Muhammad (ca. 570–632), but scholars believe that it comprised a very long piece of fabric that was wrapped around the head and that white was a common color while

black was worn by the Prophet and men of high religious standing in the community.

As green was the favorite color of the Prophet, green turbans soon became popular in the Islamic world and were spread further by Ottoman rule. With each ruler and dynasty the popular style and color of turbans would change, though each region and social class had its own style. Crowns were not worn in the Islamic world; thus, in the court the king would wear a very large silk turban decorated with jewels, while others would wear less ornate turbans of different sizes according to their rank and office. In Muslim Spain, on the other hand, only scholars would wear turbans, and most men went bareheaded or wore simple wool caps. In regions such as Persia and elsewhere in the Middle East wool caps of various sizes, with dome, cone, or cylinder shapes, were often worn instead of turbans, or else turbans were wrapped around small caps.

Court women and women of the upper class of Ottoman Turkey and in other regions were very concerned about their looks. They would pluck and shape their eyebrows according to the fashion, and they would use rouge, often made of cinabar, a red mineral, to redden their lips. At times, unibrows were the fashion; if women did not have one, they would stain their eyebrows with kohl to make them meet over the nose. Kohl or antimony was effective in preventing prevalent eye diseases as well as being fashionable, and it was applied as eyeliner by men, women, and children.

Throughout the Islamic world women would dye their nails in various colors and paint intricate designs on their hands and feet with henna, which was usually reddish but could be made brown, black, or dark blue by adding a dye such as indigo. As part of wedding celebrations, women would get together and have festivities where they would decorate the bride and guests with henna. In addition, in regions such as Persia, women would paint beauty marks and moles on their faces and necks.

Black hair was seen as the standard for beauty, and women would color their hair black with dyes such as walnut and indigo; men would dye their beards black in imitation of the Prophet Muhammad. Women would use natural oils, such as sesame and olive oil, to give their hair luster and strength. People with white hair would often dye it with henna, giving it a reddish-orange tint.

The ideal for women was to have smooth, white skin, and they would use various creams and ointments to lighten their skin color. A cream made of ingredients such as honey, beeswax, sesame oil, sandalwood, and saffron was used to moisturize and soften the skin and act as suntan lotion. Throughout the region it was the custom for women to remove much of their body hair; they would use a sticky substance made of

Gold armlet or anklet; Syria, 11th century (Freer Gallery of Art, Smithsonian Institution, purchase)

melted sugar or honey and sometimes lemon to peel off the hair. Also, natural rocks called *shabba* (alum) were moistened with water and were used as a deodorant.

Largely influenced by Sassanian (pre-Islamic Persian) and Greco-Roman styles, jewelry designs were modified according to the preferences of Muslims. Women would hang jewels and gold and silver chains on their face and ears and also would wear jeweled bracelets and armlets. In addition, they would wear fancy necklaces, earrings, rings, and pendants of gold, pearls, and gems. Paintings depicting court women show them decked in elegant styles of jewelry that changed through the years.

During the Mamluk Period (1250–1617) women wore intricate filigreed gold jewelry, some of which were set with precious jewels; this type of jewelry became popular throughout the Islamic world and could be found in places as far as Russia, Syria, Muslim Spain, and India. Jewelry had a variety of designs, with Arabic calligraphy, geometric patterns, and vegetable motifs being the most popular. Although men were forbidden from wearing gold jewelry, they were permitted to wear silver rings like the Prophet Muhammad.

It is recorded in traditions that the Prophet Muhammad used to wear perfume on Fridays and on holidays, to promote Islamic standards of cleanliness. Only men were allowed to wear perfume in public, as a well-known Islamic tradition states: “When a woman puts on perfume and goes among people so that its scent reaches them, she is an adulteress, and any eye which is attracted to her is that of an adulterer.” Because of this standard, women were allowed to wear perfume only at home.

Owing to the emphasis in Islam on personal hygiene, Muslims brought the art of producing perfumes to perfection. Although many of the essential ingredients came from

countries such as China, India, and Africa—transported by sea or overland on the Silk Road—the knowledge of perfume making was centered in the Islamic world and subsequently spread to Europe and other parts of the world. Fabricating perfumes and scented oils was a fine art that was practiced by specialists called attars, the most famous of whom was Farid od-Din Mohammad ebn Ebrahim Attar (ca. 1142–ca. 1220), who, apart from being a perfumer and herbalist, was also a famous mystic poet. Abu Bakr Muhammad ibn Zakariya ar-Razi, also known as Rhazes (ca. 865–between 923 and 935), was a Persian physician and philosopher who wrote a medical encyclopedia called *al-Hawi* that contains a section on cosmetics. Muslims believed that certain scents had medicinal and healing properties, and they were sold alongside medicine by attars; some perfumes were believed to have medicinal qualities, and they were used as medicine and in cooking. People would wear perfume on their wrists and hands, hair, and even clothes.

Umar I (r. ca. 634–44), a caliph and a companion of the Prophet Muhammad, said, “Whoever spends a third of his wealth on perfume is not being extravagant.” Such was the popularity of perfume that it was often used by poets to symbolize beautiful things, such as Paradise and love. Some of the most valuable perfumes at the time were musk, ambergris, and camphor, which were used mainly by the wealthy. Musk was especially treasured because tradition holds that it was the favorite scent of the Prophet Muhammad. More reasonable perfumes were used by common people and were derivatives of easily obtainable flower essences. Perfumes were based on vegetable oils and animal fats, unlike today’s alcohol-based perfumes. Different types and qualities of perfumes were used according to social standing and wealth. Intricate containers for holding perfumes were crafted for the wealthy, and some containers were even encrusted with jewels or made of delicate colored glass.

## ► agriculture

### INTRODUCTION

By the beginning of the medieval period most people across the globe depended on agriculture for at least part of their sustenance. Although some people continued to live by hunting and gathering, especially in more remote areas of the Americas, Africa, and the Asia-Pacific region, in most areas populations were too large to support by this method, and agriculture was essential. New technologies and crops appeared throughout the medieval period, allowing farmers to feed increasing numbers of people.

Agricultural methods varied by region, population size, and technological knowledge. Primitive peoples commonly used slash-and-burn agriculture, the practice of cutting down vegetation and burning it to create fields. This technique was used by people who typically moved their fields and perhaps their dwellings from place to place every year or so. Slash-and-burn fields lose their fertility quickly. After a field had been used for crops, the farmers would abandon it and allow natural vegetation to grow over it again while they moved on to new fields. After a few years they could return to an old field and reuse it by the same technique. In the Caribbean people such as the Arawak used slash-and-burn agriculture to grow manioc and other root crops. Throughout Asia people used this method to create their initial fields.

As populations grew, however, creating new fields annually became impractical, and people were forced to farm the same land year after year. This compelled them to solve the problem of the reduction in soil fertility that naturally resulted from growing crops. Crop rotation and fertilizers were the main correctives to this problem. In Europe farmers developed the three-field system, in which two crops were rotated among three fields, one of which was always left to lie fallow and recover its fertility. Medieval Islamic farmers adopted new, more efficient methods of crop rotation and employed fertilizers that eliminated the need to allow fields to lie fallow. Asian farmers used manure to restore fertility to their soil. They also learned to create terraces on hillsides, which permitted rice cultivation in formerly unusable areas.

Although the details varied by culture, farming was typically a family affair, requiring work from each family member. In Europe the men performed such heavy work such as plowing, women tended kitchen gardens, and children scared away birds that would eat the grain. In many communities in the Americas each family group would be allocated its own plot of land to produce food for their own consumption. Many American peoples divided agricultural work by sex. Among the Taino of the Caribbean islands women tended fields, carried water, and raised animals for eggs and meat, while men did the heavy work of clearing fields and planting crops.

Most people farmed, but not everyone owned their own land. In Europe most land was owned by lords and farmed by peasants, who cultivated crops for both themselves and their landlords. In contrast to Europe, most people in the Islamic world had the right to own property, and thus individual families could own and operate farms. In Africa and the Americas clans divided farmland among their members, allocating each man or woman a plot of land to farm for personal consumption.

Medieval farmers grew a large assortment of crops, many of them the result of careful breeding or international trade. Islamic farmers grew many crops imported from Asia and Africa. Durum wheat, sorghum, rice, fava beans, lentils, chickpeas, pomegranates, lemons, limes, apricots, artichokes, and eggplant were all typical foods in the Islamic world. Common European crops included wheat, barley, oats, peas, beans, and various types of vegetables. In Asia rice continued to be a principal crop, and much of the population of China, India, and Southeast Asia derived most of their calories from it. In the drier or colder parts of Asia, such as northern China, wheat and millet were more common crops. In the Andes people used slash-and-burn fields to grow coca leaves, manioc, peanuts, and sweet potatoes. Throughout much of the Americas people depended on a trio of crops, corn, beans, and squash, which grew well together and provided most of the necessities of a balanced diet. They also grew cotton, which they used for clothing.

African farmers developed numerous varieties of grains, fruits, and vegetables, selecting the species that thrived in their local climates. In West Africa, for example, farmers bred a variety of rice that grew at the same speed as the annual floods. Trade routes that developed in medieval Africa allowed the transfer of crops and agricultural techniques from place to place. Africa had three major environmental zones, each of which lent itself to a different type of agriculture. In the deserts of northern Africa people could not raise crops and restricted themselves to herding livestock. In savanna areas people planted such grains as sorghum and millet, timing their crops to coincide with the annual rainy season. They also raised cattle, though the tsetse fly limited livestock to dry areas. In the forests of central Africa people grew a range of crops, including tubers such as yams, legumes, vegetables, and bananas.

Getting water to crops was a perpetual problem for farmers throughout the world. People came up with a variety of irrigation techniques to get water to their fields. In the Andes people tapped into underground water tables and built aqueducts to move water around. They also constructed raised fields separated by canals and small lakes that both provided water to the crops and controlled temperatures by absorbing and releasing solar radiation. People of Mesoamerica and the southwestern United States built irrigation ditches. In the Rift Valley of Africa farmers used the local rocky landscape to create irrigation canals that used gravity to water fields. In Asia people dug elaborate networks of canals to ensure that water could be distributed over the rice fields at the appropriate times. Throughout the Islamic world people used machines to help them move and lift water. People dug deep wells and underground tunnels to reach and channel ground-

water. They also dammed rivers to collect water and release it as needed. A Persian device called a *qanat* collected water on a hilltop and released it into fields below through a series of underground channels.

Throughout the medieval period, farmers invented devices to make their work easier. New technology such as the moldboard plow (an import from China), wheeled plows, and the horse collar made European farming easier than it had been. By 1500 farming was much more efficient than it had been in 500.

## AFRICA

BY KATHRYN DE LUNA

For the last several millennia up to the present day Africa can be characterized as agricultural because most people have made a living by planting crops, herding livestock, or a combination of the two. The range of environments both today and in the past encouraged an inventive farming tradition in which Africans carefully combined diverse agricultural activities with other modes of food procurement, such as hunting, gathering wild foods, and fishing. Not surprisingly, some of these other strategies were integral to farming in the first place; hunting was necessary to protect crops from wild animals searching for food, and foraging was one of the ways in which Africans became familiar with new food plants, many of which were slowly adopted in the repertoire of cultivated plants and gradually transformed into domesticated species.

Generally, we can identify three environmental zones in Africa, with each corresponding to a different mode of agriculture. Agriculture in the deserts and steppes was limited to the herding of livestock, often in a nomadic or seasonally nomadic pattern. In the wooded and grassland savannas an annual rainy season provided moderate water to support grains—such as fonio, sorghums, and millets—and some livestock. The spread of iron technology in the first millennium C.E. was vital to the settlement of the eastern and southern savannas, because iron tools allowed people to break up the hard, packed savanna soils to plant in time for the rains. Dense vegetation supporting tsetse fly and other livestock disease transmitters created a natural limit to cattle keeping, which was most successful in the drier savanna zones or in areas where Africans burned the bush to manage vegetation patterns.

In the moist, densely vegetated African forests located close to the equator, where the rains occur twice a year, Africans grew tuber crops, such as yams, by planting root or stem cuttings with digging sticks long before the spread of iron tools. In both the grain fields of the savannas and tuber gardens of the forests, a range of legumes, wild fruits and veg-

etables, fish, and disease-resistant smaller livestock like goats and sheep supplemented the primary carbohydrates. By the final centuries of the last millennium B.C.E. foreign foods like Southeast Asian starchy and sweet bananas were cultivated in the forests of eastern and central Africa. Animals also moved along these early routes; chickens and at least two types of cattle spread from Asia throughout Africa well before the medieval era.

In Africa a focus on innovation and experimentation with diverse species created a different kind of agricultural tradition than those found in Eurasia, where adjustments to the landscape were vital to improving productivity. Terracing and irrigation systems did occur in ancient and medieval Africa; the terraces in the hills of Ethiopia, Cameroon, the Darfur region of Sudan, and the Nyanga (formerly Inyanga) area of Zimbabwe serve as primary examples. Likewise, the gravity-fed irrigation canals of the Great Rift Valley in eastern Africa and Engaruka in Tanzania attest to the engineering skills of African farmers. However, most agricultural systems in Africa up to the advent of commercial agriculture in the last century focused on the transformation of plants rather than the landscape. Africans developed hundreds of varieties of rice, bananas, and other plants selected over the centuries to produce specialized varieties for particular environments, drought patterns, taste and texture preferences, pest resistance, flood tolerance, and particular uses, such as beer brewing. West Africans even bred a variety of the indigenous African rice *Oryza glaberrima* to grow at the same rate as the floods, to ensure that the seed head continues to form even as the waters rise around it.

In Africa, as elsewhere, agriculture was intimately tied to social and political life. Unlike the agricultural histories of Europe or the fertile Mesopotamian valleys, low population densities and plentiful land in most of Africa meant that contestations over farmland were rare. Indeed, leaders struggled to attract people to work the land. Nonetheless, as in other parts of the world, control over food surpluses, access to labor to farm the land, and concerns over the fertility of the soil provided the means by which individuals, especially chiefs and groups, usually lineages, acquired power and status in Africa. In fact, farmers recognized the powers of indigenous peoples living on the lands into which they had slowly spread. Struggles to control the power of these “owners of the land” over local spirits and the ancestor spirits of “first comers” who first permanently settled such lands took place to ensure the fertility of the community and its agriculture. Such struggles have influenced changes in the character of social and political life over the last several millennia, creating numerous configurations of power between chiefs, lineages, and spirit mediums.

By the beginning of the middle of the first millennium of the Common Era farming had already spread across the continent, and communities who adopted this new technology had, through gradual experimentation, successfully integrated it into their economies. As the next thousand years unfolded over much of Africa, regional concentration on certain foods combined with specialization in hunting, fishing, foraging, salt making, and iron production drove internal trade and created opportunities for social and political change.

## EASTERN AND SOUTHERN AFRICA

Research on the agricultural history of Africa has largely focused on the spread of farming across eastern and southern Africa. Interest in the agricultural history of this region was initiated by attempts to explain a particular phenomenon in African history: the process by which related Bantu languages and cultures came to spread over most of eastern and southern Africa. Early scholarship on the Bantu expansions attributed superior technologies of iron production, farming, and pottery making to the Bantu people to explain how they spread across such a vast region, often at the expense of communities of non-Bantu hunter-gatherers and pastoralists. Although we now know that this package of farming, iron, and ceramic technologies did not always spread together or necessarily in connection with the spread of Bantu languages, peoples, and cultures, it is clear that both iron and ceramic technologies were intimately tied to the successful adoption of farming by a variety of communities in eastern and southern Africa, particularly in the dry, hard soils of the savannas.

In eastern and southern Africa this spread of cultivation is characteristic of the Early Iron Age, which, contrary to agricultural histories of Eurasia, was preceded by the spread of pastoralism. By the fall of the Roman Empire in Europe in 476 C.E. farming, iron, and ceramic technologies had largely spread across most of Africa for the different environmental zones. As the Early Iron Age was coming to a close in eastern and southern Africa, farmers were living and interacting with herders and hunter-gatherers; their dynamic relationships enabled the flow of people and knowledge across the fluid boundaries of their communities. Farmers had grown confident in their knowledge about cultivation in familiar environments, such as rich floodplains and moist forests, and were beginning to experiment with plants and animals in drier areas. Although Early Iron Age farmers were practicing mixed agriculture, their focus was on crops rather than livestock. In the savannas farmers made use of abundant land by practicing shifting agriculture: using iron axes to clear new fields, burning the cut vegetation to enrich the soil's phosphate levels, moving on to new fields every two or three years, and allowing old fields to lie fallow and rejuvenate.

nate for 10 or even 20 years. Thus, by the second half of the first millennium C.E., at the close of the Early Iron Age, the small population movements characteristic of shifting agriculture, experimentation with new crops, and the adoption of these technologies by indigenous peoples had resulted in the gradual spread of agriculture across eastern and southern Africa.

In the last centuries of the first millennium C.E. farming societies in eastern and southern Africa experienced a series of economic, social, and cultural transformations that characterize the transition to the Late Iron Age. Transformations associated with the Late Iron Age usually were local developments and elaborations on existing knowledge rather than the result of the spread of peoples, languages, and knowledge, as was the case in the Early Iron Age. The Late Iron Age in eastern and southern Africa was characterized by the development of new Bantu languages and the creation of new pottery styles and local variants on regional styles. However, the most important agricultural transformation was the extension of farming economies into drier environments with the widespread adoption of cattle keeping and new cultural ideas about the economic and social value of cattle.

As a form of wealth that could reproduce itself, cattle provided various opportunities to control other social processes, such as the attraction of dependents through the distribution of cattle or the transition into adulthood through the convention of marriage. The institution of bride-wealth, whereby the groom's family compensated the bride's lineage for her reproductive powers with cattle and other gifts, probably dates in some areas to the Late Iron Age. Bride-wealth became an important means by which adult men in the lineage controlled the timing and partners of their sons', nephews', and grandsons' marriages. Older men who had accumulated great herds could demonstrate and augment their wealth and status by using cattle from the herds to marry second and third wives and beget more children rather than using the cattle to fund the marriages of their younger male relatives. Children of a man who had multiple wives provided additional sources of agricultural labor to increase household productivity; when they eventually married, daughters brought in more cattle in the form of bride-wealth.

Archaeological and linguistic evidence for the emergence of cattle keeping provides numerous examples of how this agricultural transformation affected other aspects of life in eastern and southern Africa. A particularly stunning example of the productive powers of cattle and associated social and political developments began on the hard velds of Botswana east of the Kalahari Desert around 900 C.E. Farmers living on the grassy plains had begun to experiment with

cattle several centuries earlier, but the turn of the first millennium marked the establishment of a new demographic and social pattern in which densely settled towns with large cattle kraals were surrounded by midsized cattle-herding villages and smaller outposts inhabited by stone-tool-using hunter-gatherer communities with very limited access to cattle. The largest of these capitals gave its name to this emergent culture, Toutswe. In the Toutswe state elites in the towns controlled large herds and could demand valuable bulls in the prime of their reproductive years for consumption from the smaller herding villages. The Toutswe culture illustrates how savvy leaders forged a new, stratified social system based on control of cattle and the appreciation of agricultural activities over those of indigenous, stone-tool-using hunter-gatherers.

Command of cattle was not a foolproof path to power, however. By about 1300 C.E. overgrazing, a series of dry years, and the increasing demand for gold in Indian Ocean trade all contributed to the fall of the Toutswe state and the emergence of Zimbabwean states to the east. Even as Indian Ocean trade allowed leaders of the Zimbabwean states to develop new configurations of power based on control of trade in gold to the coast and beads, cloth, and other prestige items from the coast, cattle herding remained an integral aspect of the elite economy and cattle consumption an important demonstration of status.

In the Great Lakes region of eastern Africa similar processes characterized the Late Iron Age. Farmers focused on cattle keeping and established settlements in drier, savanna environments. Specialized modes of farming in the different environmental zones of the Great Lakes region—intensive banana farming near the lakeshore and river valleys, grain farming in the savannas, and cattle keeping in the driest areas—promoted both internal trade and, eventually, the development of kingdoms. In addition to specialized agricultural surpluses, control of the production of salt and iron and ritual powers ensuring the health of communities, their fields, and their animals, were other important building blocks of authority.

On the East African coast the emerging Swahili culture participated extensively in Indian Ocean trade, eventually developing complex plantation systems in the last centuries of the second millennium C.E. to supply demands for sisal (a fibrous plant used in rope making), cloves, and other cash crops. Even earlier agriculture was an important part of the coastal economy, not only for producing food for the inhabitants of coastal cities but also as a means of demonstrating status. Asian rice, *Oryza sativa*, had become an important prestige food as early as 1000 C.E. in cosmopolitan coastal Swahili communities.

In some areas the centralization of political power could not be accomplished through the control of cattle herds. Some time after the 14th century C.E. on the southern fringes of the equatorial forest in the Upemba basin located near the southern border of modern-day Democratic Republic of the Congo, leaders of the emerging Luba state system initially established their authority by controlling both farming and fishing surplus. Over the coming centuries leaders extended their control to trade, especially in copper, and developed a complex institution of divine kingship, which spread widely throughout the southern savanna; claims to origins in the Luba royal lineage legitimized subsequent states, such as the Lunda kingdom and chieftaincies in eastern and central Zambia.

### THE EQUATORIAL FORESTS

There has been little research on the agriculture history of the equatorial forest for this time period. Among a number of reasons for this neglect is the fact that plant remains and even iron and ceramics are not well preserved in the moist forest soils, so there are few data for archaeologists to uncover. Studies based on linguistic evidence have focused on the spread of Bantu languages and agriculture into the equatorial forests and then traced their subsequent spread from the forests into eastern and southern Africa. Thus, the history of the farmers living in the equatorial forests after the introduction of farming is largely unknown.

The early adoption of agriculture to forest environments was probably tied to interactions between hunter-gatherers and early savanna inhabitants practicing mixed farming on the equatorial and western African forest fringes in the early second millennium B.C.E. In the equatorial forests the transition to farming was a gradual process, and farming, iron, and ceramic technologies spread through the forest independently rather than as a Neolithic technological package. By the middle of the first millennium C.E. farmers in the forests of western and equatorial Africa had integrated a rich repertoire of tubers, legumes, and oil palms into their detailed knowledge about forest fruits, vegetables, medicines, meats, and fish. Archaeological and linguistic evidence demonstrates the interdependence of forest hunter-gatherers and farmers, whose relations with each other varied over time; eventually, with the integration of forest peoples into the wider Atlantic trade economy in the 16th century, this relationship took the shape of the more unequal association common today, whereby hunter-gatherers are the clients, or dependents, of farmers. Farmers in the forests were quick to adopt new foods, such as bananas and chickens from Asia via the East African coast and, after the fifteenth century, taro, cassava, and legumes from the New World via the Atlantic coasts of western and central Africa. The extensive system of

waterways in the equatorial forest served as a travel network, facilitating the spread of people, ideas, languages, and new agricultural practices.

The Africanist scholar Kairn Klieman elaborates on the agricultural history of the equatorial forest region by exploring how Bantu people moving into the forest interacted with indigenous Batwa hunter-gatherers. By about 500 B.C.E. Bantu peoples gradually adopted a sedentary agricultural lifestyle as a result of the spread of iron technology and banana cultivation, and, in reaction to this increasingly sedentary lifestyle, some Batwa broke off from mixed communities they had shared with their Bantu neighbors to specialize in procuring forest products for trade with farmers. This specialization remained viable throughout the next 2,000 years, until the integration of equatorial forest societies into the Atlantic Ocean trade system in the 16th century. The economically based identities of “farmer” and “hunter-gatherer” limited the ways in which leaders of newly sedentary Bantu farming communities were able to acquire power, but they were hardly rigid categories; members of farming communities became forest specialists and vice versa when it was advantageous to do so.

Bantu people had long believed the indigenous Batwa hunter-gatherers of the forests had powerful connections with local nature spirits, deserving of a special politico-religious status within early Bantu communities. However, as Bantu farmers adopted a sedentary lifestyle based on banana farming, they centralized political power in chiefdoms. During the second half of the first millennium C.E. Bantu chiefs reconfigured the older ideology of the primacy of the indigenous Batwa’s powers as “first comers” to the world by asserting the importance of their own Bantu ancestors as first comers either closely allied with or descended from the Batwa. As Bantu chiefs emphasized the importance of their own ancestors, they unseated the Batwa from their previous powerful political and religious roles, celebrating the Batwa as the civilizers of the Bantu even as they recast the Batwa’s role to be more symbolic than powerful.

Later, in upheavals associated with the incorporation of equatorial forest societies into the Atlantic community from the 16th to 20th centuries, power derived from the control of trade and accumulation of personal wealth would come to undermine those older patterns of authority that were based on first-comer status and the intercession between communities, their ancestors, and nature spirits. From Klieman’s research, however, it is clear that the development of social identities and the cosmologies that shaped how societies were organized, how they interacted with each other, and how leaders acquired power were intimately entwined with developments in the agricultural history of the equatorial forest between the 6th and 16th centuries.

## ON THE FRINGES OF THE SAHARA: NORTHERN AND WESTERN AFRICA

The agricultural history of northern and western Africa does not follow the same chronology as that of the equatorial forest or eastern and southern Africa. The spread of iron technology, for example, did not occur in conjunction with the development of new farming practices but was adopted into early cultivation practices as an extension of an existing agricultural system. Furthermore, nomadic pastoralism flourished along the dry fringes of the Sahara; interactions between savanna farmers and nomadic pastoralists of the desert fringes characterized social life and political organization for millennia. On the northern coasts farming shared the characteristics and history of other Mediterranean agricultural systems in which farmers grew wheat, grapes, olives, and sometimes barley.

Like farmers in eastern and southern Africa, those in northern and western Africa grew sorghums, millets, and other grains in the savannas to the south and north of the desert, often using a system of shifting cultivation. However, Africans living in the western region could also cultivate an indigenous rice, *Oryza glaberrima*, using one of three systems: In Guinea, for example, farmers planted rice on hillsides so that rainfall would irrigate the plants; along the Atlantic coast, farmers planted rice in mangrove swamps to ensure adequate moisture; rice planted in floodplains of the Senegal and Niger rivers was watered by floods and the moisture retained in the clay soils. The hundreds of varieties of rice developed by West African farmers was an important factor in the development of early permanent farming settlements and in adaptation to the particular threats associated with each of the three rice cultivation systems.

Changes in relations between sedentary farmers and nomadic pastoralists characterize the period corresponding to the European Middle Ages. By the fourth century C.E. several important technologies had spread into northern and western Africa and transformed the mobility of nomadic pastoralists: cavalry, camels, and chariots. With these new technologies, nomadic pastoralists were able to reconfigure earlier economic transactions in which farmers traded surplus grains, cloth, tools, and other products of sedentary life for pastoralists' surplus meat and milk. In earlier times farmers had controlled relations because pastoralists, as specialist producers had more need of farmers' products than vice versa. With the advent of technologies improving the mobility of pastoralists, relations became more balanced and developed into a pattern of alternating pastoralist and sedentary dominance over marginal lands between the steppe and the cultivated savanna. As early as the 14th century the famous Tunisian historian

Ibn Khaldun (1332–1406) interpreted the history of the ninth through the 14th centuries as the alternation of power between sedentary farmers and nomadic pastoralists, with the latter often raiding and conquering the former. Nomadic dynasties ruling over sedentary farmers were, of course, prey to raiding and conquest by other nomadic pastoralists on the savanna fringes. This pattern continued long past the 14th century and is a common theme tying western and northern African history to historical patterns in Eurasia and beyond.

Among the most important historical themes in precolonial West African history is the development of a series of states on the southern edge of the Sahara. The first of these states appeared at the turn of the first millennium C.E., and they continued to emerge, one succeeding the next, into the middle of the second millennium C.E. Generally, the development of the West African states of Ghana, Mali, Kanem, Borno, and the Songhai Empire was tied to control of trans-Saharan trade, particularly the supply of gold from the south to the trade networks spanning the desert. However, the agricultural productivity of these trade empires was central to their survival. Although loss of trade monopolies meant loss of regional predominance, droughts and other agricultural catastrophes could mean the collapse of the state. This was the case with the state of Ghana, which was located between the middle Senegal River and Niger River bend. At the height of its power in the early 11th century, Ghana dominated the trans-Saharan gold trade. By the middle of the 11th century, however, traders had found ways to access gold outside Ghana's networks. This shift marked the end of Ghana's trade power but not its demise as a state. It was only in the 13th and 14th centuries, when major climatic shifts threatened the farming lifestyle of its citizens and forced the dispersal of Soninke farmers from their homeland throughout western Africa, that the state of Ghana collapsed completely.

A similar pattern unfolded with the fall of the Axum state in Ethiopia, where trade was the heart of power but the breakdown of agriculture contributed to state disintegration in the eighth century. These examples, coupled with those described for eastern and southern Africa, demonstrate the central role of agricultural activities in the history of state building in Africa and illustrate parallels with similar processes in Europe, the Middle East, and Asia.

## LOOKING FORWARD

Agricultural history in the period spanning the mid-first millennium C.E. to the mid-second millennium C.E. was characterized by elaborations on farming technologies that had spread during the ancient periods of African history. Agricultural history in both the ancient and medieval periods in Africa reveals a slow series of developments in cultivation

practices, crop varieties, tools, and those social organizations that both supported and controlled farming activities. With modifications spanning millennia, Africans bred new species suited to diverse environments. Older knowledge about the bush and wild sources of food were always at hand for times of poor harvests, while times of plenty provided surpluses to strengthen social relationships through marriage and clientship.

By the middle of the second millennium C.E. as the Renaissance emerged in western Europe, some Africans in areas like the Great Lakes region and southeastern and western Africa were in the process of developing more centralized societies in which power derived from control of trade and agricultural surpluses. However, decentralized agricultural societies continued to exist as the norm in other areas so that the emergence of centralized political institutions in the form of chiefdoms and states was certainly not the inevitable result of a transition to farming. Regardless of how farming activities were woven into political institutions, most African societies in the coming centuries would be affected by the development of a complex slave trading network that supplied labor to plantations within Africa and in the New World; the adoption of new foreign crops like cassava, taro, and maize from the Americas; and the restructuring of agricultural practices and access to land during colonialism and later under the control of newly independent governments and international organizations. As African farmers faced these new challenges, they were equipped with a rich body of knowledge about domesticated species, diverse environments, and the social and political value of the crops and animals they nurtured; the enduring legacy of African agricultural history is the persistent relevance of that body of knowledge in the daily lives of most Africans up to the present day.

## THE AMERICAS

BY ELIZABETH MORÁN

Agriculture in the Americas was as varied and diverse as its geography. Methods used to develop agricultural lands progressed from the slash-and-burn technique to methods that would intensify crop production to meet the needs of a growing population. Slash and burn, or the clearing of an area by cutting and burning to create agricultural fields, is a technique that has been used throughout history in almost every part of the world.

### CARIBBEAN

In the Caribbean the first farmers, perhaps Arawak Indians (500 or 400 B.C.E.), cultivated roots and tubers such as manioc (also called cassava) by using a restricted form of slash and

burn. These farmers migrated to the islands from the Venezuelan mainland and brought this technique with them, finding it useful in large rain forest areas but wasteful on the smaller islands. Once on the islands, the Arawak needed to adapt to the unique terrain and used only a restricted form of slash and burn. Eventually they did less farming and more marine gathering, fishing, and hunting.

The Taíno (600–1500 C.E.) in the Caribbean (Cuba, the Bahamas, Puerto Rico, Hispaniola, and Jamaica) developed in a pattern similar to the Arawak but with some variations among certain groups. Some societies focused exclusively on activities like fishing, as is evident at the Unión site in Hispaniola, or on gathering. Women did most of the daily work, tending fields until harvest, preparing food, fetching water, and caring for domestic animals such as dogs, pigeons, turtle-doves, and other small birds. Men prepared the fields by clearing, burning, and planting. They also fished and hunted.

### NORTH AMERICA AND THE SOUTHWEST

For native North American groups such as the Agawams and Norwottucks of the middle Connecticut River valley, the calendar year began in late spring, after the lands thawed. Like that of many other native groups in the Americas, their seasonal calendar corresponded to the agricultural cycle. Late spring was the time to clear the fields and plant the staple crops—usually corn, beans, and squash. Horticulture was women's work. Women used hoes made from long sticks with either a freshwater shell or shell-shaped bone at the end to push a few inches of dirt around the base of each plant. The men generally planted and took care of the tobacco fields. Tobacco was smoked for both pleasure and as part of ceremonies. The Iroquois of the eastern Woodlands used slash-and-burn agriculture. Again, women were the farmers; they planted and tended to the crops while men hunted. This pattern of agriculture and gender-specific division of work seems to have been typical for most northern Native American groups.

In the Southwest, Pueblo communities along the Rio Grande used the river to irrigate their fields. In its simplest form irrigation is merely the application of water to the soil in which crops are being cultivated. The process can, however, take many forms. The primary irrigation method began with the construction of canals, but dams and aqueducts were also used to irrigate land for suitable crop harvesting. Other Pueblo communities established their towns and villages on oases, where they built dams and small reservoirs to take maximum advantage of the available water. The southwestern landscape is one of many contrasts: high mesas, deep canyons, and deserts. The climate is characterized by extremes of droughts and floods, sandstorms, and blizzards. Native communities flourished by pursuing various ways of life that

suited the particular ecosystem. For example, in the flood plains of desert areas, groups farmed by taking advantage of seasonal floods to water and fertilize their fields.

In the Americas agriculture was a part of both everyday existence and sacred practices. The native people of the American Southwest celebrated the Green Corn Ceremony late in the summer when the corn was becoming ripe enough to eat. The ceremony, which lasted several days, symbolized the beginning of a new year, the renewal of the community, and a time of cleansing. In preparation for the ceremony, public buildings and areas were cleaned and repaired. The ceremony also included fasting and the use of plant infusions in an effort to “cleanse” the body.

## SOUTH AMERICA

In Costa Rica and many other places in South America slash-and-burn agriculture was typical. In general each family group was allotted a parcel of land to work, and the allocations shifted when fertility dropped off. Men cleared and burned the vegetation while women planted and harvested the crops. Communal agricultural labor, which is still practiced among some modern indigenous groups, usually involved men assembling at the residence of the landowner and working in a group to accomplish a particular goal.

The natural environment dictates how people grow crops. The central Andes of western South America is a diverse geographical landscape that demands that its inhabitants develop various techniques to grow food. On the Andean coast people originally settled along the shoreline, but by 1800 B.C.E. they began moving inland, constructing irrigation canals to help them grow food. By 1200 C.E. irrigation networks on the far northern coast connected as many as five river valleys. The Nazca people tapped into the water table using a system that they developed around 500 C.E. and which is still largely in use today. They constructed underground aqueducts or filtration galleries that minimized evaporation and terminated in reservoirs and irrigation canals. Among the crops they planted were cotton, squash, gourds, and beans. Andean groups in the highlands developed trading relationships to gather whatever they could from coastal people: dried fish, marine salt, seaweed, and coastal crops. Because a real market system did not exist in the Andes, marketplaces were very rare. Groups established special political ties among themselves, and societies spurred the exchange of most commodities. One useful method exploited by highlanders, in particular, was establishing enclaves in various ecosystems, thus allowing for a more even distribution of resources.

Different social groups in the Andes developed their agricultural lands in different ways. In the tropical forest areas slash-and-burn technique produced coca leaves; medicinal

plants; and foods like manioc, peanuts, and sweet potatoes. Andean farmers used the *chakitakylla*, or foot plow, to tend their fields. Other places required intense agricultural techniques. The city of Tiwanaku (ca. 100–ca. 1000) was a prosperous urban center where some houses had wells and drainage systems. The key to its prosperity and longevity was its rural hinterland, devoted to growing crops in raised fields, herding llamas and alpacas, and exploiting the fish and birds living along the shores of Lake Titicaca. Andean pastoralists may have domesticated the llama in this area as early as 3500 B.C.E. Llamas were a source of meat and served as beasts of burden. Alpacas were also domesticated to provide wool for weaving into cloth. Contemporary native groups still use these animals in much the same ways.

Andean farmers devised raised-field systems called *waru waru* that made wetlands productive and somewhat protected from damage. The water in the canals between the cultivated ridges acted like a series of miniature lakes, absorbing the solar radiation during the day and releasing the conserved heat at night, thus decreasing frost damage. *Waru waru* systems increased harvests and ensured a dependable food source in a region beset by droughts, hail, frost, torrential rains, and strong winds. Tiwanaku also established agricultural “estates”—areas used specifically for intense agriculture. This particular model was followed by many other Andean peoples, including the Inca.

By the mid-1400s the Inca had established themselves as the most powerful group in the Andes, and their ability to exploit their natural resources largely contributed to their success. They used the technique of terracing to dramatically increase the amount of arable land they had available. Terraces are essentially huge window boxes that convert mountainsides into stepped fields. The Inca built retaining walls of fieldstone, scooped out the packed earth, laid a layer of stones at the bottom for water drainage, and loosely repacked the earth. With canals supplying water, these terraces could withstand frost and drought and produce several crops each growing season. The Inca developed the most extensive network of terraces that the highlands have ever known. Agricultural terraces such as that at Pisac, near the Urubamba River northeast of Cuzco, were extensive. Other terraces seem to have been primarily decorative; for instance, at Ollantaytambo, also near Cuzco, terraces displayed flowers. The Inca also did terracing in places without apparent water sources, suggesting that the technique was also seen as an important aesthetic form.

## MESOAMERICA

As populations grew the Maya opened new lands to cultivation and developed new methods to increase crop yields.

Hydraulic modifications were among the tactics intended to intensify food production. The Maya dug extensive networks of ditches to irrigate crops and to drain excess water from saturated soils, thereby improving plant growth. The Edzna hydraulic system in Campeche, Mexico, most likely constructed between 300 and 50 B.C.E. and used several centuries thereafter, has an extensive canal and reservoir system capable of irrigating at least 180 acres of cultivated land. Archaeological evidence suggests that the Maya used some lowland areas for large-scale food production, leading to the conclusion that they transported their harvests to major cities for distribution. Remains of raised fields have been found in low-lying areas. These fields provided fertile and well-drained growing conditions for various crops, including maize, cotton, and cacao. Raised fields were built by digging narrow drainage canals in water-saturated soils and heaping the earth to both sides, forming raised plots for growing crops. By periodically dredging the mulch from the drainage channels, farmers replenished the raised plots with fresh soils and organic debris, allowing continuous cultivation. The canals may also have been used to raise aquatic life such as fish and mollusks.

As in the Andes, the irrigation canals and drained fields throughout Mesoamerica were part of a larger pattern of agricultural intensification. Growing populations and the need to support them prompted extending cultivation into agriculturally marginal areas. This extension in turn prompted the development of innovations like terracing and irrigation that turned some marginal areas into very productive farmlands, which in turn permitted even greater population growth.

The Maya and many other Mesoamerican peoples used intercropping—growing several complementary species together, such as maize and beans—to intensify food production and ward off pests. Archaeological evidence and ethnohistorical accounts reveal that tree crops were once important to the Maya. Tree crops require little labor, and the fruit or nuts of some species may be collected from the ground as they fall. By mingling various food tree species, the Maya would have discouraged pests or diseases that thrive on a single species. Household gardens were vital to the daily life of people. In Cerén, El Salvador, archaeologists found portions of preserved household gardens buried by volcanic ash from a sudden eruption. The ash preserved the casts of several crops, some grown right next to the remains of houses. Carefully tilled rows of cotton and food plants like maize and manioc were separated by furrows that facilitated drainage. The volcanic ash also preserved fences built of sticks to protect fields from pests and facilities built to store the harvested food.

The 16th-century Aztec of central Mexico organized and performed agricultural rituals throughout the year. These

*Painted ceramic mask of Tlaloc, god of rain and fertility; Aztec culture, Mexico, ca. 1325–21* (Courtesy National Museum of the American Indian, Smithsonian Institution)

rituals were connected to the planting and harvesting of basic staples: maize, squash, and beans. While these foods were eaten on a daily basis, they also were used in highly sacred rituals that sometimes even included human sacrifice. In addition, basic staples were associated with deities and the origins of the world.

Ironically, agricultural work was neither the primary occupation nor the major source of subsistence in the Aztec capital of Tenochtitlán. The Aztec employed various agricultural methods on the lakeshore and beyond to provide some form of sustenance for the general population. Among these were *chinampa* agriculture, terracing, and multicropping. *Chinampas* are artificial planting areas built up from mud scooped from the bottom of a lake or freshwater swamp, held in place by posts and roots, and separated by canals. The narrow size of the plots allows the soil to receive enough moisture to provide a continuous, stable, and intensive agriculture. Household gardens were also important to agricultural production in the city. Small *chinampa* plots formed household gardens in which Aztec families grew vegetables. Larger *chinampa* plots yield crops that sustained several families.

Although *chinampa* agriculture was fundamental to the Aztec way of life, it certainly did not provide for all the food needs of Tenochtitlán. The Aztec did, however, develop *chinampa* technology to its fullest potential, expanding the existing system to cover more than 75 square miles that supported as many as 100,000 people. Although the southern district of the Mexico Basin was heavily used for artificial planting areas, most of the foodstuffs consumed came into the city through trade and tribute. The Codex Mendoza, a

16th-century painted manuscript, illustrates vast amounts of food coming in as tribute. Raw foods included squash, honey, cacao, and chilies. In addition, the Aztec received many types of foods already prepared, including many meat dishes. The Aztec tribute system was a useful method of supplementing not only the food needs of Tenochtitlán but also its labor needs. A tribute workforce could be redistributed to better serve the needs of the urban population and ruling elite. Men and women supplied the labor for cooking and other food preparation as well as labor in the marketplace. Labor redistribution was intricately organized by the Aztec state.

## ASIA AND THE PACIFIC

BY KENNETH HALL

Early Asia and Pacific agricultural productivity ranged from annual cycles of shifting cultivation among hunting-and-gathering populations in the highland, frontier, and remote island regions to the sophisticated wet-rice agriculture that could produce up to three crops a year in southern, eastern and southeastern Asia's densely populated river plains. Asia and Pacific island farmers produced a variety of grains, fruits, vegetables, and marketable specialty produce, such as cotton, hemp, tea, and spices. Most Asians cultivated and gathered root crop starches as well as rice by choice over other grains, such as wheat, millet, and sorghum. Taro and tapioca were the principal starches in Pacific island diets, but they were supplemental crops in Asia's grain-cultivation areas. Cultivated or gathered yams and sago palms were the other source of dietary starches on the islands of southeastern Asia.

The staple grain crops in India were wheat and barley in the cooler north and elsewhere as winter crops; rice in the irrigated plains and south, and millet in the dry regions of the Deccan plateau. Sugarcane was widely grown, as were leaf vegetables and gourds, plants of the *Sesamun* genus (valued for its edible oil and including sesame), peas, beans, and lentils. The Kerala coast region of southern India was the source of pepper, cardamom, ginger, and cinnamon; the Himalayan foothills produced valuable saffron; and cotton production was concentrated in the Gujarat and Tamil regions of the northwestern and southeastern coasts. Fruits included mangos, small Indian bananas known as plantains, and the sour fruit of the tamarind that is used to flavor curry. Coconut palms were imported from Southeast Asia in the Middle Ages, but palmyra and talipot palms, which provided the traditional Indian writing materials and were the source of alcoholic drinks known today as toddy and arrack, were products of coastal India. Date palms grew in the dryer regions of western India.

In addition to rice, which was their dietary grain staple throughout most of the region, Southeast Asians cultivated limited numbers of vegetables (cucumbers, onions, ginger, beans, and various gourds and, later, soybeans, introduced into the region by Chinese settlers in the fifteenth century) but instead favored fruits and spices. Fruits included coconuts, bananas, durian, mango, mongosteen, jackfruit, rambutan, and citrus fruits such as limes. Southeast Asian spices included cloves, nutmeg, and mace from the eastern Indonesian archipelago Spice Islands; widely grown varieties of Southeast Asian peppers (with the exception of black pepper, which was a product of India), tamarind, turmeric, ginger, cubeb, and calamus were used for food flavorings as well as medicines throughout Asia. Turmeric was notable for producing the "hottest" flavoring for foods.

Sugarcane was native to Southeast Asia, where it grew wild and was cultivated in the well-watered regions. It was sold as a confectionery or was chewed. Brown sugar, derived from boiling the sap of the sugar palm, was more popular as the source of liquid sugar. Honey was less in demand but was widely available and used especially as a medicine. Betel, a byproduct of the nut of the areca palm grown in southern and southeastern Asia, mixed with lime from crushed clam shells (to produce a chemical reaction) and wrapped in a betel vine leaf to form *tambula* was a chewable narcotic. It produced red saliva, which chewers spit out, and was widely popular in India, South China, and Southeast Asia.

## ANIMAL HUSBANDRY IN ASIA

Chickens, both domestic and wild, were common in all the settled and hunting-and-gathering regions of Asia. Chickens were allowed to run wild in vegetable gardens, orchards, and grasslands because "wild" chickens were culturally valued over domesticated chickens. Pigs were not indigenous to southern Asia but were common in Southeast Asia and in eastern Asia as sources of meat and fertilizer. Pig sows were especially prized, since they produced annual litters of piglets. Pigs were efficiently raised as a meat source because they needed only a small, marginal space to scavenge for their diet, eating almost anything that resembled food. Pigs ate and processed human feces; subsequently, their excrement was used as garden fertilizer.

By the late medieval era people newly converted to the Islamic religion in island Southeast Asia faced the dilemma posed by Islam's outright prohibition on the eating of pig. Local populations resolved this dilemma by eating pig meat that had been raised and slaughtered by non-Muslims. Dogs were initially domesticated as a food source (along with pigs) but in time became hunting companions and tended

livestock. The early peoples of eastern Asia and Southeast Asia used pack-hunting dogs and later bred dogs as house pets. Soldiers normally received dogs as emergency food rations; similarly, in times of famine dog meat became valuable among the people of eastern Asia and Southeast Asia. Ducks were domesticated in the wet-rice producing regions of Southeast Asia and eastern Asia both as a source of food and because of their importance as a fertilizer in the wet-rice growing cycle.

Among the seminomadic populations who inhabited the steppes and plateaus of central and southern Asia, sheep were especially important as a source of wool and skins for clothing, blankets, and shelter and also as the dietary staple of boiled mutton. Dried sheep dung was used as a fuel for heating and cooking. Goats provided meat, milk, and cheese but were not environmentally efficient, since they consumed grass from the root and thus overgrazed grasslands. Yaks supplied meat and milk and, with oxen, pulled carts. Where grasslands or grain surpluses were available, cows were the source of meat, hides, and milk, which was frequently converted into yogurt. Oxen (dry zones) and water buffalo (wet zones) were the major source of animal labor in Asia's settled agricultural regions.

Horses were raised on the Mongolian steppes and in Sind and northwestern India, where they were used for transportation and herding and as a source of mare's milk, which produced a favorite fermented alcoholic drink called *airag* (also called koumiss). Unlike other animals, horses were unable to breed in Asia's tropical zones and had to be imported; there they had ceremonial and military use rather than practical productive use. Asia's Bactrian camels, with two humps, were valuable in the desert regions owing to their ability to live on limited pasturage and their capacity to consume and store large quantities of water, which allowed them to travel long distances between water sources. In addition to their transport value, camels were a source of wool, milk, cheese, and meat.

Cattle were widely used in southern and eastern Asia for plowing, transport, and food; despite Hindu and Buddhist prohibitions, numerous Asians ate beef. In India there was normally a village cowherd who drove the cattle, branded them with their owner's marks, took their waste to the plowed fields every morning, and returned them to the village at dusk. Cow's milk, curds, and ghee, made from melted butter skimmed from milk fat, which would keep indefinitely in the hot climate, were dietary staples. Water buffaloes were of greater value in the regions of southern, southeastern, and eastern Asia that practiced wet-rice agriculture, where they were valued for their plowing rather than as a source of food. In Java wild cattle were hunted and domesticated for plowing

in the dry agricultural zones, and in the mainland Southeast Asia regions adjacent to southern Asia in Myanmar (Burma), Thailand, and Cambodia, which had access to India's white cattle stock, cattle were widely used for plowing in regions of dry cultivation. In these mainland regions of Southeast Asian and India, Indian elephants were prized for their use in transport, military ventures, and court rituals and in fulfilling heavy labor such as the clearance of jungles (toppling trees) and carrying heavy loads (stones and logs) associated with major construction projects.

### HUNTING AND GATHERING AGRICULTURE IN THE PACIFIC ISLANDS

Medieval era Australia, New Zealand, and the Pacific islands were notable for their isolation from developments in the neighboring regions of Asia, but at the same time these areas were subject to important migrations of populations among the Pacific islands that would have an impact on regional agricultural systems. Except for the sweet potato, which is thought to have had a South American origin and been transported to Asia across the Pacific Ocean by sojourning Polynesians, all the crops and domesticated animals of the Pacific islands (toro, bananas, yams, breadfruit, sugarcane, pigs, dogs, and chickens) originated in Asia. These foods were purposefully introduced by voyagers intending to settle, rather than by happenstance. Medieval era Pacific island populations normally lived in villages on the lower slopes of mountains on the edge of coastal plains, where they could plant taro, the tuber vegetable that was their principal starch crop, which they supplemented with harvests of the products of the sea, native animals (notably sea snails and tropical birds). They also picked breadfruit and coconuts from trees, which, with other local plants, provided them with the fibers they needed for their clothing.

In contrast to other Pacific island societies, the Aborigine populations of Australia were seminomads who had settled the Australian continent in prehistoric times and in the medieval era followed seasonal sources of food over a fairly defined territory in the Australian interior. None practiced settled agriculture or had significant settlements on the Australian coastline. In New Zealand the initial Maori Polynesian settlers landed on the South Island around 750, where they followed the normal patterns of Pacific island hunting and gathering. A new group of voyaging Maori populations from Polynesia arrived in the 12th century, settled on the North Island's west coast, and moved inland, where they introduced food crops that they had brought with them, notably, taro, yams, gourds, and *kumara*, a variety of sweet potato and the only tropical plant to flourish in New Zealand's cool climate. As the new crops took hold, Maori societies developed an

efficient underground storage system that allowed them to harvest the fragile *kumara* tubers before the first frost so that they could ripen during the cold winter months. The stored crops fed the local population in the winter, and the surplus was replanted in the spring.

### SHIFTING, BROADCAST, AND TRANSPLANTING CULTIVATION IN SOUTHERN, SOUTHEASTERN, AND EASTERN ASIA

The earliest settled agriculture in Asia consisted of clearing woods, planting grain, weeding, harvesting, and raising chickens, pigs, and dogs. Millet, sorghum (grain-producing grasses), and other dry-zone grains (wheat, barley, and rye) were highly adaptable and predate Asian wet rice as the staple grain in the early densely settled plains of the Indus and Ganges rivers of northern India and the Yellow and Yangtze rivers of northern and central China. Millet (dry rice) and

wet-rice (*sawah*) cultivation were incompatible; as wet-rice production spread, it displaced millet production in regions that had sufficient water and favorable climate. Initially millet was produced in the uplands by means of what is commonly called slash-and-burn, shifting, or swidden cultivation.

Shifting cultivation of dry rice, grains, and sorghum was ideal for the marginally populated frontier regions of Asia and the Pacific and the sloping highland areas with adequate drainage. Shifting cultivation required little labor and was able to produce a substantial surplus relative to the size of the workforce. A new patch of forest was cleared and burned each year. Planting normally consisted of using pointed sticks to make holes, into which two or three grains were placed. Nutrients added to the soil in the initial burn-off were washed away by rain within two seasons, thus necessitating a shifting cultivation cycle. Owing to spoil depletion, highland village communities moved at least once every 10 years. Fields, rivers, and lake production centers might be some distance apart rather than coincident. Local migration cycles, together with the relatively low yield per acre, limited highland population density to between 20 and 30 persons per square mile and made it difficult to pool significant surpluses.

The transition from upland shifting cultivation to lowland dry-grain cultivation had taken place in India's and China's northern river basins between 3000 and 2000 B.C.E. and in Sri Lanka, Korea, and Japan from roughly 300 B.C.E. In contrast, this transformation accelerated in southern India, Southeast Asia, and southern China in the medieval era. While this medieval-era transition might have resulted from population pressure, it was more likely due to the supportive physical environments or new technologies that allowed the cultivation of lands that were previously useless swampland or subject to heavy annual monsoon season flooding. Terracing was another innovation, which permitted wet-rice production on hills or mountains.

Wet-rice cultivation, initially developed on mainland Southeast Asia, spread to neighboring regions of Asia that were subject to seasonal monsoons in the early first millennium of the Common Era. In some regions, as in Cambodia, seed was more often broadcast in the muddy puddles of a raised-earth plowed floodplain, since it grew quickly and needed little work. In most areas of Asia, however, a transplanting method was preferred, which gave higher yields per unit of land used though not the highest per labor input. By either the broadcast or seedling method a productive wet-rice farmer could normally expect an annual output of 20 to 25 bushels of grain per acre. In early times one rice crop proved adequate to supply local needs, though a second could be harvested if weather and irrigation facilities permitted and there were incentives to produce a surplus for external consumption.

*Porcelain model of a granary; China, 13th century* (Freer Gallery of Art, Smithsonian Institution, Purchase-Lois S. Raphling and the Hassan Family Foundation in memory of Dr. David L. Raphling)

In the regions of southern, southeastern, and eastern Asia using the transplanted seedling method, seed was sown annually in small flooded seedling beds at the approach of the rainy season. While seedlings took root, farmers and family prepared nearby fields; they weeded and broke up soil with wooden, stone, or metal-tipped hoes until the monsoon rains soaked the earth. Then seedlings were transplanted by hand with enough space between for each plant to grow. As the crops matured, farmers repaired the local irrigation system and regulated the flow of water as rains reached their peak. When water receded and fields drained, the sun ripened the grain. At harvest the entire community worked side by side. During the subsequent dry season, fields were cleared, tools were repaired, and feasts, festivals, and marriages were celebrated.

Commonly both wet-rice cultivation systems depended on the retention of dissolved matter that was brought into the fields by seasonal floods or irrigated water, which enriched already fertile layers of soil and to which fertilizer (such as water buffalo, pig, and duck excrement) was added. Water buffaloes plowed the irrigated fields to make the land suitable for the reception of seeds and seedlings. At first, wooden and, later, metal-tipped plows turned under the mulch from the previous year and transformed the flooded soil into a creamy mud 12 to 20 inches deep, which minimized the filtration loss of the irrigated water. Domesticated ducks were important in providing fertilization but also to control potentially harmful algae. There was a wide range of traditional rice varieties, from those with an 80-day growing period, first developed in Vietnam for drought-susceptible fields, to varieties with a growing period as long as 270 days for lands that were moist over a lengthy portion of the year.

Water manipulation was the key to success. The canal networks ensured that wet seasonal floodwater was equitably distributed over local fields. Temporary channels and water-wheels diverted water for gravity-fed irrigation. Large ponds, often initially associated with temples that took responsibility for their construction and maintenance, retained rainy-season water for domestic use during the dry season. In a few areas, as in southern and central China, Java, Cambodia, Vietnam, and Sri Lanka, complex regional canal networks built during the medieval era are still used today. Terracing, which involved the elaborate construction of level raised-earth fields on mountainsides, was another innovation that allowed productive wet-rice cultivation of otherwise marginal hills and mountains in the densely populated regions of China, Sri Lanka, Java, Bali, Korea, and Japan during the medieval era and also permitted rainy-season water to be channeled from highlands to lowlands by networks of dams and canals.

Wet-rice agriculture could support a high population density owing to big yields from small areas—a field of 2½ acres could easily support a household. But large population centers in the early wet-rice regions were the exception. Small housing clusters (one house and one field or several houses and nearby fields) were more practical for flooding and draining of the fields. Too much water flow would damage the dikes, while too little would result in algae growth. Rights to occupy and use land were characterized by long-term commitment to a soil plot. Leaving their fields uncontrolled was not an option among wet-rice cultivators, except just after harvest, and developing new lands for cultivation might take several seasons.

To prevent reversion to the wild, a grassland periphery was commonly maintained around cultivated fields, which served as a border against the forest as well as a buffer against enemies. Here domesticated animals grazed, and wild animals were hunted to supplement and protect cultivation. There was also controlled use of fire, which helped maintain the border. Old, taller wild grasses were replaced by shorter hybrid varieties that provided better nutrition to livestock. Villages on the periphery were charged with the task of preventing reversion and were justly rewarded for their efforts. Early state records in China both praise and compensate those who cleared forests and extended wet-rice cultivation. War captives, debt bondsmen, criminals, and retired military were resettled in these peripheral zones to support the opening of and then maintenance of newly productive territory.

## AGRICULTURAL AND TOOL INNOVATION

By the medieval era iron tools were common among Chinese, Indian, and Southeast Asian farmers; their efficiency supported a substantial increase in local agricultural productivity, which in turn supported, if not caused, significant population increases. China's population dramatically doubled from roughly 50 million people in the ninth century to 100 million by the 13th century as the result of extensive rice cultivation in central and southern China coupled with rural farmers' holding more abundant yields of food that they could easily provide the growing market.

The Chinese were the leaders in the development of metallurgy in the seventh and eighth centuries, and the technology spread to the other Asian regions. This production involved a leather bellows system that was powered by humans. The bellows increased the temperature of an iron furnace to produce a higher-quality iron for plows, which were less likely to break under stress when plowing fields. Triangular iron plowshares, which had a U-shaped moldboard fixed to the rear of the plow, were highly effective in turning over

and crushing the earth. Further medieval era innovations included the curved-shaft plow, which was more efficient in cutting the soil, and new iron tools that further improved cultivation, including the machete. Paired with the breast harness, which had been developed around 200 B.C.E., the new plow allowed draft animals to breathe easily while pulling heavier loads. The plow, which both crushed and plowed the soil, could turn left and right and even turn around. Another new metal tool was the wheelbarrow, which could carry both people and cargo. Large, self-powered bucket waterwheels and other water-pumping devices allowed for the lifting of water over riverbanks into adjacent irrigation canals. In China and elsewhere, woodblock-printed books made the new agricultural technology widely available.

The construction and extension of water-control projects in the Yangtze River basin of China and Sri Lanka and throughout mainland Southeast Asia and Java and the development of tank agriculture in southern India to retain the seasonal monsoon rains for dry-season agriculture supported the introduction of crop production into previously marginal lands. By the 10th century farmers in many of the wet-rice-producing regions cultivated new strains of early-ripening rice, which was initially developed in the Cham regions of central Vietnam. With the new industrial technology and the widespread use of fertilizer (animal manure and composted organic matter), wet-rice farmers could easily produce two rice crops annually. This freed land for the growth of vegetables and fruits for the marketplace in the cooler winter months or coincident with rice production, as vegetables were planted on the mounded earth that separated the rice fields.

Road and canal constructions supported the transport of rice surpluses to other regions. In China some areas chose to import rice and devoted their labor to cultivating lychees, oranges, and other cash crops for the marketplace; the same was true in the eastern Indonesian archipelago's Spice Islands, where local workers exclusively farmed and gathered spices and depended on rice imports from Java as their source of dietary staple. By the end of the 15th century sweet potato tubers, which entered southern China ports from the Pacific island basin, were grown in every region of China as a common winter dietary staple. Sweet potatoes were roasted and sold as a street food in Beijing, Xi'an, Chengdu, and Shanghai, among other Chinese cities. Farmers of the Song era (960–1279) supplied China's markets with other new commercial crops, most notably cotton and tea, the latter of which was previously used as a medicine and in Buddhist rituals. Silk was another local cash crop, but it required considerable human labor. A farmer had to raise 700,000 silkworms to produce 150 pounds of silk.

## LAND TENURE AND POLITICAL ECONOMIES

Permanent use of land, through planting, the creation of irrigated fields, or the utilization of fruit-bearing trees and palms, was subject to a variety of local arrangements through the Asian agricultural regions. Among these land distributions were 1) lands regarded as the common property of the community, even though portions of the common land were known to belong to specific community members; 2) lands under individual and familial inherited control; 3) landed estates that were inhabited by mixtures of assigned laborers, war captives, and slaves and were managed by a temple-based staff; and 4) tenant farming arrangements that were subject to the authority of resident and absentee landed aristocrats, including rulers who sent dependents into the forest to clear and cultivate new lands under the control of royal retainers and kinsmen. Except for China, during the medieval era Asian labor shortages resulted in competition for labor rather than land, with resulting patterns of labor dependency and bondage that resulted from conquests rather than the development of tenant farming arrangements.

In the Khmer realm of Angkor Cambodia, Java, Myanmar (Bagan), and the Tamil regions of southern India, the elite with existing claims over land minimized the intervention of an emerging state elite in their demands for taxes and labor services by concentrating their family economic resources under a Hindu or Buddhist temple's administration. In many cases these arrangements were a front by which members of the donor family, rather than the temple staff, managed the family land assigned to a temple, the temple receiving only a designated share of the income. What was transferred by the donors was not "ownership" of land but the right to income from the land. As noted, in medieval era Asia landholding meant rights to the production and labor service of the property inhabitants rather than absolute possession. Income rights could be transferred; while inhabitants of the land continued to farm the land, their production was subject to a series of income claims, including those of the state, the temple, and the donating family, which retained guarded rights to the property, most notably the administrative and political rights over its inhabitants.

In China, owing to inheritance distributions to male children at a father's death, warlord seizures in the eras of transition, and movements of the old gentry to cities to become metropolitan elite, aristocratic and temple estates declined under the Tang (618–907) and Song dynasties. In previous times agricultural lands were "owned" by hereditary gentry and temple estates. The decay of these old estates paired with new Song tax policies allowed for land ownership among commoners. Besides working their family's assigned estate lands,

from which annual production was divided between the gentry and their dependent farming family, Chinese farmers had been subject to heavy labor taxes, which they performed on an aristocrat's lands and state public works projects. Instead of collecting labor taxes and mandatory surplus grain payments, the Song tax system converted to regularized cash collections. Paid laborers and professional soldiers replaced conscriptions of locals for state labor and military services. The Song tax collection system did not employ local gentry; instead, government officials accountable to a regional magistrate collected local taxes from village elders, who had considerable management autonomy as long as their villages paid taxes and behaved in an orderly manner.

In part to justify their collections of agricultural surplus, the Tang and Song imperial regimes implemented "ever-normal granaries," which stored surplus grain assessments collected in productive years to guard against starvation in years of drought, disease, or other societal crisis. The imperial bureaucracy also controlled local market access to salt and iron, in theory to ensure their availability to the public but in reality to guarantee their access to the imperial army in times of war.

### **AGRICULTURAL MANAGEMENT AND POLITICAL POWER**

Control of access to water was an important issue in the dry areas of Asia, but in regions where rainfall was plentiful or where there were multiple water sources useful for irrigation, the would-be elite found it difficult to dominate a water system, and local autonomy prevailed. However, where rulers rather than locals initiated hydraulic networks and continued to manage and control water, this reinforced their authority over local producers. Some historians highlight the critical role of powerful individuals or externally linked institutions—either religious or political—as the initiators of Asia's wet-rice agriculture, which was the vital source of wealth that supported the emergence of powerful, centralized states in China, Korea, Japan, mainland Southeast Asia (Myanmar/Burma, Cambodia, and Vietnam), Java, southern India, and Sri Lanka during medieval times.

Scholars debate whether terraced agriculture had to be supported by well-organized and hierarchical societies and how this may have contributed to the development of early centralized political systems. The natural order of terraced farming is hierarchical from top to bottom. Members of society politically and ritually submitted to rulers, local nobles, and temples that had the most to do with building and maintaining the water-management system, the terraces, the water canals, and the storage tanks. In such a society the needs of the individual had to be secondary to the welfare of the group.

Cultivation cycles paired with the local geography and the available labor supply to create an orderly production schedule. These rice cycles shaped the calendar of human events. The annual pulse, it is said, reinforced the community's mutual commitment to human service and charity as well as its willing submission to a central cultural authority. Asia's terraced farming societies have been thought most likely to emphasize teamwork and continuity over change.

State administrators in the noted Asian regions were especially known to promote social conformity, as reinforced by the logic of China's Confucianism and Hindu and Buddhist traditions that had their origin in southern Asia but were widely accepted as a logical foundation for the establishment of universal standards of societal conduct, as this supported greater productive efficiency. Settled wet-rice farmers were especially bound to the soil, practically if not legally, and were in theory less likely to risk rebellion against the state. To reinforce their political and economic objectives, officials encouraged transition from early matriarchies to empowered males in a patriarchal society as a way to increase the role of men in agricultural production, which had traditionally been dominated by women. Earlier hunting and fishing beyond the village, which was the previous domain of male economic activity, produced no taxable surplus. In contrast, settled agriculture was a predictable source of tax revenues that could be collected as the state's share of each year's harvest. Taxes were also assessed on the expectation of annual yields based on the records of past productivity.

## **EUROPE**

BY TOM STREISSGUTH

The continent of Europe is one of the most diverse regions on earth, with widely varied land formations, soils, climates, and growing conditions. Coupled with the isolation of peasants living in small, scattered villages and resisting change and outside influences, this diversity gave rise to a complex mix of farming practices during the Middle Ages. Historians and archaeologists have only recently made medieval agriculture a subject of intense scientific study and have found that the ways and means of medieval peasants were nearly as varied and numerous as the villages in which they lived.

### **RISE OF THE MANOR**

The fall of the western Roman Empire in the fifth century disrupted traditional patterns of land use and farming in the areas settled by the Romans, including Britain, Spain, Italy, and Gaul (modern-day France). The waves of migrants from the north left poor and isolated communities in their wake. Many regions continued to suffer generations of warfare,

sieges, pillaging, and highway robbery. As central authority broke down, local nobles and warlords began exercising absolute control within the boundaries of their private domains.

After the fall of the empire, farming was carried out by small, isolated, and self-sufficient communities. Trade was minimal, and most rural families—the vast majority of the population—subsisted on what they could raise or grow on the land surrounding their homes and villages. Out of this society arose the manorial system. Whereas Roman settlers managed large estates worked by slaves, manor lords parceled out plots for cultivation among the peasants living in the areas surrounding the lords' private estates, or demesnes. The peasants worked farmland on the manor as part of their obligatory service. These manors gradually increased in size and number as new lands, including forests, marshes, and coastal areas, were reclaimed throughout Europe for productive use. Tools were developed to hasten the clearing of land and to increase the efficiency of labor. For example, heavy axes helped to speed the job of clearing dense forests, the jointed flail was superior to a simple wooden stick for beating grain, and the long scythe simplified mowing hay.

To manage his estate, the lord employed a steward or bailiff, who oversaw the labor of the peasants and sat in judgment in the court of the manor to decide disputes over rights and duties. In England the reeve was appointed to look after the lord's interests, such as the use of his demesne lands (the shire reeve, or the reeve of an entire community, was the origin of the modern sheriff). Important duties were also held by the hayward, or guardian of the fields and hedges, who was responsible for preventing damage to the properties from the herds and corraling any stray animals.

On some estates, slaves were used for field labor and as domestic servants. The slave population largely comprised captives from the frontier wars with pagan barbarians such as the Visigoths, Saxons, and Alamanni. As Christianity spread, slavery declined in medieval Europe (the Church held slavery of its members to be against Christian doctrine). Certain legal punishments, however, reduced men and their families to serfdom, and impoverished peasants who could no longer provide for themselves and their families were consigned to voluntary servitude to work in return for sustenance. To release himself from bondage, a serf had to give a money payment or hope for a reward for his bravery in protecting and defending the lord's estate. To successfully flee a demesne was a formidable task, because serfs could hope for no outside assistance and the lord had his own knights and bailiffs as well as any local authorities to carry out a search. On the other hand, a lord could not normally displace serfs from his lands without good cause, because the vital production of his lands and herds depended on the labor of his bonded men.

## THE AGE OF REBELLION

The heavy taxes and obligations of the manorial system kept serfs tied to the land, working their crops and managing herds with very little hope of betterment in their lives. Toward the end of the Middle Ages this onerous agricultural system came under pressure from social and economic changes. The Black Death, the Hundred Years' War, and other events caused social turmoil, price inflation, and a shortage of peasant labor. In England and on the Continent the result was violent rebellion among the peasantry, beginning in the middle of the 14th century.

Rebellions flared in France, Germany, eastern Europe, and Scandinavia. The *Jacquerie*, a peasant revolt in northern France, took place between 1356 and 1358. Mobs of peasants stormed through villages and the homes of the nobles, burning, raping, pillaging, torturing, and murdering their victims. They were eventually suppressed, with bands of nobles and mercenaries carrying out massacres of the rural population. Since this event the term *Jacquerie* has come to mean any violent mob rising.

The most significant of these events took place in England. Wat Tyler's Rebellion erupted in 1381, in the village of Brentwood, England, when a royal tax collector was driven away by a well-armed mob. Tyler led the unruly crowd into the city of London, where they attacked homes, prisons, palaces, and the Tower of London. To stem the riot, King Richard II agreed to meet with the rebels and promised to abolish the traditional obligations of serfdom. But after Tyler was killed in a street fight with London's mayor, the king immediately reneged on his promises.

The wave of rural violence ebbed in the 15th century. The rise of town economies, the establishment of industries and an artisan class, and the breakup of large estates spelled the end of the old manorial system. Like many social changes in history, the transformation was accompanied by violence, as those with privilege fought to protect their rights and the lower classes defied authority and used sheer terror to achieve their goals.

In the domains of the Eastern Roman Empire, or the Byzantine Empire, the majority of farmers in the early Middle Ages were independent smallholders who owed taxes to the state rather than labor to landowning nobles. This system

resulted from the invasions and migrations from the north and east, which had broken up large estates, permanently scattered the landowning Roman aristocracy, and had ended the system of rural slavery. The staple crops in the region were wheat, olives, and wine grapes, with the addition of beans that added protein to a peasant's meager diet. Stock farming of cattle, pigs, sheep, and goats was important in the interior of the Balkan Peninsula and Asia Minor. Byzantine farmers used a variety of iron tools and broke the land with a small plow known as the ard. Through the first centuries of the empire, as the rural population expanded, new land was cleared for planting in the forests of the Balkans, and irrigation works brought water to dry regions of Asia Minor and the Levant.

### VILLAGE LIFE AND WORK

Medieval peasants lived within small villages, which in northern Europe were surrounded by unfenced land divided into narrow strips. This open-field system of scattered strips of land separated by furrows or boundary fences dates to the time of Charlemagne. Strip farming made plowing with a large team of animals easier, because fewer turns were necessary to work a single parcel of land. The heavy moldboard plow used in northern Europe dug deep furrows, allowing excess rainfall to drain more easily. By the 10th century wheeled plows were coming into use in northern Europe. These heavy instruments were pulled by teams of oxen, in teams of two or four. (Heavier, rocky soil required even larger teams.)

Horses had been less common than oxen because they were more expensive to buy and feed. But the use of horses as farm animals increased with the arrival of the horse collar, which was invented in China and came to Europe around the eighth or ninth century with the caravans of traders crossing from eastern Asia along the Silk Road. The padded collar fit around the animal's neck but did not cut off its breathing, as did earlier harnesses. By distributing the weight of the load, the horse collar enabled the horse to plow heavy soil and haul heavy carts at a faster pace than could an ox.

Each farmer worked several narrow 1-acre plots within a larger field. Farmers owned plows and heavy equipment in common and shared the labor of plowing, planting, and harvesting their crops. The plots that were the property of a single peasant were an endless subject of dispute over rights and inheritance within the household. As families multiplied, the plots were parceled out among the heirs, leading to a patchwork quilt of tenancy rights that did little to enhance the efficiency of food production.

Every year the farmer paid out a portion of his harvest to the lord as a form of rent. The peasants also relied on a house garden to provide them with cabbages, leeks, onions, and garlic as well as dye plants, medicinal herbs, and cash crops

*Man with pruning hook climbing palm tree; detail of a manuscript page, Spain, 1220* (Courtesy the Morgan Library and Museum)

such as flax and hemp. Pastures were owned communally, with stock animals looked after by the village herdsman. Also held in common were forested areas, useful for cutting wood, hunting small game, and collecting wild food such as nuts, berries, and mushrooms. The forest floors also were used for *pannage*, or pasturing for domesticated pigs, which fed on ground nuts and fallen acorns.

The homes of the peasants were constructed of wattle and daub, or mud plastered over a frame of sawn wood or heavy branches. Tightly bound straw or reeds were used as roofing material. For the peasants living in these small and dark homes, disease and hunger were familiar, travel was dangerous, and life was full of perils. Their diet consisted of bread and ale, vegetables from their private gardens, and occasional meat: beef, pork, chicken, or other fowl such as geese and wild game or birds.

In southern Europe and the Mediterranean region the demands of a different climate gave rise to different methods of working and dividing productive land. Less rainfall and drier summers made it necessary to retain moisture in the soil. Thus, shallow and less frequent plowing was done with the iron ard, a smaller and lighter version of the moldboard plow that broke up the soil without digging a furrow. Many fields in the south were enclosed, with farmers working a small number of larger plots as well as orchards. Communal farming was rare, in contrast to northern Europe, and most plots of land were owned and worked by individual families.

Throughout southern Europe vines and olives were important crops, along with wine grapes, which in medieval times ranged over a larger region of Europe than in modern times. In Spain, which was conquered and settled by the Islamic Moors from the eighth century, new crops imported from North Africa and the Middle East included rice, cotton, and citrus fruits. The introduction of Merino sheep made Spanish wool among the finest in Europe. One legacy of sheep raising in Spain was a powerful union of shepherds known as the Mesta, which was in frequent conflict with farmers over use of land, migratory routes, and grazing rights.

In areas where the manorial system was in force, peasants owed a percentage of their harvest (often half) to the local noble and exchanged their labor for the use of the land and the lord's protection against sieges, assaults, and highway thieves. Many villages also paid a tithe of one-tenth of their harvest to the church. The bailiff collected the rents and supervised the work and lives of the peasants. (Some lords held the right to prevent their laborers from moving to a residence or marrying a spouse outside the village.) The peasants worked a set number of days (often three every week) on land held directly by the lord and supplied labor when canals, ditches, or wells had to be dug or roads or mills built. The manorial system endured for centuries with little change. The local nobles provided the only authority and security known to most rural peasants, who rarely left their isolated villages and for whom moving any distance in search of better conditions or work was unthinkable. Without urban markets for crops, production remained low; the peasants subsisted on what they could grow and had no motivation to produce a surplus or plant new crops. In addition, a scarcity of coin forced many rural communities to operate on a barter system for tools, household goods, and food.

In the later medieval period, as a network of roads and new long-distance trading routes developed, production increased and city squares provided new marketplaces for the sale of produce and farm goods. Such weekly markets in the central square have survived in many European towns. An increase in production allowed some peasants to buy or bar-

ter for additional lands and thus accumulate a store of money and property. These relatively wealthy peasants could lease fertile land and pasture to tenants. Those without means could hire themselves out as laborers or servants or take up crafts like smithing, toolmaking, or carpentry.

### SPRING PLOWING AND PLANTING

Medieval farming communities were the scene of frequent negotiation over duties, particularly over the share of labor to be borne in the seasons of plowing, planting, and harvesting. For rural peasants the year began in the spring with the return of fair weather and the greening of fields and forests after the last winter frosts. The planting season began when the soil thawed and could be turned easily by the plow. A plowman directed the big teams of oxen, which were replaced in later times by horses. The moldboard positioned behind the plowshare turned the soil over after it was broken.

Spring crops included barley, oats, legumes, peas, and vetches (plants grown for forage or as animal feed). Winter crops, such as wheat, were already growing where they had been planted the previous fall. Seed was scattered by hand, and sometimes various crops were mixed together in a single field. Peas and beans were planted carefully in shallow holes, dug by a narrow stick. Each kind of seed was planted in an ideal density, which would prevent the field from being choked by weeds or by too many plants of the crop being planted.

After seed was planted, it was harrowed (covered with soil). The harrow, made of bundles of sticks or built from a wooden frame, was dragged over the field; the peasants used hammers or mallets to break up large clods of soil. The young crop then had to be defended. It was a common task of peasant children to chase crows and other predators from the fields (taking care not to harm any of the lord's private game or doves).

The days between plowing and harvest were not idle. Rural peasants had to repair hedges and fences, dig ditches and wells, tend to their homes and gardens, maintain tools, care for stock animals, and provide the lord with obligatory service. Women were responsible for home care, sewing clothes, storage of dried crops and herbs, tending kitchen gardens, preserving meat, milking cows and goats, churning butter, making cheese, and slaughtering chickens and pigs for meals.

### SUMMER LABORS

The hot summer months were reserved for making hay in the communal pastures. Hay was used as animal feed, and a good hay crop meant a steady supply of meat and milk through the winter months. Medieval haymakers used long wooden scythes to mow, with women following to move and turn the hay to make sure it dried evenly. The hay was bundled

into stacks and then brought to storage barns. Peasants who mowed the meadows belonging to the lord were entitled to a portion, in some traditions as much as they could carry off the field with the points of their scythes.

Care of the herds of sheep, goats, and cattle was also an important summer occupation. Lambs were sheared in late spring and their fleeces spun into wool. Cattle and sheep were pastured on fields intended for later crops to fertilize the soil. In some cases plowing for the fall crop began in early summer. The plowman dug as deep as possible to expose weeds, which then had to be laboriously cut at the root and pulled from the ground. Common weeds were thistles, nettles, cockles, cornflower, and marigolds.

In the summer households harvested the flax and hemp that matured in their gardens. The plants were pulled by hand and then dried in the sun and put into running water to rot away the waste parts and clean the plants. Flax and hemp fibers were beaten and separated and then hung up to dry. Hemp was wound and used to make rope, and flax was spun into yarn used for matting and other household goods.

In late summer as food stores dwindled, medieval peasants had to forage for food from the surrounding forests and take any game they could from communal lands or, illegally, from the lord's preserves. By the end of August the summer grain harvest began. This crucial harvest of winter wheat and rye and spring barley and oats depended on a steady rainfall in the spring months as well as several fair days, allowing harvesters to bring a dry crop into storage. The reapers cut the wheat with short sickles and the other grains with long scythes. Binders followed behind to gather the sheaves into bundles. In some places a tithe to the church of one of every 10 sheaves was collected, and the rest was carried to storage. Gleaners were allowed to collect any cut wheat that remained in the field. Damp grain could be dried in special ovens, if any were available. The stubble remaining was left to hens, ducks, and geese, who were turned loose to clear the fields and fatten themselves up for winter feasts.

### AUTUMN PROCESSING

Harvested grain had to be processed, which required the labor of men, women, and animals. The work was done immediately after the harvest, when the days began growing short and the nights cold. Wheat and other grains were threshed (beaten) with long-handled beaters to separate grains from the ears and stalks. The grains were winnowed by being thrown up into the air and allowing the wind to carry away the chaff, which was then used as animal feed. Seeds were removed by passing the grain over a sieve. The processed grain was collected and stored, ready to be milled into flour and then baked into bread. If a running stream was available,

grain mills were powered by water wheels. In some places draft animals were used to drag millstones over the grain and pound it into flour. Rodents and other vermin posed a constant threat to processed grain, which could be kept for a long period unless affected by damp.

After the harvest the peasant settled his yearly debts and rent with the lord of the manor. Livestock that was no longer useful to breed or to work was slaughtered at this time, and the meat was stored and preserved by salting or by hanging in a smokehouse. The skins of cattle and pigs were saved for tanning into leather for clothes and shoes. Winter crops of wheat and rye were planted and harrowed after the fall plowing. The fall was also the time for collecting wild fruit and for herds of pigs to scavenge nuts and mushrooms in the forest, a right that peasants might gain through negotiations with the lord.

In years of good harvests peasants had good stores of grain, nuts, dried fruits, and meat to last between the fall and spring. They collected wood from the forest floor (because cutting live trees was usually prohibited) and reeds for use as thatching material to repair or build homes. Household chores for women included making or repairing clothes, preserving food, preparing meals, and caring for children. Men worked at repairing their homes and tools, at crafts such as ironworking and woodworking, at milling grain, and attending markets.

### IMPROVEMENTS IN AGRICULTURE

The two-field system of planted and fallow plots was eventually replaced by a three-field system: one field was left fallow while the other two were used alternately for spring and fall crops. Three-field rotation greatly increased harvests, as did the development of new technologies starting in the 11th century. The heavy-wheeled plow fitted with a moldboard was better adapted to the heavy soils of northern Europe. A padded collar fitted to a horse enabled the peasant to replace oxen with the faster animal for plowing fields and hauling goods longer distances. Water mills made use of the power of local streams for milling grain more efficiently and for making textiles. Marl, or high-calcium earth, was used to extend animal dung as a fertilizer over large areas.

Throughout the 12th and 13th centuries European farm production and population increased. National monarchies were establishing control over larger areas, although local power still rested in the hands of regional leaders: earls, dukes, counts, viscounts, and landowning nobles. At the same time, arable land was extended to fields that were previously used as pasture and forage land. In about the 13th century manorial lords began exerting closer control over common land. These changes reduced the herds of cattle, sheep, and

goats grazing on fertile pastures—and producing the fertilizer vitally needed for crops—setting the stage for the many troubles of the 14th century.

Cash transactions became more common in marketplaces and between peasants and landowners. With the demand for hard money increasing and with the use of silver coins for paying rents, taxes, and fees, the European farmer was forced to grow and market a wider array of surplus crops. The subsistence farming of the early Middle Ages gave way to a more complex market economy in which supply and demand determined prices and the farmer began selling his harvest to raise money, which in turn allowed him to purchase food for his own table. The growth of large cities provided another impetus to agriculture; cities became vast cash markets, home to large commercial networks for buying, transporting, and selling food. Kings and their ministers paid close attention to conditions in the countryside, because successful harvests meant lower prices and helped rulers keep the peace among the naturally restive urban populations. Labor in the countryside became increasingly specialized, and as transportation improved, moving goods to market became easier and faster. This was especially true of livestock produce, such as wool, butter, cheese, meat, milk, and hides, which could be brought to market along roads and byways, avoiding the hazards of river and sea transportation.

### RURAL CRISIS

The urbanization of medieval Europe was a spur to improvements in farming technology. In the early 1300s, however, an agricultural crisis took hold in England and western Europe. Heavy rains in 1315 ruined England's harvest, driving up the price of grain to six times its average. Over the winter of 1315 to 1316 a famine struck England and western Europe. A few years later animal herds were devastated by murrain, a disease outbreak that robbed many peasants of meat and milk and the means to plow their fields. The series of bad harvests and droughts caused widespread starvation so desperate in some places that people resorted to cannibalism. Village peasants were now bearing the burden of supplying food to an increasing urban population, which produced no food of its own and was utterly dependent on good harvests for daily sustenance.

Desperate to sustain themselves, peasants flooded into the cities, causing overcrowding, crime, and unsanitary conditions. Epidemics of typhus, plague, and other diseases became more common, until the Black Death of 1347 to 1349 killed about one-third of the population of Europe. In France the Hundred Years' War struck another blow to peasant farmers who suffered the pillaging and theft of

crops and animals by the hungry roving armies of English, French, and Burgundians. The war continued until the middle of the 15th century, leaving entire regions of northern France denuded of crops and inhabitants. Just as the war came to an end, a general shift in climate occurred; a little ice age began, with colder temperatures and shorter growing seasons.

Gradually, Europe recovered from the frequent plagues, social chaos, and war, but the crisis had left a permanent mark on agriculture. With their labor in high demand in the cities, many farmers left the countryside to become artisans in the cities. The return of a cash economy enabled farmers who remained in the rural areas to begin buying land of their own. One of the areas to recover quickly was the Netherlands, where the industrious Dutch had been raising great swaths of new country from the sea floor for several centuries. Farmers raised berms, or mounds of earth, to canalize the water and built terps, small areas of raised land on which houses and barns could be built. They repaired dikes and polders, large and level areas of cultivable reclaimed from the sea. Dutch farmers began raising new crops of legumes and root vegetable crops as well.

In England a transformation took place as the open fields were enclosed for raising sheep for wool, a commodity in high demand on the continent. To survive in this land-use environment, English farmers had to consolidate their scattered strips of land and enclose them with fences or hedges. This incited an enclosure controversy that continued for some two centuries; eventually the profitable trade in English wool overwhelmed the efforts of English farmers to hold to their traditional system of open-field farming. In the meantime, on the European continent the system of manorial lords and serfs gradually gave way to an independent landowning peasantry, subject more to the whims of the marketplace than to feudal obligations to landowners.

In the Byzantine realm serfdom became more common in the late Middle Ages. Many villages became the property of wealthy landowners or were absorbed by monasteries. The rise of the Seljuk and then Ottoman Turks in Asia Minor posed a constant threat to the empire and its farmers. By the 14th century the rural population was in decline throughout the Byzantine Empire, affected by war, plagues, and a weak and corrupt government. With the fall of Constantinople in 1453 the Turks destroyed the last remnant of the Roman Empire and imposed a new administration and tax system in the countryside. The former Byzantine lands were further isolated from western Europe and adopted a new form of rural feudalism, in which Ottoman *hospodars* (governors) imposed heavy taxes and put strict limits on the movement of the rural population.

## THE ISLAMIC WORLD

BY TOM STREISSGUTH

The conquest of the Middle East, Persia (now Iran), and North Africa by Islam in the seventh and eight centuries brought a transformation in the economy and society of those regions. The remnants of the Roman imperial government were swept away, and a new faith and culture were adopted by the population. Rural estates were seized and distributed to the members of the victorious armies and their leaders. New land came under cultivation, and eventually an entirely new system of agriculture was put into place. This “green revolution,” in the phrase of some historians, had far-reaching effects both on the countries adopting Islam and on societies in Europe and Africa that did not adopt the Islamic religion.

Eventually the Islamic *umma*, or community, reached from India and central Asia in the east to the western coasts of North Africa, the island of Sicily, and the Iberian Peninsula (modern-day Portugal and Spain) in the west. The climate, soil, and agriculture of these regions varied. Generally, where settled agriculture was possible large cities and powerful states arose, and their governments collected harvests and built granaries to keep the population fed. In more arid regions, where growing crops was difficult, people tended to be migratory and more autonomous, and large clans were the basic unit of social organization.

The original home of Islam, the Arabian Peninsula, was a vast, poorly watered land of desert and mountains, crisscrossed by caravan trails and the site of a few permanent towns. The people of this region relied on trade, animal husbandry, and the growing of food crops in a few small oases. Herders kept sheep, goats, and camels, guiding them north in summer and returning in winter for grazing in sparse mountain pastures.

To the north the Fertile Crescent, an area of well-watered land, surrounded the valleys of the Tigris and Euphrates rivers. In Mesopotamia (a name that means “the land between the rivers”) settled agriculture had been practiced for millennia. Annual snowmelt in Anatolia, where the rivers had their source, brought a spring flood that caused the streams and tributaries to overflow their banks and then retreat, leaving a thin layer of silt that enriched the soil for the cultivation of grains, legumes, and vegetables. Date palms, which required little rainfall, also flourished in the region.

To the west lay Syria and the coastal plains of the Levant, the region bordering the eastern shores of the Mediterranean Sea. As in Mesopotamia, irrigation systems had been in place since long before the Islamic conquest. In level areas river water was diverted with a series of dams and canals to farming plots. In the mountains farmers terraced the hillsides to se-

cure the soil and create level ground for cultivation. Surplus farming allowed large cities, such as Damascus, Aleppo, and Baghdad, to grow some distance from the coast and the main trade routes of the Mediterranean.

Before the Islamic conquest North Africa had been known as the granary of Rome. The Nile River valley was the productive heart of the ancient kingdom of Egypt. The valley surrounded the immense Nile, the world’s longest river, which had its source in the highlands of eastern Africa. The Nile flooded its banks annually with spring runoff that originated in these mountains. The flood renewed the land and refilled the network of ponds, canals, and ditches that served to irrigate crops. The soil of the Nile Valley was so fertile that farmers could raise two crops every year.

Stretching west from Egypt was the Maghreb, a region that includes the northern provinces of what are now Libya, Tunisia, Algeria, and Morocco. Lowlands along the coast rose to steep interior mountains, where the high-altitude plains were used for crops and pastures. The farmers of the Maghreb raised grain, olives, vegetables, and citrus fruits. The region enjoyed sparse but steady rainfall, lessening the need for artificial irrigation. To the south the Sahara supported a few natural wells and oases, but it was largely a harsh and infertile region that saw minimal settlement of any kind.

In the eighth century an Islamic force pushed across the Mediterranean into the Iberia Peninsula, establishing the realm of al-Andalus atop the remnants of former Roman and Visigothic states. The Iberian Peninsula itself consisted of a large and arid central plateau surrounded by mountain ranges that ran down to the coast. There were many variations in rainfall and soil, giving rise to a great variety of crops and farming techniques. In the high elevations forests of oak and cork trees produced valuable raw materials, while in the plateaus a mixed agriculture was practiced. The conquering Moors (North African Muslims) introduced rice, sugarcane, eggplant, cotton, bananas, and citrus fruits as well as many new and sophisticated methods of agriculture.

### AGRICULTURAL PRACTICES

Muslim farmers restored dams, canals, irrigation ditches, and other infrastructure that had fallen into decay in the centuries before the rise of Islam. They dug new reservoirs and aqueducts to store and carry water. Water power was harnessed by mills, which allowed the efficient grinding of grain, olives, sugarcane, and flowers (for aromatic oils). Generally in mountainous or desert regions and in areas with little or no rainfall and infertile soil, agriculture was limited to pastoralism—the raising of animals by nomadic herders who moved seasonally from one place to another in search of good pasture. Where a minimum of about 10 inches of rain fell annually, sedentary

farming dominated. Each way of life brought about distinctive living and social conditions.

In the centuries following the Islamic conquest sedentary farming expanded at the expense of pastoralism. Available grazing land was reduced as irrigation claimed former pastures for permanent crop fields. Sugarcane, rice, and coconut palms, for example, tolerated the saline soil that was common in desert oases, which had formerly been the exclusive domain of nomadic herders. Competition over useful land generally favored the settled farmer, who could rely on the help of authorities who needed a reliable supply of food for an expanding urban population and reliable tax revenues from people tied to their land and estates.

Land ownership in the Islamic world stood in stark contrast to the manorial system of Europe, where a small layer of society had the means and legal right to own land and the vast majority of those who worked the fields had few legal rights and were often yoked to their homes as transferable property. Ordinary citizens of the Islamic world had the right to buy, sell, and mortgage productive land, and economic relationships were formalized not by oaths of loyalty but by written contracts. Cultivators who worked in the service of a landowner had the right to a significant portion of the harvest, generally at least half. Full ownership was granted to those who cultivated previously unused land. Around the major cities of the Islamic world small market gardens, many owned by single families, provided a variety of crops to the bazaars within the walls.

Under Islamic rule busy trading routes linking the Middle East, Africa, Europe, and India became the avenue for the propagation of many new species of food crops. From India came rice, artichokes, eggplants, coconut, and citrus fruits. Central Asia was the source of spinach. Africa produced sorghum, which replaced millet as a staple grain. From the Middle East spread durum wheat, a hardier variety than the wheat grown in Roman times. Durum wheat was the source of semolina flour and foods such as couscous and spaghetti, which was introduced to Italy through Islamic Sicily.

A wide variety of legumes, including fava beans, lentils, and chickpeas, were easy to store, transport, and prepare. Their cultivation also restored fertility to exhausted soils. Muslim farmers planted new orchards of lemons, oranges, pomegranates, limes, apricots, figs, and grapefruit. Banana trees came from Southeast Asia and watermelon from India. Adopting tough, drought-resistant summer crops, such as sorghum, watermelon, eggplant, and cotton, also allowed farmers to cultivate marketable produce throughout the year.

Sugarcane, also from India, had already arrived in the Sassanid realm of Iran by the sixth century. After the Islamic conquest it spread to Syria, North Africa, and al-Andalus,

where it was grown in abundance. Refined sugar eventually entered Christian Europe, where it was considered a luxury food and was in high demand in houses of nobles and royalty, who saw it as a worthy replacement for the common honey produced by feudal peasants.

New crops from tropical regions, where annual summer monsoons provided plentiful rainfall, demanded new techniques of farming. The Islamic world adopted new methods of crop rotation to replace the traditional method of rotating crops between two fields and leaving one of the fields fallow (unplanted) each year to renew its fertility. They frequently used an ard, a type of plow common in the Mediterranean region, which broke up the soil and improved its ability to hold moisture. The wider variety of crops and irrigation kept plots of land productive for longer periods.

The use of fertilizers and pesticides increased harvests and helped keep crops free of pests. To this end farmers used blood, powdered bone and horn, vegetation, chalk, lime,

Page from an herbal manuscript; Iraq or Syria, 13th century (Los Angeles County Museum of Art, the Nasli M. Heeramaneck Collection, gift of Joan Palevsky, Photograph © 2006 Museum Associates/LACMA)

ashes, and manure. They frequently plowed, hoed, and harrowed the soil. Land that was marginal, or largely infertile, was put to use for crops that could tolerate sandy soil, such as watermelon, durum wheat, and sorghum. They also developed the science of grafting and crossbreeding plants to create more productive and hardier agricultural species.

Middle Easterners were expert breeders of horses and sheep, and they tamed the camel into a useful and extremely tough desert nomad, able to carry heavy burdens long distances and survive on minimal food and water. Sheep's wool and cattle hides were produced for the use of textile and leather industries in the cities, which exported their goods to distant markets in Europe, Africa, and Asia. Eventually, however, overgrazing and erosion destroyed marginal lands and green mountain pastures throughout the Levant, the Arabian Peninsula, and Mesopotamia, a phenomenon that had lasting effects on the society and economy of the Middle East.

The raising of crops and animals was limited by lifestyle and strict restrictions on diet. Pork was forbidden to Muslims, as were meat-eating animals. Nomadic peoples survived on a diet of flat bread, dates, and vegetables, and they relied on their herds of sheep, camels, and goats for meat and milk. The diet was supplemented by dried fruits, nuts, olives, and dates. The Middle Eastern Arabs favored coffee, which was imported from highland areas of eastern Africa. Food was flavored by spices, the most expensive of which was saffron, which came from India and was commonly used to flavor rice. Although they were not native to Islamic lands in the medieval era, cinnamon, nutmeg, and pepper were imported by Muslim traders from eastern Asia.

Progress in agriculture, indicated by increased harvests and a wider range of crops, was the foundation of a flourishing urban civilization in which large cities depended on their surrounding hinterlands for a steady and abundant supply of food. In addition, cotton, indigo, silk, and other cash crops were introduced that provided valuable goods for long-distance trading and created a luxury-clothing industry. In turn, these crops were introduced to Europe through Islamic Spain and Sicily.

The design of gardens for the growing of useful and ornamental plants reached a pinnacle of development in the Islamic world. The notion of Paradise in Islamic scriptures is a well-watered garden where trees and plants flourish beside pools, fountains, and ever-abundant springs. Gardens decorated the courtyards of the nobility, the grounds of royal palaces, and public squares and parks, prime examples being the gardens in and around the palace of Alhambra in the city of Granada, Spain. The skilled cultivation of a garden developed in tandem with improvements in farming techniques outside the walls of Islamic cities. In al-Andalus gardens were used to

acclimate new crops to their environment under the supervision of expert botanists.

## AGRICULTURAL SCHOLARSHIP

Agriculture was the subject of a wide range of scholarly books and treatises in the Islamic world. Botany was a science widely studied and respected for its practical application to farming. The new techniques of farming spread widely through Arabic books, which circulated to the cities and to nobles, landowners, and cultivators. Ancient Greek texts were translated into Arabic at Baghdad's academic center Bait al-Hikma (House of Wisdom), and, with new knowledge added, they survived to modern times. Among the most important of these books were *De plantis* (On Plants) a text by the Greek historian Nicholas of Damascus (first century B.C.E.), and *De materia medica* (Concerning Medical Matters), a book by the Greek physician Dioscorides (ca. 40–ca. 90 C.E.). The *Georgika*, a work by the sixth-century Greek writer Kassianos Scholasticos, in Arabic became the *al-Filaha al-rumiya*. An even more respected ancient text, known as the *Nabatean Agriculture* (translated by Ibn Wahshiyya in 904), gave a detailed system of classification, instructions on how to plant, raise, and harvest a wide variety of food crops, and advice about grafting, treating the soil, and other topics of crop management.

These writings inspired further study and works by Muslim scholars, including *Kitab al-shifa* (Canon of Medicine), by the scientist Ibn Sina (980–1037; known in Europe as Avicenna), which treated the medicinal function of the different parts of plants. Ibn al-Awwan, a 12th-century Moorish agriculturalist, consolidated all of this ancient knowledge into the *Kitab al-filahah* (The Book of Agriculture), an encyclopedia of 35 chapters that became a standard reference book throughout the medieval Islamic world. Knowledge was spread further in specialized books about agriculture, such as the almanacs and volumes of practical advice that originated with the Persian astronomer and botanist ad-Dinawari (ca. 815–ca. 895 or 902) and the scientist Ibn Miskawayh (ca. 930–1030), both of whom lived in what is now Iraq. The almanacs advised the farmer on the best time to plow his fields, plant and fertilize his crops, graft trees in his orchard, and carry out the harvest. Almanacs also were useful in identifying the latitudes of the Islamic world, where the passing of the seasons often did not bring about dramatic changes in weather or growing conditions. In addition, farmers could produce crops to meet seasonal demand by relying on advice about the best time of year to harvest and consume certain kinds of food.

One of the most famous of these almanacs was written by al-Malik al-Mashraf, a sultan of Yemen who reigned in the 13th century. He advised his readers on the properties of soils, weather signs, and the different properties of plants

through their growing seasons. Scholars in botany and agriculture traveled widely throughout the Islamic world to teach in mosques, schools, and public marketplaces for the edification of farmers.

Developments in astronomical knowledge also contributed, among other things, to the spread of new agriculture. Astronomers tracked the progress of the sun through the signs of the zodiac, a skill inherited from ancient Babylon and the best method known in the medieval world to keep track of time's passage. A more precise measurement of time, the seasons, and the passing of the year helped farmers plant and harvest their crops at the optimal time.

## WATER MANAGEMENT

Under Islamic rule the knowledge of irrigation and other techniques spread west from Iran, Babylon, and other realms that had long mastered food cultivation under difficult conditions. The sponsorship and maintenance of irrigation works were a primary function of strong centralizing governments in the medieval Islamic world, as in ancient Mesopotamia and Egypt. By the 10th century summer irrigation and crop rotation allowed farmers in some places to grow three crops a year instead of just one. Where rivers were scarce or nonexistent, water management was the key to successful farming. Under Islamic rule a system of deep wells, tunnels, and weirs (dams) known as the *qanat*, which originated in ancient Iran, spread to the Middle East, North Africa, and Iberia. The *qanat* was dug into a high point of land or mountainside, and water ran downhill through an underground network of artificial channels. The *qanat* was built and maintained by a local association of farmers who were responsible for its upkeep—a practice that still prevails in parts of the Islamic world. It provided a reliable supply of water even in years of little or no precipitation and also was relatively safe from pillage or destruction by hostile armies.

In North Africa the underground network was known as a *foggara*. Having built these networks at great expense and hard labor, farmers carefully guarded them from vandalism and other mischief, because the destruction of their water network would lead to poverty and hunger. They controlled the use of water among themselves by a system of clepsydras, or water clocks; these were distribution weirs that channeled the water to a certain field for a specific length of time. Each farmer was responsible for the maintenance of the weir during the time he used it; this method made water management the responsibility of the community rather than the rulers. In Tunisia the *foggaras* were used to create new oases in the desert. In Algeria the medieval *foggara* network is still in use, running for thousands of miles underground, with some shafts as deep as several hundred feet.

An important part of water management was the use of dams, known as *sudd*, which were built to divert water, slow and control it during times of flood, and bring it to the level of crop fields and reservoirs. Some dams were built to control the runoff of streams during storms, while others were used to control water from perennial springs, a technique especially common in Iberia. At certain points along a stream farmers installed a *noria*, or Persian wheel, a device for lifting water from a stream to a higher reservoir or field. Driven by a river current, the wheel contained small weighted buckets that descended into the lower level and then rotated to a higher level, where they were emptied. In areas where streams did not move swiftly enough, the wheels were operated by humans or draft animals with a system of small wheels and gears.

In the Moorish Iberian Peninsula the underground water network was known as a *galeria*. Many of the *galerias* built during this era are still in use, notably around the city of Granada, the last seat of Islamic Spain. From Spain the system eventually spread to Mexico and other places of Spanish colonization in the Americas.

## IBERIAN PENINSULA

Under Roman occupation Iberian farming had been based on two annual crops, harvested in winter and in spring. With the Moorish conquest of early eighth century, the agriculture of al-Andalus was transformed. Hard wheat was introduced for cultivation on the plains around Córdoba, Saragossa, and Toledo. In these and other regions the former “dry farming,” relying only on natural precipitation, was replaced by crops watered by artificial irrigation. Deep wells and canals were dug, reservoirs prepared, and chain lifts installed to bring water to the fields in the dry and hot summer. The Moors enhanced the fertility of their fields with manure, wood ashes, decayed vegetation, and ground bone. They instituted a system of crop rotation and produced two or three crops a year.

Terracing leveled the contours of hillsides and protected fields from erosion. From mountain springs, water was transported by pack animals and aqueducts to the fields and orchards at lower elevations. The Islamic system of *qanats* and weirs distributed water from underground sources, with the outlets built according to the soil type, climate, growing season, and type of crop grown.

With the introduction of new crops, cultivation expanded into previously unused areas. A judge of Córdoba introduced pomegranates from Syria, and the renowned theologian, jurist, and poet al-Ghazali (1058–1111) brought home a variety of fig tree after a journey to the Middle East. At the same time, the ancient Mediterranean agriculture of wheat, olives, and wine grapes survived.

Al-Andalus inherited many methods of land tenure and laws concerning ownership and farming practices brought from North Africa. In Valencia, for example, the Tribunal of the Waters met each week to judge disputes over water, a carryover from a common practice in the Maghreb. As a result of this scientific and social cross-fertilization, the agriculture of Moorish Iberia was among the most systematic and productive in history.

### DESTRUCTION AND DECLINE OF AGRICULTURE

Relying on its annual river flood, Egypt remained productive, and farming also continued to prosper in Moorish Spain. After the first centuries of innovation, however, a general decline in agriculture took place in the rest of the medieval Islamic world. The constant cultivation and planting of land caused soil erosion, and irrigated land that was poorly drained became saline.

By some reckonings, the agricultural decline began around the time of the Crusades in the Levant, which were under way by the late 11th century. The invasion of Mesopotamia by Mongol armies in the 13th century brought a wholesale massacre of urban populations and the destruction of irrigation works that had been built and maintained ever since the original Islamic conquest. Invasions and civil unrest also occurred in the Maghreb, where the Banu Hilal, Almoravids, and Almohads overthrew the Islamic dynasties established during the original conquest.

The Mongols' conquest of the Abbasid Caliphate in 1258 and destruction of Baghdad virtually halted the innovative study of agriculture and other disciplines. The Mongol invasion proved to be a military and cultural disaster from which Mesopotamia never quite recovered. Trade routes from the East were closed, cutting off the introduction of new species and knowledge from India and the rest of Asia, and millions of farmers fled their homes and fields. The death blow was struck by plague epidemics, which ravaged central Asia and the Middle East in the 14th century before reaching Europe.

Large stretches of countryside that had once flourished were depopulated, and infrastructure that had supported productive farms was destroyed. Trade and the monetary economy declined, and the urban markets for farm produce shrank. Land was given over to religious communities, military leaders, and tax officials, closing it off to farming by individual farmers and ending the robust competition that had brought about innovation. Many peasants became tenant farmers with no rights of ownership and increasing obligations in the form of rents, taxes, and sharecropping. Irrigation works fell into disuse and disrepair, and fallow land returned to pasture.

By the close of the medieval period the Islamic world was weakened and vulnerable, subject to outside control and, eventually, a European colonial system. The Christian reconquest of Spain, which began in the 11th century and was consolidated in 1492 with the fall of Granada, disrupted irrigation works, forced Muslim farmers to flee the region, and discouraged innovation through the imposition of heavy taxes on those who remained behind.

#### Africa

### ~ Ibn Battuta: Excerpt from Travels in Asia and Africa (1325–54) ~

#### IBN BATTUTA RETURNS TO YEMEN

From Kulwa we sailed to Dhafari [Dhofar], at the extremity of Yemen [near the border with Oman]. . . . In

the neighborhood of the town there are orchards with many banana trees. The bananas are of immense size; one which was weighed in my presence scaled twelve ounces and was pleasant to the taste and very sweet.

(continued)

(continues)

They grow also betel-trees and coco-palms, which are found only in India and the town of Dhafari. Since we have mentioned these trees, we shall describe them and their properties here.

Betel-trees are grown like vines on cane trellises or else trained up coco-palms. They have no fruit and are grown only for their leaves. The Indians have a high opinion of betel, and if a man visits a friend and the latter gives him five leaves of it, you would think he had given him the world, especially if he is a prince or notable. A gift of betel is a far greater honor than a gift of gold and silver. It is used in this way. First one takes areca-nuts, which are like nutmegs, crushes them into small bits and chews them. Then the betel leaves are taken, a little chalk is put on them, and they are chewed with the areca-nuts. They sweeten the breath and aid digestion, prevent the disagreeable effects of drinking water on an empty stomach, and stimulate the faculties.

The coco-palm is one of the strangest of trees, and looks exactly like a date-palm. The nut resembles a man's head, for it has marks like eyes and a mouth, and the contents, when it is green, are like the brain. It has fiber like hair, out of which they make ropes, which they use instead of nails to bind their ships together and also as cables. Amongst its properties are that it strengthens the body, fattens, and adds redness to the face. If it is cut open when it is green it gives a liquid deliciously sweet and fresh. After drinking this, one takes a piece

of the rind as a spoon and scoops out the pulp inside the nut. This tastes like an egg that has been broiled but not quite cooked and is nourishing. I lived on it for a year and a half when I was in the Maldiv islands.

#### THE MANY USES OF THE COCONUT

One of its peculiarities is that oil, milk and honey are extracted from it. The honey is made in this fashion. They cut a stalk on which the fruit grows, leaving two fingers' length, and on this they tie a small bowl, into which the sap drips. If this has been done in the morning, a servant climbs up again in the evening with two bowls, one filled with water. He pours into the other the sap that has collected, then washes the stalk, cuts off a small piece, and ties on another bowl. The same thing is repeated next morning until a good deal of the sap has been collected, when it is cooked until it thickens. It then makes an excellent honey, and the merchants of India, Yemen, and China buy it and take it to their own countries, where they manufacture sweetmeats from it. The milk is made by steeping the contents of the nut in water, which takes on the color and taste of milk and is used along with food. To make the oil, the ripe nuts are peeled and the contents dried in the sun, then cooked in cauldrons and the oil extracted. They use it for lighting and dip bread in it, and the women put it on their hair.

Europe

#### Excerpt from "The Farmer's Law" (Byzantium, seventh to eighth centuries)

The Farmer who is working his own field must be just and must not encroach on his neighbor's furrows. If a farmer persists in encroaching and docks a neighboring lot—if he did this in plowing time, he loses his plowing; if it was in sowing time that he made his encroachment, he loses his seed and his husbandry and his crop—the farmer who encroached.

If a farmer without his landowner's cognizance enters and plows or sows, let him not receive either wages for his plowing or the crop for his sowing—no, not even the seed that has been cast.

If two farmers agree with the other before two or three witnesses to exchange lands and they agree for all time,

let their determination and their exchange remain firm and secure and unassailable. . . .

If two farmers exchange lands either for a season or for all time and one plot is found deficient as compared with the other, and this was not their agreement, let him who has more give an equivalent in land to him who has less; but if this was their agreement, let them give nothing in addition. . . .

If a farmer on shares reaps without the grantor's consent and robs him of his sheaves, as a thief shall he be deprived of all his crop. . . .

If a farmer takes from some indigent farmer, his vineyard to work on a half share and does not prune it as is filling and dig it and fence it and dig it over, let him receive nothing from the produce. . . .

If a farmer takes over the farming of a vineyard or piece of land and agrees with the owner and takes earnest-money and starts and then draws back and gives it up, let him give the just value of the field and let the owner have the field.

If a farmer enters and works another farmer's woodland, for three years he shall take its profits for himself and then give the land back again to its owner. . . .

*Concerning Herdsmen.* If a neat herd in the morning receives an ox from a farmer and mixes it with the herd, and it happens that the ox is destroyed by a wolf, let him explain the accident to its master and he himself shall go harmless. . . .

If a herdsman receives an ox from a farmer in the morning and goes off and the ox gets separated from the mass of oxen and goes off and goes into cultivated plots or vineyards and does harm, let him not lose his wages, but let him make good the harm done.

If a herdsman in the morning receives all ox from a farmer and the ox disappears, let him swear in the Lord's name that he has not himself played foul and at he had no part in the loss of the ox and let him go harmless.

If a guardian of fruit is found stealing in the place which he guards, let him lose his wages and be well beaten.

If a hired shepherd is found milking his flock without the owner's knowledge and selling them, let him be beaten and lose his wages.

If a man is found stealing another's straw, he shall restore it twice over.

If a man takes an ox or an ass or any beast without its owner's knowledge and goes off on business, let him give its hire twice over; and if it dies on the road, he shall give two for one, whatever it may be. . . .

If a man steals all ox or an ass and is convicted, he shall be whipped and give it twice over and all its gain.

If while a man is trying to steal one ox from a herd, the herd is put to flight and eaten by wild beasts, let him be blinded.

If a man finds an ox in a wood and kills it, and takes the carcass let his hand be cut off. . . .

If a man is found in a granary stealing corn, let him receive in the first place a hundred lashes, and make good the damage to the owner; if he is convicted a second time, let him pay twofold damages for his theft; if a third time, let him be blinded. . . .

If a man delivers cattle to a slave for pasture without his master's knowledge and the slave sells them or otherwise damages them, let the slave and his master go harmless. Where a man destroys another's beast on any pretense, when he is recognized, let him indemnify its owner.

If a man harvests his lot before his neighbor's lots have been harvested and he brings in his beasts and does harm to his neighbors, let him receive thirty lashes and make good the damage to the party injured. . . .

If a man lawlessly, when he has a suit with another, cuts his vines or any other tree, let his hand be cut off. . . .

If the owners of the cultivated plots are not willing that the water go through their plots, let them be entitled to prevent it.

## ► alchemy and magic

### INTRODUCTION

Magic has proved to be a difficult subject for American and European scholars to study because of the history of the word itself. The word *magic* comes from an ancient Iranian word meaning “power.” (It is etymologically connected with the English word *might*.) It was the basis of the term *magus*, the name of an important tribe of priests from Media (part of modern-day Iran), who were later absorbed into the Persian Empire. In the fifth century B.C.E., when Iran was at war with Greece, Greeks borrowed the word, but from their viewpoint it naturally meant the religion of the enemy, which was viewed as false, superstitious, and harmful compared with Greek religion. Greeks began to use the terms *magus* and *magic* (magic is what a *magus* performs) to refer to any kind of ritual of which they disapproved or that was at odds with the state or religion, even if those rituals were actually Greek in origin. Conversely, others used the names *magus* and *magic* for themselves and their own practices as a way of claiming that their rituals were mysterious and powerful precisely because they stood in opposition to ordinary Greek religion.

When Christianity, which was to become the universal religion in medieval Europe, made its appearance, it was im-

mediately attacked by Greeks and Romans as magic because it was foreign and subversive of the power of the Roman state. But Christians turned this charge around and claimed that Christianity was the only true religion, whereas traditional Greek and Roman religion were to be viewed as magic.

Because the meaning of the word *magic* is constantly changing in Western languages—it is often whatever the speaker condemns as contrary to his own religion—one must be very careful in calling the practices of a non-Western culture magic. In general, human beings use ritual to address needs and dangers that cannot be managed in any other way. Collective rituals that involve the whole community are meant to ensure that no disaster occurs in an area of concern to the whole, such as the success of the harvest. On the other hand, rituals intended to harm a personal enemy are often carried out in secret, and practitioners would be punished if their actions became publicly known (although more often such rituals are suspected only if some accidental harm befalls a person, so that their existence in a culture is more imaginary than real). To use religion and magic to distinguish between those two extreme poles of ritual makes some sense. That leaves, however, a very wide middle between the extremes. Everyone might pray for the recovery of a sick king, but if an individual is sick, are the exorcisms and drugs used to cure him magic or not? This is one reason that physicians and healers in medieval Western culture had to defend themselves against charges of magic: if they can heal, cannot they also harm? Quackery, too, is magic conceived of as fraudulent.

Another concept that occupies the middle ground is an occult science such as alchemy, astrology, or herbalism. These are systematic bodies of knowledge often pursued by the leading intellectuals in a culture as part of a spiritual or philosophical quest. Their private nature makes them seem like magic while the status of their practitioners (who are often priests) relate them to religion.

Whatever magic is, it easily travels between cultures, in part because it is always viewed as foreign. Nothing illustrates this better than alchemy. This pseudoscience was invented by the Greeks in Roman Egypt and was enthusiastically adopted by the Islamic conquerors of Egypt and then transmitted to the opposite ends of the earth: Western Europe and India. When there is an actual historical link between cultures, it is much easier to compare the different developments of the various forms of magic from one nation to the next. But nothing in Chinese or Mayan culture can be truly connected to alchemy because there is no cultural contact. Their practices can be called alchemy only because that is the element in Western culture they most closely resemble.

## AFRICA

BY KIRK H. BEETZ

To the medieval African, the distinction between magic and religion was tenuous. For example, the Yoruban god Shango was traditionally considered a king who became a god. Two versions of his story exist. One says that he was a cruel king who was overthrown and forced to flee into the forest, where he hanged himself. The other says that Shango was a magician as well as a king who accidentally caused lightning to kill his wives and children and that, overcome by remorse, he hanged himself in his palace. In either case he ended up becoming the god of storms and magic. Thus, a Yoruban magician might call on him for aid in casting spells. Is this religion or magic? The traditional anthropological definition is a useful resolution of the dilemma: Magic is the use of supernatural powers to control people or the forces of nature.

Another challenge in studying African alchemy and magic is the patchy nature of the information. Most medieval Africans did not leave written records of their magical practices. Thus information about African magic is found primarily in the writings of outsiders, mostly Arab explorers and traders in West Africa and East Africa and Portuguese explorers traveling Africa's coast. For some African cultures archaeologists try to determine magical practices from rock paintings and the occasional shrine. One technique anthropologists use is observing the present-day practices of an old, continuous culture, like the Yoruba, Dogon, or San, and from those observations inferring what the magic of those peoples was like hundreds of years ago. This method is not always productive, however, because Africans tended to be very pragmatic about their magic; when a spell or potion seemed to lose its power, it was abandoned for a new, more potent one, making African magic a practice that was constantly changing.

The subject of alchemy is an example of the challenge faced by historians and archaeologists when studying Africa, because the practice of alchemy in Europe and Asia was different from that in Africa. Alchemy is often associated with mixing substances to create a chemical reaction that results in the so-called philosopher's stone or in the transmutation of base metal into gold. Most Africans, however, were not interested in such endeavors. For them the purpose of creating a new substance from a mixture was to improve everyday life: healing people, making crops bountiful, or preventing misfortune. A good magician was expected to be able to concoct potions that when drunk would have magical effects.

Peoples in western and central Africa believed that alchemical concoctions could have fearsome consequences, because a magician might slip a bit of potion into someone's

drink or a bit of doctored food into someone's meal and the ingested substance would confer magical powers on its victim. Some African cultures believed that this was how magicians passed their supernatural powers to the next generation. What made this practice fearsome is that the victim could unintentionally cause havoc in the community. For instance, while victims slept, their spirits might leave their bodies and roam the village, spoiling people's food, causing people to trip and hurt themselves, giving people ghastly nightmares, or causing other suffering or calamities. If their identities were ever revealed, the perpetrators of these problems would not be punished because it was understood that they were the victims of a wicked magician and could not help creating supernatural disruptions.

The substance used for creating a magical effect, usually called a potion, tended to be a mixture of substances each considered potent already or capable of becoming supernatural when placed in the presence of other substances. Thus a potion slipped into someone's food might be composed of thread, needles, and resin. Magicians spent much time working on potions. Such mixtures were given not only to people but also to spirits in the home or at a shrine or painted on stones or other objects. Some potions had practical benefits because magicians and shamans in most regions of Africa knew about herbs and other plants that could help cure certain illnesses. When they were smeared on rocks, some potions were supposed to protect farms from thieves and disease. Magicians were constantly modifying their potions because the magic would seem to disappear. If the application of a potion caused a calamity that it was supposed to prevent, such as a crop failure, people generally responded not with anger toward the magician but with the conviction that some other magician had cast a more powerful malevolent spell to counter the potion.

When misfortune happened to a person, Africans in the medieval period took a very matter-of-fact approach to analyzing the event and understood that the cause was usually mundane. When a person suffered snakebite or when a kiln broke or a roof collapsed, Africans knew full well that it was an ordinary snake, a flaw in the kiln's construction, or a very heavy wind that was the immediate cause. Yet most Africans believed that underlying every misfortune, no matter how prosaic, was a supernatural force. An example commonly given by anthropologists is of a man who is walking along a road toward home when a snake bites him. After receiving treatment for his wound, he asks a seer why the snake was on the road at just the right time to bite him. The seer tells the man that a jealous family member paid a magician to make a snake slither on the road just when the victim was walking past or that angry spirits had sought to harm him. The vic-

tim asks the seer for magical protection against whatever had caused the snake to be on the road when he walked by.

Broken kilns and fallen roofs could be caused by angry spirits. Perhaps the victims had failed to say the spirits' names as often as the spirits would like. In West Africa, in particular, many cultures believed that ancestor spirits remained alive only if their descendants spoke their names; they would disappear if no one spoke their names. Broken crockery, spoiled food, and other everyday events could be spirits trying to communicate with their descendants. In such a case the victim would consult a shaman, who could be either a man or a woman. Shamans typically kept abreast of events in the lives of local families as well as gossip among the villagers and used that information to explain victims' misfortunes. Perhaps a man was being rude to his sister-in-law, and spirits were breaking the man's belongings until he apologized to his sister-in-law and treated her respectfully. The magical ability of a talented shaman was comforting for Africans because the shaman provided explanations for seemingly random events and offered ways for people to end their troubles.

Efforts to use magic to control people and nature were sometimes dramatic. The Igala of present-day Nigeria have a tale about a king named Agagba who had to sacrifice one of his daughters to defeat an invading army of the Jukun. In exchange for her death a magician gave Agagba charms that when scattered in water would make fish poisonous. Agagba scattered the charms in a river beside the Jukun army's camp, and the Jukun warriors died when they ate the fish.

Magic rarely required gestures as dramatic as human sacrifice, but the belief that taking a life could have magical effects appears to have been fairly common among the people of central and western Africa in medieval times. For instance, after a person died, a magician might sacrifice an animal such as a goat and compel the deceased's spirit to inhabit the animal. The sacrifice was then cooked and eaten in an effort to incorporate the spirit into another person and prevent its running loose to do harm. This practice could take a more sinister turn: Among the Ibibio a person could be killed by having his or her spirit forced into an animal that was then eaten.

Charms and fetishes had special powers. A magician had to consider the person for whom the charm was intended and create one that specifically suited that person. Magic that worked for one person would not necessarily work for anyone else. In tropical Africa some general principles seem to have underlain the making of charms. For example, bundles of feathers could protect a room from invading spirits, animal teeth could ward off physical injury from people or animals, and whistles could defend against evil magic. In sub-Saharan cultures that were not predominantly Muslim, some Muslims

*Amulet; Coptic Egypt, ca. 200-ca. 800* (Los Angeles County Museum of Art, gift of Carl W. Thomas, Photograph © 2006 Museum Associates/LACMA)

were seen as having special powers because they were literate. Even if the Africans themselves were not literate, they had respect for written words. Thus in some communities Muslim magicians would sell charms consisting of an Arabic word written on paper, which was then sealed in an amulet or a pouch. Warriors often wore several such charms for protection in battle. In societies where people seldom lived to 50 years old and infant mortality was high, magicians provided charms for use in evading the evil magic that was at the source of premature deaths.

Fetishes usually were carved wooden statues. A statue of a human being could give a spirit a home where it could be consulted in mystical matters and where it would behave itself and not torment the living. When a fetish cracked from age, it ceased to be magical and had to be replaced. Statues of animals were used to help hunters.

People were ambivalent about the status of a magician in the community. Healers and seers were valued members of some communities. Their magical explanations could ease conflicts by persuading people that the turmoil was the result of magic that could be understood and sometimes countermanded. On the other hand, many communities feared magicians, especially evil ones, and deemed any socially deviant behavior to be a sign that someone might be a source of bad magic. In East Africa people suspected of practicing malevolent magic could be killed, and people in many cultures conjectured that a magician was responsible for every death. These suspicions led to witch hunts. A corpse carried high might point out its killer before burial. In some eastern communities a person suspected of practicing evil magic would

be given a poison that would cause either vomiting or dysentery. Vomiting indicated innocence, and dysentery could mean a sentence of death.

## THE AMERICAS

BY ARDEN DECKER

In general, the use of alchemy and magic throughout North, Central, and South America is tied to a variety of social functions, including healing, harming, divining, and religious or ritual use. Prior to the Spanish conquest practitioners of alchemy and magic (witches, sorcerers, healers, and shamans) were not viewed with the negative connotations that are sometimes associated with those who practiced magic in Europe. It is useful to keep in mind that in these various cultures the manipulation of plant properties and the use of magic did not belong to a realm that was separate from religion or society at large. In fact, they played an important role in the reinforcement and continuation of cultural identity and religious beliefs. Most medieval American cultures believed that the entire natural world was animate and the line between human and supernatural realms was not rigidly defined. Because plants are highly perishable, there is little physical evidence of the use of alchemy, though some visual representations do exist. While much of what is known concerning the use of alchemy and magic is gathered from colonial-era chroniclers and explorers, we also have learned much about these practices through the contemporary people who continue to utilize them to this day.

Although their names and specific roles varied and often overlapped, most practitioners of alchemy and magic were believed to possess supernatural powers and knowledge that enabled them to control or manipulate situations and the natural environment. Witches were believed to be able to alter the acts and welfare of others in both positive and negative ways. Witches could be elders, leaders, curers, or sometimes even an ordinary person. The Aztec (ca. 1300–1521 C.E.) of central Mexico believed that witches and shamans had the special ability to transform into an animal alter ego called the *nagual* (also spelled *nahual*). By calling upon the *nagual*, the practitioner was able to vicariously perform acts against others. In Maya cultures (ca. 1800 B.C.E.–1530 C.E.) shamans often were called upon to capture “lost” animal spirits or the alter ego of a person. Shamans were particularly important within most American cultures because they served as leaders and intermediaries of the human and spiritual realms. More specifically, shamans possessed the ability to pass through the various supernatural levels. Both men and women could become shamans, thereby suggesting that both sexes held religious and political power. The role of curers and healers was

more specific. Some engaged in a general practice of healing sicknesses, while others were specialized in treating certain types of illnesses or conditions. Often they worked as ritual healers of ailments brought on by the gods, witches, or sorcerers.

The tradition of using plants in magical and ritual ceremony is long, and it is believed that shamans in North America engaged in such practice as early as the Paleo-Indian Period (ca. 13,000–ca. 8000 B.C.E.); it is commonly held that these traditions were brought over by Paleolithic peoples from Asia. Plants were used as remedies for medical issues; as master herbalists, shamans, curers, and healers all engaged in such use. In more extreme cases, witches, curers, healers, and shamans entered into ecstatic trances in order to perform magic. Hallucinogenic plants that were believed to help the person or the soul travel into supernatural realms often aided this process. Natural elements, such as leaves, seeds, or barks, were commonly believed to be magic or sacred owing to their unique effects. Some plant elements were used alone, while others would be combined and mixed with additional ingredients to enhance specific effects.

The sophisticated knowledge of plant properties among contemporary indigenous groups in North, Central, and South America indicates a longtime study of hallucinogenic and medicinal plants. It has been suggested that the use of magical plants often allows members of a society to find validation of their culture and history as they participate in rituals and ceremonies passed down for generations. It is necessary to mention that such plants were not used for recreation, as they were considered to be highly sacred and were employed only for ritual purposes.

In medieval Mesoamerica the use of psychotropic mushrooms was a longstanding part of magical or ritual practice. The Huichol Indians of north-central Mexico have continued such practices since pre-Columbian times, and it is believed that such mushrooms also were used by Classic and post-Classic Maya in shamanistic ritual. There is strong evidence to support the use of the peyote cactus in southwestern North America and western Mexico, including funerary art depicting the plant. The use of morning glory seeds called oloiqui by the Aztec was also prevalent in Mesoamerica. The colonial-era historian Bernardino de Sahagún (1499–1590) wrote about the Aztec use of oloiqui mixed with honey in ritual practices. The seeds of the *Sophora secundiflora* plant, known as red beans or mescal, have been found at archaeological sites dating before 1000 C.E. in both Mexico and Texas, and they have the longest record of use throughout Native American cultures. It is believed that these seeds were used for divination purposes. The use of members of the *Datura* family of plants also was widespread throughout the Americas. As a psychotropic plant, it was highly valued by the Inca (ca. 1450–1532 C.E.) for its intoxicating effects and was particularly important for sorcery and curing.

In both North and South America the magical properties of tobacco were often exploited. Tobacco would be ingested through chewing, licking, and smoking, or it could be absorbed through the skin. Tobacco and other plants, such as members of the pea family, were often smoked or made into snuffs, which would be inhaled, usually through the nostrils, to achieve the desired hallucinogenic effect. In South America the state of sickness brought on by ingesting large amounts of tobacco was believed to aid the practitioner in achieving

supernatural empowerment. In its most potent state, tobacco use was thought to cause paranormal vision in the shaman. It also helped the shaman perform psychiatric healing and to embark on vision quests. Columbus and his men recorded the use of snuff among the Taino peoples inhabiting their first point of contact, the island named Hispaniola.

The San Pedro cactus has been used for more than 3,000 years by cultures living in South America, and it is still in use today. There is visual evidence that cultures understood the sacred nature of this plant as early as the Chavín culture (ca. 900–ca. 200 B.C.E.), which used the plant as a decorative motif in their art. This very thin, column-shaped cactus is used for healing and in witchcraft, suggesting that the plant possesses both healing and potentially destructive powers. One way that San Pedro cactus is still utilized today is in a cure that involves combining the plant with tobacco leaves, sugar candy, lime, cane alcohol, and perfume to create a mixture full of symbolic power. The concoction would be used as a curative drink to heal various illnesses.

## ASIA AND THE PACIFIC

BY BRADLEY A. SKEEN

Most early societies have shamanic components within the scope of their religious practices. The shaman differs from the priest in claiming a personal relationship with the divine and in addressing his followers' personal concerns, such as illness or purification from sin, rather than collective concerns, such as the community's agricultural success, which may instead be mediated through priests. Practices that descend from shamanism are generally termed *magic*, while those as-

sociated with priests are termed *religion*, although the sharp distinction between magic and religion is most commonly found in European and Middle Eastern cultures. Ancient shamanic practices remained prevalent in much of medieval eastern Asia, including in Siberia and among the Ainu people of northern Japan as well as in the cultures of Australia and the Pacific islands. By the Middle Ages, shamanic practices had long been institutionalized in the advanced civilizations of India and China. These practices took the form of various occult sciences considered part of philosophical learning, among them, alchemy, astrology, and medicine.

In India the traditional expert in the occult sciences was the yogi, or practitioner of yoga. *Yoga* is related to the English word *yoke* and refers to the joining together of the human and divine. The goal of the yogi was to become divine or godlike. This was to be accomplished by meditation, the conscious manipulation of autonomic bodily processes such as breathing, the use of plant and mineral drugs, the control of the body through asceticism (such as fasting, going without sleep, or refraining from sexual activity), and the practice of occult sciences such as alchemy. Through all of these practices the physical body would be transformed, such that the yogi would be able to perform miracles such as flying or becoming invisible and could prolong youth and life indefinitely. In the Middle Ages popular yoga traditions were transformed into proper philosophical schools (such as that of hatha yoga, which was formed between 1100 and 1400 and is still widely practiced today) and systematically recorded in a textual tradition, especially within the diverse school of practices usually referred to as tantra. *Tantra* is something like the English *magic* in the sense of being a collection of practices that are supposed to accomplish miracles and that may or may not be legitimate from the point of view of philosophy and religion.

The miracle of turning base metal into gold is found early in the Indian tradition; yogis may have achieved this “miracle” through the means of a simple sleight-of-hand trick on the order of modern stage magic in order to inspire followers. The Greek pseudoscience of alchemy was actually invented in Hellenistic Alexandria and was transmitted to India in the early Middle Ages. This practice had the aim of purifying other metals (especially mercury) into gold, not for the purpose of obtaining wealth in the form of gold but under the belief that the purifications performed on the metals by the alchemist also purified his body and soul. By the time the final transformation into gold was achieved, the alchemist would have also transformed his body into a perfect one that would remain eternally young and his mind into one that knew all the secrets of the universe. Later in the Middle Ages the penetration of Islamic culture into India (beginning with the Islamic conquest of part of modern Pakistan as early

as 711) brought Islamic alchemy to India. Also, a version of Hellenistic astrology had been imported into India and flourished there essentially unchanged into the modern era.

In the 13th century a new school of medicine was developed in India, usually called iatrochemical medicine, since it used mineral rather than plant substances as drugs. (*Iatrochemistry* derives from the Greek *iatros*, or “physician,” and *chemeia*, or “alchemy.”) Alchemical in origin, the school revolved around empirical work performed in laboratories to create new compounds rather than around the mystical beliefs of alchemy. Texts of the school (by physicians such as Vrindra and Cakrapnai, of the turn of the 15th century) cite tantric yogis among its venerated predecessors. Modern versions of these texts do not claim to describe procedures that could result in eternal youth and immortality; they may instead be dedicated to the god who preserves human beings from sickness, old age, and death. Iatrochemical physicians may have been the first anywhere in the world to realize that various metals burn with distinctive colors when exposed to flame, a standard test in modern chemistry.

Daoism, which speaks of the *Dao*, meaning “the way” or “the path,” is a school of Chinese philosophy dealing with the creation and existence of the world. In China attempts to manipulate the world through magic have been part of Daoist practices. The purpose of such practices was to allow the sage to become a divine being. Purification would result not in the creation of a superior, immortal body but in the washing away of the body, leaving the sage a spirit no longer hampered by the limits of the physical. Alchemy developed independently in China, at about the same time as in the Greek world (in the third century B.C.E.), as the premier Daoist occult science. However, it was more limited in scope than Greco-Islamic alchemy, aiming at the single purpose of gaining immortality, that is, transforming a mortal into a divine being.

Alchemy gained prominence in medieval China owing to its earlier patronage by Qin Shi Huang (260–210 B.C.E.), the first emperor of a unified China. He wished to gain immortality and extend his personal rule indefinitely. One action in the effort to accomplish this was the dispatch of explorers in search of islands said in ancient myth to be inhabited by divine beings. Another action was the assembly of a committee of scholars whom the emperor commanded to produce an elixir of life that would make him immortal. The scholars decided that since gold is imperishable and since mercury is useful in refining gold, the emperor should consume large amounts of gold and mercury compounds (including the naturally occurring mineral cinnabar, or mercuric sulfide). This poisoned him, causing his mental impairment and premature death at age 50. Many later emperors held the same ambition and were likewise poisoned throughout the medieval period,

into the Ming Dynasty (1368–1644). Many of the alchemical theories produced during the time of the first emperor were collected and transmitted to the Middle Ages in the *Nei pian* (Inner Chapters), which was written in the early fourth century of the Common Era by the philosopher Ge Hong.

Medieval alchemical texts interpreted the first emperor's search for the land of the immortals as a symbolic expression of an inner journey of spiritual purification that the alchemist had to carry out together with purification of the body through such ascetic practices as long periods of fasting. Gold also was a metaphor for the purity found within the human spirit. Chinese tradition considered that all matter consisted of five elements—water, fire, wood, gold, and earth—and that these also constituted the human body, respectively corresponding to the kidneys, heart, liver, lungs, and stomach. Cinnabar was important in this system because its red col-

oration associated it with blood. If cinnabar is heated, pure mercury melts out of it, a transformation that was understood as expressing the possibility of physical rebirth through the alchemical manipulation of the body. Alchemists believed that ingesting cinnabar would reverse the effects of aging and purify the body until it was light enough to take flight. In this way, Chinese alchemy revolves around the manipulation of chi within the body. Chi, literally “steam,” is the vital breath that animates the body and is also the animating force of the whole cosmos. Purification consisted in properly balancing the chi. These same operative principles were the foundation for traditional Chinese medicine.

In Zen alchemy, developed after 1100, physical experiments upon metals and the ingestion of metallic drugs were dispensed with entirely. The transformations described in older alchemical texts were interpreted as taking place only within the alchemist's mind and spirit. The purification of intellectual gold could in this way be used to give birth to the elixir of life.

Astrology was a Greco-Arabic occult science imported into China in the Middle Ages. In its most spectacular application in China, the Buddhist monk Yi Xing (683–727) designed a water-powered armillary sphere, that is, a machine used to simulate the motions of the stars and planets. His design incorporated the invention of the escapement, a mechanical device that regulates the motion of a pendulum, allowing for precise clockwork movements. Similar mechanisms were not invented in Europe for another 500 years. This work was commissioned in 725 by the emperor Xuan Zong (685–762) to determine astrologically the best times for him to sleep with his wives and concubines so as to most likely produce male offspring.

Korea and Japan received overwhelming influence from Chinese culture. In certain instances ancient shamanic practices in these regions persisted unchanged, never having the chance to evolve in the face of already sophisticated Chinese religion and philosophy. Such practices were also preserved intentionally as a means of maintaining a separate national identity against Chinese influence. For instance, Shinto, the national religion of Japan, produced a new cult in 1279, the *Izuna shugen* (shamans of Mount Izuna). Followers of this cult sought to achieve magical effects by controlling fox spirits. The cult was widely patronized at the imperial court and by local feudal lords and was especially practiced by samurai, since the spirits in question were believed to bring luck in combat and to magically inspire skill in the martial arts.

The peoples of Australia and the Pacific islands did not have extensive contact with outsiders until the era of European exploration, well after the Middle Ages. Their religions remained essentially shamanic: individuals mediated their

Limestone guanyin, the Bodhisattva of Compassion with 11 heads; China, Tang Dynasty, ca. 703 (Freer Gallery of Art, Smithsonian Institution, gift of Charles Lang Freer)

own contact with a spirit world seen in dreams and manifest throughout all of reality. Early European anthropologists tried to use concepts from these cultures to find universal definitions of religion and magic, but that effort has generally been discredited because they relied on Western science's preconceptions. Many peoples in Polynesia, for instance, see the whole world as permeated by manna, a sort of divine energy that animates everything; to term this belief "magic" is a Western stereotyping of the native idea that does little or nothing to explain the concept within the context of the cultures where it existed.

## EUROPE

BY AMY HACKNEY BLACKWELL

Medieval Europeans believed in magic. They knew little of science and medicine, and in a complex and dangerous world magic seemed to be a reasonable explanation for natural phenomena. People were willing to do whatever they could to give themselves a sense of control over their lives. Doing so often meant wearing relics, taking herbs, and chanting incantations, at least. Some "magical" charms had real value; many herbs, for example, do have medicinal properties. Alchemists took basic village magical practice much further, studying the work of other scholars and performing experiments that blended science and magic.

Medieval Europeans engaged in many types of magical practices. They used charms or rituals to protect their homes and themselves or to create other effects. Many people believed in the power of relics—the physical remains of holy people, such as saints—to have physical effects on the living. Pieces of what were said to be the True Cross (the cross upon which Jesus was crucified), the finger bones of saints, and fragments of the clothing of holy people were popular items for sale in medieval markets. Many people purchased and wore charms to protect them from harm; these charms could be items of jewelry or the bone fragments of saints. People continued to visit sites that had been sacred in pre-Christian times; although these holy sites often took on Christian identities throughout much of the medieval era, for many people the separation of Christian and pre-Christian beliefs was only partial.

Villages frequently had residents who specialized in the use of herbal medicines and cures. These people were often women who worked as midwives and who were called on to treat various ailments. Although these "wise women" were respected for their healing abilities, they were sometimes held in suspicion for fear that their powers would allow them to do harm. During the late medieval period this suspicion often caused people to call these women witches. Because wise

*Red coral, popularly used to ward off ailments and for other magical purposes; Britain, ca. 1500 (© Museum of London)*

women were frequently widows living alone, they were vulnerable to this sort of persecution.

Wise women and village healers made ample use of herbs in both medicines and magic potions. Different herbs were said to have specific magical properties. Dill, for example, was thought to protect people from falling prey to witchcraft and from losing lawsuits. Some people hung sprigs of fennel over the doors of their houses to keep out witches. Garlic, it was believed, could keep away all manner of malevolent magical creatures, from vampires to snakes; it could also enhance courage and sexual performance. Some people took ginger in an effort to stave off old age. Henbane could cause hallucinations that people interpreted as visions from the spirit world; witches were said to use henbane to help them fly. Some people would put a new piece of horseradish in their purses every New Year's Eve as a way to keep from running out of money during the year.

Love potions were extremely popular during the medieval period. Herbalists, alchemists, wise women, and ordinary folk made love potions from all manner of herbs: Lovage, marigold, mallow, mustard, mint, radish, sage, valerian, hops, ginger, cloves, and basil were just a few of the substances that people consumed in order to inflame others with lust or to enhance their own sexual performance. Basil, so it was said, had the additional virtue of being useful for magically breeding scorpions.

The more scholarly form of medieval scientific and magical inquiry was alchemy. The word *alchemy* may have come from the Arabic term *al-kimiya*, meaning "the art of transformation," which itself derives from the ancient Greek word *khemeia*, meaning "cast together," which may be the etymological root of the word *chemistry*. Alchemists practiced their art throughout the ancient and medieval worlds. The most

proficient alchemists of the early medieval period practiced their art in the Middle East. Europeans discovered their works in the 1100s, when many Arabic texts and the works of the Greek philosopher Aristotle (384–322 B.C.E.) were translated into Latin. European scholars became captivated with alchemical ideas, such as the concept that all substances could transform into a more pure and perfect state.

Medieval European alchemists pursued their goals using a combination of techniques, some of them not very different from modern scientific observation and others derived from mysticism, tradition, and magic. Alchemists sought several things. They are perhaps best known for their efforts to transform base metals (ordinary metals, such as iron) into gold. They also tried to brew a potion called a panacea, or a cure-all, that would restore youth, prolong life, and cure all diseases. Although these goals were impossible to achieve, medieval alchemists did accomplish a great deal of scientific inquiry that paved the way for the development of the modern fields of chemistry, physics, and metallurgy. Alchemical experiments resulted in the creation of dyes and pigments, the invention of different types of acid and other chemical compounds, insights into the properties of metals, and techniques for brewing various types of alcoholic beverages.

Alchemists were hampered in their pursuits by their lack of understanding of the properties of matter. They believed that all matter was made up of four elements: fire, water, air, and earth. This belief derived from the teachings of Aristotle. Alchemists theorized that each element was either hot or cold and wet or dry and that each metal had all of these properties. They reasoned that if they could rearrange these properties within a metal, they could transform it into a different kind of metal, ideally gold. Many alchemists believed that the transmutation of ordinary metals, such as lead, into gold could be facilitated by using a substance called the philosopher's stone. No one knows exactly what the philosopher's stone was, though it seems to have been imagined in powder form.

Alchemists tended to love secrecy and symbols. The foundations of their work were spiritual as well as physical, and much of their scholarship was based on mythology and mysticism. They also used astrology to explain physical phenomena. Consequently, the writings of alchemists were full of multiple meanings and cryptic suggestions, making them appear magical to the uneducated.

Many of the best-known scholars of medieval Europe were alchemists. Most of them were members of the clergy, mainly because the clergy were nearly the only people who knew how to read and who had access to books. The first scholars to venture into this field started with Arabic works on science and mathematics. Pope Sylvester II (ca. 945–1003) studied Arabic texts on science, mathematics, and astrology

## NON-CHRISTIAN INCANTATIONS

Magical incantations or spells were common throughout medieval Europe. If a person wanted to achieve some result, such as bringing rain or making someone fall in love, he or she could probably find a series of words that, if spoken with the correct gestures and at the right moment, would have the desired effect. Although Christianity was widespread in medieval Europe, people saw no impediment to using charms and spells in addition to officially sanctioned prayers. The fact that an incantation might go against Christian doctrine apparently did not stand in the way.

Most incantations were passed on orally because most medieval people could not read or write. Some incantations, however, did survive because they were written down. For one reason or another, occasionally a priest or a monk would write down the words of local spells. Some of these manuscripts survive today. One of the most interesting of these manuscripts is the one that contains the Merseburg Incantations. These manuscripts, found in Germany, describe spells to free prisoners and to cure horses of broken legs. What is intriguing about the Merseburg Incantations is that they invoke the names of ancient Germanic gods, including Odin, Freya, and the Valkyries. Most medieval incantations, if they mentioned the divine at all, would have invoked the Christian god, Mary, or some other inarguably Christian figure. The Merseburg Incantations were composed in pre-Christian times, sometime before 750. The fact that a Christian cleric chose to write them down 300 or 400 years later suggests that people were still using these particular spells, Germanic deities and all, in an era when Christianity was supposedly supreme.

in Spain and introduced them into Europe. He was said to be a sorcerer. The English scholar Adelard of Bath traveled throughout the Arab world in the early 12th century and brought back with him several Arabic texts on astronomy and mathematics. By the late 12th century the works of Arabic scholars and Aristotle were more readily available to Europeans. Albertus Magnus (ca. 1200–80) supported the coexistence of science and religion. He was an excellent scientist for his time and wrote a great deal about botany, zoology, astronomy, and other topics, including music, particularly the way in which music could purify the soul. His work on astrology gave him the reputation of being a magician.

The most important of the medieval alchemists was Roger Bacon (ca. 1220–92), also called Doctor Mirabilis, or “wonderful teacher.” He was an English Franciscan friar who worked as a professor at Oxford and the University of Paris. He performed numerous scientific experiments and formed many ideas that he describes in his book *Opus majus* (Greater Work, 1268). This book covers scientific and mystical topics, including the influence of the planets on human life, the visible spectrum of light, and the chemistry of gunpowder. Bacon’s work influenced all subsequent European alchemists.

Alchemists of the 14th and 15th centuries were more like magicians than scientists. In their writings they generally assemble the work of earlier scholars rather than conducting and reporting on new experiments themselves. Their main interests were finding the philosopher’s stone and the elixir of youth. Many of them were persecuted as witches or sorcerers who were said to work against good Christian practices. Nicholas Flamel (ca. 1330–1417) spent his life searching for the philosopher’s stone and claimed to have discovered it through a copy of the Book of Abraham that he purchased in Spain. He said that he could indeed turn base metals into gold and also claimed that he and his wife had achieved immortality. The German alchemist Heinrich Cornelius Agrippa von Nettesheim (1486–1535) wrote a treatise called *Libri tres de occulta philosophia* (Three Books on Occult Philosophy, 1531), in which he describes the interaction of the natural world and the occult. Philippus Aureolus Paracelsus (1493–1541) is credited with transforming medieval alchemy into a more modern science and rejecting the image of the alchemist as a magician.

Church officials began taking a narrow view of witches and sorcerers in the early 1300s. Around this time magic, alchemy, and witchcraft became associated with Christian heresy. Many were accused of consorting with demons. Both alchemists and so-called witches used secret symbols and incantations in their work, giving rise to the suspicion that they had entered into pacts with the devil. Pope John XXII (1249–1334) issued an edict in 1326 forbidding priests and monks to practice alchemy. During the 14th century several people were tried for witchcraft or sorcery in France and Italy. Witch trials began occurring in England in the early 15th century. European witches were not persecuted on a major scale until the end of the medieval period. The first large European witch hunt occurred in Switzerland in 1427. The German book *Malleus maleficarum* (The Hammer of Witches), by Heinrich Kramer and Jacob Sprenger, was published in Germany in 1486 and became the scholarly basis for subsequent prosecution of witches. The height of the witch craze actually occurred during the early modern period, between 1580 and 1660.

## THE ISLAMIC WORLD

BY DANIEL NICOLAE

Alchemy and magic are often named together in medieval Islamic treatises even though they are two different concepts. Alchemy generally denotes the science of transmuting base metals into gold, while magic could apply to nearly anything wondrous. Alchemy, as the precursor of modern chemistry, was a science of the laboratory, and its practice was thus not as widespread among the general population as were magical practices. Both terms, however, have a common reference to secret sciences. Moreover, they are used as polemical terms against heresies in general.

The hermetic tradition of late antiquity notably influenced alchemy and magic practiced among Muslims. Alchemy originated among the Greeks, and Arabic alchemical treatises generally aim to imitate their Greek models. Muslim alchemists tried to attract attention by using pseudonyms such as Hippocrates, Plato, or Aristotle. As for magical artifacts, pre-Islamic mystical imagery featuring lions, serpents, and scorpions can be found on talismans. Yet magic after the rise of Islam differed in many aspects, such as in the abandoning of animal sacrifice, the use of curse tablets, or the use of dolls to destroy the enemy.

The Koran and the sayings of the Prophet (hadith) depict a strict monotheism and do not admit the existence of powers other than those of God. Magic is strictly forbidden. Nonetheless, the scriptures give credibility to supernatural forces other than God. The Koran concludes with two suras (or chapters) that are frequently used among the common people to protect themselves from evil forces. Sura 113 mentions the Semitic magical practice of blowing upon knots made in a certain fashion to tie good or evil. One hadith records that someone bewitched the Prophet using this method and that he would recover only after having recited suras 113 and 114. In the same way, the first sura is used as a talisman; like the other two, it is written on paper, cloth, or stone to be carried on one’s body. In medical literature these suras would be applied in the treatment of illnesses caused by evil forces, particularly in the practice of exorcism.

The Koran alludes to an origin of magic according to which two angels, Harut and Marut, were condemned by God to live on the earth, because they had fallen in love with a woman. Out of malice they then taught humankind the practice of magic. Moreover, we find accusations by the enemies of Islam that Muhammad himself was a magician, since he captured the masses through his rhetorical skills.

Most Islamic amulets and talismanic objects took the form of pious invocations to God, comprising prayers or Koranic quotations. In this respect they differed substantially

Stone-paste cup in the shape of a harpy (Iran, late 12th or early 13th century); the harpy, a mythical bird with the head of a woman, features in many contexts as a creature with magical powers and otherworldly associations. (© The Trustees of the British Museum)

from pre-Islamic magic and enchantment as practiced in Europe because Islamic invocations most often addressed God or his intercessors instead of demons. Invocations usually employed the 99 beautiful names of God or names of angels to protect the bearer. Nevertheless, the use of magical symbols of pre-Islamic origin continued. Quite common was a row of seven magic symbols that represented the sigla, or scribal abbreviations, of God's holy name and included images such as the five-pointed star. Magic writing was another common feature, and entire treatises were devoted to magical alphabets or alphabets of earlier cultures. Through the supernatural properties of letters, magic writing was believed to control jinn (a certain class of spirit beings), and amulets or talismans were commonly used to ward off misfortune or the evil eye that was elicited by the envy of other people.

Also popular among the literate and illiterate masses were other magical implements, such as bowls, shirts, mirrors, and padlocks. In the 12th century C.E. interest in magic notably increased, and magical medicinal bowls were produced in considerable quantity. In contrast to pre-Islamic bowls, Islamic bowls were metallic and were not concerned with the supremacy of jinn and demons. The bowls were usually imprinted with either recipes or specific therapeutic instructions. Alternatively, they could have been decorated with Koranic verses, magical writing, and human or animal forms. There are also some preserved magic shirts dating back to the 15th century C.E., which have imprinted mystical symbols and verses from the Koran. Such shirts were worn to

cure fever or to aid the birth of a child. Also produced were magic mirrors that had talismanic designs engraved on the surface and padlocks that could be placed on sacred sites like the tombs of saints to indicate that a certain vow had been taken there.

Mystical and magical interpretation of letters and numbers was considered a legitimate study by virtually all medieval scholars. The most prominent form is the magic square, particularly after the 12th century C.E. The earliest magic square, possibly of Chinese origin, was a three-by-three square consisting of nine cells. In Semitic languages every letter equates with a number, and in the magic square letters were arranged so that every row and every column as well as the two diagonals would sum up to 15. The magical properties of this square were thought to be extremely powerful, and its very name (*buduh*) acquired its own occult potency.

Unlike magical practices that were recognized in the time of the prophet Muhammad, treatises on alchemy only developed in the ninth century C.E. They were especially influenced by the movement during which many Greek texts on philosophy and medicine were translated into Arabic. In contrast to magical practices, the influence of God or scripture was not deployed, but instead philosophical and chemical reasoning. Alchemists would argue that there existed various sorts of metals but that they were not fundamentally different. Their accidents, or properties, were subject to change, as could be seen in nature where metals grow in the bowels of the earth and become gold after a long time. The alchemist proposed to hasten this process and to achieve by his skill in one day that for which nature needs a thousand years. In alchemical literature we therefore find many different recipes for making gold. The most important and recommended method consisted of mixing an elixir that permeated the base metal and transmuted it into gold. The famous Muslim philosopher al-Farabi (ca. 878–ca. 950 C.E.) was of the opinion that such a transmutation was actually possible. Later philosophers and theologians, however, criticized this art, because it was seen as magic rivaling the omnipotence of God. Moreover, it would ruin the economy, since gold in abundant quantity would diminish its value.

Several Arabic treatises were dedicated to alchemy and magic. Jabir ibn Hayyan (ca. 721–ca. 815 C.E.) is considered to be the father of alchemy and magic. Up to the 10th century C.E. many treatises, commonly referred to as the *Corpus Gabirianum*, had been composed under his name, and it is difficult to determine what really was written by him. The corpus introduced an amalgamation of different religious thoughts, mostly of an esoteric nature. Such mixing of ideas was in vogue in the ninth century C.E. Shiism, a branch of Islam, proclaimed that a new imam (a spiritual leader) would

come to abolish the law of Islam and replace the revelation of the Koran by the light of Greek sciences and philosophy, among them alchemy and magic. The *Corpus Gabirianum* considerably influenced the development of later Arab alchemy, and its parts were frequently translated into Latin.

The writings of Ibn Wahshiyyah (fl. ca. 900 C.E.) were important to the development of alchemy and magic; he compiled a famous collection of cryptic alphabets later used in esoteric works and talismanic art. His works can be seen as successive rewritings and revisions of scientific and pseudoscientific materials surviving from antiquity, preserved, amplified, and modified by Syrian and Alexandrian Hellenism. Around this same time an unknown author wrote *Turba philosophorum* (Assembly of the Philosophers), which depicts a congress of alchemists with Pythagoras leading the congregation and pre-Socratic philosophers presenting their doctrines.

More than a century later, around 1200 C.E., the *Ghayat al-hakim* (The Aim of the Sage), commonly known as the *Picatrix* (possibly referring to Hippocrates), was written in al-Andalus and was falsely attributed to al-Majriti, a famous mathematician. A compendium of numerous magical and alchemical recipes, descriptions of magical instruments, and astrological theories, *Picatrix* is one of the most widespread treatises on alchemy and magic. Moreover, the work tries to prove magic and alchemy by the philosophical teachings of the Greeks. Another important work on magic was *Shams al-maarif al-kubra* (Sun of the Great Knowledge), which was written by the mystic Ahmad ibn Ali ibn Yusuf al-Buni (d. 1225 C.E.). His writings exerted considerable influence on the later theory of letter magic and magical squares.

## ► architecture

### INTRODUCTION

Architecture is a human activity that combines a number of fields, including art, design, geometry, engineering, construction, and materials science (the science that studies the properties of materials, such as their strength and durability). Architects draw on their knowledge of these fields to create structures for human use. Throughout the medieval world these structures included not only homes and castles but also a great many public buildings, including government buildings, palaces, and edifices used for religious purposes.

Much of the architecture from the medieval period served religious purposes. For example, some of the earliest architecture in medieval Europe was built in Ireland and included monasteries, bell towers, monumental crosses, and other structures that served ecclesiastical purposes. These Irish monasteries, often built on sacred sites, were centers of worship and learning. They were homes for priests and nuns and places of pilgrimage because they housed holy relics.

As the medieval period unfolded, cities, towns, and villages across northern and western Europe, including regions that had been part of the ancient Roman Empire, became the sites of magnificent churches and cathedrals. These buildings often enhanced the prestige of a local duke or other noble, who funded their construction as a way of asserting his power and authority. The nobility also constructed fortified castles,

which were both homes and military fortresses, and, again, enhanced the prestige of their owners. In Europe early medieval architecture often continued to reflect the building styles of ancient Rome and therefore is called Romanesque architecture. The Romanesque style was later replaced by the Gothic style; over the centuries, however, many buildings had to be refurbished or expanded, so many reflect both of these styles.

Architecture served religious purposes in other parts of the world as well. In medieval China pagodas—built to look like mountains ascending to heaven—reflected a Buddhist influence. Similarly, in India numerous cave temples and monasteries were built under the influence of Hinduism. Many of these cave temples were carved out of the rock rather than built with individual stones. Stupas were stone structures built to honor the Buddha. In Burma (now called Myanmar), some 13,000 temples were built, and in Cambodia the magnificent temple called Angkor Wat remains as a monument to Asian architecture.

At the same time, Africa constructed numerous religious edifices. Among the most prominent are the monasteries of Lalibela in Ethiopia, built by the Ethiopian king of the same name who wanted his city to be a major religious center. Lalibela is particularly known for its dozen churches hewn out of rock. The city is also home to numerous chapels and other religious structures, all fashioned and arranged to reflect the major events of Christianity in the Holy Land of the Middle East. Meanwhile, as Islam spread throughout the Middle East, North Africa, Asia, and southern Europe as far as Spain, its adherents constructed numerous mosques, along with hospitals, schools, and other structures, all designed to give honor to Allah, the God of Islam. In the Americas, particularly in Mesoamerica and South America, great temple-pyramids were built.

Not all medieval architecture, of course, served religious purposes. A great deal of architectural skill was applied to government and other public buildings—and to what today would be called urban planning. Few such buildings could be found in North America, but Mesoamerica and South America were the sites of numerous palaces and palace complexes that served government and administrative purposes. The Maya of Mesoamerica, for example, were noted for their architectural achievements in such places as the Yucatán Peninsula, Belize, Guatemala, parts of Honduras, El Salvador, and the Mexican states of Chiapas and Tabasco. Mayan architecture features large, stepped platforms topped by stone structures; one-story palaces that were administrative centers or royal residences. Later, both the Aztec in Mesoamerica and the Inca of South America built large and impressive stone structures for these purposes. Similar public structures can be found in Africa, such as the Palace at Ife in Nigeria. In Asia

the Chinese built numerous palaces and other public buildings as imperial centers.

The medieval period saw the emergence of distinctive styles of architecture and the development of new architectural techniques. In the early centuries of the period the Romanesque style was marked by rounded arches, thick walls to support the arches, barrel vaults, and cross-shaped piers. Later, the Gothic style made use of innovative techniques such as the pointed arch, ribbed vaults, and the flying buttress. Many churches and other buildings throughout Europe reflect both styles because Romanesque buildings were later expanded or portions of them were rebuilt.

Asia, too, developed distinctive architectural styles, which were found not only in public buildings but in homes as well. Chinese architects relied primarily on wood rather than stone. Thus, Chinese buildings, from small homes to grand imperial palaces, tended to be frame structures, so that the load-bearing parts were frames consisting of posts with beams laid across. Walls rarely bore any weight other than their own, which meant that builders could experiment with materials and ornamentation. Also, posts needed to be thick and sturdy, and the interiors of large buildings often needed many posts to bear the weight not only of the stories above but of the typically very heavy Chinese roof. Other Asian countries, such as Japan and India, made use of Chinese styles and techniques but adapted them to their own tastes. In contrast, the Mesoamericans, like the Europeans, relied on stone. The city of Teotihuacán influenced the development of architecture throughout Mesoamerica, especially through the talud-tablero style. This architectural technique is often used in pyramid construction, where a platform (talud) sits on and juts over a sloping wall (tablero).

Ornamentation became important to the architecture of many parts of the medieval world. In Europe this ornamentation typically took the form of iconography, referring to statues, paintings, and stained-glass windows that depicted important people and events in the history of Christianity. In the Islamic world, though, depiction of human figures was generally forbidden in many contexts, so Islamic architects relied on abstract geometric designs and intricate mosaics to ornament their buildings. Throughout the world, formal gardens and landscape architecture added beauty to the functionality of buildings.

## AFRICA

BY BRADLEY SKEEN

The architecture of the Nile Valley and Ethiopian plateau saw dynamic development and the transformation of tradition into new forms. Over most of the continent architectural

forms did not change among peoples who continued their ancient way of life as hunter-gatherers or farmers. Cities grew up in western Africa as a result of increased economic activity triggered by trade with the Islamic world, requiring new styles of architecture. Southern Africa saw one of the world's great architectural mysteries appear in the form of the stone buildings called Great Zimbabwe.

## EGYPT

Apart from the Islamic conquerors of Egypt, most important architectural works in the Nile Valley were undertaken by the Coptic Orthodox Church (separated from the Greek Orthodox Church on theological and liturgical grounds since late antiquity). The chief architectural invention of medieval Egypt was the monastery. The spiritual example of monks living lives of ascetic renunciation in the desert had been a leading factor in converting the masses of the Egyptian population to Christianity. Originally, monks had lived completely alone in the open air or in caves. A typical form of architectural construction in this period was the cenobitic cell, an artificial cave hollowed out in a hillside with the entrance bricked up, in which a religious ascetic lived. The hermits often lived inside for years with only a little food and drink brought to them by followers.

The systematic construction of monasteries began in the early fourth century with the circle of followers attached to Saint Anthony at Wadi Natrun in the Western Desert and the community of Saint Pachomius at Tabennisi in Upper Egypt. As Christianity became the dominant religion in the fourth and fifth centuries C.E. and the number of monks swelled, they came together in communities that lived collectively in monasteries under the authority of an abbot. Monks no longer built their own cells, but the new monasteries were constructed by monks coming together as a workforce under the abbot's direction. From an architectural viewpoint, these structures remained as simple as possible. Originally they would have been groupings of huts, perhaps with an enclosing wall, or bare brick buildings divided into cells for the individual monks. Cenobitic cells continued in use for the more solitary members of the communities on the outskirts of monasteries well into the eighth century. Additional buildings were added, such as guesthouses for pilgrims; buildings that could be used as a refectory (a hall for dining) or an office; and, surprisingly rarely, a church. (Monks of this early period were not usually ordained priests.) There were more than 7,000 monasteries in Egypt at the time of the Islamic conquest (639 C.E.).

One of the most important early monasteries was that of Saint Jeremias, founded about 475 C.E. It was built at Saqqara, a funerary complex outside Memphis (just south of the Nile

Delta) which had been used as a royal cemetery since about 3000 B.C.E. The site was purposely chosen to give the message through the buildings themselves that the old religion of Egypt had been overcome and replaced by Christianity. The main church at Saqqara had originally been a single-room structure of mud bricks. This was incorporated as the entrance hall for the new church that was built about 600 C.E. It took the form of a large basilica, meaning that it was a monumental building featuring a central isle with rows of columns on either side leading up to the altar and an apse behind it. On either side of the columns were smaller chapels, in this case unusually sunken into the ground at a lower level than the rest of the floor. Much of the building material, including entire columns, had been stripped from tombs in the nearby ancient cemetery.

The monks here used cells that were simply rows of adjacent rooms inside a large building. These cells, and the refectory, were extensively decorated with wall paintings (though none are well preserved). Many cells were decorated with simple geometric designs or blank fields of red paint, but others employed figurative paintings of Jesus and Mary in their theological roles as Pantokrator (Ruler of the Universe), Theotokos (Mother of God) and the like. Still other cells were decorated with wall paintings simulating veined marble and other stones used in the most prestigious and opulent architectural projects. The refectory seems to have been decorated with a series of saints' portraits. Saqqara flourished in the first few centuries of the Islamic conquest but was abandoned in the ninth century.

Many monasteries underwent architectural transformations in the Middle Ages. For instance, the Monastery of Saint Anthony, founded in 356 C.E. at the site believed to be the saint's grave at the foot of Al-Qalzam Mountain near Al Zaafarana, became important only after the Islamic conquest of Egypt (seventh century) because many monks of monasteries in the Nile Valley fled there seeking refuge in the remote mountains overlooking the Red Sea from attacks by Islamic tribesmen. Partially destroyed in the 11th century, however, even Saint Anthony's had to be reconstructed as a fortress to protect it from more organized attacks and raids. Nevertheless, it was captured and looted several times during the Middle Ages. The buildings of the monastery, including its immense walls and five separate churches, were made of mud brick (adobe). Constructed at various times throughout the Middle Ages, they imitate contemporary church architecture of more conventional structures made of stone, ranging from Byzantine styles marked by towers and other structures capped by squat domes to slender Gothic bell towers.

In the cities of Egypt many older Graeco-Roman and Egyptian temples were seized and converted into churches

during the long process of conversion to Christianity in late antiquity and the early Middle Ages (fourth to sixth centuries), but many churches were also specially built. They tended to follow the standard basilica plan of most churches elsewhere in the Byzantine world. Church building went on in the early Islamic period with little alteration except the adoption of an architectural plan with Syrian features. The eighth-century church of Saint Sergius (believed to have been built on the spot where the Joseph and Mary and the child Jesus lived after the flight into Egypt) in the Muslim-founded city of Cairo incorporated a scheme with three apses behind and to either side of the altar at the rear of the basilica. In the later Middle Ages, Coptic Church architecture actually became more complex, replacing flat roofs with systems of barrel vaults and domes, as in the Church of Theodore the Commander at Cairo (dating to the 13th century). Just as the Coptic Church had seized traditional temples and reused the architectural elements of destroyed temples and tombs to signify their triumph over the “pagan” past, once Christianity became a disadvantaged minority in Egypt, church architecture and design generally avoided artistic influences from Islamic styles to reinforce the Coptic community’s separate identity.

## ETHIOPIA

The medieval monarchy of Ethiopia traced its descent to the kingdom of Axum, which had controlled the upper Nile Valley and the mouth of the Red Sea between the second and ninth centuries C.E. Axum had developed a unique architectural style. Monumental buildings tended to be erected on top of a stepped base of stone slabs. The structures were built of roughly cut stone blocks and fitted with wooden fixtures. The buildings were simple cubes or solid rectangles with little decoration, and if they consisted of several stories, the floors and stairs and so on were built entirely of wood. Decorative elaboration, if any, tended to be a simple pattern of recessed and projecting stonework on the facades.

A good example of this kind of architecture is the complex at Dungar in the southwestern quarter of the city of Axum proper, built between the sixth and seventh centuries. The foundation covers some 3,588 square yards. The structure might have been the house of an elite family or the rectory for a nearby group of churches. It seems to imitate the architecture of older imperial palaces. The main building comprises a group of living quarters. There are also a number of separate enclosed courtyards. Outbuildings consisted of a large kitchen and a Roman-style heated bath. The state of preservation of numerous other buildings on the same foundation is too poor to determine their purpose. This style of building, especially for the construction of churches, continued to be

used in Ethiopia long after the collapse of the Axum as an empire.

The characteristic boxy style of Axumite architecture coupled with their being carved directly into rock faces in situ or into the faces of enormous quarried stones may well have derived from the architecture of the Arabian city of Petra, where there is an enormous tomb complex (dating to the second century) carved into a cliff face, with each tomb resembling the facade of a freestanding building. Another factor that has to be considered in the development of Ethiopian architecture is the tradition of megalithic art common in the mountainous regions of Eritrea and southern Ethiopia. In these areas large stones were commonly erected for what archaeologists believe were funerary purposes. Many thousands of these stones, up to 9 yards tall, were erected between 1500 B.C.E. and 1200 C.E. Most are simple undressed stones while many are carved either into the shape of a phallus or a rough representation of a human being. A few are inscribed with representations of swords, weapons, human beings, or unintelligible symbols.

Axumite masons were remarkably skilled at dressing stone. Where conditions permitted—such as in the Ethiopian highlands with the construction of fortresses among outcroppings—masons could adopt their traditional style of architecture such that an entire building could be carved in place from a single stone. In the fourth century the masons began to quarry exceptionally large granite blocks to create stelae up to 36 yards high, possibly the largest single pieces of stone ever cut. The largest of these stelae were carved to resemble the outer walls of buildings, complete with false windows, doors, and bands representing stories or courses. These structures may have symbolized or perhaps been believed to function as the afterlife dwelling of the dead kings in whose honor they were erected. All of these traditions would be combined in a medieval renaissance of Ethiopian architecture.

Medieval Ethiopia also inherited the tradition of Byzantine church architecture. Once Axum converted to Christianity in 340, Ethiopia seems to have been in contact with Syrian Christians more than with the Coptic Church in Egypt. The oldest extant Christian Church in Ethiopia is the church of the Ethiopian saint Abuna Aragawi inside the walls of the Debre Damo monastery in Tigray Province in the northeast of the country. Its floor plan is a Byzantine basilica with a typically Syrian rounded apse under a small dome. There is a miniature copy of a Roman triumphal arch located between the nave and the apse, but the decorative scheme is inherited from Axumite architecture, especially the wooden coffered ceiling decorated with various carved animals that may have been salvaged from one of the old royal palaces in Axum.

While the city of Axum lost its position as the capital of a great empire, it was still venerated as the place of coronation for Ethiopian emperors. Thus, Axum's monumental architecture would have been well known to Ethiopian rulers, even as their country became an increasingly inward looking and rural civilization. The rock-carving tradition reached a new height in the form of entire churches carved out of natural rock outcroppings under the patronage of the Ethiopian emperor Gebre Mesqel Lalibela (r. 1189–1229), a saint in the Ethiopian Orthodox Church. According to Ethiopian tradition, Lalibela was responsible for building all the churches; some, however, appear to be reused Axumite structures, while others may have been built by his successors.

According to the Ethiopian hagiographical life of Lalibela, Lalibela had gone on a pilgrimage to Jerusalem in his youth while the city was controlled by the Christian crusaders. When Jerusalem was recaptured by the Islamic sultan Saladin in 1187, Lalibela, inspired by a dream, decided to build a new city of Jerusalem. He chose for its site his own birthplace, the town of Roha, which he renamed after himself. He made many superficial connections between the new city, which became the capital of Ethiopia for the next century, and Jerusalem, including renaming the local stream the Jordan and a nearby hill the Mount of Olives. But the architecture of the new Jerusalem was wholly Ethiopian and principally consists of 11 churches carved out of solid rock.

The construction procedure for such a church started with a large rock outcropping whose upper surface would become the roof of the building. Trenches were cut down through the rock to relieve the exterior walls of the building, which was left as a large, solid stone cube inside a deep pit. Then windows were cut and the interior of the structure chiseled out and removed. The outer walls were finally carved in detail to resemble the architectural features of conventional buildings built out of dressed stone blocks. This procedure is actually very close to the Axumite royal funeral stelae, which were large, solid pieces of stone carved to resemble buildings, but in this case carried further to actually hollow out the inside to allow them to be used as functioning buildings. There is some evidence also that at least three of the churches (Merkorios, Gabriel-Rufael, and Danagel) had originally been built in this fashion for use as fortresses by Axum several centuries earlier, at the height of that kingdom's power. In that case, Lalibela would have been inspired in his plan for the city in part by these already-existing structures, making a direct link with Axumite architecture. There are, however, hundreds of rock-cut churches in Ethiopia, mostly small single-room chapels, dating as far back as the 10th century; none compares in scale and complexity to Lalibela's. Excavating Lalibela's churches must have occupied a large force of stonemasons for many

years, though the life of Lalibela records that the work was done by an army of angels.

The churches are usually categorized into four divisions: the Northern Group, the Western Group, the Eastern Group, and the monasteries. In the Northern Group, Bete Medhane Alem (House of the Savior of the World), a regular basilica consisting of five aisles, is the largest monolithic structure in the world (at almost 45 yards high or, rather, deep). It was probably modeled on the Maryam Seyon (Mary of Zion) cathedral at Axum, which was destroyed in the 16th century. This group includes Bete Maryam (House of Saint Mary), Bete Dabra Sina (House of Mount Sinai), and Bete Golgotha (named for the site of Christ's crucifixion in Jerusalem), which contains life-sized wall carvings of saints and a tomb, possibly that of the emperor Lalibela himself. Bete Golgotha comprises the Selasse (Trinity) Chapel and a small monolith called Adam's Tomb. It has three monolithic altars decorated with low-relief carvings that recall the megalithic art of rural Ethiopia.

In the Western Group, Bete Giyorgis (House of Saint George) is often considered the most spectacular for its unique cruciform floor plan. The structure is cut 13 yards be-

*Painted wooden lion's head (architectural element); Qasr Ibrim, Nubia, seventh to 10th centuries* © The Trustees of the British Museum

low ground level. Its decorative roof pattern is three equilateral crosses, and the pointed-arch windows are derived from Islamic architecture.

The Eastern Group consists of Bete Amanuel (House of Emanuel), possibly the former royal chapel; Bete Merkorios (House of Saint Mercurios), which may have originally been an Axumite prison; the cavelike Bete Abba Libanos (House of the Abbot Libanos); and Bete Gabriel-Rufael (House of the Archangels), which may have originally been Lalibela's palace. Farther from the center of Lalibela lie two churches built within caves, Makina Madhane Alem (Church of the Redeemer) and Yemrehana Krestos (named for an emperor of Ethiopia), and the two monasteries Debre Damo and Ashetan Maryam.

### SUB-SAHARAN AFRICA

Monumental architecture is generally lacking in southern Africa, aside from areas that became part of the Islamic cultural sphere. Local cultures that were seminomadic and based their subsistence on hunting and gathering or on agriculture had no need for grand structures and no way to build them. The typical building was a dwelling for either a nuclear or extended family. These structures would range from a simple roof of thatch-work leaves over bare earth, a floor of thatched mats, or a more permanent foundation of mud bricks or clay.

Traditional architecture in western Africa reached a height of sophistication in the main Yoruba city of Ife (in northeastern Nigeria) after 800 and especially between 1200 and 1400. There, ordinary domestic architecture took the form of square houses built of dried clay with thatched roofs around open courtyards. Additional thatching extended partially over the courtyard to provide shade. Individual rooms each housed a nuclear family in a multigenerational household. The main feature of interest is the courtyard floors, which were paved in elaborate designs with small stones and pieces of broken pottery. Even royal palaces followed this basic pattern, differing mainly in size and in the elaboration of carving of the wooden doors and posts supporting the roofs.

Towns and cities were surrounded by massive mud-brick walls. The Ashanti architecture of Ghana was similar, in that buildings were mostly mud based (adobe) and organized around central courtyards. However, they were often finished in mud plaster and decorated with murals. The shrine at Bawjwiasi, for instance, had walls built of wattle and daub and painted with spectacular animal designs. Specially cut palm leaves on the roof provided further decoration. Another feature of many traditions of western African architecture was a type of large mud-brick cone related to the ancestor worship important in indigenous religions. These cones may be seen as precursors to the spectacular mosques of Sahelian

architecture at Djenné (in present-day Mali), begun in 1240 and at the slightly later Sankore Mosque in Timbuktu.

Most of central Africa was populated in the Middle Ages by Bantu-speaking peoples. By 800–900, those in southern Africa (modern-day Botswana and Zimbabwe) lived by herding cattle and seem to have been organized under a hierarchical social control exercised by chiefs or other authorities from defensible hilltop positions. This culture—that of the Shona people—was the background from which emerged the civilization known as Great Zimbabwe.

Zimbabwe means “walled enclosure” in the Shona language, and the name Great Zimbabwe is applied to the center of a civilization that flourished between about 1250 and 1450 in present-day Zimbabwe. The city of Great Zimbabwe reached a population of as much as 18,000 immediately before its sudden abandonment in 1450. It is surrounded (at a distance of up to 125 miles) by lesser “Zimbabwes,” comprising settlements of a few hundred to a few thousand people. The civilization probably collapsed because it could not develop new forms of urban infrastructure and agricultural production to support its unprecedented (for the area) concentration of population. The principal architectural feature of the central site is its monumental enclosing walls. Its European discoverers fantasized that these extensive ruins of large masonry walls in the interior of Africa must be the lost city of the Queen of Sheba of biblical fame. Every effort was made, for political reasons, to argue that it had been built by anyone other than native Africans. In fact, the ruins are obviously those of a city whose architecture was an extension of African traditional building; as such, they are not comparable to city walls common in European and other civilizations but served a quite different architectural purpose.

On a site of more than 1,800 acres were three sets of enclosing walls. The most important set of walls comprised the Great Enclosure itself, which is believed to have been the seat of government for the whole region; others enclosed elite residences or perhaps treasuries or processing centers related to the gold trade that seems to have been the economic basis of the community. These walls and their architectural purpose are quite singular.

It is clear that the style of stonework in the walls and other buildings is unrelated to that found anywhere else in the world but evolved from older and simpler structures that had been built in that area for several centuries before the creation of the urban center. Wall construction dates from various times over the whole life of Great Zimbabwe and became more sophisticated as time passed. The ashlar, or stone blocks, were quarried from nearby hills whose granite had the property of naturally breaking into slabs 4 to 8 inches thick, which could easily be divided into usable pieces. The basic

technique was to lay the ashlar on top of the earth without a foundation, forming two parallel walls that would be stepped back as they were built up. The hollow space between was filled in with larger slabs and rubble. Originally, the ashlar were left very rough, and the course of the walls was sinuous and sometimes incorporated boulders that happened to be lying on the site. By 1400, however, the ashlar were very finely worked, and great care was taken in fitting together pieces of appropriate sizes to make tight joints.

In earlier walls, doorways were rectangular, whereas for later ones the masons had learned how to make the sides of the doorways rounded. At no time was any kind of mortar used to hold the ashlar together; hence, the technique is known as drystone masonry. The latest work produced walls that were 12 yards high on a base half that thick. The tops of the walls were decorated with turret-like bases for upright posts of wood or soft stone; they may have been carved for decorative purposes, but none have survived. The enclosures were not simply ringed by walls; they were subdivided by interior walls into separate courtyards and plazas. One of the walls of the Great Enclosure also contained a tower generally called the Elliptical Building, which rose up to twice the height of the surrounding walls. Its purpose is unknown.

Walls like these would not have been suitable for any military purpose, such as protecting a city. They also did not support roofs, so they were not exterior walls of traditional buildings. In fact, the city lay outside the walled enclosures. The external areas had housing sufficient for as many as 18,000 people by 1450, when the civilization collapsed. The huts consisted of low adobe walls worked to a molded decorative finish and painted, with thatched roofs. The areas inside the enclosures consisted of essentially identical huts sufficient for only a few families. Other structures inside the walls included altars of granite slabs covered in clay (though this facing does not survive except as traces, it would probably have been painted and decorated) as well as raised stone platforms used for the display of various objects, perhaps cult statues or other sacred objects.

Just as they served no defensive purposes, walls on this scale could not simply have been for privacy or shelter. Great Zimbabwe probably began as a religious center with stone walls used to mark off sacred space. As the wealth of the society grew, its resources were invested in creating mammoth stone walls to establish the elite status of the ruling kings or priests. The function of the walls was to define status within the society: inside were the powerful and the sacred and outside the ruled and the profane. The walls served the purpose of demonstrating the power of those who could divert a great part of the culture's wealth to purposes of display. If we compare the walls of the Great Enclosure with the architecture

of other cultures, they are not at all like defensive city walls (though the first Europeans to see them in the 16th century naturally thought of them as belonging to the class of city walls with which they were familiar) but more nearly like the walls of a palace or cathedral. Perhaps they are most like the architectural screen in a medieval Christian church, which separated the sacred drama performed at the altar from the audience of the congregation.

Among the various Shona states that succeeded the failed Great Zimbabwe culture, stone walls always served the purpose of surrounding the dwelling of the local ruler and his family. While there was little decoration in the stonework of Great Zimbabwe (the highest courses of stone in the Elliptical Building were laid in a chevron pattern while there are a few sections of walls with rows of blocks in a herringbone pattern, or using darker ironstone to create a pattern in the light granite stonework), decorative use of stone became regular in later enclosures which were always built on a much smaller scale.

## THE AMERICAS

BY ARDEN DECKER

### NORTH AMERICA

While most North American societies did not produce architecture akin to the monumental stone structures we often associate with an architectural tradition, their history is rich with diverse and innovative building practice. Much of what is known about North American architecture derives from documentation by explorers and settlers as well as the continuation of these practices into the modern era. In addition, several cultures did engage in the creation of large-scale building programs of a permanent nature that still exist today.

The most common building practice in the Arctic centered on the need for winter houses. With limited material resources, these were either dug into the ground or heavily sided by the earth. Often materials such as bone, rock, or driftwood were used to frame these houses. The Thule culture (ca. 1000–ca. 1600) made an improvement on the original design by creating a steep passageway leading to an angled door that led up into the floor of the house. This allowed for a more weatherproofed environment. The igloo is another Arctic invention that may have its origins in the winter houses of the Thule. Made of snow bricks, these dome-shaped dwellings were primarily used for protection from winter weather. The shape of the igloo's roof was designed to avoid collapsing. The snow bricks required carefully selected snow, as the consistency could not be too loose or too tightly packed.

The wigwam served as the primary building type for many groups such as the Ojibwa (also called Chippewa) and Algonquian in the Great Lakes and northeastern areas of North America. The wigwam's design makes for easy transportation, because it consists of a simple frame and roof covering made of reeds or bark. The frame, typically constructed from bent tree saplings tied together to create tears, gave the structure an oblong shape. Often a hole would be left in the roof covering to allow for smoke to escape. These structures would house one to two families and generally ranged from 7 to 20 feet in diameter. Some variation in size and shape (such as the extended and conical shaped wigwam) also appeared. In the Great Lakes a special type of ceremonial building developed, called Midewiwin lodges. These structures were very large and featured barrel-roofed frames that would be covered by bark or mats.

Building in the form of earth mounds is perhaps the most distinguishing characteristic of architectural practice among the southeastern cultures. The Mississippian tradition (ca. 750–ca. 1500) ushered in the continuation and spread of mound building. These designs often took on elaborate geometric designs and required extensive labor and planning. Although they mostly served as a means of denoting ceremonial or burial space, they do demonstrate a propensity for building on a monumental scale. An outstanding example may be seen at Cahokia (near modern-day Saint Louis, Missouri), where beginning around 800 more than 100 mounds defined a large city center. The largest of these, Monk's Mound, grew higher than 100 feet high as the result of a series of 14 separate building phases. The temple mound would have been topped by wattle-and-daub construction. Perhaps the most well-known example of mound building is the Great Serpent Mound in Adams County, Ohio.

The Mogollon culture (ca. 500–ca. 1400) of central and southwestern New Mexico improved upon the ancient pit house design by lining the walls with stone masonry. Called great kivas, these ceremonial and social structures appeared around 800 and were large and rectangular in their plans. The Hohokam culture (ca. 500–ca. 1400), located in the southern part of Arizona, was unique in their development of defense, ceremonial, and dwelling structures. These buildings were constructed using thick walls formed by hand-shaped adobe. There is evidence of Mexican influence on Mogollon sites such as Casa Grande and Snaketown, where ball courts have been found, though they are either egg shaped or feature bulbous ends rather than the Mesoamerican I-shaped design. There is also evidence of large-scale complexes of adobe and wattle-and-daub buildings that may have been used for protection against attack. These structures feature observation holes, suggesting that the complexes also had cosmological associations.

The Anasazi (ca. 900–ca. 1300; located near the present-day Four Corners region of the southwestern United States) developed large, multistoried dwellings made of adobe brick and stone. These structures were often situated beneath overhanging cliffs for protection. The most impressive example is Mesa Verde in the southwestern part of Colorado. The Anasazi also built kivas that were circular and were used for ceremonial purposes beginning around 950. The kivas would be entered through a hole in the roof by way of ladder, and the interiors often featured a bench, hearth, and air vent. The Anasazi began to construct "Great Houses" in the 11th century at sites such as Chaco Canyon. These towns were made up of kivas, plazas, towers, and terraces and required a considerable amount of raw material to construct.

The Pueblo Indians, also living in the Four Corners area, constructed large-scale, multistoried, multiroom adobe dwellings. The layout of the pueblo, or town, often suggests some cosmological association. Domestic dwellings were constructed near the central sacred plaza, indicating a close relationship of the people to the sacred.

## MESOAMERICA

The medieval period ushered in tremendous developments in monumental architecture throughout the Mesoamerican and Central American regions. The great commercial and military city of Teotihuacán (ca. 1–ca. 700) had already begun to influence the development of architecture significantly throughout Mesoamerica, especially through the talud-tablero style. This architectural is often used in pyramid construction, where a platform (talud) sits on and juts over a sloping wall (tablero). Despite the widespread influence of this style, contemporary and later cultures began to place their own stamp on monumental architecture. The most significant of these innovations were carried out by the advanced and sophisticated cultures of the Maya, Toltec, and Aztec. It should be noted that monumental architecture throughout Mesoamerica as well as South America was most often constructed as a means of defining sacred space. Therefore, ceremonial centers often feature plans designed to reflect a culture's cosmological model.

The region that the Mayan peoples occupied is vast and varied, since it encompasses the Yucatán Peninsula, Belize, Guatemala, parts of Honduras, El Salvador, and the Mexican states of Chiapas and Tabasco. Despite the proliferation of architecture throughout the Mayan world, their cities lack any standardized system of planning, such as a grid. Rather, Mayan sites tended to grow in a more sprawling, organic fashion that was strongly influenced by the shape of the natural landscape. Classic Period (ca. 200–ca. 900) Mayan architecture is generally characterized by large, stepped platforms topped by

stone structures; one-story palaces that served as administrative centers or royal residences; and limestone temple-pyramids reaching nearly impossible heights. Many Mayan sites are also marked by the inclusion of ball courts of varying size and quality.

Located in western Honduras, the center of Copán features several impressive examples of Late Classic Mayan architecture. Much of the site's construction was commissioned under "18 Rabbit," the 13th ruler of Copán. Among these projects is the impressive Temple of the Hieroglyphic Stairway (eighth century, finished under the 15th ruler, "Smoke Shell") and is named for its elaborate staircase. The steps of this staircase are decorated with some 2,500 glyphs outlining the dynastic history of Copán. As one walks down the temple steps, one journeys backward through time. Temple 22 was also a product of "18 Rabbit's" rule and was designed as a symbolic representation of a mountain.

A large site located in the heart of the Petén region of northern Guatemala, Tikal is marked by a central Great Plaza that is defined by two impressively tall temple-pyramids (Temples I and II), an earlier dated acropolis on the north side, and a palace complex called the Central Acropolis on the south side. Indeed, much of the architecture found here is connected to the Great Plaza by a causeway. Starting in the seventh century the rulers of Tikal began building programs that resulted in ever-more elaborate and vertical temple designs. The largest and most impressive, Temple IV, measures nearly 230 feet in height. Very steep stairways lead to the tops of the temples, which are then capped by large roof combs. Much of this temple-pyramid construction was arranged to mimic the design of the Great Plaza. Recognized as twin-pyramid complexes, these centers were constructed in 20-year intervals, suggesting a correspondence to the 20-year period of the Mayan calendar known as *katun*.

While it is not the largest of the Classic Period sites, Palenque was one of most heavily populated of the Mayan region. Located near the Usumacinta River in the present-day Mexican state of Chiapas, Palenque comprises over 1,000 structures of varying size and function built upon man-made terraces. One of the most significant architectural achievements found here is the seventh-century palace complex. Built on a trapezoid-shaped platform, it is composed of vaulted rooms surrounding interior patios. This complex also features a square four-story structure known as the Tower that is believed to have served as a watchtower or observatory. The most significant examples of temple-pyramid construction may be seen in the Temples of the Sun, Cross, and Foliated Cross, all of which share similar design elements, including a stepped platform with staircase, various vaulted and divided interior spaces, and a mansard roof (a roof with two slopes)

and fretted roof comb. Another significant temple found at Palenque is the Temple of Inscriptions, so named for the hieroglyph-filled panels found on the interior. This structure is unique in that it is the first instance of a stepped pyramid containing an interior vaulted crypt. It is now commonly believed that the Temple of Inscriptions was commissioned as a funerary monument to the important ruler Pakal the Great, who died in 683.

While the Zapotec peoples first began to construct buildings on the hilltop site of Monte Albán located Oaxaca Valley as early as 500 B.C.E., the majority of Monte Albán's central structures were constructed between 400 and 900 C.E. The style of urban planning at Monte Albán lies somewhere between the free-form, organic plans associated with Mayan sites and the rigid, gridlike plan of Teotihuacán. While some of the earlier structures of the site demonstrate Mayan influence, by the Classic Period these elements had disappeared in favor of motifs resembling the talud-tablero developed at Teotihuacán. For the most part, the architecture consists of stone-faced platforms with stairwells flanked by wide balustrades as is seen in Building H located at the center of the main plaza. It is believed that these structures would have originally been covered with stucco and painted. Central to Monte Albán's Classic Period development is the I-shaped stone ball court with sloping sidewalls. This style of ball court would later appear throughout central Mexico. There was also a proliferation of richly painted, corbel-vaulted (where stones are offset and project toward the center of an archway or vaulted ceiling to support weight) underground tombs constructed throughout the site during this period.

It is during the Terminal Classic Period (ca. 650–ca. 900) that many of the Classic Period cities of the southern Mayan lowlands and central Mexico began to collapse. Populations became increasingly uprooted, and conflicts between cities increased. The exact reasons for this dramatic shift remain unclear, but we do know that while great upheaval was affecting many city-states throughout Mesoamerica, others—including Xochicalco located in Morelos, Mexico, and El Tajín in northern Veracruz, Mexico—were experiencing new growth both economically and architecturally. Many of these same issues of warfare and new alliances became even more solidified during the Early Postclassic Period (ca. 900–ca. 1200).

The northern Yucatán site Chichén Itzá is unusual in that it demonstrates two distinct architectural styles: that of the Maya in the Terminal Classic Period and that of the Toltec in the Early Postclassic Period. The primary architectural style of the Terminal Classic Maya Period is known as *puuc* and may be characterized by the presence of elaborately decorated facades that incorporate mask and latticework designs. The architectural highpoint of the Terminal Classic Period was El

Lintel 17 from structure 21 at Yaxchilán (Mayan culture, ca. 600–ca. 800); the ruler Bird Jaguar IV is seen performing a bloodletting ritual with one of his wives. (© The Trustees of the British Museum)

Caracol, a structure at Chichén Itzá that received its name from the snail-shaped plan. El Caracol is made of stacked concentric circles that suggest a spiraling motion, and it is believed to have served as an observatory from which the positions of the setting sun, moon, and Venus might be recorded.

Like many Early Postclassic Yucatán cities, Chichén Itzá bears the mark of Toltec invasion. This may be seen most readily in the four-sided pyramid known as El Castillo and the Temple of the Warriors. The sculptural program associated with El Castillo indicates both Mayan and Toltec influences as well as imagery that is unique to the Toltec Chichén period. The Temple of the Warriors bears a remarkable likeness to Pyramid B found at Tula, which, like the example at Chichén Itzá, is a stepped platform surrounded by colonnaded halls and topped by a sanctuary space supported by Toltec warrior Atlantean columns. At Chichén Itzá a very large I-shaped ball court flanked on either end by smaller temples also was constructed.

The Toltec city Tula, founded around 900 and located in the state of Hidalgo, Mexico, is a site of particular importance to the history of later Aztec and Mayan cultures. Tula features a ceremonial core composed of several massive pyramids, the best example of which is Pyramid B. This royal residence takes on a stepped pyramid–platform design with a single staircase leading to the top and a long colonnaded hall in the front that originally would have been covered by a perishable roof. The four sides of the structure are decorated with a relief sculpture program of warrior symbols. On top of the pyra-

mid itself are several giant Atlantean columns carved in the likeness of Toltec warriors. A similar design plan may be seen in the adjacent “Burnt Palace,” which also features colonnaded halls but would have served as a meeting or ceremonial center. Sometime around 1156 Tula succumbed to increasing warfare, and the Toltec, without a permanent base, headed south, spreading their style throughout Mesoamerica.

While city centers continued to pop up across Mesoamerica, the Late Postclassic Period (ca. 1200–1521) is dominated by the rise of the Aztec, who founded the great city of Tenochtitlán in 1345. Indeed, the Aztec Empire was the largest, most sophisticated center in Mesoamerica at the time of the Spanish conquest.

The rise of the Aztec was not the only development to take place in Mexico during the Late Postclassic Period. After Monte Albán was forcibly abandoned at the end of the eighth century, a new Zapotec site emerged at Mitla in Oaxaca. This center is famous for the abstract, geometric stone mosaics that decorate the architecture, the most elaborate of which is the Hall of Columns. It has been suggested by scholars that the mosaics are meant to imitate various woven textile patterns.

Sometime around 1350 a group of Nahuatl-speaking peoples arrived at Tenochtitlán, thus beginning a settlement that would grow to be the center of the Aztec Empire. Built on an island in a lake that is now Mexico City, Tenochtitlán followed a grid plan composed of a system of streets and canals. Essentially, the city was divided into four residential areas that surrounded the ceremonial center. Perhaps the most significant architectural achievement of the Aztec is at the heart of this ceremonial center, the Templo Mayor, or Great Pyramid. In fact, much of what is known about Aztec art and culture has been found within the Templo Mayor and its related ceremonial structures.

The entire ceremonial center was defined by an L-shaped Coatepantli, or Serpent Wall, constructed of stone. The Templo Mayor was built and enlarged in many stages, the final of which was completed in 1487. While most of the original structure was lost to later colonial structures, much is known about the Templo Mayor from colonial accounts and modern-day archaeological excavation. The architectural style of the Aztec borrowed from both that of nearby Teotihuacán and that of Tula. The great temple was a double pyramid oriented westward toward the nearby volcanic mountains. From the base of the pyramid grew the main body composed of four terraces. Dual staircases led to the top, where two shrines were installed: one dedicated to the rain god Tlaloc and the other to Huitzilopochtli, the god of war and the patron god of the Aztec. This double shrine was meant to be symbolic of the Aztec people, their origins as nomadic people, and their rise

to an imperial state. There are many existing examples of Aztec-style architecture found in peripheral sites like Tepoztlán (near Cuernavaca) and Malinalco (southwest of Mexico City) that demonstrate the influence and dominance of the Aztec before the Spanish conquest.

## SOUTH AMERICA

Like the cultures active in Mesoamerica at this time, those in South America produced equally sophisticated and innovative architectural forms. Building on the traditions of previous cultures, such as the Chavín and the Moche, medieval South Americans constructed large and complex city centers throughout the central Andes. During the Middle Horizon Period (ca. 500–ca. 1000) two competing cultures developed in modern-day northern Chile and Peru. Both Tiwanaku and Wari (also Huari) wielded tremendous power and influence and were equally sophisticated and organized, but they developed distinct architectural traditions.

Located near Lake Titicaca (between Bolivia and Peru), the city of Tiwanaku began around 375 and collapsed sometime around 1000. The plan of the site most likely was designed to reflect the religious and political power of the Tiwanaku, as it seems to recreate on a smaller scale an island floating in the great lake of Titicaca. Similarly, great pains were taken to ensure the division of sacred space. One of the most unusual features of this site is a man-made moat that encapsulated the center and defined it as sacred space. Within this center was the large, seven-terraced pyramid called Akapana, standing 56 feet high. The basic structure was formed from earth and gravel that was then faced in cut stone that showed off the remarkable skill of Tiwanaku stonemasons. A sunken courtyard was built into the top of the temple and was used primarily for elite residences. Buried within the pyramid itself was a system of drains, which turned the entire structure into a big fountain. Once water collected in the top terrace, it would be carried by drainpipes to the next and would then spill over onto the subsequent level. Another important architectural development found at Tiwanaku is the Gateway to the Sun, located in a second city center of Tiwanaku. The Gateway to the Sun is a portal carved from a single stone, and it features a double-jamb door. The upper part of the gate is covered in carved stone relief featuring both Tiwanaku and Wari images.

The Wari capital was located in the Ayacucho Valley of the central highlands in Peru. This site features a relatively irregular plan, and much of the remaining monumental architecture consists of high, multistory stone walls. Tiwanaku influence is evident in the appearance of Tiwanaku-style stonework on temples and burial chambers that are faced with expertly cut stone slabs.

Located near the modern-day city of Lima, Peru, Chan Chan was the chief city of the expansive Chimor (sometimes called Chimú) kingdom. The site of the Late Intermediate Period (ca. 1000–ca. 1400) is most notable for its use of adobe. It is arranged into several rectangular enclosures called *ciudadelas* (or citadels) that are surrounded by adobe brick walls reaching up to 60 feet high. The arrangement of structures within the enclosures varies from highly symmetrical to irregular, and the structures themselves range from royal palaces to storage chambers. Two of these enclosed compounds, Uhle and Tello, feature U-shaped structures known as audience rooms that probably served an administrative function. During the later phases of Chan Chan construction, *ciudadelas* such as Rivero, Bandolier, and Tschudi demonstrate a fairly regular layout, and the structures grow more and more complex in their designs. Many of these royal compounds feature geometric adobe relief decorations and openwork walls that resemble textile patterns.

By the end of the Late Intermediate Period most of the Andes were under Inca control. While Incan architecture may at first seem overly simple, with further investigation the complexity of their stonework and innovative city planning may be understood. The Inca were often forced to find means of building in the inhospitable landscape of the high Andean mountains. The most distinguishing characteristic of Incan architecture of the Late Horizon (ca. 1400–ca. 1534) is the labor-intensive use of carefully carved monolithic stonework and the alteration of the natural landscape to meet the functional needs of the people. The manipulation of the natural rock outcroppings from the Andean mountains is one of the most significant innovations made by the Inca. These outcroppings were altered to take on the shape of organic or abstract forms such as semicircles or zigzags. Sometimes outcroppings served a practical function in the form of irrigated terraces for planting crops. But others, as may be seen at Qenqo and Ollantaytambo, served primarily as ceremonial spaces that engage a series of steps and channels to create geometric designs.

The capital city of Cuzco, located in the Urubamba Valley in the Andes of southeastern Peru, is a carefully planned city that served as the ceremonial and political center of the Inca Empire. The planning of this city was so calculated that it took on the shape of an animal sacred to the Inca, the puma. This animal shape was defined by a system of roads and the use of astronomically oriented lines. As the Inca believed that stone was a living being, its use carried significant symbolic weight. Buildings and walls were constructed using monoliths, or single stones, that feature carefully articulated beveled edges. This carving style allows the stones to fit perfectly together without the use of mortar, almost like puzzle pieces,

Architecture was extremely important to the Inca Empire. Two of the most important sites were the cities of Cuzco and Machu Picchu.

and has the added benefit of creating a surface with beautiful effects of light and shadow. Cuzco has some of the best examples of this complex use of stonework. Structures such as the main temple, called Qorikancha (also spelled Coricancha), or “Golden Courtyard,” are demonstrative of the architectural style that was seen as fit for elite and religious use. Examples such as Qorikancha, which also served as an observatory, emphasize the special sacred nature of the site.

Machu Picchu, which was constructed on a ridge high above the slopes of the Andes along the Urubamba River, seems to be an almost impossible location for building architecture. Owing to its location and the types of building, the site most likely held tremendous religious importance for the Inca. In fact, it has been suggested that the site functioned as a royal estate. An elaborate site despite its smaller size, Machu Picchu contains terraces, stone buildings, gardens, baths, and a large oblong-shaped plaza. On the northeast side of the site are a series of elite residences whose designs were variations on a plan consisting of rectangular units within stonewalled, open-air patios. These royal compounds feature the same impressive stonework that was utilized in Cuzco, and they begin to incorporate the use of windows. Temples were also built of stone at Machu Picchu for ceremonial rituals.

## ASIA AND THE PACIFIC

BY KIRK H. BEETZ

The architecture of the region of Asia and the Pacific in medieval times was enormously varied, with styles varying according to the kind of shelter required for the particular environment and to the available building materials as well as to people’s tastes, as influenced by religion and tradition. That the Chinese, Japanese, and Indians developed the most influential architectural styles should not suggest that the styles of other cultures were somehow inferior: There is awesome beauty in the boat-shaped structures of Sumatra, ingenious design in the yurts of central Asia, and a strong binding influence on communities by the longhouses of Southeast Asia. In almost every area of Asia and the Pacific people showed impressive ingenuity in their architectural solutions to their needs for shelter, community, and spirituality.

### CHINA

A great deal is known about medieval Chinese architecture through a book published in 1103, called *Ying zao fa shi* (Treatise on Architectural Methods) and written by Li Jie. This book was a manual that the imperial government wanted architects throughout China to use. One of the most impressive effects of its distribution was that builders were able to prefabricate parts in one place in China and have the parts fit

together with other parts built thousands of miles away. By following the instructions in the book, Chinese builders were able to bestow their structures with a distinctively Chinese look. On the other hand, the dictates of Li Jie’s book were not slavishly followed; medieval Chinese architects were by and large practical people who adapted the designs in the book to suit various environments and terrains. For instance, walls that were designed as perfectly rectangular in the book might have been realized with dips and swerves, as appropriate to rocky or sloping ground.

One aspect of Chinese building that began in the ancient era and continued into the medieval era was that all structures followed the same basic pattern, from small peasant houses to grand imperial palaces: They were frame structures, meaning that the load-bearing parts were frames consisting of posts with beams laid across. Walls rarely bore any weight other than their own, which meant that builders could experiment with materials and ornamentation. Also, posts had to be thick and sturdy, and the interiors of large buildings often needed many posts to bear the weight not only of the stories above but also of the typically very heavy Chinese roof. As such, multiple stories were usually reserved for special buildings such as pagodas, with most other buildings, whether small homes or palaces, being one story only.

Posts were usually wooden and were painted with a mixture of hemp, oil, and brick dust to protect them from insects and weather. Sometimes, in expensive buildings, lacquer was used to coat the posts. It was probably out of this practice intended to preserve wooden posts that the custom of decoratively painting posts was derived. The color was most often red but could be other hues.

In the far north of China buildings tended to have wooden walls as thick as 40 inches, for protection from the bitter cold. In southern China, where heat was more of a problem than cold, walls could be much thinner, being composed of wooden boards or even just paper. Whether a building was in the north or in the south, an open space between the walls and roof would allow smoke to escape, as the medieval Chinese did not build fireplaces. Windows in walls were built not to allow light into the interior but to allow air to circulate. Often the windows were covered by no more than paper that could be raised to allow fresh air to enter.

The spectacular medieval Chinese roof often draws the most attention from observers. The heavy posts of the frame had lintels laid across their tops; a lintel is a horizontal beam laid across the tops of vertical posts. On these lintels, smaller vertical posts would be set, with additional lintels laid atop them. Those lintels would have yet smaller posts set on them, with again more lintels atop. Each level of the roof would be narrower than the previous one, and this pattern could con-

*Pavilions on the banks of a river; color on silk, China, Ming Dynasty, 1368–1644* (Freer Gallery of Art, Smithsonian Institution, gift of Charles Lang Freer)

continue as high as the structure could bear, creating a trabeated pyramid; the word *trabeated* comes from the Latin for “beam,” so this term essentially means “beam pyramid.” This design differs from the A-frame structure that bears the weight of the roof in many modern Western buildings; the Chinese knew of the A-frame but used it only as scaffolding to bear the weight of the roof while it was being set in place. Afterward, the A-frame would be removed, as the roof’s own weight was expected to hold it in place, with the pressure of the weight of each level being transferred outward down to the lowest posts. The impressive weight of the roofs came from the glazed clay tiles on them. If an architect wanted the eaves of the roof to extend outward far enough to provide coverage for a walkway alongside the structure, additional posts would be placed beyond the wall to hold the overhanging eaves. As such, galleries of posts could be created.

Sometimes architects wanted additional space without having to use additional posts. For this, they used brackets called *dou gong*. When Li Jie prescribed the proportions for interior space in buildings, he included standardized instructions for how the *dou gong* brackets were to be used. The

*dou gong* bracket resembles a Chinese puzzle box; its central core has upward-curving braces with grooves in their ends in which rest longer braces that also extend from the core and which may brace still longer braces. Thus, the *dou gong* bracket allowed great weight to be brought inward to the post on which it rested in an aesthetically pleasing way. The medieval Chinese decorated these brackets with bright colors, calling attention to their graceful form. By altering the height and width of *dou gong* brackets, an architect could design gracefully curving roofs, undulating roofs, or even gables.

When people think of Chinese architecture, they often think of pagodas, which are tall towers built to honor the Buddha. These towers derived from Indian structures symbolizing mountains, and in China they represented the climb from mortal existence to spiritual enlightenment. A typical pagoda was hollow inside, with a large statue of the Buddha occupying the interior. Some pagodas had separate floors going up, with windows with statues of the Buddha gazing benignly out, usually to the west, north, east, and south. Pagodas often were built at the northern edges of towns, where they blocked the passage of evil spirits that came from the north. They were built most often of wood but also of stone or brick. Perhaps the oldest brick building in China is the Song Yue pagoda, which was built in 523. Stone pagodas such as the twin pagodas at the Guiyuan temple (in Quanzhou, from the 1200s) were often built to resemble wooden ones and therefore preserve the sloping eaves and load-bearing posts of the wooden structures. The oldest standing wooden pagoda in China is Yingxian (near Datong, Shanxi Province), which was built in 1056. It has survived numerous earthquakes, some of which flattened all other buildings nearby, attesting to the soundness of its design. At 183 feet tall, it remains an architectural tour de force, featuring numerous variations in its structure, including 56 varieties of *dou gong* brackets.

## JAPAN

Little is known of the everyday architecture of Japanese houses at the start of the medieval era. Archaeological digs on the island of Honshu have revealed circular pits that were the bottoms of round houses that developed around 300 to 200 B.C.E. and remained common into the medieval era. On the island of Kyushu houses may have been oval. Postholes suggest that these houses had walls of wood; the nature of their roofs has been open to speculation, with some archaeologists and artists suggesting that they were thatched. A typical Japanese farming village had one or more storage houses. These were set on wooden stilts, probably to keep out rodents. They had wooden floors and wooden steps leading to a doorway, and they may have had pitched roofs for shedding rainwater.

It is not known when Chinese architecture began influencing Japanese architecture; the influence probably was transmitted by immigrants from Korea. Before 800 C.E. Japanese architecture became divided into three types: one employed for commoners, one for the aristocracy and temples, and one for fortresses. For aristocrats the style *shinden-zukuri* developed. A *shinden* was a central hall, and rooms in buildings in the *shinden-zukuri* style were built around the central hall. The rooms were expected to be symmetrical.

In the 1000s Japanese architecture began to change with the rise in power of the samurai, who ushered in the *shoin-zukuri* style. A building in this style could in theory be enlarged forever, if space allowed. Such buildings were asymmetrical, with rooms and exterior gardens sometimes interweaving, since one goal of the architects was to have as many rooms as possible look out on gardens. Roofs stretched far beyond the walls, and multistoried buildings would have verandas that provided shelter for people walking below. Among lakeside homes, verandas extended over the water and were called “fishing galleries.”

Out of the *shoin-zukuri* style emerged the distinctive Japanese national style of architecture, as influenced by Chinese architecture but reflecting Japanese needs and tastes. The Chinese-style roof persisted throughout the medieval era, but the Japanese modified it: The roof was peaked, but its eaves flared outward from the sides, such that the A-shaped central frame seemed to rise out of the roof. On a two-story building, upper eaves would flare out over second-floor windows; below these windows a lower set of eaves, as if a second roof, would flare out even farther from the wall and carry rainwater far from the side of the house.

Prior to 700 Japanese architects had developed structures that could be quickly built and also quickly dismantled and moved, as monarchs tended to move their palaces from city to city. The establishment of Nara as the capital city in 710 may have put an end to the practice of dismantling and reerecting palaces, but the skills learned from finding ways to simplify a building's structure to make it easy to reconstruct became part of the *shoin-zukuri* style, resulting in the modular approach to Japanese architecture. The basic module was about 6 feet by 3 feet, and floor plans would be worked out in multiples of the basic module, allowing for remarkable versatility in interior designs. One area could be raised higher than the rest of the floor and would be the sleeping area. A module could be designated for storage and become a sort of fitted cupboard—a set of drawers that functioned like a dresser.

Buddhist households often displayed religious pictures over their dining tables, and this became part of Japanese architecture in the form of the *tokonoma*, a recess in a wall specially made to display a picture, often secular. Interior walls

of paper were set into runners and could be slid into configurations that allowed for privacy or for a large space for entertaining guests. Like Chinese buildings, Japanese ones relied on posts and lintels to bear the structure's weight, allowing outer walls to be light. The outer walls were usually made of latticework bamboo plastered with mud and straw.

The islands of Japan were very heavily wooded in medieval times, making wood a favored building material. Many regions of Japan lacked stone suitable for building, making its use for ordinary structures rare, but stone was used in fortresses. Granite was often used for the bottom floors of the fortress, with the stone blocks carefully dressed to fit neatly together. The stone walls curved slightly inward as they rose, a design intended to help the fortress flex during earthquakes. Atop the stone levels would be wooden structures that were vulnerable to fire but hard to reach because attackers would have to climb the stone walls to reach them. A moat frequently was dug around the fortress.

## KOREA

Not much is known about the indigenous architecture of the Koreans, largely because wars destroyed most of what had been built. The medieval Koreans were heavily influenced by Chinese architecture. In the Bo-Hyan-Su Temple, located in the Diamond Mountains of Korea, the still surviving Chil-Song-Gak, meaning “Hall of the Pleiades,” is a fine example of how Koreans adapted Chinese architecture. Built in the 600s, Chil-Song-Gak features heavy tree trunks as the posts of its corners, with a post-and-lintel frame. The roof uses the same trabeated pyramid structure found in medieval Chinese buildings, with cedar columns used to help bear some of the load. During the medieval era the Koreans elaborated on the basic structure found in Chil-Song-Gak. They set the posts in bronze or stone, which was often carved decoratively, and the posts and lintels were painted. Exteriors, especially eaves, were carved into figures and lacquered. Perhaps to enhance a building's ability to flex in bad weather or during earthquakes, the Koreans typically placed two lintels instead of one over the tops of posts.

## CENTRAL AND NORTHERN ASIA

Cities along the routes of trade between China and regions west featured houses of stone and brick. They tended to be square or rectangular and show influences from ancient Greece, the Middle East, and China. How the houses were built and what purposes they served have yet to be determined by researchers.

Many people of central Asia and Siberia were nomads. They developed a flexible and portable structure called a yurt. A yurt is a circular shelter that can vary in size according to

how many sections of latticework are used in the walls. It was designed for portability and for ease of setup and takedown. The walls of the typical medieval yurt consisted of light wooden lattices, while the roof was composed of wooden ribs that were lashed to the wall. The lattices folded into small, lightweight sections; the heaviest part was usually the door, which was made of solid wood and fit into a light rectangular frame in the wall. Thick felt mats covered the whole structure; several layers of felt mats might be used, as the interior had to be kept warm even when outside temperatures dropped to 40 degrees below zero. The yurt was sturdy enough to endure severe windstorms.

## INDIA

Most Indian structures of the medieval era were made of wood, which has proved problematic for modern researchers into India's architecture: Much of India is very humid and subject to frequent rainfall, contributing to the decay of wood. Further, India's territories were invaded repeatedly by Islamic bandits and sometimes by armies, and the invaders objected to the Indian inclination to decorate buildings with images of their deities. Thus, beginning in the 1100s entire palaces and cities of wood were burned to the ground, destroying most

of India's architecture. By the end of the medieval era few wooden structures remained untouched. As a result, historians have only a skewed view of medieval Indian architecture: Stone buildings are what remain to represent the architecture of the period, yet stone buildings were the exception and not the rule in medieval Indian construction.

Some of the architecture of wooden buildings can be deduced from the surviving stone structures, from modern structures built using traditional methods, and from medieval writings about buildings. The writings of Indians and Chinese Buddhist pilgrims tell of buildings rich in art. Even modest wooden walls would be carved with images of animals, plants, benevolent spirits, and gods and goddesses. Indian architects believed that no building was complete without images of women on it. Cities featured buildings of two stories or more, and people could watch city life from their upper windows. The wooden palaces were said to be spectacularly beautiful, with open courtyards surrounded by gardens and brightly decorated walls.

Among the world's most spectacular medieval structures were the cave temples and monasteries of India. The practice of carving whole temples out of solid rock seems to have begun in southern India in the ancient period. In the Deccan Plateau

The Mosque of Delhi and the Iron Pillar; *watercolor on paper, India, 13th century* (Freer Gallery of Art, Smithsonian Institution, gift of Charles Lang Freer)

of the south, Hindu temples were carved into solid granite. A curious feature of India's cave structures is that they were usually carved to resemble wooden buildings. Some even had actual wood installed in their ceilings to appear to be rafters. From these hints found in stone structures, scholars have deduced that medieval Indian architects used the post-and-lintel design for bearing weight, which suggests that their walls were free to be light. In southern India walls may have been left entirely open, to allow cooling air to circulate.

Some historians believe that two national architectural styles developed in India, one northern and one southern. The southern style of medieval India seems to have been lighter, favoring walls that had many openings; the northern style is thought to have been heavier, emphasizing thick walls and presenting a solid, earth-heavy image. Most of the surviving buildings are temples composed of stone, although brickwork was sometimes used, especially for stupas; a stupa was a hemispherical mound of dirt that was overlaid with bricks, within which were relics of the Buddha. These structures were first built soon after the Buddha left mortal life, and they

were refined over centuries. By the medieval era the grounds surrounding a stupa might feature four gates decorated with sculptures. Images would be arranged around the stupa so that visitors could circle clockwise and see the progress of the Buddha's life.

The major religions of medieval India—Hinduism, Buddhism, and Jainism—saw the cosmos as a vast ocean out of which arose the world. At the center of the world was a mountain, at the top of which were the chief deities, and at the bottom of which lived human beings. Thus, the Indians built tall towers that were intended to represent mountains. These towers would be decorated with sculptures representing the many deities of the cosmos or, in the case of Buddhism, representing the ascension from mortality to full enlightenment. In southern India temple complexes often included *gopuras*, gate towers soaring several stories high.

The architectural marvels of India were widely influential. In Burma more than 13,000 mountain-temples were built. These temples were made of brick and covered by plaster, which, when dry, was painted with spiritual images. In Sri Lanka magnificent stupas were built, as were Buddhist monasteries of stone and wood, imitating Indian styles.

## SOUTHEAST ASIA

Most Southeast Asians were farmers and lived in villages in buildings somewhat similar to ones also found in Indonesia. The longhouse seems to have been common. Raised on stilts, it could be over 100 feet long and was one long interior room in which several families would live. Sleeping, lovemaking, and crafts such as weaving took place inside. Floors were wooden planks; the walls could be wooden or composed of bamboo latticework.

Most of what is known about medieval Southeast Asian architecture derives from its impressive temples and palaces, which were usually modeled after Indian architecture. Along the Mekong River are scattered remains of the Funan kingdom, which arose in the 200s, including stone temples decorated with Hindu images. Early in the seventh century Funan was overthrown by the vassal state of Chenla, which was ruled by the Khmer.

The Khmer built some of the world's most beautiful buildings; they attempted to impose a cosmic order on the undisciplined rain forest of what is now Cambodia. Although Angkor Wat, a temple found in Angkor, is the most famous of their structures, it is but one among hundreds of impressive buildings set on mountains and in valleys. The word *Angkor* roughly translates as "capital city," and *Angkor Wat* means "temple of the capital city." The temple was built just outside the walls that encompassed a vast city and palace. Construction began in the 1100s, as overseen by Hindu kings who not

only sought to demonstrate their power and impress people by building huge monuments but also wanted their capital city to reflect the order of the cosmos. Accordingly, the architects of Angkor designed towers that imitated the towers in India that represented mountains, atop which dwelled the god Brahma. Around these structures were situated reservoirs of water that had profound symbolic importance, as they represented the primordial cosmic sea out of which life arose.

The temples and palaces built by the Khmer were designed like stacks of ever-narrowing blocks, with ledges intended to hold statues of deities and of spirits. When the royal family converted to Buddhism, large blocks of stone with the face of Buddha carved on them were added to the sides of structures, often covering ledges, doorways, and windows. In Angkor Wat the effect was such that visitors might have felt as if the Buddha were watching over every place benevolently from every direction. Almost all of that temple was originally built with precisely cut stone and without the use of mortar, and the careful working of the masonry remains impressive in modern times.

Despite all their skill in designing impressive stone buildings, the architects of Angkor were not skilled in building them to weather the years. At first, foundations of stone rubble and sand were used, allowing the easy fashioning of level surfaces on which to rest buildings. Rainwater penetrated the sands, however, causing foundations to shift and walls and towers to collapse. In efforts to build stronger foundations, they hollowed out foundation stones, placed tree trunks inside them, and fitted additional hollowed stones over them; on these stones they set their buildings. The humid climate caused the tree trunks to rot, however, and from time to time entire walls of masonry would slide down. Sometimes the faces of the Buddha would drop. The buildings required constant repair.

## INDONESIA

The Indonesian archipelago is composed of thousands of islands with many cultures, some very remote from the rest of the world. All seem to have in common the building of structures with wood. In medieval times two kinds of structures predominated: the longhouse and the boat-shaped or saddle-shaped house. The longhouse was usually built lengthwise beside a stream or river. It rested on pillars of wood, keeping it above seasonal floodwaters. On the side by the stream was a veranda of wooden planks, on which people fished, prepared food, and sometimes practiced their crafts. The interior was one long room enclosed by walls of wood or woven branches. The roof was a wooden frame covered by leaves that was usually pitched to shed rain, with the eaves overhanging the veranda. Sometimes communities of several families lived in-

side one longhouse, sometimes so deep in the rain forest that a hike of several days would be required to reach the island's edge or other people.

The boat-shaped house was deliberately constructed to resemble a boat and symbolized a community's connection to the ocean. It was built on wooden stilts, partly to place it above floodwaters and partly to allow the structure to sway rather than break during earthquakes. The boat-shaped house usually had no door on its sides; instead, a trapdoor could be found in the floor near one end of the house, with the residents using a ladder to climb in and out of the house. Typically, walls were wooden boards. In Sumatra roofs were clad with wooden shingles; in Sulawesi the roofs tended to have a more exaggerated sway and were covered by thatch. The walls of Sulawesi houses tended to be made of bamboo. This kind of house was particularly favored by farmers and is still common on the island of Sumatra in the northern mountains and in Batak country.

Building with stone was uncommon on the islands of Indonesia. When Hinduism and later Buddhism reached the region, converts to the new religions built stone monuments in imitation of those built in India and on the Southeast Asian mainland. The most impressive of the monuments still standing is Borobudur, in central Java, on the Kedu Plain, built in the 800s. A towering structure symbolizing the climb from mortal existence to spiritual freedom, it was constructed of unmortared stone. It was a flawed masterpiece, with too much pressure pushing the walls outward, and the walls indeed buckled over time, owing also to the foundation shifting from the effects of rain and earthquakes. Yet Borobudur never collapsed, despite outward signs that it would. The stones had been fitted together with stone mortises and tenons, which took a long time to decay; moreover, the stones had been locked together with iron joints, and when the walls buckled, the added pressure served to lock the joints more firmly into place. Much of the structure held together until repairs were made in 1907 and then in 1982.

## OCEANIA

Oceania is a vast region encompassing many different styles of building reflecting environmental needs as well as cultural tastes. In Australia people built huts. These huts consisted of frames of wooden branches tied together with roots and walls and roofs of reeds strapped in place by roots. This sort of structure was used by people who did most of their living outside, using shelters only for sleep and protection from the elements. Similar huts were to be found throughout much of Oceania.

The people of the islands of Oceania were often dependent on the ocean for survival, so, as in Indonesia, some of

them developed houses shaped like boats. These structures are still to be found in New Guinea, for example. Tree trunks were used for the posts of the frame, and floors of wooden planks were hung on the posts. The main floor may have been raised above the ground or may have been the ground itself. The roof swayed in the middle and rose to peaks at each end, probably consisting of branches and thatch woven together. These houses, too, were often no more than shelters from rain and therefore lacked walls. Circular houses were common throughout Oceania. Walls were made of wood and bark; roofs were peaked in the center, with branches or saplings radiating out to the edge, as covered by palm leaves or bark.

The people in many parts of Oceania, including the Philippines and Samoa, were capable of constructing spectacular buildings with cavernous interiors, usually for community meetings or as places of worship. The frames of such buildings consisted of bamboo poles that were bent inward and lashed together, while the walls were made of wood. The roofs would be built on the ground and then raised onto the structure. In New Guinea structures six stories high and 120 feet long still survive.

## EUROPE

BY MICHAEL J. O'NEAL

At the beginning of the medieval period, corresponding with the fall of the Roman Empire in the late fifth century, northern and western Europe did not have the same extensive architectural tradition that could be found in much of the rest of the world, especially the Mediterranean (in places such as Rome and Greece), the Near East, and parts of Asia. Throughout the medieval period northern, western, and eastern Europe developed traditions in domestic architecture, including the castle, which served as both a home and a fortress. Additionally, ecclesiastical (that is, church related) architecture became important, particularly in early-medieval Ireland. In about the fifth century Christianity came to Ireland. Beginning in the sixth century a large number of monasteries were built and became centers of learning and spirituality. These monasteries were erected on sacred sites and most often were associated with a water well. A good example is Saint Brigid's Well, which still exists on a site near Kildare, Ireland, where Brigid (452–524) had a monastery built. Additionally, these monasteries were built in connection with ancient burial grounds. These enclosed burial grounds were usually round, representing a circle, and they were positioned in such a way that at the winter solstice the sun shone into them. The monasteries themselves were also generally circular.

Another common architectural feature of the Irish monastery was the bell tower. These towers frequently were used

as a place of refuge when the community came under attack. However, their significance was primarily spiritual. A common height was seven stories, the number 7 representing the sum of 4 + 3. The number 4 was significant as representing the four cardinal directions, and typically such towers had four windows, one each facing north, south, east, and west. The number 3 represented the Trinity of God the Father, God the Son, and God the Holy Spirit. By adding these numbers together, early Irish Christian architects believed that they were capturing in stone the perfection of God's creation.

Another common architectural achievement that survives from medieval Ireland is the High Cross. About 60 such crosses remain intact, and fragments from at least 100 others have been found. While some of these crosses, such as the one at the monastery of Saint Kevin (d. ca. 618) in Glendalough, County Wicklow, Ireland, are plain, many are highly ornamented. Some are referred to as scriptural crosses because carved on them are depictions of important events in Christianity, such as the crucifixion of Christ. One of the best examples of a scriptural cross is the High Cross of Muiredach at Monasterboice.

Primarily under the influence of the Catholic Church, ecclesiastical architecture began to spread throughout Europe. After the Roman Empire fell, the city of Rome remained an important center of influence, prestige, education, literacy, and wealth because it remained the headquarters of the Catholic Church in western Europe. To Europeans, from peasants to nobles, it was the pope, not a civic ruler, who could determine the fate of a person's immortal soul, so the pope wielded considerable power. In eastern Europe the Eastern Orthodox Church, the other main branch of Catholicism, held equal sway and exerted its architectural influence even into the eastern portions of western Europe in places such as Vienna, Austria. The result was that the Church had a profound influence over the architecture of medieval Europe. Additionally, Islam made major inroads into southern Europe, particularly Spain, and the influence of Islamic architectural styles can still be seen there in such buildings as the Salamanca Cathedral.

These cathedrals, churches, and monasteries were vital to the community. Their immensity provided a place where all the members of the community could gather under one roof, and they were homes for priests, nuns, and scholars. Monasteries and nunneries served as places of refuge and as way stations for travelers. They functioned as educational centers and libraries. They were places where relics and holy objects could be stored, preserved, and protected. They educated peasants and the illiterate about the doctrines of the church; their statues, paintings, carvings, and stained-glass windows, at a time before books became more widely available, made available pictures of saints, martyrs, the life and

## THE HAGIA SOPHIA

The Hagia Sophia in Istanbul (at the time called Constantinople), Turkey, was arguably the greatest of the early medieval Byzantine churches. It is popularly believed that the church was named after a Saint Sophia, but in fact the name comes from the Greek and means “Church of the Holy Wisdom of God” (*sophia* being the Greek word for “wisdom”). Amazingly, given its immensity, the church was built in just five years, from 532 to 537. It was erected under the orders of Emperor Justinian I, so it uses many Roman building techniques. The architect was the physicist Isidore of Miletus, though Justinian had appointed a second architect who died just a year later.

The most prominent architectural feature of the Hagia Sophia is its large central dome, which spans 104.6 feet and rises to a height of 182 feet. The dome collapsed during an earthquake in 558, but its reconstruction was completed in 562. Another earthquake struck in 989, and once again the dome had to be reconstructed. Viewers are struck by the apparent weightlessness of the dome, which appears to be supported by a continuous circle of arched windows, allowing the interior to be flooded with light. The circular dome, though, rises over a rectangular base. This posed a problem for the architect, who solved it by supporting the dome on what are called pendentives. A pendentive is a triangular segment of a sphere. At the bottom, it tapers to a point. At the top, it projects outward. The tops of the four pendentives of the Hagia Sophia spread outward to form a continuous support for the dome, transferring the weight of the dome to four massive piers at the corners of the base.

The entrance to the Hagia Sophia is at the western end. Liturgical services took place at the eastern end. At the eastern end one of the arched openings is extended outward by half domes, which in turn are supported by a series of exedras. An exedra is itself a domelike structure that forms a recess in a building’s facade. Thus, the Hagia Sophia gives the impression of a hierarchy of domes, a feature unique in medieval architecture. While the outside of the building is faced in relatively plain stucco, the inside surfaces are covered with gold, marble, green and white porphyry, and intricate mosaics.

The Hagia Sophia originally served as the seat of the patriarch of Constantinople, the head of the Eastern Orthodox Church. In the 13th century it served briefly as a Roman Catholic cathedral. But in 1453 the Turks conquered Constantinople and immediately made the building into an Islamic mosque. In 1935 the first president of the modern republic of Turkey, Mustafa Kemal Atatürk, converted the Hagia Sophia into a museum.

death of Christ, and even the torments that waited in hell for sinners. Perhaps just as important, they served as focal points for the prestige and power of a local prince, duke, or other ruler, who competed with his neighbors to see who could finance the most magnificent church. They were living, vital parts of the community.

### MEDIEVAL ARCHITECTS

Until about the middle of the 11th century, the architects who designed and oversaw the construction of buildings, particularly churches, were largely monks and priests. After that time, though, the buildings became more elaborate and complex, so a professional class of architects was employed. These men were not called architects; that term did not come into use until about the 16th century. Rather, they were called master builders, indicating that their training and experience were in construction and stone masonry.

Early on, these masons took part in the physical work of building. Later, though, they functioned more as overseers, submitting plans, supervising budgets, obtaining building

materials, organizing labor, drawing up contracts, and directing the work of artisan guilds that in turn oversaw the actual work of construction. The role of the priests, monks, and bishops at this point became that of finding a site and raising funds, often by selling indulgences to the faithful—that is, release from the torments of Purgatory after death. Unskilled labor was provided by serfs, hired workers, and in some cases by conscription; that is, bishops exploited their spiritual authority to force people to provide labor.

Historians know the names of many of these master builders. In some cases, their names remain inscribed on the buildings whose construction they oversaw. One of the most famous of these medieval architects was Villard de Honnecourt (ca. 1225–ca. 1250), a master builder who lived in northern France. He is best known for his sketchbook, compiled possibly in the 1230s. As he traveled about Europe, he visited construction sites and made sketches of the architectural features and building techniques he saw. His sketchbook remains a valuable resource for scholars interested in the techniques builders used in the 13th century.

## TYPES OF MEDIEVAL ARCHITECTURE

Two major types of architecture flourished in medieval Europe. The first is called Romanesque, a name that suggests its roots in the architectural styles of the Roman Empire. This type of architecture was especially prominent in the 11th century. The related Norman style, which originated in Normandy, a region on the northwest coast of France, also became prominent during the 11th century, primarily in England. Scholars regard English Norman architecture as essentially the English version of Romanesque.

But the form of architecture that remains most associated with the European Middle Ages is the second style, called Gothic, which underwent an enormous flowering beginning in the 12th century, specifically between 1137 and 1144 with the rebuilding of the royal Abbey of Saint-Denis by the abbot Suger (1081–1151). Interestingly, some Gothic buildings have characteristics of both the Romanesque and the Gothic—and even of later styles—principally because they took so long to construct that architectural styles changed over the generations. Some buildings have combinations of styles because they later needed to be expanded or because they were damaged and parts needed to be rebuilt.

Medieval Europeans did not use the term *Romanesque*. This term came into vogue in about the 18th century, when historians first began to study and classify the types of architecture they observed in Europe. They noticed that much of Europe's early architecture bore strong similarities to the architecture of ancient Rome. Because the Roman Empire had exerted its influence through large portions of Europe, especially Italy, France, England, and parts of eastern Europe, its architectural influence remained behind, to germinate and grow some five centuries later. Hence, historians coined the term.

Romanesque architecture was the direct result of the explosive expansion of the Catholic Church. During this era a large number of religious orders were founded. These religious orders, including the Cistercians, the Cluniacs, and the Carthusians, constructed monasteries to house their members. The result was a concentration of religious communities that spurred a building boom. Their chief characteristic was that their floor plan was in the form of a cross, symbolic of the cross on which Christ died. Running down the center of the building was a nave—the long, central aisle of a church—with aisles on each side. Projecting from the nave was an apse, or a semicircular portion with a vaulted ceiling that typically provided a “stage” for the choir. If the nave can be thought of as running north–south, the portion of the building called the transept ran east–west, completing the cross design.

If later Gothic architecture is said to “soar,” Romanesque architecture is sometimes said to “squat” because of a num-

ber of characteristics. First, instead of the pointed arch of the later Gothic, Romanesque architecture used rounded arches, usually semicircular, made of stone. The disadvantage of this type of arch is that it has a tendency to push supporting walls outward, so it requires a great deal of supporting stonework. Sometimes the supporting walls are as much as 10 feet thick. This feature gives buildings with rounded arches a somewhat squatter, less elegant look.

Second, these buildings often featured barrel vaults, sometimes called tunnel vaults. A barrel vault essentially takes a semicircular arch and extrudes it horizontally, creating what looks like the semicircular half of a barrel lying on its side. Again, the problem is a tendency to push the supporting walls outward, so once again the walls supporting these vaults are extremely thick. An alternative, though, was to make use of groin vaults, an architectural feature produced by the horizontal intersection of two barrel vaults at right angles. This concentrated the downward and outward thrust at the “groins,” sometimes called “arrises,” which are the four diagonal edges where the barrel vaults intersect. Groin vaults then can be supported by pillars rather than thick walls.

Finally, Romanesque buildings used cruciform piers. The word *cruciform* means “cross shaped,” and a pier is a vertical support, like a post. While the cross section of a pier can take any shape, typically it is square or rectangular, reflecting the shape of the stone blocks that are stacked to form the pier. In Romanesque buildings they took the shape of a fat cross. Piers were stronger than simple rounded columns, though once again they were not as elegant. A common practice was to alternate the two forms of support in a row down the side of a building: a pier and then a column or sometimes two or three piers and then a column.

Romanesque buildings were made with local stone that in itself was not always very attractive. Marble was more attractive, but it was scarce, particularly in France. To compensate, many Romanesque buildings have a profusion of sculpture: statues, relief work, carvings, and the like, all designed to enhance the building's aesthetic appeal. Poorer communities might not have been able to afford such sculpture, so the buildings were much plainer in appearance.

Examples of Romanesque architecture, or at least of architecture that reflects the Romanesque style, can be found all over Europe. Numerous examples can be seen in France, including the abbey church at Cluny and Notre-Dame-la-Grande in Poitiers. The Romanesque style was especially popular in Spain, with noteworthy examples including the church of Saint Clement in Catalonia, the monastery of Santo Domingo de Silos, and the church of Santiago de Compostela. In Germany, the Schottenkirche in Regensburg was built in the Romanesque style, as was Saint Mary Magdalene Church

in Wrocław, Poland. These, however, are just a handful of the hundreds of Romanesque buildings that can be found in these countries as well as in Italy, Portugal, Austria, the Netherlands, and the Czech Republic.

Norman architecture in many respects was not a distinct style but rather an offshoot of the Romanesque, and some architectural historians regard Romanesque and Norman architecture as essentially the same. In 1042 Edward the Confessor became king of England. Edward had spent much of his early life in Normandy, France, so he and his court brought with them many French customs and influences. It was Edward who began construction of the famous Westminster Abbey in London, a building that now reflects the later Gothic style. Then, in 1066, William the Conqueror invaded and subdued England and was crowned king on Christmas Day that year. William, too, was from Normandy, so the Norman influence on English architecture was cemented during his reign and that of his successors.

William appropriated much of the wealth of the English nobles and turned it over to the church. The result was what amounted to almost a building frenzy in England, as English bishops tried to outdo one another in the magnificence of their buildings. At the same time, the English nobles tried to match the bishops in a frenzy of castle building. About the nobles, the contemporary historian William of Malmesbury (ca. 1080/1095–ca. 1143), in his *Gesta regum Anglorum* (Chronicle of the Kings of England) wrote: “Nearly all tried to rival one another in sumptuous buildings in the Norman style, for the nobles felt that day lost which they had not celebrated with some deed of magnificence.”

Norman architecture was similar in many important respects to Romanesque architecture. It featured rounded arches, barrel vaults, thick piers, and massive walls, though sometimes the walls were not as thick as those of continental buildings because the ceilings they supported were made of lighter-weight wood rather than stone. Also, because of England’s damp climate, Norman-style buildings did not feature much in the way of external carving and sculpture, for builders feared it would rapidly deteriorate in the damp.

Modern historians of architecture can find only distant echoes of the Norman style. The reason is that most Norman buildings later underwent remodeling in the Gothic style. Thus, for example, rounded Romanesque arches were replaced by pointed Gothic arches. In many cases only the original Norman floor plan remains. The only pure Norman building remaining in England is the cathedral at Durham, begun in 1093. This cathedral, though, was just one of many that were built in the Norman style but later altered. Others, with the date construction began, are identified only by their location and include York Minster (1075), Saint Alban’s

*Capital with figures representing Luxury and Lust; yellow sandstone, Spain, ca. 1175–ca. 1200* (Los Angeles County Museum of Art, William Randolph Hearst Collection, Photograph © 2006 Museum Associates/LACMA)

Abbey (1075), Ely Cathedral (1081), the cathedral at Rochester (1083), the cathedral at Worcester (1084), Old Saint Paul’s (1087), Gloucester (1089), Norwich (1096), Chichester (1100), Tewkesbury (1103), Exeter (1112), Peterborough (1116), Romsey Abbey (1120), Fountains Abbey (1140), and Saint David’s in Wales (1176).

The term *Gothic* was originally coined during the Renaissance and used as a pejorative. The word is a reference to the Goths, one of the “barbaric” tribes of northern Europe, and it was first used in the sixteenth century to refer to anything regarded as crude. It has nothing to do, though, with the Goths themselves. Applied to architecture, it suggested something crude and barbaric. In the 19th century, though, interest in Gothic architecture revived, and art historians, critics, and the public began to regard it more favorably.

Gothic architecture, like Romanesque architecture before it, can be found all over Europe, as architects and builders traveled about and shared their techniques with one another. The Gothic, though, is especially associated with France, and no tourist to France, particularly to Paris and its environs, is likely to miss two of the most magnificent examples of Gothic architecture, the cathedral at Chartres and the Notre-Dame cathedral in Paris itself. Other noteworthy Gothic buildings include Westminster Abbey in London, the Salisbury Cathedral in England, the Strasbourg Cathedral in France, the multicolored Siena Cathedral in Italy, and the Spanish cathedrals in Salamanca and Santiago de Compostela.

Historians of architecture often divide Gothic architecture into variations, which emerged as the Gothic style devel-

oped. In France, for example, distinctions are made between Early Gothic (exemplified by the west facade of the cathedral at Chartres), the High Gothic (as in Notre-Dame in Paris), the Rayonnant style (seen in the Abbey Church of Saint-Denis outside Paris, where nearly every French king was buried), and the Late Gothic (for example, the north tower of the cathedral at Chartres). “Rayonnant” refers to a style that placed a great deal of emphasis on light and large windows, the name suggesting “rays” of the sun. Similar distinctions are made in reference to the Gothic architecture of other European nations. It should be noted that while the term *Gothic* tends to be applied widely to churches and cathedrals, secular (that is, nonreligious) buildings were also constructed in the Gothic style or at least had some of the features of the Gothic.

The chief feature of Gothic architecture, one that virtually defines the style, is the pointed arch, often called an ogive, a word used to refer to any curved feature, figure, or shape. The pointed arch had two purposes, one religious and one technological. The religious purpose was to create a sense of the building pointing toward heaven. The technological purpose was to redistribute the weight of the building. The disadvantage of Romanesque architecture was that rounded arches tended to push outward on the supporting walls, requiring thick walls and piers to support them. The pointed arch directed the weight straight downward rather than out, allowing architects to design buildings with less massive walls and thinner supports, which then could be elaborately decorated. The pointed arch was used not only for roofs and ceilings but also over doors, windows, and any other feature where an arch was needed over an opening.

The pointed arch led to a number of other architectural innovations. First, buildings could be built more vertically. This again gave them a sense of “soaring” toward heaven, in contrast to the squatter buildings of the Romanesque. Because the roof’s weight was directed downward, ceilings could be built with ribbed vaults—or vaults that had visible supports similar to a ribcage, creating the naturalism that 19th-century British art historian John Ruskin described as giving people below a sense that they were walking under the overarching branches of trees. Again because of the distribution of weight, a considerable amount of glass could be used. Often, this glass was elaborately stained; the rose window at the Cathedral at Chartres, one of the most magnificent stained-glass windows in the world, is perhaps the best example.

Yet another feature that for many almost defines Gothic architecture is the flying buttress, in French called the *arc-boutant*. A buttress is any structure built against a wall or projecting from it to reinforce the wall. A flying buttress is used to direct the thrust of a vault across an interior space, such as a chapel, an aisle, or a cloister, and out to the exterior

of the building and into the ground. A chief advantage of a flying buttress is that it allows more open space on walls for windows and ornamentation. Otherwise, these open areas would severely weaken the walls.

Some Gothic architecture is plain and has a relatively simple design. Most Gothic architecture, though, is highly ornamented and decorated. Different colored stone could be used to create stripes and other visual features; perhaps the most noteworthy example is the cathedral in Florence, Italy, with its alternating green and white stripes. Niches overflowed with statuary, especially gargoyles. Gargoyles were carved in the shape of grotesque human or animal figures, most with a frightening aspect. The word comes from the French *gargouille*, meaning “throat” and referring to the gurgling sound, like “gargling,” of water as it passes through a drain. The term was used because many gargoyles were used as ornaments at the mouths of water drains. Strictly speaking, a gargoyle is a waterspout, but the word has come to encompass any kind of grotesque, fantastic carving of a human or animal. In the medieval imagination gargoyles warded off evil spirits.

## MEDIEVAL DOMESTIC ARCHITECTURE

Domestic architecture throughout Europe was varied, depending on climate conditions and, particularly, the availability of building materials. Thus, for example, medieval England had a considerable supply of oak, so oak beams were cut from logs. In parts of eastern Europe such as Romania, hardwood was in short supply, so entire logs, usually of pine, were used in home construction.

Two types of homes, however, stand out and can be found, with variations, throughout Europe. One is the cottage constructed of daub and wattle, often with a thatched roof. The other is the half-timbered building. Both of these types of homes can still be seen in Europe. A person standing in a village in France, Germany, or England can touch the wood beams used in half-timbered homes constructed centuries ago. While few wattle-and-daub homes have survived the elements over the centuries, many modern homebuilders use medieval construction techniques to create similar historical homes, complete with thatched roofs. In England roof thatching remains a skill for which modern homeowners pay a considerable sum of money.

Typically, wattle-and-daub homes were built over a frame of hardwood, such as poplar. This hardwood skeleton gave the homes strength and a measure of durability over the years. The next step was to fill in the walls with panels made of woven staves, usually made with a hardwood such as oak. These panels looked very similar to the lattice that many modern homeowners put around the bottoms of outdoor decks and

porches. These panels were then covered with daub, a plasterlike substance usually made of subsoil mixed with straw. The daub was spread over the staves of the panel to fill in the wall. The home, then, was covered with a thatched roof. Typically, the thatch was made of a material such as wheat straw. To modern people, thatched roofs do not seem capable of keeping out the rain, but in fact they did a reasonably good job. The straw channeled the water downward over the eaves, and the roofs were so thick—often more than a foot—that the interior stayed dry. The biggest problem with thatched roofs was, and still is, birds and pests.

In some respects, half-timbered homes were similar to wattle-and-daub homes. The main difference is that the timbers show on the exterior of the building. Typically, in this kind of construction a square timber was cut out of a log. These timbers provided the framework for the house. They were generally made of oak, so they were extremely durable, and many such homes survive throughout Europe. The spaces between the timbers were filled with lattice and covered with plaster, similar to daub and wattle. Over time the oak timbers weathered and aged, turning very dark brown, almost black. The contrast between the dark timbers and the white plaster still creates a striking effect.

A peculiar feature of many half-timbered houses is that the second story often projects out over the first story, often by several feet. The reasons for this were twofold. One is that people were taxed on the basis of the amount of footage the house occupied along the street. To minimize footage, half-timbered houses tended to be very narrow. The projecting upper story, which was not taxed, provided additional room. The second reason is that the projecting upper story protected the lower story from rain and snow.

## CASTLES

Of course, not all Europeans lived in these kinds of ordinary homes. Noblemen and their families often lived in castles, primarily as a form of protection. Until the time of William the Conqueror most European castles were built on high ground out of wood, but wood had the disadvantage of being flammable, so many such castles were destroyed by invaders, who simply set them on fire. After that time stone was the favored material. Castles were not comfortable. They were cold and damp, and occupants lived in relative darkness because the windows were little more than slits.

The chief function of any medieval castle was defense. Surrounding a castle was a curtain wall, which was typically reinforced at strategic points. A sequence of gates also helped to deny entrance to invaders. Typically a drawbridge allowed access through the main entrance. The drawbridge and other gates were protected by machicolations, or openings in the

wall, from which projectiles could be rained down on invaders or from which boiling pitch could be poured. Battlements, or parapets at the top of the walls, were crenellated, meaning that there were regularly spaced gaps. These crenellations were decorative, but their main purpose was to provide protection for archers and other defenders, who could shoot from the openings, then duck behind the adjacent section of wall.

Within the walls of a castle was the keep, or a stronghold that provided refuge. Staircases were always spiral and ascended by winding to the right. Since most people are right-handed, most invaders carried their swords in the right hand, but because a staircase wound to the right, their ability to use their swords was impeded while defenders had more room to wield their swords. A watchtower not only enabled sentries to observe the movements of invaders but was also a sign of status. A castle's main place of entertainment was the great hall, called a *palas*. No castle would be complete without a chapel as well as interior gardens.

## THE ISLAMIC WORLD

BY MOHAMMAD GHARIPOUR

### ORIGINS

After the death of Prophet Muhammad, Islam was introduced in a vast geographical area that included lands from Spain to China. The architecture created after Islam, despite its regional variations, had common characteristics, such as multifunctionality, simplicity, invisibility, and transparency. In contrast to the surviving pre-Islamic monumental buildings, early Islamic buildings were simpler in design, were more climate oriented, and had more social qualities. The early buildings in this period were multifunctional places in which people could live, meet, and socialize. The origins of this idea could be found in the Prophet's mosque in Medina, which also served as a hostel for poor families and at the same time as a place for social gatherings.

Following the theory that form does not necessarily follow function, Muslims used prototype plans for buildings with different functions, such as the four-*iwan* plan, which was used in mosques, madrasas (colleges), hospitals, houses, and caravansaries. The concept of Allah as the only creator of the universe and the point of unity led to the idea of "internality" in architecture. In other words, this architecture, regardless of its function, has a high degree of invisibility, which improves the spirituality of the building. Moreover, the prohibition of the use of figurative forms in religious buildings led architects to use abstract forms and calligraphy as ornamentation inside and outside buildings. This new kind of decoration not only transferred transcendental meanings but

also attempted to define spaces and change spatial qualities. In addition, light was used as a metaphysical element to make buildings seem weightless and transparent.

## EAST

The eastern boundaries of Islamic countries include regions from Iran (Persia), central Asia, and India. After the invasion of Persia by Arabs in 651, while several local governments ruled in different regions (contemporary to the Umayyads and the Abbasids), architectural developments experienced a hiatus of sorts. Through cultural changes within society, royal palaces were replaced by mosques, which were more communal and democratic. Stressing the inner concentration and excluding the outer world, the earliest mosques were built based on Sassanid concepts and techniques. Using local materials, techniques, and styles, architects decorated secular buildings with polychromed cut-stucco and intricate motifs. The first powerful dynasty in the Islamic world was the Seljuk Empire (1038–1194 in Iran and Syria and 1038–1307 in Anatolia), which spread from Syria to Transoxiana.

This age was the highest point of creativity in architectural concepts, forms, and techniques in Islamic Persia. The most important achievement of Seljuk architecture, which was later widely used as a model, was the four-*iwān* plan, which originated in Parthia as a prototype in the plans of religious buildings, such as Friday mosques at Qazvin (1113–15) and Ardestan (1180). The Seljuks developed the use of stucco, tiny fragments of tile (*moarragh*), naked-brick architecture, polychrome, and geometrical forms in decoration. Moreover, despite using heavy material like brick, Seljuk architects attempted to lighten the domical mass both physically and visually. They also showed an interest in creating monumental portals (*pishtaq*), which were rectangular frames surrounding an arch. In Seljuk architecture in Anatolia, as opposed to the brick architecture of the Iranians and the Byzantines, the walls were made of rubble or rough stone and then faced with large blocks of beautifully dressed stone.

Although the invasion of Iran and central Asia by Genghis Khan (ca. 1162–1227) in 1218 caused serious destruction, his successors, the Ilkhanids, who were impressed by Persian civilization, were great patrons of art and architecture. The Ilkhanids' most important capital was Sultaniya (early 14th century), which was founded by Öljeitü (1280–1316). The only remaining building from this imperial city is Öljeitü's octagonal mausoleum, with its enormous dome and majestic scale. The Ilkhanids emphasized the verticality of the building by designing higher portal minarets, very tall portal arches, domes of immense size, and elongated panels, examples of which can be seen in Friday mosques in Varamin (1322) and Yazd (1442).

After the Ilkhanids, Timur (1336–1405) chose Samarqand as his capital and a center for artistic invention. He collected all the artisans of his empire in this city. Registan, Shah-i-Zinda, Gur-i Amir, and Ulugh Beg complexes in Samarqand are the best examples of this glorious age. Most Timurid buildings are impressive brick structures with glittering multicolored tile decorations on the exterior and inventive systems of plaster vaults of *muqarnas* (geometric decorations) on the interior.

## WEST

The Umayyads (661–750), the successors of the prophet Muhammad, established their capital in Damascus and adopted Hellenistic and Sassanid architectural elements and concepts in their buildings. Umayyad mosques were square or rectangular plans that included a central courtyard and a hypostyle (with a roof resting on columns) prayer hall. The Umayyads used local materials, especially ashlar stone and brick on the exterior and marble in the interior of their mosques, such as the Great Mosque of Damascus (706) and the Al-Aqsa Mosque of Jerusalem (715). Constructed with stone and brick, such Umayyad palaces as Qusayr Amra (712–715) and Qasr al-Hayr (727–729) were square in plan with a central courtyard. Although the Umayyads' rule officially ended in 750, the so-called Umayyad architecture (in Spain) after this period refers to the patronage of the dynasty founded on the Iberian Peninsula by the Umayyad prince Abd ar-Rahman I (731–788), whose most important building was the Great Mosque of Córdoba, with a hypostyle hall of spolia (reused from former buildings) columns and capitals supporting arcades of horseshoe arches.

Supported by Persians who were frustrated with Arab rule, the Abbasid Dynasty (749–1258) seized political leadership from the Umayyad caliphs. The Abbasids, who moved the caliphal capital from Damascus to Baghdad, were highly influenced by Sassanid structures that still remained in Iraq. Their new capital, Baghdad, which was founded near the Sassanid capital of Ctesiphon, had a round plan with governmental and religious buildings in the center. Their monumental buildings were structural systems composed of massive brick piers and arches with brick and molded stucco decorations. Using a hypostyle model, Abbasid mosques, such as the Great Mosque of al-Mutawakkil at Samarra and the Ibn Tulun Mosque in Cairo, were monumental. The Abbasid palaces of Samarra (836) and Bayt al-Khalifa (836) included military quarters, extensive gardens and recreational spaces, residential courts, and richly decorated ceremonial spaces in extensive complexes along the Tigris River.

Contemporary to the Seljuks, the Fatimid Dynasty (909–1171) established itself in North Africa and claimed the ca-

liphah title. The Fatimids, who were Shiite Muslims, founded the cities of al-Mahdiyya in Tunisia and Al-Qahira in Egypt and built congregational mosques, such as al-Mahdiyya, al-Azhar, and al-Hakim in Cairo, applying hypostyle plans. Fatimid buildings, which were mostly symmetrical in terms of the arrangements of portals and minarets, were characterized by their precise masonry work and ornament. Epigraphy (inscriptions), keel-shaped arches and fluted niches, and *muqarnas* were permanent elements of their decorations.

The Ayyubids (1169–1260) were one of the successor dynasties of the Seljuks, who were established in Syria and in Egypt after the fall of the Fatimids. In design of plans and facades, Ayyubid buildings utilized motifs and elements that had been established by the Fatimids and the Seljuks. Two massive fortifications, the citadels of Cairo and Aleppo, are examples of Ayyubid architecture that were founded by the sultan Saladin.

The Mamluks (1250–1517), successors to the Ayyubids, ruled Egypt and Syria for about three centuries. The architecture of the Mamluks was similar to the architecture of their predecessors, the Fatimids and the Ayyubids. The Complex of Sultan Qalaun in Cairo (1283–85) is a good example of Mamluk architecture. Mamluk buildings that were monumental used keel-shaped niches and *muqarnas* to decorate the hoods

of arched portals and niches. The interiors of the buildings had multicolored stone revetments (facings), mosaics, and carved wood. Carved stone domes, striped stone facades, *mashrabiya* (wooden screen work) balconies, and monumental portals encrusted with *muqarnas* were characteristic of this architecture.

The Ottomans (1281–1924), the successors of the Seljuks and the Byzantines, invaded Anatolia and the Balkans as well as Arabia to Algeria in the 13th century. During the reign of Mehmed II (1444–46 and 1451–81) Ottomans conquered Constantinople and erected many buildings in the city. Most Ottoman buildings had weightless and massive domes, which provided a great harmony between light and shadow inside the buildings. In decoration they focused on the interior, adding ceramic tile revetments and monumental inscriptions. Ottomans expanded existing buildings, such as Mehmed II's Fatih Complex (1463–71), which was constructed on the former site of the Byzantine Church of the Holy Apostles, adding vaults, semidomes, and columns, and more decoration. Byzantine architecture, such as the church of Hagia Sophia, served as a model for many Ottoman mosques.

## URBAN STRUCTURE

The main difference between cities in Islamic countries and their precedents in Syria, Egypt, and Persia was their organic structure. This structure was based on the quarter system, which was also called *mahalla* or *har* or *dar*. Each quarter, which was a combination of narrow streets with such minor public open spaces and public buildings as bathhouses, mosques, and local shops, was controlled by a manager, called a sheikh. In most cases, people from close families lived in the same quarter, making the area safer and more secure. The structure of a quarter, which was also a result of the underground irrigation system (*qanat*) and, to an extent, over-ground water streams, shaped a kind of street life that included ceremonies and social meetings.

The process of urban design was very climate oriented for architects and planners. They attempted to control the air circulation while providing the most shade for people who lived in such arid climates. The facades of buildings in a quarter were designed to maintain harmony within the whole quarter. Since the privacy of the residents was the most important factor in the physical connection between houses and alleys or streets, in some cases a foyer was designed to avoid a direct connection between a house and the street. Most Islamic cities were surrounded by walled fortifications to protect the city against attacks and also to control the entrance. The most important public spaces in cities were Friday mosques, near which the markets were located. In planned cities, such as Samarqand, Herat, and Isfahan,

Fragment of a balustrade; Iran, late 13th-early 14th century (Los Angeles County Museum of Art, the Phil Berg Collection, Photograph © 2006 Museum Associates/LACMA)

the urban planning was based on an enormous number of gardens, which shaped the whole city.

### MOSQUES, COLLEGES, AND MAUSOLEUMS

The religious architecture in Islamic countries includes mosques (Friday mosques, royal mosques, local mosques, and *musalas*), religious schools (madrasas), and memorial shrines. The term *mosque*, or *masjid*, literally means “a place of prostration.” Mosques functioned not only as sacred religious buildings for five mandatory daily prayers but also as public places for social gatherings, ceremonies, charity events, and even business meetings. Friday mosques of different scales (which varied from neighborhoods to a whole city) were places for Friday prayers, while *musalas* were natural clearings or walled-in enclosures to hold two feast prayers (to celebrate fulfilling the Ramadan fast and the Mecca pilgrimage).

The earliest mosque, erected by the order of the Prophet, was a walled-in square, including a courtyard separating a back portico from a roofed prayer hall. This plan, which was called hypostyle, was used in Arabic countries and was later modified in other regions. For example, in Iran and central Asia the four-*iwān* plan was used as a prototype. The roofing system was more a local decision. In Anatolia a central domed space flanked by smaller spaces flourished. The mosques in Indonesia followed regional patterns with pyramidal roofs. In China mosques with traditional hip roofings were designed. The prayer hall was required to face *qibla* (the direction of Mecca). Thus, architects oriented spaces and whole plans in mosques in certain directions. In most mosques pools were located in the center of the courtyard in order to accommodate the cleaning ritual before the beginning of the prayer.

The architecture of the madrasa followed the same plan as for mosques. In most cases, four-*iwān* plans were used, with several rooms surrounding a central courtyard. With the advancement of science, astronomy, and philosophy and the emergence of Persian scientists, such as Omar Khayyam (ca. 1034–ca. 1131), Ibn Sina (980–1037), and Razi (ca. 865–between 932 and 935), madrasas played a vital role in the medieval Islamic world. The first madrasas were probably built in the ninth century in the eastern regions of Iran. The construction of madrasas was in most cases the result of political administrative decisions to expand knowledge and sometimes to take over other religious sects or political movements. The madrasas were sometimes *iwān* buildings attached to mosques of the houses of their founders. During the rule of the Seljuks in Persia and the Mamluks in Egypt and Syria several madrasas were built.

Although erecting mausoleums was not encouraged in Islamic regulations, Abbasid caliphs began reviving this tra-

dition, which had roots in pre-Islamic architecture in Persia, Anatolia, and Egypt. The earliest-surviving mausoleum, Qubbat al-Sulaibiya, erected in Samarra in the ninth century, was an octagonal monumental mausoleum and resembled Roman mausoleums. This trend was continued later by nomad Turks, such as the Seljuks and the Ghaznavids, who erected towers on tombs of kings or members of the royal families.

### PALACES AND CITADELS

Administrative buildings in the Islamic world can be divided into two categories: palaces and military fortifications. The first palaces in the Islamic world were built in the Umayyad Period, when caliphs rejected the simple lifestyle of the Prophet and his successors. The architecture of Umayyad palaces located at Syria, Jordan, and Palestine is related to Roman villas and Sassanid palaces erected in pre-Islamic ages in the same region, when the construction of palaces and villas was the result of the kings' and nobles' desire to show their power. After the Umayyads and the Abbasids, nomad Turks, who gained power, were more interested in constructing pavilions that were similar to their tents, such as the Ghaznavid palaces in central Asia. The Ilkhanids' most important palace was in Takht-i-Suleyman, which was originally a Sassanid palace and temple. After the 15th century the Timurids, the Ottomans, and the Safavids erected several palaces in central Asia, Iran, and Turkey. Besides erecting palaces and stabilizing the frontiers of the Muslim world, Muslim leaders established a formalized system of defense. The result was the creation of several fortifications in North Africa, Spain, Anatolia, and central Asia. At the same time, the citadel, which was a fortified defensive unit, was occupied by the king or the lord. In the Islamic world these fortresses, which were based on Near Eastern architecture, especially in Assyria, varied in size and importance. With baths, reception halls, walls, towers, and probably rest areas, some citadels were initially located far from cities to accommodate alien soldiery.

### GARDENS

Gardens occupied a significant place in the architecture of Islamic countries. They were developed in two different forms; the first form was an open planted garden with a pavilion, while the second form was an inner courtyard enclosed within a building. The so-called Islamic garden was a fourfold garden that originated with Cyrus the Great's (ca. 585–ca. 529 B.C.E.) garden at Pasargadae. After the rise of Islam, Abbasid caliphs, whose palaces (in present-day Iraq) were in areas close to the Sassanid capital (Ctesiphon), continued the Mesopotamian and Persian tradition of making gardens for pleasure and hunting. Muslims, for whom pleasure gardens were traces of paradise on earth, attempted to

design gardens that resembled Koranic descriptions of paradise gardens (*Ferdows*).

These gardens still followed the pattern of the Achaemenid garden at Pasargadae, in which a pavilion was located above a fourfold planted garden with a pool in the center and trees and flowers planted in rectangular form. The gardens not only worked as spaces for pleasure but also acted as permanent components of architecture. Later, in the Timurid and Safavid periods, gardens were designed to shape urban areas, such as streets, squares, and whole cities. Although the same pattern was more or less exported to all Islamic territories, the elements of the garden, such as arrangement of trees, ornamentation, contents, and scale, were based primarily on local traditions. While Mughal gardens in India and Kashmir included large unplanted areas with plenty of local fountains, the gardens in Morocco and Spain were smaller, with a pool in center. In addition, Mughal Indians replaced pavilions in gardens with mausoleums. Two most famous examples of gardens in Islamic territories are the Hasht-Bihisht garden in Isfahan and the Taj Mahal in Agra. Muslims also used gardens as places for producing plants, medical herbs, flowers, and fruits.

### MARKETS AND CARAVANSARIES

After the establishment of Islam, Prophet Muhammad made specific regulations to recover trade in Arab society and to decrease the disparity between the wealth of classes within the society. Based on these regulations, collecting wealth without considering others' benefit was prohibited. At the same time, lawful and decent trade was strongly supported in order to improve the quality of life within society. In the Islamic world the construction of markets, which might have had roots in the Byzantine and Parthian empires, facilitated international trade for people in various regions. In addition, the role of the Islamic countries, such as Persia and Turkey, as important sections of the Silk Road; the importance of travel as a tool of learning for Muslims; and the significance of the pilgrimage in Islam encouraged governments to create markets and caravansaries to facilitate trade and financial contacts in the whole region.

The typology of caravansaries was the result of climatic circumstances, except in mountainous areas, and an enclosed plan with a central courtyard (probably with adjacent buildings, each with a central courtyard) was used. The caravansaries outside cities served as hostels for travelers and tradesmen, whereas the caravansaries inside cities functioned within markets as places to accommodate travelers and to sell merchandise. The structure of markets was based on the organization of trades and crafts (guilds). Merchandise of a particular type was sold in a specific caravansary or shop-

ping center or shopping street. Moreover, the structure of the bazaar was based on an organization to provide maximum security, especially for high-ranking businesses or expensive crafts. Markets became the backbones of Islamic cities, serving as the main circulation streets within cities and as connectors between important neighborhoods. In small towns the markets were close to the one or two gates to the town, while in larger cities the markets were placed in the center of the city. In large cities the markets were connected to the main civic centers in which temporary and occasional exhibitions were held to sell certain merchandise or in which social gatherings and administrative activities were conducted.

### HOUSES

The residential architecture in the medieval Islamic world included private houses located in cities and villages and caravansaries located inside cities or as isolated buildings outside cities and villages. The plan of caravansaries was climate oriented, and in hot and dry areas the four-*iwan* plan was applied, in which rooms were located around a rectangular or square central courtyard. Except in nonarid areas, the private houses included a central courtyard around which rooms were located. In accordance with Islamic instructions regarding the importance of guests, the largest and most decorated rooms were allocated to guests. The designs of houses stressed interior spaces, while the exterior of a house was designed in a very humble way without any fancy ornamentation. Generally, the size and complexity of houses depended on the wealth of their owners. Houses owned by rich people were sometimes complexes of several houses occupied by relatives in a large family. In these cases the houses were expanded and developed based upon the family relations among the occupants. The spaces inside houses were arranged in a way to provide the greatest privacy for residents (against visitors), especially for the women. Additionally, the size and location of rooms were based on the hierarchy of the residents in the family. The garden located in the center of the courtyard, with trees and flowers and a central pool, was a symbol of paradise that practically improved air circulation inside the houses.

### ARCHITECTS AND CONSTRUCTION

Architects in Islamic countries were usually specialists in calculation and design and were innovative and imaginative in conception and structure. In most cases, occupations related to art and architecture were family heritages. Construction, whether done by Muslims or non-Muslims, was considered a sacred process, in which architects and craftsmen took advantage of their faith in order to create a transcendental architecture. For this reason, except in a few cases, the names of architects did not appear on their buildings. The movement

## MATHEMATICS IN STONE

Architecture has sometimes been called “mathematics in stone.” An architect in any culture has to have a firm grasp of the principles of measurement, angles, the weights and carrying capacities of materials, and similar mathematical concepts. This grasp of mathematics was nowhere more apparent than in medieval Islamic architecture, particularly in the elaborate and highly complex designs of tile work found in surviving medieval Islamic buildings.

Only in the 21st century have scientists come to appreciate fully the complex mathematics that may have been involved in the construction of this tile work. Many of these scientists are crystallographers, or scientists who study the crystalline patterns of substances. Using highly sophisticated instruments that measure the diffraction of light, they can examine in minute detail the form and arrangement of crystals and what are called *quasicrystals*. While crystals are associated with glass or glasslike substances, quasicrystals are associated with such substances as aluminum, copper, cobalt, and nickel. The prefix *quasi-* means “similar to” or “resembling.”

A crystal is a symmetrical arrangement of atoms along three dimensions or axes. The pattern can be repeated over and over, causing the crystal to grow and to fill up whatever space it occupies. A quasicrystal exhibits the same structure of atoms, but instead of doing so along three axes, a quasicrystal exhibits the pattern along 10. Thus, quasicrystals are often referred to as decagonal quasicrystal structures, with the word *decagonal* deriving from the number 10.

Only in 2007 did scientists discover that the crystalline structure of medieval Islamic tile work exhibits this decagonal quasicrystalline structure—a concept that was “discovered” by Western scientists only in the 1970s. They use the term not to refer to the physics of the materials out of which the tiles were made but to refer to the symmetrical properties of the designs themselves. Put differently, when they look at a sample of medieval Islamic tile work, what they see is a pattern that replicates the kind of crystalline pattern they would see in a substance under a microscope. Clearly, such a pattern is complex beyond belief.

The question that arises is how medieval Islamic architects could have created these crystalline patterns to produce the breathtakingly beautiful tile work that adorns the mosques and other buildings they constructed. To create simple geometric patterns, straightedges and compasses can be used. But as patterns become more complex, it is inevitable that geometric distortion will occur, even when such tools are used. If geometric distortion can take place with the simplest arrangement of tiles in a row, it seems almost inevitable that it would occur when the pattern becomes seemingly infinitely more complex. However, scientists who have examined these patterns in Islamic tile work find virtually no distortion. Thus, they conclude that the architects had not only an understanding of the complex geometry involved but also tools far more sophisticated than straightedges and compasses.

of architects in different areas of the Islamic world led to similarities in architectural designs and concepts throughout the region. These architects began construction with delicate geometrical drawings as well as fragmentary drawings. Masonry techniques included stonework, brickwork, clay walling, carpentry, plastering, and tiling. Architects in the Islamic world also developed special types of construction, such as vaults, domes, and minarets.

## DECORATION AND ORNAMENTATION

One of the characteristics of architecture in the Islamic world was the special treatment of decorations and the development of types of ornamentation that were not common outside Islamic territories. The ornamentation in buildings, whether part of the structure or the exterior, was in contextual harmony with the spatial qualities of the architecture. In other

words, the components of decoration, as a complex overlay, not only formed surfaces but also defined spaces. The prohibition of the use of sculptures and figural and animal art encouraged Muslim artists to find other techniques to decorate their buildings. Taking advantage of the heritage from Mesopotamia, Persia, and to some extent Rome, early Muslim artists developed their decorations in three main phases. In the first three centuries after Islam, patterns, repetition of elements, and intricacy in stone and stucco were applied as the main elements of decoration.

The second phase, developed mainly in eastern areas, created decorative effects through brick and terra-cotta patterns. The most glorious age of this phase was the Seljuk Period (1038–1194), when ornamentation and structure were completely integrated in construction. From the 10th century the decoration of portals and mihrabs became fashionable in

the Islamic world. Using glazed tiles to decorate portals and facades of buildings and stucco to ornament mihrabs reached its highest point in the Timurid Period (1370–1506).

The third phase was marked by an emphasis on color rather than on texture. While in western areas, such as Spain and North Africa, tiles and stucco were combined with carved wooden elements in geometrical and symmetrical schemes, in Iran and central Asia brick and tile covered the whole surface of buildings. At the same time, the Ottomans used stone as a decorative element on the exterior of buildings and tiles on the interior of buildings, while Mughals in India used decorations on facades with an emphasis on white marble and red sandstone.

The decorative elements of Islamic buildings include calligraphy, geometrical patterns, floral patterns, the arabesque (an intricate floral pattern), and figurative and animal patterns. Replacing figurative arts in Western architecture, calligraphy, a way to record God's words in the Koran, was a central decorative element in Islamic architecture. From the earliest Islamic building, the Dome of the Rock, calligraphy as a sacred element was used to connect the physical space to heaven. The inscriptions were usually framed geometrically on portals, on cornices, on domes, and even in corridors. Though the inscriptions were different in purpose and decoration, the meanings of the inscriptions used in different parts of the building typically were connected through symbolic associations. Geometric patterns, with their abstract forms, which were developed in Islamic art to avoid realism, originated in Parthian and Sassanid decorations. These geometrical patterns were used to balance positive and negative areas of a building and to dematerialize architecture. The application of these patterns obliged architects to work with mathematicians to develop complicated systems of geometry.

Muslim artists, especially after the 15th century, produced floral patterns to create symmetrical and repetitive schemes. Flowers and trees depicted in manuscripts were used as motifs in objects, textiles, and buildings. Another decorative element, which also had roots in the Hellenistic Near East and Parthia, was arabesque, which was widely used after the 10th century. Arabesque as interlacing plant forms and

abstract curvilinear motifs was characterized by a series of counterpoised and leafy stems that split off and returned into the main stem. The arabesque patterns were placed on a carefully designed network of grids designed on complex mathematical principles. In western areas, such as Spain, Egypt, and Morocco, stucco, marble, and mosaic decorations were used in decorations of parts of buildings; in eastern regions arabesque provided an overall and monumental decoration.

Although Islam discouraged the depiction of figures in art and architecture, under European and Buddhist influence figural art, more or less, was applied, especially in private buildings. In addition, light and water were used not only as components to define spaces but also as decorative elements. For Muslims, light was a symbol of God, while water was a symbol of purity of soul. In addition to its patterns, forms, and designs, natural light changed with the time of day or year. This change could create different phenomenal properties in space and also could provide a mobile projection of patterns. The interplay with light and shade, especially in religious structures, was a tool to enhance spirituality while defining the function of each space. The movement of water in channels or fountains and its stability in pools played a significant role not only in cooling the environment but also in defining new dimensions, such as sound and reflection, and even in highlighting the interplay of light and shadow.

### Europe

#### ~ Procopios: "On the Great Church" (Hagia Sophia), excerpt from *De aedificiis* (sixth century) ~

The emperor, thinking not of cost of any kind, pressed on the work, and collected together workmen from every land. Anthemius of Tralles, the most skilled in the builder's art, not only of his own but of all former times, carried forward

the king's zealous intentions, organized the labours of the workmen, and prepared models of the future construction. Associated with him was another architect [mechanopoios] named Isidorus, a Milesian by birth, a man of intelligence,

and worthy to carry out the plans of the Emperor Justinian. It is indeed a proof of the esteem with which God regarded the emperor, that he furnished him with men who would be so useful in effecting his designs, and we are compelled to admire the wisdom of the emperor, in being able to choose the most suitable of mankind to execute the noblest of his works. . . .

[The Church] is distinguished by indescribable beauty, excelling both in its size, and in the harmony of its measures, having no part excessive and none deficient; being more magnificent than ordinary buildings, and much more elegant than those which are not of so just a proportion. The church is singularly full of light and sunshine; you would declare that the place is not lighted by the sun from without, but that the rays are produced within itself, such an abundance of light is poured into this church. . . .

Now above the arches is raised a circular building of a curved form through which the light of day first shines; for the building, which I imagine overtops the whole country, has small openings left on purpose, so that the places where these intervals occur may serve

for the light to come through. Thus far I imagine the building is not incapable of being described, even by a weak and feeble tongue. As the arches are arranged in a quadrangular figure, the stone-work between them takes the shape of a triangle, the lower angle of each triangle, being compressed where the arches unite, is slender, while the upper part becomes wider as it rises in the space between them, and ends against the circle which rests upon them, forming there its remaining angles. A spherical-shaped dome standing upon this circle makes it exceedingly beautiful; from the lightness of the building, it does not appear to rest upon a solid foundation, but to cover the place beneath as though it were suspended from heaven by the fabled golden chain. All these parts surprisingly joined to one another in the air, suspended one from another, and resting only on that which is next to them, form the work into one admirably harmonious whole, which spectators do not dwell upon for long in the mass, as each individual part attracts the eye to itself.

From: *The Church of Sancta Sophia, Constantinople*, trans. W. R. Lethaby and Harold Swainson (New York: Macmillan and Co., 1894).

### Europe

#### ~ Paul the Silentary: "The Magnificence of Hagia Sophia" (sixth century) ~

Above all rises into the immeasurable air the great helmet [of the dome], which, bending over, like the radiant heavens, embraces the church. And at the highest part, at the crown, was depicted the cross, the protector of the city. And wondrous it is to see how the dome gradually rises wide below, and growing less as it reaches higher. it does not however spring upwards to a sharp point, but is like the firmament which rests on air, though the dome is fixed on the strong backs of the arches. . . . Everywhere the walls glitter with wondrous designs, the stone for which came from the quarries of seagirt Proconnesus. The marbles are cut and joined like painted patterns, and in stones formed into squares or eight-sided figures the veins meet to form devices; and the stones show also the forms of living creatures. . . .

A thousand others [lamps] within the temple show their gleaming light, hanging aloft by chains of many windings. Some are placed in the aisles, others in the centre or to east and west, or on the crowning walls, shedding the brightness of flame. Thus the night seems to flout the light of day, and be itself as rosy as the dawn. . . .

Thus through the spaces of the great church come rays of light, expelling clouds of care, and filling the mind with joy. The sacred light cheers all: even the sailor guiding his bark on the waves, leaving behind him the unfriendly billows of the raging Pontus, and winding a sinuous course amidst creeks and rocks, with heart fearful at the dangers of his nightly wanderings-perchance he has left the Aegean and guides his ship

(continued)

*(continues)*

against adverse currents in the Hellespont, awaiting with taut forestay the onslaught of a storm from Africa—does not guide his laden vessel by the light of Cynosure, or the circling Bear, but by the divine light of the church

Itself. Yet not only does it guide the merchant at night, like the rays from the Pharos on the coast of Africa, but it also shows the way to the living God.

### The Islamic World

### ~ Ibn Battuta: Excerpt from Travels in Asia and Africa (1325–54) ~

From Gaza I travelled to the city of Abraham [Hebron], the mosque of which is of elegant, but substantial construction, imposing and lofty, and built of squared stones. At one angle of it there is a stone, one of whose faces measures twenty-seven spans. It is said that Solomon commanded the jinn to build it. Inside it is the sacred cave containing the graves of Abraham, Isaac, and Jacob, opposite which are three graves, which are those of their wives. I questioned the imam, a man of great piety and learning, on the authenticity of these graves, and he replied: “All the scholars whom I have met hold these graves to be the very graves of Abraham, Isaac, Jacob and their wives. No one questions this except introducers of false doctrines; it is a tradition which has passed from father to son for generations and admits of no doubt.” This mosque contains also the grave of Joseph, and somewhat to the east of it lies the tomb of Lot, which is surmounted by an elegant building. In the neighbourhood is Lot’s lake [the Dead Sea], which is brackish and is said to cover the site of the settlements of Lot’s people.

On the way from Hebron to Jerusalem, I visited Bethlehem, the birthplace of Jesus. The site is covered by a large building; the Christians regard it with intense veneration and hospitably entertain all who alight at it.

#### JERUSALEM AND ITS HOLY SITES

We then reached Jerusalem (may God ennoble her!), third in excellence after the two holy shrines of Mecca and Medina and the place whence the Prophet was caught up into heaven. Its walls were destroyed by the illustrious King Saladin and his Successors, for fear lest

the Christians should seize it and fortify themselves in it. The sacred mosque is a most beautiful building, and is said to be the largest mosque in the world. Its length from east to west is put at 752 “royal” cubits and its breadth at 435. On three sides it has many entrances, but on the south side I know of one only, which is that by which the imam enters. The entire mosque is an open court and unroofed, except the mosque al-Aqsa, which has a roof of most excellent workmanship, embellished with gold and brilliant colours. Some other parts of the mosque are roofed as well. The Dome of the Rock is a building of extraordinary beauty, solidity, elegance, and singularity of shape. It stands on an elevation in the centre of the mosque and is reached by a flight of marble steps. It has four doors. The space round it is also paved with marble, excellently done, and the interior likewise. Both outside and inside the decoration is so magnificent and the workmanship so surpassing as to defy description. The greater part is covered with gold so that the eyes of one who gazes on its beauties are dazzled by its brilliance, now glowing like a mass of light, now flashing like lightning. In the centre of the Dome is the blessed rock from which the Prophet ascended to heaven, a great rock projecting about a man’s height, and underneath it there is a cave the size of a small room, also of a man’s height, with steps leading down to it. Encircling the rock are two railings of excellent workmanship, the one nearer the rock being artistically constructed in iron and the other of wood.

## ► art

### INTRODUCTION

The art of the medieval world was very diverse and as sophisticated and complex as art of the modern world. Medieval artists were constantly working with their audiences, trying to communicate ideas or to satisfy an audience’s desires. This complex interaction between artist, art, and audience was true even in regions where one might be tempted to call the art “primitive.” For instance, in Australia and in southern Africa people still painted rocks as had their ancestors 25,000 years earlier. Still, the rock art of the medieval era was not simple scratches of primitive minds. An Australian had to fit his or her work among the works of thousands of years. These works told the history of a tribe, from antiquity to the present, and the images not only had to conform to the story told by earlier paintings, it also had to carry a great weight of symbolic content. This meant that the artist had to be familiar with the language of the community’s art—that is, the strokes of paint or incised lines that would enable a viewer of his culture to quickly understand the topic of the work of art and the actions it was intended to convey.

In southern Africa the rock art of the San and Khoikhoi was used for initiation rites and was expected to explain through images the responsibilities of adult life. As with the Australians, the southern African artist had to draw on the symbolism of his or her culture and incorporate it into a coherent work of art. The tasks of the rock painters were as demanding as those of the European painters of the same era, whose audiences expected them to incorporate Christian symbols into their works, making the symbols an important part of the impression the artists hoped to convey.

It is worth considering the role of symbolism in medieval art. Not all medieval art was symbolic. For instance, one may gaze upon a courtly painting of the Chinese Ming Dynasty (1368–1644) and see a woman feeding birds. It is possible that the painting is part of an instruction manual about how courtly women were supposed to behave, but it could be that the image itself was meant only to give pleasure, without deep inner meaning. Sometimes the purpose of a work of art is no more than to be a work of art. An easy trap for archaeologists to fall into is the notion that every painting, sculpture, or casting must have a purpose, even if the purpose is unclear. This is a habit of mind: Archaeologists are often trying to fill in portraits of entire societies with scant evidence, and every

artifact is examined for what it might say. Yet what does a pot from the Mississippi region say with its painting of jagged lines or geometric patterns? It is possible that the image has symbolic importance, such as identifying the social class of the original owner, but it may be that the image was just meant to be pleasing.

It is in the pleasing effect of much art that common ground may be found among the artistic traditions of the vastly varying cultures of the medieval world. If it is possible to make a generalization about art, it may be this: People want beauty in their lives. It is possible to cite individual people who for one reason or another do not respond to art or regard art as evil, but the vast majority of humanity responds to art. Tastes may differ, but pleasure is still derived from one or another form of art. If one were to look at the tastes in design of the medieval Japanese, one would find a pleasure in simplicity. House, temple, and palace emphasized spare lines and simple decoration, but in almost any Japanese home one would find niches built exclusively for the display of paintings. In fact, so profound was the Japanese culture's love of art that it found even wild lands, unshaped by human hands, to be works of art. There was not a rejection of ornate decoration but an embracing and including in their lives of the spirit of the artist. They experienced the art of painters and sculptors by living in it and making it a part of everyday events.

To varying degrees this was true elsewhere. For instance, in Europe no ordinary object was complete without artistic expression. Crossbows might have rams' heads carved on the ends of their shafts. Exposed ends of timbers in houses or cathedrals would have angels, animals, or plants carved on them. The image might be of a theme—an angel would fit in a cathedral's religious mission—but the principal impulse probably was that no structure was complete without art that spoke to the heart or gladdened the eye. In medieval China and Korea, cultures very different from that of Europe, one still sees the same impulse at work. It seems that no pot, no home, no government office was complete without the touch of an artist. In India almost no public space was complete without art. Indeed, Indian architects believed that no building was truly complete without images of women, either as statues or paintings.

It is in some of the saddest events in India's history that one can plainly see the importance of art to a culture. Invasions of India from central Asia and from the Near East resulted in the wholesale destruction of Indian art in northern India. Their fabulously carved wooden cities were burned, and their elaborately decorated temples were defaced or even dismantled. This stemmed in part from a profound disagreement over what art should be. Invading Muslims thought that art should not depict human forms, and religious art should

not depict any sort of living creature, because to do so would be to encroach on God's divine authority as creator of life, a point of view opposite to that of Indians, who regarded their art as a celebration of life and God. Further, the destruction of Indian art was an effort to repress Indian culture by taking away the artistic expression of the culture. Not only in India but indeed throughout the world many people regarded the works of their artists to be fundamentally important expressions of their cultures. Perhaps it is in this that modern people may learn about the minds and emotions of the peoples of the medieval world, because their art was an expression of what they valued and what they believed was beautiful.

## AFRICA

BY SHARON PRUITT

In much of medieval Africa the concept of artist, as it is known in Western cultures, was unknown. Moreover, African languages do not have a word for the Western concept of art, although expressions for describing objects as beautiful, made, or embellished do exist. The artistic portrayals of human figures associated with religion are stylized rather than representational. The figures are both people friendly and spirit friendly because individuals used them to contact the spirit world. Although many medieval African artworks are associated with religion, some were simply utilitarian and included items like household objects, weapons, and agricultural tools. Medieval African artists made both utilitarian and ritual sculptural art objects that served various purposes for the individual, the family, and the community.

Many problems exist in the study of African art with respect to artists' names, the provenance of pieces, and dates. Regardless of the media, the names of traditional African artists are anonymous to Westerners. African artists do not sign their works, as most Western artists do. Although the owners of artworks or other members of the community knew the names of the artists, early Western collectors of African art failed to ask or record their names. In addition, Westerners labeled the artworks by the culture from which they obtained them. Sometimes this creates problems, because the artwork may have originated in another culture and country and become displaced because of trade or human migration.

Specific dates for many art objects are unknown or approximated. For example, medieval terra-cotta and metal art objects, representing some of the oldest art in Africa, often are dated by radiocarbon methods. The medieval period began with the Iron Age and moved into the Bronze Age. The dates for wooden masks and figural sculptures, which are the most well-known African artworks among Western audiences, correlate best to the Western modern and contemporary pe-

riods. During the medieval period in Europe, Africans were probably producing and using wood art objects; however, there is no evidence of their survival because of the perishable nature of wood in the tropical and dry climates combined with infestations of termites. In other words, in Africa the life expectancy of wood sculpture is less than 100 years from the time the wood is cut from the tree. Westerners began to collect and acquire African wood mask and figures avidly in the 20th century; thus the dates for most African wood artworks are not before the 19th century.

### NORTHEAST AFRICA

By the fifth century the Coptic Christian religion was firmly established in Egypt. The Coptic Church followed the Monophysite doctrine of recognizing Christ as one person with one nature. Coptic religion and art spread throughout Egypt and farther south in the neighboring countries of Nubia (present-day Sudan) and Ethiopia. The geographical connections and cultural influences of Christianity and the Coptic religion were complex. During the fifth century Egypt was ruled from Constantinople, the capital of the eastern Roman or Byzantine Empire. From 619 to 629 Egypt was under Persian rule, adding a strong Persian influence to Coptic art. The art varies by region in northeastern Africa. Stylistic unity is difficult to

discern because its influences are Egyptian, Greek, Persian, Byzantine, Syrian, and Christian.

A subject of some important Coptic artworks is Saint Menas, the most popular saint of his native country, Egypt. His cult spread throughout the Mediterranean, reaching its zenith from the fourth to the ninth centuries, when his tomb was a great pilgrimage site. Menas, born in Qetwa or Mareotis in Egypt, was the only child of wealthy Christian parents. While he was still a teenager living in Phrygia, his parents died, and Menas consoled himself with his Christian faith. Desiring to be an officer, he entered the Roman military. The Roman emperors Diocletian and Maximian issued an imperial decree against the Christians stating that all the inhabitants of Phrygia must worship pagan gods. Menas refused, left the army, and sought martyrdom.

After his execution in 295, Menas's body was preserved by Christian soldiers, who were able to prevent his remains from being burned. A Phrygian commander agreed to take the body to Egypt aboard his ship. During the sea voyage Menas's body was said to have protected the vessel from the evil forces of animals with long necks, similar to camels, that attacked the boat but were rebuffed by flames emanating from the corpse. The miraculous protective powers bestowed on Menas were believed to have continued in Egypt. When the

*Coptic wall painting of the martyrdom of the saints; Wadi Sarga, Egypt, sixth century* (© The Trustees of the British Museum)

time of Christian persecution ended, Pope Athanasius of Alexandria attempted to take Menas's body back to Phrygia, but each camel on which he placed the body refused to move. Thus Menas was buried in a wooden casket on the spot, in a desolate region southwest of Alexandria (present-day Abu Mina).

The martyr's tomb was a shrine in a basilica with underground chambers. The miracles at the shrine were recorded in several languages: Greek, Latin, Ethiopic, Nubian, and Coptic. The recordings portray Menas as punishing misdeeds, performing acts of healing, or saving people from disaster. Pottery flasks called *ampullae*, which were manufactured in great quantities and transported all over the Mediterranean from the sixth through eighth centuries, were said to have miraculous powers, even at a distance, when filled with sacred oil or water. On some flasks Menas, like many Egyptian saints, is portrayed on horseback prepared to fight a war against the forces of evil. Other objects, such as a sixth-century ivory box (*pyxis*) displayed in the British Museum, portray him in a sanctuary flanked by camels or being executed. Some scholars doubt Menas actually existed and believe that his cult represented a survival of Egyptian religion, incorporating the cults of the ancient gods Osiris, Horus, Anubis, and Amen.

Coptic fresco paintings portraying Menas are found in a room of a small temple in the enclosure wall of Medinet Habu, the Mortuary Temple of Ramses III, in the Coptic town of Jême on the west bank of the Nile. The color palette is limited to black, gray, three shades of red, and white. Coptic paintings tend to stylize the human figure, flattening it out and portraying enlarged, opened eyes. Like the subject on the pottery flasks, Saint Menas appears on horseback, with camels, sometimes engaged in a miraculous act.

## NORTHWEST AFRICA

The Soninké people built their capital city, Kumbi Saleh, on the edge of the Sahara, located in present-day Mauritania. Kumbi Saleh became extremely important in the trans-Saharan trade routes. The inhabitants not only were farmers but also engaged in trade connected with the salt and copper mines, which developed to the north. To the south, trade routes extended into Ghana, which had extensive gold mines. During the Middle Ages, Kumbi Saleh became the capital of the empire of Ghana. The trade routes opened opportunities for raids from northern invaders and for the spread of Islam, which entered North Africa in the early seventh century. Kumbi Saleh was pillaged by the Islamic Almoravids in 1086.

A pre-Islamic presence in Kumbi Saleh is distinguished by ceramic objects, such as the fragment of a terra-cotta female figure that dates to about the sixth or seventh century. The small figure fragment, which measures 4½ inches, possi-

bly was used as a portable art form. It portrays a slender waist and pronounced buttocks.

## WEST AFRICA

Bura is located in southwestern Niger close to the Niger River. Little is known of the Bura civilization (ca. the third to 11th centuries). Most of the objects excavated from the site in Niger known as Asinda-Sikka are terra-cotta heads and vessels. Some stone heads and human figures also were found. Whether made of terra-cotta or stone, free standing or attached to pots, all the heads at Asinda-Sikka portray similar features. They are flat and round, rectangular, or arrowhead-shaped forms with elongated necks. Their simplified vertical noses, small circular eyes, and oval-shaped mouths (when present) are raised from the background. The Bura artists created the raised features using a technique that is similar to relief but is the additive modeling technique for clay rather than the subtractive sculpture technique. The heads are distinctively different from one another and characterized by varying hairstyles, scars, and head shapes. It is unknown whether the different styles reflect stylistic changes that occurred over time.

More than 600 terra-cotta vessels were found at a burial site in Asinda-Sikka. The funerary pots contained iron arrowheads, teeth, and other portions of human skulls. Traditional African cultures commonly refer to the significance of the head, which is considered the location of spiritual essence, vital energy, and four of the human senses. The preservation of parts of human heads in the pots at Asinda-Sikka seems to reflect spiritual empowerment. The spiritual connection to the head is further emphasized in the portrayal of human elements on the funeral pots. Some of the round pots are covered with depictions of facial features, while others include extensions, such as a flattened head attached to an elongated neck, that emanate from the mouths of the vessels. Tall cylindrical pots support human figures, and although women are sometimes depicted, many of the figures are men on horseback. Both men and horses are stylized, with raised facial features similar to those on the heads discussed earlier. In addition, the clay is modeled on the surface of the figures to simulate jewelry (necklaces, pectorals, and bracelets). In African cultures this type of jewelry display indicates royal status. These pots thus may mark the burial site or royalty.

Igbo Ukwu is the name of a culture and an excavation site located east of the Niger River. The people of Igbo Ukwu, ancestors of the present-day Nri people who are part of the Igbo ethnic group, were the earliest known smiths of copper and its alloys to produce metal sculpture in West Africa. The artwork found at the site is associated with a senior titled man from a specialized clan of ritual leaders known as the Eze Nri

who still preside among the eastern Igbo. The *eze*, or king of the Nri peoples, is a position affiliated more with a ritual leader than a political head. The Igbo Ukwu people were organized into self-contained villages, or federations of village communities, with elders and age-grade organizations sharing various governmental functions.

The history of art in southern Nigeria is characterized by three cultural traditions of the lost-wax process of metal casting. The arts of Igbo Ukwu (ninth to 10th centuries), Ife (12th to 15th centuries), and Benin (15th century to 1897) are chiefly productions in bronze, an alloy of copper and tin. Lead added to the alloy distinguishes the Igbo Ukwu artworks from the later metal castings of Ife and Benin artists, who added zinc to the alloy to form brass. In brief, the surfaces of the Igbo Ukwu lead bronze works cannot be altered after casting, which requires accurate design in the initial stages to form a precise mold. At the beginning of the process the artist must gauge precisely how the artwork should look when completed. The relationship between the Igbo Ukwu works and other metal-casting traditions in Nigeria's southern region, such as Ife and Benin, is unknown.

The art of Igbo Ukwu has been uncovered at three excavated sites related by proximity and material: a burial chamber, a shrinelike chamber, and a refuse pit. The first site was the grave of an *eze*, who was buried as if appearing in a ceremony, seated upright on a round stool and secured with two metal brackets propping up his arms. Fragments of fabrics found in the chamber indicate that the *eze* was donned in ceremonial attire. Buried with him were ivory tusks, woven mats, a leopard skull on a staff, a lead bronze of a male horse rider for a staff head or fly whisk handle, a fanlike feathered staff, a feathered crown, a pectoral plate, and thousands of glass beads, which were probably used in jewelry worn on the legs and wrists and around the neck. This Igbo Ukwu burial site is reminiscent of those of Egyptian pharaohs, who were also buried with their ritual and funerary art.

At the second site an array of lead bronze cast objects with finely worked, decorative surfaces were placed on a clay platform, possibly a shrine. Included among these objects were pendants, one in the shape of a human head containing facial scars and others portraying a leopard, elephant, and ram; vessels in the shape of calabashes and shells; ornate staff heads and knife scabbards; a hollow stand with figures and snakes; and a cast pot on a pedestal encased in a network of realistic-looking cast ropes. The surface treatments of many of these objects include various details in the lead bronze cast—for example, animals like the spotted leopard, geometric patterns such as spirals, and insects like flies.

The third site contained numerous decorative terra-cotta pottery pieces, which were possibly originally used in ritual

ceremonies. The surfaces of these pots were adorned with deep grooves of curved lines.

Ife is an ancient city in southwestern Nigeria. There is evidence that the city was occupied prior to the eighth century C.E. Scholars propose periods of development that include an Archaic Period (before 800), a Pre-Pavement Period (800 to 1000) and a Pavement Period (11th to 15th centuries). The origins of Ife can be traced back to around 350 B.C.E., when it began as a cluster of about 13 hamlets. Ife holds particular importance to the Yoruba, a historically urban people who represent one of the largest ethnic groups in Nigeria. According to the Yoruba worldview and religious philosophy, Ife is the place of origin of all humankind. It is the place where the creation of the world began and where the custom of kingship began. For this reason, Ife has great religious and political significance. Here the deities Oduduwa and Obatala descended to earth under the instruction of the creator Olodumare. Oduduwa's legacy is associated with forming the city of Ife and becoming its first divine king, while Obatala is associated with creating the inhabitants of Ife out of clay. Yoruba kings still trace their ancestry to the original Ife people and their sacred kingship system.

The Opa Oranmiyan, or staff of Oranmiyan, belongs to Ife's Archaic Period and dates to around 800. The staff is a granite monolith rising 18 feet, much taller than other stone monoliths built in Ife during the period. One of the legendary sons of the god Oduduwa, Oranmiyan was the founder of the Yoruba city-state of Oyo and the 14th-century Edo kingdom of Benin located in central Nigeria. Therefore, the Opa Oranmiyan monolith commemorates a ruler, warrior, and progenitor. The spiral-headed iron nails on this monolith may relate to Oranmiyan's association with Ogun, the Yoruba deity of war and iron (used for weapons and tools).

Human and animal subjects from the Pre-Pavement Period are stylized but more naturalistic than those from the Archaic Period. A stone male figure known as Idena ("Gatekeeper") is columnar in form. The simulated beaded necklace and bracelet on the figure suggests that he symbolizes a person of high rank. His hair is composed of wrought-iron nails. These materials link this figural sculpture to the iron and stone works that date to the Archaic Period.

In the Pavement Period paved courtyards in the palace, shrines, and gateways were sacred places that contained ritual pots fitted with lids representing various animals (rams, elephants, hippopotami, and leopards) sacred to the power position of the king. The bottom of each pot was broken to allow the poured sacred liquids to penetrate the ground. The body of the terra-cotta pots contained decorations that had symbolic religious and political meanings.

Ife kings, as descendants of Oduduwa, ruled by divine right. During the Pavement Period terra-cotta and cast brass

heads were made in their honor and possibly were primarily intended to be placed on shrines. The naturalistic heads seem to represent both male and female royalty (kings and possibly queens). The terra-cotta heads are adorned with decorative crowns; while some of the brass heads of the kings have holes around the hairline, probably for a colored glass-beaded veiled crown to be inserted. The crown symbolically shades the metaphorical king—who serves as a spiritual entity and whose speech is sacred—from the profane world. The holes around the mouth of the brass male heads are believed to have originally held hair for a beard and mustache, symbolically referring to their wisdom. It is believed that these brass heads were placed on wooden bodies that were clothed in the king's ceremonial attire and seated on a throne. They were effigies of the king erected while he was away from the palace and possibly suggest his omnipresence. Some of the terra-cotta and brass heads have lines around their necks to symbolize wealth and good health.

One brass full figure representing a king is bear chested and wears a traditional wrapped cloth around the lower portion of his body. In his hands he holds objects that may symbolize his spiritual powers as a leader. This standing figure exhibits the traditional African figural style. He is rigid in posture, frontal in presentation, and symmetrical. His head, which is naturalistically rendered, is attached to a stunted body. In fact, the head is three to four times the size of the entire body. The disproportionate size of the head on this figure reflects the African religious philosophy that the head is the most important part of the body because of its spiritual empowerment.

The Tellem lived the Bandiagara Cliffs in the Sanga region of eastern Mali. Tellem art consists of wood sculptures of human figures and utilitarian objects, such as neck rests, spoons, and bowls. The figural sculptures are stylized forms and have raised particular interest because several were originally attributed to the Dogon but later were attributed to the Tellem. The figures' upraised hands, invoking rain for crops in this dry climate, are characteristic of the Tellem style. This art style influenced Dogon figural sculpture and continued in Dogon sculpture well into the 20th century. The Tellem wood figural sculptures, intended to be placed on shrines, are covered with a thick encrustation, the result of repeatedly placing or pouring sacred liquids on or over the wood for each religious ceremony associated with the sculptures.

Tellem textiles were used for both clothing and burial blankets. The strip-woven cloths are some of the earliest extant examples of this type of West African fabrics. In the 11th and 12th centuries ritual terra-cotta pottery decorated with a plaited roulette. Possibly before and definitely beginning in the 13th century utilitarian terra-cotta pots were made by the

paddle-and-anvil technique and decorated with impressions from woven mats. Other Tellem art objects include finely knotted plait work (natural vegetable fiber weavings of skirts, belts, and mats); leather objects (sacks, sandals, and boots painted with geometric designs); and iron hairpins, spears, arrowheads, and hoes.

## SOUTHERN AFRICA

Southern Africa is the region encompassing the countries presently known as Namibia, Botswana, Zimbabwe, Mozambique, Swaziland, Lesotho, and South Africa. As elsewhere in Africa, much of the art history of the region remains obscure. Around the third or fourth centuries a gradual southern migration of peoples produced settled farming communities and show evidence of iron smelting.

Seven terra-cotta Lydenburg heads, named for the burial site where they were found, are the earliest known works of art produced by the culture that emerged in the eastern Transvaal at the beginning of the Common Era. Dating to the sixth century, these heads were produced by a culture in the Lydenburg Valley and represent the oldest known artworks from the Iron Age south of the equator in Africa. Slag in the area is evidence of the local forging of metal and firing of clay. The heads were found buried in a pit along with animal bones, pottery shards, beads, and metal ornaments.

Although not identical, all the Lydenburg heads show similar characteristics. They are hollow terra-cotta constructions with protruding noses, eyes, and mouths. Decorative details made with incised lines represent facial scars, hairstyles, and wide neck rings. White pigment residue suggests that the heads originally may have been painted. The heads are group in terms of size. The two larger ones differ from the smaller ones by a stylized animal figure surmounting the top.

The function of these heads is unknown. Speculation is that they may have been used in ritual ceremonies associated with initiation and perhaps were worn. Two are large enough to fit over a human head and neck and may have been worn as helmet masks. The five smaller ones have small holes on both sides of the neck, which suggest they may have been attached to a structural support. Although scholars have connected small pottery figurines to initiation rites throughout southern Africa, it is unclear whether the Lydenburg heads served a similar function.

## THE AMERICAS

BY JULIA MARTA CLAPP

### MESOAMERICA

The art of Mesoamerica from the fifth century to the 16th century is exceptionally rich. Variations in climate and types

of settlements as well as shifts in power have yielded equally varied objects of ritual, history, celebration, and memorial. In Mesoamerican art history the epochs encompassed by the medieval era are the Classic Period (ca. 150– ca. 650), the Epiclassic Period (ca. 650– 900) and the Postclassic Period (ca. 900–1521).

### THE CLASSIC ERA: THE MAYA

The Maya are one of the most studied civilizations in pre-Columbian Mesoamerica. Unlike many other groups, there are still Maya populating parts of Mexico and Honduras, Guatemala, and El Salvador. Before the Spanish conquest, the Maya were concentrated primarily in the northern parts of these countries as well as the Yucatán peninsula of Mexico. The Yucatán is surrounded on three coasts by the Gulf of Mexico and the Caribbean Sea. The regions occupied by the Maya are traditionally referred to as the lowlands and the highlands. The lowlands region encompasses the peninsula and takes its name from the flat landscape. The peninsula of the northern lowlands is formed by a great limestone shelf, and its flatness contrasts greatly with the Mexican and Central American highlands.

The archaeology and study of Mayan artifacts are especially popular among scientists, historians, art historians, and the general public alike. Part of their popularity is due to the Mayan form of hieroglyphic writing, from which we are able to learn a great deal about Mayan culture. Mayan art is also quite aesthetically captivating, as it tends to be both ornate and grand. The Maya have come to be thought of as the embodiment the Classic Period, as their culture was particularly rich and their methods of self-expression proficient and profound. Some art historians define the Classic Maya Period as the period in which the Maya were using the Long Count calendar.

Much Mayan art of this period was monumental. One of the many examples is found in the Mayan city Palenque, where archaeologists discovered the remains of the king Pakal (r. 615–683) buried within a pyramid called the Temple of Inscriptions. The lid of his tomb (ca. 683) was decorated with the image of Pakal as he died. The lid is ornately decorated, and Pakal's body seemingly falling through the air is carved in stone.

The Maya also made stele, carved stone markers that are similar in shape to modern-day gravestones. These were placed on the ground in front of temples or occasionally in plazas. Stelae often depict a ruler positioned frontally, with the face in profile. Lavishly dressed with an elaborate headdress, the figure usually carries such objects as scepters, which connote political power, or spears and shields, which connote military success.

Political leaders were not the only individuals whom the Maya represented in art. Although Mesoamerican civilizations have shown variations among various societies' primary deities, in the Classic Period a pantheon of gods began to solidify, and they persisted into later centuries. The rain god and the maize god, related to agriculture, were particularly important to the Maya. To these gods, the Maya made monuments whose corporeality and three-dimensionality contrasted with the flat carving of monumental stelae. Two from the important highland site called Copán—one of a scribal god and another of the maize god—are approximately 2 feet tall and are carved in stone. These figures are carved with a high degree of realism: Their body parts are proportional, and their features generally resemble those of human beings. Facial expressions vary, and each god wears a headdress and ornate jewelry around the neck. These figures, along with stelae, were placed around the interior and exterior of major temples.

Not all Mayan art was made of stone, however. The site of Tikal had less stone sculpture than such others as Copán. Instead, the pyramids were decorated with wooden lintels carved in relief. One of the most famous of these wooden lintels is from Temple IV at Tikal, which depicts a Mayan king, Ruler B, sitting on a throne and holding a spear and shield that confirm his power. The lintel, partly eroded, is densely and ornately carved.

The Maya have often been erroneously perceived as peaceful and benign, contrasting with the notoriously warlike Aztec (15th–16th centuries). However, like the Aztec, the Maya also practiced blood sacrifice, which is depicted in a stone relief carving called Lintel 24 (3 feet, 7 inches high, from the early 8th century), which depicts a ruler's wife named Lady Xoc. In the carving the kneeling Lady Xoc pulls a rope through her tongue and draws blood. Above her stands the Yaxchilán ruler named Shield Jaguar. He holds a flaming staff over her head.

Among the most amazing archaeological finds from the Classic Period Maya are the well-preserved murals of Bonampak (ca. 800), located in a region that had been largely unexplored and previously thought by archaeologists to be unremarkable. The murals are in narrative form: They tell a historical account of battle and leadership. The figures are shown both frontally and in full profile and are splendidly dressed in war regalia, headdresses, and spotted animal skins.

### THE CLASSIC ERA: TEOTIHUACÁN

Teotihuacán, located in central Mexico (about 20 miles outside modern-day Mexico City), was one of the major cities in its time (ca. 1–650). At its zenith it had a population of about 200,000, making it comparable to contemporary Euro-

pean cities, such as Constantinople, the capital of the Roman and Byzantine empires. Little is known about the people who lived there, but they left behind the remains of a stunningly grand metropolis that included housing, giant plazas, two gigantic pyramids, and other architectural achievements. Teotihuacán's historical legacy continued into Aztec times, half a millennium later; the Aztec viewed Teotihuacán as a holy and historically important site.

The sculpture of Teotihuacán is vastly different from that of the Maya. While Mayan art is ornate and intricate, Teotihuacán artisans created forms that were simple, blocky, and geometric. This style is similar to that of the Aztec. The art of Teotihuacán includes basalt sculpture of deities. One of a woman may represent a water goddess and—at 13 feet high—weighs 22 tons.

Teotihuacán art is perhaps best characterized by the plentiful and beautiful masks that have been found there. The masks do not specify gender or age, and they give a general feeling of anonymity. It is not clear how they were used—they were perhaps displayed or used in burial. The masks were made of clay, stone, serpentine, onyx, or granite. One of the best known of these masks is made of stone and has a broad forehead, almond-shaped eyes, and an open mouth. The surface of the face is inlaid with pieces of turquoise, and the eyes are inlaid with shell.

As did the Maya, the citizens of Teotihuacán painted murals. Some of the earliest evidence of pigmentation is on the surface of the Temple of the Feathered Serpent (ca. 300), where red, blue, white, and yellow polychrome is still evident many centuries later. At Teotihuacán this practice led to mural painting, which has been found in abundance in apartment complexes from the fifth through the eighth centuries. Red is an important color in these works, which generally depict culturally and politically important themes, such as warfare, sacrifice, and various deities. The images are repetitive and have been compared to wallpaper.

### THE POSTCLASSIC ERA: THE TOLTEC, THE MIXTEC, AND THE AZTEC

Several centuries after the fall of Teotihuacán and after the collapse of the Classic Maya civilization (which was gradual and documented in art with the depiction of numerous war scenes), the art and culture of Mesoamerica assumed a distinctly different aesthetic. Shifting territories, alliances, and ensuing battles led to the abandonment of Classical Period cities.

The Postclassic city Tula (inhabited by the Toltec) was celebrated by the Aztec, who elevated the importance of Toltec accomplishments and (perhaps erroneously or in exaggeration) ascribed other civilizations' achievements to the Toltec as well. Nowhere is the change in artistic approach more

evident than at Pyramid B in Tula. The low, vast building is the platform upon which massive Atlantean columns stand. These represent warriors and are adorned in warrior costume; each holds an atlatl (a spear thrower). These figures are large and are meant to be seen from far away, underscoring their symbolic importance in military defense. Their blocky, geometric simplicity and imposing silhouette are wildly different from the detailed ornament favored by the Maya.

Monumental sculpture was hardly the rule, however, during the Postclassic Period. Metalworking came north to Mesoamerica from greater Central America and was subsequently practiced by the Mixtec in Oaxaca, in the Mexican highlands. For example, in a tomb at the site Monte Albán (whose occupation spanned centuries throughout pre-Columbian history) archaeologists found an 8.5-inch piece of gold jewelry that had small, intricate carving of bells, a ball

*Masked male figure; ceramic with paint, Mayan culture, Mexico, ca. 700–ca. 900 (Los Angeles County Museum of Art, gift of John Gilbert Bourne, Photograph © 2006 Museum Associates/LACMA)*

court, and the sun. The ornament is composed of many parts, which are joined by tiny, delicate clasps.

The Aztec Empire, along with Teotihuacán, was one of the most powerful civilizations in pre-Columbian Mesoamerican history. The Aztec (also known as Mexica) were immigrants who came from a mysterious northern land called Aztlán. In central Mexico they established the Triple Alliance, a network of three polities that exerted hegemonic control over neighboring areas. The heart of the Aztec Empire was Tenochtitlán, a stunning city of boulevards and canals that was located on an island in a lake. After the conquest the Spaniards drained the lake, and Tenochtitlán became Mexico City.

The Aztec were notorious for their practice of human sacrifice as well as for their totalitarian and warlike manner of rule, and the beauty and spirituality of Aztec art have nearly been eclipsed by their scandalous reputation. The Aztec were prolific artists whose monuments, sculpture, ornaments, architecture, and manuscripts were deeply meaningful and filled with symbolism. Major themes in Aztec life and art include religion, sacrifice, and politics; all of these ideas were completely enmeshed. Unlike the Maya, who tended to depict rulers and warriors, the Aztec portrayed their gods. One of the most astonishing Aztec sculptures is the 11-foot, 6-inch-tall statue of Coatlicue (ca. 1487–1520), which was discovered in Mexico City. Coatlicue is an important goddess in the pantheon, as she is the mother of Huitzilopochtli, the primary deity of the Aztec. The monumental statue shows the goddess decapitated and without her feet or hands. In place of her head, two serpent heads symbolize flowing blood. Coatlicue was a victim of murder at the hands of her children, but the statue portrays her not as a sympathetic victim but rather as an imposing, menacing figure.

The most famous Aztec sculpture is called the Calendar Stone (ca. 1502–20). This enormous disc measures 11 feet in diameter. It is carved in relief and represents an extremely complex system of cosmological symbols. *Calendar Stone* is actually a misnomer, as the work functions not as a calendar but rather as a record of different epochs as perceived by the Aztec. In the center of the disc is a face, which represents perhaps either the earth or a solar creature. Radiating from the central figure are the 20 day signs, which are part of the 260-day divinatory calendar, and other cosmological symbols.

The Aztec also created charming sculptures of plants and animals, such as a gourd, a dog, a grasshopper, a flea, a toad, and many serpents. The sculpture of a dog is particularly appealing. The heavy stone animal has large paws like a puppy and sits in the position of a wolf baying at the moon. However, the carved mouth is upturned at the corners as if it is smiling. Many of these animals appear so delightful that it is difficult

to imagine that a culture like that of the Aztec was capable of creating them. However, the Aztec were deeply connected to the natural world, in terms of both spirituality and daily life. The function of these animals is not known, but the care and observation evident in their creation suggest that these animals were quite culturally meaningful.

## NORTHWEST COAST OF NORTH AMERICA

One of the greatest discoveries in the second half of the 20th century was that of Ozette (in 1970). Ozette was a Native American settlement in modern-day Washington State that was occupied before the conquest and inhabited until about the 16th century. Owing to a mudslide that preserved objects at the site, archaeological excavation has yielded tens of thousands of artifacts. Especially remarkable is the preponderance of wooden objects, which are especially unlikely to survive intact over several centuries (compared with other durable materials, such as stone). Many of the objects from Ozette were created for practical use: There were tools, carved tool handles, bowls, and boxes. One tool handle in particular is carved with a human face. While the lower part of the handle remains uncarved, the top is formed into a simplified and somewhat abstract face with recognizable, elongated features. A wooden box called a kerf box (in which one piece of wood is bent into shape, rather than made of joined multiple parts) has incised, simplified outline images of whales, an important animal resource for this water-based community. The significance of the whale could have been supernatural or related to hunting or both.

## THE NORTH AMERICAN SOUTHWEST

In the southwestern region of the present-day United States (modern-day Arizona), the Hohokam (ca. 500–ca. 1400) were known for their painted bowls with both geometric and abstract human forms. The painting of the Hohokam is especially repetitive. Geometric designs serve as a background for schematic and abstract human figures engaged in various activities, such as playing musical instruments or dancing. It is often difficult to distinguish males from females owing to lack of specific detail, but it is possible to guess based on hairstyle or dress.

East of the Hohokam territory the Mogollon people occupied modern-day New Mexico beginning around 500. The Mogollon also had a compelling tradition of pottery; archaeologists have found bowls in burial sites, placed over the faces of the deceased. The meaning of this practice is mostly a mystery, but one interesting detail is that most of these bowls have a hole punched out of the bottom. Scholars have suggested that the hole is the result of a ritualistic process of “killing” the bowl before it was buried, indicating that many Native

Americans believed the objects of their creation literally to be alive.

The Mogollon bowls are also painted and are more narrative and detailed than those of the Hohokam. These bowls, produced by a part of the Mogollon culture called the Mimbres, often include geometric designs around the rim of the bowl, with a scene featuring humans or animals in the center. These images are abstract, but less so than those of the Hohokam, and the content of the narrative is easier to decipher. For instance, one bowl shows two birds (decorated with a checkerboard pattern) with hatching eggs, another displays a person trapping crows in a garden, and yet another is painted with a figure between whose splayed legs seemingly emerges a baby.

The Anasazi (ca. 900–1300) occupied the area where Colorado, Utah, Arizona, and New Mexico now meet. Their habitations are distinguished by kivas, ceremonial pits in which private rituals occurred. The walls of the kiva were plastered over, and murals were then painted in detailed but abstract forms. The murals are narrative, showing various scenes about whose meaning we can make only educated guesses. Figures are painted in a blocky style but are adorned with clothing and headdresses, and they are shown holding such items as bows and arrows. These murals depict humans, plants, animals, and deities in various scenarios, many of which pertain to agriculture and fertility.

### MISSISSIPPIAN CULTURE

The Mississippian people (ca. 7500–1500) inhabited territories in the midwestern, eastern, and southeastern parts of the modern-day United States. Much Mississippian art is characterized by incised tablets and carved figural sculptures. Many of these sculptures represent seated figures that seem to be either nude or clad in extremely indistinct articles of clothing, though some are adorned with earpools. The figures have varying facial expressions that can be animated, if schematic. These may have functioned as generalized portraits of ancestors.

The Mississippian people made shell gorgets, or pieces of armor worn at the throat, which were incised with images of human figures and supernatural or other symbolic images. One gorget resembles Mesoamerican art of the era, both in style and content: A warrior whose body is depicted frontally—but whose face is in profile—holds a human head in one hand and a weapon in the other. His body is contorted to fit the shape of the gorget. The carving is simple and elegant, and includes simple clothing draping the figure as well as jewelry around his neck, wrists, and legs; he also wears a headdress. Objects with such carvings suggest important details about the culture, such as the practice of beheading,

the importance of military superiority, and the use of certain tools and articles of clothing.

### THE CARIBBEAN

The native people of the pre-Columbian Caribbean have a long, multimillennial history and probably migrated thousands of years ago from South America. The artwork of the period between 600 and 1200 was influenced by the Saladoid people, who distinguished themselves by living in rooted communities and using agriculture (rather than living transiently and eating from the wild). They established themselves from the Lesser Antilles to the eastern coast of the island of Hispaniola. Succeeding the Saladoid were the Ostionoid, who archaeologists believe are descended from the Saladoid and Archaic people. It is from the Ostionoid people that the roots of Taíno art is found. The Taíno (1200–1500) are the society who first came into contact with Christopher Columbus and also whose culture is the most studied in pre-Columbian Caribbean art.

There are several types of objects that the Taíno people made beautifully and prolifically. One of these is the *duho*, or ritual seat. *Duhos* were made out of wood and often had a high back and a simple, sloping shape. (Others had no back and more closely resembled a footstool). Often the *duhos* were carved or incised with anthropomorphic, zoomorphic, and geometric shapes, which would have been ritualistically symbolic. *Duhos* were not simply a place to sit but were used in ceremony, such as hallucinogenic or spiritual and supernatural rituals. Most *duhos* come from Hispaniola (the island on which Haiti and the Dominican Republic are located), Puerto Rico, the Bahamas, and the Turks and Caicos Islands. *Duhos* from Hispaniola tend to be made of wood, while those from Puerto Rico are generally made of stone. Bahamian *duhos* are stylistically the most complex and ornate.

The Taíno are also known for *zemis*, which are ritualistic idols or objects that the Taíno considered literally to be alive. *Zemis* generally took three different forms: stone collars, elbow stones, and three-pointers. Three-pointers are a particularly interesting type of Taíno art, as their shape is so unusual. These carved, stone objects range from 1 to 12 inches long, are roughly triangle shaped, and can stand upright on a surface. Three-pointers are carved or incised, often with one or two anthropomorphic faces, animals, or supernatural beings. The elbow stones and stone collars served as bases for the three-pointers.

### SOUTH AMERICA

The northeastern region of South America, encompassing modern-day Peru, Bolivia, and parts of Chile, has offered archaeologists a great wealth of pre-Columbian artifacts. The

region occupied by these peoples ranged from extraordinarily mountainous to sea-level, coastal territories. The best-known civilization of this region is the Inca, who, in addition to the Aztec, had the largest, most powerful empire in pre-Columbian history and who were in power when the Spanish arrived. The Inca were ultimately conquered (in 1532) by the Spanish invaders, led by Francisco Pizarro (ca. 1475–1541). However, many great civilizations produced art objects before the time of the Inca.

The Huari (of Peru) and the Tiwanaku (of Bolivia) were contemporaries whose societies were active during the Middle Horizon Period (ca. 500–ca. 1000). One of the most spectacular archaeological finds from Tihuanaco is the Sun Gate, a monolithic sculpture that archaeologists believe functioned primarily as a calendar. It is no longer at its original site, so its purpose as a gate is less apparent. The square, blocklike gate is carved in relief, with a face projecting from the top-center. The face is abstract and not easily identifiable. However, it is believed to be a deity. In addition to the projecting deity, there are low-relief carvings of dozens of birds and humans. The carvings on the Sun Gate are impressively ordered and organized, yielding an almost gridlike surface design.

South America is particularly well known in the pre-Columbian and the current era for production of spectacular textiles. These were used for everything from clothing to burial wraps to ceremonial tapestries. Textiles from the Huari were an important part of their artistic production, and the motifs found therein have similar symbolic significance to the motifs found on the Sun Gate. Before the arrival of the Spanish, South Americans wove in fibers from local animals, such as the llama and the alpaca, or plant fibers, such as cotton. Textiles are colorful and complex, with abstract representations of animals and deities (but not humans). Often the figures are difficult to “read” (interpret) because they have been expanded or contracted, rendering them quite abstract. In general, textiles were not necessarily made for personal use, so the subject matter was not a choice of the artist. Subject matter would have been determined by the government, but the means of representation were the artist’s choice.

The means of representation changed around the turn of the millennium, and designs became more geometric and less politically or religiously symbolic. These changes may have been the continuation of an evolutionary process in which images became increasingly abstract. Although animals—especially small birds—continued to be represented, the depiction of deities (in any form) seems to have ceased.

As in Mesoamerica, the working of metals was also a significant aspect of artistic production. This metalworking (especially in gold) took the form of jewelry, tools (such as ceremonial knives), headdresses, and cups. Gold was abun-

dant in this area, a fact whose importance to the invading Spanish in the 16th century cannot be overemphasized. Gold was often intricately hammered in repoussé; had attached dangling, delicate parts; and also contained inlaid materials, such as turquoise. Many of these pieces depict a deity figure with raised arms, a tunic, and an elaborate headdress.

The Inca were a powerful empire whose artistic production did not end at the time of the conquest but rather became enmeshed with Spanish traditions to create a new, colonial style. Textile production continued with the Inca, to whom textiles were extraordinarily important. The Inca did not have an economy founded upon currency but rather used cloth as economic capital. Incan society was conducted around a strong belief in production for the common good. This practice tended to yield a surplus in product; Spanish conquerors were shocked to find warehouses full of textiles at the time of the conquest. Textiles took the place of monetary currency in a complex system of tribute, taxation, organization of labor, and sacrifice. Production was strictly regulated by the government.

Incan textiles demonstrate that the civilization was exceptionally proficient in the realm of abstract thinking: Complex designs were plotted in advance and sometimes required the weaver to hold the loom sideways or upside down. As in earlier periods, many Incan textiles were highly abstract and geometric, often depicting zigzags, stripes, and color blocks. Also, many Incan textiles are divided geometrically into a grid of abstracted designs called *tocapu*, which convey symbolic, sociocultural meaning. Much of Incan textile production was devoted to tunics and tapestries.

## ASIA AND THE PACIFIC

BY CARYN E. NEUMANN

The medieval art of Asia and the Pacific is characterized by complexity, unity, duality, and diversity. Although the region is so large that it is difficult to summarize its artistic output, some commonalities exist. Buddhism and Hinduism shaped much of the art across national boundaries. Trade and conquest brought Chinese styles into Southeast Asia, influencing the art of that region. Only a few fragile pieces of Asian art have survived, and many paintings, fabrics, and pottery samples have been lost to the ravages of time. Many of the surviving pieces have been discovered in tombs or remained as part of aristocratic collections.

### CHINA

Influenced by Confucian thought, China valued function more than the individual. This thought is reflected in Chinese art in that styles are well known but individual artists

had relatively little importance. Only a few Chinese painters gained a reputation as masters. Gu Kaizhi (ca. 344–ca. 406) authored a guide to painting, *Hua yuntaishan ji* (On Painting the Cloud Terrace Mountain). Xie He (ca. 500–ca. 535) focused more on analysis than art in his *Zhongguo huihua shang de liufa lun* (Six Canons of Painting). The book explained the principles of art as expression through heavenly spirit, sympathetic responsiveness of the spirit, method in the use of the brush, faithfulness to the forms portrayed, conformity to reality in the application of colors, proper planning in the placing of elements, and transmission of experience of the past in making copies. Little remains of painting from the early medieval period in China, despite the evident interest in this art form. Much of the surviving work includes tomb murals by provincial painters or copies of paintings engraved on stone or other hard materials. Paintings of the first rank in their original form are extremely rare. The copies show impressive linear mastery, particularly in the handling of drapery, where the effect is one of swirling and fluttering movement. The people have square skulls, slightly pointed chins, and noses with sloping shoulders.

Most of what we know of Chinese art in the time of the Six Dynasties, specifically the period of the last three of these dynasties (479–589) comes from more durable forms. The continuity of earlier traditions remained strong in sculpture. Dragons, lions, chimeras, and birds retained the formation and lines of the earlier Zhou (1045–256 B.C.E.) and Han (202 B.C.E.–220 C.E.) eras. A chimera sculpture found in a Buddhist cave at Xiangtangshan is a squatting figure, with square mouth, buck teeth, large potbelly, and forepaws planted on haunches. It possesses the vigor and humor of the animals of the earlier periods. Such animals, serving as honor guards and site protectors, flanked the so-called Spirit Paths that led to the tombs of rulers, princes, and high-ranking nobles.

Chinese mythology features heavily in the art of the Sui Dynasty (589–618). The four mystical animals or the 12 animals of the zodiac appeared in paintings, engravings, sculptures, and other works of art. The four mythical animals are the green dragon, white tiger, scarlet bird, and tortoise snake. The 12 animals of the zodiac are the rat, ox, tiger, rabbit, dragon, snake, horse, sheep, monkey, rooster, dog, and pig.

The Tang Dynasty (618–907) created an especially rich environment for the arts. Politically stable, Tang China showed an openness to new ideas that created an especially rich environment for the arts. The Tang artistic style mirrored the power and vigor of the empire. Sculptures had ample proportions in three dimensions, while paintings also reflected fewer strictures. It is possible that highly calligraphic painting styles, including the extreme forms of “splashed ink,” developed in this era. Surviving Tang paintings include wall

paintings from tombs, among them, hunting scenes in landscape settings and sophisticated figural compositions of court ladies and attendants. All of these works reveal a noticeable lack of interest in the placement of figures in an environment beyond a very shallow space.

One of the great masterpieces of Tang China is the seventh-century *Scroll of the Thirteen Emperors* of Yan Liben (ca. 600–ca. 673). The painting, by a court artist, represents 13 emperors with their attendants. The first part of the scroll—the part that would have been most damaged by frequent unrolling—is a copy, but the last seven emperors are originals. The scroll contains brushwork that exhibits firm, even lines with strong composition. Secondary figures are alert, and all of the figures suggest mass and volume. Only the depiction of the faces still relies primarily on line. Shades of red, probably reflecting Indian influence, illuminates the costumes. The setting is still abstract, with the figures shown in relationship only to their immediate environment.

While Yan Liben dominated the seventh century, the greatest name in Tang painting was Wu Daozi (ca. 720–ca. 760). Acclaimed as a figure painter, he specialized in Buddhist and Daoist subjects yet left no works that survive. He is recorded as creating wall paintings of unusual power and movement, stress, and strain. Wu is credited with introducing one of the most unrealistic elements of Chinese painting: a calligraphic line of varying thickness to express the movement and power of the brush as well as to model drapery.

In addition to Tang artists who specialized in figure painting, painters who concentrated on still life subjects appeared for the first time. Painters who focused on horses were particularly popular, since horses were exceedingly important to Tang military strength. The greatest horse painter, Han Gan (ca. 706–ca. 783), showed notable realism of detail in his painting of two horses, with a central Asian groom riding one and leading the other. He used a typical abstract setting. Huang Quan (ca. 903–ca. 968) gained fame with his fur and feathers paintings. These works realistically depicted birds, insects, tortoises, and other creatures.

One of China’s most significant contributions to world art is landscape painting. It developed rapidly in the Tang Dynasty and reached fruition by the early Song Dynasty (960–1279). With decorative use of green and blue, sketchily differentiated trees, the depiction of distant foliage only along the contours of hills and mountains, and the repetitive, unvaried shape of mountains, Tang landscapes often suggested a miniature landscape rather than the grander images of the later era. An impression of space was created by placing some mountains in echelon from right to left and by overlapping others from front to back. The blue-and-green color palette became especially associated with Tang China. No ink mono-

*Album leaf: Pomegranate; ink and color on silk, China, ca. 1200–ca. 1340* (Los Angeles County Museum of Art, gift of Caroline and Jarred Morse, Photograph © 2006 Museum Associates/LACMA)

chrome landscapes of Tang now exist, though some monochrome figure paintings do survive.

During the brief period of the Five Dynasties and Ten Kingdoms of the 10th century, the economy of the middle and lower reaches of the Yellow River was devastated by warfare. However, there was less warfare among the kingdoms of the south, and the political situation there was relatively stable. The Southern Tang ruled the whole province of Jiangxi and a part of present-day Anhui, Jiangsu, Fujian, and Hubei provinces. As a relatively powerful kingdom, it encouraged the arts to flourish. The Southern Tang considered itself to be the successor of the Tang Dynasty. It imitated Tang China to a great extent, including the style of realism begun during that dynasty.

## JAPAN

Japanese art began to emerge from the shadows of China during the Heian Period (737–1185). Sculptures in the Jogan style were carved from a single block of wood in a style known as *ichiboku-zukuri* to give the impression of a columnar and massive image. A typical figure of a Buddha stands erect, evenly balanced on both feet in a perfectly symmetrical and rigid pose, facing the worshipper with no sway and no bending of the head. The expression on the face is forbidding: Jogan figures rarely seem gracious or approachable. No attempt is made to smooth over the cuts of the knife as Jogan sculpture emphasizes both the material and the tool used to work

it. Portrait sculpture is rare, and religious themes are most common. Sculptured Shinto icons began to appear in the eighth century, some in forms borrowed directly from Buddhist imagery. Others have the characteristic features and wear the dress of contemporary aristocrats. Jogan paintings, now extremely rare, included the mandala, a graphic representation of the cosmos used for meditation.

Later in the Heian Period art became more refined and decorative. In sculpture Fujiwara style images were assembled from many separate pieces of wood. These blocks were first hollowed and rough-hewn and then glued or pegged together, the finishing details carved, and paint or ornament applied. This technique, known as *yosegi-zukuri*, permitted greater undercutting and ease of pose while preventing warping and checking. Surviving Jogan sculptures have large splits because the surface of the wood dried and contracted earlier than the interior. The portrayal of Buddhist icons in painting continued. Iconic art is traditionally conservative because the magic that resides in the image may not work if the image is not accurate. One of the most important Buddhist paintings in East Asia, the *Parinirvana of the Buddha* from 1086, does show some changes. The figures evidence realistically portrayed emotion, with even animals displaying emotional states. The combination of space, color, and pattern with a unified emotional progression from calm to paroxysms of grief produces a masterpiece of Japanese art.

## VIETNAM

Triumphant in China until the middle of the ninth century, Buddhism continued to flourish in other countries of eastern Asia for several more centuries. The first sign of Buddhist artistic influence in Vietnam dates to the eighth century. Baked-earth, scale-model towers have been found by archaeologists throughout the country. These towers have sides decorated with niches in which enthroned Buddhas sit. The roofs are tile, capped with a tall parasol. The Ly Dynasty (1009–1225) made Buddhism the state religion of Vietnam. The Ly rulers ensured themselves of the clergy's support by covering the country with monuments. Only a few statues remain intact in the Traces of Buddha Pagoda built in 1057 on the slope of Mount Lan Kan. In addition to a nine-foot Buddha surrounded by dragons, flowers, and light-relief flowers, the pagoda houses works depicting animals, secondary gods, half-avian half-woman spirits holding musical instruments, and sentries. Clay sculptures of birds, dragons, and ficus leaves are stereotypical of medieval Vietnam.

## INDIA

In India the Gandhara school of art dominated from the first century B.C.E. to the ninth century C.E. It shows Hellenistic

influence in the way that clothing is draped on statuary as well as in the design of faces. Gandhara art is divided into two phases, the second phase beginning in the third century. This second phase relied heavily on stucco, blending the realistic forms of the Greeks with the rigid, frontal patterns that have ties to Indian mysticism. Stucco art was essentially a narrative of the life of the Buddha. It was the first to show the history of the Buddha on a large scale and the first to depict him as a human being. The Buddha typically has only a simple circular halo without decoration. Vivid colors of gold, black, and red were used to enliven statues on standardized architectural structures. The Gandhara style influenced the portrayal of figures throughout the Buddhist world from China to Korea and Japan.

There are too few surviving examples of painting from the Gandhara school or the Gupta Period (320–650) to make generalizations. Cave paintings found near the river Bagh show a princess in great grief being consoled by her companions, a group of princely figures, monks and female lay devotees, and dancers performing a folk dance. A few other surviving paintings depict Buddhas.

After the Gupta Period in India, the Gurjara-Pratiharas came to power in the eighth century. Hindu deities were frequently featured in sculpture and paintings, but Buddhism remained a powerful influence. Ivory carvings recovered from this period show Buddha resisting the offerings of Mara, the devil. Pieces that depict the four faces of tortoise, lion, boar, and fish were common. Surviving sculptures have elegant designs, with clouds in the background, dreamy eyes, elaborate jewelry, and naturalistic bodies. The figures tend to be thick-set, often corpulent. The sculptors were equally at home working in stone or clay. Terra-cotta sculptures survive in temples, as do examples of metalwork. Large bronzes from Kurkikar show the Buddha's descent from heaven on a jeweled ladder flanked by Indra and Brahman, his turning of the Wheel of Law, and his overcoming of Mara. The paintings from the period were strong in portraiture and reflect a love of nature.

## THAILAND

Thai art of the fifth to eighth centuries shows the strong influence of India. Sculptures of Buddhas in the so-called Gupta style have flat curls, thick lips, and a pronounced pleating of the robe; the right shoulder is bare, and the left hand grasps the end of the robe. Influence from Amaravati, India, is detected in standing Buddhas that have narrow waists, the barest hint of a robe, square heads, very large hair curls, and narrow eyes. A Thai style, Dvaravati, began to emerge in the sixth century with Buddhas who look like real people, with heavy, thick features. The style of the Srivijaya Kingdom of the eighth to 13th centuries brought lightness and grace, as

all surfaces of sandstone sculptures were carved. From the seventh to 12th centuries art showed a lack of ornamentation. Figures, usually of Vishnu, stood long and thin with short loincloths and effeminate, slightly puffy faces.

## CAMBODIA

The Cham people of present-day Cambodia excelled in architecture and statuary from the 600s until the collapse of the Champa Kingdom in 1471. Most Cham statues were made of clay, with a handful of exceptions in brick, terra-cotta, or metal. The sculptors worked mostly on subjects drawn from Hinduism and Buddhism. Among Hindu subjects, Shiva was most often represented. The god of creation and destruction, Shiva is represented in human form with an elaborate bun below a crescent-shaped tiara. He has a third eye on his forehead along with two to 28 arms. The Cham generally portrayed Shiva seated on a lotus. The Cham also made statues of dancing elephants, lions, and a lion-dragon hybrid.

## NEPAL

Simplicity of form and content are the major characteristics of Nepali art. Most of the surviving sculptures are of small size and exquisitely crafted. The Nepali artists of the Lichhavi Period (ca. 400–ca. 750) followed the same iconographic principles and artistic norms that prevailed in northern India during the Gupta Period. However, the smooth quality of the modeling and the whimsy in the posture and attitude of some of the figures are typically Nepali. Vasudhara, the Buddhist goddess of abundance and fertility, was especially popular from the ninth to the 13th centuries. The Nepali people used a technique called repoussé in architectural embellishments on buildings, making gilded copper plaques, panels, spouts, and sheaths. The principal form of painting in Nepal consisted of images of deities. Typically, a group of divinities is arranged in a rectangular composition or in a mandala, a configuration of squares and circles. In Nepal, as in its Himalayan neighbor Tibet, a primary function of a sculpture was to serve as an aid to meditation.

## TIBET

Unlike Nepalese art, which was created within the confined area of the Kathmandu valley, Tibetan art was made in a much wider geographic area and with different artistic influences. Western Tibet was shaped by influences from central Asia and Kashmir, whereas eastern Tibet exhibited more influences from China. India influenced the entire region. Buddhism came to Tibet in the seventh century and soon became the focus of Tibetan art.

As in Nepal and India, Tibetan painting is highly figurative. While the principal themes are divine, as in Nepali

and Indian work, Tibetan paintings differ by including representations of divine and mortal teachers. The teachers are always heavily robed in monastic attire and usually seated on a lotus in the classic posture of meditation. In sculpture the teacher is always oriented frontally with his hands making one of the five gestures characteristic of Buddha figures. In addition, he may hold lotuses supporting such attributes as a bell, a thunderbolt, a book, or a sword. The use of silver ritual objects appears to have been particularly popular in Tibetan shrines. In both sculpture and painting the representation of terrifying deities remains one of the most distinctive features of the Tibetan aesthetic. Another artistic form that plays an important role is the mandala. It is so frequently encountered in Tibetan arts, particularly painting, that it has come to be regarded as the very symbol of Tibetan culture. In both form and content, medieval Tibetan mandalas are more diverse than the ones in Nepali medieval art.

## INDONESIA

During the eighth and ninth centuries a genuine Indonesian style of art developed in Java, partly because the area enjoyed an economic boom that created a surplus labor force that could focus on art. A number of large-scale religious structures, or *candis*, were created that still stand. The Buddhist Candi Borobudur is noteworthy for its examples of narrative relief, an art genre rare everywhere except central Java. The reliefs, which depict religious or mythological themes, portray humans naturalistically. They appear to have been created to guide the pilgrim on the way to enlightenment.

Javanese sculpture from this era reflects Indian influence. Stone sculptures represent Hindu gods and Buddhist deities. However, statues of Ganesha, the elephant-headed Hindu god, sit with the soles of their feet pressed together, a style rare in India. He typically has a long trunk which bends toward his lower left hand, in which he holds a small, round cup of candy. He clasps a broken tusk in his lower right hand. In his upper hands he carries a rosary and fly whisk. Javanese representations of the Hindu god Shiva show him with a crown of plaited hair, the third eye on the forehead, and four hands, with the upper two carrying a rosary and a fly whisk and the lower two carrying a trident and a water jar. Sometimes the fly whisk is replaced by an ax. Most metal Javanese images are in bronze, but a few are in silver and gold. The statuettes represent Hindu and Buddhist divinities.

## AUSTRALIA

The Aborigines of medieval Australia painted the walls of caves and carved the ground, trees, and rocky surfaces of the continent. To paint, they used strips of bark, chewed at one

end for the broader lines and with a single feather mounted on a nodule of wax for finer lines. A thin, burred stick was used to make dots. Engraving tools were equally simple. For decorating objects, artists used the incisor tooth of a small animal, still in its skull. Evidence suggests that rock engravers made designs by striking the surface of the rock with a sharp-edged boulder. The colors are earthy pigments, ground with water on a rough stone.

Aboriginal bark paintings are typical of medieval Australian art in that they served as link between the people and their spiritual beliefs. Many of the brightly colored sheets of bark, with vivid color contrasts, illustrate the activities of the great creator and other spirits as well as places associated with them. The bark appears to have come chiefly from the stringybark tree, a type of eucalyptus. With its first branches located well up the tree, the stringybark offers many feet of firm, knot-free bark. The bark was removed in the wet season, when the sap is flowing and the bark was both supple and easy to strip. One or two slivers of the outer bark were pulled away to test the core beneath. Two cuts were run around the trunk, with the lowest beginning about a foot from the ground. With the aid of a stick, the artist then pulled the curled sheet of bark from the tree. The sheet was cured over fire and then left to dry in the open for days of seasoning. To prevent curling, the bark was often fitted with stretchers of two straight sticks that were bound across both ends. The artists relied on a palette of red, yellow, black, and white with occasional forays into blue, pink, orange, and gray.

In northwestern Australia, Aboriginal cave art consisted chiefly of *wandjinas*, or large, human, mouthless figures with halo designs around their heads. In the northern part of the continent Aborigines painted so-called X-ray and Mimi art. X-ray art attempted to show the dimensions of living creatures. These were large paintings in red, yellow, black, and white that depicted animals, birds, fish, and reptiles but rarely human beings. In these paintings the artists drew not only the external form of the subjects but also their internal details, such as the skeleton and internal organs. The Mimi figures, located in the same caves as the X-ray figures, exclusively depict human beings in action—running, fighting, and throwing spears. These red-ochre drawings are only a few inches tall.

The art of ground painting was apparently confined to central Australia. The simple designs referenced Aboriginal myths. The ground was prepared by sprinkling it with water and then brushing it smooth with the hands. An abstract design was joined by representations of reptiles, animals, and humans. The artists drew in black paint made from powdered charcoal supplemented by dots made of white pigment.

## EUROPE

BY KIRK H. BEETZ

For the artists of medieval Europe the history of the world was a spiritual history, divided into two eras: one spanning from the Creation to the birth of Christ and the other from the birth of Christ to the present. Not until the late medieval era did writers and artists begin seeing themselves as living in a new world in which time was measured by the history of human achievement. This marked the beginning of Renaissance thought. Artists of the Renaissance considered the approximately 1,000 years before them as part of a different age, one in which the art of the classical world had been forgotten. This was mistaken, because medieval artists not only borrowed from classical examples but also often used the techniques of ancient artists for their own purposes.

### AGE OF FAITH

The period between the fall of the Western Roman Empire in 476 and approximately 1400 became known as the Dark Ages, supposedly a period in which ignorant artists lost or abandoned ancient artistic techniques. The reality was different, and research over the past 100 years has revealed that the art of medieval Europe is dynamic, colorful, and innovative, yielding great works amid a dense complexity of styles. As the Dark Ages became ever less dark to historians, the name Age of Faith became preferable because the art that survives from medieval Europe has primarily religious subjects. It is the emphasis on spirituality that sets medieval European artists apart from their Greek and Roman predecessors. Whereas classical artists focused on realistic depictions of their subjects, medieval European artists created an artistic language composed of symbols to express spiritual truths, and the symbols were often more important than realistic portrayals of people or the world. For instance, a painting or sculpture might depict the Virgin Mary, Christ, and the prophets as towering like giants over the figures of more ordinary people, as is the case in the painting *Enthroned Madonna and Child* (ca. 1280–1290) by Giovanni Cimabue, in which Mary and the infant Christ are surrounded by much smaller figures. The symbolic point is that the Virgin Mary and Christ are towering figures whose spirituality is far more immense than that of ordinary people or even of angels.

One way in which most medieval European art differed from most classical art was in a devotion to depicting ideas rather than emphasizing physical realism, although some paintings from the Carolingian era (ca. 751–987 in France) were reminiscent of the naturalism of Roman art. Another factor that shaped medieval art was the religious differences between east and west. When the Western Roman Empire's

last emperor abdicated in 476, the eastern part of the empire continued and, over the next few hundred years, actually recovered some southern European territories, if only briefly. During the 500s a religious controversy helped separate European art from the art of the Eastern Roman Empire, often called the Byzantine Empire. The most significant break between eastern and western religious art developed out of the iconoclasts of the Byzantine Empire. An iconoclast was someone who believed that religious art should never depict human images because to do so was a transgression of the biblical commandment that people should not worship graven images. This restriction did not necessarily apply to purely secular art, such as portraits of living people. By the 700s the iconoclasts had developed a great deal of political power, resulting in 726 in the Byzantine government's outlawing religious images of people, which then resulted in the destruction of many works of art. By contrast, in Europe, to the north and west of the Byzantine Empire, images of prophets and saints were regarded as important tools in teaching Christianity to people, and the western Christian church rejected the views of the iconoclasts, with its religious buildings featuring statues, paintings, and mosaics of biblical figures. This difference of opinion was one of the most important factors in creating the division between the Eastern Orthodox and Roman Catholic churches.

The iconoclasts' destruction of artworks deemed heretical highlights another problem that researchers encounter when studying medieval art: the anonymity of many artists. This is often explained by pointing out that most medieval art was religious in nature and that artists, who were considered even by themselves as less important than their religious subject matter, were too humble to sign their creations. The matter is actually more complex than that. Many medieval religious works are signed, suggesting that a custom of not signing artworks was not universal. Artists' signatures have been lost to erosion of their outdoor statues, to deliberate destruction in war or religious upheavals, and to decay caused over time by perishable materials.

Ancient Romans who could afford to do so collected art to decorate their homes. After the fall of the western empire, southern Europeans continued the practice of collecting art for display in their homes, but by the 600s the popularity of collecting art was fading. Artists had to find new markets for their works. Money tended to flow toward churches, and artists gravitated to where they could earn livings. In southern Europe the result was that churches preserved the decorative arts of mosaics and murals. Also preserved was the attitude not only in southern Europe but in northern Europe as well that artists were skilled laborers, on the same level as stonemasons and carpenters. Indeed, stonemasons and carpenters

often carved images to decorate public buildings and private homes. It was a natural step to go from carving statues for government buildings to carving statues for religious buildings. Further, the attitude that artists were craftspeople helps explain why some painters and sculptors devoted several years to a single piece that would be displayed in a public place. For them such work was not a matter of crushing their artistic spirits or losing their freedom to create art. Instead, they had families to house, feed, and clothe, and a project that would take several years to complete for a prosperous church meant financial security for the artist and his family. A long-term project was not a burden but an opportunity.

North of the Alps, European artists of the Age of Faith were working in the artistic traditions of the Celts and Germans. The tastes of both artists and their patrons tended toward intricate interweaving of lines, influenced by goldsmiths and silversmiths and their jewelry, which tended to feature animal or plant images enveloped in mazes of lines. The lines usually could be traced back to the contours of the animal or plant images, making the lines elaborate extensions of the legs, tails, stems, or other parts of the images. From Scandinavia to central Europe, from Ireland to Ukraine, the intricate interweaving of lines based on natural forms dominated art until about 1050. This form of art may have reached its greatest height in illuminated manuscripts. An illuminated manuscript is a text that has been individually illustrated by a painter. Elaborately illustrating texts may have begun in the monasteries of Ireland; Irish monastic orders established new monasteries from Ireland to eastern Europe, bringing their skills at illuminating books with them.

Medieval book illustrations often seem marvelously abstract to the modern viewer. For instance, the Cross Page from the Lindisfarne Gospels (ca. 700) displays a cross filled with and surrounded by very detailed patterns of loops; close inspection of the page reveals that the swooping lines outside the cross can be traced back to the bodies of stylized eagles with their eyes seeming to peer from the page. The intention of the artist seems to be to show how the cross places limits on savage creatures and by inference on human passions—particularly the desire to make war, because eagles were common symbols of war.

## THE AGE OF CHARLEMAGNE

Karl der Grosse (r. 768–814) was the name of the greatest of the Carolingian kings, today best known as Charlemagne, which is French for “Karl the Great.” He managed to reunite much of what had been Roman Europe into a new empire, the art of which was influenced by his restless spirit and persistently inquisitive mind. He visited Italy at least three times, and his impressions of the grandeur of Roman art inspired him to try

to establish a great artistic tradition in northern Europe. In his capital city of Aachen, he had monumental structures built, mostly of wood, which have been lost to decay, fire, and war, but the Palace Chapel was made of stone, and it survives. For its construction, columns and bronze works were imported from Italy, and Italian artisans were very likely imported as well. Thus, Charlemagne stirred the pot of European art, mixing southern and northern European traditions. Much of the Carolingian achievement survives in stone monasteries and churches, but for the fine arts, book illustration perhaps provides the best window to Carolingian style, because little of the mosaics, sculpture, and murals of the era survive. The *Gospel Book of Charlemagne* features human figures that are reminiscent of Roman art in modeling.

## ROMANESQUE ERA

Southern Europeans were much less interested in the intricacies of art of northern and central Europe, preferring to focus on the human figure. For instance, the Beatus Apocalypse manuscript (early 1000s) features human and animal figures set against background blocks of color. Symbolism rules what the artist has depicted. One illustration presents a multi-headed beast, perhaps a dragon. It represents Satan being cast out of heaven. In the upper-left corner is a woman with an image of the sun in front of her. She represents the Christian Church, illuminating the world. About the time this illustration was made, the art of southern Europe was beginning a new phase. This was the Romanesque era, which lasted from 1050 to 1200 and spread through Europe. Although Romanesque art has been given its own era, during which it was the dominant style in much of Europe, it did not entirely die out until the end of the medieval era. Romanesque artists copied only the form of classical art, not the ideas behind it. Instead, artists adopted Roman styles because the Roman emphasis on realism was useful: Realistic figures appealed to laypeople and were easier to use to bring biblical passages to life. The ideas of the ancient Roman artists were replaced by medieval spiritual concerns.

Sculpture seems to have been affected by the Romanesque movement more than other art forms, because the Romanesque era brought with it a revival of monumental sculpture. After the 400s European sculpture focused on small, shallow reliefs and statuettes, but the Romanesque era focused on large structures for churches, monasteries, and convents and with those came demand for decorative carvings, murals, and sculptures, helping to expand the number of experienced artists who would help fuel the Gothic era to come. Not only did architecture influence the fine arts, but the reverse was sometimes also true. For example, the typical reinforcing arches for the vault of Saint-Savin-sur-Gartempe in

France were left out of the architectural plan in order to make room for a continuous mural. During the Romanesque era tall, three-dimensional statues became common; even reliefs were carved deeply enough that the figures in them almost stood free of the background. A good example is found at the eastern side of the abbey in Moissac, France, depicting the Annunciation and the Adoration of the Magi (early 1100s). The figures in these works are stiff and awkward, but they are also large, and in three-quarters view they seem to exist in three-dimensional space. Further, the sculptors have made them appear free of two-dimensional space, as if they might step away from their walls and move freely as three-dimensional beings. The sculptor moved beyond merely decorating a wall to making a statement about biblical figures being real people with true spiritual presences in the world.

The foremost sculptor of the Romanesque era may have been Benedetto Antelami, whose *King David* (ca. 1180–90) is a landmark in the development of medieval sculpture. The statue stands nearly free, on its own, and the figure's clothing drapes as if on a real body; the artist adopted a style that was his alone, much as a classical sculptor might have done.

Sculptures served to draw people to the buildings that displayed them. Visitors often brought money to donate to the church, monastery, or convent, making it worthwhile for religious groups to finance large, impressive statues. Yet not all clergy were happy with the development of lifelike statuary. One problem was that it smacked of paganism, because the sculptors were imitating realistic forms developed in classical times. Further, some clergy believed that people would use the statues to teach themselves about the Bible rather than making a proper study of their faith by actually reading the Bible. In an era when many Europeans could not read their own languages, much less the Latin of the Bible, this objection was overwhelmed by pragmatism: The sculptures were useful tools in teaching the faithful.

One of the most significant painters of the Romanesque era is Nicholas of Verdun, who painted enamel plaques. His greatest work is probably the Klostersburg altar (1181), which consists of painted panels. His figures are loose, not stiff, and even their clothing seems to flow over their bodies, suggesting movement. In addition, Nicholas of Verdun gave his human figures personalities: They have emotions recognizable to any observer.

## GOTHIC ERA

Gothic art began with Gothic architecture, which spread from the region of Paris around 1150. The huge spaces of Gothic buildings spoke of the immensity of God's spirit, and they seemed to cry out for monumental works to inhabit the great spaces provided by the architecture. For sculptors and

painters the Gothic movement presented grand opportunities for artistic expression and great challenges to create art that could make the immensity of Gothic style accessible to their audiences. It was during the Gothic era, from about 1200 to about 1550, that medieval artistic sensibilities realized their fullest expression. That these dates overlap the Romanesque era on one end and the Renaissance on the other is part of the complexity of medieval European art, in which some parts of Europe moved on to a new movement while other parts remained in an earlier movement. In the case of the Gothic era and the Renaissance, parts of Italy were moving into the Renaissance in the 1400s, while northern and western Europe continued in the Gothic era until about 1550.

Medieval Europeans called the Gothic movement in the arts *opus modernum*, meaning "modern work," because

Virgin and Child with Saints Louis of Toulouse and Michael by Lucca di Tomme; tempera on panel, Italy, before 1362 (Los Angeles County Museum of Art, anonymous gift, Photograph © 2006 Museum Associates/LACMA)

Gothic art seemed to them to be a new phenomenon. The effort to convey the spiritual reality of their subjects led artists to depict facial expressions and poses that slightly exaggerated some features to create an impression of emotional movement as well as physical movement. An outstanding example of this is a wooden sculpture from the early 1300s called *Pietà*. The name *Pietà* was given to many sculptures, all depicting the dead body of Christ being held by his mother, Mary. The *Pietà* was invented to serve as a contrast to images of the infant Christ and his mother. The wooden example by an unnamed sculptor features heads that seem too big for the bodies of Christ and Mary, and Christ's body is preternaturally thin, looking wasted. The details are realistic, with Christ's bone structure and musculature carefully rendered. By making the heads slightly outsized, the sculptor emphasized the expressions on their faces, and Mary has a profoundly moving expression that displays sorrow and misery. Her eyes stare at her tortured son. Beneath the body of Christ the folds of Mary's dress ripple, as if in motion as she shifts her legs to maintain support of her Son's body, lending a sense of movement to the whole sculpture. The figures were painted, enhancing their realism.

Stone sculptures were highly valued, probably because of their durability. Churches, monasteries, and convents had outdoor sculptures that needed to endure weather that would quickly ruin wooden sculptures. Throughout the medieval era in Europe sculptors in stone used techniques passed down from the Roman Empire. For smaller statues a sculptor would sit on a stool or armless chair; for larger ones he would need to stand. The stone he intended to sculpt would be directly before him, resting on a low table, with its lower end nearest him. The top of the statue was raised 22 to 33 degrees above the table. With charcoal the sculptor would sketch on the stone the image he wished to create. Sometimes the sculptor would make a clay version of what he hoped to sculpt, either in miniature or at full size. He would first use a pointed iron pick to chip away the stone, later using a chisel to refine the features of the sculpture. Files were used to remove the marks left by the chisel, and then the sculpture was smoothed by rubbing it with pumice and straw.

Using this approach to sculpting, Gothic sculptors in stone created the greatest monumental pieces since the fall of the Western Roman Empire. Artists from northern Europe, including Scandinavia, often carved their works to be independent of their architectural settings, especially when carving for the interiors of churches and cathedrals. Their works came close to being totally free standing, calling more attention to themselves than to their settings. Among the finest sculptors was the Naumburg Master, so called because of his series of sculptures for the Naumburg Cathedral, carved

about 1250 to 1260. Gothic artists were trying to meld abstract Christian ideas with the immediacy of strong emotional appeal, and the Naumburg Master was among the most successful at doing so.

For the choir screen in the cathedral, he carved images of biblical characters, and, as was customary for the era, he carved portraits of benefactors of the church into his scenes, including people he had never actually met because they had died before his time. Still, each figure seems to have a personality of his or her own, as if each was carved from life. Part of the screen depicts Judas kissing Jesus. It is a scene of furious action, with figures in turmoil, yet Jesus is quiet, his expression one of pain and sorrow as Judas kisses him. Although some figures are in front of Christ, he stands out because he remains a center of peace amid frantic emotions. The main part of the choir screen features the crucified Christ. The image of Christ is heavy, sagging into space and giving the Crucifixion a physical reality. To either side are Mary and Joseph, who seem to gaze at their audience as if aware of the presence of worshipers, their intense sorrow enhancing the sadness of the scene.

Gothic architecture created new opportunities for painters as well as sculptors, most notably when working with colored glass. During the 1100s glassmakers began adding various metals to glass to create colors. The technological innovations of Gothic architecture meant that walls of large buildings could be much thinner than before, because the walls no longer had to bear the full weight of themselves and their roofs. Thinner walls meant more opportunities to include windows to illuminate interior spaces. A love of bright colors emerged in the Gothic era, and making windows out of colored glass to illuminate church interiors quickly became popular.

To create a colored-glass window, the artist would first whitewash a tabletop or bench. Then he would use charcoal to sketch on the tabletop or bench the image he wished to create. Glassmakers would mix ash and fine sand with traces of various metals to give the glass color. For instance, a bit of iron would tint glass green. They would blow molten glass at the end of pipes and then spin the pipes, causing the glass to flatten and form a disk. The disk was set on a table and allowed to cool. Then the glass was cut into the shapes the artist wanted with a grozing iron, a sharply pointed iron rod. The artist would fit the pieces of colored glass together by using molten lead to bind them. The trick was to organize the glass in such a way that observers from a distance would recognize the image the artist wished to create. For details such as eyes, the artist painted directly on the glass. A spectacular example of medieval colored-glass windows is the northern Rose Window of the Notre Dame Cathedral in Paris.

During much of the medieval era sculpture had been preferred over painting, probably because it was more durable and better suited to decorating the outsides of buildings. During the Gothic era painters improved their techniques for creating durable paintings, and in the 1300s paintings gained favor, especially in southern Europe. Murals were popular in southern Europe but were uncommon north of the Alps; murals in northern Europe tended to be painted by artists from Italy. The most popular form of mural was the fresco, meaning “fresh.” Creating a fresco involved spreading fresh plaster on a wall and then applying paint on the wet plaster. During the 1200s artists tended to paint freely on the plaster, without preparation. In the 1300s they chose to sketch their images in charcoal on the wall before plastering it. This helped the artist better visualize how the painting would fill the space on the wall, and it allowed a master artist to have an apprentice paint some of the images. Painting frescos required a sure hand and patience, because the plaster could be applied only a little at a time so that it would not dry before pigment was applied.

More popular in the north was painting on wooden panels. The wood was usually poplar and was sanded smooth. Sometimes a painting would require several planks held together by crossbeams in the back. A mixture of plaster and glue, called gesso, would be applied to the surface and allowed to dry. Then it was sanded smooth. Sometimes a layer of linen soaked in gesso would be set over the surface, allowed to dry, and then covered by another layer of gesso that was smoothed after it dried. The extra layer resulted in a stable surface that held paint well. The artist would draw on the surface with charcoal or graphite and then cover the drawing with paint. Haloes tended to be done in gold leaf.

## EARLY RENAISSANCE

Some art historians classify northern European art from about 1400 to 1550 as Late Gothic art, whereas others believe the art of the north as well as the art of the south was at this time part of the early Renaissance. The Renaissance had its origins in Italy. The crucial figure in the development of the new style was Giotto di Bondone (ca. 1276–1337), a Florentine who, like many artists of his era in Italy, was not only a painter but also a sculptor and architect. Giotto was an innovator who seemed restlessly searching for ways to make his work stand out. An example of what he tried to do is a fresco in the Arena Chapel in Padua, Italy, titled *Christ Entering Jerusalem* (1305–06). The fresco presents a simple background, without the profusion of symbols common in medieval European art. The emphasis is on the figures in the painting. One of Giotto’s innovations was to remove the impression of observing something painted on a surface. Instead, he made

## ATTAINING A SENSE OF PERSPECTIVE LEONBATTISTA ALBERTI’S WAY

Most medieval artists were interested in how to give their images proportions that would seem authentic to their audiences. To create proportions that would please the eye, many artists applied geometry, but they had trouble reconciling their images with a sense of perspective. Images meant to be in the distance behind other figures did not look like they were at a distance. The notion of a vanishing point helped solve the problem, but only imperfectly. A horizontal line would be drawn across a painting and would serve as the horizon. On it was placed a point, the vanishing point, to which lines could be drawn that would dictate the shrinking of images into the distance. One problem with the technique was that although images shrank according to distance, they looked like two-dimensional images in a three-dimensional world; individual figures lacked depth.

An Italian painter and architect, Leonbattista Alberti (1404–72) came up with a solution to the problems of perspective and depth, which he published in a scholarly book in Latin, *Della pittura* (1435), which he rewrote in Italian as *De pictura* (1436) and is known in English as *On Painting*. The book covers the practicalities of painting and includes Alberti’s technique for creating three-dimensional figures with a sense of perspective that fools the eye. He began by establishing a human figure in the foreground and then drawing a horizon line from the top of the figure’s head. The vanishing point is placed on the line. Then, to one side of the painting, he established a distance point, to which he drew lines from evenly spaced points on the base line—a horizontal line extending from the bottom of the painting to a point outside of it to the left or right of the painting. He drew a vertical line from the middle of the base line and then drew horizontal lines across the surface of the painting from where the vertical line intersected the slanting lines to the base line. The result was a series of spaces becoming ever narrower as they approached the vanishing point. These spaces could then be filled with images that would fill the spaces, thus having depth, and would shrink toward the horizon, thus having perspective. Many artists followed Alberti’s geometrical approach.

observers feel that they could step through the surface and walk among the figures.

Northern Europe had its innovators, too. One of the greatest of these was the Master of Flémalle, who flourished in Flanders in the 1400s. Although the true identity of the master is uncertain, he was probably Robert Campin (fl. 1406–44), whose career paralleled the creation of works known to be those of the Master of Flémalle, so called for a large altarpiece in Flémalle. The artist's masterwork is the Merode altarpiece (ca. 1425–28), which reveals how he helped shape the art that would follow the medieval era. He experimented with oil paints, which not only held colors well but also allowed him to give the surfaces of his paintings three dimensions, because oil would hold shape. In the Merode altarpiece, he included indoor scenes in which well-rounded people moved about performing everyday tasks. He took his viewers a step further than the Italians had by humanizing his figures, making them look like ordinary people. Instead of just giving the impression that a viewer could step through a window to be among the figures of his painting, the Master of Flémalle brought his viewers into the same space as his figures, as if there were no surface to step through. He achieved this partly by applying mathematical perspective to his images.

### LATE GOTHIC

Three artists may serve to illustrate where medieval art culminated before the Renaissance in northern Europe: Hubert van Eyck (died 1426), Jan van Eyck (ca. 1390–1441), and Geertgen tot Sint Jans (fl. late 1400s). Hubert van Eyck was working on the Ghent altarpiece (ca. 1420s–32) when he died, leaving its completion to his brother Jan. In the piece the Van Eycks experimented with the use of degrees of brightness and darkness to highlight figures and to convey a sense of perspective, making objects in the foreground brighter than those in the background. Jan van Eyck's painting *Giovanni Arnolfini and His Bride* (1434) may be seen as the culmination of medieval art, with its figures surrounded by symbols. For instance, a single burning candle represents Christ, and a dog represents marital fidelity. The artist placed a mirror behind the scene, and in it are reflected the married couple and Jan himself. To ensure that his audience did not miss the point, he wrote above the mirror, "Johannes de eyck fuit hic," meaning "Jan van Eyck was here." He not only created a painting in which viewers can envision themselves standing but also invited viewers to look over his shoulder while he painted the portrait.

After the Van Eycks medieval artists continued their experiments with light and dark. For example, Geertgen's *The Nativity* (ca. 1490) is illuminated by divine light from the infant Christ. The careful depiction of light and shadow makes

the image magical, with Christ's light illuminating the simple, solemn faces of those around him. Even a far-off angel shines in the dark of night, reflected in Christ's light. Thus, at the end of the medieval era, artists were still trying to capture spirituality in their works, finding even in human characters reflections of the divine.

## THE ISLAMIC WORLD

BY ROBERTA MARIN

Islam began in the early seventh century in the Arabian Peninsula. Within a few decades the new religion had spread rapidly beyond Arabian borders, attracting a large number of adherents. The dramatic expansion has continued uninterrupted for centuries, and today Islam is established in a very wide area, stretching from the Atlantic Ocean to the China Sea and Indonesia.

In its initial expressions (seventh century to eighth century), Islamic art was deeply influenced by the style of the Byzantines and the Sasanids, two dynasties founded long before the advent of Islam. By the ninth century, however, Islamic art had formulated its own vocabulary. The most significant element involves the rejection of human and animal representations in the decoration of mosques and Koran books. Geometric and vegetal motifs and arabesques have thus been substituted for living beings. This restriction was not extended to architecture, vessels for private use, and miniature paintings, however. In these cases, ample figural scenes are featured. Another important characteristic of Islamic art consists in the broad use of calligraphy in all media. Calligraphy has always featured prominently in the arts of Islamic lands for its irreplaceable role in bearing the Koran message to worshippers.

### THE BEGINNING OF ISLAMIC ART (SEVENTH CENTURY TO 10TH CENTURY)

The distinctive traits of Islamic art are exemplified in the glass mosaics of two impressive buildings erected during the rule of the Umayyad Dynasty (661–750): the Dome of the Rock in Jerusalem, Israel (691–92) and the Great Mosque of Damascus, Syria (706–14). In the Dome of the Rock lavish mosaics show a great variety of vegetal patterns, alternated with the depiction of precious jewels. Along the frieze at the base of the cupola, the first monumental golden inscription is still visible. In the Great Mosque of Damascus, on the other hand, clusters of buildings are inserted in a large panoramic scene with rivers and huge trees. The superb mosaics were completed with the motif of pearls suspended on golden chains. Mosaics also were used to embellish the pavements of the Umayyad castles in the deserts of Syria, Palestine, and Jor-

dan. Since the castles did not have any religious functions but had been built for the pleasure of the caliphs and the courts, mosaicists felt free to decorate the floors with animal imagery. The most representative floor mosaic, with a lion hunting a group of gazelles, was discovered in the bath area of Khirbat al-Mafgiar in Palestine (ca. 720).

In Umayyad castles archaeologists have found a series of interesting ceiling and pavement frescoes. The wider group was discovered on the ceiling of Qasr Amra in Jordan and dates to the beginning of the eighth century. The so-called Painting of the Six Kings is the best-known fresco of the complex. The caliph is set in the middle of the scene, while six emperors and kings approach him to pay homage. On the pavement of Qasr al-Hair al-Gharbi in Syria (750), two frescoes have been brought to light, representing respectively a hunting scene and a goddess of fertility with a snake around the neck. Some desert castles were decorated with stone lion sculptures, symbols of strength and power, and stucco painted statues, portraying the Umayyad caliphs. Stucco was also widely used during the reign of the Abbasids (749–1258). In Samarra (present-day Iraq) the great majority of buildings were erected using unbaked brick, a poor material with a homogeneous color. For brightening up the monotonous walls, panels of colored stucco were applied on the surfaces.

During the first centuries of Islamic art, important media, such as textiles, metalwork, ceramic, glass, and ivory, were developed. The most stunning pieces, now held in major museums and collections around the world, were ordered by the wealthiest members of society. Caliphs and bold aristocrats loved wearing beautiful jewels, long dresses in silk and linen, and finely made turbans. They also furnished palaces and houses with richly embroidered textiles. Metalworkers created for them vessels in copper, bronze, and brass and sometimes in precious metals like gold and silver. Pieces in ceramic and glass were produced for daily use and special occasions. Carved animal-shaped figurines in ivory and chess pieces made of bone reflect the high skill level reached by the masters and the exquisite taste of the patrons.

### ISLAMIC ART IN EUROPE: SPAIN (EIGHTH CENTURY TO 13TH CENTURY)

The south of Spain was the only land in Europe to be under the rule of Muslim dynasties for seven centuries (710–1492). Abd ar-Rahman I (731–88), the survivor of the massacre of the Umayyad Dynasty in Syria, fled to Spain and founded the emirate of al-Andalus (now Andalusia), which became a caliphate in 929. In 1238 the Nasrids, the last Arab dynasty to dominate in Spain, came to power and ruled al-Andalus until the end of the 15th century. In 1492 the Catholic kings

conquered Granada, the capital of the Nasrid Empire, and the regaining of Spain from the Muslims was completed.

During the centuries in which Andalusia was under the control of Arab dynasties, the arts flourished. The emirs and caliphs, longing to show their supremacy to Catholic Spain and the rest of the Muslim world, decorated their buildings lavishly, regardless of the costs of artisans and materials. The interior of the Great Mosque of Córdoba (785–988) was thus enriched with a profusion of gold mosaics and stucco with vegetal motifs. In some areas of the mosque the craftsmen embellished the walls, applying large, polished marble slabs with trees of life, reminiscent of pre-Islamic art. An example of pavement mosaic is still visible in the interior of the caliph palace in the complex of Madinat az-Zahra, the city-palace built outside Córdoba by Abd ar-Rahman III an-Nasir (891–961). The wall decoration includes a series of marble and stucco panels with vegetal patterns. The Nasrids (1232–1492) erected the complex of Alhambra (the Red), whose name derived from the color of the stone with which the complex was made. The lower part of the interior walls is covered with *alicatado*, a faience (glazed) mosaic, while the upper part is covered with carved stucco panels. The two areas are separated by inscription friezes. In some rooms of Alhambra the ceilings are hidden by wooden coffers with geometric interlacings of stars. The ceiling of the Kings Room, on the other hand, is painted with three scenes of courtly life. The central one, the most controversial, portrays 10 high-ranking figures in conversation. There are several interpretations of the identity of the subjects. The most credible seems to be the theory that the kings are the rulers of the Muslim world. The peculiarity of these paintings lies in the panels, which are made in leather and hang from the ceiling vault.

Members of the court commissioned artisans to create magnificent objects, made in the most precious materials. Ivory was one of the most appreciated for its natural beauty and the difficulty in acquiring it. It was imported from North Africa and was employed to create especially luxurious boxes and pyxes (small containers). Boxes could contain table games, while pyxes held scented essences, like musk and camphor. The pieces addressed to women were decorated with arabesque, which might suggest fertility, while those produced for men were embellished with heraldic eagles and lions, symbols of the royal family supremacy.

In al-Andalus metalworkers created several beautiful objects, but the bronze animal figurines occupy a special place. The figurines reproduce common and mythological animals, like lions, deer, oxen, peacocks, and griffons, whose surfaces are lightly carved with spirals, vegetal motifs, and inscriptions. Some of them have a hole that corresponds to the mouth so that they can be used as aquamaniles (water

Tile; stone-paste painted overglaze with luster, China, Seljuk Dynasty, 13th century (Freer Gallery of Art, Smithsonian Institution, gift of Charles Lang Freer)

pourers). Goldsmiths and silversmiths produced beautiful jewels, reflecting the wealth of the court. Not many pieces have survived, but existing examples include gold, crescent-shaped earrings (12th century), a set of gold filigree and pearl buttons once decorated with enamels (13th or 14th century), and a gilded bronze belt fitting with cloisonné enamels (15th century). Among the typical Andalusian ceramic objects are the so-called Alhambra or winged vases. These unique amphora vessels derived their name from the two large and flat handles, which recall a pair of wings. They were made beginning in the 11th century and had large dimensions, and the exterior was decorated with inscriptions, animals, and vegetal patterns.

Only a few folios of the first Koran books have survived. They were written on parchment and had a horizontal page format. The script was accompanied by vegetal and geometric ornaments. The parchment was sometimes colored, as in the case of the celebrated Blue Koran, which seems to have been produced in Spain in the ninth century. In Koran production, parchment was replaced during the 11th century by paper, but not in Spain, where a series of beautiful Koran manuscripts on parchment dating to the 12th and 13th centuries has been found. Most are decorated at the beginning and at the end of the manuscript with star-shaped motifs on a background of

polygonal forms. At the end of the manuscripts the copyists inserted the colophon, which contains the date and the place of production. The major centers were Córdoba, Málaga, Valencia, and Seville. Since wall painting was not largely used in the Islamic lands, the ability of the painters is evident from the miniatures that adorn the manuscripts. One of the first examples of an Islamic book with miniature painting is the *Tale of Bayad and Riyad*, probably copied in Seville in the 13th century.

### THE ARTS IN NORTH AFRICA (10TH CENTURY TO 14TH CENTURY)

In the 10th century the Fatimids (909–1171) established their power in the area today known as Tunisia, in North Africa. Since the Fatimids wished to enlarge the borders of the empire, they fought with neighboring countries and gained control of Egypt, Sicily (Italy), Syria, and Palestine. The Fatimids constitute one of the most famous dynasties in Islamic history. They were powerful and wealthy, and their artistic expressions reveal this status. In the caliph palace in al-Mahdiyya, the first capital, archaeologists discovered a handsome pavement mosaic with geometric patterns. In al-Mansuriyah, which became the second capital of the empire, the walls of the royal palace were decorated with colored stucco panels with geometric and floral motifs. Large sections of the walls were enriched with ceramic tiles. The palace ornamentation was completed with the insertion of plaster sculptures of animals and human beings.

Artisans were able masters in carving wood and ivory. A few pieces have survived, and those held in museums and collections attest to the skill level reached by the craftsmen in these media. They created beautiful wooden ceilings for mosques and palaces. Wooden panels of mihrabs (prayer niches), *minbars* (pulpits), and boxes became more precious with the addition of bones and ivory. Wooden panels as well as ivory boxes were decorated with scenes of courtly life and animal and vegetal patterns. The figural groups were completed with complex interlacings of arabesques.

Fatimid artisans were also known for their production of rock crystal and gold pieces. Fatimid craftsmen are still unsurpassed in the production of flasks, ewers (pitchers), bowls, and chess pieces made in cut glass and rock crystal (pure quartz). Although the raw material was particularly hard to carve, these craftsmen were able to create fine objects decorated with animals and courtly scenes and rarely with inscriptions. A large number of them are kept in the treasures of Italian churches. Gold jewelry was also made during Fatimid rule. The jewelers were experts in filigree and granulation techniques, in particular, and sometimes added pearls, semiprecious stones, and cloisonné enamels. Rings were typi-

cally stirrup shaped, while the most common shape for pendants and earrings was the crescent. On some jewels animal images were used.

The artistic traditions of the Fatimids were adopted in part by the Marinids from the south of Morocco (1196–1465), who faced the North African political scene in the 13th century. In 1269 they became the new rulers and chose the city of Fès as the center of their power. The Merinids built numerous mosques and madrasas, whose internal and external walls were richly decorated. Mosaic tile work covered the lower part of the wall, while the upper part was embellished by intricately carved stucco panels with flowers and plants. The two areas were linked by a frieze with Koran inscriptions. The ceilings were hidden by beautifully carved wooden panels and the pavements by mosaic tile work.

In the Moroccan decorative arts the artistic influence from al-Andalus (Spain) is undeniable, but it was accomplished by the nomad Berbers, who still live in the Atlas Mountains. Their presence had an important impact on carpet and ceramic production as well as on jewelry production. Goldsmiths and silversmiths created beautiful bracelets, necklaces, earrings, and bent knives using the filigree technique with the application of semiprecious stones. The al-Andalus trend also emerges clearly in the Koran books. In southern Spain and North Africa the manuscripts were still copied on parchment and not on paper.

### SYRIA AND EGYPT (12TH CENTURY TO 14TH CENTURY)

At the end of the 12th century Saladin (1137 or 1138–93), known for his role in the fights against the crusaders, founded the Ayyubid Dynasty (1169–1260). The kings ruled a huge empire that stretched from Syria and Egypt to Yemen and Arabia. In the decorative arts, artisans were particularly skilled in producing copper and bronze vessels, inlaid with silver and gold. Among the stunning pieces created with this technique, the celestial globes and the pilgrim flasks are particularly impressive. The celestial globes were carved with the boreal (northern) and austral (southern) hemispheres and the 12 signs of the zodiac, showing the interest of Muslim astrologists and astronomers in the sky and the stars. The flasks were used by Christians during their pilgrimages to the Holy Land, and the decoration recalls events from the life of Jesus. Ayyubid craftsmen excelled in the production of ivory boxes as well. Some of them reached Europe and were added to the church's treasures, as gifts of the crusaders.

A large group of extant manuscripts with miniature paintings belongs to the Ayyubid Period. The first examples are translations of famous books of antiquity. *The Book of Antidotes*, written by the Greek physician Galen (129–ca. 199),

describes a series of remedies for poisoning, and *De materia medica*, written by the Greek physician Dioscorides (ca. 40–ca. 190), is a work on the medicinal properties of plants. In the 13th century literary books became popular. For example, *Kalila and Dimma* includes animal characters and fairy tales with moral teachings, and *Maqamat* (Assemblies) by Hariri (1054–1122) offers anecdotes that mirror the society of that time.

In 1250, thanks to the marriage between the last queen of the Ayyubids, Shajar ad-Durr, and the chief of the army, Aybak, power passed to a new dynasty, the Bahri Mamluks (1250–1382), who were succeeded by the Burgi or Circassian Mamluks (1382–1517). Sultans, emirs, and high-ranking members of the court ordered luxurious objects because they loved being surrounded by beauty and boldness and wanted to hide their common origins.

Artisans created handsome pieces in all media, but probably the most representative are those made in glass, metal, and ivory. The ability of the glassmakers emerges, in particular, in mosque lamps, flasks, and bowls. The lamps were hung from the ceilings of religious buildings and usually bore the inscription “Verse of Light,” taken from sura 24 of the Koran. Flasks and bowls were decorated with scenes of courtly life as well as earth and marine animals. Among the metal pieces, the mirrors occupy a special place. The most sumptuous examples were made in steel, richly inlaid with gold and silver. The 12 signs of the zodiac were the common iconography, revealing the Mamluks' interest in magic and astrology. Craftsmen excelled in the production of ivory and wooden pieces. The most handsome objects are those created by the combination of two media. In these cases, doors of buildings, *minbars*, and Koran boxes were made in wood, enriched with carved geometric motifs in ivory.

The opulence in the Mamluk arts is reflected also in the production of Koran books and miniature paintings. The Koran books were lavishly decorated on the frontispieces and the chapter headings. Many frontispieces and finispieces have been enriched with star-shaped motifs on a background of polygonal forms. Some Koran books were decorated with gold and had monumental dimensions with pages even a yard in length. Together with Koran books, the Mamluks ordered literary and scientific works, such as the *Maqamat*, and bestiaries (works related to animals), medical texts, and books on horsemanship.

### KHORASAN, AFGHANISTAN, AND INDIA (10TH CENTURY TO 13TH CENTURY)

At the end of the 10th century the Turkic tribe the Ghaznavids (977–1186) came to power. In a few decades their territories spread from Khorasan (in northeastern Iran) and Afghani-

stan to northern India. They chose as their capital Ghazni, in southeastern Afghanistan, which became an important center of culture. Persian was adopted by intellectuals as the official language. Persian books were written during the Ghaznavids' reign as well as a 273-yard Persian inscription with praises to the sultan carved on a marble panel in the walls of the royal palace courtyard. The Ghaznavids spent the cold winter months in al-Askar, a city in southern Afghanistan, chosen for its mild temperature. In the interior of the Winter Complex palace, a fresco with a depiction of the sultan's bodyguards, combined in the upper part with a stucco decoration, has been found.

During the rule of the Ghaznavids and the Ghurids, the following dynasty (1000–ca. 1215), the art of the book flourished. Abu Bakr (1165–1240), a famous copyist, is remembered particularly for two Koran books whose scripts were made in gold and inserted on a background of beautiful arabesques. The distinctive element of the miniature paintings of this era is the absence of figurative imagery and the presence arabesques.

Ceramic ewer; Iran, ca. 1200–ca. 1230 (Los Angeles County Museum of Art, the Madina Collection of Islamic Art, gift of Camilla Chandler Frost, Photograph © 2006 Museum Associates/LACMA)

A milestone in the history of Islamic art is represented by the Great Seljuks (1038–1194) and the Seljuks of Rum (1077–1307), who came from the steppes of central Asia. In the period of major expansion the Seljuk Empire ran from Anatolia to China. The Great Seljuks established their capital in Rayy (close to Tehran, Iran); the Seljuks of Rum chose Konya (Anatolia) as the principal center of their lands.

The Seljuks introduced new techniques in almost all media. Their contribution in pottery innovation is particularly noteworthy. The craftsmen employed the frit, a mix of quartz and soda flux, which permitted the creation of beautiful figurines and ewers with animal features in blue. The Seljuk ceramists also discovered the expensive technique called *minai*. It consists in the application of colored enamels under or over the colorless glaze of an object. The whole piece was put in an oven for a second time in order to fix the colors. By adopting this technique, artisans created luxurious bowls with hunting or princely scenes for the wealthy members of the court. Peculiar to this period also are star-shaped tiles with single figures, such as animals or birds, with which the walls of private residences were covered. Statues made in stucco with lively colors and faience in blue and green tones were very common in building decoration.

Something absolutely unique in the mosque interior was the use of columns in carved wood. The ability of the Seljuk woodcarvers is also revealed in the Koran stands. On a particularly special stand, the inner side is painted with lacquer. Metalworkers created handsome, dragon-shaped door knockers as well as mirrors. Among the most remarkable pieces are those in bronze or copper, enriched with a fine high-relief application of silver and gold.

The craftsmen were masters in stone and marble reliefs. Pairs of angels, seated princes, doubled-headed eagles, and hunting scenes were carved in 20 surviving large stone reliefs from Konya walls. One of the panels is especially impressive because it represents a rhino-unicorn running after an elephant and hitting the elephant with its horn. The scene came from a famous ancient fable, and it is rarely used to embellish art pieces. Among textiles, large carpets occupy a special place because they are the first examples of knotted carpets in the history of Islamic art. Seljuk craftsmen also reached high levels of skill in jewelry production, but the majority of the pieces have been lost.

Some surviving examples of Koran books are finely decorated on the initial and final pages with geometric motifs and arabesques. It is documented that both the Great Seljuks and the Seljuks of Rum ordered from the copyists manuscripts decorated with miniature paintings, but only a few copies survive. One of those is *Warqa Wa Gulshah* (Warqa

and Gulshah), copied in Konya around 1250, which gives an account of a tragic love story.

### CENTRAL ASIA: THE MONGOL INVASION OF PERSIA AND THE ILKHANID DYNASTY (13TH CENTURY TO 14TH CENTURY)

The greatest Mongol conqueror was Genghis Khan (ca. 1162–1227). He was able to gather under a single banner the numerous Turk-Mongol tribes and dominate a territory from Europe to China. In 1258 one of his descendents, Hülegü (ca. 1217–65) conquered Baghdad, defeated the Abbasids, and founded the Ilkhanid Dynasty (1256–1353), whose capital was established in Tabriz (today in Azerbaijan, formerly part of the Soviet Union).

During the Ilkhanid reign, the economy and the arts developed significantly. The artisans were known in the Islamic world for the elegance of their pieces and the extensive use of Chinese art patterns. In pottery the so-called ceramic of Sultanabad technique and the *lajvardina* technique were employed to create tiles and everyday objects. Ceramic of Sultanabad pieces were characterized by the depiction of animals, birds, and human beings on a background of lotus flowers, typical of Chinese art. The colors chosen were black and brown. *Lajvardina* (from Persian, meaning “blue” or “of lapis lazuli”) ware is distinguished by a series of geometric patterns in red, black, white, and gold colors on a blue background. In the summer residence at Takht-i-Sulaiman the northern wing is enriched with *lajvardina* star-shaped and cross-shaped tiles, decorated with enameled and golden dragons, taken again from the iconography of Chinese art.

Ilkhanid artisans embellished the interiors of buildings with stucco. The beautiful mihrab in the Winter Mosque in Isfahan (Iran) and the colored stucco decoration of the vault in the Mausoleum of Öljeitü at Sultaniya, the second capital of the Ilkhanid Empire, are especially distinctive. The cupola exterior of the same mausoleum is trimmed with both faience mosaic and the *banna-i*, with which the craftsmen created holy names and sentences by alternating bricks and enamels.

The Ilkhanids were masters in the production of Koran books and miniature paintings. The most famous calligrapher was Yaqut al-Mustasimi (1242–98), who copied a series of beautiful one-volume Koran books. Although the manuscripts were small, they were extremely precious because of the skill of the artist, who inserted on the pages fine rosettes and marginal ornamentations in gold. Yaqut’s successors, on the other hand, produced 30-volume Koran books of large dimensions. The most celebrated book, decorated with miniature paintings, is the *Shahnameh* (Book of Kings) by Firdawsi (ca. 935–ca. 1020 or 26). The *Shahnameh* is the epic national poem and was discovered in Tabriz around 1335. It was pro-

duced in two volumes and is decorated with 300 miniatures. Since the pages have been removed from the volumes and sold for public and private collections all over the world, it is difficult to conceive of the work in its complexity. The beauty of the single page, however, reveals the high level of expertise reached by the painter.

## ► astronomy

### INTRODUCTION

In the medieval world astronomy was inextricably bound up with the pseudoscience of astrology. No words existed to distinguish a scientific astronomy from a magical astrology. The reason that people looked at the sky was to determine the right time to do things. No distinction was made between, for instance, deciding to plant crops after the rising of the constellation of the Pleiades in a particular position and deciding to wait to begin medical treatment until the planet Mars had entered a particular zodiacal sign.

All cultures considered the movement and appearance of celestial objects as omens, that is, signs of the divine will. This kind of belief was forged into the more formal doctrines of astrology by the ancient Greeks, relying to a large extent on the Babylonian tradition of astronomy. Hellenistic astrology, together with a very sophisticated system of astronomy, was borrowed by the cultures of ancient India and then, in the Middle Ages, was eagerly adopted by the Islamic world. It was introduced by the Arabs to western Europe and China (though in China, in particular, it was heavily modified by traditional beliefs). The social function of astrological prediction was to give advice in uncertain matters: Is this a good time for me to open a branch of my business in a foreign city? When is a lucky day for me to hold my wedding? Other cultures, such as those in the Americas that had no contact with Greek astronomy/astrology, also sought the divine will and signs of future events in the sky, but by quite different sets of rules.

Astronomical observation was important everywhere in the Middle Ages for many practical purposes. Crops were usually planted after a particular astronomical event that would start a season of suitable weather for a given area. Sailors began to utilize the sighting of stars to aid navigation out of the sight of land (something that was rare in antiquity). Religious institutions used astronomy widely. For instance, Christians

had to make a complicated astronomical calculation to ensure that Easter was celebrated on the proper day (and from that the rest of the church calendar of rituals), while Muslims needed to know the specific direction in which to face Mecca for their prayers.

A more complicated problem is astronomy among cultures that left no or very few written records. The study of astronomy in such cultures (including many in the Americas, southern Africa, and the Australia and the Pacific region) is known as archaeoastronomy because it must rely on the interpretation of archaeological remains to conjecture about astronomical knowledge and practice. There is no question that, for instance, many cultures aligned important buildings in relation to the cardinal directions (north, south, east, and west). But beyond that, assigning astronomical meanings to archaeological remains is highly speculative. A group of seven dots in a rock carving, for instance, might be the seven stars of the Pleiades or the seven planets (premodern peoples usually counted the sun, the moon, and the planets visible to the naked eye—Mercury, Venus, Mars, Jupiter, and Saturn—as planets), but it might just as well mean that the person making the carving had seven children. Without a written text to tell us about the creator's intention there is no way to know.

Archaeoastronomy usually takes a great interest in alignments with celestial bodies. For example, a building that has some feature that can be aligned between the eye of a person standing in an arbitrarily chosen position and some event on the horizon, such as the rising or the setting of a star or planet on a particular day of the year, might be interpreted as a sort of calculating device to determine when that day occurs each year. The problem with this method is that such alignments are easy to find if any astrological event and any viewing position can be used. Also, in medieval cultures for which we have written records of astronomical procedures, observations are generally carried out on rooftops so as to have an unobstructed view of the sky and the horizon (telescopes did not yet exist in the Middle Ages), not from interior rooms with only one small portion of the sky visible or from the ground with the event in question blocked from the observer's vision by a stone stela or some other object.

## AFRICA

BY BRADLEY SKEEN

The civilizations of the upper Nile Valley (modern-day Sudan and Ethiopia) are distinct from the rest of the African continent in having received an astronomical tradition from ancient Egypt and the Mediterranean world that was not mediated through Islamic culture. The Nubian kingdoms (immediately south of Egypt) converted to Christianity in the sixth century

and added such calendrical matters as the Easter calculation to an astronomical tradition essentially taken over from Egypt and devoted to the regulation of agriculture in the Nile Valley. Any technical astronomy beyond this was strictly the concern of monks of the Ethiopian Orthodox church.

The only influence Ethiopian astronomy received from Greek astronomy is the relatively trivial idea of the shadow table, by which time can be measured through looking at the length of the observer's own shadow adjusted for the seasons. This highly approximate technique was developed in Athens in the fifth century B.C.E. and became part of the astronomical learning of Alexandria. In Egypt texts on the subject were eventually translated into Coptic (the ancient Egyptian language written in a modified Greek alphabet) and these later into Ethiopic. Any more sophisticated astronomical ideas, such as the signs of the zodiac or the names of the planets, seem to have been introduced late into Ethiopian astronomical thought and through the mediation of Islamic civilization since such terms are always given in transliteration from the Arabic. Astrology seems never to have made any impact on Ethiopian culture.

By far, however, the most important astronomical text in the Ethiopian tradition is the book known to scholars as *I Enoch*, or the Ethiopic Book of Enoch. This was composed by Jewish authors in Judaea beginning in the second century B.C.E. and completed by the first century C.E. It consists of several distinct parts that were edited together sometime before 70 C.E. Enoch is mentioned as an Israelite patriarch in the biblical book of Genesis who, instead of dying like an ordinary mortal, was said to walk with God. In later Jewish tradition this was taken to mean that he was transported bodily to heaven. In *I Enoch* he is given an extensive tour of the heavenly regions and eventually transformed into an angel. This book was very important as a sacred text in Second Temple Judaism and continued to be read in antiquity and during the Middle Ages.

Some early fathers of the Christian church wished to include *I Enoch* in the canon of the Old Testament. However, it never became a canonical text in antiquity. A few small fragments of a Greek translation of *I Enoch* are known from Egypt, and more extensive fragments of the Aramaic version have been found among the Dead Sea Scrolls. Part, or even all of the text, may originally have been written in Hebrew, but the full book survives only in the medieval translation used by the Ethiopic Orthodox church, which did incorporate it into its canon of scripture. This book, along with much Christian literature, was translated into Ethiopic (Geez) at the beginning of the medieval period (between 350 and 660) and survives in several manuscripts dating between the 16th and 19th centuries.

In chapters 72–82 of *I Enoch*, known as the book of the Itinerary of the Luminaries of Heaven, Enoch's angelic guide describes for him the heavenly bodies and their motions, the subject matter of astronomy. The author of this book shows little or no knowledge of Babylonian or Hellenistic scientific astronomy. But, like the Hebrew Bible, *I Enoch* envisions the sky as a solid dome covering the earth. The sun enters the sky by passing through one of six gates in the eastern part of the dome and then passes out through a corresponding gate in the west. These gates are simply 10-degree arc sections on the portion of the horizon on which dawn and sunset occur; however, once Islamic astronomy made an impact in the later Middle Ages, they were wrongly identified with the zodiacal signs. The sun, as well as the moon and planets, travel in a chariot driven by the winds. The length of day and night varies according to the height of the gate used at particular times. During the night the sun journeys around the outside of the dome to return to the eastern gates. On the equinoxes the days and night are said to each have nine hours, changing to a seven/eleven split at the solstices (at best an approximate figure). The moon is said to follow the same paths and use the same gates as the sun.

In line with the biblical "host of heaven," the stars are marshaled as an army under the command of an archangel, here named Uriel (Enoch's guide). Under him are the captains of the gates through which the sun and moon pass—these are five in number and are presumably the five planets visible to the naked eye. The captain of the second gate in this scheme, not specifically mentioned in the text, is most likely the moon. These officers are in command of the body of fixed stars. Together with the captains of the four seasons they are also in control of weather, particularly the amount of heat and precipitation that reach the earth, determining agricultural productivity. In addition, winds enter the world through 12 more gates located at the cardinal directions (north, south, east, and west), at the quarter points (northeast, southeast, southwest, and northwest), and through two openings each at the top and bottom of the world. Each wind carries with it either a different beneficial or destructive influence, such as heat or cold or dew or drought, but also elements more removed from weather, such as blessings or locusts. Enoch is shown that the earth (conceived of as a flat disk) is surrounded by mountains, seas, and rivers unknown to the human beings living at the disk's center and on a far vaster scale than any familiar topographic features.

The sun and moon are given a series of secret names; scholars dispute what Hebrew words the extant Ethiopic transliterations might go back to. The moon is known to shine with reflected sunlight and is said to be the same size as the sun (because of the nearly identical apparent size of the two bod-

ies), and the moon is described as one-seventh as bright as the sun. The moon is said to have the appearance of a man; that is, under certain lighting conditions the irregular features of the moon's surface suggest a human face. Compare this to the modern idea of the "man in the moon." Throughout the text various computations to reconcile the 354 period of 12 lunar months with the 365-day solar year are presented as though these were great secrets. But these sections are greatly lacking in precision compared with ancient Greek or medieval Islamic computations; they do not take into account, for instance, the extra quarter day of the solar year. In fact, many of these passages, along with those dealing with the phases of the moon, are highly corrupt in the manuscript tradition, suggesting that these concepts were not well understood by the Ethiopian monastic scribes responsible for the tradition.

Uriel's instructions to Enoch end with a prophecy of the end of the world when the stars will not obey the fixed laws ordained by God that have been explained to Enoch but will wander across the sky as they see fit, causing variations in the weather and plagues and famines. This is compared to the erring of human sinners and related to the non-Jewish and Christian practice of worshipping the stars and planets as gods. Although formal astrology is not referred to in the text, when Enoch is shown the "tablets of heaven" (presumably the pattern of the stars and luminaries and their motions), he is able to understand from it all of human history past and future.

In a second, briefer heavenly vision, Enoch is again shown something of the regular progress of the year measured by the sun and moon and told that many human beings sin by using astronomical calendrical reckonings different from those he has been shown and hence hold religious festivals on the wrong days. He is then told the names of the 16 stars/angels that rule over the four seasons. These are not related to any known system of astral religion from the ancient world, but they are merely names of features typical of each season such as "Wheat Harvest" for summer (reflecting Judaeen rather than Ethiopian seasons). But these names have also been badly garbled in the Ethiopic transliteration.

Very little is known with certainty about traditional beliefs concerning astronomy among the cultures of sub-Saharan Africa. Because the peoples in this area did not read or write, information about them comes only from the reports of others and from much later times. In particular, our first information often comes from Christian missionaries (18th century) and early anthropologists (19th century) who were likely to impose their own ideas on African beliefs. It is clear, however, that we cannot speak about scientific astronomy in this region but only about cosmological and astral myths. For instance, the sky was believed to be a solid dome over

the earth, so that if one walked to the edge of the world it would become impossible to stand up straight as the dome bent down to meet the earth.

Just as Semitic culture explained the relationship between the earth and heaven by the metaphor of a ladder and Greeks by the flight of birds, Africans tended to represent this idea though the hanging silken string of the spider. The spider was the messenger of the gods and often a trickster. Other gods would travel between the two realms on the spider's thread. The idea that the stars are organized into constellations seems to have been known, and not from Mediterranean sources, since the limits and characters of the constellations varied widely. Use of a solar 365-day calendar was unknown; time was commonly reckoned in lunar months and by seasons; agricultural planting was governed by weather conditions rather than by date.

The most sophisticated civilization in southern Africa, the Empire of Great Zimbabwe (ca. 1000–ca. 1500), may well have had a more sophisticated astronomy, but information about such a body of knowledge or its possible origin in Islamic civilization is lacking since Zimbabwean cultures left behind no written records. Highly speculative attempts have been made by archaeoastronomers to reconstruct the Zimbabwean calendar by finding alignments between architectural features in surviving ruins and astronomical events such as solstices and equinoxes, but, as with the more famous case of Stonehenge in England, it is possible to find some significance for almost any line of sight extending to the horizon. So it remains unknowable whether the buildings in question were constructed with a particular alignment in mind or whether such alignments are the result of coincidence. Hence, reconstructions of this kind are highly speculative.

## THE AMERICAS

BY J. J. GEORGE

Astronomy has preoccupied human curiosity since ancient times. Deep concern with the heavenly bodies and the passage of time as marked by these bodies is known from carved stone monuments, petroglyphs, surviving native books, and statements from native sources written down after the Spanish conquest. Uses of astronomical knowledge helped define and order agriculture, royal power, site orientation, religion, astrology, myth, shamanism, divination, and even the time when a society should go to war. Astronomy in the period from 500 to 1500 built on and perfected already established principles and practices, such as site alignment and the calendar, while focusing on horizon and zenith events of the rising and setting sun, moon, planet Venus, and star cluster Pleiades as well as on the four sacred cardinal directions.

In most of the Americas the study of astronomy and archaeoastronomy is enhanced by the ability to question historic descendants of pre-Columbian peoples and then work backward in time in the attempt to set historical analogues. Solar, celestial, or directional symbolism is encoded in many historic period, or post-European contact, Native American practices, including ceremony, myth, and architecture, with antecedents probably reaching back many hundreds if not thousands of years. Navajo sand paintings depicting the cosmos, Pawnee star maps painted on buckskin containing hundreds of four-pointed star symbols, notched Winnebago sticks tracking months by integrating solar and lunar periods, and the dome shape of the Skidi Pawnee lodge representing the structure of the heavens are historic period examples that, combined with astronomical data inferred from sources such as prehistoric petroglyphs, suggest a long tradition of stargazing and horizon dwelling.

Native North American tribes share a belief in the essential oneness of the cosmos wherein all things are interrelated, including plants, rocks, trees, animals, and even the sun, moon, and stars. Anasazi (ca. 900–ca. 1300) petroglyphs found at Chaco, New Mexico, seem to depict an unusually bright star beside a crescent moon. It has been proposed that this is a record of a great supernova that became visible on July 5, 1054. Written records from China record the same event, noting that it was as bright as Venus and that it lasted 23 days. Similarly, a ceramic bowl from the Mimbres Valley of the Mogollon people (ca. 500–ca. 1400) in southern New Mexico also may be a recording of the supernova. The bowl shows a rabbit, associated with the moon, bent into a crescent position with its back foot touching a round disk with 23 linear spokes radiating outward, the same as the number of days of visibility of the star recorded in the Far East record.

Other North American examples of astronomical use include the 13th-century settlement of Cahokia, located near the confluence of the Missouri and Mississippi rivers, where earth mounds were organized along the cardinal directions and a sophisticated solar calendar was developed. Mound alignments there imply that the sun was the principal object of attention. It has also been proposed that the Pleiades, along with other star groups, served as celestial templates for clusters of conical mounds at other sites in the Midwest, as first seen in the earlier Hopewell culture (ca. 200 B.C.E.–ca. 400 C.E.) mounds at Newark, Ohio. It has also been proposed that the Pleiades celestial schedule helped set the agricultural timetable for communities as diverse as southwestern Pueblo agrarians and northeastern Algonquians and Iroquois.

For the Mayan inhabitants of Mesoamerica, perhaps the keenest stargazers, time was a princely concern and controlling time meant deep knowledge of celestial cycles. Court

specialists schooled in celestial workings and the calendar advised Mayan rulers on armed conflict, marriage, royal accession, and ritual payment to the gods for agricultural good fortune and for healthy children. The Maya inscribed their astronomical knowledge in written documents, architecture, and carved monuments. The finest document is called the Dresden Codex and is believed to be copied from Late Classic (ca. 650–ca. 900). The Madrid Codex and the Paris Codex, though of poorer quality, also offer astronomical data; for instance, the Paris Codex shows a pictorial zodiac containing a host of sky animals, which demonstrates a concern with following the movement of the planets relative to the stars.

The Dresden Codex contains tables of computed positions of Venus and Mars, along with an eclipse-warning table and a season-reckoning table. The lunar table used to predict eclipses covers 405 lunations, or lunar months, arranged day by day for 11,958 days. In the Venus table, set up like the lunar table, pictures mark events, and numbered intervals record the length of time between the appearance and disappearance of Venus. The table is accurate to within one day over 500 years. Venus was often associated with the war god, and specialists could have used the table to determine providential times for warring.

Astronomical evidence also is encoded in Mayan architecture. After the collapse of Mayan settlements in Mexico's southern Yucatán and Guatemala at the end of the Classic Period (ca. 150–650), Chichén Itzá grew into a major Postclassic (ca. 900–1521) power by the 10th century. The Caracol Tower at Chichén Itzá is conspicuously out of line with other buildings at the site, leading researchers to speculate that astronomical observations account for its peculiarities. The large front stairway of the platform, atop which the tower rests, faces 27.5 degrees north of west; this puts it to within 2 degrees of sunset at the summer solstice and even closer to the northern standstill of Venus. In the tower itself two more Venus observations have been noted through thin rectangular windows whose purpose seems to be limited to making specific observations of Venus at its northerly and southerly standstills along the horizon.

At Bonampak in the central Mayan territory near what is today the Guatemala–Mexico border in Chiapas, murals dated to shortly before 800 in the so-called Great Palace (also called Temple of the Murals) are decorated with zodiacal symbols associated with Venus and star glyphs—the same ones from the Dresden Codex—filling a band surmounting a scene that shows the aftermath of a battle. The murals commemorate the victories of the eighth-century king Chaan Muun, who is pictured with a group of captives in supplication at his feet. Four constellations depicted above him suggest a celestial context for the war scenes. Carved dates on

stelae at the site suggest that battles were timed to the first and last appearances of Venus.

Iconographic and alignment evidence of Venus watching also has been found at the House of the Governor at Uxmal (also called the Governor's Palace), a Classic Period Mayan settlement in northern Mayan territory. The main doorway of the structure, probably a royal building, is markedly skewed from the principal site axis to align with Venus rising at its southerly standstill, reached every eight years. In the same structure more than 300 carvings of the Venus hieroglyphic symbol appear, again the same one that appears in the Dresden Codex. The House deviates in a clockwise direction 15 degrees from the main axis of the site. Moreover, its central doorway faces outward toward the horizon instead of inward toward the main axis of the site, as is customary. Observational measurements reveal that the central doorway of the House aligns precisely with the largest structure at a distant neighboring site as well as coinciding with the southernmost standstill of Venus rising.

The Aztec (ca. 1200–1521) of central Mexico tied myth, dynastic history, architecture, urban planning, and ritual to astronomical and celestial events. The Templo Mayor, the most sacred structure in the empire, was oriented to mark the sun at the equinox. Alignment studies suggest that the temple was oriented to permit the equinox sun, just before the rainy season, to rise between temples at its summit. Ritual sacrifices also took place there, and the procession of sacrificial victims was designed to mimic the eastern ascent and western descent of the sun. Another seminal event in Aztec culture was the New Fire Ceremony, also called the Binding of the Years, which occurred every 52 years and was tied to when the star group Pleiades crossed overhead at midnight. On the appointed day Aztec priests ordered the empire into darkness, all fires extinguished. When the Pleiades passed the zenith position, the priests knew that the movement of the heavens had not ceased, and another 52-year cycle commenced. The priests lit a new fire in the heart cavity of a sacrificial victim, and from this all new fire began.

In Andean South America the Inca (ca. 1450–1532) consolidated an enormous stretch of territory of more than 3,400 miles from Quito, Ecuador, to central Chile—reason enough to create a calendar based on celestial events, which they employed in regulating civil, agricultural, and religious dates on a national basis. Cuzco, the capital of the empire, was organized around a system of imaginary lines called *ceques* radiating from the political and religious center—a temple called the Qorikancha (also spelled Coricancha). Each line corresponded with a *huaca*, literally a sacred place, spread across the landscape. Overall, the system was a giant “cosmogram,” a kind of map built into the natural and man-

made topography that functioned as a directional scheme incorporating significant astronomical events, a seasonal calendar, a means to divining water rights, and a system to divide social classes.

One of the most intriguing specialized buildings that incorporates Incan astronomical orientations is the Torreón at Machu Picchu. Viewed from above, the Torreón is a P-shaped building atop a natural rock outcrop. Three trapezoidal windows overlook spectacular vistas, with the northeast window centering on the June solstice. Modifications to a carved rock on the floor of the structure, combined with the way shadows fall from a window, suggest a marking device to register solstice events. A similar structure was found at the Incan site of Pisac, suggesting that the Torreón was not unique to Machu Picchu and may have been one of a number of observatories throughout the empire.

## ASIA AND THE PACIFIC

BY KIRK H. BEETZ

Medieval astronomers from Asia and the Pacific hoped that the knowledge they gained from studying celestial bodies would help them in practical ways. They studied the heavens to discover when seasons would come and go, when to plant crops, and when to move from one hunting area to another. Many astronomers believed that their studies would reveal information about future events.

Medieval India was probably the most advanced Asian culture in astronomical studies. As early as the Vedic Period (ca. 1500–600 B.C.E.), Indian astronomers realized that the earth orbited the sun, a deduction they may have reached from studying the movements of stars across the sky throughout the year. Around the seventh or eighth century B.C.E. they posited that the earth was a sphere and that the sun was the center of the universe, around which all else orbited. Vedic astronomers probably based their theory on the fact that the sun appeared much larger than the planets and therefore was the logical body around which others orbited. By the end of the Vedic Period, Indian astronomers had concluded that the rising and setting of the sun were illusions, noting instead that when one part of the earth went dark, the sun continued to shine on another part. This suggests that they knew that the earth rotated. It is possible that by the fourth century B.C.E. Indian astronomers understood the notion of gravity. The discoveries of ancient Indian astronomers enabled their medieval descendants to advance beyond the astronomers of other Asian cultures.

An additional advantage was a general openness among Indians toward publishing their research, but they tended to write their scientific works in Sanskrit, which was difficult

to read without extensive instruction. However, those who studied the language could access the best of Indian learning, as many Islamic scholars discovered. A fairly free flow of information allowed Indian scholars to build on one another's work.

Another advantage for Indian astronomers was the revolution in mathematics in India during the medieval era. By 600 c.e. Indian mathematicians had created the decimal system. By 876 the zero had been invented, often appearing as a dot in Indian writings. Indian astronomers applied the concepts of sines and cosines as well as square roots and cube roots to their calculations, much as modern researchers do. Further, they developed trigonometry, which helped them make precise calculations for the movements of stars and planets. Much of this work was applied to the creation of calendars and was used by astrologers to determine the best days for kings to be crowned, couples to be married, and construction projects to begin.

Most astronomical research in medieval India required the support of patrons, usually monarchs who would pay the astronomers and provide them with places to work. The fickleness of royal patronage could result in work starting, stopping, and then starting again, with some monarchs losing interest in their observatories as others gained interest and set up their own observatories.

One early medieval astronomer, Aryabhata (476–550), showed that the light of the moon was a reflection of light from the sun. Further, he discovered that the earth and other planets had elliptical orbits around the sun, and he was able to calculate the dimensions of the orbits and how long each planet took to move around the sun. Aryabhata also developed a process for determining when solar and lunar eclipses would occur. The notion of *gruhtvaakarshan*, meaning “attraction,” as a force in the universe was well developed by the sixth century, when the astronomer Brahmagupta asserted that *gruhtvaakarshan* accounted for the fact that the earth is held in orbit around the sun. He argued that all things on earth fall toward the center of the earth.

During the medieval era Indian astronomers did much of their best work in other countries. China was one of those countries. The Chinese had a long history of studying the heavens, and their first observatory was probably established during the Shang Dynasty (1500–1045 b.c.e.) by shamans reading portents in the sky. Prophesying remained the principal motivation among the Chinese for studying the heavens. They believed that the gods used the movements of heavenly bodies to communicate with human beings about making choices, both mundane (such as when to build a home) and extraordinary (such as when to wage war). The Chinese practiced what anthropologists call portent astrol-

*Rahu, lord of the planets; gilt copper alloy inlaid with colored glass ornaments, Tibet, ca. 1400* (Los Angeles County Museum of Art, gift of the 1999 Collectors Committee, Photograph © 2006 Museum Associates/LACMA)

ogy, looking to the sky for guidance and advice. By contrast, the astrology practiced in Europe and the Islamic world at the time is called fate astrology, reading the unalterable future written in the heavens.

During the Han Dynasty (202 b.c.e.–220 c.e.) astronomy was made the exclusive property of royalty. Monarchs were expected to communicate with the gods on behalf of China, so it was an easy and logical step for monarchs to employ astronomers to observe the skies on their behalf for messages from the gods. Further, understanding how the bodies in the heavens moved was deemed a source of power, because the gods gave guidance through the heavens. Chinese monarchs attempted to prevent their enemies from using this power by forbidding anyone but certain government employees from owning star charts or astronomical instruments.

One of the major accomplishments of Chinese astronomy was keeping careful records of ordinary movements in the sky and unusual ones such as “broom stars,” or comets. By the Tang Dynasty (618–907) Indians managed all Chinese observatories. The Astronomical Bureau had two di-

rectors with eight professors directly under them. Six of the professors supervised 37 technicians, 440 clerks responsible for signaling the passage of time with drums and bells, and 360 students, who would join the clerks on graduation. The other two professors oversaw a team of five observers and 150 students responsible for recording the raw facts of astronomical movements.

The Divination Bureau was responsible for interpreting the data recorded by the Astronomical Bureau. The bureau had one director who supervised two assistants and four professors. The professors managed 37 clerks and 45 students, none of whom could aspire to the directorship because the post was filled by Indians early in the medieval era and by Arabs starting in the Song Dynasty (960–1279). As a result of the limitations placed on the potential careers of Chinese students, government-sponsored astronomical studies were controlled by a handful of outsiders, even after the Song Dynasty began encouraging greater freedom in the exchange of ideas in the sciences.

The Chinese divided the sky into nine fields, 12 Jupiter stations, and 28 lunar mansions. One of the nine fields was the polar region to the north, which was thought to be immutable. The 12 Jupiter stations were based on the 12 years required for Jupiter to orbit the sun, and they were used to divide the plane of earth's orbit around the sun (the ecliptic) into 12 sections. Astronomers used the lunar mansions to break down the period it took the earth to complete an orbit around the sun. The number 28 was chosen because it takes about that many days for the moon to go through all its phases.

Japanese astronomers focused on portent astrology. Only a few families were allowed to advise the government on astronomical matters, and their primary job was to keep their patrons alerted to messages the gods wrote in the heavens. They took many of their astronomical practices from the Chinese, although their bureaucracy was not as complex. Even so, their observatories had directors, professors, and students who aspired to become technicians. Astronomers had long apprenticeships during which they learned how to identify planets and stars and how to use instruments like the astrolabe, which measures the height of heavenly bodies in the sky.

The most famous of Korea's astronomical achievements is Che'omseongdae in Kyongju, the capital of the Silla Kingdom. *Che'omseongdae* means "stargazing tower." The tower, which still exists, is about 31 feet tall and 17 feet wide. Built in about 634 during the reign of Queen Seonduk, Che'omseongdae has 27 layers of stones to represent the queen's position as the 27th Sillan monarch. The tower probably had a staircase on the side and a ladder in the center. Astronomers sat or stood

on a platform at the top. Korean astronomers were open to outside ideas, and they added Chinese and Islamic discoveries to their research. During the medieval era Korean astrologers practiced both fate astrology and portent astrology, using their observations to make predictions about future events and to offer monarchs advice on what to do.

The North Vietnamese seem to have mostly followed Chinese-style astronomy, although the people of South Vietnam probably followed India's lead. Little is known of the Khmer's astronomy, but it is likely that scientists from that country took their astrological principles from India. Indonesians may have had their own approach to astronomy or perhaps shared ideas in common with Polynesians. Indian ideas were very influential in the early medieval era, and Islamic principles became influential near the end of the era, in the 1400s.

The Polynesians traveled most of the Pacific region during the medieval era. Their astronomy was pragmatic, focusing on what they needed to know about the heavens to guide their boats on long voyages. Polynesian navigators memorized the locations of numerous celestial objects, their movements, and where they should be in the sky at different times of the year. To remember this information, navigators invented stories about stars or groups of stars. Their knowledge of the night sky enabled them to identify longitudes and latitudes accurately enough to sail across miles of ocean to previously discovered islands. When they discovered islands, they were able to use their knowledge to fix the locations of the islands in their memories so that they could tell others how to voyage to them.

The peoples of medieval Australia had long been divided into several cultural groups, making it challenging to generalize about their astronomy. It is clear, however, that they did a great deal of stargazing. They looked to the night sky for hints about the changing seasons, and being primarily hunter-gatherers, they studied the night sky to see when they should move from one hunting area to another. Annual changes in the night sky could be tied to specific activities. For example, the Boorong of modern Victoria knew that when the Mallee fowl constellation, their name for Lyra, sank out of sight in October, it was time for them to gather the eggs of the earthly Mallee fowl.

## EUROPE

BY BRADLEY A. SKEEN

In the two centuries following the sack of Rome by the Goths in 410 C.E. the administrative and economic structure of the Western Roman Empire collapsed amid successive waves of barbarian invaders. The effect on scientific knowledge was

devastating. The chief intellectual language of the Roman Empire had been Greek, and in the Western world all knowledge of the Greek language as well as of the information in Greek books was lost (except for the little that had been translated into Latin or summarized or excerpted in Latin encyclopedic works). Detailed knowledge of ancient astronomy was often replaced by opinion offered by such Christian Latin authors as Lactantius (ca. 240–ca. 320 C.E.), who in his *Divinae institutiones* (Divine Institutions) reverted to a prescientific astronomy based on the Old Testament, according to which the earth was a flat circle surrounded by a single dome containing the heavenly bodies. Practically the only concern of the Catholic Church (the most sophisticated institution in western Europe) with astronomy was to regulate the calendar and especially to reckon the date of Easter each year.

In the Eastern Roman Empire, Greek astronomical learning was never lost, but it was not advanced either. Nor did much communication between the Latin and Byzantine spheres exist on intellectual matters until the early Renaissance (after 1400 in Italy). As such, Western Europe's reacquaintance with ancient astronomy came instead from contact with the Islamic world. In 11th-century Spain, numerous books of Greek philosophy and science as well as treatises in which Arab scholars had synthesized and advanced Greek ideas, began to be translated from Arabic into Latin. The most important Greek work on astronomy was the *Almagest* (Great Treatise), by Ptolemy (ca. 90–ca. 168 C.E.). Western languages still refer to this book by its Arabic title, *Almagest*. This encyclopedic work was translated into Arabic only around 900 C.E., and this translation was further rendered into Latin by Gerard of Cremona (ca. 1114–87) at Toledo, in Spain, after 1144.

The intellectual framework of all Arabic work in astronomy, however, was the science of the Greek philosopher Aristotle (384–322 B.C.E.), and this held true for European medieval culture as well, which received Greco-Arab astronomy as part of the general body of Aristotelian science in the 12th century. Science at this level was the concern solely of university professors, who in medieval Europe were necessarily members of the Catholic clergy. The Roman Catholic Church, however, had some inclination to view the philosophical learning received from Arab culture as a threat, not only because it was foreign and not Christian but also because it seemed to set up a new body of knowledge based on human reason that stood apart from the divine wisdom privileged by the church as an institution. These problems were soon solved by Thomas Aquinas (ca. 1225–74 C.E.), who in his *Summa theologiae* (Summary of Theology) and other works synthesized a new philosophical system incorporating Aristotelian science that withstood theological scrutiny.

In the system of astronomy that he worked out based on his limited knowledge of the work of Aristotle and Ptolemy, Aquinas conceived of the earth as a sphere. The earth sat motionless at the center of the universe and was surrounded by celestial spheres, to which were affixed the seven planets visible to the naked eye (from closest to farthest): the moon, Mercury, Venus, the sun, Mars, Jupiter, and Saturn. These celestial spheres were commonly referred to as crystal, but in fact they were held to be made of a perfect form of matter that could not exist in the fallen and imperfect physical world of the earth. Each planet was mounted on its sphere by an armature consisting of several smaller spheres whose movements were called epicycles. This geometrically complex arrangement was necessary because only by presupposing such a mechanism could an accurate mathematical model be worked out for predicting the motions of the planets, allowing for phenomena such as pausation and retrogradation, when planets seem to suddenly stop or reverse their direction of movement.

Zodiac sign of Aries the Ram (figure decorated with stars, suggesting constellation, against blue sky background); Italy, 1473 (Courtesy the Morgan Library and Museum)

Using this system, planetary motions could be predicted with something approaching the accuracy of modern astronomy. For example, eclipses of the sun and occultations (instances when a planet passes behind the moon) could generally be predicted years if not centuries in advance for any location on the earth. Beyond the spheres of the planets was held to be an eighth sphere containing all of the fixed stars. The equator of the earth can be mathematically projected onto this sphere as the celestial equator. The ecliptic is the path of the sun across this sphere and is tilted 23.5 degrees away from the celestial equator. Lines at the ecliptic's northern and southern extremes are the Tropic of Cancer and the Tropic of Capricorn, respectively. The constellations that lie along the ecliptic make up the zodiac.

In Aquinas's system, each of the planetary spheres was believed to be moved in the patterns perceived through observational astronomy by an angel. The angel did not move the sphere on his own but rather imparted to the sphere a force which he received from the sphere above. As such, the planetary motions ultimately came from a ninth sphere above that of the fixed stars, which was held to be occupied by the Christian god. Aristotle's own unmoved mover had been a god that was perfect in himself without requiring any further action; the created universe moved because it desired God's perfect condition. The Arab philosopher Avicenna (ca. 980–1037 C.E.) had, however, followed Neoplatonic interpretations of Aristotle and saw the existence of god as perpetually spilling out to impart motion to the universe. Aquinas followed this interpretation, and in his system, along with motion, god's will and judgment are passed down through the spheres and eventually reach the earth. This is one reason why the stars can be understood to control the course of events on earth.

Perched above the sublunary and purely physical world of the earth, this system of planetary spheres is spiritual. The human being, composed of both spiritual (soul) and physical (body) natures, forms the only link between the two worlds. Proof of this system was seen in phenomena like the tides of the ocean and the seasons of the year, which precisely follow various astronomical motions. Aquinas himself was not very interested in astrological predication, but later writers justified astrology through an appeal to the Thomistic idea of divine providence ruling the universe in accord with god's will.

Indeed, while the church used astronomy to regulate the calendar, the majority of people were more concerned with the potential practical value of astrological prediction than with an abstract understanding of celestial movements. In Latin, the principle language used in writing about and discussing astronomy in medieval Europe, *astronomia* and *astrologia* are synonyms; that is, no distinction was made between scientific astronomy and the astrology that in the

modern world is recognized as a pseudoscience. Generally, astronomical observations and advances in astronomical theory were performed by astrologers interested in making astrological predictions. The traditional criticism of astrology founded in academic skepticism grew embedded in medieval thought because of its prominence in the writings of Cicero and Augustine. These historical figures called into question the legitimacy of natal horoscopy—that is, the idea that a person's future may be known in detail from examining the positions of the planets at the instant of his or her birth—but this did not prevent astrology from gaining the greatest popularity in both learned and unlearned circles.

Astrology enjoyed the prestige of being reintroduced to western Europe in the 12th century along with other elements of ancient science and philosophy, and the pseudoscience also had the advantage of seeming rational and scientific at a time when no secure refutation of its principles of the kind furnished by modern scientific astronomy could be made. Astrology was used for the same reason divination was generally used in traditional cultures: to inquire whether an action (such as starting a business venture) whose outcome could not be determined rationally was a positive thing to do or not.

Most aristocratic households in medieval Europe would have possessed a book of hours, which served as both calendar and almanac for several years. Although unique in its importance as a medieval work of art with its many hand-rendered paintings, *Les Très riches heures du duc de Berry*, an illustrated book of hours, is typical in its presentation of astronomical material for use outside the learned debates of the university. Covering the years 1413–16, it gives for each day of the year such information as the saint whose feast is to be celebrated, the phase of the moon, and the times of sunrise and sunset. It also contains much information that modern historians would term astrological. For instance, the calendar for each month incorporated a detailed division of the month according to zodiacal signs. Each month is said to contain two “Egyptian Days” (a common term in medieval calendars whose origin is obscure), except January, which has three. These days were considered to be unfavorable for many activities, such as bloodletting, which was a common medical procedure at the time.

The book also contains a page that is essentially a reference guide for astrological calculation and medical prognosis. The page shows a painting of a man with the signs of the zodiac superimposed over his body, illustrating the principle of melothesia, the belief that the various parts of the body correspond to the zodiacal signs. Employing the tenets of melothesia, one might conclude that since, for instance, the constellation Leo “rules” the heart, if a “hostile” planet like Mars enters Leo, the result might be chest pain, heartbreak,

or some similar condition. The same reference page also contains information about other associations of the zodiacal signs in terms of the four humors (the substances that composed the body according to medieval medicine), as well as the gender and cardinal direction associated with each sign. In fact, astrology was intimately associated with medical practice in medieval Europe. University-trained physicians who professed to work in the Hippocratic tradition—which in antiquity had been highly skeptical of divination—used astrology to determine both the best treatment for an individual and the best times to apply a given treatment. Astrological methods had the advantage of seeming precise and “scientific” at a time when medical practitioners understood little about the treatment of disease.

## THE ISLAMIC WORLD

BY S. M. GHAZANFAR

While the beginning of scientific explorations is identified with Islam’s Abbasid Caliphate (749–1258), usually called the Golden Age of Islam, such endeavors continued in Islamic Spain up to the fifteenth century. In Baghdad the caliph al-Mamoon established the Bait al-Hikma (House of Wisdom) in 813, where scholars from all faiths assimilated the rediscovered Greek heritage that had lain dormant in Alexandria since the early sixth century. They not only translated and absorbed that legacy but further built upon it in substantial ways; astronomy was one key area of exploration.

The Koran, Islam’s holy book, has many verses that relate to the celestial sphere. These include “In the creation of the heavens and the earth and in the alternation of the night and the day there are indeed Signs for men of understanding” (sura 3:190) and “It is He who created the Night and Day, and the sun and the moon; all (the celestial bodies) swim along, each in its orbit” (sura 21:33). Such exhortations not only affirm the creative will of God but also encourage astronomical explorations. Muslims use a lunar calendar, so the months change according to the appearance of the moon. The beginning of each month has special significance, particularly with the month of fasting, Ramadan. Early Muslims traveled long distances by land and sea—from Timbuktu to China—in their trading pursuits, and astronomical instruments served as navigational aids in such travels. Further, Muslims face toward the building of Kaaba, in Mecca, for daily prayers; as Islam spread to distant regions, Muslims needed orientational guidance in order to maintain this and other such Islamic practices. For example, astronomers determined the proper times for prayer using spherical triangles, solving for the unknown side or angle by using trigonometric functions. For all these reasons, astronomy became a main concern for Muslim scholars more

than a thousand years ago, and their scientific achievements influenced the subsequent Latin-European Renaissance.

Some scholars-astronomers and their main contributions may be noted individually. Most early scholars approached knowledge holistically, such that their contributions often extended to several disciplines. Muhammad ibn Musa al-Khwarizmi (ca. 780–850) was a Persian scholar who wrote a renowned treatise on algebra (in Arabic, briefly, *al-Jabr*) and whose romanized name gave rise to the word *algorithm*. He was the first to use Arabic numerals to produce astronomical tables. Further, using an Arabic translation of Ptolemy’s *Almagest* (which means “The Great Work” in Arabic; the book was earlier known, in Greek, as *Mathematike syntaxis*), al-Khwarizmi wrote a book containing both stellar and terrestrial maps.

Said al-Farghani (d. ca. 850), an astronomer in Baghdad’s Bait al-Hikma, studied and wrote on the astrolabe, an instrument used to determine the positions of celestial bodies, explaining its mathematical validity and correcting faulty geometrical constructions of the central disc that were current then. His most famous work, known in English as the “Book on Sun and Movement and Encyclopedia of Star Science,” contains 30 chapters; its contents include a description of the inhabited part of the earth, an assessment of its size, and the distances from the earth and sizes of the heavenly bodies.

Abu Yusuf al-Kindi (ca. 801–73), better known as the founder of Islamic peripatetic (Greek) philosophy, wrote several books in disciplines other than astronomy. Relevant to astronomy were three of his main books, known in English as “Calculating the Azimuth on a Sphere: An Explanation of the Cause of the Retrogression of the Stars,” “Determination of the Hours on a Hemisphere by Means of Geometry,” and “Calculation and Making an Instrument to Determine the Distances of Heavenly Bodies.”

Muhammad ibn Jabir al-Battani (ca. 858–929), a mathematician and astronomer, wrote books whose titles in English are “The Movements of the Stars” and “Astronomical Work,” and he also wrote a commentary on Ptolemy’s astrological work *Tetrabiblos* (Four-Part Book). He revised Ptolemy’s star charts, and his values for the obliquity of the ecliptic and the precession of the equinoxes were more accurate than Ptolemy’s. When preparing tables for the sun and moon by comparing his own measurements with Ptolemy’s, he discovered that the shape of the earth’s elliptical orbit was changing, not fixed.

Abd al-Rahman al-Sufi (ca. 903–86), a Persian scholar who worked in Baghdad and Persia, revised the Greek astronomer Hipparchus’s work in his “Book on the Constellations of Fixed Stars,” assigning magnitudes to stars based on his own observations. A genuine stargazer, he described the

*Astrolabic quadrant, made by Muhammad ibn Ahmad al-Mizzi, the timekeeper of the Great Mosque of Damascus; Damascus, Syria, 1333–1334* (© The Trustees of the British Museum)

Andromeda galaxy, the Milky Way's closest neighbor, offering the first record of another star system. He recorded his findings constellation by constellation, discussing the stars' positions, sizes, and colors. He also wrote on the astrolabe and its various uses.

Hassan ibn al-Haytham (ca. 965–1038), another astronomer and mathematician, was described by the Harvard science history professor George Sarton as “the greatest Muslim physicist and one of the greatest students of optics of all times.” He refuted the conclusions of Euclid and Ptolemy in arguing that light comes from the visual object through the lens to be perceived by the eye; his advances in optics led to the subsequent development of the telescope. Elsewhere, he produced an accurate analysis of the focusing, inversion, and magnification of an image, and he offered the first description of the camera obscura, which would be used to observe solar eclipses. Also, he designed a new system using concentric spheres and shells to describe the simple motions of the celestial bodies. His scholarship was profoundly influential in Latin Europe, as seen in the works of Roger Bacon (ca. 1214–94) in particular and also of Nicolas Copernicus (1473–1543) and Johannes Kepler (1571–1630), among others.

Abdul Rahman al-Biruni (ca. 973–1048) formed linkages between the scholarly traditions of Baghdad and India and wrote 150 books on various subjects, including 35 treatises on astronomy, only six of which have survived. He stated that

the earth rotated around its own axis, calculated the earth's circumference, and, after determining the latitude and longitude of the world's major cities, scientifically established the direction of Mecca from any point on the globe.

Nasir al-Din al-Tusi (1201–74) wrote numerous volumes on various subjects, including mathematics and astronomy. He constructed a major observatory at Maragha, in Persia. He developed a model of the solar system in which he added two small epicycles to Ptolemy's to describe the nonuniform motions of the planets using only uniformly rotating circles. Copernicus later used the same mechanism to eliminate the equant, a concept originally developed by Ptolemy, and to calculate changes in his heliocentric orbits in his *Commentariolus*.

Ulugh Beg (1394–1449), the grandson of the Mongol conqueror Tamerlane, was another well-known scholar-astronomer, regarded as the last representative of the School of Baghdad. He established an academy of science and built an observatory in Samarqand, in modern-day Uzbekistan, featuring a quadrant with a 200-foot radius. He compiled a catalog of a thousand stars, using coordinates from his own observations rather than Ptolemy's observations. He also compiled tables of the movements of the sun and planets and observed the obliquity of the ecliptic.

Astronomical explorations were also undertaken in Islamic Spain (al-Andalus). While most manuscripts were destroyed during the reconquest and the Spanish Inquisition, some survived. Andalusian scholars who investigated various aspects of astronomy included Abbas ibn Firnas (810–87), who explored the mechanics of flying and also built a popular planetarium; Masalama al-Majriti (d. ca. 1008), who wrote books on mathematics and astronomy and extended the astronomical tables; and al-Zarqali (ca. 1028–87), who constructed astronomical instruments and produced a water clock that could tell the hours of the day and night and the days of the month, particularly useful for Islamic prayers.

Muslim astronomers built observatories in various parts of the Islamic world. The first observatory in Europe was built by Muslims in Seville, Spain; however, more renowned at the time were those in Toledo and Córdoba. While most of the great astronomical discoveries happened in observatories in the East, Toledo was the center of world astronomy during 50 years of Islamic rule. The first systematic observatory is associated with Baghdad's Bait al-Hikma. Also, many private observatories could be found in Baghdad and Damascus. Other observatories were located in Cairo, Samarqand, Bukhara (in western Asia), Esfahan (Persia), and Istanbul, with the most influential observatory being found in Maragha (Persia). In addition, lookout towers were built in various places to allow for greater study of the motions of the stars; the minarets of mosques also served that purpose.

## THE MAGNIFICENT OBSERVATORY OF ULUGH BEG

When the conqueror Tamerlane (also known as Timur Lenk, 1336–1405) died, his son Shah Rukh (d. 1447), noted for his peaceful ways, emerged as Tamerlane's successor, and he devoted his reign to promoting scholarship and trade. In 1407 his son Muhammad Taragi, better known as Ulugh Beg, was made ruler of Samarqand, within Shah Rukh's empire. Ulugh Beg was one of the leading intellectuals of his time, writing extensively about mathematics and astronomy and making star charts that remained in use until the modern age. He sponsored many building projects, but the observatory he built north of Samarqand in 1428–1429 may have been closest to his heart. During its short existence, it may have been the greatest observatory in the Islamic world.

Cut vertically into the ground on which the observatory stood was a segment of a circle lined with polished stone. Notches were cut into this circle to mark the degrees of the zodiac. It was part of an enormous sextant, an instrument used to measure the angular altitude of celestial bodies. The structure atop this stone paving was a cylinder 157 feet in diameter and three stories high. The ground floor was decorated on the outside with geometrical patterns. The upper two floors were surrounded by arcades. Around the huge sextant were storerooms for astronomical instruments and probably for the keeping of records of observations. Some rooms were workplaces for the astronomers who manned the observatory. Observations made from the Samarqand observatory served as aids in navigation for ocean traders and to determine the direction to Mecca more precisely than had ever been possible.

When Shah Rukh died, there was conflict over who would succeed him, but scholarly Ulugh Beg emerged as the new leader. He was beset by armies led by the grandchildren of Tamerlane and was forced into leading his empire in continual wars. Eventually, his son Abd al-Latif (d. 1450) overthrew him but granted him permission to make a pilgrimage to Mecca. He had his father murdered during the journey. The observatory was soon destroyed for being too secular.

The precise astronomical knowledge of the Muslims permitted them to make perfected astrolabes, which would be a vital contribution to the later voyages of European expansion. Indeed, the preeminence of Muslims in astronomy gave them advantages in navigation; thus, Prince Henry the Navigator established a school of navigation in Portugal, staffed with Muslim astronomers and navigators, and several Muslim navigators guided the Portuguese and Spanish explorers—including Vasco da Gama and Christopher Columbus—in their voyages.

While Muslims improved upon astronomical instruments already in existence, they also pioneered in the development of others. Celestial globes and armillary spheres were used primarily for solving problems in celestial astronomy. The astrolabe, described by some as the most important calculating device before the invention of digital computers, dates back to the Greeks, but the spherical astrolabe was an Islamic development, originally employed to aid in finding the direction of Mecca. Sundials were inherited from the Greeks and Indians, but Muslims made several improvements, considerably shortening the time needed to make specific calculations; sundials were often used in mosques to determine the time of prayer. Several forms of quadrants were invented by Muslims, such as the sine quadrant, used for astronomical calculations, and the horary quadrant, used to determine time through observation of the sun or stars. The equatorium, an Islamic invention

from Spain, was used to find the positions of the moon, sun, and planets; this mechanical device employed a geometrical model that represented positions of the celestial body.

The overall prominence of Islamic astronomy is indicated by the inclusion of words of Arabic origin in the modern astronomical vocabulary. Among others, the terms *zenith*, *azimuth*, and *nadir* and the names of the stars in the Summer Triangle—Vega, Altair, and Deneb—are all words of Arabic origin. In summary, early Muslim astronomers left behind an impressive legacy. They refined certain astronomical calculations, prepared tables showing the motions of stars, determined the obliquity of the ecliptic and its progressive decline, and precisely estimated the precession of the equinoxes and the length of the year. Their achievements are written not only in the textbooks of astronomy but also across the sky in the names of the stars themselves.

~ The Book of Enoch, excerpt (second century B.C.E.) ~

### LXXII THE SUN

1. The book of the courses of the luminaries of the heaven, the relations of each, according to their classes, their dominion and their seasons, according to their names and places of origin, and according to their months, which Uriel, the holy angel, who was with me, who is their guide, showed me; and he showed me all their laws exactly as they are, and how it is with regard to all the years of the world and unto eternity, till the new creation is accomplished which dureth till eternity. 2. And this is the first law of the luminaries: the luminary the Sun has its rising in the eastern portals of the heaven, and its setting in the western portals of the heaven. 3. And I saw six portals in which the sun rises, and six portals in which the sun sets and the moon rises and sets in these portals, and the leaders of the stars and those whom they lead: six in the east and six in the west, and all following each other in accurately corresponding order: also many windows to the right and left of these portals. 4. And first there goes forth the great luminary, named the Sun, and his circumference is like the circumference of the heaven, and he is quite filled with illuminating and heating fire. 5. The chariot on which he ascends, the wind drives, and the sun goes down from the heaven and returns through the north in order to reach the east, and is so guided that he comes to the appropriate portal and shines in

the face of the heaven. 6. In this way he rises in the first month in the great portal, which is the fourth. . . . 7. And in that fourth portal from which the sun rises in the first month are twelve window-openings, from which proceeds a flame when they are opened in their season. 8. When the sun rises in the heaven, he comes forth through that fourth portal thirty mornings in succession, and sets accurately in the fourth portal in the west of the heaven. . . .

### LXXIII THE MOON

1. And after this law I saw another law dealing with the smaller luminary, which is named the Moon. 2. And her circumference is like the circumference of the heaven, and her chariot in which she rides is driven by the wind, and light is given to her in (definite) measure. 3. And her rising and setting change every month: and her days are like the days of the sun, and when her light is uniform (i.e. full) it amounts to the seventh part of the light of the sun. 4. And thus she rises. And her first phase in the east comes forth on the thirtieth morning; and on that day she becomes visible, and constitutes for you the first phase of the moon on the thirtieth day together with the sun in the portal where the sun rises.

Europe

~ Thomas Aquinas: *Summa theologica*,  
First Part, Question 68 (1265–74) ~

### ARTICLE 4. WHETHER THERE IS ONLY ONE HEAVEN?

Objection 1. It would seem that there is only one heaven. For the heaven is contrasted with the earth in the words "In the beginning God created heaven and earth." But there is only one earth. Therefore there is only one heaven.

Objection 2. Further, that which consists of the entire sum of its own matter, must be one; and such is the

heaven, as the Philosopher proves. . . . Therefore there is but one heaven.

Objection 3. Further, whatever is predicated of many things univocally is predicated of them according to some common notion. But if there are more heavens than one, they are so called univocally, for if equivocally only, they could not properly be called many. If, then, they are many, there must be some common notion by reason of which each is called heaven, but this common

(continued)

(continues)

notion cannot be assigned. Therefore there cannot be more than one heaven.

On the contrary, it is said (Psalm 148:4): "Praise Him, ye heavens of heavens."

I answer that, On this point there seems to be a diversity of opinion between Basil and Chrysostom. The latter says that there is only one heaven . . . and that the words "heavens of heavens" are merely the translation of the Hebrew idiom according to which the word is always used in the plural, just as in Latin there are many nouns that are wanting in the singular. On the other hand, Basil . . . whom Damascene follows . . . says that there are many heavens. The difference, however, is more nominal than real. For Chrysostom means by the one heaven the whole body that is above the earth and the water, for which reason the birds that fly in the air are called birds of heaven [Psalm 8:9.] But since in this body there are many distinct parts, Basil said that there are more heavens than one.

In order, then, to understand the distinction of heavens, it must be borne in mind that Scripture speaks of heaven in a threefold sense. Sometimes it uses the word in its proper and natural meaning, when it denotes that body on high which is luminous actually or potentially and incorruptible by nature. In this body there are three heavens; the first is the empyrean, which is wholly luminous; the second is the aqueous or crystalline, wholly transparent; and the third is called the starry heaven, in part transparent and in part actually luminous and divided into eight spheres. One of these is the sphere of the fixed stars; the other seven, which may be called the seven heavens, are the spheres of the planets.

In the second place, the name heaven is applied to a body that participates in any property of the heavenly body, as sublimity and luminosity, actual or potential. Thus Damascene . . . holds as one heaven all the space between the waters and the moon's orb, calling it the aerial. According to him, then, there are three heavens, the aerial, the starry, and one higher than both these, of which the Apostle is understood to speak when he says of himself that he was "rapt to the third heaven."

But since this space contains two elements, namely, fire and air, and in each of these there is what is called a higher and a lower region, Rabanus subdivides this space into four distinct heavens. The higher region of fire he calls the fiery heaven; the lower, the Olympian heaven from a lofty mountain of that name. The higher region of air he calls, from its brightness, the ethereal heaven; the lower, the aerial. When, therefore, these four heavens are added to the three enumerated above, there are seven corporeal heavens in all, in the opinion of Rabanus.

Thirdly, there are metaphorical uses of the word heaven, as when this name is applied to the Blessed Trinity, Who is the Light and the Most High Spirit. It is explained by some, as thus applied, in the words, "I will ascend into heaven"; whereby the evil spirit is represented as seeking to make himself equal with God. Sometimes also spiritual blessings, the recompense of the Saints, from being the highest of all good gifts, are signified by the word heaven, and, in fact, are so signified, according to Augustine . . . in the words "Your reward is very great in heaven" (Matthew 5:12).

Again, three kinds of supernatural visions, bodily, imaginative, and intellectual, are called sometimes so many heavens, in reference to which Augustine . . . expounds Paul's rapture "to the third heaven."

Reply to Objection 1. The earth stands in relation to the heaven as the centre of a circle to its circumference. But as one center may have many circumferences, so, though there is but one earth, there may be many heavens.

Reply to Objection 2. The argument holds good as to the heaven, in so far as it denotes the entire sum of corporeal creation, for in that sense it is one.

Reply to Objection 3. All the heavens have in common sublimity and some degree of luminosity, as appears from what has been said.

### INTRODUCTION

In the ancient world the borders and frontiers of kingdoms and states were most often delineated by natural features such as rivers and mountain ranges. Many of these borders continued to be used in medieval times throughout much of the world, with Roman boundaries being retained in much of Europe, North Africa, and the Middle East. In parts of China provincial borders were maintained from the Han Dynasty (202 B.C.E.–220 C.E.). To some extent the main changes took place in areas where old civilizations had collapsed and totally new entities emerged during the period of formation of medieval states.

The rise in the population of the medieval world, as well as the decrease in nomadic tribes, produced more areas under cultivation; as a result, borders had to be formed and agreed upon. The delineation of boundaries in Europe, northern Africa, the Middle East, and large parts of mainland Asia grew in importance and were often defined by written treaties, drawn up mostly after conflicts, invasions, or incursions. Because the treaties set down exact borders, it became more necessary to have a way of defining these boundaries, often by natural boundaries but also increasingly by markers, walls, or forts.

Rivers served as useful divisions between states. The Danube, previously the boundary of the Roman Empire, became the northern border of the Byzantine Empire; the Indus

River defined, for a period, the boundary between the areas ruled by the Umayyads and that remaining under Hindu rule; and the Havel River separated Saxony in the eighth century from the lands ruled by the Abodrites, a confederation of Slavic tribes. Mountain ranges worked well in other parts of the world, such as between France and the kingdoms of northern Spain, between Spain and Portugal, along northern border of the kingdoms of Hindu India, and on the western extremes of the Tang Empire (608–907) of China. There were also frontiers defined by man-made objects such as walls—Hadrian’s Wall and the Great Wall of China being the most famous of those surviving, both built in ancient times. Watling Street, a Roman road, was to mark the boundary between the Saxon realms and the “Danelaw” (northern and eastern England, where the Danes held sway) during ninth and 10th centuries, and Offa’s Dyke delineated the frontier of England and Wales.

In other parts of the world, where there were no formally defined borders, many nomadic peoples in Africa, the Americas, and Australia tended to restrict themselves to particular parts of their respective continents, there being parts of those lands that were uninhabitable. With small populations, relative to the land area, and people moving with the seasons, these tribes rarely clashed, except in some parts of Africa such as the Sahara, where new kingdoms emerged and their rulers wanted to expand the land under their control. In the Americas the great empires of the Inca and the Maya and then the Aztec in Central America seem to have been

the only major civilizations to establish formal borders in the European sense.

In most cases the borders and frontiers in the medieval world, even in those instances where they were defined in writing, rarely lasted for long. With the fluctuating fortunes of rulers and their armies, the borders of their lands regularly changed. The few exceptions were small city-states or states based on islands, with Portugal being one of the few medieval kingdoms that has retained its frontiers for many centuries. Below the national level, the county system in Britain also remained largely untouched from medieval times until 1974. The Papal States, in central Italy, also managed to retain their size until 1860. For the most part borders changed as local rulers switched their loyalties or when their lands were invaded and captured. Although the medieval world would see some of the greatest empires in history (among them, those of the Mongols and the Arabs), the existence of confederations, especially in the Americas, allowed for the formation of many city-states with their borders often largely defined by the lands needed for the maintenance of the city or other population center.

## AFRICA

BY MICHAEL J. O'NEAL

In the modern world the borders that define nation-states are generally (though not always) clear, fixed, and recognized by other nations. When travelers pass from one nation to another, they are likely to be greeted by signs, fences, border control posts, and in some cases armed soldiers or police that make it clear that they have left the territory of one country and are entering that of another.

During the medieval period in Africa territorial borders were not as clearly fixed. A community of people that can be identified as forming a "state" or "kingdom" lived and worked around a magnet city that formed the core of that community. The city was the site of governmental, administrative, and often religious activities. Surrounding the city was countryside peopled by farmers, herders, miners, and others who earned their living from the land. Trade took place between the central city and the outlying regions; people living outside the city supplied agricultural products, while city dwellers provided manufactured goods. As the distance from the city increased, the kingdom's hold over the territory was apt to weaken until eventually the territory came under the sway of another kingdom. Occupying the border regions were tributary states dominated by the central empire through conquest, payment of tribute, or alliance. The kingdom's borders were defined, in effect, by the extent of the territory it was willing to claim as its own and defend.

Borders, too, often were defined by geographical features. Certainly mountains and rivers presented barriers not easily bridged; in this sense borders in Africa were little different from those in other parts of the world. Contributing to this geographical differentiation were climate and resources. As it still does, Africa in the medieval period presented its inhabitants with a wide range of climatic conditions that in large part defined the terrain. Some Africans inhabited forests where gold could be a primary resource. Others lived on savannas, or immense open grasslands, where herders tended animals and miners extracted copper from the earth. Still others scratched out livings from the desert, where salt was extracted.

Because of differences in climate, terrain, and resources, the various kingdoms of medieval Africa were defined in large part by the nature of their trade. The kingdoms were linked by networks of trade that tended to run from east to west, although considerable trade to the north took place as well. People at the frontiers of a kingdom typically were members of caravans of traders who exchanged the goods of their own kingdom for those of another. In medieval Africa, therefore, traders were similar to the frontiersmen of the American West.

One of the most prominent medieval African kingdom was Mali, which dominated the region of the Upper Niger River in West Africa. Beginning in about 1100 Mali replaced Ghana as the major empire in the area. Ghana had been an important gold-trading empire, but beginning in the 11th century the mines became depleted. Further, the area was raided by Berbers from the north. These events led to the breakup of the kingdom of Ghana. In the resulting vacuum smaller states in the region vied for dominance. Chief among them were the Tekrur and the Soso, the latter under the leadership of Soumaoro Kanté. Kanté ruled over a federation of states, but he was challenged by a Mali prince named Sundiata Keita, who led a coalition of forces that defeated Kanté at the battle of Kirina in the 1230s.

Sundiata thus became head of a federation of states that surrounded the Upper Niger River. Under the leadership of Sundiata, his son and successor Ouali I, and eventually Sundiata's grandnephew Kankan Musa, Mali extended its frontiers by exerting political control over neighboring states. By the early 14th century Mali had become a major empire in West Africa, extending its borders primarily through military conquest, revitalizing the gold trade, and becoming immensely wealthy. But the kingdom began to weaken in the late 14th century. Mali was unable to defend its borders against incursions, notably the Berbers from the north. Additionally, a pastoralist society called the Fulani made inroads across Mali's borders. These events, combined with internal strife

*Sandstone frieze from the first cathedral at Faras (Sudan, seventh century); in the sixth century the three Nubian kingdoms, known as the kingdoms of Nobatia, were converted to Christianity and were ruled from Faras, just inside the modern northern border. (© The Trustees of the British Museum)*

and rebellion, led to the collapse of the Mali Empire by about the end of the 16th century.

One example of the inability of medieval African states to maintain stable borders is provided by the emergence of the Songhai. The history of the Songhai peoples is shrouded in mystery, and scholars continue to debate the details based on written and oral histories. One point of agreement, however, is that the Songhai coalesced as a society in roughly 1000. They were probably not indigenous to the Niger River region, but in time they came to occupy an area at the eastern edge of the Mali Empire and were, in fact, a part of that empire. Their capital city was Gao, but historians disagree about the city's location. In the early 1400s Songhai broke away from Mali and became an independent empire. Thus the emergence of Songhai illustrates the way that borders shifted and were redefined over time as a result of the ongoing movement of peoples throughout the African continent.

Mali and Songhai are examples of major states that were able to maintain relatively fixed and defined borders for at least some period. In this respect they stood in contrast to the nearby kingdom of Hausaland, which occupied the re-

gion between the far reaches of the Niger River to the west and Lake Chad to the east beginning in about 1000. Hausaland achieved prominence primarily because its hills were rich in iron ore, so it became a major player in trade that involved iron. However, unlike Mali and Songhai, it never developed into an ordered empire with fixed borders. Rather it remained a collection of loosely organized city-states, not unlike the city-states of ancient Greece. These city-states defended themselves primarily with walled towns. Power remained in the hands of local authorities, but the various cities of Hausaland were united by their trading activities. Because the kingdom had no fixed borders, its makeup shifted over time as new cities in the region came under the influence of Hausaland and others drifted away. This process lasted into the 1300s, when Hausaland's walled cities came under attack and fell to Islamic invaders.

The kingdom of Kanem-Bornu illustrates yet another trend in how medieval Africans defined and controlled their borders. These people occupied the region around Lake Chad. This lake was an immense body of water in the interior of Africa, between the Niger and Nile rivers. Although the lake remains one of the largest in the world, it was even

larger during the medieval period. Around its shores numerous peoples settled, each practicing a unique way of life. Some were farmers, others herders, and still others fishermen. The borders that divided these various peoples were ill defined. In time tensions emerged, and each community began to develop governmental and economic structures that perhaps conflicted with those of its neighbors. Because of their central locations as links in east–west and north–south trade routes, at least two of the Lake Chad peoples achieved dominance. These were the Kanem on the northeast side of the lake and the Bornu on the southwest.

Between roughly 750 and 1600 a complex series of political events took place that continually reshaped the region and redefined its borders. Some of these events involved the arrival of Islam. Others involved various power struggles between the peoples who lived in the vicinity of Lake Chad. The chief event, though, was the desire of the Kanem to expand their borders and introduce Islam to their neighbors. To do this, they had to forge a strong military. To fund military enterprises, the Kanem needed a stable source of wealth. To this end they allied themselves with farming societies such as the Bornu, rather than with nomadic pastoralists, who were less reliable as sources of wealth. However, the Kanem were never able to carry out fully their plans for dominating the region. Nearby rival dynasties of kings opposed them, and Kanem was never able to accumulate the wealth necessary to achieve dominance. In response to numerous crises the Kanem simply picked up and moved to Bornu in the late 13th century. By the middle of the 14th century and throughout the 15th, the kingdom of Bornu became yet another dominant empire in western central Africa after having entirely redefined its borders.

The kingdoms of Mali, Songhai, Hausaland, and Kanem-Bornu dominated from West Africa to the continent's interior. Throughout southern Africa the Bantu migration continued until roughly 1000. *Bantu*, which means “the people,” is a catchall word that refers to the many peoples who inhabited such regions as Nigeria and Zambia, eventually making their way to Zimbabwe and South Africa. The earliest Bantu peoples began to spread through Africa in phases beginning in about the second millennium B.C.E. Historians regard the third phase of the Bantu migration as having begun at the start of the Common Era and continuing to about 1000, when the Bantus reached the southernmost parts of Africa.

*Bantu* refers less to an empire or kingdom, however, than to an ethnic group, united primarily by descent from a common language group. The importance of the ongoing Bantu migration until well into the medieval period is that it demonstrates that the formation of nation-states was a continuing process, with new nations (for example, Zimba-

bwe) formed and borders adjusted in response to the mass movements of peoples, often in response to war and climatic change. It should be noted that although the Bantu still exist as an ethnic group, the term in South Africa is regarded as pejorative because it was the word used by the South African apartheid regime.

## THE AMERICAS

BY J. J. GEORGE

The period from 500 to 1500 saw great change throughout the Americas with respect to borders and frontiers. Political boundaries in the modern sense of a negotiated contract indicating a fixed extent were rarely, if ever, noted; generally speaking, the literature talks about zones, spheres, and areas rather than strict borders and lines drawn from one point to another point. Many factors, including population growth and expanding cities, city-states, and empires, led to changing territorial demands that were reflected, in turn, by shifting borders and frontiers. The situation was somewhat different in the later years of the period, which saw the rise of dramatic new examples of empire with the Aztec in central Mexico and the Inca in Andean South America. With empires came new manners of social, political, and economic organization combined with thoroughness in warfare that again redefined what a border or frontier meant.

The term *frontier* often is reserved in the American lexicon for understanding the westward expansion of the United States as a manifest impulse through wide-open, uninhabited territory, even though long-established cultures had been in residence for many hundreds—in some cases, thousands—of years. As used by modern political geographers, *frontier* generally designates a physical margin, fringe, or outer boundary—more of a zone than a line—dividing peoples or cultures. It is also the division between settled and uninhabited parts of one nation, state, or culture area. The whole of the Americas provided many different examples of cultural patterns, from nomads to hunter-gatherers and from small early agrarian settlements to mammoth empire systems, though populations remained relatively small compared with the total landmass, especially in North America, and often a substantial frontier existed between contemporaneous cultures or peoples. Inevitably, however, those cultures came into contact. Conflict, warfare, tribute, or diplomacy were then common means of resolving or settling whatever political objective the parties held, and certainly this meant that thresholds, like borders, were challenged.

*Border* in a modernist sense symbolizes aspects of nationhood and identity construction that are linked to state building. Factors that ultimately define borders include natural

topographic limiters or barriers (mountains, rivers, forests, and so on); competition for space, resources, or power; the relationship of a dependent periphery to a central core; trade; tribute; migration; warring; and, on a broad scale, climate change. New technologies allowed for expansion into previously uninhabitable areas, thereby shifting, expanding, or challenging both borders and frontiers. Any combination of these factors contributed to the classification and continuous redefinition of borders throughout the Americas. Typically, however, the literature has had more to say about cultural and symbolic boundaries between groups than about the concrete, physical borders between them. Broadly speaking, because written documentation is unavailable, the exact nature of the political reality of borders is unclear, but it is certain that people understood the notion of territory as a thing to be defended or taken.

The North American landscape during the thousand-year period 500 to 1500 comprised vast swaths of variable terrain traversed by hunter-gatherer bands, entire regions such as the Arctic and the Pacific Northwest inhabited by semisedentary groups moving between summer hunting and fishing grounds and winter residences, and established agrarian communities in the southeastern and southwestern regions that depended on advanced irrigation techniques or plentiful hunting and fishing to maintain settled communities.

Various models have been suggested for understanding the relationships of peoples in the Southwest, including the Hohokam, Anasazi, and Mogollon in the period 500 to 1400. “Regional” and “macroregional” systems propose interaction spheres tied together by long-distance exchange routes. While they were clearly interacting, relationships were not always peaceful. The extraordinary physical locations of the 14th-century Anasazi cliff dwellings at Mesa Verde and the later Hopi mesa-top settlements are clearly defensive minded and indicate regular border infractions by raiding and warring parties.

Border definition in the southeastern areas between the 10th and 14th centuries is equally vague. Similar to the earlier Midwest-centered Hopewell culture (200 B.C.E.–400 C.E.) “sphere of influence,” the southeastern region is often described as an “interaction sphere” or “interaction network” within which large and small independent polities existed. The largest of the Mississippian centers, Cahokia, settled near the confluence of the Missouri and Mississippi rivers. With an estimated population reaching 40,000, Cahokians directly controlled a large territory and had strong influence on groups a thousand miles away, perhaps as far as the Iroquois region in the Northeast, though direct administrative control was considerably less.

Similarly, the Mesoamerican situation varied greatly over time. The dissolution of the central Mexican empire centered

at Teotihuacán by the eighth century created a vacuum and melted previous affiliations and borders. Numerous Mayan polities existed independently, though extensive trade ties and even military affiliations were common. The late rise of the Aztec Empire in the 13th century reconsolidated disparate cultures and polities under a single authoritarian rule with genuinely adhesive borders.

In the Late Classic Period (650–900) Mayan power polities were divided among an increased number of centers, which suggests that the period was less centralized economically and politically. Tikal in the northern Guatemalan jungles of the Petén, Yaxchilan in the Usumacinta region, Palenque in the southwestern region of Chiapas, and Copán in the southeast just over the Honduran border with Guatemala were all major centers that existed independently, each with various spheres of influence and border affinities. Some evidence suggests that Yaxchilan was a military power that led an alliance of several primary centers, including possibly Tikal and Palenque.

Increased fortification indicates antagonistic relations that challenged the sovereignty of borders. Tikal occupied a strategic military position that offered natural defensive measures that effectively safeguarded it against attack. Swamps to the east and west greatly limited threats from those directions. The north and south were defended by a system of man-made earthworks, consisting of a shallow moat and an interior rubble wall, which may have been constructed during the Protoclassic Period (100–250) or early Classic Period (ca. 250–550) and used throughout Tikal’s ascendancy until about 900. Trade contacts established earlier with Teotihuacán, the central Mexican empire from roughly the first to the seventh centuries, helped solidify its borders and frontiers.

Similarly, the Mayan site of Becán showed defensive motives. Situated in the heart of the Yucatán Peninsula roughly 150 miles north of Tikal, Becán was named after its most distinctive feature, an encircling moat and rampart (from *becán*, meaning “ditch filled with water”). Excavations revealed that the moat was originally some 16 feet deep and more than 52 feet wide, with its interior rampart rising another 16 feet. Ceramic evidence suggests Becán was settled around 550 in an area with promising agricultural potential as well as control of local trade routes. Subsequent fluctuations in population indicate shifting fortunes, and defensive facilities were built to maintain Becán’s political and economic control over the region.

The central Mexican Aztec Empire founded at what is today Mexico City rose to prominence throughout the 14th and 15th centuries by overrunning one nearby city after the next, greatly extending their borders and eventually establishing a tribute empire encapsulating a wide swath of central Mexico.

After initial subjugation of an area the Aztec relied on local leaders to administer the territory and ensure worship of the Aztec god Huitzilopochtli. Overextended and loathed by their subjects, the Aztec fell quickly to the Spanish in 1521, whose conquest campaign was greatly facilitated by peoples previously subject to Aztec rule.

Moving south, each region in the Andes took on a particular social form, with characteristic linkages among valleys and river basins, different levels of complexity in social and economic organization, and unique ways of managing territory. The variability of the physical environment constituted an important factor in determining borders and frontiers. A series of serious climatic shifts in the sixth century in the Andes contributed to displacements of populations and the eradication of previous borders. At about the same time two other events also affected the identity of certain Andean inhabitants. The first was the development of the Wari state (fifth through eighth centuries) that extended from modern Ayacucho throughout the entire central Andes. The second was the expansion of Tiwanaku culture (fourth through 11th centuries) in the Lake Titicaca altiplano (high plain). These events had the effect of shifting or affiliating previously diverse communities into a statelike apparatus, consequently reengineering previous notions of borders.

Recent theories suggest that the Wari expansion was forcible, coinciding with other political movements in the same region and with Tiwanaku's growth to the south. It appears that Tiwanaku's expansion happened in some places as a form of colonization in agricultural zones, while in other territories the process suggests a stable network of traffic in merchandise, though it should be noted that some form of violence in the process of occupation cannot be discounted. It is possible that Tiwanakan influence would have spread farther north if it had not been interrupted by the expansion of the Wari state moving into those territories. In areas previously affiliated with Tiwanaku, culture shifts represented in ceramic styles and the breaking of previous settlement patterns suggest that the Wari presence altered the conditions of Tiwanakan existence, perhaps through war. One example comes from Cerro Baúl, which was strongly protected and fortified with ramparts to reinforce an already naturally inaccessible position, strongly implying that relations with adjacent populations were less than neighborly and some kind of border was defended.

At the time of the Spanish invasion (1532) the Inca ruled the largest empire in the world. In the early 15th century the Inca were one of several vast Andean societies scattered across the Andes. From their center in Cuzco they built administrative centers, way stations, storehouses, and religious shrines, and they connected them by a massive road-build-

ing campaign. As the Inca expanded by both diplomacy and force, they superimposed their solar religion and their administration onto older communities. At the same time, they encouraged ethnic diversity and adapted already existing institutions as a means to facilitate the consolidation of new territories. In the process all previous notions of borders and frontiers were reorganized under one single entity, a program the Andes had previously seen only in microcosm.

## ASIA AND THE PACIFIC

BY KIRK H. BEETZ

A great deal of warfare in medieval Asia and the Pacific may be understood as conflicts over borders. At the outset of the medieval era nearly the whole of Asia had indeterminate borders and restive populations. The collapses of the Han Dynasty in China in 220 and the Gupta Dynasty in India in 550 meant that the borders of the two dominant cultures in eastern and southern Asia were open to invasion and dramatic revisions of the boundaries of national territories.

Much of China's medieval history is a story of trying to establish and maintain friendly frontiers. Four Chinese dynasties had some success at doing this: the Sui (589–618), the Tang (618–907), the Song (960–1279), and the Ming (1368–1644). Until its reunification under the Sui, China had been divided into several different nation-states since the fall of the Han Dynasty. Borders changed frequently, according to which ruler had just won a war or had submitted to the authority of a neighbor.

Building on the achievements of the Sui, the Tang rulers extended China's lands to the edge of the Himalayas far into central Asia, not just controlling the trade routes but also creating Chinese communities, and they established their authority over Korea and Vietnam. Further, they extended China's borders all the way to the South China Sea. In so doing, they made China Asia's largest unified nation. The Sui Dynasty had conscripted a million people to rebuild the Great Wall, and the Tang emperors did as the Han had done and extended the wall westward to help protect the trade routes.

In 751 the Tang lost control of the northwestern trade routes in central Asia to Turkic nomads, and in what is now the province of Yunnan, the kingdom of Nanzhao threw off Chinese rule. Further, the Khitan tribes in Manchuria pushed the Chinese back inside the Great Wall. With minor shifts during wars to defend them, China's borders remained stable until the fall of the Tang. In the 870s the Turks encroached on Chinese territory, and in 907 China disintegrated into numerous warring states.

The Song Dynasty managed to reunite most of China, although the far southwest, far northwest, and far north

remained out of reach. Indeed, the Khitans of Manchuria conquered the far northern regions of China and declared themselves the Liao Dynasty (907–1125). The Song emperors maintained their borders with military force and bribery: They paid their neighbors not to invade them. In 1125 the Jurchens from Manchuria drove the Khitans out of China and then seized the northern territories of the Song. In 1140 a new border between the Song and the Jurchens, who had established the Jin Dynasty in northern China (1115–1234), was defined south of the Yellow River.

The Mongols invaded the Jin territory repeatedly, ending the Jin Dynasty in 1234. The Song Dynasty proved to be a more formidable foe, and it took over 40 years of fighting for the Mongols to conquer that part of China. Thereafter, the Yuan Dynasty (1279–1368), as the Mongol rulers named their line, pressed southward and southwestward, eliminating the kingdom of Nanzhao. The borders of China became confused again when rebels established a new state with its capital at Nanjing.

In 1368 a rebel leader named Zhu Yuanzhang declared himself the founding emperor of a new dynasty, the Ming. By 1382 nearly all of China had been reunited by the Ming rulers. Ming armies ranged far north and forced the Mongols of eastern Asia into submission. The Ming emperors undertook the complete rebuilding of the Great Wall, constructing the wall as it can be seen today, adding impressive stone fortifications. They used the wall to separate farmlands in the south from pasture lands in the north. In the northwest the Turks and the Chinese had a hostile standoff that resulted in a remarkably stable border. China had difficulty extending its southern borders, but in the 1400s it managed briefly to control most of Indochina and force what is now Sri Lanka, south of India, and much of Sumatra to submit to Chinese authority.

In the early medieval era there were three kingdoms in Korea: Paekche, Silla, and Koguryo. In 936 the name of Koguryo was shortened to Koryo, the origin of the modern word *Korea*. The borders of these three kingdoms were poorly defined in the 600s, with frontiers between the kingdoms sometimes governed by no one. In 660 the kingdom of Silla allied with China to conquer Paekche. In 668 Silla defeated Koguryo to create Unified Silla. After invasions by the Khitans of Manchuria, the rulers of Korea built a wall in 1018 across the Korean Peninsula from the mouth of the Yalu River eastward to Ti-ryo-p'ò on the eastern coast. This wall served as the northern border of Korea.

The peoples of India had some natural barriers that helped them develop their own culture apart from the rest of the world. To the north lay the Himalayas, a formidable range of mountains that not only discouraged invasions into India

but also restrained the efforts of Indian rulers to invade Tibet. Most of the rest of India was surrounded by the ocean, providing the land with a rugged coast that would have made invasions by sea very difficult. The vulnerable frontier for India was the valley of the Indus River in the northwest, through which Alexander the Great had led his armies in the fourth century B.C.E. and through which Muslim armies would attack during the medieval era.

The notion of what constituted frontiers for the Indians was unique. Monarchs would try to fulfill a *digvijaya*, or campaign in conquest of the four corners of the world. The *digvijaya* involved forcing neighbors to the north, east, south, and west to submit to their authority and pay them tribute. This process created a *raja-mandala*, the “circle of kings.” The *mandala* represented the cosmos, at the center of which was the mythological Mount Meru, surrounded by four lands, then seas, then lands, and then seas in rings. In a *raja-mandala* the king served as a human representation of Mount Meru, and the lands around his kingdom formed the pattern of the *mandala*. Thus, a medieval Indian map of a kingdom would show it as a *mandala* with concentric rings spreading out from its center—the king—into the lands of his subjects.

This way of thinking about frontiers had serious consequences. One is that borders and frontiers changed frequently according to who was powerful enough at any given time to force other rulers to submit to his or her authority. Thus, much of the history of the borders and frontiers of medieval India involves the expansion and contraction of numerous kingdoms but rarely their unification. Moreover, the medieval Indian attitude toward borders and frontiers helps explain why some of India’s mightiest conquerors, such as Rajendra Chola I (fl. 1040) of the kingdom of Chola in southeastern India, did not try to retain huge tracts of land. Instead, they looted lands hundreds or even thousands of miles away and returned home to the kingdom that served as an earthly representation of the sacred *mandala*. Once a king had completed his *digvijaya*, the acquisition of wealth from looting may have had more prestige than governing conquered lands.

Exactly what the borders of Japan were at the outset of the medieval era is a matter that leaves historians bitterly divided. Archaeological discoveries suggest that there were two main cultural groups on the islands, the Nihon or Japanese and the Ainu. Anthropologists believe the Ainu may be direct descendants of the first modern peoples to inhabit eastern Asia. They were fierce warriors who many times defeated Japanese armies in pitched battles. At the outset of the medieval era the Japanese were the only rulers of the Japanese archipelago who were officially recognized by the various governments of a divided China. They controlled Kyushu and most of Honshu and Shikoku, but the Ainu controlled much of northern

Honshu and all of Hokkaido. The frontier between the Japanese and Ainu in northern Honshu was disputed between the two cultures, and during the medieval era the Ainu resisted efforts of the Japanese government to incorporate their lands into Japan.

Of greater complexity was the feudalization of Japan. From about 1185 to 1867 Japan was usually ruled in practice by military governments headed by a shogun, a high-ranking military leader. There was also an emperor and an aristocratic court, but the emperors in this period were largely restricted to ceremonial functions. The feudal military leaders usually fought among one another for control of territory, and the borders of their lands fluctuated according to whose military fortunes were on the rise. This meant that within Japan the borders of the provinces were as uncertain as the outcome of the next battle.

Although the Khmer kingdom in Indochina is the best known of the medieval nations of Southeast Asia, the kingdom of Srivijaya may have been the most powerful. By 600 it was flourishing on the island of Sumatra. By patrolling the ocean between Sumatra and Malaysia, the rulers of Srivijaya forced merchants to pay for safe passage, and they helped keep the waters free of pirates. In 1292 another power, the Majapahit Empire on the island of Java, established colonies on the Asian mainland.

The geography of the Southeast Asian mainland made the establishment of well-defined borders very difficult. For instance, Burma (present-day Myanmar) was surrounded by mountains that discouraged efforts to bring them under a government's control. Thick forest had to be continually cut back and weeded out, or it would swiftly overwhelm human settlements. The Khmer had trouble maintaining their borders because the frontiers sometimes just vanished in the ever-encroaching forest.

The borders of central and northern Asia were uncertain most of the time. The nomads who occupied much of this territory claimed certain pastures as their own, but their frequent wars with one another meant that fixed borders were almost impossible to establish. The Mongols, for hundreds of years a collection of fractious tribes, were united by Temüjin (ca. 1162–1227), who became Genghis Khan, “Lord of the Earth.” The Mongols had a straightforward political ideology: that they were destined to rule the entire world. One consequence of this ideology was that they did not recognize borders; frontiers were only boundaries to be crossed and conquered. Their ruthless way of war resulted in their conquering most of Asia.

Among the lasting effects of the Mongol conquests was the halting of the Arab advance into central Asia. Motivated by their own ideology of conquest, Muslims began pushing

even mighty China out of what are now Afghanistan and the trade routes north of the Himalayas during the 700s. In the 13th century the Mongols pushed the Islamic world back deep into the Near East; Afghanistan had the protection of mountains to its north, however, which kept it under Muslim control.

The peoples of medieval Australia may have divided themselves into territories that had loosely defined frontiers. How these would have been defined is unclear, but at the time of European colonization the Australians had many different cultural groups who had traditional lands of their own. The tribal groups of New Guinea and New Zealand had ranges that belonged to them and were vigorously defended against interlopers.

The most extensive frontiers may have been those of the kingdom of Tonga. In the 1200s Tonga's territory extended about 3,000 miles to include the present-day Hawaiian Islands. The frontiers of Tonga were the islands it claimed in the Pacific. The history of the Hawaiian Islands before the arrival of Europeans is murky, but the islands and atolls that form the archipelago seem to have been divided into four principal chiefdoms during the medieval era, chiefdoms based on the larger islands of Hawaii, Maui, Oahu, and Kauai.

## EUROPE

BY BRADLEY A. SKEEN

The borders of the Roman Empire had been secured by natural features such as rivers and mountains; continuous border fortifications, consisting of walls and chains of fortresses; and fortified cities immediately behind the borders. Enforcing border security was the responsibility of large numbers of troops. In the fifth and sixth centuries C.E. the cohesion of the western half of the empire fell apart as the costs of frontier defenses became too great for the local economy to bear. Throughout the Middle Ages the Byzantine Empire carried out the same Roman policies, retreating to and fortifying the Tarsus Mountains in Asia Minor (modern-day Turkey) against the Arab invasion of the seventh century and defending the border with the Slavic tribes in the Balkans with a continuous belt of fortifications. The area of the Byzantine Empire continually diminished in the medieval period and finally consisted only of the heavily fortified capital Constantinople, which was captured by the Ottoman Turks in 1453.

In western Europe the successor state to Rome was the Carolingian or Holy Roman Empire, which by 800 controlled territories comprising modern-day France, the Low Countries, Germany, Switzerland, and most of Italy. This state and its immediate successors revived the Roman border strategy, depending on the Pyrenees on the border with Spain and

building a system of fortifications on the eastern frontier. But from 850 to 1000 this system, too, lost cohesion under the pressure of renewed invasions by Vikings and Magyars.

The Vikings, raiding by sea, were highly mobile and could strike any point on the coast as far as the Mediterranean (they established a kingdom on the island of Sicily after 1061) and deep inland up any river (for example, traveling up the Seine to lay siege to Paris from 885 to 886). The Magyars were able to conduct lightning cavalry raids from eastern Europe wherever they chose. No system of fixed fortification could have defended so vast a threatened area. Accordingly, castles were built in each local district where the population of the countryside could find shelter when necessary.

The western Europe that emerged from the last great invasions was feudal. This means that power and control of resources were highly decentralized after 1050. Border fortifications were no longer practical. The basic unit of political administration was the lord (military leader), who controlled a local castle and a small band of armed men (knights and men-at-arms). With the threat of invasion ended, the many lords and knights no longer served any military purpose but rather enhanced their own wealth and prestige by controlling the labor of the local farmers as serfs. In this system, ties of personal allegiance and dependency between the ruler and the ruled were what mattered, though lines of political power and administration generally fell within specific geographical boundaries. It also often happened, however, that such ties crossed dynastic boundaries, and many feudal lords controlled some lands under the nominal authority of the kings of England or France. In fact, throughout much of the late Middle Ages the king of England, even though he was an independent ruler in Britain, controlled lands for which he owed allegiance to the king of France. Those lands constituted nearly half of France, a greater domain than the French king personally controlled. Moreover, the two monarchies were most often at war with one another. Under those conditions national boundaries did not have much meaning.

Identity in western Europe was more bound up in the concept of Christendom than in national allegiance. Although language and social customs varied widely, even within a unit such as the kingdom of France, everyone in western Europe felt a connection with one another through their shared Christian faith and a marked difference from foreigners who were not Christian (generally called infidels).

The idea of the Crusades focused attention on the cultural and conceptual boundary that existed between Christendom and the Islamic world. A physical border was created through invasion in an attempt to “reclaim” the Holy Land (where the events of the New Testament had taken place but which had never been part of western Europe). An actual kingdom of

## ANGLO-SCOTS BORDER REIVERS

In 1286 Edward I of England launched a devastating invasion of Scotland in an attempt to annex the country. This began three centuries of conflict between England and Scotland that resulted in frequent warfare and constant armed tension on the border. Because of this conflict, the fruits of a year of labor by peasants and noblemen alike—people who relied on agriculture for their livelihood—was liable to be destroyed in a few hours or seized if one of the armies passed through. Families and clans on both sides of the border (often with names later made famous in American history, such as Johnson, Nixon, and Armstrong) found they had to resort to reiving, or raiding, as a way of life. A local nobleman would lead as many as 3,000 armed men (called “steel bonnets” after their distinctive helmets) on raids to steal cattle, horses, and anything else to be had.

Both England and Scotland encouraged this kind of brigandage because each royal government hoped that the reiving would cause greater havoc on the other side of the frontier than on its own. This way of life produced some of the finest natural light cavalrymen in Europe, a vital resource that the crown could draw on whenever hostilities escalated to open war. Under the laws imposed on both sides of the border as zones of virtual military occupation, counterraids across the border carried out by clans to steal back the stolen cattle and other goods were not only legal but indeed obligatory. Blood feuds, betrayal, and treachery were an essential part of living and could well have led to the forming of alliances across the border and antipathies lasting generations between families of the same nation.

After the death of Elizabeth I in 1603 England and Scotland were joined under the first Stuart king, James I, and the border ceased to be a legitimate area of tension. The border reivers on both sides of the frontier were suppressed by legal means. In the 19th and 20th centuries the exploits of the border reivers became romanticized in the works of such authors as Sir Walter Scott and George MacDonald Frazer.

Jerusalem and other crusader states came into existence between 1099 and 1291. However, western Europe had nothing like the strategic resources or political will to maintain such a distant bridgehead, and the reclamation efforts eventually

failed. By focusing on that border, however, institutions such as the national monarchies and the Catholic Church tried to divert military resources and initiative away from warfare within Europe (between individual feudal lords) and toward a unifying enterprise. The church had traditionally imposed penance (rituals to forgive the sins involved in killing and intending to kill) on knights who fought even in a just war, but in the case of the crusaders granted indulgences (the free forgiveness of all sins). The church also organized military orders (such as the Hospitallers and Templars), groups of knights fighting in the Crusades who were not under the same rule as clerical monks but who nevertheless ultimately pledged obedience to the church hierarchy.

The Crusades also provided a model for Christian Europe's two physical borders, to the south in Spain and to the east beyond Germany. The intellectual framework for the Crusades was worked out by the Cistercian monk Bernard of Clairvaux in *De laude novae militiae* (*In Praise of the New Knighthood*). Written in 1128 the text declared that the war with the infidel was an outward expression of the inner war with the devil. The crusading knight's battle was as much a spiritual one as the monk's. Warfare became a sacred duty, one that could save the soul of the crusader as his ascetic discipline conquered Satan's influence in his own soul and simultaneously brought about military victory. The inner border between the human soul and sin, which was the chief concern of the church, was projected onto the geopolitical stage.

In the seventh century Spain was conquered by Islamic Moors from North Africa. Only a small fringe of Christian principalities clung to existence along the Pyrenees, resembling bands of brigands more than nations. Nevertheless, they made steady progress in the work of the reconquest of Spain from the Moors. After the initial impulse of the Crusades, this fight in Spain was also seen by Europeans as a crusade. As a result many crusading institutions were introduced there, including military orders and the granting of indulgences. Knights from throughout Europe were attracted to fighting in Spain against Islam.

But the situation that developed from the intermittent warfare between the various Islamic and Christian states in Spain produced classic "frontier conditions." The soldiers involved in the fighting were encouraged by their own rulers to act as brigands, raiding enemy states, and saw themselves as above the law because of the pressing needs of the conflicts in which they were involved. Feuds and revenge with rivals across the border (or even with allies) became important factors, but at the same time the enemy was seen as having more commonalities than countrymen further removed from the frontier. Loyalty was transferred to leaders who proved themselves in battle. Groups of Muslims and Christians might

have fought together against other mixed forces in constantly changing constellations of power. In Spain all of this was embodied in the figure of Rodrigo Díaz de Vivar (1044–99). A Christian knight, he was known as El Cid (Arabic for "chief"), a name his enemies awarded him as a sign of respect. He was a knight of the kingdom of Castile and participated in several campaigns under royal patronage against both Islamic and Christian enemies. El Cid finally conquered the city of Valencia for his own principality with a mercenary army composed of both Christian and Islamic soldiers. His exploits made him the Spanish national hero.

The territories to the east of the Holy Roman Empire were populated by Slavs organized into various kingdoms and tribes, some of whom were called *pagan* because they still practiced their traditional polytheist religion while others were Eastern Orthodox Christians. In general, because their technology and social system were less sophisticated than those of the western Europeans, the Slavs were not a serious military threat despite the devastating raids they occasionally launched. During the ninth century the Holy Roman emperors occupied a zone along their immediate eastern border to create "marches," or buffer areas, to protect their older holdings from any incursions. Throughout the High Middle Ages, German colonists spread across eastern Europe as far as the Volga but in a peaceful fashion, invited by local rulers who wanted to populate their undeveloped lands.

At about the same time as the Crusades in the Holy Land more serious military action was taken on Europe's eastern frontier. Under the influence of Bernard of Clairvaux wars in this area were declared crusades by the papacy in 1170 (and again in 1215), and knights fighting in them were given the same indulgences as crusaders in the Holy Land. Once the European adventure in the Middle East came to an end, the wars in northeastern Europe took on an increasingly religious character under the direction of the Teutonic knights. This military order had been founded in Jerusalem to assist German-speaking knights participating in the Crusades, but after the loss of the crusader states it returned to Europe and soon became the driving force in the northern crusade. It coordinated military action against the so-called pagan peoples beyond the borders of Christendom and under papal authority took direct control over the territories it conquered, including the modern states of Estonia, Latvia, Lithuania, and much of Poland.

Previous fighting between Christian states and tribes and kingdoms that practiced traditional religion had assumed many frontier characteristics and had not been conducted along strictly religious lines. However, the Teutonic knights became notorious for massacres and other atrocities that

seemed justified when committed against the “pagan other” and polarized the conflict. The knights tried to expand their crusade into Christian (but Orthodox rather than Catholic) Russia but were sharply defeated at Lake Peipus by the Russian Prince Alexander Nevsky in 1242. The Teutonic knights collapsed as a political entity after their defeat at the battle of Tannenberg in 1410, and their territories were gradually taken over by local monarchies.

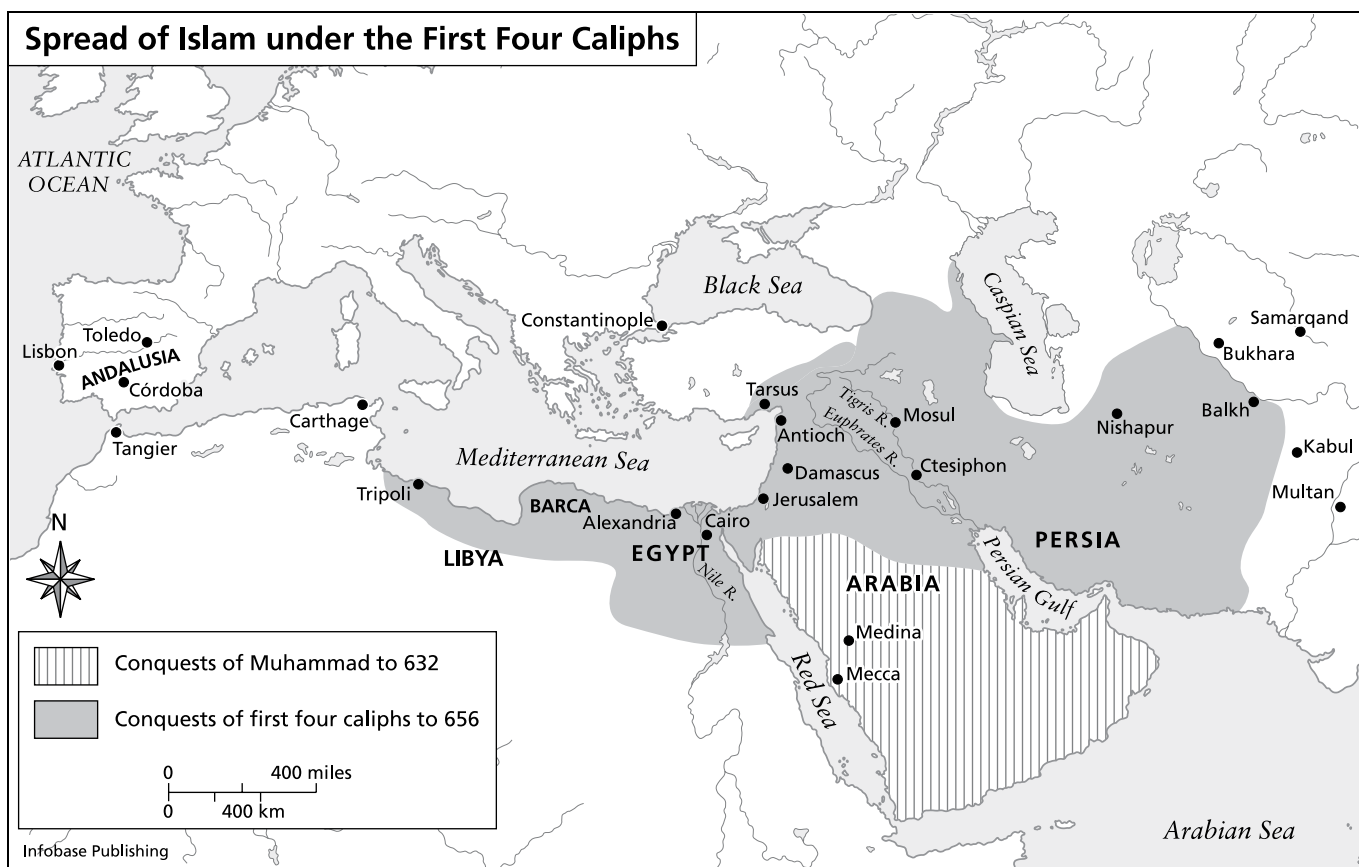

## THE ISLAMIC WORLD

BY RASHEED HOSEIN

In the history of the Middle Ages very few polities can be said to match the stunning rise in power or to equal the longevity of the Islamic Empire. With the death of Muhammad, the Prophet of Islam, in 632 C.E., the lands under Islamic rule were subsequently governed by caliphs with close genealogical ties to him. Within a century of his death these lands, known as the Islamic caliphate, would stretch to southern France in the west, across North Africa, and through the Near East and into China in the Far East. In

this configuration the territory encompassed sizable shares of both the old Roman and Persian empires. Thus, the Islamic caliphate may rightly be considered a major successor state of both Persia and Rome. Historically, the delineation and defense of the borders of the caliphate can be divided into two discernible phases: expansion (622–750) and coexistence (750–1500).

The Islamic state was founded in 622 with the departure of Muhammad and about 70 followers from the trading entrepôt of Mecca to the oasis town of Yathrib, later renamed Medina, approximately 200 miles to the north. The Arab biographer Muhammad ibn Ishaq (ca. 704–68) noted in his *Sirat rasul Allah* (Biography of the Messenger of God) that the nascent Muslim community struck out from its base in Medina on some 80 raids against the city of Mecca. While the Muslims appeared to be grossly overmatched by Mecca, the conflict began turning in favor of the Muslims, and peoples once aligned with Mecca started to side with Muhammad. Ultimately, with only minimal resistance Mecca fell in 630, and the boundaries of Islamic power, centered in Medina, would encompass the entire Arabian Peninsula.

The 25 years following Muhammad's death in 632 saw a dramatic expansion of Muslim territories in the Arabian peninsula and beyond.

Muhammad's death in 632 inaugurated the era of the *rashidun*, or "rightly guided," caliphs (632–61). As word of the Prophet's death spread, many societies abrogated their allegiance to the Islamic state. The first caliph, Abu Bakr (r. 632–34), challenged these groups to restore their financial obligations in a series of campaigns known as the *hurub al-riddah* (the wars of apostasy). The fighting culminated with the battle of Aqraba in 633. Although they were costly in terms of human life, the wars would forever secure the position of Islam in the Arabian Peninsula.

Under the second of the *rashidun* caliphs, Umar (634–44), the caliphate saw its most rapid growth. Launching campaigns against the Byzantine Empire (ca. 330–1453) to the west and against the Sassanid Empire (226–651) to the east, the Arabs directed the momentum gained during the *riddah* campaigns outward against the great polities of the age. While the Arabs had often raided border regions in the past, the idea of empire building was definitely new. This tactical shift can be partly ascribed to the relative weakness of the Byzantines and Sassanids. Both empires had spent considerable resources, in terms of money and manpower alike, in a series of conflicts, leaving both vulnerable. Not to be discounted was the influence of Islam on the Arab armies. As raiders, they attacked in small, independent units, but Islam provided an inclusive framework that allowed for the unification of disparate peoples into a larger community.

As Arab armies pushed out of the peninsula, they began to establish military centers in the newly opened territories. These garrison towns were located on the fringes between the desert and the settled land, near to preexisting urban areas. Cities such as Basra and al-Kufa (both founded in 638) and al-Fustat (established in Egypt in 641 and known as "old Cairo") were the most successful of these garrison centers. According to practice, a region conquered by armies from a garrison center would be administered from and remit taxes to that garrison town. Thus, these cities became wealthy administrative centers and were critical in expanding, maintaining, and defending the integrity of the burgeoning borders of the Islamic caliphate.

The nature of Islamic conquests largely determined the way the land was administered—and by extension the nature of the growth of the Islamic polity. If the conquest of a territory was accomplished under the force of arms, it was referred to as *ard al-unwah* (land taken by force or violence). Lands conquered in this manner were placed under the direct administration of the state. However, if a territory capitulated to Arab armies without contest, it carried the legal status of *ard al-sulh* (land taken by treaty), and its lands would remain in the hands of the conquered in return for the payment of taxes, the demobilization of any military forces, and acknowl-

edgment of the rule of the caliph. Little evidence supports the contention that forcible conversion accompanied conquest outside the Arabian Peninsula.

Arab forces made impressive inroads into Syria in 636, securing Damascus and Jerusalem from the Byzantines in the decisive battle of Yarmuk (a river in modern-day Jordan). With a victory over the Sassanids at Kadisiya (present-day Iraq), also in 636, Iraq, Iran, and central Asia were opened up for further Islamic expansion. To the west, the Muslims took control of the main agricultural and settled areas of Egypt with a victory in the battle of Heliopolis in 640. However, during the rule of the final two *rashidun* caliphs—Uthman (r. 644–56) and Ali (r. 656–61)—the inertia of the conquests largely ground to a halt in all theaters but North Africa, as domestic pressures led to the outbreak of civil war. During this period sporadic raiding occurred between the Arabs and their neighbors.

Carved stone inscription of Jalal al-Din Khwarazm-Shah, marking a military campaign (Tabriz, Iran, 1230); the Khwarazm shahs ruled Khwarazm, northwest of Transoxania, as provincial governors for the Seljuk emperors from the late 11th century. (© The Trustees of the British Museum)

The final stages of the initial expansion phase occurred under the Umayyad Dynasty (661–750). During the early portion of this period Arab forces began pushing to the borders of the Chinese Tang Dynasty (618–907) and raiding northern India. In North Africa the process of conquest was equally dynamic. Following the pattern that had opened Iraq and Egypt to Muslim rule, the Arabs founded the garrison town of Kairouan in central Tunisia in 670. From this base the rest of Byzantine North Africa would fall, ultimately leading to the Muslim crossing of the Strait of Gibraltar in 711 and the slow subjugation of the Iberian Peninsula by both force and treaty over the next eight years.

With the overthrow of Umayyad power and the rise of the Abbasid Dynasty (749–1258), the explosive nature of the conquest period was replaced by an era of general decentralization and transition. Regions began to pursue their own policies, at times acknowledging the caliph as a figurehead only. In demographic terms, as Islam became established and the armies of various peoples became fixtures in the regional garrison towns, the process of demilitarization as a result of absorption into the conqueror population began to occur. Also important in this period was the growing articulation of the Islamic world and its role in the wider world.

With the Abbasid revolution the wealth and associated power that had accumulated during the conquest era—and which had made the earliest Arab soldiers extremely wealthy—began to dry up. As the pace of conquest slackened, less money was available for military levies, forcing taxpayers in far-flung regions to begin paying for their regional standing armies. Likewise, as Arab soldiers began to raise families, their interests ceased to be purely martial. Thus, the caliphate came to face a defense crisis of huge proportions, as military assets for entire regions were alienated from the central authority, and the isolated garrisons began to demilitarize and integrate with the native population; as such, Islam spread to non-Arabs.

The situation became so acute by the ninth century that the Abbasid caliph al-Mutasim (r. 833–42) began a massive importation of slaves, referred to as *mamluks*, some of which would form the core of his personal bodyguard. This practice would prove to be an easy way for individuals to build loyal armies to protect and prosecute their agendas. As Islam forbids the enslaving of Muslims and as the non-Muslims inside the caliphate held the status of *dhimmi*, meaning that they were granted legal protection, the caliphs were forced to look beyond Islam's borders to build private armies. In time, the military commanders of such units would dominate the increasingly ineffectual caliph, becoming powerful arbiters within the caliphate.

The permeable nature of the caliphate's borders meant that Islam began to spread into regions not formally under Is-

lamic control. This trend led to the in-migration of the Oghuz Seljuk Turks in the 10th century—the first mass migration of an entire nomadic society, already Islamized, into the caliphate. This Turkic group would ultimately establish the Seljuk Dynasty (1038–1194), ruling as sultans in the name of the Sunni caliphs, and expand the borders of Islam into the Anatolian peninsula.

The Islamic world would receive two massive shocks during this period. In 1099 the First Crusade witnessed the establishment of a European bridgehead in the Levant: the kingdom of Jerusalem. Just as Muslim forces finally repelled these invaders, Mongol forces smashed into the Islamic world, sacking Baghdad in 1258 and effectively ending the Abbasid caliphate. Upon the demise of the caliphate, with the might of non-Muslim powers growing, the Islamic world was forced to redefine its relations with the other nations of the world. Chief within these processes was the articulation of key points of doctrine, such as the theoretical division of the world into discrete zones.

From a Muslim viewpoint the world that lay under Islamic suzerainty became known as *Dar al-Islam*—the abode of Islam. This category included the portion of the world that accepted Islamic law as the supreme law of the land. In essence, given this conceptualization, the rest of the world could be understood to fall under the category of *Dar al-Harb*—the abode of war. The expansion of *Dar al-Islam* was actually achieved through both the conversion of regions to Islam through peaceful means, such as among peoples attracted to the spiritual, material, and cultural wealth of the Islamic world, and through the waging of jihad, loosely meaning “struggle or effort undertaken for the sake of Islam.” While certain Koranic precepts discuss the idea of jihad, its complex rules gained articulation only in the mid-eighth century and would be revised as later historical events dictated.

Indeed, relations between the Islamic and non-Islamic worlds did not consist of constant and unremitting warfare. Recognizing that such a condition was undesirable in moral terms—and also represented a practical impossibility—the Islamic world conception allowed for a third general category: *Dar al-Sulh*—the abode of treaty. With this category, relationships between Islamic and non-Islamic states were normalized, thereby allowing for the peaceful movement of trade and peoples. These conceptions were largely rendered obsolete with the decline of Islamic power and prestige in the 17th and 18th centuries.

~ Alfred and Guthrum's Peace (ca. 878–890) ~

This is the peace that King Alfred and King Guthrum, and the witan of all the English nation, and all the people that are in East Anglia, have all ordained and with oaths confirmed, for themselves and for their descendants, as well for born as for unborn, who reckon of God's mercy or of ours.

1. Concerning our land boundaries: Up on the Thames, and then up on the Lea, and along the Lea unto its source, then straight to Bedford, then up on the Ouse unto Watling Street.
2. Then is this: If a man be slain, we estimate all equally dear, English and Danish, at viii half marks of pure gold; except the ceorl who resides on rented land and their [the Danes'] freedmen; they also are equally dear, either at cc shillings.
3. And if a king's thegn be accused of manslaying, if he dare clear himself on oath, let him do that with 12 king's thegns. If any one accuse that man who is of less degree than the king's thegn, let him clear himself

with xi of his equals and with one king's thegn. And so in every suit which may be more than iv mancuses. [A money of account representing thirty pence] And if he dare not, let him pay for it threefold, as it may be valued.

4. And that every man know his warrantor in acquiring slaves and horses and oxen.
5. And we all ordained on that day that the oaths were sworn, that neither bond nor free might go to the host without leave, no more than any of them to us. But if it happen that from necessity any of them will have traffic with us or we with them, with cattle and with goods, that is to be allowed in this wise: that hostages be given in pledge of peace, and as evidence whereby it may be known that the party has a clean back.

*The Islamic World*

~ Al-Baladhuri: "The Battle of the Yarmuk and After,"  
excerpt from *Kitab futuh al-buldan (Book of the Conquests of Lands, ninth century)* ~

*A description of the battle.* Heraclius gathered large bodies of Greeks, Syrians, Mesopotamians and Armenians numbering about 200,000. This army he put under the command of one of his choice men and sent as a vanguard Jabalah ibn-al-Aiham al-Ghassani at the head of the "naturalized" Arabs of Syria of the tribes of Lakhm, Judham and others, resolving to fight the Moslems so that he might either win or withdraw to the land of the Greeks and live in Constantinople. The Muslims gathered together and

the Greek army marched against them. The battle they fought at al-Yarmuk was of the fiercest and bloodiest kind. Al-Yarmuk [Hieromax] is a river. In this battle 24,000 Moslems took part. The Greeks and their followers in this battle tied themselves to each other by chains, so that no one might set his hope on flight. By Allah's help, some 70,000 of them were put to death, and their remnants took to flight, reaching as far as Palestine, Antioch, Aleppo, Mesopotamia and Armenia. . . .

*Heraclius' adieu to Syria.* When Heraclius received the news about the troops in al-Yarmuk and the destruction of his army by the Moslems, he fled from Antioch to Constantinople, and as he passed ad-D'arb he turned and said, "Peace unto thee, O Syria, and what an excellent country this is for the enemy!"—referring to the numerous pastures in Syria.

The battle of al-Yarmuk took place in Rajah, year 15. . . .

*Christians and Jews prefer Moslem rule.* Abu-Hafs ad-Dimashki from Sa'id ibn-'Abd-al-'Aziz:—When Heraclius massed his troops against the Moslems and the Moslems heard that they were coming to meet them at al-Yarmuk, the Moslems refunded to the inhabitants of Hims the *karaj* [tribute] they had taken from them saying, "We are too busy to support and protect you. Take care of yourselves." But the people of Hims replied, "We like your rule and justice far better than the state of oppression and tyranny in which we were. The army

of Heraclius we shall indeed, with your 'amil's' help, repulse from the city." The Jews rose and said, "We swear by the Torah, no governor of Heraclius shall enter the city of Hims unless we are first vanquished and exhausted!" Saving this, they closed the gates of the city and guarded them. The inhabitants of the other cities—Christian and Jew—that had capitulated to the Moslems, did the same, saying, "If Heraclius and his followers win over the Moslems we would return to our previous condition, otherwise we shall retain our present state so long as numbers are with the Moslems." When by Allah's help the "unbelievers" were defeated and the Moslems won, they opened the gates of their cities, went out with the singers and music players who began to play, and paid the *kharaj*.

## ► building techniques and materials

### INTRODUCTION

The need for shelter varied with the environment in which people lived and was met according to the building materials available in a particular region. People were very clever in finding ways to house themselves in demanding climates that offered few materials with which to work. For instance, the Inuit of North America lived in a cold climate that often provided little material with which they could build. The northern forests supplied wood, but food was to be found only in the far north, where trees did not grow. To be able to both eat and survive in the cold, the Inuit built shelters made of ice. They learned what kind of ice (in thickness and shape) worked best for building shelters, allowing them to survive in severe weather and temperatures that would otherwise kill them.

This situation can be compared to that of medieval Australians, most of whom lived in a spare environment that required them to move about the landscape in search of food. They learned to take branches and use roots to strap them together for shelters. In rain forests, where there was an abundance of wood, lean-tos sometimes were favored, because the rain forests provide enough natural shelter for lean-tos to have been all that people needed.

The preferred building material in the Near East was mud brick. Trees were scarce, the heat was sometimes oppressive, and mud was available. Brick houses offered shelter from the sun as well as the rain. Good stone for building could be hard to find, but human behavior motivated Near Eastern societies to find stone for building—not as shelter against the climate but as shelter against each other. War often made medieval builders look for the strongest building material available, and the vulnerability of wood, in particular, was perhaps best illustrated by the wooden cities of India that were lost when they were burned by invaders.

Human societies had other building needs besides shelter from the elements and from each other: They wanted places where they could gather together, places where business could be fostered, places for government institutions, and places for worship. In southern Florida medieval peoples found large stones in the ground and drilled holes into those stones into which they inserted logs; these logs supported wooden floors and tall, curving roofs framed by timbers and covered by thatch. Such structures required maintenance and occasional rebuilding, and their use for hundreds of years at a time suggests that they were very important to their societies. They were used as meeting places. Similar structures were built in such faraway places as Samoa and New Guinea, indicating a broad desire among human beings to gather in one place in shelter.

Places for business and trade seem to have been universally valued. Most cities and towns had market areas, which were sources of wealth for local economies and which provided opportunities for learning from visitors about developments in the larger world. In India and China societies found it worthwhile to set aside areas for marketplaces. In India marketplaces had permanent structures, usually wooden, that opened out into streets and housed merchants and their wares. In Europe marketplaces had temporary structures, set up for market day and taken down for the rest of the week. Light wooden frames that could be knocked together and taken down quickly were favored for such market stalls.

Government and religious buildings were built with an intention to impress people. Palaces were seen as visual declarations of a monarch's power. Temples and churches were expressions of religious belief and declarations of the power of the religious faith that fostered them. The great palaces of the Islamic world were often embodiments of grace in architecture, and their buildings often required thousands of workers and the importation of materials from far afield. In Europe huge logs from Scandinavia were transported into central Europe for use in great cathedrals. In most of southern and eastern Asia enormous towers were erected. In India these towers represented the creative power of the gods, the moun-

tain at the center of the universe, or Buddhism's path to enlightenment. Such buildings in China and Japan, the pagodas, have become cultural signatures. In India, China, and Africa caves were sometimes hewn out of solid rock to be filled with wondrous sculptures created with hammers and chisels and detailed with the fine tools of jewelers. It took much time and expense for cultures to build such structures, indicating the great value they had for the people who built them. They were testaments to the skill and intelligence of their builders.

## AFRICA

BY KIRK H. BEETZ

Medieval African building techniques varied according to the available materials, the climate, and the culture. Information on medieval African building techniques and materials is sketchy for most of Africa, with a few areas only recently having been studied in depth by archaeologists. One reason for this is that sites in African forests and deserts have been hard for archaeologists to find and visit. Further, the attention of many archaeologists was captured and held by the large stone ruins found in eastern and southern Africa. As a result, a skewed picture of the development of African building techniques emerged. Stone construction was portrayed as a phenomenon separate from other African building, suggesting that people from outside Africa—Egyptians, Arabs, or Indians perhaps—brought it into the country.

In the final decades of the 1900s archaeologists made progress identifying the various kinds of African building techniques and dating them, and archaeologists of the 2000s are making careful efforts to accurately trace the derivation of African building techniques. One result of this work has been the identification of a traceable development of building techniques that shows that even the most magnificent medieval structures were built by Africans using African techniques developed over hundreds of years.

In the deserts of southern Africa the common building materials were grasses and wood. The nomadic peoples of the region often did not build permanent dwellings, but some medieval cultures did erect small homes consisting of tree branches covered with leaves or dried grass. Most of the hunter-gatherers who built these structures lived outdoors, so they used them primarily for sleeping. Built together in small groups, the homes served as anchors for the people who would range sometimes for days in search of food.

Many central African peoples, including the Bakas, Mbutis, and Twas (all often misnamed "pygmies"), built lean-tos for shelter. These structures were composed mostly of leaves laid over wooden frames and set against trees. During the medieval era most of these groups were pushed out

*Cupboard door (wood, carved ivory, and marquetry); Egypt, second half of the 13th century* (Los Angeles County Museum of Art, the Madina Collection of Islamic Art, gift of Camilla Chandler Frost, Photograph © 2006 Museum Associates/LACMA)

of their ranges by migrating Bantu-speaking peoples whose origins were in West Africa.

These immigrants built homes made of clay or wattle and daub. Wattle and daub is mud dried over intertwined strips of wood. The homes were almost universally round, with square structures appearing only after European intrusions. The clay houses required occasional rebuilding because of erosion caused by rain. In most of the central African Bantu-speaking communities, women were the house builders. They quarried the clay themselves, usually from pits near rivers, and transported the clay to their building sites. Walls were built in layers about 8 inches high and forming a circle except for an opening for a doorway. These layers would be laid one atop another and allowed to dry. Roofs varied according to custom and taste. Usually the roofs were somewhat flattened cones made of wooden frames overlaid with leaves or rushes. The edge of the roof extended beyond the outside of the wall, which kept rainwater away. The center was sometimes topped by a finial (a type of building ornament).

In West Africa the basic structures had a very ancient history. Evidence for ancient population movements is hard to find, but it appears that people who lived in the Sahara grasslands from 5095 to 2780 B.C.E. migrated south into much of West Africa, under pressure from the expanding Sahara Desert and raids from well-armed nomads. They brought with them an ancient form of house building. Their basic structures were made of wattle and daub, with the wattle consisting of wooden posts interlaced with branches or wicker and the daub consisting of mud. The roofs were thatched.

The Fulani in West Africa built their homes in small groups surrounded with barriers made of brush. They and other groups, such as the Mandinka, continued to build circular houses throughout the medieval era. At the beginning of the period in the city of Jenne-jeno, only round houses were built, but by the 1100s square structures were being erected. Inhabitants of Jenne-jeno also developed mud bricks, which were dried in the sun before being used in construction. There is evidence that this development occurred throughout the kingdom of Ghana, in particular. The floors of buildings were usually smoothed earth. As the threat of war grew during the later medieval era, the people of Jenne-jeno built a 12-foot-thick wall 1.2 miles in length around their city. It was made of mud. It is likely that more such walls will be found as archaeologists study West African cities more closely.

In eastern and southeastern Africa are found the spectacular stone structures that excite the most interest among outsiders and archaeologists, yet the most common structures in these areas were made of clay or wattle and daub. Until the 900s the clay was laid the way houses in central Africa were usually built, in circular layers. It is possible

that this shows the influence of Bantu-speaking migrants into the eastern and southeastern regions of Africa. By about 1000 mud-layered walls had been replaced by mud brick walls. At first, these seem to have been crude, sun-dried bricks, predating this development in West Africa by about 200 years. Archaeologists have found evidence that development of mud bricks progressed into the 1400s, when well-shaped fired clay bricks may have been used. Such bricks were much more durable than sun-dried bricks. On the Zimbabwe Plateau a particularly durable type of clay was mined. Called *daga* by present-day local people, it dried so hard and was so durable that early archaeologists thought it was some kind of cement.

For workers to be able to reach the bottom of the church easily, another trench was dug, slanting down underneath the rock that surrounded the church and opening where

### THE CHURCHES OF LALIBELA

The small town of Lalibela is about 400 miles north of Addis Ababa in Ethiopia. It is home to about a dozen stone churches carved out of rock, with four of the churches being free standing in deep pits that were carved around them. Tradition says that 10 of them were carved on the orders of King Lalibela (fl. 1200), who was told either by Saint George or God to erect them at the town of Roha, now called Lalibela. It is said that the churches were built quickly, with angels carrying on the work at night while human workers slept.

Archeologists have found much evidence for the skills of the medieval Ethiopians; in fact, local peoples had been carving structures in rock for more than a thousand years before the most famous of the churches, Saint George's Church, was built in about 1200. Ethiopia had sophisticated metalworking techniques that allowed for the fashioning of hard iron tools. For Saint George's Church, four large trenches were dug into a huge volcanic stone. Wood and iron wedges would have been used for splitting the rock. The trenches were dug about 33 feet down and were connected at their ends to form a square. Then Ethiopian engineers needed to calculate the weight of the structure they were to build and to lay out its interior so that it could bear that weight even before carving the interior began. Even a small mistake in their mathematics could result in a misshapen structure or one that could not stand.

the main entrance to the church was carved. Using iron chisels, workers smoothed the outer surface. Getting inside the stone probably required the same technique for removing stone that Ethiopian quarry workers used—hammering wood and iron wedges into the sides to separate the rock to be removed from the rock that was to remain. Once interiors were opened, chiseling would have created the pillars and the vaulted ceilings. The result for Saint George's Church was a multistory building shaped like a cross, with doors and windows like those of many other medieval churches but carved completely from one stone. Perhaps the most prolific builders of public structures in medieval Africa were the Axumites. Their kingdom and the Ethiopian kingdom that followed it were famous in medieval times for their great cities and impressive monuments. The kingdom of Axum had busy building trades, including carpentry, stone masonry, bricklaying, stone quarrying, and architecture. Modern archaeologists, architects, and engineers are only just beginning to understand what the Axumites built. By the beginning of the medieval era the Axumite culture was already more than 1,000 years old. Since the 300s it had been Christian. The capital, Axum, and the main port of Adulis were crowded cities. Roads were paved with crushed stone, and buildings were combinations of wood, brick, and stone. Homes of the rich and powerful as well as fortresses and churches were sometimes three stories high and set on stepped-stone platforms to make them appear higher.

A single-story building and the bottom floors of taller buildings were made of stone, bricks, or wood and rubble. The stone was quarried with wooden and iron wedges pounded into rock faces. The split-off stones were dressed with iron chisels and then transported to the building site and set in place. Brick masonry was carefully laid. A brick wall, regardless of floor level, could be several layers deep. Walls made of wood and rubble had inner and outer layers made of timber, between which was laid stone rubble mortared by mud. This left the ends of timbers projecting from the edges of walls and the corners of windows. Timbers for the sides of windows had been squared by carpenters; other timbers may have been sometimes round and sometimes square. Notches in the timbers allowed them to fit crosswise into each other.

The kingdom of Ethiopia, in the Ethiopian highlands, that succeeded Axum, was famous in medieval Asia for the opportunities it provided for international trade and for its magnificent stone structures. Axumites had carved stelae—squared stone pillars—several stories high, making them look like tall houses, replete with realistic doors and windows. Each stela must have taken several years for teams of masons to carve. From 1000 to the end of the medieval era the Ethiopian kingdom seems to have outdone its pre-

decessor. Fortresses and churches of stone erected as well as churches and monasteries were carved into solid rock. The best known of these are near the village of Lalibela. Builders carved straight down into solid rock and then shaped multi-story buildings in the rock. Curiously, the kings of Ethiopia seem to have chosen to live nomadic lives in tents rather than in impressive palaces.

It would seem that no discussion of building techniques and materials in medieval Africa would be complete without reference to Great Zimbabwe. Great Zimbabwe was a city on the Zimbabwe Plateau in southeastern Africa. It was the principal city in a nation about which little is known, but it appears to have included cities as far away as Botswana, Mozambique, and South Africa. Although Great Zimbabwe receives almost all the publicity, the stone buildings of the Zimbabweans may be found at more than 150 additional sites.

The earliest Zimbabwean structures, from roughly the 1100s, were wattle and daub. The region was blessed with the sturdy building clay called *daga*. Archaeologists have noted that the widespread use of the clay in Zimbabwean buildings became more sophisticated with the passage of time. The high quality of the clay enabled people to construct durable circular houses. These houses had conical roofs of thatch. Evidence suggests that some rectangular buildings were erected using the same materials.

At first, undressed stones were laid without much skill to form walls. The stones did not require dressing before being laid because of how they were formed. There was a great deal of exposed granite on the Zimbabwe Plateau, and the alternating hot days and cold nights caused surface granite to break off in roughly regular blocks. The Zimbabweans accelerated the process by heating granite with fire and then pouring water on the hot rock. It is possible to see how the Zimbabwean stone masons learned how to improve their work, from poorly laid stone in the early years to carefully dressed stone laid with great care by 1300. Although much of the stonework was laid without mortar, for some structures *daga* was used as mortar. Apparently stone construction techniques declined, because by 1450 stone was simply piled loosely to form walls.

To bear its weight, a wall was built broad at the bases and tapered at the tops. The outer and inner sides were usually made of laid stones, and the space between was filled with rubble. The Zimbabwean builders seem to have avoided making corners, instead laying out patterns that allowed the walls to curve gently. This may have meant that they did not have techniques for making stone corners, but it may have been a stylistic preference. In any case, the people of Zimbabwe created buildings that are admirable for their beauty and strength.

## THE AMERICAS

BY ARDEN DECKER

North Americans of the medieval period built structures primarily from ephemeral materials; however, there is evidence of the use of more permanent building techniques as well. Most of the structures created during this time served multiple functions, from the residential to the ceremonial. Materials and varying techniques most often reflect the regional conditions of the individual cultures.

In the Arctic region the most common building practice may be found in the need for winter houses. These peoples, such as the Thule of the eastern Arctic region (beginning ca. 1000), utilized what little material resources they had around them, including rocks, whalebone, driftwood, or the ground itself. Often subterranean housing was framed and fortified using such materials. In circular subterranean structures, stones or bones were used to construct walls that would then be covered in sod. The Thule also used blocks made of peat to construct permanent winter houses. The use of stacked snow bricks to form dome-shaped igloos was another innovation in building in the Arctic. While it may at first seem simplistic, the creation of snow bricks was a carefully calculated process that involved the selection of snow that was neither too hard nor too soft, as it needed to be easy to mold but durable.

Some of the more ancient building traditions continued into the medieval period, including wattle-and-daub structures (a framework of twigs and branches covered with clay) and structures crafted from handmade adobe brick. Pit house construction was continued but improved through innovative new techniques. In the North American Southwest such cultures as the Mogollon (ca. 800) began to line simple pit house constructions with stone masonry to create what are called "great kivas." Kiva-style dwellings (ceremonial structures that are at least partly underground) have been found at many subsequent sites as well. In the Southwest large building complexes were constructed using a combination of adobe and wattle-and-daub techniques. The Pueblo of the Four Corners region of the Southwest also utilized adobe brick to new ends as they built large, multistory, multiroom dwellings beginning in the 11th century.

Wood planks were another form of building material used by several different cultures in North America. Among cultures of the Northwest Coast plank houses, which first appeared in the ancient period, continued to be the most prominent type of building. Wood, especially red cedar, would be either split or used as whole logs to create rectangular, roofed structures. Such structures were utilized by sedentary societies and required a communal labor force in their construction. Wigwams also necessitated the use of wood as a source

of structure. Wigwams were found primarily among north-eastern and Great Lakes area cultures and consisted mostly of bent tree saplings tied together to make a frame. These frames varied in shape and size (conical to oblong) and were covered in mats made from reeds or bark.

As many medieval Mesoamerican settlements were large scale and contained both domestic and monumental structures, there is much to be learned about their respective building techniques and materials. Many traditional building practices have continued from the ancient period and have been improved upon. Given the large scale and sophisticated urban planning of many Mesoamerican sites, it is perhaps surprising that much Mesoamerican building was completed using relatively simple local materials and procedures.

Most domestic dwellings across Mesoamerican cultures were composed utilizing such materials as stone, adobe, or wattle-and-daub walls that were then covered with vaulted stone, wood beam and mortar, or thatched roofs. Such general domestic structures would vary in shape, size, and number of rooms. Often the size and arrangement of dwellings reflected the social status of the resident family. Residences and other everyday buildings frequently were built upon stone or earthen platforms of varying heights. Such was the case at the central Mexican site of Teotihuacán (ca. 1–ca. 700), where a large number of apartment compounds were built upon platforms made from a gravel and mortar mixture. The upper walls of the apartments were made using adobe bricks with mud mortar, while the lower walls were made of stone and mud mortar. Such apartments were coated in plaster for painted decoration. Many subsequent central Mexican sites copied this technique in domestic structures and palaces. Many of these residences were more or less finished depending upon the status of the person residing there. Some had dirt floors, but those belonging to the wealthy often had plaster-covered floors.

Among the Maya and other cultures limestone was a popular material used for the facing of monumental structures. The stone was often covered with thick plaster and painted with decorative elements. There is some evidence of fired bricks being used to build walls and other structural elements at Late Classic Mayan sites (600–800) as well as at some Aztec sites. The use of columns, first developed during the ancient period, continued to be employed during the medieval period. One of the chief building techniques developed during the medieval period in Mesoamerica was the invention of the corbel vault. This structural element was especially important at Mayan sites, including Palenque (600–800) in the modern state of Chiapas and in Chichén Itzá (ca. 850–1200) in the northern Yucatán peninsula, where the use of side-by-side corbel vaults allowed interior spaces to become

larger and higher. The central wall created by the corbel vault system created a stable structure to support the inclusion of roof combs to the exterior of the structures. This style of building was utilized primarily for elite centers or residences and ceremonial buildings.

Like the other regions in the Americas, South America experienced new developments in building techniques as sites grew larger and more complex during the medieval period. Cut stone and adobe were the two most common building materials used at this time. The site of Chan Chan (located near Lima in Peru) was constructed solely from adobe brick. The Inca developed such sophisticated cut-stone technology that their technique was elevated to the status of art form. Structures were typically built atop large earthen or rubble platforms of varying heights and sizes. Sometimes these platforms would be stepped and even faced in cut stone. At such sites as Tiwanaku (beginning ca. 550), located slightly south of Lake Titicaca, adobe was used in the construction of common and elite residences alike. However, cut stone was used in the construction of only the most important structures at the site, as was common throughout South America at this time. A sunken courtyard that functioned as a temple has been excavated, revealing the use of cut stone and sculpted tenon heads to line the interior walls.

At the Middle Horizon (550–1000) region of Lambayeque (in northern Peru), monumental pyramids were constructed from chambered adobe walls that were filled with sand and gravel. The pyramids had smaller structures of perishable ma-

terials with column-supported roofs on top. Some pyramids at other sites, such as Cochasquí (900–1438, near Quito, Ecuador), began to feature access ramps. Here large rectangular pyramids, featuring circular constructions made from wood and thatched roofs, served as elite residences. Iskanwaya (ca. 1300), a site built by the Mollo culture on the northeast side of Lake Titicaca, had rectangular structures made of shale rock from local quarries. Because shale is easily split, the Mollo used it to create structural elements, such as doorjambs and lintels. Many of these buildings included windows and were constructed around large interior patios. There is some evidence that the shale was covered with plaster and decorated with red ochre paint.

The most infamous and innovative technique developed in South America was Incan stonework. Buildings and walls were constructed using a technology that required monoliths, or single stones, which were carefully carved with articulated beveled edges. This carving style allowed the stones to fit perfectly together without the use of mortar, almost like puzzle pieces. Each stone had to be carved individually in order to fit each stone against another and leave no space between stones. The stones were carved using several different techniques. Some were shaped by stone-on-stone abrasion or with bronze and stone tools. Excellent examples of this technique are apparent in the city walls, palaces, and temples of such sites as Cuzco and Machu Picchu (ca. 1438–1534), located high in the central Andes Mountains. However, adobe structures that were plastered and painted also figured prominently at Incan sites. These structures had inventive architectural elements, such as niches, windows, and even double-jamb doorways. The use of the natural landscape was another important Incan building technique. Manmade terraces that were carved from rock outcroppings were used for irrigated gardens and even ceremonial spaces laid out in geometric patterns.

## ASIA AND THE PACIFIC

BY KIRK H. BEETZ

The sort of building materials used in Asia and the Pacific region in the Middle Ages varied according to what was available. In general, wood was preferred, but in central Asia stone and brick were more readily procured and were more often seen in everyday construction. Building techniques differed considerably, being affected by the local understanding of engineering as well as by the nature of the tools in use.

During medieval times the building techniques developed in China and India were the most influential in Asia. In China wood was the dominant building material. The typical

Chinese building began with a raised platform made of clay, earth, or solidly packed stones. The platform usually would be surrounded by a wooden or bamboo frame that would be painstakingly filled in; the filling material would be thoroughly tamped down, and eventually the frame would be removed. On the platform were the frame of the building and, atop the frame, the roof. The raised platform was sometimes paved with bricks or stone on its outside. These basic elements were incorporated into ordinary houses, palaces, and even towering pagodas.

In 1103 a guide for standardizing building in China, *Ying zao fa shi* (Treatise on Architectural Methods), written by Li Jie, was published. This text explained how buildings were to be constructed and also presented standardized forms and sizes, which allowed for the introduction of prefabrication on a large scale. A prefabricated structure is one that is composed of independently fashioned parts that can be transported and assembled with relative ease. In medieval China, then, such parts as brackets and roofing frames could be built in one location and shipped around the country to be used in construction projects for which parts had been built in several different locations, with the expectation that everything would fit together properly.

Construction projects were put in the hands of master builders. A master builder was expected to understand at least the basic principles of Chinese architecture. Under the authority of master builders would be craftspeople, such as carpenters and masons; foremen, who supervised smaller groups of workers; and the common laborers whose muscle was needed to bear heavy loads and perform strenuous tasks. Building peaked during winter, when more farmers were available to provide labor. Before beginning construction, a master builder would consult a geomancer, a magician whose expertise was in divining through a study of the geographical features of the landscape. A geomancer would confirm or ensure that the construction would neither harm the earth nor provoke the land's anger.

The building projects that dwarfed all others were the enormous walls that surrounded Chinese cities and sometimes lined territorial borders. In 607 the construction of a defensive wall extending from Beijing to Datong required over 1 million laborers. The Great Wall of China, which most people know from books and pictures, came into existence through the rebuilding of this wall during the 1400s. The command of large numbers of people brought prestige to master builders, and on occasion temples were built in their honor after their deaths. Foremen were responsible for keeping order among laborers, who usually sang while they worked. Foremen were careful to listen for laborers singing complaints about the hard work, as such singing could curse a new building.

*Fragment of a wall with a relief bodhisattva; Tang Dynasty, China, ca. 618–ca. 907* (Freer Gallery of Art, Smithsonian Institution, gift of Eugene and Agnes E. Meyer)

The people of medieval Japan were surrounded by forests, such that Japanese builders were blessed with a wealth of different kinds of woods, including cedar, maple, cypress, spruce, red pine, and mulberry. This abundance of wood and a shortage of stone suitable for building meant that almost every structure was made of wood. Prior to the establishment of the city of Nara as a permanent capital in 710, imperial palaces were sometimes designed to be taken down, transported elsewhere, and then reerected. This gave Japanese builders much experience in working with wood, as well as in creating modules that could be prefabricated and installed wherever building plans required.

The Japanese liked natural forms, and they liked their structures to be elegantly understated, as if part of the environment rather than imposed on the environment. Thus, they emphasized the use of bare wood. In working with wood the Japanese employed a number of different kinds of axes, with blades that could be curved or straight, single-sided or

double-sided; some were long and heavy, some short and delicate. Important to late medieval Japanese building was the carpenter's square, which became popular in the 1300s. This tool allowed Japanese builders to fashion smooth right-angled edges, which led to the development of complex, tightly fitting joints that facilitated the fitting together of prefabricated modules with great precision.

In medieval India wood was by far the preferred building material, as the region had an abundance of different kinds of softwoods and hardwoods alike. Although the stone and brick edifices that survive from medieval India and the island of Sri Lanka are among the most beautiful and impressive structures in the world, medieval writings say that the wooden ones were even more magnificent. Indeed, much of what is known of these wooden structures derives from the writings of people who saw them and from medieval stone structures that were built as if they were wooden, even imitating how wooden beams fit together. The Indians were very industrious builders. In constructing the Kailasantha Temple at Ellora in the 700s, workers carved out about 150,000 cubic feet of stone. In about 1000 workers hauled an 80-ton dome to the top of Brihadeshvara Temple in Thanjavur, which is 200 feet high. They accomplished this remarkable feat by first building an earthen ramp several miles in length and then dragging the dome up.

The chief architect of a building project was called "the holder of the thread." For small projects this person would direct the work of craftspeople, probably all local. One of the chief architect's incidental concerns would be negotiating his way among the various social requirements of Indian castes, because each task, from felling a tree to carving an image, had its own specialists with their own rules to follow. For large projects, especially ones involving the use of stone, the chief architect could have several hundred skilled workers under his command. His principal assistants were the chief stonemason, who would oversee the quarrying and transport of stone as well as its installation in the building, and the chief public artist, who would direct the carving of statues and reliefs as well as the painting of images on the building's exterior.

Medieval Korean builders used wood extensively but also often used stone. In general, Korean builders organized themselves much as the Chinese did, consulting soothsayers to determine whether the time and place were right for building, appointing a master builder, and assembling the materials needed for construction. A notable difference from Chinese building was the Korean taste for painted images on their buildings. Where Chinese builders might have lacquered wood to protect it or included blocks of color on pillars or walls, Koreans were likely to adorn pillars with bronze bases and decorative carvings.

Central Asia and Siberia are equally mysterious regions with regard to medieval building techniques. In Siberia and Mongolia people were mostly nomadic. Their principal structure was the yurt, a tentlike dwelling that could be quickly taken down and folded for carrying on camels or horses and then erected in a new place in about half an hour. The principal materials needed for a yurt were wood, fur, and wool. The wood was carved thin, so as to be lightweight, and would form ribs that arched upward and were lashed together at the central peak of the yurt. Additional hoops of wood would encircle the upper parts of the ribs, holding them in place. Wraps of textiles or furs would encircle the lower part of the yurt, keeping the lower portions of the ribs stable while allowing for a doorway. Fur and wool would also be matted together and laid over the top of the yurt to keep the interior warm.

Before the climate became too dry for settled communities to thrive, many people of central Asia lived in houses in towns and villages built mostly of brick, much of which survives. Both Chinese and Persian influences on building styles are evident, and perhaps some of the building practices were like those of China and Persia.

Wood dominated medieval Southeast Asian building materials, but the stone structures of the Khmer survived longer than the wooden structures that were typical of surrounding areas. For their cities and temples, the Khmer used sandstone, wood, sand, and stone rubble. Foundations were composed of rubble and sand, with the sand smoothed to provide a level surface on which the building would be set. Wooden shafts were set vertically in stones at the base of a building to provide stability for the walls; however, rainwater could cause sand foundations to shift, and wood would decay, and the sides of buildings often collapsed because of these problems. In terms of organization, Khmer builders followed the practices of the Indians.

The islands of Indonesia had their own local building styles, varying among the different cultures inhabiting the islands. By and large, people built houses and storage sheds as communities, and most people were expected to have skills that could contribute to the construction. Wood was by far the preferred building material. On Sumatra an entire house, from the stilts to the walls to the roof, could be made of wood, though walls often featured latticework made of lighter natural materials. Palm leaves could be used to overlay the frame of the roof, as was common on other islands.

The influence of Indian building techniques in Indonesia can be found in stone structures such as Hindu temples. How such projects were organized by Indonesians is unclear, although particular people presumably designed and directed construction; the practice of appointing a chief architect was probably one that Indonesians imitated. Some construction

workers may have been imported from Southeast Asia, Sri Lanka, or India. The builders on medieval Java seem to have improved upon the construction techniques learned from mainland builders, as their surviving structures feature iron braces and stone mortises and tenons not found in the impressive structures of contemporary Southeast Asia.

Wood, bark, and bamboo were the primary building materials in the Philippines and Oceania. In general, all people were expected to have some skill in woodworking. In some places, such as Australia, essential skills included the abilities to trim tree branches and saplings for frames, to trim fibrous roots for use in tying frames together, and to properly lay leaves over the top of a dwelling so as to shield it from rain. On many Pacific islands, local factors were such that building was complicated and required extensive skills in selecting the proper woods and designing structures. Remarkably sophisticated houses featuring thatch or palm leaves, wooden pillars, and latticework walls often were built using only two basic tools: an adze fashioned with a seashell and a stone axe.

## EUROPE

BY KIRK H. BEETZ

At the beginning of the Middle Ages, Europe had two significant building traditions. One was Roman and emphasized stone as a building material; the other was northern European and emphasized wood as a building material. Throughout the medieval era Europe south of the Alps used stone as its primary material, while the rest of Europe emphasized wood. Southern Europeans tended to follow Roman building techniques, whereas other Europeans blended Roman techniques with homegrown methods.

During the Middle Ages many parts of Europe were covered by vast forests. From the late Roman era into the early Middle Ages the populations of cities declined, while people sought ways to earn livelihoods in rural areas. Small villages multiplied as the rural population began growing in the 600s. By the 700s there were builders who traveled hazardous forest trails from village to village, taking work where they could find it, but almost everyone in a village needed to know how to do some basic building tasks.

Early medieval homes were fashioned from wooden frames with walls made of wattle and daub. Wattle consisted of the intertwining of tree branches, and daub was mud smeared over the wattle and allowed to dry. Roofs were usually made of thatch and were pitched to allow rain to run off. Sometimes roofs were overlaid with soil, with grass planted in the soil or, in Ireland and Scandinavia, in sod. The weight of this material put a heavy burden on the wooden posts of the house's frame, requiring that the posts be heavy and thick,

but in winter the roof of soil and grass would hold snow, thus helping to insulating the house to keep it warm inside. The builders of such wooden houses in the early medieval era had only three basic tools: a hatchet, an adze, and a chisel. They used these tools to make posts square by hacking the sides off felled tree trunks and chipping out imperfections, creating remarkably smooth sides for their posts.

Every village had a church and, with the rise of feudalism in the 800s and 900s, a manor house. The church was often the strongest structure in a village and the place to which villagers retreated if their village was attacked. The manor house was where the lord of the village lived. Both were wooden. Their construction almost always required the direction of a professional builder. Even for making wooden boards,

the hatchet and chisel were the principal tools. As with the houses, the posts of squared wood bore most of the weight of the structures. Nails were seldom used except for constructing doors. Instead, joints would be carved near the ends of beams so that they slipped into each other neatly.

In southern Europe there were more stonemasons available than elsewhere in Europe, and the destruction of forests during classical times meant that wood was harder to come by than elsewhere. There was a general decline in the wealth of commoners that meant the old Roman-style houses were too expensive for most people, so houses on farms and in villages tended to have roughly laid stone walls topped by wooden frames. Under the Byzantine Empire of southeastern Europe and the Germanic rulers of Italy, some cities continued to flourish. Construction of houses in the cities tended to be of bricks, stone, and concrete, which was a mixture of gravel and cement invented by the Romans. It was possible for stonemasons to have enough work in a single city that they did not have to travel the countryside to earn their livings. In the Byzantine Empire, in particular, Roman construction techniques survived, including the use of the semicircular arch, and there was enough wealth so that large public buildings could be constructed, especially churches based on the Roman basilica, using large stone pillars and cement walls to support roofs of wood and concrete.

In northern Europe during the early medieval era wood was the dominant building material even for the palaces of monarchs, but when possible builders used stone, with stone becoming the primary building material for cathedrals and fortresses during the 1110s. Thus, even palaces and manor houses tended to be built with combinations of wood and stone. Few wooden structures have survived, making it difficult for archaeologists to identify how builders made their transition from wood to stone, but accounts of royal life include incidents when palace roofs or porticos made of wood collapsed. By the end of the Middle Ages advances in warfare had made building defensive walls and fortresses of stone almost a necessity in places where stone was available.

By the 1000s many manor houses built in central Europe had walls of brick for their bottom floors, with wooden walls for upper floors. This construction required greater skill than usually could be found in a village, making the hiring of a master mason necessary for directing the work. As master masons became more available to European settlements, even the walls of ordinary houses tended to become ones of stone, brick, or wood, filling in the spaces between the posts that supported the weight of the roof. In the 1000s, as manor houses and churches became larger, with walls of stone or brick instead wattle and daub or wood, preventing walls from buckling outward became a problem. The Romans

had solved the problem by building thick, heavy piers of stone and concrete. A pier was a vertical structure intended to bear outward-pushing weight in buildings. Such piers meant that interior spaces of churches and manor houses could be constricted, because of the space the piers required. In churches it meant that members of a congregation would have their views of the altar and the religious rites blocked.

By the beginning of the Romanesque era in about 1050 the master stonemason had become a fixture of building construction. Master stonemasons directed all aspects of construction of a building and tended to be multitasked. Although they were often illiterate, they knew geometry and mathematics, could use a variety of tools, and often were skilled in more than one aspect of construction. Those who hired them sometimes noted with satisfaction that they had master stonemasons who could skillfully carve both stone and wood. Typically, master stonemasons traveled to where they could find work, and even the least accomplished of them frequently would work in eastern Europe, Scandinavia, France, and England during their lifetimes. Builders of castles and cathedrals competed with one another for the services of the best stonemasons, which meant that master stonemasons were treated respectfully, even by bishops and nobles. The master stonemasons deserved the respect they were given, because they often had to oversee the work of several thousand laborers while managing expenses and the importation of materials. Stone was often imported from quarries in eastern Europe, while the logs that would become the huge beams of cathedrals were imported from Norway and Sweden, sometimes traveling from one edge of Europe to the opposite edge.

Working under the command of master stonemasons, like officers in an army, were masters of the crafts necessary for constructing buildings of wood and stone. Although stones meant to be decorative—that is, visible—were often imported, for most constructions a nearby quarry, still often dozens of miles away, had to be identified. A quarry master supervised the removal of stones from it, and a master stonecutter was placed in charge of dressing the stones. There was a master mortar maker who oversaw the making of the mortar that was used to hold stones or bricks together. It was vital that he see to it that mortar dried properly. There was also a master roofer, who had to be skilled in the use of wood, stone, concrete, and lead, which often was used in quarter-inch layers on roofs to prevent rainwater from seeping into the structure.

The master carpenter supervised not only the carving of wood for buildings but also the mechanical devices used to put wooden beams and boards in place. The master blacksmith directed the making of nails, latches, and metal bars

that were sometimes used to hold stone blocks in place. The master glass maker became important during the Gothic era (roughly 1150–1550 in most of Europe, with Italy moving into the Renaissance in the 1400s) because advances in architectural design allowed walls to be thin enough to contain numerous windows. Artists were hired to paint glass for windows, to carve wooden altar pieces, or to sculpt stone, though carpenters and stonemasons often did these tasks themselves, depending on the budget of the building project.

By the 1200s the toolkit of construction workers had expanded to dozens of tools. There were hammers, axes, chisels, and levers for cutting and moving stone. There were hammers and wedges for splitting wood, big saws for crosscutting tree trunks and large branches, several different planes for smoothing wood, augers for drilling wood, and braces and bits for drilling fine holes in wood. A brace and bit consisted of a handle bent in the middle like a staple, with a loose grip that allowed the carpenter to spin the handle in a circle; the business end could have one of several different sizes of bit for drilling into the wood. In the 1300s treadle-driven lathes for shaping wood became common.

Although most European houses remained wooden structures that relied on heavy posts to hold both roofs and walls, as the medieval era progressed, demand for large public buildings increased. The increasing size and complexity of buildings meant that humans carrying loads on their backs alone could not handle transporting all the construction material required. By the Gothic era the windlass had come into common use for help in constructing buildings large and small. It consisted of a drum wound with rope and a crank on the side of the drum to turn the drum, thus winding the rope and raising whatever was attached to the other end of the rope.

The windlass was often coupled with pulleys for raising heavy loads. A pulley was a wheel with a grooved rim in which a rope was set. It would be set in scaffolding or other wooden framework above the windlass and above the load to be hoisted and would turn as the windlass was cranked. The force a windlass could apply was limited to the strength of people turning cranks on its two ends, but medieval builders needed great force for raising the heavy Scandinavian logs used in tall roofs as well as large stones and prefabricated concrete parts for walls and roofs. They adapted an ancient Roman device for this purpose. It consisted of a large wheel that looked much like the wheel in cages for rats or hamsters today. One or more men would trudge in it, turning the wheel, which would turn a large windlass. In towering cathedrals and other tall buildings this large wheel would be placed high on scaffolding, at about the level where beams, stones, or concrete needed to be delivered, and it was almost always attached by rope to a large pulley.

## THE ISLAMIC WORLD

BY KIRK H. BEETZ

Structures surviving from the medieval period in all Muslim countries reflect both local and imported influences. Islamic builders not only copied ancient architectural patterns from Greece, Rome, and Byzantium but also recycled various materials, from pillars to aqueducts. But a local stamp is also evident in every building. Driven by the need to conform to the dictates of their religion, builders in every region of the Muslim world blended their traditions with those of the ancient empires that had ruled their countries in times past.

The Near East was the birthplace of Islam as well as many of the architectural features considered typical of Islamic public buildings: rooms and courtyards arrayed in a series of pavilions, domes on mosques, and interior colonnades that create an illusion of infinite space. The conversion of churches and temples of other faiths into mosques and the tendency to dismantle older buildings to use their pieces in constructing new buildings were common. Otherwise, the inclination was to use native construction workers and local building techniques, resulting in a diversity of styles for Islamic buildings.

The Dome of the Rock, built in Jerusalem in about 691, is an example of the construction methods used in the early Islamic world. It was built over a holy site, the rock where Abraham almost sacrificed his son, Isaac, and where Muhammad left to meet with God in heaven. Much of the stone and brick used to build the Dome of the Rock came from older buildings, and Roman columns were used to hold up the roof. This recycling practice was not uncommon; in Egypt palaces, fortresses, and mosques were often made from materials taken from ancient Egyptian structures.

Near Eastern Islamic building primarily followed the patterns of Greek, Roman, and Byzantine architecture, partly because Roman architecture was well known to local builders and partly because Byzantines were often employed as architects and construction managers. But Islamic structures had some unique requirements. For instance, they needed to have a wall oriented toward Mecca so that worshippers would know in which direction to pray. For help in this orientation the builders of the Near East adopted a numbering system from India, probably the foundation of what became known as Arabic numerals. Muslim mathematicians developed the skills necessary for determining the direction of Mecca from any geographic location, and buildings were oriented accordingly. For courtyards Near Eastern builders often liked to line up the walls with the four directions of the compass. Builders would lay paving stones in courtyards to allow for

water channels that flowed north, south, east, and west from a central fountain. The channels brought water into rooms surrounding the courtyard.

Adequate water supplies were important throughout the Near East and North Africa. Where possible, governments refurbished Roman aqueducts to provide water to thirsty cities, and Muslim builders became masters of water management. For instance, they learned to filter water by introducing an underground cistern into which water flowed, dropped most of its debris, and then flowed into cisterns from which it could be drawn. Keeping the water underground for much of its travel through a city's water system cut down on evaporation. However, only the rich could afford to have water flow into their homes; others had to rely on public fountains and wells, much like the ancient Romans. The wells were notable for their linings of clean, plastered masonry.

Many Near Eastern buildings were made of mud bricks and baked bricks. The baked bricks were used to shore up the sides of mud-brick walls, because baked bricks were less prone to erosion from wind and rain. Typical of the use of brick was Qasr al-Salam (Palace of Peace) in Baghdad, Iraq. Its baked brick was covered with white plaster carved with designs. Sometimes bricklayers made their walls decorative by varying the pattern formed by their bricks. One technique was to set a layer of bricks flat on the long sides, cover that with a layer of bricks on their short edges, and repeat the alternating pattern until the desired height of the wall was reached.

The Islamic movement into southern Europe was no sudden event but took hundreds of years, and the eventual Islamic withdrawal was a slow one as well. In the meantime Muslims created some of the world's most magnificent buildings. In Islamic Spain construction often made use of materials taken from Roman buildings and Christian churches. Thus, even the most elaborate of Muslim structures featured uneven lengths of pillars. Sometimes pillars were set one atop another, and sometimes they received caps of different sizes, depending on how long the pillars needed to be to reach the ceiling.

One of the world's greatest architectural achievements is the Alhambra, derived from the word *al-hamra*, meaning "red fort." The ceiling of the Alhambra's throne room shows the builders' skilled use of wood. In a technique developed in North Africa, where wood was in short supply, the wood was carved into small squares that were then fit together. This painstaking procedure resulted in a wooden structure able to flex with sharp changes in temperature without cracking. The Muslims of Spain had access to more wood than did people in North Africa, and they used it for frames for their roofs, which were often coved with tiles. The Alhambra was built and refurbished over centuries, and the use of wood in its in-

terior reveals a mature craftsmanship in its carefully laid out geometric patterns.

The building techniques of East Africa and central Asia are the least understood by modern archaeologists and historians. In East Africa the Islamic influence stretched along the coast from south of Ethiopia to the islands near Madagascar. Archaeologists had long thought that the building techniques of Muslim East Africa originated in Arabia and India because advanced use of stone in the construction of mosques and houses seemed foreign to the region. Extensive research into the ruins of medieval towns and cities since the 1970s, however, revealed that the large, well-built structures of East Africa were the result of a gradual evolution from more primitive structures, showing that the building techniques used in Islamic structures were local in origin rather than imported.

Most buildings in Muslim communities served merchants and the merchant trade. Wood, stone, mud bricks, and coral were the primary building materials. Little is left of wooden structures, because wood decays rapidly in most of the environments of East Africa. Mud brick is quickly eroded

by rainfall and therefore requires constant repair and maintenance. This leaves mostly stone and coral as the building materials archaeologists find to study.

Perhaps the most interesting stone structures are the flood walls built on the edges of islands to protect against storm surges and tidal floods. The walls were composed of large, rough stone blocks stacked without benefit of mortar, yet mortar was often used in East African construction. The mortar was made by mixing sand with lime, which was the by-product of burning coral. That recipe resulted in a durable mortar that still holds together walls of long-abandoned buildings. Coral was mined on land where movements in the earth had thrust up the seafloor, but it was also mined from underwater reefs. Archaeologists do not know how this was done, although the underwater mining of coral was extensive. Coral was also used as building blocks for the walls of houses and decoratively in mosques, often set in walls to mark the mihrab, a niche that marked the direction of Mecca. Walls frequently were covered with plaster made from lime.

The dryness of much of central Asia has helped preserve medieval buildings, but people in the region have long de-

molished old buildings to reuse bricks or stone for new buildings. The primary building materials in Islamic central Asia were stone and brick. Typically, stones were smaller than the blocks used in building Near Eastern monuments and were not dressed. They were laid in rows, sometimes several rows deep. Building a house seems to have been a community project, requiring many people to carry stones and lay them. Structures with walls made of the unmortared stone often collapsed during earthquakes.

Techniques from the Near East, Europe, and China seem to have been used for building, resulting in architectural forms reflecting those influences. Both the Near Eastern and Chinese construction methods appear to have been imported into central Asia, but the European-style techniques may have resulted from a shared culture with European ethnic groups rather than importation. How building was organized during the medieval era is not known, but the building of walls along hillsides to prevent slides from erosion and the construction of public structures such as mosques almost certainly required the employment of master builders. These master builders probably came from Byzantium, the Near East, and China.

Many central Asian Muslims were nomads. In their patterns of life and their building techniques, they probably differed little from the non-Muslim nomads of central and northern Asia as well as Mongolia. They lived in yurts, lightweight tentlike dwellings that could be easily dismantled and carried and then set up again in about half an hour. The frame of the yurt was formed using slender wooden beams bent to meet in the middle of the roof. Straps of leather or textiles wrapped around the upper frame held it in place. Wide, sturdy straps encircling the lower part of the frame kept it steady but left space for a door, which was made of wood and was the heaviest part of the yurt. The structure was then covered in felt mats.

Muslim invasions of India resulted in widespread destruction of buildings as part of an effort to eliminate images of deities and people, which the Koran stipulates are an affront to God. In the early 1200s two Muslim leaders, Muhammad of Ghor and Qutb-ud-din Aybak, apparently destroyed images in 1,000 temples that were subsequently rededicated to Islam. In the 1200s, 27 temples of Hindus and Jains were torn apart so that builders in Delhi could reuse the bricks and stones to construct the Qutb mosque, known as Quwwattul Islam (Might of Islam). It and many other mosques and palaces were intended to be widely visible statements of Muslim power.

In Quwwattul Islam numerous pillars taken from the destroyed temples were used to support the roof. These came in widely varying lengths, and the builders sometimes stacked

three of them to reach the roof. Some Indian building techniques and materials are evident in the structure, indicating that local builders were used. It is possible that architects and master builders from the Near East were sometimes used in designing and directing the construction of public buildings in India, but usually local architects and master builders were used. This resulted in structures Islamic in nature but with the technical flair of India. For instance, the minaret for Quwwattul Islam is a massive structure, five tiers high, resembling a Hindu temple tower intended to represent the mountain at the center of the world. Its tiers are fluted and the balconies ripe for the placing of statues, as a Hindu or Buddhist temple would have been.

The building projects would have been organized like traditional Indian building projects. The chief architect was known as “the holder of the thread,” and he directed the work of all the craftspeople. His lieutenants included a chief stonemason, who may have been responsible for dismantling local buildings to obtain materials for new construction projects. Building small structures probably involved only local workers, but big projects such as large mosques or palaces would have drawn workers from nearby provinces.

## ► calendars and clocks

### INTRODUCTION

The medieval era is the birthplace of a modern temporal sensibility, yet it is also a place that adhered to premodern forms of timekeeping. Time itself, especially past time, was not measured in years but in other units. It could be counted, but only for very specific purposes. In a predominantly agricultural world most people simply had no need to know exactly the year or the hour. The day began with the first rays of sunshine and ended with the loss of sunlight. The changing of the seasons marked the passage of time. Clocks, if they were known, were a pricy rarity. To the majority of people of the medieval era time moved as it had for the ancients.

Most of the temporal references in surviving medieval texts set events in sequence to the reign of a ruler, not by how much time had passed between one event and another. In most contexts in which dates are used, only the present or the past needs to be named. In a situation in which the future must be described, a consecutive numerical system must be used. Continuous numerical systems were rarely employed in daily life, particularly in Africa and the Americas. There were only several groups of people in society who needed to place themselves in time. The clergy relied upon calendars to tell them when holidays, especially Easter, were to be celebrated. Scribes and notaries who drew up legal documents needed to be able to put dates on the documents. Jews and Christians might count years, known as *anni mundi*, from the Creation

according to the Bible. However, scholars came up with different dates for the base date of the Creation, thereby complicating the calendar considerably.

Consular years, in which the year was named after the two consuls of Rome, had been used since 450 B.C.E. and continued through the imperial period. The last named consul in Constantinople, Basilius, held office in 541 C.E. In 567 the consulship in Byzantium became an office of the emperor, and, after the first year of his reign, the *post consulatum* designation was used until the accession of the next emperor. Regnal years might be of a king, duke, bishop, or another form of authority. Indiction years consisted of a block of 15 years that started in 312 C.E. A year is identified as part of the current indiction (for example, “in the tenth year of the indiction”), but the cycles themselves are not numbered, thus necessitating other information to identify a particular year. None of these dating systems is numerically continuous.

As regnal dates indicate, time could be closely attached to political regimes, as in Asia, the Islamic world, and Europe. The use of a date on documents served to validate a ruler’s authority in a very particular way, by naming time after him or his dynasty. A dating system would change in response to a regime change. In many cases dates on documents might have been used less to place the item in long-term time than to indicate who was in charge.

The method of naming years known as *anno Domini* (meaning “the year of our Lord” and abbreviated A.D.) dating has been in use in Europe since the sixth century. Its basic

premise is that Jesus was born in the year 1. All subsequent years, numbered consecutively, are years of the Incarnation of Christ. A consecutive, numerical system such as A.D. dating allows us to calculate automatically how much time has passed between two dated events and how they are related in time to other events. It took several centuries before this form of dating became the standard system in Europe. A number of different systems for naming years were in use in earlier times, most of which were not continuously numerical. Without a numerical set of year dates, it is not a simple matter to calculate the numerical passage of time. The evidence suggests that A.D. dates were adopted by Europeans in moments of political fragmentation: in England during the seventh century, in France of the late ninth century, and in Italy during the late tenth century. The A.D. method provided a default calendar system that was politically neutral and spiritually appropriate. (In modern times the notation C.E., meaning “Common Era,” has been widely adopted as an equivalent and more neutral designation.)

In many parts of the world the day was organized according to the temporal hours system. Under this convention each hour is variable in length because it is calculated by dividing the period of daylight and nighttime into 12 parts each. A daytime hour in the summer is thus longer than its winter equivalent. The widespread introduction of mechanical clocks into Europe in the 14th century ended temporal hours and laid the foundations for our modern sense of time, but older systems of timekeeping remained firmly entrenched. Only those Europeans within sight or sound of a public clock could use the equal-hours system. Mechanical clocks remained too complex and expensive for private use.

## AFRICA

BY MICHAEL J. O'NEAL

Historians' knowledge of timekeeping systems in medieval Africa is limited. While cultures in the northern part of the continent developed fairly sophisticated systems late in the ancient period and continued to use them during the medieval period, sub-Saharan cultures with the requisite knowledge of mathematics and astronomy emerged later. Thus, by the start of the medieval period, obelisks and sundials were in common use in North Africa, the Greeks had introduced water clocks, and the Egyptians had developed a calendar. Later, as Islam spread through the northern regions, so did knowledge of astronomy and calendars.

Medieval Africans from the sub-Saharan regions probably measured time in ways not markedly different from those of their ancient ancestors. To measure the time of day, they probably used primitive sundials, which could have consisted

of something as simple as a stick stuck in the ground. More elaborate sundials were obelisks built of stone. When the sun rises, the stick or stone marker of an obelisk casts a shadow pointing toward the west. As the sun rises higher in the sky, the shadow becomes progressively shorter until noon, when the shadow begins to lengthen and point toward the east. A tree or any other vertical object would have served the same purpose.

Although medieval Africans, much like their ancient forebears, probably felt little need to keep accurate measurements of time during the day, they used their observations of the heavenly bodies to mark the passage of the year and the seasons, which would have been especially important for agricultural purposes, like planting and harvesting. To this end they probably relied on stone monuments built during the ancient period. One of the most prominent monuments was built by the Borana people in southern Ethiopia and north-west Kenya. The Borana ignored the sun, instead developing a calendar based on the movements of seven star groups in conjunction with the phases of the moon. Near Lake Turkana in Kenya archaeologists have discovered a group of 19 stone pillars. The site is called Namoratunga, which means “stone people.” Although the stones were probably erected in about 300 B.C.E., they continued to be used as a calendar into the medieval period. Indeed, the modern Borana, numbering about a half million, continue to live in the region.

The Borana system of time was based on a 354-day lunar cycle. The Borana did not keep track of weeks, but they did keep track of months, adding a “leap” month every three years to track the lunar calendar with the solar year. The basis of the Borana calendar was seven stars or star groups: Triangulum, Pleiades, Aldebaran, Bellatrix, Orion's Belt, Saiph, and Sirius. The new year began when a new moon was observed in conjunction with Triangulum; the next month began when the new moon was seen in conjunction with the Pleiades, and so on. The Borana had names for each day of the month, but they had only 27 day names, so after 27 days the names repeated.

Astronomers and archaeologists, though, have debated the meaning of “in conjunction with.” Some of the stars cannot be seen when they are too close to a new moon. Researchers suggest that the 19 Namoratunga pillars were intended to mark the positions of the stars. Using statistical analyses, archaeologists have determined that there is only a 0.43 percent likelihood that the pillars could have marked the rising of the stars by chance. For those archaeologists this is strong evidence that the cluster of pillars was an astronomical observatory and hence a calendar.

Another calendar system that survived from the late ancient period and was used during the medieval period is

found at ruins called Great Zimbabwe. The site consists of hundreds of stone megaliths, or monuments, spread out over a 200-square-mile area in Zimbabwe. In fact, Zimbabwe, which means “houses of stone,” is named after the ruins.

Construction of the stone megaliths probably began in about 400 but continued into several subsequent centuries, with many of the megaliths erected from the 11th through the 15th centuries. At its most populated the area was home to perhaps 18,000 people, many of whom were engaged in the gold trade. The ruins comprise three groups: the Hill Complex, the Valley Complex, and the Great Enclosure.

Archaeological investigators have debated the purpose of the megaliths, but they are particularly intrigued by the Great Enclosure. Some argue that it was an astronomical observatory and thus a kind of calendar marking the passage of time by the movements of heavenly bodies. A large stone wall encloses the site, and the sun bisects a chevron pattern on one portion of the wall on the summer solstice (the first day of summer). Further, a passageway in the wall is constructed so that a person inside, with a limited view of the sky, can see only the Milky Way on the summer solstice. Other stones at the site appear to be markers for the spring and autumn equinoxes. These peculiarities strongly suggest that the Great Zimbabwe ruins and similar megaliths were used as astronomical observatories and thus as calendars.

Medieval sub-Saharan Africans had a concept of time that differed from that of people in modern Western nations. Under the influence of science and technology, modern people think of time in strictly rational terms. Time is measured accurately to parse the day. Television and radio shows begin and end at certain prescribed times, people are expected to arrive at and leave work at certain times and to keep appointments “on time.” In medieval Africa, however, time had a more spiritual significance. That was particularly the case among various Bantu peoples who lived in the southernmost parts of Africa. In South Africa, where the Gitlane River is met by its northern tributary, the Makgemeng River, archaeologists have made an interesting find: a complex of stone structures that may have incorporated an astronomical observatory and perhaps served a timekeeping purpose.

The structures, made of dolomite stone, are arranged in the shape of a sickle. They are located on a hill called Thotana ed Fedile, which means “Time is up the hill.” The structures are not particularly large. At their base they are 5.6 feet thick, and they taper to a thickness of about 2.3 feet. Overall they are about 3.3 feet tall. The complex is marked by various doors, altars, and walls. It remains unclear when the complex was built, but artifacts found at the site show that the place was a center of trade with India and suggest that it was built sometime around the late first or early second millennium.

The entire complex is arranged in such a way that the movements of both the sun and the moon traverse the sickle at particular points, leading investigators to believe that the complex was a large calendar and astronomical observatory. The purpose of the site, however, was not simply to mark the passage of time. It is believed that it was intended to serve as a point of transition between earthly life and the afterlife and be, in effect, a meeting place for people and their deceased ancestors. Its builders were men who had absorbed some of the religious traditions of the Indians with whom they traded. They lived in what amounted to a monastery, and they could be called monks. Whatever terminology is used, they were holy men who were interested in, among other things, easing the passage of people and purifying them for entry into the afterlife. The entire complex was referred to as the Moon Sickle, with the word *sickle* used to suggest the notion of people being cut down by time and entering the afterlife.

## THE AMERICAS

BY ANGELA HERREN

Throughout the Americas an awareness of seasons and the basic movements of the sun and moon played an important role in life wherever settled agriculture was practiced. By the first millennium C.E. many cultures in the Americas erected monuments marking astronomical events, developed sophisticated calendar counts, and established ritual activities in veneration of and propitiation toward supernatural deities associated with natural phenomena. No clocks from the ancient period of the Americas exist, but 16th-century authors indicate a pre-Hispanic awareness of the daily movement of the sun and of cast shadows.

In North America cultures like the Anasazi of the American Southwest (ca. 900–ca. 1300) developed ritual practices aimed at regulating and controlling the seasonal rainfall necessary for the cultivation of crops. Like their descendants, the Anasazi probably carried out dances, rites, and festivities in the communal space near their brick and stone multiple-family dwelling units. Older men probably trained and initiated younger men in circular or rectangular underground spaces known as kivas. Painted plaster frescos in many kivas feature rainmaking ceremonies and anthropomorphized cultigens, such as squash and maize, indicating the agricultural nature of the ritual practices learned in these sacred spaces.

Historical records and architectural structures in South America indicate a basic knowledge of astronomy in the Andean region. By the time of the Inca civilization (ca. 1450–1532) many stone monuments and temples celebrated the agricultural and supernatural role of the sun in society, and some appear to have marked actual astronomical events. Ac-

According to some scholars Inca elites claimed the sun as an ancestor and patron. Mythic origin stories placed the emergence of the creator god Viracocha, the sun god Inti, and humans at either Tiwanaku or the Island of the Sun in Lake Titicaca, two southern Andean locations. The Inca king, understood to be a divine descendant of Inti, mediated between the sun and the people of the Andes. During the most important solar festival, called Capac Inti Raymi, many children were offered in sacrifice and buried with gold, silver, and other valuables.

An Inca descendant named Don Felipe Huamán Poma de Ayala claimed in letters written to King Philip III of Spain, from the late 16th century or early 17th century, that the Inca sowed and harvested crops based on the advice of an astrologer. He also described the Inca practice of keeping track of the passage of time by observing the way a shadow created by the sun fell at different times of the year. At the mountaintop site of Machu Picchu, in northern Peru, the central window of the Torreón, or “Observatory,” framed the rising sun during the June solstice. In addition to noting the motion of the sun, the Inca and their ancestors appear to have observed the lunar cycle, maintaining a calendar of civic, agricultural, and ritual activity that followed the phases of the moon and may have consisted of approximately 12 cycles of 28 days.

Scholars disagree on the accuracy of Incan astronomical record keeping. Some believe that the Inca tracked the movements of Venus, the Pleiades, and certain constellations. While the Andeans may or may not have predicted eclipses, Huamán Poma de Ayala states that these unusual events caused great concern and fear that the eclipsed planet was dying. Regardless of the details of their records, the Inca followed a calendar of events based at least generally on solar and lunar cycles. Agricultural activities like planting, weeding, and harvesting, as well as such events as boys’ puberty rites, offerings to the gods, and a festival of the dead, occurred at regular annual intervals.

The most complex calendrical systems of the ancient Americas developed during the Late Formative and Proto-classic periods (c. 400 B.C.E.–250 C.E.) of Mesoamerica. Early inhabitants of Guatemala and the Mexican regions of Veracruz and Chiapas devised several methods of keeping time. These calendar counts remained in active use until the arrival of the Spaniards in the 16th century.

The oldest Mesoamerican calendar, 260 days in length, marked the intersection of a continuous and repeating cycle of 20 day names and 13 numbers. Although different Mesoamerican groups gave the calendar various names, it always functioned the same: The day sign and number both advanced daily, and after 260 days the original configuration was restored. Each day name carried positive or negative associations in supernatural terms. Painter-scribes recorded

*Pottery plate with a deer glyph (Cholula, Mexico, ca. 1200–1521); the deer was a calendrical sign common to this pottery and found in Mixtec and Aztec manuscripts that show the 20 day signs that formed the basis of the 260-day calendar. (© The Trustees of the British Museum)*

this information in almanacs, and diviners used the calendar to interpret the future. For example, the Aztec called in a diviner after the birth of a child to assess the nature of his or her birth date. If necessary, the diviner manipulated the calendar, naming the child on a more auspicious day. The 260-day calendar probably derived from the nine-month human gestation period. Some indigenous communities in southern Mexico and the Mayan highlands continue to use this calendar count.

A 365-day solar calendar came into use shortly after the introduction of the 260-day calendar. This calendar consisted primarily of 18 periods of 20 days, with each period bearing a name and associated number; ancient Americans considered the five days of the year following these 18 periods to be unlucky and dangerous. People avoided activity during these days and thought of them as unfortunate birth dates. Known as the “Vague Year,” the solar calendar lacked leap days and so eventually wandered through the seasons, necessitating movable feasts, or periodic adjustments of seasonal festivals.

Mesoamericans used the 260-day and 365-day calendars concurrently and kept track of the intermeshing of these two cycles. Every 52 years the two calendar counts completed a full cycle, or calendar round. Important ritual activities marked the completion of one cycle and the beginning of

the next. The Aztec celebrated this period with a New Fire ceremony. During the New Fire ceremony, called *toxiuhmolpilli*, or “binding of the years,” all Aztec extinguished the fires in their private homes and temples. Families threw out old utensils and kitchen implements, replacing them with new ones. At a site to the east of Tenochtitlán, the capital, priests sacrificed a captive taken in battle and ignited a New Fire. A torch from this bonfire relit the fires at the Great Temple of Tenochtitlán, and representatives disseminated the fire to surrounding communities.

While the calendar round completed every 52 years and then started over, the development of the Long Count calendar allowed for records of a much longer span. The Long Count posited a zero date, or starting point, equivalent to the European date of August 2, 3114 B.C.E. Units of time in this calendar thus measured the amount of time elapsed since that date. According to the Maya Long Count system, time was recorded in units of one day, 20 days, one year, 20 years, and 400 years. These five tallies appeared on monuments and architecture in descending order, with the largest numbers first. The Maya used a vigesimal system, or a system based on units of 20, the number of fingers and toes on a human being. In the Long Count system all years equaled 360 days.

## ASIA AND THE PACIFIC

BY KIRK H. BEETZ

The cultures of Asia and the Pacific region were enormously varied during the medieval era, developing many different methods for keeping track of the days and of the passing of time during a day. Accounts of these cultural traditions can make it seem as though China and India had the most sophisticated calendars and timepieces, but this perception may be a distortion because Chinese and Indian records of their timekeeping practices are presently more complete than those of other cultures.

For most Asian peoples, developing calendars that could predict such future seasonal events as solstices and equinoxes seems to have been of great importance, but this concern was not universal. The peoples of medieval Australia kept track of the passage of the year by watching the movements of constellations in the night sky, looking for celestial signs to tell them when they should move to fresh hunting territories or when the local birds would lay their eggs. These societies did not look to the sky for predictions of the future but for indications of what was happening in the present. The peoples of the Pacific islands often memorized the patterns of stars in the sky, which could tell them about seasonal changes that might affect local fisheries or warn of the arrival of the stormy season.

Two traditions of calendars dominated timekeeping in eastern and southern Asia. One was the Indian tradition, which was used not only in India but also in what is now Sri Lanka, most of Southeast Asia, and Indonesia. The other was the Chinese tradition, which was used in China, Japan, Korea, northern Vietnam, Manchuria, and the small kingdoms along China’s southern and western frontiers. It is likely that there were places where neither tradition was adopted; these areas would include the peoples living in tropical forests in and near Burma (Myanmar) and in the far north of Asia.

The origins of Indian calendars are steeped in antiquity: It is possible that even in the Vedic Period (ca. 1500–ca. 600 B.C.E.), the times of the solstices and equinoxes had already been established by Indian astronomers. During the medieval era Indian calendars varied in their details in different regions of India, and there were occasional variations in the names given to parts of the calendar according to the different religions of India, especially Hinduism, Buddhism, and Jainism.

The calendars of India were influenced by the traditions of timekeeping that had developed in Mesopotamia, Greece, and China. From ancient Sumer, India derived the seven-day week. In Sanskrit the days of the week were *Ravi vaasara* (meaning the “Sun’s day”), *Soma vaasara* (the “Moon’s day”), *Magala vaasara* (“Mars’s day”), *Budha vaasara* (“Mercury’s day”), *Guru vaasara* (“Jupiter’s day”), *Shukra vaasara* (“Venus’s day”), and *Shani vaasara* (“Saturn’s day”). From the Greeks, Indian mathematicians borrowed trigonometry, which provided the mathematical techniques for calculating the lengths of the solar year and the movements of the planets. From the Chinese, India derived the concept of coordinating lunar years with solar years.

The Indian solar calendar divided the year into six seasons, with each season having two months, making 12 months altogether. The seasons were *Vasant* (roughly corresponding to late spring), *Grishma* (summer), *Varsha* (the monsoon season), *Sharad* (fall), *Hemant* (early winter), and *Shishir* (early spring). In addition to a solar calendar, the Indians used a lunar calendar. It usually had 12 months. Depending on local custom, a lunar month began either with the new moon or with the full moon. The first month of the lunar year was known as *Chaitra*. Indian calendar makers compared the movement of the moon to the earth’s movement around the sun; in order to keep the lunar years in agreement with the solar year, they would add a 13th month every few years. This added month would be identified as *adhika*, meaning that it was an extra month. The next month would be identified as *nija*, meaning that it should be counted as the original month. Thus, *adhika Chaitra* would be followed by *nija Chaitra*. The *nija Chaitra* would have been considered the first month of the new year. The lunar calendar usually was used to keep

track of special religious days. There might be more than one lunar calendar for any year, varying by region and religion. The variations included changes in the names of the months and in the way in which extra months were added.

Chinese calendars were inspired by the regular movements of celestial bodies across the sky. In ancient times the Chinese had calculated the length of the solar year at 366 days. In the fourth century C.E., however, the Chinese fixed the solar year at  $365\frac{1}{4}$  days. The Chinese solar year had 12 months, which Chinese astronomers marked off by following the movement of the handle of the constellation known as the Big Dipper across the sky. The movement of the planet Jupiter was especially important to the Chinese, and they noted that it orbited the sun approximately every 12 years. They called Jupiter the "Year Star." From the 12 years of Jupiter's orbit the Chinese derived their 12-year cycle of the zodiac, with each year named for an animal, as well as their 12 months of the year and their 12-hour cycle of day and night. Also important were the movements of the moon; the Chinese calendar makers combined a lunar calendar geared to the phases of the moon with a solar calendar geared to the  $365\frac{1}{4}$ -day year.

The Chinese calendar makers were considered to have a sacred duty: They had to predict key events during the year so that the emperor would be sure to conduct religious rituals at the proper time. Failure to do so could result in chaos and disaster, because when the monarch failed to fulfill this sacred duty, the harmony between the earth and the heavens might be disrupted, releasing violent forces on the earth. This belief not only made the predictions of annual events important but also made the calendar-making process so vital that access to its results was often limited to the imperial family. Chinese calendar makers continually ran into problems of accuracy. For instance, they discovered that the solstices drift about 20 minutes per year; this discovery was hard to square with their belief in a consistent, unchanging universe. Another problem was that months based on the phases of the moon did not fit easily into a solar year.

The Chinese calendar makers made a new calendar every year by placing a stick vertically in the ground and watching its shadow. When the shadow reached its shortest point of the year, the calendar makers fixed that day as the summer solstice and then calculated the occurrence of all the other annual events from it as well as whether an extra month would be needed to keep the lunar months in agreement with the seasons.

This Chinese calendar was accepted by China's neighbors for political reasons. For most of the medieval era Chinese recognition of another nation as an independent state was coveted by other nations in eastern Asia because it conferred great prestige. Among the obligations a nation undertook

when it was recognized by China was to adopt the Chinese calendar. Thus the Chinese calendar became the standard measure of time in eastern and central Asia. Japan began using the Chinese calendar in 645, although it was not consistently used until the 700s. In 839 Japan and China broke off relations, which meant that Japanese rulers no longer received updated Chinese calendars. This, in turn, resulted in Japan's calendar quickly falling out of line with the Chinese calendar.

There were two dominant approaches to dividing up the period of daylight in Asia and the Pacific in the medieval period. The more common approach involved stretching the daylight hours to fit the period of sunlight as spring gave way to summer and shrinking them as summer turned to fall. For most people this seasonal variation made sense because their lives were ones of working from sunrise to sunset, regardless of the length of that period. For instance, in Japan daylight was divided into six units and night was divided into six units regardless of the length of day or night. An alternative approach was the one most modern people are familiar with, namely, the division of each day into rigid time periods that remain the same no matter how long daylight lasts.

For some peoples in the medieval period the measuring of hours and minutes mattered so little that it is unlikely that they were motivated to make timekeeping devices. These people would have been found in rural areas that did not observe the daily rituals common in cities. Timekeeping devices often were very simple. In China and India people told time by burning a stick of incense of a certain length that was known to require a specific amount of time to burn down. This method was imprecise but was adequate to remind someone to prepare a meal or to perform a religious ritual.

It is unclear when water clocks, called clepsydras, first appeared in India and China. Some historians believe that water clocks were introduced to eastern and southern Asia from the Near East, but others maintain that water clocks were invented independently in several parts of Asia. There is evidence to support both points of view. One kind of water clock consisted of a basin with regular marks along its inner side. The basin was filled with water that drained from it at a regular pace; as the level of the water lowered, the newly revealed marks indicated the passage of time.

Another timekeeping device was the sundial. In India the sundial seems to have been influenced by the ancient Greeks and served to divide the day into hours. Chinese sundials often consisted of a rod stuck vertically in a circular surface. In an effort to measure the time of day with precision, the Chinese divided the circle into 100 equally wide units, across which the shadow of the stick fell as the sun crossed the sky.

This method of keeping time proved to be unsatisfactory because it did not work in the dark of night or on a cloudy day.

China made the most rapid progress toward the invention of a reliable mechanical clock of any country in Asia or the Pacific during the medieval era. In 725 the astronomer Yixing and the engineer Liang Lingzan built an escapement for a device called the “water-driven special bird’s-eye-view map of the heavens.” The development of the escapement, which is a mechanism that converts the force of a power source (usually a pendulum or balance wheel) into equal specific movements of a gear train, was a crucial step toward creating a truly mechanical clock. The device constructed by Yixing and Liang Lingzan was intended primarily to keep track of the movements of heavenly bodies.

Around 1088 an armillary sphere was built on the grounds of the imperial palace under the direction of a royal minister named Su Song. An armillary sphere is a device composed of movable rings depicting the movements of astronomical bodies. This device included an escapement that measured the passage of time. It had no face but had small mechanical figures built into it that rang bells and beat drums to toll the hours of the day. It stood about 40 feet high, with a wheel about 10 feet wide that was turned by water. Measured scoops of water, always the same amount, turned the wheel, which in turn moved the escapement the same distance each time a scoop of water was poured. This machine was the closest that any country in the world had come to creating a fully mechanical clock in the medieval period. Su Song’s work was eventually destroyed during the Mongol invasion of China. The design notes for its construction survived, however, and modern engineers have been able to duplicate it. Its importance for the world was that engineers in the Near East and Europe learned of its existence and thereby knew that it is possible to build a complex functional escapement for measuring time.

## EUROPE

BY JULIE-ANN VICKERS

For most of the medieval period daily activity was linked to the natural rhythms of day and night as well as the passing of the seasons. The methods used for calculating the calendar year and measuring the hours were often imprecise and confusing. These problems, however, were the concern primarily of an educated minority and had little effect on the lives of ordinary people. However, by the end of the Middle Ages the calendar and daily time had become increasingly standardized and their measurement more accurate, owing to developments in technology and astronomy. These developments, in turn, had a profound economic and social impact on all levels of society.

The civil calendar used in Europe throughout the medieval period was the same as that introduced in Rome by Julius Caesar (100–44 B.C.E.) in 46 B.C.E. Known as the Julian calendar, this was a system of 12 lunar months synchronized with a solar year of 365.25 days. Every fourth year was a leap year, to account for the additional quarter day every year. Unfortunately, an error in calculation meant that the Julian year was 11 minutes, 46 seconds too long. This error added up over the years so that by the 13th century, the calendar year was seven days in arrears. Although medieval scholars had identified the source of the error and found this disruption to the calendar year problematic, the issue was not finally resolved until the reform of the calendar by Pope Gregory XIII (1502–85) in the 16th century.

Ancient Rome also supplied the Middle Ages with a system for designating the days of the month. Unlike the sequential system of numbers we use today, known as direct reckoning, in the medieval period dates were allocated in anticipation of fixed points in the month. These fixed points were known as *Kalendae* (the first day of the month and the name from which we derive the word *calendar*), *Nonae* (the fifth or seventh day), and *Idus* (the 13th day—except in March, May, July, and October, when it was the 15th day). Inclusive counting was also used, and therefore March 27 was called the sixth day before April 1 (*ante diem VI Kalendas Apriles*). Aside from errors caused by the use of inclusive counting, the previous example highlights another major problem with this system: Days from the latter half of each month were designated using the name of the following month. This practice was a common source of confusion for medieval readers and writers. The advantages of using direct reckoning, or a sequential system, were recognized early on in England, and this system had become common there by the end of the 12th century. In the other major centers of Europe direct reckoning had become standard by the later Middle Ages.

An even greater source of perplexity in the medieval calendar was the date for the beginning of the year. There were at least six different dates in use during this period. In ancient Rome the first day of the year was January 1, and during the Middle Ages this date was still generally known as New Year’s Day. Nevertheless, this date was the least used to mark the start of the year, probably due to its association with the religion of ancient Rome. Another Roman date, March 1, was sometimes adopted but was officially recognized only in Venice. The Byzantine Empire commenced the year on September 1, a date inherited from the ancient fiscal year. The other three dates were religious in origin and became popular because they were associated with festivals commemorating important events in the life of Jesus. By the 10th century

December 25, the date of the Nativity of Christ, had been established as the start of the year throughout western Europe. However, March 25, the date of the Annunciation, gradually gained in popularity and had become the dominant usage by the late Middle Ages—particularly in England, where it remained in use until 1752. In France, Easter Sunday was sometimes employed as the start of the year, but its popularity remained limited because the date on which it fell varied from year to year.

While the confusion generated by different aspects of the medieval calendar caused problems for the scribes and scholars of the period, it had little impact on the lives of the bulk of the population. In a period when many people were unsure of their date of birth, time was experienced as a deeply cyclical phenomenon marked by events rather than by numerical dates. The annual round of religious festivals and the seasonal work of the agrarian year were the two most important cycles of time for the majority of people. From the ninth century onward calendars providing a list of

feast days commonly accompanied liturgical service books. One of the most common types of calendars in both eastern and western Europe during this period was a liturgical calendar, containing illustrations of the type of agrarian work carried out in each month. These were known as the “labors of the months.”

For most of the medieval period the hours of the day, like the calendar year, were linked to natural cycles and religious observance. The primary means of dividing each 24-hour cycle was into two 12-hour periods of day and night, starting, respectively, at sunrise and sunset. Daytime in this period, therefore, referred literally to the hours of natural light available for work. These 12-hour periods were accorded to day and night regardless of the season so that a system of variable hours had to be used; for instance, an hour of daytime in summer was necessarily longer than an hour of nighttime in summer in order to maintain an equal number of hours in each period. Numbered hours, however, were rarely used to indicate time. Instead, the canonical hours—otherwise known as the Divine Office or the Liturgy of the Hours—signaled the passage of the day. These were the hours in which the monks engaged in formal prayer; they were divided into matins (dawn), prime (daybreak), terce (morning), sext (midday), none (afternoon), vespers (evening), and compline (night). In every village church bells rang out these hours, alerting lay people to the liturgical time of day.

In order to observe the canonical hours, people needed to be able to determine the approximate time of day. Prior to the 14th century there were four main methods available to measure time. One method was the observation of the movement of celestial bodies in the night sky. In this way the need to keep the canonical hours led to advances in applied astronomy. Burning candles marked with gradations was another way for determining how much time had passed, particularly at night. But candles were expensive in this period and therefore were used sparingly. One of the more common instruments for determining the hour in the earlier Middle Ages was the sundial. This instrument measured time by the position of the shadow cast by a central rod onto a surface marked with the hours; its major drawback was the need for a direct source of sunlight. Clepsydras, or water clocks, were also commonly used in this era. They measured time by the regulated flow of water into or out of a graduated vessel, thereby circumventing the limitations of the sundial. None of these methods of timekeeping was precise by today’s standards. However, by the early Middle Ages water clocks were already well developed; when calibrated with the sundial, they were more than adequate for keeping the canonical hours.

Calendar showing the month of November, with saints' days; France, ca. 1495–ca. 1505 (Courtesy the Morgan Library and Museum)

In the 13th century the need for a more precise timekeeping instrument developed in response to the advancing field of astronomy. It is likely that the technology for mechanical clocks first appeared in northern Italy in the late 13th century—but because medieval Europeans used the same word for both the water clock and the mechanical clock, the origins of the latter remain obscured. By the early 14th century the first mechanical clocks had begun to appear in towns. The technology behind these clocks was the escapement system, a weight-driven mechanism that controlled the periodic movement of a wheel. These first clocks were huge and lacked numbered faces; they were placed in towers and did not sound the hour automatically but relied on someone to ring a bell in response to an alarm. In 1335 the first fully automatic clock was erected in Milan, and by the end of the 14th century mechanized clocks were sounding the hours in major urban centers throughout Europe.

The transition to mechanized time, however, did not immediately bring precision and uniformity to timekeeping. Despite their technological sophistication, the first generation of mechanical clocks kept time very poorly, often losing or gaining time in a single 24-hour period. There was also confusing variation from city to city regarding the point of day allocated for the zero hour, which could be noon, midnight, or, more commonly, sunrise or sunset. Despite being a source of bewilderment for both travelers and merchants, this situation continued well into the Renaissance. There was a similar lack of uniformity in the length of the hours. In order to assist the calculations of astronomers, mechanized clocks were originally designed to keep uniform hours, regardless of the season. In some towns, however, the clocks were adjusted to maintain the centuries-old tradition of variable hours. The initial impact of mechanized clocks was also limited by their sheer size. Moreover, it is thought that hourglasses, the first evidence of which appears in ships' records of the 14th century, developed in response to the need for a portable and reliable means of measuring time at sea.

Despite these problems, the development of mechanized time represented nothing less than a technological revolution. At a fundamental level, the building of mechanized clocks in urban centers represented the separation of time, and therefore people's daily activity, from the domain of the church. The daily hours were no longer linked to religious observance but became numbered, secular, and uniform. In the economic sphere the ability to measure time accurately and publicly led to a more precise regulation of labor hours. Combined with the increasing uniformity of the calendar, mechanized clocks also allowed merchants to carry out their business transactions between cities more efficiently, thereby facilitating trade and productivity.

## THE ISLAMIC WORLD

BY KIRK H. BEETZ

Timekeeping has been important to the Islamic world since Muhammad gave instructions on the kind of calendar to be created and on the five daily prayers every Muslim must say at certain times of the day. The research and invention that went into organizing calendars and timing the hours of the day were part of the scientific achievement that marked the Islamic world.

Umar the Great (r. 634–44), the second caliph, established the Islamic calendar in 634 or 638. The first year of the calendar was the year in which Muhammad moved with his followers from Mecca to Medina. Thus year 1 of the Islamic calendar began in year 622 of the Christian calendar. The first day of the first year of the Islamic calendar fell on July 16. The Islamic year had 354 days rather than the 365 of the Christian calendar, which means that soon after year 1, the years of the Islamic and Christian calendars ceased to correspond. The 365-day calendar is a solar calendar; that is, it is based on the time it takes the earth to orbit the sun. The Islamic calendar was a lunar calendar, based on the time it takes the moon to go through its phases.

To keep them in sync with the solar year, lunar calendars must be adjusted by the addition of days to certain months or by adding one or more months to a particular year. Muhammad specifically forbade the making of such adjustments, however, because God created the lunar cycle for people to measure the passage of time, and God's cycles were not to be tampered with. Even so, the moon's phases do not follow a precise set of days, meaning that Islamic months varied from 29 to 30 days in length. The order of the 12 months of the resulting calendar was as follows: Muharram, Safar, Rabiul-Avval, Rabiuth-Thani, Jamadiyul-Avval, Jamadiyul, Thani, Rajab, Shaban, Ramadan, Shavval, Dhil-Qadih, and Dhil-Hijjih.

The first, third, fifth, seventh, ninth, and 11th months were each 30 days in length, with each of the other months 29 days long. This is how the 12-month year totaled 354 days. Although the first day of Muharram is the first day of *ras al-sana*, the new year on the Islamic calendar, it was not celebrated during the medieval era. The most important month on the calendar was Ramadan, the month that Muhammad received the Koran from God. During that month Muslims were forbidden to wage war, except when attacked, and they were supposed to fast during the day.

Within the limitations of their faith Muslim scholars strove to create the most precise 354-day calendar possible. Muslim astronomers discovered that even by alternating 29- and 30-day months, a slight drift in following the phases of the moon caused an extra day to appear every few years.

They compensated for the drift by creating a 30-year cycle during which one day was added to Dhil-Hijjah in the second, fifth, seventh, 10th, 13th, 16th, 18th, 21st, 24th, 26th, and 29th years.

The years of the Christian calendar sometimes are preceded by the abbreviation A.D., which stands for *anno Domini*, meaning “in the year of our Lord,” which is itself short for the original phrase, *anni Domini nostri Jesu Christi*, meaning “in the years of our Lord Jesus Christ.” The years of the Islamic calendar are often preceded by A.H., an abbreviation for *anno Hegirae*, meaning “in the year of the migration,” referring to Muhammad’s move to Medina. The designation A.H. probably was not used by Islam in the medieval era but came into use in the Western world to distinguish Islamic dates.

A few names of the months on the Islamic calendar seem to have come from an older Arabian lunar calendar, now apparently lost. Other lunar calendars developed in the Near East occasionally added a month to keep certain months within certain seasons. Because Muhammad forbade that common practice, Islamic months drifted 11 days at a time from one year to the next, relative to the solar year, which meant that the months did not correspond to seasons. This created a significant problem for farmers, whose work depended on keeping track of the seasons so that they could plant crops when they should and know when harvests should take place. Keeping track of rainy and dry seasons was especially important in many areas of the Islamic world.

The result of this problem was that the Islamic calendar was closely followed in cities, but in rural areas other calendars were followed for everyday life and the Islamic calendar for tracking holidays and religious observances. In some parts of the Near East and North Africa people found that the Christian calendar, only about 100 years old, was the easiest to use. Elsewhere farmers employed lunar calendars such as those of the Sumerians, Greeks, and Jews. The Sumerian year had 360 days divided into 12 months of 30 days each; the Babylonians added the 24-hour day. The Greeks had a 354-day calendar to which they added 90 days every eight years. The additional 90 days were added haphazardly. Many Islamic farmers chose to use calendars similar to the Jewish one, in which months and seasons were linked. Developed to meet farmers’ need to track the seasons, the Jewish calendar had a 19-year cycle, with each year having a normal 12-month cycle into which an extra month was added during the third, sixth, eighth, 11th, 14th, 17th, and 19th years. The extra month came after Adar, the sixth month of the year, and was called Second Adar. Although a given day of the month could drift by about 28 days from one year to the next, days of the month remained roughly in the same season from year to year, enabling most Muslim farmers to track seasons.

Measuring the hours of the day has always been important to Muslims because the Koran requires them to pray five times a day at certain hours. Timepieces therefore became a special interest to Muslim engineers. Unfortunately for the modern historian, almost every timing device used in the medieval Islamic world has been lost, with the remains of a couple of water clocks in Morocco being the only exceptions. Historians disagree greatly about which cultures invented what device or important enhancement, but there was probably cross-pollination between the Islamic world and China. Indian devices most likely became known to the Islamic world when much of India was conquered by Muslims, and Muslim engineers credited ancient Greek scientists for providing essential knowledge in developing timepieces.

In general there were sundials, water clocks, candle clocks, and possibly mechanical clocks and sand clocks. The issue of who created the first mechanical clock is a murky one, with credit usually going to European inventors of the 1300s, although some Islamic water clocks included mechanical works in their movements. What is known about Islamic clocks comes mostly from written sources and pictures made of the clocks. Many medieval Muslim engineers made their discoveries public or published treatises on how to make devices such as clocks. The most important of these writers was Ibn Ismail ibn al-Razzaz al-Jazari (1136–1206), usually called simply al-Jazari. He invented or adapted about 60 devices, including water clocks and candle clocks.

The most important clock for the medieval Islamic world was probably the water clock, also called a clepsydra, a Greek word meaning “steal water.” A water clock uses the regulated flow of a liquid to keep track of time. The liquid was usually water but could be other liquids, and late in the medieval era Muslim engineers may have developed a clock that used the flow of mercury. The clock that was the most famous in the medieval Islamic world was al-Jazari’s elephant clock, which may have stood five feet high and was made in the shape of an elephant.

Al-Jazari credited the writings of Archimedes for inspiring his elephant clock, which tracked the daylight hours in 12 parts, regardless of how long the day was. Thus in the summer, with its long days, hours on the clock lasted longer than in winter. It had two cisterns inside, one above the other, with floats that acted as stoppers on the openings through which water flowed. The passage of water from the upper cistern to the lower one regulated the time, while the floats occasionally plugged the holes, thus keeping water pressure steady in the upper tank. Every half hour the water in the lower cistern was heavy enough to pull a string, releasing a ball that would fall into the image of a snake, which would tip forward, pulling other strings that moved the clock’s hands. By adjusting a flow regulator at the

### IBN ISMAIL IBN AL-RAZZAZ AL-JAZARI (1136–1206)

Usually known simply as al-Jazari, he was one of the great engineers of the medieval world. Born in northern Mesopotamia, between the Tigris and Euphrates rivers, al-Jazari was the son of the chief engineer of the Artuqid Dynasty of Diyarbakir. He had become the chief engineer before 1181, when the sultan Nacer ed-Din Muhammed ibn Qura told him to write a book about engineering.

Al-Jazari responded by researching the state of Islamic engineering and then setting out its principles in carefully detailed language along with illustrations. So complete were his descriptions that modern engineers have been able to follow his instructions to recreate his designs. He finished his book in about 1204, and it was published in 1206. The book is known as *Kitab fi ma rifat al-hiyal al-handasiyya*, roughly meaning “Book of Knowledge of Ingenious Mechanical Devices.”

More than a mere chronicler of other people’s work, al-Jazari was an inventor as well as a designer, and his book describes some of his inventions along with the techniques he used to build the other machines he writes about. He was both a master hydraulic (water) engineer and a master mechanical engineer, seemingly at home explaining irrigation machines as well as gears and levers. He based much of his work on the writings of the ancient Greeks and on his own wealth of practical experience.

Although al-Jazari is probably most famous for his water clocks, his devices for moving water from streams or canals to irrigation channels or storage cisterns were probably of the greatest practical value to his audience, because managing water was a constant issue in the Near East and North Africa. He created artificial singing birds, and he designed mechanical musicians that had gears and levers that moved the figures and made the sounds. Perhaps because he had a sense of humor about his work, his book included inventions of a less spectacular nature, such as a cup that appeared to be full of water yet poured nothing and a cup that appeared empty but did, in fact, pour water.

connection between the two cisterns, a timekeeper could lengthen or shorten the hours for the day. The clock needed to be started at the break of dawn.

A candle clock from a copy of al-Jazari’s treatise on automata (opaque watercolor, ink, and gold on paper); Syria, 14th century (Freer Gallery of Art, Smithsonian Institution)

Whether candle clocks were used extensively or not is not known. A candle clock consisted of a candle of a specific weight placed in a metal tube that was capped, with a groove around the cap’s edge and a hole for the wick. As the candle burned and became lighter, a device, perhaps a weighted lever, pushed the candle upward; as it rose, the passage of time could be noted in a bowl on which it stood. The groove collected wax from the burning of the candle and needed to be periodically wiped clean.

The possible existence of purely mechanical clocks and sand clocks in the medieval Islamic world is much disputed by historians. Most historians believe that sand clocks, typified by the hourglass, were not invented until after the medieval era, but it is possible that sand clocks were used before then, although what they looked like is a mystery. As for mechanical clocks, the clock designers of the Islamic world were interested in making devices that would track time independent

of outside interference, and the general interest in mechanical devices among Muslim engineers resulted in water clocks with extensive mechanical movements, much like the elephant clock's weights and strings.

An inventor named Abbas ibn Firnas is said to have invented a timekeeping device in the 800s that was much like a modern watch, but what it looked like or how it worked is not known. What is known is that by the 1200s engineers in Islamic Spain were creating clocks for public places. Their work may have been the foundation for the first fully known examples of mechanical clocks that emerged in the mid-1300s elsewhere in Europe.

## ► children

### INTRODUCTION

The vast majority of the population of the medieval era left no record of its feelings toward children. Poetry, paintings, sculpture, and other art forms give an indication of attitudes to children and the treatment of childhood, but such sources focus largely on elite Europeans. Children in Asia, Oceania, Africa, and the Americas in this period are the subject of few sources. Nevertheless, some generalizations can be drawn. While some cultures treasured children, others overworked them and worse.

The historian Philippe Ariès declared in 1960 that the idea of childhood in medieval society did not exist. To an extent, he was correct. Among the ordinary people of Korea, India, Japan, and China children were needed to help support the family. They could not always enjoy the luxury of play, especially when their labors on the farm were critical for the family's survival. The wealthier families of Asia could afford to give their children a childhood. These youngsters could play and study instead of engaging in labor from dawn to dusk. In medieval Australia and Africa both boys and girls were much indulged. Africans rarely disciplined their children. Australian children were given toy hunting tools to prepare them for lives as hunters. Male children in the Americas were taught to hunt, while female children were taught to gather.

In Europe, in the time between 300 and 800, ideals about childhood underwent substantial change. The treatment of children became gentler, partly due to the influence of Christianity and partly because of more humane traditions of child rearing brought by the "barbarians" to the former classical world. The Christian belief in the need of every human being for salvation immediately implied a higher status for young children. They needed to be brought as quickly as possible into the family of God. Young children were made aware that they had a soul and that their lives in the hereafter were dependent on the state of their souls.

Christians viewed infanticide as murder, in contrast to the acceptance of the practice in ancient Greece and Rome. Abandonment was judged less harshly, partly because of familiarity with the biblical story of Moses and his son. Medieval Christians extended sympathy and understanding to those who abandoned their children through poverty or other misfortune.

Children were generally marginal to medieval society, not fully part of it. Part of this marginality stemmed from the likelihood that they might die before reaching adulthood and becoming part of society. If an Incan child survived infancy, his or her relatives celebrated with a feast. While epidemic

diseases were relatively uncommon from the eighth until the mid-14th century, children succumbed to infections, famine, and malnutrition. Gregory of Tours in the sixth century movingly described a famine that first killed young children. Writing with tears in his eyes, he lamented the loss of those that were so dearly loved. Unnatural causes also claimed the lives of many children. Children were virtually unattended and thus could be the victims of crimes and accidents. To explain their deaths and disappearances, medieval Europeans revived the Greek and Roman libel that the Jews practiced ritual murder of children. The belief that Jews were capable of such atrocities fueled anti-Semitism.

Medieval children had a range of educational opportunities, depending upon their culture and status. In the Americas childhood was not even viewed as a distinct stage of life because of the shortness of life. The medieval European world recognized the first seven years of life as a separate stage of life. The second stage, up to the age of 12 for girls and 14 for boys, was a time for education, with fathers training sons and mothers training daughters. In China and India education was equally valued as a means of advancing. Elite children had the opportunity for more formal, written education. Africans educated only boys, generally giving them a religious training. For most children around the world education simply meant a gradual initiation into the world of adult work, whether through a formal apprenticeship or simply through carrying more and more tasks within the home or on the land. From an early age children were not cut off from adult society. In the outside world children were immediately part of society in which the ages mixed and in which neighbors played their part in looking after children.

## AFRICA

BY AMY HACKNEY BLACKWELL

Although very few historical records describe childhood in medieval Africa, observers from modern times have noted that children in traditional societies all over Africa were treated kindly and rarely disciplined. Children throughout the continent spent their early years playing and learning how to function in their societies. Their training included life skills such as weaving and hunting and instruction in the rules of their cultures.

African mothers tried not to give birth too often. Women who lived as hunter-gatherers tended to allow the longest amount of time between births. The Bushmen of the Kalahari raised their children four or five years apart. Children nursed until they were at least four years old because it was difficult for them to eat the foods available to them. The nursing

also kept them hydrated in the dry climate. Small children rode on their mothers' backs as they wandered from place to place; some hunter-gatherers walked many miles every day in search of food or water—distances too far for young children to cover.

In farming societies children received siblings at a much faster pace. Babies typically arrived every two or three years. Infants spent most of their time with their mothers. A mother often tied her baby to her back with a sling and carried it while she went about her day's work, tending her crops, grinding grain, and cooking. Toddlers were weaned when their mothers gave birth again, and from that point on children spent much less time with their mothers and much more with other children.

With whom a child lived was determined by the clan's particular practices. Babies lived with their mothers, and though many children continued to live with their parents after being weaned, some children left their biological parents to live with their uncles. Their parents still saw them often and attended any important ceremonies involving them, but this arrangement allowed the clan to form strong relationships in several directions. The concept of family in African societies included clan; therefore, children were not moving outside the family when they left their biological parents to reside with an uncle or some other adult relative.

In many societies children were grouped by ages. A group might contain all the children within a four- or five-year range. The children in a group moved through their society's various stages together, progressing from toddlers to school-aged children and into adulthood at the same time. For most African youngsters childhood was a time to work on the skills they would need as adults and to work themselves. The youngest children, three- and four-year-olds, spent their days playing while their mothers worked in the fields. They played various games that involved singing and movement, and they engaged in imaginary play, pretending that they were performing adult tasks.

Slightly older girls (between about the ages of five and 12) acted as the village babysitters. Their mothers entrusted them with the care of their younger siblings, and the girls carried the babies around and fed them while performing their daily chores. Girls also helped their mothers in the fields, gathered wood, fetched water, washed and made clothes, wove cloth, and assumed other household responsibilities. Their mothers taught them skills specific to their regions, such as distinctive weaving patterns or pottery styles. Girls in hunter-gatherer groups accompanied their mothers on gathering expeditions, learning to identify food sources and helping to carry home the food they found. By the time a girl was 12 years old she

was usually proficient at all the skills she would need to run a household as a wife and mother.

Boys spent their childhoods in a similar fashion, engaging in work that trained them in the skills they would need as adults. In herding societies boys between about five and 10 years of age were put in charge of the herd animals. They had to bring the animals out to graze every morning and scare away any wild animals that might kill the livestock. At the end of the day they brought the animals back home and made sure they were safely secured. They also milked the livestock. Boys in farming communities might spend their days helping in the fields. Fathers taught their sons how to hunt, including how to make weapons, stalk animals, and skin and clean their prey. Boys also learned how to make farming tools, fences, houses, musical instruments, boats, and other useful objects.

Both sexes participated fully in the festivals and cultural events of their communities. Children listened to storytellers at night, learning the histories and beliefs of their cultures. At various festivals children heard adults singing traditional songs, saw them perform traditional dances, and then imitated them on the outskirts of the festival activities. Likewise, children watched sporting events and learned to play games by imitation.

Both boys and girls had time to play, though girls typically worked much harder than boys and had less free time. Children's games often imitated the activities performed by adults. They might play house or marriage or pretend to be grinding corn like their mothers. Adults sometimes stopped their own work to assist children in their play "work." Girls played a game with a loop of string similar to cat's cradle, and most children engaged in footraces, wrestling matches, and play battles. Many games included songs that the children sang while they played.

During the medieval period some African societies provided formal schooling to at least some of their children, almost always boys. Typically the schooling was religious. In Muslim areas some boys attended a school where they learned to read and recite the Koran. In Christian areas of Ethiopia some boys learned to read and write Ge'ez. But the majority of African children remained illiterate. They learned about their religions through oral transmission, listening to their leaders speak of the gods and religious obligations. These included daily prayers, the worship of ancestors, the proper sacrifices, and an individual's obligation to observe all the correct rituals throughout life.

One set of rituals was the rites of passage marking the transition from childhood to adulthood. These rites generally occurred somewhere between about the ages of eight and 14, though this varied among regions. In many societies, when children reached puberty, they went away from their villages

for a period of seclusion and training. They might go alone or in a large group.

Boys' initiation rites typically included seclusion, training, and a ritual ceremony. Often boys went off to live away from the village for a period of weeks or months. The men of the village instructed the boys on what it meant to be a man. The boys practiced skills such as moving quietly through the woods, hunting, and camping on long journeys. They might learn about routes through the wilderness to other settlements. They studied the traditions, history, and customs of their society. Some of their training might focus on warfare and the use of weapons.

In many societies the initiation into manhood concluded with circumcision or some other form of genital cutting. In circumcision the foreskin, the loose skin covering the end of the penis, is removed. Some Africans practiced subincision, in which a slit was cut on the bottom surface of the penis, exposing the urethra. Muslims, in particular, believed that circumcision was a requirement for manhood, but many traditional societies performed the operation as well. The boys being circumcised were expected to endure the cutting without sound or movement. Some Africans practiced other kinds of cutting as well; the Bushmen, for example, cut patterns into boys' faces, chests, and backs and rubbed dirt into the cuts to form decorative raised scars. When the manhood initiation was completed, the village usually held a celebration to welcome the boys back. The boys rejoined their communities as men, with all the rights and privileges attached to that rank.

Girls went through their own initiations into womanhood. In many cultures, when a girl first menstruated, she was expected to live in seclusion for some time, either in a special hut in her village or in a location slightly removed from the settlement. The women of her family and village instructed her on the proper roles and duties of women and prepared her for marriage. The girls learned the taboos associated with menstruation, which often included not touching tools used by men in hunting. Some Africans pampered a girl at this juncture, carrying her on their backs to prevent her from touching the ground and feeding her special foods.

Many cultures performed a version of genital cutting on girls. Female genital cutting, sometimes called circumcision, appears to have existed long before the advent of Islam in Africa. Different cultures practiced different forms of cutting. In some societies a girl's clitoris or just its hood was cut off. In others her inner labia was cut away. In the most extreme form of cutting her inner labia and clitoris were removed and her outer labia cut and sewn together, leaving only a small opening for urine and menstrual blood to escape. People believed that this procedure was necessary to make girls faithful

wives. As with boys, girls were expected to endure the pain in silence. Girls in some societies had their skin cut in decorative patterns to make them more beautiful.

Many Africans permitted adolescent boys and girls a wide degree of sexual freedom. Girls and boys might engage in sexual play together before puberty. In most cultures women married much older men, and girls often set their sights on older men. Among the Maasai, for example, it was not uncommon for men to have prepubescent girlfriends. Teenage boys in most cultures could not marry until they were quite a bit older, even if they had already passed the manhood initiation. In some societies they were encouraged to form relationships with older women, typically widows.

## THE AMERICAS

BY ANGELA HERREN

While little information exists about childhood in early American cultures, archaeological data and material culture remains suggest that these societies welcomed children into the world and celebrated when they defeated the high infant mortality rates. In these societies women raised children, teaching them to participate in community and household labor as soon as they were capable. Perhaps as the result of shorter life spans, early American peoples did not conceive of childhood as a distinct era in one's life. Parents educated children on their societal roles early in life. Skeletal remains indicate that many cultures engaged in the practice of cranial deformation, strapping boards to the soft skull of an infant to induce a permanent profile of aesthetic value in the culture. Spanish and mestizo accounts from the 16th century provide the most detailed information on childrearing in the Aztec and Incan cultures.

Many native North American children grew up in nomadic or seminomadic communities until around 1000, when some groups established a more sedentary lifestyle based on agricultural production. Native North American women typically carried their children on cradleboards on their backs while they traveled or worked, and many groups practiced cranial deformation by tying a flat board to the child's forehead. As children grew up, their parents and relatives taught them the duties and values of the community.

The Mississippian people (ca. 750–ca. 1500), who inhabited the area around the Mississippi River basin, taught their children to perform household and community tasks and to respect the rituals of the dead. Girls learned to perform such tasks as planting and caring for crops, collecting firewood, weaving, preparing ceramics, drying meat, and caring for younger children. Boys eventually learned important male activities, like hunting, trading, felling trees, clearing land,

and engaging in warfare. Like the Adena (ca. 1000 B.C.E.–ca. 200 C.E.) and the Hopewell (ca. 200 B.C.E.–ca. 400 C.E.), inhabitants of the area around southeastern Ohio, the Mississippians interred their deceased with many goods and precious items in great earth mounds. While the Adena often shaped their mounds like animals, the Mississippians built rectangular mounds and used them as bases for temples. Children learned to respect the religious official known as the Great Sun and to participate in the ritual life of the community. For recreation, children played with toys of wood and bone, eventually learning to race, gamble, and play chunky (a game played with stones and spears) like their elders.

The Anasazi (ca. 900–ca. 1300), Hohokam (ca. 500–ca. 1400), and Mogollon (ca. 500–ca. 1400) cultures of the American Southwest began to live more sedentary lives around 900–1100, though they remained seminomadic until the arrival of Spaniards in the mid-16th century. Traditionally, male children learned to hunt deer, rabbit, and other animals with spear-throwers and eventually bows and arrows, while female children learned to gather fruits, roots, and nuts. In the more sedentary societies children learned to clear land and cultivate corn, squash, and beans. Anasazi boys learned to weave baskets, and girls learned how to make and paint ceramics. Ball courts and platform mounds appear at some sites around 550–900, indicating that children would have been exposed to religious and communal activities.

The Taíno of the Greater Antilles, one of the best-documented cultures of the Caribbean, raised children in small chiefdoms until the arrival of Christopher Columbus (1451–1506) in the late 15th century. According to European accounts, mothers used padded boards to carry children on their backs and practiced cranial deformation. Children were born into either the *naboria*, a lower class that performed hard labor, or the *nitaíno*, the upper class. Owing to the warm climate, Taínos wore little clothing, but they decorated their children with jewelry and protective amulets. Children grew up in small, thatched-roof dwellings that surrounded the central plaza of the village. Their parents taught them to perform everyday labors, like cooking, hunting, fishing, and cultivating staple crops, such as cassava. At times warring neighbors called Island Caribs seized women and children in a process known as bride capture.

The Aztec, a culture that dominated central Mexico in the 16th century, celebrated the birth of their children with many rituals and festivities. Soon after a woman gave birth, a diviner arrived to review the calendar and to determine the nature of the day sign under which the child had been born. For example, the day sign 1 Monkey signaled a future in the creative arts, while 7 Flower produced good craftsmen. The diviner could mediate the effects of a negative day sign by

choosing an auspicious date for the naming ceremony. During the naming ceremony the midwife ritually bathed the child, and guests presented gifts. Boys received a small warrior's shield and arrows, and girls received a spindle whorl, a reed basket, a spinning bowl, a sweeper, and a broom. These gifts signaled the gender-specific tasks in which all community members participated. Boys often received more specialized craft symbols as well. If their day signs permitted, they might follow in the footsteps of their fathers and receive a carpenter's awl, a feather worker's obsidian knife, a scribe's brush, a goldsmith's tool, or another such object as a symbol of their probable trade.

Sixteenth-century sources indicate that Aztec children lived highly regulated lives. For example, custom dictated the number of tortillas a child was allowed to eat per day at different ages. Parents expected young children to stay close to home, where they learned to perform household chores. If children did not abide by strict behavioral codes, they received punishment. Naughty children were made to breathe the smoke of burning chilies.

Sometime in the early teenage years Aztec children attended school. Children of lords and nobles studied under priests at the *calmecac*, a school associated with the temple. Children of commoners typically attended the *telpochcalli*, a school with military emphasis, though they could attend the *calmecac* if they showed exceptional ability. Both schools taught song and dance from manuscripts painted with the ancient Aztec pictographic writing system. Children at the *calmecac* focused on history and religion, while *telpochcalli* students learned more about the military success that held the empire together. While women's roles typically centered on the home, some women occupied important ritual, social, political, and professional positions in society. Around the age of 20, Aztec couples married and began to have their own children.

At the time of the 16th-century Spanish conquest, indigenous inhabitants of Costa Rica, Panama, and Colombia raised their children in chiefdoms with varying degrees of social complexity. Children learned practical skills like farming, fishing, and preparing food, and they learned cosmological concepts from designated spiritual leaders. Elite objects made from ceramic, gold, feathers, jade, and other materials taught children simultaneously about social roles, spiritual concepts, and the many animals, birds, and insects of Central America.

Like the Aztec, the Inca, who dominated the Andean region of South America in the 15th and 16th centuries, marked important changes in a child's life, though they waited much longer than the Aztec to celebrate. While Incan mothers bathed their children shortly after birth, little formal celebra-

tion occurred until a mother weaned her child, around one year of age. Mothers strapped infants to their backs while they worked or placed them in cradles to rest. According to 16th-century accounts, mothers picked up their children infrequently, as a way to acclimate them to the hardships of adulthood. Once a child had survived infancy and had grown healthy and strong, adult friends and relatives gathered to celebrate with feasting. During a ceremonial ritual, guests cut the child's nails and locks of the child's hair, and an adult male relative named the child. Celebration and ritual also accompanied the onset of puberty; at this time young adults received a new, permanent name, given to them by an important adult male relative.

Most Andean children spent childhood learning to perform household duties and playing with dolls, tops, figurines, slings, and other toys. By the 16th century male children of Incan nobles were attending school in Cuzco, the Incan capital, for four years. Under wise men, they studied oratory, Incan history, religion, warfare, and the use of the quipu, an accounting device made of knotted strings. "Chosen women" between the ages of 10 and 14 also attended school for four years, learning how to cook, weave, spin, prepare corn beer, and perform other domestic activities. Selected from among the conquered peoples of the Incan Empire and from noble families in Cuzco, these women were revered for their great beauty. Most of the girls became teachers, temple caretakers, or secondary wives to the Incan ruler. Some of the most beautiful became sacrifices to the gods of the Inca.

During a ceremony dedicated primarily to the sun god Inti, the Inca chose a particularly beautiful child between the ages of 10 and 15 to offer as a sacrifice. After feasting and celebration that brought great honor to the victim's family, ritual leaders took the child to a mountaintop. After killing the child, the Inca interred the body with ceremonial garments and small toys. The Inca valued the purity and perfection of children and believed that human sacrifice was the highest form of offering. Scholars suggest that these rituals occurred on momentous occasions, such as a natural catastrophe, a war, or the coronation of a king. While Incan sacrifice is well documented, earlier examples of human sacrifice have been found as well. For example, in 1995 archaeologists unearthed the remains of 42 sacrificed adolescents at a Moche (ca. 1–ca. 600) site called Huaca de la Luna.

## ASIA AND THE PACIFIC

BY KIRK H. BEETZ

The lives of children varied greatly among the many cultures of Asia and the Pacific and often varied significantly within an individual culture over the 1,000 years of the medieval era.

In some cultures children were treated with great indulgence, but in others children were abused and overworked.

Care should be taken in making generalizations about how medieval Australians treated children, partly because Australians had many cultural groups with varied perspectives of what children were and should be. Further, archaeological evidence indicates that cultural practices relating to children changed over time, with some once-strong practices abandoned by the time Europeans arrived in Australia. For example, excavated grave sites reveal the remains of men surrounded by ornaments, indicating that they held high status in their communities. With them are the remains of infants. Although archaeologists theorize that infanticide was part of the burial ritual for a man of high status, the reasons for the sacrifice are not known because the practice seems to have ended long before Europeans arrived to record the customs of the Australians.

As ghastly as infanticide is, it was only one side of how Australians treated their children. In general, medieval Australian children probably were treated with much indulgence, even being carried when they were sturdy enough to walk. As soon as they could stand and play on their own, they were introduced to toys such as small spears and hatchets. The ends of spears were blunted and wrapped in kangaroo or similar skin to protect the youngsters. Beginning at about age five both boys and girls were shown how to hunt game and identify useful plants as well as how to find their way home if they became separated from their groups.

In Micronesia the elders particularly indulged boys, who were often allowed to do as they pleased until they were initiated into manhood and then expected to follow social rules. In highland tribes in New Guinea even young men were not expected to behave maturely. Often a young man lived apart from his family, perhaps to avoid upsetting the community of women in which girls tended to remain even as young adults.

The lives of children of the wealthy and socially elite in medieval Korea differed greatly from those of the children of most other Koreans. The children of wealth and privilege tended to have many toys and had access to education. On a child's 100th day of life, family members gathered to feast on fruits and drink alcoholic beverages, because even among the wealthy in medieval Korea about half of children did not live to that milestone.

Children took their fathers' names and belonged to their fathers, not their mothers. Among the rich and highborn every young man was expected to father a male heir. At age 14 a boy had his hair tied into a long topknot to represent his coming of age, and usually a wife in her 20s was found for him. The wife was responsible for enticing the boy into fathering

children with her, giving him the opportunity as early as possible to sire a male heir.

For most medieval Koreans, however, this marriage custom was not practical. Korea had an economy based on agriculture, and most Korean children had to work on farms as soon as they could walk. They were expected to rise at dawn, go into the fields, and work until dark, usually with their parents. They learned how to farm and how to practice the crafts necessary to keep a farm productive. Children of blacksmiths, carpenters, and other craftspeople may have had more social opportunities than the children of farmers because their parents had a better chance of acquiring the wealth needed to reach a higher social standing, but they, too, had to learn to work very early in their lives.

In imperial Japan before the 1180s the gulf between the courtly elite and the rest of society was enormous. The nobility and those who worked in government had almost nothing in common with other Japanese. For a son of a government official or a courtier, educational opportunities were abundant. Confucianism was imported from China in the 600s, but unlike the Chinese the Japanese did not use Confucianism to allow the best students to compete for good civil service jobs. Only the sons of the elite in Japan were allowed to study Confucianism, and only they were allowed to have government jobs, which were hereditary. Even after the establishment of military rule in the 1180s, this continued to be the custom.

Both the sons and daughters of the courtly elite were taught to write with brush and ink from an early age. They were expected to become fluent in spoken and written Chinese. By the time they were in their teens, they were expected to be able to write poetry in Chinese as well as Japanese, and their skill could gain them valuable contacts among nobility and the royal family. During most of the medieval era girls could aspire to become famous writers. By contrast, the children of commoners had little hope of acquiring an education or venturing far from their homes, unless they were conscripted into military service. Farm children worked in the fields, usually on lands their families did not own. Children of craftspeople begin learning the family craft as soon as possible.

The era of the Kamakura Shogunate (1192–1333) in Japan brought with it changes for some children. The son of a samurai would become a warrior like his father. The boy learned to ride horses almost as soon as he could walk, and much of his time was spent practicing horsemanship and the martial arts, especially archery. When he was not outdoors, he learned from tutors or family members the fine arts of writing, painting, and playing a musical instrument. Further, he learned the military code of Japan: unswerving loyalty to his master,

merciless cruelty to his master's enemies, and the willingness to sacrifice his life at any time for his lord or family.

Japan had a tradition of great female military leaders before the 1180s, and even under military rule some women learned the martial arts. Although it was rare, some women became samurai. Typically, however, the daughter of a samurai was trained to become the wife of samurai, and her education was limited to what would attract and keep a husband. Ideally, a wife was an ornament of her home, promoting her husband through her skills in art and in entertaining important guests. In practice, a girl had to learn the skills of running a business, because when she was married a woman often had to manage her husband's money and his feudal lands.

A child in medieval China yearned to go to school. For boys, school was a way to a better life. Although government officials often hired family members for government jobs, written records show that even the sons of slaves sometimes climbed the social ladder to great success by becoming scholars. The primary purpose of an education for most Chinese was preparation for government service. Life for uneducated Chinese was usually bleak. Because it had an agricultural economy, China needed most of its people to live on farms. Children who remained on farms worked almost every waking moment. The opportunities for children of craftspeople were somewhat greater. With their skills in making porcelain, metal objects, or wooden furniture, craftspeople could

live in cities, where the standard of living for children was usually higher than in rural areas.

Students educated in mathematics could aspire to become an architect or engineer. With knowledge of Confucianism, a young person could try to obtain a civil service job, which could elevate the status of the entire family. Acquiring such knowledge required more than memorizing Confucian texts, however; from the Tang Dynasty (618–907) through the Ming Dynasty (1368–1644) students were expected to be able to write essays analyzing Confucian texts and comparing Confucian principles to modern governmental practices. At age 17 a student took part in a nationwide test; passing the test almost guaranteed the student a promising future, and a student who failed could take the test again.

Boys often went to boarding schools, where they spent their time memorizing texts and learning mathematics and the arts. Classes were conducted outside in enclosed courtyards by teachers who had whips close at hand. Failure to complete homework could result in a whipping, although the use of corporal punishment was limited by government edicts. For most young Chinese the chance for a better life made living away from home, studying continually, and being whipped much preferable to following in their fathers' footsteps.

Girls had somewhat more limited opportunities for education. During the early medieval era girls could learn what boys learned, but they were rarely allowed to go to boarding schools. Daughters of well-to-do families could have tutors to teach them the sciences and the arts. As the medieval era continued, life for even the daughters of the social elite had become bleak. In the 900s members of the elite began binding their daughters' feet to show that the girls were highborn and did not need to work to survive. Typically begun when a girl was between the age of four and seven, foot binding caused the girl's feet to grow to only half their normal length, caused intense pain, and handicapped the girl for life.

Not much is known for certain about the lives of children in Southeast Asia. The children of northern Vietnam probably lived much as Chinese children did. On the islands of Sumatra and Java, Indian practices may have been followed by many people. On Sumatra boys seem to have been raised to be warriors. To the west of Vietnam were the cultures of Cambodia and Thailand, heavily influenced by India.

In medieval India children were usually cherished, regardless of their social status. At birth an infant's lips were moistened with water, butter, curds, and honey. The father whispered the name he and his wife had chosen for the child into the newborn's ear but did not disclose it to anyone until the child came of age. At about two weeks of age the baby

## A ROYAL CHILD IN INDIA

Medieval Indian monarchs were usually members of the Kshatriya caste, composed of warriors and government leaders. A king often had many concubines living in a harem. Children of the king spent their early childhoods in the harem, where they played games. Sometimes the king took his harem, including the children, out on excursions that included bathing in a river. When they were deemed old enough, children were removed from the harem and put in the care of a tutor.

The birth of a crown prince was cause for celebration. For about 10 days the king and his subjects celebrated with parties, dancing, and music. Every day of his childhood the crown prince had his body rubbed with yellow oil to make him look golden. He wore a necklace of tiger claws to ward off evil. When he was removed from the harem, the crown prince began training to become a leader. From the age of three he learned the rules of conduct for his caste and studied sacred books. As he grew bigger and stronger, he practiced horseback riding and the skills of a warrior in addition to studying academic subjects. At age 11 he began training in how to run a kingdom and how to manage the national bureaucracy. When his tutors considered him ready he was placed in a military unit, and eventually his father sent him to fight in a war. By the time he was a young man he was expected to command a military unit.

If a king had only daughters, sometimes the eldest daughter was raised as if she were a crown prince. She was expected to marry and have a son, who would become part of her father's line of kings. A king might adopt a son who by custom would have all the rights, privileges, and duties of a natural-born crown prince.

was given a name to use until the real one was revealed. At night the family kept a lamp lighted beside the child to ward off evil.

Children of the poor were put work in the family business as soon as they could walk. Education was very much desired by children of all social ranks because only through education could they learn how to live fulfilling lives. In general, a Hindu child was expected to learn the rules of his or her caste, especially those regulating moral behavior. With a good education a girl could aspire to marry a well-to-do

husband or manage a business of her own. A boy could hope to become a leader in his community.

## EUROPE

BY SOPHIE OOSTERWIJK

In the medieval period childhood was a clearly recognized phase of human life. The "ages of man" were a popular theme in art and culture. Ranging from three basic ages (youth, maturity, and old age) to more extended schemes, depictions show the different stages of life from birth until death. Many variations of this theme included separate stages for infancy, childhood, and adolescence or youth. Artistic renditions may depict infancy as a swaddled baby or a toddler behind a baby walker and childhood as a young boy at play.

In real life there were also specific stages of childhood that marked a transition. Medieval infants often were weaned relatively late, at the age of two or even three, but they remained in the nursery during this first age of infancy. Children usually started their elementary education or training at the start of the age of childhood, around seven and grammar school education or formal apprenticeships in their early teens. There was no uniform age to mark adulthood. Children might marry young: Legally, girls could marry as early as 12 and boys as early as 14, though laws varied and did not necessarily apply to other aspects of life. An adolescent could still be technically a minor in terms of inheritance or legal responsibility.

Birth and child care are among the topics discussed by such medieval authors as Bartholomaeus Anglicus (fl. ca. 1220–40) and the Tuscan physician Aldobrandini of Siena in the 13th century, though in reality midwives rather than physicians assisted mothers during childbirth. Newborn babies were expected to be bathed and cleaned after birth before being swaddled tightly in cloths or bands with the intention of keeping them warm and allowing their limbs to grow straight. Many late medieval tomb monuments show images of swaddled infants, or so-called *chrysons*, which usually commemorate children who died in early infancy. The need for hygiene is often emphasized in medieval medical handbooks. It is impossible to prove how often children were washed, but there are many literary references to bathing as well as depictions in medieval art of infants being bathed in a tub by their mothers or nurses.

Birth was a hazardous event for mothers and children alike. Many miracle stories describe parents praying desperately for a stillborn baby to revive, at least long enough to allow baptism to safeguard the child's immortal soul. Birth rates were generally very high, but so were infant mortality rates, and therefore many parents experienced child loss. The high

infant mortality rate did not make such losses any less sad: Expressions of loss and regret are found in many medieval texts, such as the Middle English poem *Pearl*, in which a dreamer mourns the death of a little girl not yet two years old.

Baptism was the first sacrament that a medieval child was expected to receive, and it was considered vital in terms of salvation. Children were regarded as innocent, yet their souls first had to be cleansed from original sin through baptism. For this reason, it was officially forbidden to bury unbaptized children in hallowed ground. The earlier theological stance that death without baptism meant eternal damnation gave way to the idea that the souls of unbaptized children would be consigned to the *limbus puerorum*, which was a kinder fate than hell but which did not offer any hope of ever attaining heaven. To prevent the perdition of an immortal soul, some medieval preachers' handbooks include instructions for midwives on how to baptize an unborn child in extremis without the help of a priest.

Baptism of noble children could result in lavish celebrations and exchanges of gifts, with godparents being carefully chosen as sponsors for the child. However, such feasts might be abandoned or curtailed in favor of a hasty baptism if the baby proved to be weak or unlikely to survive long. In a ceremony known as churching, mothers were ritually received back into the church after giving birth. In continental Europe bishops bestowed the sacrament of confirmation on older children; in England, however, it was not unusual for very young children to receive confirmation, as is illustrated in many medieval depictions of the seven sacraments.

Child care was regarded as a woman's domain. Babies were breast-fed, and the Madonna suckling the infant Christ (known as the *Virgo lactans*) became an increasingly popular image in medieval art. However, aristocratic and royal mothers tended to employ wet nurses, who were carefully chosen for the quality of their milk and for their moral behavior. In Italy it was customary to send newborn babies away to be nursed in the country, though wealthier families preferred live-in wet nurses. Rich households usually had designated nurseries, often with their own staff. High-born babies might even be attended by their own rockers to rock their cradles, and extant lullabies prove that there were special songs for babies. Many examples in art attest to the existence of baby walkers to help a toddler in learning to walk. Games and play were also important. Depictions in art, literary texts, documentary evidence, and archaeological finds all prove that medieval children had a wide variety of toys to play with, ranging from simple objects made of wood or clay to more expensive toy castles and swords for young princes.

Medieval children were also distinguished by the clothes they wore. Few medieval items of clothing survive, yet there is

evidence that children's dress was adapted to suit their needs, in terms of both material and style. An example is the 1494 portrait of the 26-month-old dauphin Charles Orland (1492–95), who is shown wearing a white shift with a bib and a thick cap over his white coif to help prevent head injuries in case of a fall. The exception was the type of court costume represented in early Renaissance depictions of high-born children, such as Hans Holbein's (ca. 1497–1543) portrait of Edward, the infant son of Henry VIII (r. 1509–47), in his Tudor cap and gold-trimmed shift and robe. Such dress was obviously intended for formal occasions and not for everyday wear.

Medieval education was different for girls and boys. High-born sons often received private education, while other boys might be sent to school before receiving further training in their future professions, either in apprenticeships or at university. Discipline was strict, and medieval schoolmasters are traditionally depicted with a birch. Children learned their letters initially with the help of a hornbook, a tablet onto which the alphabet was copied. Literacy became increasingly important for girls as well, though they were usually taught at home. The image of Saint Anne teaching the young Virgin Mary to read became a popular theme in art and thus an example to medieval mothers. Monasteries and nunneries also often derived an income from educating pupils.

Although young children were usually involved in the world of adult life and work, they were not treated as adults. In the countryside peasant children were gradually introduced into an active working role, usually with tasks to match their age and experience, such as running errands or tending livestock. Inevitably, accidents did happen, but authorities were apt to reprimand irresponsible parents who failed to recognize the limitations of young children or to exercise due care and attention.

Families usually determined their children's future. An extreme example was the earlier practice of child oblation, through which parents could donate young children to the church and which was regarded as binding; the custom was questioned in the 12th century and was finally abandoned. Apprenticeships were contracts that parents or families entered into on behalf of children in their care; these contracts were strictly regulated by the guilds and stipulated the duration of the apprenticeship as well as the conditions and fees. Many sons followed their fathers' careers, and many medieval artists and artisans were trained by their fathers or continued their fathers' workshops, as in the case of the Louvain painter Dirck Bouts (ca. 1400–75).

Marriage was another aspect over which children themselves had little control. They could be promised in marriage at a very early age, though the church did not regard such marriages as legally binding until both parties had reached

the age of consent. Royal and noble children were sometimes handed over to their prospective spouses or in-laws after the contracts had been signed, with conditions intended to safeguard the interests and welfare of both parties. An example was the marriage in 1396 of the English king Richard II (r. 1377–99) to the French princess Isabella of Valois (1389–1409), age six. The king apparently pampered his child bride with toys and gifts, but the marriage was never consummated because he died before Isabella reached the legal age of consent as stipulated in the marriage contract. She was later returned to France and married off to her younger cousin, Charles d'Orléans (1394–1465).

Although the conditions surrounding childhood were different in the Middle Ages, it would be wrong to assume that children in this period were regarded or treated as miniature adults. The depiction of children in early medieval art was dictated to a large extent by artistic as well as religious conventions, so that the Romanesque Madonna appears formal and remarkably less affectionate than the more tender Gothic Madonna of later periods. While children are admittedly harder to find or to recognize in early art, the fact that they became an increasingly popular theme for artists in later periods reflects a growing trend toward secularization and realism in medieval art. Likewise, the high mortality rate among children may have resulted in a degree of resignation among parents, but not indifference. There are numerous records testifying to the anguish felt by bereft medieval parents from all stations of life, even if only a small proportion of deceased children were actually commemorated on tomb monuments. The fact that children were often demanded as hostages to guarantee their parents' loyalty proves that the natural tie between parents and children was believed to be the strongest possible bond.

## THE ISLAMIC WORLD

BY KIRK H. BEETZ

Children's lives were governed by their family relationships, their obligations to their faith, and their educations. The lives of children in the Islamic world were governed primarily by the customs of Arabians, which became part of the laws derived from their Islamic faith. Even so, variations were created by local traditions.

In the medieval Islamic world a child was anyone who had not yet reached puberty, with adulthood coming at age 14 or 15. Childhood was seen to progress in stages. The first was from birth to teething. This period was crucial because many children died from disease at this time, making teething a special event that marked a child's progress in life. At a child's birth someone would whisper into the child's ear

the *adhan* and then the *shahada*. The *adhan* was the call to prayer, and the *shahada* was the first pillar of Islam, that there is no god but God and Muhammad is his messenger. The *shahada* would be repeated frequently to the infant, not in the expectation that he or she would understand it but to accustom the child to repetition of passages from the Koran. Seven days after a child's birth the family would host a feast, during which the child would be named. A sheep or goat was slaughtered for the occasion as an expression of gratitude for the child's successful birth. A child had the right to be breastfed until age two.

The second stage in a medieval Islamic child's life ended at about age seven, an age at which a child was expected to be able to begin memorizing the Koran. No one was considered properly educated who had not memorized the Koran word for word, and children were expected to be able to recite passages from it. The third stage in a child's life ended at around the onset of puberty, which could be as late as age 14 but was watched for at about age 12. It was at this age or a little earlier that boys and girls were segregated from each other. Before puberty children were not considered sexual beings because they could not complete the sex act, and the genders were allowed to be in each other's company. The final stage of childhood was the transition into adulthood, rarely taking place later than age 15.

Circumcision was an important rite in the Islamic world of the medieval period. It had been a custom practiced in Arabia before Muhammad's time, and it became an important part of Islamic life. During the medieval era Islamic scholars were in wide disagreement over when circumcision should occur. Some thought a child should be circumcised on the seventh day of life. Others thought that circumcision should not take place before the age of 10 years, while still others said it should not take place until after puberty. Circumcision was considered an important act of ritual purification that cleansed a child. For boys from well-to-do families a parade was held, with the child carried on the back of a horse before a barber removed his foreskin. Poor families would wait until there was a wedding procession that could include their son's parade.

Circumcision of girls was very controversial and entailed the cutting off of some of the upper genitalia. Many scholars claimed that female circumcision was necessary for the girl to be purified. Some people believed that it would dampen a girl's sexual desires and make giving birth to boys more likely than giving birth to girls. The circumcision was not a cause for celebration but was performed in private by a woman hired for the purpose. It is probable that the majority of Muslims in medieval times regarded female circumcision as shameful, regardless of what scholars might say. It was more common

*A musical toy from a copy of al-Jazari's treatise on automata (opaque watercolor, ink, and gold on paper); Syria, 14th century (Freer Gallery of Art, Smithsonian Institution)*

in North Africa and Arabia than elsewhere, probably because some pagan cultures in those regions had practiced female circumcision before their conversion to Islam.

The matter of educating girls was contentious. Muhammad had set an example by having well-educated wives, but he was also quoted as having said that teaching a woman to write was like feeding venom to a snake, which some people interpreted to mean that just as giving a snake poison would make it more venomous, educating a woman would make her more poisonous. Many girls therefore were denied any kind of education and even punished if they learned to read. Yet many people reasoned that like a boy, a girl had to learn to read the Koran and commentaries on the Koran to fulfill God's wishes.

Before the age of seven, children learned to read and write mostly from male family members such as fathers, uncles, cousins, and older brothers and sometimes from educated female family members. Seemingly, a girl was more

likely to become educated if she had educated female relatives as her teachers. In general, it was acceptable for a woman to teach boys and for a man to teach girls. In fact, some women became esteemed for their knowledge of the Koran and religious laws and were sought out by adults who wished to learn from them.

The educational process involved learning passages by rote. At age seven a child would be expected to learn to recite the shortest chapters in the Koran and work his or her way through increasingly long passages. Reciting the Koran from beginning to end was an act of piety that every educated person was expected to do on important occasions and to mark religious holidays. A child who could do so was a source of pride to the family. By the 1000s a child was also expected to learn the hadith, which were accounts of what Muhammad said or did. These, too, were memorized. Although paper made its way into the Islamic world from China by the 1000s, it was too expensive for any but the wealthiest of people to

use. So children wrote their lessons on surfaces that could be cleaned, usually wooden tablets, and their best way of retaining their understanding of what they learned was to memorize it. Some young people performed prodigious feats of memorization. Important texts were passed on from teacher to student from generation to generation for hundreds of years. Teachers would recite their personal insights into religion, law, or science, and students were expected to memorize them word for word. To a student who had mastered a complex text, the teacher gave an *ijaza*, a kind of diploma that said that the student was qualified to teach the text to others.

Discipline was an important part of a child's life. Teachers were urged by experts in education to beat students who misbehaved. Misbehavior included inattentiveness to studies, failure to learn a text, gambling, lying, and other moral transgressions. There were even texts that described the kind of stick to use and the area of the child's body on which to inflict the beating.

The family was central to the Islamic way of life. After loyalty to the family came loyalty to the family's clan. From birth a child was usually surrounded by family. Under the law adult men were expected to care for women, and in a big family a child would have uncles and cousins involved in seeing to his or her welfare. Adult family members were expected to help teach children how to live and behave. Early in life, often before age seven, girls began to prepare for marriage. Boys began to prepare to care for the women in their lives. Marriage rarely had anything to do with love, because the husband and wife seldom had the chance to get to know each other beforehand.

It was possible for children to be betrothed to each other before puberty, but this seems to have been uncommon. Usually the husband was older than his wife, sometimes decades older. A girl could be married before she was 10 years old, but a boy was expected to be able to support a family with his labor and therefore almost always had to be an adult. Further, the husband was expected to give his bride a dowry. Ancient Arabian custom had assigned the dowry to the father or male guardian of the girl, but under Islamic law the dowry had to go to the girl, and it was supposed to remain her money throughout her life. If her husband divorced her, she kept the dowry he had given her. This meant that husbands either came from wealthy families or had to be well established in their careers before marrying.

When boys and girls reached puberty, they could no longer be in the company of the opposite sex unless they were family members, women past menopause and therefore no longer considered sexual beings because they could no longer bear children, or men who were eunuchs (that is, men who had been castrated). A sure way for a person to gain a bad

reputation was to fail to be generous, and generosity included entertaining outsiders in one's home. This resulted in the development of the harem, which was a space in a house into which no males who were not family members could enter, unless the male was a eunuch. In the homes of the wealthy the harem was a separate room in which women could gather and be comfortable. It was the place that learning began for both girls and boys. For the majority of homes there was no separate room, so women and children stayed behind a curtain, apart from the male hosts and their male guests.

Childhood was not just a relentlessly bleak experience of beatings and rote memorization. Children were recognized as being different from adults and were not expected to fulfill adult responsibilities. For instance, even though children were expected to know the difference between right and wrong, they did not receive adult punishments if they broke the law. In many communities children were not obliged to fulfill the rituals of worship required of adults. This changed at age 14, when the full weight of punishment would be meted out and children had to fulfill many responsibilities of adults.

Children had a large variety of games they could play. Playing with balls was especially popular. They could ride seesaws; as they matured, they could wrestle, race, and play polo. Horsemanship was a highly esteemed skill, and many children not only rode horses but also competed with each other in feats of skilled horsemanship. In central Asia a girl was as likely as a boy to be seen riding for fun. Puppetry was a common form of entertainment for children, as was playing with dolls and toy animals. Young and old alike enjoyed board games, and a child might learn chess and backgammon from the same adults who taught them the Koran and hadith. Gambling games were forbidden, as was the use of dice.

## ► cities

### INTRODUCTION

Cities in the medieval period had many purposes; they were centers of governance, trade, culture, the exchange of ideas, and the sharing of natural resources. Many of the cities established in the ancient world were still being used in the medieval period, but a sizable number had declined, some considerably. Then, too, new cities emerged, and minor settlements grew into significant population settlements, with the rise of new centers of commerce and wealth. The constant need for defense against attacking armies and also from marauders and bandits saw most of the cities erecting large walls to protect their populations or adapting previously existing walls from the ancient period.

Traditionally, the city served as the population center of a political entity, often being self-governing to some extent. Cities were usually surrounded by defensive walls, built at enormous cost and maintained and adapted over many centuries. The entrance gates were usually garrisoned, and these gates served as points to control the inflow and outflow of population, both in terms of law and order and in terms of the collection of tariffs or other taxes levied on goods coming into a city. In some cases the city had a number of concentric walls to protect the entire city and then particular parts of the city. Charlemagne's capital at Aachen (in modern-day Germany) and the city of Baghdad (in present-day Iraq) are two examples.

Most of these cities emerged over time, with relatively little thought going into long-term planning. Indeed, the choice of the location of capitals, such as in the early part of the kingdom of Angkor in modern-day Cambodia, seemed to be very much at the whim of the ruler. As a result, the growth

of many cities was haphazard. They would often sprawl along the side of a river or bay, since most cities were reliant on water for drinking as well as for trade. At the same time, they were carefully located away from floodplains. Medina and Mecca (in today's Saudi Arabia) were not located on the coast or on rivers, relying instead entirely on wells.

The largest city of the medieval period, Ch'ang-an, located near the modern city of Xi'an, the capital of the Tang Empire of China, was noticeably preplanned as a massive rectangle. It had 11 great avenues running north–south and 14 running east–west, with the entire city divided into 106 wards. At its height during the eighth century it is thought to have had a population of about 1 million within its walls and as many as another 1 million people living in the suburbs beyond its walls. The Japanese Yamato rulers were so impressed by accounts of the city that they modeled Nara and Kyoto on it when they were built, respectively, in 710 and 794.

The second-largest city of the period, Baghdad, straddled the Tigris River, and the third-largest city, Constantinople, was set on a peninsula and enclosed within the Wall of Theodosius, built in the late 440s. Although the fourth-largest city, Córdoba, stretched to both sides of the Guadalquivir, the walled part was all on the north bank. The southern bank saw the suburban expansion of the city.

The medieval European definition of a city was a large town made into a city by charter and usually dignified with a cathedral and therefore with a bishop. The size of the city and its commercial activity often meant that a level of local government operated in these cities, with a number of them emerging as city-states. San Marino (on the Italian peninsula) and Vaduz (Liechtenstein) are two that have survived as independent states to the present day, although many in Italy and Germany retained levels of autonomy they had gained in medieval times well into the early modern era.

With cities being the central focus of the medieval state, the capture of a city earned status for invaders or rebels, and the loss of a capital city often symbolized the fall of the kingdom or empire, regardless of whether it survived as a political entity elsewhere. Thus, the sacking of Rome by the Visigoths in 476—even though the Romans had moved their capital to Ravenna—signified the end of the Roman Empire as a major power and, indeed, the end of the ancient world. The fall of Jerusalem to the crusaders in 1099 and its subsequent fall to the Seljuk Turks in 1187 marked two important phases in the history of the Crusades. The triumphal entry of Joan of Arc into Orleans in 1429 symbolized the beginning of the end of English rule in France and the emergence of early modern France.

As cities represented the power of particular political entities, attacks on cities led to the developing of siege-warfare

techniques. If the city resisted, the attackers often sacked the city, pillaging it and either killing many of the inhabitants or selling them into slavery. The destruction of the city of Béziers (modern-day France) in 1209 during the Albigensian Crusade, the sacking of Acre (present-day Israel) in 1291, and the ruin of the city of Angkor in 1432 were all done with such thoroughness that none of these cities was able to recover.

To protect its citizens, city councils often sought terms from attacking armies to prevent the inhabitants from being slaughtered. The Huns and the Mongols tended to attack places with such ferocity that many cities surrendered quickly. Occasionally, some cities prevaricated in the hope that reinforcements would arrive, as in the case of York during the Viking invasion of northern England in 1066. In that instance the delays provided enough time for Harold II to defeat the Vikings and save the city from attack. During the Hundred Years' War, Edward III laid siege to the city of Calais for more than a year. In 1347, he offered to spare the city if six citizens would surrender to him. Five burghers of the city volunteered, expecting to be executed. Their lives and those of the citizens of Calais were spared, but the city fell to English rule.

## AFRICA

BY TOM STREISSGUTH

The cities of medieval Africa developed along trade routes, in populous farming areas, and on the continent's long Atlantic Ocean and Indian Ocean coastlines. The earliest sub-Saharan communities were nomadic, in constant search of food and game herds. They followed networks of footpaths and river systems to move from place to place. They raised villages in forest clearings or near sources of freshwater. But with a range of natural and human enemies, these settlements were temporary, their inhabitants always ready to move to safer and more productive locations.

Ironmaking among agricultural peoples went hand in hand with the rise of permanent settlements. The tools manufactured from iron ore allowed farmers to clear land and cultivate the soil efficiently and to manufacture useful household utensils and weapons. To be exploited, however, a source of copper or iron ore had to be protected. Iron technology also demanded a permanent workshop, where the difficult work of heating and smelting iron ore could be carried out. The needs of an artisan and metalworking class thus led to the establishment of the first large, settled communities.

Agricultural surpluses and the profits of trade allowed African cities to develop aristocracies and build civic institutions. The wealthy ruling classes sought to conserve their privileges by raising permanent capitals, which made possible the extension of authority over a wide area. These towns grew

around a defensible point, such as a hilltop or river promontory, which could be protected by walls of stone, earth, or wood. Within the perimeter of some major cities a citadel contained a royal seat of power, surrounded by the homes of retainers, courtiers, and servants. Coastal cities were dedicated to trade, while some inland centers served as religious sites. The largest African cities had neighborhoods of farmers, artisans, and merchants; the urban population also absorbed foreigners, who arrived as traders or slaves.

## CITY PLANS IN MEDIEVAL AFRICA

Large public works often were constructed by slaves or, in places of strong central authority, by levies of residents conscripted to labor for a set period each year. Roads, palaces, walls, public squares, and religious shrines rose to serve the city's populations and glorify their rulers. The outer walls of the city protected residents and visitors from the hostile elements, both human and animal, lurking in the surroundings. It was common for tolls to be collected on all merchandise passing through the gates, providing an important source of income for the city rulers. Within African cities, walls also marked out neighborhoods and the property of kinship groups (clans) with claim to specific plots of ground, on which they raised homes, outbuildings, and garden plots. The home itself was often in the form of a walled compound, in which daily life revolved around an enclosed field or courtyard.

Some cities grew to cover many thousands of acres, which included extensive crop fields that could provide food whenever the city was besieged. In many cities the royal palace and surrounding buildings were enclosed by inner walls that served to mark and protect the royal precinct, considered the exclusive, sacred ground of divine kings. Common people were forbidden to observe their ruler or to know anything about the movements or actions of the king. The work of artisans who served the ruler also was protected; their knowledge was considered privileged and secret, and the products of their forges and workshops were reserved for the use of the king.

The fortunes of African cities rose and fell with the levels of trade, the fortunes of royal dynasties, and the extent of conflict with neighboring cities and societies. Trade with India and Southeast Asia via the ports of the Indian Ocean stimulated the growth of prosperous coastal towns, including Mombasa, Zanzibar, and Mogadishu. Foreign trade and colonization also played important roles. The cities of Ethiopia and the Sahel region, for example, depended on trade with Arabia and North Africa, respectively. Over the medieval period, Islam arrived with traders and Arab merchants who moved south into the Sahara Desert region, transforming the architecture, religion, and culture of prosperous cities. In the 15th century

Portuguese caravels began sailing down the West African coast, disrupting trading ports and carrying out a murderous trade in slaves and gold. As Europeans established depots and trading stations in West and East Africa, Christian missionaries followed them. The effort to settle and exploit Africa's human and natural resources brought about new concepts of city design and function in sub-Saharan Africa.

### FALL OF ROME AND ALEXANDRIA

The city of Alexandria, founded by the Macedonian general Alexander the Great in the fourth century B.C.E., remained the busiest port in the Mediterranean for several centuries. A vital link in the importation of grain from the Nile River valley to Rome, Alexandria was a major harbor and a city of fine palaces, mansions, and public buildings laid out on a regular grid of streets divided into four major quarters. As a cultural center Alexandria was unsurpassed in the Mediterranean world; it was home to respected philosophers and astronomers, and its library and academies were renowned throughout the empire.

The decline of the Western Roman Empire in the fifth century wrought a transformation in the city. As its harbor declined in importance, Alexandria lost population and grew isolated from the Nile Valley as well as the new center of imperial authority, the eastern capital of Constantinople (modern-day Istanbul), far to the north on the bridge between Asia Minor and Europe. Pagan temples and monuments in Alexandria were thrown down by the dominant Christians, and the city's libraries and academies were largely abandoned.

In 616 Alexandria was overrun by a Persian army under King Khosrau II. An Arab army arrived to lay siege in 641; the citizens endured 14 months of assaults before the city finally surrendered in 642, having lost its renowned library and the thousands of manuscripts contained within it. The Arab conquest of Egypt and North Africa that soon followed destroyed the last remnants of Roman culture on the continent and began an era of Islamic domination of North African cities, trade, religion, and culture that has lasted to the present.

### AXUM

In the early Middle Ages, while Alexandria declined into a small and isolated coastal settlement, the Axum Empire of northern Ethiopia was prospering. The abundant rainfall in the region allowed its farmers to produce two harvests every year. Terracing of the mountainsides increased the area under cultivation. The bumper crops and the wealth that flowed along trading routes between mountainous Ethiopia and the Red Sea created a prosperous merchant class whose members spent their disposable income on luxury items created by artisans in wood, stone, gold, and gems. By the fifth

century C.E. the capital of Axum was one of the wealthiest cities in Africa.

Axum drew a large population of migrants and foreigners while extending its power to far-flung valleys and towns in the Ethiopian highlands. Trade through the Red Sea port of Adulis linked the city to India, Persia, and the Mediterranean ports of the Byzantine (Eastern Roman) Empire. The city imported cattle, iron, and salt while exporting luxury goods from the interior of Africa, including ivory, rhinoceros horn, gold, spices, frankincense, and war elephants. Metalworking technology arrived from the Middle East via the Nile Valley, giving rise to a busy iron industry; Axum was one of the first realms in sub-Saharan Africa to mint its own coins. Beginning in the fourth century the Axumites adopted Christianity through links to the eastern Mediterranean. (Christianity remains an important faith in modern Ethiopia.)

The Axumite nobles built impressive mansions in the city and provided a market for expensive cloth, wine, glass, and spices from Arabia and the Levant. The Axumite kings celebrated their lives and their reigns by raising tall obelisks, more than 100 of which eventually fell and now litter the streets and parks of the modern town of Axum. The tallest of these monuments was 108 feet high. The most elaborate obelisks had detailed bas-reliefs carved into their surfaces.

Axum began a slow decline soon after the fall of the Roman Empire, which had traded with Axum via Egypt and the lower Nile Valley. Axum's foreign markets either vanished or were besieged and conquered by Islamic armies sweeping across the eastern Mediterranean and down the coast of the Red Sea. The city's farming hinterland also suffered environmental damage. As trees were cut down to provide wood for the furnaces of metal foundries and for the manufacturing of brick and glass, the soil began to erode, and crop yields suffered. The situation worsened as rainfall began to decline in the eighth century; the port of Adulis was conquered by the Arabs in the same period, and Axum's main link to the outside world, and its main source of revenue, disappeared. Urban society grew tumultuous, with violent revolts brewing in the streets and hunger rampant. The city's nobility took refuge in isolated hilltop fortifications and then moved to central Ethiopia, leaving Axum a poor and sparsely inhabited ghost town.

The Axum Dynasty was finally toppled and Aksum itself destroyed in the 10th century, after an assault by Queen Gudit, a determined opponent of Christianity. In 1137 the Zagwe rulers ascended to power from their capital at Roha in the Lasta Mountains. In this northern town (modern-day Lalibela), a series of 12 rock-cut churches were constructed during the reign of King Gebre Mesqel Lalibela, which ended in the early 13th century. This Christian king envisioned Roha

as a new center of Christianity, meant to replace Jerusalem, which had fallen to the Muslims in 1187 after the short-lived reign of the European crusaders. The layout of Roha's streets, the design of its churches and monuments, and even the name of its principal river, the Jordan, were all in imitation of ancient Jerusalem. The Zagwe Dynasty was overthrown in the 13th century by rulers claiming descent from Solomon and the Queen of Sheba. Under the Solomonian kings, the city of Roha declined, and the kings themselves wandered from place to place with no fixed capital.

### JENNE-JENO

In the fertile plains and marshes of the Niger Delta, in what is now central Mali, the city of Jenne-jeno (or Djenne) reached its greatest extent in the ninth century. For centuries the city had been a center of copper and iron manufacture and served as a trading hub linking the interior regions of the Sahel with the western coasts of the Atlantic Ocean. Jenne-jeno grew among an ancient network of small and separate communities, each with its profession or craft specialty: farmers, herders, ironworkers, potters, weavers, and merchant traders. A grid of narrow streets was laid out on a series of low hills, each inhabited by one of these communities. Streets were connected by alleys; the houses shared common walls. A stone wall surrounded the city's residential area and protected the inhabitants from hostile raids as well as from flooding from the regular rises of the Niger River and its tributaries.

Jenne-jeno became an important political center of the Mali Empire, which at its greatest extent comprised parts of what is now Mali, Senegal, Gambia, Mauretania, and Guinea. From their excavation of rare Chinese porcelain and glass and beads from the Near East, archaeologists have concluded that the city traded extensively with Egypt and Arabia as well as the East African ports on the Indian Ocean. As trade developed, an infrastructure arose to meet its needs: quarters for lodging travelers and their caravans, carpenters to provide vehicles, and buildings for storing goods.

Historians still debate the reason for Jenne-jeno's decline, which started in the 12th century. In the 10th century the arrival of Islam may have disrupted trade and set rival religious faiths against each other in political dissension and civil war. A general climate change in the region may have brought about pestilence, drought, or a loss of fertility in the overworked soil. The Songhai Empire that replaced the Mali realm finally conquered the city in the late 15th century.

### TIMBUKTU

The town of Timbuktu rose on the frontier between the Sahara Desert and Sahel, the grassland savanna lying between the desert and the rain forests to the south. Tuareg nomads,

who founded the city in the 10th century, used the site as a depot for their trade in salt, in high demand throughout North Africa. According to one legend, the name of the city comes from Buktu, an old woman renowned for her honesty whose home was used as a place of safekeeping for the possessions of Tuareg nomads, who traveled constantly between this region and the North African coast.

Timbuktu became a center of trade in gold, ivory, salt, and slaves. It was a principal city of the Malia Empire beginning in 1324 and then was brought into the Songhai Empire in the late 15th century. The city lost its importance as a trading center when Europeans began building warehouses and ports on the West African coast. These ports, which overlooked the mouths of rivers, diverted a considerable amount of trade from the Sahara Desert region to the sea lanes of the Atlantic Ocean. Timbuktu itself became a cultural, educational, and religious center of Islam, with impressive mosques and one of the largest universities in Africa.

### KOUMBI SALEH

Lying in what is now southeastern Mauretania, 200 miles north of the modern-day Malian capital of Bamako, Koumbi Saleh was a capital of the Ghana Empire, one of the largest united realms in the history of West Africa. The city was founded in the third century C.E. by the Mandinko, a people speaking the Mande language who plied the trading routes between the Sahara region and the coastal cities and forests of West Africa. Koumbi Saleh held a strategic position between the salt deposits of the Sahara Desert and the productive goldfields of West Africa. (Salt was in high demand throughout Africa and in some markets was traded for an equal weight of gold.) At the rise of the Ghana Empire in about 1000 C.E. the population of the capital city rose to as much as 30,000.

Koumbi Saleh had two major urban concentrations, lying about 6 miles apart. The northern and southern halves were divided along religious and cultural lines, with separate Muslim and traditional African neighborhoods and a network of suburbs lying between. Muslim merchants occupied the northern half, while a royal palace and precinct, enclosed by a wall, were located in the southern half. A traveler named Abdallah ibn Abdel Aziz, also known as El Bekri, described an audience with the king, who appeared within an elaborate pavilion guarded by fierce dogs and who possessed gold so abundant that it was crafted into the collars of the dogs and woven into the hair of the king's attendants. Several large mansions in the ruins of the city have been uncovered by archaeologists, who discovered foundations covering an area of several thousand square feet. These homes included extensive storehouses where a variety of iron weapons and goods were found.

Koumbi Saleh became the center of a web of busy caravan trails. Several satellite towns, including Aoudaghost to the north, were constructed to facilitate trade, but these routes also cut an easy path through the desert for Berber traders who were expanding their influence and disrupting trade. In the 11th century the Almoravid realm of North Africa conquered the Ghana Empire, seized salt and gold mines, looted the homes and palaces of the capital, and converted the population forcibly to Islam. With its main source of taxes and revenue diverted to the Almoravid rulers, the city declined into a series of small, poor settlements. Eventually the site was abandoned and many of its people made slaves.

Smaller trading outposts, including Gao, Agades, and Timbuktu, survived the Almoravid conquest to become major cities of the Mali Empire. This realm flourished under the rule of Kankan Musa, a king who extended his authority over all the busy trading stations of the Sahel. Kankan Musa held a vast treasury in gold and spent much of it on the building of mosques in Gao, Timbuktu, and other flourishing cities. Mali was said to have so much gold that the king crashed the Arab gold markets of Cairo by his generous presents of gold coins, nuggets, and objects during a formal state visit.

Many cities of the Mali Empire have disappeared from the map and remain the object of archaeological searches. Other cities of the Sahel lie in ruins and bear little testimony to their origins or history. In Darfur, 600 miles west of the Nile Valley, a desert town known today as Jebel Uri was built of stone within a circular wall that still reaches a height of 12 feet. The wall stones were fit together skillfully without mortar and provided the townspeople with a nearly impenetrable line of defense against desert nomads and raiders. Based on its location historians have concluded that Jebel Uri was a part of the trading network of the Kanem Empire, which arose in the region north of Lake Chad. The town was a key point on the routes that crisscrossed the Sahel, linking the Niger Valley, the Nile, and the Indian Ocean. The city was inhabited for several centuries, during which its people raised hundreds of circular stone huts and a large hall or palace with ceremonial steps and platforms that have survived centuries of neglect and weathering.

### KANO, IFE, AND KONGO

The Hausa people of West Africa also built walled towns, which they called *birane*. The Hausa were among the first indigenous Africans to master ironworking technology and, as a result, were among the first to raise large, permanent communities. Kano, in modern-day northern Nigeria, was one of the largest of these Hausa cities. It was the southern terminus of an important caravan route that crossed the central Sahara Desert and reached the Mediterranean coast in Tunisia.

Slaves, gold, ivory, and kola nuts were traded through Timbuktu and other stations to the north, while silk and leather goods, copper, and salt arrived from the desert. These caravans stretched for miles and consisted of thousands of camels and carts; Kano became a distribution center for foreign goods in a wide area of West Africa.

Kano was founded as an important religious center on a prominent cliff known as the Dalla Rock, believed to be the home of a deity. The town fell to the Berbers in the 11th century, but its walls survived and were reinforced during the following centuries. Walled enclosures remained a key feature of Hausa cities throughout the medieval period. (The walls of Kano itself eventually grew to 30 feet in height and attained a circumference of 12 miles.)

The earliest major town in the neighboring Yoruba region was Ife, which was founded about 700 B.C.E. and flourished as a source of bronze, stone, iron, and terra-cotta goods. The city's iron and pottery workshops produced goods that were distributed throughout West Africa. As in the Sahara region and Ethiopia, ironworking was a direct cause of the stratification of societies into groups based on their crafts and livelihoods, the emergence of an aristocracy and a merchant class to trade nonessential goods, the growth of cities, and the establishment of highly centralized states.

Kongo (Mbanza Congo) became the center of a large medieval empire that rose in the early 15th century and covered what is now Angola, the Atlantic coastal region of Zaire, and Gabon—one of the largest realms in African history. King Mbene founded this imperial capital, a town that eventually reached a population of nearly 100,000 people, making it by far the largest urban center in medieval sub-Saharan Africa. The arrival of the Portuguese in the late 15th century transformed Kongo, raising a Christian cathedral and making the city a center of the trade in slaves captured in the rain forests of the interior and brought to depots on the Atlantic Ocean coast.

### EAST AFRICA

The eastern coasts of Africa, from Somalia to Mozambique, were linked from prehistoric times with ports in Arabia and across the Indian Ocean to India and Southeast Asia. Settlements on the island of Madagascar were founded by explorers from Indonesia during the time of the Roman Empire, and this society of mariners, fishermen, and traders eventually spread up the coast as far as the Red Sea. Cities of this coast preserved their independence, though beginning in the seventh century many began paying periodic tribute to Arabian princes and governors. East African cities traded in ivory, gold, rhinoceros horn, iron goods, and tortoiseshell from the interior and bought wheat, rice, honey, sesame oil, and ghee from India. Contacts with Ethiopia and the Lake District of

east-central Africa also helped the spread of ironworking technology down the coast to southern Africa.

By the eighth century the immigration of Arab merchants and traders was transforming these cities into strongholds of Islam. Zanzibar, Mogadishu, and Mombasa were key ports in the medieval period, linking the Red Sea with the emerging kingdoms of southern Africa through the bustling harbor town of Sofala, at the mouth of the Sofala River. This port and Sinna were the principal towns of the Monomotapa realm, which covered what is now eastern Zimbabwe. The wealth of the ruling aristocrats of Monomotapa was based on their immense herds of cattle. The nobles and princes of the kingdom raised great mansions in Sofala and monumental religious centers in the interior.

Cattle farming had spread south to the valley of the Limpopo River and the Transvaal region of present-day South Africa, giving rise to bustling market centers such as Toutswe and Mapungabwe, which also traded gold and ivory with Indian Ocean ports. The capital and metropolis of Monomotapa, and the largest archaeological site in sub-Saharan Africa, was Great Zimbabwe.

## GREAT ZIMBABWE

Like Kano, Great Zimbabwe was founded as a religious center, the home of the Mwari cult. It was settled sometime in the 10th century. Beginning in the 12th century the town began to prosper from trade in gold and cattle. The great wealth that was collected into the city's treasury allowed its rulers to raise monumental walls, religious centers, marketplaces, and palatial homes. The principal market of Great Zimbabwe lay within the so-called Great Enclosure, while outside that precinct were a residential neighborhood and the cult center on a nearby hill.

In about the 14th century Great Zimbabwe may have come under siege or been involved in a protracted conflict. The residents began raising walls of cut stone, laid in a variety of patterns and reaching a height of more than 30 feet, with an outer wall extending 800 feet. Great Zimbabwe reached the peak of its prosperity and influence—from Zimbabwe into neighboring Mozambique—in the middle of the 15th century. The city itself covered an area by some estimates as large as 3 square miles while controlling subject towns and farms as much as 200 miles in every direction. At its height Great Zimbabwe may have been home to a population of about 20,000.

Archaeologists divide the city into three main areas: the Hill, the Valley, and the Great Enclosure, which sheltered several hundred buildings. The homes, walls, and palaces were constructed of close-fitting stones joined without mortar. The excavations revealed that Great Zimbabwe was a vital trad-

ing center, where objects from as far away as the Middle East, Persia, and China have been found. In the 16th century the site was visited by Portuguese explorers who wondered at the great extent of the city and the ingenuity of its builders and engineers. By that time, however, the city was in decline, its trade routes usurped by the Portuguese and other Europeans who were taking control of coastal ports on the Atlantic and Indian oceans. Over the following centuries the site was plundered for its stone and artifacts. It was also subject to excavations by archaeologists convinced that no African nation had been capable of raising such a city and that some forgotten European or Middle Eastern community had built an outpost somehow lost to recorded history. Although Great Zimbabwe has been long abandoned and damaged by looters, it remains a national shrine of the modern nation of Zimbabwe and a symbol of the achievements of native Africans before the transformations wrought by the Arabs, Europeans, and other outsiders.

## THE AMERICAS

BY J. J. GEORGE

The process of indigenous American urbanization and the development of cities saw its greatest achievement in the years 500–1500 C.E. By the 1530s the Spanish had landed throughout the Americas, as led by Christopher Columbus in the West Indies in 1492, Hernán Cortés in Mexico by 1519, and Francisco Pizarro in Peru by 1532. The arrival of the Spanish and subsequent European colonists meant that American life as an autonomous cultural process ceased. Characteristics of and approaches to urbanization that had evolved out of earlier traditions were discontinued, and the landscape of the Americas shifted, irrevocably, to its colonial period. Thus, meriting close historical attention are the principles of urbanization in the Americas as they originally developed, such as can be seen in the evolution of certain primary American type-sites in the period 500–1500 C.E.

Urban settlements and cities had begun developing in ancient times and with a unique American vocabulary, generally originating during the social transformation of simple nonhierarchical farming societies into class-stratified states. There is little consensus among scholars regarding the specific qualities that determine whether or not a site qualifies as a city, as no checklist with enumerated characteristics exists. Rather, the conditions are broad and flexible, and any particular site might display some but not all general criteria. Indeed, a wide array of typologies is used to classify sites and settlements. Among the most commonly defined types of settlements, as based on function, are major capitols, political

towns, fortresses, administrative centers, regal-ritual centers, ceremonial centers, burial mound sites, and mercantile cities. As based on size and complexity, smaller settlements may be defined as towns, villages, village clusters, hamlets, or camps. Most scholars agree only that a few major settlements from the medieval Americas, such as central Mexico's Teotihuacán (c. 100–700 C.E.) and 16th-century Tenochtitlán, should be classified as cities or, at the least, major examples of advanced urbanism.

Part of the scholarly uncertainty over classification stems from the fact that terms like *city*, *urbanism*, *urbanization*, and *urban society* are often left undefined. Uncertainty also derives from the fact that textual evidence is in short supply, such that most of the relevant data come from archaeological evidence; reconstituting entire complex civilizations through excavations, without the subtleties and nuance of native written thought, has its limits. For example, archaeological scholars have thus far met with extreme difficulty in trying to decipher the roles of most individuals in the urban environment, primarily because they are much less visible in the material remains. In contrast, archaeologists often have become more familiar with elite classes, as through interpretations of grave goods, royal burial contexts, and specialized architecture. Clarification of the roles of common individuals—their practices, perceptions, attitudes, values, calculations, and emotions—will ultimately provide a more detailed understanding of American urbanism and of how cities worked.

Questions of demography—the statistical study of populations, especially with reference to size, density, and distribution—and of function are usually primary considerations in determining a site's urban texture. Cities are typically political, economic, and religious centers for surrounding territory, and they usually feature a wider range of specialized production and services. As in modern times, the city represented the central core of a greater community within which a more diverse range of activities could take place. According to the 20th-century archaeologist and urban theorist V. Gordon Childe, criteria that qualify and determine “city-ness” include the status of a site as the head of a hierarchy of settlements that performs unique functions for a regional society for its time; status as a permanent settlement that is considered home by a significant number of residents whose activities, roles, practices, experiences, identities, and attitudes differ substantially from other members of the larger society, particularly from those who identify with more rural areas; and status as a large settlement with various functions affecting a large hinterland. A town is a smaller settlement with fewer functions affecting a smaller region.

Childe has attempted to tie the rise of civilization to the development of cities. Other theorists have attempted simi-

lar analyses, with the primary questions constituting mirror images of one another: Can civilization exist without cities? Similarly, can a city exist in the absence of a civilization? In defining civilization, Childe identifies various qualifying factors that in turn reflect upon the internal workings of city-ness, such as monumental public architecture; advanced art styles involving artistic representations in multiple media; the development of practical means of recording, such as astronomy, calendars, numeral notation systems, accounting systems, and, sometimes, writing; relatively large population and density; the differentiation of the population into ordered, hierarchical social classes, such that access to knowledge or privilege is granted only to some; the concentration of human and natural resources for public enterprise; and extensive foreign trade. Such criteria as these were rarely, if ever, all in evidence at one settlement at a particular time. Rather, they serve as clues, benchmarks, and examples that help scholars determine a typology and assess the urban complexity of different sites.

Beyond the various typologies, scholars have used various methods in analyzing cities and the process of urbanization. The anthropologist and Mesoamerican scholar Michael E. Smith has delineated four basic approaches to urbanization: ecological, functional, “cosmovision,” and built environment. With an ecological approach, research focuses on subsistence, settlement patterns, economic organization, and population. Cities and towns are analyzed as part of a society's adaptation to the natural environment. The functional approach emphasizes regional economic functions, as based on the idea that economic activities tend to cluster in specific settlements, which geographers refer to as centers. From this perspective, a smaller settlement might yet be classified as a city if it shows a wide influence. The cosmovision approach emphasizes the symbolic role of cities as human replications of the cosmos, as sacred spaces, or as places containing sacred spaces where ritual activities are carried out, often affecting a larger hinterland. The built-environment approach applies a vocabulary derived from architecture, design, and environmental psychology to examine the relationship between human behavior and architecture. In this approach features such as earthen-mound pyramids, large plazas, and ceremonial avenues, all of which were common in cities throughout the Americas, are read as efforts by rulers to impose political ideology on inhabitants, often as expressions of power.

## NORTH AMERICAN URBANISM

North America lacks superior examples of urbanization when compared with the Mesoamerican cities of Teotihuacán and Tenochtitlán. Perhaps because much of the regional geography is conducive to easy travel, nomadic hunter-gatherer societ-

ies remained common in many areas. Even where agriculture bore an early influence, large cities failed to evolve, although this does not indicate that complex societies did not exist or that settlements with urban characteristics did not develop. Material evidence remains scarce and data largely insufficient, but a number of North American sites merit attention.

By size and complexity the site of Snaketown is not properly a city, but it does show advanced urban characteristics. Southeast of modern Phoenix, Arizona, and a capital city of the Hohokam culture, Snaketown represents about 700 years of continuous occupation, with its decline occurring around 1200. The site comprised more than 30 acres, with an estimated total of perhaps 5,000 houses, which were built and rebuilt on the ruins of earlier ones. Special architectural features included earthen pyramids, the largest of which was 95 by 70 feet at the base and 10 feet high, with a perishable structure at the top; crude replicas of the ball courts of Central America, with a playing field 185 feet long and 60 feet wide; and irrigation ditches that were expanded over the centuries, with canals eventually reaching over 30 feet in width and 10 miles in length. A Mexican influence is revealed in the frequent use of the snake motif on art objects.

While Pueblo Bonito (920–1085), in Chaco Canyon, in modern New Mexico, and Mesa Verde (1100–1275), in southwestern Colorado, are most accurately called villages or towns, as proto-urban sites they provide architectural examples that resonate with elements considered “citylike” in modern times. Initial settlement at both sites occurred as early as 350 C.E. and is attributed to the Anasazi culture. Using only the immediately available materials—stone, earth, and wood—the Anasazi built unit structures with adjoining walls called pueblos that often appear in striking harmony with their physical environments. As populations grew, the Anasazi added second stories to their pueblos, reserving many interior rooms for storage, thus forming what are sometimes informally referred to as the first apartment buildings. Mesa Verde is most famous for its dramatic setting, with its apartment-like structures and kivas, or religious ceremonial structures, set into a deep niche on the underside of a canyon wall.

By the time the Anasazi flourished, between 1100 and 1300, the “great houses”—highly integrated assemblages of rooms, kivas, plazas, towers, and terraces—of Chaco Canyon rose as comprehensively planned structures, each incorporating ceremonial, religious, defensive, economic, and political functions into a single, walled development. Like Mesa Verde, these developments exhibited proto-urban characteristics, the most prominent of which were, again, the stacked units, which reached as high as four stories at Pueblo Bonito.

Farther east, the floodplain of the Mississippi River, a wide and well-defined natural area of easily cultivated soils

and marshy lakes, is referred to as the American Bottom. Usually thought of as a “cult center” of the late Mississippian culture, the major temple site of Cahokia (fl. 900–1100), to the east of Mississippi River at modern St. Louis, Missouri, is a cluster of groupings of ceremonial mounds and temples covering several square miles. The Mississippian culture period was characterized by the emergence of sedentary societies based on maize agriculture, with ranked or layered social orders governed by leadership believed to have been semi-divine. Mississippian settlements were formally organized around plazas flanked by earthen mounds surmounted by temples, council houses, or chiefly residences.

As broadly defined to include nearby mound groups, Cahokia stretches over 10 miles from the banks of the Mississippi River eastward. The Cahokia site proper occupied an area of 5 to 6 square miles, with more than 100 mounds. The site’s innermost sanctum, a ceremonial and residential center, comprised the most substantial temple mounds and was surrounded by a palisade of vertical logs, with defensive towers set at intervals. (The largest temple mound, referred to as Monk’s Mound, after a Trappist community that lived there from 1809 to 1813, is 104 feet tall, covers 16 acres, and contains 22 million cubic feet of earth.) Archaeologists have divided the history of Cahokia into a series of phases, as defined by the diagnostic pottery type, distinctive architecture, level of sociopolitical integration, and relationships to neighboring peoples; the phases are called Lohman, Stirling, Moorehead, Sand Prairie, and Oneota. Cahokia was occupied in various forms until about 1650, but the site ceased to be a major city at least 300 years before the French arrived in the mid-eighteenth century. Some scholars estimate that at its height as many as 40,000 persons lived in greater Cahokia.

## MESOAMERICAN URBANISM

Regarding Mesoamerican urban, social, and cultural development, the village farming community was the primary template during the Early Preclassic (ca. 1800–ca. 1200 B.C.E.). In some regions, especially southern Mesoamerica, the temple center was a contemporaneous development, with major religious architecture being built during this period. The Middle Preclassic (ca. 1200–ca. 400 B.C.E.) and Late Preclassic (ca. 400 B.C.E.–ca. 150 C.E.) witnessed population increases and the rise of ceremonial centers; in nearly all areas such centers were found. In the lowland forest territory of modern Guatemala, on Mexico’s Yucatán Peninsula, and in the Veracruz-Tabasco region of Gulf Coast Mexico, temple centers grew in size, complexity, and importance as politico-religious nuclei of scattered village and hamlet life. The emerging trend, with energy, population, and organization being drawn inward toward a center, precipitated civic devel-

*Jade figure of an eagle warrior (Aztec culture, Mexico, ca. 1325–1521); the eagle played an important role in the legendary foundation of the Aztec capital, Tenochtitlán because, according to myth, the god Huitzilopochtli asked the Aztecs to found their city where they saw an eagle perched on a cactus. opment; thus, the Mesoamerican city has relatively ancient origins, even though it is best known from the Classic Period (ca. 150–ca. 650), through the major examples of Monte Albán, in the valley of Oaxaca, and Teotihuacán, in central Mexico. The Postclassic (ca 900 to the Spanish conquest in the 16th century) was marked by the rise of new states. The Toltec capital of Tula rose to the north of contemporary Mexico City and dominated the region from the 10th to 12th centuries. Toltec migration also influenced Postclassic Mayan cities on the Yucatán Peninsula. After the fall of the Toltec, the Basin of Mexico witnessed the settling and organizing of nomadic tribes. Finally, by 1325 Tenochtitlán, the great capital city of the Aztec Empire, was established in what is today Mexico

City. The Spanish arrived in Tenochtitlán in 1521, thus ending purely American urban development.

Mexican urban development initially arose north of contemporary Mexico City at Teotihuacán (ca. 1–ca. 650 C.E.) and in the south in the Valley of Oaxaca at Monte Albán (ca. 600 B.C.E.–ca. 900 C.E.). Teotihuacán was the largest and most complex urban settlement in the Americas until the rise of Tenochtitlán in the 14th century. By 600 C.E. Teotihuacán was the fifth-largest city in the world, with a population estimated at 125,000. Urban developments at Teotihuacán included an internal drainage system of subterranean canals, administrative and ceremonial buildings, a central thoroughfare called the Avenue of the Dead (which featured a monumental linear arrangement), a regular grid pattern, large public congregational plazas, and barrios for workers and foreigners on the periphery believed to have been organized by craft specialization. Teotihuacán was the center for an extensive empire with trade ties extending throughout Mesoamerica.

Monte Albán developed gradually and saw great fluctuations in population as well as in regional influence, eventually losing ground as an urban center while remaining a pilgrimage site of religious importance. It was thought to have risen as a center for the coordination of various regional sites, eventually developing advanced administrative, economic, social, and ritual capabilities and responsibilities. Monte Albán was built atop a hill 1,000 feet above the surrounding valley floor, with its population concentrated on terraced hillsides. Its layout focused on a civic-ceremonial center atop the hill, with multiple structures framing a central plaza. A ball court, stone slabs covered in bas-relief, slabs with evidence of a ritual 260-day calendar, and pottery produced on a large scale all suggest the kind of cultural complexity indicative of cities.

After the fall of Teotihuacán in the eighth century Mexican urban life disintegrated, with the decline lasting some 300 years. Tula, Xochicalco, El Tajín, Cholula, and Cacaxtla either continued as occupied sites or rose to prominence in the void left by Teotihuacán. Scholars suggest that Xochicalco (700–1000), built on a hill near modern-day Cuernavaca on the western slopes of central Mexico, replaced Teotihuacán as a trading center. Among its remains are palaces, a ball court, circular platforms, stepped-pyramid temples, stelae, glyphic inscriptions, and sculpted reliefs, indicating a fairly complex urban environment. Xochicalco was located on a route between the Basin of Mexico and southern and eastern regions along which cacao, cotton, feathers, jade, and obsidian were carried. Some scholars suggest that the settlement represented a merger of Mayan, Oaxacan, and Gulf Coast influences that,

The major Mesoamerican cities in the medieval period included Tenochtitlán, Chichén Itzá, Tikal, Machu Picchu, and Cuzco.

in effect, formed a bridge between Classic Teotihuacán and Postclassic Tula. Its peak population was around 20,000.

Following the fall of Teotihuacán, Tula, also called Tollan of the Toltecs, became the dominant city. Tula followed a traditional courtyard model spread over a large area. Its main square reveals a transition between the monumental linear center at Teotihuacán and the clustered center favored by the Aztec. The main square was a space of some 400 feet on each side, bordered to the north by several palace-type structures and a colonnaded hall and to the east by a stepped pyramid; the western and southern sides were open. Tula was occupied from about 800 to 1150, at which point it was sacked and burned. Its peak population is estimated to have been between 30,000 and 60,000. The Aztec looted much of Tula's undestroyed artwork, in a sense claiming the site as an ancestor city in order to establish their legitimacy as an empire. Toltec influence was felt widely, and in due time Toltec architecture and art styles were transferred to the Yucatán, especially the site of Chichén Itzá.

The climax of Mesoamerican urbanism came at Tenochtitlán, the great city of the Aztec empire, which rose over a period of less than 200 years from a swampy backwater island in the middle of Lake Texcoco to a vibrant, organized, complex metropolis with as many as 200,000 residents, larger than anything the Spanish knew when they arrived in 1521. In the following decades the Aztec reclaimed swampland by constructing agricultural plots called *chinampas*; built an immense dike system; and, through a combination of political alliances and military prowess, increased their influence such that by 1428, under the ruler Itzcóatl, the Aztec were the dominant power in the Basin of Mexico. From this point they began to spread their influence throughout central Mexico.

As the Aztec state expanded, the capital at Tenochtitlán grew, relying on tribute from conquered territory to support a large population invested primarily in governmental, religious, cultural, and military pursuits. The absolute center of activity, so to speak, was the Templo Mayor, also called the Great Pyramid, the main religious temple-pyramid. The basic plan of Tenochtitlán was cruciform, with the two axes meeting at the Templo Mayor, subdividing the city into four districts, each with its own temples, squares, markets, schools, and general constructions. Three causeways connected the island to the mainland, extending to the west, north, and south along the axes dividing the city.

The urban conceptions of the Maya were totally distinct from contemporaneous urban developments in central Mexico. In Mayan settlements clear differentiation is made between three typical sectors contributing to the overall texture of the settlement. The first typical sector is the central complex, featuring a group of plazas, courtyards, and plat-

forms surrounded by stepped pyramids, palaces, and other constructions with ceremonial or perhaps residential functions. The second area is an intermediate sector that shows declining numbers of built structures as it transitions to the third sector, the agricultural countryside. Scholars do not completely agree regarding site typology—whether Mayan settlements are cities by either function or demography—but the Mayan treatment of urban space was certainly unique.

One factor that made Mayan centers unique was the aesthetic sensibility displayed in the combination of public space, ceremonial architecture, and topographical exploitation into a functional and beautiful unity. Although their techniques were limited and they were working with only a few architectural forms and urban elements—such as paved streets, reservoirs of water, platforms, low walls or embankments, stairways of various sizes, stelae, and the stepped pyramid-temples, which were crowned by roof combs and often painted a vibrant red—the Maya were nonetheless able to sculpt transformative architectural spaces. Late Classic Period (ca. 650–ca. 900) ceremonial centers such as Tikal, Copán, Palenque, Piedras Negras, Yaxchilán, and Uaxactún were as much works of art as functional spaces. By and large the Maya avoided the axial monumentality and the linear progression of the grid of Teotihuacán, favoring instead elemental surprises that give the feeling of improvisation within well-defined structures. Mayan population statistics vary by site; for instance, a proposed upper limit at Tikal ranges between 40,000 and 80,000, while a suggested population for Copán is 20,000.

By the ninth and 10th centuries Classic Maya civilization in modern Guatemala, Honduras, Belize, and highland Mexico was collapsing, for unknown reasons, with power shifting to the northern Yucatán lowlands. Toltec influence was very important in the cultural development of the Yucatán Maya; arriving from central Mexico, the Toltec forced upon the Maya the cult of Quetzalcoatl, the feathered serpent god, and also introduced changes in local sculpture, architecture, and urban planning. Chichén Itzá was a regional capital and remained an important religious center for more than two centuries.

## SOUTH AMERICAN URBANISM

In South America a golden age of urbanism began in the Andes around 1000 C.E. following the decline of Tiwanakan influence, as led by the rise of the Wari Empire in central Peru and of the Chimú in northern Peru and culminating with the rise of the Inca Empire in the 15th century; the Spanish arrived in 1532.

The cities of the Wari empire (750–1000), including the capital of Huari and the regional center of Pikillacta, developed in opposition to each other from a planning perspective.

Huari developed organically, changing a great deal over the years, eventually accomplishing a switch from ritual to administrative concerns. At its height Huari covered roughly 6 square miles, with population estimates ranging from 10,000 to 70,000. High walls erected across the city during its final phase suggest a garrison and speak to the militaristic impulses of the empire. Pikillacta was planned and erected in one phase, as dominated by an enormous rectangular complex 2,445 by 2,067 feet. Its right angles belie an undulating landscape that slopes nearly 270 feet from end to end. The complex is subdivided into four main parts separated by very few interior passageways. A single exterior entrance leading through an extremely long corridor along the east wall seems to reveal much about control of access.

The Chimú Empire (c. 1100–1470) was centered at the coastal capital city of Chan Chan. Although the city did not grow in accordance with a preconceived plan, it did contain streets, alleys, wells, and communication and sanitary facilities necessary for urban life. The city's urban core covered more than 2 square miles (with the total ruins covering around 8 square miles), as entirely occupied by 11 immense, high-walled adobe *ciudadelas* (citadels that combined royal palaces, administrative and storage spaces, and mausoleums) and intermediate spaces. Chan Chan supported an estimated population of 30,000–36,000, with most living in commoner housing or workshop neighborhoods outside a core of elite residences.

The culmination of Andean urban development occurred with the great Inca empire (ca. 1450–1532), which had its capital at Cuzco. Despite its symbolic character, political-administrative nature, and preeminent ritual and religious importance, Cuzco never managed to equal the commercial activity of Tenochtitlán, the monumentality of Teotihuacán, the elaboration of Tikal, or even the size and scale of Chan Chan. It was, nonetheless, the most important urban space in the empire. In the course of their empire building the Inca made use of cities they conquered, frequently reorganizing them to meet their own needs and demands, often along a similar organizational scheme as used in Cuzco. Some of these cities were Quito, Tumibamba, Tumbes, Cajamarca, and Pachacamac.

Cuzco rose quickly from obscure village to royal domain built of exquisite masonry. It was centered at the confluence of three rivers—the Huatanay, Tullumayo, and Chunchul—taking advantage of a traditional Andean concept known as *tinkuy*, which conveys the harmonious balancing of opposites that occurs where rivers or paths meet. The Inca straightened and canalized the first two rivers, creating a space that Spanish chroniclers claimed was shaped like a puma—certainly as unique an urban design element as seen anywhere. The city was divided further into an upper and a lower section,

or *hanan* and *hurin*, demarcating dominant and subdominant moieties, respectively. Further delineating urban space was a system of lines radiating from the absolute center of the empire, a sacred structure called the Qorikancha. These lines, not truly straight, were both symbolic and practical inventions, connecting sacred spaces called *huacas* as well as delimiting water rights. When the Spanish arrived in 1532, the Inca were already in decline. Smallpox arrived ahead of the conquistadors and set the tone for a rapid conquest. With their arrival, indigenous American urban development came to an end.

## ASIA AND THE PACIFIC

BY LAURA LEE JUNKER

Cities are generally defined by anthropologists, geographers, and historians as larger-scale settlements that lie within regional settlement hierarchies and have populations in at least the tens of thousands. They play a central role in the political, social, economic, or religious life of societies, and they are accordingly functionally diverse, often featuring monumental ritual and administrative architecture, commercial zones, and socially stratified housing areas. The terms *cities*, *urbanization*, and *state-level societies* tend to be associated but are not synonymous. *Urbanization* refers to the relative percentage of people living in cities versus rural areas; a highly urban society is frequently defined as one that has 20 percent or more of its population in cities. Large population concentrations in cities may be associated with states or, in rare cases, with a prestate level of society, such as that of a politically fragmented chiefdom.

India and China developed cities on a grand scale at the center of extensive empires or states by the second millennium B.C.E., while cities were very late in developing in Korea, Japan, and Southeast Asia. They arose partly from contacts with China and India during the beginning of the medieval period (the early first millennium C.E.). Of these societies, those of the islands of Southeast Asia were the most urbanized in the 10th through the 15th centuries, owing to the great significance of foreign maritime trade that drew people to coastal ports. China and India had cities approaching 1 million in population. Many Pacific island chiefdoms developed ritual and political centers dominated by monumental ceremonial architecture and elaborate chiefs' residences by around 1000 C.E., but they were essentially rural agricultural societies with no true cities.

### INDIA

Cities date back to the third millennium B.C.E. in India in association with the rise of the large urban centers of Harappa

and Mohenjo Daro. These centers boasted sophisticated sewage systems but show little evidence of large-scale religious architecture. The fall of the Harappan civilization in the early second millennium B.C.E. was followed by a long period of the rise of political centers, during which the tenets of Hinduism and ideas about social caste began to coalesce through a combination of indigenous developments and Indo-European (Aryan) migrations into the region between 1500 and 500 B.C.E. These changes in religion and society set the stage for a new type of urban center by the early first millennium C.E. in which religious architecture on a grand scale was the key to ideological reinforcement for royal authority, and the residential structure of the city reflected strong social segregation.

During the rule of the Gupta kings in the Ganges basin of northern India in the fourth and fifth centuries C.E., which was considered a golden age for the development of classical Indian culture, cities were focused on large Hindu temple complexes with exquisite religious art devoted to specific deities. Cities of the period were centers for learning and the arts, including sculpture, painting, Sanskrit literature, religious philosophy, mathematics, and scientific discovery. Historical descriptions make it clear that residential and production zones in large cities and surrounding villages were organized according to social strata and craft professions, since social prohibitions about intercaste interactions were already in place.

Between about 650 and the 1400 C.E., the core time frame for the medieval period, two factors significantly shaped urban landscapes in India. The first was the repeated invasion by foreign groups with new religious orientations, particularly Islam, including Arabs, Turks, and Mongols. The second factor was the outflow of Indian merchants and missionaries both east into Southeast Asia and west into the Middle East and eastern Africa. India became a battleground between rising Muslim polities to the north and Hindu and Buddhist states and empires to the south, and its cities emphasized militarism and defensive constructions. While capitals were often placed in the interior in defensible positions and near strategic borders, cities oriented toward maritime commerce grew along the shores of the Bay of Bengal and the Indian Ocean. The capital city of Vijayanagara, the center of the Vijayanagara Empire beginning in the 14th century until its conquest by northern Islamic states in 1565, has perhaps been studied in greater detail than any other Muslim or Hindu cities of the medieval era.

Between the 14th and 16th centuries the Vijayanagara Empire controlled nearly the whole of southern India, and its capital near the northern border housed an estimated 200,000 to 500,000 inhabitants. At the core of the city was a

4-square-mile walled royal center featuring towering gates, large brick and stone temple complexes dedicated to various Hindu deities, opulent imperial palaces, elite mansions built by ruling kings and other high-ranking nobility, and administrative buildings associated with military activities and the state economy. The greater urban area covered an astounding 135 square miles, fortified by natural granite outcrops, the Tungabhadra River, and cut stone fortifications 6 to 20 feet thick, with towers, bastions, and gateways. This urban sprawl encompassed nucleated neighborhoods, craft-production zones, markets, agricultural fields, complex irrigation systems, and additional Hindu temple complexes. Archaeological and epigraphic evidence suggests that households were clustered both by social class, or caste, and by ethnicity or religion (Muslim traders, for example, being concentrated in their own section of the city), with distinct architecture, access to wealth, and symbols of social identity.

The central location of Hindu temples and shrines emphasized the kings' use of religious ideology and public ritual to reinforce their political authority. Carved scenes of battle and large-scale military facilities (such as elephant stables, soldier barracks, and artillery magazines) manifested their military might. An elaborate system of water control, including large-scale reservoirs and irrigation canals, attests to strong imperial control of the subsistence economy, while minted coinage and high foreign-trade volumes at the capital show a centrally managed economy. While the degree of urbanism—the percentage of urban versus rural dwellers—in the large polity is unknown, it is clear that Vijayanagara was the largest of an extensive network of smaller but similarly structured cities throughout the empire, with those near the coast supporting maritime trade with polities of western Asia, eastern Africa, Southeast Asia, and China.

## CHINA

China developed the earliest cities in eastern Asia. Many scholars argue for a trend toward urbanism by the late third millennium B.C.E., culminating in the huge cosmopolitan cities of the Tang (618–907) through Ming (1368–1644) dynasties in the medieval period. At the time of the Roman Empire in Europe the Zhou feudal states of China were unified through the conquests of the emperor Qin Shi Huang (r. 221–210 B.C.E.) into the Qin Dynasty (221–207 B.C.E.), ushering in the beginning of a 2,000-year imperial phase of Chinese history and the model of cities as rigidly ordered bureaucratic and commercial centers. The unification of the empire through centralization and standardization (of money, writing systems, language, architecture, and culture) was a key strategy for the Qin Dynasty and the Han Dynasty (202 B.C.E.–220 C.E.) stretching to the waning years of the Roman Empire.

Chinese cities became international trade centers along the Silk Road stretching to the Roman-held eastern Mediterranean. Ruling an empire of 57.7 million people, which extended from northern Vietnam in the south into the Korean peninsula in the east and contained numerous cities of up to 250,000, the Han established 1,500 administrative provinces, each centered at walled cities.

The breakup of the Han led to a several-century period of political fragmentation, social instability, and economic decline in China that ended with the reestablishment of a strongly centralized empire, the spread of Buddhism as a state religion, and renewed urban growth by the Sui (589–618 C.E.) and Tang dynasties. In the seventh century the Tang imperial capital Xi'an was the largest city in the world, housing more than 1 million people within the 32-square-mile area encompassed by its 23-mile rectangular outer wall. Establishing a model for emerging urbanism in Korea and Japan of this period, Xi'an was laid out in a rectangular grid of streets traversing and delimiting walled neighborhoods, royal compounds, administrative and commercial areas, and Buddhist temple complexes.

Central to the Tang capital was a royal palace and administrative core. This was a walled inner city within the city that housed the imperial family, high-ranking nobility, and various government offices, and it was often constructed anew or augmented by each successive Tang emperor. Typical of these walled palace complexes was the approximately 1-square-mile imperial center known as Daminggong built by the Tang emperor Taizong (626–49 C.E.). This consisted of a U-shaped group of several dozen buildings on earthen platforms that included lavish living quarters, ceremonial halls, and administrative offices, according to Tang Dynasty texts. While few pre-10th-century Buddhist temple complexes have survived in China, silk paintings of the period depict huge monasteries with dozens of courtyards at Xi'an and at major provincial capitals and cities throughout the empire, underscoring the religious underpinnings of imperial authority.

Fundamental changes in Chinese politics, economic systems, and social order occurred with the waning of the "golden age" of Tang rule and its succession to the Sung (960–1279 C.E.), Yuan (1279–1368 C.E.), and Ming dynasties. These changes had significant effects on Chinese demography, urbanization, and city structures. Aristocratic Tang period bureaucracies, landed estates, and wealth controlled largely by birthright nobles gave way to some degree of political meritocracy and economic mobility for commoners. Foreign trade opportunities expanded to encompass overland routes through central Asia and maritime routes to Japan, Southeast Asia, India, the Middle East, and East Africa, which opened up new possibilities for production and commerce in cities

along trade routes. Paper money, improvements in transportation, and technological innovations (such as mechanized silk spinning, printing presses, a new crucible method of iron extraction from ore, and technologies of mass porcelain production), combined with the rise of peasant entrepreneurs, revolutionized city-based trade and industry, while changes in wet-rice technology fed larger and larger populations. The result was a rapid population increase (to 100 million by the 12th century and 150 million by the late 14th century) and intensified urbanization.

While the capital of Xi'an was China's only very large city during the Tang era, by the late 13th century a significantly greater proportion of Chinese people lived in cities (particularly the rising peasant entrepreneurs), and more than 10 cities had populations higher than 1 million. Hangzhou (the southern Sung capital and Yuan-captured city) had 4 million inhabitants. It was described by the Venetian explorer Marco Polo (1254–1324), who knew it as Kinsai, as having the traditional highly ordered Tang pattern of grid streets, Buddhist temple complexes, Confucian learning centers, and sprawling commercial zones, but on a particularly spectacular scale, teeming with abundant wealth and luxuries.

## KOREA

Beginning around 500 B.C.E. during the height of militaristic competition and economic growth among the Zhou feudal states in China and continuing through the establishment of the Han Dynasty in China, the Korean peninsula became enmeshed in Chinese exchange networks and political expansion. These contacts with powerful Chinese states and empires, combined with already growing social stratification and political complexity in Korean societies, set the stage for the emergence of early states and cities in the region by at least the second century B.C.E.

The pre-10th-century rise of cities is best exemplified in the history of the southeastern Korean city currently known as Kyōngju, established as the capital of a polity known as Saro in 57 B.C.E. It expanded to a city of nearly 1 million people during the ascendancy of the powerful kingdom of Silla before its ultimate defeat in 935 C.E. by the rising Koryo kingdom of northern Korea. Kyōngju emerged in the first century B.C.E. as a response to the Han Dynasty invasion and occupation of northern Korea and fears of military forays into the south. According to early accounts, Kyōngju consisted of a small palace complex with 21 buildings surrounded by a wall with eight gates that may have been the center of a polity of about 10,000 people. This legendary past is supported by wall foundations and large building foundations that may be dated to this period, as well as elaborately furnished graves with horses, bronze armor, and ornaments of gold, jade, and glass.

By the fourth century the small, legendary Saro polity had incorporated adjacent groups through conquest and emerged as the large Silla state centered at Kyōngju, one of three competing kingdoms (including Paekche to the southwest and Koguryo to the north) that dominated the Korean peninsula between about 300 and 668 C.E. The archaeological remains of the city in this period consist of three fortresses (the largest about half a mile in area), the foundations of numerous large structures, and dozens of huge, brick-lined earthen mound tombs, the largest 404 feet long and 75 feet high, scattered over an area of about 12 square miles. The tombs house what are clearly royal and noble burials.

Textual evidence indicates that the nonelite population of the city was divided into craft groups that produced at least 22 distinct classes of goods, including textiles, pottery, gold and bronze work, leather products, and jade items. It is not clear whether craft workshops were segregated in the city (since only a single pottery kiln site has been identified archaeologically) or whether the laborers lived in distinct residential zones by social class or profession, though burial tombs are clearly segregated by social rank. The enormous wealth in the tombs reflects both the sophistication of craft specialization in the state economy of Silla and its far-flung foreign trade interests overland through central Asia along the Silk Road or by sea via Southeast Asia and India. Silla was renowned for the gold bracelets, rings, and crowns it exported to other Korean kingdoms, China, Japan, and possibly more distant lands. A glass pitcher from the Roman world, a silver bowl from central Asia, and lacquer fragments, bronze vessels, and glazed ceramics from China provide evidence of Kyōngju's link to international commerce.

By the mid-seventh century the kingdom of Silla had established an uneasy alliance with the Tang Dynasty of China, which aided in its expansion through the conquest of the neighboring kingdoms of Paekche and Koguryo. Chinese cultural influence intensified, including the importation of Chinese writing systems, the large-scale adoption of Buddhism, and the implementation of Chinese concepts of bureaucracy and civic organization, all of which had profound effects on cityscapes like Kyōngju. Chinese ideals of city layout, function, and order were adopted, such as the establishment of a rectangular grid of streets, functionally discrete walled compounds within the larger walled city (including separate royal palace zones and housing areas divided by social rank), and the central predominance of royal and religious architecture.

The construction of Buddhist temple complexes on a grand scale was central to the growth of the city. One temple group known as Hwangyongsa, north of the gridded core of the city, included an enormous 96,000-square-foot pil-

lared temple, underground ceramic drains, and wide streets separating it from other ritually significant buildings. These included a stone Tang-style pagoda, a unique bottle-shaped structure, and a star-gazing pavilion that is the oldest standing astronomical observatory in Asia. Archaeological excavations also have revealed several palace compounds that probably housed the Silla kings, including one with five pavilions, elaborate gardens that surrounded the artificial Anapji Pond, and broken wine cups, the remains of wooden boats, and gaming dice, indicating the pleasures of palace life. According to texts, the non-kingly aristocracy also maintained elaborate households with tiled roofs and enclosed courtyards within the city as well as large, walled country estates worked by thousands of peasants and slaves, which formed a second tier in the settlement hierarchy.

The later medieval period (ca. 1100–1600) saw significant warfare with and influence by external powers such as the Mongol Yuan rulers of China and the newly reunited imperial Japan. These developments led to increasing international trade and monetization of the economy, the rise of a nonelite mercantile class, generally greater wealth disparities among the social strata, and a fading of Buddhism in favor of Confucian ideals. Urbanization grew dramatically because of the external threats, the increasing use of technology in agriculture and resultant displacement of human laborers, and the commercial opportunities in cities. The structure of cities reflected these changes: The once-dominant Buddhist architecture gave way to large commercial zones, ostentatious displays of wealth in nonaristocratic households, and the incorporation of foreign styles in architecture and city layout.

## JAPAN

Japan's trend toward urbanization and the formation of cities is strongly tied to trade and cultural contacts with China and Korea in the early first millennium C.E. This is not to say that Japanese societies had no previous trajectory toward socio-political complexity, population growth, or concentration in large settlements. The first Japanese states and cities emerged just after the Yayoi Period (ca. 300 B.C.E.–300 C.E.), characterized by the coalescence of population into large fortified towns, the emergence of social stratification as manifested in elaborate moated and mounded tombs, and the sophisticated production of bronze and other prestigious goods.

Fujiwara (built in 694 C.E.) and P'yōngyang (built in 710 C.E.) in the Nara basin are considered the first cities in Japan, constructed as capitals of the Yamato state that emerged near the beginning of the Kofun Period (300–737 C.E.). Before this time the Yamato kings ruled from a series of scattered fortified palaces that were primarily administrative and ritual centers lacking the diverse population and economic activi-

ties generally associated with true cities. By this period the Yamato kings and other aristocrats had long ties to the Tang court, which had resulted in the importation of Buddhism, Chinese writing systems, a culture of horse-riding warrior-aristocrats wearing Chinese-style armor, and Chinese concepts of state administration and city planning. Therefore, it is not surprising that these early cities tended to replicate the Tang capital of Xi'an but on a considerably smaller scale. Fujiwara, for example, covered an area of 2 to 3 square miles and had an estimated population of 30,000.

Like Xi'an, Fujiwara was laid out in a grid system of streets that segregated the city into neighborhoods and administrative units, with a walled royal palace complex in the northern-central sector of the city featuring the king's residence, administrative buildings, and audience halls. These were built of nondurable wood, but their foundations and the remains of their clay tile roofs are archaeologically visible. Japanese cities like Fujiwara, however, did not follow the Tang practice of protecting the outer city with defensive walls, presumably owing to the absence of foreign predators. Aristocratic residences that contained high-status goods, one covering an area of 130,000 square feet, were situated close to the central palace complex wall, while more modest dwellings of commoners, craft-production workshops (for metal, ceramics, bone, and textiles), and at least two markets (using minted coinage) were located nearer the city's periphery. Large Buddhist temple complexes were situated both inside the walled royal center and in several places within the city. The Yamato administrators solved the problem of waste disposal in the crowded city by constructing simple latrines that emptied into ditches along the sides of streets, but maintaining health in the population was a continuing challenge, as evidenced in archaeological finds of parasite eggs in the soil of the latrines.

In the Heian Period (737–1185 C.E.) the Nara Basin state expanded to incorporate groups to the north and south on the island of Honshū to form an empire, ushering in a 400-year period of relative stability and the flourishing of traditional Japanese aristocratic court culture before the rise of feudal warrior (shogunate) rule in the late 12th century. The new capital of Heian-kyo (present-day Kyoto) rigidly followed the city-design precepts of Fujiwara, featuring gridded streets, a walled royal center, mansions for nobility close to the royal center, state-controlled market and production zones, and Buddhist temple complexes, but on a much grander scale; the city covered around 10 square miles and housed about 100,000 people, of whom about 10 percent were noblemen-administrators.

The capital city became first and foremost the center of an aristocratic culture that became a lasting symbol in con-

temporary times of all that is uniquely Japanese: The development of certain formulaic poetic styles and fictional literary canons, forms of writing and painting, spiritual and ceremonial practices derived from Buddhism, ideas about gender relations, and an idealization of the warrior spread outward from the polity center at Heian-kyō. However, the increasing diffusion over time of once-absolute imperial power to court administrators who amassed private estates outside the capital, coupled with the rise of independent militarized bands led by warlords in the frontier regions, soon led to a complete refiguring of the political order and urban landscapes by the 12th century.

Between the 12th and 16th centuries, the period known formally as the medieval age in Japan, the weakened imperial court survived but was eclipsed by independent warlords (shoguns) with only nominal allegiance and obligation to the emperor. While an aristocratic dominance of the social order persisted in the form of shogun leaders, nonaristocratic warriors (*bushi*, or samurai) and, to a lesser extent, merchants and commoners moved for the first time to center stage in Japanese culture and urban life. Large-scale cities like Kamakura, Kyoto, and Hakata of 200,000-plus inhabitants developed outside the imperial capitals. These cities retained some elements of traditional city planning but were focused less on aristocratic housing and imperial administration and more on commercial activities. Guilds of merchants under the protection of shoguns or other powerful authorities traded in specialized commodities such as salt, oil, paper, silk, or lumber, and both sanctioned ships and Japanese "pirates" left ports for China, Korea, and parts of Southeast Asia.

Another important element of the settlement landscape were the hundreds of so-called castle-towns centered on the large, heavily fortified, multistoried palaces of feudal shoguns and lesser-ranked warlords. European missionaries and merchants who entered Japan in the 16th century were astonished by the scale, architectural complexity, and lavishness of the wooden castles, which were often five to seven stories high and surrounded by walls 30 to 50 feet tall. These small cities in themselves also contained the mundane houses and commercial establishments of the peasantry whose economic livelihood depended on the protection and patronage of their warlords. At the end of the 16th century Togugawa Ieyasu (1543–1616), the third of three feudal warlords who reestablished a unified Japan through the military conquest of the more than 250 warring fiefdoms, ushered in the modern era of Japanese history. He established his new capital, in a symbolic nod to the warrior ideal, at the fortified castle of Edo on the site of what is modern Tokyo.

## SOUTHEAST ASIA

Southeast Asia contradicts the notion that cities and urbanism emerge only in regions with generally high population densities and in which kingdoms or states are the primary type of political organization. The earliest known cities for which there is archaeological evidence arose in Southeast Asia by about 200 C.E. and began to proliferate after the ninth century. Some emerged in rich, rice-growing river valleys, such as coastal Vietnam (various Cham polities of the third through the 14th centuries), the Mekong valley (the Khmer state of the ninth through the 15th centuries), the Chao Phraya plains of Thailand (the Dvaravati states of the fourth through the 10th centuries), and the fertile plains of Java (such as the Mataram of the 14th through the 16th centuries). Others arose in coastal locales strategic for maritime trade, such as the eastern coast of Sumatra (Srivijaya of the seventh through the 11th centuries) and the smaller islands of the eastern archipelagos (such as the cities of Majapahit on Java, Manila and Jolo in the Philippines, Ujung Pandang on Sulawesi, and Ternate on Maluku in the 13th through the 16th centuries).

By around 1200 C.E. and certainly by the time of European contact in the 16th century Southeast Asian cities tended to be larger in both population and area than most European ones, with Thang-long (Vietnam), Ayutthaya (Thailand), Pegu (Myanmar), Melaka (Malay Peninsula), Ujung Pandang (Sulawesi), Brunei (Borneo), Mataram (Java), and possibly other cities reaching populations at least in the range of 100,000 to 200,000 and covering areas between 4 and 15 square miles. Urban population densities often averaged more than 50,000 people per square mile, and more than 20 percent of the population lived in cities, making Southeast Asia one of the most urbanized regions of the medieval world. By contrast, rural populations outside the centers were surprisingly low, with an average of 15 persons per square mile for the region, approximately one-fifth that of China and Japan, one-third that of Polynesia, and one-half that of Europe. This was due to an agricultural emphasis on low-labor swidden farming of mixed tropical crops and only occasionally high-labor wet rice. The resultant highly urbanized but generally low-density kingdoms were supported through foreign maritime trade and plentiful lands for both intensive and nonintensive agriculture.

In Southeast Asian states that adopted Hindu, Buddhist, and later Islamic religious ideologies, cities were dominated by sacred architectural complexes at their core, but large-scale walls and fortifications, secular palace structures and elite residences, specialized craft-production and market zones, housing for foreign traders, and large water-management facilities were also an integral part of most urban landscapes. The pow-

*Standing female divinity (Angkorian Period, Cambodia, 12th century); this sculpture is from the Angkor region, the seat of the Khmer Empire centered in the spectacular city of Angkor. (Arthur M. Sackler Gallery, Smithsonian Institution, Gift of Arthur M. Sackler)*

erful Khmer state coalesced along the middle Mekong River in Cambodia in the ninth century out of warring regional chiefdoms and lasted for 600 years until its defeat by a rival Thai kingdom in 1431 C.E. Khmer was centered for most of its existence at the spectacular city of Angkor. At its height in the 12th century the city covered more than 10 square miles and had an estimated 500,000 to 1 million residents. The city was dominated by a series of walled temple complexes and kingly mausoleums built in elaborately carved stone by successive rulers as potent symbols of power. These initially manifested devotion to the Hindu cult of Shiva in the early dynasties and eventually reflected a religious shift to Mahayana Buddhism.

The largest and most elaborate of the more than 60 temples at the site was the Angkor Wat temple complex built by

the Cambodian king Suryavarman II (r. ca. 1113–50) shortly after his ascent to power. An outer wall of 4,900 feet by 3,900 feet and a moat 650 feet wide surrounds a second inner wall encompassing raised terraces, Hindu-style buildings with low-rise pillars, and a central sandstone temple monument with five lotus-bud-shaped towers soaring up to 215 feet above the ground. The inhabitants took advantage of the adjacent Tonle Sap Lake to build an elaborate system of reservoirs, canals, and moats, probably to control flooding and to irrigate large-scale rice fields. One reservoir held an estimated 2 billion cubic feet of water.

While archaeological work has been limited in nonelite residential and commercial areas of the city, dense scatters of broken ceramics, metal fragments, and other household goods suggest that the city housed sizable populations engaged in craft and trade activities. This is supported by Khmer inscriptions and carved bas-relief murals on the walled royal complexes that depict not only kings in royal processions and military battles but also women selling fish and other products at markets, metallurgists and other craftsmen, royal warehouses, tax collectors, and a variety of foreign merchants, providing evidence for an economically vibrant and socially diverse city.

Island cities of the same period in Southeast Asia were organized similarly around the state control of religious, social, and economic matters, but they often were constructed of perishable wooden materials and less tightly compacted. With an economy fueled heavily by foreign maritime trade rather than intensive agriculture or the internal production of luxury goods, cities like Melaka (Malay Peninsula), Ujung Pandang (Sulawesi), Mataram (Java), and Manila (Philippines) were very large capitals of branching regional settlement systems with relatively sparse and ethnically diverse populations in their hinterlands. In 1511 Islamic Melaka (which strategically controlled the narrow straits funneling trade between the Indian Ocean and South China Sea) was a cosmopolitan city of about 200,000 with a spectacular series of mosques, a walled royal core (with buildings for housing royal elephants, storing artillery, and receiving foreign dignitaries), and walled estates for the thousands of wealthy foreign merchants who lived semipermanently in the city. Among the maritime trading polities of the Southeast Asian islands, even those that were not bureaucratically complex enough and too small in total population to be classified as states (such as Sulu, Magindanao, and Manila in the Philippines) were concentrated in substantial fortified cities, suggesting that *states* and *cities* are not necessarily synonymous.

## PACIFIC ISLANDS AND AUSTRALIA

Since Australia was inhabited by small-scale, mobile hunter-gatherer bands throughout its precolonial history, it is not

relevant to the discussion of medieval cities and urbanization in the region. Among the Pacific island societies the archaeologically and historically known chiefdoms of Hawaii, Tonga, Samoa, Tahiti, New Zealand (the Maori), the Marquesas Islands, and Easter Island (the Rapa Nui) reached their zeniths between 1200 and 1800 C.E. Although the political boundaries of the multiple chiefdoms in these island archipelagos shifted dramatically over time according to the fortunes of interpolity warfare and the political ascendancy of powerful chiefs, polities with populations ranging between 20,000 and 100,000 were not unusual, well within the range of necessary population densities to create cities.

The richest island archipelagos supported total populations in the hundreds of thousands; Hawaii is estimated to have supported 250,000 to 500,000 people at European contact. Centralized economies on some islands included specialist craft production, prestige-goods wealth, tribute or tax collection, and *corvée* labor (a tax payable in the form of labor to the state). Despite frequently high population densities, a high degree of social stratification, centralized economies, and political organization on the level of complex chiefdoms or even incipient states, the societies of the Pacific islands had no cities by modern definition. Ecological diversity and an economic reliance on resources adapted to different microenvironments such as fish, root crops, wild forest products, and domesticated pigs and fowl meant that the concentration of populations in large urban centers was impractical.

Most noticeable on the settlement landscape of these island societies are ceremonial and political complexes known as *marae* in Tahiti, *tohua* in the Marquesas Islands, *heiau* in Hawaii, and *ahu* on Easter Island. These stone-faced, earthen platforms or walled courtyards with statuary (such as the enormous heads of Easter Island) and perishable wooden structures served as ritual centers, places where chiefs resided and were buried, and symbols of political authority in the region. At Mu'a on the island of Tongatapu in the Tonga archipelago is one of the largest of these complexes, built by paramount chiefs of the Tui Tonga Dynasty around the 15th through the 17th centuries. The Mu'a complex includes an earthen ditch and bank enclosure measuring 1,300 by 1,600 feet that encompasses numerous raised house platforms for chiefs, other nobility, and priests; a large open space and stone arrangements associated with ritual; stone-faced stepped earthen mounds for elite burial; and other, more irregularly shaped mounds that may have been used for elite amusements, such as bird shooting.

Among the Maori of New Zealand more than 4,000 sites known as *pa* began to appear around 1300 to 1400 C.E. These sites ranged from one-quarter acre to 125 acres in size, were often fortified by ditches and wooden stockades, and were

frequently located on defensible hilltops. These defensively fortified sites on the northern island have yielded evidence of a limited number of habitation structures housing a subset of the population (probably the chiefly nobility) and large subterranean pits for the long-term storage of yams or sweet potatoes, a staple crop for the Maori.

In all these cases the ceremonial and political centers appear not to have housed the population of commoners and may not even have been occupied full time by the chiefly elite, who moved frequently throughout their realms to collect tribute and strengthen their political coalitions. Rather than being concentrated at a geographic center, craft production, trade, collective labor for subsistence, and many political and religious activities took place at widely dispersed villages throughout a chief's domain. Therefore, the complex societies of Polynesia never underwent an urbanization process, and cities were not part of the settlement landscape.

## EUROPE

BY JOHN SODERBERG

The division between Roman and medieval cities is clearly marked in popular imaginations, with medieval people living among the ruins of amphitheaters and aqueducts. Historians and archaeologists, however, have found almost as many paths between the two periods as there are regions of Europe, some confirming the popular image and some confounding it. Whether a city endured, collapsed, or grew on fresh ground, however, every medieval European city provides insights into the workings of the society that fostered it. Inhabitants of cities in any period confront the same problem: how to get food and other necessities into a place too densely populated to produce them locally. Town dwellers must form links with increasingly unfamiliar and distant people to obtain necessities and luxuries. As the Roman-era social structures giving life to those links faded, new relationships had to be created with hinterlands and with the wider world.

Defining what constitutes a city is a perennial problem. Early scholars assembled lists of features a settlement must possess to qualify as urban. As more and more urban sites were found to lack some criteria, scholars adopted more flexible definitions of what a city is and shifted their attention to understanding what motivates people to live in crowded conditions. One important thread of explanation emphasizes a growing centralization of power. One theory of the Roman Empire posits that in many areas it did not collapse but instead withered into the hands of local elites, who used the remains of its institutions to consolidate control. Some scholars have found explanations relying solely on elite power unsatisfying and have emphasized that cities embody challenges to

central authority as much as instruments for its development. From that viewpoint cities become what have been called "arguments in stone." Their remains provide a glimpse of the many tensions that ran through societies.

## BYZANTIUM

The Byzantine Empire grew out of the division of the Roman Empire in the fourth century C.E. Constantine (272–337) transformed the former Greek colony of Byzantium into his new capital of Constantinople, which occupies a strategic location on a peninsula in the Bosphorus, the straits connecting the Black Sea and the Aegean Sea. Constantine imported art and building materials from around the empire to create his new capital. The new city, consecrated in 324, was rebuilt and expanded considerably over time.

Constantinople is a testament to the entwined processes of continuity and change leading from antiquity to the medieval era. In some respects the city exemplifies continuity. Constantinople benefited from the quintessentially Roman urban amenity: a robust water supply that brought water from as far as 150 miles to feed underground sewers, fountains, massive cisterns, and baths. By the seventh century, however, most public baths had been shut down and turned to other uses. Similarly, Constantine brought the practice of *annona civica* (free distribution of bread baked in city-owned ovens) from Rome when he founded the new capital, but in the seventh century, after the provinces that produced most of the grain were lost, the practice ended.

Perhaps the most striking evidence of change is in the layout of Constantinople. Unlike traditional Greek and Roman cities, which were centered on a forum or acropolis, the focal point of the new city was the imperial palace. Much of the earlier city was cleared for its construction. From the palace the emperors could enter their box at the Hippodrome, a 60,000-seat arena for chariot races. The Hippodrome also provided a stage for the emperor to appear before and be confronted by the populace. As a testament to their importance to civic life in Constantinople, the horse races ran up until the 12th century, long after many Roman-era institutions had faded.

Streets were major features of civic life in Constantinople. The best known is the Mese, which was paved with marble blocks and lined by porticoes and sidewalks where commerce of all sorts occurred. At regular intervals, streets opened into forums and plazas that held triumphal arches and monumental statues. The major streets of Constantinople were wide and straight and had underground sewers. But minor streets, those leading to the homes of much of Constantinople's population were often narrow, winding, and unpaved. The size of the city's population varied considerably over time. Estimates

are that by the early sixth century the city held half a million people; however, following plagues and attacks in succeeding centuries, the population appears to have dropped below 100,000 by the early eighth century. The city saw a resurgence from the turn of the millennium to the 13th century, when the population again declined.

In addition to its role as the political center of the empire, Constantinople served as a crucial center of medieval Christianity. As with most medieval cities, churches and monasteries were spread throughout various sections of town; however, the ecclesiastical landscape was dominated by Hagia Sophia (Church of the Holy Wisdom of God), located northeast of the palace. Considered among the greatest achievements in medieval architecture, Hagia Sophia was originally built at the behest of Justinian I in 537. The enormous central dome is its most stunning feature. Resting 184 feet in the air, it is entirely encircled at its base by 40 windows, making the dome appear to float.

Outside Constantinople the transition from antiquity to the medieval period had dramatic consequences for cities. In antiquity the essential concept of a city was the *polis* (Greek) or the *civitas* (Latin), notions that emphasize the role of the city as the political, religious, and cultural focus of a region. More practically, cities in the Roman Empire were self-governing in many respects and were responsible for the collection of taxes. From the late fourth century the independence of Byzantine cities declined as administration was increasingly taken over by officials of the central government and wealth diverted more and more to Constantinople. With the invasions of the seventh century many cities became little more than places of refuge, often encompassing less than 1,000 square feet. Military and administrative roles became paramount.

## WESTERN MEDITERRANEAN

In Byzantium urban merchants played a relatively minor role in maintaining social order and shaping urban development. By contrast, on the Italian Peninsula merchant aristocrats dominated the development of cities. From the fifth century bishops rose to leadership of many towns and extracted concessions from secular aristocrats, leaving most cities largely independent. But as their wealth grew, merchants began to assert control over town government. From cities like Venice and Genoa merchants fueled the development of expansive trade networks that connected western Europe, Byzantium, and Islamic North Africa.

The most powerful of these regional principalities was Venice, which began as a set of settlements on islands in the Venetian lagoon. The sixth-century writer Cassiodorus commented that Venetians lived like aquatic birds, and the city

remains famous for its canals. In the Middle Ages the central thoroughfare, the Grand Canal, was kept wide enough for a 200-ton ship to pass. Economically, Venice began by primarily producing salt and exporting trade goods from the Italian interior. In the early medieval period a doge (duke) elected from among prominent families of the Rialto (Venice's chief island) ruled Venice. Beginning in the 12th century an oligarchy ruled the city. The source of Venice's economic might was the system of trade contacts throughout the Mediterranean. By the 11th century Venice essentially controlled trade between Constantinople and the western Mediterranean. With the Crusades, Venice established trade colonies around the Mediterranean, including the North African coast. By 1300 the population was roughly 100,000. The center of the city was the doge's palace, a central piazza, and a campanile (bell tower) whose lights served as a beacon.

While Venice had little in the way of a legacy from the classical era, Rome's ancient legacy was essential to its medieval development. Following the shift of the imperial capital in the fourth century, Rome entered a period of dramatic decline. Its population was about 500,000 around 400 C.E. and a tenth that size by 700 and through the Middle Ages. Studies of ceramic assemblages have shown that while various types of imported pottery were prevalent to the end of the seventh century, during the eighth century locally produced pottery became prominent. The area around the Coliseum became known as the *campo vaccine* ("cattle field").

During these same centuries, however, the emergence of Rome as the center of western Christianity lent it a new significance both as a physical settlement and as a symbol of the combined achievement of antiquity and the Middle Ages. The admiration for Rome's past and its 12th-century present is colorfully displayed in the text *Mirabilia urbis Romae* (The Marvels of Rome), which describes the emperor Augustus receiving a vision of the Virgin holding the infant Jesus. Similarly, but earlier, Pope Boniface IV (608–615) rededicated the Pantheon, a gem of classical architecture, to the Virgin Mary. These activities fostered the notion of *Roma aeterna*: the pinnacle of civilization destined to endure. While such ideas might seem peripheral from a purely economic view of cities, they were enormously significant for shaping how medieval populations thought of cities and society as a whole. In the seventh century, as far away as Ireland, a monk named Cogitosus used the phrase "little Romes" to describe Irish monasteries with aggregated settlements.

Constantine's elevation of Christianity is evident in the Lateran Basilica. Previously, Christian worship had been held in *titulae*, privately owned buildings and domestic spaces. The basilica, a large public hall for transacting business, was central to the life of Roman towns. The Lateran Basilica adapts

the form to Christian worship, reflecting the changed position of Christianity following Constantine. While the Lateran area continued as the official papal center, from a very early date Saint Peter's grave, on the Vatican Hill, became a center of devotional activity. The basilica was first completed in 329, similar in form to the Lateran Basilica, except that it had a transept inserted between apse and nave.

By the ninth century Saint Peter's became the most significant locale in western Christendom, attracting huge numbers of pilgrims. To serve their needs, a substantial settlement grew up around the basilica, including hostels for pilgrims, monasteries, and a poorhouse. Leo IV fortified the area with a wall in the mid-ninth century, creating the Leonine city (*civitas Leoniana*). In the 11th and 12th centuries, fueled in part by serving the needs of pilgrims, the area became a thriving commercial and tourist area known as the Borgo. In the 13th century papal residences were expanded and rebuilt, further shifting the center of gravity toward the Leonine city.

The core of medieval Rome was known as the Abitato. In the 11th and 12th centuries the vitality of the Borgo drew settlement toward the riverbank and the Ponto Sant'Angelo, the only link across the Tiber to Saint Peter's Basilica. Competition between the settlements became sufficiently intense that innkeepers of the Borgo attempted but failed to establish a monopoly. From the 12th century on an increasingly large portion of the Abitato became densely settled, with narrow winding streets. Aside from the Lateran and Leonine settlements, the outskirts of Rome, also known as the Disabitato, were sparsely settled with farmhouses and mansions until the 12th century, when villages and fortified houses multiplied.

Three groups vied for control of Rome: popes, emperors, and local aristocrats. As was the case in much of Italy, during the sixth century bishops gradually became the primary civil authorities in Rome. The bishop of Rome became responsible for provisioning the city and paying the salaries of troops. The independence of Rome and its bishop grew over time, with Charlemagne defining territory under the pope's control in 781. In the 11th and 12th centuries, with the growth of pilgrimage trade and other commercial activity, Roman families became more powerful. Their increasing power is demonstrated in the construction of hundreds of towers in the city. In 1143 they rebelled from papal authority and refounded the senate as the Roman Commune in the center of ancient Rome: the Capitoline Hill. While the Commune lasted only until 1188, it established local families as significant players in city governance for the rest of the Middle Ages.

The Roman Empire was not alone in being split into eastern and western portions. Significant areas of Mediterranean Europe were in Islamic control during the Middle Ages. The

## YORK, ENGLAND

The city of York in the north of England had been the Roman city of Eboracum, visited by the Roman emperors Hadrian, Severus, and Constantius. In 314 a bishop from York went to the Council of Arles, the first representative council of bishops of the Western Roman Empire. The Saxons who arrived more than a century later continued the Roman traditions, converting to Christianity. By the eighth century the city had become a place of such great learning that the scholar Alcuin, the head of the cathedral school of York, was hired by the Frankish king Charlemagne to run the palace school in Aachen.

In 866 the Vikings captured the city. During the Viking period the city changed greatly, with large numbers of Scandinavian migrants settling in and around York, such that when the king of Norway, Harald III Sigurdsson (known as Harald Hadrada), embarked on his invasion of England in 1066, he chose York as the place to launch his attack. He expected to receive much support from the locals. He was, however, defeated and killed at the Battle of Stamford Bridge, and three years later the city was devastated by a fire. The Normans then planned a new city, which covered 263 acres and included within its walls 40 churches, nine chapels, four monasteries, four friaries, 16 hospitals, and nine guildhalls for trade and fraternity guilds. The raising of sheep on the moors around York became a major agricultural occupation, making the city prosperous as the center of the north English wool trade.

history of cities in those areas differs significantly from those discussed so far. In fact, rather than wither, Spanish cities such as Córdoba and Seville flourished. Following the establishment of the caliphate, which ruled most of the Iberian Peninsula and North Africa from 929 to 1031, Córdoba became one of the most magnificent cities in medieval Europe. The mosque of Córdoba, begun in the late eighth century and extended through the 11th century, is often compared to Constantinople's Hagia Sophia as a primary achievement in medieval architecture. Whereas public baths fell into decrepitude elsewhere in Europe, medieval Córdoba maintained hundreds. The population of Córdoba in 1300 is estimated at 250,000. In the 13th century the caliphate broke into constituent kingdoms, and Christian kingdoms to the north began taking control of the Iberian Peninsula.

As in Rome, pilgrimage had a significant impact on cities of the Iberian Peninsula, particularly from the 12th century. Although it was not a major population center, Santiago de Compostela was an enormously significant spot in the imaginative landscape of medieval Europe because it became the end point of a network of pilgrimage routes through France and Spain. Construction of a Romanesque cathedral was begun in 1076, designed in part to accommodate large numbers of pilgrims, and a pilgrim's hospice was founded in 1104. The *Codex Calixtinus* (a 12th-century text also known as *Liber sancti Jacobi*, or the Book of Saint James) describes vendors in the courtyard next to the cathedral selling scallop shells (insignias of Saint James), wine flasks, medicinal herbs, and other items. Moneychangers and innkeepers also worked the area. Estimates are that the population of Santiago de Compostela grew from 1,500 at the beginning of the 10th century to 6,000 by 1300. The Black Death, the Avignonese papacy (a prolonged period of crisis in the Catholic Church), and other turmoil in the 14th century took a toll on the town and the stature of its bishop, though pilgrimage remained significant through the Middle Ages.

## NORTHERN EUROPE

Northern Europe provides ample testament to the various paths taken from the ancient to the medieval world. Autun, originally a Roman provincial capital, maintained a Roman-era distinction between the fortress as a *castrum* (land or building reserved for military defense) and the outer settlement as the *civitas* (land owned by the civil government) well into the Middle Ages. Emporia, by contrast, appear on fresh ground. These trade settlements have been important in overturning views of northern Europe as composed of agricultural, isolated, and self-sufficient groups. Birka is one in a sequence of aggregated settlements on Lake Mälaren in central Sweden. At its peak in the 10th century Birka had a population of 500 to 1,000 individuals.

The settlement had stone jetties. As isostatic rebound—the rise of landmasses after glaciers retreat—caused the shoreline to recede, settlement expanded into the new land, and the jetties were extended. Excavations have produced evidence of large-scale manufacturing with bone, antler, leather, metal, and other materials. At Birka 3,000 graves are known, including two distinct groups. One—cremations interred under mounds—is typical of Sweden in this period. The other—burials in coffins and chambers with sumptuous grave goods, such as swords, brooches, textiles, and other imported valuables—is thought to reflect either the burial of foreigners or the adoption of new customs by inhabitants of Birka. Emporia also are associated with exotic trade items. Excavations at Helgö, a predecessor to Birka, produced an

Irish crosier, a Byzantine silver dish, a Coptic ladle, and a Buddha figurine.

A royal manor on a nearby island is thought to have held sway over Birka. The association of many emporia with royal centers and certain features of their layout, such as fixed plot boundaries, have led scholars to see many emporia as products of royal initiatives to secure and enhance their grip on power by controlling long-distance trade. Recent studies, however, have emphasized the importance of local production and the integration of emporia with their surrounding landscapes.

In the 11th century, Sigtuna became the major town in Sweden's Mälaren Valley. But by the 13th century Sigtuna had lost its economic and administrative position to Stockholm. Such discontinuity of urban centers is common to many regions of northwestern Europe in the early Middle Ages.

Paris, which became the leading city of the former Roman province of Gaul, grew from a fortified settlement built around 280 on the Île de la Cité, one of two islands in the Seine. In the early medieval era, as the settlement grew, an enduring distinction appeared between the central fortified nucleus and suburban commercial settlements on the right bank of the Seine. Commercial settlements grew up around the Abby Church of Saint-Denis and other suburban monasteries.

While Paris was home to the Capetian Dynasty (987–1328) from its foundation by Hugh Capet, the city took its place as the primary city of France during the reign of Philip II Augustus (r. 1180–1223). He established a more permanent residence in the palace on the Île de la Cité, paved city streets, and built the Louvre fortress and city walls (still visible from a gallery in the modern Louvre museum). The city population rose to between 25,000 and 50,000 during his reign. By 1300 Paris had 200,000 inhabitants, making it the largest city in northern Europe.

Universities became an important component of city life beginning in the 12th century. Universities provided corps of trained clerics to keep up with the growing reliance on written records for ecclesiastical and secular administration. By 1250 Europe had approximately 25 universities, all in cities and all affiliated with the church. In Paris the Left Bank filled with students and teachers, hence the term Latin Quarter. By 1250 an estimated 10 percent of the city's population was students. In the 12th and 13th centuries the University of Paris became the most prominent institution of learning in Europe.

The incorporation of literate administrators and lawyers into court life also had important ramifications. The use of written records greatly increased the ability to rule at a distance, which in turn increased a sovereign's ability to reside in one location and heightened the logistical difficulty of moving a court from place to place. These changes spurred the development of Paris and other cities as capitals.

*Charter of King John, May 9, 1215, granting Londoners the right to choose a mayor* (© Museum of London)

Tensions among municipal, royal, and ecclesiastical authorities shaped the development of cities in the later medieval period. Throughout the Middle Ages royal and ecclesiastical lords became increasingly powerful, leaving them in control of the land on which much of the population lived. Although in many respects a town is an instrument of that process, a lord granting a charter to a town gave away at least some jurisdiction. Once on the landscape a town also created a population difficult to control.

One solution was to build a castle overlooking the town: an imposing alteration of urban geography that reflected and asserted power over a populace. One of the best known was built by William the Conqueror (ca. 1028–1087). After forcing London to surrender, one of his first actions was to order construction of the White Tower, the core of what became the Tower of London, and three other castles. William placed the White Tower in a commanding position in 1078, at the southeast corner of the city walls. A curtain wall and moat were added in the 12th century. In the 13th century the tower became a royal residence.

Another means of bringing towns under control—particularly those like London that had existed before the rise of feudal rule—was to create a charter stipulating rights for townspeople and defining the form of government. As often as not, however, a charter was only an opening gambit in an

ongoing struggle among royalty, ecclesiastical powers and various constituencies in a town.

A third method of gaining control of and profit from towns was to create new ones. From the 12th century thousands of “planted towns” were created. Land was set aside, and essential components of a town—such as castles, churches, streets, and marketplaces—were built. Then future citizenry were attracted to settle in burgage plots (lands owned by a king or lord but held by someone else), which would be held on a rental basis. Important concentrations were established in central and eastern Europe with the eastward expansion of German-speaking people and in western Britain and Ireland with the westward expansion of the Anglo-Normans.

An example of a planted town is Ludlow, founded around 1100 as part of a campaign to secure the Welsh borderlands. It contained a castle and fortified courtyards that overlooked the River Teme, with the borderlands beyond. The town had a regular street grid, and a town wall was built in the 13th century. The second charter of the town, dating to 1449, refers to a council of 12 alderman and 25 councilors, elected by burgesses of the town. The lord of the castle, however, retained rights that included holding the court of justice. In return for granting liberties, the lord gained rights to rents and taxes.

Although the economic and political programs associated with planted towns are of primary importance, they were also part of a more fundamental remaking of the cultural landscape in a manner similar to 19th century colonial endeavors. The archbishop of Pecham, for example, opined that the native Welsh could be civilized only by the planting of towns. Pecham’s vision drew from classical Roman ideas about the city, casting the town as the standard bearer for civilized values and practices. Ironically, native Welsh were excluded from being burgesses in 1295.

As urban merchants became increasingly wealthy, they challenged royal and ecclesiastical rule in cities, as happened in Rome and Santiago de Compostela. The nature and extent of the power that urban populations were able to acquire varied considerably from region to region. Similarly, the extent to which townspeople won freedom from feudal authority depended on the socioeconomic circumstances in a given area. But the stories of cities in the later Middle Ages turn on the vicissitudes of these relationships. Before the Norman conquest London was governed by a group of aldermen, each responsible for a section of the city. The aldermen resisted the imposition of royal control manifested in the building of the White Tower. By the 14th century town government was constituted as an elected mayor and council of aldermen elected by guild members (according to a disputed charter of 1319). Particularly in the late 14th century conflicts among guilds led to considerable conflict and rebellion in northern Euro-

pean cities. London was troubled by fishmongers and grocers vying with drapers for power in the 1370s and 1380s.

In addition to relations among guilds within towns, connections among merchants from various places was an important factor in shaping towns in the later medieval era. In central Europe guilds of merchants formed associations that fostered the movement of goods from city to city. The most important of these was the Hanseatic League, a trade federation that established a monopoly over much commercial activity in the Baltic and parts of the North Sea. In addition to fostering international trade and the socioeconomic relationships on which it rested, the Hanseatic League was important for fostering the autonomy of cities as its merchants amassed wealth and political leverage. The league had its center at Lübeck, in northern Germany on the River Trave. The town was an important Slavic capital centered on a citadel first built in 819. In 1143 the town was reestablished several miles upriver, though the basic form of the settlement echoes the earlier town with a castle, harbor and market settlement, and a foreign merchant settlement. The town boasted a water system composed of wood pipes, wells, and cisterns; sophisticated manufacturing of glazed ceramics; and a complex of large baking ovens that supplied oceangoing vessels. In 1227 Lübeck became a free imperial city, which meant that it was freed from local obligations and its officials reported directly to the emperor. Lübeck law allowed merchants to operate under the Lübeck city council in Baltic towns affiliated with the Hanseatic League. The Hanseatic League remained a significant force up to the 16th century.

The Flanders city of Ghent is an appropriate stopping point in a review of medieval European cities for at least two reasons. First, by the late Middle Ages, Flanders had become the most heavily urbanized portion of Europe, with city dwellers comprising 20 to 40 percent of the total population. Ghent and other Flemish cities were also sites of changes in production that prepared the way for the urban centers of the early modern period, when industrial-scale manufacturing became a key engine of growth and social change.

Ghent is located at the confluence of the rivers Scheldt and Lys. By the 10th century a manufacturing center and port had developed in the environs of the castle. Over time the commercial settlement gained considerable freedom from the count of Flanders, including property rights and concessions from tolls at local markets. The population grew quickly as Ghent became the chief Flemish center by the late 12th century, drawing in merchants from around Europe and raw wool from England. Wool was manufactured into cloth and exported throughout Europe. By the early 13th century wealthy merchants dominated the politics of Ghent, and less powerful craftsmen organized into guilds that were often in

conflict with the ruling *echevins* (aldermen), a tension in turn exploited by counts and kings. Ghent declined after 1300, partly because of the rise of the English cloth industry and partly because of the Hundred Years' War.

Through this rise and decline Ghent demonstrated the effects of the shift from a manorial to an industrial economy. In the early 14th century Ghent had 60,000 people, many of whom were originally drawn to the city as they gained freedom from the breakdown of manorial holds on tenants. *Stadt Luft macht frei* ("Town air makes you free") was a common saying of the time. For some the freedoms of city life yielded wealth and membership in a new patrician class, yet the town also imposed strictures, particularly for lesser merchants and those producing cloth. These tensions led to violence and rebellions in the 13th and 14th centuries.

## THE ISLAMIC WORLD

BY JUSTIN CORFIELD

During the medieval period the Islamic world covered most of the Middle East; North Africa; and, at times, much of modern-day Spain, Portugal, and eastern Europe. Islamic civilization had an impact on existing great cities such as Cairo, Damascus, and Baghdad and provided opportunities for the creative energy of the new religion of Islam to manifest in every aspect of life—medicine, science, philosophy, art and architecture, agriculture, and commerce. Aided by maritime and overland trade between Asia and Europe, there was also great wealth in the region.

Few of the cities in the Islamic world were founded during medieval times. Most were established centers of population—many operating since ancient times—located on rivers, in bays, or on caravan routes, and many of them had been enlarged during the late Roman and Byzantine periods. The result of the changing patterns of trade meant that some cities, such as Alexandria in Egypt and Sidon in modern-day Lebanon, declined. At the same time, other ports grew considerably, because of their proximity to major inland cities, such as the port of Jeddah (Medina and Mecca) and that of Acre (Jerusalem). Numerous new cities were established, many in modern-day Iraq, such as Baghdad and Mosul. The location of some cities (for example, Medina and Mecca) along caravan routes far from rivers was reliant on wells and occasionally their inhabitants had problems with water supplies in time of drought.

The wealth of the Middle East led to the considerable expansion of cities, and large numbers of cities outgrew the old Roman and Byzantine defenses and needed new ones. Many such cities were protected by defensive walls along rivers or the seafont and also along the landward side. Some of these

walls were used regularly to defend a city against attack, a threat that ensured that the defenses of the city would be well maintained. Some such defensive walls, however, were badly damaged through war or were allowed to crumble. By the end of the medieval period a number of cities had begun to decay, and a reduction in overland trade between Europe and China coupled with a general shift in trade routes to the sea led to significant changes. At the same time, there was a decline in the ability to irrigate fields to provide food for many of the cities, a problem exacerbated in many places by the depredations of the Mongols beginning in the 13th century.

### CONFIGURATION OF CITIES IN THE ISLAMIC WORLD

The dominant feature of all the cities of the Islamic world was the mosque in the city's center, typically surrounded by markets and trading areas. The minarets for the mosque dominated the city, and it was from the minarets that the faithful were called to prayer. (In the eastern part of the Islamic world—modern-day Iran, Afghanistan, Turkmenistan and Uzbekistan—the minarets atop the entrances were not used to call the faithful to prayer and are largely decorative.) Many survive to this day. The minarets varied widely, from larger structures, such as those of the Great Mosque at Samarra, in modern-day Iraq, to the more traditional and narrower towers of the Grand Mosque in Constantinople (modern-day Istanbul).

Islamic architectural traditions—arches, hemispherical roofs, and decorations with calligraphic script or flower forms—became common throughout the region, albeit with distinct local variations in style. These elements were used in many important buildings in cities throughout the Islamic world (apart from mosques), such as baths, gardens, public hospitals, bazaars and covered market places, domestic housing, and palaces. Most North African cities had medinas—areas of cities that were largely inhabited by Arabs—featuring terraced houses with plain fronts and with entrances leading into courtyards. Crucial to most of these cities during medieval times were also surrounding walls to protect from attack by European crusaders, other Muslim groups, or the Mongols. Outside the city walls large cemeteries were laid out. When some of the cities expanded, the cemeteries often served to divide the old part of cities, within the medina, from the newer parts.

### MAJOR CITIES OF THE MIDDLE EAST

In Arabia the major cities were Mecca and Medina, trading centers located along caravan routes near the Red Sea. Mecca was 45 miles inland from the port city of Jeddah, and Medina was about 110 miles inland. Indeed, Mecca had been a center

of commerce long before the birth of the prophet Muhammad. It was captured by the Umayyads in 692 and sacked by the Qarmatians (members of a Shiite Muslim sect known as the Ismailites) in 930. Medina (called Yathrib in medieval times) was the capital of the Umayyad Dynasty until they moved to Damascus in 661, leading to a decline in the importance of the city until the 19th century.

Elsewhere in Arabia were numerous other important cities. Jeddah, the main port, developed during the later medieval period as a stop for pilgrims going to and from Mecca. In the south of the Arabian Peninsula the city of Sanaa had been founded in ancient times on the plains between the mountains and the desert at the crossroads of several old caravan routes. With the advent of Islam in the early seventh century, the Great Mosque of Sanaa, al-Jama' al-Kabir, was built in the center of the city. Sanaa had been a walled city before the arrival of Islam, and subsequently the city was enlarged westward. The city suffered several floods, with one in 875 severely damaging the Great Mosque, which sustained further damage in 911 when Sanaa was attacked by the Qarmatians.

On the east coast of the Arabian Peninsula the city of Muscat occupied a strip of land along the Gulf of Oman. From the seventh century, many Arab seafarers preferred to use the nearby island of Hormuz in modern-day Iran, but from the ninth century Muscat began to regain some of its earlier economic power. Two forts were positioned on either side of the city, and the landward side of the city was protected by walls. The rapid increase in the popularity of the city and the safety it afforded meant that it was not long before many of its buildings towered over the city walls.

The city of Jerusalem was captured by the Arabs in 638, and although it was occupied by the crusaders from 1099 until 1187, it remained, in essence, an Islamic city. The city was dominated by the Dome of the Rock, which was constructed on Moriah, a hill in the eastern part of the city, beginning in 688. Christian churches and Jewish synagogues were permitted to remain, and worship continued in them until the end of the 10th century, when many were destroyed under the direction of the caliph Hakim. The brief crusader period saw the defenses of the city massively enlarged, but this did not prevent the Latin Kingdom of Jerusalem from being overwhelmed by the Seljuk Turks almost 90 years after it had been created. For most of the medieval period the city was also a center of pilgrimage for Christians and Jews—the former visiting the Church of the Holy Sepulcher and the latter the Western Wall. There are surviving written accounts by Christian pilgrims who visited the city throughout the medieval period. Numerous hostels in the city catered to them.

North of Jerusalem, the port of Acre had been a major trading center since ancient times and was captured by the Arabs in 636. They held it until 1110, when the crusaders took the city and made it their chief port in the Holy Land. They heavily fortified it with a double series of walls on its landward side for fear that a land attack was a far more serious threat than assault by sea. The city was able to control the bay, and Acre remained in the hands of the crusaders until 1187, when it was captured by Saladin after his victory at the battle of the Horns of Hattin. From 1189 until 1191 it withstood a siege, before being captured by Richard the Lionheart of England and Philip II of France and their English and French crusaders. Jerusalem was refortified, becoming the last outpost of the Latin East until May 1291, when it was captured by the Mamluks, whereupon it reverted to being a Muslim city. The changes during those centuries of fighting saw much of the city destroyed.

Farther north, in modern-day Lebanon, the cities of Beirut, Sidon, and Tripoli were prosperous ports from ancient times, with all being absorbed into the Islamic world beginning in the seventh century. With the rise of Islam came mosques, baths, and medical facilities throughout these cities, along with the establishment of large markets called souks.

Damascus, said to be the oldest continuously inhabited city in the world (and the capital of modern-day Syria), was a major city of the Islamic world. It had been a Christian city, having biblical connections with Saint Paul and also being the reputed burial place of Saint John the Baptist. Captured by the Arabs in 636, it was from 661 until 750 the seat of power of the Umayyad Caliphate, during which time the eastern part of the Cathedral of Saint John the Baptist was transformed into the Umayyad Mosque, with Christians allowed to worship during the seventh century and at various times afterward. The wealth from trade meant that artisans from surrounding areas came to live in Damascus, which quickly gained a reputation for its fine textiles and metalwork.

This prosperity attracted other groups. The Abbasids captured the city in 750, and in 1076 it fell to the Seljuk Turks; it also withstood attacks from the crusaders in 1126. The Mongols briefly occupied the city before the Mamluks from Egypt took the city in 1260. Soon afterward the architectural style of the city led to what became known as the Damascene style, and this rising level of affluence led to attacks by the Mongols for a second time. The Mongols under Timur (also called Tamerlane) captured it in 1401 and sacked the city. Strong defenses were thrown up around the Old City, located around the Umayyad Mosque. This central part of the city was bisected by a road known as the Straight Street, with many of the other paths being no more than alleyways between houses.

This walled city also had a citadel in the northwest corner. The northeastern part of the old city remained the Christian Quarter, and the southeastern part was the Jewish Quarter.

The ancient city of Aleppo, to the north of Damascus, was destroyed by the Persians in 611 and then captured by the Arabs in 637. In the medieval period the city was subject to attacks by the Byzantines, the crusaders, and the Mongols and also suffered from earthquakes. Unlike Damascus, the citadel at Aleppo sits on a hill east of the Old City, where the Great Mosque, al-Jamaa al-Kabir, is located. The citadel thus dominated the city, with its position ensuring that the Byzantines were unable to take it despite laying siege to it in 961 and again in 968. The importance of Aleppo lay in its site, which allowed it to serve as an important trade link between Europe and Asia as well as facilitate contact between Christians and Muslims.

Mesopotamia (present-day Iraq and Kuwait) became the political center of Islamic civilization. The city of Baghdad (meaning “gift of God”) on the Tigris River was founded by the caliph al-Mansur in 762 as the new capital of the Abbasid Dynasty (749–1258), and soon the city was the center of Islamic civilization. Built around previous settlements from the period of Achaemenid Persia (fourth to sixth centuries B.C.E.), the city represented a blend of Persian and Hellenistic traditions. It was not long before many traders, mostly Muslims but also Jews, came to settle in the city, and it subsequently becoming a global commercial center all over the Middle East, with links to eastern Europe and even Scandinavia and eastward to India and the Far East. When the city fell to the Seljuk Turks in 1055, its importance declined considerably. In 1258 Baghdad was sacked by the Mongols, and in 1411 it was taken by the Turkomans.

Other cities in the region included Mosul in the north and Basra to the south. Mosul, founded by the Sassanids, probably on the site of a former Assyrian fortress, in the third century, became a Christian center briefly before being captured by the Arabs in 641. By the 10th century Mosul was widely known as an important center for textiles. It rose in importance when Zangi, the Seljuk governor of Mosul, used it as a base for attacks on the crusaders in the 1130s and early 1140s but declined after being attacked and sacked by the Mongols in the 13th century. Basra also was founded during early medieval times, growing from a military camp established in 637 and gradually attracting the nearby Bedouin tribes.

In Persia (modern-day Iran), the cities of Isfahan, Shiraz, Tabriz, and Yazd were also important in medieval times. Isfahan was only a provincial center when it was captured by the Seljuk Turks in 1055. Under their rule a flourishing trade began in the production of carpets, but in 1222 the city was sacked by the Mongols and did not recover until the end of

the 13th century. By contrast, Shiraz, which had declined after the Arabs captured the city in 747, rose in importance under the Buyids from 945 to 1055 and survived the expansion of the Mongol empire, building up a tradition for literature and art, especially the painting of miniatures.

Farther east, in modern-day Afghanistan, the cities of Herat, Qandahar, Ghazni, and Kabul (captured in 664) were also important centers of the Islamic world, all being located on caravan routes. They were seldom visited by many people, however, owing to their relative remoteness, with the possible exception of Herat, which was closer to the main caravan route from Baghdad to China. Separate routes into India induced more people to pass through Kandahar, and the Silk Road and that trade route were soon connected by another caravan route from Kabul through Ghazni to Kandahar. By contrast with the Afghan cities, those of Samarqand and Bukhara (both captured by the Arabs in 710) and Tashkent in central Asia all lay along the Silk Road from the Middle East to China, where trade in silk and other precious cloth took place. All these cities acquired a distinct Muslim countenance, with the erection of mosques, markets, palaces, and fortified garrison posts.

### CITIES OF ASIA MINOR AND THE BALKANS

In Asia Minor the Seljuk Turks captured many Byzantine cities that lay astride the Silk Road, such as Konya, which became the capital of the Seljuk Turkish sultans of Rum. Many, such as Smyrna (Izmir), were attacked by the Arabs, Seljuk Turks, Genoese, crusaders, Mongols, and Ottoman Turks, resulting in major destruction to the city's infrastructure.

In 1453 the Ottoman ruler Mehmed II captured the city of Constantinople, which effectively marked the end of the thousand-year-old Byzantine Empire (also called the Western Roman Empire). The city then became the capital of the Ottoman Empire, from which the empire further expanded into the eastern Mediterranean and the Balkans. Mehmed II set about bringing the city into the Islamic fold. The most noticeable immediate change was the conversion of the Hagia Sophia, formerly a basilica, into a mosque.

In the 14th and 15th centuries the Ottomans conquered large parts of the Balkans and transformed many Byzantine cities there into Islamic ones. In 1371 the Bulgarian czar Ivan Shishman became a vassal of the Ottoman sultan Murad I, and the Ottoman Turks took Sofia in 1382. Bosnia became a part of the Ottoman Empire in 1463, and the rebellion of the Albanian Christians came to an end in 1468. This led to Ottoman domination of the region, with mosques and civic and administrative buildings erected in Sofia, Sarajevo, Mostar, Durrës, and other cities in the region. In most instances mosques were built in the center of cities where churches had stood.

### AFRICAN CITIES

The great cities of Egypt, Cairo, and Alexandria saw dramatic changes as they were transformed into Islamic cities. Alexandria, built in ancient times, was conquered during the seventh century, but its importance and also its population ebbed with the enlargement of the nearby port of Rosetta, which had access to both the Mediterranean and the Nile. But the biggest change was the shift of power to the city of Cairo, 50 miles up the Nile. This shift made Cairo the major city in the region and one of the most important in the Islamic world. There was also a gradual shift of power within the city itself, with the new Islamic heart set on the east bank of the Nile at the al-Azhar Mosque, constructed starting in 970. Nearby, the Mosque of Sayyidna al-Hussein is the reputed burial place of al-Hussein, the grandson of the prophet Muhammad. Cairo later came under attack from the crusaders and others. At the center of the al-Azhar Mosque, the sultan Saladin began building a citadel in 1176, which later became a palace used by the Mamluks.

Farther east the main Islamic cities in North Africa were Tripoli in modern-day Libya, Tunis and Kairouan in present-day Tunisia, and Algiers and Constantine (Bone) in modern-day Algeria. The prosperous ancient city of Cyrene was largely deserted during the medieval period, and Benghazi also saw a loss in importance with the emergence of such ports as Ajdabiya. The Arab city of Tripoli sits on a rocky point overlooking the Mediterranean. The mosques have modest minarets dominating the old city; one of them, the Sidi Abdul Wahab Mosque, was built next to the surviving Roman remains of the Arch of Marcus Aurelius. Tunis is situated east of the ancient (and Byzantine) port city of Carthage. Close to the center, the Zaitouna Mosque, also known as the Mosque of the Olive Tree or the Great Mosque, was built beginning in the ninth century and was surrounded by many souks.

In Morocco the cities of Fès, Marrakesh, Meknès, and Tétouan were massively enlarged during medieval times. Fès was by far the largest, with considerable fortifications around what is now Fe'ez-el-Bali, an area that had a significant Christian and Jewish population. The latter group was forced to move west to a new settlement during the 14th century, creating the first *mellah*, or Jewish quarter, in Morocco.

Mention should also be made of the important Islamic cities of western Africa, notably Timbuktu (in present-day Mali), a major center of learning and commerce in early Islam. Despite its surrounding impressive walls, however, the city was unable to withstand attacks by the Tuareg, who sacked it in 1431. On the east coast the port city of Zanzibar (in modern-day Tanzania) had long been the focus of Arab

*By the late 15th century the Ottoman Empire extended from modern-day Bosnia to the eastern edge of the Black Sea.*

trade with the region, and a significant Islamic city was built on the western, sheltered side of the island.

### MOORISH CITIES OF SPAIN

Many Islamic-style architectural developments are evident in Spain, where the city of Granada, in southern Spain, was a major center of the Islamic world from 711. In terms of their cultural and intellectual significance, Toledo, Córdoba, and Seville were more prominent, with Córdoba being perhaps the most prominent center of intellectual activity at the time and Toledo being the key location from where knowledge was

transmitted to Latin Europe. However, the fall of Córdoba in 1236 and the fall of Seville in 1248 led to the migration of Muslims to Granada, and this city remained one of the richest in late medieval Europe and a center of great learning and artistic endeavor. Dominated by the Alhambra, a fortress-palace complex, Granada reached its peak in the 14th century under Yousuf I and Mohammed V (who built the royal palace within the Alhambra). During the late 15th century it started to decline as the result of infighting within the ruling family. A civil war ensued, and the city fell to the Christians 10 years later, in 1492.

~ *Marco Polo: The Glories of Kinsay [Hangchow],  
excerpt from The Travels of Marco Polo (ca. 1300)* ~

When you have left the city of Changan and have travelled for three days through a splendid country, passing a number of towns and villages, you arrive at the most noble city of Kinsay, a name which is as much as to say in our tongue "The City of Heaven," as I told you before.

And since we have got thither I will enter into particulars about its magnificence; and these are well worth the telling, for the city is beyond dispute the finest and the noblest in the world, . . .

First and foremost, then, . . . the city of Kinsay [is said] to be so great that it hath an hundred miles of compass. And there are in it twelve thousand bridges of stone, for the most part so lofty that a great fleet could pass beneath them. And let no man marvel that there are so many bridges, for you see the whole city stands as it were in the water and surrounded by water, so that a great many bridges are required to give free passage about it. And though the bridges be so high, the approaches are so well contrived that carts and horses do cross them. . . .

There were in this city twelve guilds of the different crafts, and each guild had 12,000 houses in the occupation of its workmen. Each of these houses contains at least 12 men, whilst some contain 20 and some 40—not that these are all masters, but inclusive of the journeymen who work under the masters. And yet all these craftsmen had full occupation, for many other cities of the kingdom are supplied from this city with what they require. . . .

Inside the city there is a Lake which has a compass of some 30 miles and all round it are erected beautiful

palaces and mansions, of the richest and most exquisite structure that you can imagine, belonging to the nobles of the city. There are also on its shores many abbeys and churches of the Idolaters. In the middle of the Lake are two Islands, on each of which stands a rich, beautiful and spacious edifice, furnished in such style as to seem fit for the palace of an Emperor. And when any one of the citizens desired to hold a marriage feast, or to give any other entertainment, it used to be done at one of these palaces. And everything would be found there ready to order, such as silver plate, trenchers, and dishes, napkins and table-cloths, and whatever else was needful. The King made this provision for the gratification of his people, and the place was open to every one who desired to give an entertainment. Sometimes there would be at these palaces an hundred different parties; some holding a banquet, others celebrating a wedding; and yet all would find good accommodation in the different apartments and pavilions, and that in so well ordered a manner that one party was never in the way of another.

The houses of the city are provided with lofty towers of stone in which articles of value are stored for fear of fire; for most of the houses themselves are of timber, and fires are very frequent in the city. . . .

Since the Great Kaan occupied the city he has ordained that each of the 12,000 bridges should be provided with a guard of ten men, in case of any disturbance, or of any being so rash as to plot treason or insurrection against him. Each guard is provided with a hollow instrument of wood and with a metal basin, and with a time-keeper to enable them to know the hour of the day or night. And

so when one hour of the night is past the sentry strikes one on the wooden instrument and on the basin, so that the whole quarter of the city is made aware that one hour of the night is gone. At the second hour he gives two strokes, and so on, keeping always wide awake and on the lookout. In the morning again, from the sunrise, they begin to count anew, and strike one hour as they did in the night, and so on hour after hour. . . .

If they see that any house has caught fire they immediately beat upon that wooden instrument to give the alarm, and this brings together the watchmen from the other bridges to help to extinguish it, and to save the goods of the merchants or others, either by removing them to the towers above mentioned, or by putting them in boats and transporting them to the islands in the lake. For no citizen dares leave his house at night, or to come near the fire; only those who own the property, and those watchmen who flock to help, of whom there shall come one or two thousand at the least. . . .

All the streets of the city are paved with stone or brick, as indeed are all the highways throughout Manzi, so that you ride and travel in every direction without inconvenience. Were it not for this pavement you could not do so, for the country is very low and flat, and

after rain 'tis deep in mire and water. But as the Great Kaan's couriers could not gallop their horses over the pavement, the side of the road is left unpaved for their convenience. The pavement of the main street of the city also is laid out in two parallel ways of ten paces in width on either side, leaving a space in the middle laid with fine gravel, under which are vaulted drains which convey the rain water into the canals; and thus the road is kept ever dry.

You must know also that the city of Kinsay has some 3000 baths, the water of which is supplied by springs. They are hot baths, and the people take great delight in them, frequenting them several times a month, for they are very cleanly in their persons. They are the finest and largest baths in the world; large enough for 100 persons to bathe together.

I repeat that everything appertaining to this city is on so vast a scale, and the Great Kaan's yearly revenues therefrom are so immense, that it is not easy even to put it in writing, and it seems past belief to one who merely hears it told.

*Europe*

~ A Letter from Senator Cassiodorus, Praetorian Prefect,  
to the Tribunes of the Maritime Population (mid-sixth century) ~

It is a pleasure to recall the situation of your dwellings as I myself have seen them. Venetia the praiseworthy, formerly full of the dwellings of the nobility, touches on the south Ravenna and the Po, while on the east it enjoys the delightsomeness of the Ionian shore, where the alternating tide now discovers and now conceals the face of the fields by the ebb and flow of its inundation. Here after the manner of water-fowl have you fixed your home. He who was just now on the mainland finds himself on an island, so that you might fancy yourself in the Cyclades, from the sudden alterations in the appearance of the shore.

Like them there are seen amid the wide expanse of the waters your scattered homes, not the product of Nature, but cemented by the care of man into a firm foundation. For by a twisted and knotted osier-work the earth there collected is turned into a solid mass, and you oppose without fear to the waves of the sea so fragile a bulwark, since forsooth the mass of waters is unable to sweep away the shallow shore, the deficiency in depth depriving the waves of the necessary power.

The inhabitants have one notion of plenty, that of gorging themselves with fish. Poverty therefore may associate itself with wealth on equal terms. One kind of

(continued)

*(continues)*

food refreshes all; the same sort of dwelling shelters all; no one can envy his neighbour's home; and living in this moderate style they escape that vice [of envy] to which all the rest of the world is liable.

Your whole attention is concentrated on your salt-works. Instead of driving the plough or wielding the sickle, you roll your cylinders. Thence arises your whole crop, when you find in them that product which you have not manufactured. There it may be said is your subsistence-money coined. Of this art of yours every wave is a bondservant. In the quest for gold a man may be lukewarm: but salt every one desires to find; and

deservedly so, since to it every kind of meat owes its savour.

Therefore let your ships, which you have tethered, like so many beasts of burden, to your walls, be repaired with diligent care: so that when the most experienced Laurentius attempts to bring you his instructions, you may hasten forth to greet him. Do not by any hindrance on your part delay the necessary purchases which he has to make; since you, on account of the character of your winds, are able to choose the shortest sea-track.

### *The Islamic World*

#### ~ *Yaqut al-Hamawi: "Baghdad under the Abbasids,"* from *Geographical Encyclopedia (ca. 1228)* ~

The city of Baghdad formed two vast semi-circles on the right and left banks of the Tigris, twelve miles in diameter. The numerous suburbs, covered with parks, gardens, villas and beautiful promenades, and plentifully supplied with rich bazaars, and finely built mosques and baths, stretched for a considerable distance on both sides of the river. In the days of its prosperity the population of Baghdad and its suburbs amounted to over two millions! The palace of the Caliph stood in the midst of a vast park several hours in circumference which beside a menagerie and aviary comprised an enclosure for wild animals reserved for the chase. The palace grounds were laid out with gardens, and adorned with exquisite taste with plants, flowers, and trees, reservoirs and fountains, surrounded by sculptured figures. On this side of the river stood the palaces of the great nobles. Immense streets, none less than forty cubits wide, traversed the city from one end to the other, dividing it into blocks or quarters, each under the control of an overseer or supervisor, who looked after the cleanliness, sanitation and the comfort of the inhabitants.

The water exits both on the north and the south were like the city gates, guarded night and day by relays of

soldiers stationed on the watch towers on both sides of the river. Every household was plentifully supplied with water at all seasons by the numerous aqueducts which intersected the town; and the streets, gardens and parks were regularly swept and watered, and no refuse was allowed to remain within the walls. An immense square in front of the imperial palace was used for reviews, military inspections, tournaments and races; at night the square and the streets were lighted by lamps.

There was also a vast open space where the troops whose barracks lay on the left bank of the river were paraded daily. The long wide estrades at the different gates of the city were used by the citizens for gossip and recreation or for watching the flow of travelers and country folk into the capital. The different nationalities in the capital had each a head officer to represent their interests with the government, and to whom the stranger could appeal for counsel or help.

Baghdad was a veritable City of Palaces, not made of stucco and mortar, but of marble. The buildings were usually of several stories. The palaces and mansions were lavishly gilded and decorated, and hung with beautiful tapestry and hangings of brocade or silk. The rooms were lightly and tastefully furnished with

luxurious divans, costly tables, unique Chinese vases and gold and silver ornaments.

Both sides of the river were for miles fronted by the palaces, kiosks, gardens and parks of the grandees and nobles, marble steps led down to the water's edge, and the scene on the river was animated by thousands of gondolas, decked with little flags, dancing like sunbeams on the water, and carrying the pleasure-seeking Baghdad citizens from one part of the city to the other. Along the wide-stretching quays lay whole fleets at anchor, sea and river craft of all kinds, from the

Chinese junk to the old Assyrian raft resting on inflated skins.

The mosques of the city were at once vast in size and remarkably beautiful. There were also in Baghdad numerous colleges of learning, hospitals, infirmaries for both sexes, and lunatic asylums.

## ► climate and geography

### INTRODUCTION

The effect of climate and geography on human history is often the subject of controversy. Sometimes the effect seems obvious, such as how the Himalayas have acted as a barrier between India and other parts of Asia. Still, neither climate nor geography can explain why the Islamic Near East became one of the most technologically and scientifically advanced places on earth until the 1100s, when the peoples of the region seem to have renounced many of their achievements. It seems easy to account for China's rise as a cultural power when one looks at the fertile valleys of the Yellow and Yangtze rivers and notes how the land could support millions of people, but the matter becomes complicated when one also observes that the China of the Tang (618–907) and Song (960–1179) dynasties was the most technologically advanced society on earth, yet trailed Europe by the end of the medieval era. It is also hard to explain why the deserts of southwestern North America saw the rise of city-building cultures and the deserts of Australia did not.

Thus, both climate and geography should be seen as factors in human history but not factors that by themselves propelled events. Instead, they shared their influence with such factors as religious faith, nationalism, diseases, and natural

disasters. It may be wise to remember that human beings have the capacity to choose behavior that is not in their best interest, to impose themselves on their environment, and to make their own history, sometimes in defiance of the natural world.

Climatologists believe that at present humanity is living in an “interglacial period.” They have used many sources of evidence to outline changes in the world’s climate over the past few hundred thousand years and have noted the arising and then disappearing of glacial periods, often called “ice ages.” Strictly speaking, an ice age is a period in which glaciers spread out over land. The most recent ice age is known as the Last Glacial Maximum. It ended in about 12,000 to 11,500 B.C.E. Evidence gathered by geologists and paleontologists indicates that the world’s average temperature rose by 16 degrees Fahrenheit within 50 years. This resulted in the retreat of the great glaciers that had covered much of the landmass of the Northern Hemisphere and a dramatic shift in the migration patterns of game animals, thus both opening up new ranges of land and inviting human beings to migrate into those ranges, following game herds.

Climatologists believe that there have been three main factors in the changes in climate worldwide. One is volcanic activity. Volcanoes can fling debris high into the atmosphere, and the part of the debris called *volcanic aerosols* can reflect sunlight away from the earth, causing the earth’s temperature to fall. Long periods of volcanic activity could create an ice age. Even so, volcanoes often emit large amounts of carbon dioxide, which can allow sunlight through the atmosphere to the earth but prevent heat from radiating away. When the carbon dioxide enters the oceans, temperatures can become cooler, but enough carbon dioxide in the atmosphere can result in warming. Interglacial periods have had higher amounts of carbon dioxide in the air than have glacial periods.

The changing in intensity of the sun’s light can be another factor in climate changes. How changes in the sun’s light occur is being debated by astronomers, but the sun has differing periods of brightness. During peak periods of sunlight the earth warms. During low periods of sunlight the earth cools. Yet another factor in climate change is the relation of the earth to the sun. The earth has an eccentric orbit, meaning that its orbit goes through a 100,000-year cycle of moving closer to the sun and moving farther away from the sun. Another eccentricity is a 41,000-year cycle of changes in the earth’s tilt relative to its orbit, changing how parts of the earth face the sun.

Volcanic activity can have a powerful short-term effect on climate. For instance, in the early 500s, there may have been a one- to three-year period in which global temperatures dropped, causing failed crops, which led to social break-

downs in many parts of the world. A prominent explanation for this event is that the volcano Krakatau (in the Sunda Strait between Sumatra and Java) exploded in about 514, throwing so much volcanic aerosol into the atmosphere that it blocked enough sunlight to lower the world’s average temperature by a couple of degrees.

Not all climatologists agree, but many believe there was a period of global warming called the Medieval Climate Anomaly, lasting from about 900 to about 1400. There seems to have been an increase of carbon dioxide in the air and an increase in the sun’s intensity. This period is often used to explain mysteries in human history such as the disappearance of the Vikings of Greenland. In theory, they settled southern Greenland during the Medieval Climate Anomaly and then saw their crops fail as the earth cooled. From about 1500 to about 1850 was a period called the Little Ice Age, although it was not a true ice age, with growing glaciers. During that period the average global temperature was about 2 degrees lower than before and after.

Geography has played a role in the climate. Mountains alter air currents; ocean currents carry warm water, warming coasts, and cold water, cooling other coasts; and the effects can change because ocean currents shift their courses. For a time the meeting of cold air with warm air resulted in rains that made the Sahara rich in wildlife, with vast grasslands where people tended herds of cattle. The Sahara is sometimes cited as an example of how human beings can alter climate and geography. The dense forests of western and central Africa cause an updraft in moist air that flows north. Overgrazing and the felling of the forest south of the desert have produced less moisture and a weaker updraft, resulting in loss of rainfall and the expansion of the desert. It may be one of humanity’s triumphs that it learned to alter geography. In the medieval era people dug canals and changed the courses of rivers to bring water to make wastelands fertile.

Mountains and oceans were barriers to be overcome, not surrendered to. In this there is a source of hope for modern peoples, because the story of climate and geography of medieval times speaks of human beings using their ingenuity to find ways to live with and manage the great forces of nature that make the land they stand on, the oceans they sail, and the rivers they fish.

## AFRICA

BY LEAH A. J. COHEN

Many of the terrestrial and climatic features that distinguish Africa in the modern era were also important in medieval times. Africa is a large continent, representing approximately one-fifth of the world’s land surface area, with several major

geographical features. One of Africa's unique characteristics is that it straddles the equator, with large expanses of land on either side.

In the north the African coast borders the Mediterranean Sea, where the winter rains are dependable. To the south this coastal region borders the great Sahara, which over the course of the planet's long history has fluctuated between savanna and desert; by medieval times the Sahara had returned to being desert, and in the early 21st century it was the largest hot desert in the world, spanning approximately 1,700 miles north to south and 4,000 miles east to west, from the Atlantic Ocean to the Red Sea. The Sahara is far from static in size, having been observed to expand and retreat in its boundaries from tens to hundreds of miles within a decade. The Sahara separates North Africa from sub-Saharan Africa to the south. By no means uniform in terms of physical features, the desert features oases and river valleys (such as the great Nile River valley) as well as higher-altitude areas that provided water and more lush vegetation to inhabitants and travelers in medieval times. The Sahel region, running east to west just south of the Sahara, is characterized by semidry savanna grasslands and forests. Farther south, the land gradually comes to feature more lightly wooded savanna areas, which feed into the central African rain forests. Rain forests are also found on Africa's western coast. The central part of the continent thins from east to west down to the southern tip of the cape.

Africa's ecological zones are more closely correlated to altitude to the south of the equator than to the north. In the east mountains and plateaus begin in Ethiopia and run southward into present-day South Africa. During at least the first part of medieval times this area was savanna grassland and woodland, and much of it was home to the tsetse fly, which limited the herding of large animals until consistent and substantial forest clearing transformed the landscape. The principal deserts in the south are the Kalahari and Namib deserts.

While mountainous areas are present, Africa is not known for grand mountain ranges. However, one of the continent's major features is the Great Rift Valley, which has long been a bed of volcanic activity, running north to south in eastern Africa from the Red Sea to Mozambique. Elongated lakes, such as Lake Malawi, Lake Turkana, and Lake Tanganyika, characterize this region. Several mountainous areas disrupt the raised plateau spanning much of the continent to the sides of the rift, including the Atlas Mountains in the northeast, the Ethiopian Highlands in the east, and the Drakensberg in the south. Principal peaks include Mount Kilimanjaro, at 19,340 feet, in present-day Tanzania; Ras Dashen, at 14,872 feet, in Ethiopia; and Mount Cameroon, at 13,435 feet, in Cameroon. Most of Africa's highland areas were produced by volcanic activity; exceptions include the Atlas and

Drakensberg mountains, in the north and south, respectively. Little folding or merging of tectonic plates has occurred in Africa because the continent is positioned atop one relatively stationary tectonic plate.

The continent's major rivers include the Nile River in the northeast, the Niger River in the west, the Congo River in west-central Africa, and the Zambezi River in south-central Africa. Since much of the continent (especially in the east and south) is characterized by plateau landscape, many of the major rivers reach the ocean with dramatic waterfalls that drop down the steep escarpments characterizing much of the coastline. The coastline itself is relatively smooth, with few coves that serve as good natural harbors, and provided relatively little opportunity to access the interior during medieval times.

## CLIMATE

The major factors, primarily terrestrial, that influenced climate in Africa during medieval times have indeed been influential throughout the continent's long history. These factors included topography, location, and the size of the continent. Such characteristics remained constant throughout the medieval period and contributed to the ecological patterning of tropical rain forest, open savanna grassland, desert, and the coastal Mediterranean terrain.

Owing to Africa's location straddling the equator, such that it lies mostly between latitudes 35 degrees north and south and receives a great deal of solar energy, one of the dominant climatic concerns across much of the continent is the amount of rainfall. The long boundary between the Sahel and the Sahara is based on rainfall and is therefore not fixed. The Sahara sometimes is defined as the area that receives less than 8 inches of rainfall annually, while the Sahel receives up to 20 inches of rainfall annually. South of the Sahel is moister savanna, which receives up to 40 inches of rainfall each year. This ecological zone transitions into more forested areas and tropical rain forests in the Congo River basin, where the annual rainfall can reach approximately 200 inches. Such rain forests also are found along Africa's west coast. Rainfall and associated ecological factors vary based on elevation, and in the early 21st century some of the mountain peaks in Africa were snow covered year round.

Ocean currents and associated air currents play a substantial role in regional climatic variation in Africa, since they alternately bring moisture and warmth from the equatorial Atlantic or dryness and cold from the north. The Guinea Current brings rainfall and a warm climate to western Africa and the warm Mozambique Current does the same in southeastern Africa. The Canary Current carries dry, cool air to the western coastal area of the Sahara Desert, while the Benguela

Current creates cool, dry conditions in the southern Africa desert areas on the west coast.

Many climatologists argue that the medieval period in Africa is part of a long-term trend of increasing dryness that began around 4000 B.C.E. Still, the medieval period did witness small-scale increases and decreases in moisture and temperature, with regional variations. Other climatic factors that were influential during this period included surface winds, volcanic activity, and solar radiation.

The dominant climatic phase during this period was the Medieval Warm Period, which began as what some scientists believe was a generalized global trend sometime between 800 and 950 and ended with a comparatively consistent dropping of temperatures throughout the 1300s. As a result of Africa's largely tropical location, relatively little variation in temperature is found, in contrast to most landmasses farther north or south. Northern Africa, in particular, features a vast interior (noncoastal) area; since land heats and cools more quickly than does water, the interior portion of northern Africa—much of which is the Sahara—gets both colder and hotter than the coastal areas. Some African locales may have been between 5 and 7 degrees Fahrenheit warmer at the peak of the Medieval Warm Period than they are in the modern era, with record highs in the interior well above 130 degrees Fahrenheit. In association with the added heat, much of Africa was drier during the Medieval Warm Period, although climate change was gradual, did not begin coincidentally throughout Africa, and did not necessarily follow the same trends in all regions on the continent.

Nile River data show minimal flows during some of the Medieval Warm Period. For parts of the upper Nile basin, in eastern Africa, scientists have observed that rainfall progressed from relatively high levels during the second half of the first millennium C.E. to much drier conditions sometime between 900 and 1200. Data from Lake Hayq, on the eastern edge of the Blue Nile (in northern Ethiopia), show that rainfall dipped between 750 and 1200 C.E. Around or after 1000 C.E. substantial agricultural settlements in the inner Niger delta disappeared, perhaps because of decreased rainfall in the region. Lake Naivasha and the basin of Lake Victoria, in eastern Africa, and (at least immediately before 1300) the Lake Bosumtwi area, in western Africa, were also much drier during this period.

While the Medieval Warm Period was generally a time of increased dryness in Africa, evidence indicates that some locales may have experienced increased moisture. Timbuktu received increased rainfall during this period, and parts of the Chad River basin that do not support expansive settlement in the modern era owing to lack of moisture were populated from around 200 to 1100. Also, between 800 and 1300, parts of the modern Sahel region experienced higher rainfall.

Variations in rainfall during the Medieval Warm Period may have been caused by differences in the patterns of surface winds. In the areas closest to the equator, rainfall is largely controlled by the Intertropical Convergence Zone. This zone is a low-pressure belt that represents the colliding of winds from the Northern Hemisphere—such as the Harmattan, a dry northeast trade wind—and the Southern Hemisphere—such as the monsoon, a wet southeast trade wind. This belt moves north and south around the equator, and as it passes over land the moist winds of the monsoon bring rainfall. The north-south movement of the Intertropical Convergence Zone occurs twice yearly, meaning that places in equatorial Africa generally have two rainy seasons. Areas farther from the equator and on the outside edges of the swing of the Intertropical Convergence Zone experience only one rainy season each year. The shifting boundaries between the Sahara, Sahel, savanna, and rain forests—which are based on annual rainfall—have been attributed in part to changes in the location of the Intertropical Convergence Zone. Periodic droughts, including decreased annual rainfall and the delayed onset of seasonal rains, have been a normal aspect of climate patterns in Africa throughout its history.

Evidence indicates that during the Medieval Warm Period the Intertropical Convergence Zone experienced a more northerly swing, while during the Little Ice Age (a period of cooling that followed the Medieval Warm Period) it traveled a more southerly course. This would have meant that the rains associated with the Intertropical Convergence Zone fell on areas farther to the north (such as Timbuktu and Lake Chad, compared with Lake Naivasha and Bosumtwi) and that the boundary between the Sahara and the Sahel would have been north of where it was during the Little Ice Age.

The Medieval Warm Period came to a close as temperatures began to drop gradually starting in the 1300s. This extended phase led into the Little Ice Age, which lasted from 1550 to 1850. During this period temperatures in interior southern Africa are thought to have been almost 2 degrees Fahrenheit cooler on average than they are in the modern era.

Regarding the phase leading up to the Little Ice Age, data show that parts of the Sahel experienced increased dryness from 1300 to 1450. Lake Malawi's water level fell during the end of the warm period, from 1150 to 1250, and then again from 1500 to 1850. The corresponding decrease in rainfall for the later dates represented a severe drought for this area of southern Africa. However, as was true for the warm period, patterns were far from consistent. Data from some areas of the Sahel-Sahara border and from eastern Africa indicate that during the Little Ice Age rainfall actually increased: Lake Chad was higher, Nile River flows were high, and the water level of Lake Naivasha was rising.

The termination of the Medieval Warm Period may have been in part caused by variations in solar radiation, or energy coming from the sun. Short-term and long-term variations in solar radiation have always occurred, as associated with numbers of sunspots, and the Little Ice Age has been associated with a 70-year period of minimum sunspots. Another contributing factor may have been an increase in volcanic activity. The sulfur dioxide released during volcanic eruptions travels high into the stratosphere and forms sulfate aerosol, which acts to reflect solar radiation back into space before it has a chance to warm the earth, resulting in cooler global temperatures. Thus, even if no increase in volcanic activity in Africa near the end of the Medieval Warm Period has been observed or recorded, volcanic activity elsewhere on the globe could have triggered cooler temperatures in parts of Africa; indeed, one such event took place in Iceland in 1175.

### **HUMANS WITHIN THE ENVIRONMENT: THE EFFECT OF TRADE**

Human settlements molded and were molded by their environments with regard to numerous geographic and climatic factors during medieval times. Such factors included rainfall, soil type, ecological variations, and availability of natural resources. Interactions between humans and their environments were largely shaped by increases in the number of and contact among cultures that were growing increasingly complex and sophisticated.

One of the major human activities of the medieval period in Africa was the trans-Saharan trade. This extensive network was driven by the continent's wealth of valued natural resources, including gold, salt, and ivory, as well as by the transport and exchange of slaves. As the Sahara had returned to desert conditions long before the medieval period, nomadic Berber people who were native to the Sahara region had extensive knowledge of survival in that climate and landscape. The brief and minor humid phase that began in the middle of the first millennium C.E. led humans living in the Sahel to move north toward the Sahara, where they interacted more intimately with Berbers and Arabs, who were in turn traveling farther and farther south, ultimately reaching Sahel regions by the year 600. During this period population centers developed in the drier regions, serving as stopover locales for the long-distance Saharan caravans.

Berbers became essential contributors to trans-Saharan trade, leading the long and large camel caravans that crossed the desert to trade Africa's natural resources with Arab, Mediterranean, and eventually European peoples. The original introduction of the camel into regional trade activity in the third or fourth century C.E. dramatically changed human patterns in the context of the very harsh landscape. In the centu-

ries that followed, trade routes blossomed and allowed for the rise of great civilizations based on the exploitation of Africa's natural resources. The economies of the medieval Ghana Empire (eighth to mid-13th centuries), from which arose those of the Mali empire (beginning ca. 1100), from which arose those of Songhai (mid-15th to late 16th centuries), were based on the wealth gained from the trade of gold, salt, slaves, ivory, kola nuts, copper, leather, rubber, iron, cloth, and other items. Trade across the Red Sea with Arabia also expanded during this time period. The civilization of Axum, in northeastern Africa, traded in ivory, slaves, and other natural resources with Arab seamen.

### **RISE AND FALL OF CIVILIZATIONS**

The rise and fall of great African empires often can be attributed to geographic and climatic causes. The moderately sized trade city of Adulis, on the Eritrean coast, outgrew its water resources and was moved to the nearby highlands of northern Ethiopia, becoming the city of Axum. This city prospered in part as the result of favorable climatic conditions that graced the area with two rainy seasons, allowing for two farming seasons each year. As the population expanded, forests were cleared for settlement, agriculture, and iron smelting. Over time, excessive cropping led to soil erosion and declining soil fertility. The final blow to the region was a decline in rainfall around 750. These factors led to the demise of the civilization by 800.

The Ghana Empire, in present-day Mauritania and Mali (and bearing no connection with present-day Ghana), was founded and flourished based on the region's rich gold mines during the first millennium C.E. Many factors have been cited as contributing to its fall, including population growth that stripped the region of natural resources, drought, and conflict with outside groups. The people of Ghana enjoyed relatively favorable rainfall between 300 and 1100. However, a regional drought in 1100 made the successful raising of cattle and sheep difficult. Furthermore, economically Ghana relied on its control of gold in the trans-Saharan trade; around 1200, gold mines opened up elsewhere, also contributing to the civilization's decline. By 1235 the Ghana Empire no longer existed.

As Ghana declined, the Mali Empire became a main force in the trans-Saharan trade of gold and salt. At its height in the 14th century the empire stretched from the Atlantic outlet of the Senegal River some 1,250 miles inland, east of Timbuktu. Climate change assisted growth in trade and wealth for the empire: During the dry period from 1300 to 1450 Malian peoples were able to access areas rich in gold that had previously lain well within the wet habitat of the tsetse fly, which carries a deadly disease known as sleeping sickness. At

the time, this habitat was limited to tropical Africa's savanna-woodland border.

Climatic conditions that produced a moist, warm period in southern Africa from approximately 900 to 1300 allowed for the development of the Mapungubwe civilization (ca. 1075–ca. 1270) in present-day Botswana and Zimbabwe. This herding and trading civilization boomed during the moist period but disappeared in the mid-13th century, just as the climate began to change. Shona pastoral settlements then developed in the highland areas to the north, around the city of Great Zimbabwe, between 1275 and 1450. This Shona civilization collapsed during the latter half of the 15th century, but the impact of the great numbers of humans that had lived in the area left the landscape forever changed, denuded and stripped of many of its native trees.

### CLIMATE AND DISEASE

Disease shaped human settlement and migration patterns throughout the African continent during the medieval period. The rainfall boundary of 40 inches was then quite important to humans, because it represented the lower limit of the tsetse fly habitat. Herders tended to live farther north, where rainfall levels were lower, to prevent infection of their herds by sleeping sickness, which was particularly fatal to large livestock. Since the Intertropical Convergence Zone moved farther to the north during part of the Medieval Warm Period, so also did the pastoral inhabitants who made their livelihoods in the grasslands free from the tsetse fly. Although rainfall was sufficient to grow certain cereal crops in the area just south of the Sahel, inhabitants of this area could not use large plow animals to cultivate the soil, also due to sleeping sickness, which limited the expansion of farmland. Sleeping sickness further necessitated the use of human porters, rather than large domestic animals, for trade in areas where the tsetse fly was common.

Another African disease that affected human societies was bilharziasis, or schistosomiasis, which was transferred to humans through contact with bodies of water that were home to the disease's snail hosts. Malaria and measles were also common concerns, though low population densities served to limit the capacity of these diseases to become endemic during the medieval period. The threat of widespread endemic diseases accompanied the increases in population densities seen from this time period onward, as the rising of the great medieval civilizations led to the growth of urban areas and more frequent use of close living quarters.

### LIVELIHOODS

Many of the common livelihoods of the medieval period were closely related to and shaped by the climate and by the geo-

graphic nature of the land. Farmers were constrained by the need for rainfall sufficient to grow crops; after the decrease in rainfall between 1100 and 1400, farmers largely remained below latitude 18 degrees north. Pastoralists, again, were geographically constrained by sleeping sickness. Human groups in the central rain forests tended to maintain their hunter-gatherer livelihoods because the soils could not sustain long-term fertility if cleared for farming. As such, population densities were lower in this region.

Pastoralists from dry areas of the Sahel-Sahara border region tended to engage only in herding, rather than making livings through a variety of occupations, because entire communities needed to possess particular specialized skills to ensure the survival of their herds and themselves. In the Great Lakes region of eastern Africa, on the other hand, pastoralists found the raising of cattle and other animals much easier owing to the plentiful rainfall and kinder environmental conditions. They were therefore able to devote additional time to the development of agriculture, establishing productive banana and fishing industries. The nature of the ocean currents off the shores of Africa, in fact, produced certain areas with rich fishing grounds. Cool currents provided particularly plentiful ocean harvests near the shorelines of present-day Morocco, on the western Sahara coast, and Namibia, on the western Kalahari and Namib desert coasts.

Trade through both the Arabian and trans-Saharan networks developed, and it was sustained because of Africa's rich supplies of natural resources. Thus, social interdependence only grew during this time period, both within communities and between communities. In turn, increased opportunities for trade allowed persons to specialize more frequently in one particular skill, such as craft work. Greater supplies of goods, in turn, fostered further increases in trade and specialization as well as the development of castes based on professional trades and of hierarchically organized social systems.

### NATURAL RESOURCES

Many African groups had the technology to smelt copper and iron long before the start of the medieval period. This technology had reached southern Africa by the turn of the 11th century. The process of iron smelting required the harvesting of grand numbers of trees for the production of charcoal. As such, the clearing of forests transformed the landscape, exposing the soil to the elements, which led to increased erosion and decreases in soil fertility. However, this process also aided human settlement because forest clearing opened up land for farming—at least until the soil nutrients were sapped—and eliminated the habitat of the disease-carrying tsetse fly. Furthermore, the invention of iron tools increased agricultural

production, allowing for increased population densities, since more food could be produced on smaller areas of land.

Arab and Indian traders and explorers had long been interested in Africa's rich natural resources, traveling over the Sahara and by sea on predictable ocean currents between India and eastern Africa. From approximately 700 C.E. onward a well-established Arab slave trade was present on the east coast. Toward the end of the medieval period European explorers also became interested in Africa's various resources. In the 1400s the Portuguese became the first Europeans to travel to the continent and engage in the exportation of goods and slaves. The exploration and colonization of Africa was limited to certain coastal areas during this period owing in part to the harsh physical conditions. For example, many of Africa's rivers were not ideal for navigation because of rapids and steep drops over cliffs. Exceptions included rivers in western Africa, such as the Niger, which was an important trade route in medieval times. European traders also found few natural harbors on the continent's coastline.

## THE AMERICAS

BY MICHAEL J. O'NEAL

During the centuries before European contact, the culture and history of the numerous peoples who inhabited the continents of North and South America continued to be shaped by the elements. The Americas offered inhabitants a wide range of geographical and climatic conditions, from tropical heat to Arctic cold, from lowlands and plains to mountain highlands, and from densely forested regions to sparsely covered deserts and tundra. The process of continually adapting to unique geographical conditions gave shape to the material cultures of American peoples. In some cases, relatively abrupt climate change forced Americans to adapt, move to other areas, or die out.

### NORTH AMERICA

For most people in the modern world the geography of North America has an east–west orientation. A sub-Arctic band stretches east–west north of Canada. Both Canada and the United States are visualized as occupying east–west bands of territory. (Mexico, too, is part of North America but is considered separately.) To a geologist, however, North America consists of largely north–south zones, including at least five: the Canadian Shield, which underlies the northeast portion of the continent; the Appalachian Mountains, which extend from northern Quebec to Alabama; the Atlantic–Gulf Coastal Plain, which extends from southern New England to Mexico; the Interior Lowlands, which extend from northern Canada through the North American Great Plains; and, finally, the

North America Cordillera, a system of mountains, plateaus, and basins that stretches from Alaska to Mexico. Accompanying these geological features is a rich network of lakes and waterways, including major river systems such as the Mississippi and its main tributary, the Missouri River, along with bodies of water such as the Great Lakes that were carved during the last ice age.

These geographical features shaped the cultures of medieval Americans. To the north the Inuit culture of Alaska, northern Canada, and Greenland, the descendants of what is called the Thule culture, spread eastward from Alaska beginning about 1000 C.E. They displaced the earlier Dorset culture, largely because the latter did not have boats, sled dogs, or other innovations that gave the Inuit an advantage over them. By about 1300 the Inuit had arrived in western Greenland. The Inuit were nomadic and occupied regions north of Canada's timberline. Because they lived in regions with little or no vegetation and not suited to agriculture, they lived primarily by hunting game, fishing, and whaling and supplemented their diet with seaweed. Their first contact with Europeans was probably with the Vikings, who created settlements in Greenland and eastern Canada.

Even in the cold of the Arctic North climate changes had a profound impact on the Inuit. Beginning around 1350 (although climatologists and others disagree about the date) the so-called Little Ice Age hit North America. This was a 300-year period, perhaps longer, during which temperatures in the Northern Hemisphere became noticeably cooler. Because temperatures dropped in the high Arctic regions, the Inuit had to leave their whaling and hunting sites to move south. The Inuit culture depended heavily on whaling for fuel (whale oil), bones for tools, and especially food, without which the Inuit diet became poor. While the culture had always been nomadic, the Inuit found themselves forced to move more often and even to set up semipermanent settlements. Rather than using sod and whalebone to construct dwellings, they turned to less-permanent houses made of ice, commonly known as igloos. They moved into the edges of the Canadian timberline, where they were forced to coexist with other Indian groups.

Climatologists note that the Little Ice Age was preceded by a period variously referred to as the Medieval Warm Period or the Medieval Climate Optimum. On either side of the North Atlantic temperatures were unusually warm from roughly 800 to 1300. Some climatologists believe that the phenomenon was global, others think that it was restricted to the Northern Hemisphere, and still others consider it to have been a phenomenon of little importance (although this group is in the minority). In any event, the period coincided with a period of peak solar activity called the Medieval Maximum,

a period that lasted for about 150 years beginning in 1100. Archaeological evidence shows that temperatures increased in eastern North America during this time. Even Alaska grew measurably warmer. The period also coincided with extreme droughts in western North America, particularly in the Great Basin area of the western United States.

These climatic changes had a profound impact on numerous North American cultures. One of these cultures was that of Greenland, now politically part of Europe as a Danish territory but geographically part of North America. Between the third and the 10th centuries Greenland was essentially uninhabited; some earlier Eskimo cultures had died out by about 200. In the 10th century, however, Danish explorers established colonies on Greenland, the world's largest island. These settlements were in deep fjords on the southern part of

the island, which was much warmer and more lush than it is in the 21st century, probably because of weather associated with the Medieval Warm Period. The relative warmth permitted hunting and agriculture. These colonies, which contained a mixture of Danes and Inuit, lasted for about four or five centuries and then died out as Greenland became colder during the Little Ice Age. When agriculture became impossible, famine struck.

Geography and climate likewise shaped the culture of Native American peoples elsewhere throughout the continent. Numerous examples could be cited; each Native American group and confederation adapted itself to the geographical niche it occupied. For example, Plains Indians such as the Sioux occupied primarily the steppes, or vast, open grasslands, that dominated the center of the continent from

## HOW DO ARCHAEOLOGISTS KNOW ABOUT CLIMATE?

In the modern world, scientists use sophisticated instruments to measure current temperature and other climatic conditions. Even ordinary people can get fairly accurate temperatures simply by consulting a thermometer positioned on a tree or post outside the home. But historians, archaeologists, climatologists, and environmentalists are vitally interested in learning everything they can about temperatures and other climatic conditions during historical periods when accurate records were not kept and people did not have the tools for measuring these conditions. So the simple question is this: How do these investigators know what temperatures were in any particular region of the world a thousand years ago?

Investigators have developed a number of tools to answer that question. One is the science of palynology, or the study of plant pollen. Pollen from plants can survive in numerous sets of conditions. It has been found in pottery, burial artifacts, and deep peat bogs, for example. By studying plant pollen, scientists can learn which plants grew in an area at a particular time. This information offers insight into the region's climate, particularly how the climate changed over time. Another science is that of geomorphology, or the study of landforms. Again, the emphasis is on how landforms changed over time, often as a result of changes in climate. A third science is that of paleoethnobotany. Paleoethnobotanists study how plants were used in the past; in this sense, their focus is similar to that of palynologists, for plant use provides clues about such factors as temperature and moisture conditions.

These sciences, though, measure relative conditions over time. They can tell scientists that a particular plant, for example, grew in a particular region at a particular time. Such knowledge can provide evidence about relative temperatures and other climate conditions. But is it possible to measure actual temperatures? The answer is yes. One technique for doing so is called obsidian hydration. Obsidian is a type of volcanic glass found, among other places, in the western United States. Obsidian absorbs water on its surface, but the rate at which it does so depends on temperature. The outer layer of a piece of obsidian is called the hydration layer. By measuring the thickness of the hydration layer, scientists can accurately determine temperature conditions at the time the layer formed.

Numerous other techniques exist as well. Climatostratigraphy is a science that enables investigators to trace ice movements, providing clues about temperatures and changing climatic conditions. The examination of seabed deposits enables scientists to measure the amount of oxygen contained in shells and skeletal remains, which varies depending on temperature conditions at the time. Similarly, lakebed deposits yield what are called varves, or alternating layers of coarse and fine sediment, determined by climate. The size of tree rings is dependent on climate; rings are examined by scientists called dendrochronologists. Ice cores are drilled from glaciers in places such as Greenland. The different crystalline structures of the ice can provide evidence of temperature conditions at the time the ice formed, and a long core can provide a narrative of changing conditions over time.

central Canada down through Minnesota and the Dakotas and into the Great Plains. These areas were too dry to support forests but were wet enough not to become deserts. The grasslands supported large game animals, including buffalo, elk, and deer. Accordingly, Native American cultures in this region adapted to the resources provided by geography. These groups—including the many that made up the Sioux—lived largely nomadic lives following the herds of buffalo, although certain northern Sioux led more settled lives, where agriculture provided a portion of their living.

In contrast, the groups of the Eastern Woodlands, who lived in the eastern United States and Canada in a region stretching westward to the Mississippi River, lived a very different kind of life, again largely as a function of geography. Among the earliest groups were those of the Adena and Hopewell cultures, which flourished until about 800. They occupied niches with a relatively moderate climate and rich soils. Thus, although they hunted and gathered, they supplemented their diets with agricultural products, including beans, corn, pumpkin, and squash. Abundant forests provided wood and wood products for a host of items, including dugout and birch-bark canoes, fencing for villages, and log dwellings.

In contrast to the Plains Indians, the Eastern Woodland cultures, with abundant resources at their disposal, lived more settled lives, for they did not have to move about in search of food. Thus, they built more permanent homes, including those made of clay and poles in cooler regions and those made of thatched palmetto leaves in the hotter southern regions. Because they led a more sedentary existence with more fixed territorial boundaries, their societies, rituals, religious beliefs, and class systems became more complex. While Plains Indians relied on buffalo hides for clothing, Eastern Woodland Indians used deerskin. Even religious beliefs were shaped in part by geography. More northerly nations held that the world was formed out of mud; groups in hotter, more southerly regions placed their religious emphasis on the sun and fire as the source of creation.

Native Americans in mountain regions faced a different set of challenges. The Ute, for example, developed a culture shaped by geography in the millennium before the arrival of the Spanish in the region. The Ute never formed a fully organized, centralized culture. Rather, they consisted of a number of bands that occupied different niches of the mountains of Utah, Colorado, and New Mexico. Thus, for example, the Mouache band inhabited the eastern slopes of the Rocky Mountains; the Capote lived in the San Luis Valley of Colorado; the Tabeguache, sometimes called Uncompahgre, occupied the valleys of Colorado's Gunnison and Uncompahgre rivers; and the Uintahs lived in the Great Salt Lake basin. Other bands occupied different parts of the region.

In contrast to the Plains Indians, the Ute bands did not inhabit a broad, open region, where movement and communication were relatively unimpeded, and, in contrast to the Eastern Woodland groups, they were not surrounded by lush forests and highly arable land. In the numerous river valleys, canyons, and mountain ridges of this region, the bands remained largely separated from one another, and each adapted to geographical conditions in its own way. Geography had a profound impact on the social organization of each band. Because these mountain regions were sparsely vegetated, a large amount of land was needed to support a group of people through hunting and gathering. Accordingly, the unit of social organization was the family rather than the band or the group. Bands came together during the winter months, when festivities were held and marriages were contracted. During the summer months the families that made up the band separated to hunt, gather, and perhaps plant crops in mountain meadows.

To the north, Native American groups in the centuries before the arrival of French trappers and traders occupied ground similar to that of the Ute in a region that consisted of numerous canyons, mountain ranges, and valleys. However, conditions were different. Winters were longer, with more snow, but the region was also moister, with numerous rivers and river valleys and denser vegetation. Thus, peoples such as the Nez Percé, Spokane, and Coeur d'Alene had a broader range of resources. Crops were planted in the more arable soil, timed to mature with differences in temperature caused by variations in elevation, so essentially the people moved uphill as temperatures warmed. Hunters pursued game throughout the varied geographical terrain, often wearing snowshoes to hunt in the snow; during the spring, they turned to salmon fishing in the region's numerous rivers and lakes. Fishing, hunting, and gathering took place during the warmest summer months at the highest elevations, and then the people moved back downhill for the autumn salmon runs. Because resources were denser the groups of the Pacific Northwest were able to live in more concentrated communities rather than being spread out like their neighbors to the south.

In the Southwest of the present-day United States one of the most intriguing cultures for archaeologists is that of the Anasazi, a commonly used term but one that some historians tend to avoid in favor of Ancient Pueblo or Ancestral Pueblo (to distinguish them from still-living Pueblo groups). The Ancient Pueblo inhabited a region centered in the Colorado Plateau that extended into New Mexico and Nevada and portions of Arizona and Utah. The terrain of this region included high plateaus (up to 8,400 feet in elevation), mesas, some woodlands (with primarily pines, junipers, and piñons), steep canyons, basins with desert grasses, and mountains. Water

was not plentiful. Streams ran off the mountains, and there were occasional summer rains, but these were undependable. The Ancient Pueblo therefore relied on snowmelt and on springs where erosion had caused seeps beneath layers of sandstone. Although there are rivers in the region, the Ancient Pueblo did not make use of them; rather, they settled near small streams and tributaries, which were more easily diverted for irrigation purposes.

The Ancient Pueblo are perhaps best known for their cliff dwellings. In the canyons erosion created bridges and windows in the rock. In some parts of the region shale rock, which erodes more easily than sandstone, was hollowed out by erosion, leaving behind sandstone overhangs. These dwellings remain, and tourists and historians continue to visit them in several U.S. national parks.

The Ancient Pueblo provide a striking example of the interactions of climate, geography, and human populations during the medieval period. From 700 to 1130 the population of the Ancient Pueblo communities increased rapidly. This increase was probably the result in part of reliable rainfall, leading to increased fertility and decreased mortality. Some historians use the term *golden age* to refer to the period from 900 to 1130, when a warm climate and regular rainfall led to larger communities, which in turn gave rise to trade, local pottery and architecture, better food-storage technologies, and the domestication of the turkey. But after about 1150 significant climate change occurred in North America, with a 300-year-long dry period. Ancient Pueblo farmers tried to stave off disaster by using dams and terraces to control and store water, but evidence shows that many people abandoned settlements under environmental stress. Simultaneously, and unrelated to rainfall patterns, the water table in the region dropped, compounding the drought.

Ultimately, the Ancient Pueblo culture disappeared in the 12th and 13th centuries, although some historians argue that it did not actually disappear but was absorbed by other cultures. Historians are also not in complete agreement about the reasons behind this apparent disappearance. The collapse of the Ancient Pueblo probably came about through a combination of circumstances, including crop failure resulting from drought, the erosion of topsoil, and deforestation. These environmental stresses, caused by climate change, weakened the Ancient Pueblo culture, rendering it helpless in the face of invasions from the north by Ute, Shoshone, and Paiute, who were themselves under stress because of the drought. Archaeological evidence suggests, for example, that communities moved from canyons, where water was still adequate, to mesas, where water and arable land were scarcer, probably for defensive purposes. Warfare became common as communities turned to raiding and theft for food and other supplies.

Climate change also had effects on Ancient Pueblo religious beliefs. Many ceremonial centers were closed up with rock and mortar, and huge fires were set in underground chambers called *kivas* in the belief that the people could thereby appease the gods that controlled nature.

The Anasazi are the most intensely studied of the Pueblo peoples, but they were not the only culture that inhabited this area—a region sometimes referred to as Oasisamerica. The Hohokam people occupied the desert lands of Arizona and the Mexican state of Sonora. The area was extremely dry, but it was bounded by two rivers, the Colorado and the Gila. To grow crops, they constructed canals, and to protect themselves from the intense sun, they formed underground dwellings during the earliest phase of the culture's development, up to about 550. The culture lasted until about 1400, when it collapsed under the same climatic stresses that affected the Anasazi. The Mogollan people, who lived in Arizona and New Mexico, attained their height from about the 11th through the 15th centuries. They lived in mountainous regions that were not suited to agriculture, so they made their living through ceramics and minerals, which they traded with Mesoamerica to the south.

## MESOAMERICA

The geography of Mesoamerica is as complex as that of the rest of North America. Mesoamerica includes central Mexico, the Isthmus of Tehuantepec, the Yucatán Peninsula, the countries of Guatemala and Belize, and parts of Nicaragua, El Salvador, Honduras, and Costa Rica, although these last are often regarded as a transitional zone between Mesoamerica and Andean South America. Despite this complexity, geographers and climatologists divide Mesoamerica into two broad parts. One is the lowlands, which feature tropical climates. The other is the highlands, which include both dry tropical and cold mountainous climates. Overall, however, Mesoamerica offered a warm, temperate climate with abundant rainfall and arable soil. The climate during the medieval period was similar to that in the 21st century, and some archaeologists have argued that it was even more hospitable, especially in the highlands.

The chief climatic problem that Mesoamericans faced on an ongoing basis was water—either too much or too little. In the highlands water tended to be scarce. Accordingly, highland farmers learned to channel water from mountain runoff to their fields. One technique, used extensively during the middle of the Postclassic Period (ca. 1150–ca. 1350), was the *chinampa*, a word that comes from the Nahuatl language and means “square made of canes.” The *chinampa* was a rectangular plot of fertile land made of silt, mud, and decaying vegetation in the shallows of highland lakes in the Basin of

Mexico to ensure that crops planted in them had sufficient water. In contrast, people in lowland regions had too much water from heavy tropical rainfall. These people constructed systems of drainage to get rid of excess water.

Climate and geography helped shape a number of Mesoamerican cultures during the centuries before the arrival of Europeans. The area referred to simply as Central Mexico comprised primarily high plateaus with moderate to cool temperatures and little rainfall; what rainfall there was fell during a rainy season between May and October. Because of the lack of moisture the peoples of this area, notably Classic Period Teotihuacán (ca. 1–ca. 650) and Postclassic Period Tula (ca. 900–ca. 1200) and Tenochtitlán (ca. 1200–1521), built canals that connected the rivers with hillside reservoirs for holding water. These water supplies enabled the people to cultivate maize and other crops. Teotihuacán, the chief city during the Classic Period, reached the height of its power around 450 and eventually collapsed. Some historians blame the climate changes of 535–536 for the city's collapse. During this year observers throughout the world noted a large number of climatic aberrations, including a lack of sunlight, low temperatures, dark clouds, and crop failures. Historians suspect that a comet or meteorite or perhaps a massive volcanic eruption filled the atmosphere with dust that created an artificial winter. Whatever the cause might have been, buried bodies at Teotihuacán show evidence of malnutrition, which may have led to unrest, rebellion, invasion, and the abandonment of the city.

The Maya region, which encompassed the Yucatán Peninsula of Mexico, Guatemala, and Belize, had different geographical features. The northern Yucatán consisted of lowlands that were hot and frequently battered by hurricanes. The area had little surface water, but its porous limestone rock contained many sinkholes where water could be found. Southward the Maya area was composed of tropical forests, highlands, and finally a lowland coastal region. In contrast to the highlands of Central Mexico, the Maya highlands experienced abundant rainfall.

The large region of northern Mesoamerica, between the Sierra Madre Occidental mountain range to the west and the Sierra Madre Oriental range to the east, was flat, hot, and dry. Again, the people of this region had to construct canals and store rainwater for agricultural purposes.

## **SOUTH AMERICA**

In many respects the geography of South America is one of extremes. The continent contains the world's southernmost city, Ushuaia, Argentina. The world's highest waterfall, at more than 3,200 feet, is Angel Falls in Venezuela. The world's largest river by volume is the Amazon—nearly 80 million

gallons per second flow into the Atlantic Ocean during the rainy season—and the Amazon's drainage basin, at 2.7 million square miles, is the largest in the world. The Andes is the world's longest mountain range, at 4,400 miles. The Amazon rain forest is the largest rain forest in the world. Chile's Atacama Desert is the world's driest, with some parts receiving an average of just 0.04 inches of rain each year; one portion of the desert went 400 years with absolutely no rainfall.

A major climatic condition that historically has had a profound effect on South America is commonly called El Niño. The word means “child” in Spanish and refers to the Christ child, for the phenomenon tends to begin around Christmastime. About every two to seven years the waters of the eastern Pacific Ocean grow warmer. The phenomenon begins in the western Pacific, but by the time it reaches South America it causes warm air to rise off the coast of Peru, leading to rainfall in areas that are normally desert. This heavy rainfall dries the air so that eastern South America gets less rain than normal.

Additionally, the El Niño effect has an impact on winds. Normally the trade winds of the Pacific, so called because they powered sailing ships engaged in trade, blow in a westerly direction. These winds move warmer surface water away from South America, allowing cooler water from below to well up. This cooler water is rich with nutrients, supporting fisheries along the western coast. During an El Niño episode, the trade winds die down and even blow in an easterly direction. These winds blow warmer water into the western coast of the continent, causing immense disruption in fish populations. In turn, fewer fish means fewer seabirds, reducing the amount of natural fertilizer produced by the birds.

Overall, an El Niño episode is associated with wet summers in Peru and Ecuador (remembering that summer in the Southern Hemisphere runs from December to March), causing major flooding into March and April. Argentina and Brazil likewise become wetter during the spring and early summer. The winter in central Chile is milder than normal, with a great deal of rain. The Amazon River basin, Colombia, and Central America become much hotter and drier.

The Moche culture (ca. 100–ca. 700) of northern Peru provides a good example of how these changes in climate affected early South Americans. The Moche, who lived primarily in river valleys near the Pacific Coast, depended on agriculture for their livelihood. The culture also produced a great deal of highly sophisticated pottery, with an enormous amount of variation in shapes and themes. While historians are uncertain what caused the demise of the Moche culture, many pin the blame on a super El Niño, which lasted about 30 years beginning in about 563. (Normally the El Niño effect lasts only a year or two.) After 30 years of persistent and

torrential rainfall the region experienced 30 years of extreme drought, and sand dunes engulfed many communities. These climatic events disrupted the Moche way of life and may have caused the people to lose faith in their religion, since they offered sacrifices to the gods to ensure stable weather. By roughly 700 the Moche had disappeared. Some historians believe that weather was the direct cause. Others think that it was an indirect cause, creating tension and competition for ever-scarcer resources, which led to civil war.

One of the most famous empires of South America before the arrival of the Spanish was that of the Inca. Although the Inca Empire had reached its peak at the time of the Spanish conquest in the 16th century, the empire's roots extended back to about 1200. In time, the empire stretched some 2,500 miles from Ecuador to Chile. The Inca Empire occupied a large portion of the Andes. The climate and terrain were difficult. But with a genius for organization, the Inca overcame these difficulties and developed an advanced civilization. For example, Inca engineers found numerous ways to develop agriculture in the mountainous terrain, creating elaborate and monumental terraces, drainage systems, and irrigation systems. They learned to use fertilizers to boost the productivity of the thin mountain soil. They created a network of roads to foster communication and trade, no small feat given the changes in climate and elevation throughout the empire.

The mountains created numerous chasms over which the Inca constructed suspension bridges, some up to 200 feet long. A messenger system enabled runners to carry messages a distance of 150 miles a day—again, no mean feat given the difficulties of the terrain. Textiles became a major industry because the high mountainous land could support populations of llamas and other wool-bearing animals. Finally, a major source of Inca wealth was copper, gold, silver, and tin, mined from the mountains and converted into a host of products.

## ASIA AND THE PACIFIC

BY BRADLEY A. SKEEN

Eurasia is the largest of the earth's continents. It is the main landmass in the eastern portion of the Northern Hemisphere. It includes the subcontinents of India, Arabia, and Europe and is bounded on the north by the Arctic Ocean, on the east by the Pacific Ocean, and on the south by the Indian Ocean and Africa. Asia covers about 17 million square miles. Straddling both hemispheres, the Pacific Ocean is the world's largest and deepest body of water, covering more than 169 million square miles and comprising 42 percent of the world's water surface.

From the point of view of plate tectonics, the principal landmass of Asia is on the Eurasian plate, and the eastern-

most part of Siberia is on the North American plate. These two plates are drifting apart and forming a rift valley east of the Verkhoyansk mountain range. The Arabian, Indian, and Australian plates are impacting the Eurasian plate from the south and being subducted, or drawn under, the larger plate. This makes the southern portion of Asia exceptionally mountainous. In particular, the Indian Subcontinent is separated from the rest of Asia by the Hindu Kush and Himalaya mountain ranges, the highest on earth. To the east of the Eurasian and Australian plates, the Pacific plate is being subducted under the Eurasian and Philippine plates. This action has led to the so-called Ring of Fire along the Pacific Rim, the earth's most active area of volcanism, producing large chains of islands (Japan, Taiwan, the Philippines, Indonesia, and New Zealand) off the eastern coasts of Asia and Australia. Subduction of the Pacific plate also causes frequent and destructive earthquakes throughout the region. Off the coast of Asia the Pacific Ocean has widely dispersed island chains, including the Hawaiian island chain near the center of the Pacific plate. The Hawaiian Islands and some other Pacific chains like the Society Islands, including well-known Tahiti, have come about from a hot spot of magma welling up from deep within the earth to produce a shield volcano. In Hawaii this has produced a chain of islands as the Pacific plate moved across the hot spot, from the most recent and largest of Hawaii itself, moving east to Midway, which has nearly been eroded away, and continuing in a range of underwater peaks that have eroded from older island peaks. Because these volcanically formed islands have rich volcanic soils and permanent water sources, they have significant agricultural potential and generally have supported large human populations. Other Pacific islands were formed out of the buildup of uplifted coral reefs and, without permanent water sources, have more limited farming and have supported smaller populations that are largely dependent on marine reef resources.

## SIBERIA

The region of Siberia extends from the Ural Mountains in the west on the border with Europe eastward to the Pacific Ocean. The southern limit of Siberia roughly coincides with the Altai mountain range, Lake Baikal, the Stanovoy mountain range, and the Amur River valley. Baikal is the deepest freshwater lake in the world at 5,371 feet and the fourth largest in surface area. Because of its immense volume, it contains more water than any other lake—in fact, one-fifth of all the freshwater in the world, as much as the North American Great Lakes combined. Western Siberia is extraordinarily low in elevation, averaging about 165 feet, but the east is mountainous, with many peaks reaching heights of nearly 10,000 feet. Siberia is cut through by a series of great rivers that rise in the moun-

tains on its southern edge and run northward into the Arctic and Pacific oceans. From west to east these rivers are the Ob, the Yenisei, the Lena, and the Amur.

The northern fringe of Siberia is tundra, sparsely inhabited by human beings. South of this is a wide belt of ancient coniferous and deciduous forest. Agriculture is difficult in Siberia for several reasons. The summers are not particularly warm, and the winters are the coldest of any large landmass that is not actually glaciated (such as Antarctica or Greenland). Because of this, much of the land has permafrost at a depth of less than a yard; these lands are forested only by the Siberian larch, which has specially evolved a shallow root system to adapt to this condition. Average rainfall is less than 20 inches (except in the Kamchatka Peninsula at the extreme eastern edge of Siberia, which is a temperate rain forest). Thus Siberia was inhabited in medieval times by tribal peoples who lived by hunting and gathering in the forest with only very limited agriculture. The tribes were monarchical and loosely federated under the khan of Sibir, who submitted to the Mongols in the 13th century, but these arrangements probably made little practical difference in the lives of the widely scattered families and clans.

## INNER ASIA

Inner Asia extends south from Siberia in the west as far as the chain of mountain ranges that separate the Indian Subcontinent from Asia proper and in the east to the fertile plains of China. It includes the modern territories of Mongolia, western China (including Tibet), the former Soviet central Asian republics, Afghanistan, Kashmir, and northern Pakistan. The climate varies from steppe to desert, probably with ever-increasing desertification throughout the Middle Ages resulting from natural climate changes and human activity (deforestation). The driest region is the Gobi Desert in Mongolia. Farther west are a number of large, shallow freshwater lakes (Lake Balkash, the Aral Sea, and at the extreme western limit the Caspian Sea). These lakes are fed by large rivers flowing from the southern mountains, including the Amu Darya, the Syr Darya, and the Hari Rud.

Tibet is the southernmost part of inner Asia. At the beginning of the Middle Ages (629–842), the Tibetan monarchy dominated inner Asia and even controlled the Chinese western capital of Xian. But Tibetan power was broken through civil war, and Islamic invaders and Chinese empires divided the area between themselves. In the 13th century conquerors from the northern extreme of inner Asia, the Mongols, unified virtually the whole Asian continent under their rule.

The only practical way of life in the grasslands and deserts of inner Asia is nomadic horse breeding. Local tribes lived by controlling large numbers of horses through a continuous

wandering of many hundred or thousands of miles each year. The nomadic way of life was so different from that of settled agricultural civilizations like China and western Europe that, once he had conquered northern China, the Mongol ruler Genghis Khan considered massacring the entire population of farmers because he could not imagine what use they served in society. Trained by their way of life on the steppe, the populations of inner Asia produced the finest cavalymen in the world. The steppe tribes usually had little trouble attacking and overcoming more settled populations when they wished. The Great Wall of China was built and maintained as a not entirely successful means of containing them. Iranian horsemen from inner Asia in the first millennium B.C.E. had conquered the Near East and southern Russia and occasionally raided China. But the stirrup was developed in this area during the early Middle Ages, making nomadic life on horseback much easier and cavalymen still more effective as soldiers. Thereafter, migrations of peoples from this area, such as the Huns, Magyars and Turks, led to the collapse of the western Roman Empire, the general collapse of civilization in western Europe known as the Viking Age (850–1500), the collapse of the Byzantine Empire (1453), and the conquest of much of eastern Europe by the Turks.

The last great wave of invading tribesmen from inner Asia consisted of the Mongols under Genghis Khan (ca. 1162–1127 B.C.E.). Genghis Khan and his immediate successors conquered an empire that endured throughout the later Middle Ages and stretched from China to include all of inner Asia, Iran, the Near East as far as Baghdad, European Russia, and India. Except for a call from the central Mongol government in China to turn resources inward, Mongol forces that were preparing to attack western Europe and had probed as far as the border of the Holy Roman Empire (1241–42) may well have succeeded, changing the entire course of world history. The Mongol Empire was essentially a unification of the various states connected by trade along the Silk Road. India, protected by its mountainous borders, had long been spared invasion from the inner Asian steppe, but in the 14th century Tamerlane (1336–1405), a Mongol nobleman, conquered northern India, and his successors in the Mongol Dynasty later overran nearly the entire subcontinent.

From late in the first millennium B.C.E. a trade network developed in inner Asia that is now usually known as the Silk Road. The name derives from its being the main way that silk reached western Europe from China. It was a caravan trade between Xian, the western capital of China, and Roman or Byzantine port cities on the Mediterranean. Desert tribesmen brought huge caravans of camels and other pack animals across two principal routes: one all the way overland across the whole of inner Asia to Iran and the second to ports in

India. This was possible because of the vast stretches of desert and grassland in inner Asia that lacked settled inhabitants and so could be crossed without local resistance or having to pay local taxes or tariffs. The main items exported from China were silk and later porcelain. But the West did not produce anything that was compact enough to transport by caravan and was desired in China, so the return traffic was mostly in gold.

Technology also flowed along the Silk Road: not only the secret of silkworm cultivation (which reached the Byzantine Empire in the mid-sixth century) but also gunpowder and the spinning wheel, which were Chinese inventions. On the other hand, the bubonic plague, or Black Death, was also endemic in inner Asia and probably traveled to the West along the Silk Road to spark the pandemic in western Europe (1348–50) that killed one-third of the population. The religions of Buddhism and Manichaeism also traveled along the Silk Road and became dominant in inner Asia before the arrival of Islam.

Conflict between the Muslim states of inner Asia and China disrupted trade on the Silk Road after the eighth cen-

tury, but it was restored in the later Middle Ages when the Mongol conquest of the whole area between China and Baghdad in the 13th century unified the area and again ended barriers to trade. The famous visit to China by the Venetian merchant Marco Polo was along the Silk Road and took place at this time, though it is far from clear whether he actually made this journey or composed his published account of it based on other extant reports of travels through inner Asia and China. The second collapse of the Silk Road after the end of Mongol domination in inner Asia stimulated the search for new trade routes with China in western Europe.

### EAST ASIA

The heartland of China is the fertile plain dominated by river valleys stretching along the coast from Korea to Southeast Asia. The main rivers (from north to south) are the Yellow, the Yangzi, and the Pearl. The abundant waters of these rivers and excellent soils in their floodplains led to the development of agriculture by about 7000–5000 B.C.E. and early states by about 2000 B.C.E. However, China's rivers are more prone to

Fujiyama from *Okitsu*, by *Yoshida Hiroshi*; woodblock print, Japan, 1928 (Arthur M. Sackler Gallery, Smithsonian Institution, Purchase and partial gift of H. Ed Robison, S1988.254)

disastrous flooding than those that watered early civilizations in the Near East and India. As a consequence, from very early times large-scale centralized government was necessary in China to deal with the maintenance of the water system, including dams, dikes, and canals. The scale and efficiency of these works reached their height in the Middle Ages under the Sung (960–1279 C.E.) and Yuan (1279–1368) dynasties. These works included the Grand Canal, a network of artificial inland waterways more than 11,000 miles long connecting central and northern China and allowing barge traffic to move at right angles to China's generally eastward-flowing river systems.

Korea is a peninsula divided from the Chinese mainland by the Yalu River. It is mountainous, though few of the peaks reach 6,500 feet. Because of its position, it was inevitably influenced culturally and politically by China and, in turn, developed in interaction with Japan. Because Korea was characterized by smaller, distant river valleys separated by mountains, during the Middle Ages it was divided among several states usually at war with one another. Imperial Tang (618–907) and Sung China alternated tactics of diplomacy with military intervention against the smaller-scale and more vulnerable Korean states, but in 1231 the Mongols conquered Korea outright.

Located just off the Korean coastline, the islands of the Japan archipelago are separated from mainland Asia by the Sea of Japan. While more than 3,000 islands are in this group, the main islands are (from south to north) Kyushu, Shikoku, Honshu, Hokkaido, and Sakhalin. The most southerly three of these islands are the core areas for the emergence of rice agriculture about 1000 B.C.E. and the first Japanese states around the fourth through the seventh centuries of the Common Era, with earlier hunting-and-gathering populations known as Jomon peoples pushing northward into northern Hokkaido by around the seventh century C.E. The islands of Japan are volcanic and extremely mountainous. They are also subject to frequent powerful earthquakes with attendant landslides, making much of the land unsuitable for farming even though the climate is temperate. As a result, throughout the medieval period most of the mountainous land area was forested and remains so today, but the limited lowland alluvial plains were used intensively for wet-rice agriculture, allowing the population to grow dramatically in the early kingdoms and through the medieval shogunate period. Japanese culture has been deeply influenced by that of China. Isolated by an arm of the Pacific Ocean, however, Japan did not fall under the political domination of China in the Middle Ages. The Mongol Empire sent invasion fleets to Japan in 1274 and 1281, but both were repelled, at least partly because of severe damage

to attacking Mongol ships from two of the typhoons typical of the weather in that area.

## INDIA

The Indian Subcontinent, consisting of the modern countries of India, Pakistan, Bangladesh, and Sri Lanka on the island of Ceylon, surrounded by the Indian Ocean, is cut off from the rest of Asia by a ring of the world's highest mountains: the Hindu Kush, the Karakoram range, and the Himalayas. These mountain ranges contain peaks such as Mount Everest (29,030 feet) in the Himalayas and K-2 (28,250 feet) in the Karakoram, the highest and second-highest mountains in the world, respectively. These ranges have generally protected India from invasion from inner Asia since prehistoric times, except for the invasion of the Mongols begun by Tamerlane in the late 14th century. Runoff from these mountains feeds two great rivers in the northern plain of India: the Indus (home to one of the earliest centers of civilization), emptying into the Arabian Sea, and the Ganges, emptying through a massive delta of mangrove swamps in Bangladesh into the Bay of Bengal. South of these river valleys most of India is taken up by the mountainous territory of the Malwa, Deccan, and Chota Nagpur plateaus. To the west of the Indus Valley lies the Thar Desert.

Protected from most cold fronts moving from the north by its encircling mountains, India is far hotter than other areas of the world lying at the same latitude. In the summer months (March through June), the average temperature on the Gangetic plain (where the bulk of the population lived in the Middle Ages as in modern times) is 104 degrees Fahrenheit. Given these conditions, droughts are quite common. Nearly the entire year's rainfall is concentrated in the monsoon or rainy season (June through September). At this time a series of storms moving from west to east breaks over the subcontinent from the Arabian Sea.

Aside from making agriculture practical, if relatively uncertain, in India the monsoon has had an important effect on world history. The prevailing winds during the monsoon season made it unusually easy for sail-powered ships leaving the mouth of the Red Sea (between Africa and Arabia) to travel directly to the island of Ceylon, laying off the southeast tip of the Indian Subcontinent just above the equator. Once the monsoon was over, the return trip from Ceylon to the Red Sea was made just as easily on the winds blowing back to the west of the so-called retreating monsoon. This exceptional condition made the voyage possible for ancient and medieval ships that otherwise rarely left sight of land because they lacked even rudimentary navigational technology like the compass. This weather system was first systematically exploited for trade in antiquity by the Ptolemies

(304–30 B.C.E.), the Greek dynasty that ruled Egypt after the conquests of Alexander the Great, and then by the Romans. It became as important as the Silk Road for the transfer of goods and ideas between East and West. In the early Middle Ages control of this trade passed to the East African state of Axum in Ethiopia, but by the ninth century, with much of the Indian Ocean coast in Islamic hands, the monsoon trade was monopolized by Arab merchants (who greatly improved its efficiency through the invention of modern sails and riggings on their ships). After losing this trade, the empire of Axum quickly collapsed.

The great European trading states such as Portugal, Genoa, and Venice were highly dissatisfied with the Arab monopoly, because the high fees and taxes charged by Arab merchants and governments cut into their profits when they transshipped Indian and other oriental goods across the Mediterranean. This condition was made worse as the breakup of the Mongol Empire in the late 14th and 15th centuries disrupted trade along the Silk Road. An effort to break the Arab stranglehold on Far Eastern trade was behind the efforts of the European trading powers to find other sea routes to India and China. Their explorations led to such discoveries as those of Vasco de Gama (who rounded the horn of Africa in 1497–98) and Christopher Columbus (who discovered America in 1492 while trying to reach the Orient) and to Ferdinand Magellan's circumnavigation of the globe (1519–22).

## SOUTHEAST ASIA

Southeast Asia consists of a large peninsula south of eastern China and the numerous nearby islands of the Indonesian and Philippine archipelagos. This includes the territory of the modern states of Myanmar (Burma), Thailand, Laos, Vietnam, Cambodia, Malaysia, Indonesia, and the Philippines as well as a number of smaller polities like the Sultanate of Brunei on the island of Borneo. The region is separated from southern China by high mountains ranges that to the south give way to several broad, flat river valleys. From west to east the principal rivers (most of which have their sources in the Himalayas) are the Irrawaddy, Salween, the Chao Phraya, and the Mekong. The region has a tropical monsoon climate (much wetter than India, with the rainy season lasting from May to October) and was originally covered in rain forest, with mangrove swamps in the lower elevations and bamboo forests in the mountains. The area has a long history of rice farming, however, and in the Middle Ages the conversion of forest to cultivated land quickly accelerated.

The Indonesian archipelago consists of more than 13,000 islands, including five large ones: (from west to east) Sumatra, Java, Borneo, Sulawesi, and New Guinea. New Guinea and Borneo are the second- and third-largest islands in the

world, respectively. Located directly on the equator, they are extremely mountainous, with many peaks above 10,000 feet and more than 150 active volcanoes and frequent major earthquakes. In the ninth century C.E. the Mataram kingdom had to build a new capital after its former royal residence was destroyed in a volcanic eruption. The Philippine archipelago to the northeast of Indonesia consists of another roughly 7,000 volcanic islands (Luzon and Mindanao being the largest), equally mountainous and sharing the tropical monsoon climate of the area.

One of the most expansive states in medieval Southeast Asia was the Khmer Empire. Begun about 800 C.E., it reached its height in the early 13th century (controlling much of modern Thailand, Cambodia, Laos, and Vietnam) and was overthrown by 1431. Like any organized imperial state, it depended on wealth from large agricultural surpluses. Rainfall was sufficient to sustain a rich production of rice agriculture in the region throughout the Middle Ages, but the complex irrigation system also needed to grow rice was neglected because the empire tended to devolve into civil war. The collapse of the system for managing the climate for agriculture led eventually to the collapse of the state.

## AUSTRALIA

Southwest of Asia is Australia, the second-smallest continent. It extends over more than 4.5 million square miles. Most of Australia is a desert, with nearly half of the continent covered by sand dunes. The northern fringe is rain forest and is subject to the same tropical monsoon climate system as Southeast Asia. The eastern and southern coasts, separated from the rest of the continent by the Great Dividing Range (whose highest peaks are only about 6,500 feet), enjoy a more temperate climate with abundant rainfall. The world's largest coral reef, the Great Barrier Reef, lies off the east coast of Australia.

Hunter-gathers from Asia either crossed then-extant land bridges from Asia or made short sea voyages to occupy Australia about 45,000 years ago. These were the ancestors of the current Aborigine population, and the character and development of their culture were only minimally disturbed by outside influence (sporadic trade with island Southeast Asia) until Europeans arrived in Australia well after the medieval period (ca. 1600 C.E.). Although they possessed only the simplest technology and did not practice agriculture, the Aborigines may well have had a tremendous impact on the climate of Australia. By introducing campfires, they probably started grass and forest fires at a much faster rate than the fragile forest ecosystem that existed then could absorb, resulting in the deforestation and desertification of much of the continent.

## POLYNESIA AND THE PACIFIC OCEAN

The South Pacific Ocean has large numbers of relatively small islands of volcanic origin, their climate tropical and prevailing vegetation thick forests. Because of the islands' isolation, the number of species of plants and animals that migrated to them from mainland Asia is quite small. Consequently, large numbers of new species developed on each island. Most South Pacific islands are within a few hundred or at most a few thousands miles of the Indonesian archipelago or Australia. The deep-ocean archipelagos nearest New Guinea (Fiji, Tonga, and Samoa) were occupied by colonists from that island in antiquity. Those settlers developed into the Polynesian culture remarkable for its great seafaring tradition. In the early Middle Ages they began to sail farther from the mainland and colonized more-distant areas. They reached the Hawaiian Islands by about 400 C.E. and New Zealand (by far the largest Polynesian island) off the southeast coast of Australia in about 1000. The millennium also began with the Polynesians reaching Easter Island across the greater part of the Pacific, only about 2,300 miles from South America. The presence of South American sweet potatoes in Polynesian agriculture and of Asian chickens at some pre-Columbian archaeological sites in South America has been variously interpreted by scholars. Some researchers view these foreign resources as evidence that Polynesian explorers reached as far as South America, even if there is no archaeological evidence for permanent settlements. Other researchers provide compelling evidence that exotic plants and animals can migrate long distances across the Pacific without human intervention, owing to natural rafting in the strong currents and storms typical of the region.

The Polynesians never developed a metallurgical technology for agriculture or warfare, owing to the lack of metal resources on the islands, and the ready availability of wood and other perishable resources eliminated pottery from their technological repertoire on all but a few western Polynesian islands, which has caused some early scholars to view them as technologically "primitive" or "backward." This negative assessment by early scholars was rationalized through the idea that living in a so-called paradise without the need for struggle against nature made Polynesian culture stagnant, in contrast to areas like eastern China, where adverse climates and the difficulties involved in agriculture spurred rapid technological growth. However, in the Hawaiian archipelago and in some other areas of the Pacific, societies developed very sophisticated irrigation systems and artificial fishponds to mass-produce the staples of their diet (root crops and fish) and to support high population levels. In the realm of a technology that was vital to Polynesian culture—navigation—Polynesians

were by no means backward compared with other medieval cultures. They were the only sailors in the world who routinely ventured far out of sight of land.

Moreover, the Pacific Islanders were not immune to the problems of overpopulation and environmental degradation that plagued medieval populations elsewhere in the world. While it is true that initially low population densities and abundant resources on newly discovered islands previously unexploited by humans might well confer initial benefits of a wide range of resources, better health, longer lives, and higher birthrates with lower infant mortality. However, as populations grew and technological limits for intensified food production were reached, many Polynesian island populations faced significant pressures in the form of overpopulation and environmental degradation by the few centuries prior to European contact. On some islands, agricultural land tended to be worked past its sustainable limits to meet the demand for food. This led to deforestation as more and more land was brought under cultivation and to other forms of agricultural degradation, making it even harder to meet the needs of an expanding population on a limited amount of land. On some islands, like the Hawaiian Islands, this crisis was met with the development of ever more efficient means of irrigation agriculture that managed to keep up with both explosive population growth and the increasing demands of aristocratic chiefs for feasting foods, and looming disaster was averted up until European contact. In other island chiefdoms it led to terrible massacres and civil wars over the available food supply whose casualties (and sometimes cannibalism) drastically reduced the demand for food. The most dramatic example of the latter kind of disaster was the near depopulation of Easter Island around 1600 C.E. as several chiefdoms battled over dwindling land and resources, destroying the medieval culture that had made the world famous Easter Island statues. So, in fact, Polynesian culture was under geographic and climatic pressure as severe as in China or anywhere else in the world.

## EUROPE

BY TOM STREISSGUTH AND BRADLEY SKEEN

The majority of people in medieval Europe would have lived and died within a few miles of their birth places and would have had more familiarity with the exotic foreign lands mentioned in the Bible than with their own continent. Travel in medieval Europe was dangerous, and many people were tied by bonds of family and feudal obligations to the homes where they lived. The geographical learning of the Roman Empire was mostly lost in western Europe, though it began to be recovered from contact with Islamic culture in Spain in the 12th century. The exploration undertaken for commercial

purposes, especially by the Portuguese, at the end of the Middle Ages, however, soon gave Europe the most sophisticated geographical science in the world.

## GEOGRAPHY

Although distinct on linguistic and historical grounds, Europe is a subcontinent of the larger Eurasian continent from a purely geographical point of view. The continent of Europe extends from the North Atlantic Ocean east to the Ural Mountains and from Scandinavia (well above the Arctic Circle) south to the Mediterranean Sea. The southernmost parts of Europe are the islands of Crete and Malta at approximately 35 degrees north latitude. (For comparison, this is the same range of latitude as between Point Barrow, Alaska, and Memphis, Tennessee, in North America.) By convention, Europe ends at the shores of the Caspian Sea and the Caucasus Mountains in the extreme southeast. The narrow straits (varying between 2,297 feet and 4 miles) of the Bosphorus and Dardanelles, with the larger Sea of Marmara lying between, divides the Balkan Peninsula from Asia Minor. In the extreme southwest Europe is separated from Africa by another narrow, the Straits of Gibraltar, which is as little as 8 miles wide. The European landscapes are extremely diverse, with tundra and boreal forest in the far north; regions of mountains and elevated plateaus in the center; and coastal lowlands, bays, and narrow inlets along more than 20,000 miles of winding seacoast.

Broadly speaking, Europe consists of a vast fertile plain that extends from Ireland to the Urals, some elements of which are low lying enough to be submerged under the Irish and North Seas, the English Channel, and the Baltic Sea. This area is bound by two mountainous regions. The northern region consists of the mountains of Scotland and Scandinavia, and the southern peninsulas extending off Europe are extremely mountainous. The limits of this southern zone are marked by the ranges of the Pyrenees, the Alps, the Carpathians, and the Caucasus. The dormant volcano of Mount Elbrus in the Caucasus is the highest mountain in Europe at 18,510 feet.

Communication across the ranges of the Pyrenees and Alps is generally possible through passes or narrow valleys that link the heads of rivers in the northern and southern watersheds. Aside from the coastal plains, there are only two important passes in the Pyrenees: Col de la Perche and the Col de Somport. In the Alps the Romans had already extensively used the Col de l'Argentière, the Col de Montgenèvre, the Great and Little Saint Bernard passes (all between Italy and France) as well as the Splügen and Brenner passes between Italy and Germany. As the importance of commerce and communications between Italy and Germany increased in the Middle Ages, new pass routes were opened up, includ-

ing the Simplon, the Saint Gotthard, and the San Bernardino. The Mont Cenis pass between France and Italy seems also to have been first used extensively in the Middle Ages. The modern names for these passes are still essentially the medieval ones. So many of them are named after Saint Bernard because it was precisely isolated, desolated areas such as passes that Christian monks sought out in order to live in a constant state of struggle with the world, away from the distractions of human society. The Alpine passes contained monasteries of the Cistercian order that had been founded by Saint Bernard (1090–1153).

The southern peninsulas are themselves quite mountainous. The major ranges in Spain are (from north to south) the Cantabrian Mountains, the Sierra de Guadarrama, and the Sierra Nevada. South of the Po valley, the Apennines extend down the whole length of Italy. There are a number of active volcanoes in Italy, including Vesuvius near the city of Naples, Etna on the island of Sicily, and Stromboli, a small volcanic island just north of Sicily. The chief mountain ranges in the Balkans are the Dinaric Alps, the Pindus range (extending into northern Greece) and the Balkan Mountains in Bulgaria.

The European plain is traversed by several major rivers that rise in the southern mountains. From west to east these rivers include the Garonne, the Loire, the Seine, and the Rhine (820 miles). The Elbe and the Vistula (650 miles) continue this pattern but rise from the Bohemian mountains, a plateau in central Europe. The largest rivers in Europe are located in the east. The Danube (1,777 miles) rises from sources in the Alps but runs southeast through the Hungarian plain and cuts through a gap in the Carpathians (the Iron Gate) to reach the Black Sea. The Dnieper (739 miles) is the largest of several rivers that descend from the Russian steppes to empty into the Black Sea, while the largest river in Europe, the Volga (2,293 miles), traverses the steppes to empty into the inland Caspian Sea. The principal rivers in Spain are the Tagus, the Ebro, and the Guadalquivir, while the North Italian Plain is traversed by the Po. The largest rivers in the Balkans, the Sava and the Drava, are tributaries of the Danube.

Europe includes several prominent peninsulas: the Balkan Peninsula in the southeast, the Italian peninsula in the central Mediterranean, Iberia (modern-day Spain and Portugal), Brittany, Jutland (now a part of Denmark), and the Scandinavian landmass that includes the nations of Norway, Sweden, and Finland. Several large islands in the Mediterranean Sea, including the Balearics, Sardinia, Corsica, Sicily, and Crete, have been inhabited for thousands of years. The islands of Great Britain and Ireland lie off the northwestern coasts of the continent. The large North Atlantic island of Iceland (an English misunderstanding of its native name, which

is simply “island” with the “s” pronounced), along with the smaller groups of the Faeroe and Shetland islands, is usually considered part of Europe. The Arctic Ocean islands of the Svalbard archipelago are technically part of Europe but are virtually uninhabited.

### THE DEVELOPMENT OF CULTURAL REGIONS

After the fall of the Western Roman Empire in the fifth century C.E., Europe was divided into several major cultural regions. In the former Roman provinces of Spain, Gaul (modern-day France), and Italy, Romance languages descended from Latin continued to be spoken. The differentiation of Latin into discrete local languages was fostered by the geographical isolation of the various regions from each other. Germanic languages dominated in the territories to the north (including Britain, which had been the least Romanized imperial province). Later, Slavic peoples, migrating from an uncertain homeland, came to dominate all of eastern Europe, from the borders of Germany to the steppes of southern Russia and Ukraine and south into the Balkan Peninsula. There were also a number of cultural enclaves that survived the invasions of the Middle Ages. The Basque peoples sheltered in the mountains of northern Spain seem, in fact, to have preserved a language and culture that are not Indo-European and which must date back to prehistoric times. On the northwestern fringe of Europe, on the Brittany peninsula in France, on Ireland, and in Cornwall, Wales, and Scotland in Britain, pre-Roman Celtic languages and cultures survived throughout the Middle Ages. In Transylvania (northwest Romania) a group of Romance speakers survived, surrounded by Slavic peoples.

Western Europe underwent two periods of intense invasion that seriously damaged political and cultural infrastructure. In the fifth and sixth centuries Germanic and Asiatic tribes, such as the Goths, Huns, and Lombards, caused the dissolution of the Roman Empire in the West. In the ninth and 10th centuries renewed invasions by Vikings from Scandinavia and Magyars and Arabs from Asia left the map of western Europe fragmented into hundreds of small principalities. Roads fell into disrepair and communications were poor or nonexistent. In western Europe small communities organized around fortified hills or strongholds ruled by a local nobleman. The insecurity of the times forced ordinary people to gather for their own protection within the walls of these strongholds, the precursors to feudal estates that dominated the political life of medieval Europe.

The mountainous terrain of Scandinavia gave rise to a way of life dependent on hunting and herding that was generally healthier than the cereal crop-based agriculture of many other areas of Europe. This produced a lower rate of infant mortality and thus a consequent population explosion

after the year 750 C.E. The Scandinavian way of life, moreover, produced young men naturally fitted for war by their superior diet and the hazards of their existence as hunters in the mountains. Since inland communications were impossible in the densely forested mountains of Scandinavia, the population was well acquainted with seafaring. As a result of this combination of conditions, the Scandinavians—called Vikings in the West and Varangians by the Byzantines—set out on a remarkable series of raids and exploratory voyages. Besides the destructive character of their raids, the Vikings also colonized many areas of western Europe and founded states in northern France (Normandy) and Sicily. Not limited by the learned geography of western Europeans, which held that there were no islands or continents across the Atlantic, Vikings settled the Faeroe Islands, Greenland, Iceland, and even North America (Newfoundland in modern Canada). In the east the Varangians settled in the Baltic Sea region and moved inland along the natural highways of the south-flowing rivers of Russia, including the Volga and the Dnieper, to trade ultimately with Constantinople and Islamic states on the fringe of Europe. Forming a ruling elite among Slavic peoples native to the area, they founded the state of Kiev Rus, the ancestor of modern-day Russia.

The Eastern Roman Empire, also known as the Byzantine Empire, survived the fall of the Western Roman Empire and slowly contracted throughout the Middle Ages in the face of Arabic and Slavic invasions. Its capital and last surviving city (captured by the Ottoman Turks in 1453) was Constantinople, located on the Bosphorus at the frontier of Europe and Asia Minor. In the early Middle Ages the Byzantine emperors controlled the eastern Mediterranean and the Balkan Peninsula as well as Asia Minor. They maintained the defensive strategy of the Roman Empire, relying on rivers and fortified passes as a means of defense.

### LAND AND RESOURCES

Europe’s fertile soils, moderate climate, and wealth of mineral resources attracted the waves of new settlers in the fifth and sixth centuries. At that time gold and silver deposits were common in central Europe, while the Baltic coasts produced amber, a fossilized tree resin used to make decorative amulets, brooches, and other adornments. Deposits of tin (used in making bronze) were worked in Cornwall, in southwestern England, and Sicily was an important source of sulfur. In the Mediterranean region quarries were worked for stone and marble deposits for use in building construction; in the north, people relied on the abundant timber resources to provide fuel and building material.

Iron, the most valuable single mineral resource in Europe, came in the form of iron ore deposits in Scandinavia,

northern England, and western Germany. Europeans had been forging iron weapons and tools since well before the rise of Rome. Iron was collected from mines and bogs, smelted in a furnace to get rid of impurities, and then hammered and shaped while it cooled. The crafting of iron ore into useful tools in this manner was a long, complex process that could be mastered only by specialists. Iron mines and workshops made up the foundation of large-scale industry, which would play a central role in transforming Europe from the medieval to the modern age.

Europe's high water table and abundance of wells and springs also helped shape the medieval economy. The network of streams provided hydropower for medieval mills. Most medieval villages were raised on or near a source of running water, which powered the heavy equipment used for the grinding of grain to make flour for bread. The mills were commonly the personal property of the landowners and in some places were used as income-producing property. Medieval milling technology was based on Roman precedents but was constantly improved to become far more efficient and useful than in Roman times. The circular motion easily made by running water in natural streams was adapted by increasingly complex mechanical devices, such as cams, to make rope, to run looms for weaving cloth, to cut wood, to process mined and quarried stone, and to generate air currents through bellows and other means to make hotter furnaces for working metals. All of these advances helped point toward the later Industrial Revolution and were possible because of the medieval willingness to exploit the natural geography of mountainous regions. As often as not, the pioneers in these areas and kinds of technologies were monasteries rather than secular villages.

A belt of low-lying and fertile plains, which runs from Poland west to Germany, the Low Countries, and northern France, became the most densely settled region of Europe. At the dawn of the medieval period this region was covered by a heavy forest, impassable in many places, which effectively isolated human settlements. Within the North European Plain, the Rhine, Seine, Elbe, and Loire rivers provided the principal trade routes between coastal ports and the cities of the interior. Craft industries developed in the earliest major trading ports of northern Europe, known as the "emporium," including the island of Birka (Sweden), Hedeby (northern Germany), and York and Hamwih (modern-day Southampton) in England. In later centuries European merchants began trading with the Middle East via the Mediterranean Sea and with east Asia via the Silk Road, a route that crossed from the Russian steppes east through central Asia and to China. Cities grew at important points along these trade routes, with many of them rising among the remains of ancient Roman

fortresses and settlements. Others, like Novogord in Russia, were medieval foundations.

Geographical features, climate, and soil conditions shaped the local economies. In the mountains timber cutting and pasturing of sheep, goats, and cattle were the principal means of livelihood. As in Scandinavia, this kind of life produced more fit young men than the land could support, and such regions often became sources of mercenary soldiers. A disproportionately large proportion of the Roman soldiers fighting the barbarian invasions at the beginning of the Middle Ages came from the region of the Dinaric Alps in modern Croatia and Bosnia, while in the later Middle Ages, Swiss mercenaries became the most sought-after military force in Europe. Lowland plains gave rise to settled agriculture, while coastal regions thrived on fishing, salt making, and merchant trade. Trade also brought a few imported crops, such as citrus, rice, and cotton, from North Africa and the Arab world. These crops required the warm weather and irrigation works that were available in Spain, southern Italy, and Greece. Olives, grapevines, figs, and flax had arrived from the Near East and Egypt before the medieval period and remained essential southern European crops.

The city of Venice, which had been built on a series of sandy barrier islands by refugees from the Lombard invasion of Italy, depended on trade for survival. Venetian ships roamed the eastern Mediterranean and the Adriatic coasts, linking Europe with the Ottoman Empire and the Levant. Venetian merchants supplied luxury goods in high demand among the nobility and the monarchs of Europe, and through its "value added" trading economy, the Venetians built the wealthiest state in Europe. Many of the trade goods brought to Europe by the Venetians (and by their close competitors the Genoese) originated in China and were brought first into the Islamic world along the Silk Road or through the Indian Ocean trade. It was the desire to get around this Islamic monopoly (which resulted in huge increases in prices) on Oriental luxuries that drove the European age of exploration, just beginning at the end of the Middle Ages.

## THE RISE OF NATIONS

The fall of Rome left a divided political and social map of Europe. The collapse of Rome and its successor states was often conditioned by geographical factors. The migrations (from the western European point of view, invasions) of peoples from the steppes and from Scandinavia was motivated and facilitated by the geographical conditions of their homelands. The only unifying factor in early medieval Europe was the new religion of Christianity. Missionaries moved north to convert the pagan societies of Germany, Denmark, and the Low Countries. Ireland converted to the faith in the fifth century,

and Britain followed in the sixth and seventh centuries. The Scandinavians, living in the forests and mountains north of the Baltic Sea, took up Christianity in the 10th century; distant Finland and Estonia were the last to convert. In many places the conversion of pagans to the new faith involved a transformation of culture, language, and social and political institutions and did not always progress smoothly.

In 711 Islamic armies crossed the Mediterranean to establish a Moorish state in Spain. They were finally stopped north of the Pyrenees in the middle of the eighth century but would remain in Iberia until the end of the Reconquista campaign in the 15th century. The conversion of northern Europe was conditioned by geographical factors. The regions of Germany and Scandinavia had lain outside the Roman Empire and so had been unaffected by the imperial conversion to Christianity. However, Ireland was converted early. Christian monks on that island lived a sort of ascetic life that often caused them to cast their fate into the hands of god and go to sea in a coracle, a kind of small boat made of wooden spars with a leather hull, quite similar to an upside-down umbrella and not much larger. Prevailing currents took the monks who survived through the North Sea to the shores of Germany or southern Scandinavia. There, the Irish monks began the missionary work of converting the Germanic tribes.

In the late eighth century, as Christianity was unifying isolated states and principalities under the authority of the pope, a powerful military leader emerged among the Franks: Charlemagne, also known by his Latin appellation Carolus Magnus, or Charles the Great. This monarch mastered a huge realm north of the Alps, unifying the largest state since the fall of Rome, and was crowned by the pope as the Holy Roman Emperor of all Christianity in 800. The Frankish empire of Charlemagne was held together by a single man's political and military skill. After his death, his short-lived "Carolingian" realm was split among three heirs, laying the foundation of the modern states of France, Germany, the Low Countries, and Italy. The society of early medieval Europe was too fragmented for a single ruler or administration to govern effectively. Instead of reviving the empire in the name of imperial Rome, which had been the dream of Charlemagne and the popes, western Europe soon divided into small principalities. The conflicts among these states left Europe vulnerable to the raids of northern Vikings and eastern Magyars, which continued until the 10th century.

To the south the ancient Greeks had built an enduring legacy with their language, customs, and far-flung colonization, which reached from the Black Sea to the coasts of France and Spain. The invasions of the "barbarians" (a word originally coined by the Greeks) left the Greek-speaking Eastern Roman Empire relatively unscathed after the fall of Rome.

While western Europe remained politically weak and economically primitive, the eastern Byzantine emperors ruled a thriving state that incorporated cultures of ancient Greece, the Slavic peoples, and the Mediterranean societies of the Levant. Justinian I, a Byzantine emperor of the sixth century, sought to bring former Roman domains in North Africa and Italy back into the empire, but he failed in his goal of rebuilding the Roman Empire from Constantinople. Over the centuries to come the Byzantine Empire would be greatly weakened by rivalry between the Eastern Orthodox Church and Christian sects of Egypt and the Levant as well as by a hard-fought campaign against Persia that would leave the treasury drained of money and resources.

Under the rulers who followed Charlemagne in western Europe, feudalism became the dominant economic system. Western Europe fragmented into tiny discrete geographical areas under the impact of repeated invasions that destroyed the political and physical infrastructure (such as roads and established trade routes) that had tied the Roman world together. The manorial system bound feudal domains in a system of mutual obligation, with loyalty, service, and protection exchanged between serfs, knights, and landowners. As new areas were settled and new land was cultivated, the landscape of Europe was tamed into small strips of land, divided by hedges and furrows and gradually spreading into the shrinking areas of untamed forest wilderness. Little by little market centers developed, where peasants could bring surplus livestock and crops for sale and trade goods with neighboring communities. As communications improved, royal dynasties emerged to challenge the autonomy of the landed nobility. The struggle to unify nations out of the far-flung duchies and counties consumed western Europe in long centuries of conflict and invasion.

The endless fighting that tore at the economy and social fabric of Europe worried emperors as well as the popes. A schism between the eastern and western Christian churches occurred in the middle of the 11th century, further weakening the church's authority. In an attempt to heal the divisions, Pope Urban II called on Europeans to undertake a crusade to Jerusalem and to recapture the holy city from the Muslim "infidels." The first crusade began in 1095; over the next two centuries several more crusades arrived in the Middle East. Crusaders either marched through the Balkans and Asia Minor to reach the Levant or sailed in fleets from Mediterranean ports in Italy and France: Venetian and other European traders were happy to support the Crusades as one strategy of breaking the Islamic monopoly on trade with the Far East. Although they were unsuccessful in the end, the Crusades brought Europeans into contact with new regions of the world and greatly expanded the horizons of European trade and culture.

## CLIMATE

Along with a diversity of landscapes comes a wide variation in Europe's climate. The climate of eastern Europe is generally cold and dry because it is dominated by Arctic air masses sweeping down from Siberia. Western Europe has moderate temperatures, heavier rainfall, and longer growing seasons. Both eastern Europe and western Europe have the familiar four seasons of spring, summer, fall, and winter. But the southern peninsulas, which are surrounded by the Mediterranean, share the climate of North Africa and Western Asia, with two seasons: hot, dry, agriculturally unproductive summers and cool, rainy winters that allow a crop to be planted.

The climate of western Europe is noteworthy, especially for its fluctuations during the Middle Ages. Western Europe is far warmer than other areas of the earth at similar latitudes. The reason for this begins with a tropical current that flows from Africa toward South America. The current is deflected up the coast of the American continents and returns eastward in the form of the Gulf Stream, a wind-driven current that goes about as far as the island of Bermuda. The tremendous amounts of warm water delivered by the Gulf Stream continue until it washes up against the shores of western Europe because of a mechanism known as the North Atlantic Drift. The water from the tropics cools as it travels north and at the same time evaporates, making the remaining water denser because of the greater concentration of salt.

When the cooler, saltier water sinks in the North Atlantic, it sets up a circular current within the ocean that draws more warm water behind it. This system of currents makes western Europe warmer and rainier than any other comparable area of the world. Over time there can be considerable variation in this system, with a corresponding variation in the climate of western Europe. One such time is known as the Medieval Warm Period, which lasted from the ninth to the 14th centuries. At this time harvests and the range of crops grown in northern Europe increased (which also was helped by improvements in technology). Wine grapes, for example, were grown as far north as southern England. The retreat of field ice from the northern seas allowed the Scandinavian Vikings to send out colonizing expeditions to Greenland, Iceland, and, in the late 10th century, North America.

The Medieval Warm Period proved a temporary variation and was followed by the Little Ice Age, a period of cooling that brought longer, more severe winters and shorter growing seasons. As the continent cooled, regions of the far north again became uninhabitable. The last Viking colonies in Greenland died out in the 15th century, though the people of Iceland survived as a distinct society. Nevertheless, the increasingly favorable climate that resulted in greater agricultural produc-

tion throughout the later medieval period undoubtedly promoted economic recovery from the devastation of the Viking incursions and the disruption that followed. In addition, it no doubt contributed to the spirit of self-confidence and innovation that would carry western European culture across the world after the end of the Middle Ages.

## THE ISLAMIC WORLD

BY BRADLEY A. SKEEN

Islam came into being in the deep desert of Arabia and quickly spread from one end of the Old World (Eastern Hemisphere) to the other, from the straits of Gibraltar between Africa and Europe on the Atlantic to Indonesia and the Philippines in the Pacific Ocean, and from the deserts of central Africa to those of central Asia. Thus, the Islamic world comprised every kind of climate from desert to rain forest.

### ARABIA

Arabia was the cradle of Islam. Islam arose in the year 610 when Muhammad ibn Abdallah (ca. 570–632) was said to have received revelations from God in the city of Mecca in western Arabia. Proclaiming himself God's messenger and prophet, Muhammad gained followers and also decriers, eventually migrating to Yathrib (modern-day Medina) to escape persecution. By the time of his death the Islamic religion had spread to the entire peninsula.

The Arabian Peninsula is a large body of land between Africa and Asia, though it is technically part of the latter continent. It sits on a separate tectonic plate that is pulling away from Africa, making the deep rift valley of the Red Sea. As a result, there is a ridge of mountains along the western edge of the peninsula. The highest peak, at 12,028 feet, is Jabal al-Nabi Shoaib in the extreme southeastern corner (present-day Yemen). The eastern edge of the Arabian plate is being subducted under (falling below) the Eurasian plate and closing the Persian Gulf. To the south lies the Arabian Sea, an arm of the Indian Ocean.

The climate of the entire peninsula is dry, and the Rub al-Kahli (Empty Quarter) in the southern part of Arabia is one of the driest deserts on earth, with dune seas up to 1,083 feet deep. Some areas receive no measurable rainfall and have temperatures as high as 130 degrees Fahrenheit. The process of desertification increased during the Middle Ages, making the ancient caravan route across the Rub al-Kahli impossible to traverse. The Nedj, or central plateau, however, had considerable areas of pasturage, and the local tribes of Arabia lived by herding horses and camels through a cycle of nomadic migration between oases and other fertile areas. Once the tribes were unified and no longer spent their military efforts

in private feuds and as proxies fighting along the border controlled by either the Byzantine or Sassanid empires, the Arab horsemen proved a formidable and highly mobile military force, enabling the rapid spread of Islam on the back of their military conquests.

Arabs also participated in the east–west trade between the civilizations of eastern Asia and Europe, taking caravans across the Syrian Desert between Mesopotamia and the Mediterranean coast and sailing in the Persian Gulf and Red Sea. Muhammad’s own family had a background in this kind of trade, and he himself had been a merchant in his early life. Arabia itself was also productive of luxury goods that were widely traded; among them was frankincense (commonly used as an incense and well known as one of the gifts of the magi offered to the infant Jesus in the infancy narrative of the Gospel of Matthew), which comes from the gum of trees that grow only in the southwestern corner of Arabia.

## NEAR EAST

Between 632 and 642 the forces of the Rashidun Caliphate conquered the entire Middle East, from Egypt to the farther limits of the Persian Empire in inner Asia. The Near East (comprising the modern states of Syria, Lebanon, Jordan, and Israel-Palestine) has an arid climate, but the fringe of mountains along the Mediterranean coast promotes a rainy season that makes settled agriculture possible; indeed, this is the area where the first permanent agricultural settlements—cities—were founded in prehistoric times.

Maritime mountains extend all the way down the eastern Mediterranean coast from the Nur Mountains (called Amanus in ancient times) in Syria to the volcanic mountains of the Sinai Peninsula. Important peaks in this range are Mount Lebanon (10,131 feet) and Mount Carmel (1,789 feet). Mount Lebanon has permanent snow cover and a large cedar forest on its lower slopes, the primary source of timber in the region in ancient and medieval times, giving rise to the phrase in the Semitic languages “Cedars of Lebanon” as a metaphor for something exceptionally strong. Mount Carmel figures prominently in the religious traditions of Judaism, Christianity and Islam. Immediately east of the coastal range is an arm of the Great Rift Valley formed by the tectonic separation of Africa and Arabia, which extends from central Africa through the Red Sea and finally ends in the Levant. This valley contains the lowest points on the earth’s surface, including the Dead Sea, a salt lake whose surface is 1,378 feet below sea level. The Dead Sea is also unique in having a high concentration of mineral salts, making the water buoyant enough for bathers to float. The Arab tribes in the area developed a mythical explanation for the low elevation of the land in the Middle Ages. Based on a garbled account

of the story of Sodom and Gomorrah in the biblical book of Genesis, they explained that God had punished the patriarch Lot by striking down the whole land his tribe inhabited. Farther east across this valley is another mountain range, called the Anti-Lebanon (including the Golan Heights), which runs parallel to the maritime range and in the remote past was part of the same mountains before they were driven apart by tectonic forces.

The Temple Mount (Mount Zion) in Jerusalem is actually a rather low rise in the maritime range, but one with considerable cultural significance. It was the traditional site of the main Jewish temple in antiquity. As such, it was the spot from which the Islamic prophet Muhammad is thought to have ascended to heaven and returned, according to the Islamic sacred scripture the Koran. Because of its importance in Islam, the Muslim conquerors of Jerusalem quickly built (ca. 700) two important religious structures on the remains of the Jewish temple (which had been destroyed by the Romans in 70 C.E.): the Dome of the Rock and the al-Aqsa Mosque. Possession of Jerusalem and the ancient site of the Jewish temple was also an important goal of the European crusading armies that briefly conquered much of the Near East in the 12th century C.E. Under that regime, control of the Temple Mount was placed in the hands of a religious order of crusading knights, the Knights Templar.

## EGYPT

Egypt has been undergoing increasing desertification since prehistoric times and is an exceptionally dry desert. Egypt receives the smallest amount of rainfall of any similarly sized tract of land in the world; away from a narrow coastal band the average rainfall is less than 0.2 inches per year, and many years see no rain at all. However, the whole of Egyptian civilization was concentrated during the Middle Ages, as in antiquity, in the narrow valley of the Nile River (except for a few oases in the Western Desert, such as Siwah, whose inhabitants, incidentally, resisted Islamic conversion until the 12th century). The Nile is the longest river in the world (4,160 miles). Its source, however, was a mystery until the 19th century, when it was discovered in a system of lakes in central Africa (which also comprised Lake Victoria and Lake Albert, among others) by the British explorers Richard Francis Burton and John Hanning Speke.

The Blue Nile is a tributary that joins the Nile at Khartoum in the Sudan. This branch of the river is fed by rain in the Ethiopian highlands, where rainfall accounted for much of the Nile flooding. The peculiar feature of the Nile was to flood its valley in Egypt every year with remarkable regularity. The crest of the flood usually occurred on July 21. Far from being destructive, the flood made agriculture possible

by inundating the earth in the valley with water and by laying down a new deposit of rich topsoil. As a result, whereas most agriculture in the medieval world might return seven grains for each seed planted, fields in Egypt routinely returned 20:1, making Egypt the most agriculturally productive area in the world.

### MESOPOTAMIA

Mesopotamia (modern-day Iraq and Kuwait) became the political center of Islamic civilization. The city of Baghdad (meaning “gift of God”) was founded in 762 as the new capital of the caliphate, the central government nominally in charge of the whole Islamic Empire. The name *Mesopotamia* comes from the ancient Greek meaning “between the rivers.” The “rivers” are the Tigris and Euphrates. Like the Nile in Egypt, they carried water to an essentially desert region to make very productive agriculture possible and enabled the emergence of one of the world’s first civilizations (Sumer and Akkad) in antiquity. But unlike agriculture in Egypt around the Nile, agriculture in Mesopotamia depended on a very complex and delicate system of canals and irrigation, and the rivers’ frequent flooding was destructive rather than beneficial. The irrigation system had always used waterwheels and other machinery to regulate the flow of water and generate mechanical power, but these systems were considerably improved by engineers such as al-Jazari (fl. 1206). His machines tended to replace human and animal power with flowing water and used devices such as cranks; he was one of the first engineers to realize how to convert circular motion into reciprocal motion (such as the up-and-down motion of a pump). The high level of technology achieved was a real advance on Greek models inherited from antiquity and far more sophisticated than contemporary European technology.

### IRAN AND INNER ASIA

The Plateau of Iran lies between the Persian Gulf and the Caspian Sea. It has been thrust up by the subduction of the Arabian underneath the Eurasian tectonic plate. The Zagros Mountains run along the southern edge of the plateau and serve as the border with Mesopotamia. This range has peaks above 14,764 feet. Most of the land is arid, with the only well-watered plain lying at the southern end of the Caspian Sea. Hence the country is much better suited to pasturage than agriculture. Accordingly, the national way of life in Iran was horse breeding, and the country’s military might consisted of its well-mounted and highly trained cavalry. The Caspian Sea is the world’s largest inland body of water, with an area of 143,244 square kilometers. Fed at its northern end by the Volga River, the area around the Volga delta is fresh water, but much of the Caspian is highly saline.

To the east of the Caspian Sea and the north of the Plateau of Iran lie the inner Asian steppes. This vast area of grassland supported many peoples who lived from horse breeding and who consequently made highly effective cavalry and were repeatedly able to successfully raid and conquer more settled peoples in Europe, India, and China. The stirrup, which makes riding and especially fighting from a horse much easier, was invented in this area at the very beginning of the Middle Ages. To some degree this development triggered an outward migration from inner Asia that eventually overwhelmed the Roman Empire.

The first great conquerors from inner Asia were the Iranians themselves, who in antiquity gained an empire that stretched as far as Egypt in Africa and Thrace in Europe. They were followed by Huns and Turks and eventually by Mongols from the desert regions somewhat farther east. The latter two groups in general converted to Islam. In the Middle Ages the population of inner Asia was made up of various Turkic and Iranian peoples. Originally the area was marked by religious diversity, with many nations following traditional religions and others embracing ancient world religions, such as Manichaeism and Buddhism. But by the end of the Middle Ages the entire region was almost uniformly Islamic.

The nature of the inner Asian steppes—vast expanses of grassland with no major rivers or settled populations to impede travel, made the area a major trade route between East and West. This was the so-called Silk Road, actually a network of caravan routes by which silk, porcelain, and other precious items were shipped from China to Europe, mostly in exchange for gold and silver. Without actual roads or other infrastructure to support trade, the caravans consisted of large strings of horses or camels carrying relatively small loads on their backs without the aid of wheeled vehicles such as carts or wagons, which could not easily be dragged through the tall grasses. The caravan routes passed either north of the Caspian Sea to end in ports on the Black Sea or to the south to end in cities on or near the Mediterranean coast, such as Damascus or Beirut.

### INDIA AND THE INDIAN OCEAN

Islamic military operations to conquer India were attempted shortly after the conquest of the Sassanid Empire (651), but the greater part of the Indian subcontinent did not fall to Islamic rule until the establishment of the Mughal Empire in India in the 15th and 16th centuries. The Muslim heartland in India has always been the Sind (modern-day Pakistan), the valley of the Indus River. This was the host to another ancient civilization, as were the Nile and Tigris-Euphrates valleys.

Islamic control of India together with central Asia produced a monopoly over the two major east–west trade

routes: the caravan trade through inner Asia and the annual monsoon trade across the Indian Ocean between India and East Africa (for which prevailing winds made it easy for a fleet of trading vessels to sail from the mouth of the Red Sea to southern India and back once a year). This led first to the collapse of the Christian kingdom of Axum in Ethiopia, which had briefly controlled the Indian Ocean trade during the disruptions caused by the Islamic conquest of Egypt and much of the Byzantine Empire (seventh to ninth centuries C.E.). The prices of all goods delivered to western Europe were also systematically raised by taxation because of hostility between the Islamic regimes in the Mediterranean and the Christian civilization of western Europe. The desire to get around this Islamic monopoly led, at least in part, to the European age of exploration at the very end of the Middle Ages with the discovery, between 1480 and 1520, of new routes to India around the southern tip of Africa; the discovery of the Americas; and the first circumnavigation of the globe.

## NORTH AFRICA

Cyrenaica and Tripolitania in Libya (on the North African coast just west of Egypt) were conquered by Muslims in the original expansion of the caliphate under Muhammad's successors. The rest of the North African coast was conquered by the Umayyad Dynasty before 750 C.E. In Roman times the North African coast had enjoyed a temperate climate similar to Italy's and had supported many large and prosperous cities. However, deforestation caused by excessively intense agricultural exploitation of the land by the Romans allowed the Sahara to spread as far as the coast in many places. The Maghreb—the coastal plain between the Atlas Mountains and the Mediterranean in modern-day Morocco, Algeria, and Tunisia—was not as badly affected by this process as Libya. The Berber groups native to the area, suppressed under the earlier Visigothic and Roman rulers, already lived a manner of life similar to that of the Arabs because of the desert character of the land, which was comparable to Arabia. They enthusiastically converted to Islam and adopted the Arabic language, making the conquest of North Africa easier.

The main geographical feature of North Africa is the Sahara Desert. The Sahara is the second-largest desert in the world (after only Antarctica) at 3.5 million square miles (approximately the same size as the continental United States). The Arabian Desert, though separated from the Sahara by the Red Sea, is part of the same climate system. The Sahara has been expanding both north and south since the last ice age, approximately 8,000 years ago. As a desert, the Sahara was, like inner Asia, devoid of settled peoples or geographic barriers to trade in the medieval period and so became the home

of an extensive caravan trade between the Mediterranean and the peoples of central Africa. The trade was conducted by Berbers and Arabs from North Africa but also by the Taureg and other groups native to the Sahara itself. The main items traded were salt (vital for life in the dry, hot conditions of the desert), gold, and especially slaves taken in central Africa and sold at the slave markets in Islamic North Africa.

A hub of the trade across the Sahara was the city of Timbuktu. Located in the modern-day nation of Mali, the city stands on the river Niger (which empties into the Atlantic on the eastern African coast) at the edge of the Sahara. It was thus a natural transshipment point between river-borne and caravan traffic. Founded in the 10th century by the Tauregs, Timbuktu became the major city of the successive central African empires of Ghana, Mali (after 1324), and Songhai (after 1468). The madrasa of the Sankore mosque there became an important center of learning renowned throughout the Muslim world and a center for propagating Islam along the African trade routes deep within the continent. Because Europeans were not directly involved in the Sahara trade and because no Christian European ever visited the city before the 19th century, Timbuktu became in Europe a byword for the foreign and the unreachable. The city declined sharply at the end of the Middle Ages when the slave trade shifted south to Portuguese trading centers established on the African coast.

## SPAIN

The mountainous Iberian Peninsula, today comprising Portugal and Spain, was conquered by Moors from North Africa in 711 and became not only part of the Islamic world but also a leading cultural center. Although the climate is arid compared with that of western Europe (except for the northwestern coastal strip), it has a far wetter and more temperate climate than much of the rest of the Islamic world. Spain is separated from North Africa by the Strait of Gibraltar, a stretch of ocean only 9 miles wide.

Iberia is cut through by the valley of rivers that flow from central mountains into the Atlantic, such as (from south to north) the Guadalquivir, the Tagus, and the Duero. In the northwest the Ebro runs from the Pyrenees into the Mediterranean. The heart of Islamic civilization in Spain was in the Guadalquivir valley in the southern province of al-Andalus. The main cities in this region were Córdoba and Seville. Toledo, farther north on the Tagus, was also an important city. After the Guadalquivir valley was lost to the Christian kingdom of Castile in the 14th century, Islamic culture survived until 1492 in the city of Granada in the southern mountains of al-Andalus (Sierra Nevada), with peaks of about 11,483 feet.

## ASIA MINOR

In the first decades of the 11th century a small group of Turks (called Seljuks after their first ruler to convert to Islam) conquered much of inner Asia. At the battle of Manzikert in 1071, they defeated the Byzantine Empire and annexed all of Asia Minor (or Anatolia, approximately the Asiatic portion of modern Turkey), bringing that area, previously shielded by the barrier of the Taurus Mountains, under Islamic rule for the first time (and coincidentally giving the impetus to the First Crusade when the Byzantine emperor Constantine appealed to Pope Urban II for military assistance). Asia Minor, though mountainous, was a rich agricultural area and, because it was the western terminus of the inner Asian caravan trade, constituted the wealthiest portion of the Byzantine Empire. Accordingly, the Seljuk state founded in the area called itself the Sultanate of Rum (that is, Rome).

## EASTERN EUROPE

During the later Middle Ages approximately the eastern half of Europe became controlled by Islamic states. The Balkans is a large peninsula in southeastern Europe, and its territory is extremely mountainous. The highest peaks in the region are Musala in modern-day Bulgaria (9,596 feet) and Mount Olympus in Greece (9,560 feet). The Danube, which flows through the Balkans, is the longest river in Europe outside Russia. North of the Danube lies the Carpathian Mountains and the fertile Hungarian plain. The Ottoman Turks crossed into Europe through the straits at Gallipoli into the Balkans in the 1360s and began to conquer Byzantine territory in Europe as well as the Slavic and Hungarian states beyond, eventually reaching as far as Vienna in the Holy Roman Empire. Ottoman encroachment into Europe caused many Byzantine scholars to move to Italy, helping to spark the cultural movement of the Renaissance. The Ottoman capture of the Byzantine capital of Constantinople in 1453 is an important marker of the end of the Middle Ages. The burning of the city resulted in the irretrievable loss of a great deal of ancient Greek literature. The Turks made the captured city their own capital, gave it its modern name of Istanbul, and constructed important architectural landmarks there, such as the Blue Mosque and the Topkapi palace.

The early state of the Kiev Rus (in the modern-day Ukraine and Russia) was conquered by the Mongol Golden Horde, which quickly converted to Islam. The vast steppe regions of Russia allowed the nomadic Mongols to maintain their traditional way of life. This isolation ultimately proved fatal, since their Russian subjects maintained contact (however limited) with western Europe and adopted more modern forms of social and military organization, which eventually allowed them to overthrow Mongol rule.

The Volga, the largest river in Europe, empties into the northern end of the Caspian Sea. The surrounding region as far as the Caucasus Mountains, which mark the border between Europe and Asia, was occupied in the early Middle Ages by a Turkic people called the Khazars. While most of the peoples of inner Asia converted to Islam, the Khazars converted to Judaism beginning in the late eighth century. They seem to have been influenced by the Jewish merchant class of the area, many of whom had fled persecution in the Byzantine Empire.

## EAST AFRICA AND THE FAR EAST

Trade along the eastern, or Indian Ocean, coast of Africa was taken over in the Middle Ages by Arabs and Persians. They founded many trading colonies (with Zanzibar being the most important), and Islam spread, especially to local ruling elites; the area, however, was not conquered as part of the Islamic or Turkish worlds. Islam was also spread along trade routes to the eastern Asian archipelagos of Indonesia and the Philippines, beginning intensively in the 13th century. Islamic merchants routinely traded as far east as Canton in southern China.

## CONCLUSION

The phenomenal expansion of Islam in the generation after Muhammad was conditioned by the Arabian desert climate in producing a marvelous force of light cavalry for the work of conquest. At the same time the rapid spread of Islam was equally facilitated by the geographic realities of the time. Existing large political units like the Sassanian Empire or Byzantine provinces could be conquered and occupied by exploiting the administrative structures already in place, while missionary work proceeded along existing trade routes such as the Silk Road and the annual Indian Ocean monsoon merchant fleet.

## Africa

~ Ibn Battuta: Excerpt from *Travels in Asia and Africa (1325–54)* ~

### THE GREAT RIVER NILE

The Egyptian Nile surpasses all rivers of the earth in sweetness of taste, length of course, and utility. No other river in the world can show such a continuous series of towns and villages along its banks, or a basin so intensely cultivated. Its course is from South to North, contrary to all the other great rivers. One extraordinary thing about it is that it begins to rise in the extreme hot weather at the time when rivers generally diminish and dry up, and begins to subside just when rivers begin to increase and overflow. The river Indus resembles it in this feature. The Nile is one of the five great rivers of the world, which are the Nile, Euphrates, Tigris, Syr Darya and Amu Darya; five other rivers resemble these, the Indus, which is called Panj Ab [Five Rivers], the river of India which is called Gang

[Ganges]—it is to it that the Hindus go on pilgrimage, and when they burn their dead they throw the ashes into it, and they say that it comes from Paradise—the river Jun [Jumna or perhaps Brahmaputra] in India, the river Itil [Volga] in the Qipchaq steppes, on the banks of which is the city of Sara, and the river Saru [Hoang-Ho] in the land of Cathay. All these will be mentioned in their proper places, if God will. Some distance below Cairo the Nile divides into three streams, none of which can be crossed except by boat, winter or summer. The inhabitants of every township have canals led off the Nile; these are filled when the river is in flood and carry the water over the fields.

## Asia and the Pacific

~ Benjamin of Tudela: Excerpt from *The Itinerary of Benjamin of Tudela (12th century)* ~

Thence one returns to the land of Khuzistan which is by the river Tigris, and one goes down the river which falls into the Indian Ocean unto an island called Kish. It is a six days' journey to reach this island. The inhabitants neither sow nor reap. They possess only one well, and there is no stream in the whole island, but they drink rainwater. The merchants who come from India and the islands encamp there with their wares. Moreover, men from Shinar, El-Yemen and Persia bring thither all sorts of silk, purple and flax, cotton, hemp, worked wool, wheat, barley, millet, rye, and all sorts of food, and lentils of every description, and they trade with one another, whilst the men from India bring great quantities of spices thither. The islanders act as middlemen, and earn their livelihood thereby. There are about 500 Jews there.

Thence it is ten days' journey by sea to Katifa, where there are about 5,000 Jews. Here the bdellium is to be

found. On the twenty-fourth of Nisan rain falls upon the water, upon the surface of which certain small sea-animals float which drink in the rain and then shut themselves up, and sink to the bottom. And about the middle of Tishri men descend to the bed of the sea by ropes, and collect these shell-fish, then split them open and extract the pearls. This pearl-fishery belongs to the King of the country, but is controlled by a Jewish official.

Thence it is seven days' journey to Khulam which is the beginning of the country of the Sun-worshippers. These are the sons of Cush, who read the stars, and are all black in colour. They are honest in commerce. . . . From Passover to New Year, that is all during the summer, no man can go out of his house because of the sun, for the heat in that country is intense, and from the third hour of the day onward, everybody remains in his house till the evening. Then they go forth and kindle lights in all

(continued)

*(continues)*

the market places and all the streets, and then do their work and business at nighttime. For they have to turn night into day in consequence of the great heat of the sun. Pepper is found there. They plant the trees thereof in the fields, and each man of the city knows his own plantation. The trees are small, and the pepper is as white as snow. And when they have collected it, they

place it in saucepans and pour boiling water over it, so that it may become strong. They then take it out of the water and dry it in the sun, and it turns black. Calamus and ginger and many other kinds of spice are found in this land.

*Europe*

~ *The Venerable Bede: Excerpt from The Ecclesiastical History of the English Nation (731)* ~

**BOOK 1, CHAPTER 1**

Britain, an island in the ocean, formerly called Albion, is situated between the north and west, facing, though at a considerable distance, the coasts of Germany, France, and Spain, which form the greatest part of Europe. It extends 800 miles in length towards the north, and is 200 miles in breadth, except where several promontories extend further in breadth, by which its compass is made to be 3,675 miles. To the south, as you pass along the nearest shore of the Belgic Gaul, the first place in Britain which opens to the eye is the city of Rutubi Portus, by the English corrupted into Reptacestir. The distance from hence across the sea to Gessoriacum, the nearest shore of the Morini, is fifty miles, or as some writers say, 450 furlongs. On the back of the island, where it opens upon the boundless ocean, it has the islands called Orcades. Britain excels for grain and trees, and is well adapted for feeding cattle and beasts of burden. It also produces vines in some places, and has plenty of land and waterfowls of several sorts; it is remarkable also for rivers abounding in fish, and plentiful springs. It has the greatest plenty of salmon and eels; seals are also frequently taken, and dolphins, as also whales; besides many sorts of shellfish, such as mussels, in which are often found excellent pearls of all colours, red, purple, violet, and green, but mostly white. There is also a great abundance of cockles, of which the scarlet dye is made; a most beautiful colour, which never fades with the heat of the sun or the washing of the rain; but the older it is, the more beautiful it becomes. It

has both salt and hot springs, and from them flow rivers which furnish hot baths, proper for all ages and sexes, and arranged according. For water, as St. Basil says, receives the heating quality, when it runs along certain metals, and becomes not only hot but scalding. Britain has also many veins of metals, as copper, iron, lead, and silver; it has much and excellent jet, which is black and sparkling, glittering at the fire, and when heated, drives away serpents; being warmed with rubbing, it holds fast whatever is applied to it, like amber. The island was formerly embellished with twentyeight noble cities, besides innumerable castles, which were all strongly secured with walls, towers, gates, and locks. And, from its lying almost under the North Pole, the nights are light in summer, so that at midnight the beholders are often in doubt whether the evening twilight still continues, or that of the morning is coming on; for the sun, in the night, returns under the earth, through the northern regions at no great distance from them. For this reason the days are of a great length in summer, as, on the contrary, the nights are in winter, for the sun then withdraws into the southern parts, so that the nights are eighteen hours long. Thus the nights are extraordinarily short in summer, and the days in winter, that is, of only six equinoctial hours. Whereas, in Armenia, Macedonia, Italy, and other countries of the same latitude, the longest day or night extends but to fifteen hours, and the shortest to nine.

Ireland, in breadth, and for wholesomeness and serenity of climate, far surpasses Britain; for the snow scarcely

ever lies there above three days: no man makes hay in the summer for winter's provision, or builds stables for his beasts of burden. No reptiles are found there, and no snake can live there; for, though often carried thither out of Britain, as soon as the ship comes near the shore, and the scent of the air reaches them, they die. On the contrary, almost all things in the island are good against poison. In short, we have known that when some persons have been bitten by serpents, the scrapings of leaves of books that were brought out of Ireland, being put into water, and given them to drink, have immediately expelled the spreading poison, and assuaged the swelling. The island abounds in milk and

honey, nor is there any want of vines, fish, or fowl; and it is remarkable for deer and goats. It is properly the country of the Scots, who, migrating from thence, as has been said, added a third nation in Britain to the Britons and the Picts. There is a very large gulf of the sea, which formerly divided the nation of the Picts from the Britons; which gulf runs from the west very far into the land, where, to this day, stands the strong city of the Britons, called Aicluith. The Scots, arriving on the north side of this bay, settled themselves there.

## ► clothing and footwear

### INTRODUCTION

The wearing of clothing is a distinctively human trait. It is not preordained by nature; it is not required by human genes. Instead, it is an artificial custom that developed to help people cope with difficult climates and evolved over the ages into social customs for many but not all cultures. Frequently, the wearing of clothing is a form of self-expression—a way for a person to show individuality by displaying his or her personal taste in cuts of garments, colors, and shoe styles. In cultures in which powerful social groups fear or just resent individuality, the kind of garments worn sometimes has been fixed by government decrees or religious prohibitions.

There were a variety of reasons for not wearing clothing in some cultures. One was the lack of suitable materials for making clothing. Among those peoples who had no textiles, animal skins, tree bark, or leaves might be the only sources of material for garments, and a lack of any of these items could leave people with limited choices in clothing and footwear. Another factor is climate. A hot climate could account for why some medieval Australians, Africans, and Americans wore few clothes most of the time. Among nomadic Australians, most clothing would have been too much of a burden to carry. In warm, moist climates, such as tropical forests, clothing could be very uncomfortable when muddy or wet, and clothing could foster skin diseases such as those caused by fungi. In many cultures scanty clothing could be a sign of poverty or misfortune. The poverty could be deliberately chosen, as was the case with many Indian ascetics, but more often it was a sign of a society's failure to care for its poor.

The most obvious reason for wearing clothing is for warmth. In northern Asia people were often nomadic, but the wearing of animal skins was a necessity for survival. Their domestication of beasts of burden aided in the carrying of the clothes they needed. In searing hot sunlight in open territories such as deserts and grasslands, clothing could be worn as protection from the damage sunlight could cause. Even so, someone who labored hard in hot weather outside might have to minimize clothing that was close to the skin, for the same reason people in tropical forests would do so: to avoid skin infections. Hence, loose robes were common in the Near East and North Africa.

As societies became more complex, the purposes of clothing often became more complex, too. In medieval cities there might be bakers, blacksmiths, tanners, launderers, and other specialized workers who would require special clothing such as aprons or gloves to protect themselves from the everyday hazards of their tasks. Thus it would be possible to recognize the livelihoods of people just by what they wore.

In many societies clothing carried political messages. Even in a small central African community, a leader could be recognized by his or her robes, or the status of the daughter of a chief might be acknowledged by the sandals she wore. During the Han Dynasty (202 B.C.E.–220 C.E.) of China laws were made governing what kind of clothing people could wear. These laws stemmed from resentment by the rich of poor people who wore nice clothes; commoners were restricted to dull colors and unimposing cuts of garments. At times during the medieval era yellow was the color that distinguished Chinese commoners from their social superiors. Emperors were required to wear certain types of robes at specific times of the year to influence the changes in the seasons. In India outcastes were often required to wear only torn, well-used clothes—sometimes only animal skins, which were considered very impure and identified them as the lowest of the low in society.

The availability of certain kinds of animal skins or fabrics could affect what people wore. For instance, the history of cotton fabrics is one of adoption by societies over hundreds of years, first in India and North Africa, then in the Far East, then in much of the rest of Asia, and eventually in Europe. Cotton was a light fabric, well suited to wearing in warm weather, but Europeans went without it because for centuries it was unavailable to them. Much trade in the medieval world involved clothing and the materials for making clothes. The silk and cotton wraps used in India and western Africa became fabric for shirts in other lands. The zori, a thonged sandal, of Japan, became popular footwear not only in eastern Asia but eventually far to the west.

## AFRICA

BY AMY HACKNEY BLACKWELL

Each of the various peoples of Africa created unique clothing cultures and traditions. Further, each people created a distinctive weaving style, which was passed from generation to generation. As a ruling class emerged in Africa, weavers and tailors developed luxury versions of their products. The clothing of kings and nobles was rich and elaborate, serving to separate them from the common people over whom they ruled.

People wore clothing for various reasons. Wealthy people used clothing to show their status, but for most people clothing was functional. Except at high elevations, the climate in Africa was generally warm, so people did not require clothing to protect them from extreme cold. Protection from heat and sun was a larger concern. Thus tropical African clothing was often made of lightweight cloth and in light colors to reflect sunlight away. Because the weather was so hot, people could wear very little clothing and still remain comfortable.

Woven cloth first arrived in North Africa in Phoenician times, early in the first millennium B.C.E. During the ancient period weaving technology traveled south across the Sahara, such that by the fifth century C.E. many African peoples were wearing clothing made of woven cloth. Most cloth was made of cotton, which grew well in North Africa, the Middle East, and India and, by the beginning of the medieval period, was also grown in much of sub-Saharan Africa. The use of cotton clothing traveled gradually through the African continent over the next millennium.

Cotton was not the only fabric available for African clothing. Wealthy people wore imported clothes made from silk. In tropical Africa people used the fibers of the raffia palm to make a woven textile called raffia. Garments made from raffia included hats, capes, loincloths, and shirts. Many African peoples of the medieval period had no woven cloth of any kind. Whatever clothing they wore had to be made of leather or available plant materials. Leather and skins and other similar substances also could be used as a fashion statement. Many people wore animal skins as decoration and to show their courage or status. The people of central and eastern Africa wore the black and white skins of the colobus monkey. Chiefs might wear lion skins to show their courage and strength.

Different African peoples used different colors when making their clothing. The Masai of eastern Africa favored red in their clothing and tried always to wear at least a small amount of that color. The people of Ghana chose bright shades of gold, yellow, green, red, blue, and black, with each color having a distinct meaning. Only people of the highest status could wear gold clothing. Yellow was the color of fertil-

*Clothing patch (leather, cloth, gilt, and paint); Egypt, ca. 250–ca. 650*  
(Los Angeles County Museum of Art, Gift of Jerome F. Snyder, Photograph  
© 2006 Museum Associates/LACMA)

ity, green evoked renewal and the cycle of birth and decay, red was the color of passion and political will, blue was the color of the sky and a pure spirit, and black symbolized spiritual awareness and communion with ancestors. Different colors also had various ceremonial meanings. For example, in western Africa some people wore white clothing for happy occasions, such as naming ceremonies, and dark clothing in black, brown, or red for funerals.

The Bambara people of Mali made a fabric called *bogolanfini*, a cotton cloth dyed with fermented mud to form elaborate patterns in black, brown, and white. Common motifs included squares, fish bones, and stars. The Bambara women made shirts, trousers, and wraps out of this cloth. The seamstress would make sure that the patterns on the cloth fitted together correctly so that a finished garment would have an attractive appearance.

As people traded with one another and traveled across the continent, the same basic garments became common throughout much of Africa. These clothes included wraps made of rectangular pieces of cloth, loose shirts of varying lengths, trousers and shorts, and gowns. Each group had its own distinctive ways of making and wearing their clothing. Common people wore the simplest forms of these garments and had the scantiest wardrobes. The wealthy and the nobility wore the most complicated and elaborately sewn and decorated versions and owned more clothing.

Medieval Africans showed tremendous ingenuity in wrapping and tying rectangular sheets of cloth into garments.

Ethiopians wore long rectangular cloths wrapped around their bodies and tied over the shoulders and around the hips with straps. The entire garment fell to the feet. The front was cut longer than the back, which allowed the wearer to drape it into graceful folds. Masai of both sexes dressed in loose garments with cloaks wrapped around their shoulders.

Women throughout much of Africa often wore wrappers similar to Asian sarongs. They could put long rectangular strips of cloth to a variety of uses. A wrapper could be made into a dress in several ways. A wearer could hold one end of the cloth under her arm in front of her chest and then wrap the cloth around her body twice, passing it under her breasts and around her back and then tying the ends in front of her chest. Women often left their breasts bare out of custom and so that their babies could nurse freely. A woman might use a second long piece of cloth to secure her baby to her body, either on the side of her hip where the child could reach her breasts or on her back to be out of the way while she worked or traveled. Women also wrapped cloth around their heads for decoration and to keep the sun off. Some of the many methods of wrapping were very elaborate and decorative.

Most men and some women in western Africa wore long, flowing robes known as boubous. Adapted from Islamic styles of the Middle East and North Africa, the boubou had long, wide sleeves and fell to the wearer's ankles. It was basically a long shirt constructed from a large square of cloth; the large amount of cloth allowed ample airflow within the garment. The sleeves of the boubou were very long—long enough for a man to place them over his shoulders when sitting. Sometimes a man would wear drawstring trousers and a shirt underneath it. The shirt and pants would be made of the same material as the robe, typically a silk fabric, with embroidery decorating fancy versions.

Apparently, the boubou appeared in the Ghana Empire around the eighth century and was adopted by the men of the Mali Empire in the 13th century. The first wearers were Islamic Africans who had contact with the camel caravans that traveled to western Africa across the Sahara from the Middle East or North Africa. Many of the conventions for wearing the boubou were adopted from the Berber people of the Sahara.

A colorfully patterned fabric called kente cloth was first made in Ghana in the 12th century. It was originally fabricated as clothing for the kings of the Ashanti people. The king decided who else could wear kente cloth. At first only the royal household and officials were granted permission, but over the years the privilege extended to more people, and eventually it became widespread throughout the region.

Kente cloth is made by weaving strips of cloth in bright colors and patterns and then sewing the strips together into

a patchwork design. The designs were not merely decorative. Patterns had specific meanings that communicated status, religion, and historical and cultural meanings. Some patterns were worn only by men and others only by women. A man would usually drape the kente cloth over his shoulders as a shawl or wrap, leaving his right shoulder and arm uncovered. A woman would wrap the kente cloth around her body as a kind of dress. The kente indicated the wearer's status and wealth and often had a ceremonial significance.

The groups of small people who inhabited the forests of central Africa typically wore very little clothing, and their children wore none. Adults sometimes covered their genitals with small garments, though they, too, often went completely naked. Men occasionally wore loincloths made of the skin of animals, such as deer. Women would make themselves little aprons of green leaves, which had to be fashioned anew daily because the leaves dried out.

The various Bushmen who inhabited the deserts of southern Africa often wore nothing at all. Infants and children went completely naked, and diapers did not exist. People of the desert did not make cloth, so any sort of clothing they wore had to be made of leather or gathered plant material. Adults of both sexes might cover their genitals with loincloths or aprons made of leather. Women with babies secured them to their bodies in leather slings.

Some groups of pastoralists in eastern Africa likewise wore very simple clothing. Men wore brief loincloths made of pieces of leather tied around their waists with leather thongs. Women might wear the same type of garment. A woman might also wear an entire goatskin or sheepskin dyed black or red and tied around her body with a leather thong. Both sexes typically wore no clothing on their torsos. Children went naked.

Nakedness was, in fact, fairly common among adults in much of Africa throughout the medieval period. In the 15th century, for example, a North African historian visited Mali and reported to his horror that women of the Mali Empire, from slave girls to the sultan's daughters, went about naked. He also reported seeing men dressed in fine clothes and described men washing their clothes so that they would have good white garments to wear on Friday for religious services.

Throughout Africa many people went barefoot for their entire lives. Those who did wear shoes typically wore simple sandals made of leather. The shoes had leather soles cut in the shape of the wearer's foot. The straps might be in a thong design, with a piece of leather between the big toe and second toe to hold the shoe steady in front. The leather straps could be made from plain leather or from many narrow strips of leather braided together in a decorative pattern.

## THE AMERICAS

BY JULIA MARTA CLAPP

In Mesoamerica clothing was symbolically and socially significant, as were most other aspects of native cultural production. Much of our current knowledge comes from art produced by Mesoamericans, such as manuscripts, murals, and sculpture. Textiles are an especially perishable material, so evidence comes less often from actual artifacts, except in more arid climates, such as Peru in South America, where textiles have survived in greater quantities.

Mesoamerican garments from this period were generally formed by single pieces of cloth that were draped over the body, tunics that slipped over the head through a hole cut in the center, pieces of cloth that were sewn together to form a garment, and cloth sewn in order to sheath the arms and legs. The four basic types of clothing were the loincloth, the hip cloth, the cape, and the wraparound skirt. Garments were woven from plant and animal fibers (such as cotton or the wool of the llama). Weaving was generally (but not always) performed by women.

Information about the Aztec (ca. 1200–1521) is particularly rich because of the records of the civilization itself as well as those of the Spanish conquerors and missionaries who recorded aspects of Aztec life. (Of these, one of the most prolific was the Spanish missionary Fray Bernardino de Sahagún [1499–1590], whose 12-volume *Florentine Codex* is an invaluable resource.) There were dozens of different types of garments worn by the Aztec. These were distinguished by their use, such as garments used in ritual or war, by rulers, by gender, or in everyday life. They were also distinguished by their decoration; garments were woven with colors and patterns and at times were trimmed with materials, such as leather or feathers.

An example of Aztec clothing made to be draped over the body was the loincloth, which was worn by men. Second in this category was the hip cloth, also a male garment, which was a triangular piece of cloth worn around the waist and tied on the side. The mantle, or cloak, was a garment that indicated high social status and that could be worn by royalty, warriors, or common people who had earned the right. While mantles indicated social status or deeds recognized by the ruler, they could also be used in trade and tribute.

Aztec women wore skirts, which were often decorated with colorful woven patterns or images. Different skirts would be worn for different activities, such as ceremony, mortuary practice, and daily duties, such as cleaning. Garments that slipped over the head but were not sewn were worn only for ritual. These garments would be worn alone or with another item of clothing underneath.

Some sewn articles of clothing were generally worn open in front, in the manner of an unbuttoned coat. They could take various forms: as armor for warriors or as fringed jackets for men. A second type of sewn clothing was joined with seams and pulled over the head instead of worn open in front. This second type was worn primarily by warriors. (It is interesting to note that Spanish conquerors in both Mesoamerica and South America adopted the custom of wearing woven fabric armor in favor of their much heavier metal protection.)

The Maya of the Yucatán peninsula in the late Postclassic period (ca. 900–1517) incorporated many of these same principles in their clothing. Many of the details are similar, such as feather decoration and the triangular hip cloth or quilted armor. In addition—as with the Aztec—these articles of clothing were worn by humans and (representations of) deities alike.

One article of clothing that art historians have identified as uniquely Mayan is the kilt. The kilt was worn ceremonially during the five days just before the New Year, which the Maya considered to be unlucky. Kilts were usually woven or made of plant leaves. Mayan women wore hip cloths or skirts cinched at the waists. Over the skirts they wore slip-on garments, which covered the breasts and the back and were open at the arms. Evidence suggests that the lowland Maya of this era did not seem to wear ornate ritual costumes. It is important to remember that these findings (and any findings) are not definitive but rather reflect the extent to which archaeological research has been able to provide information.

*Four-cornered hat; camelid fiber, Peru, ca. 600–ca. 850* (Los Angeles County Museum of Art, Costume Council and Museum Associates purchase, Photograph © 2006 Museum Associates/LACMA)

South America before the Spanish conquest has an exceptionally rich history in textile production. All clothes worn by inhabitants of modern-day Peru, Bolivia, Chile, and Argentina were constructed out of woven cloth. In the Middle Horizon Period (ca. 500–ca. 1000) artisans from the Wari state (now Peru) made cloth with an astonishingly high number of threads per inch. (The greater the thread count, the better the quality of the cloth.) Tunics made from this fabric were worn as ritual attire by elite citizens (as were mantles) and also were included in burials. They were woven with brightly colored geometric designs or depictions of abstract animals and occasionally were decorated with feathers. One particularly extraordinary tunic from around 1000 to 1500 is made of cloth with bright, tropical feathers sewn onto it, creating an entirely feathered surface. The fact that this tunic has survived is a testament to the dry climate of this area, which can preserve delicate materials. Other kinds of tunics and mantles as well as loincloths and head cloths were worn by society as a whole. The elite also wore the unique square (four-cornered) hats. These were boxlike, woven hats with a nub of woven material at each corner. They were decorated with colorful images of animal-like creatures and were worn perched atop the head.

During Inca times (ca. 15th and 16th centuries) textile production was at the heart of social control and economic exchange. Clothing was the means by which an individual expressed his or her social status. Because the empire was so geographically large, manner of dress was also a way of identifying local affiliation with a particular region. Dress further could reflect particular situations, such as a warrior's victory in battle (for which he would be rewarded with luxurious clothing) or a war prisoner's humiliation (in which he would be required to wear a long red tunic indicating his defeat by the Inca).

Tunics were the most common form of everyday dress and—like everything else in the Incan civilization—were strictly regulated by the government. Measurements were standardized: 33.27 inches long and 30.71 inches wide. In general, the tunic was decorated not with intricate imagery but rather with geometric pattern. (However, it is important not to underestimate the symbolic significance of geometric design in Incan society.) All woven clothing was worn as a single piece: The Inca (as contrasted with the Spanish) did not sew together pieces of cloth to form a garment.

The mantle was also an important part of Incan clothing and, unlike the tunic, was frequently decorated with fantastical images of birds and beasts woven into the fabric. These were very abstract or were mythical animals not found in life. One side of the mantle was usually smooth and “finished,” while the other side was less so; the finished side would have

been exposed to the outside. The mantle generally was worn draped over the shoulders.

Regretfully, there is still much work to be done in Native North American art of this period. Our knowledge of clothing from the era before the invasion by Europeans is very limited in comparison with all we know about Mesoamerica and South America. What we can surmise comes mostly from figurative representations in art and artifacts retrieved from burials. Each has limitations. In burials we cannot be sure whether the garments were for burial purposes only or were worn in real life as well. In sculpture we can only make an educated guess as to the type of figure represented and the meaning or function of its garments.

For example, there are art objects from the Mississippian Period (ca. 750–1500) in the midwestern, eastern, and southeastern United States that probably represent elites—either rulers or priests who wore ornate costumes. These costumes often take animal form, essentially transforming the wearer in what is thought to have been a ritual ceremony. Other figures are depicted wearing simpler clothing of skirts, shirts, and loincloths.

People in the Caribbean during this era were known as the Taíno. Knowledge of their clothing styles and traditions is also relatively limited, for several reasons. As with the Native North Americans, this era is understudied in history. Second, the Taíno, living in an especially warm environment, did not wear many clothes. Last, the common problem related to perishable materials persists in the Caribbean: The materials simply have not withstood the effects of time and the environment.

We do believe that in general, young men and women who were unmarried spent their everyday lives naked. The few remaining artifacts of exquisite beadwork suggest that Taíno royal and ceremonial costume was just as elegant as that of other native civilizations and was similar in the decorative use of beads and feathers. Otherwise, as did other Americans before the Spanish conquest, the Taíno wore skirts and mantles.

## ASIA AND THE PACIFIC

BY CARYN E. NEUMANN

The fragility of the clothing and footwear worn in the distant past makes the study of historical costumes difficult. While medieval textiles have largely disintegrated, information about dress can be found in several sources. Travelers often gave detailed accounts of the costumes they saw. Sculpture and paintings also serve as mirrors into a distant past, as do governmental and religious rules. The popularity of certain fashions in India is implied by the Buddhist and Jain regula-

tions forbidding monks to use materials deemed impure or to wear clothing or footwear considered provocative. All these sources reflect the social and cultural practices of the period.

The history of clothing and footwear in the medieval Asian world must begin with China, sometimes called the kingdom of costumes. The Tang Dynasty (618–907 C.E.) and the Song Dynasty (960–1279 C.E.) were particularly noted for their splendor, while the Yuan Dynasty (1279–1368) was heavily influenced by the less colorfully arrayed Mongols. Costumes popular in earlier dynasties were relatively plain. The Sui Dynasty (589–618) began with relatively plain dress. At the start of the seventh century the Sui government specified the costume for each rank, from the emperor to petty officials.

The Tang initially retained the Sui dress code. In time, however, the Tang absorbed exotic styles of clothing and headgear, transforming regulation dress into distinctively and beautiful costumes. Men's costumes consisted mostly of silk turbans, or *fu tou*, and robes with round collars that were holdovers from the Sui era. Gauze hats, popular among Confucian scholars and hermits, were the usual headgear for formal occasions such as imperial court gatherings, legal hearings, and formal banquets. Typically, a robe was made of fabric woven with designs and colors indicating the rank of the wearer. Later in the period the robes were embroidered with various designs to identify the wearers as civil officials (birds) or military officers (animals). A Tang woman usually wore a bamboo hat with a veil and a short-sleeved cropped jacket with a long skirt, the waist of which was fastened under the armpit. The jacket sleeves gradually became longer as time passed. The collar was round, square, slanting, or V-necked. Many women wore boots, as did men of all classes.

At the beginning of the Song Dynasty the costuming of officials and members of the military remained almost the same as in the previous period. The rise of the idealist philosophy, however, led to a call for simplicity in dress. Consequently, Song clothing was quite reserved and conservative, with fewer variations and quieter colors. Most men continued to wear robes with round collars. The color of the robe—purple, crimson, red, blue, or green—indicated the wearer's rank. A woman's upper garments consisted mostly of a coat, silk or satin blouse, loose-sleeved dress, overdress, short-sleeved jacket, and vest. Beneath all those was a skirt. A lower-class woman wore a jacket but no overdress, and a short-sleeved upper garment and sleeveless vest identified the wearer as a commoner. Men wore boots, but women did not, because foot binding had come into fashion. Women wore silk or satin shoes embroidered with various designs.

The Yuan Dynasty, initially noted for its simplicity in clothing, also adopted an elaborate system of dress. The

Oval buckle with dragon; jade or soapstone, China, ca. 1279–ca. 1368 (Los Angeles County Museum of Art, gift of Patricia G. Cohan, Photograph © 2006 Museum Associates/LACMA)

working costume for an official was a floor-length robe made of muslin with loose sleeves, a round collar, and buttons on the left side. Different colors denoted different ranks. The emperor and his courtiers wore clothes of one color only. Commoners wore tight-sleeved gowns and short-sleeved overjackets. Women also wore robes buttoned on the left side. Cuffs were tight, and trousers without a crotch or waist were worn under the robe. Dark shades showed the Mongolian influence, as did the buttoning on the left. Men and women of the north wore boots, while footwear styles in the south remained the same as the Tang system.

In Korea the basic styles of dress were established in the Three Kingdoms Period (300–668). Among the mountain nomads of northern Asia, both men and women wore pants (*baji*) and jackets (*jeogori*). For both men and women the typical jacket extended to the hip and was tied around the waist with a band. It had a straight neck band, narrow sleeves with trimmed hems and cuffs, and a rectangular cloth with variously colored stripes sewn to the center front of the bodice (*seop*). The pants had narrow legs tied at the ankles. In southern Korea, although women usually wore pants, they occasionally wore skirts (*chima*) instead. The skirt was long and gathered, with a wide band attached at the hemline. A coat (*po*) was worn over a jacket with pants or a skirt. The basic shape of the coat was the same as the jacket, except that the coat might have wide sleeves. Hats usually had brims. The hat of high official was decorated with feathers and held on by a string adorned with jade, coral, agate, or lapis lazuli, indicating the wearer's rank.

As in most of eastern Asia between the seventh and ninth centuries, the Silla Kingdom (668–918) of Korea adopted the official clothing styles of China's Tang Dynasty. In

1387 the ruler Wu ordered that officials' attire follow that of the newly established Ming Dynasty. Thereafter, Korean officials wore the *samo* silk hat and the *dannyeong* coat of their Chinese counterparts. Ranks were distinguished by the materials used in making the belts. Shoes were fabricated from leather, silk, wood, cattail, straw, and brass. Men's and boys' shoes had blunt toes, while footwear for women and girls were pointed. Clogs with high heels were used on muddy roads in the rain.

Travelers, particularly students, brought Chinese clothing and dyed fabrics to Japan. During the Sui Dynasty, Chinese women changed the closing of their kimono-like robes from the left to the right side. Japanese women promptly followed suit, relegating kimonos crossed from right to left to the dressing of corpses. Men's costumes were stiffer in both cut and material. Straight cuts of fabric were the norm.

Color particularly appealed to the Japanese. In 648 the emperor Kotuko reorganized the Japanese court according to the Chinese Tang style. Regulations mandated that men and women below the rank of prince wear, in order of rank, purple, lavender, crimson, Indian red, cherry, mulberry, dark blue, light blue, leaf green, and grass green. Paler shades indicated lower stations. Persons of no rank wore yellow. Successive ranks of the nobility were also indicated by the colors of their hat cords, with purple—signifying the perfect harmony of yang and yin in Chinese cosmology—given to the highest rank.

Hats were colored to indicate ranks. Many were decorated with lacquer. The emperor's tall hat carried a sort of roof, festooned with jewels in the Chinese style. Other men wore high, narrow caps. The nobility wore robes of brocades and thin gauzes in many colors and designs. Shinto priests wore white robes with blue skirts or green coats, stiff black hats, and lacquered shoes. Women typically did not wear hats. After the fall of the Tang Dynasty the cut of all Japanese clothing became extremely large. A nobleman of the Heian Period (737–1185 C.E.) wore sleeves so big that they hung to his knees when his arms were crossed. A woman might wear as many as 20 kimonos at once, with two cloaks on top.

Like other parts of Asia, Tibet fell under the influence of China. In their cold, mountainous homeland where snow remains on the ground even in the summer, the Tibetan people dress warmly year-round. Eighth- and ninth-century accounts indicate that boots—simply hide turned inside out with the inner fur keeping feet warm—were the most common footwear. In the 11th century the historian Ouyang Xiu noted that the Tibetans wore fur and felt. Another observer from the court of the Tang emperor Gaozong reported that the Tibetans wore several layers of sheepskin in the winter and still needed to wear wool in the summer.

When the Tibetan ruler Songtsän Gampo married the princess Wencheng of the Tang court, she brought much of the Tang culture into Tibet. As Gampo abandoned his furs, the upper classes followed suit by adopting Chinese styles. They wore silks and satin with leather boots that had upturned tips. Aristocratic men wore cloaks, while noble women typically dressed in capes. Males wore tweed or sheepskin vests. Commoners still could wear only felt in the summer and fur in the winter. Tibetan fighters were rewarded for their bravery on the field of battle with tiger skin robes to indicate that they were as brave as tigers. To punish a man who fled the battle, a foxtail would be attached to his head to indicate humiliation.

The Tang Dynasty collapsed in the ninth century along with the Tubo Kingdom in Tibet. Clothing styles changed as well. Despite its internal political divisions, Tibet continued to be strongly influenced by Chinese fashions. The Yuan Empire brought boots with colorful brocade patterns, vests made from brocade with patterns in gold and decorations of pearls, robes with colorful mantles for Buddhist priests, and a black headdress with gold trimming for the Living Buddha. Felt, wool, and skins remained popular in Tibet, in concession to the weather. When the Yuan Dynasty collapsed in the 14th century, Tibetan officials and nobles were forbidden by the Phag-ru regime to wear ordinary dress on festive and ceremonial occasions. They had to wear silks, satins, gold, jade, and jewelry. As prosperity increased in Tibet during the Phag-ru regime, the production of tweed also increased. It became the main material for Tibetan costumes and was used to pay tribute to the Chinese central government.

In India, the Philippines, and other parts of the Pacific with warm climates, it was common practice to walk barefoot. Shoes were worn to protect the feet against severe climatic or topographic conditions. The ascetics of the Hindu, Buddhist, and Jain sects in India were not generally permitted the worldly luxury of footwear. Instead, they used footwear made of wood to prevent contact with any ritually impure substances. Other Indians wore mules, slippers, shoes, boots, socks, and, most often, sandals. These items, often colored, were made from cow, buffalo, or goat hide; silk, wool, or cotton; or various grasses, with ornaments of animal skins, feathers, and scorpions' tails. The toe-knob sandals (*paduka*) of India were fancier attire made of wood, ivory, brass, silver, and semiprecious stones such as jade.

## EUROPE

BY AMY HACKNEY BLACKWELL

Medieval clothing was simple and designed mainly to keep the wearer warm and covered. Most people in the medieval period dressed in tunics and cloaks that required minimal

sewing and tailoring. Families wore clothes they produced themselves, from making the cloth to finishing the garment. Because it took much time and effort to make a single garment, few people had extensive wardrobes. It was common for a person to have only one set of clothing and to wear it every day for months or even years. By contrast, a wealthy member of the nobility or royalty might own an extensive wardrobe fashioned from fine materials. Because the upper classes were the most common subjects of paintings of the time, the best information about medieval clothing comes from them.

Most medieval clothing was made of wool, linen, and leather. Cotton was unknown in Europe until the end of the medieval period and did not become a common fiber in clothing until the Industrial Revolution. People raised sheep throughout Europe, using the animals for meat and milk as well as wool. They spun the wool into threads and used looms to weave the thread into cloth that was warm and water resistant, albeit itchy. Flax grew throughout Europe, and people wove it into linen cloth. Although linen was most common in warm areas, some northern peoples imported it to make lightweight garments. Silk had to be imported from Asia, which made it uncommon and expensive.

In the early medieval period (between 450 and 900) the fashion center of Europe moved from Rome to Byzantium. Byzantine styles spread throughout Europe but were especially concentrated in eastern Europe and Russia. The basic Byzantine outfit for a wealthy person started with an undershirt made of silk or fine linen, worn by men and women. The shirt had long, fitted sleeves, unlike the sleeveless tunics common during the ancient period. It also might have a high neck. On top of their garments both sexes wore long cloaks. An ordinary cloak was made in the shape of a rectangle. For formal occasions people wore semicircular capes that fitted the shoulders and draped better than rectangular cloaks. Cloaks were fastened at the neck or shoulder with pins. In bad weather men and women wore hooded cloaks, which might be sewn shut in front to keep out the wind. The clothing of both sexes was as richly adorned with embroidery and jewels as the wearer's budget allowed.

On top of the cloak a man would wear a long tunic; lengths ranged from below the knee to the ankles. During the fifth and sixth centuries many men topped that tunic with another tunic called a *dalmatica*, which had been popular during the Roman imperial period. The *dalmatica* had long, loose sleeves and fell to the feet. During the later Byzantine period ordinary men stopped wearing the *dalmatica*, although kings and priests still wore it. Below his tunic a man would wear a pair of short breeches. On his legs he wore stockings, either knitted of wool or cut and sewn from silk and tailored to fit the leg closely. During the sixth century

men began wearing trousers, which until that time were considered suitable only for barbarians. Mens' shoes were made of soft leather or fabric and were custom-fitted to the wearer's feet. Early shoes were simply designed and had no heels, but they became more structured over time.

A woman wore a full-length gown on top of her under-shirt. Over that she might wear a gown, called a *stola*, belted around the waist. Over everything a lady would place a cloak called a *palla*. The *palla* could be woven in very elaborate patterns. Ladies sometimes covered their faces or heads with veils of fine silk. Women also wore leather or cloth shoes, often heavily adorned with pearls or gold embroidery.

In western Europe during the early medieval period people wore styles similar to those of Byzantium but much less elaborate. The Norman court of France became something of a fashion center in its own right during the Byzantine period and later. Both men and women in Europe wore long, tight-fitting tunics called *bliauts*. Men's *bliauts* fell to below the knee and women's to the floor. Both sexes wore heavy mantles over their garments. Some mantles were hooded. In cold climates people covered their shoulders with cloaks made of fur or sheepskin.

Under the *bliaut* a person would wear a chemise, or shirt. The chemise could be sleeveless if worn under a *bliaut* with long sleeves, or it could have tight, laced sleeves if the *bliaut* was sleeveless. Starting in the 12th century women laced their *bliauts* very tightly around their waists. They might wear corsets underneath to make their waists even smaller. On top of the *bliaut* a lady would wear a girdle, or belt, which could be as elaborate as the wearer's taste and means permitted. A woman's *bliaut* contained a great deal of material in the skirt.

Leather shoe and model for a foot; Britain, late 14th century (© Museum of London)

The skirt could be slit up the sides, with a long train in back. Sometimes the sleeves were very wide and loose as well.

Men began wearing linen undershirts called *shertes* in the 11th century. The *sherte* fell to the knee and had long sleeves. Wealthy men wore *shertes* decorated with embroidery. In the winter they covered their *shertes* with heavier woolen tunics. Men's *bliauts* were as tightly laced as women's, and historians believe that some men wore corsets under them. A man's *bliaut* often had a band of heavy embroidery around the hem to help it hang nicely. Under his clothing a man wore breeches that resembled cloth diapers; they were wound around the waist and through the legs, and the loose ends were tucked into the belt. Some men wore trousers. Peasant men made do with pieces of leather wrapped around their legs and secured with leather thongs. On their legs people wore loose stockings that could be sewn from heavy woolen cloth or knitted from fine silk or wool. People held up their stockings with garters that crisscrossed the legs and were fastened above or below the knee.

During the later medieval period people continued to wear the same basic styles with occasional new garments and a wider variety of fabrics as trade with the East introduced new textiles to Europe. Fabrics came in a greater profusion of colors as well. In the 12th and 13th centuries men continued to wear linen undershirts and drawers. They wore stockings that covered their legs entirely and held them up by tying the tops to their undershirts or belts. Over his undershirt a man would wear a calf-length tunic topped with a sleeveless shirt called a *cyclas*. During the 1300s men began wearing a short tunic called a *cotehardie*. It was made in four panels sewn together at the front and sides. The panels could be of different colors, a design called parti-colored. Men sometimes wore a padded tunic under the *cotehardie* to make themselves look more muscular. Atop the *cotehardie* a man might wear a calf-length tunic called a surcoat; it had loose sleeves that showed the tight sleeves of the *cotehardie* beneath. On his head a man would wear a cloth covering called a coif that tied under the chin. Over that he might wear a hood; in the late 13th century the hood grew longer until its point might hang down almost to the wearer's feet.

A woman of this period wore two gowns, one on top of the other. The undergown had long sleeves and a long skirt. The overgown had shorter sleeves and longer skirt so that it trailed in back and had to be held up in front, showing off the undergown. Typically, a woman wrapped her head and neck in lengths of linen in a style called a gorget or wimple. A woman also wore the *cotehardie* in a longer version than the man's style.

During the 14th and 15th centuries tailors became more skillful, and clothing began to fit better than in previous cen-

turies. Men's tunic hemlines rose until they were scarcely hip length. Stockings in this period evolved into actual tights, which covered the legs and the man's lower torso. A man would tie his stockings to a short sleeveless tunic and cover that with a long-sleeved jacket called a *jupon* or *pourpoint*. The *cotehardie* still existed, but only nobles wore it in this period.

Women continued to start their ensembles with a chemise made of fine linen or silk cloth. Over that a woman would wear a dress called a corset, which had a fitted bodice laced up the front, long tight sleeves, and a full skirt. Over that she would wear a surcoat with a low neckline and large armholes through which the corset could be seen.

During this period both sexes began wearing a gown called a *houppelande*. The garment and its enormous sleeves both fell to the floor. The hems of the sleeves were cut in elaborate patterns and ornately embroidered. The *houppelande* was usually worn with a high collar.

Both men and women continued to wear shoes made of leather or cloth. Men wore fitted leather boots when they went outside or rode horses. For inside wear some men wore shoes with long, pointed toes, occasionally stiffened into curls with whalebone or wire. When they went outside, both sexes tied wooden platforms called patters to their shoes, which

kept the shoes and hems of their garments out of the mud and dust.

## THE ISLAMIC WORLD

BY CARYN E. NEUMANN

Textiles held enormous importance as one of the major industries of the medieval Islamic world. Textile manufacture and trade probably occupied a majority of the working population. There has been little research into the clothing of the period, however, partly because few dated examples have survived the ravages of time. As a result, it is difficult to assign clothing styles to the major centers of the region. Clothing nonetheless constitutes a cultural statement that communicates a great deal of information about the medieval Islamic world.

The fashion of dress of the medieval Muslim community stayed close to the styles of the earlier period, with certain modifications for the new moral sensibilities engendered by Islam. Functionality became tempered by ideology. The basic articles of clothing for both sexes at the start of the medieval Islamic era consisted of an undergarment, a body shirt, a long gown or tunic, a head covering, and an overgarment such as a

mantle, coat, or wrap. Footgear consisted of shoes or sandals. A person might wear many garments or only one, depending on a variety of factors, including weather, occasion, and economic means. Many of the items worn by men and women were identical. Jewish and Christian groups sometimes used the same costume as their Muslim neighbors. More often, costume was the outward sign of religious beliefs, as exem-

plified by the colorful embroidered silk dresses worn by the Iranian followers of Zoroaster.

Undergarments in particular reflect Islamic ideology. There is a well-known story of Muhammad (ca. 570–632), the founder of Islam, in which he averts his glance from a woman who has fallen from her horse until he is assured that she is wearing underwear. Medieval Arabic dictionaries define clothing simply as that which conceals or covers the genitalia. Not everyone in early Islamic Arabia could afford a separate undergarment, however. There are numerous accounts of men without underwear being forbidden to sit or squat publicly, truss up their garments while working, or drape themselves in a fashion whereby one side of the mantle is pulled up on the shoulder, leaving the other side of the body exposed.

The body shirt, or *qamis*, could be worn by both sexes, like so many other Islamic clothes. The length of the body shirt ranged from mid-thigh to full length. It could have long or short sleeves. The opening for the neck was round, either slit down the front or not. Children often wore only a body shirt. Muhammad supposedly covered his uncle with a body shirt when the man was taken prisoner naked at the battle of Badr in 624. Robes or tunics might be worn over the *qamis*. These robes include the *thawb*, a long- or short-sleeved gown; the *jubb*, a woolen tunic with narrow sleeves; a *qaba*, or sleeved robe slit in front with buttons made of fabric such as brocade; and a *farruj*, a robe similar to the *qaba* but slit in the back. Many robes were nothing more than a piece of cloth, although this cloth could be quite elaborate, with threads of silk decorating linen. The habit of wearing several layers of tunics and robes continued through the Middle Ages.

Throughout the Muslim world loose wraps were a common feature of dress for both men and women. These were simply large pieces of fabric that the wearer wrapped around the body. Males and females set themselves off from members of the opposite sex by the manner of draping, the accessories (jewelry, headgear, footwear, and veils), and colors, fabrics, and decoration. The Bedouin maintained a fairly consistent style across the centuries, partly because of their nomadic existence outside the pale of sedentary civilization. They preferred wraps in dark colors, typically of a blue-black shade. Wraps for townspeople of the Arabian Peninsula and the more cosmopolitan centers of the eastern Mediterranean were common as well. However, city dwellers used textiles of finer quality that were more ornate than those of the nonurban dwellers. Many wraps and mantles were known by their fabrics. The *namira* was a man's wrap with stripes of varying colors that gave it the appearance of a tiger skin. Some wraps, particularly a striped one made of Chinese silk, were considered so luxurious that they were given as gifts. They were

## SILK

Silk, the most luxurious textile of the medieval era, spread into the Islamic world from China in about 300 C.E. and moved into Europe with the Islamic invasions of the eighth century. Silk is lightweight, soft, and surprisingly strong. Its cost priced silk beyond the reach of most commoners.

From one era to another and from place to place, silk was produced in the same way. Silk is the filament of the cocoon spun by the larvae or caterpillars of moths belonging to the Bombycidae and Saturniidae families of the Lepidoptera order. One of the few cultivated insects, the silk moth lays 300 to 500 eggs. The eggs are collected and kept in cold storage until the beginning of the mulberry leaf-producing season. Silkworms will eat only mulberry leaves. After about 40 days of feeding, the larvae begin to secrete fibroin, a liquid protein, mixed with sericin, a resin. On contact with the air, the sericin solidifies, cementing two fibroin strands together. Each silkworm secretes about 1,600 to 4,000 feet of silk filament that is spun into a cocoon in about 60 hours. The silkworm pupates into the chrysalis. After 10 days, when the chrysalis is about to emerge from the cocoon as a moth, it is killed by steam. Cocoons are boiled to soften and dissolve some of the sericin. The mixture is stirred with rods, to which the filaments attach. After being unwound, this product is sold as raw silk.

To make silk cloth, the raw silk is soaked in an oil-based emulsion and wound onto a spindle. The silk filaments are pulled from the end of the revolving spindle and twisted together as they come off the rapidly moving machine. The result is a strong yarn that is wound on spools. Silk fabric is woven in the same manner as other fabrics, on a loom. The Sasanian Persians developed the eastern drawloom, permitting weavers to make intricate and ornate figurative designs that were typically animals.

apparently not meant to be worn. The wraps of urban people were worn over fitted clothing.

The habit of covering the head out of modesty and respect was the norm for people in the medieval Islamic world. Muslims and Jews customarily covered their heads while praying. A man or a woman might draw a long mantle or wrap over the head. In his last public appearance, in about 630, Muhammad supposedly wore a wrap over his head, held in place with a black headband. Women typically covered their faces with a variety of veils when appearing in public. The three most common veils were the *qina*, a rectangular piece of fabric that covered the head and fell down like a curtain over the face; the *litham*, a rectangular cloth that covered the nose and lower half of the face; and the *burqu*, a harness-like affair consisting of fabric suspended from the center front of the headband to cover the face. The lower corners of the *burqu* were attached to the sides of the headband by a string, creating a masklike effect. Women of good reputation covered their faces before strangers, and a woman who lacked a veil was described with the same word (*hasira*) used to describe a warrior without armor. Men did wear veils on occasion, normally by draping the outer mantle in a manner that covered both the head and face. Very handsome young men are reported to have occasionally veiled their faces, particularly at fairs and

festivals, to protect themselves from the evil eye. The free end of a turban cloth also frequently served as a veil to protect the wearer from getting dust in the eyes while riding.

The turban has been worn by Arabs since pre-Islamic times. By the medieval period it consisted of one or two caps and a cloth wound around the head. Jews wore a shawl-like head cloth. A high cap appears to date from the seventh century. On military expeditions men wore a *mighfar*, a cap or head cloth of mail over a helmet. The *mighfar* was called a *sabgha* when it had a mail-covered back flap to protect the neck. Medieval Arab women apparently did not wear hats, as no existing sources describe them in hats.

Footwear for both sexes consisted either of sandals or boots. Sandals were apparently the norm, while boots were viewed as luxury items. The sandal, or *na'l*, could be constructed from palm fiber, smooth leather, or leather with animal hair. Soft, fine sandals were the mark of a person of high rank, usually royalty. The *khuff* was a boot made of leather. A custom found in the Jewish Talmud and also attributed to Muhammad held that a believer should always put the right shoe on first and remove the left one first. He or she should not go outdoors barefoot or with only one shoe, for fear of creating an ill omen. Furthermore, shoes should never be left with the soles facing heavenward.

In the Umayyad Period that began in the eighth century most Muslims abandoned earliest Islam's aversion to luxury garments. Silk, satin, and brocade clothing became far more common. Only the ascetic priests, known as Sufis, still wore simple clothing. The styles remained the same as in previous eras. Conquered people were prohibited from dressing like their conquerors, and Arab warriors on duty in the Persian territories were banned from donning Iranian clothing. Nonetheless, the Umayyad caliphs had adopted certain elements of the previous regime, the Sassanian Dynasty (224–651), for themselves and their entourage. They wore special robes of office with wide embroidered or jeweled collars and embroidered borders. High-status men wore coats with pearl borders cinched with an ornamental belt. They wore a high conical hat, the *qalansuwa*, as a royal symbol. It consisted of a frame of reed or wood covered with silk or another fabric.

Clothes have always been viewed as objects of significant material value in the Middle East. Accordingly, clothing played an important political role. High officials were customarily thanked for their service with a gift of textiles. They received so-called robes of honor, turbans, and other garments woven in the households of rulers. These clothes were typically heavily decorated with embroidery and gold. Muhammad gave valuable clothing as gifts to his entourage. Garments could be used to pay taxes or tribute. Pious wishes,

## ► crafts

### INTRODUCTION

One of the great pleasures in studying history is discovering the many ways in which people can create societies and adjust to their environments. One way to understand the many variations in human society is to study people's crafts. For instance, crafts can show what people found to be most important in their lives: Hunter-gatherer societies, especially when enduring shortages of food or water, tended to focus on crafts that

would ensure their survival. In medieval Australia the making of bags out of animal skins for carrying water was a common craft, as was making loose netting for carrying goods or for trapping birds. That hunter-gatherer societies were not immune from the human conflicts found in other types of society is revealed in the fact that Australians devoted about as much time to making spears and practicing for warfare as they did to weaving baskets for transporting goods with them during their travels.

That people almost universally adopt technologies that can help them is evidenced in the medieval nomadic societies of southern Africa, where hunter-gatherers such as the San exploited the resources they found within their territories: People who had access to clay in their ranges made pottery, those with grasses made baskets, and those surrounded by furred game animals made coats or pouches. All such groups then traded with one another to gain the goods that the others produced. One lesson from the history of crafts is that seemingly primitive societies can engage in complicated trade and economic practices.

Through the study of crafts, archaeologists and historians can trace the development and even the decline of societies. One of the reasons the Tang Dynasty is often called China's golden age is that China during the Tang engaged in making numerous crafts, and archaeologists can find the remains of fine pottery, excellent metalwork, and evidence of other crafts scattered in Tang villages as well as Tang cities. The crafts of the Tang speak of an era during which most of China's people could partake in at least some of the benefits of the manufacturing economy.

On the other hand, an economic decline can be traced in Korean pottery of the 1300s. Korean potters had long imitated Chinese manufacturing techniques, but in the 1100s there was a revolution in Korean pottery manufacturing when Korean potters learned how to make celadon ware—pottery with a beautifully serene blue-green glaze. For about two centuries Koreans produced some of the best pottery ever made, but warfare against the Mongols and then the Chinese brought Korea's economy down, and celadon ware became crude and sloppy. Archaeologists infer from this that despite outside pressures, Korea managed to maintain an economy stable enough for craftspeople to perfect their crafts and pass on their knowledge. But by about 1300 the society was destabilizing, resulting in a decline not only in the quality of pottery but also in the quality of life for Koreans.

As economies become more complex, the number of crafts seems to increase, partly because people want better lives and will buy products that serve to make their lives superior to what they otherwise would have been. Thus, carpenters flourish when people can afford expert workmanship

for building houses and making furniture and even toys. A remarkable aspect of the society of the medieval Indians was that they could provide their children with expertly crafted toys throughout the medieval era. This indicates that people could afford to buy toys for their children, and the presence of toys even among the lower castes suggests that people thought that well-made toys were important.

The creativity of people can be seen in the crafts they use to solve problems. For instance, transporting water from its source to a home or public cistern would be difficult to do with only cupped hands for holding the water. One way to carry water is in baskets, but being woven with grasses or strips of bamboo, baskets tend to leak. Some societies responded to this problem by improving their basket-weaving techniques: tighter weaves meant less leakage. Other cultures chose to use another type of vessel, for example, ceramic containers, but crudely made pottery can soften and fall apart when wet. This meant either having to shift to yet another technology or doing what the peoples of eastern Asia did: improve their kilns to allow for higher temperatures when firing pottery, thereby making the pottery harder, and invent glazes that could seal the sides of the vessels from water. When looking at such solutions, it is very much worthwhile to note that medieval craftspeople seldom wasted the opportunity to beautify their work, whether with painted designs or, in the case of pottery, with beautiful glazes like celadon. Medieval craftsmanship was not just about satisfying basic needs; it was also about bringing beauty into everyday life.

## AFRICA

BY KIRK H. BEETZ

The crafts of medieval Africa were as varied and accomplished as those of anywhere in the world. It is part of human nature to want beauty in life, and medieval African craftspeople seem to have tried to imbue even the simplest objects with grace, elegance, and beauty. Even a simple spoon would be made long, with a smoothly rounded drop at one end to counterbalance the scalloped scoop at the other end.

To many medieval Africans metalworking was the most important of all crafts. In western and central Africa blacksmiths were considered to have special spiritual powers that gave them a status higher than that of most other people. In western Africa metalworkers were almost always men. Their work depended on the availability of metal with which to work, and during the medieval era iron and copper were available in abundance. Ironworking was common from at least 500 on, and crucibles with traces of copper in them have been found dating from the 700s. The iron was mined in western Africa and was often available as either raw

*African elephant ivory waste from a British workshop making items such as combs and knife handles; 15th century (© Museum of London)*

ore or smelted ingots. Copper was accessible in some parts of western Africa and could be obtained through trade in the form of ingots throughout not only western and central Africa but also eastern Africa far into the modern nation of South Africa. In the region of the Congo metalwork from the 1000s included a vast variety of objects. Copper was used for fishhooks, knives, spearheads, and belts as well as for jewelry such as necklaces and bracelets. Archaeologists have found iron objects dating to the 1000s, including fishhooks, spearheads, harpoon heads, knives, axes, spears, and hoes. The introduction of iron hoes was especially significant in western and central Africa because draft animals were unavailable to help till farms and breaking the ground for planting required direct human labor.

Smiths had kilns outside their homes for melting or softening metal. They did most of their hammering and shaping inside their homes. They shaped metal by hammering it and by using iron tongs to draw hot, soft metal through holes in drawplates, making wire of various thicknesses, which was wound into coils. The wire was used to make jewelry as well as for decorating stone or wood or for tying iron to shafts to make weapons or tools. In medieval nations such as Mali and Benin gold, copper, and bronze in sheets were often hammered into shape for decorative purposes, such as covering for an art object.

Carved wood was decorated with metal. A common ritual object was a carved wooden animal in which nails were driven, with each nail representing a wish the person doing the nailing wanted fulfilled. Knives and adzes were the tools of woodworkers. Wood carving was very important throughout most of Africa, but wood is perishable, which means that the further back in time one looks, the fewer wooden artifacts survive to the present. An additional problem was that if a

wooden object became defective in some way, it was usually disposed of and replaced. Even so, enough wooden artifacts survive to tell archaeologists something about how they were made and why they were made.

Although wood carvers made kitchen utensils, bowls, cups, and other useful household items, in western and central Africa their most important work involved the carving of spirit figures and masks. It seems that throughout the medieval era and after, most western and central African cultures honored the spirits of their ancestors. For a deceased person to prosper in the spirit world, he or she needed to be remembered in the present world. The carving of somewhat abstract representations of the deceased ancestors helped keep their memories alive among the living. Moreover, an ancestral spirit could be drawn to the carving to listen to and help the living. The spirit figures usually had arms, legs, and head, with faces that were not intended to depict accurately the face of any of the departed. When a spirit figure was damaged, for instance, by splitting because of drying out, it was disposed of because it could no longer hold a spirit in it, and it was replaced by a new carving. The carver had to find a living tree that had a part that could be used. That part was carved out of the tree in the form of a cylinder, hence the tendency of the spirit figure to have its limbs tightly held against its body. When finished, it had to look as though it were spiritually powerful. It has been difficult for archaeologists to tell how spirit figures changed during the medieval era, because the carvers worked from what they knew, and since carved wood rarely lasted more than a couple of generations, the carvers did not have an ancient legacy to imitate, as stone carvers might have. Thus the sizes, shapes, and styles of the spirit figures probably changed greatly during any 100-year period.

Masks were very important in many African societies. Masks served various functions, depending on the culture that made them. In societies in western and central Africa and much of Africa to the south, masks were used in initiation rites. A young person wore a mask during rituals that would connect him or her to the spirit world. Sometimes the masks were huge and covered all of the head and rested on the shoulders. A person who could carve good masks was considered very important, because he or she had an especially powerful connection to the spirit world, but in some societies the children were expected to carve their own masks. Masks were used in religious ceremonies, and wearers often were overcome by the spirit in the mask and would dance as if in a trance for many hours. Some masks were for use only in secret societies that had special connections to spirits. A mask could be handed down for several generations before being considered beyond repair and replaced.

Such masks were thought to bear the imprint of each of its previous owners, the spirits of whom subsume the body and mind of the wearer.

For many, probably most, western and central African cultures the wilderness was associated with the male principle, and wood was considered part of the wilderness, which may be one reason why most wood carvers were men. On the other hand, the earth was associated with the female principle. This meant that in most medieval cultures of the region women quarried the clay used in building houses and making pottery and transported the clay, and they were usually in charge of building houses and making pottery. Most medieval pottery from the area survives in fragments, but enough complete pieces exist to make it clear that the medieval potters were very skilled. Making pottery combined three important elements: earth, water, and fire. This meant that the act of making pottery was spiritual. The potters did not use wheels. They molded their wares by hand by coursing the clay sides in circular bands from bottom to top, or they made coils of clay and then wound them in circles to form their products. These products varied from ones for cooking to ones for storage. In Benin and Mali pottery was used to pave city streets. Among the peoples of the Sahel steppes, huge pots were sometimes set in the ground, and children would climb into them to fetch stored grains, usually rice, wheat, or millet.

Among those who made huge storage pots, shaped like bells, were peoples in Chad. It is among the descendants of those people that one of the most extraordinary uses of basketry survives. Although basketry had to have been very important in medieval Africa, very little from medieval Africa survives, and usually it is in the form of patches of woven grasses rather than intact artifacts. Basketry was used to make nets for catching animals in the forest and fish in streams and the sea. In eastern Africa fishermen sometimes used baskets to store fish live in the water of tide pools or streams. Waterproof baskets for carrying water seem to have been common, although some of the evidence for this comes from ceramic pots made to look like baskets. In Chad millet farmers built their houses out of woven mats that formed circular walls. Each house was in a compound surrounded by a wall of woven grasses, probably intended to keep wild animals out.

Along the east coast of Africa, from Ethiopia to near the southern edge of present-day South Africa, a great exchange in crafting techniques was in constant motion during the medieval era. Some of the metalworking techniques of Ethiopia influenced western and central Africans, while the migrations of the Bantu-speaking peoples from western Africa to the east and to the south brought their traditions for weaving baskets and carving wood. Ethiopia and a string of mighty

city-states along the eastern coast borrowed ideas from India, China, Indonesia, the Near East, and Europe. In Ethiopia this blending of outside influences with African traditions resulted in doors and window frames of shapes recognizably influenced by foreign styles. Some historians speculate that these works were made by outside artisans, but it is much more likely that Ethiopian artisans incorporated new ideas into their work, probably for reasons similar to those of people of the present incorporating exotic decorative elements in their homes. Ethiopia had its own tradition of carpentry, as evidenced by doors from the medieval era that still bear the images of people and animals in an unmistakably African style, often inlaid with metal.

Metalwork was a major occupation throughout eastern Africa. Some places in southern Africa, such as the city of Kilwa, could import metals from nearby sources, while others imported ingots from Ethiopia and West Africa. Their products reveal a mastery of form and function from spoons and knives to hoes and ritual axes. Their potters were very skilled, but perhaps their tasks lacked the sacred element found in western and central Africa, because the quality of their pottery seems to have varied from somewhat crude objects probably intended for everyday household use to glazed pots that rivaled the works found overseas. Indeed, in Ethiopia and some of the city-states pottery sometimes had walls so thin that they were almost translucent, yet they were durable enough to survive use as cups and plates.

One craft that especially excites archaeologists is that of glassmaking. Most Africans imported glass from abroad, mostly from the Byzantine Empire and India, but there is evidence of glassmaking in Africa. In a few of the city-states, glass fragments have been found that were likely made from the remelting and reshaping of glass from abroad, but in the region of today's South Africa, there seems to have been a site where glass beads were made from scratch. Little about how the beads were made has been figured out by archaeologists, but glass beads were held in great value in much of the medieval world, and glassmaking in Africa could open new ways for understanding the medieval African economy.

Across most of today's South Africa were nomadic cattle herders, and farther to the west were hunter-gatherer peoples. These peoples tended to import many of their craft objects. Among those in the Kalahari groups of hunter-gatherers tended to specialize according to what natural resources they had within their territories. Those with lakes and marshes mined clay from the shores and made pottery. Those with access to grasses made baskets. Wood carvers may have been universal among the peoples of the Kalahari, with the manufacture of digging sticks, bows and arrows, and spears being of special importance to their survival.

## THE AMERICAS

BY NANDI COHEN

The crafts of the Americas during the medieval period differed greatly from their ancient counterparts. The development of cities with major ceremonial centers necessitated specialized production centers to create luxury items for elites. In addition to cities, small agricultural hamlets, towns, and villages dotted the landscape, often providing tribute to the governing polity to which they belonged in the form of both raw materials and finely worked crafts. Moreover, inhabitants of these smaller regions continued to produce utilitarian crafts for household consumption. Crafts are generally defined as handmade objects created from natural materials for utilitarian, social, and symbolic purposes. Throughout the Americas individuals produced crafts in many cultural, social, and economic contexts, all of which directly influenced the appearance and function of every item created.

In Mesoamerica the city of Teotihuacán in central Mexico (fl. ca. 1–ca. 650 C.E.) possessed a series of highly specialized craft workshops, identified by several archaeological features such as tools and large amounts of leftover waste materials. Archaeologists discovered evidence of ceramic and lapidary workshops, which led them to infer that leather, wood, feather, and papermaking shops must have existed as well. Well-preserved evidence of obsidian workshops reveals that artisans crafted ceremonial weapons, tools, and decorative objects, including sacrificial knives and spear points as well as amulets in the shapes of humans and animals in black and green obsidian. Green obsidian, extracted from quarries in the central Mexican city of Pachuca, was highly revered for its scarcity and ritual significance.

Toward the first millennium the first evidence of metallurgy in Mesoamerica appears, with many examples found in western Mexican burials. The presence of metal objects along the western coast of Mesoamerica provides strong evidence of the existence of maritime trade with the north coast of Peru, where metallurgy had been going on since nearly 1000 B.C.E. Throughout the Americas metal objects tended to possess a ceremonial and ritual significance over a utilitarian one. Although some examples of metal tools such as copper axes and knives have been uncovered, for the most part these were used as symbolic status markers rather than weapons. The same archaeological sites also yielded a wealth of copper bells, human and animal figurines, and amulets.

The Aztec provide some of the most comprehensive information about craft production for the high level of artifact preservation and the existence of extensive ethnohistorical documentation on Aztec culture and ways of life. (Historical period documents, often written by 16th-century Euro-

pean travelers in consultation with indigenous informants, reconstruct preconquest history in the Americas.) Mobilized into three major imperial capitals, known as the triple alliance—Tenochtitlán, Texcoco, and Tlatelolco—the Aztec Empire came to dominate nearly the entire expanse of what is present-day Mexico from about 1200 to 1521 C.E. Clusters of households in various barrios (neighborhoods) tended to specialize in one particular product for both personal consumption and tribute payment to the empire. As in Teotihuacán, artisans specialized in lapidary work (the cutting and polishing of precious stones), woodworking, feather working, weaving, and metallurgy. What distinguished Aztec crafts from their predecessors, however, was their incorporation

*Female standing figure; slip-painted ceramic, Huastec culture, Mexico, ca 100–ca. 600* (Los Angeles County Museum of Art, gift of the Art Museum Council in honor of the museum's 25th anniversary, Photograph © 2006 Museum Associates/LACMA)

of exotic materials imported from lands as distant as eastern North America and northern South America, facilitated by traveling merchants known as *pochteca*. Turquoise from the American Southwest and feathers from tropical Central America, for example, are common materials found in Aztec crafts obtained through long-distance trade.

Feathered objects were of special significance to the Aztec, crafted by specialists into elaborate multicolored headdresses and shields for elites and warriors. Detailed illustrations of feather workers in Fray Bernardino de Sahagun's famous encyclopedic work about Aztec culture, the Florentine Codex (1577), provides invaluable information for reconstructing how craft workshops were organized and the types of objects produced, particularly those of perishable materials that have survived to the present day in small numbers. In addition to feather work, wooden objects were ubiquitous in the Aztec Empire, and bowls, weapons, sculptures of deities, and furniture were created for all sectors of society. Wooden objects for commoners were generally simple and unadorned, while those for elites were often more elaborate and inlaid with precious stones, imported shells, gold, and silver.

In the Andes artisans used diverse materials to produce crafts like baskets and finely woven textiles; metalwork of copper, gold, and silver; and ceramic and wooden vessels. A distinctively Andean craft object is the wooden *kero*, or ceremonial drinking cup. Artisans carved decorative motifs on the exterior of the *keros*, often depicting animals and humans interspersed with geometric designs. This craft tradition began in the Tiwanaku Empire located in present-day western Bolivia (ca. 100–ca. 1000) and continued through the colonial period. Portable crafts were important in the Andes throughout the medieval period, serving as utilitarian items, ceremonial objects, and grave goods. As in Mesoamerica, feathered goods like tunics and headdresses were highly valued and reserved only for elites. On the southern coast of Peru archaeologists discovered large rectangular mosaics fashioned from macaw feathers and decorated with depictions of birds, suggesting an intimate link between medium and subject.

Gold and silver miniature sculptures, a craft tradition that flourished from pre-Inca cultures and survives to the present day, probably served as amulets or divinatory objects and represented revered animals, such as llamas, as well as humans. These objects were often wrapped in textiles and left in burials and as offerings at *huacas*, or sacred sites. Some examples survive in which the human figurines are adorned with doll-sized clothing and feather work is executed in painstaking detail.

The seafaring Taíno culture was the last indigenous group to inhabit the Caribbean (including present-day Cuba, Jamaica, Puerto Rico, Haiti, and the Dominican Republic)

before the arrival of Columbus in 1492. They produced various distinctive crafts of stone, plant fibers, and wood. Taíno artisans crafted objects from stone into mortars and pestles, ceremonial and utilitarian weapons, and various vessels and sculptures. Special baskets known as *cibucanes* were used for processing manioc, a root crop that was integral to Taíno subsistence, have been found in domestic contexts at archaeological sites. Other baskets, called *jabas*, were crafted from cotton, hemp, and banana leaves, and used for storage purposes.

*Duhos*, or wooden ritual chairs, are among the most important craft objects of the Taínos, directly associated with divine rulership and used primarily by high-ranking individuals during ceremonies. They were a device used to distinguish the elites from the commoners, somewhat analogous to thrones in European aristocracies or *petates* (woven floor mats) in Mesoamerica. A *duho* also symbolized the human being's transportation into the spiritual realm, serving as a seat during *cohoba* rituals, at which participants partook of hallucinogenic substances. Artisans crafted *duhos* from high-quality woods such as mahogany, onto which they would carve geometric designs in low relief and finish with several layers of resin.

In North America elaborate wooden boats and sculptures of all sizes from miniatures to larger-than-life totem poles were created by people inhabiting the northwestern coastal region of present-day Oregon, Washington, western Canada, and Alaska. Ecological factors made the region unsuitable for ceramic production; thus stone and wooden vessels as well as tightly woven baskets took the place of clay pots. Potlatch ceremonies in which elites redistributed their material wealth to the rest of the population involved the exchange of various crafts, including feathered headdresses, wooden masks, finely painted vessels, baskets, and textiles.

Artisans of the Mississippian cultures (ca. 750–ca. 1500) of the present-day eastern United States were expert stone carvers, producing finely detailed sculptures of humans and animals found in both domestic and funerary contexts. Among the Hopi of the American Southwest the continuing tradition of producing kachina dolls (representing ancestral spirits) possesses deep roots. Used in ceremonies to ensure bountiful harvests, successful hunts, and fertility, the dolls were fashioned out of wood with painted decorations, although archaeological evidence suggests that they remained relatively simple, with few accoutrements, in the prehistoric era. It was not until modern times that kachinas were adorned with feathers and elaborate painted designs.

Basketry remained an important craft for all North American cultures, acquiring ever more elaborate designs and weaving techniques through time. Using various wild plants, basket makers had to undergo extensive technical

processes to prepare the fibers for weaving. Depending on the type of plant, the process could involve soaking, pounding, partially cooking, or steaming the fibers. Both coiling and plaiting techniques for weaving baskets were employed by basket makers throughout North America. Coiling called for the tight twisting of strands of plant fibers, beginning at the base and gradually spiraling around to create the body of the basket. Plaiting required the braiding and subsequent stitching of strands into a body. Both of these basic techniques, among countless others, allowed for the creation of baskets to fulfill many needs, including storage, cooking, personal adornment, and ceremonial functions.

Crafts throughout the Americas took on a diversity of forms during the medieval period, attaining culture-specific functions and significances that occurred in tandem with large-scale political, social, and economic transformations. Crafts fashioned out of local and imported materials served innumerable purposes, from assisting in basic subsistence activities to articulating the ideologies of an empire. With the arrival of Europeans in the 16th century, many of these traditions died out as indigenous populations were devastated by disease, exploitation, and warfare. More commonly, however, artisans incorporated new design schemes and iconography into their practices to keep up with the rapidly changing needs and demands of colonial society while retaining many of their ancient forms and techniques.

## ASIA AND THE PACIFIC

BY KIRK H. BEETZ

Crafts varied enormously across Asia and the Pacific during the medieval period, based on the availability of materials and cultural preferences. Even in the simplest culture, crafts could be complicated, requiring careful design and patient work.

Basketry came the closest to being the universal craft of medieval Asian and Pacific regions, with nearly every culture using baskets. In Oceania, Indonesia, and the Philippines baskets were essential to the everyday lives of people, but in China they were less important because of the many alternatives for storing and carrying the goods produced in China's advanced manufacturing society. Baskets were made of perishable materials such as reeds and bamboo; thus most of the baskets created during the medieval era have decayed. Unable to determine the full range of basketry from that time, anthropologists study the basketry of modern people in traditional societies and infer what it was like hundreds of years earlier.

Baskets made in the arid areas of Australia had a better chance of surviving over long periods. Most of these extant baskets are made of tightly woven reeds. In general, baskets

## CARRYING ONE'S LIFE IN AUSTRALIA

Most medieval Australians were nomadic, moving in small groups through territories shared with other small groups. In some places such as forests, the nomads had a fair amount of certainty that if they moved with the changing seasons, they would find seasonal foods each place they journeyed. In other cases their lives consisted of constant movement across the land, always searching for food and water. They needed to carry with them food, water, and small personal belongings, such as magical objects and symbols of status. Their solutions for satisfying their needs are examples of the ingenuity of people and how human beings creatively exploit even small opportunities in their environment. For instance, in eastern Australia, bags were made out of bark. A section of bark was folded in half, holes were made along the edges where they met, and cane was used to stitch the edges together. Resin was used to seal the bark so that the bag could carry water.

In Arnhem Land in northern Australia, people made bags out of bark, but they seem to have preferred bags made of green palm leaves for most of their carrying needs. They harvested fresh palm leaves and folded the leaves so that their edges aligned. The bottom end of the stalk was folded inward, and the loose ends were sewn together. These bags were often decorated, with ochre being favored for making the designs.

More common in Australia were baskets of a variety of shapes made of woven grasses, often with human hair woven into them. These served for general tasks of carrying but also were used by both men and women to carry magical and other personal objects. Men's baskets were decorated with bird down and feathers—brightly colored feathers were preferred. Both men and women's baskets were decorated with images of sacred places or of trees and streams. Frequent use of the baskets would have rubbed off the images, which suggests the baskets were not opened and closed often, although it is possible that rubbed-off images were just replaced with new ones.

were used for carrying food or small items. To carry water, Australians used sacks made from possum or kangaroo skins. These were sewn with sinew, using small kangaroo bones as needles. The insides of the skins were lined with bark, and

then skin and bark were soaked, releasing tannins from the bark into the skin. The tannins acted as preservatives and helped prevent the skin from fouling the water. After the soaking, the skin was rubbed vigorously to soften it.

Elsewhere in Asia and the Pacific baskets were used for food storage. In the streams of Southeast Asia people used baskets to dip into the water to catch fish. In most areas almost everyone was expected to know how to make baskets, but in India basketry was a recognized trade of special craftspeople. Usually women, Indian basket makers worked with many kinds of grasses, most commonly those found growing in or near water. The basket makers gathered the materials themselves. Their products could be very sophisticated, especially the boxes householders used to store valuables, laundry, spices, and other everyday articles. With loose weaves the craftspeople created sacks, and with tight weaves they fashioned sandals. They made mats used to line roofs, to cover

*Ivory throne leg; Eastern Ganga Dynasty, Orissa, India, 13th century* (Freer Gallery of Art, Smithsonian Institution, Gift of Charles Lang Freer)

floors, and even as fences. Their work could be seen almost anytime in public in the form of umbrellas, usually made of woven reeds and used for protection from rain and sunlight. Indian basket makers also made rope from woven grasses.

Woven rope was important almost anywhere for use in making nets. In Australia and other parts of Oceania nets were loose crossings of rope designed to be flexible enough to collapse around what they held. In Australia nets were made by women and used in hunting. Draped between trees or wooden posts in a spot where birds were known to fly near the ground, the nets would catch birds and hold them until people came to collect the catch, which usually became a meal. This use of nets was common in forests on Pacific islands and in most of eastern and southern Asia. The Australians also used netting to make bags for carrying goods during their frequent migrations.

Woodworking was another craft found in most areas of Asia and the Pacific. In Japan woodworking was an essential part of the culture. Because of the country's abundant supply of trees, the Japanese used wood for most of their housing and storage needs. The medieval Japanese, both poor and rich, preferred sparsely furnished, nearly empty rooms. A home was supposed to impress by the elegance of its design rather than the opulence of its interior. Thus Japanese woodworkers were skilled at fulfilling household needs with unobtrusive furniture. For instance, a staircase might have tucked under it a *kaidan-dansu*, a storage chest that fit under the stairs, making use of space in such a way that the room still seemed uncluttered and open.

Japanese woodworkers were primarily travelers, and during most of the medieval era they were highly valued by rural communities. Food and lodging were usually part of their pay, and the rest of their fee could be paid in goods they could take with them or in money. They were well cared for because their work made life much better for their clients. The woodworkers carried with them small lathes with which they fashioned cooking and eating utensils and wooden vessels. Much of these were custom made, but because wooden cooking utensils were always in demand, woodworkers often made them ahead and sold them to clients with other orders. Among Japanese tales of the era are ones about woodworkers who became rich by turning discarded wood into chopsticks and selling them.

Despite their importance to Japanese society, woodworkers and other craftspeople were considered part of the lower levels of society, beneath samurai (the warrior class) and farmers, and were usually forbidden even to add surnames to their names. In the latter half of the medieval era some craftspeople, most notably carpenters who worked for the shogun (a military governor) or for daimyo (a feudal baron),

were given permission to adopt a surname. Chinese craftspeople also were considered to be part of the lowest levels of society, beneath nobility, government officials, and farmers. During the Tang (618–907) and Song (960–1279) dynasties, craftspeople were even forbidden to take the government-sponsored examinations that allowed people who passed to enter government service, an important privilege for people who wanted to better their lives.

The Tang Dynasty was a particularly dynamic period for woodworking. During that era a courtier invented the first Chinese chair. As a gift to the emperor, the courtier created a small couch with a back carved in the shape of a dragon, apparently launching the popularity of chairs. Household furniture had consisted primarily of stools and benches, but stools were often replaced by chairs. Unlike the Japanese, who slept on woven mats on the floor, the Chinese slept in beds. These were customarily more than 3.5 feet above the floor to prevent demons in the ground from reaching sleepers. A bed had four posts and cloth draped between the posts to provide privacy.

Indian woodworkers were part of the Shudra caste, the laboring caste. In everyday life they ranked much higher than most other craftspeople because building houses involved important religious rituals. Although some woodworkers felled trees themselves, they often employed foresters, who were a class of craftspeople. In either case the woodworker would be present and would ask the spirit living in the tree to forgive those who were about to cut it down. A rope was tied around the tree and pulled to direct the tree's fall. Usually the woodworker cut and sawed the lumber where the tree fell, using a cart to transport the planks and other pieces to the woodworker's workshop or the site where a house was to be constructed. Woodworkers not only built houses but also made beds, chairs, tables, and storage chests as well as carts and sandals. Accounts from the medieval era even credit woodworkers with building flying machines. Some of their work survives in the form of spinning tops and other toys.

Medieval China, Korea, and Japan are famous for their pottery. During the 600s Chinese potters invented porcelain by mixing the mineral feldspar into stoneware. The Chinese became so famous for their porcelain that much of the modern world calls it china. Many art historians believe Chinese porcelain reached its highest quality in the Song Dynasty, but it was during the Yuan Dynasty (1279–1368) that the process of making porcelain was at its most advanced, with potters mixing the white clay kaolin and china stone, which contained feldspar, and firing their creations at about 2,640 degrees Fahrenheit.

The zenith of Korean pottery making is considered by most art historians to be from 1100 to 1300, when craftspeople manufactured celadon ware. For centuries Koreans had

*Funerary sculpture of a double-courtyard residential compound; molded earthenware with green glaze, middle Ming Dynasty, China, ca. 1450–ca. 1550 (Los Angeles County Museum of Art, gift of Mrs. Blanche Wilbur Hill, Photograph © 2006 Museum Associates/LACMA)*

imitated Chinese techniques to create gray stoneware, but during the 1100s Korean potters mastered a blue-green glaze that resembled a serenely beautiful sky. Only the Japanese, who began producing celadon ware in the 1600s, have come close to the quality the Koreans achieved for about 200 years. The best pieces may have been the incised celadon ware. After shaping a pot, the potter painted it with iron oxide, coated it with celadon glaze, and then fired it. The potter would then incise images into the sides of the pot and fill the cuts with white, black, or reddish brown slip. The pot would be fired again, recoated with celadon glaze, and fired a third time at temperatures hot enough to make stoneware. Korean masters taught the technique to Japanese potters in Kyoto.

The production methods of Indian potters were different from those of eastern Asian cultures because of a fundamental difference between their cultures' views of pottery. Unlike eastern Asians, Indians did not intend their pottery to last a long time. In many Indian households ceramic wares were broken at the start of a new year and then replaced. As a result Indian potters always had plenty of work. They tended to work quickly. They gathered clay from shores of ponds or lakes, mixed it with cow dung and ashes, and then shaped it on a potter's wheel. The products were fired at low temperatures.

Indian potters and metalsmiths were Shudras and held in about equal esteem. Smiths worked at anvils, near furnaces. The smith served other crafts by making tools for carpenters, weapons for hunters, needles for tailors, and razors for barbers as well as weapons and armor for soldiers. In Japan metal usually had to be imported from other countries, and Japanese smiths tended to specialize in making weapons. Japanese sword makers may have brought medi-

eval steelmaking to its apex in Asia and the Pacific. They were held in somewhat higher esteem than most Japanese craftspeople, partly because they worked in a religious atmosphere. Their work was ritualized and worshipful, and those who purchased their swords had a spiritual attitude toward the product that could save their lives. Swords were made by folding white-hot iron with carbon and pounding it and folding it over and over again, dozens of times. The result was a sword that when burnished would have a lasting shine and a very fine edge. Prices for swords were often set by the government according to their length, without regard to quality. Another group of craftspeople were the sword sharpeners, who devoted their days to keeping the weapons shining and keen.

## EUROPE

BY KIRK H. BEETZ

During the thousand or so years of the medieval era innovations and changing economic conditions altered the practices of craftspeople and their living conditions. The status of crafts and the particular crafts that flourished in a given region differed according to the supply of natural resources in each area. As trade routes improved during the medieval era, raw materials became much more widely available outside the areas where they were found, allowing for towns and cities to have ever-greater varieties of craftspeople.

By the time the Western Roman Empire officially ended with the abdication of the last Roman emperor in 476, craftspeople in Roman Europe were almost universally suffering. Their taxes were high, and customers had become rare. For many European craftspeople the supplanting of Roman authority with the authority of Germanic invaders may have come as a relief. The invaders were interested in employing craftsmen to build houses, churches, and palaces as well as make domestic goods. Even so, as late as the age of Charlemagne in the 800s blacksmiths remained rare. Blacksmiths had been so important in the Roman Empire that nearly every village had at least one. During the 800s foundries were uncommon and mines even more so. For centuries iron had been dug in surface pits, but those pits were depleted, and the digging of passages to follow deposits of iron ore deep underground was yet to become common enough to supply many foundries. Iron was so valuable in warfare that European governments tried to regulate where iron ore went and who was allowed to possess smelted iron. Much iron was made into armor and weapons and also agricultural tools. The shortage of blacksmiths affected the productivity of other craftspeople. For instance, nails were hard to come by, which limited the kind of work carpenters could do.

An exception to this situation was the Byzantine Empire, also called the Eastern Roman Empire, which retained knowledge of ancient Roman craftsmanship. The Byzantine government built and controlled workshops and set the prices of all manufactured goods, along with the wages for employees of craftspeople. Even for privately owned workshops, the government set standards for quality, with government inspectors keeping close watch. In contrast to the situation in much of the rest of Europe during the 800s, craft work of the old Roman Empire thrived in the Byzantine Empire, even with government price controls. At this time Constantinople had 23 crafts guilds for such work as shoemaking, glassmaking, ceramics manufacturing, smithing, and perfume distilling.

A craftsman was not required to join a guild in order to work at his or her craft, and even people expelled from guilds could still find work at monasteries, churches, and the estates of the wealthy. To join a guild, a craftsman had to pay an entrance fee and probably had to prove proficiency in his or her craft. Future craftspeople were usually assigned to a workshop as apprentices at about the age of twelve and had to work for free or for a tiny stipend while learning from the master of workshop. After several years, the apprentice could join a guild and open his or her own workshop, often with the help of his or her former master, or could continue as a journeyman—an employee whose wages were set by the government. Guilds provided benefits for their members: They found work for members, bought and distributed raw materials to members, and saw to it that during hard economic times even small workshops had enough paying work to survive. A small number of guilds were imperial guilds, because they produced wealth that the imperial government especially wanted. Silk workers, metal workers, and dyers were required to join imperial guilds.

Byzantine potters made a variety of items. Many were crude vessels, intended for dirty work and not meant to last long. Other items were very well finished, often for display. Potters provided various household items, such as bowls,

*Cattle jaw used by craftsmen to practice designs; Britain, late 10th century* (© Museum of London)

cups, plates, and jars for wine or oil. Glassmakers also manufactured household items such as candlesticks, cups, and jars. Syria had long been a leader in glassmaking, and Syrian glassmakers were among the empire's finest craftspeople, but some Syrian glassmakers were unhappy with the government control of their work and left for northern and central Europe. Although glassmaking would not be widespread enough to provide commoners with glass windows until the 1300s, the glassmakers brought with them a set of skills that future European glassmakers followed, such as glassblowing.

A glassmaker would blow through a long tube to make a glass bubble expand, break the bubble off the end of the tube, split the bubble in two, and flatten the two halves while they were still molten. The resulting slabs of glass could be shipped to markets, and by the 1100s a set of crafts had developed to make use of the glass by cutting it into small pieces to be painted and used in mosaics, to fit between edges of lead for use in windows, and for remelting to be reshaped as cups, jars, and lamps. The use of metals to give glass color was borrowed from Byzantine glassmakers. Adding a little iron, for example, made glass appear translucent green. By the 1000s European glassmakers had a preference for mixing beech wood ash with well-washed, finely grained sand and firing the mixture in a charcoal furnace to produce glass.

Cologne had a colony of Syrian glassmakers, and they may have been among the first to form a crafts guild. Trade guilds for merchants already existed when craftspeople began forming their own guilds in the 1100s, in an effort to escape the feudal requirement that they pay part of their production to local nobles. This occasionally resulted in violence. For instance, craftspeople in Laon, France, bribed King Louis VI (r. 1108–1137) to allow them to organize into a commune, a protective organization that freed them from their feudal overlords. Their bishop organized nobles to give Louis VI a bigger bribe, and permission to organize was withdrawn. The result was a riot in which craftspeople used their tools such as knives and hammers to kill the bishop and those nobles who tried to protect the bishop.

The benefits of guilds had a mixed history in medieval Europe. Like those in the Byzantine Empire, many guilds bought raw materials and distributed them to guild members, and they saw to it that all members shared in the available work. When members were sick or injured, their guilds cared for them, and when a member was too old to work, his or her guild provided money, food, and household necessities. These practices proved very important in the mid 1300s, when most of Europe had an economic recession. By seeing to it that even the poorest of their members had enough work to survive, guilds enabled their crafts to survive the recession

and be prepared to help fuel a vigorous consumer economy in the 1400s. On the other hand, some guilds became imperious in their behavior, forbidding members to work at crafts outside the guild and sometimes even requiring members to give up ownership of their tools and equipment, making them totally dependent on their guilds not only for employment but for the tools with which to work.

Medieval European craftspeople usually worked in their own homes, although big public works projects such as castles and cathedrals would attract carpenters and blacksmiths to workshops set up on the work sites. Their products often were made to order, with wealthy nobles providing much work to those craftspeople who made housewares and luxury goods. The patronage of nobles was joined by that of wealthy merchants as international trade improved. Craftspeople often made goods to sell in markets. During the first few centuries of the medieval era, they hauled their goods to a weekly market if there was one close enough to their homes. At the markets the craftspeople had portable stalls. The towns where the markets were held often charged the craftspeople for the privilege of entering the town, a practice that continued into the late medieval era. A town might charge for the privilege of selling, additionally for bringing a cart, additionally for using a horse, and even more for bringing a horse shod with horseshoes. This meant that men and women hauled as much as they could on their backs; if they were forced to use a cart and horse, then they used an unshod horse.

By the 1000s, the light portable stalls were giving way to permanent stores in marketplaces. The best locations would often be given to the most socially prominent craftspeople. These stores were gradually replaced by houses with shops on the bottom floor and the craft person's family living quarters upstairs. Streets would be named for the crafts found on them, such as Potters Street.

Craftspeople often made their own tools, which became prized possessions passed from parent to child or from master to apprentice. Sometimes they were inherited by close friends when their owners died. Even so, crafts in general became ever more dependent on the work of blacksmiths when the availability of iron increased enough for blacksmiths to become common. They made tools such as hammers, hatchets, axes, adzes, saws, drills, awls, and knives. Much of a blacksmith's work was producing nails. A blacksmith's shop typically had a furnace and bellows, usually tended by a family member or an apprentice. The blacksmith would have an anvil, often set on a wooden trunk, and a stone trough filled with water, both near the furnace. The blacksmith's tools included light and heavy hammers, tongs, and files. Many of the tools made by blacksmiths were for carpenters, who made chairs, benches, tables, and beds for their clients. Metal awls and hole punch-

ers were used by tanners, who produced belts, boots, and other leather goods. The leather goods could be used as tool belts by other craftsmen, and so on, with late medieval craftsmanship becoming ever more interdependent.

## THE ISLAMIC WORLD

BY BASHIR A. KAZIMEE

Crafts and art reflect the values and emotions of a society. In the world of Islam, which covered a vast territory in medieval times, artisans and professionals enriched their work with new values and traditions. The technical skills and artistic achievements of other cultures, such as Byzantine, Coptic, and Sassanian, played an important role in the maturity of Islamic craft work and remained sources of inspiration. However, the development of crafts in later periods of Islam reflects a distinctive style and aesthetic flavor that suited the Islamic belief system. Muslim craftsmen produced unique ceramic works, colored glass, metalwork, and wood carvings with lasting expressions of beauty and creative spirit.

During the Middle Ages ceramics and pottery developed significantly throughout the Islamic world, and the demand for pottery increased. Professionals and artists combined functional design with highly artistic adornments, and they were able to apply wide ranges of decorative techniques, such as thumb marks, channels, embossing, engraving, and calligraphy, to the surfaces of the clay vessels. During the early Islamic period pottery work was influenced by the Chinese pottery industry, and Islamic potters imitated Chinese techniques, especially the Chinese porcelain in the style of Tang, which was admired in the region. However, within a half century there was considerable development in this craft, unparalleled elsewhere in the world.

The rediscovery of tin-enamel glaze, which resulted in a clear, white surface, was perfected in Persia and soon spread throughout the Islamic world as far as Spain. There it formed the basis for Hispano-Moresque pottery and provided Europe with luxury pottery for centuries to come. Another important innovation in this craft was the use of luster painting, which originated in Mesopotamia and reached its peak during Seljuk and Mongol times of the early 11th to mid-14th centuries. Luster painting involves a mixture of certain sulfuric pigments and dissolved gold, silver, or copper oxide applied to the surface of an already fired smooth glaze that appears as a shining metallic film. Chinese potters created objects using this technique much later. In Moorish Spain luster paint was used in the famous potteries of Valencia.

During the rule of the Ayyubids (1169–1260) and later the Mamluks (1250–1517), ceramic pottery flourished in Syria and Egypt. The city of Raqqa, located on the fringes of

Syria and Mesopotamia, and later the cities of Damascus and Cairo evolved into the most important centers of manufacturing pottery and glass. Medieval 13th-century Syrian ceramic wares included fine examples of luster with underglaze techniques, which typically appeared in turquoise and black colors. In this period Syria also produced three-dimensional glazed ceramic sculptures, such as animals, horses, and human figures.

The use of blue cobalt and lapis lazuli mineral pigments that appear as beautiful shades of blue was another hallmark of Islamic pottery. From 1260 to 1368 cobalt mineral pigments, known as Mohammedan blue, were a commodity in China and were imported from the Middle East. The use of new pigments and minerals resulted in completely new coloring techniques and the development of color-enameled ceramic wares. These techniques offered many advantages to pottery artists and encouraged them to use a wide variety of mediums and decorations.

The craft of glassmaking also developed dramatically in the Islamic world during the Middle Ages. Damascus and Aleppo were major centers for the production of enameled glassware. Phoenician and Roman techniques of glassmaking were still influential in the Syrian glass industry before it reached new heights during the Islamic period. Syria produced famous articles for the demanding Muslim and Western markets. Blown pipe glass was produced through many different techniques to create valuable wares. The spiral fluted effect, the honeycomb, carving, and other decorative elements were commonly applied to glass vessels. One of the popular objects produced by the Syrian glass industry was the inscribed glass lamp. It was produced in large quantities for mosques.

Metals and mining played an important role in the working economy of medieval Islamic countries. Metals were mined and produced in large quantities for domestic consumption as well as for export. Craftsmen and professionals in the Islamic world converted metal into valuable goods for demanding markets. Metal objects produced from steel, copper, tin, and brass included such items as kitchenware, vessels of various sizes, incense burners, and lamp stands for household and commercial uses with a range of working techniques. These objects were cast, wrought, pierced, or drawn from metal. Decorating techniques included engraving, chiseling, damascening by inlay, embossing, laceworking, gilding, and incrustation.

The popularity of cast bronze and brass forms was significant in the Middle Ages. Large numbers of cast-bronze items of different styles were mass-produced in eastern Iran. The most popular items in the marketplaces of the Middle East were bronze lamp stands, decorative items, caskets,

*Stone-paste jar painted in black under turquoise glaze; Syria, late 12th to early 13th centuries* (Freer Gallery of Art, Smithsonian Institution, Gift of Charles Lang Freer)

and inkwell bases. Most scientific instruments were made of brass. The best-known scientific objects made of brass are astrolabes, used by astronomers, navigators, and surveyors. These articles are exceptional examples of the arts and crafts of the period, with their rich inlay and embossing techniques. Many surviving objects of this period include the names of the artists and makers.

Metalwork reached its height of technical sophistication in 13th century, when some of the artisans migrated westward from Afghanistan and Iran owing to the invasion of the Mongols. These artisans settled in Iraq, where the major center of metal production was Mosul (in modern-day northern Iraq). The industry also flourished in eastern Anatolia, Damascus, and Cairo at the same time. In this period Mosul was very famous for its red copper, silver, and even gold inlay craft artistry, which employed an earlier Iranian technique.

In the later part of 13th century, under the patronage of the Mamluk Dynasty, Cairo advanced as a major center of commerce and artisanship. Mamluk metalwork is notable for its mass production. It became possible to produce metal objects in large quantities and to fabricate elaborate objects in a

very short time. Some fine examples from the Mamluk Period include bronze plaque doors that were used to cover religious buildings and palaces, often displaying intricate geometric patterns and magnificent sculptural motifs for decoration.

Wood is a relatively rare commodity in most of the arid regions of the Middle East, but woodworkers always applied their unique skills wherever elegance and craftsmanship were necessary. Medieval carpenters handled a wide range of tasks, using wood materials to build structures, furniture, cabinetry, and other functional items. Wood was an integral part of building, too, even when the structure was crafted of other materials. The intricate geometric designs and assembly of various interlocking patterns on buildings are still admired. In relief carving, in marquetry, and in latticework made of intricately jointed turned wood, Islamic craftsmen produced work that had few parallels elsewhere.

In the porch of the Ali Qapu palace in Isfahan (1598), timber columns support a patterned ceiling ornamented in precious wood of several colors, inlaid with mirrors, exemplifying a brilliant work of wood mastery. The transparent screened windows called *mashrabiya*, characteristic of Islamic houses, were constructed in part to shade the interior from the harsh sunlight and in part to segregate women's quarters from public view. Such screens often project out in the upper stories, displaying a wide variety of ingenious patterns, and consist of small pieces of turned wood grafted together.

Syria is believed to have been an important center for wood carving and inlaying. Earlier examples of wood carving dating to the 10th century show a simple floral carving style, in which the technique of inlaying wood with ivory, bone, or mother-of-pearl was perfected with sophisticated geometric designs. In the Middle Ages the craft of wood carving was an important industrial art in many regions of the Islamic world, and this art maintained its high standard of craft in the traditional techniques. The wood species commonly used were suitably grained timber, such as walnut, rosewood, red pomegranate, or maple. Most of the carving was done with hand tools, such as chisels, files, and saws. Articles produced in this period include richly carved chest frames, chessboards, combs and banister rails, bowls, sherbet spoons, and caskets.

Furniture for homes was simple but elaborate in its quality. Plain tables, chairs, storage shelves, and chests were made out of plain wood. The surfaces were scraped and sanded with pumice stone and then polished with linseed oil. For more elaborate works the carpenter applied metal plaques or inlays to the surface of the wood for ornamentation. Until the 13th century the city of Rhagae in Persia had a thriving industry of wood products for export and was renowned for its wooden furniture industry.

Basketry and mat weaving from reed and grass existed for many centuries before the birth of Islam in this region. Grain baskets found in Iraq and Egypt date to about 4500 B.C.E. The techniques and craft of basket making and mat weaving did not change much during the Islamic period. The basket weaver prepared the raw material—bamboo or rushes—in bundles. Bamboo was softened by soaking it in water. The plaiting of the basket was done by hand. The only tools used for basket plaiting were a wooden block and a curved knife, serving to split and cut the reeds and rushes. The process of mat making was similar to that of basket weaving. Basket makers also made brooms.

Other material sources of craft and artistic expression, such as textiles, colorful carpets, leatherwork, and embroidery, remained consistent with local tastes across the Islamic world. These and other decorative items filled not only the marketplaces and homes of Muslims but also the palaces and homes of many across the world for many centuries.

## ► crime and punishment

### INTRODUCTION

The main role of punishment in medieval society, as it is today, was to serve as a deterrent to would-be criminals and also to satisfy the victims of crimes with the terms of punishment. In the ancient world few places had written laws, most parts of the world relying on oral tradition and the enforcement of laws by rulers or tribal chiefs. This usually meant that punishments were imposed on the basis of legal precedents, with the penalties meted out generally reflecting the existing practice of the group or area. Because the laws were not written, it meant that they often were open to wide interpretation and ad hoc amendment. It also meant that they might be openly flouted by powerful people.

Throughout the medieval period and around most of the world there were attempts to codify these laws, in terms of recording in legal works or by carvings on stone, the punishments for specific named crimes. In Europe this coincided with the emergence of parliaments, such as those operated by the Vikings or the Witan in England, the Cortes in the Spanish kingdoms, and the Sejm in Poland. These parliaments frequently served not only to enact laws but also to clarify points of dispute and be the final place of appeal for wealthy people seeking redress.

In much of the world conviction for serious crimes resulted in capital punishment. Executions generally were conducted in public, not only to show the power of the state but also to show that the person actually had been executed. In some places these executions were done with solemnity, but in other cases, especially in instances where large numbers of people were being killed, such as after a rebellion, executions might be conducted with dispatch. The location of the places of execution varied. In China and in many parts of Africa people would be executed outside the city walls. In Europe executions were often in centers of towns or cities, usually at

a spot reserved for such a purpose, such as Tyburn in London. When Joan of Arc was burned to death as a witch in 1431, the execution took place in the center of the city of Rouen, and the burning of Jacques de Molay, the last Grand Master of the Knights Templar took place just outside Notre Dame Cathedral, in the center of Paris in 1314.

The method of execution generally depended on the offense, with most offenders in Europe, Asia, and the Islamic world being executed by hanging or beheading. Beheading seems also to have been used in Central America. However, many kingdoms and empires came up with more painful and degrading methods of executing people guilty of more heinous offenses. Slow strangulation was used in China for people found guilty of particularly terrible crimes, and those in western Europe were hanged, drawn, and quartered, with their heads, arms, and legs later put on public display. In Romania, Vlad III had criminals impaled on stakes. A Viking who was involved in ransacking a church in London in 991 was flayed alive, and in Europe during the late medieval period people found guilty of poisoning or making false coins (counterfeiting) could be boiled alive, a punishment also used in Japan.

In some countries people were fined, but this was a punishment rarely imposed except in cities, where there was an organization (court, church authority or town council) to receive the fines, and among wealthier people, who were in fact able to pay the fines. The shortage of coins in much of the medieval world meant that fines were often impractical in country areas. Prisons were used largely to hold people awaiting trial or political prisoners; few medieval countries employed imprisonment on a large scale. As a result, many legal systems around the world inflicted various forms of corporal punishment, such as flogging, whipping, or caning. For the most part such punishment took place in public, with many towns in Europe having whipping posts in the town squares.

The system of stocks also was used to hold people for short periods of time. The Chinese developed the use of a cangue, a large wooden collar, as a mobile stock in which people could be locked for periods of time at no cost to the authorities. In some parts of the world branding criminals or cutting off hands, ears, or noses was also used as punishment. Burning was largely reserved for people with heretical beliefs. Some tribal societies in Africa, Australia, and the Americas tended to exile criminals as a severe form of punishment. People were not executed but might have little chance of survival in harsh climatic conditions.

## AFRICA

BY KIRK H. BEETZ

The study of law involves a study of words, because people use language to define and explain laws. This makes studying

crimes and punishments in medieval Africa difficult, because most medieval African cultures did not leave written records of their laws. Another challenge when trying to understand medieval African crime and punishment is that Africans often did not think of crime the way many other cultures did. For many African societies laws as outsiders might understand them were not needed, because social relationships defined how people were supposed to conduct themselves and traditions served to identify people who transgressed against society. Each African culture established the punishments it needed to suit the crimes it confronted.

One way to identify crime and punishment in medieval Africa is to study the behavior of traditional societies in modern times, inferring from observations how Africans behaved hundreds of years earlier. The weakness in this approach is that even the most traditional of societies is likely to change over periods of hundreds of year, so that what a culture does now may not be what it did in the medieval era. African cultures seem to have been flexible, often eagerly incorporating new ideas or discoveries from other cultures with which they came into contact. For example, the hero of a folktale may have used a spear in an early version of the tale but changed to using a musket in a later version, an alteration that resulted from Africans' exposure to musket-carrying Portuguese explorers.

Folktales from the medieval era offer insights into what various African cultures considered crimes as well as what they considered to be fitting punishments for those crimes. It is important, however, to keep in mind that Africa had many cultures, and what was a crime in one culture might not have been a crime in another. For instance, in the Herero culture of southwestern Africa, stealing cattle was a crime, yet in their stories about the hero Kemangurura, the Kikuyus of Kenya tell of his defeating an army of the Masai and then becoming a great leader by taking bringing Masai cattle home with him. In parts of eastern Africa, in the Sahel steppes and farther south, boys were taught how to steal cattle, and men were encouraged to do so as a way to gain prestige.

Crimes that often appear in African tales are murder, attempted murder, stealing, breaking and entering, and illicit sexual behavior. Crimes of identity theft also appear in the form of people being denied their rights by having their identities appropriated through subterfuge by others. A good example of this is the story of Kwege told by the Zaramo of Tanzania. If Kwege were to step over a log, he would die, so on a long journey he has his slave, Bahati, carry him over logs. Bahati extorts an item of clothing from his master every time Kwege needs to be carried over a log. When they reach the home of Kwege's uncle, Bahati looks like the master and Kwege looks like the slave, and Bahati claims to be Kwege. After some suffering on Kwege's part, Bahati's subterfuge is revealed, and he is executed. This suggests that a person's

identity was a highly valued possession and closely tied to that person's status in the community.

The death penalty seems to have been practiced by most African cultures. It was often invoked for murder. The Boloki of the Central African Republic told a story of how murder was introduced into the world by a selfish man, Mbungi, who cut off his wife's head. When he started a journey into town, her head followed him, asking him to wait for her. He tried cutting the head to pieces and burying the pieces, but even then the head followed him as he continued his journey. When they saw the head, members of the wife's family bound Mbungi and killed him.

An important aspect of many African folktales is the persistence of justice. For instance, the Xhosas of southern Africa told a story about Nyengebule, who beat the younger of his two wives to death for not bringing him any of the honey she had found in the forest. Feathers fell from her hair while she was beaten, and they transformed into a bird that followed Nyengebule, announcing his crime to anyone nearby. He tried to kill the bird several times without success, so he hid the bird in one of his bags when he went to the murdered wife's family to demand the return of the dowry he had paid. When he opened his bag to retrieve something, the bird flew out and declared the crime. Nyengebule was executed for his evil deed. Again, justice is persistent, following the criminal relentlessly until the criminal is found out and punished.

The attitudes revealed by these folktales are somewhat mystical, and most African cultures treated crime as part of the supernatural aspect of their world, as something that deceased ancestors would know about and could reveal. When a community suspected that a crime had been committed, especially a socially destructive one such as a theft from communal food stores, members of the community might ask a magician to persuade ancestors to identify the culprit. Magicians were usually very well acquainted with the activities of local people, which increased the likelihood of their successfully identifying the culprit. This put much pressure on criminals to confess their crimes.

Many African peoples, particularly in western and central Africa, had no clear legal code and no government authorities to enforce the law, which confused early Arab and European visitors who were accustomed to judges and trials. Yet these African societies were orderly, with elaborate customs for how people were responsible for each other. Crimes were viewed as actions that disrupted the traditional relationships of immediate families, clans, and villages. For instance, husbands who did not take care of their wives were punished, as were wives who did not fulfill their matrimonial duties.

Gender roles in Africa were defined in ways that would not be familiar to most people outside Africa. African cultures were not strictly patriarchal, with men dominant over

women, or matriarchal, with women dominant over men. Instead, division of labor between the genders in Africa involved cooperation between men and women to keep their families, clans, and villages prosperous. In many cultures men were the manufacturers of goods such as iron tools and ceramic vessels, and women were the traders, the experts in the mathematics of trade and in the marketing of village goods. A criminal could be a man who made shoddy goods or a woman who did not take good care of her family's finances.

Likewise, punishments for crimes in Africa might be considered unusual by non-Africans. For example, thieves were not hanged and did not have their hands cut off, nor were they even imprisoned. Instead, thieves were punished by loss of status within their immediate families, clans, or villages. The change could be subtle, such as a woman not being allowed to wear as many iron rings around her ankles. A man could have his status as head of his household transferred to one of his sons. A public proclamation of the transfer was unnecessary because people would simply begin treating the criminal as subordinate to other men in his family, and they would speak to his son in terms befitting a head of household. So vital were a person's social ties that a change in status would be humiliating and even frightening, because to many Africans social ties were essential to their well-being.

In western, central, and eastern Africa most deaths were considered suspicious, even deaths from old age or disease. To the African cultures, every event had a cause deeper than that apparent on the surface. Typically, a corpse was carried high in the air by several men as it was taken to its burial site to enable the corpse to point out its killer among the villagers, even when the person had died from natural causes. Punishment for a killer identified in this way was execution or exile. Among western African peoples, a criminal could be identified with the use of a scorpion. For instance, if a family suspected one of its members of stealing food from the family's stores, the head of the family would gather together all members of the family and place a scorpion on the arms of each family member until it stung someone. The scorpion was supposed to be controlled by the family's ancestors, who would inspire it to sting only the guilty person. This was a fairly effective bit of psychological pressure, because the guilty person would often confess before the scorpion ritual began, preferring not to risk death from the scorpion's poison.

Some African cultures developed criminal systems more familiar to outsiders. Most of the information about those systems comes from Muslim and European traders and explorers. For instance, the city of Benin and the kingdom of Ghana had police forces. Generally, the police enforced laws governing protocol, such as the law requiring traders to speak to certain representatives of the king before speaking to anyone else and then to spend several days not talking about

trading before being allowed to begin their business. Punishment for disobeying the law could entail the confiscation of the traders' goods and expulsion from Benin or Ghana as well as loss of trading rights.

## THE AMERICAS

BY ARDEN DECKER

As there are no substantial documents concerning law, crime, or punishment in the Americas during the medieval period, much of what is known has been gleaned from information provided by Spanish chroniclers of the colonial era. We may attempt to reconstruct the workings of legal systems in the times before European contact through such documents.

Very little is understood about how North Americans of the medieval dealt with crime and punishment. There have been suggestions on the basis of physical evidence that some North American Indians used human sacrifice and cannibalism as forms of social control. Certainly the severity of this type of punishment (if it indeed served as such) would have been a powerful deterrent against crime. Given the many scenarios, however, that could generate the physical findings, it is difficult to draw any definitive conclusions regarding the functioning of a legal system at this time. Indeed, the existence of any system of jurisprudence among North American Indians in this period remains a debated topic among scholars.

Much of what we know about crime and punishment in Mesoamerica comes from early Spanish colonial sources on jurisprudence in the two largest cities in the Aztec Empire at the time of the Spanish entry: Texcoco and Tenochtitlán. By 1428 both of these cities had joined with a small city-state called Tlacopán to form the Triple Alliance. It must be noted, however, that the specific manner in which crime and punishment were dealt with in the heart of the empire may not be the case for Mesoamerica at large. Examination of the two larger cities nonetheless contributes immensely to current understanding of law in medieval Mesoamerica.

Jurisprudence among the Aztec was primarily concerned with taxation, land rights, and social control. The earliest recorded legal code comes from the Texcocan ancestors and is clearly related to the needs of a hunter-gatherer society. Some of the early laws known to the Texcocans stipulated that no fires could be lit outdoors without the ruler's license on penalty of death. Similarly, hunting required a license from the ruler. Moreover, no one could steal another hunter's game under penalty of having their bows and arrows confiscated. Adultery was considered a particularly serious offense; the breaking of this law was punishable by beheading with arrows.

The laws were something to be feared in 15th-century Texcoco and Tenochtitlán, as they served the primary role of

controlling the population. The laws were not considered fair, because the equal treatment of all citizens was not assumed, as it is today. The 15th-century Texcocan ruler Nezahualcoyotl was the first to establish a supreme legal council, under which the ruler himself could alter only specific legal policies. Nezahualcoyotl was arguably the most significant law-giver of the Aztec world. Among his accomplishments was the institution of 80 sets of laws divided into four parts, each part overseen by a supreme council. Most of these laws were designed to protect and benefit the state as a whole.

Texcocan noblemen were elected to official positions to facilitate the legal process. The many provinces of Texcoco were organized into six regions for purposes of collecting taxes and other legal issues. Each of these regions was assigned two judges who served at the main palace in Texcoco. The judges oversaw all cases pertaining to their respective jurisdictions and sentenced criminals with the approval of the supreme leader. These local judges were allowed to pass sentence on those who broke minor laws. If the crime was particularly serious, a judge could hand down a sentence without any official defense for the accused, but this circumstance appears to have been rare. Colonial Spanish chroniclers suggested that general councils were held every 10 to 12 days to decide minor or clear-cut cases. Another council known as the *nappapoolatolli* was held every 80 days to decide difficult or unresolved cases. These were most often resolved by public punishment or execution. While the specific circumstances are unknown, it seems that accused persons could appeal their sentences.

By all accounts, most accused persons received some type of trial to decide their punishment. While the exact court procedures are not entirely understood, we do know that witnesses could be called during trials and evidence could be submitted. Some colonial accounts have suggested that witnesses were sworn to tell the truth by an oath to the earth goddess. Similarly, judges were required to be truthful and honorable in their post. They were forbidden to receive gifts or bribes under penalty of being removed from their position. Within the courtroom there were bailiffs and scribes who recorded the proceedings of the trial. There has been some evidence to suggest that there were persons acting as trial lawyers, but this information is not conclusive.

Adultery, drunkenness, and treason are the crimes most often discussed in colonial chronicles. It should be noted that men of military rank or nobility would receive less severe punishments than the common man. Punishment was often physical rather than financial; it might include dismemberment, beating, stoning, or mutilation. These penalties were sometimes used in combination with such nonphysical punishments as verbal reprimands or public humiliation. The punishment for adultery varied according to the status of the perpetrator and the severity of the crime. Adulterers could

face stoning, strangulation, or even burning alive as punishment. Alcohol consumption was acceptable as long it was associated with some type of celebration or medicinal purpose. Some areas of the empire were more tolerant of drunkenness than others. When punishment was strictly enforced, it could be as severe as strangulation.

Theft was considered the worst possible offense and punished most severely. Again, the punishment would vary according to the magnitude of the theft and the value of the stolen property. Stealing goods from the public market was regarded as particularly offensive. Convicted thieves were often punished by strangulation. Often the bodies of these offenders would be dragged through the streets as a warning to others. A less harsh sentence for theft made the perpetrator a slave to the victim until the stolen goods were paid for. Similarly, in business and land laws a person who failed to pay a debt would be jailed until the debt was paid or made the slave of the person to whom they were in debt.

Most of our information about crime and punishment in South America during this period concerns the Inca Empire of Peru. The empire was strongly centralized and implemented Incan law over any new territories it acquired. The Inca (chief ruler) was an absolute monarch, and his rule was to be upheld by all persons under the empire's control. Even so, some local laws were kept in place, as deemed necessary by officials. Like Aztec law, much of Incan law centered on social control, collecting taxes, and forcing new territories to accept Incan authority. The justice system served primarily to compel obedience from commoners. Laws were enforced by several different methods, including spying, investigation, and sentencing by the central government.

While some colonial chroniclers suggested that there was an official court in the capital city of Cuzco, its existence has not been definitively established. We know that there was a hierarchical trial system in place that began at the level of the local governors and went up to the high court of the Inca state. There is no evidence, however, that the Incan legal system had lawyers. Unlike the Aztec judicial system, there is no evidence that the Incan system required people to swear oaths.

Incan laws were enforced at the local level by persons called *mitimaes*, who judged crimes related to taxation. They were also in charge of sentencing rebellious people in their communities and enforcing such cultural codes as the law that required all people to wear the characteristic clothing of the province in which they lived. This requirement helped determine who owed taxes. If someone altered his or her dress, they could be punished for attempted tax evasion. Other low-level officials, called *curacas*, handled such community problems as property theft. Often these crimes were punished by reprimand, public beatings, or even death, depending on the seriousness of the offense.

The legal offices of the Incan government were not specialized; officials often served simultaneously as governors, tax collectors, and judges. The more significant the crime in the eyes of the state, the higher the rank of the official appointed to judge the case. In crimes committed against the central government, inspectors were sent to investigate the crime and report any other violations. A governor then served as judge on behalf of the central government to punish the perpetrators. These judges even had the power to impose the death penalty if they saw fit. Crimes against the Inca himself often included refusal to pay taxes or performing witchcraft against the ruler. During the trials, all persons associated with the crime would be called into court to explain their accusations. The accused would be given the chance to defend himself or herself. If the guilt of the accused remained uncertain after a trial, the governor would investigate the person's reputation among the community. If the overall assessment was negative, the accused would be tortured until a confession was extracted.

## ASIA AND THE PACIFIC

BY JUSTIN CORFIELD

Some countries such as China had detailed codified legal systems that other countries sought to emulate during the Middle Ages. In other places customary laws and common law provided the only system of justice, with village elders giving permission for customary punishments. In imperial China most punishments were decided by magistrates appointed by the central government. Injustices did occur, and numerous folk stories tell of those who escaped bad judgments, with the most famous being the classic novel *Water Margin*, also known in English as *All Men Are Brothers* and presumed to have been written by Luo Guanzhong (ca. 1330–ca. 1400).

Although prisons existed, they usually served as places to hold people until they were tried. Common punishments were monetary fines, flogging, being sentenced to a certain number of years of hard labor or exile, or execution. The Chinese codes established levels of sentencing, with lesser punishments imposed on people who surrendered themselves and pleaded guilty. Offenders could mitigate their punishments by paying money to the imperial treasury. For some offenses the required sentence was banishment.

The offenses considered most heinous were poisoning, murder, seriously wounding another person, and “killing by magic.” Punishment for any of these offenses was execution either by beheading or by strangulation with a cord. The latter was used on wealthier people to avoid the shedding of blood. If a member of the imperial family was found guilty of a crime, the effort to avoid spilling royal blood went as far as sentencing the offender to commit suicide by taking poison. Marco Polo described an instance when the Mongol ruler Kub-

lai Khan faced this dilemma after capturing a rebel warlord, Nayan, who was Khan's cousin. The punishment designed by Khan required Nayan to be wrapped in a carpet and dragged around until he died, the carpet ensuring that no blood would be spilt and that “the sun and the air” would not witness Nayan's death. Most beheadings took place outside the city walls, often with the body of the deceased left on display to serve as a warning to others.

Generally the Chinese, like many other cultures during this period, avoided using prisons as much as possible. Malefactors like thieves or even people found guilty of breaking the curfew were held overnight, tried the following morning, and if found guilty immediately punished. The cangue was a Chinese invention used largely to prevent the need for a prison population. It was a large square wooden collar divided into two pieces with a hole in the middle, allowing it to be locked around the neck of the offender. Some cangues were built for two or more prisoners in a row. Sleeping and eating were difficult with the cangue, making the prisoner's life a misery for several days or weeks. Corporal punishment in China involved hitting the criminal on the buttocks with a polished bamboo cane. A sentence of as much as 100 strokes could be imposed, causing serious injury and occasionally death.

The most heinous of crimes was treason, for which the perpetrator was executed, often in a gruesome manner. One form of execution was the Death of a Thousand Cuts, in which the traitor was tied up and cut with a sharp knife 1,000 times before being killed. Punishing a traitor often meant executing the culprit's parents, grandparents, children, and grandchildren. If any of those relatives had already died, their bodies were dug up and burned and the ashes scattered to the wind.

Punishments meted out by the Tartars and Mongols were severe. Marco Polo wrote that capital crimes included murder and theft of a horse. For the former there was no mitigation, but a convicted horse thief could escape being “chopped in two” by making a payment to the owner of the horse. A person found guilty of theft had to pay a sum equal to nine times the value of the item stolen to escape a flogging, which consisted of between seven and 107 strokes. The crime of assault was punishable by amputation of the hands or by the victims wounding their attackers in the same manner they had been injured.

The medieval legal system in Vietnam was based on the Chinese model; in fact, Vietnam was occupied by China until 939. Capital punishment could involve decapitation, strangulation, being crushed by elephants, or “slow death.” Following decapitation, the head was displayed in public and later thrown in a river. Less severe punishments included branding the face, cutting off the nose or foot, and castration. Caning and time in stocks or the cangue were other possible penalties.

The Vietnamese system of punishment was overhauled by the Emperor Le Thanh Ton (r. 1460–1497). He enacted the

Hong Duc Penal Code, which introduced strong Confucian ethics into the civil and criminal laws. Completely codifying all the laws in Vietnam along the Chinese model, it consisted of 721 articles and remained in force until the 19th century.

Japanese magistrates operated much like those in China, holding people in prison until they confessed their crimes or were brought to trial. Authorities could use water torture, “pressing with stones,” or flogging to gain a confession. A prisoner ready to confess was led to the dais on which the magistrates sat and forced to kneel on white sand, symbolic of truth. The punishments prescribed depended not only on the crime but also on the class of the offender. If a samurai was convicted of raping a woman who did not live on his lands, he was banned from participating in military service for 100 days and could have one side of his head shaved. The penalty for rape by a commoner could be execution.

The Japanese legal system regularly resorted to capital punishment for murder, robbery, and some instances of adultery. Arsonists were burned alive. Samurai found guilty of capital crimes were permitted to commit seppuku, or harakiri (ritual suicide by disembowelment), to avoid the court’s designating a method of execution. Some people might be sentenced to work in the mines. Banishment involved sending the offender to a remote island, not permitting other people to come within roughly 25 miles of the offender’s home, or not allowing the offender to return to his or her home district. Smaller crimes could warrant house arrest; restrictions on liberty; or, in the case of women, having her head shaved. Some other offenses warranted floggings, and people found guilty of gross insult or slander or flagrant adultery were branded.

Various legal codes operated throughout the Indian Subcontinent, with punishments resembling those imposed by the Chinese. In some other parts of Asia most of the information on legal codes and systems of punishment is fragmentary and derived from the records of travelers from China or other parts of Asia. One Chinese official, Zhou Daguan, recorded his travels to Angkor, Cambodia, around 1296 to 1297. He suggests that crime was relatively rare. Although people could have hands, feet, or noses amputated, most penalties called for the use of the cane or fines. The death penalty, rarely imposed, was effected by burying the offender alive outside the western gate of the city. Zhou also recorded some peculiar punishments. Although there was no prescribed punishment for adultery, if a woman’s lover was caught by her husband, the lover’s feet could be squeezed between two wooden splints until he surrendered his property to stop the pain.

A Cambodian method of identifying guilt was similar to the “trial by water” used in feudal Europe. If someone was accused of being a thief but the case was in doubt, the suspect’s hands were plunged into boiling oil; unharmed hands indicated innocence, whereas burns were a sign of guilt. It

is probable that similar systems of punishment existed in Champa in central Vietnam and in Ayuthia in Thailand.

Tribal codes of justice were used in the Pacific. To handle disputes arising between individuals or neighboring groups, some Pacific peoples used a complex system of “payback.” Senior men and women would meet to decide whether an offense had been committed, who was at fault, and what the punishment should be given. In a hostile environment isolation from one’s community was certainly a harsh punishment. Other punishments might involve banishment for a period or even spearing for major offenses.

## EUROPE

BY TOM STREISSGUTH

The collapse of the Western Roman Empire brought social and political chaos to much of the European continent. The system of Roman law was in large part replaced by the new customs of the migrating peoples who were overrunning Roman cities and provinces. Law codes of Germanic societies took some procedures from Roman law and mixed them with pagan law customs. In Ireland, where Roman armies never set foot, Brehon law remained in force for civil disputes throughout the medieval period.

Criminal law followed local customs in the new feudal estates and principalities. One of the most important legal traditions was *wergild*, which placed a value in gold on each individual. Varying with the age and status of the victim, the *wergild* had to be paid in a case of violence or murder against that person. *Wergild* was set in each village and was meant to put a stop to the constant feuds that plagued early medieval communities with generations of murder and violence. Rather than taking personal vengeance against the perpetrator or his family, the victim or his family could simply demand a *wergild* payment and thus put an end to the dispute.

The traditional law of the Franks, known as the Salic law, set out an elaborate schedule of *wergild* payments to be made in the case of specific acts and injuries. The Salic law distinguished between Franks, Romans, slaves, nobles, and freemen. The more powerful the victim of a crime, the more severe the fine or punishment. With the creation of a vast Frankish Empire under the rule of Charlemagne in the late eighth century, the Salic law was imposed in much of northern and central Europe and replaced the local customary laws that had been enforced in those regions.

Christianity had an important impact on the treatment of crime. Where religious authority was established, ordinary crimes were separated from religious crimes, such as immoral acts and heresy, and systems of canon (church) law were created to try to punish infractions. The church reserved the right to try priests and other ecclesiastics and set

Carved wooden panel depicting Chaucer's "Pardoner's Tale" of greed and crime; Britain, ca. 1410 (© Museum of London)

its courts apart from and in some places above the secular law. (This issue would remain a point of contention between kings and popes throughout the Middle Ages.) The church also provided a place of sanctuary for fugitives, a right that could not be transgressed by secular rulers.

A distinction was always made between crimes against persons and crimes against property. Property crimes included theft, trespassing, and fraud. The use of land belonging to kings or nobility was always considered a serious crime, often punishable by death. Crimes against persons included slander and insult and the more serious crimes of violence, including assault, rape, and murder.

Medieval trials often consisted of physical ordeals intended to determine criminals' guilt or innocence or to persuade witnesses to tell the truth. The idea was that an ordeal opened the proceedings to God's direct intervention in deciding an accused criminal's fate, ensuring that the innocent would go free and the guilty would be punished. A trial by ordeal could proceed in various ways. The accused might be thrown into a river, because it was believed that a guilty party would be rejected and float to the surface. Hot brands might be applied to the skin and the burns examined over several days for signs of infection (and thus guilt). In 1215 the Catholic Church banned trial by ordeal.

In medieval Europe criminal trials also were carried out by oath. The parties in a dispute swore their innocence, and the final decision in the case rested in the hands of chieftains or feudal lords who had the right to dispense justice on their own lands. The value of an oath varied with the status of the person making it, with the word of a noble considered more trustwor-

thy than that of a commoner. Trial by combat, another important way of bringing criminals to justice, was a contest between the accused and the accuser, with the winner declared to be the prevailing party in the case and the loser to be at fault.

Numerous punishments were available to the courts, most of them involving some form of mutilation or execution rather than imprisonment (prisons for long-term confinement or "correction" did not exist in the Middle Ages). Thieves might have a hand cut off or be hung from a public gibbet, which was placed prominently outside the walls as a warning to the law-abiding populace. Medieval courts also had different punishments for different social classes, as in the Salic law of the Franks. Punishments were less severe for a landowner or noble, and monarchs placed themselves above the reach of the courts altogether.

To avoid punishment, those accused of crimes often fled. Their property was confiscated, any bail they posted was forfeit, and their families often were banned. Those who fled were subject to capture and, in some places, summary execution. Criminals could also occasionally bargain down their punishment as a condition of returning.

The adoption of Roman law in the late medieval period instituted national criminal codes, which replaced the customs of towns and feudal estates. The custom of *wergild* disappeared, and in England a common law developed out of the findings of juries and judges in past cases. Capital punishments declined toward the end of the Middle Ages and were reserved for more serious crimes such as conspiracy, assassination, highway robbery, and murder. The worst form of execution was reserved for traitors and conspirators: Their

bodies were broken with sledgehammers on a wheel, or they were drawn and quartered—stretched and torn apart by horses. In the Inquisition courts of the church, heretics were bound over to the civic authorities for a public burning.

In England the Star Chamber was instituted by the Tudor kings to hear cases on appeal; its decisions superceded the findings of common-law courts. The Star Chamber held public trials and, as a branch of the royal government, was supposed to provide a fair hearing and avoid the petty rivalries and corruptions of local courts. It dealt with fraud, bribery, property crimes, public disorders and, after the Church of England was established, obedience to the doctrines of the church. The Star Chamber could order fines, time spent in the stocks, whippings, brandings, and mutilations but never execution.

## THE ISLAMIC WORLD

BY CHRISTIAN LANGE

The Islamic polity was born when the prophet Muhammad emigrated from his hometown Mecca (in modern-day Saudi Arabia) to Medina in 622 C.E. Until his death in 632 Muhammad laid the foundations of the Islamic political and legal order, including rules governing the prosecution of crime and the administration of punishment. The greatest danger to the urban settlements of seventh-century Arabia resulted from bands of nomads attacking caravans on the ancient trade routes connecting southern Arabia with Greater Syria. This is reflected in the “brigandage verse” in the Koran, which stipulates that “the reward of those who make war upon God and His Messenger and strive after corruption in the land is that they be killed or crucified, or have their hands and feet cut off on alternate sides, or that they be banished from the land.” Until the end of the Umayyad Dynasty in 750, marauding Arab nomads, among them the infamous brigand-poets (*saliq*), continued to challenge the central authority of the caliphate.

With the rise of the Abbasids (749–1258) and the development of Islamic urban society from Spain to India, urban criminality appears on the horizon of Islamic criminal history. In the towns of Syria, Iraq, and Persia local militia, created originally around the 10th century to protect the city’s neighborhoods against abuses by the agents of the repressive state apparatus, developed into gangs of common thieves and ruffians. A different class of urban criminals was that of the so-called Clan of Sasan (*Banu Sasan*), the blanket designation in medieval Islamic literature for the practitioners of begging, swindling, confidence tricks, displaying disfiguring diseases and mutilated limbs, and other offenses. Crime and criminals were never absent in Islamic history, even though periods of peace, prosperity, and security may have helped to curb criminal activity.

No criminal codes existed in Islam before the 15th century. In theory criminal law was developed by the jurists of

Islam, who devoted special attention to offenses mentioned in the corpus of Islam’s sacred texts (the Koran and the Sunna, the collected reports from the prophet Muhammad). In accordance with the law of Islam (sharia) jurists classified punishments for offenses that touched on public interests as the “rights of God.” This concept implied that once a procedure was initiated, neither the victim nor the judicial authorities could pardon the defendant. In addition to brigandage the Koran stipulates that four offenses are punishable as rights of God: theft, fornication, unfounded accusation of fornication, and consumption of alcoholic drinks. The punishments prescribed for these offenses, known as divinely ordained punishments, are amputation of the right hand for theft, 100 lashes or stoning for fornication, 80 lashes for unfounded accusation of fornication, and 80 or 40 lashes for alcohol consumption. The typical punishment for apostates—those who renounce Islam publicly by words or by conduct—is execution.

This rather grim picture needs to be qualified in important respects. The divinely ordained punishments tend to be defined narrowly (with the exception of brigandage) and underlie strict rules of evidence. For example, four eyewitnesses are required in cases of alleged fornication. In addition, the accused has ample opportunity to use legal doubt as a defense, because according to a widely circulated saying of the prophet Muhammad, the divinely ordained punishments are to be averted on the strength of doubt. Thus, as jurists conceive it, the purpose of a divinely ordained punishment is to serve as a threat and deterrence rather than an actual prosecution of a crime. The Koran regulates murder and corporal injury only insofar as the victim’s immediate relatives are given a right to seek retaliation in the court of the Islamic judge, in the form of either “an eye for an eye” (talionic, or retaliatory, punishment) or monetary recompense. Complaints must be brought forth by the victim’s party because talionic punishments are considered the rights of men.

The majority of offenses, however, are not specified in either the Koran or the Sunna. They fall under a third, residual category of punishment—that of discretionary punishment. Legal discussions of discretionary punishment contain little systematic reflection. However, a lot of attention is given to the issue of slander and calumny, which reflects Islamic law’s prohibition of exhibitionism and effort to protect personal honor. The Syrian al-Kasani (d. 1189) proposed an influential fourfold classification of discretionary punishment, the more “honorable” the offender, the less harsh the punishment (in descending order: jurists and descendants of the Prophet, landowners and military leaders, merchants, and commoners).

According to legal theory, discretionary punishment was the domain of the Islamic judge, but the repressive state organs appear to have adjudicated and implemented

discretionary punishments with little regard to sharia, often under the pretext of following the dictates of political expediency. Beginning in the 12th century jurists tried to assimilate the concept of political expediency into the framework of sharia. Late medieval jurists such as the Syrian Ibn Taymiyya (d. 1328), developed the influential doctrine of “governance in accordance with sharia.” In the long run, however, this doctrine tended to further subordinate Islamic judges to the executive power of the temporal authorities.

Documents of investiture for the office of the Islamic judge from the ninth to the 15th centuries tend to be silent with regard to the divinely ordained punishments, let alone the discretionary punishments. Only with the full development of the doctrine of political expediency under the Ottoman Empire (13th–20th centuries) were Islamic judges reintegrated into the administration of penal justice. From early on there was a dual regime of religious and temporal criminal justice. The institution known as the Court of Grievances was originally instituted under the caliph al-Mahdi (r. 775–785). According to al-Mawardi, the major medieval theorist of Islamic public law, this court possessed the authority to investigate crimes *ex officio*, in addition to relying on rules of evidence somewhat more lax than those of the Islamic judge’s court. However, the Court of Grievances seems to have functioned as a criminal court only in cases that aroused great public interest, such as when the popular mystical preacher al-Hallaj was sentenced to death by crucifixion in 922 in Baghdad.

In the day-to-day prosecution of crime, the urban police and the market inspector played a more important role. Between the 11th and 13th centuries in Baghdad the chief of police was a powerful political player, second in importance only to the vizier. The police punished crime according to both the principles of political expediency and sharia. The brigandage verse in the Koran was conveniently exploited for the persecution of all sorts of offenders. The police were aided by the market inspector, who was set to watch over public morals and commercial fraud. Market inspectors are mentioned in the chronicles as having publicly rebuked, flogged, or ignominiously paraded trespassers against norms of public behavior.

Types of punishment in medieval Islam included executions, corporal punishments, shame punishments, banishment, imprisonment, and fining. The form of execution most frequently mentioned in the chronicles is crucifixion, a practice that comes closer to hanging than to the Roman-style nailing on a cross. However, execution by the sword may have been just as common or even more widespread. Other forms of execution, rarely mentioned in the sources, included stoning, throwing from towers (a punishment applied to sodomites), strangling (of high-ranking members of the military

or administrators), burning (mostly of heretics), drowning (of ill-reputed women), and trampling by elephants (especially in the East). Corporal punishments included flogging with whips, switches, or crops; beating of the soles of the feet was common under the Ottomans.

Except in cases of retaliation, a strong reticence to mutilate bodies appears to have prevailed through much of Islamic history. Ignominious parades on donkeys, camels, or oxen were common sights throughout the Islamic Middle Ages. Offenders were led through the city, their faces blackened with smut or embers, sitting backward, while their crimes were called out to the public. Other forms of shame punishment included the privation of the right to act as witness, a coveted position of honor. The stipulation in the Koran that certain criminals “shall be banished from the land” was taken to refer to both banishment and imprisonment, since prisons were thought to be a kind of netherworld of almost eschatological proportions. Little is known about what popular prisons looked like, but conditions in the great prison in the Cairo citadel (Mamluk Period, 1250–1517) seem to have been miserable, with prisoners starving to death if unaided by their families. Pecuniary punishments, though disputed by the jurists, were a common form of discretionary punishment.

The outstanding feature of the administration of penal justice in medieval Islam would seem to be the divorce of legal theory from penal practice. Soon after the decline of charismatic religious leadership in early Islam (ca. 622–720) the prosecution of crimes was usurped by the temporal authorities (ninth–11th centuries). However, concurrent with the development of Islamic legal doctrine, the jurists managed to reclaim a measure of influence in criminal law by defending the inviolability of the human body as well as that of the private sphere of Muslim households and by bringing the concept of political expediency back into the fold of sharia (especially from the 14th century on). Thus, debates about the extent to which the prosecution of crime in medieval Islam lay outside the realm of religious law must take into account specific historical and doctrinal contexts. The study of the history of Islamic criminal law is still in its infancy, despite some progress in recent years, especially with regard to the Ottoman Period, for which court registers are available.

~ The Xosa Tale of Nyengebule (undated) ~

So it was with Nyengebule. He had two wives, who, one day, went out together to collect firewood in the forest. The younger found a bees' nest in a hollow tree, and called her companion to help her take out the honeycomb. When they had done so they sat down and ate it, the younger thoughtlessly finishing her share, while the elder kept putting some aside, which she wrapped up in leaves to take home for her husband. Arriving at the kraal, each went to her own hut. The elder, on entering, found her husband seated there, and gave him the honeycomb. Nyengebule thanked her for the attention, and ate the honey, thinking all the time that Nqandamate, the younger wife, who was his favourite, would also have brought him some, especially as he was just then staying in her hut. When he had finished eating he hastened thither and sat down, expecting that she would presently produce the tidbit. But he waited in vain, and at last, becoming impatient, he asked, "Where is the honey?" She said, "I have not brought any." Thereupon he lost his temper and struck her with his stick, again and again. The little bunch of feathers which she was wearing on her head (as a sign that she was training for initiation as a doctor) fell to the ground; he struck once more in his rage; she fell, and he found that she was dead. He made haste to bury her, and then he gathered up his sticks and set out for her parents' kraal, to report the death and demand his lobolo-cattle back. But the little plume which had fallen from her head when he struck her turned into a bird and flew after him.

When he had gone some distance he noticed a bird sitting on a bush by the wayside, and heard it singing these words

"I am the little plume of the diligent wood-gatherer,

The wife of Nyengebule.

I am the one who was killed by the house-owner,  
wantonly!

He asking me for morsels of honeycomb."

It kept up with him, flying alongside the path, till at last he threw a stick at it. It paid no attention, but kept on as before, so he hit it with his knobkerrie, killed it, threw it away, and walked on.

But after a while it came back again and repeated its song. Blind with rage, he again threw a stick at it, killed it, stopped to bury it, and went on his way.

As he was still going on it came up again and sang:

"I am the little plume of the diligent wood-gatherer . . ."

At that he became quite desperate, and said, "What shall I do with this bird, which keeps on tormenting me about a matter I don't want to hear about? I will kill it now, once for all, and put it into my bag to take with me." Once more he threw his stick at the little bird and killed it, picked it up, and put it into his inxowa. . . He tied the bag up tightly with a thong of hide, and thought he had now completely disposed of his enemy.

So he went on till he came to the kraal of his wife's relations, where he found a dance going on. He became so excited that he forgot the business about which he had come, and hurried in to join in the fun. He had just greeted his sisters-in-law when one of them asked him for snuff. He told her—being in a hurry to begin dancing and entirely forgetful of what the bag contained—to untie the inxowa, which he had laid aside. She did so, and out flew the bird dri-i-i! It flew up to the gate-post, and, perching there, began to sing . . . .

He heard it, and, seeing that every one else had also heard it, started to run away. Some of the men jumped up and seized hold of him, saying, "What are you running away for?" He answered—his guilty conscience giving him away against his will—"Me! I was only coming to the dance. I don't know what that bird is talking about."

It began again, and its song rang out clearly over the heads of the men who were holding him. . . .

They listened, the meaning of the song began to dawn on them, and they grew suspicious. They asked him, "What is this bird saying?" He said, "I don't know."

They killed him.

## Asia and the Pacific

~ Jean-Baptiste du Halde: Excerpt from  
Description de la Chine (1735) ~

No crimes pass unpunished in China. . . . The bastinado is the common punishment for slight faults, and the number of blows is proportionate to the nature of the fault. . . .

Another punishment, less painful, but more infamous, is the wooden collar which the Portuguese have called cangue. This cangue is composed of two pieces of wood, hollowed in the middle to place the neck of the criminal in. When he has been condemned by the mandarin, they take these two pieces of wood, lay them on his shoulders, and join them together in such a manner that there is room only for the neck. By this means, the person can neither see his feet nor put his hand to his mouth, but is obliged to be fed by some other person. He carries night and day this disagreeable load, which is heavier or lighter according to the nature of the fault. Some cangues weigh two hundred pounds and are so troublesome to criminals that out of shame, confusion, pain, want of nourishment and sleep, they die under them. Some are three feet square and five or six inches thick; the common sort weigh fifty or sixty pounds.

The criminals find different ways to mitigate the punishment. Some walk in company with their relations and friends, who support the four corners of the cangue that it may not gall their shoulders. Others rest it on a table or on a bench; others have a chair made proper to support the four corners, and so sit tolerably easy. When, in the presence of the mandarin, they have joined the two pieces of wood about the neck of the criminal, they paste on each side two long slips of paper about four fingers broad, on which they fix a seal, that the two pieces which compose the cangue may not be separated without its being perceived. Then

they write in large characters the crime for which this punishment is inflicted and the time that it ought to last; for instance, if it be a thief or seditious person or a disturber of the peace of families, a gamester, etc., he must wear the cangue for three months in a particular place. The place where they are exposed is generally at the gate of a temple which is much frequented, or where two streets cross, or at the gate of the city, or in a public square, or even at the principal gate of the mandarin's tribunal.

Then the time of punishment is expired, the officers of the tribunal bring back the criminal to the mandarin, who, after having exhorted him to amend his conduct, frees him from the cangue, and to take his leave of him orders him twenty strokes of the battoon, for it is the common custom of the Chinese justices not to inflict any punishment unless it be a pecuniary one, which is not preceded and succeeded by the bastinado, inasmuch that it may be said that the Chinese Government subsists by the exercise of the battoon. . . .

There are some crimes for which the criminals are marked on the cheek, and the mark which is impressed is a Chinese character signifying their crime. There are others for which they are condemned to banishment or to draw the royal barques. This servitude lasts no longer than three years. As for banishment, it is often perpetual, especially if Tartary is the place of exile; but before they depart, they are sure to be bastinadoed; and the number of blows is proportionate to their crime.

## Europe

~ Leo III: *The Ecloga on Sexual Crimes* (726) ~

1. A married man who commits adultery shall by way of correction be flogged with twelve lashes; and whether rich or poor he shall pay a fine.
2. An unmarried man who commits fornication shall be flogged with six lashes.

3. A person who has carnal knowledge of a nun shall, upon the footing that he is debauching the Church of God, have his nose slit, because he committed wicked adultery with her who belonged to the Church; and she on her side must take heed lest similar punishment be reserved to her.

4. Anyone who, intending to take in marriage a woman who is his goddaughter in Salvation, bringing baptism, has carnal knowledge of her without marrying her, and being found guilty of the offence shall, after being exiled, be condemned to the same punishment meted out for other adultery, that is to say, both the man and the woman shall have their noses slit.

5. The husband who is cognizant of, and condones, his wife's adultery shall be flogged and exiled, and the adulterer and the adulteress shall have their noses slit.

6. Persons committing incest, parents and children, children and parents, brothers and sisters, shall be punished capitally with the sword. Those in other relationships who corrupt one another carnally, that is, father and daughter-in-law, son and stepmother, father-in-law and daughter-in-law, brother and his brother's wife, uncle and niece, nephew and aunt,

shall have their noses slit. And likewise he who has carnal knowledge with two sisters and even cousins.

7. If a woman is carnally known and, becoming pregnant, tries to produce a miscarriage [abortion], she shall be whipped and exiled.

8. Those who are guilty whether actively or passively of committing unnatural offences shall be capitally punished with the sword. If he who commits the offence passively is found to be under twelve years old, he shall be pardoned on the ground of youthful ignorance of the offence committed.

9. Those guilty of "abominable crime" [homosexuality?] shall be emasculated.

*A Manual of Roman Law: The Ecloga*  
(Cambridge, U.K.: Cambridge University  
Press, 1926).

*The Islamic World*

~ *The Koran, excerpt (seventh century)* ~

Of old our Apostles came to them with the proofs of their mission; then verily after this most of them committed excesses in the land.

Only, the recompense of those who war against God and his Apostle, and go about to commit disorders on the earth, shall be that they shall be slain or crucified, or have their alternate hands and feet cut off, or be banished the land: This their disgrace in this world, and in the next a great torment shall be theirs—

Except those who, ere you have them in your power, shall repent; for know that God is Forgiving, Merciful.

O ye who believe! fear God. Desire union with Him. Contend earnestly on his path, that you may attain to happiness.

As to the infidels—if that they had twice the riches of the earth to be their ransom from torment on the day of resurrection, it should not be accepted from them! And a dolorous torment shall be their's.

Fain would they come forth from the Fire; but forth from it they shall not come: and a lasting torment shall be their's.

As to the thief, whether man or woman, cut ye off their hands in recompense for their doings. This is a penalty by way of warning from God himself. And God is Mighty, Wise.

But whoever shall turn him to God after this his wickedness, and amend, God truly will be turned to him: for God is Forgiving, Merciful.

Knowest thou not that the sovereignty of the Heavens and of the Earth is God's? He chastiseth whom He will, and whom He will He forgiveth. And God hath power over all things.

O Apostle! let not those who vie with one another in speeding to infidelity vex thee;—of those who say with their mouths, "We believe," but whose hearts believe not;—or of the Jews listeners to a lie—listeners to others—but who come not to thee. They shift the words

(continued)

(continues)

of the law from their places, and say, "If this be brought to you, receive it; but if this be not brought to you, then beware of it." For him whom God would mislead, thou canst in no wise prevail with God! They whose hearts God shall not please to cleanse, shall suffer disgrace in this world, and in the next a grievous punishment;

Listeners to a falsehood and greedy devourers of the forbidden! If, therefore, they have recourse to thee, then judge between them, or withdraw from them. If thou withdraw from them, then can they have no power to injure thee. But if thou judge, then judge between them with equity. Verily, God loveth those who deal equitably.

But how shall they make thee their judge, since they possess already the Law, in which are the behests of God, and have not obeyed it? After this, they will turn their backs; but such are not believers.

Verily, we have sent down the law (Towrat) wherein are guidance and light. By it did the prophets who professed Islam judge the Jews; and the doctors and the teachers judged by that portion of the Book of God, of which they were the keepers and the witnesses. Therefore, O Jews! fear not men but fear Me; and barter not away my signs for a mean price! And whoso will

not judge by what God hath sent down—such are the Infidels.

And therein have we enacted for them, "Life for life, and eye for eye, and nose for nose, and ear for ear, and tooth for tooth, and for wounds retaliation:"—Whoso shall compromise it as alms shall have therein the expiation of his sin; and whoso will not judge by what God hath sent down—such are the transgressors.

And in the footsteps of the prophets caused we Jesus, the son of Mary, to follow, confirming the law which was before him: and we gave him the Evangel with its guidance and light, confirmatory of the preceding Law; a guidance and warning to those who fear God;—

And that the people of the Evangel may judge according to what God hath sent down therein. And whoso will not judge by what God hath sent down—such are the perverse.

And to thee we have sent down the Book of the Koran with truth, confirmatory of previous Scriptures, and their safeguard. Judge therefore between them by what God hath sent down, and follow not their desires by deserting the truth which hath come unto thee. To every one of you have we given a rule and a beaten track.

## ► death and burial practices

---

### INTRODUCTION

With death often seen, in religious terms, as a rite of passage, there were a wide variety of burial systems throughout the medieval world, influenced by the differing nature of these views. These customs helped influence varying attitudes toward dead bodies. Many cultures of the medieval world had beliefs that centered on the afterlife, with distinct views on resurrection and heaven. In the context of such beliefs, death sometimes was seen as less sad because the person who had died was thought to be transcending to a “better” place. As a result, great care was always exercised in preparing the bodies of dead family members for this transition.

Enormous efforts were made to show respect for the bodies of the dead. In most parts of the world, for example, the bodies were washed. In some parts of the world, such as northern Europe, this was often done for practical and aesthetic reasons, but in the Islamic world it took the form of a “spiritual cleansing,” an important ritual meant to prepare the body for life in the next world. By contrast, for convicted criminals many forms of capital punishment involved the disfigurement or dismemberment of bodies or even in some cases their burning.

The task of preparing bodies for burial was often undertaken by family members in village societies in Africa and the Islamic world. The routine often was seen as a part of the grieving process. By contrast, in most of Christian Europe,

especially in cities, bodies were often washed and put in coffins by professional undertakers. By medieval times most societies had come to realize that bodies should be buried away from areas where people live, for reasons of public health. This understanding led people to locate burial grounds on the outskirts of cities, towns, and villages. In western Africa rituals dictated exactly where the dead would be buried. In China, Vietnam, and Korea geomancers would try to find the best place to bury people, which for farmers might be near the graves of other ancestors or in a distant field. In Christian Europe burials were in churchyards, positioned in the center of a settlement but away from the areas where people lived and crops were grown.

For those societies that used cremation—mainly in Buddhist parts of Asia—this method of disposing of bodies solved the problem of hygiene, and it became more common in areas where there was great pressure of population growth. The Parsi communities in India used the “Towers of Silence,” allowing vultures to eat the flesh from bodies placed in these circular structures. Maritime societies continued to perform burial at sea, and some such societies, like those in Scandinavia, even buried people in boats.

In the medieval world the grand burials of the ancient world, with large numbers of personal effects and sometimes even slaves, gave way to a more practical and simpler burial style. People would proceed to the afterlife clothed as they had been in life but largely without their household goods. They might still be buried with some of their favorite objects, but

these items often were placed with the dead for sentimental reasons and not necessarily because the person would need such things in the afterlife.

Although societies had various customs, around the world there were two instances when burial practices changed—in time of war and during epidemics such as the plague. War and pestilence often led to the death of large numbers of people, and there was a need to bury bodies quickly. Large pits would be speedily dug and bodies placed in mass graves. Archaeologists have found numerous examples of this in cities which were badly affected by the Black Death in the 1340s, such as in Siena (Italy) and London.

Death was a period of great sadness in all medieval societies, with sanctioned periods of mourning after the death of a political or religious leader or family member. This happened in China, Korea and Japan for emperors throughout the medieval period. In Christian Europe, the Islamic World, and Asia it is known that people embarked on pilgrimages to places where holy or religiously influential people were buried. Paying respect to the honored dead was also prevalent among the Aborigine of Australia, and it seems likely that it also was practiced in sub-Saharan Africa and the Americas, as such customs were certainly being followed when the first European explorers arrived in these regions. Although gravestones with names mark the burials of the deceased in many societies, it was forbidden among the Aborigine to mention the name of the dead person for a prescribed period.

Beyond helping explain components of varying belief systems in the medieval world, studies of burials provide other sorts of information about cultures and people. Archaeologists studying Anglo-Saxon burial sites in Britain, for example, have been able to trace in considerable detail the spread of the Anglo-Saxons through England. Similarly, African burial customs have shown the regions where various ethnic groups managed to extend their power. Where intact remains of bodies are available at medieval sites, archaeologists have been able to study them to deduce much about the medieval diet, methods of dealing with medical problems, and life expectancies.

## AFRICA

BY JUSTIN CORFIELD

The medieval traditions related to death and burial practices varied greatly throughout Africa depending on the local customs, which in turn were heavily influenced by the terrain and the availability of material for the burials. Burials were common in the vast majority of places; cremation was unusual because of a belief in human spirits.

In pre-Islamic North Africa the Roman traditions of burying people in small mausoleums along the sides of roads was popular outside some of the cities along the Mediterranean coast. This continued for a long period after the end of the Western Roman Empire. Some of these graves around Carthage have been excavated by modern-day archaeologists and date from the fifth and sixth centuries. A Jewish community in North Africa during the Roman occupation used Jewish burial customs throughout the medieval period. Many of the old Jewish cemeteries do not survive, but there are some Jewish graves at Volubilis in modern-day Morocco. They are located around the ruins of a late-Roman-era synagogue.

With the coming of Christianity to North Africa came the Christian custom of burying people with their bodies lying east–west. After the advent of Christianity in Nubia in about 540 several Christian cemeteries were built, though some Egyptian traditions can still be seen at places like Ballana. Later Nubian burial sites show gravestones decorated with Christian emblems. The graves of some of the Christian bishops from the 10th century can still be found along the west wall of the Faras Cathedral in modern-day southern Egypt. In Ethiopia some people were buried in crypts, perhaps the most famous being the subterranean crypts at Lalibela, the capital of the kingdom established by King Lalibela during the 13th century. Many other medieval graves have been found throughout Ethiopia, including those of the Falashas (sometimes called the black Jews of Ethiopia), who used traditional Jewish burial practices.

In the Sahara care usually was taken to bury people some distance from oases, partly for reasons of hygiene. Cairns, or heaps of stones, typically were placed on top of the graves to prevent the bodies from being exposed in a sandstorm or attracting wild animals. Except for some of the more important rulers, people were always buried outside the perimeter of towns in the Sahara. The So people of the Sahara retained a number of legends, one of which centers on a chief whose people had to keep his death secret for a year by burying him in a jar and then holding a small, private formal funeral at which a sheep and possibly two slaves were sacrificed. (Slave sacrifice was occasionally used as a way of curing people who were ill.)

There was a traditional belief in sub-Saharan Africa that life did not end with death but continued within another world as the human spirit went into a different dimension. The result was that most religions did not have a clear divide between life and death; although the latter was feared, it also was viewed as the start of somebody's deeper relationship with the earth. The cherishing of ancestors—the spirits of family members who had died but could still intervene in earthly affairs—meant that the goal of life was to become an ancestor.

A proper funeral was therefore necessary to prevent the spirit of the dead person from becoming a “wandering ghost.”

In tropical western Africa and in west-central Africa the customs involved in dealing with a dead person were remarkably similar. The first process involved washing the body of the deceased, which was often undertaken by the women of the household. Then a bandage was wrapped around the head to keep the jaw of the person closed. This was to prevent the soul of that person from leaving the body and wandering or, according to other tribal beliefs, from returning. If somebody had died within a house, the body was removed through a hole in the wall, which was often made especially for the purpose. The hole was then immediately filled to prevent the spirit of the person from returning. If possible, the corpse was removed feet first, pointing away from the person’s house. In some cultures the body was then taken to a burial ground near the village, often along a crooked or zigzag path to confuse the spirits. Thorns were sometimes placed on the path to slow down any attempt by the spirit to return. Groups holding the opposite belief, by contrast, buried the person close to the home to allow the spirit to return. Customs differed regarding the use of specific burial places outside towns and the burial of children within townships, and many groups buried the bodies of infants close to a house.

For the Bakongo people of the modern-day Democratic Republic of the Congo, a body buried in the ground often was interred in a relatively shallow grave marked by a cairn. Dishes and jars were usually broken and placed over the grave. Symbolically this signified the release of the spirits associated with the deceased, and it also removed any incentive for the soul of the dead person to search for the broken pottery. Small, unbroken pots often were attached to nearby trees to lure evil spirits into them, keeping their malign influence away from the grave of the deceased. In addition, a white chicken was sacrificed over the grave to release the powers of the spirit world; it also was believed that the chicken would serve as food for a long journey. Particularly wealthy families sometimes sacrificed larger animals, including oxen.

Other symbolic customs included lighting lamps and bonfires to help the soul find a path to the world of the dead. Occasionally, shiny objects such as quartz were placed on the grave to help the living see the ancestral spirits as a reflection. This custom was particularly strong among the people living in present-day Ghana, who replaced the quartz with glass pieces during the late medieval period. For coastal communities it was also customary to decorate the sides of the grave with seashells, especially white shells. This signified the transition to the world of the dead, which was connected to the world of the living by water or by the ocean. Many of these Bantu customs were later continued by the slave com-

munities in the Americas, who kept some of these traditions for several centuries.

In central Africa, where many settlements were located on hilltops that had been cleared by farming, the graves of kings frequently were located on the sides of the hills with a sacred fire tended by the people. In modern-day Burundi burials were at the edges of forests. A Nyamwezi chief in the central part of modern Tanzania was buried with an accompaniment of human sacrifice, which was rare in the rest of Africa. A Bantu group of west-central Africa had a different custom, by which fire represented the life of a king; a perpetual fire was maintained by his supporters and put out when he died. This practice was also used for periods by the Shona, the southern neighbors of the Bantu, who dominate modern-day Zimbabwe. Burial goods have been found in south-central Africa, including deposits of cruciform copper ingots found in some of the graves in the Sangha region to the west of Lake Tanganyika. Three separate pottery traditions have been identified by archaeologists working through pots associated with Sangha graves. Pottery styles also have been identified among the material found in graves of the Mutapa Empire (also called the Empire of Great Zimbabwe, dating to the late 15th century), which was in the northern half of modern-day Zimbabwe, perhaps reflecting some of the customs associated with the civilization of Great Zimbabwe.

In the Limpopo valley lived people who were identified as following a “cattle cult,” which involved the burial of cattle along with the interment of humans. Different burial customs were followed by people in Madagascar and the islands of Comoros, where people were more influenced by Asian and Islamic traditions. At Vohémar in Madagascar excavations have revealed large numbers of grave goods buried with bodies. These items included Chinese objects, glass beads, and bronze mirrors, showing pagan traditions that transcended communities adopting Islam.

## THE AMERICAS

BY KEITH JORDAN

The indigenous peoples of the Americas practiced a variety of death and burial customs during the medieval period. Native Americans of the Mississippian culture (ca. 750–ca. 1500) of the midwestern and southeastern North America deposited the bodies of deceased chiefs in charnel houses placed atop platform mounds. The bodies were cared for by priests, along with the chiefs’ stone or wood ancestral portrait sculptures, ritual objects, luxury goods, and weapons. These mortuary shrines were ritually destroyed from time to time and their occupants reburied in the mound. A new charnel house was then built atop the old one. Some of these interments were

extremely elaborate. At Spiro, Oklahoma, and Cahokia, Illinois, some bones of rulers were placed on the wooden litters on which they had been carried in life. Persons of lower rank were accorded secondary burials in basketry coffins. The grave goods at Spiro included shell drinking cups and ornaments, stone pipes carved into human effigies, and ornaments of copper imported from the area around Lake Superior. Many of the objects were centuries old at the time they were buried.

One mound at Cahokia yielded two central figures, one placed above and the other below a bird-shaped cape made of thousands of shell beads. Human sacrifices were later incorporated into this mound, including the bodies of young women from outside the Cahokia region—perhaps sent as tribute from vassals of the chief—and four young men whose hands and heads had been removed.

The Hohokam (ca. 500–ca. 1450) of present-day southern Arizona practiced complex burial ceremonies that changed over the course of the culture’s development. From about 700 to 1150 cremation was the favored form of mortuary practice. Along with the ashes of the dead, burials from this period contain stone tools, ceramic vessels, and shell ornaments. Some of these items had been burned as well, perhaps to “kill” the objects to accompany their deceased owners. After 1150 burial in the flesh became more common in the Hohokam region, although cremation was still practiced.

The people of the Mimbres culture, which flourished in present-day New Mexico between 750 and 1200, buried their dead under the floors of their stone and adobe houses. A distinctive feature of Mimbres graves is the frequent placement of a painted pottery bowl over the head of the corpse. Each bowl had a hole punched through it before inclusion in the grave. Archaeologists speculate that this act was intended to “kill” the object and release its spirit into the afterlife to accompany the soul of the dead person. Another possibility is that the pot with its hole over the head symbolized the emergence of the deceased into the next world.

The Anasazi, or Ancient Pueblo, peoples of the Southwest (ca. 900–ca. 1300) buried their dead in abandoned residential structures and separate cemeteries. Burials were accompanied by offerings of ceramics, jewelry, or textiles. Ritual specialists occasionally were buried with their ceremonial regalia. In general, however, Anasazi burials do not reflect vast differences in status between individuals. The major exception to this pattern occurs at Chaco Canyon in New Mexico, where a distinct ruling group presided over this religious and economic center from about 950 to 1100. In one stone building complex, a residential and ritual center known as Pueblo Bonito, several rooms contained very rich and complex burial sites. In the most elaborate of them, two adult males had been

*Ceramic funerary urn, Zapotec style, Mexico, ca. 250–750* (Courtesy, National Museum of the American Indian, Smithsonian Institution [catalog number 163631])

laid to rest under a floor of wooden planks. Above this floor the bones of 14 other people lay scattered about the room. It is not clear whether the condition of the bones resulted from disturbance by robbers, secondary burial, or the dismemberment of human sacrifices to accompany the two men. The site contained thousands of turquoise beads, ceramic vessels, wooden staffs and flutes, and baskets decorated with turquoise mosaic. One of the two men had sustained severe head injuries at the time of death, which may indicate that he died defending the site. Pueblo Bonito burials differ from those at smaller Chaco sites not only in the amount of grave goods but also in the extended position of the bodies. Whatever their precise roles in Anasazi society, these inhabitants of Pueblo Bonito received exceptional treatment in death.

While commoners of the Classic Period (ca. 200–ca. 900) of Maya civilization usually were buried under the floors of their pole and adobe dwellings, the divine kings of the Maya were interred in elaborate stone tombs under pyramid-temples. The dead of all social classes were venerated as ancestors by their descendants. In the case of royalty the temples were the sites of elaborate rituals in which living kings sought vi-

sionary communion with the spirits of their predecessors to legitimate their earthly rule. The platforms of such temple-tombs sometimes rose as high as nine levels, probably to symbolize the nine levels of the Mayan underworld. Here the king descended after death as had the Maize God in the saga of the mythological Hero Twins. As the maize plant sprouted again from kernels of corn, the king hoped to be reborn as a god. This equation of the human life cycle with that of vegetation and the hope of resurrection like the sprouting of new plant life probably explains the custom of burying wealthy people with a green jade bead in the mouth.

Probably the best known Mayan royal tomb is that of King Pakal the Great (r. 615–83) in the Temple of the Inscriptions at Palenque in Mexico. A hidden stairway, not rediscovered until the 1940s, led from the temple atop the pyramid down to a crypt at its base. The king had been laid to rest in a stone sarcophagus with a carved lid showing his resurrection from the underworld as the Maize God. Images of ancestors adorned the sides of the sarcophagus and walls of the tomb. The corpse was covered in red cinnabar, symbol of blood and life, and adorned with jade ornaments, including a jade mosaic mask over the face. The mask further identified Pakal with the greenery of the risen Maize God. A long tube connected the burial chamber to the temple far above and functioned as a conduit for Pakal's spirit to manifest to his descendants.

Ancestor veneration also characterizes the elite funerary practices of the Mixtec kingdoms of Oaxaca, Mexico, during the Late Postclassical Period (ca. 1200–1521). At some sites deceased kings were entombed in caves as mummy bundles. These locales became ancestral shrines where oracle priests spoke on behalf of the dead and were consulted by their descendants on matters of royal succession. The looted remains of these cave burials include fragments of luxury items like turquoise mosaics and decorated textiles. At the site of Monte Albán, the Mixtec reused a tomb, now referred to as Tomb 7, built by the earlier Zapotec. This burial site remained undisturbed until discovered in the 1930s. It contained the skeleton of a man about 55 years old, surrounded by the secondary burials of family members. More than 500 exquisite treasures accompanied the occupants of Tomb 7, including ornaments of gold, silver, rock crystal, and turquoise.

In contrast to Maya and Mixtec practice, the Aztec of central Mexico (ca. 1300–1521) cremated their dead, both royal and commoner, after wrapping them in textiles to form bundles. The Aztec also frequently sacrificed dogs to help guide the deceased on the difficult four-year journey to Mictlan, the underworld, a cold and gloomy place situated in the far north. At the ruins of the Aztec Great Temple in modern-day Mexico City, modeled pottery urns contained the ashes of

elite persons with offerings of jewelry and obsidian weapons. The same site also yielded the bones of sacrificial victims deposited with other offerings in caches dedicated to the gods.

Nobles of the Moche culture (ca. 100–ca. 700 C.E.) of Peru's northern coast were buried in the mud brick pyramids or platforms that supported their palaces and temples. While few of the contents of these sumptuous tombs have survived centuries of looting, the intact examples discovered at Sipán in the 1980s reveal the splendor that surrounded these rulers in death. They were accompanied by magnificent jewelry in gold, turquoise, and imported shell, ranging from delicate ear ornaments to massive breastplates. Sacrificed warriors and retainers stood guard over their masters. Recent interpretations of scenes in Moche art as well as archaeological remains indicate that the funeral of a ruler was viewed as a dangerous time of political and spiritual transition for the community. Human sacrifices and the torture of captives marked this transitional phase, ending with the rebirth of the ruler as an ancestor in the afterlife. All Moche dead were interred in an extended position lying on their backs, and most were provided with cloth shrouds, with members of the elite encased in reed or cane coffins. Lower-ranking folk spent their eternities in rectangular graves or small mud brick tombs.

The successors of the Moche on the northern coast, the Chimú (ca. 1000–ca. 1470), buried their dead kings in the palace compounds they inhabited during life. All of their accumulated wealth remained part of their estates, maintained like modern museums. Royal descendants had to embark on new conquests or find other means to enlarge their own treasuries, since they did not inherit the riches of the dead. Chimú burial platforms, like the rest of the palace compounds, were built of adobe. Ceramic images show funeral processions carrying the bodies of dead nobles in pod-shaped reed coffins. Although the royal tombs at the Chimú capital of Chan Chan have been heavily looted over the centuries, they show that these rulers also took numerous sacrificial victims with them in death to serve them in the hereafter.

At the time of the Spanish invasion in 1527, the Inca of all classes regarded their dead as ongoing members of the community whose advice was sought for daily matters by the living. Many tombs therefore remained open for continued access. Many subjects of the Inca Empire (ca. 1450–1532) used artificial mummification (evisceration, or removal of the internal organs; drying; and perhaps the application of herbal substances) to preserve the bodies of the dead, which were then flexed and wrapped into bundles of textiles. Artificial heads of textiles or wood added a more lifelike quality to the mummy. On the level of royalty the mummies of Inca emperors were treated like living rulers, carried in processions to state events, and allowed to retain their palaces and

treasure. The specialists who maintained the mummies (and who consumed all the offerings made to the dead rulers) became a very powerful caste, rivaling living emperors in influence. The last Inca emperor, Atahualpa (r. 1532), attempted to destroy the power of the mummy retainers, who had opposed his accession in the civil war that followed his father's death. The Spanish conquistadors completed the task, eventually burning the royal mummies as idols as part of their campaign of forcing the population to convert to Roman Catholicism.

## ASIA AND THE PACIFIC

BY LISA NIZIOLEK

Cultures around the world and throughout time have considered death to be a rite of passage. People have surrounded death with ritual activities believed to help the deceased make the transition from this world to the next and the living to cope with the loss of an individual. Written historical records from indigenous people, explorers' chronicles, and missionary accounts as well as archaeological material provide information regarding death and burial practices in medieval Asia and the Pacific.

In China elite members of society often were interred in elaborate tombs resembling palace structures. Stone statues lined the walkways leading up to the tombs—this was called the *shendao*, or spirit road. Each tomb had a long tunnel and sealed openings or shafts in the ceiling. The chambers held painted walls, ceramic figurines, delicately carved tombstones, and decorated sarcophagi, frequently made in the likenesses of palaces. The size and design of each tomb represented the importance of the individual buried within it. For example, royalty close to the emperor had tombs with elaborate sarcophagi, several columns, intricate engravings, and several human and animal figurines. The tombs of ministers had only simple carvings, a coffin, and a few figurines.

The burial practices of nonelites were simpler than those of elites, but they still allowed the living an opportunity to honor the dead. In an Astana cemetery in western China, for instance, the deceased was dressed with a hat and shoes that the local people constructed from wastepaper. Throughout China a deceased person was transformed into a venerated ancestor through mortuary rituals that enhanced the social status of the dead person's living family. Customs included washing and dressing the corpse while performing traditional lamentations for the dead. A significant amount of money was spent on the coffin, a determination of the proper burial place with a geomancy specialist (one who prophesies through the study of features of the landscape), funeral supplies and personnel, and paper images of animals and servants to burn at the funeral that would accompany the dead

into the next world. After the 10th century the practice of cremation—until then an uncommon custom—was used more frequently, especially in areas where land was scarce. Cremation was less expensive than interment, and it was increasingly practiced by members of the lower and middle classes.

Most mortuary practices in India included the practice of cremation, which in Buddhism signals the breaking of the final tie to the physical world. Ancestors were venerated through festivals and memorials. Masses and memorials for the dead, such as the Avalambana festival, were held to save generations of ancestors from suffering.

Although it was known from earlier historical records, the Hindu practice of suttee became more widespread in India during the sixth century, particularly among the Rajput court. The act of suttee was the voluntary self-immolation of a widow or concubine left with no sons upon her husband's death. Suttee was practiced by royalty and commoners, and in Rajputana several memorials were erected to commemorate the deaths of women who died on their dead husbands' funeral pyres.

In the eighth century the Parsis from Iran introduced new mortuary practices to India. Instead of cremation or interment, which were believed to pollute the fire and the earth, they placed their dead in *dakmas* ("towers of silence"). Ideally situated on hills where vultures had easy access to the corpses, these towers were several levels tall and had exposed chambers in which the dead were placed by ritual bearers. After the bones were cleaned and dried by animals and the sun, they were placed in a central chamber with a stone floor where they were naturally pulverized by the sun and rain. At the end of this process, any remaining bones were buried, but no tomb or monument was constructed in commemoration.

Keyhole-shaped tumuli were a common grave type in medieval Japan. These large, mounded stone structures were burial places for the deceased. They often contained numerous grave goods, including armor, iron swords and spear points, arrowheads, and farming tools. The size of the tumulus and number and quality of grave goods probably indicated the dead person's status in life. Although earlier tumuli contained simple, single burials in wooden coffins that were inaccessible after the tombs were closed off, later ones incorporated design changes that enabled the main chambers to be reentered at later times through side doors. This allowed mourners to gain access safely to the burial chambers inside a tumulus to add more coffins when needed.

In the sixth century improved stonecutting technologies allowed for the construction of larger and more finely built stone tombs. These later tombs incorporated stone slabs

weighing up to several tons and beautifully painted frescoes. The frescoes, which feature figures in Korean costume and grave goods imported from Korea, indicate medieval ties between Japan and Korea.

Graves in Korea take the form of mounded earth and stone tombs, often with a square shape. Near Pyongyang in northern Korea, mounded tombs of various sizes are found clustered together. For example, one tomb cluster near the northern Han River contains mounds ranging in size from 20 to 200 feet in diameter. Some of the tombs are decorated with paintings, one of a warrior riding an armored horse and a group of noblewomen wearing pleated skirts. Some also contained pottery.

Another tomb form from the period is the pyramidal stone tomb. These tombs have the appearance of multitiered pyramids and sometimes contain several burials. Grave goods in one of the tombs near the Han River included a pottery steamer, farming implements, spearheads, and pottery. Jar burials also have been discovered in Korea, usually composed of a large and a small jar placed mouth to mouth to contain the full body of the deceased. The jar burials are found clustered atop keyhole-shaped or square earthen mounds. Jar

burials had few grave goods, suggesting that they probably were not linked to social status.

Jar burials also have been found in Vietnam and throughout Southeast Asia. These large, lidded burial jars contained fragmentary skeletal remains of one or several individuals, some of whom may have been cremated, along with incised smaller vessels, metal jewelry, beads, and tools. Near the Sulu and Celebes seas in Southeast Asia jar burials were secondary burials, where the bones of the deceased had been cleaned and prepared elsewhere and then placed communally in the vessels. Small decorated vessels, metal objects, beads, and jewelry accompanied these burials.

In the Philippines burials frequently involved the interment of the deceased in a wooden coffin under or near the person's house site. Commoners and slaves were interred in simple wooden coffins with grave goods related to their life activities, such as weaving or fighting. Elite mortuary rites were more complex and their graves more elaborate than those of commoners. Leaders were wrapped in shrouds and placed in wood-railed pits under their houses along with grave offerings, such as Chinese porcelain, gold ornaments, decorated weapons, and aromatics. The number and quality of grave-of-

*Tomb of the Sufi saint Shaikh Salim Chisti (15th to early 16th centuries) at Fatehpur Sikri, India, watercolor on paper* (Freer Gallery of Art, Smithsonian Institution, Gift of Charles Lang Freer, F1907-192)

offerings and mortuary customs, as elsewhere in Asia, reflected the social position of the deceased and the ability of the family to provide these goods and rituals.

One of the most famous burial sites in the Pacific islands is that of Chief Roy Mata in Melanesia. According to legend, after his death the chief's body was displayed in the villages over which he ruled. He was then buried along with members of his kin group. Archaeological research has revealed a central male burial, accompanied by several pairs of males and females. Although the males were found lying on their backs, the females were found in positions suggesting that they had been buried alive, with some clutching their partners. Between Chief Roy Mata's legs was a bundle burial, possibly the remains of one of his ancestors. Found in the graves were shell beads, pig tusks, and shell bands. In other parts of

the Pacific islands are unmounted burials, burial mounds, and megalithic tombs, which incorporate large stones and stone slabs.

Although they are dated to the centuries immediately following the medieval period, accounts from European explorers provide insight into medieval mourning and burial practices in the Pacific islands. For example, in Tonga mourners burned or beat their cheekbones with their fists until they bled, and they carved or burned concentric circles into their arms. Males were reported to hit their heads with clubs, knock their teeth out with rocks, and stick spears into their bodies as signs of mourning. Another common feature of Tongan burials was covering the grave with sand and black and white pebbles collected as part of the funerary ritual.

Early burials found in New Zealand bear similarities to those found in parts of Oceania. Some burials in New Zealand and the Pacific islands included adzes, personal ornaments, fishhooks, and other grave offerings that were strikingly similar to each another in style and were located in or close to settlements. At several early Maori sites in New Zealand individuals, probably members of the same kin group, were found buried in clusters close to habitation areas. Each individual was interred in a shallow grave in either a flexed or an extended position, with one or more large stones placed at the deceased's head or feet or right above the body. Secondary burials in these graves are known from the period as well. When present, grave goods included food offerings, perforated moa eggs, adzes, and personal effects of the deceased.

Mortuary customs among early Aborigines in Australia were diverse and included partial dismemberment and drying, ritual consumption of the body, cremation, interment in a shallow grave, or placement in a hollow tree or rock crevice. On the coast of eastern Australia a cemetery was uncovered at Broadbeach that contained the remains of at least 140 people. Burials were mostly secondary burials in bundles of bark or animal skin. Some primary burials also were found, and it has been suggested that these may represent the defleshing stage before the final burial. One of the best-excavated cemeteries is on the Murray River at Roonka Flat in south-central Australia.

## EUROPE

BY JUSTIN CORFIELD

The medieval period saw significant changes in the system of burial in Europe. This was largely because of the spread of Christianity: The common pagan practice of burying people north-south was replaced by the Christian tradition of burying people east-west. This practice is mentioned by Bishop Hildebert of Tours, writing in the 12th century: "A man ought

so to be buried that while his head lies to the West his feet are turned to the East, for thus he prays as it were by his very position and suggests that he is ready to hasten from the West to the East.” In addition, people were no longer buried along the side of roads, as was common in Roman Europe, but rather in official burial grounds organized by the Anglo-Saxons and the Jutes. Burial grounds soon were placed in churchyards.

Many people in Roman times were buried alongside roads outside the city walls. Because it had been common for hundreds of years, this practice continued in Italy after the collapse of the Western Roman Empire, especially in Romano-Celtic Britain and Gaul during the late fifth and early sixth centuries. The Anglo-Saxons tended to use particular sites at which to bury their dead, usually with valuable objects. Initially, during the invasion of Britain in the fifth century, the Anglo-Saxons used boat burials. It was thought that this sort of burial allowed the honored dead to sail to Valhalla, or heaven. The most elaborate excavated to date is at Sutton Hoo, near Woodbridge, Suffolk. There, in 1939, archaeologists found mounds and the remains of boats, along with the most famous of all finds—a helmet similar to those found in eastern Sweden.

As the Anglo-Saxons moved inland from the coastal regions of Britain, they stopped burying people in boats. There is clear evidence that many of their burial sites were used for many generations, sometimes several centuries, showing that the local community had earmarked a particular spot for burial. Unlike the Anglo-Saxons, the Vikings continued the use of ship burials for many more centuries and occasionally buried people within stone circles set up like a boat, as in Højstrup and Bække in Jutland, Denmark. At the Viking cemetery at Lindholm Høje archaeologists have studied as many as 700 graves, many containing cremated remains. Vikings also used stone markers, often inscribed with the name of the person buried.

With the growth of Christianity throughout Europe, burials started to be organized by church authorities. Christians believed in the resurrection of the dead—meaning the actual physical body—and early on they were opposed to cremation, which would not preserve the physical body. Before death people were given the “last rites” by a priest, who would be summoned and would arrive preceded by a person ringing a handbell. After the rites were uttered, a crucifix would be held before the dying person. As death approached, the doors and windows of the room were opened to allow the soul to go to heaven unhindered. For some monks and pious laypeople, the body might be laid on the ground to show humility. Family and friends were usually present at the time of death.

In Christian Europe when a person died, the preparation of the body for burial was the task of women, who washed the

naked body and wrapped it in a shroud made from linen. In England the face was covered, though this often did not take place elsewhere in Europe. The body of Edward I of Britain (r. 1272–1307) was intricately wrapped, with care taken over each finger. Such care would not have been taken with most people buried in shrouds. Wealthy people had their bodies placed in a wooden coffin prior to burial. (Edward’s body was placed in a lead casket.) Sometimes the coffin would be used for burial, but on many occasions it was only for transport. Remains of the wooden coffin of Saint Cuthbert (635?–87) survive and show that it was decorated with stylized images of Jesus Christ, the Virgin Mary, the Apostles, the Archangels and Evangelists. Only occasionally were bodies embalmed, which involved opening up the person’s body, removing the organs, immersing the body in alcohol, inserting herbal preservatives through cuts into the body, and finally wrapping the body in sheets.

During a funeral procession pallbearers would carry the coffin, and in the case of famous people, such as rulers, crowds of people would come to pay their respects. Such a scene is represented on the famous Bayeux tapestry, which portrays the events surrounding the Norman invasion of Britain in 1066. The scene shows a group of men watching the coffin of the English king Edward the Confessor (r. 1042–66) being carried to Westminster Abbey—the only surviving image of a Saxon funeral. By the Middle Ages, if a member of a city guild was to be buried, it was expected that all members of the guild would come to the funeral. Sometimes people al-

*Funerary badge, probably a memento from the funeral of Edward of Woodstock (known as the Black Prince) at Canterbury Cathedral in 1376, Britain* (© Museum of London)

lotted money in their wills for a requiem—a special mass for the dead; others had the church fees paid by their families. The English cardinal Henry Beaufort (d. 1447) left enough money for 10,000 masses in his honor, and King Henry V (r. 1413–22) of England provided for 20,000 masses to be said for his soul.

The catacombs—subterranean tunnels and rooms—where skeletons were stored in early Christian times were replaced by burials in church crypts and in-ground burials in churchyards. Throughout the medieval period wealthy people could be buried inside churches—often in return for benefactions, or charitable donations, or for faithful service in the case of clergy. The ordinary parishioners typically were buried in the grounds of the church, which were considered consecrated, or declared sacred. Generally the sites of graves were marked with either a wooden or a stone marker, and the bodies were buried clockwise around the church, with land reused when needed—usually after several centuries, by which time the previous body had decomposed. Traditionally, people who had been executed were buried face down, and those who had committed suicide were buried nearby on unconsecrated ground. In cities the use of churchyards for burials presented space problems, so burials began to take place in churches outside the walls of the city.

There were exceptions to the choice between burial inside a church or in a churchyard. When many bodies had to be buried quickly—such as after a battle or during an epidemic—mass pits were used. This could occur after a battle or during an epidemic, as was the case during the Black Death (bubonic plague) in Europe in the mid-14th century. Some societies, mainly on the Continent and especially in the Mediterranean, adopted the custom of burying people in a mass grave until the bodies decomposed and then exhuming the bones and storing them in ossuaries—which might be as large as a building or as small as a chest. The Sedlec ossuary, a Roman Catholic chapel beneath the Church of All Saints at Sedlec, a suburb of the town of Kutná Hora in the modern-day Czech Republic, contains some 40,000 skeletons believed to date to the 13th century.

Most kings, queens, and nobles were buried within cathedrals or churches, with their places of burial marked by significant monuments in marble and stone, often giving detailed descriptions to highlight their contributions. Nobles frequently were buried in the churches attached to their castles or, for lesser nobility, in the nearby parish church. In the 14th and the 15th centuries, mainly in Britain but also at some other places in Europe, their tombs were decorated with embossed brass reliefs. In most cases the base of the tombs were carved from a single block of stone.

People visited the graves of famous people, and some tombs even became places of pilgrimage. In 813 a grave found near Santiago de Compostela in northeastern Spain was said to have been revealed supernaturally as being that of Saint James, one of the 12 apostles, who was martyred in Jerusalem in 44. Despite early skepticism, the new shrine in the cathedral started attracting pilgrims from around Christian Europe. At Glastonbury Abbey in Somerset, England, a grave said to be that of the legendary King Arthur also had many pilgrim visitors. After Edward the Martyr, king of England (d. 978), had been murdered, his body was briefly hidden in the hut of a poor blind woman before being interred at a nearby church at Wareham in Dorset and then moved to nearby Shaftesbury Abbey. The blind woman was said to have recovered her sight, and a series of similar miracles followed the body from Wareham to Shaftesbury. As a result, the king's grave became a place visited pilgrims, in particular those who were blind.

## THE ISLAMIC WORLD

BY BABAK RAHIMI

Like Judaism, Christianity, and Zoroastrianism, Islam recognizes the doctrine of resurrection, in which people's souls and bodies reunite on the world's last day so that they may face judgment by God for their deeds on earth. Death plays a pivotal role in the Islamic narrative of resurrection, described as a threshold through which humans are brought to face the final Day of Judgment; the Koran states, "Man shall on that day be told of all his deeds, from first to last. Indeed, man shall bear witness against himself, plead as he may with his excuses." Death is universal, according to the Koran, but not all humans are aware of their mortal reality. In a sense, the human understanding of death can be said to take one of two forms: either rejection or acceptance of a hereafter, a notion often associated with belief in an omnipotent God.

By the tenets of Islam, death should be considered at all times and viewed as merely a crucial stage in the preparation of the soul for the day of resurrection, when good souls shall be granted eternal life in heaven; unbelievers, by contrast, will suffer eternal torment in the fires of hell after their death on the earth. Free will plays a central role in this eschatological concept of death, since individuals are understood to choose their fates—and, at times, their deaths—through their behavior in the earthly world. However, predestination, too, figures in the Islamic notion of death, since both believers and unbelievers can experience their mortality in relation to the power of divine will. Thus, the destiny that ultimately determines the death and life of a human being can be understood to rest in God.

With the rise of Hadith literature, or literature relating to traditions established by Muhammad, in the two centuries after the Prophet's death (in 632 C.E.) new sacred canonical texts emerged introducing a legal system of practices and doctrines to the Muslim community. Hadith literature played a central role in determining how Islamic jurists ought to conduct various forms of funerary rites in order to treat the dead in a religiously appropriate manner. Based on this literature, precise religious rulings, called *fiqh*, were carried out by diverse medieval Muslim communities, highlighting shared patterns of funeral practices.

Central to the Koranic concept of resurrection is the belief that the decomposed, scattered corpses of the deceased will be recomposed for the Day of Judgment. The ritual treatment of the corpse, accordingly, has played a significant role in Islamic history, especially in the medieval period. As with birth and marriage, medieval Muslims held diverse attitudes toward death, such that various practices were employed in the treatment of the corpse. Nevertheless, in accord with overarching Islamic theology and practices, Shia and Sunni communities alike have shared certain funerary customs. Also, Islamic death ceremonies share many features with Christian and Jewish ceremonies, as the ritual of earth burial plays a predominant role in the funerary proceedings of the three religions.

Medieval Muslim funerary rites usually involved the three stages of preburial, burial, and postburial proceedings. For deceased males, in the preburial stage, bereaved women of the family and community would wail, and senior male family members of the deceased—or hired hands—would wash the corpse three times, in order to protect it from earthly contamination. In the case of a deceased female, usually the senior female members of the household or professional corpse washers would perform the washing. The washing ritual would resemble the ritual ablution performed by Muslims before prayer in being a physical and symbolic display of entering a temporary stage of bliss and meditation.

Fragrance would be applied to the body, which would then be covered with clean cloth or a shroud, called a *kafan*, which was usually white but at times green—especially if the deceased was believed to be a descendant of the Prophet. The only two exceptions to this particular ritual performance occurred when the person had died while performing the ritual purity (*ihram*) ceremony during the pilgrimage to Mecca or when the person had died a martyr's death while fighting for God. In such cases, the body would be quickly buried with the clothes on without the performance of the washing ritual. Otherwise, the washed body would be taken to the cemetery on a bier before the end of the first day of death. The place of burial typically would be somewhere outside a city; however,

*Tombstone, marble, Iran, 12th century* (Los Angeles County Museum of Art, Gift of Nasli M. Heeramaneck, Photograph © 2006 Museum Associates/LACMA [M.73.7.1])

at times a Muslim cleric or major saint would be buried in a mosque. At the burial stage a cleric or pious man would lead the prayer for the deceased, and the assembly of faithful, both men and women, would recite the prayer and patiently attend the burial. The body would be placed in the grave with the head facing in the direction of Mecca. Immediately after the burial, food would be offered to the family of the deceased, completing the burial stage.

The postburial stage would include the performance of three major commemorative ceremonies: mourning ceremonies on the seventh and 40th days after the death and on the first anniversary of the death. In these ceremonies animal slaughter, communal feasting, and public recitation of the Koran and sayings of the Prophet would be central features. After the first anniversary ceremony the family of the deceased would occasionally visit the grave, washing the tombstone with water and performing prayers.

According to certain Sunni theological schools of thought, attending to the deceased after the proper stages of

burial is a sign of *jahl*, or “ignorance,” recalling the pre-Islamic period of pagan cults of ancestor worship. Since belief in the absolute greatness of God is the central principle of the Islamic faith, such schools contend, no Muslim should associate any divine power with any earthly phenomena, including the deceased—regardless of how saintly their lives on earth were. For most medieval Sunni theologians, crying at or attending to the grave of the deceased was a sign of *shirk*, or associating partners with God, who alone was to be praised and worshipped.

Given this perspective, prohibitions from and restrictions on visiting graves or performing ceremonies at the tombs of the deceased, especially the shrines of Muslim saints, became major legal and theological issues for Sunni scholars. Theologians like Malik Shafii, Ahmad ibn Hanbal, and Abu Hanifa, whose teachings based on their interpretations of the Hadith literature became the basis for Islamic jurisprudence in medieval times, proposed new religious rulings with the purpose of regulating funerary practices such as tomb and shrine building. For Hanbal, for instance, constructing buildings over graves or tombs was not to be forbidden, but it was to be discouraged for potentially being an evil act. According to Abu Hanifa, funeral buildings were not to be discouraged, because the intentions of the Muslims who visit the grave of the deceased were of primary importance.

The Sunni theologians’ disapproval of certain funerary ceremonies, including wailing and the performing of prayers over graves, was in fact a direct assault against the spread of Shia Islam in the 10th and 11th centuries. Since Shiism promoted the culture of martyrdom, including the ceremonies of wailing and tomb building for the deceased—in particular, for the holy imams whom Shiites believed were martyred by the Sunni caliphs—Sunni theologians found political motives for imposing greater restrictions on funerary proceedings. Such regulations thus served the purpose of distinguishing Shia and Sunni communities, with the latter considering themselves alone to be the true Muslims. The politics of tomb and shrine building played a predominant role in the shaping of medieval Muslim communities, as Shia and Sunni theologians debated the sanctity of funerary architecture, making reference to various collections of Hadith literature. In the medieval Islamic world funerary ceremonies became not only major theological concerns, regarding the proper Islamic manner for the burial of the deceased, but also political statements for various Muslim communities seeking to legitimize their Islamic identities.

## ► drama and theater

### INTRODUCTION

People in general enjoy spectacles, from fireworks displays to well-told stories, which implies that theater of some sort probably dates from early in the existence of modern humans. In the stone age societies that have survived to modern times, singing, dancing, storytelling, and the acting out of stories tend to be important aspects of community life. Indeed, such displays seem to help to bind communities together.

Some historians place the beginning of drama with the ancient Greeks, who may have been the first people to develop a theory of dramatics. But this would be to dismiss the elaborate dances of the ancient Egyptians and the rituals of death and new life celebrated in Mesoamerica as well as to exclude the performing arts of the Islamic world before the 1800s, when Western drama was introduced, and in Africa even to the present day—simply because the peoples of these places did not conceive of drama and theater in the same way as the ancient Greeks. During the medieval era the peoples of the world developed many different traditions for public performances, from the intimate dance parties for women in Muslim homes to the huge community events of the Maya. If there is a common thread among the different performing arts of the varied cultures of the medieval era, it is that in each performance an audience was looking for something extraordinary. In the dances of North Americans the extraordinary might have been bridging the gap between the spiritual and material worlds through dance. In Europe it might have been capturing the nature of the divine, if only for an instant, in the portrayal of biblical events. In China it might have been in the perfecting timing of the pitch of a singer's voice with the notes of a flute.

It may be in the hope of witnessing something extraordinary that audiences found their pleasure and their disappointment. In the Byzantine Empire actors were often held to exacting standards by audiences who knew plays by heart. The failure of an actor in gesture or word to match audience expectations could have led to disappointment and even anger, but a performance of exquisite precision, with every cadence right and every gesture measured just so, could leave an audience amazed and eager to return for another performance.

The idea of a returning audience was important, because returning audiences meant more money for the professional performers or satisfied followers to the religious or government leaders who sponsored the sacred dramas, dances, or other performances. The relationship between a performance and the audience was a tricky one, and it was one that government and religious authorities had trouble controlling. Ancient Roman leaders had seen value in keeping populations

distracted from their troubles by giving them violent games and comic theater, but other leaders saw danger in the theatrical arts.

Writers and performers sometimes found themselves in the difficult position of wanting to remain alive and wanting to satisfy audiences who may have been very angry toward authority. In the Byzantine Empire and the Near East a way out of the position would be to avoid cities and to play only in remote areas, far from the interest of central governments or religious authorities. On the other hand, few performers became rich from what the rural poor could pay. Governments and religious authorities often tried to shut down forms of public performance that threatened the status of leaders or seemed to stir audiences to behavior that seemed out of control. Such audiences were out of the authorities' control. Still, efforts to suppress local dance traditions in North Africa, the Passion play of late medieval Europe, and satires and parodies of all kinds almost everywhere at one time or another usually failed. The shadow puppet plays in Cairo would relocate when their performance was suppressed—moving out of the city if necessary—and they would continue to draw audiences that laughed at and argued with the characters.

This brings up another nettlesome problem for performers: the degree to which an audience should be encouraged to participate in the action. Should the performers—singers, dancers, or actors—behave like dictators themselves, governing everything an audience is allowed to do, or should they behave like a Vice figure in a European morality play and strut among the audience, exchanging jibes and jokes according to what the audience seems to want? The answer to that question in the medieval era differed from performer to performer and was shaped by custom, skill, and the hope of having another audience again on another day.

## AFRICA

BY DIANNE WHITE OYLER

Drama and theater in medieval Africa does not correspond to our present-day notion of drama. The modern Western concept of drama was established in 350 B.C.E. by Aristotle in the introduction to his *Poetics*. According to Aristotle, a drama must be performed on a stage to communicate a message through dialogue and movements provided by a text to an audience drawn into an imaginary world. In the medieval African setting, however, the stage was not limited to a specific type of building or location. The action might occur at any place in the community where the actors and the audience could engage the world of the unknown. Performances were staged outdoors in public locations in the community. In addition, there was no separate class of performers in the

medieval African theater. All members of the community participated in the production as either the leaders or the audience.

African drama during the medieval period was both religious and secular. Many of these productions were ritual dramas on religious topics. The type of drama that was staged for a preliterate audience was oral, and as it was passed down from one generation to the next, community members were charged with maintaining its accuracy. Small changes occurred during this process until the text became fixed through transcription. This type of drama is considered unconventional by contemporary standards because it seems to lack dialogue and plot. In the performance of ritual drama, however, dialogue is replaced by the interchange of songs among the performers, which brings the drama to an emotional climax. Written drama in this period was confined to societies that had generated indigenous writing systems before the Arabic, Greek, or Roman alphabets were imported. These alphabets were not used until the continent became more closely involved in an emerging global economy.

Religious drama in Christian and Islamic Africa focused on liturgy. Christian liturgical enactments began in the church to teach the general population about events in the Bible or in church history. When these performances became too secular, they moved out of the sanctuary and generally were referred to as mystery plays. In a similar fashion Islamic mystery plays commemorated important events in Muslim religious history.

Although the retention of oral and written texts was managed differently, the theatrical performances included some of the same techniques, including storytelling, singing, music, movement, and dance. These performance techniques provided nuances of the story that could not be represented adequately on the written page. For example, the performer might use repetition to create a mood or to provide continuity from one part of the story to another, using one or more techniques to produce the transition.

One important feature of African theater in the medieval period was audience participation. African theatrical performances were not passive experiences. The priests, the organizers and directors, and the members of the audience were active participants in the production, which might contain the use of call-and-response techniques among the actors or between the actors and the audience. The production might also include a chorus using repetitive phrases to heighten the tension as the story is being told.

Both written and unwritten dramas were performed for communities in which most of the members were not literate. The performance might be either private, for an immediate family with few or no outside viewers; or public, presented

at religious shrines where the priest, theater organizers, and members of the audience participated in the performance. Written texts were produced for religious plays staged at the temples of specific gods. Before staging the play, theatrical performances prepared the audience for its participation in the event.

In a preliterate society the audience judged the quality of a theatrical production on the basis of performance techniques and their own aesthetic sense derived from the local context. These audiences also judged the accuracy of the rendering of the unwritten text because members of preliterate societies shared the knowledge of the unwritten text as a part of their socialization. While the performance might change to reflect the aesthetic preferences of different communities, the unwritten text—the facts as the community understood them—remained unchanged. The same can be said of the audiences of written dramas. The audience judged the production according to aesthetic standards based on the general sensibilities of the community. While preliterate audiences compared the content to their common knowledge of the story, literate audiences evaluated the production on its accurate portrayal of the written document.

Many societies in western and central Africa participated in masking dramas, which portrayed the relationship between the lives of the community and the lives of the spirit world. This specialized knowledge was entrusted to specific groups whose responsibility was to represent anonymously the spirits, who were identified by masks. The actors' bodies were completely covered. The mask might represent the spirit in a courtroom setting, in which a conflict among members of the community was resolved, or in a religious setting, in which the community was brought back into harmony with the moral values of its worldview.

Other societies in these regions participated in ritual dramas of spirit possession. Specialized knowledge of this type of ritual drama was entrusted to specific individuals or to a group who sought to be conduits between the spirit world and the everyday physical world. They asked the gods for wisdom in solving problems that appeared to have no solutions, such as problems of fertility. The spirit-mediums called upon the spirit world. When the mediums made contact with the spirits, they fell into a trance, allowing the spirits to speak through them to provide insight into the problem. Even though Islam or Christianity became dominant in many parts of Africa, spirit-possession dramas coexisted as a cultural practice or went underground. The dramatic performances required women to dance and sing in honor of spirits who had no place in Islamic or Christian societies. The local communities, however, felt that they must acknowledge the spirits.

The most important dramatic performance in these regions of medieval Africa was in the oral tradition, a form of storytelling usually in the form of an epic poem. The oral tradition, a story that is passed down from generation to generation, is chanted or sung and is accompanied by musical instruments such as drums, stringed instruments, or xylophone, dance, and audience participation. Although each ethnic group has a term to designate its official storyteller or historian, the general term used by the French is *griot*. The griot caste of oral tradition specialists is responsible for maintaining the collective memory of the local community or, in the case of the king, a royal genealogy and historical record. In addition to being responsible for this specialized knowledge, these specialists must learn complex language skills, mnemonic devices, and performance art. Even though this is specialized knowledge, the entire community participates in the rendering of the oral tradition because they know the stories, the genealogy, and the history from their own points of view and judge the presentation on the basis of aesthetic quality and content accuracy. One important oral tradition from the medieval period is the epic of Sundiata, which includes songs, short stories, ritual dances, and music to recount the founding the empire of Mali in 1235 by Sundiata Keita.

During the medieval period people in preliterate Egyptian societies performed unwritten ritual dramas, while those in literate societies performed ritual dramas recorded in indigenous writing systems, hieroglyphs as well as Greek in the region of the Nile Delta. Coptic Christian priests used dramatic techniques in presiding over funerary festivals in their churches, while some Christian churches in Egypt, Axum, and North Africa produced mystery plays. The Arabic dramatic tradition migrated to Africa through the military conquest of North Africa in the seventh century and through trade and migration to eastern and western Africa through the eighth century. The indigenous people who converted to Islam maintained their own dramatic traditions in addition to those that were borrowed from their new religion.

The Muslims brought with them the dramatic rendering of pre-Islamic poetry that had been collected and transcribed by Islamic clerics. This poetry was performed using such performance techniques as song, dance, rituals, ceremonies, and instrumental music. The narrator traced the sequence of events, creating verbal imagery through the dramatic techniques of imitation and impersonation. Narrators or storytellers in the genre of *hikaya* (“story” or “tale”) presented another type of dramatic performance by singing the account and accompanying themselves on musical instruments, occasionally punctuating points in the narrative with gestures or movement. One type of storyteller recited romance stories at coffee shops in the evening during religious festivals.

During the medieval period the region of northern Africa known as the Maghreb—modern-day Tunisia, Algeria, and Morocco—was a crossroads of commerce and culture. The indigenous Berbers had a distinctive oral literature that included poetry, folktales, and drama based on local topics. The peoples of the Maghreb had a type of puppet theater as well as oral narratives that were performed as songs at local festivals. The celebrations included dances, songs, and chants from pre-Islamic to religious rituals. The *al-halqa*, or “circle,” was a popular theater with a narrator who beat time on a drum, telling familiar stories to an audience that gathered in a type of theater-in-the-round.

## THE AMERICAS

BY ALESSIA FRASSANI

Drama, including ritual dance, music, and chanting, is an important aspect of indigenous American art, religion, and political ideology. Dramatic performances were embedded into religious festivals and political celebrations rather than being pure entertainment. With the notable exception of the *Rabinal Achí* of highland Guatemala, no literary theater exists from pre-Columbian America. Archaeological and historical findings, on the other hand, inform us about parades, pageants, and civic ceremonies that were carried out according to ritual or agricultural calendars, to celebrate victories in war or the accession of kings and emperors, and to honor ancestors. Amerindian drama relied heavily on audience participation. Everyone was required to maintain the proper ceremonial behavior and perform such specific rituals as bringing offerings.

Sources for drama in the medieval Americas are either archaeological or literary/historical. The latter sources are available only for the period immediately before the Spanish conquest. Starting in the 1530s Spanish officials and clerics, eager to document the peculiarities and achievements of the newly encountered civilizations, began to compile texts and descriptions of Aztec and Inca theatrical and religious performances. The Spanish were struck by the religiosity of the Amerindian people and their fondness for ceremonial and deferential behavior towards rulers and deities. Pre-Columbian cultures were basically oral; writing had a restricted role and was practiced only by the elite. Painting and weaving were the most important means of preserving information, but they were almost completely destroyed by the Spaniards.

For the period before the Spanish conquest, stone carvings, murals, and vase paintings are the only durable testimony to public display of the gods’ and rulers’ power. Dance and music were perceived to be vehicles for communicating with the gods and forces of nature. Many elaborate costumes

and courtly gestures of the Mayan rulers found on stone carvings have been interpreted as dance costumes and poses meant to enhance the role of the kings as intermediaries between cosmic forces and their divine right to wage war and kill enemies. Battle and presentation scenes on murals also have been interpreted as ritual reenactments of war episodes, carried out within the city borders of the winning party after the actual battle.

Sacrifice, a central element of Amerindian religion, also played an important part in the dramatic arts. It might take the form of simple offerings of food and objects or involve self-inflicted wounds and even human sacrifice. In any case, it was perceived as a necessary act to ensure the continuity of agricultural cycles, royal lineages, and all human activities within the larger realm of nature. Practiced widely in the Americas, the sacrifice of war captives, children, or young women was perceived as the highest form of worship and was the culminating act of public rituals that lasted several days. The victims were sometimes honored like gods for months before the celebrations in which they were killed.

Native North Americans are well known for their rich artistic heritage of dances, music, and public spectacles. Most of the information was recorded by travelers, explorers, and merchants in the 19th century; little archaeological evidence exists to prove that these documented customs were observed in earlier centuries. Given the widely scattered locations of indigenous settlements among both sedentary and nomadic tribes, communal performances were the primary vehicle of social interaction, economic exchange, and family formation. Agricultural or seasonal cycles played a major role. An early British visitor to the southeastern region of North America named John White depicted a dance performed by a group of 15 people circling around carved poles. The performers are adorned with little more than bird feathers. Music is produced by rattles. Scholars have speculated that this dance might have been a harvest ceremony, given the time of year depicted.

According to early sources, animal dances dedicated to family ancestors or to ensure good luck in hunting also were common. Through the dance, which enabled the performers to become animals briefly, family members could communicate with their dead and honor their past. Other forms of drama involved blood sacrifice, such as the Sun Dance among the northern Plains Indians. During this ceremony, boys were introduced to adult society by having their chests cut open and then sewn up by a medicine man. The rite was closely related to warfare and meant to instill courage in the young warriors. Similarly, the native people along the northwestern coast of North America performed highly dramatic rituals during which the actors transformed themselves into frightening and powerful creatures, either mythical or real,

and ritually “ate” the initiates before reintroducing them to the real world as adults.

Between 600 and 800 the Mayan civilization, located in the southern lowlands of Mexico, Guatemala, Honduras, and Belize, underwent a period of expansion. The elites in the major population centers monopolized ritual and drama to sustain a powerful political ideology. Dances enabled the rulers to transform themselves into animals and supernatural beings, thus publicly demonstrating their divine qualities. Depictions of Mayan rulers standing in a frontal position with one heel lifted have been recognized as indicating that the ruler was dancing. Hands raised above shoulder level and wrists held in a twisted position are also indications of dance. The movements and gestures were highly codified; they had specific meanings related to Mayan sacred beliefs. The notion that the ruler’s performance of a public dance had a special power can be traced to a mythological dance executed by two primordial Mayan heroes. According to the *Popol Vuh*, the Mayan account of creation, the twins Hunahpu and Xbalanque performed a dance in front of the lords of the underworld in order to rescue their father from death. In this way Hunahpu and Xbalanque gave humankind the power of defeating death through ritual dancing.

A similar concept of dance as renewal associates Mayan depictions of dancing rulers and gods with the young maize plant. The agricultural cycle of the plant is replicated by the human figure. The position of the legs and outstretched arms indicates dancing, while the elongated head and foliated headdress and back rack signal the dancer’s association with the sprouting plant.

War and sacrifice are other common themes associated with ritual dancing among the ancient Maya. The murals at Bonampak in the southern lowlands and Cacaxtla in central Mexico depict reenacted scenes of battle and the ritual torture and killing of captives. The Bonampak murals date to 790; they are found in a three-chambered windowless edifice. They record a public drama that had taken place not long before the painting was executed. In the first room royal dignitaries are getting ready for the dance, while musicians and attendants holding large fans are rehearsing the performance. The main dancers, including the ruler, wear jaguar pelt costumes and headdresses with quetzal feathers. The second room contains a depiction of a theatrical recreation of warfare. Music is playing during the furor of the battle, and more dramatic effects are achieved by the elaborate costumes of the fighting warriors. In the third room the ruler’s accession ceremony culminates in a sacrificial dance with blood-letting rituals. On the stairs of a giant pyramid numerous figures balance themselves by spreading their arms, waving fans, and wearing oversized plumed headdresses.

Hundreds of miles away from Bonampak there are murals in the Tlaxcalan town of Cacaxtla that show clear Mayan influences. The theme of the murals is related to a ritual war dance as depicted in the Bonampak examples. A series of wall paintings in the main plaza depicts a mythological battle scene. Jaguar warriors dressed in animal pelts with turquoise decorations on their back are shown defeating eagle warriors, who are almost naked and unarmed and recognizable only by their plumed headdresses. Both predators, the bird and the land animal, are associated with military and heroic virtues throughout Mesoamerica.

While most of the evidence of pre-Columbian Maya theater comes from archaeological investigation, an extraordinary text from the town of Rabinal in the Guatemala highlands provides the only extant traditional Mayan dance drama. All forms of pre-Columbian drama were prohibited by the Spaniards after the conquest, which makes the survival of this piece all the more remarkable. Scholars agree that the characters, themes, and overall structure make this piece a truly indigenous drama with no influence of European theater. Recorded by a Belgian priest in the 19th century, the *Rabinal Achí* is still performed today in the Mayan Quiché language. The story takes place in the 14th century and recounts the events surrounding a rebel warrior, the Man of Quiché, who was tried and executed by a former ally, the Man of Rabinal. The play has few characters; most of the dialogue is exchanged between the opposing Rabinal and Quiché warriors. Instructions for the disguises and adornment of the characters show a striking similarity to the depictions at Bonampak and Cacaxtla. The warriors wear jaguar and eagle costumes and are addressed as if they were animals.

The drama has a high moral tone, as the Quiché warrior first challenges the Man of Rabinal and eventually accepts his death by beheading. The piece ends with the farewell of the renegade from Quiché to the mountains and valleys of his youth. The text has a typical native form, with phrasing organized into repetitive verse couplets in which slightly different words and concepts complement one another to create new meanings. This rhetorical device is known throughout Amerindian cultures and is related closely to the oral nature of native drama and literature. The text of the *Rabinal Achí* was also passed down orally for many generations before it was finally recorded in 1856 with its original content and structure intact.

The development of dramatic arts among the Aztecs (ca. 1350–1521) cannot be separated from the rise of the imperial power that dominated central Mexico until the arrival of the Spanish. Ritual and theatrical performances were tightly related to religion and its ideological use by the Aztec political elite. The most important sources for Aztec drama are Span-

ish accounts, especially those written by friars, who tried to divert the natives' love of dramatic public performances from "pagan" to Catholic beliefs. Two friars, Bernardino de Sahagún and Diego Durán, compiled the most important accounts of central Mexican festivals, describing the chronological arrangement, meaning, and forms of the most important dances, hymns, celebrations, and ritual enactments.

From these sources we know that religious drama among the Aztecs was performed according to a ritual calendar. A year was composed of 18 months of 20 days each. Every month was celebrated by a specific set of religious activities. The calendar followed the agricultural cycle, with festivals closely related to rainfall and the planting, growth, and harvesting of the maize plant, the staple food of Mesoamerica. There were special schools in which young men and women were trained as theologians, scribes, and poets in order to preserve the ancient theatrical, literary, and religious traditions. In Nahuatl, the Aztec language, these schools are known as *calmecac* and *telpochcalli*. The latter school, literally "school for the youth," was open to commoners, while the former, meaning "house of learning," was only for the offspring of the nobility. Although elaborate paintings recorded the songs, hymns, and other religious celebrations, the students were required to learn this information by heart. As adults, they would eventually perform rituals in various capacities.

The common people also participated in public rituals following a carefully ordered series of rituals and offerings. Among all these characters and performers, one stands out as horrible to the contemporary mind. *Ixiptla* is the Nahuatl term for the sacrificial victim of an annual Aztec ritual. The person was chosen on the base of age, gender, and physical qualities and was required to impersonate a god. The chosen person spent months or an entire year preparing for the role, which entailed being treated as a deity with respect and worship. The "actor" learned how to behave, dress, sing, and chant as a deity. The final rehearsal took place the day or night before the celebration, when the music, chanting, and dancing of the accompanying retinue began.

The so-called intermediate area of the Americas, including the Isthmus of Panama on the mainland, the Caribbean Antilles, and the northern portion of South America, did not witness the social, economic, and political changes that affected Mesoamerica to the north and the Andean region to the south. As a consequence, information is scarce and available only for the period immediately preceding the first contact with the Spanish in the 1490s. Among the Taíno of the Greater Antilles (present-day Puerto Rico, Cuba, Haiti, and the Dominican Republic), shamans known as *behiques* performed the most important and delicate public rituals together with the *caciques*, or political leaders. Chanting ac-

accompanied by such traditional instruments as gourd maracas was used during curing rituals. The ceremonial ingestion of *cohoba*, a hallucinogenic substance, further enhanced the power of the performer.

Social memory and customs were preserved through public rituals that involved communal dancing, music playing, and recitation of oral history. Although little information exist about the so-called *areytos*, or religious ceremonies, Spanish witnessed some of such gatherings and confirmed that they were the main vehicle for passing down to future generations the knowledge and wisdom of the ancestors. Ceremonies might last several hours and sometimes kept the clan members dancing all night.

The Moche, who flourished between 200 and 500 C.E. along the northern coast of present-day Peru, are famous for their rich tradition of pottery depicting drama and dance scenes. Musicians often are portrayed in full round, holding and playing panpipes, conch shells, drums, flutes, and whistles. Performers wear large gold earspools and have facial painting or scarification. Standing musicians often have one foot in front of the other, probably indicating that they are dancing. The most complex dance scenes, however, are found in fine line vase painting, a tradition that evolved in Moche art over the course of hundreds of years.

The Moche danced in processions that involved dozens of people. Performers proceeded by rhythmically leaning forward to the beating of drums and creating long lines by holding hands or a long rope. The vases depict group dancing spiraling from the bottom to the top of the vase. In some cases the upward movement clearly indicates the climbing of a platform pyramid topped by a temple. The long line is sometimes interrupted by musicians and usually ends with a leading character facing the dancing crowd. He often holds a goblet used to collect and consume human blood. This figure, together with the appearance of headless or naked characters among the retinue suggests that the dance was performed during sacrificial rituals. The practice of ceremonial human sacrifice has been confirmed by the finding of numerous skeletons and the presence of decapitation scenes in wall decoration.

The Incas dominated a vast territory in the Andean and coastal region of South America from the 1430s to the Spanish conquest in the 1530s. As a result there are written historical sources that complement the archaeological data. The written sources are mostly Spanish chronicles written by eyewitnesses who talked to natives born before the conquest. Some basic elements of Incan drama are similar to their Aztec counterparts in central Mexico and date from about the same period. These similarities, however, are not due to contact between the two cultures but rather to a similar imperial ideology that controlled state rituals and shared pan-Ameri-

can cultural features. Inca imperial power rested largely on a series of public ritual activities surrounding the figure of the emperor and intended to reinforce the social order. Oral tradition, sacrifice, and agricultural cycles continued to be crucial features of dramatic performance. Incan dramas were recited aloud by actors who were members of the nobility. Although some devices were used to memorize the texts, the tradition was passed down to future generations only through oral recitation and chanting. The prose, therefore, was highly poetic and repetitive in nature for ease of memorization. Actors usually engaged the audience in dialogues and choruses. Royal philosophers called *amautas* were responsible for writing historical commentaries and accounts that glorified Inca history and celebrated past rulers. Such recitals were held right before agricultural festivals that engaged the population at large, but were usually restricted to members of the elite.

The Incan calendar was composed of 12 months of 30 days, beginning with the month of Capac Raymi in December, which marked the beginning of the rainy season in the tropical highlands. Also important was the Inti Raymi, the harvest ceremony in June. Celebrations were held in Cuzco, the Incan capital but simultaneously connected the political and religious center with the distant peripheries of the empire. Participation often meant that family members (including children) left the village for several days to attend services in a regional *huaca*, or sacred place.

The most important component of the cyclical festivities was the *taqui*, a Quechua term that refers to participation ceremonies by singing and dancing. Dancers often held a rope of multicolored threads while moving in procession in and around the *huacas*. This was a tradition that had been carried through since the time of the Moche, who lived in the Peruvian region almost a thousand years earlier, demonstrating that the Inca did not invent but rather continued and renovated a long-lasting Andean dancing tradition.

A particularly controversial text titled *Ollantay* is sometimes thought to be at least in part an original pre-Columbian tragedy. The written text dates from the 19th century; some scholars maintain that it reflects too many influences from the classical tradition of Spanish drama to be considered a truly original Inca piece. The plot is set in the 15th century during the reign of the Inca Pachacuti and his son, Tupac Yupanqui, and relates the long and troubled love affair between Ollantay, a general of the Inca army, and Cusi Coyllur, the daughter of the emperor Pachacuti. Their relationship is initially opposed by the emperor because Ollantay is not of royal blood. The courage, honor, and mercy demonstrated by the warrior in a battle against the Inca general sent by the emperor to defeat him nonetheless serves to reunite the couple after 11 years of separation. The recognizably Inca elements

of the drama include the historical setting, the accurate descriptions of Inca imperial policies and organization, the archaic language employed, and a series of refrains typical of Incan poetry.

## ASIA AND THE PACIFIC

BY CARYN E. NEUMANN

Drama and theater in the medieval era often differed little from one country in Asia and the Pacific to another. The spread of the major religious doctrines of Hinduism, Buddhism, Confucianism, and Islam brought similar themes to Asian plays. Trade, territorial expansion, and the restless nature of the stage performer all combined to blend dramatic styles across national boundaries. Chinese theatrical traditions dominated in eastern Asia, whereas Indian traditions were predominant in southern Asia; Japan developed its own powerful dramatic traditions. Most of the major Asian theater styles intermingled classical and folk traditions. Original interpretations of the material were not encouraged.

Chinese drama attained its peak of formal and artistic perfection as well as its greatest popularity during the Yuan (or Mongol) Dynasty in the 13th century. About 160 Yuan dramas survive, with 150 consisting of an introduction, four acts, and, occasionally, an epilogue. The sole contemporaneous source of information on Yuan Dynasty playwrights is the *Lu-kuei pu* (Register of Ghosts) by Chung Ssu-ch'eng, written in 1330, about 60 years after the height of Yuan drama had been reached. Kao Wen-hsiu, Po Jen-fu, and Kuan Hanch'ing, all of northern China, were the most famous and prolific playwrights of the era. Plays were typically performed on stages in temples, a traditional site for Chinese drama. Secular theaters held performances on a platform with a collapsible railing to keep the spectators at a distance. The actor deviated little from the script, while combining song, dance, stylized pantomime, and other stage skills in the performance. The best-known Yuan dramas are *Li K'uei Carries Thorns*, from 1279, about a clerk who becomes a bandit; *Rain on the Hsiao-Hsiang*, from 1246, a folktale about tribulations endured by an exiled man and his daughter; and *The Mo-Ho-Lo Doll*, from 1279, about the Indian Buddhist god Mahoraga ("Mo-ho-lo" in Chinese).

Korea's geographic position has meant that the country has been heavily influenced by Chinese culture and arts. In turn, Koreans introduced performing arts from the continent to the Japanese. The Japanese also were strongly influenced by the introduction of Buddhism in the sixth century, which blended with the Shinto traditions of the country.

Between the seventh and 10th centuries *gigaku* became one of the most popular performing arts in Japan. The art

form came from Korea in 562 when a Japanese envoy returned home with musical instruments, masks, and costumes belonging to *gigaku*. The dance itself, however, was introduced by a Korean performer, Mimashi, who visited Japan in 612. He reportedly had studied in China.

*Gigaku* apparently involved a procession of at least 40 people performing dances, pantomimes, and music. The leader (*chido*) opened the parade by appearing in a red-headed mask with a wide mouth, a long nose, widely opened and bulging eyes, dark eyebrows, and sometimes whiskers on his chin. His function was to purify the air from any evil influences. He carried a spear and might be accompanied by two assistants. The *chido* would be followed by four people impersonating lions. Lion masks were believed to have the power to heal sickness and exorcise evil spirits. Two actors would portray one lion. They were both draped with one large

Male mask, Japan, early 16th century; the use of masks in dance, court ritual, processions, and religious ceremonies expanded and flourished under the patronage of the Japanese imperial court during the seventh and eighth centuries, when a wide variety of performance, dance, and musical forms reached Japan from Korea, China, and southeastern and western Asia. (Freer Gallery of Art, Smithsonian Institution, Collected by Seymour J. Janow and gifted in his memory by his Family, F2003.5.10)

piece of cloth or with hairy hides. The legs were covered with red trousers and the feet with straw sandals. Children, wearing vermilion masks with large ears and smiling faces, accompanied and led the lion. Fan carriers followed the lions. Groups of musicians and spear carriers brought up the rear. Once the procession reached the stage, the performance consisted of a lion dance, a play about five women that included strong sexual overtones and phallic elements, and a dance by an old man that would end the show.

The Japanese *kagura* appeared in the eighth century as religious entertainment. Dances and songs were performed for the gods, often by actors wearing masks. In the *shishi kagura* wandering Shinto priests with lion (*shishi*) masks performed for the purpose of exorcism and the prevention of sickness. Also in the eighth century the *bugaku* was introduced from Tang China. This art form reflected a high degree of dramatic freedom that was characteristic of the Japanese court arts until the 11th century, when the innovative impulse diminished in favor of stylized forms dictated by highly ceremonial court etiquette. *Bugaku* involved dance accompanied by music.

By the later part of Heian Period (737–1185), *bugaku* expanded to include the chanting of Chinese poems and the performance of folk songs. The performances generally illustrated the values of a peaceful culture. A typical example is *Shundeiki* (Flowers in the Spring Garden). In this play four noblemen dance under the cherry blossoms. The performers generally would wear the official uniform of their court rank and white footgear of thickly knitted silk, with a thin deerskin sole. Props used in *bugaku* consisted of 9-foot-long spears; full-size swords with elaborately ornamented scabbards and hilts; maces; drumsticks; an 8-inch-long coiled serpent; and an oversized jewel painted in five colors. The false jewel would sometimes be made of earthenware and would be deliberately broken during the performance, sending bits of shredded paper into the audience.

The best-known medieval Japanese dramatists are Kan-ami Kiyotsugu (1333–84) and his son, Ze-ami Motokiyo (1363–1443). Both well-known actors, they specialized in the theatrical art of Noh, a Buddhist-influenced drama with a plot that combined music and dancing. Noh plays were filled with quotations and allusions from classical Chinese and Japanese poems, legends, and myths. Noh themes focused on real-life emotions—love, hate, sorrow, vengeance, and jealousy—but the plays were highly stylized. Patronage by the shogun Ashikaga Yoshimitsu elevated the social status of Ze-ami and Kan-ami from the lowest class of society, where actors normally resided. Ze-ami's best-known work, the *Kadensho* (Book of the Transmission of the Flowers) is a treatise on Noh that is based closely on the instructions of his father. Ze-ami names Ichu as one of the best actors of his

father's time while also paying tribute to the younger actor Zo-ami for perfectly blending flute playing and fan dancing. Kan-ami and Ze-ami were pioneers in the effort to synthesize the various Japanese stage arts and to unite them with the realism of the Noh drama.

Cambodian drama and theater were introduced into Laos in 1354 when Prince Fa Ngum left Cambodia to establish an independent Lao kingdom. In costuming, staging, music, and dance, Laotian drama is generally the same as the Cambodian style. However, *mohlam*, a distinctive Laotian style of singing that is accompanied by a musician playing a Lao reed panpipe, continued to be popular during the medieval period. In *mohlam luong*, the Laotian musical style combined with Cambodian dramatic style for a hybrid play.

In Indonesia, *wayang kulit*, or shadow drama, is an ancient form that continued to be widely popular in the medieval period. Mythological heroes and heroines borrowed from the epic stories of the Mahabharata and the Ramayana as well as other legendary books made appearance after appearance on stages. *Wayang kulit* features carved leather puppets manipulated by one puppeteer for about nine hours. The puppeteer, who does not move from his position behind a white cloth screen during the entire performance, speaks the dialogue of each character, chants narration, and sings mood songs. *Wayang orang*, or dance drama, also enjoyed considerable popularity, with music provided by a gamelan ensemble, an orchestra group featuring percussion instruments in particular. It is essentially *wayang kulit* with live actors and a narrator chanting between scenes. The Malaysian *wayang kulit* is clearly related to the Javanese form and apparently was introduced during the medieval era, though its history is murky.

In India several hundred Sanskrit plays survive from the period between 400 and 1000. The plays are romantic works that emphasize the harmony between good and evil while ignoring the brutal realities of life. Ritual was essential to the staging of these works. The plots are often extremely minor, the acting non-naturalistic, and the language highly formalized. Music, dancing, and spectacle were major elements. As in China, temples served as the main theater buildings. As was common elsewhere, acting was a miserably paid profession; as a class, performers were little better off than agricultural workers. Medieval Indian traveling troupes worked in exchange for food and board. At the end of a performance a plate was sent around for donations of coins. Rural troupes often earned their best income from wealthy landowners who would hire a company to entertain during a festival or special family occasion. Women's roles frequently were filled by men and boys. In the period from the 11th to the 16th century there was an increasing push to drive women from the

stage, partly as the result of segregation of women as a tenet of Islam.

## EUROPE

BY KIRK H. BEETZ

The early history and development of medieval European drama and theater are murky and have been the subject of debate and speculation among historians for more than a hundred years. There were apparently two fundamental sources for the dramatic forms that developed in Europe: Roman theater and Christian festivals. By the end of the Western Roman Empire in the fifth century dramatic forms called mimes and pantomimes were the most popular theatrical presentations among Romans. Mimes either were unscripted or involved thin stories arranged around jokes, and they featured singing, dancing, acrobatics, and magic acts. They tended to focus on sex and on current events. Dancing, in particular, became a popular entertainment in itself. Pantomimes usually focused on tragic myths and were performed by actors who did not speak. These actors were much admired for their ability to tell stories entirely through skilled gestures, and audiences often knew by heart the gestures required in a particular pantomime. Both mimes and pantomimes continued to be performed into the 600s, when they seem to drop from recorded history for most of Europe. It is likely that acting companies continued to travel though southern Europe performing mimes for hundreds of years longer, perhaps evolving into the companies that staged morality plays.

In the Byzantine Empire the broad comedy that had typified mimes remained very popular. Sexual humor, parodies of political and religious leaders, and jokes about people's foolish behavior in everyday life attracted enthusiastic audiences not only in cities but also in rural areas. If actors hoped to become rich, they needed to establish themselves in Constantinople, but numerous actors scratched out their livings by traveling from audience to audience throughout the empire. Tragedies also attracted audiences, although little is presently known about the tragedies. Byzantine audiences enjoyed listening to singing, and Byzantine tragedies probably included singing or may have been sung in their entirety.

Byzantine pictures of dancers show them wearing costumes reminiscent of those of Persian dancers, and the folk dances of Syria also may have been influential. Dancers seem to have been mostly women and children, who emphasized the swaying of their bodies with clothing that flowed and swirled around them. Dancers often performed in groups, and they may have included acrobatics in their performances, perhaps adapting a custom from Egyptian dancers, who were recorded by ancient Greeks as incorporating acrobatic stunts

in their dances. In Constantinople and perhaps others cities performances that resembled cabaret shows became popular. These shows had a mix of singing, dancing, juggling, and magic acts.

Church authorities tended to believe theatrical productions to be immoral, and they tried to have all performances of plays, singing, and dancing outlawed. Some performers of acrobatics or dancing were prostitutes who made their livings from the patronage of well-to-do clients, creating a seedy image of immorality for those involved in theatrical productions. However, banning theatricals was contrary to the desires of the public at large, and church authorities found themselves fighting for no more than to have performances banned on Sundays.

For the origins of medieval European liturgical drama, historians often look to the performance of the *Quem quaeritis?* This Latin phrase means "Whom do you seek?" It stems from a brief portion of the Easter liturgy, during which Mary the mother of Christ, Mary Magdalene, and Mary the sister of Lazarus approach Christ's tomb and meet angels. An angel asks, in Latin, "Whom do ye seek in the sepulchre, O followers of Christ?" The three Marys answer, "Jesus of Nazareth, the Crucified, O heavenly ones." The angels declare, "He is not here; he is risen, just as he foretold. Go, announce that he is risen from the sepulchre." This little bit of dialogue was introduced to churches large and small in the 900s, probably with nuns playing the three Marys and priests playing the angels in front of the congregation.

The brief *Quem quaeritis?* probably stemmed from the same impulse that inspired clergy to hire artists to depict biblical scenes and figures in statues, paintings, and windows—because these figures helped a mostly illiterate public visualize and understand important aspects of religious thought. Thus, Easter celebrations expanded to include plays. The most important Easter plays were the Passion plays, which may have evolved out of the *Quem quaeritis?* performances that themselves had become ever longer and more complex. A Passion play makes reference to Christ's Passion, his Crucifixion. These plays were popular throughout Europe. At first, Passion plays were serious, dignified portrayals of Christ's suffering and death, but it became the responsibility of the laity to stage and perform the plays, and the laity introduced topical commentary into their performances. By the 1400s the plays had lost much of their dignity and were given over to crude comedy, distressing religious leaders enough that they tried to have the plays banned.

The performance of plays in or on the grounds of churches expanded in the 1100s to include miracle plays. These plays focus on the lives and deeds of Christian saints and heroes. Dozens of them depict parts of the life of Christ's

mother, Mary. They emphasize Mary's role as healer and consoler of people. The oldest extant miracle play, from France in the 1110s, centers on Adam, though most miracle plays tell of people who lived after Christ's birth. These plays depict how people interact with God, and they tend to concentrate on good deeds, conversions to Christianity, and miracles wrought by God through human beings.

Historians disagree as to when mystery pageants evolved; some place the origin of the pageants as recently as the 1300s, while others note that dialects in some of the plays date them to a hundred years earlier. To complicate matters, the pageants often were revised and sometimes were replaced altogether with new ones. How the plays were staged is also the subject of much argument. Some pageants were certainly performed on carts that served as stages and that were drawn through streets of towns or cities, but there is evidence that mystery pageants also were performed in circular theaters or in churches. The best-known and most complete collections of mystery pageants come from England. Pageants and records of pageants have been found in Germany, France, Italy, the Czech Republic, and Hungary.

Mystery pageants were performed as parts of mystery cycles. A complete mystery cycle included pageants covering Old Testament events and figures who presaged Christ, Christ's life through his Crucifixion, and events related to Christ's Resurrection. There frequently were more than 40 pageants in a single cycle. It is known that these cycles were presented in market towns in England and the rest of Europe on mobile stages, usually pulled by oxen or mules. Each pageant in the cycle was the responsibility of a local trade guild that paid for the cart, the scenery, and the costumes. For instance, out of the 48 pageants of the city of York's mystery cycle, the tanners were responsible for the *Creation*, and the *Fall of Lucifer*, the shipwrights for the *Building of the Ark*, the masons for the *Coming of the Three Kings to Herod*, and the carpenters for *Resurrection*. The cycles were presented each spring, with audiences assembling at way stations to watch each pageant as it passed. With different groups responsible for different aspects of Christ's life, it was possible to have several different actors portraying Christ as well as several actors playing other recurring figures.

It is likely that the writers were nuns, priests, monks, and friars. The two playwrights who are most highly regarded by modern literary scholars are the Wakefield Master and the York Realist—their identities as yet unknown, although their plays are recognizable because of the styles of their authors. The Wakefield Master seems to have been called upon to revise some of the plays of the Wakefield cycle and to write a few new ones. The hallmarks of the cycle include a keen sense of dramatic tension and a graceful use of language. The York

Realist is called a realist because of the realistic portrayals of characters and situations in these plays. The *Crucifixion* by the York Realist is still performed in modern times, in America as well as Europe, and it is notable for its chilling depiction

### THE YORK REALIST

The first surviving record of the York mystery cycle dates from 1376, when someone left a note about the rent for storing three of the wagons used in the annual performances. By then the performances were a well-established part of life in York. The pageants were performed during the festival of Corpus Christi (about seven weeks after Easter) and drew large crowds of people. Between 1425 and 1433 a master hand wrote or rewrote a total of eight new pageants for the York mystery cycle, focusing on the events surrounding Christ's Crucifixion. This writer is known as the York Realist because of the realistic portrayals of the characters. In the York Realist's pageants characters have the everyday cares and interests of ordinary people, even when they are involved in extraordinary events.

The York Realist wrote these pageants in verse, yet the dialogue of the characters seems sharp, to the point, and commonplace. Of the York Realist's eight pageants, the *Crucifixion* best displays the writer's genius. It has only five characters: Christ and four Roman soldiers. For most of the performance the soldiers have the stage to themselves, with the wooden cross they are constructing. They have workaday attitudes toward their efforts and are even a bit bored. They try to get their jobs done with the least amount of effort as fast as they can. They talk much as members of their audience would have, and their joking could induce laughter in their audience.

Out of this scenario comes the full horror of the events that transpire. The soldiers have drilled holes for nailing Christ's hands and feet to the cross. They have miscalculated the location of the holes, and as they struggle to stretch Christ's arms to fit over the drilled holes, they continue to joke wryly. This drama is a stark portrayal of banal evil, and audience members who earlier laughed at the soldiers' jokes are in the uncomfortable position of laughing along with monsters. When Christ forgives the soldiers for their sins, he is forgiving the audience for their sins as well. Rarely has any dramatist succeeded so well in speaking directly to the heart of the audience.

of the banality of evil as Roman soldiers go about their business of tormenting Christ.

Morality plays were probably the most popular form of drama during the late medieval era in Europe, yet less is known about them than the other forms of medieval theater. Only two are widely known: *Everyman* and the *Castle of Perseverance*. *Everyman* is the title of a play in English from the 1550s, derived from *Elckerlijc*, a Flemish play of the 1400s. *Everyman* is the epitome of what a morality play was intended to be. Its characters are all symbolic, with the main character representing every individual person. Everyman is told that he is about to die, and he must find those who would go with him to speak on his behalf before God. He goes from friend to friend, asking to be accompanied to the afterlife, but his money cannot even get them up off the floor, and Friendship will accompany him to the grave but no farther. Only Good-Deeds goes with him to the afterlife. The strongly moralistic aspect of the symbolism gives rise to the term *morality play*. However, *Everyman* is not a dull play; it is full of humor and surprises.

The *Castle of Perseverance* is at present the earliest-known complete morality play. It is an English play, and one of its fascinations for modern historians is that its manuscript includes diagrams of a theater. The play was performed by a traveling company of actors. They erected a circular wooden wall, probably just outside a town or village, allowing only one entrance, through which customers were admitted. Audiences apparently sat in circles around the center, in which a wooden tower was erected. Actors could pop up among the audience, and the play's action could make its way among the audience. Key figures in morality plays were the Vices. These representatives of evil were allowed to make the jokes that good characters could not, and they were often the delight of the audience—wandering among the audience and cracking jokes about audience members as well as about characters in the play. This method suggests that there probably was a bit of improvisation by the acting company during each performance, adjusting jokes and jibes according to the audience's responses.

## THE ISLAMIC WORLD

BY KIRK H. BEETZ

Many publications that address the topic of drama and theater in the Islamic world flatly state that the Islamic world had no drama—or at least not until the introduction of European plays in the 1800s. This is an odd bit of cultural myopia, because the Islamic world always had dramatic productions that were immensely popular, often making performers and playwrights famous and wealthy. Perhaps the reason much Muslim theater still goes unrecognized by historians is that Muslims created

their own kinds of theater to suit their tastes. For instance, the staging of plays with humans as actors was morally dubious for Muslims, as such performances could be perceived as violating the same religious laws that forbade painters to depict real people in their work. Consideration for these laws may have led to the very sophisticated Islamic tradition of shadow puppetry, in which real events could be depicted without figures being displayed other than as shadows.

The origins of puppet theater in the Islamic world are themselves shadowy. Islamic puppeteers may have been influenced by Chinese shadow puppet shows, since Muslims had extensive contact with China and are known to have borrowed ideas from the Chinese. Shadow puppetry involved figures manipulated by wires whose shadows were cast onto a canvas screen, with the screen draped between the audience and the puppets. The puppets were usually colorfully painted. The two best-known medieval forms of puppet shows were *khayal al-zill*, meaning “shadows of the imagination,” and *karagöz oyunu*, a form named for its main character, Karagöz. The puppeteer was called *rais al-khayal*, a “shadow master.” A *rais al-khayal* might work alone, putting on small shows on backstreets of cities or in homes in villages. He was expected to perform with his own unique style and interact with the audience; viewers would argue with characters or call out their approval or disapproval of what characters were doing, making each performance a combination of the show itself, audience participation, and the *rais al-khayal* responding to the audience.

A popular *rais al-khayal* could become wealthy and could have several people working for him. Most plays had a *muqaddim*, a narrator and commentator on the action, who could be voiced by the *rais al-khayal* or by a hired actor. A successful troupe could employ several actors to voice the characters, with boys used for the female voices. Rather than make the puppets himself, a *rais al-khayal* could employ a *qassas*, meaning “cutter,” who would make the puppets out of camel skin. A *qassas* worked with a *megariz*, who was responsible for affixing the wires used to manipulate the puppet. A puppet would be about a foot tall, with the camel skin stretched thin enough to be somewhat translucent.

The term *khayal al-zill* originated in the 900s in Cairo, where shadow puppet shows were commonly staged at night. The *khayal al-zill* was especially popular during Ramadan—the month of fasting in Islam—with performances occurring in the evening when the day's fast was broken. A *rais al-khayal* was expected to know at least 30 plays, one for each night of Ramadan. His audiences were usually only men and boys. The *khayal al-zill* was performed for hundreds of years, but the genre's quality rose and sank like genres in the dramatic traditions of other cultures. Playwrights provided scripts

for the *khayal al-zill*, and their subjects ranged from complex theological themes to comedies featuring crude sexual humor. For most of the medieval era the most popular plays were ones that featured exciting battles, and most plays ended with a rousing battle scene; those that did not ended instead with a stirring song. Some political leaders tried to suppress the *khayal al-zill*, as plays often satirized government policies. Efforts to suppress the satirical plays rarely succeeded, however, because they often were what audiences most wanted to see; stages were portable, so authorities had difficulty both in preventing people from staging the plays in homes, tents, or outdoors in remote byways and in dissuading people from attending performances. Word of mouth was usually enough publicity to draw an audience.

The *karagöz oyunu* probably developed among the Turks. This form was named for the everyman character Karagöz, who was the protagonist of every play. Karagöz typically was a boisterous nitwit whose adventures tended to be broadly comical, featuring much slapstick. Topics could involve the high and mighty, but everyday people living ordinary lives were the more common subjects. Disagreements among characters usually were resolved through beatings. Audiences would cheer their favorite characters and laugh uproariously, making performances wild and happy affairs. The characters in the plays were puppets manipulated on a stage above the head of the puppeteer, who would wrap cloth or canvas around himself in a convention his audience understood to mean that he could not be seen.

Of the medieval Islamic world's dramatic traditions, the *ta'ziyah* is probably the most familiar to Western audiences because it involves a story told in action by actors. *Ta'ziyah* is the term for the figurine effigy at the shrines of Shia imams, particularly Husayn ibn Ali, the grandson of the prophet Muhammad. The dramatic form is often referred to as a "Passion play" by Western scholars because it is about the death of an important religious figure, like the Passion plays of medieval Europe were about the Crucifixion of Christ.

The *ta'ziyah* event commemorates the martyrdom in 680 at the battle of Karbala of Husayn ibn Ali, an important figure in the history of the Shia branch of Islam. The play is still presented during the month of Muharram, usually in places where the population is entirely or almost entirely composed of Shiites, because the play could be a source of antagonism for other Islamic sects. In fact, among many Shiite and Sunni scholars the custom has come under considerable criticism, with some often suggesting that it be abandoned.

The presentation usually involves most of a community in weeks of preparation and is often a grand spectacle: For nine days many devout followers of the tradition publicly recite the events of the life of Husayn ibn Ali, often with great

dramatic emotions. During those days men whip themselves bloody while gathered in the streets. On the 10th day a coffin representing that of Husayn is paraded through the streets, followed by a horse representing Husayn's warhorse as well as by men still bloody from their days of whipping themselves. After a male choir and a female choir wail lamentations, the play is presented, lasting about three hours. The play ends with a battle during which, as accompanied by a roll of drums, Husayn's effigy is slain. Afterward, participants go to mosques and shrines to reverently complete their commemoration of Husayn's death.

The dance traditions of the Islamic world are much misunderstood even within the modern Islamic world. The term *belly dance* probably made its first appearance in English in 1899, when the phrase was used to attract audiences to a fairly serious effort by Egypt to present its customs to audiences at a world's fair in the United States. To the modern ear, however, *belly dance* implies a sensuality that was not necessarily part of the performances in question. Arabic has many terms for the dances that were popular in the medieval Islamic world, but the two that seem to be most common are *raqs sharqi*, meaning "dance of the East" or "Oriental dance," and *raqs baladi*, meaning "folk dance." The *raqs sharqi* were dances intended for performance in front of audiences, whereas the *raqs baladi* were social dances. Both terms probably originated in Egypt during the medieval era.

Most modern studies of the history of dance in the Islamic world have been written by dancers who wished to know more about dances that were passions for them. The sources of dances in the Islamic world are many, and during the medieval era they were combined and modified in hundreds of different ways to suit the interests of dancers and audiences. Almost all *raqs sharqi* derived from social dancing. In the Maghreb, in North Africa, men and women danced together, naked except for short skirts. The use of draperies held in hands during dances may have evolved from efforts to have women cover their breasts while dancing, although such use of handheld draperies may have originated far away in India, likewise in efforts to cover dancers, who there often gave public performances in the nude before the Muslim conquests. In Egypt both religious and secular dances had often been performed in the nude before the coming of Islam. During the medieval era female dancers who performed unclad or nearly unclad were often prostitutes.

Religious leaders tried to abolish all dancing, as well as music, but despite threats of damnation and oppressive laws ordinary Muslims continued to dance. In the Near East dancing became segregated between the sexes, with men dancing for men, out of sight of women, and women dancing for women, out of sight of men. By the 1300s the male musicians

who played for women dancers at large gatherings were required to wear blindfolds. The dances performed by women are the best known, as women have been the major preservers of Muslim traditions of dance. One form that is well known and performed worldwide involves carefully controlled movements of the abdomen. This kind of dance may have developed in Arabia in the 800s as a way for women to develop their abdominal muscles so as to make childbirth easier. During the medieval era, such dances were performed by women only for women until the 1300s, when men among the Turks adapted some of the movements for their own dances. The women dancers wore a variety of outfits, including light robes that flowed with their movements, often exposing their abdomens. Their dances were improvisational, involving many movements of hands and body that were traditional and

would be recognized by their audiences. Careful placement of feet was essential, with the rhythm of music being conveyed as flowing through the legs and manifesting itself in the rocking of the hips. All movements required well-developed muscle control.

~ Apu Ollantay (*Incan drama, ca. 1470*) ~

**ACT 3, SCENE 7**

The garden in the palace of Virgins of the Sun. . . .  
(Enter the INCA TUPAC YUPANQUI with YMA SUMAC, OLLANTAY, UILLAC UMA and RUMI ÑAUI; URCO HUARANCA, HANCO HUAYLLU and PIQUI CHAQUI in the background.)

Tupac Yupanqui. But this is the Aclla Huasi;  
My child, art thou not mistaken?  
Where is thy imprisoned mother?

Yma Sumac. In a dungeon within these bounds  
My mother has suffered for years,  
Perhaps even now she is dead.  
(She points to the stone door.)

Tupac Yupanqui. What door is this?  
(Enter MAMA CCACCA and PITU SALLA. Mama Ccacca kneels and kisses the Inca's hand.)

Mama Ccacca. Is it a dream or reality,  
That I behold my sovereign?

Tupac Yupanqui. Open that door.  
(Mama Ccacca opens the door.)

(CUSI COYLLUR discovered chained and fainting, with a puma and a snake, one on each side of her.)

Yma Sumac. O my mother, I feared to find  
That you had already passed away;  
Pitu Salla! Haste. Bring water.  
Perhaps my dove may still revive.

(Exit Pitu Salla.)

Tupac Yupanqui. What horrid cavern do I see?  
Who is this woman? What means it?  
What cruel wretch thus tortures her?  
What means that chain bound around her?  
Mama Ccacca, come near to me  
What hast thou to say to this?  
Is it the effect of malice  
That this poor creature lingers here?

Mama Ccacca. It was thy father's dread command;  
A punishment for lawless love.

Tupac Yupanqui. Begone! begone! harder than rock.  
Turn out that puma and the snake,  
Break down that door of carved stone.

(To Mama Ccacca.) Let me not see thy face again.  
A woman living as a bat;  
This child has brought it all to light.

(Enter Pitu Salla with water. She sprinkles it over Cusi Coyllur, who revives.)

(continued)

(continues)

Cusi Coyllur. Where am I? Who are these people?  
Yma Sumac, my beloved child,  
Come to me, my most precious dove.  
Who are all these men before me?

(She begins to faint again and is restored by water.)

Yma Sumac. Fear not, my mother, 'tis the King;  
The King himself comes to see you.  
The great Yupanqui is now here.  
Speak to him. Awake from thy trance.

Tupac Yupanqui. My heart is torn and sorrowful  
At sight of so much misery.  
Who art thou, my poor sufferer?  
Child, tell me now thy mother's name?

Yma Sumac. Father! Inca! Clement Prince!  
Have those cruel bonds removed.

The Uillac Uma. It is for me to remove them,  
And to relieve this sore distress.

(Cuts the rope fastening Cusi Coyllur to the wall.)

Ollantay (to Yma Sumac). What is thy mother's  
name?

Yma Sumac. Her name was once Cusi Coyllur,  
But it seems a mistake. Her joy  
Was gone when she was prisoned here.

Ollantay. O renowned King, great Yupanqui,  
In her you see my long lost wife.

(Prostrates himself before the Inca.)

Tupac Yupanqui. It all appears a dream to me.  
The "Star"! my sister! and thy wife.  
O sister! what newly found joy.  
O Cusi Coyllur, my sister,  
Come here to me, and embrace me,  
Now thou art delivered from woe.

(Music.)

Thou hast found thy loving brother;  
Joy calms the anguish of my heart.

(Embraces Cusi Coyllur.)

Cusi Coyllur. Alas! my brother, now you know  
The cruel tortures I endured

During those years of agony;  
Thy compassion now has saved me.

Tupac Yupanqui. Who art thou, dove, that hast suffered?  
For what sin were you prisoned here?  
Thou mightest have lost thy reason.  
Thy face is worn, thy beauty gone,  
Thy looks as one risen from death.

Ollantay. Cusi Coyllur, I had lost thee,  
Thou wast quite hidden from my sight,  
But thou art brought again to life—  
Thy father should have killed us both.  
My whole heart is torn with sorrow.  
Star of joy, where is now thy joy?  
Where now thy beauty as a star?  
Art thou under thy father's curse?

Cusi Coyllur. Ollantay, for ten dreary years  
That dungeon has kept us apart;  
But now, united for new life,  
Some happiness may yet be ours.  
Yupanqui makes joy succeed grief,  
He may well count for many years.

Uillac Uma. Bring new robes to dress the princess.  
(They put on her royal robes. The High Priest kisses her  
hand.)

Tupac Yupanqui. Ollantay, behold thy royal wife,  
Honour and cherish her henceforth.  
And thou, Yma Sumac, come to me,  
I enlace you in the thread of love;  
Thou art the pure essence of Coyllur.

(Embraces her.)

Ollantay. Thou art our protector, great King,  
Thy noble hands disperse our grief;  
Thou art our faith and only hope—  
Thou workest by virtue's force.

Tupac Yupanqui. Thy wife is now in thy arms;  
All sorrow now should disappear,  
Joy, new born, shall take its place.

(Acclamations from the Chiefs, and Piqui Chaqui.  
Music: huancars (drums), pincullus (flutes), and pututus  
(clarions).)

Europe

~ Everyman, excerpt (English version,  
ca. 1550, of an older Flemish play) ~

Here beginneth a treatise how the high Father of  
Heaven sendeth death to summon every creature to  
come and give account of their lives in this world and is  
in manner of a moral play.

*Messenger.* I pray you all give your audience,  
And hear this matter with reverence,

By figure a moral play—

The Summoning of Everyman called it is,

That of our lives and ending shows

How transitory we be all day.

This matter is wondrous precious,

But the intent of it is more gracious,

And sweet to bear away.

The story saith,—Man, in the beginning,

Look well, and take good heed to the ending,

Be you never so gay!

Ye think sin in the beginning full sweet,

Which in the end causeth thy soul to weep,

When the body lieth in clay.

Here shall you see how Fellowship and Jollity,

Both Strength, Pleasure, and Beauty,

Will fade from thee as flower in May.

For ye shall hear, how our heaven king

Calleth Everyman to a general reckoning:

Give audience, and hear what he doth say. . . .

*God.* . . . Where art thou, *Death*, thou mighty messenger?

*Death.* Almighty God, I am here at your will,

Your commandment to fulfil.

*God.* Go thou to *Everyman*,

And show him in my name

A pilgrimage he must on him take,

Which he in no wise may escape;

And that he bring with him a sure reckoning

Without delay or any tarrying.

*Death.* Lord, I will in the world go run over all,

And cruelly outsearch both great and small;

Every man will I beset that liveth beastly

Out of God's laws, and dreadeth not folly:

He that loveth riches I will strike with my dart,

His sight to blind, and from heaven to depart,

Except that alms be his good friend,

In hell for to dwell, world without end.

Lo, yonder I see *Everyman* walking;

Full little he thinketh on my coming;

His mind is on fleshly lusts and his treasure,

And great pain it shall cause him to endure

Before the Lord Heaven King. . . .

*Everyman.* O, to whom shall I make my moan

For to go with me in that heavy journey?

First *Fellowship* said he would with me gone;

His words were very pleasant and gay,

But afterward he left me alone.

Then spake I to my kinsmen all in despair,

And also they gave me words fair,

They lacked no fair speaking,

But all forsake me in the ending.

Then went I to my *Goods* that I loved best,

In hope to have comfort, but there had I least;

For my *Goods* sharply did me tell

That he bringeth many into hell.

Then of myself I was ashamed,

And so I am worthy to be blamed;

Thus may I well myself hate.

Of whom shall I now counsel take?

I think that I shall never speed

Till that I go to my *Good-Deed*,

But alas, she is so weak,

That she can neither go nor speak;

Yet will I venture on her now.—

My *Good-Deeds*, where be you?

*Good-Deeds.* Here I lie cold in the ground;

Thy sins hath me sore bound,

That I cannot stir.

*Everyman.* O, *Good-Deeds*, I stand in fear;

I must you pray of counsel,

For help now should come right well.

*Goods-Deeds.* *Everyman*, I have understanding

That ye be summoned account to make

Before *Messias*, of Jerusalem King;

And you do by me that journey what you will I take. . . .

(continued)

*(continues)*

*Everyman.* Methinketh, alas, that I must be gone,  
To make my reckoning and my debts pay,  
For I see my time is nigh spent away.  
Take example, all ye that this do hear or see,  
How they that I loved best do forsake me,  
Except my Good-Deeds that bideth truly.

*Good-Deeds.* All earthly things is but vanity:  
Beauty, Strength, and Discretion, do man forsake,  
Foolish friends and kinsmen, that fair spake,  
All fleeth save Good-Deeds, and that am I.

*Everyman.* Have mercy on me, God most mighty;  
And stand by me, thou Mother and Maid, holy  
Mary.

*Good-Deeds.* Fear not, I will speak for thee.

*Everyman.* Here I cry God mercy.

*Good-Deeds.* Short our end, and minish our pain;  
Let us go and never come again.

*Everyman.* Into thy hands, Lord, my soul I commend;  
Receive it, Lord, that it be not lost;  
As thou me boughtest, so me defend,  
And save me from the fiend's boast,  
That I may appear with that blessed host  
That shall be saved at the day of doom.

*In manus tuas*—of might's most  
For ever—*commendo spiritum meum*.

► **economy**

**INTRODUCTION**

Economics is about possibilities. The nature of an economy, its breadth, and its wealth all affect what people can do. Medical care, houses to live in, healthy diets, scientific research, and much more are limited by how much an economy can support. In looking at the economies of the world from 476 to 1500 from the perspective of several hundred years later, there was an overall expansion of economies that allowed creative, highly motivated people to build the ships of exploration, to devise the labor-saving machinery, and to create the arts that made the modern world possible.

Not every economy expanded. Some remained unchanged; others collapsed. Even for the strongest, those of China, the Islamic World, and late medieval Europe, there were profound setbacks caused by plagues, wars, environmental catastrophes, and bad governmental policies. Economic changes often were responses to crises caused by disruptions to economies. For instance, the development of feudalism in Europe was largely a response to the profound insecurity created by the collapse of the economy after the fall of the Western Roman Empire in 476. People needed food, housing, and protection from physical harm, none of which could be adequately provided when Roman coins ceased having value, food production dropped, and trade could no longer provide enough food and other goods to towns and cities.

As to why some economies seem to have gone unchanged during the medieval era, historians, archaeologists, and economists have been unable to arrive at a consensus. Take Australia as an example. Archaeological research indicates that the people of Australia, as recorded by Europeans during the Age of Exploration, were living much as they had several thousand years earlier. Even the most traditional of societies is likely to change in some ways over several hundred years, but the economics of the lives of Australians does not seem to have altered during the medieval era. They were primarily hunter-gatherers whose technologies and customs were geared to extracting livings out of the natural world without using agriculture. Such an economy cannot support high densities of population, and therefore Australia never had the concentrations of people found in Mesoamerica, China, India, the Near East, and southern Europe. On the other hand, many economists have noted that concentrations of populations in special locations such as towns seem to be necessary for generating the wealth associated with advanced economies. So which must come first? Did the Australians first need to generate enough wealth in food or goods to support a denser population, or did they first need to develop denser concentrations of population in order to generate greater wealth in food and goods?

An economy is the product of human endeavor, and it requires interaction among people. When people choose not to cooperate, for example, to fight wars, economies can respond in various ways. For many cultures wars of conquest were

profitable enterprises. Seizing the lands of northern India, the Byzantine Near East, North Africa, Spain, and Sicily brought wealth to Arabs, just as wars of conquest had brought wealth to ancient Rome. A problem for Rome was that when it started defending its borders rather than expanding them, the booty from conquest stopped flowing into its economy. The Arabs ran into that problem and another one. They sometimes eliminated the people who had made local economies successful. For instance, once-prosperous farmlands in the Near East stopped being worked because their farmers were eliminated, thus knocking out the agricultural underpinnings of some of the conquered lands. The results were weakened economies, which placed stress on Arab governments and created disunity in the Islamic world. In general, the consequences of wars during the medieval era were calamitous for economies. The wars of the Byzantine Empire to protect itself from its neighbors placed severe strains on its peasants in the form of almost unendurable taxes; the conquest and looting of northern India by Muslims left much of the local population destitute; and the conquests of the Mongols severely depopulated some regions to the point that economic activity ended, as in much of central Asia through which the Silk Road ran.

The building of great monuments, which would at first glance seem to be indications of strong economies, was an illusion of economic power in many places. The great edifices of Constantinople, the mosques of India, and the monuments of China were sometimes built by a population that was nearly destitute, surviving on meager food in poor housing. In many cases, construction workers were slaves, poorly cared for and often worked to death because conscripting new slaves was cheaper than caring for them.

This aspect of economies gives rise to the question of what makes an economy successful. Would the economy of the Byzantine Empire be considered successful because for nearly a thousand years it held fairly steady and strong, even though most of its people suffered impoverished lives, fearing the tax collectors? How does a disparity between the rich and the poor factor into the matter? The medieval economy of the Mayan peoples, with its robust trade and huge cities, would seem to have been a success, but a consensus has developed in recent years among historians that the Mayan cities' dense populations and impressive monuments came at the cost of the forest environment; that the ecological destruction was so severe that the Maya no longer could feed or house themselves; that many perished in the ecological catastrophe; and that the Mayan culture survived only by a radical change in their economy, shifting to a subsistence economy in scattered, low-density settlements.

Perhaps economies are too complex to judge as successful or unsuccessful. Perhaps the merits of an economy de-

pend on one's perspective. A member of an aristocracy might view a wide disparity of wealth between upper classes and lower classes to be both natural and desirable. A lover of literature or the arts might note that the greatest proliferation of literary and artistic achievements has tended to come from societies in which there is a great deal of wealth available to support writers and artists. Many modern people would look to see how well the needs of the entire population were being met and would look for a broad distribution of wealth.

## AFRICA

BY KIRK H. BEETZ

The economy of medieval Africa was vigorous, boisterous, and dynamic. In many African cultures every person knew about economics and participated daily in economic activities. Among some western African cultures the words for *life* and *economy* were equivalent. Children learned early the mathematical computations necessary for understanding trading and the value of goods, and they were involved in the complex give and take of economic practices. Even some board games were intended to teach children the basic mathematics they would need to conduct business with others. Both Arabs, who began trading with Africans early in the medieval era, and Europeans, whose efforts to trade in the interior of Africa began in the 1400s, were surprised by the often superior bargaining skills of the Africans.

### STATELESS ECONOMIES OF WESTERN AND CENTRAL AFRICA

The medieval economies of western and central Africa are difficult to understand, partly because the farther into the interior of Africa archaeologists and historians have gone, the less information they have found to study. Further, these economies were often stateless, existing without the benefit of organized governments. To understand the economies of these regions requires a look at the environment of their vast territories, which stretch from the western seaboard, beginning just south of the Sahara, and sweeps over steppes, rivers, and dense forest until reaching the territories of Ethiopia and the trading cities of the eastern seaboard. Two environmental factors posed special problems for the peoples of the regions: the soil and insects. These two factors limited food production and transportation, making a significant impact on the economy.

Insects affected people, animals, and crops. The tsetse fly and the anopheles mosquito are disease-carrying insects. The mosquito carries malaria, a disease that was most often fatal in medieval times and could severely reduce a community's ability to be economically viable. The tsetse fly carries dis-

eases fatal to draft animals. Thus cattle—the mainstay of pastoral life in the Sahel, the steppes south of the Sahara running west to east across the continent—could not survive in large numbers in the forests of western and central Africa. The tsetse fly also attacked horses and camels. Consequently, from Lake Chad to Timbuktu, donkeys were used frequently for transporting trade goods. Otherwise only men and women could carry goods away from the systems of the Senegal and Niger rivers, balancing loads on their heads. Additionally, farmers had no beasts of burden to help them till their lands; they had to rely on human muscle. Even when a farmer succeeded in cultivating a crop, it could fall prey to another insect that severely affected the region's economy: the locust. Periodically hordes of locusts swept through farming areas in the grasslands of western and central Africa, consuming entire crops.

The other major environmental factor was the nature of the soil. In ancient times farming peoples from western Africa began migrating east and southeast into the interior. They used rivers to travel through dense forest to places where they could clear land and settle. By the 500s these farmers had reached the headwaters of the Congo River and were continuing to displace the indigenous hunter-gatherer peoples. They used a form of slash-and-burn agriculture for their lands: An area would be burned, the ashes helping to enrich the soil a little, and it would be farmed for seven years before being allowed to lie fallow for 15 years or so. The soil was very poor, with most of its nutrients within a few inches of the surface. Heavy plowing, the farming method used in Europe and China, would have destroyed the fertile surface of the soil, turning up dirt unsuited for growing crops. Western and central African farmers had to use hoes to prepare the soil for seeding, which restricted how much land they could till. Thus the soil severely restricted the types and amounts of crops farmers could grow. Without sufficient crop surpluses available, the economies of western and central Africa could not grow. Areas with richer soils, such as river deltas, tended to be more prosperous because farmers had harvests, creating larger surpluses than in other regions with poorer soils.

Despite poor soil, insects, and various natural disasters that periodically destroyed fields and left many people without food, starvation was not inevitable in these stateless societies. Food was redistributed to those in need from those who still had it, without a governing body to organize relief efforts. This happened because of the notions about wealth and economy held by most people living in these regions during the medieval era.

An Arab or European trader or explorer visiting a village in the stateless societies was likely to be disappointed on asking to speak with the village leader. Usually the person

with the highest ranking in the community would emerge from a house no different from any other house and would be dressed like everybody else or naked, because in many areas any type of cloth was a luxury. The visiting trader or explorer expected certain trappings of office typical of an Arab or European leader: fancy clothing, expensive jewelry, and a big house with several servants. To the African villagers, however, their unassuming ruler was very wealthy. That wealth was based on the leader's network of relationships and was part of an economic system that anthropologists call social banking.

Stateless African societies were organized around family, clan, and village. A complex web of relationships governed how people behaved toward each other. The status of a person in a stateless society depended on the number of people who were obligated to that person and on the number of people to whom that person was obligated. A person built wealth by performing favors, helping others in their work, and settling disputes. Twice each growing season every farm had to be weeded, usually requiring more work than one farmer could do. Members of the farmer's family, clan, and village would help with the labor, not in return for money or goods but in exchange for the obligation the farmer would owe them. In turn, the farmer would help others, repaying obligations and creating new ones owed him.

When money or luxury items were brought into a social banking system, the owner of the money or goods seldom kept them. Instead money went to people needing to purchase items for their homes or families, cloth went to people needing clothing, jewelry went to people needing ornamentation for weddings or other events, and so on. Thus material wealth was spread throughout the community. By giving away material wealth, a person gained the wealth that actually mattered to the Africans, those numerous obligations. Through social banking, the person in a community with the least material wealth could be its most esteemed and wealthy leader. By contrast, a person who hoarded material goods and lived in luxury could be the most despised member of the community and its poorest in terms of "deposits" in the social banking system. Stateless societies were based on reciprocity—the concept of "I help you now, and you help me later." According to the African definition of *reciprocity*, receiving payment for providing help was not as important to the giver as having a person obligated to help in return when needed. The giver did not need to receive back what he or she gave to be considered wealthy.

Through the relationships of giving and receiving, the stateless economies of western and central Africa survived cataclysmic disasters such as hordes of locusts, fires, droughts, wars, and plagues. Those who had food gave it to those who

had none. For those who had no shelter, homes would be built. The giving and receiving extended to neighboring villages. Almost all trade was within a local area, and villages built relationships with each other, making it natural for people of one village to help those of another. The economic system was not perfect, because invasions by slavers or prolonged famines could overwhelm a village economy, but in general the social banking system helped people survive hard times.

A stateless economy was flexible. All land was held in trust for all members of a village, but it was understood that once a person was given an area to farm it was his or hers to farm until death. A person or family in the village could give a stranger permission to farm some land that the person or family normally cultivated. At that moment the stranger became a member of the village and a partner in the local economy, because the stranger had become part of the village's wealth by becoming obligated to a member of the village. Through hard work, the stranger could create a surplus of food on the land, and that surplus could become part of the community's storehouse of surplus food to be used to feed those in need. This brought the stranger obligations from the community, and the stranger would then rise in status and no longer be considered a stranger.

Another kind of stateless economy in central Africa during the medieval era was in the community of hunter-gatherer peoples of several ancient lineages. The hunter-gatherers formed a thin population spread through the dense forests of the interior, seldom forming groups larger than about a dozen people. It is tempting to look at them as homeless people with little material wealth and thus little economic impact, but they seem to have been canny traders who contributed much to the wealth of communities around them by trading animal skins and ivory for goods such as iron tools and decorative beads. Those animal skins could travel far, and the ivory would be shipped as far away as China, bringing outside wealth into Africa.

### **CITY-STATES AND EMPIRES OF WESTERN AND CENTRAL AFRICA**

Until the 1400s, when Europeans began trading and looting along the Africa's western seaboard, most international trade came either from the north, through the Sahara, or from the east, where there was vigorous trade with Asia. The geography of Africa was a powerful limiting factor in foreign trade. The Sahara alone was formidable, and many traders perished when attempting to cross it to reach western and central Africa. Routes through the desert into the Sahel were dictated by the places where travelers could stop for food and water. At those places arose cities, which were established as trading centers.

Some medieval trading centers still exist—for instance, Timbuktu—but they are only remnants of what they were during the medieval era, when they were the best places for traders to transfer their goods from camels to donkeys or human bearers. Timbuktu was a great seat of learning, with a sophisticated urban culture, great houses, and busy markets. Other significant cities were Audoghost and Oualata to the west and Gao, Takedda, and Manan to the east. Each of these cities was a state unto itself, often dominating hundreds of miles of the surrounding territory. Food came mostly from farms near the cities. The material wealth of the city-states came from the high tariffs they charged for traders to pass through or to exchange goods. Few northern traders went farther south, preferring to both sell their goods and buy others in the city-states to take back north.

The economies of these city-states depended entirely on trade, primarily salt and gold. The peoples of western and central Africa imported salt either from the west coast, where it was made from evaporating seawater, or from the north, where it was mined from large deposits. Gold came from the region of the modern-day Republic of Guinea and from the forests of modern Ghana. The economies of the cities benefited from taking percentages of the gold and salt that passed through them. Along with gold, traders from the south brought many goods such as exotic woods, animal skins, and gems, whereas traders from the north brought cotton cloth, beads, tools, and weapons as well as salt.

It was difficult to carry goods through the forests of western and central Africa, making travel on waterways desirable when possible. Along the rivers of the region arose trading cities such as Ghiarou, Niani, and Jenne-jeno of western Africa and Katsina and Kano of central Africa, with Benin arising near the Niger Delta to the south. Trade in these cities involved few foreigners. Primarily local people made the perilous journey north to acquire and bring home goods that had crossed the Sahara desert. The cities of the interior were economic engines for their regions, generating wealth by serving as clearinghouses for local goods to be exchanged for salt and luxury goods such as cotton cloth. These cities also helped local populations trade among themselves, exchanging such items as kola nuts, fish, and millet.

City-states may have formed the basis for the emergence of empires in the regions, but much is still unknown about the early histories of such empires. Two are fairly well known by name: Ghana and Mali. The southern border of the Ghana Empire was about 100 miles north of the northern border of modern Ghana. Little is known about the origins of these two empires, although oral histories recorded by visitors indicate that both were built by warrior-kings who conquered neighboring lands, forcing them either to become part of their na-

tions or to pay tribute. Much of the rise and fall in economic success of the two empires depended on neighboring peoples paying tribute. The tribute was usually paid in goods and slaves.

Both the Ghana and Mali empires had important gold mines. The empire of Ghana was never able to exert direct control over its mines, which were established deep in nearby forests in locations that remained carefully guarded secrets. Monarchs of the empire of Mali claimed direct control over gold mines to make sure the profits went to the empire and especially to the monarch. But even some Mali mines escaped the control of the government. In each case the government became rich in the gold trade by controlling the opportunities for gold to be traded, making sure the miners traded only with representatives of the empire. Since ancient times the people who worked those mines had taken pains to keep the locations of their mines secret, and even during the medieval era some successfully kept them secret. This did not mean that they escaped government oversight altogether, because to trade their gold they had to go to markets that were regulated by the government. Under the law of Ghana all gold had to be traded to the monarch, and miners had no choice but to exchange their gold for goods whose values were regulated by the government.

The empire of Ghana taxed the production of goods within its borders, taking a share of whatever was produced, and it taxed trade goods both entering and leaving the country. With the wealth generated by trading gold with North Africa, the empires of Ghana and Mali could maintain large, well-equipped armies. The empires used their armies to ensure that their neighbors paid tribute and to enslave people captured from the interior, fostering a slave trade that generated much wealth for the empires.

## TRADING ECONOMIES OF ETHIOPIA AND EAST AFRICA

Ethiopia's medieval economy was complicated by its relationship to the Muslims, who gradually took control of much of the territory surrounding Ethiopia. From ancient times the kingdom of Axum near the coast had traded extensively with the Near East and the rest of Asia, and it shared close relations with the Arabs. Early in the medieval era pressure from Muslim armies forced the Axumite kingdom to collapse, and the center of government moved west from Axum into the Ethiopian highlands. Although Ethiopia built magnificent structures, most notably Christian churches, it did not have a seat of government as most empires did. Instead, the monarchs of Ethiopia tended to move about, living in large tents. This was not a unique practice. For example, before the Norman invasion of 1066, English kings tended to travel from

place to place in their country because no one place could feed their entire court for more than a short time. This may have been one of the reasons the Ethiopian monarchs were nomadic; other possible reasons include making sure their presence and leadership were evident and acknowledged in their far-flung lands and making it hard for invaders to locate them in times of war.

With trade to the east and south often disrupted by Islamic incursions, Ethiopia developed strong relationships to the north and west. To the north was Egypt. Beginning with the Islamic takeover of Egypt in the 600s, Ethiopia paid a tribute of 365 slaves each year to Egypt, a practice that continued into the 1300s, despite occasional changes of regime in Egypt. In exchange for this tribute, Ethiopians on pilgrimages to Jerusalem were given safe passage through Egypt and access to Egyptian markets. For most of the medieval era Ethiopia was a powerful empire that exacted tributes from its other neighbors. The rulers of Eritrea paid tribute in silk and cotton from China and India, armor and weapons from the Near East, gold, and Arabian horses. Provinces outside the Ethiopian highlands paid tributes with shares of their harvests as well as with cattle, mules, ivory, gold, honey, and wax. In 1332 Ethiopia conquered Dawaro, Bali, and Sharka, small states to the south that were then forced to pay tribute.

The internal economy of Ethiopia resembled that of feudal Europe during the Middle Ages. Fiefs were held by chiefs, knights, monasteries, and even the monarch, and according to accounts from outsiders, the peasants were ill treated. Peasants were required to pay one-third of their harvests to their feudal masters. In northern Ethiopia trade with foreigners was spurred by a need to acquire portable goods that could be paid as taxes to the government. The monarch took the entire court when traveling around Ethiopia, including bureaucrats, servants, and soldiers. Moving the monarch every three months or so from one place to another required between 50,000 and 100,000 donkeys and thousands of bearers. The monarch and nobles had between 5,000 and 6,000 tents. On a smaller scale provincial governors and local chiefs replicated this process of moving their governments.

During the medieval era several powerful city-states arose along the east coast of Africa, from south of Ethiopia through modern-day Mozambique. Among these city-states were, from north to south, Warsheikh, Mogadishu, Bur Gao, Ungwana, Malindi, Gedi, Mombasa, Mtambe Mkuu (on Pemba Island), Unguija Ukuu (on Zanzibar Island), Mkan-dini, Dar es Salaam, Kivinja, Kilwa, Murrapania, Sofala, and Chibuene. These city-states existed entirely for trade, and they became—like the great trading cities of medieval Italy—trading empires with great fleets and domination over the territories around them. At least two of these city-states, Kilwa and

Unguija Ukuu, minted their own coins and developed cash economies—that is, economies in which goods were bought and sold mostly with money rather than exchanged through bartering. Coins from other empires have been found by archaeologists, including Chinese coins from 618 to 1279, indi-

### GLORIOUS KILWA

The city of Kilwa was founded in about 800 on an island on the coast of present-day Tanzania. The water between Kilwa's island and the mainland was only knee-high during high tide. Archaeology has been able to trace the city's development from a gathering of mud-and-wattle homes to a walled city with structures made of coral stone. Although Kilwa always had some mud-and-wattle buildings even at the height of its prosperity, during the 12th century buildings made of stone mortared with lime began to dominate the city. From about 1200 to the late 1400s Kilwa was one of the most prosperous cities in Africa.

Its economy was based on trading goods from the interior of Africa to visitors from Asia. Sailing into Kilwa's waters during the city's height, visitors would have been impressed by the city's walls and towers. Docked outside its walls were African boats made of woven reeds and big ships from Arabia, India, Sri Lanka, and Indonesia. Most Chinese traders hitched rides on Indian ships. The shores of Kilwa were alive with sailors, traders, and government officials in charge of regulating trading.

Within the city were narrow streets bounded on either side by three- and four-story stone houses, probably the homes of rich merchants. In its marketplaces would have been Arabs, western Africans, Indians, Sri Lankans, and Chinese, all using Kilwa's copper coins to buy and sell. For their long voyages home, these visitors would buy millet, sorghum, oranges, lemons, figs, pomegranates, sugarcane, and sheep grown on the farms surrounding Kilwa.

The city's internal economy bustled with members of building trades, highly skilled metalworkers, and potters. In addition to extracting tariffs on goods traded within its lands, Kilwa exacted tribute from people as far south as the city of Sofala, on the coast of modern-day Mozambique. With its vigorous economy, great wealth, impressive buildings, and crowded markets, Kilwa may have been like one of the fantastic lands described in the *Arabian Nights*.

cating the wide range of the trade accomplished by the cities on the east coast of Africa as well as how long they maintained their prosperity.

Trading cities exacted stiff tariffs on goods passing through their ports, but they were essential for exchanging goods from the interior of southern Africa for goods from Asia. Ivory and gold from the interior of southern Africa were much coveted in Asia; the Chinese especially prized African ivory. Goods such as cotton cloth and glass beads from India and porcelain from China were common in the port cities, and trade of imported goods extended into the African interior. Tax officials carefully monitored everything brought into and sent out of their cities. Tariffs were so steep that one-third to one-half of imported cloth had to be paid to city governments. For instance, Mombasa exacted one mitqal in gold for every 1,000 lengths of cotton cloth and then took half of the cotton cloth. A mitqal varied in amount from place to place in Africa but was usually about an eighth of an ounce. The value of the ivory and other African goods obtained in trade for the remaining cloth was so high that traders could still make great fortunes.

The economies of the large trading centers began to decline for two reasons: the rising power of Arab traders and the arrival of the Portuguese. For most of the medieval era ships from Indonesia, China, Sri Lanka, India, and the Near East regularly sailed in great numbers to the African trade cities, but in the 1300s trade became increasingly dominated by Arabs, who exacted taxes and tribute by controlling the shipping lanes along the African coast. In the late 1400s an increasing number of Portuguese ships began docking at African ports. The Portuguese were impressed by the well-organized cities with their beautiful homes and the great ships, many bigger than those of the Portuguese, anchored in the cities' harbors. The Portuguese looted the ships, invaded the cities that had welcomed them, carried off the people of the cities to be sold into slavery in Portugal, and plundered everything they could carry. Crewmen and soldiers were promised one-twentieth the value of whatever they brought to their ships. Then the Portuguese burned the cities. A few, such as Kilwa, recovered somewhat, but they were never again as prosperous as they had been.

### HUNTER-GATHERERS AND PASTORALISTS OF SOUTHERN AFRICA

Vast swaths of southern Africa were plains or deserts. From west of Kilwa across southern Africa and then north through the Kalahari lived both hunter-gatherers and nomadic pastoralists. Among the pastoralists were the Khoisan people who lived from the southern tip of Africa north into central Africa. Cattle ownership was the basis of the wealth of a person,

clan, or tribe. Not much is known about the economic lives of the medieval Khoisan people, although archaeologists have been slowly filling in some of the information. The eastern Khoisan traded with the cities of the east coast, providing animal skins, ivory, milk, and beef to the cities in exchange for pottery, beads, and cereals. As with the peoples of western and central Africa, their culture had a component of social banking, with mutual obligations among people forming the nucleus of kinship.

The San of southwestern Africa were mostly hunter-gatherers who either moved across the land in small groups or lived in small villages from which they would forage. Climate and geography affected the choices they made, with people living in the desert tending to move frequently to find water and food and those living in wet areas tending to settle in one place and venture forth for days at a time to hunt and gather food to bring home. It seems that from their first encounters, Europeans misjudged the San. Because they rarely wore clothing and lived in small huts, the San appeared primitive and unsophisticated, but they were intelligent traders who formed a complex economic system.

Each San community was relatively self-sufficient, but importation of salt from the north was vital for many of the people of the Kalahari. Their need for salt often brought them into contact with the Hausa and other peoples of the Congo River region. The peoples south of the Congo River area tended to be settled folk who raised crops and kept cattle, and they often intruded into areas the San considered their own, resulting in inconclusive wars. In spite of occasional hostilities, the San often found work among the farmers and herders, earning material goods and social banking. The San had more than their labor to trade; in whatever environment they happened to live, they exploited the natural resources. This meant that people living near rivers and lakes could get clay with which to make pottery, those living in grasslands or the forest could collect animal skins, and those who lived along the west coast could gather sea salt they created through evaporation of small human-made ponds. With their various surplus products, San communities traded with each other and their neighbors. The common language they maintained throughout their vast territory enhanced the San's ability to trade among themselves, and many San also spoke the languages of their neighbors.

### **CITY-STATES AND EMPIRES OF SOUTHERN AFRICA**

Among the most poorly understood cultures of medieval Africa are those of the city-states and empires of the southern African interior, including the people who built Great Zimbabwe, the stone monuments that were once the heart of a

large city on the Zimbabwean plateau. Foremost among these peoples may have been the Shona, who seem to have begun conquering their neighbors early in the medieval era. They created empires that had vigorous economies based on farming, manufacturing of household goods, and trade, mostly with the city-states on the east coast. Great Zimbabwe was once considered the capital of a single empire centered on the Zimbabwean plateau. However, with the discovery in the 1970s of another stone capital at Manekweni in the lowlands, archaeologists began to realize that the Shona and other local peoples actually formed several empires that stretched from the modern-day nation of Zimbabwe almost to the Kalahari, encompassing forests and grasslands as well as tens of thousands of people. More than 150 additional sites of stone structures built like Great Zimbabwe have been found. The ruler of Great Zimbabwe seems to have been the most powerful monarch of the region, a sort of king of kings who exacted tribute and military cooperation from the lesser monarchs.

Much speculation but little hard data surround the economies of these empires. Based on archaeological discoveries the territories appear to have spread in bands from east to west. This territorial structure could have been shaped by the necessities of trade: The rulers focused on the movement of goods from east and west and on ensuring that the goods passed westward into the interior or eastward to the seaports as quickly as possible. The governments exacted tariffs on all goods entering and leaving their territories—a double payment for anyone seeking to pass safely through an empire without stopping to trade. The wealth of an empire, and hence of its ruler, depended on making sure that traders could pass through their lands securely, and thus well-trained armies were maintained to protect them.

Outside the imperial borders were mostly nomadic pastoralists such as the Khoisan. These peoples were subdued by the imperial armies but not necessarily absorbed into the borders of the empires. Instead they paid tribute to their powerful neighbors. This was not an entirely one-sided arrangement, because the pastoralists gained access to trade goods in larger quantities than they otherwise would have, and they found buyers of their goods who might never have ventured among the pastoralists without the security of provided by the military forces of the empires.

## **THE AMERICAS**

BY MICHAEL J. O'NEAL

During the millennium following the ancient period until contact with European explorers and conquerors, the economic systems of the Americas in many respects differed little from the systems that had prevailed in earlier times.

The peoples of the Americas continued to survive primarily through agriculture, though significant economic activity included trade, mining and metalwork, pottery making, civic improvements such as road and temple building, and the like. In North and South America an ethnic culture, with emphasis on clans and families, allocated labor and resources, usually under the command of a leader. Some of these cultures remained nomadic, although in many places people adopted a more complex and sedentary form of life. In Mesoamerica, in the region that corresponds roughly to modern-day Mexico and parts of Central America, large city-states dominated the economic activities of the regions that surrounded them. Severe climatic change, however, disrupted the economies of the Americas. The Anasazi of the American Southwest and the Moche of South America, for example, underwent significant decline and virtual extinction as a result of major changes in climate that led to drought, reduced crop yields, warfare over resources, and famine. The result was profound changes in the centuries preceding the arrival of the Europeans—primarily the French and Spanish in North America and the Spanish in Central and South America.

## NORTH AMERICA

The cultures of North America left behind no written records, so historians and archaeologists have to make inferences about their economic systems on the basis of the archaeological record, in some instances supplemented by oral traditions. Further impeding the work of historians and archaeologists is the cultural disruption that took place during the centuries before European contact and in the early centuries after that contact took place. Severe climate stresses, warfare, and, later, European-borne diseases forced many cultures to abandon their settlements. The archaeological record is sometimes disrupted because of internal warfare. In many cases people moved hundreds of miles away. Their elders were lost to disease. As a result of these stresses, there was a lack of cultural continuity. In some cases, peoples wound up migrating back to their original homelands and did not know that they had done so.

During the millennium before European contact some native North American cultures developed fairly extensive economic systems. Many, however, did not. While numerous examples could be cited, one is the so-called Belle Glade culture, which lived in the area surrounding Lake Okeechobee in Florida. Remains of this culture show that it survived from about 1000 B.C.E. to 1700 C.E.; archaeologists specify the Belle Glade III Period as extending from about 700 to 1300. However, the culture never developed a sophisticated economic system. The people remained hunter-gatherers, living off deer, fish, mollusks, turtles, and snakes. They engaged

in some agriculture but cultivated only a very small amount of maize. They made pottery that was entirely undecorated. While clearly hunting, fishing, pottery making, and shelter construction are activities that contribute to an economy, there was little in the way of an organized economy that included manufacturing, mining, trade, and so forth. This was the case for numerous North (and South) American cultures during this era.

Many of the cultures of pre-Columbian North America are referred to under the heading “mound builders.” These cultures were the distant ancestors of numerous North American native nations. They are called mound builders because they constructed large earthworks used for residential, ceremonial, religious, and burial purposes—in effect, building communities atop large, artificial mounds of earth. Many of these mounds were pyramid shaped. Others were in the form of flat-topped pyramids. Still others were in the form of ridges, circles, squares, and rectangles, and some were even shaped like animals or objects. While many of these mounds were destroyed by later agricultural pursuits, others can still be found and have become tourist attractions in the 21st century, preserved in national parks. The Native Americans of the Belle Glade culture constructed low mounds, primarily to provide housing above the water of low-lying, swampy areas. The most prominent mound builders, though, were the peoples who were part of the Mississippian culture, a loose collection of groups that flourished along the Mississippi River and its tributaries.

The mound builder culture is conventionally divided into three periods. The Archaic Period extended back to the second and third millennia before the start of the Common Era. The so-called Woodland Period began roughly in 1000 B.C.E. and extended to roughly 1000 C.E. The third period refers to the Mississippian culture, which extended from about 800 or 900 to 1600 C.E. Again, not much is known about the economic organization of the Mississippian culture. Clearly, a chief economic activity was the construction of the mounds themselves. Archaeologists have calculated that the amount of labor needed to construct some of these mounds extended into the millions of man-hours. One such mound was more than 1,300 feet long and built in the shape of a serpent. Clearly, this type of activity required a great deal of organization. The very existence of such a structure implies that the culture had to be sedentary rather than nomadic; that a social hierarchy existed to direct construction, organize labor, provide resources, and perform similar tasks; and that the various Mississippian cultures shared some sort of common heritage that led them all to construct such mounds, even though otherwise the cultures had marked differences.

Supporting the economic activities of many pre-Columbian Native American communities was agriculture. By this time, cultivation of maize, or corn, had spread throughout much of North America, and maize had become a staple crop. (The word *maize* is used because, in Europe, *corn* refers to any type of grain; *maize* refers specifically to what modern-day Americans call corn.) Archaeological evidence shows that among the Mississippians, maize cultivation was conducted on a fairly large scale, suggesting that populations grew and lived in fixed, permanent communities. Again, large-scale agriculture implies the existence of an economic system to direct production. Land had to be allocated, workers had to plant and harvest the crops, crops had to be stored and distributed, and so on.

Pre-Columbian Americans learned a number of techniques for surviving through maize-based agriculture. For instance, they learned that they needed to supplement their diets with other sources of protein and with certain other nutrients. Thus, they planted beans along with maize; the beans used the tall maize stalks as support—as, in effect, beanpoles. They also planted squash as a form of ground cover to keep down weeds. They rotated crops, planting nitrogen-fixing crops to reconstitute the soil for later maize planting. And they treated corn with alkali to release essential nutrients, particularly niacin (though pre-Columbian Americans would not have given it this name). Although little is known about the particulars of this activity, that it took place is certain, so a hierarchy of agents in the economic system, from supervisors to laborers, had to have existed.

The economic system of any people is tied directly to the culture's social organization. Elites are the people who direct economic activities, coordinate trade, allocate land, and determine how the fruits of economic activity are distributed. Among the Mississippian cultures, it is clear that economic and other activities were directed by a small class of elite people. In some cases this role may have fallen to a single chieftain; in other cases, an oligarchy, or group, of prominent people were probably in charge. Also, religious figures played a role in the economy, for they would have had authority over such matters as the shape and placement of mounds and the nature of the structures built on them for ceremonial purposes. Further, the mound itself, as the center of the community, would have given the administrative and economic personnel who lived there control over the economic activities of people in outlying regions.

One of the most prominent mound-building Mississippian cultures is referred to as the Cahokia culture, which flourished from about 700 to about 1400 in what is now Illinois. Cahokia is representative of numerous similar cultures that inhabited North America during this time period. At its

height Cahokia may have been home to 15,000 people, making it the largest city ever in North America until Philadelphia reached that size in the 1800s. Cahokia was the site of 120 mounds, including the massive 100-foot-tall Monks Mound (so named by French monks who discovered the site in the 1700s). Archaeologists estimate that Monks Mound, which covers 14 acres, would have required some 14 million baskets of soil, all carried by hand from nearby sites. Additionally, on the grounds in front of the mound was a 50-acre plaza that evidence shows was leveled out of undulating ground. These construction projects were a major economic activity for the Cahokians.

The economic organization of Cahokia was similar to that of any region dominated by a single large city. In the outlying regions people grew crops, which they bartered for goods made by city dwellers, such as potters and metalworkers. (The Cahokians, along with other Mississippian cultures, did not smelt ore; what metal tools they had were fashioned directly out of soft metals.) The alluvial plain in the area, where the Mississippi, Illinois, and Missouri rivers come together, was 80 miles wide at points, providing rich land for agricultural production. Additionally, the Cahokians grew other crops, primarily seed crops, which were stored in granaries that probably were located in the mounds. An immense labor force accomplished these tasks without the benefits of steel tools such as plows or draft animals. To direct all of this activity, a social elite lived in houses constructed atop the mounds.

The city was part of an extensive trading network that stretched up and down the Mississippi River and west as far as the Rocky Mountains. Goods were bartered, since there was no money, and rulers maintained their grip on power primarily by conferring economic benefits on common people. Also, they maintained peace with neighbors by paying tribute, usually in the form of ornaments such as beads and seashells, which were obtained through trade with cultures many hundreds of miles away. Traded items included not only agricultural products but also hardware, such as hoes made with flint blades and axes with stone heads. Imported items included copper from Minnesota, salt, chert (a stone used in tool making) from Oklahoma, and mica from as far away as the Carolinas.

In addition to these activities, the Cahokians were also astronomers. Archaeologists have discovered a ring of cedar posts outside Monks Mound. Archaeologists call these posts “Woodhenge,” to echo the name of the stone monuments called Stonehenge in England. These posts were aligned in such a way as to point toward where the sun rises at the spring and fall equinoxes and summer and winter solstices and thus are a type of solar calendar.

The Cahokian culture essentially evaporated by about the end of the 14th century. No one is certain why, but historians offer a number of theories. Chief among them is environmental degradation, warfare, or some combination of the two. The Cahokians built a stockade around the city in about 1100, suggesting that some of their neighbors were not on entirely friendly terms with them. Then, as the population grew, resources became scarcer. Small increases in the water level of the surrounding rivers could have made large portions of cropland unusable.

The Cahokians consumed vast quantities of wood not only for firewood but also for the construction of structures, including the stockade, which periodically had to be rebuilt; just the stockade consumed about 20,000 relatively large trees. Deforestation caused soil erosion, further reducing the amount of tillable land available to a growing population and creating marshlike conditions in many places along the rivers. People had to go farther and farther away to find firewood, and game animals became scarcer. At the same time, buffalo herds began to appear to the west, perhaps luring people away from the crowded city to the plains, where meat was plentiful—much as modern-day people move in response to changes in the labor market, housing prices, and similar economic factors. Other Mississippian cultures up and down the river were becoming more powerful. As a result of any or all of these factors, the economic system of the Cahokians collapsed, taking with it the entire population.

## MESOAMERICA

Economic patterns in Mesoamerica continued those established during the ancient period. Mesoamerica was inhabited by a succession of large and powerful city-states that relied on agriculture and trade for survival. These cultures also left behind a considerable amount of monumental architecture.

Numerous civilizations from Mesoamerica could be cited, but perhaps the most dominant one during the pre-Columbian period was that of the Maya. The reach of the Maya civilization extended throughout northern Central America. It included modern-day Guatemala, Belize, and parts of El Salvador and Honduras as well as the Mexican states of Tabasco, Chiapas, and, on the Yucatán Peninsula, Yucatán, Campeche, and Quintana Roo. Historians conventionally divide Maya history into three periods. The earliest, the Preclassic, extended back into the centuries before the Common Era until about 250 C.E. During the Classic Period, from about 250 to 900, Maya civilization reached its zenith. Sometime around 900 Maya civilization went into decline and eventually collapsed. Its position as the dominant Mesoamerican culture would later be assumed by the Aztec, the people the

*Black limestone mask, Santiago Ahuizotla, Mexico, 150 B.C.E. to 700 C.E.; masks like this one, in the Teotihuacán style, were brought to the Aztec capital as tribute after wars.* (© The Trustees of the British Museum)

Spanish conquistadors encountered on their voyages to the New World in the 16th century.

The Maya Classic Period was a period of intense economic activity. Maya culture was highly urbanized, with major cities including Palenque, Calakmul, Chichén Itzá, Caracol, Copán, and smaller cities including Bonampak, Altun Ha, Dos Pilas, and Uaxactun. Most of these cities were located in the southern lowlands, though there were some population centers in the northern highlands. One of the Maya's most significant economic activities was pyramid construction. For example, Calakmul is the site of the largest pyramid platform, at almost 150 feet squared, to have survived from the Classic Period, but numerous other pyramids, used primarily for ceremonial purposes, are found throughout the region. Additionally, the Maya produced an extraordinary number of temples, administrative buildings, palaces, monuments, and stone slabs celebrating the lives of rulers. Unfortunately, many of these buildings and monuments were made of soft, chalky limestone, so time has not been kind to them.

Maya society was highly stratified, with a king at the top, a relatively small number of clan rulers, and a large peas-

ant labor force. The Maya achieved enormous wealth first through the development of agriculture. Through such innovations as terraced and raised fields and extensive irrigation systems, the Mayan economy was able to support a large population; several Mayan cities had populations of more than 50,000, and some may have had as many as 100,000 or more. Historians believe that one of the factors that led to the decline of Mayan civilization was a drop in agricultural output caused by drought, deforestation, and soil erosion.

Later in the Classic Period, though, the backbone of the Mayan economy was trade. One of the commodities at the center of Mayan trade was salt. Historians estimate, for example, that the city of Tikal consumed more than 131 tons of salt annually, using it in their diet and as a preservative as well as for religious and ceremonial purposes. Much of this salt came from salt beds that lined the coast of the Yucatán Peninsula. During the dry season from January to May salt marshes were left behind, where, it is estimated, up to 22,000 tons of salt were extracted from the sippy ground. Many geographically isolated islands traded salted fish for other commodities they could not provide for themselves. Indeed, throughout Mayan realms, places that could not otherwise support themselves acquired valuable commodities, including food, by bartering for them with salt.

This type of trade turned a number of Mayan cities into “middlemen” in trade and exchange. One good example is Tikal. The city itself did not have many resources. The source of its wealth, though, was serving as a hub for the exchange of salt from the north with such commodities as obsidian and jade from the Chiapas highlands and elsewhere. Another major hub was Cancuen, as evidence by the city’s 270,000-square-foot, 170-room palace. So important was this type of trade and exchange that the decline of cities such as Tikal was attributable in large part to changes in trading routes. Tikal, for instance, was a major hub, but when the population of Mayan lowlands declined, Tikal served as a transfer point for fewer and fewer goods. Contributing to its decline was the rise of sea trade, which allowed goods to be transported far more quickly and efficiently.

Meanwhile, Tikal, Copán, and other Mayan cities conducted a vigorous trade in salt and obsidian, a volcanic glass used to make tools and ornamental objects. This obsidian was transported in a form called spall, referring to flakes and smaller chunks. Much of the obsidian came from central Chiapas communities such as El Chayal, Ixtepeque, and Teotihuacán. Obsidian, though, did not simply pass through these communities. A major economic activity was the processing of obsidian into usable sizes and forms. It is estimated that Tikal, for example, had about 100 obsidian workshops in the year 700. These workshops employed not only skilled crafts-

men but also a large number of porters, usually slaves, who moved the commodity about as it arrived in the city and was distributed to workshops and then shipped out to other communities. The Maya did not use wheels or beasts of burden, so slaves carried products under their own power. In many places in Mesoamerica roads were built with very light-colored stone so that goods could be transported at night rather than during the heat of the day.

In control of all these activities were members of an elite class who maintained their power from the wealth they obtained through trade. This elite class formed alliances with similar elites in other cities, sometimes through marriage and other kinship alliances. By exchanging salt, obsidian, and other commodities such as jade and the mineral pyrite (used for mirrors), they maintained their control over the people in their region. The prestige of certain goods can be measured by the proximity of workshops to elite neighborhoods and royal palaces. In particular, the manufacture of embroidered cloth was considered a prestige activity; ownership of such cloth for clothing was a sign of high status.

Much of this trade was conducted over land routes, but trade by sea was equally important for some communities. A good example is the island of Ambergris Caye, located off the coast of Belize. A large merchant class maintained a virtual monopoly over seagoing trade. One of the island’s major exports was salt. Salt was traded for obsidian, jade, and similar materials, used on the island to manufacture pottery, which was then traded for other commodities the islanders needed, including food. Other goods included amber, embroidered cloth, cacao (beans that were the source of chocolate), and turquoise. Some of the goods were luxury goods, such as quetzal feathers and jade, used by members of the elite as symbols of their power and wealth. Others were more utilitarian household goods, the demand for which was rising during the Classic Period as populations increased.

All of this trade was conducted without benefit of money, although cacao beans were often used as a form of currency—contradicting, perhaps, the old saying that “money doesn’t grow on trees.” Goods were priced relative to one another and exchanged in barter transactions. The personal wealth of those who controlled trade and manufacture was acquired from the goods themselves, which could then be bartered for food, clothing, and other goods.

The decline of Mayan civilization can be traced back to the collapse of its economic system. Historians have offered several theories about why Mayan cities lost power, influence, and wealth by the end of the Classic Period. One theory is that populations grew beyond the ability of the land to carry them, leading to famine. Others point to warfare between city-states, requiring cities to devote more of their economic

## THE ROLE OF OBSIDIAN IN THE MESOAMERICAN ECONOMY

The importance of obsidian in the Mesoamerican economy cannot be overstated. Obsidian flakes and tools have been found at nearly every archaeological site in the region. Obsidian was valued as a cutting tool because of its crystalline structure. The cutting edge of an expertly made obsidian blade is literally one molecule thick, making it immensely sharper than even the highest-quality steel blade. In fact, modern surgeons have begun to use blades of obsidian, often made using Mayan technology, because these blades do less damage to surrounding tissues and create less scarring. Some eye surgeons, in particular, have turned to obsidian blades because of the delicacy of the surgeries they perform.

The ancient Maya used these blades for nearly any purpose for which a sharp tool was necessary. Crops were harvested with machete-like blades. Meat was butchered with obsidian knives. Projectile points such as arrowheads and spear points were almost universally made with obsidian. One of the Maya's most lethal weapons was a club with razor-sharp obsidian studs along its length.

The use of obsidian for ritual and ceremonial functions demonstrates the intersection between the economy and culture. The obsidian trade was important to the Mayan economy in part because obsidian was used for ritualistic purposes. Obsidian was often included among burial goods. It was thought that obsidian was a kind of blood that came from the earth—understandable, since obsidian was formed by volcanic eruptions—so it was often used in bloodletting rituals.

Obsidian manufacture was a major economic activity for the Maya, analogous to steel manufacturing in modern life. Obsidian has an extraordinarily fine crystalline structure, making it relatively easy to fracture. The first step was to remove the cortex, or the outer layer of rock. The next step is called lithic reduction. “Lithic” refers to stone, and “reduction” refers to the process of striking the material with a hammerlike instrument to chip off smaller pieces from the core. Out of these smaller pieces, called flakes, tools could be formed, or the material could be shaped into ornamental objects.

All of this activity required a large labor force and coordination of activities. Obsidian had to be mined, although sometimes it could be found in rock outcroppings or in riverbed nuggets. The raw materials had to be transported. Skilled craftsmen processed the material. Then finished products had to be transported to their destinations.

resources to military expeditions and the construction of walls and other fortifications for defense. Others point to population movements, making cities in the trade network obsolete. Because these cities could not obtain commodities such as obsidian, their outlying agricultural communities could not obtain tools needed for working the land.

The economic system of the Aztecs, who dominated Central America during the 1400s and early 1500s, was based on agriculture. While corn was the most important crop, workers also grew squash, beans, avocados, tomatoes, potatoes, and numerous other crops. Additionally, the tropical lowland provided such commodities as rubber, cotton, and cacao beans. The Aztecs had no currency, but these cacao beans, from which chocolate is made, were often used as a medium of exchange. Otherwise, goods were bartered.

An important part of the Aztec economy was the marketplace, such as the one at Tlatelolco, which was the largest in the Americas. There, people could find virtually every product available in Mesoamerica. Later, the Spanish explorer Hernando Cortés estimated that as many as 60,000 people

visited it each day. Other smaller markets could be found in other cities throughout the Aztec world. Additionally, merchants carried their goods on trading expeditions. Numerous porters carried goods in long caravans. Much of this type of trade took place between the lowlands and the highlands. Lowlanders provided cacao beans, rubber, feathers, jaguar hides, and cotton; highlanders provided manufactured products such as knives.

## SOUTH AMERICA

The Andean mountain region of South America is best known for the rise of the Incan culture, which flourished for about a hundred years before conquest by the Spanish. However, the Incan culture had two major precursors that laid the infrastructure for Incan civilization. One of these cultures was that of the Tiwanaku. Located in modern-day Bolivia, Tiwanaku was a critical economic and administrative center for an empire that may have been home to more than a million people; the city of Tiwanaku itself was about 3 square miles and by about the year 800 may have been home to up to

40,000 inhabitants. The city began as a small village in about 200 B.C.E., but at its height it was arguably the most important city in the Andes.

The backbone of the Tiwanaku's economy was agriculture, and most economic activity related to agricultural production and engineering. The city and its surrounding area were located at a high elevation, with relatively warm days but cold nights. Further, the region had poor soil and somewhat sparse rainfall. Accordingly, Tiwanaku devoted its labor and resources to a number of agricultural innovations. Its farmers practiced raised-bed agriculture, increasing the yield of the land. In combination with an extensive irrigation system, terraced fields on hillsides, and raised beds in the shallows of rivers and lakes, the region was able to harvest more potatoes from an acre of land than farmers can today using modern methods and fertilizers. Connecting the fields was an elaborate system of canals, which in time were stocked with fish for consumption. These canals not only provided water but also absorbed heat from the sun, providing a kind of thermal "blanket" to prevent crops from freezing at night. Thus, virtually 100 percent of Tiwanaku's economic activity was devoted to agriculture. Farmers, of course, cultivated and harvested crops, but engineers, road builders, stonemasons, and other craftsmen devoted their time and resources to building and maintaining the infrastructure that supported agriculture.

The other major culture that was a precursor to the Inca was that of the Wari. While the people of Tiwanaku were peaceful farmers who showed little interest in extending their realm, the Wari were a warlike culture that spread through military conquest. They lived in modern-day Peru, reaching the height of their power between 700 and 1200.

The Wari were able to achieve their power because they had numerous economic resources. These resources included minerals, petroleum, fish, sugar, wool, cotton, pottery, foodstuffs, and coffee. The Wari fed themselves by using terraced fields for agriculture, making their fields far more productive and increasing the amount of land available for cultivation. Extensive irrigation systems watered the fields. Beyond that, though, the Wari economy relied on trade and was a stop-over on a trade network that extended from the Pacific coast inland. To foster this trade, the Wari built an extensive road network, roads that were later used by the Inca culture. These roads also were used for the movement of troops who conquered neighboring regions and absorbed them into the Wari Empire. Additionally, the Wari economy revolved around construction and engineering. The Wari constructed numerous cities that were laid out in precise ways, some of them crisscrossed by underground tunnels. Their stone buildings even had ventilation systems and were resistant to earth-

quakes. Wari city planners and engineers would be the envy of modern people who perform these tasks.

All of this construction activity implies a system of organization, a class structure with skilled tradesmen, a large labor force, supervisors to oversee the activities, and a class of entrepreneurs to conduct trade. Unfortunately, though, historians know little about the day-to-day workings of the culture, primarily because the Wari left behind no written records. Much the same can be said of other South American cultures that rose, prospered, and fell during this era.

The Inca Empire, which dominated the western coast of South America from the late 12th century into the 1400s, built an economic system based on an abundance of resources, including water; agricultural land; mines; precious and semi-precious metals, such as gold, silver, and copper; and a large force of peasant labor. The Inca economy was a command economy, with the state controlling resources, products, and the allocation of labor, although local barter between individuals was tolerated. A system of tribute called *mita* funded the state's enterprises. The economic system depended, first, on the ability of the state to marshal a large labor force in the construction of cities, irrigation projects, the terracing of mountain land for agriculture, and especially the empire's vast network of roads, which linked every part of the empire and was used by llama caravans carrying goods. Additionally, a corps of runners and couriers carried messages as well as fresh fish from the coastline to the interior. These couriers, who were posted at intervals, could cover up to 1,200 miles in as few as six days.

## ASIA AND THE PACIFIC

BY KENNETH R. HALL

Domestic welfare in Asia improved during the medieval age because of the increased agricultural productivity of essential grains and cash crops. Different localities specialized in marketplace products such as cotton, indigo, sugarcane, tea, and pepper. Long-distance trade was supported by the development of road or river networks that linked upstream urban centers and coastal regions. In some cases Asia's medieval-era urban centers were coincident with the centers of political power, as was the norm in China; in other cases, as in India and Japan, they arose from marketplaces that developed around a major ritual complex or commercial emporium that was linked to other centers of trade. Urban residents, who might number 400,000 or more, consumed substantial quantities of food and demanded luxury goods. This had an enormous impact on the surrounding countryside, which provided food and local handicrafts. It also necessitated increasing numbers of local artisans and merchants

and ensured regular economic and cultural contact among the various urban centers of Asia.

### THE SPREAD OF SETTLED AGRICULTURE

Medieval Asian and Pacific societies benefited from ample and freely available productive land that supported the basic economic needs of the region, which was generally underpopulated before 1500. Asians and Pacific islanders moved from less fertile to more productive unoccupied areas by foot or boat; they also migrated as the result of natural catastrophes (such as volcanic eruptions and earthquakes), prolonged unfavorable weather conditions, environmental or geological change, or to avoid contact with other mobile and potentially hostile populations. The geography of the region is diverse. The several dry and less fertile zones included China's Gobi Desert, southern Asia's Thar Desert, and the many desert regions of Australia; the rugged mountainous regions, such as the Himalayas, that surround the northern borders of southern Asia; the sparsely settled volcanic Southeast Asian and Pacific islands where mountains and jungle coincide; and the substantial grasslands of central Asia and Australia, where there was a pastoral tradition and where meat and milk products, rather than grains, were dietary staples.

Before the medieval era the rich alluvial soils of the Indus, the Ganges, and the Yellow River plains of northern India and northern and central China had sustained the transition from upland shifting to settled, lowland cultivation. This move was supported by new technology, such as improved tools, better water management, and a sense of seasonality, which included the use of a calendar; all these improvements allowed farmers to cultivate lands that had been useless swampland or that had been subject to heavy annual flooding. By the early medieval era settled and increasingly populous village societies in other regions of Asia were cultivating millet and other traditional grains.

The traditional Asian productive units were family centered and based in a village. The Chinese village was a collection of traditional extended-family households that consisted of the male family head, his wife, their children, his parents, and his brothers and their wives and children. Japanese village households were nuclear, consisting of the male head of family, his wife, their children, and his parents. Brothers established branch households by clearing new lands or by colonizing frontiers. The other regions of Asia and the Pacific had local variations of these.

Wet-rice cultivation became common in Southeast Asia, central and southern China, coastal southern Asia, the region of present-day Sri Lanka, southern Japan, and southern Korea from 500 to 1000 C.E. Initially in the areas of modern-day Thailand, Cambodia, and Vietnam wet-rice seeds were dis-

tributed at the beginning of the monsoon season on a plowed floodplain that had been divided into small fields bordered and contained by elevated earth. The rice seedlings matured after the terraced fields annually flooded with the water of monsoon-swelled rivers and lakes. The wet-rice crop grew quickly and needed little work, and it was harvested after the floodwaters receded.

Other regions of Asia adapted a more labor-intensive transplanted seedling method that was developed in the Cham regions of today's central and southern Vietnam in the first centuries C.E. In contrast to the broadcasting method, seed was annually sown in small, flooded seedling beds before rather than at the beginning of the rainy season. While seedlings took root, farmers and their families prepared nearby terraced fields; they weeded and broke up soil with wooden, stone, or metal-tipped hoes until the monsoon rains soaked the earth. Seedlings then were transplanted by hand with enough space between them for each plant to grow.

In the wet-rice regions of Asia there were three food staples: rice, fish, and coconuts. Rice might be affected by periodic disease, rodents, and insects. Fish (from the ocean, rivers, flooded rice fields, or fish farming in water-storage tanks) and coconuts, however, were virtually free of pests and diseases. Fish usually was dried or fermented and was the major garnish to rice. Properly prepared, rice and fish could be stored for more than a year. Coconuts (the source of fruit, sugar, oil, and palm wine) could not be stored as long but were available at three-month intervals.

Most people ate rice, whether dry or wet, in preference to other grains or starches. Reliance upon other staples was socially unacceptable except during rice famines, when rice cultivators could normally turn to root crops (such as taro and tapioca, which were grown as supplemental crops in wet-rice areas) and yams (which were gathered from nearby forests or were cultivated in rain-fed fields). Sago palms were another alternate source of starch. During the dry season local populations grew a variety of vegetables such as beans, tomatoes, and peppers. Early Asian rice cultivators also supplemented their diet by networking with highland hunters and gatherers, in part to negate the highlanders' potential to raid their productive villages but also to exchange their diverse agricultural produce for meat and forest products, such as wood, bamboo, and tree resins.

Despite potentially high productivity, with the exception of China urbanization in the early wet-rice producing regions was unusual. In part this was due to cultural preference, the geographical isolation of the productive regions, the intensive communal labor commitments of wet-rice cultivation, and the seeming lack of need for supralocal political commitment.

Control or protection of access to water was an important issue that had social and political consequences. In regions where rainfall was plentiful, where there were many water sources useful for irrigation, or where there was no threat from outsiders (such as raids by upland populations and semi-nomads from the grassland steppes), there was little need or opportunity for a political elite to manage or dominate the water system. However, where there was a limited water source or a wider need to coordinate water management, political development was likely. While some historians emphasize the role of local initiative in the development of wet-rice agriculture, others highlight the critical role of a single powerful individual or external institution—religious or political—as the initiator or consequence of wet-rice cultivation and emphasize the subsequent requirements of surplus productivity to pay the political or managerial elite.

Historians debate whether terraced agriculture—and irrigated wet-rice agriculture as a whole—required the efforts of a well-organized and hierarchical “hydraulic” society and how this contributed to the development of early centralized political systems. In a so-called hydraulic society the great majority of individuals were subordinated politically and ritually to those who built and maintained the terraces, water canals, and storage tanks that comprised the water-management system. In such a society the needs of the individual were secondary to the welfare of the group. The social system reflected the natural hierarchical structure of terraced farming, with both water and power flowing from top to bottom.

## THE CHINESE POLITICAL ECONOMY

China’s economic vitality can be measured by its urbanization. By the Song era (960–1279) China had five cities with populations over 1 million; 50 had populations of at least 100,000. The Italian merchant Marco Polo (1254–1324), who visited China at the end of the 13th century, described China’s cities as the greatest in the world, with marketplaces where anything one might desire was available. In the minds of China’s Confucian scholars, this prosperity depended on each person’s fulfilling their societal responsibility: Peasants produced grain and cloth; artisans transformed China’s natural resources into finished products; merchants facilitated the circulation of China’s various products; and rulers managed money, which had become the essential basis of commercial exchange.

The previous dynasty, the Tang (618–907), had abandoned the use of bolts of silk as supplementary currency and introduced copper coinage and a low-denomination unit of exchange. By 1085 Song mints were producing 6 billion copper coins per year, which circulated throughout Asia as the regional basis of increasing monetized exchanges that peri-

odically created shortages of copper cash in China. By the end of the Tang era Chinese merchants traded receipts from deposit shops where they had left money or goods. To insure against periodic credit and monetary shortfalls, Song administrators licensed shops to issue these certificates of deposit; these licensures evolved into the world’s first government-issued paper monetary system.

In the Song era Chinese merchants formed partnerships and joint-stock companies, and they developed management systems that separated owners and managers. In large cities merchants and artisans were members of guild organizations according to the types of products they produced and sold. The guilds set production standards and prices and arranged sales to wholesalers and shop owners. The government negotiated with these guilds in its acquisition of goods or assessment of taxes.

During the Tang and Song eras the center of China’s economic productivity shifted from northern China to the Yangtze River basin in central China. This was due to the greater potential productivity in central and southern China, where warmer temperatures allowed the harvest of two crops per year. The south also had more rivers and streams that reduced the cost of transport and allowed the development of regional specialization. The Tang initially constructed and the Song extended the Grand Canal that linked the Yangtze and the Yellow River basins, which allowed mass shipments of rice and other goods from south to north.

In 742 China’s population was roughly 50 million; with expanded rice production in central and southern China and other economic innovations, China’s population reached 100 million by 1102. Farmers responded to the new economic opportunities by increasing their productivity. They brought new fields under cultivation, built new water-management systems, and developed innovations such as steel-tipped plows, wheelbarrows, waterwheels, and double-cropping (the planting of two crops in alternate rows or a succession of carefully timed crops).

Farmers’ surpluses allowed them to acquire charcoal, tea, oil, wine, and cloth from the marketplace. They even began to purchase grain for their daily consumption and to specialize in the cultivation of cash crops, notably sugar, oranges, cotton, silk, and teas. Some rural people moved to urban centers, where they became craftsmen, or took jobs in the transportation industry, notably in providing inland and coastal transportation. By the Song era China’s shipbuilders were building compartmentalized ships that could carry 500 sailors and extensive cargo on China’s rivers and canals and in the adjacent ocean. Among the variety of products Song merchants sold were Chinese silks, porcelain, stoves, plowshares, cooking equipment, iron nails, printed books (from

newly invented printing presses), and exotic imports from the other regions of Asia.

China's prosperity was a potential burden on peasant producers; those who were less productive become tenant farmers who were dependent on landed gentry. Severe debt led to debt bondage, wherein the husband might sell his wife and children or himself into slavery to pay family debts. China's economic transformation provided both opportunity and pressure on the Chinese government. Government tax revenues soared, but so did government expenses.

The Tang government tried to ensure their rural public's well-being by implementing an "equal field system," which provided roughly 19 acres of land to each farming family. This innovation was also a way to remove the economic resources of the state's two opponents, the landed gentry and the Buddhist Church, which at that time had vast wealth based in their extensive landholdings. Locally powerful gentry used their influence with local officials to maintain their families' continued land control, and they were the beneficiaries when peasant families lapsed into debt.

To ensure the availability of key commodities against merchant hoarding, the state held monopolies over such supplies as rice, cotton, salt, and iron. The Tang implemented "ever normal granaries," which were filled with annual tax assessments at the time of harvest, to guard against periods of famine. The statesman Wang Anshih (1021–86) of the Song unsuccessfully tried to implement a broad social welfare program that included guaranteed loans to farmers (to allow them to avoid debt), fixed commodity prices, unemployment insurance, and old-age pensions. The Song tried to moderate the revenue-collection systems that had traditionally applied to northern China, which were based in annual household assessments. The Song system taxed the acreage cultivated in the newly developed wet-rice regions of central and southern China.

In search of additional revenues, to be more efficient and fair in the assessments of taxes on peasant production, to insure food for the imperial court and the army, and to divest control over the milling of grains from merchants and local nobles, Song monarchs made the milling of grains a state monopoly during the late 10th and 11th centuries. A new water mill agency, staffed by state eunuchs (castrated men), took direct control over mill construction and their operations at the strategic intersections of the state's waterways. Song-era art and literature portrays the efficient management of mills as symbolic of the orderly Song state. By 12th century, however, subsequent Song monarchs had privatized the mills, to the advantage of local merchants, Buddhist temples, and landed aristocrats, and later dynasties could not or were disinterested in reestablishing this monopoly. With similar objectives, early

Song monarchs created new bureaucratic agencies to manage the import of foreign commodities at China's coastal ports, but by the 12th century they had relinquished this further state initiative to better manage China's economic affairs.

When the Mongols took control at the end of the 13th century, they initially implemented a decentralized system of land grants. Their military commanders, nobles, and army units received revenue collection and exploitation rights over a designated territory. However, because the Mongol warrior-commander assignees had military responsibilities elsewhere, they were often unable to collect their entitlements. In their absence bandits, rebels, and local militia fought to take control. The Mongol rulers eventually reappointed Chinese administrators but extracted taxes by licensing tax collectors, called tax farmers, most of whom were Muslim merchants from central Asia who had bid against each other for these entitlements. Former Chinese officials in part agreed to cooperate with the Mongol rulers so they could use their administrative posts to shield Chinese society, and especially their own landed wealth, from Mongol rule.

When the Ming (1368–1644) deposed the Yuan (Mongol) Dynasty and restored Chinese authority, they avoided the ruinous experiences of the Mongol tax collectors. Ming authorities incorporated gentry in their *lijia* system, in which the local elite took responsibility for equitably assessing, collecting, and transporting local taxes, paid mostly in grain, in theory to support the community. But when these local collections fell short of what the Ming bureaucrats needed to cover their basic government services, they levied additional local tax assessments that impoverished local peasants. Eventually the Ming implemented an inclusive monetary tax to achieve some degree of equity. In their attempts to survive the severe Ming tax initiatives, new lineage associations formed. These local associations held designated land in common and supported cooperative ventures to provide emergency support for those in need and to fund joint ancestral rites, ancestral temples, and schools. In time these hierarchical lineage associations became major economic and political forces and a vital local institutional means of protecting local interests against those of the imperial government.

### TEMPLES AS ECONOMIC CENTERS IN INDIA AND ELSEWHERE

In contrast to China, where government regulation beginning in the Tang era prevented religious centers from having enough economic resources to challenge the authority of the state, in India and elsewhere temple complexes were alternatives to political centers in their support of economic activity. Temples were also major consumers of goods and in various ways stimulated trade. Well-endowed temples accumulated

large quantities of land, livestock, and valuables such as gems, precious metals, and coins from the donations of pious pilgrims. Much of this wealth was used to support daily rituals in the worship of temple deities as well as periodic festivals. Oils and incense were lighted for the gods' pleasure, perfumes and flowers were sprayed and spread on their images, and offerings of food were made several times a day. Temple administrators, priests, cooks, gardeners, guards, musicians, and dancers all were paid temple employees. Sculptors, metalworkers, and other artisans who constructed and maintained temples found additional employment in the towns that grew up around sacred temple centers, as did merchants who catered to the temple's direct needs and its pilgrim trade. Representative inscriptions from southern India and Cambodia report that major temples could feed more than 1,500 pilgrims on a normal day and about 4,000 on festival days.

Merchant guilds agreed to make voluntary contributions to a specific temple, usually calculated as a percentage of goods sold. While merchants had been patrons of temples from earlier times, beginning in the 12th century skilled artisans, notably wealthy weavers and workers in precious metals, were occasional patrons. As their economic standing rose, weavers and other artisan communities began to demand more social recognition; they sought prominent roles in temple ceremonies and membership on temple-management committees.

### TAXATION, CURRENCY, CLOTH, AND SLAVERY IN INDIA AND JAPAN

In India during the post-Gupta era (ca. 650–ca. 1500), as in Japan under the Kamakara (1192–1333) and Ashikaga (1336–1573) shoguns, a regionally based military elite who periodically accepted subordination to enterprising warrior-dominated courts provided security to their rural dependents in return for a share of local production. At the local level in Japan administrative stewards and constables, who had managed aristocratic estates during the previous imperial period, merged into a hereditary military elite, called the samurai, who were ultimately bound by service contracts to a supreme military lord, or shogun. The shogunate system, called the “tent government,” depended on the shogun's willingness to acknowledge the local territorial income and administrative rights of his samurai lords. The shogun's income derived from his personal estates rather than revenue transfers from his subordinate samurai's local income collections.

In India competition between the military and long-standing semiautonomous agricultural and ritual communities and powerful merchants culminated in the formation of the Deccan Plateau-based Hindu state of Vijayanagar in the 14th century. Vijayanagar controlled the entirety of southern India, while northern India remained politically divided. In

part, the Vijayanagar state was the consequence of a rapid economic expansion in southern India from the 10th century onward. This enabled the nonlaboring landholding elite, in partnership with regional monarchs, to consolidate private ownership over previously uncultivated lands and thus undercut the authority of the corporate communities of peasant cultivators. By the 14th century social unrest and dynastic conflict pitted the landlords against peasant cultivators, artisans, and merchants, to the advantage of the intervening warriors.

Vijayanagar's monarchs incorporated the regional warrior elite (*nayaka*) as provincial governors, who asserted their political and economic authority from regional military garrisons, in contrast to the previous age when troops clustered around the royal courts or their patrons. The new warrior elite regarded local agricultural institutions as stumbling blocks to effective rule and destroyed them; then they initiated local alliances with individual elite and cooperative temples. In 1429 widespread peasant and artisan rebellion against the initially unreasonable revenue demands of the partnering landlords (*kaniyalur*) and Vijayanagar's *nayaka* officers necessitated more direct royal intervention and consolidation of state authority but to the advantage of the *nayaka*, who cooperated in the restoration of local order. Subsequently, Vijayanagar's kings incorporated the locally based *nayaka* warrior elite as the state's agents but with promises of tax concessions and the restoration of preexisting landholding rights to the peasantry. The empowered warrior elite were obligated to make stipulated remissions of local revenues to the king and to personally maintain numbers of cavalry to meet the king's demands in times of war. Local linkage among *nayaka* warrior elite, merchants, artisans, and temples was mutually profitable. Through the late 17th century there was sufficient opportunity for local producers and the warrior elite to share in the enhanced regional economy, in part driven by the regional cotton-weaving industry that was linked to the profitable Indian Ocean trading networks, to ease social tensions.

In both India and Japan ambitious rulers increased the rate of land tax that was assessed on the estimated rate of annual yield, or their share collected directly at harvest time in the grain-threshing room. In India officials or their representatives negotiated with long-standing village governing committees composed of village and caste elders in making local revenue settlements. Either merchants paid their taxes directly to royal officials who supervised urban marketplaces, or a marketplace or merchant and artisan organization made collective payments to the state.

Some historians regard the revenue collections by the military elite as exploitative and parasitical—as payments for little more than protection against a potential raid by warrior

or samurai troops. More sympathetic historians counter that India's warrior system, in particular, maintained the autonomy of village societies and provided them the security required for their continued productivity and social stability.

While there was earlier small-scale use of high-volume gold and silver coinage in the various regions of India, by 1300 smaller-denomination brass and copper coins were being issued in India and China to facilitate the greater number of marketplace exchanges. Unlike China, India at that time did not progress to the use of paper currency, although India's major commercial centers were known for their money-lending potentials and were networked to other major marketplaces by an assortment of personal, partnership, guild, caste, or merchant association connections.

By 1300 India's textiles had become a major medium of exchange throughout Asia as an alternative to monetary transactions. The best Indian textiles were woven in Gujarat, such as the extremely expensive silk and cotton cloth with woven patterns and the less expensive, plainly woven and coarse cotton textiles decorated with woodblock prints. High-quality Chinese silk, Javanese dyed cotton batik, and Indian cloth with woven patterns were in high demand for use in religious rituals throughout Southeast Asia; the less expensive Indian and Javanese cotton cloth replaced local bark cloth or nudity as the attire of the local upwardly mobile.

In volume and character, slavery in India, as elsewhere in Asia, changed during the 13th and 14th centuries. In earlier times individuals became slaves because they were in debt, as a legal penalty, or as a result of being captured in warfare or by pirates. In the 13th century increased military capacity, notably the first use of gunpowder warfare, encouraged raids against neighboring territories to capture and enslave populations, who were sent to cultivate frontier lands. This increased productivity either directly (through income rights) or indirectly (through taxation) sustained the substantial expenses of that era's courts and their luxurious lifestyles. Northern India's regional authorities enslaved populations that refused to pay taxes and sold them in flourishing slave markets, from which they were sent to destinations in central Asia. In this same era several ports in Southeast Asia were major slave markets, largely supplied by local warfare and the rampant piracy in the regional waters and adjacent coastlines of the China Sea and Indonesian archipelago.

### KOREA'S MEDIEVAL-ERA ECONOMY

Korea's medieval economy was based in a rigid and restrictive social hierarchy. Distinguished Confucian aristocrats with ties to the imperial capital were in control; commoners were rice farmers who provided a share of their produce and their labor as tax payments to the state and its aristocrats; and

the "lowborn" were bound in service bordering on slavery to the Korean elite and government officials. The "lowborn" were hereditary agricultural laborers, domestic servants, and workers in government gold mines and porcelain factories.

These court monopolies supplied the consumptive demands of Korea's elite, supported Korea's overseas trade, and provided the commodities for Korea's mandatory tributary payments to the Chinese court. With the exception of silk, which was woven by villagers and collected as a mandatory tax payment to the state and its elite, government bondsmen rather than independent artisans produced other fine manufactured goods and crafts. A small Korean merchant class serviced the state's elite with high-quality Korean products and luxury imports from neighboring China and Japan. Most of Korea's higher-level trade took place in the imperial capital. Rural poverty, the result of the exorbitant drain of local productivity to subsidize the court-based elite and periodic famines, restricted commoners' access to larger marketplaces. Local marketing was characterized by barter exchanges of local production rather than cash-based transactions.

Royal officials and the military received a mixture of assigned salaries and hereditary rights to produce from delegated property. Powerful absentee noble families, who preferred to live in the capital city rather than in the primitive countryside, military commanders, and richly endowed and powerful Buddhist temples controlled the remaining unassigned lands, which were organized into regional estates. Unlike the military elites who came into power in medieval Japan and India, Korea's military elite was not closely linked to the land or the agricultural population by residency. They were centered in regional command posts or at the imperial capital, and they depended on a professional managerial class to control their rural estates and to collect their share of local produce.

In the 1390s the Yi rulers (1392–1882) attempted to rectify the hereditary Korean landholding system by confiscating all the landed estates, burning the old land registers that recorded preexisting landholding rights, and then redistributing assignments of lands to a wider network of royal officials and military, known as merit subjects. Despite their intentions, the reassigned land again became the hereditary property of elite families.

### ASIAN TRADE NETWORKS

Throughout the medieval era peoples and cultures of the Indian Ocean and the adjacent regions to its east were linked in a maritime network that extended from the port cities of the eastern coast of the African continent all the way to Japan and Korea. The Tang and Song governments took great interest in commercial exchanges with the regions to China's south.

Their interest stemmed from periodic insecurities along the Silk Road caravan route across central Asia. This resulted in regular market shortages that made China's merchants unable to satisfy the Chinese aristocracy's continuing demand for Western products or the Chinese government's need for the substantial tax revenues it assessed on imports.

From 500 to 1000 Buddhism and Hinduism reinforced the enhanced India-China commercial network along the Silk Road and the Indian Ocean passageway, as evidenced by the archaeological remains of large temple complexes built in this era in Southeast Asia (modern-day Indonesia, Cambodia, Vietnam, and Myanmar), southern India, Sri Lanka, and northeastern India. In Southeast Asia trade-derived opportunities supported the rise of new political economies, including Sumatra-based Srivijaya, Champa and Vietnam on the Vietnam coastline, Angkor in Cambodia, Mataram in Java, Sri Lanka, post-Gupta (after 650) India (Bengal and southern India), and the Korean and Japanese imperial regimes. Exchanges of metals, religious artifacts, ceramics, and exotic jungle products assumed new significance, in contrast to the earlier trade that was based in the exchanges of India's textiles, pepper, and bronze artifacts for China's silk, Middle Eastern incense, and Southeast Asia's spices.

The volume of Indian Ocean trade surged in the 11th century thanks in part to the regional stability established over the Middle East by Muslim Abbasid caliphs (749–1258) and Seljuk Turks (1038–1194). Middle Eastern merchants took to the Indian Ocean to seek Asian goods in exchange for their own. This, paired with a stable Chinese market, caused southern India and Sri Lanka to become new international commercial hubs, filling roles as strategic intermediaries in the trade between the Middle East and Southeast Asia. In Southeast Asia, Java became prominent because of its central role in providing international access to the spices of the Moluccas, or Spice Islands, of Indonesia's eastern archipelago.

By this time regional centers were working together as one great integrated Indian Ocean trade network. The increased volume of trade attracted a multiethnic community of trade specialists that included Middle Easterners, Indians, Southeast Asians, and Chinese. All the sojourning traders made seasonal voyages using the Asian monsoon winds, which blew from southwest to northeast from June through August and reversed to blow from northeast to southwest from December through March.

China's Ming rulers supported the new Melaka emporium on the southwestern coast of the Malay Peninsula, which was empowered to maintain the security of the vital Strait of Malacca passageway. Between 1405 and 1433 the eunuch admiral Zheng He and his fleet of Chinese battleships reinstated the Chinese tributary trade system, wherein Indian Ocean

countries sent periodic embassies to China's courts to present diplomatic "gifts" of their prize marketplace commodities in return for honorific material symbols and official proclamations that confirmed their local authority. Partly in response to these Ming initiatives, Asia's 15th-century trade volume substantially increased, as did the number of participants in Asia's marketplaces and the diversity of traded commodities. This prosperity attracted the attention of Europeans, whose desire to acquire Asia's exotic commodities resulted in Europe's 16th-century Age of Discovery.

## EUROPE

BY KIRK H. BEETZ

When the last emperor of the Western Roman Empire abdicated in 476, the economy of the region was in decline. During the 400s the populations of European towns and cities decreased. Even the city of Rome itself, which once had more than a million residents, saw its population dwindle to a quarter of a million. The fundamental problem was that the rural economy could not support the urban economy. People in the cities, unable to get enough food from local farms, often had to flee their homes to the countryside. During the sixth century the situation worsened. The wars of the Germanic peoples further disrupted trade, often destroying the routes that had brought food and other goods into cities. Urbanites who fled to the countryside typically did not farm effectively and eventually perished. Those who succeeded in staving off catastrophe barely grew enough to feed themselves. For roughly 400 years Europe was mired in a subsistence economy, in which people grew barely enough food to keep themselves alive. Very little was left over for sale to others.

During the sixth and seventh centuries the populations of European cities outside Italy and the Byzantine Empire declined so that no city or town had more than 10,000 residents. Some historians argue that this was true for Italy too, but other historians believe that Rome retained a population of about 20,000. Italy had the advantage of being in the middle of the Mediterranean Sea, with access to some of the wealth available from trade routes heading west, east, and south across the water.

The European economy saw its first period of growth during the eighth century in the north and west, when cities like Ipswich in England and Dorestad in the Netherlands were home to international trade. That growth was sustained in the ninth century during the reigns of the Carolingian kings, especially Charlemagne (r. 768–814), who tried to standardize European coinage and encourage trade. Around 900 the European economy began to grow because new technology made farming more productive and trade routes were open-

ing up, connecting the various parts of Europe economically. At the same time Vikings raided much of Europe, sometimes going far inland to attack places like Paris. The destruction and thievery of the Vikings did much to slow Europe's economy, but they also forged new trade routes. The two most important were a route from Denmark south along the coast to Spain, with stops at Britain, Flanders, and France, and a route southeast from the Baltic Sea down to the Byzantine Empire and the Islamic Near East.

From about 900 to 1200 feudalism was the dominant political structure in most of Europe. Feudalism was defined primarily by economic relationships. After the fall of the Western Roman Empire, many people had few choices for survival. One was to go under the protection of a powerful lord. In return for that protection a person had to agree to help work the lord's lands and to pay the lord an annual fee. Another choice was to become a soldier in service to the lord. During the ninth century the cavalry was the most important part of European armies. Often, if he could afford to do so, a man would sell his land to buy a horse and basic military equipment and become a knight. Another option was to become a serf, a person who was tied to the land and could not leave without their lords' permission.

The 11th century in Europe was a period of steady growth in wealth and populations. A trade route down the center of Europe, from Flanders to Italy, became well established. In the Champaign region of France, northern traders who made the annual trip south established a yearly trade fair, held at various locations throughout the years. The trade fairs attracted farmers and villagers throughout France and merchants ready to purchase their goods. Equally important, the merchants met with regional traders who would buy goods and carry them home to distribute to local peddlers, thus spreading goods over wide ranges. Sometimes the peddlers were paid in kind—that is, they traded their goods for other goods—but increasingly they were paid with coins. Many trading centers minted their own coins, but the Byzantine Empire, Venice, and England produced the coins that were the most trusted and therefore the most widely used.

By the 13th century Europe was developing a cash economy, in which people paid for purchases with coins rather than in kind. Europe's population grew to about the same level it had reached in the 300s. The cash economy was slowly breaking down the feudal societies, because that type of economy thrived best when trade was free, and free trade required that people be free to trade. The serf chained to a plot of land was not free. Towns depended on people being free to manufacture goods and to buy and sell them. Thus towns rejected the authority of feudal lords, often choosing to govern themselves with elected town councils. Such freedom did not

come easily, and people often had to fight against feudal leaders for the right to live freely. The cash economy was making living in towns attractive, and many serfs fled their lands to find freedom in towns.

The 14th century brought catastrophes to many parts of Europe and an economic downturn in the middle of the century. Towns tended to have narrow, sewage-laden paths winding among tightly packed houses. This helped foster the spread of disease. The most notorious disease was the Black Death, or bubonic plague, which was spread by fleas from rats. Other diseases such as smallpox were sometimes considered part of the Black Death. The Black Death was worst from 1358 to 1360. By 1400 the European population had declined by 40 percent to 50 percent from where it had been in 1300. Not all parts of Europe were hit equally. Eastern Europe seems to have been hit harder than western Europe, and northern France did better than southern France. Nevertheless, the places that suffered the least still lost at least 10 percent of their populations. The plague hit rural areas as well as cities, towns, and villages. With fewer farmers, Europe's agricultural productivity declined sharply, leading to a short-

*Alms box for donations to the poor, Britain, 15th century* (© Museum of London)

age of food in both rural and urban areas. The solution many landowners turned to was the use of slaves. To have enough laborers to work the lands, landowners in the regions hardest hit by the plague imported slaves from Spain, Italy, and eastern Europe. But just as some areas were not as hard hit as others, in some areas the demand for manpower resulted in higher wages. Not until the middle of the 1500s would populations recover to about the numbers of the 1300s.

## THE BYZANTINE EMPIRE

The economy of the Byzantine Empire was remarkable for its stability over 800 to 900 years. From the mid-300s, when it was the Eastern Roman Empire, to 1261, when bad economic policies resulted in a steep decline, the Byzantine Empire managed to remain an economic powerhouse, and its coinage was so reliable that it was the preferred money in much of the Near East and southern Europe. While the rest of Europe had a subsistence economy based on agriculture and barter until the late 900s, the Byzantine Empire had a cash economy, and shops in its cities and towns had trade goods from all over the world.

The Byzantine economy was heavily managed by the government, which set quotas for goods to be brought into its cities, set prices for many products, and told manufacturers what they could make and in what quantities. Cities were the primary consumers of goods grown or manufactured in the empire and of imported goods. City officials called prefects monitored all buying and selling within their cities and often regulated prices. The urban economy was managed by two groups: government agents and guilds. Government agents, especially tax collectors, examined anything brought into a city, anything taken out of the city, and anything manufactured and sold in the city. By keeping records of all they observed, government agents helped maintain a stable economy, one with enough of everything needed for life and without too much of anything (which could cause inflation). Tax collectors, the most determined record keepers, were feared and loathed throughout the empire because they could seize money or property as required for people to pay their taxes.

Guilds had long existed in the Roman Empire. In general they offered members limited protection against government policies and set qualifications for membership. Mostly they functioned as fraternal organizations, building guild houses where members could meet for dinner and socialize. They elected officers who could be members of a low social class and would gain prestige they could not have won outside their guilds. The Byzantine government changed the guilds by strictly regulating how they were organized and what they could do. By the ninth century Constantinople had 23 guilds. Each guild could elect its own president, but

the president had to be approved by the local prefect. Guilds determined who could practice a craft and controlled where a shop could be located, how many employees a shop could have, how much a shop could produce of an item, and the price of that item. Of paramount importance were bakeries, because they made bread, the fundamental food of the subjects of the empire. The government taxed bread, and increases in the tax sometimes caused riots and outright rebellions. On the other hand, the imperial government owned warehouses to store grain, and it required bakeries to buy from those warehouses, where costs were fixed. During shortages the warehouses ensured that bakeries had the flour they needed and that bakers were not driven into bankruptcy while keeping bread affordable for the poorest people. During surpluses bakeries could not buy cheap grain and undersell their competitors, a practice that could allow large bakeries to drive small ones out of business. Because of the government-owned grain warehouses, cities and towns always had bakeries available to serve every neighborhood.

Certain guilds were considered so important to the economy that they were made imperial guilds, answerable directly to the emperor. These guilds received preferential treatment over other guilds. Among the imperial guilds those for metalworking, making the purple dye that was reserved for the imperial family's clothing, and silk manufacturing. Oldest of these guilds was that of the purple dyers, established in about 610. The imperial guilds manufactured primarily luxury items, items that were very desirable. Silk was probably the most valuable of the imperial goods, and the empire prohibited its exportation, even after the empire acquired silkworms and learned to make its own silk cloth.

Although the Orthodox Church frowned on lending money for interest, the practice was tolerated because it helped the national economy expand. The moneylenders were the goldsmiths, mostly Greeks. At first the government loosely regulated interest rates. Emperor Justinian I (r. 527–65) forbade charging more than 12 percent interest, but most rates were between 4 percent and 8 percent. Eventually interest rates were set by social rank, with aristocrats paying the lowest rate of 4.5 percent, merchants paying 8.5 percent, and most other people paying 6.5 percent. In the last few centuries of the empire Italians took over most of the moneylending. The government would confiscate any money lent outside government-sanctioned shops. The national bank controlled currency exchanges, and it was the only place people could legally buy and sell the currency of the empire and of other countries. Again, the government would confiscate any currency exchanged outside the national bank.

Taxes were always heavy. The government charged a 10 percent tax on all goods entering or leaving the empire. Land

was taxed. Every 15 years land was reappraised, and the tax on it was accordingly adjusted. One of the most oppressive aspects of the tax was that if a landowner fled his or her land without paying the taxes owed, the neighbors of the land had to pay the taxes in addition to their own. Further, the government imposed one tax on all the land in a village, including all farmlands. All residents, rich or poor, were responsible for paying the tax, called the *annona*. To avoid the *annona*, many freemen abandoned their farms to find work in cities, leaving much arable land uncultivated.

The imperial government aggravated the problem with *pronoia*, a practice used in the early years of the empire but mostly set aside until the 1100s. *Pronoia* was a kind of land grant that freed people who had done service to the empire from paying taxes on their land during their lifetimes. These privileged people often bought land to add to their holdings, tax free. In 1261 the *pronoia* was made hereditary, taking land permanently out of taxation and increasing taxes for everyone else. *Annona* and *pronoia* badly damaged the farming industry and, combined with trade concessions to Italian city-states, brought the empire's economy near collapse. Lacking sufficient funds in its coffers, the Byzantine Empire found it hard to prepare and provision the armies it needed to keep the Turks at bay.

### ITALIAN CITY-STATES

The politics of Italy for most of the medieval era was chaotic, with invasions by Germanic, Byzantine, and Muslim armies as well as frequent wars among the Italians themselves disrupting economic life. But Italy had three important economic advantages: It was located in the middle of the northern Mediterranean Sea and therefore in the middle of trade by water to both the East and West, it was the southern terminus for much of the trade from northern Europe, and its cities, even though badly depleted of their populations, retained some of the organization of ancient Roman times, helping them to control aspects of their economies.

By the 12th century cities in Italy were emerging as significant economic centers; one of the most important was Venice. In 425 the Huns had sacked the city of Aquileia, an important glassmaking center. Its people fled to islands in a lagoon, where they founded Venice. Glass manufacturing became an important source of income for the city, helping its economy thrive while most of Italy suffered from a severe economic downturn. At least two important factors led to Venice's rise to power. First, its laws forbade any citizen to own estates outside the city, cutting down opportunities to build farming estates and focusing the attention of citizens on trade as their primary source of income. Second, Venice's location in the northeast of Italy was ideal for trade with the Byzantine

Empire, of which it became a part. The traders of Venice were able to broker special deals with the Byzantine Empire that lowered their tariffs for moving goods into and through the empire. In addition, in the 1260s Venice received special trade concessions from the Byzantine Empire as a reward for its aiding the empire in a war against its northern neighbors. The result of these concessions was that Venice was able to draw trade, and therefore income, away from other parts of the empire, contributing to the significant economic decline that resulted in the empire's death. Venice also contributed to the eventual downfall of the Byzantine Empire by making deals with the Arabs that strengthened Arab armies.

During the medieval era Italian merchants extended their trade to China and deep into northern Africa. The gold they brought north from Mali in Africa helped relieve a shortage of gold in Europe, which in turn made Italy an essential part of the overall European economy. At the same time that trade was booming, Italian agriculture became productive enough that farmers could grow cash crops—that is, crops farmers grew solely to sell for money, not to contribute in any way to the farmers' subsistence. Thus both in urban areas and rural areas, cash was increasingly available for investing in economic endeavors such as building windmills to process grain and ships to carry goods to faraway lands.

To manage the cash that could be invested, Italian city-states invented the basics of modern banking. It was probably Venice that developed the first modern-style banks. Moneychangers had been around for centuries. They exchanged one form of currency for another. This meant that they were usually found in cities that saw a great deal of trade with foreign countries. In the 13th century some moneychangers took the next step in their work: They began accepting cash on which they paid interest. Then they invested the cash in business enterprises, hoping to realize profits after paying the interest they owed. Particularly in Venice, Genoa, Florence, and Pisa, trade economies were booming, offering numerous opportunities for investment that resulted in financial gains. With the large pools of money they amassed, cities financed armies and navies to project their authority across land and sea and invested in foreign economies to give them influence beyond the borders of Italy. Further, the newly wealthy families of Italy believed they should help their people regain the glory of ancient Rome, as they imagined it to have been. Thus the Italian city-states financed the Renaissance, giving employment to authors, artists, and architects and encouraging the boom in learning and the arts that would transform the culture of Europe.

### ECONOMICS OF THE CHURCH

When the emperor Constantine the Great (r. 306–37) made Christianity the official religion of the Roman Empire, the

Silver penny of Ethelred II, minted in Lewes, England; 1003–16. Changing coin designs was a hidden form of tax, since all coins had to be exchanged for the new designs; the moneyer would charge a fee and pay the king for the right to issue the coins. (© The Trustees of the British Museum)

event had pragmatic consequences. For centuries the Roman government had supplied free bread to the unemployed and homeless in its cities, but economic problems had made this impossible for the government to continue in many European cities. In those cities Christians had taken up the charity of feeding the poor. So vital were the Christians' charitable efforts that many cities could not survive without them, and Christian bishops even took over many of the administrative duties of city governments. Thus, making Christianity an official religion had the effect of incorporating Christian charities and administrators into the national government. From 500 to 1000 Christians' role in government became even more important as bishops became the only source of law and order in cities whose finances had collapsed. One way the Roman Catholic Church of the medieval era financed its work, both religious and secular, was through charging parishioners a tax, called a tithe. Although the word *tithe* implied 10 percent, local churches often demanded and received much higher percentages of the work and wealth of the people living in their parishes.

The church divided Europe into collectorates, which were regions created to make taxation easier. Each collectorate had a collector who acted on the pope's authority. A collector was responsible for gathering the tithes and lump-sum fees for church services. The fees were usually gathered from clerics living in a collectorate and were sent to the pope. The

clerics replenished their funds by increasing the tithe owed by the laity or by imposing another tax called Peter's pence. The often-oppressive tithe, fees, and tax eventually made the general public resentful of the church. By 1100 Europeans were complaining of the church's abuses of its authority to levy taxes. Many church leaders seemed to have almost no interest in religious faith but a great deal of interest in acquiring luxuries for themselves. In the early 14th century many people began asking for reformation of the church's finances.

Another important way for the church to raise money was through simony. Simony was the selling by the pope of church offices over which he had authority. By 1400 every church office had a fixed price, and the number of offices appointed by the pope was increasing. A person wishing to acquire an office usually bought an expectative, which put the purchaser in line for the office. When the person holding that office died, whoever had purchased the next expectative took the office, and after him would be the purchaser of the next expectative, and so on.

### SCANDINAVIA

During the medieval era most Scandinavians lived on the lowlands that outlined their countries, with the inland mountain ranges scarcely populated. The economy of Scandinavia was based on agriculture. Although most people were farmers, fishing was also important to the economy. Scandinavian

traders amassed wealth by selling wood, furs, amber, and salted fish as far away as the Near East. The traders brought home silver, gold, and luxury items. Silver and gold jewelry gave prestige to their wearers. But Scandinavians tended to be practical about silver and gold items, often melting them down to make coins when there was a shortage of coins or when the owner wanted to make an expensive purchase.

Viking pirates brought a great deal of wealth back to Scandinavia after looting monasteries and convents, villages, and towns. They established three cities in Ireland for trade. They raided Ireland for slaves, who were often transported to the east coast of the Baltic and forced to march overland to be sold in Iran. From 991 to 1014 Danish Vikings forced England to pay a tribute, called the *danegeld*, bringing as much as 36 million gold coins to Denmark. The trading and raiding gave Scandinavia enough wealth to create a cash economy. In the process of settling in Ireland, England, and Normandy, the Vikings established enduring connections between Scandinavia and the rest of Europe that made Scandinavian natural resources, seamanship, and merchants permanent parts of the medieval European economy.

### NORTHERN EUROPE AND THE HANSEATIC LEAGUE

Much of northern Europe had never been under the control of ancient Rome, and its economy had seldom been more than a subsistence one. During the 700s international trading centers developed in England—in London, York, and Ipswich—and in Sweden, most notably in Birka. By the 900s England was a major producer of wool, and much of England's wool was traded to Flanders. Flanders manufactured fine woolen cloths, giving rise to towns where cloth manufacturers could set up shop and trade their goods. The cloth of Flanders became highly valued throughout Europe and was a major part of northern European trade with Italy and the Byzantine Empire. In the 11th century northern Europe exported large evergreen tree trunks from Norway and Sweden for use in European building; amber, furs, and wax from throughout northern Europe were also in demand as trade items. Surpluses of wheat and rye grown in eastern Europe were transported on the Baltic Sea to ports in the Netherlands, Denmark, and Germany and exchanged for cloth and manufactured goods. The Vikings controlled most of the Baltic trade until the 1100s, with the Swedish town of Visby monopolizing much the remaining Baltic shipping.

The town of Lübeck, founded in the 12th century on land the duke of Saxony had seized, had been a Slavic town. Merchants from Saxony used Lübeck as a base for trading east and west along the Baltic Sea's southern coast. The Hanseatic League was founded as a confederation of merchants who

wished to take advantage of the expanding regional economy by making trade easier. Thus the league was partly the result of an already growing economy, but it also served to accelerate economic growth by making sure that its members had legal agreements to conduct business with many towns. Government authorities often objected to the influence the Hanseatic League had on their economies, but the league was so powerful during the 14th and 15th centuries that it could defy government efforts to control it. For instance, from 1368 to 1370 Denmark waged a naval war against the Hanseatic League and lost; in a reversal of more common relationships between governments and merchants, Denmark was required to pay the league 15 percent of the income from its trade.

A key event in the growth of northern Europe's economy came in 1266, when England's Henry III (r. 1216–72) granted Hanseatic traders from Hamburg and Lübeck charters to establish trading colonies in England. Since the late 10th century England had one of the most stable currencies in Europe. Its silver coins were made by minters given charters by the imperial government to make coins. People often cut coins in half or even into smaller pieces to make exact change for a purchase, so every three years the government declared all old coins to no longer be legal tender, and people had to go to the minters to trade their old coins for brand-new ones. The exchange rate was roughly eight or nine new coins for every 10 old coins. Most of the difference constituted a tax that went to the national government. The result of this policy was that English coins became the preferred coinage for cash purchases in much of northern and western Europe. The agreement of 1266 brought England into a special trade status with northern Europe that boosted the economies of all the lands involved, because England's economy gave added stability to the international economy of northern Europe and England gained greater access to the raw materials of eastern Europe.

## THE ISLAMIC WORLD

BY MASSOUD ABDEL ALIM

The seventh-century Byzantine world invaded by Arab Muslims consisted of politically organized, settled societies living in urban settlements (towns and cities), with an economy based on agriculture, free trade, and small crafts. Although pagan elements continued to exist, the population was largely monotheistic and Christian (which incorporated many sects), with Jews and Zoroastrians making up most of the balance. Kinship ties favored family, lineage, clientage, and ethnicity. Seafaring trade crisscrossed the Mediterranean Sea. Overland trade routes carried goods from Syria through central Asia to the Far East and back.

The Arabian Peninsula of the seventh century, by contrast, was primarily a politically fragmented, largely pagan, pastoral-nomadic society living in camps and oases, with strong clan and tribal affiliations. The declining power of several border kingdoms undermined order and encouraged violent clashes between clans. Nomadic Bedouins continually raided caravans, which compromised trade routes. As a result the economies in the parts of Syria and Iraq closest to the Bedouin migration path gradually became pastoral and nomadic, a development that eventually incorporated most of Arabia itself.

By the mid-seventh century Mecca (in present-day Saudi Arabia) was an important center along the caravan route. Caravans brought spices, leather, medicines, cloth, and slaves from Africa and the Far East to Syria. From Syria they brought money, weapons, cereals, and wine into Mecca. Meccans negotiated with both the Byzantines and Bedouins to secure guides, scouts, and safe passage and to safeguard scarce and precious water rights. Consequently, Mecca acquired both political and economic influence.

After migrating to Medina, Muhammad and his followers made continual efforts to enlist the support of other clans and to subdue those clans—including the Quraysh, his own—in Mecca and elsewhere who were resistant to his religious leadership. Muslim forces routinely raided opposing tribes and compelled them to pay the *zakat*, or alms tax, as a sign of solidarity and membership in the Islamic community. Bedouin tribes complied for a while but considered the tax a form of tribute, and after Muhammad's death they refused to continue payments. In response, Muslim forces took military action and were ultimately defeated by the Bedouins. In the short term Meccan trade was disrupted, but once the Meccan tribes were finally subdued and brought under the aegis of Islam, trade resumed.

After conquering most of their neighboring lands, Muslim Arabs established garrison cities to house military detachments. These garrisons served several purposes. First, they isolated the new military elite, with its special privileges and rights to booty, from conquered populations. Second, they ensured military dominance over conquered peoples by providing ready means to squelch any rebellions. Third, and significantly, the leaders stationed in these garrisons implemented the economic and taxation policies imposed on conquered peoples. A pattern emerged in which the conquerors became the new political and military elite and the settled societies were exploited to support them.

After the caliphates of Abu Bakr (632–34 C.E.) and Umar ibn al-Khattab (634–44 C.E.), the third caliph, Uthman ibn Affan (644–56), and his ruling regime in Medina developed two fundamental policies in dealing with conquered popu-

lations. Motivated by a wish to channel Bedouin migrations and use them to greatest advantage, the Uthman regime decided first to ensure that minimal disruption occurred among conquered peoples and second that they would develop relationships with local rulers to implement the new tax policy. Knowing the Bedouin practice of raiding camps and caravans to seize goods and other scarce resources, they understood that the looting of settled populations would undermine their ability to generate future income for the ruling regime. Further, the Uthman regime understood the need for cooperation from the local elites, because the Muslim Arabs had neither the knowledge nor the manpower to administer sedentary societies. Thus the Muslim Arab conquests of the seventh century preserved the continuity of the social organization and market economy.

### ECONOMIC IMPACT OF THE MUSLIM CONQUEST

The Arab Muslim conquest had significant consequences on the economies of conquered lands. To the east, barriers to trade fell as Sassanian Iran became part of a single political entity with parts of the former Byzantine Empire. Conquering armies required housing quarters, mosques, administrative centers, and sanitation facilities. Construction followed the conquest. Iranian cities such as Samarkand, Bukhara, and Nishapur thrived with continued Muslim expansion to the east. Other cities, such as Isfahan, Rayy, and Qazvin, also grew.

The results in Mesopotamia (in the area of present-day Iraq) were more mixed. Baghdad became the seat of the caliphate and prospered along with other cities such as Basra, al-Kufa, and Mosul. Garrisoned armies followed a similar pattern of building a supportive infrastructure. A natural disaster, however, hampered economic development. Around 627 the dikes along the Tigris River burst, shifting the river flow westward and flooding the lower Euphrates River. To the present day the region is a marshland, and its inhabitants are referred to as Marsh Arabs. Following this event on the eve of the Muslim conquest, the state-supported irrigation system was seriously compromised, and agricultural output decreased. The new regime made some efforts to reclaim agriculture by repairing the irrigation system and planting date palm forests. New governors even imported slaves from Africa to assist with the labor. On the whole, after conquest the agricultural output of Mesopotamia did not reach previous levels.

Mesopotamia, like Syria and Egypt, suffered from yet another negative impact of the Muslim conquest—Bedouin migrations. Large migrations of these pastoral-nomadic people from the Arabian Peninsula into the cities and towns of Greater Syria (present-day Syria, Jordan, Lebanon, Israel, and parts of southeastern Turkey) and Mesopotamia undermined

agricultural areas and commerce, as nomads perpetually sought pasturelands for their flocks. Following their practice of caravan raids, Bedouins also continually attacked villages and towns. Along with a new taxation system, farmers gradually abandoned their fields, townspeople relocated, and local economies became increasingly pastoral and nomadic.

In Syria the Muslim conquest created a new political border between it and Byzantine Anatolia. Although the area north of Aleppo (northern Syria) had been a thriving center of olive cultivation and olive oil production, those industries declined because Syria was cut off from its markets with the Byzantine Empire. Further, the area east of the Ar Raqqa–Damascus–Aqaba axis had been a center for grape cultivation and wine manufacture. It too saw a downturn as a result of the loss of the export market and the Muslim prohibition of alcohol. In addition, economic activity from Christian pilgrimages to Palestine declined. From an economic perspective, therefore, the Muslim conquest brought prosperity to Iran and economic decline in Syria and Egypt and had a mixed impact on Mesopotamia or Iraq.

### TAXATION OF CONQUERED POPULATIONS

Conquering Muslims typically made treaties with local notables, which protected the property and social status of the elites in exchange for payment of tribute (or taxes). These treaties built on existing taxation systems, with a local chief or prince serving as the point person for the new regime in collecting owed taxes. In this way the Muslim military leaders did not have to deal directly with individuals and had in place a class of people called *awan*—helpers who would be in charge of dealing with locals and intervene in disputes. A system emerged wherein the *awan* underestimated taxes owed to Muslim rulers, overestimated them to subjects, and retained the difference—a practice that was known and tolerated.

Conquered populations were subjected to a land tax and a poll tax. The land tax and poll tax were broadly considered revenues from *fay*, or immobile booty. *Ghanima*, or movable booty, was seized by conquering armies and distributed as they moved along. The land tax rate depended on the quality and productivity of the land and its distance from the market, among other factors. The tax was levied on the amount of land that one man working with one team of animals could be expected to work in one day. The poll tax was levied on the entire population and then subdivided among villagers. Payment in gold coins was expected. The tax originated from the Koran: “Fight those who do not believe in Allah and the last day and do not forbid what Allah and His messenger have forbidden and do not practice the religion of truth, from among those who have been given the book, until they pay *jizya* out of hand, in a state of humiliation.” This last instruction often

took the form of a blow to the back of the head, as the appointed local leader handed over the required number of gold coins to the Muslim administrator.

The economic consequences of this taxation system were significant. In some cases taxes reached nearly half the value of agricultural output. Taxes limited the attention farmers could give to the soil and the level of investment required to maintain agricultural productivity. Even the choice of which crops to plant was influenced by tax considerations. The tax burden was such that Egypt experienced several revolts by its Coptic peasants in 697, 712, and 725 to 726, indications that resistance to the system as well as to Muslim rule lasted many decades after the conquest. Ultimately, many peasants fled their lands and homes.

The tax system reflected a person’s place in society. Peasants, workers, and merchants paid taxes. Landowners, administrators, clergymen, soldiers, and emperors collected them. To pay the land and poll taxes was not only an economic burden but also a sign of social inferiority.

Another form of taxation was the farm tax: in this scheme, a tract of land was assigned to an individual who agreed to pay the caliphate a fixed sum (usually 10 percent) in exchange for the right to tax the peasantry at the land tax rate (up to 50 percent of the value of the agricultural output). The difference was retained by the person assigned the farm. Such persons were often members of the military who had served the caliphate and were thus rewarded with land grants.

Self-interest, class interest, and clientage thus helped implement this system of taxation. For local elites the system permitted landowning families to send sons to the central government in Baghdad to act as administrators and merchant families to broaden the reach of their trade by setting up offices in Baghdad. For the unfortunate peasants inability to pay these taxes left them with two options: They could convert to Islam or see their children sold off in slavery.

### ECONOMY UNDER THE SELJUK EMPIRE (1038–1194)

After the breakup of the caliphate in the 11th century, the Islamic Empire lost its central government in Baghdad, despite the newly formed Seljuk regime’s best efforts to reinstate it. The empire was too far-flung and complex, and large landowners were primarily military and thus disaffected from the needs of agricultural production. The system of tax administration was still in place, but taxes were paid to slave governors or local Seljuk rulers. The lack of clear succession—the legacy of a nomadic heritage—permitted the subdivision and fragmentation of large parts of the empire, thus subverting any consolidation into a central administration. The notion of a Muslim empire rested increasingly on its understanding of Islam itself.

Most Sunni Muslims did not prefer any particular economic system. Although they were well motivated for economic gain, Muslims tended not to see economic activity as a vehicle for either personal or societal transformation. Nor did they try to organize people to achieve specific economic objectives, in contrast to fundamentally economic ideologies, such as communism or Marxism.

During this period, and despite the lack of a central imperial government, Islam became a unifying force in organizing social, political, and economic activity. Persia, Iraq, Syria, Egypt, and North Africa were part of an Islamic polity. Political power was highly fragmented, but gradually a sense of Islamic identity emerged. The countryside continued to provide agricultural output, but with relative stability came the growth of cities, which became centers of manufacturing and crafts: textiles, metalwork, pottery, leather goods, and processed foods. A long-distance mercantile system known as *mudaraba* evolved, in which an investor empowered an agent to trade in quantities of goods or capital and then returned to that investor his capital along with his share of the profits. Such a system required the trust that develops with a mutually understood and practiced system of values.

Whatever the type of manufacturing, units of production tended to be small. Skills passed from father to son, and shops were often handed down through generations. A hierarchy of crafts was established, with activities related to precious metals, paper, and perfume held in the highest esteem and dyeing, tanning, and butchering in the lowest. In addition to skilled crafts, cities were teeming with itinerant peddlers, street cleaners, day servants, and rural migrants. Just outside the cities were places where caravans could rest, animals could receive care, and traders could acquire food and supplies.

Although Muslims were required to pay the alms tax, they continued to have privileged status throughout the Islamic world. Non-Muslims continued to endure excess taxation as well as restrictions on dress, behavior, and economic opportunity. The taxation of non-Muslims followed the same principle outlined by Muhammad. In addition to enforcing the laws regarding personal status (marriage, divorce, inheritance, and so on), local Islamic clerics, or learned men charged with maintaining the rules and traditions of Islam, collected taxes, regulated commercial contracts, set the terms of profits that could be made within a contract, and implemented rules and taxes against non-Muslims.

### **ECONOMIC IMPACT OF THE MONGOL INVASION AND RULE (CA. 1220–CA. 1500)**

The single most consequential economic event in the medieval Muslim world was the Mongol invasion, which began

in 1219 and did not end until 1260 at the Battle of Ayn Jalut (near the Syrian coast in then Palestine). Starting in inner Asia, the chieftain Genghis Khan and his four sons conquered all of Eurasia to the Pacific Ocean. As the Mongols moved west to Iran, one city after another fell to their rule, including Samarqand, Bukhara, and Herat. The scope of destruction was widely reported—and often exaggerated—in later historical accounts. It is true, however, that many local populations were systematically exterminated and that most peasants were either driven from their land or made serfs and taxed—all with ensuing catastrophic effects on agricultural output, revenue, and population levels. Crafts such as pottery and metalwork ceased to be practiced for over a century. Urban life ground to a standstill.

Moving farther west, Hülegü Khan, Ghengis Khan's grandson and founder of the Ilkhanid Dynasty, aimed for the heart of the Muslim world. In 1242 Hülegü's forces defeated the Seljuks in Anatolia, picking off one small principality after another. Their continued incursions tipped the balance of power, and new pastoral-nomadic migrants entered and settled in Anatolia, thus putting additional pressure on the eastern border of the Byzantine Empire. As always when settled agricultural communities encounter nomads, agriculture declined in the competition for resources. After a five-day siege in 1258 the caliphate in Baghdad fell to the Mongols, and the caliph and his sons were murdered. More slaughter ensued.

Although the Mongols laid waste to large segments of the Islamic Empire in the 13th century, they started rebuilding once they gained political control. By then the Mongols, who had not espoused any single religion, had themselves adopted Islam throughout their four main political branches. As they rebuilt devastated economies, their impact on commerce was significant.

First and foremost, the Mongols maintained trade routes throughout their conquered empire, which reached westward to the Mediterranean and southward to Egypt. Every 30 miles or so were shelters called caravansaries, which contained provisions, places to house and refresh both traders and animals, and scouts and directions to the local area. This system provided stability and safety for goods as well as travelers. From Persia spices, steel, jewels, pearls, and textiles moved east to China. From China, Tibet, and Mongolia flowed furs, falcons, silks, porcelain, and medicines to Persia. Mongol trade routes became the main arteries in international trade.

Second, the Mongols promoted trade by finding international markets for local textiles. Fabrics such as satin (from the Mongol port of Zaytun), damask silk (from Damascus, where most of the Ilkhanid trade passed from Persia to Europe), and muslin (from Mosul in northern Iraq) originated from Mongol efforts to promote textile trade. The Mongols

encouraged other forms of commerce, a small example of which was the trade in playing cards, which proved so popular among soldiers and merchants that cards were eventually printed from carved blocks normally reserved for printing scriptures.

Third, the Mongols sought to improve agricultural output to maintain a steady supply of food for local populations. Perhaps better than anyone they understood the nomads' need for grain and crafts, just as settled peoples needed the livestock produced by nomads. They encouraged the expansion of rice and tea cultivation from its origins in China to Persia and the Middle East. They improved tools and spread the use of the triangular plow. They imported seeds from China, brought in new varieties of rice and millet, and improved yields of citrus trees and root crops (carrots and turnips). They also transplanted new varieties of peas, grapes, lentils, nuts, and leafy vegetables.

In addition, the Mongols developed new varieties of cotton, wool, and other materials for making rope, dyes, oils, ink, and paper. They created a special bureau for overseeing the technology and promotion of the cotton industry and promoted improvements in weaving and manufacturing. This was a significant undertaking, because cotton had become a major fiber crop and required an array of cultivation techniques (pruning, staking, harvesting); crop-processing techniques (cutting, threshing, grinding); and commodities-transporting techniques (bundling, preserving). Cotton cultivation and its associated textile manufacture remain a major industry in the Middle East.

A similar interest was given to the peasantry, who were organized into 50,000 household units that were largely permitted to run their own affairs, overseeing local farms, land and water management, animal husbandry, food reserves, and local governments. The Mongols encouraged literacy as well and built schools for both peasants and their children. This effort constituted one of the first-known attempts at universal education.

The Mongols introduced paper to the Middle East—and eventually to Europe—where only parchment had been used, thus allowing greater facility in printing and disseminating information. Technological improvements to the blast furnace also originated from the Mongols and permitted metalwork to be done at higher temperatures, thus improving the quality of the final product. The mechanized meat spit also had its origin with the Mongols and reduced the labor-intensive burden of cooking meats.

One of the most interesting innovations, albeit one that did not outlive the Mongol regime, was the introduction of paper money. The money was made from mulberry bark, cut into rectangles of various sizes, marked with various cash

values, and stamped with a special seal. The system was in place at the time of Marco Polo, in the late 13th century. The Mongols based their paper currency on silver and copper commodities, whose value in paper was controlled by an administrative body. Trade using the currency was enforced by order of the khans on the penalty of death. Problems arose, however, when perceptions of weakness in the Mongol rulers undermined confidence in the currency. Inflation usually followed. At one point inflation exceeded 1,000 percent, making the paper essentially worthless. The system was relatively short lived but was the first experiment with paper money in the premodern period.

Contemporary historians hold that the legendary destruction of cities in Iran and Iraq had a broader strategic purpose, arguing that the Mongols attempted to redirect commerce along routes that could accommodate large movements of military units, thereby safeguarding those routes. Beyond the razing and depopulation of cities, the Mongols also destroyed irrigation systems, thus preventing future agriculture and permitting the land to revert to grazing pastures. Such pastures were arguably needed for feeding horses and providing a path to retreat into inner Asia when necessary. Whatever the ultimate assessment of the Mongol invasion of the Muslim world, it may be said that the scope of their building and contributions to conquered lands was at least as significant as their initial destruction.

### **ECONOMIC CONDITIONS AT THE END OF THE MEDIEVAL ERA (CA. 1400–CA. 1500)**

On the eve of the modern era in the 15th century Anatolia was largely in Muslim hands. By 1453 Constantinople had fallen and with it the millennium-long Byzantine Empire. Muslim expansion continued into Bulgaria and the Balkans, arousing great consternation on the part of European powers. Fresh winds were blowing, however, and the European world was awakening to a new age of progress that relied on technology, maritime trade, the gradual emergence of civil authority over religious dictates, and innovative forms of association predicated on common interests as opposed to kinship and tribal loyalties. Thus a novel set of dynamics created the preconditions from which economic progress ensued.

The Muslim Ottoman Empire retained its nomadic heritage, tribal affiliation, and agricultural base. It derived most of its revenues from land and agricultural taxes and thus did not invest in maritime power or exploration. Continued dominance over the civil societies prevented new ideas and technology from the non-Muslim West to be introduced and assimilated into Muslim lands. As a result, the Muslim world gradually fell behind in technological and economic development.

*The Americas*

~ Report by Juan Polo de Ondegardo,  
excerpt (ca. 1550) ~

**OF THE LINEAGE OF THE YNCAS AND HOW THEY EXTENDED THEIR CONQUESTS**

A knowledge of the *huacas* and places of worship is very important for the work of conversion. I have a knowledge of them in more than a hundred villages; and when the Lord Bishop of Charcas doubted whether the custom was so universal, at a time when we were in a joint commission by order of his Majesty, I showed him the truth of it in Cuzco. And although the discovery of these things has taken time, yet it has been necessary as regards the question of tribute and contributions. For a very large portion of the harvests was set apart for this service, and stored in places prepared for the purpose. Part was expended on the sacrifices of the villages, and a larger share was taken to Cuzco from all parts. The portions thus set apart were from a third to a fourth, varying in different districts. In many villages all belonged to the Sun, such as in Arapa and others. In these the greater part was devoted to sacrifices, in others (belonging to the Ynca) not so much.

Another share of the produce was reserved for the Ynca. This was stored in the granaries or sent to Cuzco, according to the necessities of the Government. For it was not always disposed of in the same way. The Ynca supplied with food all his garrisons, his servants, his relations, and the chiefs who attended upon him, out of this share of the tribute, which was brought to Cuzco from all parts of the country. In time of war

the provisions from some parts were sent to others, in addition to the ordinary consumption, and there was such order in these arrangements that no mistake ever occurred. Sometimes the stores were sent from the magazines in the mountains to the coast, at others from the coast to the interior, according to the exigencies of each case, and this was done with never-failing speed and exactness. When there was no demand the stores remained in the magazines, and occasionally there was an accumulation sufficient for ten years.

There can be no doubt that this share of the Ynca was well managed. I visited many of the store-houses in different parts, and they were, without comparison, larger and better than those set apart for the service of religion.

The lands set apart for the tribute of the Ynca and of religion were sown and reaped in the same order; but it must be understood that when the people worked upon them, they ate and drank at the cost of the Ynca and of the Sun. This work was not performed by gangs, nor were the men told off for it, but all the inhabitants went forth except the aged and infirm, dressed in their best clothes, and singing songs appropriate for the occasion. In these two kinds of tribute there were two things that seem worthy of note. One is that the aged, infirm, and widows did not join in it. The other is that although the crops and other produce of these lands were devoted to the tribute, the land itself belonged to

(continued)

*(continues)*

the people themselves. Hence a thing will be apparent which has not hitherto been properly understood. When any one wants land, it is considered sufficient if it can be shown that it belonged to the Ynca or to the Sun. But in this the Indians are treated with great injustice. For in those days they paid the tribute, and the land was theirs; but now, if it is found convenient to tax them in some other way, it is clear that they will pay double tribute—in one way by being deprived of their land, and in another by having to pay the tax in the form that may be now fixed. If any one, as is often done, sets up a claim by saying the Ynca had power to appropriate the land, the injustice and wrong is all the greater; because if such was the right, his Majesty succeeds to it; and, as regards *encomiendas* for a life or lives, it is clear that it is not the intention to grant them, nor is it just as regards the estate of the Ynca. Such tribute or tax was levied by the Ynca as King and Lord, and not as a private person. Hence arose a notable mistake. It was declared that all the farms of coca belonged to the Ynca, which was true, and therefore they appertain to his Majesty. He could grant them in *encomienda*, and resume them at the end of the term, if he so pleased, as is the case with the *alcabalas* of Valladolid. The Fiscal exerted himself to prove that the farms belonged to the Ynca, and that the *encomienda* only extended to the Indians, and this

was through not comprehending the nature of the tribute that was given to the Ynca. In effect, the Ynca took the produce of all the coca farms throughout the Andes for his own use, except a few small patches granted to chiefs and *camayus*. All the rest was taken to Cuzco, but there was not then so much as there is now, nor one fiftieth part; for in this too the reports were deceptive, as I have more particularly shown in my report on the coca.

The Ynca did the same with all the males in the flocks, which were appropriated for the service of himself and of religion, being left, however, in the same district where they were bred, and merely counted. No female was included in the tribute. The pastures and hunting-grounds were demarcated, that the flocks might not be passed from one province to another; but that each might have its assigned limits. This rule has also given rise to pretensions on the part of some, to the flocks, on the ground that they belonged to the Sun or the Ynca; and, before order was established, a great quantity was seized on this pretext. It is very certain that if his Majesty took the tribute of the flocks, he would not wish that it should be given out of what the Indians held as their own, and enjoyed as such; but only from that which belonged to him, from having been given by them to the Ynca and to religion.

Europe

~ Documents Concerning Guilds (12th–13th centuries) ~

**THE LAW OF THE FULLERS AND WEAVERS OF WINCHESTER (ENGLAND, 1209)**

Be it known that no weaver or fuller may dry or dye cloth nor go outside the city to sell it. They may sell their cloth to no foreigner, but only to merchants of the city. And if it happens that, in order to enrich himself, one of the weavers or fullers wishes to go outside the city to sell his merchandise, he may be very sure that the honest men of the city will take all

his cloth and bring it back to the city, and that he will forfeit it in the presence of the aldermen and honest men of the city. And if any weaver or fuller sell his cloth to a foreigner, the foreigner shall lose his cloth, and the other shall remain at the mercy of the city for as much as he has. Neither the weaver nor the fuller may buy anything except for his trade but by making an agreement with the mayor. No free man can be accused by a weaver or a fuller, nor can a weaver or a fuller bear testimony against a free man. If any of

them become rich, and wish to give up his trade, he may forswear it and turn his tools out of the house, and then do as much for the city as he is able in his freedom.

**GRANT OF A GUILD TO THE CARPENTERS,  
COMMUNE OF RICHIRZEGCHEIDE  
(GERMANY, 1180)**

Be it known . . . that in those times in which Theoderic in Mulingazzin and Henry Flaco were mayors of the citizens, they, with the advice and common consent of the officials of Richirzegcheide, agreed for the honor of St. John the Evangelist, for the sake of usefulness, to concede a fraternity to the carpenters who were petitioning them. And this was approved in the City Hall in the presence of the officials of Richirzegcheide. They shall have this fraternity by this law; that every carpenter, that is dreslere, wishing to join the said fraternity will give twelve solidi for the fraternity. And it was decreed that every apprentice, who is commonly called leirtint, should pay four solidi on his entry. But others who are not of the craft of these brethren, and who wish to have the said fraternity, will give twenty-four denarii for the same fraternity. Also they ought to enjoy this law, that, whatever man or woman of the fraternity should depart this life, there will be given for his obsequies at death four pounds of wax; and, for his vigil, six men, who will watch diligently, are appointed; and, to his burial the men and women who are of the fraternity shall all be compelled to come. He who neglects to watch when he is ordered will give two denarii for satisfaction. Whoever is unwilling to be present at the funeral of a brother or sister, as has been said, will pay just as much.

Also it has been decreed that whatever guest or citizen sells the timber or other merchandise of the brethren to another, and does not pay for it on the next day at the latest, if the seller makes a complaint about it, whatever brother remains a debtor in such a way shall give ten denarii to the brethren for satisfaction. Also it has been decreed that if any of the said brethren who are said to be carpenters shall give their work to a guest or citizen, or shall promise him work, and then delay more than two weeks, if it be a citizen or guest who is impeded in this way, and if he complain about it, then the brother who hindered him by delay

shall pay ten denarii for satisfaction to the brethren. Witnesses, etc.

**CHARTER OF PRIVILEGES TO THE BUTCHERS OF  
PARIS (FRANCE, 1182)**

In the name of the Holy and Indivisible Trinity. Amen. Philip, by the grace of God, King of the Franks. Be it known to all present and future generations that the butchers of Paris came to our presence asking that we would grant and permit them to hold in peace their ancient customs, just as our father and grandfather, Louis of good memory, and other predecessors of ours—the Kings of France—had granted them. On the advice of those who attended us we heard their petition, but, since those customs granted by our father were not in a written charter, we have ordered them to be put into writing, and to be confirmed with our seal. These are the customs:

1. The butchers of Paris can buy living and dead cattle, and whatever pertains to their trade, freely without custom and without giving any pedagium within the area of Paris, whencesoever they come, or whithersoever they are taken, if by chance it should happen that they are being taken anywhere. Fish of the sea, and fish from fresh water, they may likewise buy and sell.
2. No one can be a Paris butcher, nor shall other butchers have their rights, namely, food and drink, unless they wish to concede them of their own will.
3. On the Octave of Christmas every butcher will give us annually twelve denarii; on the Octaves of Easter and of St. Denis, thirteen denarii to him who holds it in fief from us.
4. Every butcher shall owe an obole for stallage to our reeve for every Sunday on which he cuts pork or beef, and every butcher owes every year to us, at the vintage, one hautban of wine.

And in order that all these things may remain secure for ever, we have strengthened this charter by the addition of our seal and signature. Done at Paris in the year of the Incarnation of the Lord, 1182, in the fourth year of our reign. Witnesses, etc.

## ► education

### INTRODUCTION

In the ancient world formal education was restricted to the wealthy or some others who showed great ability at a young age. Schools existed in the Roman Empire, in China, and elsewhere, but generally they were run by individuals as private ventures. As a result they flourished with the skills and reputation of an individual teacher. Many operated from temples or from areas close to temples, with wealthier people able to afford private tutors for their children—the tutors in some of these societies often being educated slaves.

During the medieval period there was a gradual movement toward the establishment of schools—institutions that employed teachers, providing a greater sense of continuity. A number of famous European schools date from the Middle Ages, and frequently sons attended the same schools as their fathers had. Schools arose with the emergence of the urban middle class and the growth of cities around the world. The majority of these early schools, as in the ancient world, also tended to be established as offshoots of places of worship—the monasteries of Christian Europe, the mosques of the Islamic world, and the temples of Asia and Mexico. Monks, nuns, and other clerics and the like served as teachers. These schools predominantly were for the education of boys. Pupils were taught the rudiments of reading and writing, with many

spending a year or a couple of years at these institutions. In medieval China during the Sung Dynasty (960–1279) schools were established in Hangchow for sons of senior officials, and similar institutions existed in other Chinese cities. The introduction of the hangul script in Korea revolutionized formal education in that country.

With only the wealthy able to afford a formal education, most children’s education continued to be undertaken at home. As a result, parents—most often the mother—taught children many aspects of everyday life. Girls learned the preparation of food, cooking, sewing, and other homemaking skills. They also learned about hygiene and the provision of basic medical care. Most sons tended to follow their father’s occupation, helping their fathers and thereby gaining skills. This was especially true in the agricultural sectors of the economy. In the urban societies of Europe many boys intending to find work as artisans or craftsmen were sent to work for other people as apprentices, where they learned the trade before returning to help their fathers. This system of apprenticeship tended to be formalized in Europe, as also in the Islamic world and in China, Japan, and Korea.

In sub-Saharan Africa, Pacific island communities, and Australia, it appears that the education of children was often placed in the hands of village elders. Older men and women, respectively, would teach boys and girls life skills such as hunting and the lore of their cultures. This was a formalized process and often led to an initiation ceremony when the adolescents were deemed to have become adults. In many Aboriginal societies as well as some African ones circumcision was used to mark this transition. Communities of the Americas likewise passed along specialized knowledge and skills through oral traditions and apprenticeship forms of training. In Mesoamerica learning sometimes took place in workshops and schools that taught the trades.

Another of the major changes in the system of education in medieval times was the establishment of universities. Although academies existed in the ancient world in the Greek and Roman spheres of influence and also in India, the modern university, where there were substantial numbers of paid staff, started with the founding of the University of Constantinople in 849. Gradually other universities were established—in Fez (modern-day Morocco) in 859; Cairo, Egypt, in 970; Parma, Italy, in 1064; Bologna, Italy, in 1088; Paris, France, in 1150; and Oxford, England, in 1167. A total of 55 universities trace their origins to institutions established before 1500, all either in Europe or in the Islamic World (with the exception of Sungkyunkwan University in Seoul, Korea). Even though they were not formal universities, similar institutions existed in India, China, and Japan.

## AFRICA

BY CHARLES B. HUTCHISON

The term *education* is indeed one of the most slippery in the English language. It is important to make a distinction between what may be considered Western or modern education and older educational traditions. In ancient as well as current traditional Africa there has been a delicate balance between education, teaching, and learning. It is useful to understand that learning occurs when a stimulus and a response leads to a permanent change in behavior. For this reason, learning is natural and inherent in human nature from birth to death. Africans throughout history have recognized this fact. For this reason, traditional Africans have had a lively awareness of the educational process and have always valued both formal and informal education since ancient times.

In talking about education in medieval Africa, it is crucial to understand that Africa was not carved out into tiny powerless countries like the present-day nations on a map of the continent. Africa included the main continent and parts of the current Middle East—which was considered northern Africa. This history of the geographical term helps to explain why there are dark-skinned, woolly-haired persons of African descent living in places like Yemen and nearby regions in the early 2000s. Africans lived in these parts of the Middle East before the invasion of the Arabs in the seventh century and later European colonization. When the Arabs and later the Greeks and Europeans arrived on the African continent, they marveled at the advanced African educational systems and civilizations, which were already several thousand years old. Africans lived in such large kingdoms as Ethiopia, Egypt, Songhai, Mali, Ghana, and Zimbabwe. Thousands of years before the medieval period Africans had already traveled across the globe, and their educational influence extended literally throughout the world. They significantly influenced later civilizations, such as the Aztec, the Inca, and the Greek, and ruled parts of southern Europe like Spain, building and leaving behind significant, African-based artifacts in all these places. For these reasons, many historians would argue that the discussion of medieval education or civilizations across the globe is incomplete without mentioning the influence of medieval Africans.

Education had three primary functions in medieval Africa. First, it was a means of learning how to live in the society. The traditions and customs of the society of any society can be complex. The function of the immediate community was therefore to educate their youth regarding acceptable societal norms and conventions. Second, education was a mechanism for refining and transmitting working knowledge and historical information. The proverbial gatherings

and discussions under the baobab tree was just one means of passing on this information. Families participated in this endeavor by teaching their kinsmen and kinswomen family trades and traditions. Another means of handing on the traditions took place in royal courts, where the members of the king's councils would discuss policies for later communication to the subjects.

The third notable function of education in medieval Africa was its use not only for the sake of survival but also for entertainment and in intellectual pursuits. For example, what may be termed ancient African martial arts or war dances—which later became the popular Brazilian martial art *Capoeira*—wrestling, and several other physical art forms were taught in traditional schools for public entertainment during festivals. Formal learning for pure intellectual satisfaction also was advanced throughout Africa. Medicine and astronomy were widely taught subjects, and the knowledge of such secret arts and sciences as metallurgy was disseminated among certain groups and passed down through family lineages. Although more people study the African rulers of Egypt who invented hieroglyphs, it is noteworthy that literacy was common in such other parts of medieval Africa as the regions of present-day Mali and Ethiopia. (Note that in earlier times the term *Ethiopia* referred to all of Africa outside Egypt.)

Historians indicate that the oldest-known form of formal education may have begun in ancient Ethiopia and later was transferred to Egypt. Ethiopians were the rulers of Egypt over the course of several Pharaonic dynasties. This fact is not surprising, since Ethiopian educational practices are probably the longest unbroken tradition of education in the world. Medieval Ethiopia had its own form of ancient writing and manuscript preservation. As is still true in many parts of Africa, there were specific groups of people who went through formal learning processes to become priests or to hold other important offices.

Formal education in medieval Africa also was illustrated brilliantly during the reign of Mansa Kankan Musa (1312–37). At this time the famous University of Sankoré in Timbuktu was at its height, and people from all over the region, including Arabs from the Middle East, came to Africa to learn from the African professors at learning centers called *madrassas*. Historians note that the University of Sankoré had formal professors grouped according to rigorous academic hierarchies. These professors were at the top of the academic world of their times, and it was very difficult for foreign teachers to gain admission to their ranks, owing to the extreme strictness of the admission qualifications. Education was deemed too important to neglect even in the most trying and challenging times. For this reason, these learning centers and

their ancient manuscripts have been protected by the African people through the years. The University of Sankoré and a few other learning centers in the region are still in operation to varying degrees.

In medieval Africa formal education began at birth. This traditional schooling continued in combination with informal education until death. Even after death the dead still have many things to learn and duties to perform—for both the dead and the living. For this reason, Africans, both ancient and contemporary, have traditional ceremonies that are performed for the dead as a part of their ritualized educational process. For example, many West Africans have extremely elaborate funeral and mourning programs that take several days. The dead are buried after “conversations” with the living, whereby they are “spoken to.” Before burial they are given money, dresses, jewelry, and other valuable objects to help them pay their way across the waters. Once they arrive at the new land, they are expected to learn new and higher things to teach the living. This custom explains in part why the memory of the dead was and still is honored in traditional Africa. These traditions are so old and widespread across the continent that one can see strong similarities between the burial rites and artifacts of the pharaohs of ancient Egypt, as illustrated by their hieroglyphic texts, and those of many other African kings and nobility.

As with any cultural knowledge, the seriousness with which education takes place in Africa is understood only when one has lived in the culture. It is possible to shed light on how traditions and customs were and still are actively used by Africans to educate their youth. The Akans of Ghana migrated from regions of Sudan (ancient Nubia). With the advent of Islamic incursions, they moved southward and spread across parts of western Africa, bringing their cultural practices with them. Although they are scattered in several modern-day African states, they still maintain many of their ancient and medieval practices.

One of these practices is the *dzin to*, or “naming ceremony.” Among the Akans of western Africa, like the Fantis of Ghana, when a baby is born, the infant is not exposed to the public and is not given a name until the eighth day of life. On the eighth day the family has a naming ceremony, in which a family elder takes two containers, with water in one and alcohol in the other, and pronounces the following words: “Nana Kosa (or another name), *Ese nsu a nsu a, nsa a nsa a,*” meaning, “Nana Kosa, if you say this is water, it is water. On the other hand, if you say it is alcohol, then it is so.”

This ceremony has two purposes. First, it is meant to teach the infant. The Akans believe that the child has a fully developed soul and is capable of learning early in life. Second, this formal ceremony is performed in the midst of all family

members and invited guests from the community. Here the elder, as a powerful custodian of community knowledge, is pronouncing wisdom for the education of all the hearers. He is acting as a traditional teacher in a formal manner. Adults are reminded of community virtues through such ceremonies, and the young are taught how to act virtuously.

In medieval Africa the school curriculum was defined in part within the family unit. This was so because the families (and oftentimes the tribes to which they belonged) had their trade specialties. For example, some were professional musicians who learned the “language of the drum” and thus could play the “talking drums.” Others were metalworkers like blacksmiths and goldsmiths. In a functional African society there were many such family-based professionals. In terms of education these trades had their own secrets, and such secrets were held within the families. It was through a guarded apprenticeship process that such trade secrets were passed down—but only within families. Oftentimes, there were traditions or rituals that prohibited the sharing of these trade secrets.

One of the most widespread forms of informal basic education in medieval Africa involved the telling of stories. Many of these stories were crafted in such a way to teach moral values. These stories are now popularized around the world, like the stories concerning Ananse the Spider and Brer Rabbit (western Africa) and Fudukazi the Tortoise (southern Africa). These tales, passed down from medieval times, are still instructive today and have become a part of the educational tradition in many countries around the world. Across the continent, however, these stories all had similar themes, with the fundamental objective of teaching the next generation about moral standards. Stories were therefore a powerful means of moral and ethical education in medieval Africa.

Another important technique of education in medieval Africa was the use of proverbs and symbols. Proverbs are short, wise sayings that are intentionally phrased to stimulate moral thinking, for example, “Your left hand washes the right, as the right washes the left.” This proverb indicates that people need to learn to cooperate with each other in order for all to prosper. Many African proverbs were also motivational and promoted good decision making for the betterment of the larger society. Some African groups also had and still use specific visual symbols that stand for concepts or important ideas. The Akans of Ghana have the Adinkra symbols, similar to (but not necessarily the same in meaning as) those of the ancient Africans of Pharaonic Egypt. Adinkra symbols are drawings or carvings that help people remember important information. The *Gye Nyame* symbol, for instance, stands for the fact that only God can determine one’s fate in life. Therefore, people should not allow anyone to negatively influence their potential in life.

Medieval Africans, like their ancestors in the Zimbabwean civilizations of southern Africa, the Egyptians and Ethiopians of northeastern Africa, and the many empires like those of Songhai, Ghana, and Mali, have always cherished good education. The high value placed on education is evident both in their traditions and in ancient historical records and artifacts.

## THE AMERICAS

BY ANGELA HERREN

Archaeological and historical records provide little information on formal education systems in the Americas before the 16th century. However, evidence suggests that communities passed along specialized knowledge through oral traditions, ritual practices, and systems of training and apprenticeship. Lacking a formal alphabetic writing system, early American cultures recorded complex knowledge for future generations in various forms. In all these cultures the adults trained children to perform everyday tasks. Cooking, cleaning, weaving, child rearing, hunting, fishing, agricultural production, construction, art making, and other basic community labors often were divided according to gender. In more stratified societies the opportunity to learn specialized knowledge was sometimes limited by ability, social standing, and political considerations.

Native North Americans recorded meaning in frescoes, symbolic architecture, monuments, petroglyphs, and iconographic motifs on ceramic, stone, shell, and metal objects. Information about astronomy, the spiritual world, life, and death complemented knowledge obtained through ritual practices and oral traditions.

The art of the Mississippian phase of the Woodlands cultures (ca. 750–ca. 1500), mostly recovered from burial sites, indicates that community members learned and performed tasks like killing game, gardening, cooking, and engaging in ceremonial activities that celebrated the dead. Select individuals learned specialized social roles. Carved circular plates worn at the chest depict ritual decapitation and may illustrate aspects of the warrior's life. High-status burial sites contained the remains of priests or chiefs adorned with headdresses and ritual clothing. The predominance of representations of powerful animals and birds like the falcon, rattlesnake, and deer suggests that Woodlands people imparted to their children an intimate knowledge of and spiritual association with local fauna.

The Hohokam and Mogollon (ca. 500–ca. 1400), two cultures that flourished in the southwestern part of the present-day United States, also developed a sophisticated knowledge of local flora and fauna. Adults taught their children

important sustenance activities such as hunting, fishing, and gathering and important ritual activities like playing musical instruments and dancing. In the same geographic region the Anasazi developed large centralized communities (ca. 900–ca. 1300) at sites such as those found in Mesa Verde in Colorado and Pottery Mound in New Mexico. Extensive multifamily dwellings built from adobe brick contained living and storage spaces, platforms, and circular subterranean rooms called kivas. Women probably worked on the open platforms, teaching their daughters cooking, ceramic painting, and other skills. Like later Pueblo peoples, Anasazi men may have initiated their sons into manhood by teaching them important ritual knowledge in the ceremonial spaces of kivas decorated with frescoes showing human, animal, and supernatural figures engaged in activities related to fertility and mortuary rites. According to Pueblo descendants of the Anasazi, the small hole in the floor of the kiva signified the *sipapu*, the place where man first emerged from the earth.

Soapstone bowl of a kind associated with girls' initiation rites, Strait of Georgia culture, British Columbia, ca. 1–900 (© The Trustees of the British Museum)

Inhabitants of Mesoamerica educated their youth and community in the home, in workshop environments, and in specialized schools. The pictographic writing system that Mesoamericans developed in the first millennium B.C.E. proved to be one of the most influential complements to the educational system. Before the arrival of the Spaniards in the 16th century indigenous inhabitants used images to record information on sculpture, architecture, portable arts, and painted manuscripts.

Material culture remains from Classic Period locations like Teotihuacán (ca. 1–ca. 700), Monte Albán (ca. 400–900), and the Mayan region (ca. 250–900) provide insights into medieval learning processes. At some sites archaeological remains show *barrios*, or neighborhoods, where practitioners of a certain trade gathered, perhaps sharing knowledge, materials, tools, and equipment like pottery kilns. Some excavated objects betray the work of apprentices or less-skilled artists training in a particular technique. For example, many Mayan ceramic vases display “pseudoglyphs” that mimic the form of Mayan pictographic writing without conveying meaning; they may demonstrate the work of an “illiterate” painter-scribe imitating an experienced artist.

Sixteenth-century accounts of the Aztec peoples, a group that rose to power in central Mexico in the 14th century, indicate an advanced and formalized system of education. From a very early age children learned to perform gender-specific tasks at home. Girls learned to cook, clean, and weave textiles. Boys began to learn about warfare and might begin training in the trades of their fathers. Sometime before the age of 15, boys and girls attended the school to which they had been dedicated at birth. Children of lords and nobles primarily attended the *calmecac*, a school associated with a temple. Commoners typically attended the *tehpochcalli*, a school with military emphasis, although especially gifted commoners were allowed to attend the *calmecac*. Both schools taught children song and dance. *Calmecac* students studied more extensively from painted manuscripts and eventually could become priests or wise men if they continued their education.

Painted manuscripts were an integral part of the intellectual environment in the pre-Hispanic Mesoamerican world. In a small, portable format that simplified their storage and transport, the manuscripts recorded calendars, religious and ritual data, economic information, genealogies, maps, songs, poems, and history. The writing system’s pictorial nature and uniformity in representation enabled painter-scribes to convey information in a consistent and legible manner that was accessible to groups speaking various languages.

Interpreting the educational systems of the Caribbean region is particularly challenging because Spanish colonization resulted in the annihilation of most indigenous populations

by 1510. Nevertheless, material remains and 16th-century Spanish documents suggest that advanced cultures like the Taíno of the Greater Antilles shared ritual and social beliefs with their communities through the construction and use of civic structures like ball courts and plazas, religious wood and stone carving, and ceramic production. The Taínos produced many objects related to deity worship, such as three-cornered stones; *zemis* (deities rendered in human and animal form); and collars of stone, bone, and wood that represented the costume worn in ceremonial ball games. They shared their history, religion, and cultural beliefs through dance, music, and oral tradition.

From about 700 until the Spanish invasion in the 16th century, indigenous inhabitants of the regions of present-day Costa Rica, Panama, and Columbia developed sophisticated social, political, and religious systems and produced stone statuary, lapidary work, ceramics, and gold work that reflected their values and beliefs. The gold necklaces and pendants of this region, for example, are products of skilled individuals who learned to mine ore; artisans who learned techniques like mold making, burnishing, and repoussé; and priests who taught the spiritual qualities of the animals and birds reproduced in metal. The gold work also reflects the role of elites, who controlled the power and wealth in the society and wore such items, and of long-distance traders, who moved the goods from one place to another. Although archaeological evidence does not suggest the presence of schools or formalized education, Central American societies clearly relied on priests to impart spiritual knowledge and accomplished individuals to teach the skills of their trades to younger protégés.

In South America the material and archaeological remains of early Andean cultures reveal the importance of cosmology as a guiding force in the acquisition of knowledge. For instance, the city center at Tiwanaku (ca. 100–ca. 1000) symbolically references Andean origins on an island in Lake Titicaca, and Machu Picchu is a 16th-century Incan royal retreat where monuments and structures embrace and highlight relationships to the sacred landscape. On a smaller scale portable works often depict shamans, spirit figures, and abstract conceptions of the universe in a variety of media. Throughout Andean history various cultures used textiles to record and share historical, religious, and social information. Women learned their culture’s many weaving and embroidery techniques from their mothers or in weaving workshops.

By the 16th century the Inca provided limited formal education to select members of the population. Boys from elite families attended a four-year school in the capital city of Cuzco to learn oratory, warfare, the Inca religion and history, and *quipu* use from wise men. The Incan *quipu*, an ingeniously simple and highly portable device made from knotted

strings, allowed the user to perform complex accounting and possibly to record historical and phonetic information as well. While most girls learned weaving and other skills from their mothers, “chosen women” attended a special school in the provinces of the Inca Empire. Between the ages of 10 and 14 the chosen women studied the arts of spinning, weaving, cooking, brewing corn beer, and other domestic activities. Renowned for their great beauty, they were selected from conquered provinces of the Inca Empire and from the children of nobles in Cuzco. While some of the most beautiful women were destined for sacrificial offering, most became temple priestesses, teachers, or secondary wives to the Inca king.

## ASIA AND THE PACIFIC

BY KIRK H. BEETZ

When the Han Dynasty ended in 220 C.E., China went through hundreds of years of civil wars. Schools and education often suffered from neglect or outright destruction, although some governments tried to keep the tradition of state-run schools alive. The founding of the Tang Dynasty (618–907) brought a resurgence of state-funded education. The need for graduated students able to serve in the government probably made itself apparent early in the emperor Gaozu’s reign (618–26). In 618 he founded three colleges in Ch’angan (modern-day Xi’an), and in 624 he ordered that schools be founded in every prefecture in China. In 629 the emperor Taizong (r. 626–49) founded medical schools in the capitals of the prefectures. These public schools were often underfunded, and late in the 600s many fell into disuse. In 738 the emperor Xuanzong (r. 712–56) commanded that China’s prefectures build schools in all of their villages, creating 19,000 schools. He also insisted that the prefectures hire qualified teachers for each school.

With the passing of the Tang Dynasty and debilitating wars China’s schools again fell on hard times, but in 1044 the Song Dynasty (960–1279) created schools in each prefecture. These were supplemented by 124 private schools, and many small communities established their own schools and hired their own teachers. The Yuan Dynasty (1279–1368), of northern China, created a school system that probably was administered by former Song government officials. Although the Ming Dynasty (1368–1644) encouraged education at the village level, only 1,200 such schools had been established by the year 1400. Private schools, which were often paid for by the parents of students, helped produce the educational officials needed by the government.

During the medieval era two sorts of schools existed in China: secular and religious. Secular schools frequently were government run and focused on preparing boys for the examinations given by the national government, usually only once

a year. The examinations tested not only how well students had memorized the Confucian classics but also how well they understood them by having those taking the examinations write essays applying Confucian theory to current events. Passing the examinations usually guaranteed a student a government job and a chance to advance up the social ladder. A student could take the examinations an unlimited number of times.

Religious schools were run by Buddhists or Daoists and were usually funded by monasteries. These schools sometimes required their students to commit to becoming monks or priests. Students were expected to memorize important religious texts and prayers and to write essays expressing their views about what they learned. Some Buddhist and Daoist schools were significant centers of learning, attracting students from far away who would live in rooms near the schools.

A boy could enter a school at almost any age. His treatment in school depended less on his social rank than on his age, with older students given more privileges than younger ones. The learning of Chinese pictographs began as early as possible, as an educated person was expected to know about 50,000 of them. Arithmetic also was considered essential for any educated person, and by about age 13 one was expected to apply arithmetic to realistic problems, often involving aspects of accounting. A boy who misbehaved could be expelled. Offenses could be punished by whippings. Students sat in school courtyards and listened to their teachers, and teachers were expected to have their whips visibly nearby. Girls rarely attended schools. For most girls, their best hope for a good education was to have been born into a rich family that would pay a tutor to instruct them.

In Korea the official written language was Chinese, and boys were taught the way Chinese boys were taught, with many villages having small schools. Attending school was considered less than respectable for girls, and during most of the medieval era they were not allowed to be educated. By the 1400s education in Korea had fallen on hard times. Few could read or write because written Chinese often could not accurately reflect actual Korean speech. Only the wealthy could afford to spend the years required to learn to use Chinese pictographs to convey Korean words and ideas.

Sejong Jangheon Yeongmun Yemu Inseong Myeonghyo the Great, the king of Korea from 1418 to 1450, bore much influence on the nation’s educational system. Sejong was an extraordinary scholar who excelled in phonetics, music, poetry, the sciences, and swordsmanship. He was also a devout Buddhist during an era when Buddhists were regarded with great suspicion by the bureaucrats of the Korean government. Although Sejong was king, the traditions of the day demanded

that he gain the consent of his aristocratic advisers with respect to major decisions, and they often resisted his reforms.

In 1420 Sejong created the Hall of Worthies, an institution of scholars who were to pursue research for national interests. At his command, they wrote 20 major books on history, agriculture, medicine, and government. He allowed promising young scholars to take reading vacations, or paid periods of study. Perhaps Sejong's greatest ambition was to bring literacy to even the lowest ranking of his subjects. In 1443 he told the Hall of Worthies to create a new written language designed to reflect and express the everyday speech of Koreans. Sejong himself directed the research and participated in the creation of the letters of the new alphabet. In 1446 he made the new written language, hangul, the written language of Korea and ordered that it be taught to everyone, women and men alike. The script was simple enough that it could be learned in several days.

The government bureaucrats who had devoted decades of their lives to learning to write with Chinese pictographs resisted the institution of hangul, even trying to have the script banned after Sejong's death, but its use spread among the common people. Hangul proved a boon to women, who had previously been denied schooling, with even aristocratic women becoming literate. Many books were published in the new script, making learning available to all Koreans, and many of Sejong's later scholarly projects were intended to make hangul more useful to his subjects. For instance, he commissioned an agricultural handbook that Korean farmers could use in the course of their daily work.

In terms of functionality, Korean schools were often paid for by the parents of students. Teachers were treated as exalted figures, and students had to be respectful to their teachers—even to bad or cruel teachers—at all times. Like Chinese students, Korean ones had to memorize Confucian texts and learn arithmetic and science. Their education was directed toward annual examinations that, if passed, would qualify them for government jobs; as in China, this was perceived as a great opportunity for a boy to improve his life. Decorum was very important in Korean schools, and violations of decorum resulted in punishment. The number of punishable violations was vast. For instance, if a student walking on a road saw his teacher coming toward him, he was to stand on the left side of the road and bow to his teacher as his teacher passed; any variation in this, such as hiding from sight, was punishable. In general, the Koreans used physical punishment only as a last resort. Instead, misbehaving students were publicly humiliated in various ways. For the worst offenses, students were expelled, and people in their villages would scorn them. Having their names and offenses posted for other students to see was a more common punishment.

In about 600 Japan's emperor sent students to China to study in Chinese colleges. Often staying in China more than 20 years, these students returned to Japan and became advisers to the emperor. Japanese schools at first were modeled on those of China, with secular and Buddhist schools emphasizing memorization, mathematics, and the ability of students to write about what they learned. The first teachers were usually from Korea and China, with the first state-run college in 647 being directed by a Korean, but in time Japan began producing its own teachers. Among the earliest Japanese teachers were aristocrats fallen on hard times, samurai without lords, scholars who had not received government jobs, and people who chose teaching as their profession.

The colleges of Japan were reserved almost exclusively for aristocrats, although commoners were sometimes admitted. Entry into college almost automatically guaranteed a job in government later on; only the most dull-witted of aristocratic children did not pass school and their examinations. Japanese towns and villages built their own schools and hired their own teachers, and parents participated in school activities such as celebrations and the supplying of study materials. Students were usually taught indoors. In class, students could be divided into groups working on different projects. Classes were often coeducational, with girls learning what boys learned; a notable exception to this would be a military school in which military arts were taught, since such schools were private academies reserved for the sons of samurai, the warrior aristocracy.

In schools, boys and girls learned to read and write. At first, Chinese pictographs were learned, but the Japanese found that Chinese writing was often ill suited to their language and began using pictographs as sounds rather than as ideas. Students practiced writing with brush and ink on paper, covering both sides in ink and continuing to use the paper for as long as the wet ink could be discerned from the dried ink. Girls and boys alike had to learn mathematics because as adults they would need to be able to keep accounts of their family's goods, income, and expenditures.

Girls were rarely able to attend school in medieval India. A girl's best hope for an education was to have someone in her family teach her or to have wealthy parents who would hire a tutor for her. Otherwise, school was intended for boys. At age four or five a boy had to learn the alphabet. He had to attend a town or village school, where he would spend about three years learning reading and arithmetic. The student then had to attend a religious school, usually Hindu, Buddhist, or Jainist. In Hindu schools the student would have a special agreement with a teacher called a guru. The rites for this formal commitment called upon the student to promise to obey and honor his teacher and the teacher to promise to care for the

student. The student then moved to the school of the teacher, who could have many students of different ages. Schooling could be over by age 19 or continue for two or three decades, with the student attending one of several universities. A university was composed of several colleges, with a few hundred students in each college.

Students were expected to learn a broad range of subjects, including the essentials of language: grammar, phonetics, etymology (the linguistic history of a word), prosody (versification, or the cadence of a language), and literature. They were expected to learn mathematics, including algebra, and also learned astronomy and chemistry. Essential for students at religious schools was the learning of morality according to their faith. This was especially complex for Hindus, because each caste, or hereditary social class, had its own moral code that students were expected to follow.

The Indian alphabet of Sanskrit spread throughout Southeast Asia, excluding northern Vietnam, where students were expected to learn Chinese writing. Only the rich in Vietnam could afford to commit the time needed to learn enough Chinese pictographs to be literate in written Chinese. In the 1000s northern Vietnam introduced Confucian examinations, but the offering of these became irregular. In the 1400s the examinations were revived and became a part of Vietnam's educational system, which was modeled on that of the Chinese. Literacy was uncommon in most of medieval Southeast Asia except for on the islands of Indonesia, where the ability to write poetry was essential for both men and women in matters of courtship. Most education was religious, with Buddhist and Hindu schools present. Students were expected to become religious scholars.

A significant challenge in the historic study of educational practices in Oceania is that when people who could read and write came to the islands and to Australia, they almost immediately began teaching people in ways that were different from local customs. Thus, the very people who produced the first written records of how indigenous peoples taught their young people were themselves altering local educational methods, making their records somewhat dubious; modern scholars have had difficulty determining what practices were responses to the influence of newcomers.

By virtue of its size, Australia long retained some locales where the educational practices of outsiders did not intrude. A medieval Australian child was expected to learn the rules of kinship and was taught how to properly speak to different relatives. Formal education began with initiation rites. In some cultures, a boy who behaved properly toward others, could make a straight spear, and could hunt small game was given his initiation rites before boys who were rude or lazy. In other cases, the onset of pubic hair signaled the time

for initiation. For girls, menstruation was most often the signal for initiation rites to begin. During initiation both boys and girls were expected to learn songs and myths. Education could continue for many years, with youths passing through series of stages of learning the mysteries of their history and religion before becoming elders in their groups.

## EUROPE

BY AMY HACKNEY BLACKWELL

The vast majority of medieval Europeans had no formal education. Even among the wealthy, education was rare. Few people could read, and fewer could write. One reason for this was practical: Books were expensive and time-consuming to make, and good light was not readily available.

For most laypeople education consisted of learning skills by observation and practice. Women taught their daughters how to manage households and care for children, and girls learned these skills by helping their mothers. They would learn how to cook, clean, spin, weave, and make clothing. The daughters of the wealthy might learn more skills, both practical and decorative. They would learn to manage a household and treat illnesses, which were often the responsibility of noblewomen. They might also learn embroidery, music, and other arts designed to make them attractive and pleasant companions. Both boys and girls learned culture through experience. Little children listened to folktales told by their parents and grandparents, and older children might learn songs and poems by listening to minstrels perform. Local priests or monks might provide some sort of religious instruction.

Boys might help their fathers in the fields or with hunting. Tradesmen taught their trades to their sons, who were then expected to continue in those occupations. For example, a master mason would raise his son to be a mason as well, taking him to work and giving him jobs appropriate to his age and abilities. During the later medieval period some boys learned their trade through apprenticeships. A boy would live with the family of a tradesman somewhere between the ages of seven and 14. He would spend several years as an apprentice, working as a servant to his master while gradually learning the trade. His family might pay a fee to the master in return for the training. After a specified period of time, usually seven years, the apprentice would be declared a journeyman, a competent craftsman with all the necessary skills to practice his craft. Many boys stopped their education at this stage and spent their lives working as journeymen, but some continued to improve their skills until they could produce what was called a masterpiece, an example of their work that showed complete mastery of the craft. A journeyman

who made a masterpiece was considered a master and could thereafter open his own workshop and take on his own apprentices. Some girls learned trades through apprenticeship, particularly textile trades such as embroidery or female-dominated trades such as midwifery.

A son of a wealthy or noble family might spend his youth learning to be a knight. When he was about seven years old he would be sent to live with another noble family, who would train him in military arts and courtesy. Sending boys to other families was part of a long tradition of fostering, which served a dual purpose: It allowed boys to form alliances with their foster families, and it kept the boys' families from attacking the foster families. A boy often went to live with a family richer than his own or even at the king's court. When a young boy first arrived at his foster home, he became a page. He worked as a personal servant to the lords and ladies of the house and began his training for the knighthood. He learned noble skills such as riding horses, hunting with bow or falcons, proper behavior at court, and the use of a sword. When the boy turned 14, he might become a squire, serving as the personal assistant and shield bearer to a knight. The knight was expected to teach his squire the skills he would need in battle. After the young man had worked for seven years or so as a squire, his lord might finally make him a knight.

Formal education in reading, writing, and other academic subjects was available only through the church throughout most of medieval Europe. In many areas only priests and monks were literate. Boys who went into the priesthood or joined a monastic order often learned to read and write, though not all did, and illiterate clerics were not at all uncommon. Boys destined for the priesthood learned the fundamentals of Christian theology and how to conduct religious services. A boy who joined a monastery would become a novice, or trainee monk. He would learn the monastic lifestyle, including the words and songs to the several religious services he had to attend every day. He would learn the tasks expected of monks, which could include farm work, cooking, sheep husbandry, cheese making, or any other operation his monastery ran. Most novices received some instruction in Latin reading and writing. If a novice displayed a talent for writing, he would be taught how to copy books. If he was artistic, he might learn how to paint the pages of books with designs called illuminations. He might also learn how to make parchment or vellum from sheepskin or calfskin, how to manufacture ink and pigments, and how to bind books. The only way to create new books was to copy them by hand, so medieval monasteries performed an invaluable service in preserving and transmitting information. Ireland's monasteries of the early medieval period

*A hornbook, teaching and instructional aid for children, Britain, 15th century* (© Museum of London)

were especially renowned for producing literate monks who did excellent copying work.

Actual schools for lay students were rare in western Europe during the early medieval period. The few schools that existed were small cathedral schools run by priests and designed primarily to train boys for the priesthood. During the 12th and 13th centuries, however, schools became more common, especially in cities with large populations of merchants and professionals. Schools gradually moved away from cathedrals, became more open to lay students, and taught subjects beyond theology and canon law.

Medieval students studied a specific set of subjects. The seven so-called liberal arts were defined in late antiquity and persisted throughout the medieval period. They were divided into two parts, the trivium and the quadrivium. The trivium included grammar, rhetoric, and logic, or dialectic. Mastery of the trivium was considered necessary for progression to the quadrivium, which included arithmetic, geometry, astronomy, and music.

Grammar schools were designed to teach the trivium to boys. Wealthy families could send their sons to school for a fee. The grammar in question was Latin for most of the medieval period. Latin functioned as a sort of universal language within Europe, and merchants dealing internationally found it a useful common language. During the 15th century scholars began studying the grammar of vernaculars such as French and Spanish, but for the most part schools kept teaching exclusively in Latin.

Many wealthy families hired personal tutors for their children instead of sending them to school. Some of these tutors taught both sons and daughters, customizing lessons by sex and age. Some educational theorists recommended that families attempt to create an exclusively Latin environment to enhance their children's education. This required parents, tutors, and household servants to address the children solely in Latin, so in practice this ambition was not often realized.

The Byzantine Empire, or Western Roman Empire, maintained a system of formal education throughout the early medieval period. When the Western Roman Empire fell into decline, teachers migrated to Constantinople, which became the new center of learning. The Eastern Roman emperor Theodosius II (r. 408–50) founded a school similar to a university in Constantinople in 425. It was decreed an actual university in 849 and offered degrees in medicine, law, philosophy, and forestry in addition to the liberal arts. Education in the Byzantine world fell on hard times in the 13th century after Constantinople was captured by the crusaders in 1204, and the university disbanded in the 1300s.

Universities first appeared in western Europe during the 11th and 12th centuries. These early universities arose out of schools that had existed for many years or even centuries. What made them universities were their size (they were larger than cathedral schools) and their administration in a manner similar to that of craft guilds. This self-regulation allowed universities to teach a wider variety of subjects than schools that were restricted by particular cathedrals. Universities also were distinctive in that they granted degrees to their graduates. Both Paris and Bologna claim to be the sites of the first university. It is hard to pinpoint exactly when the educational institutions in each of these cities became universities in the modern sense, but both were well established by the early 1200s. They were quickly followed by a profusion of new universities all over Europe, including those of Oxford and Cambridge in England.

The first universities still emphasized the education of religious professionals. They taught canon law, theology, logic, and mathematics, all of which were useful to church administrators. They also began to teach more secular subjects, including medicine, astronomy, rhetoric, music, and

the other liberal arts. Different universities specialized in different fields; for example, the university in Paris specialized in Christian theology, and the university in Bologna was known for its teaching of law. By the end of the medieval period scholars had rediscovered the ancient Greek and Roman classics, and students were beginning to study the new philosophy of humanism. Students typically began university studies around the age of 14 or 15 and continued for about six years.

What education existed in medieval Europe was confined almost exclusively to men and boys. Grammar schools taught boys. Women were not admitted into medieval universities. University students were generally considered clerics, similar to priests, and women could not hold this status. For the most part, the only women who learned to read or write were the daughters of noble families who could afford private tutors. Girls who learned to read often studied different subjects than did their brothers. Certain subjects were considered inappropriate for women, so even the most educated women learned only a portion of the material available to men.

## THE ISLAMIC WORLD

BY SEBASTIAN GÜNTHER

Islamic education builds on two major principles: the idea of a lifelong pursuit of learning and the close correlation of knowledge and action for the welfare of the Muslim community. Although it primarily aims at the nurturing of religious belief in the individual, Islamic education incorporates numerous secular disciplines, both literary and scientific. Thus it aspires to develop individuals who are well grounded in the virtues of Islam and have obtained the solid general education needed to become valuable and fully integrated members of society. This inclusiveness of Islamic learning relates to primary and higher education. It is evident in the Koran, the holy scripture of Islam, and in the Hadith, the literature of Islamic prophetic traditions. It is also expressed in numerous proverbs, aphorisms, and wisdom sayings and in much of the poetry and prose of Middle Eastern literature. Scholarly discussion of educational theories and practices are offered in various genres of medieval Arabic writings, particularly in those devoted to educational philosophy and ethics, pedagogy, and didactics.

In pre-Islamic Arabia lyric poetry represented the summit of the artistic and intellectual attainment of the Arabs. Poetry was “the register of their learning and the final word of their wisdom,” according to the philologist Ibn Sallam al-Jumahi (d. ca. 845 in Baghdad). At the beginning of the seventh century Muhammad, a native of the city of Mecca, communicated the Word of God in the form of the Koran.

Shortly after the prophet Muhammad died in 632, the individual parts of the Koranic revelation were compiled from both oral and written sources, arranged in one text, and published by an authorized committee of learned Muslims. Thus the Koran became Islam's first book as well as its first holy book.

The Islamic religious tradition expressly prioritizes learning and education. Chapter 96 of the Koran, verses 1 through 5, traditionally considered to be the very first revelation to the prophet Muhammad, start with the divine command to “read” or “recite” words of the revelation. These lines emphasize that God taught humankind through the scriptures and that God is humankind's undisputed supreme teacher. The Koran also indicates that Muhammad was first ordered to listen to the revelation, recite the divine text himself, learn of its meanings by way of explanation, and eventually convey and teach God's message to others. This divinely inaugurated method of instruction—listening, learning and understanding, and teaching—had a significant impact on education and the transmission of knowledge in the medieval Muslim world. An imperative to seek knowledge and learning is also met in sayings attributed to the prophet Muhammad, such as “To acquire knowledge is an obligation on every Muslim, male or female” and “Seek knowledge, even if it is in China.”

By the 10th century the Muslim world extended from Spain to the borders of China. Multitudes of people adopted Islam as their religion. This situation stimulated Islamic learning on both the basic and higher levels, causing Arabic-Islamic civilization to become a “knowledge society.” In the ninth to the 13th centuries Baghdad, the capital of the Abbasid Caliphate, was the vibrant commercial, cultural, and intellectual metropolis of the Muslim world. It witnessed remarkable learning activities in the humanities and great advancement in the natural sciences. Baghdad's famous translation academy, the Bait al-Hikma, or House of Wisdom, was officially sponsored by Caliph al-Mamun (r. 813–33) to prepare professional Arabic translations of philosophical and scientific works, particularly those in Greek. Most of these translations were carried out by Christian Arabic (Syriac-speaking) scholars. They advanced considerably Muslim scholars' creative adaptations of not only the Hellenistic heritage but also Byzantine, Iranian, and Indian traditions.

Philosophy was the most important branch of the Hellenistic tradition incorporated into the dynamically developing Islamic body of knowledge. The importance that medieval Muslim thinkers granted to philosophy helped to establish reason, logic, and the laws of nature firmly in Islamic thought. Examples of prominent Muslim sages are al-Kindi (d. 873), a brilliant scientist and metaphysician; al-Farabi (d. 950), logician, metaphysician, musical theorist, and the most impor-

tant Islamic political philosopher; and Ibn Sina (known to the Western world as Avicenna; d. 1037), a philosopher and physician who contributed insightful original ideas to the Aristotelian and Neoplatonic traditions. In Islamic Spain, Abu Bakr ibn Tufayl (d. 1185) is noted for his allegorical and philosophical narrative of a solitary individual on an island who independently arrives at philosophical and religious truths. Ibn-Rushd (known in the Western world as Averroës; d. 1198), the most Aristotelian of the Islamic philosophers, is renowned for developing a theory of the intellect based on Aristotle's theory of the soul. His rationalistic philosophy had a far-reaching impact on both Islamic and medieval European scholarship. Despite different ethnic and cultural backgrounds, all these scholars wrote their major works in Arabic, the lingua franca of the medieval Muslim world.

Reason and logic were also significant to Islamic theology. In the eighth and ninth centuries Muslim scholars disputed, for example, whether God was to be understood through revelation (literally) or through reason (metaphorically). The orthodox theologian al-Ashari (d. 935) bridged these conflicting positions. Although he set limits to philosophical speculation in religious matters, he did not end it. Al-Ghazali (d. 1111), perhaps the most important theologian of Islam and a noted jurist and mystic, accepted Greek logic as a neutral instrument of learning and recommended it for Muslim theologians.

Creativity is evident in narrative and descriptive disciplines, such as history and geography, in the codification of law, and in philology and grammar. Examples are the works of al-Tabari (d. 923), a particularly influential historian and Koran commentator, and Abu l-Faraj al-Isfahani (d. ca. 971), a celebrated man of letters, historian, and musicologist.

In the natural sciences medieval Muslim scholars displayed industriousness and originality, as evident in the works of Jabir ibn Hayyan (d. 803), known as the father of chemistry; al-Khwarizmi (d. 840), considered the founder of algebra; and Ibn al-Haytham (d. 1040), who significantly advanced experimental and theoretical research in optics. Abu l-Qasim al-Zahrawi (d. 1013) explained surgical procedures and gave detailed illustrations of surgical instruments. His great encyclopedia of medicine—composed to facilitate student learning—was used in Latin translation at European hospitals and universities for centuries.

In early Islam learning and education were rather informal. Instruction took place in teaching sessions and study circles held at mosques or privately at the homes of scholars. The professor lectured while sitting on the floor or a small pedestal. The students were also seated on the floor, with the most senior students sitting closest to the professor. Oral instruction was the predominant feature of Muslim learning,

and personal contact between the teacher and the students was viewed to be the best way to guarantee the authenticity of transmitted knowledge. This idea of authoritative transmission remains crucial to Islamic learning, especially in the religious disciplines. Nonetheless, from the seventh century on, lectures and seminars were regularly based on written collections of data and notes used by scholars and students as memory aids. In the ninth century the book emerged in Muslim society and was soon recognized as a powerful medium of education.

As Islamic civilization matured, medieval Islamic education began to rely on various institutions. The elementary or Koran school admitted children as young as six or seven years of age. The topics to be taught included the precise articulation and memorization of the Koran, knowledge of reading and writing, the duties of worship, and good manners. Other recommended topics were the Arabic language and grammar, handwriting, arithmetic, poetry (provided the verses were morally decent), proverbs, speeches, and the historical reports and legends of the ancient Arabs. Elementary schooling took place in a simple building. The teacher was responsible for renting the school or classroom and the equipment needed for teaching. The teacher's salary was paid directly by the pupils' parents. Reviews of the children's knowledge of the Koran and their advancement in learning took place on Wednesday evenings or Thursdays. There was no school on Fridays or religious holidays. Basic instruction concluded with a final oral exam after the pupil had memorized the Koran.

At more-advanced levels of schooling pupils and adolescent students were instructed in Arabic and Islamic history, Arabic language and literature, arithmetic and geometry, music, astronomy, medicine, and logical argumentation. Children of the lower social classes received vocational instruction in practical professions. Girls were not excluded from elementary or higher learning, although preference was given to their moral education at home, provided by their families.

For higher Islamic learning two institutions are particularly important: the mosque and the college of law (madrasa). Although it was primarily a place of worship, the mosque has been a center of learning from the earliest time of Islam and has served educational purposes throughout the centuries. In the ninth century, however, the college of law became the principal institution of higher Islamic learning. The key importance of the college is related to the priority that law generally occupies in Muslim life. For devout Muslims it is imperative to learn and obey God's will and to ascertain what to do and what to avoid doing. Thus Muslims seek guidance from those who are well versed in the sacred scriptures and who can derive laws from them. In the medieval period the

training of specialists in the knowledge of God's law became a prime objective of Islamic education.

The earliest colleges emerged from the practice of teaching at mosques. With the growing need in Islamic society for law experts, colleges were established in separate buildings attached to larger mosques. In Iran, Syria, and Egypt colleges were sometimes built next to holy shrines or near the graves or mausoleums of famous scholars. Many law colleges combined living and teaching accommodations. Each college was financed by a pious endowment supporting both faculty and students and was directed by an imam-professor.

The college of law flourished in the 11th to 14th centuries and hence became a palpable feature of Islamic culture and civilization. Curriculum focused on religious law and Islamic jurisprudence, the Koran and Koranic exegesis, and the Islamic prophetic traditions. It also included Arabic language, grammar and literature, and logic—disciplines considered essential for accurate expression and sound reasoning. Astronomy was studied because it related to the calendar and issues relevant to practices of the Islamic faith. However, the constraints in the subjects taught at the college, along with the rising influence of religious scholars, who by then were professionalized under state patronage, affected the cohesiveness of Islamic thought. This strengthened conservative elements in Islamic education and led, among certain scholars, to an opposition to secular learning.

Some of the more famous medieval institutions of higher education are the Azhar in Cairo, Egypt, founded in 970 under the Shiite dynasty of the Fatimids (r. 909–1171) and eventually the principal religious university of the Islamic world; the Nizamiyya in Baghdad, Iraq, established in 1057 by the vizier Nizam al-Mulk (d. 1092) and considered the most famous law college of the medieval Muslim world; and the mosque-universities of Zaytuna in Tunis, Tunisia, flourishing in the 13th century; the Qarawiyyin in Fez, Morocco, one of the most renowned medieval centers of learning, attracting scholars from Christian Europe; and Alhambra in Grenada, Spain.

From the eighth to the 16th centuries there was a continuous tradition of Arabic-Islamic scholarship dealing with pedagogical and didactic issues. Medieval Muslim scholars writing on education included theologians, philosophers, jurists, litterateurs, Hadith scholars, and scientists. Although many of them taught, none was a specialist in education. Nonetheless, their ideas and philosophies on education contributed much to Islam's classical pedagogical tradition. Prominent examples are the jurist Ibn Sahnun (817–70), who apparently was the first Muslim scholar to write a legal handbook for elementary school teachers; the man of letters and theologian al-Jahiz (ca. 776–868), who dealt with issues in ed-

education from a literary and philosophical viewpoint; and the aforementioned scholars al-Farabi, Ibn Sina, and al-Ghazali. For example, al-Farabi suggested an integrated curriculum for the higher learning of the sciences, both foreign (grounded in Greek philosophy and science) and religious (based on the Koran and its interpretation) sciences; Ibn Sina contributed to child education through his theoretical considerations on the intellect and his medical findings; and al-Ghazali, noted for his theological-mystical approach to learning, was one of the great architects of classical Islam's educational philosophy and ethics. Other Muslim scholars with specific interests in education include al-Zarnuji (d. first half of the 13th century), al-Tusi (d. 1274), Ibn Jamaa (d. 1333), Ibn Khaldun (d. 1406), and al-Almawi (d. 1573).

While early Muslim thinkers underscored logos and the spirit of inquiry along with the care for perfection and human excellence, later medieval scholars tended to emphasize

the integrity and purity of the transmission of knowledge that had already been definitively established. Generally, however, medieval Muslim scholars strongly promoted the idea that books are stimulating and indispensable tools for learning. Their writings and ideas provide a wealth of insight into the dynamic world of classical Islamic learning.

#### Asia and the Pacific

#### ≈ “Hsio Ki; or, Record on the Subject of Education,” excerpt from Li Ki (ca. second century) ≈

**1.** When a ruler is concerned that his measures should be in accordance with law, and seeks for the (assistance of the) good and upright, this is sufficient to secure him a considerable reputation, but not to move the multitudes.

When he cultivates the society of the worthy, and tries to embody the views of those who are remote (from the court), this is sufficient to move the multitudes, but not to transform the people.

If he wish to transform the people and to perfect their manners and customs, must he not start from the lessons of the school?

**2.** The jade uncut will not form a vessel for use; and if men do not learn, they do not know the way (in which they should go). On this account the ancient kings, when establishing states and governing the people, made instruction and schools a primary object;—as it is said in the Charge to Yüeh, “The thoughts from first to last should be fixed on learning.”

**3.** However fine the viands be, if one do not eat, he does not know their taste; however perfect the course may be, if one do not learn it, he does not know its goodness. Therefore when he learns, one knows his own

deficiencies; when he teaches, he knows the difficulties of learning. After he knows his deficiencies, one is able to turn round and examine himself; after he knows the difficulties, he is able to stimulate himself to effort. Hence it is said, “Teaching and learning help each other”; as it is said in the Charge to Yüeh, “Teaching is the half of learning.”

**4.** According to the system of ancient teaching, for the families of (a hamlet) there was the village school; for a neighbourhood there was the hsiang; for the larger districts there was the hsü; and in the capitals there was the college.

**5.** Every year some entered the college, and every second year there was a comparative examination. In the first year it was seen whether they could read the texts intelligently, and what was the meaning of each; in the third year, whether they were reverently attentive to their work, and what companionship was most pleasant to them; in the fifth year, how they extended their studies and sought the company of their teachers; in the seventh year, how they could discuss the subjects of their studies and select their friends. They were now said to have made some small attainments. In the ninth year, when they knew the different classes of subjects

and had gained a general intelligence, were firmly established and would not fall back, they were said to have made grand attainments. After this the training was sufficient to transform the people, and to change (anything bad in) manners and customs. Those who lived near at hand submitted with delight, and those who were far off thought (of the teaching) with longing desire. Such was the method of the Great learning; as is said in the Record, “The little ant continually exercises the art (of amassing).”

**6.** At the commencement of the teaching in the Great college, (the masters) in their skin caps presented the offerings of vegetables (to the ancient sages), to show their pupils the principle of reverence for them; and made them sing (at the same time) the (first) three pieces of the Minor Odes of the Kingdom, as their first lesson in the duties of officers. When they entered the college, the drum was beaten and the satchels were produced, that they might begin their work reverently. The cane and the thorns were there to secure in them a proper awe. It was not till the time for the summer sacrifice was divined for, that the testing examination was held;—to give composure to their minds. They were continually under inspection, but not spoken to,—to keep their minds undisturbed. They listened, but they did not ask questions; and they could not transgress the order of study (imposed on them). These seven things were the chief regulations in the teaching. As it is expressed in the Record, “In all learning, for him who would in be an officer the first thing is (the knowledge of) business; for scholars the first thing is the directing of the mind.” . . .

**8.** If a student do not learn (at college) to play in tune, he cannot quietly enjoy his lutes; if he do not learn extensively the figures of poetry, he cannot quietly enjoy the odes; if he do not learn the varieties of dress, he cannot quietly take part in the different ceremonies; if he do not acquire the various accomplishments, he cannot take delight in learning.

**9.** Therefore a student of talents and virtue pursues his studies, withdrawn in college from all besides, and devoted to their cultivation, or occupied with them when retired from it, and enjoying himself. Having attained to this, he rests quietly in his studies and seeks the company of his teachers; he finds pleasure in his friends, and has all confidence in their course. Although he should be separated from his teachers and helpers, he will not act contrary to the course;—as it is said in the Charge to Yüeh, “Maintain a reverent humility, and strive to be constantly earnest. In such a case the cultivation will surely come.” . . .

**11.** The rules aimed at in the Great college were the prevention of evil before it was manifested; the timeliness of instruction just when it was required; the suitability of the lessons in adaptation to circumstances; and the good influence of example to parties observing one another. It was from these four things that the teaching was so effectual and flourishing.

### Europe

#### ≈ Petrus Paulus Vergerius: “The New Education” (ca. 1400) ≈

We call those studies liberal which are worthy of a free man; those studies by which we attain and practice virtue and wisdom; that education which calls forth, trains and develops those highest gifts of body and of mind which ennoble men, and which are rightly judged to rank next in dignity to virtue only. For to a vulgar temper gain and pleasure are the one aim of

existence, to a lofty nature, moral worth and fame. It is, then, of the highest importance that even from infancy this aim, this effort, should constantly be kept alive in growing minds. For I may affirm with fullest conviction that we shall not have attained wisdom in our later years unless in our earliest we have sincerely entered on its search. Nor may we for a

(continued)

(continues)

moment admit, with the unthinking crowd, that those who give early promise fail in subsequent fulfillment. This may, partly from physical causes, happen in exceptional cases. But there is no doubt that nature has endowed some children with so keen, so ready an intelligence, that without serious effort they attain to a notable power of reasoning and conversing upon grave and lofty subjects, and by aid of right guidance and sound learning reach in manhood the highest distinction. On the other hand, children of modest powers demand even more attention, that their natural defects may be supplied by art. But all alike must in those early years,

*Dum faciles animi iuvenum, dum mobilis aetas*

whilst the mind is supple, be inured to the toil and effort of learning. Not that education, in the broad sense, is exclusively the concern of youth. Did not Cato think it honorable to learn Greek in later life? Did not Socrates, greatest of philosophers, compel his aged fingers to the lute? . . .

We come now to the consideration of the various subjects which may rightly be included under the name of "Liberal Studies." Amongst these I accord the first place to History, on grounds both of its attractiveness and of its utility, qualities which appeal equally to the scholar and to the statesman. Next in importance ranks Moral Philosophy, which indeed is, in a peculiar sense, a "Liberal Art," in that its purpose is to teach men the secret of true freedom. History, then, gives us the concrete examples of the precepts inculcated by philosophy. The one shows what men should do, the other what men have said and done in the past, and what practical lessons we may draw therefrom for the present day. I would indicate as the third main branch of study, Eloquence, which indeed holds a place of distinction amongst the refined Arts. By philosophy we learn the essential truth of things, which by eloquence we so exhibit in orderly adornment as to bring conviction to differing minds. And history provides the light of experienced cumulative wisdom fit to supplement the force of reason and the persuasion of eloquence. For we allow that soundness of judgment, wisdom of speech,

integrity of conduct are the marks of a truly liberal temper. . . .

The Art of Letters . . . is a study adapted to all times and to all circumstances, to the investigation of fresh knowledge or to the re-casting and application of old. Hence the importance of grammar and of the rules of composition must be recognized at the outset, as the foundation on which the whole study of Literature must rest: and closely associated with these rudiments, the art of Disputation or Logical argument. The function of this is to enable us to discern fallacy from truth in discussion. Logic, indeed, as setting forth the true method of learning, is the guide to the acquisition of knowledge in whatever subject. Rhetoric comes next, and is strictly speaking the formal study by which we attain the art of eloquence; which, as we have just stated, takes the third place amongst the studies specially important in public life. It is now, indeed, fallen from its old renown and is well nigh a lost art. In the Law-Court, in the Council, in the popular Assembly, in exposition, in persuasion, in debate, eloquence finds no place now-a-days: speed, brevity, homeliness are the only qualities desired. Oratory, in which our forefathers gained so great glory for themselves and for their language, is despised: but our youth, if they would earn the repute of true education, must emulate their ancestors in this accomplishment.

After Eloquence we place Poetry and the Poetic Art, which though not without their value in daily life and as an aid to oratory, have nevertheless their main concern for the leisure side of existence.

As to Music, the Greeks refused the title of "Educated" to anyone who could not sing or play. Socrates sets an example to the Athenian youth, by himself learning to play in his old age; urging the pursuit of music not as a sensuous indulgence, but as an aid to the inner harmony of the soul. In so far as it is taught as a healthy recreation for the moral and spiritual nature, music is a truly liberal art, and, both as regards its theory and its practice, should find a place in education.

Arithmetic, which treats of the properties of numbers, Geometry, which treats of the properties of dimensions, lines, surfaces, and solid bodies, are weighty studies because they possess a peculiar element of certainty. The science of the Stars, their motions, magnitudes

and distances, lifts us into the clear calm of the upper air. There we may contemplate the fixed stars, or the conjunctions of the planets, and predict the eclipses of the sun and the moon. The knowledge of Nature—animate and inanimate—the laws and the properties of things in heaven and in earth, their causes, mutations and effects, especially the explanation of their wonders (as they are popularly supposed) by the unraveling of their causes—this is a most delightful, and at the same time most profitable, study for youth. With these may be joined investigations concerning the weights of bodies, and those relative to the subject which mathematicians call “Perspective.” . . .

Respecting the general place of liberal studies, we remember that Aristotle would not have them absorb the entire interests of life: for he kept steadily in view the nature of man as a citizen, an active member of the State. For the man who has surrendered himself absolutely to the attractions of Letters or of speculative thought follows, perhaps, a self-regarding end and is useless as a citizen or as prince.

## ► empires and dynasties

### INTRODUCTION

The primary form of government all over the world in the Middle Ages was the monarchy, the rule of a single man (rarely and never ideally a woman) over a state or empire. The model for this institution was the family, ruled over by the single head, the father. The medieval father and king both had authority over their respective spheres, the family or kingdom, while their households or subjects had obligations to the head. The king or father also had the duty to protect those who were dependent on him and not to exploit them. The concept of the family is thoroughly interwoven in all human cultures and served as a model to make the inequality of power relationships inherent in a monarchical system comprehensible and acceptable to the subjects of a kingdom or empire. Families made up a clan and clans a nation, so it seemed natural that the father and clan chief should be ruled over by a king. The king’s own family took on its own larger life as a dynasty; its squabbles played out as civil wars. The monarchical title and authority were passed down from generation to generation like family property.

Power in medieval states tended to be decentralized. Local leaders were not eliminated by the king even when new territories were conquered; instead, they were brought into the family. Once Korea was conquered by China, for instance, the two states referred to each other as younger and elder brothers. Often there were true family alliances between local leaders and the ruling dynasty, contracted through marriage. Medieval technology could not sustain direct control over a territory as large as China or Europe, and power necessarily

devolved on local rulers or governors who were largely beyond the reach of the central monarchy. Such officials received their right to rule from the king or emperor and therefore had an obligation to support him with taxes and soldiers. This system of government is known as feudalism. But often distant or great nobles and governors had little contact with the center and effectively acted and ruled independently or openly rebelled. Such independence would be taken in hand by the monarchy whenever resources and circumstances allowed; very often a large territory would be unified or reunified by military conquest only to fragment again into *de facto* independent countries. This happened almost at once when the huge Mongol Empire conquered by Genghis Khan was divided among his sons and grandsons. The history of medieval China is one of new dynasties unifying the country, only to have it splinter apart again. The modern western European nations essentially correspond to the individual provinces of the Roman Empire because these were small enough to be governed with a reasonable amount of direct control from the center.

The other major trend in governance during the Middle Ages was democracy. This, too, found its roots in the family, in the equality of brothers. A few states, such as some of the Swiss cantons and Italian cities, were long-lasting self-governing democracies, but the democratic power in government was most often directly tied up with the monarchy. In their origins, a surprising number of medieval monarchies were elected, either by the national army as equals selecting a leader or by a group of leading nobles choosing a king based on the interests of their own regions. The Germanic tribes that overwhelmed the Roman Empire often chose their kings in this manner, and the institution became enshrined in the system of election of the Holy Roman Emperors by the leading nobles and bishops. The caliphs, the supreme political and religious leaders of Islam, were originally elected by the army. The monarchies of many other states all over the world were also elected, for instance, those of the Aztecs of Mexico and the kingdom of the Congo in central Africa. Still, this process inevitably gave way to a dynasty when the reigning king's son or other close relative was elected as a natural successor, so that over time the succession became a matter of inheritance and the election was reduced to a show of support or was done away with entirely.

Another trend common in medieval monarchies was the supplanting of the legitimate ruling family or office by a court official. Typically, the old dynasty would continue as a symbolic figurehead. In the kingdom of the Franks, for example, the Merovingian Dynasty, which had originally built the Frankish Empire, was supplanted by their "mayors of the palace." The Merovingians continued as putative rulers for several generations while power was exercised by their officials,

who eventually took the royal title for themselves. The Japanese emperors, on the other hand, continue as titular heads of state to this day, but real political power in Japan passed almost immediately after the foundation of the imperial state to court officials such as the shogun. The caliphs, or successors to Muhammad, were similarly kept as religious leaders after the fragmentation of the Islamic state in the 10th century but lost political authority to the various successor dynasties in the different parts of the empire and were themselves appointed by the Buyid Dynasty that controlled Baghdad.

China and states that molded themselves on China, such as Korea and Japan, benefited from the Confucian tradition to institute a civil service bureaucracy based on education and examination rather than birth or privilege. This established a class of governors and bureaucrats trained to exercise political authority but lacking their base of power to rebel against the central authority. Other areas of the world did not enjoy such professional bureaucracies until after the medieval period, although the governmental use of university-trained lawyers in western Europe in the High Middle Ages began a trend in this direction.

Another factor that conditioned state formation in the Middle Ages was the conflict inherent in the way of life of nomadic tribes and of settled states based on agriculture. From the Roman Empire to India to the Islamic world to China, large states collapsed again and again either in the face of invasion from the steppe nomads of inner Asia or from the inordinate expense involved in defending against them, which could range from paying for a huge standing army to the maintenance of the Great Wall of China. Countless states were destroyed or replaced by nomadic invaders. The central valley of Mexico, the center of civilization in North America, seems to have been conquered several times by nomadic peoples from the surrounding regions.

## AFRICA

BY TOM STREISSGUTH

In the view of many historians, successful agriculture led to the rise of centralized kingdoms in medieval Africa. The harvesting of surplus food allowed people to gather in cities, where specialized professions such as ironworking and goldsmithing developed. As societies stratified into laborers and artisans, a class of nobles, those who gained control of land and goods, gathered power and established their authority in large cities and neighboring regions. Eventually, in a given region a single powerful family might emerge to establish a hereditary dynasty. A complex state could then rise to power, as controlled by ministers, provincial governors, and an administration for collecting taxes and tolls. Medieval African

empires protected and expanded their borders with standing armies and in some cases survived to dominate large regions for centuries.

Key factors in the process of empire development were mining and trade. Although gold was not considered especially valuable in sub-Saharan Africa, it was in high demand as a trade item, one that distant realms in North Africa and the Middle East took great pains to acquire. All medieval African kingdoms rose in proximity to valuable mineral resources, including copper, iron ore, and gold, as well as to fertile land, needed for both crops and herds. Furthermore, all controlled long-range trade routes and featured a class of middlemen and merchants who traded along major rivers, through seaports, or across the Sahara Desert.

Geography and climate were also important factors in the development of empires. The port of Adulis, on the hot and arid western coast of the Red Sea, was a key link in trade between the Nile River valley, other Red Sea ports, the eastern coast of Africa, and the Indian Ocean. Adulis also lay near a mountainous region about 100 miles to the west that enjoyed a mild climate with good rainfall. These Ethiopian highlands were free of the diseases that were endemic to lower elevations, including malaria and sleeping sickness; they also were protected by a series of ridges that formed a strong natural barrier to invasion. In this region the empire of Axum rose at the dawn of the medieval period.

## AXUM

The city of Axum at its height was the capital of a realm stretching from the Sahara Desert to the Arabian Peninsula. The Axumites struck the first coins in sub-Saharan Africa and developed a system of phonetic writing known as Geez. Their empire originated in the settlement of the Red Sea coast by traders and farmers in the time of the late Egyptian dynasties. According to tradition, this was the land of the Queen of Sheba, whose visit to King Solomon is described in the Old Testament book of Kings. The queen brought a great treasure of gold and precious gems to the king, who reciprocated with gifts of his own and with a son, King David, founder of the Solomonic dynasty of Ethiopia as Menelik I; David had brought to his homeland the Ark of the Covenant, a relic said to contain the stone tables on which were inscribed the Ten Commandments.

Axum prospered by controlling busy routes between southern Arabia, eastern Africa, and India. At its height the Axumite kingdom included the upper Nile Valley to the north and Yemen, on the southern coast of the Arabian Peninsula. The fall of Kush, an empire in what is now Sudan, allowed the Axumite leaders to establish new tributary states and also brought the realm into contact with Christianity, which was

spreading into Africa from its home in the Roman-controlled Levant. Axum converted to Christianity during the reign of its king Ezana, who was baptized into the new faith by a Syrian bishop. By 500 churches in Axum were holding mass in the native language of Geez, and the Axumite Christians claimed descent from the ancient tribes of the Hebrews and their legendary warrior king David.

The rulers of Axum were buried in stone tombs marked by tall stelae. Many of these obelisks survive in the modern city, where a few still stand upright while many more are overturned and lying in pieces on the ground. The obelisks were decorated with elaborate bas-reliefs; the tallest was more than 100 feet in height.

The port of Adulis boasted one of the busiest harbors in the ancient world, where ships called from the Persian Gulf, the east coast of Africa, India, and as far as the East Indies. Adulis was home to Egyptians, Greeks, Arabs, Indians, and Africans and featured a cross section of ancient faiths, including Judaism, Christianity, and Buddhism. With the rise of Islam in the seventh century, however, and the conquest of vast territories by Muslim armies, Adulis's sphere of influence began to shrink. Arabs seized control of many desert and seaborne trading routes; they refrained from directly attacking Axum, however, as Muslims honored the city as a refuge for the early disciples of Muhammad, the founder of Islam.

Environmental degradation played an important role in the decline of Axum. Trees were stripped for their bark to fire charcoal furnaces, used to produce iron as well as brick, glass, and pottery kilns. Timber also was used for firewood and for home construction. With the landscape denuded of trees, soil eroded in the heavy rainfall, resulting in a loss of fertility and a decline in food production. At the same time, conflict in the Mediterranean after the fall of Rome lessened trade through Adulis, and the Persian Empire was taking control of trade in the Arabian Peninsula. In the eighth century Adulis was overrun by Arab armies. Axum declined further; the state stopped minting coins as central authority fragmented and disappeared. Drought beginning in the middle of the eighth century worsened the situation.

By the ninth century Axum had declined into a small, poor, and insignificant village. In modern times the city and its many carved obelisks survive as a symbol of ancient Ethiopian glory. Axum also remains a religious center, place of pilgrimage, and, according to legend, the resting place of the Ark of the Covenant, replicas of which are enshrined as holy relics in Ethiopia's modern Christian churches.

## GHANA AND TAKRUR

Around the third century the use of camels eased the hardships of travel across the Sahara Desert. These ungainly beasts

*Bronze head of the king of Ife, with a beaded crown and plume, Yoruba culture, Nigeria, ca. 12th–14th centuries* (© The Trustees of the British Museum)

could bear heavy burdens and survive on small amounts of food and water. Camel caravans, some numbering in the hundreds of animals, moved slowly across the gravelly plains of the desert, making the entire journey between the coast and the towns of the Sahel, just past the southern limits of the desert, in a few weeks.

The caravans provided a spur to trade in gold, salt, and other goods between sub-Saharan Africa and the Mediterranean coast. They also helped the Berber nomads of the desert establish their supremacy over the lucrative cross-desert trade. An important mint in the city of Carthage, a Roman port on the Mediterranean, relied on gold from alluvial deposits in the forested highlands of western Africa. The demand for gold by the Roman mints and later among the Arabs of North Africa brought about the rise of centralized

states in western Africa, which remained the leading source of gold for the Mediterranean region and Europe throughout the medieval period.

The Ghana Empire arose in the fifth century. Its early history is obscure, with some historians holding the view that the Berbers founded the kingdom by establishing their supremacy over the local Mandingo people. Eventually, the two groups mingled—or the Berbers were forcefully expelled—and a capital was founded at Koumbi Saleh, in what is now Mauritania. Ghana dominated the Niger Delta, a fertile region of grassland, marsh, and springs, while its kings extended their authority over distant tributary states. Koumbi Saleh supplied abundant amounts of gold, and its artisans also produced copper and iron goods for ornaments, tools, and weapons.

By the 11th century the Ghana Empire's northern reaches were subjected to raiding and plundering by the Islamic Almoravid Dynasty (1056–1147), of the region now comprising Morocco, Tunisia, Algeria, and Libya. Ghana's trade with North Africa was disrupted, and the empire's decline was hastened by overgrazing and overpopulation. Drought conditions worsened in the 11th century, putting further pressure on the food supply. In the meantime the Berber and Tuareg nomads of the Sahara sided with the Almoravids, and the kingdom of Takrur, of the Senegal River valley, also joined the alliance against Ghana. In 1052 an Almoravid army attacked Koumbi Saleh, and after this siege Ghana went into decline. War continued until 1076, when the Almoravid general Abu Bakr captured and destroyed the city.

At the collapse of Ghana in 1076 the kingdom of Takrur was thriving from trade in gold, salt, grain, and slaves. This realm controlled caravan routes between western Africa and the cities of the north. Takrur adopted Islam in the 11th century under the king War Jabi, the first leader in western Africa to accept the new faith. Takrur was never a strong military power, however, and its rivals were powerful and dangerous. The Sosso realm, which had once paid tribute to Ghana, emerged as Takrur's strongest rival. By 1200 Sosso armies were raiding and pillaging the tribes of the Manden region, just south of the borders with Ghana. The Mandingo peoples there counterattacked in 1235 under the leadership of Sundiata Keita, who united the 12 Manden tribes and established the Mali Empire. Sundiata led his troops to a final victory at the battle of Kirina, which brought Sosso authority to an abrupt end. In 1280 Takrur was finally destroyed by the Mali emperor Sabakoura.

## THE MALI EMPIRE

The realm founded by Sundiata Keita would endure for four centuries. The Mali Empire controlled a wide swath of west-

ern Africa from its political center in the Niger Delta. Its emperors imposed law and customs on far-flung regions that the kings of Ghana were unable to control, and their acceptance of the Islamic faith allied them more closely with the North African states. The Mali emperor Mansa Musa was renowned for his lavish palaces and great wealth. Mansa Musa imposed a constitution and convened an assembly known as the Gbara, at which representatives of the Mandingo clans debated important decisions.

The emperors of Mali were chosen from the clan of the Keita. The capital of the realm was located in Niani, in what is now northern Guinea. The realm expanded rapidly in the late 13th century under the emperors Ouali and Sakoura, the latter a former slave. Mali took control of new territory to the west as well as the realm of Takrur and the cities of Timbuktu and Gao, which was important to the Songhai people. Productive copper and gold mines were seized, allowing Mali to extend its authority and influence south into the Hausa region. Under Sakoura, Mali carried out a thriving trade with North Africa in gold, salt, slaves, ivory, and kola nuts.

From Niani the emperors levied taxes on mines and collected regular tribute from the subject tribes. New territories were governed by viceroys appointed by the emperor; upon proving their loyalty, these territories were allowed to govern themselves with elected leaders. The Mali emperors accepted Islam but allowed the subject tribes to follow the religions of their choice. Through the Mali Empire the Islamic faith spread into the forest kingdoms of sub-Saharan western Africa.

The empire was defended by a large and well-trained standing army, with both infantry and cavalry. Each of the tribes paying tribute to the emperor also had to provide troops. With these forces Mali reached its greatest extent in the middle of the 14th century, when it was organized into 14 large provinces. The realm covered most of western Africa, from the coast of the Atlantic Ocean to the central Sahara Desert.

Emperor Mansa Musa annexed Timbuktu, making the city a center of Islamic study and establishing the university known as Sankoré. This emperor's most famous achievement, however, was the pilgrimage to Mecca that he undertook in 1324. Mansa Musa brought along a vast treasury of gold, which he distributed as alms and as gifts to the princes he met along the way. The gold was so plentiful, stories tell, that it caused a crisis of inflation in Egypt and the Middle East. The free-spending emperor and his huge entourage attracted notice throughout the Islamic world and as far as Europe, where princes and navigators took especial note of this previously unknown source of gold in distant Africa.

In the middle of the 15th century Portuguese explorers began making their way down the western coast of Africa. These navigators were seeking a new water route to the East

Indies and were following the reports of an abundance of gold in the western African interior. Portuguese ships anchored off the mouths of prominent rivers, including the Gambia, and sent slave-raiding expeditions into the forests along the coasts. The Mali emperors opened up diplomatic and trade negotiations with the Portuguese.

## SONGHAI

No states managed to rival the longevity of the Mali Empire in the medieval era, but a few regions did break away from its hold. By the middle of the 15th century disputes over succession to the throne were weakening central authority in Mali and making the empire vulnerable to military conquest. The Songhai, who dominated a region to the north and east of Niani, broke away from Mali in the late 14th century. Under their leader Sunni Ali Ber (r. 1464–92) the Songhai armies conquered Timbuktu in 1468. Songhai seized valuable salt mines in the western Sahara in the 1490s. This began a century of slow decline for the Mali Empire, as its provinces and resources gradually fell to rival states. In 1545 the Songhai forces attacked and occupied Niani, the Mali capital, forcing the emperor Mansa Mahmud III to retreat. Although Mansa Mahmud eventually regained his capital city, the Songhai Empire surpassed Mali to become the most powerful state in western Africa.

Sunni Ali Ber's successor, Askia Muhammad Touré (r. 1493–1528), founded the Askia Dynasty and expanded the frontiers of the Songhai Empire, pushing south into Hausa territory. Askia Muhammad created a large centralized bureaucracy, instituted a system of standard weights and measures, replaced traditional religion with Islam, and appointed Islamic judges to implement Islamic law. The majority of people held to their traditional religions, however, and Islam was only known in the cities and among the upper classes. Songhai was a short-lived realm that grew too large to be effectively controlled from its capital. In 1591 it was overthrown by the Moroccan sultan Ahmad I al-Mansur Saadi, whose forces conquered Gao, Timbuktu, and Djenné. After these defeats, Songhai disintegrated into several small states.

The Kanem Empire and the successor empire of Bornu rose in the central Sahel around 1200, as the Kanuri people began to conquer surrounding areas as led by Mai Dunama Diblemi, who converted to Islam and declared jihad against local chiefs. Kanem controlled trade between Hausaland, the Sahel region, and North Africa. In the early 1400s the center of the empire moved to Bornu, southwest of Lake Chad. This realm grew in the late 15th century and the 16th century as Songhai weakened.

To the east the Kitara Empire flourished in the region near Lake Victoria. Ruled by the Bachwezi Dynasty, Kitara

was destroyed in the 16th century by invasions from the north. Strong centralized kingdoms were developing in the lake region of East Africa at the close of the medieval period. These included the realm of the *mwami*, or Rwandan kings, which prospered just east of Lake Kivu in a heavily populated area with lush pasture and a temperate climate. Rwanda lay between the kingdoms of Burundi to the south and Buganda to the north.

In the west the growing trade between the coastal regions and the interior, along with the migrations of people of the savanna as the desert advanced to the south, spurred the rise of forest kingdoms along the coast and just inland. These included the Wolof Kingdom in the west. The Wolof, who fielded a powerful army in what is now Senegal, controlled a strategic crossroads between the coast and the interior, and they moved salt, gold, and slaves between the coast and North Africa. In the early 15th century the Mole-Dagbani and Mossi kingdoms flourished along the Volta River.

### THE KINGDOM OF KONGO

At the time of the savanna and forest kingdoms a migration of Bantu-speaking peoples was occurring throughout the southern half of Africa. From their homeland in the area surrounding the great bend of the Niger River, Bantu speakers arrived at the lower reaches of the Congo River by the early medieval period. They built a capital city at Kwilu, near the coast in what is now the Democratic Republic of Congo. Two small kingdoms, Mpemba Kasi and Mbata, allied their ruling dynasties around 1375, establishing a system for electing a joint king. In the next generation, the king Nimi Lukeni founded a new capital at M'banza Kongo.

The kingdom of Kongo featured a strongly centralized monarchy, with the kings ruling the far-flung provinces through appointed governors. Thousands of small villages in the forest and coastal regions, from Cameroon to Angola, were under the control of M'banza Kongo. They paid taxes with crops or with currency, in the form of the small *nzimbu* shells found around the site of Luanda, in the southern reaches of the kingdom. M'banza Kongo itself grew into a large city, as supported by the tribute of the provinces and by taxes on the iron and copper ware, raffia cloth, pottery, and other goods that moved between the interior and the Atlantic coast.

The Kongo kings established a large permanent army of archers and infantry, who fought with spears, swords, and shields. The army had bases in the capital and in the most important towns. This force enabled the king and provincial governors to quickly put down rebellions, which were common in areas distant from the capital. The Kongo kings expanded the realm into one of the largest in Africa by the time Portuguese navigators arrived in the 1480s.

The Portuguese navigator Diogo Cão encountered the Kongo realm during his voyage of 1482–83. Cão took several Kongo leaders captive and brought them north to the court of the king of Portugal. He returned with his captives in 1485, when he converted the Kongo king Nzinga Nkuwu to Christianity. Missionaries followed to baptize the king and members of the Kongo aristocracy, starting with the ruler of the coastal province of Soyo. At the same time a literate Kongo citizen returning from Portugal opened the first school. Nzinga Nkuwu took the name of João I in honor of Portugal's king at the time, João II.

The death of João I in 1506 sparked a civil war between his son, Nzinga Mbemba, or Afonso, and Afonso's half-brother Mpanzu Kitima. Afonso overcame his rival—thanks to the intervention of the Virgin Mary and the Christian Saint James, in his view—and ruled for 37 years, the longest reign in Kongo's history. The kingdom thrived through trade and expanded through the conquest of neighboring regions, which brought in many prisoners of war, who were valued as slaves. Kongo became an important source of slaves for Portuguese sugar plantations on the island of São Tomé. A devout Christian, Afonso banned the animist religion native to the region and made Christianity Kongo's official religion. His son Henrique was ordained as a bishop.

Afonso sought to model his monarchy on that of Portugal, establishing schools in Kongo that would educate the elite to live and rule in the European manner. He grew concerned with the effects of the slave trade on the realm and made an attempt to abolish the trade altogether. The Portuguese were not inclined to relinquish the advantages of this lucrative business, however, and continued to both buy and capture slaves for export. Kongo, in turn, came to depend on the trade for the financing of the school-construction program and of the importation of luxury goods for the enjoyment of the king and nobles.

### MAPUNGUBWE, THE MWENE MUTAPA, AND GREAT ZIMBABWE

In southern Africa the Bantu migration brought a transformation of economic life and social organization. Dependent on cattle, usually for either milk or meat, the Bantu peoples were moving in search of pasture and elevated land that would allow their animals to escape trypanosomiasis, or "sleeping sickness," a disease brought by the lowland-dwelling tsetse fly. The Bantu peoples brought iron smelting as well as cattle raising with them to the region south of the Zambezi River, a region well suited to cattle, with good forage and a temperate climate. The Mapungubwe cities of the Limpopo River valley arose in the 10th century. Terraced fields were built on the hillsides to increase the ground area available for cultivation.

An aristocracy claimed land at the summits of these hills and built walled enclosures for defense.

The rise of large kingdoms in southern Africa was closely tied to practices of cattle raising. The raising of cattle for beef, rather than for the milk production that dominated East Africa, was a less labor-intensive form of husbandry. Beef cattle could sustain large and expanding populations, while milk production was better suited to arid climates and marginal land.

The Zambezi and Limpopo valleys traded with the outside world through the port of Sofala, a Swahili-speaking city-state on the Indian Ocean coast. Beginning in the 13th century productive and abundant gold mines in this area were providing a medium of exchange for items of value brought to Sofala by Arab traders.

In the 13th century the Mapungubwe realms were eclipsed by the Shona states, which also were based on cattle raising. Among the Shona, *zimbabwe* was the name for a royal precinct or stone-walled enclosure, more than 300 of which have been found in the region and the largest of which is known as Great Zimbabwe. Here the kingdom of the Mwene Mutapa—the title borne by its kings—arose to become the strongest realm in medieval southern Africa. This kingdom traded in gold and other resources through Sofala. Glass and ceramics were imported, while iron, copper, cattle, and cowrie shells were shipped abroad or exchanged at the coast. The great trade wealth accumulated in their treasuries allowed the Zimbabweans to centralize their government. Their seat of power at Great Zimbabwe remains the largest archaeological site in Africa outside the Nile Valley.

Great Zimbabwe, which has been dated to the 12th century, contained a hill complex and several smaller, dependent sites known as valley complexes. The hill complex was a sacred district where rituals were carried out, iron forges were worked, and the royal treasury was kept. The Imba Huru, or Great Enclosure, a royal precinct surrounded by a much larger city, was protected by a massive wall 15 feet thick, 800 feet in length, and about 32 feet tall at its greatest height. The builders collected granite blocks from the surrounding hillsides and fitted the rough stones together without mortar.

The Mwene Mutapa controlled much of what is now Zimbabwe and parts of Mozambique, with the realm reaching its height in the middle of the 15th century. Overgrazing eventually brought about a decline in the kingdom's food supply; meanwhile, the water supply became degraded and contaminated, while surrounding forests were denuded of trees, which were cleared for firewood. The capital of the realm was moved from Great Zimbabwe to Mount Fura, on the Zambezi River. Rival Shona states warred for control of dwindling pasture and gold resources, and the arrival of Europeans in the 16th

century began a debilitating trade in slaves. By the middle of the 17th century the kingdom of the Mwene Mutapa had disintegrated under the assaults of the Portuguese, who had conquered Sofala and other Indian Ocean ports, with additional pressure having come from the migration of the Zulu people from the north.

## THE AMERICAS

BY J. J. GEORGE

The concept of an empire as a major political unit comprising one large territory or several territories or peoples ruled by a single sovereign is usually associated with states or city-states. Although exactly what constitutes a state is a matter of continued debate, at its most basic level it is, like an empire, the political organization of a populace sometimes numbering into the hundreds of thousands or even millions. For example, the Inca civilization, centered in Peru, controlled about 6 to 8 million people. Some of the practical criteria evident in statehood are territorial control, unified governmental efficiency, divisions of labor, a monopoly on the use of military force, established social classes, often the presence of monumental architecture (especially at the capital or core), and satellite communities of various sizes and complexity surrounding the capital. An empire, then, is the result of a state expanding beyond its core area to encompass peoples with various ethnic or state identities and controlling its widening territory through diplomacy, force, or reciprocity.

Ideally, dynastic rule and kingship would follow a strict rule of primogeniture, which mandates that the exclusive right of inheritance belongs to the eldest son. But succession was rarely so clean and easy in the medieval period. Politics, power, and intrigue, not to mention misfortune or simply not bearing a son, helped shape the role of succession. A range of eligible persons was usually considered in instances of dynastic succession, almost invariably from close relatives already in positions of authority. It was, nonetheless, of great importance, especially among royalty and the elite, to be able to trace a person's ancestry along both paternal and maternal lines, because many societies were strictly divided by class. Obviously, tracing a line of nobles was more advantageous than tracing a lineage with commoner's roots.

The best information available on empires and dynasties in the Americas comes from central Mexico, especially for the Aztec Empire; the Maya territory; and South America, particularly the Inca. In relation to the sociopolitical climate of North America during the medieval period, scholars do not use the term *empire*. While many North American societies were old and complex, even the largest and most diverse often are described politically as chiefdoms and demographi-

cally as towns or villages. Even in societies whose successions of chiefs or dynasties reverberate with empirelike issues of power, data are absent or incomplete. Further, the definition of *empire* simply does not correlate with the types of societal organizations present in medieval North America.

## CENTRAL MEXICO

Conventional scholarship divides Mesoamerican cultural development into periods that are generally consistent with the cultural chronologies of the Maya Empire and other areas of Mexico. Although research is continually refining and amending the dating, the periods from 500 to 1500 C.E. are as follows: Early Classic (ca. 150–ca. 600), Late Classic (ca. 600–ca. 800), Terminal Classic (ca. 800–ca. 925), Early Postclassic (ca. 925–ca. 1200), and Late Postclassic (ca. 1200–ca. 1530), the latter dominated by the rise of the Aztec and the arrival of the Spanish. The Spaniard Hernán Cortés and his men landed on the Gulf Coast in 1519 and by 1521 had entered the great Aztec capital of Tenochtitlán. Soon thereafter the Aztec Empire fell, and the period of Spanish colonial rule ensued.

A full picture of the situation of empire in central Mexico must begin with the final 250 years of Teotihuacán, from roughly 500 to 750, during which the city and the vast culture associated with it experienced its climax, denouement, and eventual destruction by fire. At its greatest extent Teotihuacán reached a population of approximately 125,000 and an area of control of roughly 10,000 square miles. Considering the limits of human energy unaided by beasts of burden at the time (12 to 15 miles a day, with minimal gear), this represents a significant piece of property. Teotihuacán's urban core as well as the extent of its control and influence went unmatched until the rise of the Aztec Empire and its capital, Tenochtitlán, in the 15th and 16th centuries.

Teotihuacán apparently did not want to or was not able to unify all the territories within its reach under a single cohesive structure; rather it concentrated on controlling key settlements, routes, and resource areas in “blocks” of territory. Nevertheless, its presence was felt throughout Mesoamerica. Outside central Mexico evidence of its presence has been found at Monte Albán in Oaxaca, Veracruz, Chiapas, Belize, and Guatemala, particularly in the form of architectural signatures, carved stone reliefs, and pottery. So pervasive was Teotihuacán's influence between 400 and 700 C.E. that scholars have proposed assigning that period its own classification—the Middle Classic.

Why Teotihuacán fell is a matter of ongoing debate. One theory is based on the idea that the nature of Teotihuacán constituted a religious confederation, deriving its power and influence from moral force. The erosion of the religious fer-

vor that led to cohesion consequently left it vulnerable and weak to invasion. Another theory suggests that, in essence, Teotihuacán was a victim of its own success; developing and spreading its own urban social formula prompted the emergence of rivals who pressured and ultimately challenged Teotihuacán authority. Moreover, if it had been suffering from internal conflicts as has been suggested, any additional pressure from external sources would have caused it to abandon its imperial outposts and focus on matters at home. Conclusive explanations remain elusive at this time.

The collapse of Teotihuacán created a vacuum in which numerous polities maneuvered for greater power through shifting alliances and outright war. People from the northern colonies migrated south, many settling in Tula, which had been a town while Teotihuacán dominated but subsequently grew rapidly. By about 950 Tula became the capital of the Toltec Empire. Around 1000 its center expanded to cover about 5 square miles with an estimated population between 32,000 and 37,000. From there its influence extended to include the Mexico Basin, the regions north and west of the basin, and the Valley of Puebla. Major centers aside from Tula included Tollanzinco, Tenanco, and later Chapultepec, where Huemac, the last Toltec king, moved the capital in 1156. Toltec influence was also recognized in the Yucatan at Chichén Itzá. The period from 987 to 1187 corresponds with Maya-Toltec development, and this phase of construction at Chichén Itzá is its most magnificent.

Toltec dynastic history is derived from two sources. The first is the *Historia Tolteca-Chichimeca*, an account of the history and origins of Texcoco, a city-state in the Mexico basin later subsumed by the Aztec Empire, written by an educated Texcocan after the Spanish conquest. The second, called the *Anales de Cuauhtitlan*, is a generalized history of a city-state by persons who claimed their ancestors had come from Tula. Neither source inspires great confidence. The order of Toltec rulers according to the *Anales* is Mixcoamatatzin, Huetzin, Totepeuh, Ihuitimal, Topiltzin, Matlaxochitl, Nauhyotzin I, Matlaccoatzin, Tlilcoatzin, and Huemac.

The Toltec hold something of a privileged place in the history of central Mexico because subsequent regional dynasties made it a point to attach their historical lineage to that of the Toltec as a way to usurp tradition for self-legitimizing purposes. Not the least of the empires to do this was that of the Aztec (or more specifically the Aztec-Mexica, with Mexica being the tribal affiliation within the Aztec group), whose origin myth has them coming out of Tollan—another name for Tula and the Toltec Empire—and wandering for years before settling a swampy, snake-infested backwater island in Lake Texcoco in the Mexico basin, from which rose their capital city Tenochtitlán.

The founder of the Aztec imperial line was Acamapichtli, elected king (*tlaotani*) in 1376. On his death his son, Huitzilohuitl (r. 1395–1417), was elected, followed by Acamapichtli's grandson Chimalpopoca (r. 1417–27) and then his other son Itzcóatl (r. 1427–40). The Mexico basin was essentially composed of a system of competing city-states, and under Itzcóatl, Tenochtitlán allied itself with Texcoco and Tlacopán, two other regional city-states, to form what is commonly called the Triple Alliance. Beginning in 1428 the three allied powers first succeeded in conquering powerful city-states, notably Chalco. During the reign of Motecuhzoma I (r. 1440–68) the Triple Alliance expanded far beyond the basin. Succeeding Aztec *tlaotani* include Axayácatl, Tízoc, Ahuítzotl, and Motecuhzoma II, who was the last ruler before the Spanish conquest.

In the course of developing the empire the Aztec made substantial achievements: They built major waterworks and causeways, expanded *chinampa* (raised field) agriculture, promoted ceremonial and public architecture within urban centers, and raised standards of living. The strength of the Aztec military grew as well. Warfare became idealized and unremitting, long-range military campaigns grew commonplace, and ever-increasing tributes from conquered regions were expected.

As the empire extended its control over more distant and diverse city-states and regions, control became more tenuous. Enemy states such as the Tarascans to the west and the Tlaxcalans to the east remained independent, and quelling rebellions and reconquering upstart city-states necessitated great expenditures of money and materiel. Imperial strategies for establishing and maintaining control can be divided into four areas—economic, political, frontier, and elite—each geared toward expansionist objectives.

The economic strategy was to control resources, emphasizing production and exchange with the goal of expanding trade and diversifying goods. Conquered city-states were grouped into tributary provinces; tribute was a scheduled, repetitive, and relatively predictable form of delivering products to the imperial centers. Tribute items included large quantities of food staples such as maize, beans, cacao, honey, salt, and chilies; textiles and clothing items such as garments, raw cotton, and cochineal dye; jewelry and luxuries such as colorful feathers, lip plugs, amber, turquoise masks, and gold bars; and miscellaneous products like copal incense, paper, and pottery bowls. The Codex Mendoza, one of the few painted manuscripts to survive the conquest, contains a list of all tribute items brought to Tenochtitlán from the periphery. While tribute was meant specifically for the benefit of the imperial center, the demands of production nonetheless stimulated commercial activity and interaction in outlying areas, with

the fortuitous effect of encouraging cohesion based on intertwining interests and needs.

The political strategy emphasized controlling political competitors by diffusing the power of local rulers (*tlaotque*) and making sure formerly autonomous states were dependent on their new imperial center. After conquering a city-state, the Aztec most often left existing political structures intact, so long as the conquered people agreed to pay tribute and accept the Aztec god Huitzilopochtli. Sometimes, however, the Aztec directly interfered with local political offices by eliminating some, downgrading others, and creating new administrative positions and installing persons who were family of the Mexica ruler. In a few particularly unstable areas, the Aztec installed powerful governors, military garrisons, or forts.

The frontier strategy focused on goals of security and containment along hostile imperial borders. Especially hostile borders to the east and west inhabited by the Tlaxcalans and the Tarascans, respectively, necessitated establishing fortresses, dispatching garrisons of warriors, and sending colonists to strengthen frontier regions. In the case of the Tarascans, to whom the Aztec suffered a disastrous defeat in 1478 or 1479, the Aztec established several client states along the border to act as a kind of strategic province or buffer zone. Situated along dynamic borders, the obligations of the client states included maintaining trade routes and stabilizing the border.

The elite strategy emphasized economic, social, and political links among elites throughout the imperial domain. These links were established through the reciprocal exchange of luxury goods, marriage alliances, and the shared use of common symbols and restricted cultural codes, such as writing and palace architecture. Perhaps the most interesting consequence of this level of interaction stemmed from the need for successful communication. To facilitate communication, Nahuatl, the native language of the Mexica, was imposed on the provincial regions as a kind of lingua franca; specific forms of manuscript painting spread; and new forms of stylistic interaction involving painted ceramics, mural painting, and manuscripts helped bind the elite into a kind of interacting social class. The Aztec succeeded in their imperial campaigns until the arrival in Tenochtitlán of the Spanish, led by Hernán Cortés, in 1521.

## THE MAYA

Unlike the Aztec and Inca civilizations, the Maya never constituted a unified or coherent empire but rather were divided into more than 60 kingdoms, each ruled by a “divine lord” and constantly struggling to maintain their autonomy or conquer their neighbor. The Classic Period marks the height of Mayan influence, largely in the central area, though they were never

isolated from developments in central Mexico, which at this time was dominated by Teotihuacán. The central area comprised the Tabasco, Campeche, and Quintana Roo states of Mexico; the Petén of northern Guatemala; Belize; and western Honduras. By 800 dynasties began to fail, and population levels dropped dramatically. In the Postclassic Period, Mayan population centers were largely concentrated in the northern and southern areas—the Yucatán Peninsula in the north and Chiapas, Mexico, and the highlands of Guatemala in the south. The last Mayan settlements remained beyond Spanish control, in part because they were buried deep in the jungles of northern Guatemala.

The intellectual achievements of the Maya include their writing and timekeeping systems. Although the origins of both systems are obscure, the Maya perfected both. Social and political developments emphasizing dynastic descent and ultimately divine kingship created the need for permanent records to proclaim genealogy, ritual, and great deeds. Legitimizing the rule of individuals by fixing their lives within a sacred time order was the primary purpose of these dynastic records. They were inscribed on monolithic stelae, stone wall panels, altars, thrones, and door lintels. The Maya left an astonishing permanent record in durable material such as stone, but most writing was done on perishable material, especially bark paper, which was used to make Mayan books called codices (of which only four examples remain from the Postclassic Period). The surviving texts are dedicated entirely to the concerns of the elite class. It is because of these records that much is known about Classic and Postclassic Mayan dynasties.

The Mayan political landscape in the Classic Period is an extraordinary system of shifting alliances and warfare, with complex hierarchical and family linkages. Mayan city-states depended less on borders for definition than on the dynastic seat at their ceremonial and commercial focus or core—the literal center. Domination or conquest rarely meant territorial acquisition, partly because of the massive expenditure of labor this required. Instead, conquest depended on bringing a rival “divine lord” under control. Where possible, the conquering center would work through the existing royal structure; recent scholarship indicates that when resistance proved permissive, a dominant “overking” might be installed, to whom the local king was beholden.

Tikal, Palenque, Piedras Negras, Calakmul, Naranjo, Caracol, Dos Pilas, Quiriguá, Yaxchilan, and Copán were all important classic Mayan centers. The political landscape comprised a confusing and elaborate system of shifting alliances, family linkages, and warfare that, in many ways, was similar to classical Greece or Renaissance Italy, with a sophisticated and widely shared culture flourishing amid perpetual

conflict and division. For example, Tikal, centered in the Petén region of northern Guatemala, is among the largest and most complex Mayan sites, and its dynastic history is known to span at least 33 rulers over 800 years. Inscriptions trace the origin of Tikal’s classic dynasty to a lord called Yax Ehb’ Xook (“First Step Shark”), whose ruling dates are not known specifically but estimated to begin around 90. The first contemporary date appears in 292 on stela 29, which also provides the first visual example of a Tikal ruler (*ajaw*), a richly dressed figure outfitted in regalia denoting rulership, an image that went essentially unchanged for the next 600 years. He is referred to as Animal Headdress.

From the fourth century rulers, listed here with their ascension dates if known, include Curl Snout (379), Stormy Sky (411), Kan Boar (458), Jaguar Paw Skull (486), Lady of Tikal (511), Bird Claw, Wak chan K’awiiil (537), Animal Skull (593), 23rd and 24th Rulers (ca. 640), Shield Skull (657), Ruler A (682), Ruler B (734), 28th Ruler (766), Ruler C (768), Nuun Ujol K’inch (ca. 800), Dark Sun (810), Jewel K’awiiil (849), and

Gold pendant with a miniature portrait of a Mayan ruler, Mexico, ca. 600–1521 (© The Trustees of the British Museum)

Jasaw Chan K'awiil II (869). By the ninth century Tikal, along with most other centers of the Classic Period, had been all but abandoned, and by the 10th and 11th centuries the jungle had reclaimed the once-great cities as its own.

## SOUTH AMERICA

Conventional scholarship subdivides Andean settlement into broad historical trends called horizons and intermediate periods. Horizons feature widespread similarities in the art and culture of various areas that may be associated with the power of a cult, state, or empire. Regional diversity, by contrast, is more characteristic of intermediate periods. Together the two types of periods help to define settlement patterns and the manner in which various settlements interacted or related to one another. Using these subdivisions the period from 500 to 1500 comprises the end of the Early Intermediate Period (100 B.C.E.–550 C.E.), the Middle Horizon (550–1000), the Late Intermediate Period (1000–1430), and the Late Horizon (1434–1532). The Spaniard Francisco Pizarro arrived in Peru in 1532, and the great Inca civilization, then at its climax, soon fell.

In the south-central highlands of Peru and Bolivia, beginning around 600, the Tiwanaku state began an aggressive expansion out of the southern Titicaca Basin, so called for its relation to the lake of the same name—Lake Titicaca—the epicenter of the largest agricultural center in the highlands. The site of Tiwanaku itself is a vast, planned urban capital that sprawled over the landscape of the altiplano, or high plain. At its height from 800 to 900 Tiwanaku boasted an impressive architectural core of pyramids, temples, palaces, streets, and state buildings. Surrounding the core of the capital was an urban settlement of artisans, laborers, and farmers who lived in adobe structures up and down the valley. Current estimates suggest that the total urban settlement covered an area of roughly 2 square miles, with a population in the valley ranging from 30,000 to 60,000. Large areas of intensified agricultural production are associated with Tiwanaku populations around the basin. At its height, including the surrounding area, the Tiwanaku state possibly reached a population of 100,000 people.

Tiwanaku artifacts and colonies are found throughout the area surrounding the Titicaca basin and beyond. Colonies are suspected in Moquegua, the Cochabamba and Larecaja regions of Bolivia, and the Arequipa area of Peru. It seems that Tiwanaku was not able to maintain an Inca-style empire by incorporating large, contiguous areas but that it selectively controlled economically and militarily strategic areas. Tiwanaku declined in the 11th century.

Roughly contemporary with, and possibly sharing origin with, Tiwanaku was the highland Wari culture, an expansive

state that stretched from the Cuzco area in southern Peru to Cajamarca in the north. For a long time the nature of the relationship between Tiwanaku and Wari was debated. *Enigmatic* might best describe it, because it seems to have been antagonistic when needed and cooperative when demanded. Each had religious and military aspects as well as being economic hubs. Overall, however, Wari took a more militaristic stance. The capital site, also called Huari, is at the center of up to 6 square miles that have been attributed to the Wari urban complex, which includes nearly 500 acres of stone architecture and 740 acres of domestic residences.

Provincial Wari settlements tended to be rigid and intrusive, akin to military compounds, and seem intended to dominate and organize the region within which they sat. For example, the settlement of Pikillacta, located near Cuzco, was built on a grid, had 700 individual structures, occupied 1 square mile of land, was surrounded by a multistory wall, and had a single entrance leading along a long, easily policed corridor.

Before the rise of the Inca, the Chimú Empire (or Chimor) flourished from about 1000 to 1470. Its capital was the site of Chan Chan in the Moche valley on the northern coast of Peru. Chan Chan's urban core covered roughly 2 square miles, with surrounding ruins covering nearly 8 square miles, and was entirely occupied by 11 immense, high-walled adobe *ciudadelas*—a combination of royal palaces, administrative and storage spaces, and mausoleums. At the height of its power Chimú controlled the northernmost 600 miles of the Peruvian coast, a desert region cut through intermittently by a series of fertile river valleys.

Little is known for certain about Chimú government, its rules of succession, and social structure, but it is suspected that Chimú was ruled by divine or semidivine kings who personified the state. Traditional history maintains that the founder of the royal dynasties of Chimú was a personage named Tacaynamo, whose son Guacricaur undertook the conquest of the lower Moche valley. In turn, his son, Nancenpinco, is said to have conquered a number of neighboring valleys, as did the seven successive rulers until Minchancaman, the Chimú sovereign whom the Inca faced in the 15th century.

Chimú apparently shared certain traits with their eventual conquerors. Like Chimú, the Inca expanded through military conquest, were economically organized by a system of labor tax supervised by the state administrative system, and embarked on large programs of land reclamation for agricultural use. By 1438 the Inca imperial campaign had begun.

The land of the Inca, known by its inhabitants as Tahuantinsuyu, or “Land of the Four Quarters,” was one of the world's great imperial states. At its maximum extent it stretched over 3,000 miles from northern Ecuador to just south of Santiago,

Chile. Administered from Cuzco, Peru, more than 350,000 square miles of land were unified, something no previous Andean state or empire had even approximated. The Inca built grand stone architecture, over 25,000 miles of roads traversing mountains and deserts, and thousands of provincial installations and stockpiled every imaginable supply as well as works of art in precious metal, stone, and cloth. Yet by 1532, the year the Spanish arrived, the empire was already showing signs of division and decimation; evidence suggests that smallpox arrived ahead of the Spanish. As magnificent as the rise had been, the conclusion of the empire was even more dramatic; in less than 100 years it had gone from what was probably a fairly sleepy town at Cuzco to imperial power to a Spanish colony.

The known history of the Inca is somewhat more complete than that of previous Andean empires through a combination of archaeological research and accounts written by the Spanish and, a little later, mestizo sources. Although the Spanish accounts are colored by their biases and must necessarily be read with discernment, they are nonetheless an invaluable resource. As the Spanish learned, the Inca civilization developed in the span of only four generations. According to the conventional list of kings, the empire was launched when the ninth king, Pachakuti, usurped the throne from his father and began to conquer the people around Cuzco. The entire list is Manqo Qhapaq, Zinchi Roq'a, Lloq'e Yupanki, Mayta Qhapaq, Qhapaq Yupanki, Inka Roq'a, Yawar Waqaq, Wiraqocha Inka, Pachakuti Inca Yupanki, Thupa Inka Yupanki, Wayna Qhapaq, Waskhar Inka, and Atawallpa.

Following the collapse of the Wari in the 11th century, a power vacuum developed in the Cuzco valley, and regional political competition ensued among entrenched settlements and newly developing villages. At the same time, Cuzco was rapidly developing and may have grown to as much as 125 acres, 10 times larger than any other village in the valley. Cuzco rose quickly from an obscure village to a royal capital and an urban hub, the center of a centralized state. The Inca solidified local authority through various combinations of force, diplomacy, reciprocity, alliances, and marriage, effectively reducing ethnic diversity, political competition, and administrative redundancy to create an Inca heartland capable of soon-to-be-realized dramatic expansion. Pachakuti then initiated the Inca imperial period, drawing in large part on the ability to mobilize large amounts of resources and people from the core area, including an army prepared to engage in extended campaigns.

The Inca proved to be master administrators, so much so that it could be said that logistics, strategy, and organization, rather than training, tactics, or technology, were primary reasons for the Inca's success. The Inca subdivided their en-

tire world into manageable and interlocking units—from the four quarters of Tahuantinsuyu to taxpayers to their famous sculpted stone walls. Governmentally the ruler oversaw governors of the quarters who in turn controlled regional and local administrators, who supervised a population divided into multiples of 10 taxpayers. The census data from this system were as accurate as any gathered from modern systems. This level of detail, alongside a feared military apparatus, forced nomadic labor, kidnapped local rulers, a highly well-organized bureaucracy, and an efficient supply system spread across the empire's unparalleled road network, among other factors, allowed the Inca to rapidly expand and quickly control an enormous amount of land and people.

## ASIA AND THE PACIFIC

BY KENNETH HALL

During the medieval era Asia was the most advanced region of the world. While the West entered a period of decline after the fall of Rome at the end of the fifth century, India, China, Korea, Japan, Sri Lanka, and Southeast Asia were reaching the heights of their respective civilizations.

### CHINA

With the fall of the Han Dynasty in 220 northern China endured 400 years of periodic raids by seminomadic tribesmen from the steppe grasslands of central Asia as well as warfare among the powerful regional warlords. Dynastic stability returned first under the Sui Dynasty (589–619), a line of ruthless warriors whose military victories allowed them to consolidate their authority over northern and central China. The most noteworthy achievement of the Sui was the construction of the Grand Canal, which linked the productive eastern Yangtze basin to Beijing in the north and allowed surplus wet-rice production from southern China to reach needy consumers in northern China. The Sui emperors ultimately overextended their reach both in their commitment of human and financial resources to the restoration of dynastic government as well as in their heavy military spending as they attempted to secure China's western frontier. Popular revolts, political assassinations, and internal disloyalty provided the opportunity for the Sui regional governor Li Yüan (r. 618–26) to seize authority and restore order under the new Tang Dynasty (618–907).

The Tang Dynasty is frequently referred to as China's cosmopolitan age because of its openness to new ideas and cultural options. People of various ethnicities flowed into the capital city of Ch'ang-an (present-day Xi'an) by way of the reopened Silk Road, a major overland connection to the West. The Tang state institutionalized an educated Confu-

cian bureaucracy selected through a competitive civil service examination system to secure qualified candidates for public office. Like the Sui, the Tang Dynasty ultimately collapsed as the result of the financial drain of funding the troops required for the ongoing defense of China's northwestern borders. After a dissident military governor named An Lushan led a temporarily successful rebellion against the Tang that lasted from 755 to 763, the Tang emperors' authority was overly dependent on the support of regional governors. Tang authority collapsed in 907 when the regional governors established their own autonomy in what is known as the period of "Five Dynasties and Ten Kingdoms." Ultimately one of these competing powers, the Song, reintroduced dynastic authority in 960.

The Song Dynasty (960–1279) applied the broadly based neo-Confucian concept of human creativity, believing that it stimulated human intelligence to all sorts of constructive activities, including the development of such new technologies as printing with moveable type, weaponry powered by gunpowder, and improvements in navigation. The Song era is especially known for its artistic achievements and as an age in which the traditional classes and genders mixed more openly. Merchants and gentry shared in literary conversations at popular teahouses. In addition, urban residential districts became open to cross-class residence based on wealth rather than on birthright. Indeed, retrospective Chinese accounts of the Song era criticized the Song rulers for being overly relaxed, supposedly making China more vulnerable to foreign invasion.

The Mongol conquest of China in 1279 shocked the Chinese, since China had never previously been subject to rule by non-Chinese. The Mongols were warriors from the northern Asian steppes whose forces conquered and temporarily controlled the entire Asian continent from China to Turkey and from northern India to Southeast Asia by the late 13th century. The Mongol lord Kublai Khan (r. 1279–94), the first emperor of the Yuan Dynasty (1279–1368) waged a prolonged war against the Song from 1253 onward and finally completed his conquest in 1279.

Although the powerful Mongol Yuan emperors ruled China for a little less than a century, they adopted the country's governmental system, employed its Confucian bureaucrats, and accepted its cultural practices. The Chinese concluded from this acceptance by their conquerors that their civilization must be superior to any other. The Yuan emperors were aggressively expansionistic. Following his conquest of China, Kublai Khan sent his troops south to fight in the region of present-day Myanmar and Vietnam and sent Mongol fleets to attack Vietnam and Java. All these attempts to further extend the power of the Yuan Dynasty were costly failures, however,

*Kublai Khan (1215–94) and his empress enthroned, ink on paper, Mughal Dynasty, India, 1596 (Freer Gallery of Art, Smithsonian Institution, Purchase, F1954-31)*

especially Kublai Khan's repeated attempts to invade Japan in 1274 and 1281. Kublai Khan's successors found themselves weakened by his debts. They were also isolated politically as the Mongol realm fragmented into independent regional components in the 14th century. Their own deficiencies ultimately paired with general Chinese dislike for alien rule to make the Yuan emperors vulnerable to overthrow by resurgent Chinese forces led by Ming generals.

The Ming Dynasty (1368–1644) was intent on reestablishing the pre-Yuan Confucian bureaucratic system. The emperors of this dynasty attempted to restore the Tang Dynasty system of rule instead of the more relaxed policies of the Song, which they held accountable for the fall of China to the Mongols. The Ming emperors, however, followed in the footsteps of the Yuan in their early foreign initiatives. Between 1405

and 1433 Ming rulers sent General Zheng He and his fleet of more than 300 warships on seven expeditions into the Indian Ocean to represent China's interests beyond its borders. After Zheng He's death these voyages ceased. In part, the country turned away from exploration because conservative Confucian political factions convinced the Ming emperors that internationalism was both expensive and unnecessary. The Confucian bureaucrats also argued that the voyages were detrimental to China's military priority, which was defending its northern borders from barbarian invasions. Thereafter Ming military investments focused on rebuilding the Great Wall and preparing for the inevitable invasion from the central Asian steppes.

## KOREA

By 668 the Silla kingdom, one of three rival states in early medieval Korea, had defeated the Koguryo realm to its north, annexed its former Paekche ally to its south, and consolidated its authority over most of the Korean peninsula. During the so-called Unified Silla era (668–918), the Silla rulers administered their realm with the assistance of Korean Buddhist monks. They also established a Confucian academy to train scholar-bureaucrats for a new civil administration and experimented with a formal examination system to fill the civil service with qualified candidates. The resulting political system depended on so-called flower knights (*hwarang*), a cultural and paramilitary youth organization that trained and educated the sons of the Silla elite. The *hwarang* instilled in their pupils the bone rank system, a societal hierarchy of warrior-aristocrats based on birth. By the 780s powerful landholding regional clans began to challenge the Silla Dynasty's central authority. Regional autonomy and limited court authority characterized the last decades of the dynasty, known as the Later Three Kingdoms era, which lasted until 935.

In about 918 a former merchant named Wang Kon rose to power, supported by regional Silla landholding clans. Wang founded the new Koryo Dynasty (918–1392) from which the name of Korea is derived), based in the city of Kaesŏng. The Koryo rulers abolished the Silla ranking system and replaced it with their own set of status distinctions. A literate class of bureaucrats who had passed the state's Confucian civil service examinations led Koryo society, in partnership with Buddhist clergy who had qualified for service through a separate examination. A privileged hereditary ruling class that included royalty, civil bureaucrats, military bureaucrats, and the Buddhist priesthood controlled the administration of the Koryo state.

The Koryo civilian bureaucracy held authority until 1170, when the state's generals, supported by a network of military officer-bureaucrats, began a 20-year civil war in response to

the increased concentration of power in the court. Other state bureaucrats who opposed the absolutism of the court joined their ranks, and from 1197 to 1258 the Choe family clan of military dictators held power. The Mongols ended this period of military-bureaucratic partnership by invading Korea in 1231 against limited opposition. They restored the Koryo royal family in 1259 and placed the Korean kings under the watchful eye of a Mongol overlord.

General Yi Seong-gye defeated the remnants of Mongol authority in 1364, following the slow collapse of the Mongol Yuan Dynasty in China during the 1350s. After 28 years of civil war, he deposed the Koryo rulers in 1392, founding the Joseon Dynasty (1392–1910), based in present-day Seoul, the capital of modern South Korea. Yi Seong-gye, who took the title of King Taejo (r. 1392–98) reassured the new Ming Dynasty rulers of China by accepting Korea's formal status as a Chinese tributary state, which subsequent Joseon and Chinese rulers described as a relationship between a "younger brother and elder brother." King Taejo and his successors implemented a new style of government run according to the principles of Confucianism and purposely reduced Buddhism to the status of a secondary religion. He seized lands belonging to Buddhist monasteries, closed temples, and placed the supervision of restricted Buddhist activities under the watchful eye of a newly empowered landowning aristocracy known as *yangban*.

Taejo and subsequent Joseon rulers favored Confucian ancestor worship and its rituals over Buddhist traditions and implemented a Confucian social code that discouraged practices that had reinforced the autonomy of the traditional family clans, such as taking multiple wives, granting permission for widows to remarry, and marrying within the family clan network. In return, the gentry were granted the hereditary right to both civil and military appointments. Confucian examinations and official appointments were open only to *yangban* candidates—in contrast to the Chinese examination system and bureaucracy that was in theory open to all males. The first centuries of Joseon rule were highly innovative and productive, but over the centuries the system lapsed into aristocratic factionalism and administrative ineffectiveness.

## JAPAN

By about 400 the Yamato clan, centered in the region surrounding present-day Nara in the Kinai region of the Yamato plain of south-central Honshu, was able to forge a network among the aristocratic clans, or *uji*, of their region by a combination of conquest, absorption, and the incorporation of the *uji* leaders as government ministers. The imperial clan began to organize the other *uji* into ranks that were subordinate to the ruling Yamato family, which claimed ultimate authority

due to its divine descent from the sun goddess Amaterasu. The Soga *uji* eventually took over the day-to-day affairs of the early Japanese state. Following a war over the imperial succession in 587, the Yamato emperors—initially an empress—became symbolic heads of state and spent most of their time performing state Shinto rituals, while the *uji* were assigned specific tasks in the new imperial administration (including revenue management, religious rituals, and waging warfare) by the Soga Prince Shōtoku, who served as the court regent to the Yamato empress.

Prince Shōtoku (r. 593–621) promoted the spread of Buddhism in Japan as a superior new form of magic as well as because of its importance in forming ties to contemporary China. Prince Shōtoku thought that Buddhism played a key role in the renewal of the Chinese social order that promoted centralization of political power. With Shōtoku's encouragement, clan leaders in Japan competed with one another to erect lavish local shrines dedicated to the main Buddhist sects, each an extension of Buddhist sects based in China. The central temples of these Buddhist sects in Japan were located in the imperial city of Nara. The Nara temples served as centers from which the competing sects spread their influence among the clans.

The Buddhist priests and *uji* elite accepted their proper place in the new Yamato political and religious order. After Prince Shōtoku died, the heads of several powerful *uji*, led by Fujiwara Kamatari, the head of the Nakatomi clan, planned and eventually staged a successful revolt in 645 coincident with the succession of a new emperor to the throne. Subsequently Kamatari assumed a partnership with the new emperor, Tenchi, and as the head of the retitled Fujiwara family he implemented the new Taika (“great change”) Reforms that were intended to eliminate what remained of Japan's old decentralized government. Kamatari also established a new capital at Naniwa (now incorporated within the modern-day city of Osaka, south of Nara), which was modeled on the urban grid pattern of the contemporary Chinese Tang capital at Ch'angan. The Taihō Code (702), which was implemented in 710 by Kamatari's Fujiwara successors, further codified the new Japanese political order, formalizing the Yamato state structure that had emerged gradually over the previous century.

Nara became the new imperial capital in 710 following the death of Emperor Tenchi, ending the historical tradition that the Yamato court move each time an emperor died in order to avoid the ritual pollution associated with the deceased. Nara was the site of the realm's greatest Buddhist temples, such as the stunning Tōdai-ji (Eastern Great Temple) and its great statue of the Buddha, known as the Daibutsu. The monks of six Nara-based sects competed for the patronage of the emperor and his elite but too often took this competi-

tion into the streets of Nara, where subsequent records report that they regularly fought with one another as justification for the government's fear over the growing importance of Buddhism.

An open affair between a Buddhist priest and the empress Shōtoku in the 750s reinforced public fears that Buddhism had become a threat to the civil order. When the priest and the empress tried to dislodge the Fujiwara family's control of the court, the imperial military intervened to physically occupy the Nara temples and to place the Nara priests under a form of house arrest. With the death of the empress the new emperor Kammu (r. 781–806) and his Fujiwara advisers decided in 784 to move the Japanese capital to Heian (modern-day Kyoto) at the northern end of the Yamato plain. The move was completed in 794, leaving behind the tarnished reputation of the Nara court and the previously powerful Nara-based Buddhist sects.

To eliminate the negative influence of the Buddhist sects and female members of the imperial family, during the Heian imperial era (794–1185) only the Tendai and Shingon sects of Buddhism were officially recognized, and women were no longer allowed to hold the imperial throne as rulers in their own right. The imperial authority of the Heian rulers reached its height in the 10th century, when the Fujiwara clan had exclusive management of the affairs of the court on the emperor's behalf. Under the Fujiwara family, which continued to dominate imperial government until 1160, the court became more and more insulated from the affairs of the countryside, and eventually the rural areas were no longer subject in fact to the direct authority of the court.

After 1185 a series of military strongmen called shoguns wielded ultimate political authority in Japan. The shogun received his authority from the emperor after winning battles against armed opponents. In theory, the emperor delegated the responsibility of running the Japanese imperial state to the shogun. Under the decentralized system of the Kamakura shogunate (1185–1333), which was based in the city of Kamakura southeast of modern Tokyo, the regional samurai lords were vassals of the Kamakura shoguns. The Kamakura court was administered by hereditary educated samurai. Its authority depended on its negotiated alliances with local samurai rather than reassignments of loyal Kamakura samurai to military fiefs. The emperors in Kyoto and the Kamakura shoguns competed for the support of local administrators, who controlled semiautonomous farming estates called *shōen* that had developed in the later imperial era.

The Kamakura shoguns were successful in repelling two Mongol invasions of Japan, in 1274 and 1281, respectively. The shoguns had considerable help from the *kamikaze* (“divine winds”), severe typhoons that destroyed the invading

Mongol fleets. The expense of maintaining a strong defensive force against potential Mongol invasions, however, eventually undermined the Kamakura shogunate. After defeating the Kamakura clan in 1338, the Kyoto-based Ashikaga, or Muromachi, shoguns ruled Japan from 1336 to 1467. There was a further decentralization of authority, but the Ashikaga era is especially noteworthy for cultural developments that represented a fusion of the imperial court traditions with samurai culture. The Ashikaga era ended with a century of civil wars from 1467 to 1568 among rival samurai armies loyal to regional warlords who were consolidating their power.

## INDIA

Gupta imperial rule over northern India ended around 550 as a result of the century-long drain on public resources to defend India's northwestern frontier against repeated attempts at invasion by eastern Hun seminomads. There was a brief renewal of centralized authority under Harsa (r. 606–47), a military leader of the early seventh century. Harsa claimed that he had restored the Gupta realm. Harsa's was a military rather than a civilian administration, however. After his death India once again lapsed into a group of regional states dominated by martial kings or chiefs.

At the turn of the second millennium northern India faced a new onslaught from the northwest by Muslim invaders, most of whom were Turks from central Asia. The new invaders, like numbers of seminomads before them, entered India via the northwestern passageways. Between 1010 and 1525 India was ruled by a series of Muslim dynasties. After 1206 the Muslim fortified city of Delhi and its suburbs became the new capital, and the rulers were known collectively as the Delhi sultans.

The initial Muslim invasion was led by Mahmud of Ghazni (r. 997–1030), a warrior based near the present-day city of Kabul in Afghanistan. Mahmud, who was the first Muslim ruler to take the title of sultan, raided India 17 times between 1001 and 1025. His heirs continued to have a presence in the city of Lahore from 1010 to 1156 and in the Punjab region until 1186. Between 1175 and 1205 the Ghurids of northern Persia extended their authority into northwestern India. Finally, in 1206 the Ghurid warrior Qutb-ud-Din Aybak (r. 1206–10) took Delhi. Aybak's successors, collectively known as the Slave Dynasty, also known as the Mamluk Dynasty, reigned from 1206 to 1290. The Khilji Turks ruled the Delhi Sultanate from 1290 to 1320, followed by the Tughlaq Turks (1320–1413), the Sayyid Turks (1414–51), and the Lodhi Afghan rulers (1451–1526). In 1526 Zahir-ud-Dom Muhammad (known as Babur), an Afghan heir of the Mongols (r. 1526–30), defeated the Lodhi armies and initiated the Mughal Dynasty (1556–1707).

The Delhi era of Muslim rule in India is characterized by some scholars as a succession of Turkish dynasties that ruled from their walled fortresses over their largely Hindu subject populations in northern India, from whom they exacted taxes in return for offering them protection. Despite this seeming separation between ruler and ruled, Muslims and Hindus began a productive intercultural dialogue typical of the earlier eras of cultural integration, except that the Muslim rulers allowed Hindus greater opportunity to retain their cultural traditions as long as they submitted to Islamic sovereignty.

Alongside these developments in northern India, southern India was ruled by a series of Hindu dynasties from roughly 600, in part the result of the resettlement of refugees from the north. The Pallava, Chola, and Pandyan kingdoms were based in the multiple river system valleys and fertile plains of India's southeastern Coromandel Coast. The Chera monarchs ruled over the southwestern Malabar Coast. Among these dynasties, the Cholas consolidated their control over their rivals in the 10th and 11th centuries. They sent successful military missions to annex the neighboring region of present-day Sri Lanka as well as raiding parties against Bengal to the north and the Srivijaya Empire, which at that time controlled the straits of Melaka. These straits were a vital maritime passageway between China and India.

In the 14th century the Vijayanagara Hindu monarchy (ca. 1323–1565), which constructed a lavish court and ritual complex on the southern Deccan plateau of Karnataka, annexed the entire southern region. The Vijayanagara rulers incorporated the existing regional warrior elite (*nayaka*) or assigned members of the royal military as delegated provincial governors. Similarly to the contemporary Delhi Sultanate system, the Vijayanagara commanders governed from regional military garrisons, in contrast to the previous age, when royal troops were clustered exclusively around the royal court. The *nayaka* partnered with local elite and strategic temples to control the surrounding rural communities.

## SRI LANKA

Anuradhapura was the early center of the Sri Lanka agricultural and Theravada Buddhist community. It remained the capital city of the island from ancient times until 1000, when invading Tamil Chola armies from southern India plundered the city and established a new capital at Polonnaruwa to the southeast. Sri Lanka forces retained Polonnaruwa as their capital when they retook the island in 1070. The state that was based in the new capital reached its height in the reign of Parakramabahu I (r. 1153–86), as Sri Lanka prospered as a center of the trade network surrounding the Indian Ocean and as the international center of Theravada Buddhist scholarship. But by 1200 this realm had fragmented, in part because the Tam-

ils of southern India regained a political foothold in northern Sri Lanka. There they founded the Jaffna kingdom and began a series of raids against their Sinhalese neighbors from their regional power bases in Kandy in the hills of central Sri Lanka and Kotte in the south near present-day Colombo.

## CAMBODIA

The Angkor state, centered in present-day Cambodia, was founded by King Jayavarman II (r. ca. 802–50), who celebrated the unity of the Khmer people as the result of the favor of the Hindu god Shiva. Angkor remained the realm's capital under Yasovarman I (r. 889–910). Suryavarman I (r. 1010–50) extended Angkor's territory in all directions and consolidated its political authority; Suryavarman II (r. 1113–50) defended Angkor against its neighbors in the kingdom of Champa in central Vietnam and also sponsored the construction of the Angkor Wat temple complex, dedicated to the Hindu god Vishnu.

In 1177 the Champa king's forces raided Angkor, desecrated its temples, and carried off the state's wealth and significant numbers of its population. Jayavarman VII (r. 1181–1215?) restored order and built a new capital city adjacent to Angkor Wat at Angkor Thom, which he centered on the Bayon Mahayana Buddhist shrine. Following the death of Jayavarman VII the Angkor state steadily declined. The armies of the Thai kingdom of Ayutthaya, based in former Angkor territories in the north and west, sacked the Angkor capital in 1431 and brought an end to the Khmer Empire (802–1432). They carried Angkor's royal regalia back to the Thai capital on the lower Chao Phraya River, where it remains to this day as the symbolic source of Thai political authority.

## BAGAN MYANMAR (BURMA)

Bagan, Myanmar's first inclusive state (ca. 800–1280), was centered in the middle of the Irrawaddy River basin. Buddhism always provided the economic and conceptual bases for Myanmar sovereignty. Bagan's cultural diversity and Buddhism had their roots in the early Mon Mahayana Buddhist tradition, which flourished in modern-day lower Myanmar and Thailand. In 1057 Anawrahta (r. 1044–77) annexed the southern part of Myanmar and its Mon culture, which allowed him to promote Theravada Buddhism as the source of cultural unity in the core agricultural zones that surrounded his court. Theravada Buddhist monasteries and temples in the court complex and elsewhere received strategic allocations of land rights and labor for resettlement. The Buddhist institutions in turn asserted their leadership in the development of new irrigation networks and wet-rice agriculture. Eventually the competition for power between the kings of Bagan, the wealthy Buddhist religious organizations, and each side's network of supporters brought down the Bagan state.

## SUCCESSION IN ANGKOR

Although there are many records of the kings of the medieval Cambodian kingdom of Angkor, some writers have suggested that royal succession was not through the male ancestral line but through the men who married into a female matrilineal line of descent. This certainly explains various succession crises in Angkor, but it cannot explain the absence of references to females in many of the surviving genealogies.

One of the usurpers in Angkor was King Suryavarman I, a Buddhist, who managed to take over several of the small kingdoms that had developed in eastern Cambodia in the late 10th century. He seems to have been a powerful military figure, and his reign is officially stated to have begun in 1002, but it was not until nine years later that his supporters swore an oath to him, according to the surviving inscription in the royal palace of Angkor. The manner of his claim to the throne was twofold. He himself traced descent from Prithivindradevi, the mother of King Indravarman (r. 877–90), and his wife was a descendant of Harshavarman I (r. 900–ca. 922). This made him, at best, the fifth cousin of his immediate predecessor.

A close study of his circle of patronage shows that Suryavarman I was clearly from an elite family, with some royal heritage, who managed to involve himself in a number of political coalitions to establish powerful friends at the court at Angkor and use his power to cajole others to support him in what essentially was a coup d'état, made possible by the collapse of social order in the capital, and his promise to restore law and order. He certainly achieved the latter during his reign, which lasted until 1050.

A Mongol invasion in 1287 destroyed the remnants of the Bagan kingdom, and a new Burmese dynasty emerged by the end of the 15th century at Toungoo in the southwest. The new dynasty was vigorously expansionist and regularly went to war against the neighboring Thais, in part in order to dominate the high volume of international trade in the upper Bay of Bengal.

## JAVA

Sanjaya (r. 732–60), a patron of the Hindu god Shiva, was the first significant ruler of Java. He built his court and the first of Java's sprawling temple complexes on the sacred Di-

eng Plateau in north-central Java. Sanjaya was succeeded by a series of Sailendra monarchs into the mid-ninth century, all of whom followed his lead and built several major Mahayana Buddhist temples in central Java near modern-day Yogyakarta, including the early ninth-century temple complex at Borobudur.

In the late ninth century Hindu kings based in central Java defeated the Buddhist Sailendras and proclaimed their sovereignty over what they called the Mataram state (ca. 760–1000). These kings constructed their own equally impressive central temple complex dedicated to Lord Shiva at Prambanan, north of Yogyakarta near Mount Merapi, an active volcano.

After a devastating eruption of Mount Merapi in the 10th century temporarily made the plains of central Java uninhabitable, the center of Javanese civilization shifted to eastern Java. Temples assumed less importance as statements of royal authority. Instead, the kings of Java through the reign of Airlangga (r. 1019–45) encouraged the spread of wet-rice agriculture in eastern Java and exploited the region's strategic position close to the international maritime trade route to eastern Indonesia's Spice Islands. Following Airlangga's death, the Java monarchy split into competing factions, with kings identified by their association with two rival courts, one at Kediri on the southwestern edge of the Brantas River plain and the other at Singhasari to the southeast on the Malang Plateau.

The Majapahit Empire (1293–1525), based near present-day Surabaya, was the high point in the development of the Hindu-Buddhist civilizations on the islands of Southeast Asia. It controlled all the islands that are now part of Indonesia, which they called Nusantara. Local societies appropriated Majapahit's refined culture. The most notable of these societies was neighboring Bali, which still practices the Hindu religious traditions it inherited from the Majapahit Empire. During the 15th century the Majapahit Empire faced aggressive competition from the newly Islamic ports on Java's northern coast. In 1528 the empire finally fell to a military coalition led by the Demak Sultanate.

## MELAKA

The Melaka (Malacca) maritime state was founded by the Sumatra-based Malay prince Parameswara (d. 1414), who claimed to be the heir to the earlier network of ports along the straits that the Chinese and Indians called Srivijaya. Parameswara moved his court there from what is now Singapore in about 1390. Within 50 years Malacca had become the wealthiest commercial port in Asia. It served as both the connecting hub in the trade between India and China and as the international source of Indonesian spices.

The initial success of Melaka was the result of special diplomatic ties with the Ming Dynasty of China. Merchants wishing to trade in Chinese ports were given special treatment if they first made stopovers in Malacca. In return, the state was obligated to keep the straits free of piracy, thereby assuring the regular flow of Western luxuries, Indian textiles, and Southeast Asian spices into China. When the Ming court ended their aggressive diplomatic relationships with the region in the 1430s and subsequently began to restrict China's overseas contacts, the ruler of Malacca, Sultan Muhammad Shah (r. 1424–44) converted to Islam in order to encourage the Muslim merchants who dominated trade in the Indian Ocean to use his port and to legitimize Malacca's control over other ports in the straits region.

## VIETNAM

Northern Vietnam remained under Chinese sovereignty until the fall of the Tang Dynasty, when Vietnamese armies prevented the restoration of Chinese rule under the new Song Dynasty. The leadership of the newly independent Vietnam Lý state (1009–1225) partnered with Mahayana Buddhist monks trained in China to establish and administer the new government institutions. Minor officials were chosen by examination for the first time in 1075, and a civil service training institute and an imperial academy, which provided a mixed Buddhist and Confucian education, were set up in 1076. In 1089 a fixed hierarchy of Buddhist and secular state officials was established with nine degrees of civil and military scholar officials.

By the 13th century, however, the Buddhist religious institutions had become a threat to Vietnamese secular leadership. The Trần Dynasty (1225–1400) as well as the subsequent Lê Dynasty (1428–1527) began to recruit newly trained Confucian scholars from among the Vietnamese landed aristocracy to replace the Buddhist monks as state bureaucrats. Vietnam's emperors implemented their own version of the Chinese Confucian examination system. Unlike the Chinese examinations, however, which were open to all qualified male applicants, the Vietnamese system admitted only the sons of the Vietnamese landed elite.

From the 13th to the 15th centuries, the Vietnamese rulers repelled repeated Chinese attempts to annex their territory and fended off periodic raids by their Champa Hindu neighbors in central Vietnam. The multiple wars between the Vietnamese and the Champa eventually resulted in the fall of the Champa Kingdom to victorious Vietnamese forces in 1471. In 1527, however, the Lê state fragmented into regional courts ruled by rival factions of the royal family. After that, Vietnam had no effective central authority until the 19th century.

## EUROPE

BY BRADLEY A. SKEEN

The Romans abandoned the island of Britain in 410, and the entire Western Roman Empire collapsed in 476 under the impact of invasions by Germanic groups. However, the Roman provincial system remained more or less intact because the invaders could control the old Roman aristocracies and power structures more easily than they could establish new states. In most cases the Germanic peoples had been brought into the empire to serve as mercenaries against groups considered even more barbaric, and once they were in military control they saw no further need to submit to Roman authority. The last Roman emperor in the west, Romulus Augustulus, was a youth who reigned only from 475 to 476, dying after some years of captivity under the Ostrogothic kings of Italy.

### GERMANIC KINGDOMS

After 410 the Romans abandoned Britain as indefensible against the threat it faced from raids along the North Sea coast by Picts from Scotland and by Germanic peoples (Saxons, Angles, and Jutes) from across the sea. In 449 the Roman-Celtic king of Britain, Vortigen, entrusted the security of Great Britain to German mercenaries led by their chieftains Hengest and Horsa. But these leaders repudiated their allegiance to Vortigen and divided Britain into several German-ruled kingdoms. The Anglo-Saxon conquest of Britain seems to have been limited to the eastern part of the island for a century or so by a Romano-Celtic victory at Mount Badon in the late fifth century. Historical sources for this period are lacking, and popular traditions attribute this victory to King Arthur, who was probably a legendary figure.

In 476 the German prince Odacer, already in command of Roman military forces in Italy (mostly his own Ostragoths), declared himself emperor, the usual step for rebelling military commanders. However, he then declined that title in favor of that of king of Italy, thereby avoiding war with the emperor in Constantinople, who at that time was hard pressed by other enemies. Theodoric the Great (454–526) succeeded him and greatly strengthened the kingdom, but his state (including Dalmatia, modern-day Slovenia, and Croatia) did not last long under pressure from the Byzantines who reconquered much of Italy. After 560 invasions by the Lombards and other Germans destroyed the Ostragothic kingdom.

In 415 the Visigoths had been admitted to the Western Roman Empire as mercenaries and granted land to settle in southwestern France. After the general collapse of 476 they became an independent nation under King Euric, ruling most of southern France and almost all of Spain. However, the Visigoths under King Alaric II were defeated by the Franks in

507 and lost their territories north of the Pyrenees. The capital moved from Toulouse to Toledo. The last Visigothic king was Roderick, who was killed in 711 while fighting to prevent the eventually successful Islamic conquest of Spain.

The Germanic Burgundians, under their king, Günter, had established a kingdom inside the tottering Roman Empire in 411, making its capital the city of Worms on the Upper Rhine. Later, however, the Romans engaged the Huns as mercenaries to destroy the kingdom. Little is known about that conflict, but it eventually became an important element of Germanic legend and inspired the German national myth of the *Nibelungendlied*. In 443 Günter's son Gunderic was granted a second territory for the Burgundians, located inside the Roman Empire around the city of Lyon in southeastern France and including modern-day Switzerland. This state lasted until it was conquered by the Franks in 554.

Like other Germanic peoples, the Franks had come into the empire as mercenaries divided into several groups. The Frankish groups were a confederacy in which each tribe or group of tribes had their own kings. One of these kings was the semilegendary Merovech (Latinized as Meroveus) who is counted as the founder of the Merovingian Dynasty (447–751). By 486 his descendent Clovis (r. 481–511) had become king of the entire Frankish nation, which by then controlled northern France, Belgium and the Netherlands, and northwestern Germany. In 507 he conquered southern France from the Visigoths. His sons conquered Burgundy (554).

### BYZANTINE EMPIRE

The Eastern Roman Empire is called the Byzantine Empire by modern historians, after Byzantium, the original name of its capital, Constantinople. After the loss of the western half of the empire to Germanic invaders, the Byzantine emperor Justinian (r. 527–65) attempted to reconquer the west and succeeded in occupying the southern half of Italy, the extreme south of Spain, and much of North Africa (an area that had been conquered by the Germanic Vandals). But these conquests were short lived. The area of the Byzantine Empire continually diminished throughout the medieval period under pressure from Slavic invaders to the north and Muslim invaders to the south and east. Eventually it consisted of only the heavily fortified capital, Constantinople.

During the seventh century the Heraclian Dynasty was barely able to negotiate the continued existence of the Byzantine state in the face of invasion by Arabs newly converted to Islam. All the empire's possessions in Asia outside the western half of modern-day Turkey were permanently lost. During the Isaurian Dynasty in the next century the empire was threatened by internal religious strife: the so-called iconoclast controversy concerning whether paintings of saints

(icons) should be allowed to decorate churches. In the ninth and 10th centuries the Macedonian emperors restored prosperity to the empire and retook most of the Balkans, southern Italy, and Armenia. The 11th century brought new pressures, however, from Islamic Arabs and Turks and the loss of most Asiatic territories. The Comnenian emperors (1057–1185) attempted to retrieve their position in Asia by calling for help from the western Christian nations, which came in the form of the Crusades. These campaigns, however, did not have any decisive military effect, and during the Angeloi Dynasty, in 1204, the crusaders actually sacked Constantinople. After that the Byzantine Empire was ruled by the Palaiologan Dynasty and was slowly absorbed by the Turks (at first the Seljuks and then the Ottomans) until Constantinople itself was captured in 1453.

### CAROLINGIAN EMPIRE

In western Europe the kingdom of the Franks became the dominant power. Control of the kingdom passed in the eighth century from the Merovingian kings to courtly officials, members of the Carolingian Empire, who ruled under the title of mayor of the palace. The first such figure was Charles Martel (686–741), who defeated an Islamic invasion of France at the Battle of Tours in 732, limiting the Muslim conquest to Spain. His grandson Pepin the Short took the royal title in 751, and Pepin's son Charlemagne (Charles the Great) succeeded him in 768.

Charlemagne greatly expanded the size of the Frankish kingdom, occupying northern Italy and conquering much of Germany, including Saxony, Bavaria, and Carinthia (modern-day Austria). His expedition to Spain, however, was unsuccessful. On Christmas Day of 800 the pope crowned him emperor in recognition of the reunification of much of the Western Roman Empire into the new Carolingian state. In return Charlemagne ceded control of central Italy to the pope as the Papal States, a territory that continued as an independent principality until Italian unification in 1870 and today endures symbolically as the small territory of Vatican City.

The whole empire remained intact under Charlemagne and his son Louis the Pious (d. 840), but disputed succession resulted in a civil war that divided the empire in 843. Through the Treaty of Verdun, Charlemagne's grandsons divided the empire into three kingdoms. Charles the Bald received territory roughly equivalent to present-day France, and Louis received modern-day Germany and Austria. Lothair received the imperial title and the kingdom of Italy, to which was added territories equivalent to the Low Countries, the French provinces of Burgundy and Alsace-Lorraine, and Switzerland. The status of these lands was continuously disputed

### FROM LOTHARINGIA TO BURGUNDY

In 843 the empire of Charlemagne was split among his three grandsons: the western kingdom of Charles became the nucleus of France, and the eastern empire of Ludwig became the nucleus of Germany. Between the two lay the kingdom of their brother, Lothair, comprising what is today the Netherlands, Belgium, the Rhine valley, Switzerland, southeastern France (Provence and the Dauphiné), and northern Italy. This patched-together state was not destined to be, however; by 870 it had been annexed by Germany, except for some small portions taken over by France. While it lasted, it was called Lotharingia (after its ruler), which survives in the name of the modern-day French province of Lorraine. The dispute over control of this territory lasted throughout the Middle Ages and afterward, down to the world wars of the 20th century.

During the later Middle Ages the dukes of Burgundy attempted to form an independent state in this middle region. John II of France (r. 1350–64) made Burgundy a separate duchy under his younger son Philippe (1342–1404), and this dynasty soon gained control, through marriage, of most of the regions that are today the Netherlands and Belgium, as well as extensive territories along the upper Rhine bordering Switzerland. The textile-manufacturing industry in Flanders (present-day Belgium), and the international trade based in the Netherlands, soon made the duchy one of the richest states in Europe. Throughout the Hundred Years' War, Burgundy surpassed the French kingdom in wealth and power. The last independent duke, Charles the Bold (1433–77), attempted to consolidate his rule by occupying key cities in Switzerland, but he was defeated by the Swiss in a series of battles and was finally killed at the siege of Nancy. Despite his superior resources, Charles could not overcome the Swiss with his force of mounted knights because their peasant army had more quickly adapted to the changing conditions of warfare at the end of the Middle Ages. Within months Charles's daughter Mary wed the future emperor Maximilian, and the territories of Burgundy passed into the larger dominions of the Hapsburg dynasty.

throughout medieval and modern European history. After 870 Lothair's middle kingdom and the imperial title passed to Germany, which for the rest of the Middle Ages was the Holy Roman Empire. France took on an independent identity.

## VIKING AGE AND FEUDALISM

The disruptions caused by Viking sea raids from Scandinavia and overland by Magyars from eastern Europe tended to fragment and undermine any but the most local centers of power. At the same time the invaders created new and sometimes dynamic states. The western Europe that emerged from the last great invasions in 1050 was feudal. Power and control of resources was highly decentralized. The basic unit of political administration was the lord, a military leader who controlled a local castle and a small band of armed men (knights and men-at-arms). The land was allotted to the lord by a higher authority, such as a king, in return for service from the lord and his dependents. Thus a kingdom was nothing like a modern nation-state but was a collection of reciprocal relationships centered on a king. Each territory had its own laws and traditions, its own military obligations, and its own revenues and forms of taxation that no lord or king could standardize. It was not unusual for a nobleman to control fiefs from more than one monarch. The English king himself eventually controlled a host of titles to lands in France, such as the Duke of Normandy and the Duke of Aquitaine, making him the vassal of the French king.

## SCANDINAVIA

The Scandinavian Peninsula was the homeland of the Viking raiders who ravaged the entire European continent during the Viking age and founded kingdoms from Norman Sicily to Kiev Rus in the present-day Ukraine. In Scandinavia, Harold Fairhair united the kingdom of Norway and founded a dynasty that lasted until 1387. Denmark was unified and converted to Christianity under its first king, Harold Bluetooth, in 965. The early history of Sweden is less clear, but the first king to unify much of the country was Erik the Victorious (d. ca. 970), who was succeeded by the first Christian king Olof (d. ca. 1020).

## BRITISH ISLES

The Anglo-Saxon conquest of Britain had resulted in the formation of seven independent kingdoms: Northumbria, Mercia, Wessex, Sussex, Essex, East Anglia, and Kent (besides the Celtic kingdom of Wales in the southwest of the island). These kingdoms eventually were united under Alfred the Great (ca. 849–99), king of Wessex and then of England. From as early as 800, however, England was plagued by raids and invasions by Danes, causing much of the northeastern part of the country to become virtually a separate state under Danish control, the so-called Danelaw. King Canute I of Denmark (ca. 995–1035) finally conquered all of England. After Canute the succession of Danish and Anglo-Saxon kings was confused. In

1066 the matter was settled when William, the Duke of Normandy (a distant relation to Edward the Confessor, one of the last Anglo-Saxon kings), invaded England and became king more by rite of conquest than by lawful inheritance. William and his descendents continued as vassals to the French king in Normandy, even while becoming independent monarchs in England.

William the Conqueror's granddaughter Matilda married Geoffrey Plantagenet, the duke of Anjou in France. Their son became King Henry II of England (1133–89), because English law permitted inheritance of the throne through a female family member (which the Salic, or French, law did not). Henry and his descendants in the Plantagenet Dynasty, also known as the Angevin (from Anjou) Dynasty, ruled England throughout the rest of the Middle Ages. Members of the Plantagenet line also became the kings of Sicily and of the crusader state of Jerusalem. Henry's marriage to Eleanor, duchess of Aquitaine (1122–1204), gave England control over the French duchies of Anjou, Brittany, Normandy, and Aquitaine—the whole eastern half of France. Further, Henry began the English conquest of Ireland in 1171, a process that was completed by the end of the Middle Ages.

Henry's sons were among the most famous kings of England: Richard I, the Lionheart (r. 1189–99), and John Lackland (r. 1199–1216). Richard led the Third Crusade from 1189 to 1192 but during his journey back to England was kidnapped and held captive by a German nobleman. John, acting as regent, gained universal hatred in English history because of the taxes he had to impose to pay Richard's ransom. When he returned to the throne, Richard fought to gain an even more dominant position over the French throne and was killed in the process.

The Plantagenet king of England, Edward III (r. 1327–77), lay claim to the French throne by virtue of his descent from the French king Philip IV (r. 1285–1314), whose daughter Isabella was Edward's mother. Inheritance through the female line was not permitted under French law, however, and the French aristocracy accepted Philip's nephew, Philip VI, as their rightful king in 1328. (He ruled until 1350.) Edward pressed his claim by invading France and won a great victory at Crécy in 1346. But the general dislocations of the Black Death, or bubonic plague (1348–50), dampened the glory of this victory. For the next century British kings focused on claiming the French throne and frequently campaigned in France in a conflict that became known as the Hundred Years' War (1337–1453). Henry V (r. 1413–22) won a major victory at Agincourt in 1415 and actually forced the French king Charles VI to accept him as his heir. However, Henry's death at age 34, leaving only an infant son as heir, again prevented the English claim to the French throne from being

*The coronation of William I, Westminster Abbey, London, Christmas Day, 1066* (© Museum of London)

fulfilled. The British cause in France ultimately failed, and by 1453 England lost all its possessions in France except the coastal city of Calais.

The ascension to the throne of Henry IV (r. 1399–1413), Henry V's father, had not been entirely regular. He was of the Plantagenet family but was not the legal heir. However, he had won a civil war against other claimants, and no one questioned the rule of the popular and successful Henry V. Once the infant Henry VI was on the throne, however, other members of the royal house began to press their claims against an increasingly corrupt regency government. Hostilities eventually escalated into civil war (1455–89) between the house of Lancaster and the house of York, two rival branches of the Plantagenet family. The conflicts were later known as the Wars of the Roses because of the white rose badge sometimes worn by Yorkist soldiers and the red rose of the Lancastrian soldiers. The question of who would wear the crown was settled in 1489 by the military victory and coronation as king of Henry Tudor (r. 1489–1509), whose only claim to the throne stemmed from descent from Henry V's widow and her lover, Owen Tudor.

Edward I (r. 1272–1307) had attempted to conquer Scotland on the northern extremity of Great Britain but was not entirely successful. Thereafter English policy tried to neutralize Scotland by fomenting civil war between rival Scottish claimants to the throne and occasionally intervening directly. The house of Stuart gained control of the Scots monarchy after 1371 and, after the Middle Ages, eventually gained control of England through a marriage alliance.

## FRANCE

During the Viking raids, Robert, the count of Paris, succeeded the last descendent of Charlemagne as king of the Franks (r. 922–23). This was the beginning of the Capetian Dynasty,

named after Hugh Capet (r. 987–96), Robert's grandson. This long-lasting dynasty ruled France until 1328 and thereafter, through the branches of the family called Valois and Bourbon, through the French Revolution (1789–99) and after.

However, the French monarchy was not at first in a very favorable position. It directly controlled little besides the area immediately around the French capital of Paris, and after 1154 the kings of England controlled the western half of the country. Eventually Philip II (r. 1179–23) took over most of the English possessions in France during the reign of the English king John (especially as a result of the military victory at Bouvines in 1214) and secured much of the south of the country as a result of the crusade against the Albigensian heretics of that region.

In 1328 the main Capetian line died out, and Philip VI of Valois, descended from the brother of the earlier Capetian king Philip IV, became king of France. This succession was disputed by Edward III of England, whose claim to the Capetian Dynasty was more direct than Philip's but was through a female ancestor, which was legal in English but not French law. This dispute resulted in the Hundred Years' War between the English and French crowns for control of France. England was generally successful in the war, especially with the aid of its allies the dukes of Burgundy. However, in 1429 Joan of Arc, a French peasant girl who claimed to be inspired by divine voices, sparked a restorationist movement among many French nobles and ordinary people, leading to important French victories, especially in Orleans. By 1431 Joan had been captured by the English and executed as a heretic, yet this martyrdom strengthened French resolve. Especially after the defection of Philip III, the duke of Burgundy, from the English alliance in 1435, the English were quickly expelled from France, marking the end of the medieval period in France in 1453.

## HOLY ROMAN EMPIRE

The eastern part of Charlemagne's empire passed to Louis the German in 843, according to the terms of the treaty of Verdun, which split the empire into three parts. Most of the central kingdom of Lothair also quickly became attached to the eastern kingdom. Northern Italy, too, was included in this territory. The Papal States in central Italy remained independent, while southern Italy was controlled by Byzantine and Islamic invaders before finally being conquered by the Normans. The kingdom of Sicily, including the southern half of the Italian Peninsula, eventually passed to the control of the kingdom of Aragon in Spain.

At first the imperial title was not of much importance and was held by various members of the Carolingian family. However, once the Carolingian line died out, new kings of the eastern Frankish kingdom were chosen by election. Earlier Germanic kings had been elected by meetings of the entire society. A relic of this custom was the parliament or diet, a legislative body that existed in all western European kingdoms during the Middle Ages as a check on royal power. But only in the eastern or German kingdom did the older practice of elective monarchy reassert itself. The elections were originally conducted by the leading noblemen. The first elected kings were the duke of Franconia, Conrad I, elected in 911, and his successor, the duke of Saxony, Henry the Fowler, elected in 919. Henry's son, Otto I, also called Otto the Great, was elected king in 936 and took for himself the title of emperor in 962 in recognition of his continuing effort to revive and defend the tradition of the Roman Empire and of his victory over the Magyars at Lechfeld in 955. This began the Ottonian Dynasty of emperors and the proper use of the name Holy Roman Empire. Otto I ruled until 973.

Election by the leading princes and churchmen continued until 1356, when the papal decree known as the Golden Bull fixed seven electors: the count of Palatine, the king of Bohemia, the duke of Saxony, and the margrave of Brandenburg, together with the archbishops of Cologne, Mainz, and Trier. This electoral system made the German emperors even weaker than the other western European monarchs because the emperor would directly owe his throne to his leading noblemen and would usually have to bribe them at the time of election with land and cash and make promises not to infringe on their powers at the expense of the central government. A tremendous blow was struck to the power of the emperor under the Salian Dynasty (1024–1125), when Henry IV (r. 1056–1106) lost to the papacy the right to appoint bishops in the empire.

Frederick Barbarossa (r. 1152–90), Frederick I of the Hohenstaufen Dynasty (1138–1254), increased the power of the

emperor by reviving Roman law (the old system of law of the Roman Empire as opposed to the traditional law of the Germanic tribes), which held that the emperor was not bound by law or custom in his actions and that the nature of the law depended on imperial decisions and decrees rather than older judicial decisions (precedents), as in common law. Frederick II (r. 1212–50), however, was already the king of Sicily when he was elected in 1215, and he concentrated on reforming and strengthening his own kingdom. Consequently, he was happy to devolve unprecedented power on the German nobles—for instance, recognizing the various dukes and princes as rulers of independent states in their own right rather than as his feudal vassals.

After the Hohenstaufens the position of emperor declined in power and importance. Emperors from various families were elected, and sometimes competing emperors were elected by different sets of electors. Emperors tended to concentrate on their own lands rather than the empire as a whole. The beginning of the Hapsburg Dynasty reversed this trend, however. Rudolph I (r. 1273–91) of Hapsburg had served as emperor, but the Hapsburg Dynasty (which would rule the empire until its dissolution in 1806) properly begins with Frederick III (r. 1440–93) and his son Maximilian I (r. 1493–1519), who brought about legal and constitutional reforms to strengthen the structure of the empire, although the imperial government remained weak compared with contemporary states such as France or Spain.

## SPAIN

In 711 Spain had been conquered by Islamic Moors from North Africa. After failing to conquer France also, the Moors fell back from the Pyrenees and the Cantabrian mountains in northern Spain because the region and people were particularly poor. Local Visigothic peoples in these remote regions began to carry out raids and guerilla attacks against the Moors. As early as 718 the Visigothic king Pelayo proclaimed himself ruler of this area as the king of Asturias. By his death in 737 he had managed to recapture the city of Leon, beginning the Reconquista, the long period of retaking of Spain by Christian rulers.

Subsequently Christian knights carried out a policy of raids against nearby Moorish settlements, with occasional attacks against large Moorish cities deep in the interior of Spain when the opportunity offered. This drove the Moors from lands adjacent to Asturias, which was then repopulated with Christian peasants; in this way the border between Christian and Moorish Spain gradually shifted south through the eighth and ninth centuries. Eventually Asturias was divided because of the old Germanic custom of dividing a king's lands among his sons. By 1000 several independent kingdoms had been established in northern Spain: Portugal, León, Castile,

Navarre, and Aragon. Under Alfonso VI (1040?–1109) Castile was joined to León through inheritance and became the dominant power among the Christian kingdoms, closely followed by Aragon, which also conquered extensive overseas possessions in Italy and the Mediterranean islands. By 1228 only a small area in the extreme south of Spain around the city of Granada was left in Moorish hands. In 1469 the marriage of Queen Isabella of Castile and King Ferdinand of Aragon unified the greater part of the Iberian Peninsula. In 1492 they conquered Granada, completing the Reconquista. In 1512 Navarre was added to the unified monarchy, as was Portugal (briefly) during the 16th century.

### CRUSADER STATES

Beginning with the First Crusade in 1099, western Europeans gained a number of overseas possessions in the Holy Land, or the Middle East. These were ruled by relatives of the principal European royal and noble houses. The most important possession, the kingdom of Jerusalem (1099–1291), was initially ruled by Baldwin, duke of Lorraine. Its greatest ruler, however, was Queen Melisende (r. 1131–53), who married Fulk of Anjou, part of the Plantagenet Dynasty of England.

Another crusade, however, was declared by the papacy in 1170 in northern Europe against the pagan tribes inhabiting the Baltic Coast. These wars succeeded in conquering a large territory, including much of modern Poland and the Baltic states. They were not ruled by a royal house but by the Teutonic Knights, an order of crusading knights originally founded in the Holy Land to assist German knights. The order was headed not by a king but by an elected grand master. The Teutonic Knights and their leader were drawn from the noble families of western Europe, even though there was no succession by inheritance. The Teutonic Knights operated as an independent country under papal control until 1410 when they gradually began to lose territory, a process completed by the mid-15th century.

### SLAVIC KINGDOMS

The Slavs invaded Europe in the sixth century, occupying territories in the Balkans at the expense of the Byzantine Empire. The first Slavic kingdom to emerge was Moravia, but it was quickly absorbed by the Carolingian Empire. Poland became an increasingly important state, eventually controlling most of eastern Europe under the Piast Dynasty, which began with Mieszko I (r. ca. 963–92). Serbs entered the Balkans in the seventh century under the rule of the Vlastimirović Dynasty, establishing an organized kingdom around 1000. In 1346 Stephen Dušan (r. 1331–55) conquered much of the Balkans, but by 1389 the Ottoman victory at the battle of Kosovo brought the Balkans under Turkish rule.

The ancestor of the modern Russian and Ukrainian states was Kiev Rus, composed of Slavic and Viking elements. However, the independence of that state was ended and the whole of eastern Europe conquered by the Mongols in the 1230s.

### MAGYARS AND BULGARS

Among the waves of peoples who invaded Europe from the east at the beginning of the Middle Ages were two groups that formed permanent kingdoms. In 895 the seminomadic Magyars, or Huns, under their king, Arpád (r. from ca. 890), entered the great basin of the Carpathian Mountains, one of the richest and most fertile areas of Europe. They conducted destructive raids throughout central Europe until 955, when they were defeated at the battle of Lechfeld in Bavaria by the Holy Roman emperor Otto I. From 680 to 681 Bulgars, people probably ethnically related to Turks or Huns, conquered much of the Balkans and founded the precursor of the modern Bulgarian state under their khan, Asparuh. Both kingdoms were eventually conquered by the Ottoman Turks at the end of the Middle Ages.

## THE ISLAMIC WORLD

BY MASSOUD ABDEL ALIM

### THE FOUR RASHIDUN CALIPHS (632–661 C.E.)

On his deathbed in 632 C.E. Muhammad (ca. 570–632) named one of his closest companions, Abu-Bakr (r. 632–34), as his successor, marking the beginning of the rule of four Rashidun, or “rightly guided,” caliphs. The caliphate period encompassed this initial 30 years, several civil wars, and two major dynasties: the Umayyads (661–750) based in Damascus, Syria, and the Abbasids (749–1258) in Baghdad, Iraq. The key characteristic of the caliphate period is the union of religious and political power under one ruler. The caliphate ended in about 935 with the death of the philosopher and theologian Hasan al-Ashari, after which time political fragmentation became decentralized and the caliphate retained religious authority only.

Abu-Bakr’s two-year reign was focused mainly on maintaining the unity of the newly created *umma*, or Muslim community. He led wars of apostasy (defection from a religious faith), in which he fought the Bedouin tribes attempting to break away from the *umma* after Muhammad’s death. His victories gradually united the Arabian Peninsula. His successor, Umar I (r. 634–44), continued this policy and enticed breakaway tribes to participate in raids on tribes surrounding Muslim-controlled areas. This practice ensured that the *umma* could provide food and other resources for its mem-

bers, as Muhammad had declared it was forbidden to raid or wage war against other Muslims.

Umar I waged wars against Iraq, Syria, and Egypt. He won a decisive victory against the Persians at the battle of Kadiya in 637, which eventually led to the defeat of the Persian Sassanids at their capital in Ctesiphon, Iraq. Umar I, however, found greater resistance in Byzantine Anatolia, but he had a decisive victory in 636 at the battle of Yarmuk between Jordan and Palestine. He conquered Jerusalem in 638; by 641 Umar I controlled most of Syria, Palestine, and Egypt. Muslim armies continued to expand westward by conquest and eventually controlled North Africa. Umar I was assassinated in 644 when a Persian prisoner of war stabbed him in a mosque. Muhammad's followers then elected Uthman ibn Affan (r. 644–56) as the third caliph.

Uthman continued the Muslim conquest, seizing Cyprus from the Byzantine Empire, Tripoli in present-day Libya, most of Armenia, parts of the Caucasus region to the Amu Darya River in Iran, Herat in present-day Afghanistan, and the province of Sind in western India. By the mid-seventh century the Muslim empire reached from North Africa in the west to the Himalayas in the east. This broad reach catapulted Uthman to great power and stretched his political skills. He made enemies in several key constituencies, including the military, wealthy Meccan clans, and followers in Medina. Disputes arose about the ownership of land, administrative posts, and scriptural interpretation of the Koran. Rivals and enemies found a more suitable leader in Ali ibn Abi Talib (r. 656–61), Muhammad's cousin and son-in-law. In 656 Uthman was assassinated in his home, and his rivals named Ali the fourth caliph.

As a relative of Muhammad, Ali ibn Abi Talib enjoyed some support among Arabian tribes as Muhammad's true successor, but he also faced resistance, notably from elements in Mecca. During the next five years the first of several civil wars broke out. A group led by Aisha (614–78), one of Muhammad's wives and his favorite; her relative Talhah; and Zubayr, a companion of Muhammad's, attacked Ali for not avenging Uthman's murder. In the ensuing battle of the camel—so called because Aisha rode with the rebels and observed the battle from her camel—Ali defeated them and proceeded to appoint his lieutenants to key posts. He was, however, not completely successful in satisfying his army's need for spoils of war and continued to meet resistance, notably from Muawiyah I (r. 661–80), the new head of the Umayyads in Syria.

## THE Umayyad Dynasty

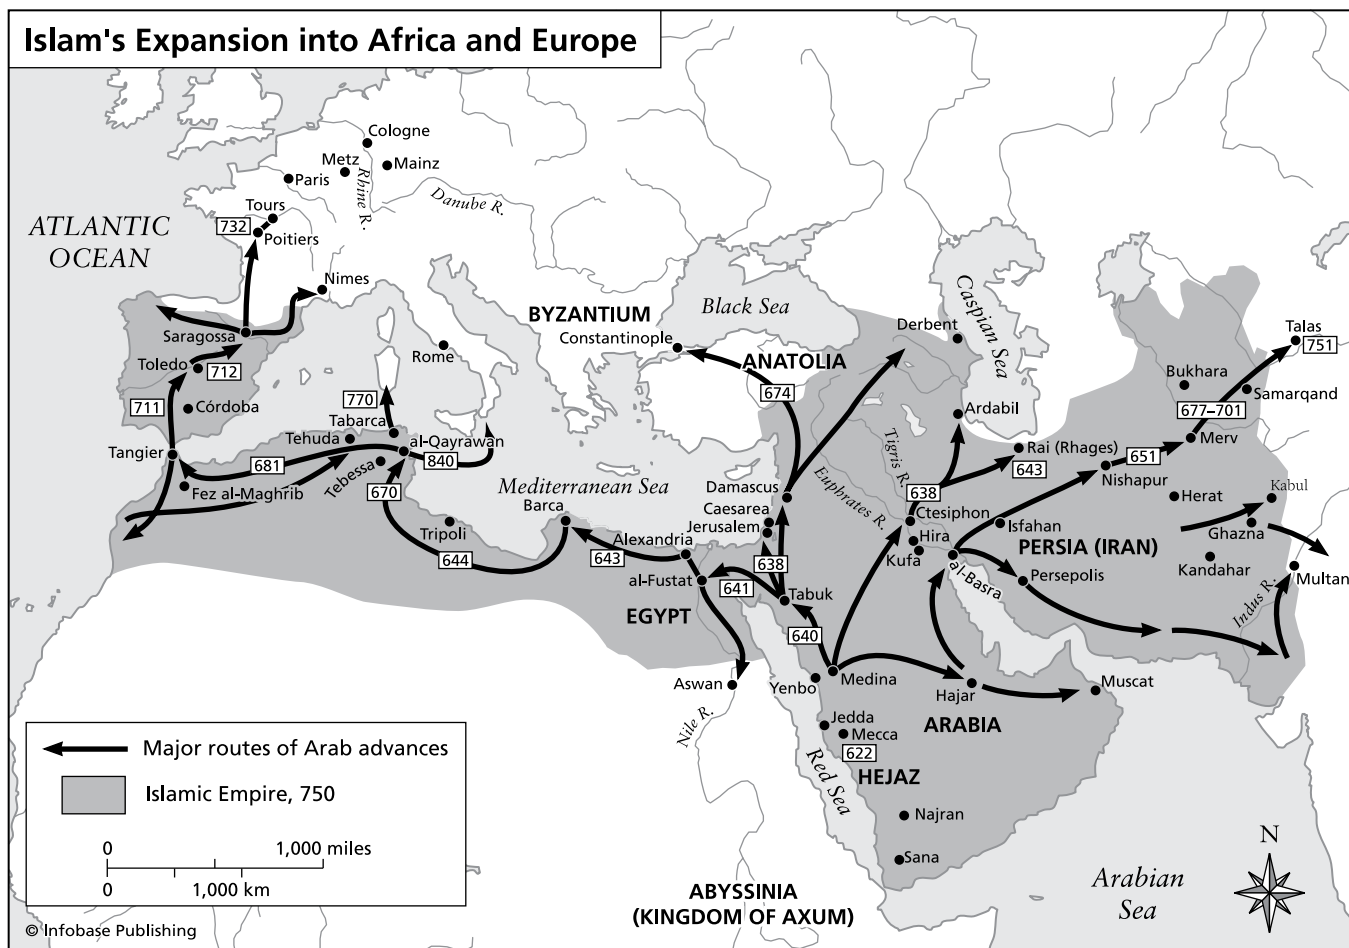

Muawiyah challenged Ali but, to avoid another civil war, attempted to negotiate a settlement. The two sides met in 657 at

Siffin (in the upper Euphrates, or present-day Iraq). Muawiyah asked neutral Muslims to manage the arbitration, which went against Ali. Upon Ali's defeat, Muawiyah declared himself caliph in Jerusalem. Ali's supporters (the Shia) were outraged and refused to accept the outcome. They became known as seceders; they held that the ruler of the *umma* should be the most pure Muslim rather than the most powerful. This is the genesis of the Shia-Sunni schism in Islam.

Muawiyah restored a strong administration and continued Umar's practice of segregating Arab Muslims from conquered populations. Initially, Muawiyah permitted Byzantine and Persian administrators to keep their posts because Arab Muslims lacked the skills required to manage complex, urbanized populations, but gradually these *dhimmi*s (subjugated Christians and Jews living under Muslim rule) were replaced with Muslims. Muawiyah was faced with several challenges in ruling his new empire. Rather than acting as an absolute monarch with dynastic aspirations, he ruled at the outset more like an Arab tribal chief, following the Arabian tradition of selecting leaders from the group's strongest men. A devout Muslim, he believed that Muslims should not fight with one another and worked hard to prevent another civil war. But he also understood the threat of sectarian division. Before his death he named his son Yazid I (r. 680–83) as his successor, a move that was met with immediate resistance.

Muhammad's daughter, Fatima, produced two sons by Ali: Hasan (624–80) and Husayn (629–80). Hasan was named caliph in 661 following Ali's assassination. That same year he acknowledged Muawiyah's grip on power, abdicated, and retired to Medina. In 680 Husayn revolted against Yazid, Muawiyah's son and successor, and was killed, along with his entire entourage, when Umayyad forces met Husayn's partisans in Karbala, on the Euphrates River. The massacre at Karbala became seared into the consciousness of Husayn's followers and was a seminal moment in the schism between the Sunni and Shia sects of Islam. His burial site eventually became one of the leading sites of pilgrimage for Shiite Muslims. By 683 Umayyad forces had conquered Medina, Ali's home base, and, following the death of Yazid I, his infant son, Muawiyah II was named successor. A second civil war ensued.

During the civil war Ibn al-Zubayr was recognized as the effective caliph, but he was opposed by Kharajites and eventually was defeated and killed. The Umayyads turned to Marwan I (r. 683–85), a cousin of Muawiyah I, and his son, Abd al-Malik ibn Marwan (r. 685–705), who together defeated the rebels by 691. Abd al-Malik exerted increasing political control, replaced Persian with Arabic as the official language, and built the Dome of the Rock in Jerusalem in 691 at the site of the ancient Jewish temple and later Christian church as a

Under the reign of the Umayyad caliphs (r. 661–750), Arab armies spread Islam into northern Africa and the Iberian Peninsula.

sign of the new supremacy of Islam. Abd al-Malik also loosened the edict separating Muslims from conquered people, a policy that created resentment against the special status and privileges accorded to Arab Muslims.

Abd al-Malik was succeeded by his son al-Walid (r. 705–15), who continued to centralize power and waged additional wars of conquest. Whereas earlier conquests focused on tribal expansion and built upon the migration of peoples, these new conquests were conducted for world domination and incorporated into the Muslim empire North Africa, Spain, Transoxiana, and Sind. Al-Walid also continued his predecessors' mandates to translate Greek and Persian works into Arabic, a task that was carried out by Christian, Jewish, and Persian scholars. Christians had translated Greek works into their native Syriac, which they then retranslated into Arabic. Jews translated ancient Hebrew into Arabic, and Persians translated pre-Islamic works from their native Farsi (which eventually became written in the Arabic script) into Arabic.

Both Abd al-Malik and al-Walid built upon existing Byzantine and Sassanid civilization to develop an infrastructure that incorporated Islamic symbols. Abd al-Malik substituted Byzantine gold and silver coins with ones displaying Arabic script. Al-Walid built new mosques in Medina and Damascus, drawing from Byzantine and Sassanid building practices. They also adapted administrative practices, chancery (public archive) documents, and even military organization from existing Byzantine models.

Internal strife continued, and by the reign of Umar II (r. 717–20) it came to a head. Umar II understood that Arab privilege over non-Arabs was increasingly untenable and that the empire needed to become more inclusive, compensate Arab and non-Arab members of the military equally, recognize the tax equality of all Muslims, and relieve converts of the poll tax that was required of Christians and Jews. These reforms were implemented unevenly as they challenged the established power structure. The last Umayyad caliph, Hisham ibn Abd al-Malik (r. 724–43), died in 743, and for the remainder

of the decade yet another power struggle took place between the Shiites, Kharijists, and various tribal factions.

### THE ABBASID DYNASTY

By the middle of the eighth century a branch of Muhammad's family, the Abbasids (named after an uncle called Abbas), began to lay claim to the caliphate. After leading a revolt in the Khorasan villages (near Marw), the Abbasids and their supporters seized power and declared Abu al-Abbas as-Saffah (r. 750–54) the new caliph. He decided to move the capital from Damascus to Baghdad, which was strategically located on the Tigris River. He declared the equality of all Muslims, continuing Umar's reforms and embracing both Arab and non-Arab Muslims. Arabic became the common language, conversions of conquered populations grew, and commerce expanded. Military officers were selected and promoted for their allegiance to the dynasty rather than for their ethnic origin.

In the new order the Abbasids delegated administrative posts to non-Arabs and even non-Muslims: Khorasan Persians, Nestorian Christians, and Jews participated in running the empire. Even Shiites were included. A more coherent administration emerged with three *diwans*, or bureaus, each with a distinct function. The chancery managed records and correspondence; tax collection was the domain of the department of land tax; and disbursements were handled by several bureaus, the most important of which was the military. This basic three-part structure subsequently subdivided into additional divisions and separate offices, creating an elastic administrative infrastructure that could meet the needs of a far-flung empire. Another innovation was the creation of the office of the *wazir*—a sort of chief operations officer—who was tasked with the coordination, supervision, and general management of the *diwans*. The centralized power base of the empire now had an effective administrative organ.

The provinces closest to the capital—the rest of Mesopotamia, Syria, Egypt, western Iran, and Khuzestan—were most tightly controlled by the Abbasid regime, which appointed governors on a rotating basis so that no single individual could accumulate enough power to challenge the regime. Farther out—in the Caspian region (Jilan, Tabaristan, Daylam, and Jurjan), inner Asia (Transoxiana, Farghana, Ushrusana, and Kabul), and North Africa—central control weakened considerably. In some cases the Abbasids appointed the heads of local dynasties to rule on their behalf.

The Abbasid Caliphate represented the full expression of the caliph as the supreme ruler in both the religious and political arena. Having drawn from the civilizations they conquered, the Abbasids were ready to place their own stamp on the society they created. As the ninth century progressed,

leaders in the Abbasid Dynasty patronized scholars, promoted pilgrimages to Mecca, appointed judges, drew religious leaders into their administration, and continued building mosques with Islamic decorative themes. Furthermore, they became champions of orthodox Islamic beliefs and defended the faith against heretics, or nontraditional thinkers. As a result, some poets, theologians, and scribes were repressed as the Abbasids required absolute loyalty to the caliphate. This massive consolidation of political and religious power contained the seeds of its own destruction.

The old problem of succession reemerged upon the death of Harun ar-Rashid (r. 786–809), with two of his sons pitted against one another. A third civil war ensued. Al-Mamun (r. 813–33) defeated his brother, al-Amin (r. 809–13), and declared himself caliph in 813. As a tactic to consolidate power, al-Mamun and his successor, al-Mutasim (r. 833–42), formalized the recruitment of Turkish and other enslaved soldiers into whole regiments. Al-Mutasim also moved the military and administrative parts of the regime to a new capital, Samarra, north of Baghdad. In the meantime, the central administration became weakened as a result of the growing influence of provincial leaders, interference from the military, and internal

pressures. Two major factions emerged, the Banu Furat and the Banu Jarrah, each with its own *wazir* and encompassing numerous small power centers. Each faction eventually gained control of the government and served its own members' interests first, a practice that increased administrative costs and decreased efficiency. The effectiveness and power of the Abbassids' central government ebbed. By the mid-10th century the Abbasid Dynasty declined, and the empire broke into various independent provinces. The caliphate was over.

### FRAGMENTATION FOLLOWING THE END OF THE CALIPHATE

Henceforth the Muslim world would be run by political leaders who, although they were Muslim in belief and practice, would not represent the highest religious authority on theological matters. Indeed, no single office for such leadership ever evolved. Political power continued to be dynastic but was highly decentralized, with several power centers throughout the Muslim world, notably in Iran, Egypt, and Spain. Several dynasties dominated the 10th century: the Samanids (819–1005) in Khorasan (eastern Iran), the Hamdanids (905–1004) in Mesopotamia, the Buyids (932–1062) in western Iran, the Ikhshidids (935–69) in Egypt, the Shiite Fatimids (909–1171) in Egypt, the Umayyads (956–1031) of Spain (or al-Andalus), and the Ghaznavids (977–1186) in Khorasan and Afghanistan.

The Samanid Dynasty was a Sunni Iranian dynasty encompassing a vast area that included Khorasan (eastern Iran), Rayy (the southern tip of the Caspian Sea), Kerman (southeastern Iran), and Transoxiana (northeastern Iran). Bukhara, in Transoxiana, was the Samanid capital; Samarqand, to the east, became an important cultural center. The Samanids largely maintained the Abbasid administrative structure: Members of local elite families governed the main power centers, with tribal chiefs or slave governors in the provinces. Under the Samanids, a Persian Islamic literature developed, as did other artistic forms. The Samanid regime lasted until the turn of the 10th century.

The Hamdanid Dynasty was Arab and composed of pastoral tribesmen. Their rule over Aleppo (Syria) and Mosul (northern Iraq and part of Mesopotamia) favored pastoral nomadic tribes over the existing sedentary agricultural population and led to economic decline.

The Buyid Dynasty held power in western Iran, Iraq, and Mesopotamia. They adapted the caliphate by appointing caliphs as nominal heads of state, recognized their leadership of Sunni Muslims, and acknowledged that their legitimacy derived from them. But real political power was held and exercised by the dynastic rulers. Largely a coalition of family members who ruled separate provinces, the Buyids' constant internal strife eventually weakened its central authority.

Several dynasties emerged in ninth-century Egypt and Syria as a result of appointments of slave governors by the Abbassids. One of the more notable was the Ikhshidid Dynasty, founded by a Turk named Muhammad ibn Tugh. The Ikhshidids ruled over Egypt, Syria, and the Hejaz (west-central Saudi Arabia).

Having seized power in Tunisia and claiming legitimacy as descendants of Ali, the Shiite Fatimid Dynasty went on to conquer North Africa, Egypt, and southern Syria. With the decline of the Abbasid Empire they established a rival caliphate; moved their capital to Cairo, Egypt; in 983 and built the al-Azhar madrasa (school), which remains a major Islamic center of learning. Cairo now competed with Baghdad as a second cultural and political center of power. The Fatimid regime integrated political and religious rule under one leader. Their administration derived from the Abbassids and contained both Jewish and Christian officials, along with Muslims. Islamic decorative themes—calligraphy, birds, animals, greenery, and fountains—thrived during this period.

On the western end of the empire, in Spain, the Arab conquest that had begun in 711 led to the establishment of a branch of the Umayyad Dynasty in the 10th century. This regime suppressed local revolts and built up a military from captives of conquered territories in northern Spain, Germany, and the Slavic states. The most notable line of leaders of this period were the Abd ar-Rahmans, especially Caliph Abd ar-Rahman III an-Nasir (r. 929–61), who centralized government control, expanded irrigation projects, continued building great mosques, and waged jihad, or holy war, against Christians from northern Spain. Córdoba and Seville became great cultural and commercial centers.

On the far eastern part of the empire a slave governor, Alptigin, seized power in Afghanistan, then called Ghazna, and founded the Ghaznavid Dynasty. Alptigin's forces went on to conquer Transoxiana, Khorasan, western Iran, and Lahore and other parts of northern India. The Ghaznavids built upon the Samanid administration and supported religious leaders and Islamic education. The regime replaced the existing establishment with enslaved soldiers. The Ghaznavids lost power to the Seljuks, members of the Oghuz tribe, when they crossed the Amu Darya River in 1025.

### THE SELJUK EMPIRE

The main leaders of the Seljuk Empire (990–1118) were Tughrul Beg (r. 1040–63) and his brother, Chaghri Beg. They conquered Nishapur in 1037 and ruled Khorasan by 1040. Moving westward, they defeated the Buyids and seized both Baghdad and the caliphate in 1055. They declared themselves sultans and reigned over an empire that stretched from Khorasan to Iraq. The nomadic Seljuk also made incursions into Anatolia and

gradually accumulated scattered pockets of control. They won a decisive victory over the Byzantine Empire at the battle of Manzikurt (now Malazgirt, near the northern source of the Euphrates River) in 1071, a victory that enabled additional nomadic peoples to enter Anatolia. By the end of the 11th century the Seljuk Empire reached to the Mediterranean Sea.

The Seljuks built upon Ghazvanid and Buyid modes of administration and continued the practice of building up their armies from slave recruits from Turkish, Greek, Khorasanian, Kurd, Georgian, and other tribes. They also looked toward religious authorities to legitimize their regime. As nomads, however, their customs and practices undermined these efforts. They had no clear path for succession. Grazing rights and inheritance often went to the whole family of a ruler. Furthermore, the practice of granting tracts of land to military leaders in lieu of booty subverted the development of bureaucratic institutions. Eventually the Seljuk Empire fragmented into numerous small states ruled by leaders of its various branches. These states included Iraq, Anatolia, Azerbaijan, Mesopotamia, Syria, Khuzestan, Fars, and Kerman, among others. Renewed nomadic invasions ensued, and political power continued to fragment in the 12th century, which ultimately cleared the way for the Mongol invasions of the 13th century.

### THE CRUSADES AND FURTHER POLITICAL FRAGMENTATION

Thus far, political power had passed from one Muslim dynasty to another—some Sunni, others Shiite. But by the late 11th century the Byzantine Empire initiated a counterattack to the several centuries of Muslim conquest. In 1094 Alexius I Comnenus (r. 1081–1118), the Byzantine emperor, appealed to the Western Roman Empire for assistance in stemming the Seljuk infiltration into Anatolia. In 1095 Pope Urban II (1035–99) declared the First Crusade. In 1099 crusader armies from Europe conquered Jerusalem and eventually established states in Palestine, Lebanon, Syria, and Anatolia. The crusader states lasted to the 13th century (1099–1291).

In Mesopotamia (Iraq) the Zengid Dynasty (1127–1250) reigned for most of the century. One of its more notable achievements occurred in 1144, when Imad ad-Din Zengi, the emir of Mosul in northern Iraq and Aleppo in northern Syria, defeated western crusaders in Armenia.

The founder of the Ayyubid Dynasty, Salah ad-Din (r. 1174–93), a Kurdish general known as Saladin in the West, defeated the crusaders in 1169 and reclaimed Jerusalem in 1187. He went on to defeat the Fatimids in Egypt and returned its Muslim population to Sunni Islam. The Ayyubids ruled Egypt (1169–1250) and Syria (1183–1260). They were deposed after a rebellion by Mamluks, or slave regiments. The officer Aybak (r. 1250–57) was named the first Mamluk sultan

of Egypt. The Mamluk Dynasty reigned up to the early 16th century in Egypt (1250–1517) and Syria (1260–1517). Unlike their predecessors, they managed to maintain some unity in controlled lands and governed by maintaining slave regiments and a bureaucracy in Egypt.

On the other side of the Mediterranean the Almoravids, a coalition of Moroccan Berbers, achieved political unification and founded the Almoravid Dynasty in Algeria and Morocco (1056–1147) and southern Spain (1086–1106). They established Sunni Islam over Shia and patronized the arts, philosophy, and architecture. The Almoravid Dynasty ended with a challenge from the Almohad movement, which attempted to reassert the primacy of the Koran and Hadith and emphasized moral purity. Their leader, Ibn Tumart (ca. 1080–1130), founded the Almohad Dynasty (1130–1269), which initially ruled Morocco, followed by Spain (1145), Algeria (1147), and Tunisia (1160). His successor was Abd al-Mumin (r. 1130–63), who replaced the prevailing religious oligarchy with a hereditary monarchy. Despite their efforts, however, the Almohad movement was not fully implemented. In 1212 the Almohads were defeated in Spain, and they gradually lost power as the 13th century progressed. By the end of their reign the age of the caliphates was over.

### MONGOL INVASION AND RULE

The legendary Mongol chieftain Genghis Khan (r. 1206–27) was building an empire in the Far East and rapidly moving west. Between 1219 and 1229 the Mongol general Hülegü (ca. 1217–65) attacked eastern Iran and the Amu Darya River area, Azerbaijan, and Syria; he eventually defeated Muhammad (r. 1200–20), the shah of the Khwarizmian Turks, and his son Jalal al-Din Mingburnu (r. 1220–31). The Mongols laid a number of Muslim cities to ruins, including Bukhara and Baghdad, and left a broad swath of massacred populations and devastated agricultural economies. They were ultimately stopped by Baybars I (r. 1260–77), the sultan of the Egyptian Mamluk Dynasty, in 1260 at the battle of Ain Jalut in northern Palestine.

Four states emerged: the Il-Khan descendants of Hülegü in Iraq and western Iran, the Chagatai in the Syr Darya–Amu Darya river basin, the White Horde in the Irtysh River area (north and east of the Caspian Sea), and the Golden Horde on the Volga River (north and west of the Caspian Sea). Their rule was fundamentally militaristic and their lifestyle nomadic. Although they tended toward Buddhism, they eventually converted to Islam and became the main political power in central Asia.

By the end of the Middle Ages (early 16th century) the Muslim empire was composed of three distinct centers of power. The Safavid Dynasty (1501–1732) ruled Iran (that is,

the region encompassing modern-day Iran, Iraq, and several south-central Asian states). The Mughal Dynasty (1526–1858) reigned in India. Finally, the Ottoman Dynasty (1281–1922) ruled Egypt, Syria (greater Syria, which included Lebanon, Palestine, and Israel), and Anatolia or modern-day Turkey.

### 39. HOW THEY MADE THE SON OF SOLOMON KING

And they made ready the ointment of the oil of kingship, and the sounds of the large horn, and the small horn, and the flute and the pipes, and the harp and the drum filled the air; and the city resounded with cries of joy and gladness. And they brought the young man into the Holy of Holies, and he laid hold upon the horns of the altar, and sovereignty was given unto him by the mouth of ZADOK the priest, and by the mouth of JOAS (BENAI AH) the priest, the commander of the army of King SOLOMON, and he anointed him with the holy oil of the ointment of kingship. And he went out from the house of the Lord, and they called his name DAVID, for the name of a king came to him by the law. And they made him to ride upon the mule of King SOLOMON, and they led him round about the city, and said, “We have appointed thee from this moment”; and then they cried out to him, “Bāḥ [Long] live the royal father!” And there were some who said,

“It is meet and right that thy dominion of ETHIOPIA shall be from the River of EGYPT to the west of the sun; blessed be thy seed upon the earth!—and from SHOA to the east of INDIA, for thou wilt please [the people of these lands]. And the Lord God of ISRAEL shall be unto thee a guide, and the Tabernacle of the Law of God shall be with all that thou lookest upon. And all thine enemies and foes shall be overthrown before thee, and completion and finish shall be unto thee and unto thy seed after thee; thou shalt judge many nations and none shall judge thee.” And again his father blessed him and said unto him, “The blessing of heaven and earth shall be thy blessing,” and all the congregation of ISRAEL said, “Amen.” And his father also said unto ZADOK the priest, “Make him to know and tell him concerning the judgment and decree of God which he shall observe there” [in ETHIOPIA].

### OF THE LINEAGE OF THE YNCAS AND HOW THEY EXTENDED THEIR CONQUESTS

IT must be understood, in the first place, that the lineage of these Yncas was divided into two branches, the one called Hanan Cuzco, and the other Hurin Cuzco. From this it may be concluded (and there is no memory

of anything to the contrary) that they were natives of the valley of Cuzco, although some pretend that they came from other parts to settle there. But no credit should be given to them, for they also say that this happened before the flood. From what can be gathered and conjectured in considering the traditions of the

present time, it is not more than three hundred and fifty to four hundred years since the Yncas only possessed and ruled over the valley of Cuzco as far as Urcos, a distance of six leagues, and to the valley of Yucay, which is not more than five leagues.

Touching the Lords that the people can remember, their recollection does not carry them back beyond the time already stated. They preserve the memory of these Lords by their *quipus*, but if we judge by the time that each is said to have lived, the historical period cannot be placed further back than four hundred years at the earliest.

It must have been at about that period that they began to dominate and conquer in the districts round Cuzco, and, as would appear from their records, they were sometimes defeated. For, although Andahuaylas, in the province of the Chancas, is only thirty leagues from Cuzco, they did not bring it under their sway until the time of Pachacutec Yupanqui Ynca, who defeated those Chancas. . . . On the other side of Cuzco is the road of Colla-suyu; and they also retain a recollection of the time when the Canas and Canches, whose country is even nearer, were paid to go with the Yncas to the wars, and not as vassals following their lords; and this was in the same battle in which Pachacutec Ynca fought against Usco-vilca, Lord of the Chancas. They also recollect the time when they extended their dominion along this road to the lake of Villañaota, the point where the Collao begins. Two powerful rivers flow out of this lake, one going to the north sea, and the other to the south. The lake was worshipped by the natives, and looked upon as a noted *huaca*. A long interval of time elapsed before the Yncas advanced beyond this point. It was the successor of that lord who conquered the Chancas who began to advance beyond this point, and those provinces had no peace until the time of Tupac Ynca, father of Huayna Ccapac. We found these wars recorded in the registers of the Yncas, but each province also had its registers of wars, so that, if it were necessary, we might very easily fix the time when each province was subjugated by the Yncas.

But it is enough to understand that these Yncas at first extended their conquests by violence and war. There was no general opposition to their advance, for each province merely defended its land without aid from any other; so that the only difficulty encountered by the Yncas was in the annexation of the districts round Cuzco. Afterwards all the conquered people joined

them, so that they always had a vastly superior force as well as more cunning in the art of war. Thus it was seldom that they were completely defeated, although sometimes they were obliged to retreat, and desist from a war during a year.

No province ever attempted to disturb them in their own land, only seeking to be left in quiet possession of their territories, and this seems to me to have been a great advantage to the Yncas. There is no memory of such an attempt in their registers; but, after the districts were reduced to obedience, the great natural strength of this region conduced to its security. The four roads which diverge from Cuzco are all crossed by rivers that cannot be forded at any time in the year, while the land is very rugged and strong. There cannot, therefore, be a doubt that in this, and in possessing better discipline and more knowledge, lay the advantage they had over all the other nations of this region. This superiority is shown in their edifices, bridges, farms, systems of irrigation, and in their higher moral lives. If other nations have anything good, it has all been taught them by the Yncas. The Yncas also had a different system of warfare, and were better led, so that they could not fail to become lords over the rest. Thus they continued to extend their dominions and to subjugate their neighbors.

The second thing that may be taken for granted is that having resolved to conquer and subjugate other nations, the Yncas sought some color and pretext for prosecuting their objects. The first story that these Yncas put forward, though it was not the title which they finally asserted, was an idea that, after the deluge, seven men and women had come out of a cave which they call Paccari-tampu, five leagues from Cuzco, where a window was carved in masonry in most ancient times; that these persons multiplied and spread over the world. Hence every province had a like place of worship where people came forth after the universal destruction; and these places were pointed out by their old men and wizards, who taught them why and how the Yncas venerated the cave of Paccari-tampu. Thus in every province these places of worship are to be found, each one with a different tale attached to it. . . .

The third thing to be understood is that as soon as the Yncas had made themselves lords of a province, they caused the natives, who had previously been widely scattered, to live in communities, with an officer over

(continued)

*(continues)*

every ten, another over every hundred, another over every thousand, another over every ten thousand, and an Ynca governor over all, who reported upon the administration every year, recording the births and the deaths that had occurred among men and flocks, the yield of the crops, and all other details, with great minuteness. They left Cuzco every year, and returned in February to make their report, before the festival of Raymi began, bringing with them the tribute of the whole empire. This system was advantageous and good, and it was most important in maintaining the authority of the Yncas. Every governor, how great lord soever he might be, entered Cuzco with a burden on his back. This was a ceremony that was never dispensed with, and it gave great authority to the Yncas.

The fourth thing is that in every place where a settlement or village community was formed, the land was divided in the following manner: one portion was set apart for the

support of religion, being divided between the Sun and the Pachayachachic, and the thunder, which they called Chuquilla, and the Pacha-mama and their ministers, and other *huacas* and places of worship, both general and such as were peculiar to each village. It would take long to enumerate them, for they were so numerous that, if they had had nothing else to do, the sacrifices alone would have given them occupation. For each town was divided in the same way as Cuzco, and every notable thing was made an object of worship, such as springs, fountains, streams, stones, valleys, and hill summits, which they called *apachetas*. Each of these things had its people whose duty it was to perform the sacrifices, and who were taught when to sacrifice and what kind of things to offer up. Although in no part were there so many objects of worship as in Cuzco, yet the order and manner of worshipping was the same.

~ Manifesto of Accession as First Ming Emperor (1372) ~

Since the Sung dynasty had lost the throne and Heaven had cut off their sacrifice, the Yuan [Mongol] dynasty had risen from the desert to enter and rule over Zhongguo [China] for more than a hundred years, when Heaven, wearied of their misgovernment and debauchery, thought also fit to turn their fate to ruin, and the affairs of Zhongguo were in a state of disorder for eighteen years. But when the nation began to arouse itself, We, as a simple peasant of Huai-yu, conceived the patriotic idea to save the people, and it pleased the Creator to grant that Our civil and military officers effected their passage across eastward to the left side of the River. We have then been engaged in war for fourteen years; We have, in the west, subdued the king of Han, Ch'en Yu-liang; We have, in the east, bound the king of Wu, Chang Shih-ch'eng; We have, in the south, subdued Min and Yueh, and conquered Pa and Shu; We have, in the north, established order in Yu and Yen; We have established peace in the Empire, and restored the old boundaries of Zhongguo. We were

selected by Our people to occupy the Imperial throne of Zhongguo under the dynastic title of "the Great Ming," commencing with Our reign styled Hung-wu, of which we now are in the fourth year. We have sent officers to all the foreign kingdoms with this Manifesto except to you, Fu-lin [Byzantium], who, being separated from us by the western sea, have not as yet received the announcement. We now send a native of your country, Nieh-ku-lun [Fra. Nicolaus de Bentra, Archbishop of Peking], to hand you this Manifesto. Although We are not equal in wisdom to our ancient rulers whose virtue was recognized all over the universe, We cannot but let the world know Our intention to maintain peace within the four seas. It is on this ground alone that We have issued this Manifesto.

## ► employment and labor

### INTRODUCTION

Employment and labor practices in the medieval world showed a remarkable degree of similarity. Their differences were in large measure a reflection of differences in the nature of resources that laborers could exploit for economic advantage. Thus, employment practices were different in the open grasslands of sub-Saharan Africa, where farming and especially herding were major sources of employment, than they were in, say, the desert regions of Mesoamerica or the heavily

forested regions of eastern North America. While tools and similar items were made by skilled workers out of obsidian (a glasslike volcanic rock) in Mesoamerica, iron was widely used in Europe and Africa, so workers in these materials developed different skills and technologies. Nevertheless, a number of common themes emerge.

First, agriculture continued to be a major economic activity, employing large numbers of people to prepare fields and plant, cultivate, and harvest crops. Additionally, people were employed in food preservation and storage. Along rivers, lakes, and coastal communities, more emphasis was given to fishing, the hunting of sea mammals, and the gathering of such foods as turtles and crabs. While hunting and gathering as a primary way of life had receded throughout most of the world, these activities remained important in regions where the population density was low and the availability of game and naturally growing food sources was high. In areas where farmland was scarce, such as mountainous regions, considerable labor was expended on such practices as building terraces for crop cultivation. In dry areas large labor forces were needed to dig and maintain irrigation systems.

A second common theme was the rising importance of the city and village. As people gathered into larger communities and as agricultural surpluses allowed people to turn to other forms of economic activity, increasing specialization of labor occurred. When virtually everyone no longer had to be involved in food production, classes of skilled artisans—potters, weavers, metalworkers, blacksmiths, sculptors, stonemasons, engineers, and architects—could emerge. In some parts of the world, notably in Europe and China, trade guilds and formal systems of apprenticeship for workers emerged. These systems helped ensure that goods were made to high standards. They also restricted membership, thus keeping prices high. As a consequence of this increased specialization of labor, states took steps to ensure that fairness reigned in the marketplace by employing classes of inspectors, for example. Penalties could be severe for a merchant who attempted to cheat customers with the use of faulty scales or coins from which precious metal had been shaved.

A third common theme had to do with the distinction between household and communal labor. In the medieval world a considerable amount of labor was performed at the household level. Farmers and herders tended to operate independently, but so did many artisans and craft workers. In this context, the entire family was involved in labor. Children could help tend herds, for example, and women not only performed domestic tasks but also produced craft goods such as textiles.

However, considerable labor was expended on communal and public works projects. In some cases, these commu-

nal projects were local. The efforts of the entire community were needed to terrace a field, for instance, or to build an irrigation system to water crops, and interlocking family relationships, often brought about by marriage, created systems of labor cooperation for tasks requiring many hands. In many cases, though, these public works projects were mandated by higher authorities, usually a king or a similar ruler. Such public works projects could have involved millions of man-hours of labor. They included the construction of roads, palaces, pyramids, granaries, temples, churches, and defensive fortifications such as walls around cities. The Pueblo peoples of the present-day southwestern United States engaged in communal labor to construct dwellings carved into cliffs, and they constructed storage facilities for grains, beans, and other foods. They also built irrigation canals.

Religious authorities were often the driving force behind community construction projects. In medieval Europe millions of man-hours, sometimes over several generations, were poured into the construction of cathedrals by hundreds of sculptors, stonemasons, and laborers as well as the workers needed to quarry and transport stone. Similarly, as Islam spread throughout Asia, the Near East, and northern Africa, mosques were constructed along with the cities that surrounded them. In the Americas religious figures drove the construction of enormous kivas, or dug-out ceremonial centers. All of these activities required massive workforces.

In some instances, slave labor was used for these projects. Even when workers were not slaves, they often performed this work as a kind of “tax” paid to the ruler. In general, because systems of currency and coinage had not yet developed in many parts of the world, workers paid taxes to a ruler “in kind,” meaning that they paid a portion of the fruits of their labor as tax. Thus, in Africa, gold miners turned the nuggets they found over to the king. In France the system was called *corvée*, referring to the practice of paying taxes with a percentage of crops or labor for a specified period of time. While coinage existed in Europe and throughout parts of the Islamic world, barter and payment in kind were still widely practiced.

A fourth common theme was the role of trade. While trade had long been a fixture of economic life, it grew in importance during the medieval period as trade routes became more passable. Trade in numerous commodities took place throughout the Eurasian landmass and into Africa, and trade routes were established throughout the Americas. In some cases, such as South America, trade was facilitated by networks of roads. This trade employed numerous people, in particular, classes of porters who carried goods from one location to the next. Marketplaces in cities became the hub of economic activity, as workers traded their wares for other

goods—and often for raw materials—that they needed. In connection with trade, states often employed large numbers of men in armies to keep trade routes open and protect the flow of goods. This was a common practice in the Horn of Africa as well as in China.

## AFRICA

BY MICHAEL J. O’NEAL

The civilizations of sub-Saharan Africa rose and fell in importance as their economic fortunes changed or as neighboring peoples conquered their lands. The economies of each of these kingdoms depended heavily on two industries, trade and mining, although agriculture remained an important industry and pottery, construction, and textile work was prevalent. The trans-Saharan trade routes were the lifeblood of these communities, providing not only goods but also exposure to books and new ideas. Additionally, many sub-Saharan civilizations produced enough agricultural surpluses to support specialist classes, such as spiritual healers, musicians and artists, and large standing armies to keep trade routes open and protect the capital cities.

Employment and labor were organized in medieval Africa as either independent enterprises, most of which were operated at the household level, or government-run enterprises. Peasants and farmers raised their crops and tended their herds at the household level. Additionally, most craftspersons—including potters, textile workers, and metalworkers—operated independently out of their homes, trading the goods they manufactured at larger market cities. Traders also operated autonomously as sole proprietors of their businesses. Activities that could not be conducted at the household level were largely run by the government. Medieval Africa did not know “capitalism” as the term is understood in the modern world. That is, there were no investors who pooled their money to form a business enterprise that would realize a profit. Most projects requiring large workforces—including public works, construction, and mining—were operated by the government, although some mining and gold panning were done at the household level. In many cases slaves performed much of the labor required by the government, though in general slaves were reasonably well treated and eventually could buy their freedom. Slaves could even aspire to marry their owners’ sons or daughters.

The development of any kind of economic system depends on the establishment of a civilization and a population base large enough to supply the people’s wants. Most important, an agricultural surplus must exist to enable people to withdraw from farming and herding and engage in other economic activities. Further, there must be some type of state, an

authority with the power to redistribute agricultural production to specialist labor in other sectors of the economy. The state has to be relatively stable and able to support an army for protection and for maintaining open lines of trade and exchange. In states like the kingdom of Ghana, rulers instituted taxes on foreign traders who wanted to enter the area. These taxes were paid in salt, peacock feathers, iron, silk, and other goods. Further, specialists in the economy cannot exercise their crafts without trade and exchange, which provides the raw materials—such as metal, stone, and cotton—that specialists need to create useful goods.

The most prominent states of medieval sub-Saharan Africa included the kingdoms of Ghana (not to be confused with the modern-day nation of Ghana), Mali, Songhai, and Benin (present-day Nigeria). In 1000 this area had more cities with populations of at least 20,000 people than did any other area of sub-Saharan Africa. Two factors contributed to the region's population density. One factor was the area's abundance of fertile agricultural land. A large strip of savanna, running east to west along the southern border of the Sahara Desert, provided high-quality soil for cultivating crops and grassland for grazing herds. Accordingly, much of the labor in this region was agricultural.

The second factor was the presence and extent of trade. The region provided a vital link to northern Africa, the Mediterranean, Europe, and trade routes to the East. Traders had long been traversing the forbidding Sahara, but the growing prevalence of trading caravans using camel power increased the level of that trade. Thus traders from the north were able to cross the desert, arrive at a more hospitable region to the south, and continue around the Horn of Africa to exchange goods. This trading enterprise employed a large class of merchants, along with the porters, couriers, and other laborers needed to facilitate the exchange of goods, and numerous marketplaces emerged where goods were bartered.

Traders also traveled south along the Nile River to the interior of central Africa, though the difficulties of the journey and the lack of a population base the farther south they went limited their efforts. Of more significance was the east coast of Africa, where flourishing trade from Asia had taken place in ancient times and continued into the medieval period. Little is known about the plant foods available in eastern Africa, but there is ample evidence of considerable economic activity revolving around harvesting the sea and its coasts for fish, shellfish, and turtles. Further evidence suggests that the area was home to sizable herds of goats, sheep, and cattle. These activities set the economy of the east coast apart from the economies of and the west coast. The chief reason for the difference had to do with geography. The west coast of Africa, with its rocky shorelines, was far less accessible. Further, pre-

vailing winds from the north made travel by sea difficult on the west coast; it was easy to sail southward, but the return journey was impossible until the development of sails and rudders that allowed sailing against the wind. In contrast, the east coast was more accessible, and wind patterns made sea navigation easier.

A region's economic activity is largely dependent on the resources available there. The region south of the savanna grasslands provides a good example. The region is more forested than the savannas, and considerable economic activity was facilitated by the Niger River. Agriculture in this region was intensive. Evidence suggests that the type of agriculture practiced is what archaeologists call recession agriculture. Crops were planted and grown along floodplains after floodwaters had receded. The alluvial silt left behind by receding floodwaters was particularly rich in nutrients and easily worked, so crops could be grown in abundance and surplus grain could be stored and transported. All these activities would have employed numerous laborers for planting, cultivating, harvesting, loading, storing, and accounting for produce. The produce could be traded to other less-fortunate communities in dryer areas in exchange for crafts and other goods. Goods exchanged included salt, cattle, spices, gold, dates, copper, horses, ivory, textiles, animal hides, jasper stone, glass and glass beads, and slaves.

Important components of the sub-Saharan economy were metallurgy and mining. The kingdoms of Ghana, Songhai, and Mali depended heavily on gold, iron, and copper mining. Early in the medieval period iron was a dominant metal used to make weapons, tools, and jewelry. Most metalwork was done at the household level, and archaeological records abound with evidence of blacksmithing and other activities related to mining or working iron. Later gold was a dominant metal, used to forge craft items and as a form of tribute to kings. While some mining was organized at the state level, much was conducted at the household level. Little archaeological evidence exists to provide information about how the mining industry was organized. It is believed that children, because of their smaller stature, were sent into mines to retrieve gold nuggets. In Ghana gold nuggets were the property of the king, but individuals were allowed to keep gold dust as a form of income.

Other important contributors to the economy were pottery and textile workers. Pottery was made at the household level and shows a high degree of expertise, not only in the design and firing but also in the painstaking decorations. Clay pottery was most common, but metal pots were also prevalent, and the kingdom of Benin was particularly noted for its bronze work. Early in the medieval period clothing was made predominantly of leather and animal hides, but by the turn

of the second millennium a thriving industry in the spinning and weaving of cotton was under way.

Construction was also a major source of employment. In Ghana, for instance, the king attempted to protect the capital city by employing thousands of workers to construct what was in effect a second city about six miles from the capital, requiring a labor force to quarry stones, build streets, design and construct buildings, and maintain the city. This second city was the nation's chief trading city. Merchants and craftspeople gathered there to trade their goods. Much of this trade was conducted through a system of silent barter. Because traders did not speak the same language, gold was left in a particular place. A merchant who wanted the gold in exchange for another commodity took the gold and left goods in its place; if the amount of goods was not adequate, transactions between the two traders stopped until the seller left behind enough goods.

Many people in Benin were employed in the construction industry. The city of Benin, the kingdom's capital, featured wide, straight streets; a person could walk down a street for a mile or more and still not see the end of it. Additionally, construction of the king's immense palace required the labor of hundreds of stonemasons, designers, and builders as well as workers who transported the stone for the palace and the streets from the quarries to the construction sites. It has been estimated that to construct the walls surrounding Benin City, 5,000 men had to work 10 hours a day throughout a single dry season, though it was more likely that 1,000 men worked over five seasons.

Zimbabwe in southern Africa provides the most impressive example of stone construction. Again, resources played a major role in determining the nature of economic activity. Widely available was a great deal of granite that could be quarried in flat stones and sheets. This meant that a large class of stonemasons and construction workers could construct massive buildings and stone walls using dry stone techniques; that is, stone could be stacked without the use of mortar.

## THE AMERICAS

BY MICHAEL J. O'NEAL

In pre-Columbian North America, modern notions of "labor" and "employment" were largely unknown. These institutions imply the existence of organized public or private enterprises that paid workers a wage to perform specific tasks. However, in most North American cultures during the millennium before the arrival of Europeans, labor was a household or communal activity. These cultures tended to be organized as settled or nomadic tribes comprising a cluster of clans and kinship groups that formed a commu-

nity for purposes of mutual advantage. At the head of the group was a chief, who, along with a relatively small group of elite families, directed the community's economic activities. These leaders gathered labor forces to carry out tasks necessary for survival, in exchange distributing benefits such as food, shelter, and clothing.

A chief form of labor was agricultural production, particularly the cultivation of maize, or corn, which had become a staple crop in North America during the first millennium of the Common Era, as well as in Central and South America. Of course, the level of agricultural production differed depending on the region. In the Eastern Woodlands fewer people were employed in agriculture because the region also provided ample game meat or fish, along with naturally occurring nuts, berries, tubers (that is, root vegetables), and the like. Agriculture employed far more people in agricultural lands, including the alluvial plains along major rivers such as the Mississippi and its tributaries, where individual families grew crops in the rich, well-watered soil. In the Great Plains of the Midwest hunting, particularly of buffalo, elk, and other larger game animals, continued as the major source of food. In the Southwest various forms of beans were a major crop, while along the western coasts, especially in the Northwest, fish was the primary staple.

Individuals became a labor force when it was necessary for the larger community to carry out public-works project under the direction of social and religious elites. A good example is provided by the mound-building Mississippian cultures, which flourished from about 700 or 800 until about 1400 to 1500. They are noted for their construction of enormous mounds, or elevated earthworks, that formed the centers of their community. One of the best-known examples is the city of Cahokia, which flourished in modern-day Illinois where the Mississippi, Missouri, and Illinois rivers meet. The Cahokians required an enormous labor force to construct the 120 large mounds in the area, including Monks Mound, which covers an area of 14 acres. Historians estimate that it would have taken millions of man-hours to construct some of these mounds. In addition, homes, granaries, ceremonial centers, burial grounds, stockades, and similar structures were constructed and often had to be rebuilt or refurbished as time passed.

In the view of some historians the mounds served more than practical purposes. In this way they were much like the pyramids of ancient Egypt. As public-works projects, they served to bind people to their community. They became part of their cultural identity. They legitimized the role of the elites, who administered the affairs of the realm from them. They provided the "cement" that held together a large labor force that could be mobilized for agriculture, defense, and

other purposes. And because of the role of ancestor worship in the religious beliefs of these peoples, the mounds, as the site of burials, were a way of tying workers to their ancestors' power. Labor, then, was not just a way of getting tasks done. Labor was a way of forging a common community.

The notion of communal labor extended to other areas of North America at this time. Among the peoples of the Southwest, collectively called the Anasazi (ca. 900–ca. 1300), who are the ancestors of present-day Pueblo peoples, communal labor not only helped the people meet material needs but also forged a sense of belonging to a community. Thus, enormous amounts of labor were expended on the construction of the many dwellings carved into rock cliffs or apartment-like residences; monumental architecture; kivas, or dug-out ceremonial centers; storage facilities for beans, grains, and other foodstuffs; and canals for irrigation. In the four corners area, centers like Pueblo Bonito and their environs served as hubs where elites resided and where craft production took place. They were connected by roads that integrated the outlying communities. An index of the amount of labor required is the sheer size of many of these kivas. Pueblo Bonito, for instance, built beginning in 919, was five stories tall and had 800 rooms. Given the absence of metal tools and beasts of burden, this kind of building activity could have been carried out only by a massive human labor force.
