SPANISH EMPIRE When the United States entered the community of independent nations in 1783, its neighbors to both the south and west were territories of the Spanish Empire. Spain claimed sovereignty over the North American continent west of the Mississippi River and the Florida territory. These holdings, though vast, were not as significant—or wealth producing—for Spain as were its colonies in Central and South America, particularly the viceroyalties of New Spain (Mexico) and Peru. By 1783, though, Spain's presence in the New World had become tenuous. A significant reason was the influence and ambitions of its colonies' newly independent neighbor. Through both its ideology and its expansionist agenda, the United States would play a significant role in the ultimate fate of Spain's American domain. As had been the case with Great Britain and its North American colonies, Spain would eventually see its American possessions drift into independence, but the process by which it occurred would be markedly different.

TREATY OF PARIS, 1763

Compared to the other European colonial powers in the Americas—especially Britain and France—Spain had assumed second-tier status by 1754, when the French and Indian War, the North American phase of the Seven Years' War, broke out. Allied with France in a losing cause, Spain lost Florida to the victorious British in the Treaty of Paris (1763) at war's end. The treaty also granted Spain the Louisiana Territory (the western portion of the Mississippi River valley) to compensate for the loss of Florida (seen as more valuable), but the British motivation here was not so much to placate Spain as to expel the French from America entirely. When the thirteen British North American colonies rebelled and declared independence in 1776, the Spanish government saw an opportunity possibly to undo some of the damage done in 1763 to its colonial holdings. Certainly France saw things this way, and the French government was able to convince the more hesitant Spanish to enter the American Revolution (1775–1783) on

the side of the pro-independence Patriots. While France provided the lion's share of assistance to the war effort in America, Spain engaged Britain in Europe. First on the Spanish agenda was reclaiming Gibraltar; that promontory, situated strategically at the mouth of the Mediterranean, had gone to the British along with Florida in 1763. After the British surrender at Yorktown in 1781, peace negotiations began at Paris. The Spanish, however, had yet to recover Gibraltar, and only through French pressure did Spain reluctantly abandon its Mediterranean project and agree to the Treaty of Paris of 1783. The treaty did, however, return Florida to the Spanish.

POLICY TOWARD THE UNITED STATES

The Americans' successful anticolonial revolution concerned the Spanish Crown. By the 1770s, the Bourbon monarchs of Spain were well into the process of reforming and restructuring the management of their colonial empire. Beginning in the reign of the first Bourbon king, Philip V (r. 1724–1746), and continuing with his successors Ferdinand VI (r. 1746–1759) and Charles III (r. 1759–1788), the Bourbon Reforms significantly altered the administration of Spain's colonies, as well as their relationship to the metropolis. Influenced primarily by the principles of mercantilism, the Spanish Crown sought to tighten the lines of authority over what had become a dangerously autonomous colonial elite and to extract what it saw as the proper amount of revenue from its American possessions. The reforms unsettled the many Spanish colonists who were concerned about the increased presence of direct royal authority where previously a wide latitude had existed. Many in the colonial elite were influenced to a degree by elements of the Enlightenment-based thought that so pervaded this revolutionary era. The writings of Thomas Paine and Thomas Jefferson, the U.S. Declaration of Independence and Constitution—these and similar writings had some impact upon the changing political culture of the Spanish colonies. Yet many of the revolutionary currents in the larger Atlantic world alarmed these colonial elites. In particular, the French Revolution's increasingly radical nature alienated most of this traditionally conservative group. The violent revolution in France's colony of St. Domingue, led largely by the island's black population, alarmed the elites even more. Certainly, then, the potential for radical upheaval was far less in Spain's colonies than in other areas of the Americas. Nevertheless, the monarchy was concerned about these stirrings of colonial discontent—as well as the perceived threat from the first independent republic in the hemisphere, the United States.

Spanish policy toward the United States reflected this wariness. As soon as Spain recognized the independence of the United States, it proclaimed the Mississippi River, and the port of New Orleans at its mouth, closed to Americans. This peremptory action was at best of questionable legitimacy in terms of international law, as Spain claimed ownership of the whole Mississippi by virtue of possessing land only on its western half. Protests from the U.S. government centered around this issue. In 1784 negotiations between John Jay, foreign secretary under the Articles of Confederation, and Diego de Gardoqui, the Spanish foreign minister, proved fruitless; it would take another decade until the issue would be resolved.

Western settlers suffered most from the closing of the Mississippi River and New Orleans to Americans. Deprived of the easiest and least costly outlet for the transportation of their produce (downriver to the Mississippi and New Orleans, as opposed to overland across the Appalachian Mountains), westerners began to doubt whether the federal government truly valued their needs and concerns as the prohibition dragged into the 1790s. Indeed, some westerners, particularly those in western Tennessee and northern Alabama, contemplated shifting their allegiance to the Spanish if that would make their lives and commerce easier. For much of the 1790s General James Wilkinson, commander of the southwestern department of the U.S. Army, was also in the pay of the Spanish, who sought to exploit any unrest that they could on the edge of American settlement. Wilkinson personified what one historian has called "the problem of neighborhood" faced by the United States in its frontier regions; shifting allegiances, prompted by distinctly western concerns, meant that loyalty and union could be problematic notions west of the Appalachians. Coupled with its failure to address the Native American "menace" on the frontier, the U.S. government's inability to budge the Spanish on the Mississippi question was a primary element in the East-West sectional tensions that so plagued the Republic in its early years.

SPAIN AND FRANCE

The vicissitudes of the French Revolution dramatically altered the course of colonial and diplomatic events for the nations of both the American and European continents by the mid-1790s. When the French revolutionary regime began to wage war on the other European powers in 1793, Spain allied itself with the antirevolutionary monarchies, led by Great Britain. By this point, however, Spain's leadership had declined in both vigor and ability. Charles III had prov-

en the most effective of Spain's Bourbon monarchs, but his successor Charles IV (1788–1808) was closer to the other end of the spectrum. Additionally, he found himself in the unenviable position, along with his controversial and unpopular foreign minister, Manuel de Godoy, of suborning Spain under Napoleon Bonaparte and his French Empire. Fearing that its alliance with Britain might bring repercussions should France gain the upper hand in the conflict, Spain reversed diplomatic course and began to take measures to placate France, its expansionist neighbor. This was the immediate context for the conclusion of a treaty with the United States in 1795. Believing that the previous year's treaty between the United States and Great Britain (Jay's Treaty) had drawn those two nations into an alliance, Spain sought to smooth any rough edges that remained in its relationship with America. Pinckney's Treaty, also called the Treaty of San Lorenzo, allowed for American access to the Mississippi and the right of deposit for American goods at New Orleans. Thus, from Spain's diplomatic and military distress came a coup for the United States, as one of the most significant festering issues faced by the Republic was finally resolved.

But Spain's best efforts to make things right with an ever-more-menacing France proved unsuccessful. In 1801 Napoleon forced the Spanish Crown into the Treaty of San Ildefonso, which retroceded the Louisiana territory to the French. This action had ominous ramifications for the United States. The French began to limit American access to the Mississippi and New Orleans in violation of the terms of Pinckney's Treaty. Realizing that the United States would have to move well into the British orbit to counter the French hold on New Orleans, President Thomas Jefferson (who was certainly no Anglophile) sent Robert R. Livingston to Paris to purchase Florida and New Orleans. Napoleon, reconsidering his American ambitions in the wake of the revolution in St. Domingue and needing money to finance renewed warfare in Europe, offered the entire territory to the United States for \$15 million. Thus, while it can be said that the Louisiana Purchase was made possible by the peculiarities of France's situation, ultimately the chain of events that led to it started from the circumstances of France's weaker neighbor, Spain.

Spain was not yet through with Napoleon Bonaparte, either. In 1804 Napoleon had forced Charles IV into a treaty under which Spain was responsible for yearly subsidies to France. The burden of these payments quickly proved to be untenable, and Spain's economy—already experiencing serious difficul-

ties—further suffered. The next year, a combined Spanish and French fleet engaged and lost to the British, under Admiral Horatio Nelson, at Trafalgar. This defeat severed Spain's maritime link to its American colonies. When Charles IV abdicated in 1808, Napoleon mediated between claimants to the Spanish throne, including Ferdinand VII, whom most Spaniards regarded as the legitimate successor. Napoleon, however, put his brother Joseph at the head of the Spanish Empire, which set off the chain of events that led to that empire's disintegration over the next two decades. Loyalists of Ferdinand VII established juntas throughout Spain, and the same step was undertaken in the colonies. But in the Americas, these movements often only wore the "mask of Ferdinand"—they professed loyalty to a "legitimate" Spanish monarch but in fact worked for colonial autonomy and even independence. By 1810 Spain's colonies were moving into rebellion, with insurgencies having erupted in Mexico, Venezuela, and Argentina. The Wars of Independence in Spain's American dominions would last for over a decade, but at their end, what was once a far-reaching colonial dominion had become a collection of independent republics. Even after the restoration of Ferdinand VII to the Spanish throne in 1814 and the final defeat and exile of Napoleon the following year, Spain's empire continued to unravel.

THE UNITED STATES AND FLORIDA

Much of this imperial collapse originated within internal dynamics of the empire itself, but in the case of Florida, Spain's weakness and declining power were underscored by the actions of the United States. That nation had long been interested in the territory; southern slaveholders resented the presence of Florida as a haven beyond American jurisdiction for fugitive slaves, and many in the region also feared various Indian groups like the Creeks and Seminoles, whom they believed were urged by Spanish authorities to attack American settlements. In 1806 Jefferson attempted to get funds appropriated for secret negotiations with Spain in an attempt to purchase Florida. Congress approved the funds, but the negotiations in Paris (1806–1807) failed.

The issue was brought forth again in 1818–1819 by General Andrew Jackson of Tennessee. Charged by President James Monroe and Secretary of War John C. Calhoun with suppressing the raids on American settlements in the Southeast carried out by the Seminole nation, Jackson—who had advanced his military career fighting Indian allies of the British in the War of 1812—carried his mission into Spanish

Florida itself, where the Seminoles' raids had originated. Quickly seizing the fortress at Pensacola, Jackson forced the Spanish governor to lower the Spanish colors, which in effect meant acknowledging American sovereignty in the area, even if temporarily. Jackson also arrested and subsequently executed two British citizens whom he accused of providing the Seminoles with both the arms and the encouragement to attack American settlements. While Jackson accomplished his goal of halting Seminole incursions into American territory, he also provoked an international incident; Britain was outraged at the executions of its citizens, and Spain protested vigorously at the general's actions, which could be interpreted as waging war on Spain. For his part, Jackson believed that he had acted with Monroe's implicit approval; he himself had long been an advocate of taking Florida as a means of ending Indian "hostilities" on the southern frontier.

While most of Monroe's cabinet demanded disavowal of Jackson's actions and a formal censure of the general, Secretary of State John Quincy Adams realized that in this imbroglio lay an opportunity for the acquisition of Florida. Declaring to the Spanish ambassador Luis de Onís that Spain had demonstrated a singular inability to control its colonial possessions, Adams insinuated that the United States reserved the right to engage in similar incursions in the future, should Spanish authorities be unable to control the native populations of Florida. Forced to concede the point, Onís and the Spanish agreed to an 1819 treaty that ceded Florida to the United States in return for an assumption of \$5 million in American claims against the Spanish government. The treaty also established a distinct line between the Louisiana Territory and Spanish territories in the west, which would hold great portent for U.S.-Mexican relations in subsequent years.

U.S. HEMISPHERIC DOMINANCE

The Adams-Onís Treaty, also known as the Transcontinental Treaty, dramatically illustrated the contrasting arcs of the United States, the ascendant power in the Western Hemisphere, and Spain, the hemisphere's first preeminent power but now a shell of its former potency. By 1819 much of Spain's colonial dominion had already escaped its grasp in all but the formal sense. In 1821 Mexico won its independence. By 1825 South America (except for Portuguese Brazil) was a collection of independent states as well. Save for a few Caribbean colonies, including Cuba, Spain's New World Empire was no more. The United States moved quickly to foster its role as the

"mother republic" in the hemisphere. Part of the reason for this was a sense of obligation, variously articulated, to support those nations that sought to emulate the republican forms successfully launched by the United States. There was a very real sense for many Americans that the Western Hemisphere represented the new republican era, as opposed to the declining and superseded monarchical age of the other side of the Atlantic.

Additionally, there was an element of marked self-interest; the roots of what would become the ideology of Manifest Destiny were already evident in such actions as the acquisition of Florida. American (mostly southern and slaveholding) migration into the Mexican province of Texas, beginning in the early 1820s, was another such manifestation of American expansionism. Though these migrants entered Texas by the invitation and sanction of a Mexican government eager to populate its northern frontier, within fifteen years the province would be lost to Mexico; another five years after that, Texas was part of the United States and Mexico had lost the rest of its northern territories in a humiliating and one-sided war with the growing Republic to the north.

Perhaps the most famous—at least in retrospect—articulation of what Americans perceived their role in the Western Hemisphere to be was the Monroe Doctrine. Articulated in President Monroe's December 1823 annual message to Congress, the policy statement—actually formulated by Secretary of State Adams—declared that the Americas were no longer to be seen as areas of colonization for European powers. Instead, the Western Hemisphere was a hemisphere of republics, with the United States playing the role of defender and guarantor of this state of affairs—the first among equals, as it were. While the European response to this proclamation was mostly bemused condescension, the Monroe Doctrine was an important assessment of America's opinion as to where it stood in the hemispheric and in the international community, and it would continue to be the backbone of U.S. foreign policy into the modern era.

It is this persistence of the ideology inherent in the Monroe Doctrine that is the most significant factor in assessing the relationship between the United States and the areas that were formerly the colonial empire of Spain. Many Americans (most notably Henry Clay) were warm advocates of the "sister republics" of Latin America, seeing these nations as attempting to travel the same admirable republican road traveled by the American Revolutionary generation. But others, while professing similar ideals, saw

Latin American nations as something else—perhaps inferior nations, destined to be conquered and absorbed; perhaps seedbeds of dangerous radicalism; perhaps, later, as areas in which to expand the institution of chattel slavery. Ultimately, the United States forged a relationship with the Latin American republics that in many ways was remarkably similar to that between the United States and Spain in an earlier era: sometimes as an ally, sometimes as an adversary, but consistently acting in self-interest. Latin Americans would thus exist in the same ambivalent, and often unequal, hemispheric partnership as had their former colonial masters.

STAMP ACT AND STAMP ACT CONGRESS

After the Seven Years' War (1756–1763), the government of Great Britain faced a financial crisis. During the war, Britain's national debt had doubled, from approximately £70 million to £140 million. More significantly, the cost of administering Britain's North American colonies skyrocketed with the acquisition of Canada from the French and Florida from the Spanish. The government planned to maintain an army of 7,500 soldiers in its newly acquired territory, a substantial portion to be posted in remote garrisons along the Mississippi and Ohio Valleys. This military establishment would cost about £350,000 annually. American customs, the chief source of revenue for the British government from its colonies, generated only about £2,000 annually.

Faced with these financial realities, Prime Minister George Grenville proposed in early 1764 that Parliament enact a stamp tax in the American colonies. The proposed tax was actually a series of duties levied on legal and economic transactions. Newspapers and legal documents would have to be printed on stamped paper purchased from a royally appointed stamp distributor. Liquor licenses and land patents would also be subject to a stamp duty, as would some common nonessential consumer items, such as playing cards and dice. Such a system of taxation already existed in Britain, where the king's subjects paid at a rate higher than that proposed by Grenville for America. Colonial agents in London objected to Grenville's proposal but offered no alternative other than having the crown requisition funds as needed from colonial assemblies, a system that had failed to raise adequate revenues in the past.

When Parliament passed the Stamp Act in March 1765, no one in Britain or America anticipated the furor it would unleash in the colonies. The colonists objected to the Stamp Act primarily on two grounds. First, they claimed it violated their right as British subjects to no taxation without representation because no American representatives sat in Parliament. Patrick Henry famously made this argument in a speech before the Virginia House of Burgesses in May 1765, sparking the passage of a series of resolutions against the Stamp Act that were widely circulated and imitated among the other colonial assemblies. Second, the colonists objected to a provision in the Stamp Act that gave vice-admiralty courts jurisdiction over cases arising from enforcement of the tax. The colonists considered this measure another violation of their rights, because vice-admiralty courts

“The Times are Dreadful, Dismal, Doleful, Dolorous, and Dollar-less.” The masthead features a skull and crossbones in place of the official stamp. LIBRARY OF CONGRESS.

typically tried crimes committed on the high seas and did not use juries.

At the suggestion of the Massachusetts assembly, nine of the colonies sent delegations to a meeting in New York in October 1765 to frame joint petitions to the crown and Parliament against the Stamp Act. The twenty-seven delegates at the Stamp Act Congress—representing Massachusetts, Connecticut, Rhode Island, New York, New Jersey, Pennsylvania, Delaware, Maryland, and South Carolina—spent two weeks carefully drafting these petitions, which acknowledged their loyalty and submission to the king and Parliament but stated unequivocally their constitutional claim to no taxation without representation.

While elites met in assembly halls, the common folk practiced a different kind of politics out-of-doors. The first crowd actions occurred in Boston in August 1765, when a mob tore down the home of Lieutenant Governor Thomas Hutchinson and ran

Andrew Oliver, the person expected to be appointed the colony’s stamp distributor, out of town. Similar riots and intimidation of stamp distributors occurred in Rhode Island, Connecticut, New York, Pennsylvania, Maryland, and South Carolina. As the stamped paper necessary to carry out the Stamp Act arrived in colonial harbors, it was either destroyed by mobs or locked up by government officials for safekeeping. When the date set for the act to take effect, 1 November 1765, arrived, neither a single sheet of stamped paper nor a single stamp distributor was available to anyone who might have wished to comply with it. Merchants, lawyers, and printers cautiously resumed business once it became apparent that the act was unenforceable.

Meanwhile, changing political winds in Britain opened the door to repealing the act. For reasons unrelated to its American policy, the Grenville ministry fell out of favor and a new one led by Charles Watson-Wentworth, second Marquis of Rockingham,

took over. British merchants who feared the disruption of their American trade organized petition drives for repeal in seaports and manufacturing towns. In February 1766 Parliament debated the subject. The political hero of the Seven Years' War, William Pitt, gave a famous speech defending the American position, and Benjamin Franklin, working in London as a colonial agent, acquitted himself brilliantly as a defender of American liberties. With the tide of opinion clearly against enforcing the Stamp Act, the Rockingham ministry devised a solution to the crisis. The act of repeal was accompanied by the Declaratory Act, which asserted Parliament's power to legislate for the colonies "in all cases whatsoever." Both measures became law on 18 March 1766.

The Stamp Act brought forth the constitutional issues on which the colonies and Britain would split. The colonists, believing they had achieved a great victory for their rights as British subjects, never budged from their contention that Parliament had no right to tax them. In Britain, subsequent measures intended to ease the government's financial burden in America, such as the Townshend Act (1767) and the Tea Act (1774), tried to raise money by levying imposts on the colonists' overseas trade, but like the Stamp Act, they met stiff American resistance. The Stamp Act Congress had proved the efficacy of united colonial opposition to such measures, and mob actions remained the most prominent tactic in the Patriot cause.

“STAR-SPANGLED BANNER” “The Star-Spangled Banner,” the national anthem of the United States, was inspired by the flag that flew over Fort McHenry in the harbor of Baltimore, Maryland, during the War of 1812 (1812–1815). During that con-

flict, the British conducted frequent raids on American towns and harbors along the Atlantic coast, including forays into Chesapeake Bay. Some American harbors were fortified, including Baltimore, whose five-pointed, star-shaped brick fort named Fort McHenry prepared to face certain attack by British forces. In anticipation of such an attack Major George Armistead, commander of Fort McHenry, wanted a U.S. flag made so large that the British would clearly see it waving from a great distance as a symbol of bold defiance of their invasion. A Baltimore widow, Mary Pickersgill, had experience making ship flags and agreed to sew a flag that would measure thirty feet wide by forty-two feet long. Pickersgill spent several weeks measuring, cutting, and sewing the fifteen stars and stripes that, because of their size, had to be assembled on the floor of a nearby brewery. In August 1813 Pickersgill presented the flag to Major Armistead and was paid \$405.90 for her work.

In August 1814 a large British force landed in Maryland and marched toward Washington, D.C. The British easily defeated the American army at Bladensburg, then entered the capital and burned several public buildings, including the White House. The British subsequently returned to their ships and moved to attack Baltimore. The combined naval and army force coordinated a three-day attack on the city fortifications both in the harbor and on land. On the morning of 13 September 1814, British ships began hurling over fifteen hundred shells, bombs, and rockets toward Fort McHenry from positions in the Patapsco River beyond the reach of the fort's guns. The bombardment, which lasted about twenty-five hours, was designed to divert attention from a British army landing at North Point to be followed by a march overland to take Baltimore.

In the meantime, apprehensively watching this activity from an American truce ship anchored in the river was a Georgetown attorney named Francis Scott Key. Key had visited the British fleet to negotiate the release of a Maryland doctor, William Beanes, who had been taken prisoner by the British during the attack on Washington. Key was successful in obtaining Dr. Beanes's release but could not depart until the attack on Baltimore was concluded. During the night, Key watched the British fire hundreds of projectiles toward the fort but heard only occasional sounds of McHenry's guns returning fire. Unsure if the fort had fallen to the enemy, at the break of dawn Key peered through a telescope and saw the fort's enormous flag waving in the morning breeze, a symbol of defiance and triumph in the face of the enemy.

Relieved and inspired by the sight, Key took a letter from his pocket and on the back wrote some poetic verses about the events he had witnessed.

Once the defeated British forces departed, Key completed his four-verse poem on 16 September and sent it to a printer for distribution the next day as a handbill entitled, *The Defense of Fort McHenry*. He had composed the poem in the form and meter of a well-known English melody titled "To Anacreon in Heaven." The new combination of song and poem soon became known as "The Star-Spangled Banner," which slowly grew in popularity as a patriotic tune throughout the nineteenth century. During the early twentieth century, various patriotic and veteran organizations lobbied for the song to become the official national anthem, a wish granted by Congress on 3 March 1931.

As for the inspiration for the anthem, Armistead acquired the flag after the war. A few weeks after the battle he provided pieces of the flag to a soldier's widow to bury with her husband. In later years he distributed additional pieces for similar purposes. The flag was kept by his descendants. In 1907 Eben Appleton, Armistead's grandson, loaned the flag to the Smithsonian Institution in Washington, D.C., for an exhibit. He donated it permanently in 1912 on the condition that it never be removed so that all U.S. citizens could view the Star-Spangled Banner. In 1965 the flag was moved to the Smithsonian's new National Museum of American History in Washington and given a prominent place as the first exhibit inside the museum's entrance on the National Mall. Conservation work on the flag at the turn of the twenty-first century (1998–ongoing) will ensure its preservation as a symbol of U.S. strength and independence for succeeding generations of Americans.

Steven J. Rauch

to, by 1821, a sprawling Republic of twenty-four states that extended beyond the Mississippi River. The principle that new states could join the Union on an equal footing was an important, if problematic, facet of republican political theory in America. The reality of westward expansion made debates over statehood one of the key political battlegrounds of the early national era. The statehood question became, increasingly, the site of the growing sectional conflict over slavery. The Missouri crisis of 1819–1821 over the admission of a new slave state was the first of the major crises that foreshadowed the Civil War.

After the Declaration of Independence in 1776, the original thirteen Atlantic colonies considered themselves to be independent states. During the Revolution each state but Rhode Island and Connecticut enacted its own state constitution. The Articles of Confederation treated the states as sovereign republics, loosely allied but under a weak national government. The framers of the U.S. Constitution of 1787 provided for a union with a more powerful central government, with the thirteen original states to become full members by ratifying the Constitution. In Article IV, section 3, the Constitution gave Congress the power to regulate the admission of new states into the federal Union. This acknowledged implicitly the principle that the new nation would allow its territories outside the original states to become full and equal members of the Union—in contrast to the British colonial system from which the Americans had broken away.

CONCERNS OVER EXPANSION

From the beginning of the Republic, the notion that the federal Union would continue to admit new states in addition to the original thirteen had caused concern among some who opposed an increase in the power of the central government at the expense of the original states—especially those states such as Virginia that had extensive claims in the western lands. But Virginia in 1784 and the other states agreed to cede their western claims to the national government, opening the way for the creation of new states. Another problematic matter regarding the admission of new states was the idea that an expansive national republic conflicted in part with the traditional republican theory that had influenced many in the founding generation. That theory, articulated by British opposition thinkers and Enlightenment philosophers such as Montesquieu, generally held that the republican form of government worked best only on a small scale, in societies small in physi-

STATEHOOD AND ADMISSION The early years of the new nation saw the United States grow from the original thirteen eastern seaboard colonies

cal size and culturally homogenous. But James Madison's essays in the *The Federalist* (1787–1788) addressed and sought to allay these concerns by arguing in favor of an extensive republic in North America tied together by commerce and common political beliefs.

Most Americans, however, had never been bothered by these considerations; from the founding of the Republic they had supported the concept of adding new states on an equal footing. Also, the reality of western expansion made the question of new states a pressing issue. Having been prevented from settling west of the Appalachian Mountains by the British Proclamation of 1763, American settlers after the Revolution began to pour into the western territories. Just a few years after the Constitution was ratified, the first new states of Vermont (1791), Kentucky (1792), and Tennessee (1796) were added to the Union.

EQUALITY FOR NEW STATES

In fact, before the Constitution was even drafted, the principle of adding new states on equal footing had been determined by the Continental Congress. The question of how to dispose of the western territories was influenced by the need to pay off the vast Revolutionary War debt, in part by the sale of land; by the desire to provide an orderly process for settling the territories through provision of security, the rule of law, and protection of property rights for U.S. citizens who migrated west; and by the pragmatic reality presented by the speedy westward migration after the Revolution. Shortly after Virginia's land cession, Congress in April 1784 approved an ordinance designed by Thomas Jefferson for settlement and state formation in the territories north of the Ohio River, with the new states to be equal to the old ones. That ordinance was superseded by the Land Ordinance of 1785 and the Northwest Ordinance of 1787. The Northwest Ordinance set forth provisions for interim territorial governments as well as a specific process for achieving statehood, based on the criteria of reaching a certain level of population and self-government. Reenacted by the new federal Congress in 1789, the ordinance explicitly enshrined as national law the principle that new states could join the Union on an equal footing. Ohio (1803), Indiana (1816), Illinois (1818), and later Michigan (1837) and Wisconsin (1848) were admitted to the Union under the terms of the Northwest Ordinance.

NEW STATES AND SLAVERY

Sectional politics began to play a major role in considerations of state formation in the early 1800s. The

Constitution had brokered an uneasy compromise on slavery, permitting the southern states to protect the institution. Because each new state would add two voting members to the U.S. Senate as well as members of the House of Representatives, whether new states would be slave or free would affect national policy. With the admission of Louisiana (1812), Mississippi (1817), and Alabama (1819), all slave states, the issue gained nationwide attention. The balance of slave and free states in the Senate remained equal. When Missouri applied for statehood in 1819, it launched the first of the sectional crises that preceded the Civil War.

Missouri at the time of its application for statehood already had thousands of slaves. But Republican representative James Tallmadge of New York in 1819 introduced in Congress two amendments to the Missouri statehood bill that would ban the importation of new slaves into the state. These amendments galvanized northern antislavery sentiment and rallied northern congressmen of both parties to vote against the admission of Missouri to the Union. In 1821 the two houses of Congress compromised by admitting Missouri as a slave state on certain conditions, while also admitting Maine, previously a part of Massachusetts, as a free state. While the Missouri Compromise defused the sectional crisis temporarily by preserving the free state-slave state balance, it only delayed the eventual reckoning of the slavery issue in the new nation, which led ultimately to the Civil War.

The process of state making and state formation occupied a prominent place in the political discourse of the new nation. It made important contributions to the history of the United States by establishing the principle of admitting new states on an equal footing, by regulating the expansion of the Union, and by foreshadowing the coming sectional crisis.

STATES' RIGHTS The concept of states' rights presupposes a federal relationship among states. In the case of the United States, the constitutional principle of states' rights can be traced to the federal Union's creation by the states for limited purposes. As embodied in the Tenth Amendment to the Constitution, states' rights became one of the founding principles of the Jeffersonian Republican Party that dominated federal politics in the first quarter of the nineteenth century.

Throughout the imperial crisis of the 1760s and 1770s, the chief points on which the colonists insisted were the "rights of Englishmen" and the prerogatives of their colonial legislatures. The Sugar Act (1764), the Declaratory Act (1766), the dissolution of the New York assembly (1767), the Tea Act (1773), the Massachusetts Government Act (1774), the Boston Port Act (1774), the Administration of Justice Act (1774), and various other of the parliamentary initiatives to which the colonists objected so stoutly should be understood as having offended them primarily as they impinged upon the colonists' right of self-government. At first, this inherited right was said to extend to an exclusive right in the provincial assemblies to tax the colonists; Patrick Henry's Stamp Act Resolves of 1765 based this right on a cogent account of Virginia's colonial history, and the Stamp Act Congress of 1765, drawn from nine colonies, asserted this exclusive right in Pennsylvanian John Dickinson's resolutions.

In 1766 Parliament repealed the Stamp Act. Simultaneously, it adopted the Declaratory Act, in which it claimed authority to legislate for the colonists "in all cases whatsoever." Americans would remember that claim.

By the time the fighting started in 1775, radical colonists such as Thomas Jefferson were going further than Dickinson's resolutions. For Jefferson, in his pamphlet entitled *A Summary View of the Rights of British America* (1774), Parliament had no right to legislate for the colonists at all; the only legitimate constitutional tie between the colonies and the mother country was that they shared a common crown. When the Second Continental Congress declared in 1776 that the thirteen colonies were and of right ought to be free and independent states, it based its claim on a Lockean account of government that culminated in an assertion that King George III had effectively abdicated his role in regard to the thirteen colonies. Among George's supposed misdeeds was his failure to prevent the British Parliament from legislating for North America.

Besides coordinating American foreign and defense policy, the First and Second Continental Congresses had, by default, to establish the working federal relationship among the states. Each time Congress claimed authority, it met with opposition from those states that could expect to carry the most of the burden or, in some cases, to be negatively affected. Nowhere was this clearer than when it came to the states' western land claims.

Several states claimed extensive lands beyond the Proclamation Line of 1763. From its earliest days, Congress endeavored to provide rational national policies for the governance of those lands, but the states with western claims, particularly Virginia, rose to the defense of their parochial interests. In defending their claim to exclusive jurisdiction over their trans-Ohio River territories, Virginia members of Congress such as George Mason, James Madison, and James Monroe developed a sophisticated theory of states' rights and reserved powers that would later be resuscitated and reinvigorated by the Virginia-centered Jeffersonian Republican Party.

In 1777 Congress submitted the proposed Articles of Confederation to the states. After four years of debate, the Articles—America's first federal constitution—were ratified. Leading figures from all sections of the country recognized the inadequacy of the Articles, particularly when it came to the federal government's taxing power, but tiny Rhode Island stood in the way of their favorite proposal: an amendment to the Articles granting Congress power to levy a tariff.

A NEW CONSTITUTION

In response, self-styled Federalists plotted to hold a continental convention to reinvigorate the federal government. Led by Alexander Hamilton and James Madison, and with the support of General George Washington, they finally succeeded in convening a group of delegates from twelve states at Philadelphia in May 1787.

The Federalists' purported goal was to formulate acceptable proposals for amending the Articles of Confederation to give the government adequate powers. In fact, however, their true goal was to substitute a new government for the old one. Seeing through Federalist pretensions, several notable American politicians, including New York's George Clinton, North Carolina's Willie Jones, and Virginia's Patrick Henry, refused to participate; Rhode Island rejected the invitation to send delegates altogether.

Why? Henry, James Monroe, and other Virginians believed that a stronger congress would be willing and able to sacrifice Virginia's rights for the majority's benefit. Henry's concern had been raised by Congress's 1786 attempt to trade American rights to navigate the Mississippi River for limited access to Spanish colonial ports in the Caribbean Sea. Both in the Philadelphia Convention and in the subsequent state ratification conventions, proponents of leaving the preponderant legislative authority in the states opposed the nationalist program of the Federalists. They did so largely out of concern for the primacy of the states in the federal system. At Philadelphia, that insistence resulted in the state legislatures' power to elect U.S. senators and in the defeat of James Madison's proposal that Congress have a veto over all state laws; in the ratification conventions, it shaped the debate in myriad ways.

Most important, concerns for state sovereignty elicited from Virginia governor Edmund Randolph, a Philadelphia Convention delegate and the leading Federalist orator in the Richmond ratification convention of 1788, repeated avowals that the new federal government would have only the powers it was "expressly delegated" by the Constitution. Fellow Federalist delegate George Nicholas, a lieutenant of Madison's, picked up on this formulation, and the two of them forcefully repeated that claim at the convention's end. Nicholas and Randolph were two of the five delegates chosen to draft Virginia's instrument of ratification, which reserved certain rights to the people. It was on this understanding that Virginia ratified, and Federalists in other states—notably South Carolina—made similar assurances.

Federalists had already proven untrustworthy: they had promised that the Philadelphia Convention would merely propose amendments to the Articles. Therefore, several ratification conventions proposed amendments akin to what became the Tenth Amendment, which says that any powers not delegated through the Constitution to the federal government are reserved to the states respectively or to the people. To remind federal officials of their intention to hold them to Randolph's pledge, the majority of the Virginia General Assembly in 1790 adopted a resolution written by Patrick Henry to the effect that Hamilton's bill for assumption of the state debts was unconstitutional because in adopting it, Congress exercised a power not "expressly" granted to Congress.

THE EARLY 1790s

The First Congress saw a heated discussion of the idea of taxing slave imports. Members of Congress from

the Deep South insisted that the Constitution's denial to Congress of a power to prohibit slave imports before 1808 implicitly denied it the power to tax slave imports. Ultimately, South Carolina representative Aedanus Burke said that if a special tax were placed on slave imports, South Carolina would secede from the Union. Georgia delegates echoed this threat, and the proposal failed.

Through the 1790s, self-styled Republicans would repeatedly insist that the federal government, in exercising powers not "expressly" granted it by the Constitution, were violating the Tenth Amendment; that is, they would say that virtually every controversial measure of the federal government amounted to an impingement upon states' rights.

For example, James Madison's opposition in the House of Representatives to the 1791 bill granting a federal charter to a bank rested ultimately on the idea that the power to grant such charters had been reserved to the states. Secretary of State Thomas Jefferson, at the request of President Washington, made a virtually identical argument in the cabinet. Federalists consistently rejected this argument, as Washington ultimately did in signing the bank bill. So far as they were concerned, the federal government was a sovereign in the international system. Since it alone represented the American people abroad, it could tax and spend for all the purposes of government.

Republicans remained steadfast in their insistence that various federal measures violated the reservation of residual powers to the states throughout the 1790s. Thus, the Virginia politician John Taylor of Caroline insisted that the federal excise tax on carriages was unconstitutional because the power to levy it had not been expressly granted and because of its disproportionate sectional incidence (only two carriages were taxed in all of Connecticut, he asserted, but virtually every substantial planter in Tidewater Virginia had one); for rhetorical effect, Taylor added that if the federal government could overstep the bounds of its authority to tax a particular type of property held mainly in the South in this instance, that would be a dangerous precedent for taxing another type of property that was held mainly in the South. From the beginning, then, the Republican insistence on states' rights was tied to slavery, not only by U.S. senators and representatives from the Deep South but by leading Republicans in Jefferson's home state.

One result of this Republican campaign was the Eleventh Amendment, affixed to the federal charter in 1795. This amendment grew out of the unpopularity of the U.S. Supreme Court's decision in *Chis-*

holm v. Georgia (1793). The majority of the Court said in the decision that Georgia could be made a party defendant to a suit in federal court even without that state's consent. Legislatures from Massachusetts to Virginia protested, and the result was an amendment denying the federal courts authority to make a state a party to a suit against its will. Popular opinion seems to have been behind the amendment.

THE ALIEN AND SEDITION ACTS

The climax of the Federalist-Republican debate of the 1790s came at the decade's end. In response to the Alien and Sedition Acts of 1798, the Republican-dominated legislatures in Virginia and Kentucky promulgated the Virginia and Kentucky Resolutions of 1798. The federal government, according to these Republican resolutions, had been created by the states, had only the powers granted it by the states, and must, in the last resort, be kept by the states from depriving Americans of their rights. Virginia's version, secretly penned by Madison, said that the remedy to unconstitutional and dangerous federal legislation was state "interposition"; the first draft of Kentucky's, secretly written by Jefferson, called the proper remedy "nullification."

Alexander Hamilton believed that "Virginia" (meaning the Republican Party) meant to dismember the Union. Some leading Republicans, such as Taylor and the U.S. representative from Virginia, William Branch Giles, were contemplating precisely that in 1798. The Virginia General Assembly, meanwhile, took steps to invigorate Virginia's militia. Vice President Jefferson wrote to Taylor in June 1798 that the time for secession had not arrived yet. In the days before the election of 1800, he believed that what he called the "reign of witches" would be dispelled by the arrival of the tax bill associated with the Federalists' military buildup.

In the interim between 1798 and the election of 1800, things did not look very promising for the Republicans. Federalists achieved their largest congressional majority in the elections of 1798, and ten states responded to the Virginia and Kentucky Resolutions with staunch, in some cases resounding, disapproval. Several of them rejected the idea that it was a state's right to interpret the federal Constitution, saying that this authority lay in the federal courts. In 1799, Kentucky adopted a second set of Jefferson-penned resolutions, this time saying it would be among the very last to secede because it loved the federal Union for the purposes for which it had been created. In Virginia, Madison left retirement to sponsor his *Report of 1800* as a member of the House of Dele-

gates. Along with asserting the unconstitutionality of virtually every controversial Federalist measure of the 1790s, the *Report of 1800* also clarified what the Republicans meant when they said the states had created the federal government: a "state," in this context, was the sovereign people of a particular state. The government of a state was not sovereign, the people were.

REPUBLICAN PRESIDENCIES

Once Jefferson assumed the presidency in 1801, he changed his tune. The Revolution of 1800, as he came to call it, had proven not that Americans hated taxes, but that they approved of the Virginia and Kentucky Resolutions of 1798. States' rights would be the Jeffersonian gospel ever after.

Jeffersonians gleefully pushed their platform of limited federal government and low taxes through Congress in 1801. That platform circumscribed their options in foreign policy markedly, leading to the military fiasco that was the War of 1812. Hit harder than the rest of the country by the war's economic repercussions, Federalist governors of some New England states exercised their states' right to refuse to send militiamen to fight beyond their states' boundaries. In 1814, as the war went badly, New England Federalists staged a regional convention to consider their options. Although some of the instigators of the Hartford Convention of 1814 favored New England independence, most did not. Still, Republicans succeeded in branding the conventioners as disloyal, and the coincidence of the war's end with the convention's end spelled doom for the Federalist Party as a national force.

Still, by the war's end in 1815, even President Madison found himself constrained to concede that the Principles of '98 had seemed far more practical in theory than they had proven in practice. In 1816, he asked Congress to charter the second Bank of the United States. State-level Republicans in several states disapproved, and they enacted legislation intended to impede operation of bank branches within their bounds. One state, Maryland, imprisoned the chief operating officer of its bank branch, and he appealed the case to the Supreme Court.

McCulloch v. Maryland (1819) was the result. In his opinion for a unanimous Supreme Court, Chief Justice John Marshall wrote a Hamiltonian reading of the Constitution into constitutional law, where it remains enshrined. Rejecting the argument that Jefferson and Madison had made against the constitutionality of the first bank in 1791 and that had been repeated by framer Luther Martin before the Court,

Marshall held that the Constitution granted Congress very broad authority to legislate for the common good. Maryland, the Court ruled, had no right to interfere with the bank's operations.

President Madison left office in 1817 with a ringing states' rights veto message as his last official act. Leaders in Congress intended for the federal government's share of bank profits to be used in construction of various public works. Madison responded that he found no mention in the Constitution of a congressional power to fund construction of roads, bridges, canals, and other internal improvements, so the advocates of these improvements must first secure a constitutional amendment. Observers noted that Madison's position in his Bonus Bill Veto Message of 1817 clashed with his signature on the 1816 bill chartering the bank.

Virginia's dominant Republicans had other opportunities to joust with John Marshall's Supreme Court, including *Martin v. Hunter's Lessee* (1816). In that complicated litigation, the Supreme Court issued a writ ordering Virginia's highest court to send a certified copy of the record in the case so the Supreme Court could consider an appeal. Spencer Roane, a states' rights-minded Jeffersonian on the Virginia Court of Appeals, took the bait: he wrote that the Supreme Court had no authority to order the Virginia Court of Appeals to do anything. Virginia's court system and the federal court system were coordinate systems, he said, and each must conduct its business without the interference—much less oversight—of the other. In his opinion for the Supreme Court, which still stands as the keystone of American judicial federalism, Justice Joseph Story said that all matters of federal law ultimately could be appealed to the Supreme Court. Both *Martin* and *McCulloch* provoked furious responses from leading Jeffersonians in speeches, in books, and in newspapers (and, in Jefferson's case, in private correspondence), but these had no notable effect on the Marshall Court. Jefferson lamented that the Court seemed to be undoing the Republicans' repeated victories at the polls. Roane, for his part, never certified the record in *Martin* for Supreme Court review.

The Missouri crisis. In 1819 citizens in the Missouri Territory submitted their draft constitution to Congress with an application for statehood. A Republican representative from New York, James Tallmadge, touched off the Missouri crisis by responding that while Missouri should be admitted to the Union as a state, it must do so with a constitution banning slavery from its territory. In the main, northerners—whose states had either eliminated or virtually elimi-

nated slavery—agreed, while southerners held that slavery must be allowed in Missouri if its citizens wanted it. Jefferson, in retirement, said that the issue was states' rights, specifically the right of the state of Missouri to make for itself a decision—whether to allow slavery within its territory—that every other state had made for itself. (Jefferson was wrong about that, as he should have realized, for the Northwest Ordinance had decided the issue without giving any say to citizens in the states carved out of the Northwest Territory.) The Missouri Compromise respected Jefferson's principle in regard to Missouri, but rejected the idea of allowing citizens of future states carved out of the Louisiana Territory north of Missouri's southern border to decide that issue for themselves. President James Monroe, with the concurrence of War Secretary John C. Calhoun, accepted the Missouri Compromise as a suitable solution to a very difficult problem, despite its arguably anti-southern and anti-states' rights elements.

Divided Republicans. By the time Monroe left office in 1825, the blurring of the Republican Party's old principles had become so marked that John Quincy Adams, his generation's leader of what a Republican member of Congress once dubbed "the American House of Stuart," succeeded him as Republican president. In his Inaugural and his First Annual Address, Adams called for an expansive federal spending program. He also tried to send a diplomatic delegation to a conference that would feature representatives from the Republic of Haiti, recently established by history's only successful slave rebellion. Opposition to President Adams swelled among those who remained devoted to the old Jeffersonian nostrums of states' rights and strict construction. Soon enough, the Republican opposition to this Republican president would give birth to a new party, the Jacksonian Democratic Party, with the same constitutional emphases. While states' rights might sometimes be ignored by those who trumpeted them most loudly, the idea that the states came first and that the federal government had limited power retained great influence upon the American imagination at the end of the early Republic.

STEAMBOAT A particular stroke of genius of American inventors was applying steam power to a boat to create the steamboat. In the late eighteenth century John Fitch, James Rumsey, and Oliver Evans produced different types of steamboats. Fitch tested his boat in 1787 on the Delaware River. This ungainly craft had engines that powered six paddles on each side; it was never a commercial success. Robert Fulton produced a paddle wheel steamboat, which was the first viable craft. Fulton had met Robert R. Living-

ston, U.S. minister to France, while in Paris, where Fulton was working on the development of a submarine. Livingston persuaded Fulton to return to the United States and build a steamboat. The wealthy Livingston also provided the financial resources for Fulton's work. In 1807 Fulton successfully tested the *North River Steamboat of Clermont* on the Hudson River. Although the *North River* had sails, it did not use them during the 150-mile voyage from New York City to Albany. Fulton's boat quickly became a commercial success because it was practical and stressed passenger comfort.

Fulton and Livingston also succeeded in gaining the exclusive right to operate steamboats on the waters of New York State and within the territory of Louisiana, but their monopoly was short-lived. Fulton's success and the relatively low cost of building a steamboat encouraged rivals to enter the business, and after a period in which a number of conflicting grants were given to individuals by local authorities, the U.S. Supreme Court ruled in the landmark case of *Gibbons v. Ogden* (1824) that the commerce clause of the U.S. constitution gave the authority for such agreements only to the U.S. government. This formally negated the agreements that Livingston and Fulton had obtained, although competitors had in fact been challenging their control for over a decade.

As more builders entered the steamboat industry, they improved the overall design of the boats, manufactured better engines, and strengthened hulls. Northeastern steamboats were most noted for their passenger and tourist trade, although they also carried some cargo.

Steamboats had their greatest impact on the waters of the Mississippi River system. Nicholas Roosevelt, the grand-uncle of Theodore Roosevelt, piloted the first steamboat on the Mississippi in 1811. The boat was a product of the Mississippi Steam Navigation Company, a partnership of Roosevelt, Fulton, Livingston, and Livingston's brother Edward, a prominent attorney and legislator. Henry Shreve, a former flatboatman from Pennsylvania, brought his own steamer to New Orleans in 1814. Shreve and others modified the traditional structure of steamboats, widening and lengthening the deck, reducing the draft, placing the engine on the main deck, and adding several stories. This is the design most familiar to twenty-first century Americans. These improvements enabled western steamboats to operate in shallow waters (sometimes as low as six feet) but still carry enormous amounts of cargo.

Steamboats produced a revolution in commerce in the Mississippi River valley. In 1810 river travel

from New Orleans to Louisville took at least four months. By 1830 goods and passengers could make the same trip in a mere eight days. The cost of shipping goods plunged, too. In 1815 it cost five dollars to ship 100 pounds of freight from New Orleans to Louisville; the cost in 1860 was twenty-five cents. Westerners used steamboats to ship an amazing array of items. Surviving manifests reveal that steamboats carried everything from farm implements to pianos. Steamers also carried live cargo: cows, mules, chickens, and slaves. The boats stopped at towns, farms, and plantation landings along the river, making it easy and affordable for westerners to purchase just about anything.

Steamboats were also a catalyst for the development of the Cotton Kingdom. It was difficult to stack cotton bales on flatboats, but western steamboats accommodated the cotton trade well. When steamboats stopped at a plantation, roustabouts wrestled the five-hundred-pound bales onto the boats. The wide decks of the western steamers meant that cotton could be stacked as high as the pilothouse before being tied down. By 1830 it was common for these "cotton boats" to carry over four hundred bales (about eighty tons) of cotton on a single trip.

These economic advances encouraged westward settlement: the steamboat brought both migrants and civilization to the Mississippi River valley. Wealthier customers traveled as cabin passengers. Staying in individual rooms, they ate sumptuous meals and spent their days conversing, reading, listening to music, or playing cards. Most steamboat travelers, however, were deck passengers, who slept and ate alongside the cargo. They prepared their own food in what was essentially a floating barn and slept wherever they could find room. Deck passengers usually participated in wooding, which involved scrambling ashore with the crew to carry several cords of wood on board for fuel.

Steamboats also changed the lives of slaves. Many bond servants worked on steamboats, being either owned by crewmembers or hired from owners on a yearly or monthly basis. Slave porters served meals to the cabin passengers, while slave firemen tended steamboat furnaces—work that was difficult and dangerous. Bond servants sometimes took advantage of their work on steamboats to escape or locate lost family members. Milton Clarke, a slave who had been hired to work on a steamboat, found his sister in New Orleans after she was sold to an interstate slave trader.

STEAM POWER Steam power development during the colonial and early republican periods was initially hesitant but ultimately decisive. Beginning as an import with only slight relevance to the domestic situation, the steam engine then became a power source that was adapted to local needs. Technological breakthroughs eventually placed America at the forefront of steam power development, and by the close of the period it was a technology poised to overrun the American continent.

ORIGINS AND EARLY APPLICATIONS

Steam power has its beginnings in the British reliance on coal as a fuel and the flooding that occurred as increasingly deep coal seams were mined. The steam engine built by Thomas Newcomen (1663–1729) in 1712 was the first practical application of steam to the problem of pumping out flooded mines. Although the early steam engines were inefficient and troublesome, their widespread adoption in England was ensured because they performed a crucial function and, in most cases, consumed a fuel that was mined on the premises.

The first application of steam power in the New World took place in New Jersey. In 1748 Philip Schuyler, who owned a severely flooded copper mine close to Newark, ordered an engine from the Hornblowers, a family of steam engine builders in Cornwall, England. The machine, accompanied by Josiah Hornblower and numerous duplicate components, was shipped in 1753 and finally made operational in 1755. This engine returned the mine to profitability and continued to operate, sporadically at least, for over fifty years.

Two decades were to pass before the next attempt to employ steam in America. Christopher Colles (1739–1816), an Irish immigrant, undertook the

fabrication of two engines for water pumping installations—one in 1773 for a distillery in Philadelphia and another in 1776 for New York City's first public waterworks. Although the Philadelphia engine remained unfinished, these two engines were the first to be constructed in the colonies. One other engine was made about 1780 for pumping water from the mine at Joseph Brown's Hope Furnace near Cranston, Rhode Island.

ADAPTATION

Just as steam power's origins arose from the English situation, so the first American breakthroughs arose from local needs, specifically the traversal of long distances via water navigation. Developments in England during the final quarter of the eighteenth century were again of assistance. Successive improvements to Newcomen's basic engine by the Scottish engineer and inventor James Watt (1736–1819) had resulted in steam engines that were more thermally efficient, smaller, smoother running, and capable of providing rotary motion.

Although Robert Fulton (1765–1815) is widely accepted as the originator of the steamboat, John Fitch (1743–1798) is credited with operating the first successful steam-powered boat in the United States. But Fitch's 1787 steamboat is to steam navigation as the Schuyler mine engine was to stationary steam development—a successful but isolated first step. Fulton chose New York City as the location for the 17 August 1807 inauguration of his large vessel, the *North River Steamboat of Clermont*. The *Clermont* was a success, not only technologically but also economically—Fulton immediately began regular fare-paying operation from New York City to Albany and used the proceeds to begin building improved boats. Other steamboat experimenters such as Nicholas Roosevelt and John Stevens and his son Robert began to build similar vessels. Just four years later Fulton's Pittsburgh-built *New Orleans* departed for its namesake port, and a new era in river navigation in the United States began.

HIGH PRESSURE

In 1804 the American inventor Oliver Evans (1755–1819) provided the major impetus for the American steam revolution when he successfully operated an experimental engine that employed high pressure steam. Richard Trevithick made the same breakthrough completely independently in England at the same time. "High pressure" engines were, for a given power output, more compact than Watt-type engines. Their economy was such that they could be

designed for use in both modest and large applications—thereby extending steam power's reach beyond steamboats and pumping installations into flour, sugar, and saw mills. Despite being covered by Evans's patent, the subsequent building and refinement of high pressure engines and boilers took place largely outside the patent system—a circumstance helped no doubt by the isolation of many installations and compounded with grass roots ingenuity, expediency, and commercial considerations. Evans, already known for his 1795 work, *The Young Millwright and Miller's Guide*, also had considerable influence through his 1805 *Abortion of the Young Steam Engineer's Guide*, perhaps the most accessible steam treatise of the period. The ubiquitous horizontal stationary engine of nineteenth-century America owed its bare-bones sophistication to the high-pressure steam engine as first applied and adapted to river navigation.

RAILROADS

By the late 1820s another era of steam power in America was just beginning—that of the railroad. The earliest successful steam locomotives had been developed for use in English collieries, and by the mid-1820s this technology was being applied to public railways connecting towns and rural communities in the north of England. Predictably, accounts of these ventures found their way to the United States. The Delaware and Hudson Canal Company, organized in 1823, proposed the incorporation of a section of railroad into their planned canal route and to that end ordered four locomotives from England. The first to be steamed, the *Stourbridge Lion*, was road tested in August and September of 1829. It was an outright failure, largely because the locomotive was too heavy for its track. But this, unlike the failures of the earliest steam installations on the American continent, was only the slightest of setbacks. By this time the numbers of practical mechanics—a groundswell of mechanical knowledge diffused in the close to four hundred steamboats plying the Mississippi and its tributaries, and concentrated in machine shops and foundries in Pittsburgh, Philadelphia, New York, and elsewhere—was such that this false start did no more than neatly presage the ensuing divergence of American and British railroad practice. At the end of the 1820s working methods rooted in the American situation had emerged—methods that were poised to fully adapt steam technology to the American situation.

SUGAR ACT The Sugar Act (1764), also known as the American Revenue Act, was the first overt imperial tax raised by Parliament in British America. It was one of a series of measures introduced by the ministry of George Grenville in an effort to reduce Britain's national debt by defraying the cost of colonial administration and the defense of a much-expanded empire in the aftermath of the French and Indian War (1756–1763). The Sugar Act yielded the largest revenue of any imperial tax before the Revolutionary War.

The Sugar Act revised the earlier Molasses Act (1733). It decreased the duty on foreign molasses imported into North America from six pence per gallon to three pence, prohibited the importation of rum, and increased the tax on sugar imports from five shillings to one pound seven shillings per hundred-weight. It imposed new or higher duties on foreign textiles, coffee, and indigo and on wines directly imported from the Madeira and the Canary Islands. In an effort to close a tax loophole, it doubled the duties on foreign goods reshipped from Britain to America. It added iron, hides, whale fins, raw silk, potash, and pearl ashes to the list of goods permitted to be exported by the colonies to Britain. Of perhaps greater significance, it introduced elaborate enforcement regulations and new trial procedures in the vice-admiralty courts. Furthermore, it was more effectively enforced than the earlier Molasses Act, partly in consequence of more rigorous efforts by the collectors of customs but also because of the intervention of the Royal Navy.

The act did not provoke the same unity of opposition among the thirteen colonies as the Stamp Act

did the following year. This was because, although the preamble had clearly stated that it was a revenue measure, it conformed in many ways to the tradition of navigation acts that sought primarily to regulate trade. Furthermore, it did not affect all levels of society or equally impact all the thirteen colonies. The opposition was therefore limited primarily to merchants in the northern and middle colonies, where refineries depended upon the cheap and plentiful supply of molasses from the French Caribbean. The Sugar Act was soon overshadowed by the much more unpopular Stamp Act. Nevertheless, it caused colonies to correspond with one another and some cities to sign nonimportation agreements, thereby setting precedents for opposition to the Stamp Act. The Sugar Act was relatively popular in the British Caribbean, where planters wanted to secure the monopoly of the North American market because they were unable to compete profitably with the rival French. Indeed, the Patriot opposition complained that it was sacrificed to the lobbying power of the British planters in the Caribbean. The act was a major obstacle to a united colonial alliance of the North American and West Indian lobbies in London.

The Rockingham ministry revised the Sugar Act when it repealed the Stamp Act in 1766, reducing the tax on the import of molasses from three pence to one penny per gallon. North Americans nevertheless protested the new Sugar Act with formal petitions from the merchants of New York, followed by Boston and the legislature of Massachusetts. Their attempts to win further concessions to trade openly with the French Caribbean widened the breach with the British Caribbean and diverted the colonial lobbies from uniting against other measures like the Currency Act (1764) and Townshend Act (1767). The legislation played an important role in alienating colonial opinion against the vice-admiralty courts and the Royal Navy.

SUMMER OF 1816 *See Natural Disasters.*

SUPREME COURT The “least dangerous” branch was Alexander Hamilton’s classic description of the U.S. judiciary in Federalist No. 78 (1788), because it had “no influence over either the sword or the purse.” This description was still accurate in 1828, but dramatic changes had occurred during the intervening four decades. However committed to the separation of powers, the framers of the Constitution emphasized the political branches. The order of their presentation demonstrates the level of their concern. Article I defines legislative authority in 2,279 words. Article II presents the executive in less than half that space, 1,012 words. By comparison the judiciary, provided for in Article III, seems almost an afterthought, described in only 365 words. The Supreme Court is established in the first sentence: “The judicial Power of the United States, shall be vested in one supreme Court, and in such inferior Courts as the Congress may from time to time ordain and establish.” Another sentence provides a brief but highly significant list of authorities granted to this court (or courts), including “all cases . . . arising under this Constitution and . . . the laws and treaties . . . under their authority.” Seven additional sentences assure judicial independence, assign areas of original and appellate jurisdiction, guarantee criminal jury trials, and define rules for treason cases.

JUDICIARY ACT OF 1789

Original jurisdiction granted by the Constitution to the Supreme Court was limited to “Cases affecting Ambassadors, other public Ministers and Consuls, and those in which a State shall be Party.” All other cases were supposed to reach the Supreme Court through appeals—but appeals from whom? The most contentious judicial issue in the Constitutional Convention, whether there should be subordinate federal courts or whether state fears should be mollified by advancing federal issues only from state courts, was left for the first Congress to resolve. Therefore, it was important that Congress act promptly and creatively in determining the structure of the federal judiciary, including even the structure of the Supreme Court. The first Senate rose splendidly to the challenge. While the House of Representatives focused on economic and administrative issues, the Senate’s first major assignment was to create the Judiciary Act of 1789, described as one of the great-

est, and certainly one of the longest lasting, laws in American history. It survived nearly unchanged for a century and early in the twenty-first century remains an essential part of the American judiciary.

Oliver Ellsworth of Connecticut chaired the Senate’s grand committee, ably abetted by William Paterson of New Jersey. Having succeeded in the Constitutional Convention of 1787 in guaranteeing a strong role for small states such as theirs, they now cooperated in the Senate to establish a strong judiciary despite their earlier concerns that state judiciaries would be weakened unjustly if forced to compete with federal courts at the local level. Both would soon be appointed to the Supreme Court that they created, Paterson in 1793 and Ellsworth in 1796 as chief justice. The legislation was reported in June and then debated for sixteen weeks until it became law on 24 September 1789. It established a Supreme Court of six justices, augmented by thirteen district courts and three circuit courts to which federal issues could be appealed. Districts were linked to state boundaries, except that Maine and Kentucky, which were not yet states, each had its own district court. Because of delays in the ratification of the Constitution, North Carolina and Rhode Island had not yet been added to the new nation while the judicial legislation was in process. The single judge in each district court would sit with two Supreme Court justices to staff the circuit courts. Most important (and controversial) was section 25, which allowed appeals to the Supreme Court from state courts. President George Washington, obviously waiting anxiously for passage of this legislation, sent the names of six justices on 24 September; they were confirmed two days later by the Senate.

JUSTICES ON HORSEBACK

The Supreme Court justices’ early years were devoted to incessant travel to circuit courts and to vigorous protection of judicial independence. They soon learned how exhaustive service in circuit courts ranging from New Hampshire to Georgia could be. Congress granted a single concession in response to continual complaints and occasional resignations regarding this burden. Beginning in 1793 only one justice was required for each circuit court, sitting with a district judge. Despite the resentment and exhaustion, the justices’ presence in local courts provided important opportunities for them to establish their independence. In particular, on circuit they were able to establish a foundation for the judicial review that would be confirmed later by the Marshall Court. Without strong objection, circuit courts ruled ac-

The Old Supreme Court Chamber. The U. S. Supreme Court met in this room in the Capitol Building in Washington, D.C., from 1810 to 1860. © BETTMANN/CORBIS.

tions by the Connecticut, Rhode Island, and Vermont legislatures to be in conflict with the U.S. Constitution. In *Hayburn's Case* (1792), two circuit courts ruled that Congress had exceeded its constitutional limits by assigning Supreme Court justices to non-judicial functions. The justices softened this affront by carrying out their assignment as “special commissioners” rather than as judges. In *Hylton v. U.S.* (1796), the Supreme Court ruled that a carriage tax passed by Congress was not a violation of the Constitution; ruling that the tax was constitutional at least implied that it might instead have been found to be unconstitutional.

Nine of Washington's ten appointees were Federalists in both senses of the word: strong supporters of the Constitution as well as active participants in the political party that would soon be known as Federalists. The exception was Samuel Chase, whose strident Federalist partisanship offset his initial opposition to the Constitution. John Adams's three appointees all voted Federalist, while all seven of the

justices appointed after Marshall were Republicans—although Joseph Story embraced John Marshall's Federalist jurisprudence. Marshall and Henry Brockholst Livingston had likewise supported ratification of the Constitution as young men.

JUDICIARY ACT OF 1801

Partisanship proved a massive barrier to Congress's one attempt to remove the responsibility that caused so many to resign or refuse appointment to the Supreme Court. The Judiciary Act of 1801, approved just weeks before Thomas Jefferson became president, sought to relieve the justices of circuit-riding responsibilities. It created six new circuit courts and, most important, provided circuit judges for all of those courts. Under it, Supreme Court justices would no longer rule on issues that they had already decided on circuit. Much of value was included in the legislation, but the timing was abominable. President Adams and a Federalist-dominated lame duck Senate quickly proved the accuracy of Republican assump-

tions that all sixteen new circuit judges and their accompanying clerks and marshals, plus a few new district judges, would be Federalists. Even decreasing the Court from six to five, which had the virtue of reducing the number of tie votes, was also suspect because it would not become effective until the next justice died or retired. Jefferson would not only inherit Federalist judges with a prospect of lifetime service, he would not even be able to appoint a replacement when the first Federalist Supreme Court justice died. Worse yet, these “midnight appointees” to the circuit courts were given increased jurisdiction, further threatening the viability of the state courts.

The Republican Congress rescinded the Judiciary Act of 1801 at the first opportunity, early the following year, abolishing the new courts and judges and consigning Supreme Court justices again to the circuit courts. This blow was softened somewhat by the Judiciary Act of 1802. It increased the number of circuit courts to six, with one justice assigned to each one for two sessions. Justices’ travel burdens were lessened further by decreasing Supreme Court responsibilities from two two-week sessions annually to a single four-week session. Judicial reform was so politicized in 1801 and 1802 that significant change remained nearly impossible for decades.

Fortunately, the Federalists who still packed the Supreme Court shared the realism of their new leader, the politically adept Chief Justice Marshall. He recommended quiet acquiescence in the changes; only the volatile Samuel Chase demanded that they refuse to return to the circuit courts. Paterson, who had been second only to Chase in blatant partisanship when addressing juries in sedition cases, rendered his greatest service as a justice when he ruled in *Stuart v. Laird* (1803) that the Judiciary Act of 1802 was constitutional.

FINALLY SOME REPUBLICAN JUSTICES

Federalist justices maintained their majority on the Supreme Court throughout Jefferson’s presidency and most of Madison’s first term. The first Republicans were appointed in 1804 and 1806. Even Kentuckian Thomas Todd’s appointment in 1807 did not bring the Republicans to equal representation, because he was named to a seventh position, established to serve the new western circuit. Not until 1812, after Gabriel Duvall (November 1811) and Joseph Story (February 1812) had replaced two deceased Federalists, did Marshall and Bushrod Washington finally become a Federalist minority, albeit a very influential one.

In fact, Marshall’s most productive years came during the Republican ascendancy. Republicans on the bench did not really become Federalists, as Jefferson sometimes contended, but Marshall’s congenial personality and the responsibilities of the bench often persuaded them to side with his judicial nationalism. Because Madison did not share the antagonism that Jefferson had long felt for Marshall, the chief justice in turn acted less politically on the bench during Madison’s presidency. Marshall never crossed over to the Republicans, but by 1817 there was really no Federalist Party to abandon.

Chief Justice Marshall introduced significant revisions of court procedures without need for additional judiciary legislation. His first decision, *Marbury v. Madison* (1803), marked an advance from *seriatim* decisions (in which justices individually read their own opinions) to majority opinions that could be accompanied by dissenting and concurring opinions. During Chief Justice Ellsworth’s brief tenure, individual decisions were sometimes abandoned; after 1803 *seriatim* decisions were rare. The Jay Court, where each justice stated his own opinion with the chief justice speaking last, sometimes left the public wondering just what the Supreme Court had said. When John Marshall spoke for the majority, the message came loud and clear.

SUPREME COURT JUSTICES Half of the twenty justices of the U.S. Supreme Court who served from 1790 to 1828 were appointed by Presi-

John Marshall. Chief Justice of the U.S. Supreme Court from 1801 to 1835, in a portrait by James Reid Lambdin after Henry Inman. THE NATIONAL PORTRAIT GALLERY/SMITHSONIAN INSTITUTION.

dent George Washington. When John Adams's three appointees are added to Washington's ten, the two Federalist presidents named nearly two-thirds of the justices in the nation's founding years. Thomas Jefferson complained to Connecticut merchants on 12 July 1801 about the lack of vacancies in federal offices: "Those by death are few, by resignation none." This would prove especially true of Federalist justices. During seven consecutive Republican administrations, Jefferson named three justices, James Madison two more, and James Monroe and John Quincy Adams one each. Two of the Federalists, Chief Justice John Marshall and Bushrod Washington, outlasted Jefferson, who died in 1826. Marshall served until 1835, near the end of Andrew Jackson's two terms as president.

FEDERALIST DOMINANCE

Selection of the six members appointed to the first Supreme Court of the United States was largely influenced by two dominant considerations: the need for geographical balance and for extensive government or judicial experience, including a demonstrated commitment to the success of the newly adopted U.S. Constitution. Because the justices spent much

more of their time in the circuit courts than in the Supreme Court, it was essential that they be widely distributed. The order of appointment of the initial six justices followed a clear North-South pattern while also rewarding the populous states: Chief Justice John Jay (New York), John Rutledge (South Carolina), William Cushing (Massachusetts), John Blair (Virginia), James Wilson (Pennsylvania), and James Iredell (North Carolina).

All members of this first Supreme Court had demonstrated firm commitment to the Constitution. Jay's lengthy career in the Continental Congresses and in diplomacy had made him one of the leading American nationalists. He was not at the Constitutional Convention that developed the Constitution but wrote three important essays urging ratification in *The Federalist* (1787–1788) and would have written several more if not prevented by poor health and injuries. Wilson and Blair were signers of the Constitution and members of their state ratifying conventions; Wilson's contributions to the Constitution were exceeded only by those of James Madison. Rutledge was also a signer. Cushing supported the Constitution in the Massachusetts ratifying convention and Iredell supported it both in the North Carolina convention that rejected it in 1788 and in the reconstituted convention that approved it in 1789.

Similar credentials were held by all but one of Washington's remaining appointments. Thomas Johnson (1791) was in the Maryland ratifying convention. William Paterson (1793), another signer, worked avidly in the convention and afterward as a New Jersey senator to develop a strong judiciary based on the supremacy clause that he contributed to the Constitution. He and Oliver Ellsworth of Connecticut, who would become the third chief justice in 1796, were the principal authors in the first Senate of the Judiciary Act of 1789, which provided the basic ground rules of the federal judiciary for the next century. Ellsworth was on the committee of detail, which assembled the first draft of the Constitution, as were Wilson and Rutledge, who chaired it. Ellsworth led the campaign for Connecticut's ratification of the Constitution, as did Paterson in New Jersey.

Samuel Chase, also appointed in 1796, represented a new criterion of eligibility. During his radical years he had opposed Maryland's ratification of the Constitution. In Congress during the Revolutionary War, however, he had consistently supported General Washington and, more important, by 1796 he had become deeply committed to the Federalist Party. Commitment to the new political parties

would from that point be joined with geographical balance to determine appointments. John Adams appointed only Federalists and his four successors appointed only Republicans.

Federalist Senates dutifully confirmed all but one of Washington's appointments. Rutledge was twice appointed but only once confirmed, thus confusing statistics on Court membership. Technically the senior associate justice, Rutledge had sat with circuit courts but never attended the Supreme Court when he resigned in 1791 to become South Carolina's chief justice. He later changed his mind and requested appointment as Jay's successor. Washington promptly granted an interim appointment and Rutledge acted as chief justice for the August 1795 term. By the time the Senate convened four months later, however, Rutledge's attacks on the Jay Treaty (1794) had made him politically unacceptable to Federalist senators, and he was rejected by a narrow vote.

Rutledge was not alone in deciding that the Supreme Court was less appealing than he had expected. Jay found the office too limiting and the time and energy devoted to circuit court duties too enervating, so—while still sitting on the Court—he became Washington's special envoy to Great Britain, where he negotiated Jay's Treaty (1794). He was elected governor of New York while abroad and resigned from the Court in 1795. In 1800 he was reappointed and confirmed as successor to Chief Justice Ellsworth (ironically his own successor), but he rejected the position, which he described as lacking "energy, weight and dignity." Ellsworth also took a year off to negotiate peace with France and resigned upon his return. Despite the brevity of his period as chief justice, Ellsworth achieved a major procedural change. Sometimes he persuaded his colleagues to replace *seriatim* opinions (justices individually reading their own opinions) with majority opinions that might be accompanied by dissenting and concurring opinions. Thomas Johnson served only two years before refusing ever again to ride circuit. Alfred Moore of North Carolina, who joined the Court in 1800, served only four uneventful years before making the same decision.

JEFFERSONIANS GAIN GROUND

Adams's two Virginia appointees were major exceptions from this pattern of short tenures. Bushrod Washington, favorite nephew of George Washington, served from 1799 to 1829. John Marshall was an even greater political coup, serving as chief justice from 1801 to 1835. Taking note of the young ages of Adams's successful appointments (Marshall at age

forty-five and Washington at age thirty-six), the three succeeding Virginia presidents appointed Republicans young enough to survive all but those two Federalists. William Johnson (South Carolina) served thirty years from 1804, Henry Brockholst Livingston (New York) sixteen years from 1806, Thomas Todd (Kentucky) nineteen years from 1807, Gabriel Duvall (Maryland) twenty-three years from 1811, Joseph Story (Massachusetts) thirty-four years from 1812, and Smith Thompson (New York) twenty years from 1824. The exception was John Quincy Adams's lone appointee, Robert Trimble, who served only two years before dying in 1828.

Political affiliation trumped geography when it came to appointments of chief justices. Washington appointed the South Carolinian Rutledge to become chief justice as successor to Jay of New York, Washington then gave consideration to the Virginian Patrick Henry as Rutledge's successor (after Rutledge was rejected by the Senate) before finally turning to Ellsworth. Next, Ellsworth was succeeded by Marshall, even though another Virginian Bushrod Washington was already on the Court.

LIMITS ON JUDICIAL GRANDEUR

Ironically, neither of the great early justices was first choice of his presidential appointer. John Adams turned to Secretary of State John Marshall only six weeks before the presidency and the appointment would be lost to Jefferson. Jay had been appointed but declined. A young Philadelphia attorney was next considered and Adams at least talked of considering the ailing Justice Cushing, who had been unwisely appointed and confirmed as chief justice in 1796. Fortunately, Cushing recognized even then that his physical and mental health would not allow him to accept. (Ninety-eight years would pass before the next associate would be appointed chief justice.) Unwilling to wait longer, Adams turned to Marshall, from whom he could receive a timely response because they were face-to-face in Washington, D.C. Even at that precarious moment, High Federalists in the Senate stalled in hopes of coercing the president to appoint William Paterson instead. Marshall would soon become so powerful a figure on the Court that there were only limited opportunities for others to shine.

The monumental exception was Joseph Story, whose appointment by President Madison was even more confused because finding a reliable Republican lawyer in New England was difficult. Former Attorney General Levi Lincoln of Massachusetts was appointed and confirmed but declined because of ill

health and near blindness, Alexander Wolcott of Connecticut was appointed but overwhelmingly rejected by the Senate, and John Quincy Adams of Massachusetts was appointed and confirmed unanimously but preferred to remain ambassador to Russia. Only after trying Lincoln one more time did Madison conclude that Story was adequate despite Jefferson's strong objections. While lobbying for Lincoln, Jefferson described Story as "unquestionably a Tory and too young." Elsewhere he branded him a "pseudo-Republican." At age thirty-two Story became the youngest justice in the history of the Supreme Court. He was Marshall's perfect teammate, providing the legal scholarship to enhance Marshall's common-sense decisions. Most of the memorable decisions that were not delivered by Marshall were written by Story.

Samuel Chase might have achieved greatness if not for his rapidly declining health and his violent temper and partisanship. His first opinion (*Ware v. Hylton*, 1796), ruling that legislation violating a U.S. treaty was unconstitutional, is regarded as the greatest Supreme Court opinion prior to Marshall's *Marbury v. Madison* (1803). Chase's *Calder v. Bull* (1798) set permanent limits on the Constitution's ex post facto clause. Sadly, his offensively partisan charges to juries, especially in Sedition Act cases, while on circuit made him in 1804 the only member of the Supreme Court ever to be impeached. The following year, the Republican-dominated Senate fell well short of the two-thirds majority required for removal. Thenceforth, the Jeffersonians' impeachment threat was withdrawn and the judges, in turn, became less politically pugnacious.

Judicial experience was desirable for would-be justices, but not mandatory. Only Cushing, Chase and Blair had extensive judicial experience and Todd had spent considerable time on the bench. At the other extreme, Wilson, Paterson, Moore, Washington, Marshall, and Story had been in court only as lawyers. The others had spent limited time on various local benches. It should be added that Story and Wilson could be fairly described as the Supreme Court's prominent early scholars.

SURVEYORS AND SURVEYING Despite their generally poor training, colonial surveyors played an important role in shaping the early American landscape. Their primary instrument was the Gunter's Chain, which helped minimize the errors made by surveyors with limited mathematical skills. The chain contained one hundred links and measured sixty-six feet. A square with ten-chain sides enclosed an acre, and eighty chains measured 5,280 feet, or one mile. Most early surveys were done by traverse, which meant that from a starting point the surveyor created the boundaries around a property using a mariner's compass to measure the angles and a Gunter's Chain to measure the sides. In the North, most colonial land surveys were roughly rectangular and contiguous, but in the South surveying by "metes and bounds" meant that claimants were free to draw boundaries around any piece of land unclaimed by another. Surveys were recorded in two ways. A written description of the tract was usually accompanied by a map or plat, while on the land itself boundaries were identified by markings on trees, buried stakes, or piles of stones.

In the mid-eighteenth century, surveyors were in high demand by large landowners whose lands were vulnerable to squatters. A recorded survey meant that landowners could persuade squatters to take on a lease or be forced out. In Virginia, Lord Fairfax employed as surveyors both George Washington and Peter Jefferson, the father of the future president. The hardships of surveying and the value of the service meant that surveyors commanded salaries on a par with lawyers. For George Washington and many others, however, surveying not only provided large fees but also the opportunity to identify desirable tracts for their own land speculations.

In 1763 the proprietors of Maryland and Pennsylvania hired the English astronomers Charles Mason and Jeremiah Dixon to conduct a survey of

the long-disputed boundary separating their colonies. Assisted by the colonial astronomer David Rittenhouse, the group used custom-built equipment and astronomical surveying techniques to ensure the accuracy of the 244-mile border of the present states of Maryland, Pennsylvania, and West Virginia. This boundary became known in the nineteenth century as the Mason-Dixon Line, the division between slave and free states.

In the decade prior to the American Revolution, speculators formed several companies for the purpose of acquiring lands in the trans-Appalachian West. Despite the Proclamation Line of 1763 prohibiting settlement in this region, George Washington and Benjamin Franklin were two of the many prominent colonial figures involved in these ultimately futile attempts to make large-scale land acquisitions. Men such as Daniel Boone pushed far into the wilderness in the employ of private speculators and land companies who paid them to find and survey choice tracts for future purchase.

Following the American Revolution, a surge in western migration caused the Continental Congress to pass the Land Ordinance of 1785. In an attempt to prevent widespread squatting, this law called for the western territories recently ceded by the states to be surveyed and sold by public auction. The land was to be divided into townships of six miles square, each subdivided into thirty-six sections. North-south boundaries were called township lines and east-west ones range lines. The starting point for the survey was designated as the place where the Ohio River crossed the western border of Pennsylvania. Thomas Hutchins was given a three-year commission by Congress to serve as the first geographer of the United States. He received a salary of six dollars per day to supervise a team of surveyors to be drawn from each of the states. They were to survey the first seven ranges north and west of the Ohio River, and on 22 September 1785 Hutchins began surveying the first range line. With teams of axmen clearing the path ahead, the rear chainman stood by the starting stake holding one end of the chain while the front man carried the chain toward a mark sighted using compass bearings, unrolling it as he went. At the end of sixty-six feet, the spot was marked, the rear chainman came up, and the process was repeated. In this manner the surveying teams inched their way across the landscape.

Hutchins's efforts were hampered by conflicts of interest involving his surveyors, several of whom

were agents for land companies seeking to purchase large tracts for resale to individual settlers. Indian unrest also helped delay the survey, and the work itself was not only late, but poorly done. Hutchins died in 1789, but the general speed and accuracy of survey work did not improve until the appointment of Jared Mansfield as surveyor general in 1803.

Mansfield was a Yale-educated mathematician who began immediately to regularize the survey system. Beginning one mile west of Indiana's border with Ohio, Mansfield designated the First Principal Meridian. This was a carefully surveyed north-south township line from which east-west range lines were run at precise right angles. He then personally surveyed the Second Principal Meridian. From that point the landscape began to take on the checkerboard pattern that is still recognizable from the air. Mansfield's successor, Edward Tiffin, introduced the practice of correcting for the convergence of longitude lines (as they approach the poles) by decreeing that after every four or five ranges, new meridians be marked off at precisely six-mile intervals.

In 1816 Ferdinand Hassler, a professor of mathematics at West Point, was appointed the first superintendent of the U.S. Coast Survey and he began the massive job of surveying the nation's coasts. Within two years, however, the survey was suspended by Congress, which feared that Hassler's methods were too slow and expensive. Work on the survey resumed in 1833 after Hassler's reappointment by Congress. He continued to work on the coast survey until his death in 1843.

TAMMANY HALL See **Society of St. Tammany.**

TARIFF POLITICS A tariff, or schedule of custom duties on goods, generally serves one of three purposes: raising government revenue, protecting domestic production, or attempting to persuade foreign countries to change specific policies. Tariff policy in the early Republic was a particularly divisive issue, highlighting the nation's diversity of philosophies and interests and, in some cases, sparking constitutional debates.

THE FIRST TARIFF

Under the Articles of Confederation, states set tariff levels, often leading to conflicting policies and leaving the general government dependent on the states for revenue. To end this, the drafters of the Constitution of 1787 required uniform duties and in Article I, section 8 gave Congress the sole power to "lay and collect Taxes, Duties, Imposts, and Excises, to pay the Debts and provide for the common Defense and general Welfare of the United States." To ensure open access to overseas markets, they also expressly forbade

Congress from passing export duties. This seemingly simple framework, however, left considerable room for disagreement over the means and ends of tariff legislation.

On 8 April 1789, only days after the first Congress reached quorum, James Madison introduced the first piece of tariff legislation, a revenue proposal designed to ensure that the Treasury benefited from spring imports. Almost immediately, several members of Congress questioned whether duties should not also protect American manufacturers. Representatives from Pennsylvania, a state with a history of protective state duties, sought higher levels. Southern states, committed to exporting staple crops, desired little or no protection for manufacturers. After serious debate, a compromise measure passed both houses. It set ad valorem rates of from 7.5 to 10 percent on specific luxury and manufactured goods and 5 percent duties on the rest.

HAMILTON'S REPORT ON MANUFACTURES

The following year Congress asked Secretary of the Treasury Alexander Hamilton to assess the best way to promote national manufacturing. His famous *Report on Manufactures* was submitted to Congress on 5 December 1791. This document laid the groundwork for an activist government by supporting high tariffs and promoting a diversified economy. The Re-

port suggested the usefulness of government aid for manufacturing through duties, patents, and especially direct subsidies or bounties. Yet Hamilton's commitment to an active international commerce and the revenue it brought (which helped fund the national debt) led him to advocate only modest tariff increases. He proposed raising rates on some twenty products by from 5 to 10 percent, eliminating or reducing tariffs on others deemed necessary for manufacturing, and temporarily increasing the base ad valorem rate from 5 to 7.5 percent. Subsequent opposition to Hamilton's plan, much of which Congress passed over southern objections in early 1792, targeted not specific rates but the *Report's* broad construction of the "general welfare" clause in offering bounties to specific industries. While Hamilton favored the encouragement of manufacturing, his policies do not suggest he favored high tariffs to protect them. As with most of his contemporaries, Hamilton envisioned a national economy founded primarily on commercial agricultural production for Atlantic markets. By 1797 the base tariff had been incrementally raised to 12.5 percent as part of the efforts to further reduce the national debt.

WAR, PEACE, AND PANIC

Military and commercial warfare during the Jefferson and Madison administrations slowly began to change some groups' perspectives on the appropriate economy for the country. Restricted trade led many Republicans to praise a more diversified national economy and the realities of war drove tariffs to new heights. In 1804, support of a small navy to protect ships against Barbary pirates raised the ad valorem schedule another 2.5 percent. Jefferson's embargo and the War of 1812 against Britain created conditions favorable for industrial growth, leading many Republican artisans and manufacturers to support protection. When war with Britain began, tariff rates were doubled in July 1812.

The return of peace in 1815 raised concern that British goods would destroy nascent American industries. Over the objection of most (but not all) southern Republicans and many Federalists, National Republicans in Congress retained protected levels to support iron and textile producers. These efforts proved only marginally successful, and when the Panic of 1819 threatened to ruin manufacturers, Philadelphia publicist Mathew Carey (1760–1839) and U.S. representative Henry Baldwin (1780–1844) from Pittsburgh called for further increases of between 5 and 10 percent. Though successful in the House, the measure failed in the Senate by one vote,

as its supporters were unable to overcome the South's almost unanimous opposition (1 to 15 against).

By 1824, however, despite continued resistance in New England and the South, heavy majorities from the mid-Atlantic region and the West narrowly passed a tariff raising average rates from 27.4 to 34.5 percent. The legislation's success rested on support for an expanding home market for American goods and a belief that self-sufficiency, rather than a favorable balance of trade, determined national wealth. Besides manufacturers, western grain producers—seeking federally funded internal improvements and restricted in lucrative markets by the British Corn Laws—also supported higher tariffs, a major plank of Henry Clay's emerging American System. Southern tobacco, rice, and cotton producers, however, sent over two-thirds of their crops to foreign markets. Joining some northern merchants in opposition, they contended that the measure forced them to pay more as consumers and restricted trade with European nations, which might look elsewhere for their supplies. According to these free traders, protectionists sought a monopoly of southern trade and a redistribution of southern wealth to the North.

THE TARIFF OF ABOMINATIONS

Efforts on behalf of and against the tariff reemerged in 1827, when protectionists sought to raise the tariff on woolen textiles to nearly 50 percent. The bill passed the House by 106 to 95 but failed in the Senate when Vice President John C. Calhoun (1782–1850) of South Carolina cast the tie-breaking vote against. Both angered and emboldened, manufacturers organized a large convention at Harrisburg, Pennsylvania, to gather their strength. Fearing the inevitability of a higher tariff and the increased consolidation of wealth and power that might result, South Carolinians Thomas Cooper (1759–1839) and Robert Turnbull (1775–1833) argued it was time for the South to "calculate the value of union" and suggested radical constitutional remedies such as state nullification of the tariff or even secession. Other former nationalists, including George McDuffie (1788–1851) and Calhoun, hoped that the tariff could be rolled back by political means.

When tariff legislation was offered in 1828, southern Congressmen sought to make the bill objectionable to key New England senators by helping to pass extremely high tariffs on raw materials for manufacturing. This strategy of out-protecting the protectionists backfired, however, when former free

trade allies such as Massachusetts senator Daniel Webster (1782–1852) “swallowed the bitter pill,” accepting the higher tariff on raw materials in exchange for protective levels for their manufactured goods. The resulting tariff was as high as 50 percent on many goods. According to most southerners, this “tariff of abominations” confirmed the region’s minority status and violated at least the “spirit of the Constitution.” Subsequent efforts at legislative compromise in 1832 defused the issue for many but failed to appease the most avid southern free traders. Some called for a constitutional convention, others for nullification, a strategy that a number of South Carolinians believed might be a useful tool in an anticipated struggle to protect slavery. Only after a convention of South Carolinians nullified the tariff and President Andrew Jackson threatened to force compliance with tariff laws did legislators reach a compromise that resolved the impasse by incrementally reducing the tariff to revenue-only levels.

Until the 1980s, modernization theory and developmental economics led historians to see free trade opposition to protective tariffs as a reaction against modernity. A more positive understanding of free trade, however, has led many economists to suggest that, at least until the 1850s, antebellum tariffs, in addition to harming southern interests, were probably too high to optimize national economic production. Regardless of its effects, the debates over the tariff left lasting scars in both the North and the South and continued to remain an important issue up to and through the Civil War.

TAVERNS In the beginning, there was a tavern—literally. In what became the first permanent British outpost on the mainland of North America, Jamestown, the Virginia Company directed workmen to build a tavern before they constructed a church. By the colonial and early national periods, taverns were common, especially in cities and towns, along roads and paths, at the intersections of major thoroughfares, and at ferries. Called “ordinaries” in some places, taverns provided food and drink, lodging, stabling, and news, much as similar institutions had in the Old World.

In these public houses local courts met, commercial and social exchanges occurred, mail arrived, and a variety of contests played out in their rooms and on their grounds. Colonial legislatures often mandated their existence and tried to regulate what went on inside them, in part by requiring keepers to obtain licenses. The keeper was the “master,” and after he or she paid a fee and offered a “surety,” a bond backed up by others who knew and vouched for the individual, the keeper was responsible for providing particular services and for keeping order. Legislation and local bylaws specified the prices tavern keepers could charge for everything from drink to stabling and the behaviors keepers were not to permit: disorderliness, excessive drinking, gambling, and, at times, loitering by seamen and laborers, and, in some places, visits from African slaves and native Americans.

Also from the beginning, agents of official culture tied tavern regulation—or at least, their attempts at regulation—to economy and social order. They recognized that alcoholic beverages, which had some health benefits, could stimulate fights or worse, and that the frequent games of chance engaged in and feats of prowess displayed at taverns could lead not only to reputations made but also to the ruin of rank and resources. The fears of early American authorities were not unfounded; dire consequences could and did result.

Magistrates rarely achieved the level of control over taverns they sought, however, and contesting over and in taverns among customers, keepers, and authorities became more evident from at least the late seventeenth century onward, especially in urbanizing areas. In major cities, which had larger and

Fraunces Tavern. George Washington said farewell to his officers in December 1783 at this tavern in lower Manhattan. The building, which was rebuilt several times in the 1800s due to fires, was restored by the state of New York in 1907. © BETTMANN/CORBIS.

more diverse populations, laborers who expected drink as a part of pay, a persisting tradition, railed against authority from tavern to street, and in both places they allied occasionally with aspiring, populist-leaning factional leaders. In New York City in 1741, for example, white and black patrons of John Hughson's harbor tavern launched the "New York Conspiracy" against the local mercantile and political elite in a quest for money and freedom, not just for slaves but also for the much larger population of poor whites. Three decades later, Samuel Adams and John Hancock discussed their ideas for a far more famous conspiracy, the Boston Tea Party, in Boston's Green Dragon tavern.

Throughout the eighteenth and early nineteenth centuries, taverns remained sites from which various

collections of people launched campaigns against authority. The War of Independence, the Whiskey Rebellion, and numerous local, economic-policy resistance efforts were all nourished on the public stage, as the historian David Conroy has termed it, that was the early American tavern. The alliances made there were not, however, all of the same kind. Allegiances, and the drinking that cemented them, varied from local collections of laborers, to white workingmen and black slaves, to wage laborers and middle-rank professionals.

The class- and race-based alliances that figured so prominently in the political actions against authority in the eighteenth century weakened or, in some places, dissolved during the early Republic, and again the tavern was a critical public stage. Histori-

ans have made much of the specialization that diminished the centrality of taverns—the ordinariness of the “ordinary”—especially after the Revolution and especially in urban areas. British-inspired coffeehouses spread; boardinghouses offered alternative sleeping and eating facilities; hotels attracted well-to-do travelers, as well as local families of substance; grogshops and other “mean” drinking facilities began to proliferate; and a broad range of eating establishments, including oyster houses often run by African Americans who were unable to obtain tavern licenses in a city such as Baltimore, emerged. Underlying this specialization were the same processes that altered earlier alliances: a rapidly expanding and diversifying population, the transition to capitalism (which included expanding trade in and an ever-widening variety of food and alcoholic beverages), and changes in social relations.

The experiences of urban women of European descent figured in and help to illustrate many of the changes that affected late colonial and early national taverns. Until the 1780s women had a substantial presence in taverns, especially as keepers and occasionally as customers. Across the colonies statutes had actually encouraged widows and single women to acquire licenses. Running a tavern, authorities believed, enabled women to sustain themselves and avoid the poverty that rulers had long feared. Through the 1820s, however, fewer women acquired licenses, and apparently fewer still frequented taverns unattended by male escorts. Some women may have chosen to get a boardinghouse license rather than one for a tavern. Others, however, were unable to afford tavern licenses and to compete with the newly arriving male immigrants, who worked as keepers for one of the local landlords who now owned and rented out multiple properties on which taverns sat.

Some poor women also used the only resource they “owned,” their bodies, in specialized occupations in taverns, including “physical culture” exhibitions, displays that combined body poses and acrobatics, and prostitution in taverns. Evidence from the largest cities—New York, Philadelphia, Baltimore, Charleston, and New Orleans—points to the increasing presence of prostitutes and the legal construction of prostitution in the late eighteenth and early nineteenth centuries. Moreover, prostitutes did not ply their trade only or even primarily in the taverns; rather, they operated in another emergent facility, the bawdy house, some of which women ran.

Not all taverns underwent the kinds of changes evident in late colonial and early national cities, of

course. Rural taverns of colonial and early national America have not received the attention that urban ones have, but some patterns seem likely. Travelers who made their way to the still vast rural areas—both of the initial British, Dutch, and Spanish colonies on the East Coast and of territories-become-states west of the Appalachians—were likely to find public houses along roads, at ferries, or even in river-bank caves. Their keepers were still likely to be militia colonials, merchants with substantial local influence, or widows who had inherited the place from their husbands. The tavern trade—the exchange of money or services for drink, food, lodging, and stabling—was significant in the local economy, and the tavern fare—refreshments, games and exhibitions, meetings, weddings, and more—was vital within the life of the community. Tavern signs made visible both the place and its name, so whether people were literate did not matter. Men and women were patrons, and everyone in the locale knew who was and was not welcome inside. Political discussions reverberated inside, and alliances formed. Cider made from local apple orchards, along with rum, beer, and whiskey, sold well. Until the temperance movement organized, early national rural taverns resembled the ordinary, the public house that was so common a thousand or even a hundred miles to the east and that had long ago ceased to exist.

TAXATION, PUBLIC FINANCE, AND PUBLIC DEBT Crises in taxation and public finance often cause major political transformations. The U.S. Constitution is one such case. Its adoption and the ensuing policies pursued by the Federalist administration under George Washington (1789–1797) in turn brought dramatic and controversial changes in the American fiscal and financial regime. These reforms became a permanent fixture of the political economy of the early Republic. Despite vociferous criticism of Federalist policy while in opposition, the Democratic Republicans made only minor changes to the fiscal and financial system after they came to power. By far the most important changes in taxation, public finance, and public debt management between the founding and the Age of Jackson took place within a few years of the adoption of the Constitution.

TAXATION AND EXPENDITURES

When the Constitutional Convention convened in May 1787, the nation's public finances were in a critical state. Under the Articles of Confederation (drafted in 1777, ratified in 1781), Congress had no power to tax but had to requisition funds from the state governments to meet expenses, above all the payments on the public debt created by the War for Independence. After the war, most of the states adopted ambitious tax programs to raise money for these requisitions and for servicing their own debts. While these taxes gave rise to hardships and protests, among them Shays's Rebellion in 1786–1787, they did not generate much money for Congress. Instead, popular protests made the state governments put an end to their tax programs, and by early 1787 money had virtually stopped flowing into the federal treasury. Congress could not pay its handful of civil officers or its few troops. Nor could it honor the claims of its creditors and therefore had difficulties raising new loans. This was a matter of great consequence: like modern wars, eighteenth-century wars cost enormous amounts of money. And like modern wars, they were paid for with borrowed money. A government unable to borrow money was therefore in a dangerously exposed situation in the event of a crisis that might lead to war.

Article I, section 8 of the Constitution gave Congress the power to "lay and collect Taxes, Duties, Imposts and Excises, to pay the Debts and provide for the common Defense and general Welfare of the United States." The only constitutional restrictions on federal fiscal power were that duties had to be uniform throughout the Republic; that any direct tax

had to be proportionate to the census; and that no duties on exports could be imposed. Under the leadership of Alexander Hamilton, who served as secretary of the Treasury from 1789 to 1795, the Federalists used Congress's new power to completely restructure the American fiscal system.

Eighteenth-century American governments implemented three basic types of taxes: direct taxes on persons and property; excises on retail sale and production; and customs duties. In most of the states the most important taxes in the 1780s were on persons and property. Excises, particularly on spirits, were used in many of the states, but they raised only a minor part of total revenue. Customs duties were important in some states, particularly New York. The Federalists were well aware that the direct taxes which the states had levied had been both unproductive and unpopular. They also knew that there were strong objections to excise duties because they required a high level of supervision and control. Finally, they knew that customs duties were regarded as a light form of taxation and that there was general support for granting Congress an independent income in the form of the impost. This led them to create a fiscal regime that relied almost exclusively on customs duties to raise federal government revenue.

Apart from the Quasi War (1798–1800) and the War of 1812 (1812–1815), customs duties accounted for more than 90 percent of total federal tax revenue between 1789 to 1829. For long periods (1804–1813, 1822–1862) it was the only federal tax levied. It was a very productive tax: in 1792 alone, the receipts from customs duties, \$3.4 million, superseded the total amount paid by the states on Congress's requisitions between 1781 and 1787. As American trade grew during the Wars of the French Revolution (1793–1801) and the Napoleonic Wars (1803–1815), the income from customs duties grew as well. In constant prices, the annual income had doubled by 1800 and grown fourfold by 1807. The following fifteen years were volatile, but by the end of the 1820s customs duties had reached a level twice that of 1807, or roughly \$23 million.

Internal taxation played only a minor part in the Federalists' fiscal system and created far more conflict than revenue. Congress introduced an excise duty on alcohol in 1791, and later the Washington administration levied taxes on snuff, sugar, carriages, and auction sales, while the administration of John Adams (1797–1801) taxed slaves, houses, and land to finance the Quasi War. President Thomas Jefferson (1801–1809) intensely disliked federal internal taxes and managed to eliminate them by his sec-

Seizing the Tax Collector. This eighteenth century engraving by French artist François Godefroy depicts an incident in 1774 in which angry Boston residents tarred and feathered tax collector John Malcolm. © BETTMANN/CORBIS.

ond term. Nevertheless, a program of internal taxation far more ambitious than anything tried by the Federalists was launched by Republican president James Madison (1809–1817) to finance the War of 1812. Federal internal taxes are best known for provoking the Whiskey Rebellion in 1794 and Fries’s Rebellion in 1799, but although these revolts certainly demonstrated the narrow confines of legitimate federal taxation in the early Republic—and how perilous it was to challenge them—they were of only limited significance in the general development of the American fiscal system.

In the states, Congress’s requisitions and the charges on the public debt had been by far the greatest items of expenditure before the adoption of the Constitution. When the federal government assumed responsibility for the debt, these expenditures disappeared from the state budgets. As a result, direct state taxes were reduced by at least 75 percent. Because these were the taxes that had brought hardship in the 1780s, the Federalist reform in effect provided relief

for the taxpayers. It also made conflicts over fiscal policy disappear from the agenda of state politics.

As state taxes fell and income from the federal impost grew, the federal government came to raise far more money than the states in both absolute and per capita terms. However, since the impost was collected directly from merchants, most ordinary taxpayers made no direct contribution to the federal government. At the same time, state taxes on persons and property continued to be low and state governments tried to raise revenue from other sources, such as taxes and fees on banks and income from investments. As a result, the American people were very lightly taxed in the four decades following the adoption of the Constitution.

On the expenditure side, payments on the public debt and appropriations for the military dominated the federal budget. There was little difference between Federalists and Republicans in this respect. Between 1789 and 1815, debt payments and support

of the army and navy accounted for almost 90 percent of total expenses. Foreign relations and the Indian Department accounted for roughly 4 percent of total expenses and the civil list and “miscellaneous” civil expenses for the remainder. In the final category, the central government apparatus accounted for more than half the costs. The only significant other “civilian” expenses were payments for lighthouses and buoys and pensions for invalids. By the late 1820s, however, the federal government had begun to make considerable outlays on internal improvements. The administration of John Quincy Adams (1825–1829) spent \$2.1 million, more than 3 percent of total expenditures, on roads and canals.

In the states, the major expenditure items in the budgets from the 1790s and onward were the costs of executive, legislative, and judicial departments of government. Some states also spent considerable sums on education. In the late 1820s state governments, too, had begun to spend on internal improvements. However, the real boom in state-financed internal improvements began in earnest only in the 1830s.

PUBLIC DEBT

The War for Independence was fought on credit and both the states and the federal government were heavily in debt when the war ended. In 1790 the collective state debt was estimated at \$26 million, while the federal debt stood at \$52 million. In the years immediately after the war, public creditors received different treatment in different states. Congress, however, was unable to honor the claims of both domestic and foreign federal creditors, with the sole exception of the investors in its Dutch loans. Congress defaulted on the debt owed to France and paid interest on its domestic debt in so-called indents or certificates of interest. Both federal securities and indents fell sharply in value in the 1780s. Since Congress paid neither principal nor interest in specie, the

value of securities was determined by the likelihood that either the states or Congress would redeem them, or at least begin to pay interest in specie, at some future date. The securities had been issued as payment for services rendered and goods received during the war and had been given to a great number of soldiers and military suppliers. Most of these original holders did not possess the means to wait for a possible future redemption, but sold their securities to the highest bidder at prices far below face value. Over time, the debt was concentrated in fewer hands. According to one estimate, some fifteen thousand to twenty thousand people held securities in 1790.

The funding and assumption plans, which Hamilton presented to Congress in 1790, rapidly restored the value of securities. In a first move, the federal debt was “funded” on the British model. Old securities were exchanged for a new emission on which the government promised to pay interest in specie from the proceeds of earmarked taxes. While the government did not pledge to redeem the principal, securities could be sold on the market when a creditor needed specie. In a second move, the federal government assumed \$18 million of state debt. In this way, the public debt was nationalized and the majority of the states became debt free. With a few exceptions, state borrowing did not become a factor in public finance again before the 1830s. In a final move, Congress created the Bank of the United States, which formed an integral part of the Federalists’ system of public finance.

The Federalist program restored public credit, and from this time on the public debt was regarded as a near risk-free investment by Americans and foreigners alike. Yet the program was not universally endorsed. The opposition argued that securities appreciation would benefit the final and not the original holders and demanded that the government discriminate between final and original holders so as to benefit both equitably. Congress soundly defeated this

proposal because it would have jeopardized the restoration of public credit and thereby seriously restricted the ability of the federal government to raise new loans. The Republicans, however, continued to see the funding plan as a way to line the pockets of speculators with tax dollars, a view that modern historians largely share. The assumption of state debts also met with opposition. Assumption was proposed when Congress was still investigating the relative contribution of the states to the common war effort. Some members of Congress feared that assumption would lead to a premature settlement that would be disadvantageous to their states. In the end, it required the famous deal over the location of the new capital to enable the measure to gain Congressional approval. When the final settlement of accounts was reported in 1793, however, the issue died down. The chartering of the Bank of the United States was also controversial. Republicans deemed it unconstitutional and Congress refused to re-charter the bank when its twenty-year charter expired in 1811. Congress, with the support of President Madison and other leading Republicans, chartered the second Bank of the United States in 1816, but it suffered the same fate as its predecessor when Andrew Jackson used his presidential veto to prevent its re-charter in 1832.

The federal government made use of its ability to borrow money almost from its inception. New securities were issued to consolidate the foreign debt and to finance the naval and army buildup during the Quasi-War. Short-term loans from the Bank of the United States covered budget deficits and financed the expedition to quell the Whiskey Rebellion. However, despite their criticism of Federalist public finance, it was the Republicans who made the most use of loans. Jefferson purchased Louisiana in 1803 by issuing \$11.25 million in securities that were eagerly picked up by British and Dutch investors on the

Amsterdam market. Madison borrowed \$82 million, mostly from domestic creditors, to prosecute the War of 1812. But if the Republicans borrowed more than the Federalists, they also redeemed the debt more rapidly. Because they saw the public debt as an evil, they used a long series of budget surpluses to reduce it. By 1829 the debt was down to \$48.6 million. Five years later it was entirely paid off.

CONSEQUENCES

The fiscal and financial reforms carried out by the Federalists in the early 1790s had several important long-term consequences. First, while a fiscal system totally dependent on income from customs duties may have been popular with taxpayers, it was also very vulnerable to trade disruptions. English and French attacks on American trade during the Wars of the French Revolution and the Napoleonic Wars had direct repercussions for government income and public credit. Thus, if the new fiscal regime gave the federal government a certain independence from its taxpaying citizens, it made the nation vulnerable to the actions of European states. The attempts to deal with these powers dominated much of American politics up to 1815, from Jay's Treaty (1794) and the Quasi-War to Jefferson's Embargo (1807) and Madison's war with England.

Another important consequence of the Federalists' reforms was that the federal government became far stronger than it had been in the 1780s. In 1787 the American Republic was an impotent and bankrupt union of thirteen former colonies strung out along the Atlantic seaboard. Five decades later, it had conquered most of the North American continent. By the end of the nineteenth century, the American Empire extended to Asia. Sound public credit, backed by a regular revenue, was an important prerequisite for this development, whether it was used to raise money for territorial purchases or wars of conquest. In the struggle over North America, it is no coincidence that the two powers that emerged victorious—the United States and Great Britain—had the soundest public finances, while those that had to give way—France, Spain, and especially Mexico—all had considerable fiscal and financial difficulties.

The most important consequence of the reforms of the early 1790s was the creation of a financial system. In both the Netherlands and England, government borrowing had given rise to an active securities market that also allowed private enterprises to raise capital from investors. In the United States the same development occurred. The funding and assumption

of the public debt gave rise to a rapid expansion of the securities market and the banking sector, which mobilized domestic and attracted foreign capital and made it available to entrepreneurs. Virtually every major economic activity in the early national period was financed by loans and bonds. In particular the large-scale investments in canals, turnpikes, bridges, and railways, which were so important in extending market expansion throughout the nation, would not have been possible without banks and a well-developed securities market. It may well be the case that the financial system created by the Constitution and the Federalists' policies was the primary cause of the spectacular growth of the American economy that had made these erstwhile colonies outgrow their former mother country by the time of the Civil War.

TEA ACT Perhaps the greatest irony surrounding the Tea Act is that America was only a secondary consideration in the minds of most of its parliamentary sponsors. Instead, Parliament focused upon the distress of the East India Company, which was important for a variety of reasons, not the least of which was its leading role in the British penetration of India. Most particularly, the East India Company experienced difficulty in selling its tea, millions of pounds of which lay rotting in the company warehouses, due primarily to the continuing boycott of British tea by the American colonies (a market that consumed millions of pounds of tea annually) as a reaction to the continuation of the Townshend tea tax. Though some British tea was sold in the colonies and Americans seemed disposed to buy more if the price was right, the taxes caused British tea to be undersold by the Dutch variety that was widely smuggled into the colonies. In searching for means to assist the company, parliamentary leaders rejected repeal of the tea tax, fearing that Americans would consider this an admission that they lacked the right to tax the colonies. Instead, they decided to exempt the East India Company from taxes charged upon tea landed in England, as was required of all tea, before reshipment to the colonies. This seemed a perfect answer, beneficial to all: the price of East Indian tea would be reduced, enabling the company to compete favorably with the smugglers, while the principle of parliamentary taxation would be upheld. For their part, Americans would enjoy cheaper tea prices. Thus, the Tea Act passed in Parliament without a division, and practically without comment, on 10 May 1773.

Americans, however, viewed the Tea Act in an unexpected light. Merchants were upset by the clause that allowed the company to select the tea consignees, leaving the valuable trade to be monopolized by a fortunate few. Even worse, these consignees were often unpopular, politically connected merchants, such as the sons of Governor Thomas Hutchinson in Boston. Vocal opposition came also from the tea smugglers who recognized immediately the disastrous effects that the Tea Act might have upon their profits. Finally, the Tea Act met determined opposition from radical agitators like Samuel Adams, who with a jaundiced attitude towards any parliamentary legislation, insisted that the real purpose of the Act was to lure unsuspecting or unpatriotic Americans into paying the Townshend tea tax. Once Americans purchased the dutied tea, the constitutional principle would be surrendered, and new taxes would be placed upon a wide variety of goods.

The combination of the radical political element with the leading seaport merchants produced a dynamic opposition to the Tea Act, one that had not been seen since the days of the Stamp Act.

As tea ships approached four ports (Boston, New York, Philadelphia, and Charles Town), radicals and merchants organized to prevent the landing of the cargo. In Boston, local conditions practically guaranteed trouble. Here the radicals, still smarting over suspicions that Boston merchants had evaded the earlier nonimportation association, were determined to prove their patriotic credentials through an unyielding stance. Governor Hutchinson, on the other hand, humiliated by the recent publication of selectively edited versions of his correspondence that undermined the governor by effectively portraying him as a determined advocate of repressive policies, saw an opportunity to achieve a rare victory over his radical tormenters. Hutchinson's victory seemed likely, since once the tea ships entered the harbor, as they did in late November, they could not legally depart until all duties were paid. If this did not occur within twenty-one days, the cargo would be landed and confiscated. With naval vessels patrolling the harbor and himself the only official authorized to release the ships, Hutchinson considered himself master of the situation: the tea would be landed. But Hutchinson had underestimated the determination of his opponents. When threats, pleas, and negotiations failed, the radicals boldly destroyed the entire cargo of 342 chests of tea worth approximately ten thousand pounds on the evening of 16 December 1773.

Events transpired more peacefully at New York and Philadelphia, largely because the respective governors wisely decided against pressing matters and allowed the ships to depart without payment of duties. Charles Town was the only port to land the tea, due to the quick thinking of Lieutenant Governor William Bull, who defused a gathering crisis by ordering the tea landed early on the morning of 22 December 1773 and stored securely in the basement of the Exchange building.

News of the proceedings in the colonies raised an outcry of anti-American resentment in England. Though offended by the reaction of America at large, King George III, Lord North, and Parliament were in agreement that Boston in particular had assumed a revolutionary position and merited a clear demonstration of British authority. Thus, General Thomas Gage, the commander in chief of the British army in America, was dispatched to replace Hutchinson as governor of Massachusetts, and the Coercive Acts were passed between March and May 1774. Such an

overreaction served to rally American support behind Boston. Though many thought that Boston had acted rashly in destroying the tea, most Americans considered the Coercive Acts to be excessive and, indeed, "intolerable," as they were labeled. Thus, a new crisis was begun, one which would result in the Continental Congress and, within a year, the fighting at Lexington and Concord.

TECHNOLOGY The first generations of colonists brought their traditional tools with them from their homelands. Faced with a new environment, they soon supplemented their well-known practices with the skills and knowledge of Native Americans and enslaved Africans imported to North America. Although the word "technology" had been introduced in the seventeenth century, colonists spoke of the "mechanick arts," "tools of husbandry," "useful arts and sciences," and "ingenious improvements," all reflecting the combination of practical knowledge and artifacts.

Early American technology involved simple hand tools, made largely of wood, and consumer goods produced, like the tools themselves, one at a time by skilled artisans. Improvements came haphazardly, indicated directly by the experience of tool users, and tended to have only local, fleeting impact. However, colonists recognized the limits of their knowledge, the constraints of their tools, and the potential benefits of improvements. Thus they learned how to adopt, adapt, and invent technologies.

Between 1690 and 1780 Americans revolutionized their technological and material world as well as their political world. Indeed, technology would come to have a special role in the development of an American identity and political ideology. Technology's political significance was every bit as important as its role in the new nation's economic system and the everyday lives of its citizens.

INNOVATIONS

Despite innovations in agricultural technology, such as Thomas Jefferson's plow design and the evolution of the cradle scythe for wheat harvesting, the major influences on agricultural practice came from mechanical innovations in processing. Hand tools were augmented by complex machines and inanimate power sources. Eli Whitney's 1793 cotton gin increased the efficiency of preparing cotton fibers for spinning and weaving, permitted the use of short-staple cotton, which was better suited to the inland climate and soil conditions, and encouraged the western spread of a cotton monoculture tended by slaves. The automatic flour mill invented by Oliver Evans in 1795 not only increased the efficiency and quality of milling but demonstrated the principles of product flow, mechanical systems, and automation through mechanical contrivances.

Woodworking, textile, and papermaking machinery required higher speeds, greater precision, and improved durability of machine components. To meet this need, iron was substituted for wood. However, because those skilled in these fields recognized that machinery might be improved or replaced before it wore out, wood, the less expensive material, often sufficed. Still, at the time of the Revolution, America was the world's third-largest producer of iron and also produced steel needed for edged tools and arms. After the Revolution both trades were decimated by the importation of cheap British iron. The drive to succeed inspired an extensive and increasingly sophisticated machine-tool industry. These "machines to make machines" enabled the necessary and continuous changes in technology.

The adoption of steam power for manufacturing was slowed by the abundance of the more familiar, less expensive waterpower available to Americans. But the very existence of America's extensive river system made the application of steam power to transportation even more attractive. John Fitch's pioneering work in 1787 and the prominent success of Robert Fulton's *North River Steamboat of Clermont*—better known as the *Clermont*—in 1807 began a rapid expansion of steam-powered water commerce, communication, and travel. By 1830 America had steam locomotives traveling some thirty miles of track and, within the decade, more than two thousand miles.

The need for easily repairable rifles led government gun makers to seek interchangeable parts, a concept that Jefferson had encountered in France and the British had come close to developing in the production of naval block-making machinery. Eli Whitney promised to produce guns with interchangeable

parts in 1798 but failed to deliver. Between 1812 and 1830 innovators such as Roswell Lee, John Hall, and Simeon North in Springfield, Massachusetts, and later Harpers Ferry, Virginia, developed the system by employing uniform gauges, special-purpose machine tools, and a division of labor that focused each man on a specific tool or task. They also learned that these new techniques required the imposition of a new sense of discipline and organization among workers. Connecticut clock maker Eli Terry employed similar techniques in the quantity production of identical wooden-movement clocks between 1800 and 1830.

Seeking to exploit a growing worldwide demand for cloth and new British inventions, entrepreneurs organized textile production outside of the traditional household. The organization of production into factories challenged traditional family roles and community structures. Change began with the arrival in the United States of Samuel Slater, a British mechanic, who knew how to build spinning machines modeled after Richard Arkwright's seminal invention. Funded by the Quaker merchant Moses Brown and his son-in-law, William Almy, Slater's mill in Pawtucket, Rhode Island, began operation in 1790. In 1810 Francis Cabot Lowell formed the Boston Manufacturing Company with a dozen investors and hired a mechanic, Paul Moody, to construct a power loom. Lowell developed the pattern of combining waterpowered spinning and weaving machines under one roof and employing young women to tend them. Waltham and, after 1825, the company town of Lowell, Massachusetts, became the symbols of factory towns. Smaller mills spread throughout rural areas used similar technologies but hired entire families as workers and offered a different image of industry amidst a rural environment. Whether located along a rural stream or in a planned city, tended by "Lowell girls" or men and their families, these factories effectively combined innovative technology with an equally innovative vision of society.

IDEOLOGIES

In technology as well as politics and morals, a "spirit of improvement" appealed to Americans. Yet they debated how technology related to their notions of freedom, progress, and perfectibility. What would be the role of manufactures in establishing economic independence and social stability in the new, overwhelmingly rural nation? Would innovations provide prosperity and would prosperity contribute to republican virtue or inequality and despotism?

Thomas Jefferson, well-known as a gentleman inventor, initially opposed manufacturing, fearing the growth of poverty, class distinctions, and urban blight. By 1812, however, he had moderated his views in light of the nation's economic needs. Labor-saving devices might even allow women and children to tend machines while men stayed in the fields; Jefferson's main hope for democracy lay in the maintenance of an agrarian society of economically independent small property owners. Philadelphia merchant Tench Coxe became the most prominent promoter of a political economy and republican virtues based on factory production.

For better or worse, technical innovation involving broad social consequences as well as immediate, practical results was now a common American experience, seemingly self-reinforcing and unremitting. When the Harvard lecturer Jacob Bigelow brought the word "technology" to the general public's attention with the 1829 publication of his *Elements of Technology*, Americans finally had a single word to convey the concept.

TEMPERANCE AND TEMPERANCE MOVEMENT From the 1780s through the 1820s, Americans drank a great deal of alcohol. The per capita consumption in those decades, more than twice that at the beginning of the twenty-first century, was the highest ever recorded in American history. Distilled spirits, especially rum and whiskey, were the favorite drinks, with beer and wine consumed much less

often. Because so many farmers turned their grain into whiskey, the price was low and the supply plentiful. Homemade hard cider was also cheap and easy to make.

PERVASIVENESS OF ALCOHOL

Before the 1820s, most Americans had no misgivings about the moderate use of liquor. In towns and cities, it was purer than water, more readily available than milk, and less expensive than tea and coffee. At meals, a glass of whiskey or cider enlivened the ubiquitous diet of fried meat and corn. At work, manual laborers believed that frequent small drinks throughout the day improved their stamina. In sickness, liquor was believed to have medicinal value, and few doctors disputed that claim. At community ceremonies—barn raisings, elections, court days, fairs, dances, militia musters—alcohol appropriately enhanced the festivities. In short, Americans had made liquor an integral part of everyday life.

In those years, oversight by the government was modest. Local and county officials issued licenses for the sale of liquor, granting the privilege to innkeepers, retailers, and dramshops (later called bars). Although unlicensed vendors were occasionally prosecuted, enforcement of license laws was sporadic. Drunkards were frequently arrested, but usually for disorderly conduct rather than intoxication. Another means of regulation, taxation, was unpopular, as western farmers made clear by their fierce opposition to the federal tax on domestic distilled spirits levied in 1791.

THE TEMPERANCE MOVEMENT BEGINS

In the 1810s, organized opposition to heavy drinking began to take shape. Evangelical Protestant ministers in various states became more outspoken, dwelling on the spiritual dangers to Christian youth who drank. Salvation depended on proper conduct, not just pious beliefs, and even moderate drinking could be harmful. Religious revivals spread the conviction that sin was not ineradicable; free will could and should be exerted to combat threats to moral purity.

In 1813 the first sizable temperance society emerged. The Massachusetts Society for the Suppression of Intemperance (MSSI) attracted several hundred prominent Boston men and sponsored local auxiliaries throughout the state. The nonsectarian MSSI assailed intemperance on religious grounds but, as would be the case with temperance advocates throughout the century, they also stressed the economic and social consequences of inebriation. Poverty, crime, and insanity supposedly stemmed from

the abuse of liquor. To improve conditions, the MSSSI urged town officials to arrest illegal sellers as well as drunkards. The MSSSI members also hoped that the example of their own moderate drinking would prompt others to emulate their restraint, although they doubted that habitual drunkards could be reformed. Within five years, it was clear that the MSSSI's exertions had made little headway. Without full time staff, charismatic leadership, newspapers, and other methods to gain widespread support, the MSSSI never rallied enough people to convince local officials to do what the MSSSI wanted.

AMERICAN TEMPERANCE SOCIETY

A more vigorous organization, the American Temperance Society (ATS), spread rapidly after its creation in 1826. The ATS relied on evangelical ministers for its leadership, but it consciously sought a large nondenominational membership. Unlike the MSSSI, the ATS wanted every sober man and woman to remain so by joining a local temperance society and signing a pledge to abstain from all distilled liquors (after the mid-1830s, wine and beer were also proscribed by a "long" pledge). The goal was to make drinking unfashionable and disreputable by convincing every decent American to abstain.

The ATS worked hard to get people to join. Itinerant agents organized state, county, and local auxiliaries. The first temperance newspaper publicized the reform. Hundreds of short pamphlets disseminated sermons and addresses. The energetic recruitment yielded approximately 1.5 million members in 8,000 societies by 1835. Nearly one in every five free white adults joined, with the proportion lower in the southern states than elsewhere. As the numbers rose, many towns had more than one society, with young men's societies especially popular. Women, who accounted for approximately half of the national membership, occasionally formed separate groups. A group largely absent from the movement before the 1840s were former drunkards—their conversion was not a goal of the ATS—and free blacks, Indians, and slaves were not recruited.

THE POPULARITY OF TEMPERANCE

The sudden and widespread popularity of temperance cannot be understood solely in terms of evangelical religion or ATS proselytizing. Men and women devoted to causes other than temperance realized that the drink reform movement resonated with and strengthened their particular interests. They knew that the temperance pledge represented values they respected. For instance, employers in fac-

ories, mills, shops, and offices prized the punctuality, self-control, and frugality of a young man who abstained. Temperance became a symbol of dedication to economic as well as spiritual self-improvement. Furthermore, many women believed that abstinence was a pledge to a tranquil family life marked by kindness rather than cruelty. Temperance sermons and addresses often cast wives, mothers, and children as the victims of drunken rage.

The moral influence of the abstainers did not convince everyone. Although liquor consumption dropped sharply in the 1830s and 1840s, very few liquor sellers voluntarily quit their work. By the mid-1830s, some local and state temperance societies began to seek legal relief. Rather than prosecute illicit sellers, they pressured local and county officials to withhold all licenses. "Local option" allowed regions within a state to be "dry." Whig Party candidates and voters were more inclined to favor "no-license" than the Democrats, but the issue divided both parties and was approached warily whenever it arose in election campaigns. Because the illegal sale of liquor continued and remained difficult to prosecute, by the early 1850s temperance crusaders sought statewide prohibition. A surge of Irish immigrants at that time made the goal especially appealing as abstainers once again celebrated their reform as the quick and reliable way to determine who was and was not respectable.

TENNESSEE Tennessee, created out of land earlier held by North Carolina, joined the Union as the six-

teenth state in 1796. Four major groups of Native Americans—Cherokee and Creek in the East, Shawnee in the Middle, and Chickasaw in the West—also claimed the territory. The Proclamation of 1763, England's attempt to prevent settlement west of the Appalachian crest, proved futile as hunters from Virginia and the Carolinas continued to pursue deer and beaver over the mountains. The first permanent white settlers crossed into northeast Tennessee by 1769. When British officials ordered them out, the colonists ignored the British orders, united as the Watauga Association, and negotiated with the Cherokee for land concessions.

Feeling exposed to the British and their Cherokee and Chickamauga allies at the start of the American Revolution, the Wataugans sought and received incorporation as Washington County, a part of North Carolina, in 1777. Frontier elites like William Blount, a delegate to the Continental Congress and later the territorial governor, supported the Revolution to secure their land claims, while the North Carolina government eagerly sought the Tennessee lands to offer as bounties to military enlistees and veterans. Despite, or perhaps because of, the disorder of war, settlers continued pouring into Tennessee during the Revolution and pushing west, establishing Nashborough (now Nashville) in 1779 along the Cumberland River. After the war, Blount urged North Carolina's cession of its Tennessee claims, a maneuver meant to decrease the state's federal taxes and increase the value of Tennessee lands with the prospect of federal military protection. When North Carolina delayed in ceding its territory, Tennessee settlers decided to create their own government. Naming themselves the state of Franklin, the settlers unsuccessfully petitioned the Continental Congress for admission as the fourteenth state.

North Carolina finally relented, and in 1790 Congress organized the Territory Southwest of the River Ohio, or the Southwest Territory, to be governed by the provisions of the Northwest Ordinance with the important exception of allowing slavery. The 1791 census revealed 35,691 residents, enough to call the territorial assembly to meet at Knoxville in 1794; population grew rapidly, and by 1795 the territory had more than enough residents to apply for statehood. Delegates framed a constitution in early 1796, but the state's admission to the Union, the first under the Northwest Ordinance rules, was nearly scuttled by Senate Federalists who did not want to admit likely Jefferson partisans in an election year.

The first decades of statehood saw political power divided between personal factions headed by John Sevier and William Blount. In national politics, however, the state was securely Jeffersonian. The most important political issues continued to center around land access and taxation. A three-way battle over public lands—between North Carolina, Tennessee, and the federal government—was not fully resolved until the 1840s. Native American land claimants, left with few military options since the 1790s, gradually negotiated land sales or exchanges; the 1818 Chickasaw Purchase included all of West Tennessee and opened the way for the eventual growth of Memphis after the 1820s.

Buoyed by immigrants coming west from the Carolinas or south from Pennsylvania and Virginia, population grew rapidly in the first years of statehood, from 105,602 persons at the state's first census in 1800, to 261,727 in 1810, 422,813 in 1820, and 681,904 in 1830. These statewide figures mask some important trends, most notably the westward shift of population. By 1820 Middle Tennessee had more than two-thirds of the state's population and, after 1826, the state capital at Nashville.

Tennessee's early national economy was built on land, which was valuable for speculation and agriculture. In addition to cotton and tobacco, the farmers grew corn, as much as half of which was distilled into whisky, and hogs for local consumption or export to the Deep South. The state also produced iron; mid-state entrepreneur Montgomery Bell owned several furnaces, which he staffed with free and bound workers. Slave labor would be more prevalent, however, in agriculture. Although the 1791 territorial census tallied 3,417, the slave population had grown to 13,584 by 1800 and 44,535 in 1810, topped 80,000 in 1820, and climbed over 141,600 in 1830. Revolutionary-era antislavery sentiments held on more in the East but were overshadowed as slave-based agriculture grew in Middle and West Tennessee.

Although few Tennesseans had been directly affected by British actions leading to the War of 1812, large numbers of them volunteered for military service. An ambitious Andrew Jackson had already served Tennessee as both a U.S. representative and senator but gained national attention for defeating the British at New Orleans and battling Indians throughout the Southeast. The Tennessee legislature returned him to the Senate in 1823, and state voters strongly supported his presidential runs in 1824 and 1828 and his reelection in 1832.

TERRITORIAL GOVERNMENT See
Government: Territories.

TEXAS During a fifteen-year span, from 1820 to 1835, Texas changed from a sparsely settled outpost on the northeast fringe of the Spanish North American empire to a territory, dominated by approximately thirty thousand immigrants from the United States, on the brink of rebellion against Santa Anna's Mexico. The individual who set this transformation in motion was Moses Austin, a man who had spent most of his adult life in the borderlands between Spanish- and Anglo-America.

Austin was born in 1761 in Connecticut. As a young man he established himself as a businessman, first in Connecticut, then successively in Philadelphia and Richmond, Virginia. In 1789, in partnership with his brother Stephen, he acquired control of a lead mine in southwestern Virginia. Three years later he moved his family there to manage the enterprise; in 1797, facing financial difficulties with the Virginia mines, he relocated much farther west, to a site in Spanish Louisiana (now in Missouri) south of St. Louis, where he again acquired and developed rich deposits of lead.

Austin differed from most Americans who moved west in the late eighteenth and early nineteenth centuries. First, he had little interest in acquiring land for agricultural production. He was a businessman and a frontier industrialist, seeking to extract and process nonagricultural resources from the land. Second, his search for wealth was not con-

finied by national boundaries. In 1797 he crossed the Mississippi and established himself in Spanish territory, seeking and winning contracts from Spanish authorities to develop mineral wealth. Six years later the Louisiana Purchase returned him to American jurisdiction.

When the Panic of 1819 drove him into bankruptcy, Moses Austin again looked to Spanish America for opportunity. Familiar with the land hunger of his countrymen, Austin traveled to San Antonio in 1820 and convinced the Spanish governor there that as a former Spanish subject he should be allowed to bring in three hundred American families to colonize Texas. Austin intended to regain his fortune through the venture, with extensive land for himself and fees from his settlers. The Spanish, in turn, expected to gain needed population for their border province, securing it from external invasion and stimulating its economic development.

Neither party survived to achieve its goals. Other leaders under different political authority would carry out the colonization of Texas. Austin died in early 1821 after returning to Missouri to organize his Texas colony; his eldest son, Stephen F. Austin, took over the project. When he returned to Texas to finalize plans he learned that the Spanish authorities had been deposed, and a new independent Mexican nation was being organized. Austin traveled to Mexico City where he succeeded in convincing Mexican officials to reauthorize his father's project.

Stephen F. Austin was the most successful of the *empresarios* (colony organizers), and his colony rapidly transformed Texas. He settled the 300 families required by his father's contract and proceeded to award a total of 1,540 land grants, which by 1830 represented a population of 4,248. Other *empresarios* followed Austin's example. Colonists rushed to Texas, stimulated by the economic troubles of the early 1820s and plentiful supplies of cheap land. Mexican authorities estimated the 1830 population of Texas as 21,000 persons—15,000 Anglos, 2,000 African American slaves, and 4,000 Tejanos (Mexican residents of Texas). The Spanish plan to secure Texas through colonization succumbed to its own success. By 1830 Anglos, outnumbering Tejanos by almost 4 to 1, had essentially assumed control of the territory. Within a few years conflicts over slavery, immigration policy, taxation, culture, and politics led to rebellion and Texas independence.

TEXTILES MANUFACTURING Textiles manufacturing appeared in the American colonies as soon as English settlers arrived. The colonies produced small amounts of coarse textile cloth, usually woolen and always homespun, for local use. However, the colonial relationship hindered development of American textile manufacturing. The British government established the colonies as sources of raw materials and as consumers of English-made goods so colonial charters prohibited textile manufacturing. Restrictive regulations and taxes, such as the Sugar Act of 1764 and the Stamp Act of 1765, affected textile production and contributed to colonial discontent. As the Revolution approached, imported cloth became more expensive and difficult to obtain and efforts towards colonial manufacture increased.

Dramatic change in the U.S. textile industry occurred in the late eighteenth century with the introduction of machines. They aided the development of textile manufacturing in the United States, which had been hindered by the high cost of labor and the scarcity of capital. The United States had a ready resource of highly skilled craftsmen to design, build, and improve the machines. Despite British efforts to stop the export of textile manufacturing knowledge and machines, American inventors based their earliest designs on those of the Englishman James Hargrave for the spinning jenny, which he patented in 1770. Jennies, machines to spin thread from fiber, appeared first in Philadelphia in 1774–1775. In the 1780s machines appeared for carding cotton and wool by cleaning and arranging their raw fibers.

THE SLATER SYSTEM

Rhode Island became the first textile manufacturing center in the United States, with mills established at Providence and Pawtucket in 1789. These new factories overcame initial difficulties with the arrival of the Englishman Samuel Slater in 1789, who had a thorough understanding of the advanced textile machinery used in the English mills in which he had ap-

prenticed. (He claimed to be a farmer to bypass British emigration laws.) Slater built the equipment and the mill, supervised it, and paid half the expenses. His partners, William Almy and Moses Brown, purchased the raw material, had the yarn woven into cloth, sold the cloth, and paid the other half of the expenses. Slater eventually used his financial success and expertise to build his own mills. After the introduction of the mills and the machinery, most U.S. cloth was factory-made rather than homespun.

The mills utilizing the Slater system were located in rural settings where water power was available; they used the Arkwright water frame, which originated in England. Initially, they used poor or orphaned children, ages seven to fourteen, as workers. This system evolved into a family labor system under which housing adjacent to the mill was rented to families. The paternalistic mill owners, usually individuals or family groups, imposed certain forms of conduct upon their worker families, such as church attendance, and often paid in goods at the company store.

Between 1807 and 1810, the number of U.S. cotton mills jumped from fifteen to eighty-seven in what was called “cotton mill fever.” This jump coincided with the 1807 Embargo Act, which excluded English manufactured textiles, and the growth in the supply of cheap cotton from the South. Cotton production vastly expanded there following the development of the cotton gin in 1793. By the 1820s the South had become the world’s leading supplier of cotton. This cheap and easily accessible supply of cotton facilitated a shift from woolen to cotton products in the early nineteenth century.

LOWELL, WALTHAM, AND INDUSTRIAL GROWTH

Francis Cabot Lowell led a new revolution in U.S. textile manufacturing in the 1820s. The Lowell or Waltham system utilized power looms and limited liability corporations. The first mill in Waltham, Massachusetts, opened in 1814, and later mills followed at a site that became Lowell, Massachusetts. These mills based their system on an integrated production process, new machinery, and methods that required less skill than needed previously. The Lowell-Waltham system integrated the spinning and weaving into one facility. Raw cotton entered one end of the mill and finished cloth exited the other. These mills also focused on the production of cheap cotton cloth in abundant amounts. They used water power that rose upward through as many as four floors through a system of shafts and belts. They mechanized everything that they could mechanize

with the power loom and other new machines. Mill owners increased productivity by adding machinery rather than labor or wages.

The process of producing cloth was broken down into its simplest elements so that each worker performed only a single element and each position required less skill than workers had needed in earlier forms of manufacturing. Most of the positions described as unskilled, however, were filled by women who developed dexterity, quickness, keen eyesight, and other skills to work with the machines. But if workers became "too skilled," management increased the number of machines per employee (called a "stretch-out") or increased the machines' operating speeds (called a "speed-up").

The people, both owners and workers, came from outside the locality. Large, capital-intensive corporations rather than individuals or families owned the mills. The owners hired managers to run the mills. The workers were young, unmarried women recruited from farm families. They lived on the mill site and often had to abide by a strict moral code.

By 1839 Lowell, Massachusetts, had outstripped Manchester, England, as the world's leading producer of textiles. Twenty-nine mills there produced one million yards of cloth each week. The Lowell mills used a complex and integrated system that included capital, labor recruitment, supply purchasing, integrated production, and the sale of the finished product. This system provided a model for industrial growth and organization in the United States. The financial success of these mills, and their Boston owners, also provided a source of capital for further industrial growth.

PENNSYLVANIA AND FLEXIBLE PRODUCTION

Another center of textile manufacturing emerged in Pennsylvania in the 1820s. While the textile industry had created and shaped Lowell, Philadelphia shaped its textile industry. Proprietary firms or partnerships founded the Pennsylvania mills with small amounts of capital. The owners and workers came from the local communities. The mills focused on specialized items rather than bulk fabrics. Philadelphia became a center of specialized and flexible manufacturing enterprises of all types and sizes that produced woolens, hosiery, carpet, and silks in addition to cotton goods. The flexible firms at Philadelphia held up better during the uncertain financial times of the Civil War and provided an alternative model for industrial growth called proprietary capitalism.

Textile manufacturing coincided with the initial stages of an industrial revolution in the United States. It provided models for later industrial growth and spurred that growth by providing capital and pushing technological developments.

THAMES, BATTLE OF THE Oliver Hazard Perry's victory over British naval forces on Lake Erie on 10 September 1813 rendered the resupply of British forces in Upper Canada difficult if not impossible. Now highly vulnerable to attack by the advancing American army commanded by William Henry Harrison, governor of the Indiana Territory, the British decided to withdraw their troops from Upper Canada and concentrate on the Niagara frontier. The local commander at Fort Malden, Major General Henry Proctor, failed to notify his Indian allies, led by the Shawnee chief Tecumseh, of that decision before beginning the dismantling of his fortifications at Malden. Tecumseh, enraged by what he regarded as British duplicity and cowardice, demanded that Proctor either fight or turn over British military supplies to his warriors. Stung by Tecumseh's reproach, Proctor modified his plan of retreat and made a stand at the Thames River near Moraviantown on 5 October 1813. Outnumbered by the Americans by at least three to one, British forces left the battlefield in some disarray. Tecumseh and a hard core group of warriors loyal to his pan-Indian cause remained to fight, but were soon defeated. Tecumseh died in battle. Several Americans later claimed the honor of having

killed the great Shawnee war chief. The most notable of these claimants was Richard Mentor Johnson, later the vice president of the United States from 1837 to 1841. But the greatest political beneficiary of the Battle of the Thames was Harrison, whose reputation as a heroic frontier fighter was essential to his election as president in 1840.

THEATER AND DRAMA Determining the role of the theater in the new nation from the post-Revolutionary period until the eve of Jacksonian democracy presents a challenge, since few Americans of that period could agree on the place of the playhouse in American culture, or even on whether such entertainments should exist. For this reason, any examination of theatrical and dramatic culture in the early national period must explore not only plays, performers, and audiences but also opponents of the theater and their motives.

FIGHTING OPPOSITION TO THE THEATER

Though colonists had enjoyed professional theatrical entertainments since 1752, many remained divided in their attitude toward play going. Some groups (like the Quakers and Puritans) objected to the theater on religious grounds, while others saw it as a welcome cultural link with Great Britain. In 1774, the Continental Congress outlawed all theatrical entertainments, stigmatizing them as a luxury and a corrupting British import. The country's resident professional troupe, the Old American Company, fled to Jamaica, returning to the United States in 1784. In cities like Charleston, which had supported prewar theater, they were welcomed home with enthusiasm. But in cities like Boston, New York, and Philadelphia, the company met with open hostility. Many cities had passed wartime and postwar bans on theatrical entertainments, and fined or arrested actors who tried to stage illegal performances. These laws were gradually repealed throughout the late 1780s and 1790s.

Religious opposition to the theater lingered in some communities; others objected to the theater because of its association with British culture. Yet none of these opponents could withstand the tides of economic and cultural reform sweeping the new nation. The exigencies of the Revolutionary War had brought new groups of men to power in every major urban center. These men saw the theater as a symbol of power in the new nation. They believed that if they built luxurious playhouses—complete with red velvet curtains and crystal chandeliers—they would show their fellow citizens and Great Britain that the fledgling nation possessed all the hallmarks of a civilized people. Indeed, theaters of the new nation offered more than venues for seeing plays. They served as social centers, where the elite could gather to play cards, gossip, and dance. They also served as political lightning rods.

PATRIOTIC THEATER AND PARTY POLITICS

The owners and managers of the early national theaters had promised that their productions would serve to “polish the manners and habits of society” and establish a “democracy of glee.” Yet many audience members objected that the British plays offered in the theaters did not reflect American tastes or values. Moreover, party politics sometimes disrupted the refined atmosphere that managers had struggled to establish.

Political disputes centered on the tension between Federalist and Republican factions within the audience. The most famous politically motivated riot took place on 30 March 1798 at the opening of William Dunlap's *André* in New York's Park Theatre. *André* tells the story of British spy, Major John André, executed by George Washington during the war. It features an American character named Bland, who, furious at Washington, tears the black cockade from his hat (a Federalist symbol), and throws it away. Outraged at this attack on American honor, the audience rioted, forcing Dunlap to revise the play's ending. Managers frequently altered plays to suit audience tastes, excising references to kings, aristocracy, and the like.

American playwrights were few and far between. Among the best known were Royall Tyler, Judith Sargent Murray, Mercy Otis Warren, Susanna Rowson, William Dunlap, and John Daly Burk. Moreover, despite their patriotism, audiences remained skeptical about whether American works could rival British ones. (This sense of cultural inferiority plagued the new nation well into the nineteenth century.) Even Tyler's *The Contrast* (1787) and Row-

Theater Design (c. 1797). Architect Benjamin Henry Latrobe's design for a theater, with assembly rooms and a hotel, to be built in Richmond, Virginia. The design was never executed. LIBRARY OF CONGRESS.

son's *Slaves in Algiers* (1794), two of the most famous plays of the early national period, received only a handful of performances.

By the end of the eighteenth century, many of the nation's playhouses faced financial disaster as rivalry between competing theaters drove some out of business. Other entertainments crowded into relatively small urban markets, including the circus and institutions like Peale's Museum in Philadelphia—sites many Americans found more “democratic” than the class-based seating arrangements of the formal playhouse. On the eve of the nineteenth century, the theater's continued success seemed doubtful.

THEATER FOR THE COMMONER

Jefferson's election in 1800 transformed both American culture and American drama. His presidency ushered in a new age of sentiment in the theater, coinciding with the trend toward Romanticism in literature. Managers turned to emotional melodramas that featured simple heroes and heroines. The plays that they produced between 1800 and the 1810s were largely American adaptations of European

melodramas, many by German playwright Augustus von Kotzebue. Some of the American playwrights of the period include James Nelson Barker, *The Indian Princess*, William Dunlap, *The Africans, or War, Love, and Duty*, William Charles White, *The Clergyman's Daughter*, and John Howard Payne, *Brutus, or the Fall of Tarquin*. With the westward expansion of the Jeffersonian era, the theater moved into the frontier areas of Ohio, Kentucky, and the Louisiana Territory, as well as Washington, D.C., the new capital city. Under Jefferson, American artists and writers turned their attention to the development of a native drama and aesthetic. In 1802 and 1803 Washington Irving, writing under the pseudonym of Jonathan Oldstyle, wrote commentary on the theater in a series of letters for *The Morning Chronicle*, launching the nation's first sustained body of theatrical criticism.

Moreover, native subjects and themes gained in popularity. By the early nineteenth century, the “Stage Yankee” had become a fixture of the American theater, as had other “native” characters. At the end of James Nelson Barker's *Indian Princess* (an 1808

WILLIAM DUNLAP

William Dunlap (1766–1839) has been dubbed the “Father of American Drama” for the prolific number of plays he produced during his lifetime (some fifty original scripts, translations, and adaptations), his stewardship of New York’s Park Theatre (1798–1805), and his *History of the American Theatre* (1832), the first chronicle of the nation’s fledgling dramatic efforts. Devoted to the development of an American cultural aesthetic, Dunlap served as a director of the American Academy of Fine Arts (1817) and helped found the National Academy of Design (1826). In addition, he wrote the *History of the Arts and Design* (1834), in which he encouraged the new nation to shun the old European system of patronage and to allow artists freedom of thought and expression.

Dunlap united art and conscience, arguing that the arts could transform the new nation, and teach lessons of “patriotism, virtue, morality, and religion.” A passionate abolitionist, he served as secretary for the New York Abolition Society for a number of years and adapted the popular German play, *The Africans, or War, Love, and Duty* (1810), a story about the evils of slavery and the humanity of those trapped in the system. His many original plays—including *The Father, or American Shandyism* (1789), *Darby’s Return* (1789), *André* (1798), and *The Glory of Columbia* (1803)—exalt what he viewed as the American qualities of loyalty, courage, and selflessness. Dunlap was the first in the history of early American theater to see the theater as a “powerful engine” of moral enlightenment, and he beseeched the government to ensure that it would flourish in freedom by calling for a national theatre that would be under the auspices of the federal government, rather than at the mercy of particular groups with specific political agendas.

Heather S. Nathans

play about the life of Pocahontas), one of the characters predicts an age “when arts and industry, and elegance shall reign,” an age of “a great, yet virtuous empire in the west!” Yet American writers still felt inferior to British playwrights, who remained the mainstay of the theatrical repertoire.

The craze for British theater was fueled by English stars who roamed the American circuit throughout the early nineteenth century, including George Frederick Cooke, Edmund Kean, Fanny Kemble, and Junius Brutus Booth (father to Edwin Booth, one of America’s greatest stars, and John Wilkes Booth, one of its most infamous assassins). While these performers revolutionized American acting, they also revealed a need for a native talent.

THE RISE OF NATIVE TALENT AND NATIVE THEATER

Two stars rose to the challenge, and met with varying degrees of success in America. Ira Aldridge, a black tragedian, got his start in New York’s African Theatre (1821–1823), where he performed serious dramatic roles traditionally reserved for white performers, including *Hamlet* and *Richard III*. Persecution by white audiences closed the theater in 1823, and Aldridge moved to Europe, where he enjoyed a successful career. Edwin Forrest, a working-class hero, began in smaller roles on the western touring circuit before returning to the East to establish himself as a star.

For both American politics and theater, 1828 marked a pivotal year. As Andrew Jackson moved into power, the mood of the theater shifted from Romanticism to rugged individualism and homespun humor, reflecting “Old Hickory’s” rough masculinity. In 1828 Forrest announced a series of competitions for original plays written about American characters, and his contests launched a new age of American playwriting and a new style of American drama—plays with a heroic central character fighting oppression and injustice. These plays included John Augustus Stone’s *Metamora*, Robert T. Conrad’s *Jack Cade*, and Robert Montgomery Bird’s *The Gladiator*.

The year 1828 also witnessed the debut of Thomas “Daddy” Rice’s immensely popular “Jump Jim Crow” song and dance, a performance that inspired hundreds of imitators and started a nationwide craze for minstrel performance (ironically, one of the few theatrical genres American artists can claim to have originated).

By Jackson’s inauguration in 1829, American theater had firmly established itself in the new nation. Though its artists would continue to struggle against the stigma of home-grown drama, they had also created a theater that showcased what they defined as the uniquely “American” virtues of humor, simplicity, independence, and courage.

THEOLOGY Theology means, literally, knowledge of God. From the 1750s to the 1820s the number of American theologians grew rapidly. The most significant feature of the era was the rise of popular theology, apace with popular government: Americans by the thousands and later by the millions strove for and believed they attained knowledge of God's will for all aspects of religion. Although a few, such as Benjamin Franklin, Ethan Allen, and Thomas Jefferson, questioned the authority of the Bible, the

American denominations, from Baptists to Unitarians, continued to regard Scripture as divinely inspired, however they differed in interpretations. Plentiful English Bibles, the growth of literacy, and the political empowerment of ordinary people fed the theological zeal of Americans, as did the freeing of churches from government regulation, the rapid growth of population, and headlong westward expansion.

SALVATION, FREE WILL, AND PREDESTINATION

Theologians drew various conclusions from the Bible regarding the path to salvation (soteriology). Anglicans, Roman Catholics, Methodists, Presbyterians, and Congregationalists, among others, practiced infant baptism (pedobaptism), catechized their young, and encouraged them to live according to Christian teachings. In these traditions one typically followed a lifelong course toward salvation. But revivalists and others continued to hold a stricter standard: church membership was a privilege only for adults who had earned it by their behavior, their belief, and, in many congregations, their testimony of a conversion experience. For the Baptists (literally antipedobaptists, though they disliked the term), conversion preceded baptism, which, following the New Testament, was by immersion and for adults. For Baptists, as for most Protestants, the sacrament of the Lord's Supper (Holy Communion) was not a means to salvation but a privilege for those who had proved themselves already among the sanctified.

Two giants of the Protestant Reformation, Martin Luther and John Calvin, agreed that all were born sinners and could not achieve salvation except through the free grace of God, enabled through the atonement of Christ. The Arminian notion, which gained ground throughout the eighteenth and triumphed in the nineteenth century did not deny this, but suggested that all persons could freely choose to apply for this divine gift by prayer and reformation of character. Many Calvinists, though they exhorted everyone to seek salvation—Anglican George Whitefield (1714–1770), Puritan-Congregationalist Jonathan Edwards (1703–1758), and Baptist Isaac Backus (1724–1806) are striking examples—insisted that Christ's atonement was limited to those predestined for salvation. This doctrine has always seemed at best impractical, and at worst a spiritual elitism reminiscent of Christ's enemies as described in Scripture. To the devout predestinarian certain facts were inescapable: through original sin mankind was incapable of redemption without divine grace; the will to seek salvation was itself proof

of the workings of that grace; the rejection of salvation by sinners proved that Christ's atonement was limited. How else explain the rejection of so precious a gift by so many? Underlying all these beliefs was the idea of the absolute sovereignty of God, who wrote the spiritual script for all mankind.

From the eighteenth century to the present, when Americans speak of Calvinism they often mean predestination; when they speak of free will, they mean Arminianism. It should be noted, however, that the denominations strictly in the Calvinist line—Baptists, Presbyterians, Congregationalists, and Reformed Churches (both Dutch and German) all had their divisions over this issue. Baptists were mostly predestinarian until the era of the American Revolution, when the Free Will Baptists emerged and flourished. And Whitefield, who never left the Church of England, remained a predestinarian, as did many other "low church" Anglicans and Episcopalians, well into the nineteenth century. On the other hand, most Anglicans were Arminian; John Wesley (1703–1791), the founder of the Methodist Episcopal Church, USA, who always considered himself a member of the Church of England, was a thoroughgoing Arminian.

PERSISTENT PIETISM

Another essential strand in Christianity was Pietism. Some denominations and sects embodied virtually all the elements of Pietism: a sincere effort to live in Christian love and harmony in both family and community, adhering to a strict code of personal behavior, and setting apart some time each day for religious devotions. German-speaking groups, mostly in Pennsylvania, including Mennonites, Dunkers, Moravians, and Schwenkfelders—strongly exemplified Pietism, as did the Quakers. But Pietism was present in all denominations, especially among Lutherans, Baptists, and Methodists. Wesley's mature faith was strongly shaped by his encounters with the Moravians. Wesley thus added Pietism to Arminianism, and capped his system with perfectionism: the belief that one could entirely transcend sinfulness in this world, even before graduating to the next. Both Pietism and perfectionism would grow and express themselves in different strands of American Christianity. The Second Great Awakening produced, along with a wave of revivals and their innovation, the camp meeting. It also produced a variety of reform agendas, led by missionary societies, Sunday schools, the temperance movement, and the early stirrings of the antislavery movement. The urge toward perfection began to suggest the approach of the

Second Coming; theological speculation began to dwell on the possibility of the Millennium.

IMITATING THE APOSTLES: ITINERANT MINISTRIES

Itinerancy, the practice of traveling from town to town and province to province for the purpose of preaching, became an issue during the Great Awakening of the 1740s and after. Where churches were established by law, as in most of New England, Maryland, and Virginia, established ministers often prevented itinerants from preaching, either by refusing them the use of their churches or by having them arrested for preaching in barns or fields. Whitefield, the greatest itinerant of the century, proved unstoppable; the rest, occasionally silenced in one place, soon found another. Where new congregations could not find suitably ordained ministers, Methodism's apostle, Francis Asbury (1748–1816), authorized intelligent laymen to lead congregations. As the nation matured, circuit-riding ministers visited such congregations until they could find suitably educated ministers. Similarly, the Baptists chose intelligent and devout laymen as ministers, launching the age of the Baptist farmer-preacher. The Methodists and Baptists expanded with the frontier, becoming the largest Protestant denominations in the United States. Ministers of the formerly established churches often criticized them for their lack of education, to which they replied that Jesus and his twelve apostles were not college graduates but itinerant ministers. Furthermore, as quickly as possible Methodists and Baptists founded colleges and seminaries.

SOME LEADERS IN THOUGHT AND ACTION

The most richly stored and original theological minds of the era either directly influenced religious developments or trained the ministers and laymen who did. Jonathan Edwards, of Connecticut and Massachusetts, was a revivalist as well as a theologian. He combined scientific insights from John Locke and Isaac Newton with traditional theology to write profound works on the religious affections and the sovereignty of God. John Wesley, who preached and wrote exhaustively to save the souls of millions, sent Francis Asbury, exactly the right man to make Methodists of Americans. Isaac Backus, successfully self-taught, led the Baptists in balancing Congregational independence with consistent beliefs and practices, while working for the complete freedom of churches from secular government. Yale's Nathaniel William Taylor (1786–1858) worked out a practical reconciliation between Calvinism and free will by redefining the doctrine of original sin. Not all develop-

ments were in this liberal direction. Archibald Alexander (1772–1851), from the Shenandoah Valley of Virginia, helped found the Princeton Seminary in 1812, and persuaded two generations of students that Presbyterians should return to their Calvinist roots in sixteenth-century Geneva. Earlier, Henry M. Muhlenberg (1711–1787) of Philadelphia succeeded in bringing order to the various forms of German and Scandinavian Lutheranism that arrived with various waves of immigrants. Samuel Seabury (1729–1796) of Connecticut and William White (1746–1836) of Philadelphia saved Anglicanism by successfully separating the Episcopal Church from the Church of England. Both progressives and conservatives earnestly believed they were restoring and realizing essential, traditional Christianity.

TIPPECANOE, BATTLE OF From the start, antagonism existed between Prophetstown, the pan-Indian nativist community established in 1808 by the Shawnee prophet Tenskwatawa and his brother,

the war chief Tecumseh, at Tippecanoe Creek in Indiana, and the territorial government at Vincennes led by Governor William Henry Harrison. But the following year the antipathy was exacerbated by the Treaty of Fort Wayne, a land deal wherein a number of tribal leaders agreed to an extensive new land cession. Tecumseh and the Prophet refused to accept the treaty and predicted war if it were not revoked. Harrison, concerned that opposition from Prophetstown would make it difficult if not impossible to survey and settle the newly acquired lands, demanded that its substantial non-Shawnee majority be expelled from the community. When the Prophet refused, Harrison took advantage of Tecumseh's absence on a recruitment mission in the South to stage a preemptive strike in the fall of 1811.

The Battle of Tippecanoe on 7 November later established Harrison's reputation as a heroic Indian fighter. But despite the mythology that surrounds Tippecanoe, the actual battle was indecisive. Although the Prophet's forces were scattered by Harrison's assault and his village burned, warriors from

a number of tribes soon rebuilt Prophetstown on a site nearby. In correspondence with his superiors, Harrison continued to warn of the menace to American expansion posed by the Prophet and his followers. Although legend maintains that the Prophet, ignoring Tecumseh's advice to stall for time, launched an ill-considered, poorly planned pre-dawn attack on Harrison's forces, the most reliable sources indicate that the fight began when several high-spirited Winnebago warriors, in violation of the Prophet's orders, skirmished with some of Harrison's sentinels. Equally dubious is the claim that Tecumseh, enraged by the Prophet's bungling, threatened to kill his brother and in fact removed him from the leadership of the movement. The evidence indicates unequivocally that Tenskwatawa remained its spiritual leader, continued to serve as the civil head of Prophetstown during Tecumseh's absences on diplomatic missions, and succeeded him as war chief after his death at the Battle of the Thames in 1813. Late-twentieth-century research also indicates that Tecumseh and the Prophet both desired a peaceful accommodation with the United States that would permit them to organize a pan-Indian nativist state on lands not yet settled by Americans.

The Battle at Tippecanoe was thus not, as myth would have it, fought to protect the frontier from an Indian aggressor supported by Britain, but was rather the outgrowth of Harrison's efforts to eliminate a community and a movement that threatened to obstruct plans for further Indian dispossession. Tecumseh and the Prophet were never tools of the British, whom they in fact distrusted. The true significance of the Battle of Tippecanoe is not that it secured the frontier from a fierce adversary, but rather that it provided a rich mythology that not only promoted the political career of William Henry Harrison, a future president, but expressed in epic terms the belief that American history is the story of the triumph of civilization over savagery.

TORIES See **Loyalists**.

TOWN PLANS AND PROMOTION Town and city populations grew even more rapidly than rural populations in the new American nation, particularly in the areas settled west of the Appalachian Mountains after the end of the War of Independence in 1783. New towns in this region were often the products of enthusiastic marketing campaigns designed to sell building lots and to attract businesses and residents. These promotional activities, often called boosterism, helped to define America's westward migration.

Town promotion also owed much to speculators and developers exploiting lands acquired by treaty and conquest from American Indians. Sir William Johnson set this pattern in western New York in late colonial times; subsequent promoters such as William Cooper followed his example. Huge land gains after the War of 1812 encouraged even more aggressive commercial ventures, often advertised by beautifully drawn imaginative maps and views.

A successful town needed a solid economic base. In an era when most bulk goods moved by water, whether river, lake, or canal, boosters planned their towns accordingly around their waterfronts and constantly lobbied for government subsidies to attract steamboats, or to construct levees, wharves, and docks. Artificial waterways followed. The Erie Canal, built from Albany to Buffalo, New York, after the War of 1812, was a particularly successful internal improvement, contributing to the growth of towns along its route.

Successful cities were often identified with the product they shipped. Cincinnati became known as "porkopolis" for its processing of hogs. Pittsburgh became an iron center, Memphis a cotton center, Louisville a tobacco port, and Galena, Illinois, the center of a lead-mining region. Preexisting French and Spanish towns shared in the growth after the 1803 Louisiana Purchase. St. Louis became the center for the western fur trade; New Orleans became the South's largest city as most of the commerce of the Mississippi and Ohio River Valleys passed through it

on the way to the Gulf of Mexico. In a few years railroads would help other cities, such as Chicago, to grow and prosper as well.

As much as city leaders did not want their ventures to fail, they did not want their communities to remain mere dots on a post office map. Economic development often rested on borrowed money, and the desire for credit spurred the western banking industry. Cautious banking practices often yielded to pressure for riskier "wildcat" ventures. In times of rapid expansion loans might be repaid; but in times of commercial contraction, such as the Panic of 1819, many banks and businesses failed, taking their towns down with them, and many grandiose plans were thus never realized.

This threat of failure was a spur to even more intense promotional activity. Boosterism was evident in the carefully surveyed town street plan, or plat, which permitted lots to be sold with a clear legal title. Planners could choose from several popular designs. Those with roots in New England often created their sites around town commons, with important buildings such as churches facing a central grassy square. Many examples of such towns can still be found along the shores of Lakes Erie, Huron, and Michigan. Planners who hailed from the middle states often preferred to copy Philadelphia, with its rectangular grid centered on a market street. Examples of these towns are found on or near the National Road in central Ohio, Indiana, and Illinois. Developers from the southern states showed a preference for towns built around central courthouse squares. These are common in the Ohio Valley and throughout the Southwest. A few developers emulated Pierre L'Enfant's more complex 1791 plan of Washington, D. C., with its diagonal avenues and dramatic public parks. Indianapolis is a good example.

Everywhere, town boosters sought to embellish their towns with impressive buildings. Architects worked in new high styles, designing copies of ancient Greek and Roman structures. False fronts on commercial buildings, tall steeples on churches, and elaborately carved or lathed wooden decorations were all designed to attract attention and convey a sense of importance. Town leaders gave particular attention to encouraging elegant hotels, large county courthouses and schools, and fine private homes; they welcomed colleges not only for the educational distinction they might confer but also for their imposing buildings. Town cemeteries, with elaborately sculpted monuments and tombstones, often doubled as elegant public parks. Boosters described their communities not as they were but as they might be, ex-

aggerating possibilities to convey hope and confidence. In their anticipatory fervor and ambitious plans, the present and the future of the new Republic came together.

TOWNSHEND ACT The Townshend Act was part of a broad legislative program introduced into Parliament by Chancellor of the Exchequer Charles Townshend during 1767. Contrary to American hopes, the repeal of the Stamp Act in 1766 had led few in Parliament to question either their power to tax the colonies or the necessity of future taxes. Only the instability of British politics prevented an earlier exertion of British power under the Declaratory Act, passed on the same day as the Stamp Act repeal. By early 1767, further acts of American resistance had combined with the rising cost of imperial administration to make parliamentary action seem necessary.

Townshend had long favored a more active colonial policy, though the instability of the Chatham administration produced inaction. With the earl of Chatham absent and the duke of Grafton and other leading ministers opposed to new taxes, Townshend found it difficult to organize cabinet consensus on American policy. By late April 1767, however, Townshend had secured agreement on the New York Restraining Act and the establishment of an American Board of Customs Commissioners at Boston. He had also achieved consensus upon the establishment of an independent civil list, transferring the salaries of governors and other key officials from the provincial assemblies to the crown. In May 1767 Townshend surmounted Grafton's opposition to new taxes

by proposing his tax plan as a private member of the House of Commons rather than in his official position. The concept of taxation met the approbation of the Commons, and the next few weeks were spent in securing agreement over items to be taxed and tax rates. The final bill, passed without opposition on 16 June and approved by King George III on 29 June, included new taxes upon tea, glass, paper, lead, and painter's colors. Townshend estimated that these taxes would raise only forty thousand pounds annually, well below the revenue necessary to his purposes. Yet he made it clear that this was only a beginning and that other products would be taxed in the future.

Having expressly presented his taxes as "external" trade duties in response to American objections to the Stamp Act as an "internal" tax, Townshend expected only limited opposition from America. Initially, he was correct, as resistance was slow to develop. Though John Dickinson challenged the constitutionality of the taxes in his fourteen *Letters from a Farmer in Pennsylvania*, published in late 1767 and early 1768, the colonial legislatures moved slowly. Even the Massachusetts assembly, which could usually be expected to proceed quickly to radical measures, hesitated before, on 11 February 1768, agreeing upon a circular letter to the other assemblies. In moderate tones, it questioned both the duties and the assumption of colonial salaries by the crown before concluding with an offer to consult upon a united plan of action.

This call met with mixed results and might have proved disappointing if not for the intervention of the newly appointed secretary of state for the colonies, Wills Hill, the earl of Hillsborough. On 22 April 1768, Hillsborough ordered Governor Francis Bernard to demand that the Massachusetts assembly rescind its letter, directing Bernard to dissolve the assembly if it refused. Hillsborough blundered further by ordering the other colonial governors to ignore the Massachusetts letter, again insisting upon dissolution or prorogation as the price of refusal.

Hillsborough's rash move caused the lukewarm opposition to the Townshend duties to become associated with the much more dynamic issue of assembly rights. As most of the assemblies were dissolved, aggrieved Americans stiffened in opposition to the new taxes and called extralegal popular meetings to protest British policy. These meetings adopted non-importation associations, agreements which all citizens were pressured to sign, promising a boycott of all nonessential British goods. Though enforcement varied in effectiveness, the associations marked a

critical juncture in the Revolutionary movement, as authority was transferred from the legally authorized legislatures to extralegal popular bodies that were neither recognized by or accountable to British authorities.

TRAILS TO THE WEST The earliest Americans traveled on trails blazed by generations of animals moving across the landscape in search of water and better grazing. From the explorers of the sixteenth century to the settlers of the seventeenth and eighteenth centuries, European immigrants and their descendants followed paths established by their Indian predecessors.

The Wilderness Road, the most important land route from western Virginia through the Cumberland Gap and into Kentucky, is said to have followed a route established by migrating herds of American bison. In 1750 Dr. Thomas Walker traveled through the Cumberland Gap and into the country beyond. Before 1770, "long hunters" like Daniel Boone were following the trail to the rich hunting grounds of Kentucky. Branches of the Wilderness Trail led south to the country occupied by the Cherokee and Creek peoples. Over the next decade, the old trail blazed by animals and Indians would become the primary overland route for settlers moving west.

Originally known as the Warrior's Path, the Great Philadelphia Wagon Road also began as a game trail. Wagons driven by German and Scots-Irish immigrants rumbled south out of the Pennsylvania settlements on their way to new homes in Virginia's Shenandoah Valley and the backcountry of the Carolinas and Georgia.

Nemacolin, a Delaware chief, and Maryland frontiersman Thomas Cresap established a path connecting the Potomac and Monongahela Rivers in 1749–1750. The young George Washington followed the same route on a 1754 journey to a skir-

lish that marked the beginning of the French and Indian War (1754–1760). The following year British general Edward Braddock transformed that trail into a wagon road in his unsuccessful attempt to capture the French Fort Duquesne at the present site of Pittsburgh, Pennsylvania.

Work began on a federally funded National Road in 1815. The first section, originally called the Cumberland Road, followed the path that Nemaquin, Washington, and Braddock had traveled through the Allegheny Mountains. With the support of Kentuckian Henry Clay and other western congressmen, work continued on the National Road during the years from 1825 to 1833. From Wheeling in Virginia (later West Virginia), the road followed part of Zane's Trace, named for pioneer Ebenezer Zane, who had established a crude wagon trail through the forest of eastern Ohio in the late eighteenth century, following an existing Indian path. The National Road continued across Ohio and Indiana to Vandalia, Illinois. In the age of the automobile it became Route 40, an important roadway to the West.

Rivers were the most important early pathways leading to the frontier. Far more settlers traveled down the Ohio River and up and down its tributaries than ever traveled overland into the Ohio watershed. Early western commerce also moved by water. Farmers in the Ohio watershed sought to move beyond the local market by floating their products down the local tributary to the Ohio and Mississippi to New Orleans aboard locally constructed flatboats. The crew of local men or boys would sell the boat at their destination and return home on foot along the famous Natchez Trace or another land route, risking an encounter with such notorious outlaws and "land pirates" as John Murrell and the brothers Micajah and Wiley Harpe.

Those who traveled to the Far West also took advantage of the rivers. Alexander Mackenzie, the first man to cross the North American continent from Atlantic to Pacific, traveled the Canadian waterways. Likewise, the Corps of Discovery (1803–1806), the first American transcontinental expedition, headed by Meriwether Lewis and William Clark, traveled down the Ohio, up the Mississippi, and northwest on the Missouri River to its headwaters in what became the state of Montana. They crossed the Rocky Mountains on foot and descended the Clearwater, Snake, and Columbia Rivers to the Pacific Ocean.

Commerce, and the American flag, traveled southwest from Missouri on what became known as the Santa Fe Trail. Spain had jealously guarded the borders of its provinces in northern Mexico. In 1821,

the year in which Mexico threw off Spanish rule, William Becknell salvaged a failing business career with the profits from the first pack trip from Independence, Missouri, to Santa Fe. Stretching nine hundred miles across the Great Plains, the trail quickly emerged as an important economic link between the United States and Mexico.

With the outbreak of the Mexican War in 1846, the U.S. Army moved down the Santa Fe Trail to seize control of New Mexico and California. With American victory in 1848, the United States constructed a series of five forts to protect travelers from Indian raiding parties. In 1862 Confederate forces attempted to capture one of those posts, Fort Union, battled Union troops at Glorieta Pass, New Mexico. Union victory in this most decisive of all western Civil War battles enabled the government to retain control of the trail.

No route to the West was better known than the Oregon Trail. Between 1841 and 1861, an estimated 300,000 emigrants traveled the 2,170-mile-long trail from Independence, Missouri, to Oregon City, Oregon. Robert Stuart, a member of a group of fur traders who established Fort Astoria on Oregon's Columbia River, followed a Crow Indian trail through South Pass in 1812. A twenty-mile-wide valley through the Rocky Mountains, the pass was the key to locating the trail to Oregon and California.

Other immigrants would travel slightly different paths. Some followed branches of the Oregon Trail that carried them to California. Between 1846 and 1869 more than seventy thousand converts to the Church of Jesus Christ of Latter-day Saints traveled the Mormon Trail from a jumping-off point in Iowa to the Great Salt Lake Valley of Utah. In contrast to the hopes of overland immigrants for a better life in the West, the U.S. government in 1838 forced over fifteen thousand citizens of the Cherokee Nation to travel a Trail of Tears from their ancestral homeland in North Carolina and Tennessee to resettlement areas in the Indian Territory, later Oklahoma.

Some early trails established the route for later roads and highways. Other historic pathways simply vanished, leaving nothing more than the grooves cut by decades of wagons passing through a rocky area. The hardships suffered by those who braved an overland journey by foot, handcart, or wagon have been largely forgotten. What remains is the romantic vision of Americans moving west as portrayed in popular culture, from traditional songs like "Sweet Betsy from Pike" to novels, films, and television shows.

TRANSCONTINENTAL TREATY Signed in February 1819 by Spain and the United States, the Transcontinental Treaty finally settled the boundaries of the Louisiana Purchase of April 1803. The United States had bought Louisiana from France with the same undefined boundaries with which France had received it from Spain. Immediately, President Thomas Jefferson wanted to open negotiations with Spain to fix the boundaries. He argued that Louisiana encompassed not just the western Mississippi Valley, but also the Gulf Coast from the Rio Grande in the west to the Perdido River in the east. With good reason, Spain considered the purchase invalid and refused to cede so much of its territory. Desultory negotiations ended entirely late in Jefferson's presidency as Spain collapsed under foreign invasion and internal turmoil. Capitalizing on this distress, the United States unilaterally annexed West Florida, as far east as the Perdido, in 1810.

In May 1816, President James Madison and Secretary of State James Monroe prepared for renewed negotiations by setting their priorities in three areas: Florida, Texas, and the Pacific Northwest. Acquiring East Florida was most important; leaving unimpeded American claims in the Pacific Northwest—an important stopover in the China trade—came second; and securing Texas from the Sabine River to the Rio Grande was least important. They also sought millions of dollars in damages claimed by American merchants against Spain. Madison and Monroe envisioned a treaty in which the United States would assume the damage claims and abandon its pretensions to Texas in exchange for Florida and the protection of its interests in the Pacific Northwest. Their desire to sign a treaty was always balanced against their ef-

fort to avoid a new war so soon after the War of 1812. Expecting their position to improve over time, Madison and Monroe did not press Spain too hard.

These priorities continued to shape policy under President Monroe and Secretary of State John Quincy Adams after Monroe's inauguration in March 1817. Monroe and Adams expected a long period of fruitless negotiations with Spain. But a series of unexpected developments at home, in Spanish Florida, and in Europe transformed Spanish thinking in 1818. At home, public and congressional opinion clamored to support the revolutionary movements in Spain's American colonies. In Florida, General Andrew Jackson seized two Spanish forts during his war against the Seminole Indians. In Europe, the Great Powers decided against intervening on Spain's behalf against its rebellious colonies. Spanish policymakers, like their American counterparts, had calculated that time was on their side. Prolonging the negotiations would allow them to strengthen their European alliances and quiet their New World colonies. The events of 1818, however, suggested instead that they could lose Florida without receiving anything in exchange and drive the United States into support of the rebels or even war unless they made real concessions quickly.

Within months of this reevaluation, Adams and the Spanish minister in Washington, Luis de Onís, completed a treaty on the lines that Madison and Monroe had projected nearly three years earlier. The United States received Florida. The two sides fixed a boundary that ran from the Sabine River to the Pacific Ocean. And the United States assumed \$5 million in damage claims of American merchants. The Spanish king delayed ratification for two years, but the treaty officially took effect in February 1821.

Because it established the first solid American claim on the Pacific, the Transcontinental Treaty has operated, along with the Monroe Doctrine, to establish Adams's claim to greatness as secretary of state. For a quarter century after its completion, however, the treaty was often seen as most significant—and most controversial—for abandoning the weak American claim to Texas.

TRANSPORTATION

This entry consists of three separate articles: *Animal Power*, *Canals and Waterways*, and *Roads and Turnpikes*.

Animal Power

Before 1830 walking remained the most common mode of human transportation, but throughout the eighteenth and early nineteenth centuries people in-

creasingly used animals to move goods and themselves over land. Advances in horse technology, such as improved wagons, continued selective breeding, and new uses of the horse, paralleled steady improvements in infrastructure such as turnpikes and canals. Although oxen continued to provide a less costly source of power for transportation into the mid-nineteenth century (in part because they doubled as a food source), horses were generally preferred for their greater speed.

Excessively poor road conditions throughout the colonial period made travel on horseback the only practicable method of long-distance conveyance. Early U.S. government-sponsored road construction in the 1790s allowed for greater use of carriages and wagons, but improvements were sporadic. Thomas Jefferson's journey from Philadelphia to Monticello (a distance of about 260 miles) in January 1794, by combination of stagecoach and horseback, took eleven days. Despite a top speed of forty miles per hour, a horse could sustain such high speed only for about

two miles. Thirty miles was generally considered a day's journey.

The four-wheeled Conestoga wagon, with its distinctive boat-shaped body and cloth top, became the dominant freight vehicle in eastern America after 1750, reaching its peak of use between 1820 and 1840. First built by German immigrants in Lancaster County, Pennsylvania, in the first decades of the eighteenth century, the Conestoga's first major use came in May 1755 when General Edward Braddock called on Benjamin Franklin to hire 150 such wagons, along with the drivers and horses, to carry supplies on his expedition to retake Fort Duquesne (on the site of modern Pittsburgh). In 1789 the physician Benjamin Rush commented that it was common to see 100 such wagons per day enter Philadelphia from western settlements. The largest wagons, with a team of six sturdy horses, could haul up to five tons.

By 1750 horse herds of formerly domesticated stock from New Spain had spread northward throughout the Great Plains and the Columbia Plateau. Tribes such as the Sioux, Blackfoot, and Nez Perce quickly took advantage of the greater efficiency of equestrian hunting and greater mobility offered by horses, though many tribes that encountered horses did not turn to a nomadic lifestyle. The Chickasaw and Nez Perce tribes were especially noted for their success at selectively breeding strong, rugged horses.

Mules made their debut in America shortly after 1785 when George Washington acquired "Royal Gift," a prized Spanish donkey eventually used to sire a line of American mules. By the early nineteenth century, mules were in use throughout the South, working primarily as draft animals on plantations. Despite their higher cost and sterility, mules were preferred over horses in plantation agriculture owing to their innate ability to avoid injury. This was an important trait because less direct supervision by owners often meant that overseers or slaves were prone to injure—or in extreme cases kill—a draft horse through overwork or neglect.

During the height of the canal era (roughly 1815 to 1840), animal power reached its greatest efficiency. A single horse or mule was capable of towing a forty-ton canal boat for six hours on the Erie Canal (completed in 1825). Replacement horses were simply towed along with the rest of the cargo and brought to the hitch by way of a plank extended to the towpath.

A system of stagecoaches offered long distance public transportation along the eastern seaboard by 1780. The first urban public transportation system

in America consisted of a horse-drawn "omnibus" that ambled along Broadway Street in New York beginning in 1829. Other cities such as Philadelphia (1831) and Boston (1835) soon followed with their own oat-powered public transport. A fixed rail horse-drawn streetcar or "horsecar" was introduced in New York in 1832 and was quickly adopted by most major U.S. cities.

Canals and Waterways

Long-distance travel in early America meant travel by water. Throughout the colonial period and into the nineteenth century, the coastal trade linking the major port cities of the east coast helped to build critically important economic and political ties that created a sense of unity, mutual interest, and common purpose.

RIVERS

Great open waterways, from the Gulf of St. Lawrence in the north to the Delaware and Chesapeake Bays on the mid-Atlantic coast, offered the earliest explorers a route into the interior of the continent. Trade and settlement moved inland along the great rivers: the St. Lawrence, the Connecticut, the Hudson, the Susquehanna, the Delaware, and the Potomac. No early explorer made better use of the inland waterways than the Frenchman, René-Robert Cavelier, Sieur de La Salle. Between 1673 and 1682 he traveled up the St. Lawrence, through the Great Lakes, and down the length of the Mississippi River.

As European settlements extended west across the Allegheny Mountains, the network of inland rivers became the major transportation arteries. The Ohio River stretches over 980 miles from Pittsburgh, Pennsylvania, to its juncture with the Mississippi at Cairo, Illinois. The major watershed for thirteen states, it was the principal route into the western country during the period of expansion that began in the last quarter of the eighteenth century. The Lewis and Clark expedition (1804–1806) traveled up the Missouri River to its headwaters in present-day

Washington Canal and Rhode Island State Lottery. The expense involved in the construction of canals led to a number of creative fund-raising ventures, including lotteries. This ticket was for a lottery held in 1826 to raise money to construct the Washington County Canal in Rhode Island. LIBRARY OF CONGRESS, RARE BOOK AND SPECIAL COLLECTIONS DIVISION.

Montana, crossed the Rocky Mountains on foot, and descended the Clearwater, Snake, and Columbia Rivers to the Pacific Ocean.

Rivers were the key to the early western economy. In the early nineteenth century, western farmers often floated their products down their local tributaries to the Ohio and Mississippi Rivers and on to New Orleans aboard locally constructed flatboats. These unpowered craft were often crewed by local men or boys who sold the boats at their destination and returned home on foot along the Natchez Trace or other land routes. Keelboats, designed to be poled upstream, also carried goods on the western rivers. Keelboat men like Mike Fink, along with such notable outlaws and "land pirates" as John Murrell and the brothers Micajah and Wiley Harpe, earned an enduring place in western legend and lore.

STEAMBOATS

The advent of the steamboat opened a new era in the history of American transportation. Both John Fitch (1743–1798) and James Rumsey (1743–1792) had conducted early experiments with steam-powered river vessels, but neither was able to develop a practical, marketable design. With the support of Chancellor Robert Livingston, a wealthy New York landowner, Robert Fulton (1765–1815) succeeded where others had failed. On 17–19 August 1807 he rode 150 miles upstream from New York to Albany on his famous *North River Steamboat*, later rebuilt and

known as the *North River Steamboat of Clermont*, in honor of Clermont, Robert Livingston's Hudson River estate. The first voyage took thirty-two hours over a two-day period. Granted a monopoly for steam navigation of the Hudson River, Fulton and Livingston were able to force John Stevens, their great rival, into operating his steamboat in Delaware Bay.

In 1810–1811 Nicholas Roosevelt, an associate of Fulton's, built the steamboat *New Orleans* in Pittsburgh. He set off down the Ohio in the spring of 1811 with a party of eight. For the next eight months, the *New Orleans* and its crew would face one hazard after another, from low water and the threat of Indian attack to the New Madrid earthquake, which caused the Mississippi to run backward for a time. The first steamboat to travel the Ohio-Mississippi system arrived in New Orleans on 12 January 1812 and delivered a load of cotton consigned to it in Natchez.

Over the next two decades, the advent of the steamboat would shape the economic, political, and cultural life of the West and the South. Cities like Pittsburgh, Cincinnati, St. Louis, Memphis, and Natchez prospered as major inland ports. By 1840 New Orleans was one of the busiest ports in the world and a major entry point for European immigrants to the United States. During the nineteenth century, an estimated four thousand steamboats were operated on the Mississippi River system.

CANALS

The rise of commerce on the western rivers was a matter of serious concern for the citizens of east coast ports, notably New York. In 1817 New Yorkers began work on the Erie Canal in an effort to attract the western trade. Connecting Buffalo on Lake Erie to Albany on the Hudson River, the Erie was an artificial waterway furnished with a series of locks to raise and lower canal boats, compensating for the different elevations of the two bodies of water. The construction of the canal was one of the great civil engineering projects undertaken in the first half of the nineteenth century. A generation of engineers who would go on to supervise the construction of roads, bridges, and railroads learned their profession as young men working on the Erie Canal or one of the other waterways that it inspired.

The completion of the canal in 1825 reduced the cost of shipping a ton of produce from Buffalo to Albany from one hundred dollars by road to just ten dollars. The three weeks required for an overland journey across the state was reduced to eight days by canal. The commerce of the expanding Old Northwest began to flow eastward along the new waterway, while waves of European immigrants traveled west by canal to the Great Lakes. As the planners had hoped, New York City remained the nation's leading business and population center.

The success of the Erie Canal underscored the importance of internal improvements, government-funded road and canal projects designed to encourage commerce and economic growth. A wave of canal building swept the United States. By the end of the nineteenth century, several dozen canals had been constructed in twenty-one states, from Maine to Oregon.

The history of the Chesapeake and Ohio Canal was typical of many others. President John Quincy Adams broke ground on 4 July 1828 for a canal that would run alongside the Potomac River for over 180 miles from Cumberland, Maryland, to Georgetown, in the District of Columbia. By the time the work was completed in 1850, the canal included 160 culverts that allowed small streams to pass under the canal and eleven aqueducts carrying the waterway over larger rivers and roads. The Potomac dropped 605 feet from Cumberland to Georgetown. A canal boat making that journey passed through seventy-four lift locks along the way. The most difficult construction challenge was to bore a 3,118-foot tunnel through a hard rock ridge. The labor force was a mix of local farmers and immigrant labor.

The Baltimore and Ohio Railroad, which served the same geographic area, was completed eight years before the C&O Canal and earned much higher profits. The canal survived as a less expensive means of transporting coal from Cumberland to Washington, D.C. The old rivalry finally came to an end in 1889, when a flood devastated the canal and the railroad was able to take control. The B&O restored the canal and kept it in operation until 1924, when another major flood brought an end to traffic on the old C&O.

In the age of air travel and coast-to-coast super highways, the waterways that were so important to commerce and transportation in the new American nation remain important economic arteries into the twenty-first century. Engineers have transformed the St. Lawrence River, which allowed the French to travel inland from the coast, into a seaway that connects to the Great Lakes, opening the Midwest to the commerce of the world. The keelboats, paddle wheel steamers, and canal boats have vanished, but the products of American fields and factories still move up and down the Mississippi and its two great tributaries, the Ohio and the Missouri.

Roads and Turnpikes

Early roads in every region of North America were animal paths, often carved by bison migrating between salt licks, water sources, and natural pasturage. If the herds were large enough, they trampled underbrush in broad swaths, turning narrow trails into wide but still rudimentary roads. Native Americans used these same trails, most obviously during hunting seasons but also on diplomatic or warring trips against other nations and European and American settlers.

By the 1750s a network of roads provided an infrastructure for colonists' transportation. Early emi-

grants traveled the Mohawk Road from Albany, New York, to Lake Erie. The Great Warrior Path through Virginia's Shenandoah Valley became the Great Wagon Road by which Germans and Scots-Irish migrated from Pennsylvania through the southern backcountry to central North Carolina, where another Indian trail, the Great Trading Path, ushered colonists into South Carolina and Georgia.

While Indians had relied on herds to maintain these traces, American colonists actively cleared roads. Following English tradition dating from the Middle Ages or earlier, Virginia enacted road-clearing

legislation in 1632 requiring each man to work on the roads a given number of days each year or to pay another to work in his place. William Penn's policy of 1683 placed Pennsylvania county courts in charge of road clearing and empowered them to assign road overseers. Despite official efforts to maintain roads, however, colonial roads remained narrow, difficult-to-travel surfaces of compacted dirt.

The French and Indian War marked a shift in American ideas about roads. In 1753 George Washington oversaw the widening of Nemaolin's Path through northwestern Virginia to facilitate attacks

on the French in western Pennsylvania. A year later, needing to move large armies through northern and western wildernesses, the British began a series of road clearings. General Edward Braddock authorized a twelve-foot wide military road between Fort Cumberland, Maryland, and Fort Duquesne in western Pennsylvania. Six hundred soldiers cleared about two miles of the rude path each day. In August 1759 General Jeffrey Amherst sent two hundred Rangers to widen the Indian Road from Crown Point, New York, to Lake Champlain. When the war ended, many Americans had access to wide roads on which horse-drawn wagons could more conveniently haul goods.

But without constant attention, these military roads quickly became overgrown and impassable. By the 1770s Braddock's Road was abandoned, and the Crown Point Road fell into disuse until cleared again in 1777 by colonial militias on their way to Fort Ticonderoga. More traveled roads fared little better. The Boston Post Road, cleared and maintained since 1673, served as the primary route between Boston and New York City. Heavy use by post riders and the general public created ruts, holes, and mud. Gradually the route became part of the King's Highway, connecting Boston to Charleston. Since the King's Highway linked all thirteen colonies, it became a central military road during the Revolutionary War. After the war the name drew disgust, and Americans once again employed more colloquial names, such as "Boston Post Road."

In the meantime, some Americans busily carved roads out of the trans-Appalachian wilderness. In 1775 Daniel Boone led about thirty woodsmen through the Cumberland Gap, clearing a road on behalf of the Transylvania Land Company into central Kentucky and beyond to the falls of the Ohio River. It would be another twenty years before the road was widened enough to accommodate wagons. By 1785, in an age before the steamboats, the Natchez Trace allowed Mississippi rivermen to return northward through Mississippi, Alabama, and Tennessee. And in 1796 Ebenezer Zane began blazing a road across the southern Ohio Territory between Wheeling, Virginia, and Limestone, Kentucky.

The new and expanding nation required not only new roads but improved roads as well. By modern standards, roads were very poor. Tree stumps under a foot high dotted most roadbeds. Most trails were not wide enough for wagons to pass. And the only option to muddy roads before 1800 was the corduroy road: half-sawn logs laid flat-side down and covered with dirt, which provided a solid albeit bumpy route through low-lying, marshy areas.

State legislatures desperately sought new ways to ensure road transportation. Pennsylvania chartered the Philadelphia and Lancaster Turnpike Company, which, in 1794, completed the nation's first toll road. Eight years later the Catskill Turnpike opened in New York. Private turnpike companies paid the expenses of maintaining and upgrading roads, passing the costs onto travelers and profits onto stockholders, most of whom were owners of land adjacent to the road and merchants who meant to use it. By 1811 states were issuing charters wholesale: New England had about 180 chartered companies; New York, 17 companies; and New Jersey, 30 companies. South of the Potomac River, however, river systems remained the dominant mode of transportation, and few turnpike companies were formed.

The federal government also became involved in road construction. In 1806 post riders carved the Federal Road through Creek Indian lands in the Alabama and Mississippi Territories. President Thomas Jefferson signed legislation authorizing the construction of the Cumberland Road, which eventually stretched from Cumberland, Maryland, to Vandalia, Illinois. In 1808 Secretary of the Treasury Albert Gallatin promoted road building to aid federal government and "facilitate commercial interests."

Despite these efforts at road improvement, during the War of 1812 the army was greatly hampered by the scarcity of good western roads. As the war ended, President James Madison approved funding for what became known as Jackson's Military Road from Nashville to New Orleans. A series of federal military-road projects followed. Madison and later James Monroe showed less interest in public roads, however. Madison vetoed John C. Calhoun's 1817 Bonus Bill, which would have funded a network of roads that were to bind the Republic together, and a similar proposal two years later failed as well. Determined, Calhoun, as Monroe's secretary of war, repackaged his plan for internal improvements, and in 1824 a new era in federal road construction began. The Survey Act of 1824 called for federal surveys for commercial, military, and post roads, all to be done by the Army Corps of Engineers. Road construction began immediately in the Michigan, Florida, and Arkansas Territories, where the need for military roads was greatest.

Road technology improved alongside governmental funding. By the 1810s, plank roads of flat sawn boards were replacing corduroy roads. Macadam, layered rock in twenty-foot-wide roadbeds to provide stability and drainage, likewise improved roads. In 1823 the Boonsborough Turnpike, the first

macadamized road in the nation, was built in Maryland. The most significant use of macadam was on the Cumberland Road project, which, by 1825, had received so much funding from the federal government that it was renamed the "National Road." In 1826 work began in Kentucky on the Maysville Turnpike, the first macadamized road west of the Appalachians.

An active federal government employed new technologies to satisfy a highly mobile population, with the result that the United States had an official road-building program by the late 1820s. Still, as the far west opened and pioneers carved new roads, beginning with the Santa Fe Trail in 1822, most American roads remained what all roads had been one hundred years earlier—simple dirt roads.

ned by post roads since the late seventeenth century, and stagecoach lines had just begun to operate from Boston to Baltimore. Further inland, several military roads had been carved out of the wilderness and construction of the Great Wagon Road, which would eventually connect Philadelphia to the Georgia backcountry, had been under way for several decades. In most areas, though, roads remained mere pathways—seldom trodden, primitive, and undeveloped—winding along old Native American trails. Muddy in wet weather, suffocatingly dusty in the dry season, impassably obstructed by foliage and tree stumps all year-round, these roads rendered any significant trip a slow, difficult, dangerous, and uncertain venture.

IMPROVING THE ROADS

Following the Revolution, private companies and public institutions built a sophisticated network of improved roads that would, by 1820, connect all of the cities along the seaboard and extend deep into the western territories. Road building was limited to hand labor, picks and shovels, and black powder explosives. Although most roads were built of earth compacted atop large boulders, corduroy roads were built in marshy areas by felling trees, trimming them, and laying them side-by-side on the ground. By the 1820s, road builders were experimenting with British macadamized surfaces. These roadbeds were graded, covered with large gravel, and compacted by heavy-wheeled vehicles. Macadam roads were durable, and their archlike cross sections facilitated drainage into adjoining ditches. Where stone gravel was unavailable, builders substituted oyster shells and iron slag from furnaces. Where there was stone, builders—as early as the 1790s—also constructed small-scale stone arch bridges to ford streams and gullies. Wooden bridges, planks on timber pilings modeled after wharf construction, were not uncommon in the last two decades of the eighteenth century, but bridge building escalated in the early 1800s with the invention of the sturdy and economical wooden latticework truss. Riding these improved roads and bridges were Conestoga wagons, high-wheeled, boat-shaped wagons that could carry from four to six tons of freight, and an increasing number of coaches and carriages, particularly after 1826, when the invention of the Concord Coach, cradled by flexible shock-absorbing leather braces, took passenger comfort to new levels.

BOATS

Throughout the period, overland transport of goods cost approximately twelve times as much as water

TRAVEL, TECHNOLOGY OF Travel by foot and by horse and wagon, familiar and omnipresent means of transportation from the earliest days of settlement, still provided the dominant mode of travel in mid-eighteenth-century America. On the eastern seaboard, many of the major cities had been con-

transport. Ease and economy characterized river transport, and flatboats, large flat-ended floating boxes flowing with the current and carrying from thirty to forty tons of goods, were in use for one-way trips on the rivers early in the eighteenth century. After the Revolution keelboats, maneuverable boats with shallow keels, pointed ends, and sails and poles to move upstream, filled the Ohio and Mississippi Rivers. The two-masted barge, capable of carrying one hundred tons, appeared in 1800 and further increased carrying capacity. Upstream travel took about four times as long as downstream travel, with the attendant increase in costs, and experiments to economize upstream trips included failed attempts at using horse treadmills to run paddle wheels. The problem of upstream travel was solved by the invention of the steamboat. Invented by John Fitch in 1787, the steamboat was put into regular commercial use by Robert Fulton, whose *Clermont* made the run from New York City to Albany in thirty-two hours in 1807. Improvements over the next decade included moving the boiler up onto the deck to give the vessels a shallower draft and using high-pressure steam to increase the pulling power. Steamboats debuted on the Ohio River in 1811 and soon became the most important mode of shipping on the major waterways.

CANALS

For much of the eighteenth century, visionaries dreamed of creating waterways to facilitate internal trade. Canal building, however, was limited by the prohibitive costs of constructing canalways, locks, and towpaths and by the fact that technology that had not yet developed brick linings to prevent lock walls from leaking or movable lock gates that could withstand tons of water. After the Revolution amateur engineers, aided by British professionals, solved the technological problems, and joint-stock companies provided the necessary capital. After several small-scale efforts in the 1790s, the first large-scale canal project, the twenty-seven-mile Middlesex Canal, linked Boston and the Merrimack River in 1803. In 1817 ground was broken for the Erie Canal, which—like most of the other great canal projects of the time—was government funded. Over the next eight years, through an incredible combination of engineering skill, human labor, technological innovation, and political determination, the Hudson River was linked up with Lake Erie. Spinoff benefits from the effort included the creation of machines that snapped off trees and plucked up stumps, the development of hydraulic waterproof cement, and the on-the-job education of amateur engineers who would

go on to work on other major infrastructure projects. The financial success of the canal spurred a canal mania that swept the growing nation and confirmed many Americans' perception of the country's growing prosperity and unlimited future.

RAILROADS

The canal's day in the limelight quickly faded, however, as the railroad, the new symbol of American growth and economic success, emerged. Throughout the 1820s, governments and internal improvement societies sent architects and engineers to England for technical knowledge of locomotives and steam engine construction. Even so, when the first commercial railways were established in the 1830s, imported English locomotives provided the power. Over the course of the decade, an engine factory was set up in Philadelphia, churning out locomotives adapted to American conditions. Front-turning trucks (wheels) were added to accommodate tight curves, and more powerful engines were developed to haul up the steeper grades of American topography. Iron rails pinned to wooden ties replaced the English system of rails placed atop stone foundations or wooden pilings in an effort to reduce the effects of frost heaving in the colder American climate. Technological and managerial expertise would greatly improve the railways in the years to come, and the railroad network would offer the promise of fully integrating the agricultural and commercial areas of the young nation and serve as a great engine of expansion and development.

TRAVEL GUIDES AND ACCOUNTS American travel writing as it is understood in twenty-first century terms, as a genre produced by writers who travel in order to write for a market in which travel writing sells, emerged in the 1820s and 1830s. Magazine and book publishers began to offer travel sketches that characteristically featured a literary observer who fashioned accounts of touristic journeys within the United States as well as Europe for the benefit of a bourgeois reading public. As travel became more accessible over the course of the nineteenth century, literary travel writing about Europe, Asia, Africa, South America, and the U.S. interior continued to gain popularity and attracted contributions from some of the major literary figures of the nineteenth century.

Travel writing in this modern sense depended not only on a ready marketplace, but also on the geopolitical stability and technological advances that made leisure travel possible. During the Revolutionary War (1775–1783), diplomatic business brought well-known Americans like Thomas Jefferson, Benjamin Franklin, and the Adams family to Europe. Massachusetts native Elkanah Watson, to whom Foster R. Dulles refers, in *Americans Abroad* (1964), as “the first [American] tourist,” parlayed an errand on behalf of the Continental Congress to Franklin in Paris into more extensive travels and the book *A Tour in Holland* (1790). However, during the Napoleonic Wars (1792–1815) European travel became difficult, and American accounts of Europe became scarce.

During that period, the combination of patriotism, territorial expansion, and the advent of the steamboat contributed to a proliferation of travel accounts of the American interior. The earliest, written in the wake of the French and Indian War (1755–1763), offered topographical descriptions emerging from surveyors’ expeditions and diaries of military campaigns. In the decade following the Revolutionary War, three major travel accounts were published that continue to be read widely today: J. Hector St. John de Crèvecoeur’s *Letters from an American Farmer* (1782), William Bartram’s *Travels* (1791), and Jefferson’s *Notes on the State of Virginia* (1785). These works combined the scientific impulse of the eighteenth century with the equally strong imperative of documenting the natural wonders of America for a curious and often skeptical European audience. These works are merely the most enduring examples of a broader craze of describing America for the benefit of Americans, foreigners, and potential settlers. Other

examples include works by John Filson, Gilbert Imlay, and Jedidiah Morse.

The dual impact of the Louisiana Purchase (1803) and Robert Fulton’s introduction of the steamboat (1807) prompted the next phase of travel within, and thus travel writing about, the North American continent. Lewis and Clark’s transcontinental expedition (1804–1806) and Zebulon Pike’s exploration of the trans-Mississippi West (1805–1807) enacted on a grander scale the surveying trips of the mid-eighteenth century, with equally grand textual results. However, even as Americans were being treated to accounts of heroic confrontations with the difficulties of western travel, steam propulsion made travel on the Ohio and Missouri Rivers, as well as down and, crucially, *up* the Mississippi, safer and less arduous. During this period accounts by domestic and foreign travelers proliferated, most notably Timothy Flint’s *Recollections of the Last Ten Years* (1826), James Fenimore Cooper’s *Notions of the Americans* (1828), and Washington Irving’s *Tour on the Prairies* (1835).

Following the Napoleonic Wars, further technological developments reduced the length of time required for Americans to make the transatlantic crossing. As a result, two competing versions of the so-called Grand Tour emerged in the 1820s. Not only should an educated person of means see the museums, churches, and ruins of Europe, but he or she should also embark on what Gideon Miner Davison in 1825 termed “The Fashionable Tour” of New England and the eastern Great Lakes. Davison’s guides, as well as works by Timothy Dwight, instructed readers on the picturesque satisfactions of Niagara Falls, Montreal, and Lake George in New York’s Adirondack Mountains, destinations made more accessible by the completion of the Erie Canal in 1825.

A final strain of American travel literature is less particularly American than either the narratives of the provincial visiting Europe or the traveler confronting the mysteries of the western wilderness. However, the accounts published by sea captains, naval commanders, and common sailors of their adventures and sufferings on voyages all over the world comprise a significant proportion of U.S. travel writing. John Ledyard sailed with the British explorer Captain James Cook on his third, ill-fated voyage and published an account of his experiences in *A Journal of Captain Cook’s Last Voyage to the Pacific Ocean and in Quest of a North-West Passage* (1783). Other important American accounts of sea travel include works by David Porter and Amasa Delano.

TREATY OF PARIS The agreement in 1783 between the United States and Great Britain known as the Treaty of Paris formally ended the struggle for American independence. The British “acknowledged” their former colonial subjects as “free, sovereign and independent.” Both sides opted for political reconciliation and commercial cooperation rather than continuous hostilities and competition.

In October 1781 Continental troops forced General Charles Cornwallis to surrender his troops in the wake of the Battle of Yorktown. The British decline spurred by this defeat was exacerbated by other defeats to the French and the Spanish on other continents and compounded by accumulating debt. Subsequently, the political situation changed. In March 1782 King George III installed a new cabinet. Its leaders secretly negotiated with senior American diplomats authorized by the Continental Congress. Five men were commissioned. John Adams, John Jay, and Benjamin Franklin (who, being pro-French, initially objected to the talks) conducted the bargaining; Henry Laurens was captured and held by the British; and Thomas Jefferson remained in America until after the deal was sealed. Jefferson was more inclined than the others toward the French perspective, so his absence facilitated an Anglo-American agreement.

On 30 November 1782 the peace treaty was initiated in Paris. It ended the Revolutionary War by February 1783. On 15 April 1783 the preliminary Articles of Peace were ratified by the United States. On 6 August 1783 Great Britain did the same. On 3 September 1783 the Definitive Treaty of Paris (merely adding procedural details) was signed by American and British representatives. On 14 January 1784 this

treaty was ratified by the United States and went into formal effect. On 9 April 1784 Britain followed suit.

American and British diplomats sidetracked the ambitious French, although the Americans had explicitly promised in 1778 not to sign a separate treaty. Britain had an interest in making concessions to the United States; doing so positioned the Americans as a potential ally, which aroused the ire of the French. The separate British-U.S. arrangement minimized gains for the French and their Spanish allies. The British exchanged with them territories in the Caribbean, West Africa, and the Mediterranean but maintained their fortress of Gibraltar. The Anglo-Saxon powers totally overlooked the interests of indigenous and racial populations.

As a result of the Treaty of Paris, the British ceded—without compensation—vast territories they possessed to the United States, whose boundaries were set in the Great Lakes and along the Mississippi River and thirty-one degrees north latitude, although New Orleans was excluded. This transfer of sovereignty doubled the size of the original colonies, primarily at the expense of native tribes. The terms, however, compared poorly with American aspirations upon independence in 1776 and what the Continental Congress had stipulated in 1779. Canada remained British. The Mississippi River itself and its navigation did not become exclusively American. Spain regained Florida. The French continued to possess vast territories beyond the Mississippi until the Louisiana Purchase of 1803. American diplomats secured much, but their ability to maneuver amid the conflict of their interests with those of the British, French, and Spanish was limited.

Both American and British sailors were authorized to navigate the Mississippi River. U.S. citizens retained their previous fishing rights to rich British waters such as the Grand Banks and all other banks of Newfoundland as well as the Gulf of St. Lawrence. Americans were also permitted to dry and cure their catch on unsettled beaches in Labrador and Nova Scotia.

The United States pledged that its Congress would “earnestly recommend” to state and local authorities the restoration of property confiscated from British Loyalists during the war, prohibit future expropriation, release the Loyalists from confinement, and halt their persecution. These commitments had a weak legal basis and were rarely observed. Both sides promised that creditors would recover their prewar debts, but implementation was imperfect.

TRENTON, BATTLE OF By December 1776 the Continental Army, reeling from a series of defeats that resulted in the loss of New York and New Jersey, seemed to be in the process of dissolution. As Congress retreated from Philadelphia to the relative safety of Baltimore and the army faced the expiration of the enlistments of all but fourteen hundred men, the future appeared bleak indeed. Defeat had severely impacted Patriot morale and even George Washington privately admitted that the end might be near.

Washington quickly recovered from such pessimism and displayed the determination and resourcefulness that were such prominent marks of his character. He knew that the British garrisons at Trenton and Princeton were isolated and exposed to attack. The garrison of fourteen hundred Hessians at Trenton, under the command of Colonel Johann Rall, was of particular interest. Homesick and exhausted from weeks of dealing with hostile elements in “pacified” New Jersey, the Hessians made an inviting target.

The crossing of the Delaware River, on Christmas evening 1776, has rightfully assumed a prominent position in American iconography. If the crossing did not match the image of indomitable courage

in the famous, and largely inaccurate, Emmanuel Leutze painting of 1851, it was indeed heroic. The unsung heroes were Colonel John Glover and his Marblehead mariners, who managed the crossing on a raw and bitter night in which rain, sleet, snow, wind, and floating ice made the crossing difficult and dangerous. Though Washington deplored the delays caused by the weather, the bitter night actually assisted his designs, as weather conditions, rather than the alcohol of legend, were largely responsible for the achievement of surprise. The fighting lasted only an hour and a half and, at the cost of less than ten men killed and wounded; the Americans killed or captured over nine hundred Hessians, including Colonel Rall, who was killed.

Trenton was Washington’s most striking victory. Though other campaigns possessed more strategic significance, the victory at Trenton, and the less conclusive fighting at Princeton a week later, rejuvenated Patriot morale and carried the cause through the difficult winter of 1776–1777.

TWO PENNY ACT *See* **Parsons’ Cause.**

UNITARIANISM AND UNIVERSALISM In 1961 the Unitarians and Universalists merged to form a single denomination, recognizing that their views on religious, social, and political matters had become virtually identical. This was not the case in the era of the American Revolution, when each had its American beginnings. The idea of a universal salvation had occurred to one or another Christian in the Old World as well as the new, and had been advanced on the eve of the Revolution by the liberal Congregationalist Charles Chauncy (1705–1787). But the organized Universalists were originally led by itinerant revivalists, and drew their members from the Baptists and Congregationalists, or from the unchurched. By contrast, New England Unitarianism emerged quietly and gracefully among the wealthiest and best-educated Bostonians as a further extension of Chauncy’s Arminian Congregationalism (Arminianism, named for a sixteenth-century Dutch theologian, Jacobus Arminius, may be briefly described as free-will Calvinism).

Even in the beginning, however, Unitarians and Universalists had important things in common. Most of their churches arose and persisted in New England, where throughout their formative years—approximately the 1770s to the 1820s—the Congregational Church continued its regional dominance in

overall wealth and numbers. It did this in spite of disestablishment (1818 in Connecticut, 1832 in Massachusetts) and the vigorous growth of competing denominations. Those Congregationalists who had not themselves become Unitarians vigorously opposed the central idea that the Creator was one and indivisible and not a Trinity—Three Persons of one Divine Substance. Similarly the Congregationalists joined with other Christian denominations in being scandalized by the Universalists’ defining principle: that the Atonement of Jesus extended to all souls. Critics argued that this was an open invitation to sin; Universalists saw it as divine encouragement to piety and virtue.

The first Unitarian congregation had previously been Anglican: the venerable King’s Chapel in Boston. In 1787 it ordained the Reverend James Freeman, an avowed Unitarian, as minister. Unitarian principles quietly spread until 1805, when Harvard appointed Henry Ware (1764–1845) Hollis Professor of Divinity. After several further similar appointments, Harvard’s faculty was firmly Unitarian, and a number of Congregational churches had proclaimed themselves Unitarian as well. Most famous among these was the Federal Street Church in Boston, whose minister was William Ellery Channing (1780–1842). Channing preached an inspiring and perhaps intoxicating message of the perfectibility of human nature.

His sermon "Unitarian Christianity" (1819) is perhaps the defining text of the whole movement.

The Unitarian culture of eastern Massachusetts encouraged literature, science, and the fine arts, becoming the basis of a genuine New England Renaissance. It also prepared the ground for its precocious, if somewhat rebellious, spiritual child, the transcendentalism of the editor and essayist Margaret Fuller, the clergymen George Ripley and Theodore Parker, and the writer and philosopher Ralph Waldo Emerson. At their most radical, as in Emerson's case, the transcendentalists denied all traditional religious dogma, including the authority of the Bible, and exalted nature as the direct manifestation of the divine. Compared to the transcendentalists, however, the first generation of Unitarians remained theologically conservative in many respects. They avowed the holy inspiration and truth of Christian Scripture, the existence of miracles, and the immortality of the soul. Unitarians were not indifferent to the world around them but chiefly aimed to improve it by cultivating the individual. In "Likeness to God," Channing wrote of Christianity:

This whole religion expresses an infinite concern of God for the human soul, and teaches that he deems no methods too expensive for its recovery and exaltation. Christianity, with one voice, calls me to turn my regards and care to the spirit within me, as of more worth than the whole outward world. It calls us to "be perfect as our Father in heaven is perfect"; and everywhere, in the sublimity of its precepts, it implies and recognizes the sublime capacities of the being to whom they are addressed. (*Selected Writings*, p. 149)

The first important Universalist minister in Revolutionary North America was John Murray (1741–1815), who arrived in New Jersey in 1770. Raised as an English Calvinist, Murray joined the London church of the evangelical Anglican George Whitefield and subsequently converted to the Universalism of the Methodist James Relly. An itinerant for several years in America, Murray accepted the invitation of a small congregation in the seaport town of Gloucester, Massachusetts, in 1779, where his ministry attracted considerable interest and more than a little hostility. He also married a devout widow, Judith Sargent Murray (1751–1820), who proved to be a gifted and prolific author. Another founding father of Universalism was Elhanan Winchester (1751–1797), born in Brookline, Massachusetts, widely traveled as a young Baptist itinerant, and founder of the Society of Universal Baptists in Philadelphia in 1781. Benjamin Rush, a celebrated physician and signer of the Declaration of Independence, joined that

society while maintaining his membership in the Presbyterian Church.

Hosea Ballou (1771–1852) established himself as Universalism's leading theologian with the publication in 1804 of his *Treatise on the Atonement*. Ballou was born and raised in rural New Hampshire, the eleventh child of a theologically severe, but personally warm, Baptist minister. His conversion to Universalism came when the movement had grown sufficiently to have some organization; he was ordained a minister at the Universalist General Convention of 1794. After preaching successfully in several towns, he settled permanently as pastor of the School Street Church in Boston in 1816. For the next quarter of a century he labored but a few blocks from William Ellery Channing's Federal Street Church, but Channing seems never to have sought his fellowship. Ballou's *Treatise* combined the optimistic rationalism of the Enlightenment with a determinism reminiscent of Jonathan Edwards. God had ordained that Christ should work the salvation of all humankind. The individual soul had but little choice: one could assent to divine grace either now or later. Death would speed the sinner to Heaven as swiftly as the saint. Many of the earlier Universalists had believed that unrepentant sinners would experience some discipline or punishment between death and Heaven, a notion that never entirely disappeared. Indeed, it regained currency after 1830.

Widely different in their origins, and appealing mostly to quite different segments of American society, the Unitarians and the Universalists both exhibited the idealism and optimism of the newly free and democratic United States. If the Unitarians were somewhat condescending and aristocratic in manner, they lived according to a high code of ethical behavior and greatly enriched the national culture. The Universalists, the foremost spiritual equalitarians, made democracy eternal.

VACATIONS AND RESORTS In the late eighteenth and early nineteenth centuries, few Americans actually “vacationed” in the modern sense of the word. Only the wealthy enjoyed leisure trips away from home. Most extended visits were to family and friends, but those did not offer the same sort of excitement and adventure nor confer as much social status as summer trips to fashionable resorts. Mountain and beach resorts, difficult to reach in this era and therefore expensive, attracted elite families from across the country. For weeks and even months at a time, the upper classes gathered at these exclusive spots for socializing and recreation. Though everyone had his or her own favorite, Saratoga Springs in New York, the Virginia Springs in the Blue Ridge Mountains, and the seashores of Newport, Rhode Island, and Cape May, New Jersey, were especially popular.

From the mid-1700s through the 1800s, the search for health combined with the search for pleasure led hundreds and eventually thousands of elite men and women over the mountains or to the seashores to resorts that offered healthful and entertaining escapes from the heat, diseases, and boredom of plantations, farms, and cities. While many men and women visited these areas seeking cures, most traveled to them to enjoy the company of people like themselves, maintain their good health, and participate in an array of leisure and social activities. At the Virginia Springs and Saratoga Springs, visitors, even those who were not sick, daily drank and bathed in mineral waters that supposedly cured or prevented illness. Ocean bathing served the same purpose at Newport and Cape May. But always more alluring were the parties, balls, excursions, picnics, card games, sporting events, and, especially, the gossiping and courting that took place in the dining rooms or ballrooms, on the lawns, or at the bathhouses. To see and be seen, to watch and participate in the scenes of fashionable display was often the real draw of these resorts. A great deal of social status and reputation could be won (or lost) during a summer’s stay.

While at these leisure places, elite Americans (as well as their servants) came together from across the nation and learned more about each other. They shared political and business information as well as

social gossip. Politicians solidified support; planters and merchants discussed prices and made deals; and society matrons guarded the behavior of their class. Close ties of friendship also formed, especially among women, and were reaffirmed whenever visitors met again. Indeed, many of the connections begun at resorts continued once the travelers returned to their homes. Because of their presumed exclusivity, the fashionable resorts, especially Saratoga Springs in the North and the Virginia Springs in the South, also became the premier places for finding a spouse, at times joining couples from different regions of the country. These places of resort did unite their visitors, creating cross-country ties and fostering a sense of national identity at crucial times of nation building. But, increasingly over time, they could also divide their guests, reinforcing sectionalism and regional identities. At the Virginia Springs, for example, southerners established the social rules for fashion and behavior, threw most of the parties, and, in general, held sway. They readily accepted northerners into their social circles, at least until 1830 when sectional tensions intensified, but they never permitted them to set or enforce the rules of spa society. Though fashionable mountain and seaside resorts helped create a national elite by bringing wealthy and influential Americans together regularly in these places of leisure and beauty and by encouraging communal ties, the resorts would prove unable to hold this elite together.

VALLEY FORGE Valley Forge, Pennsylvania, located on the west bank of the Schuylkill River about twenty miles northwest of Philadelphia, served as the Continental army’s main encampment from 19 December 1777 to 19 June 1778. Although Valley Forge has become a national symbol of patriotic fortitude and perseverance in the face of adversity,

George Washington—while not excluding “altogether the idea of patriotism”—sought during this six-month period to make his army increasingly professional in attitude and abilities as the only way that it could endure in “a long and bloody War.”

In determining the disposition of the Continental army for the winter of 1777–1778, Washington faced a choice of difficulties. Most of his general officers recommended establishing winter quarters at some distance from British-occupied Philadelphia—either in the vicinity of Lancaster and Reading, Pennsylvania, or at Wilmington, Delaware—so that the troops could be rested, reequipped, and trained for the next campaign. Pennsylvania political leaders and the Continental Congress, however, pressed Washington to position his army much closer to the city in order to protect the local populace from British depredations. Ever sensitive to public opinion and needs, Washington decided in mid-December 1777 to encamp at Valley Forge. He did so because it was far enough from Philadelphia to guard against a surprise attack and near enough to cover much of Pennsylvania, while also supporting Continental and militia patrols operating against British foragers and partisans in the intervening no-man’s-land.

Washington was aware that his decision to give priority to civilian concerns imposed additional hardships on his officers and men. Instead of being quartered in substantial buildings, they lived in tents during their first weeks at Valley Forge while constructing primitive log huts that provided basic protection against winter weather but few creature comforts. The troops also were more vulnerable to the bad effects of the ongoing supply crisis than had they been dispersed in more remote areas. The near collapse of the commissary department in the wake of an ill-conceived congressional reform effort and the breakdown of the transportation system due to bad weather and worse management brought the army to the brink of starvation for several days in December and again in February. Lack of shoes and clothing further reduced the army’s combat readiness. On 23 December 1777 Washington reported 2,898 of about 11,000 rank and file in camp as unfit to do duty for that reason. A month later the number was nearly four thousand.

Washington acted vigorously to relieve immediate supply crises by applying to civil authorities at all levels for assistance and dispatching long-range foraging parties. He was equally active in seeking more far-reaching remedies. When a congressional investigation committee arrived at camp in late January, Washington was ready with a comprehensive

set of recommendations designed to put the army on a firmer professional footing, including the drafting of soldiers, half-pay pensions and honorary rewards for officers, regimental reorganization, and various measures to strengthen the quartermaster, commissary, clothier, and other administrative departments. Congress adopted many of those ideas in some form during the winter and spring, and its appointments of Nathanael Greene (1742–1786) as quartermaster general on 2 March 1778 and Jeremiah Wadsworth (1743–1804) as commissary general of purchases on 9 April 1778 revitalized those departments.

As the Continental army prepared at Valley Forge for the new spring campaign, it became significantly more adept in battlefield maneuver under the guidance of a recently arrived Prussian officer, Friedrich Wilhelm von Steuben (1730–1794). He devised a simple uniform system of drill particularly suited to American circumstances and trained the main army in it. Steuben also began introducing European administrative procedures and helped to instill stronger discipline and professional pride in the lower ranks.

The progress that the Continental army continued to make during the next two campaigns in the science of military administration was halted in the winter of 1779–1780 by a severe national financial crisis and the worst weather in recent memory. Encamped once again among log huts at Jockey Hollow near Morristown, New Jersey, about thirty miles from the British army in New York City, the troops endured at least twenty-three snowstorms over four months, including an early January blizzard that left four-to-six-foot drifts. Critical shortages of clothing and food again brought the army to the edge of dissolution, which Washington avoided by rationing shoes and assigning local magistrates quotas for cattle and grain.

In the long war of attrition that the American revolutionaries fought, Valley Forge and Jockey Hollow were notable low points where materiel and morale ran perilously thin. Washington’s solution was to stabilize the army by introducing professional methods and standards while assuring civilians of the army’s willingness to sacrifice for their protection. That balancing act worked well enough to keep an effective military force in the field until the war could be won with French help.

VERMONT Upon achieving statehood in 1791, Vermont became the first addition to the original thirteen states. Objections from New York prevented Vermont's admission to the Union until then. Vermont originated in resistance to the authority of colonial New York. By the time of its admission to the Union, Vermont was riven by the deep ideological and political divisions that characterized it through the 1820s.

In the mid-eighteenth century, the colonial governments of New Hampshire and New York issued competing land grants to the territory that became Vermont. The French and Indian War (1754–1763) eliminated the western Abenaki, an Algonquian-speaking group, as an obstacle to white settlement. Despite a ruling by the Privy Council in London in 1764 that appeared to invalidate New Hampshire's grants, migrants acting on them arrived in increasing numbers during the 1760s. Resistance to New York's jurisdiction was strongest in western Vermont, which was largely settled by farmers from western New England and the Hudson River valley. These settlers were a mix of devout New Lights, veterans of earlier Hudson Valley "rent wars," and deistic political radicals such as Ethan Allen and Matthew Lyon. The southwestern town of Bennington was the base for the informal militia known as the Green Mountain Boys, which harassed New York officials and grant holders.

Increasing cooperation between Vermont's eastern and western areas made possible Vermont's declaration of independence in 1777. Because Congress rejected Vermont's request for admission as a state, it spent the war delicately situated between the United States and British Canada. Meanwhile, Vermont adopted a radical constitution in 1777 that, among other provisions, abolished slavery, making Vermont the first political entity in North America to do so. At the time, African Americans constituted less than 1 percent of Vermont's population.

Vermont remained reluctantly independent until 1791, a fragile experiment in republican government operated by common men. The most important political figure in the state's early history was Thomas Chittenden, a farmer with limited education who advocated Jeffersonian principles. Chittenden was governor, with the exception of one year, from 1778 to 1797. Vermont's survival was threatened in the 1780s, on the one hand by mob actions of discontented farmers, and on the other by arriving gentry harboring contempt for democracy. Vermont's survival was not fully assured until New York dropped its objections to Vermont's admission in return for a payment of thirty thousand dollars.

Vermont's population grew faster than any other state's in the 1790s, increasing from 85,341 in 1790 to 154,465 in 1800. Most migrants came from New England, with a scattering of Irish and French Canadians in its northern reaches. By then Vermont state politics were bitterly divided, with Federalists achieving a tenuous supremacy after 1800. Towns and communities across the state were similarly the scenes of clashes between Jeffersonian and Federalist principles and parties. Dissension between the two worldviews, which played out in such areas of life as theology, educational policy, and commercial practices, deepened and took on new dimensions with the opening of the Champlain Canal in 1823. The canal dramatically altered Vermont's economy, redirecting it to the south and demanding greater market participation. This "market revolution" ended the early phases of Vermont's history, with the state's population rising to 280,652 by 1830.

VESEY REBELLION The plot organized by Denmark Vesey, a free black carpenter, in Charleston, South Carolina, in 1822 was perhaps the largest slave conspiracy in North American history. Although brought into the city in 1783 as a slave of Captain Joseph Vesey, Telemaque, as he was then known, purchased his freedom in December 1799 with lottery winnings. For the next twenty-two years, Vesey earned his living as a craftsman. According to white authorities, he was “distinguished for [his] great strength and activity”; the black community “always looked up to [him] with awe and respect.” His last (and probably third) wife, Susan Vesey, was born a slave but became free prior to his death. His first wife, Beck, remained a slave, as did Vesey’s sons, Polydore, Robert, and Sandy, the last of whom was the only one of his children to be implicated in his 1822 conspiracy.

Around 1818 Vesey joined the city’s new African Methodist Episcopal congregation. The African Church, as both whites and blacks called it, quickly became the center of Charleston’s enslaved community. Sandy Vesey also joined, as did four of Vesey’s closest friends, Peter Poyas, a literate and highly skilled ship carpenter; Monday Gell, an African-born Ibo who labored as a harness maker; Rolla Bennett, the manservant of Governor Thomas Bennett; and “Gullah” Jack Pritchard, an East African priest purchased in Zinguebar in 1806. The temporary closure of the church by city authorities in June 1818, and the arrest of 140 congregants, one of them presumably Vesey himself, only reinforced the determination of black Carolinians to maintain a place of independent worship and established the motivation for his conspiracy.

At the age of fifty-one, Vesey resolved to orchestrate a rebellion followed by a mass exodus from Charleston to Haiti. President Jean-Pierre Boyer had recently encouraged black Americans to bring their skills and capital to his beleaguered republic. Vesey did not intend to tarry in Charleston long enough for white military power to present an effective counterassault. “As soon as they could get the money from the Banks, and the goods from the stores,” Rolla Bennett insisted, “they should hoist sail for Saint Doming[ue] and live as free men. For all of his

acculturation into Euro-American society, Vesey, as a native of St. Thomas, remained a man of the black Atlantic.

Vesey planned the escape for nearly four years. Although there are no reliable figures for the number of recruits, Charleston alone was home to 12,652 slaves. Pritchard, probably with some exaggeration, boasted that he had 6,600 recruits on the plantations across the Cooper and Ashley Rivers. The plan called for Vesey’s followers to rise at midnight on Sunday, 14 July—Bastille Day—slay their masters, and sail for Haiti and freedom. As one southern editor later conceded, “the plot seems to have been well devised, and its operation was extensive.”

Those recruited into the plot during the winter of 1822 were directed to arm themselves from their masters’ closets. Vesey was also aware that the Charleston Neck militia company stored their three hundred muskets and bayonets in the back room of Benjamin Hammet’s King Street store, and that Hammet’s slave Bacchus had a key. But as few slaves had any experience with guns, Vesey encouraged his followers to arm themselves with swords or long daggers, which in any case would make for quieter work as the city bells tolled midnight. Vesey also employed several enslaved blacksmiths to forge “pike heads and bayonets with sockets, to be fixed at the end of long poles.”

Considerably easier than stockpiling weapons was the recruitment of willing young men. In addition to their fellow craftsmen, Vesey and his lieutenants recruited out of the African Church. Vesey knew each of the church members well—he knew whom to trust and whom to avoid. As former Charleston slave Archibald Grimké later wrote, Vesey’s nightly classes provided him “with a singularly safe medium for conducting his underground agitation.”

The plot unraveled in June 1822 when two slaves revealed the plan to their owners. Mayor James Hamilton called up the city militia and convened a special court to try the captured insurgents. Vesey was captured at the home of his first wife on June 21 and hanged on the morning of 2 July, together with Rolla, Poyas, and three other rebels. According to Hamilton, the six men collectively “met their fate with the heroic fortitude of Martyrs.” In all, thirty-five slaves were executed. Forty-two others, including Sandy Vesey, were sold outside the United States; some, if not all, became slaves in Spanish Cuba. Robert Vesey lived to rebuild the African Church in the fall of 1865.

In the aftermath of the conspiracy, Charleston authorities demolished the African Church. The state assembly subsequently passed laws prohibiting the entry of free blacks into the state, and city officials enforced ordinances against teaching African Americans to read. The City Council also voted to create a permanent force of 150 guardsmen to patrol the streets around the clock at an annual cost of \$24,000. To deal with the problem of black mariners bringing information about events around the Atlantic into the state's ports, in December 1822 the legislature passed the Negro Seamen Act, which placed a quarantine on any vessel from another "state or foreign port, having on board any free negroes or persons of color." Although U.S. Circuit Court Judge William Johnson struck the law down as unconstitutional, a defiant assembly renewed the act in late 1823. Many of those who nullified federal law in 1832—including Governor James Hamilton, who resigned his office in 1833 to command troops in defense of his state's right to resist national tariffs—were veterans of the tribunals that had tried Vesey and his men a decade before.

VIGILANTES *See* **Regulators.**

VIOLENCE In the years following the American Revolution, society in regions other than the frontier became more violent as a result of several factors. One underlying reason for increasing violence was the increasing overall population of the new nation, from 3 million in 1790 to 31 million in 1860; major

population growth especially affected cities, such as New York, which grew from 40,000 inhabitants in 1790 to nearly 1 million by 1860. An increasing disparity between the rich and the poor also contributed to a spike in violence, as did ethnic and religious tensions among foreigners, immigrants (especially Irish Roman Catholics), and more established Protestant groups. Racial tensions were on the rise, as whites feared black competition for jobs, interracial marriage, and the specter of social equality, with blacks retaliating. Another factor was the decline of a paternalistic system of labor; masters now lived with or in close proximity to servants, laborers, and apprentices, thereby weakening workers' sense of their place in an organic social order. As a consequence of changes in the social order, separate upper-, middle-, and working-class cultures arose with separate notions of morality, along with an increasing individualism that gave ordinary folk confidence in their own judgment and self-worth. Thus government's role was altered from an active guardian of the common good, achieved through state regulation to redress injustice and solve economic problems, to a supposedly impartial arbiter that merely existed to protect property and preserve order.

TAXES AND AUTONOMY

The three most significant episodes of American violence in the late eighteenth century reflected the old colonial notion of corporate violence, which had prevailed before and leading up to the Revolution. In Shays's Rebellion (1787) in Massachusetts, and the Whiskey Rebellion (1794) and Fries's Rebellion (1799) in Pennsylvania, respectable members of aggrieved communities banded together, invoked the principles of the Revolution concerning self-taxation and local autonomy, and staged carefully limited violence against outsiders who threatened to foreclose on their estates or otherwise punish them for non-payment of taxes. The community members involved in these actions considered themselves "the people" assembled against unjust grievances; only those who suppressed them called them rebels. A small number of men were killed or punished severely as a result of these cases of tax resistance.

ETHNIC AND RACIAL VIOLENCE

In the early nineteenth century, cities were the most frequent sites of large-scale violence, as novels such as Charles Brockden Brown's *Arthur Mervyn* (1799–1800) and Herman Melville's *Pierre* (1852) attest. There men of all classes representing different ethnic groups lived side-by-side and competed for jobs, po-

litical power, and prestige while seeking to demonstrate their masculinity and patriotism in a crowded arena. Some riots were limited to the working class, as when American sailors brawled with Spanish sailors (Philadelphia, 1804) and French sailors (Philadelphia, 1806; Charleston, 1811; Savannah, 1811; New York, 1812; Norfolk, 1813; and New Orleans, 1817—all but the Philadelphia fights leading to deaths). Rioting against Roman Catholic foreigners and immigrants, and against blacks, occurred most frequently; mobs were usually composed of all classes, led by “gentlemen of property and standing” who went unpunished. In 1815 whites attacked blacks opening a new house of worship in Philadelphia, burning the building, and in 1819 they attacked blacks daring to celebrate Independence Day in New York City. White crowds chased blacks en masse out of the cities of Providence, Rhode Island, in 1824, and Cincinnati, Ohio, in 1829.

The worst of these ethnic and racial riots, however, occurred in the 1830s, after large numbers of Irish Catholics arrived in the cities and abolitionists began to push for immediate emancipation of slaves. Crowds opposed to Irish immigrants burned the Ursuline Convent in Charlestown, Massachusetts (1834), believing the nuns there kidnapped Protestant girls and threatened to kill them if they did not become Catholics. That same year other crowds devastated New York’s and Philadelphia’s black communities; burned Philadelphia’s Pennsylvania Hall, built by abolitionists to hold interracial meetings (1838); and murdered the abolitionist newspaper publisher Elijah Lovejoy in Alton, Illinois (1839). The deadliest ethnic riots occurred in the 1850s, when the Democratic Party, which included many Roman Catholics, clashed with the nativist Know-Nothings, who opposed all immigration, during several elections. The worst occurred in Baltimore in 1856, leaving from 8 to 17 dead and from 64 to 150 wounded. Another major ethnic riot, however, was anti-British; in New York City in 1849, partisans of the American actor Edwin Forrest tore down the Astor Place Opera House where the British actor William Macready was performing; 22 people died and at least 48 were wounded. Baltimore was also the scene of the bloodiest riot during the economic depression of the 1830s: the houses of the mayor and several directors of the Bank of Maryland were destroyed, and order was restored only when volunteers fired into the crowd.

Unlike the spikes and troughs of urban violence and violence between whites, the violence associated with slavery in the early Republic was relatively constant. Violence was integral to the slave system,

from the usual practice of whipping disobedient slaves to executing rebels and runaways in frequently horrific ways. Whites on slave patrol policed the South; federal marshals pursued runaways into free states, where they sometimes met with violent resistance from blacks, as in Boston (1819), York, Pennsylvania (1825), and Philadelphia (1835), and, on at least one occasion, death, as in Christiana, Pennsylvania (1851). Slave rebellions in the United States were rare; in the larger West Indies islands and South America, by contrast, the smaller white population and the availability of large, unsettled areas facilitated escape by slaves who formed autonomous Maroon communities. The only rebellions involving large numbers of blacks in the United States were Gabriel’s Rebellion (1800) and Nat Turner’s Rebellion (1831), both in Virginia, and the Vesey Rebellion (1822) in Charleston, South Carolina. Both Gabriel and Denmark Vesey were betrayed by conspiracy; only Turner’s rebellion resulted in white deaths. White violence against blacks was punished on rare occasions when whites openly and outrageously offended communal standards for the treatment of slaves or free blacks.

INDIAN POLICY

The rules of civilized warfare that the United States, France, and Britain generally practiced toward one another were suspended in dealings with Indians. By the American Revolution, Indians had generally been defined collectively as a distinct (red) race that was temperamentally uncivilized and hostile. The massacre of peaceful Christian Indians at Gnadenhutten in 1782 in present-day Ohio by Revolutionary militia was a taste of the forthcoming century. Even those who wished to protect the Indians, such as Thomas Jefferson, given their belief that frontier expansion was inevitable and government’s role limited, could only envision their forcible removal to land too undesirable and distant for whites to covet.

DOMESTIC VIOLENCE

In the antebellum period states and municipalities instituted reforms regarding domestic violence. Influenced by Victorian notions that women were the proper guardians of the home and possessed a nature morally superior to men, by 1850 nineteen states allowed divorce on grounds of cruelty. The intertwined temperance and women’s movements were crucial in calling attention to the way drunken husbands abused wives and children. New York was the first city to build an institution to protect abused children in 1825, and by the 1850s most states had

done so. But in general beating was considered a masculine prerogative to correct unruly wives and children, and prosecutions were successful only when women's lives or physical well-being were threatened. In schools, too, physical punishment of students was reported in three-quarters of early-nineteenth-century autobiographies.

PUNISHMENT OF CRIMINALS

Physical violence in the punishment of criminals decreased in the early Republic, although arguably at the expense of mental torment. Extended periods of imprisonment in penitentiaries and reformatories to induce social conformity rather than whipping or public humiliation became the standard punishments for noncapital crimes. The Eastern State Penitentiary, founded in Philadelphia, which substituted silent labor in solitary confinement, and New York's prison at Auburn, where convicts worked in closely supervised teams, were pioneering institutions. Public execution of criminals declined, with the death penalty carried out more frequently behind prison walls: authorities found that rather than serving as warnings against vice, the open-air spectacles encouraged merriment, riot, and further crime.

A VIOLENT SOCIETY?

Society celebrated violence in other ways. Upper-class enemies, especially but not exclusively in the South, fought duels if they believed their honor was insulted. Although in most cases seconds worked out an amicable accord, the duel between Aaron Burr and Alexander Hamilton in 1804 and the confrontation between James Stark and Philip Minis in Savannah in 1832, which resulted in Stark's death, were only two of hundreds of incidents that ended fatally. Unlike men in Europe, much of the free male population in the United States owned guns and belonged to voluntary military societies once the required colonial militia system faded. Masculinity was demonstrated through active participation in homosocial associations such as saloons, fire companies, political parties, and the Masons and other fraternal orders. The outer limit of these associations were filibustering expeditions where men organized, successfully in some instances (Florida, 1819; Texas, 1836; Nicaragua, 1855) to take over territories in Latin America, for which they were cheered rather than punished. Although illegal and opposed by reformers and genteel members of the elite, bare-knuckles prizefighting, along with cock- and dog-fighting and bear-baiting, remained popular working-class activities. Unlike the regulated prizefights of the late nineteenth

century instituted by a progressive elite seeking to preserve society's masculine, aggressive qualities, those before the Civil War had few rules and no time limits, and went on until losers were dead, unconscious, or had lost an eye or an ear.

Was the early Republic a violent society? In 1831 Alexis de Tocqueville, the French writer and observer of American ways, reported that he could travel through large stretches of America between the Appalachians and the Mississippi River in perfect safety. Nevertheless, in cities and families, on plantations and in schools, in popular culture and the treatment of prisoners and Native Americans, violence permeated American society.

VIRGINIA In 1750 the Virginia colony had an estimated population of 230,000. Enslaved black people made up more than 40 percent of this number. Most of Virginia's white population growth had come from British immigration. In the colony's earliest days, as many as three of every four new colonists were indentured servants hoping to work their way into a better life.

John Rolfe's experiment with tobacco in 1612 had proven to be a defining moment in the economic history of Virginia. Thereafter, new settlers came to Virginia expecting to prosper by growing tobacco as a cash crop. Tobacco culture led to the establishment of large plantations worked by indentured servants and later by slaves. By the 1750s Virginia was exporting from 40 to 50 million pounds of tobacco a year and wealthy planters dominated Virginia politics.

The rich, untapped soil of Virginia at first produced abundant tobacco crops, but successive crops drained the soil of its fertility. By 1750 many of the prominent planters of Virginia had tapped out the soil of their Tidewater and Piedmont plantations and had started anew in the Shenandoah Valley. Less wealthy Virginians, along with German and Scots-Irish farmers from other colonies, had also begun to move into the valley. The poorest of the migrants moved further westward into the mountains on the frontier, where they bore the brunt of Native American hostility. Frontier settlers and their interests received little attention from political leaders in the east.

COLLISION ON THE FRONTIER

The native peoples of the Tidewater and Piedmont regions had long been decimated and dispersed by epidemics and generations of warfare. However, Shawnee and Leni-Lenape (Delaware) bands from beyond the mountains periodically raided white frontier settlements in western Virginia. Meanwhile, as good land grew scarcer, many colonists looked to the Ohio Valley as the next source of new farmland. A group of wealthy Virginians, including Governor Robert Dinwiddie, formed a land speculation company and obtained from King George II (r. 1727–1760) an extensive Ohio grant in territory claimed by both France and Britain.

Virginia's colonial government, safely ensconced in the east, had been unwilling to allocate money for building forts and defending the disputed western territory of the Ohio Valley. An increasingly menacing French presence, however, led Governor Dinwid-

die, anxious for his land grant, to send the twenty-one-year-old militiaman George Washington to confront the French in Ohio country. Washington's mission of 1753 was the first of several unsuccessful forays. Essentially, Virginia was conducting a private war with the French in order to control western lands, which it claimed to the Pacific Ocean. However, the Virginians' defeat in 1754 at the hands of the French drew the British government's attention and ignited the French and Indian War (1754–1760).

In 1755 George Washington and several hundred Virginia troops joined General Edward Braddock and his British regulars on a mission to capture Fort Duquesne. On 9 July a French and Indian force ambushed the army, inflicting in just three hours the debacle known to history as Braddock's Defeat. The surviving British regulars departed, leaving the western frontier open to deadly raids. Virginia colonists, already resentful of British royal authority, grew to resent the British even more for having failed to protect them. Colonel Washington spent the next three years commanding a Virginia militia regiment charged with protecting the frontier. After the war the British government incurred Virginia's wrath with the Proclamation of 1763, which barred colonists from settling west of the Allegheny Mountains and ordered existing settlers there to return east. Virginia speculators and settlers alike faced ruin and blamed their plight on the authorities in distant London. Many defied the proclamation and continued to settle west of the line.

ROAD TO REVOLUTION

Virginians again chafed under British authority when Parliament sought to recoup its military expenditures by taxing the colonies. Members of Virginia's House of Burgesses emerged as leaders in the growing resistance. Frontier lawyer Patrick Henry spoke out against the Stamp Act (1765), making statements that many of his peers considered treasonous. However, a majority of the burgesses came to agree that resistance was necessary, and in May 1765 they adopted the Virginia Resolves, a set of statements asserting the exclusive right of colonial governments to make their own laws and tax their own citizens.

The Stamp Act was repealed in 1766, but in the face of new forms of British taxation imposed by the Townshend Acts of 1767, the burgesses passed additional resolutions in 1769 objecting to British actions. Not for the last time, the royal governor dissolved the House of Burgesses, and the burgesses reconvened in a tavern. There they devised and enact-

ed a plan to boycott British imports, which other colonies emulated.

In 1773 Henry, Thomas Jefferson, and other legislators established a Committee of Correspondence to communicate with the other colonies and organize opposition to British authority. When the House of Burgesses voted to aid Boston in the aftermath of the Boston Tea Party (1773), Virginia's royal governor, John Murray, Lord Dunmore, disbanded the legislative body. Meeting in a tavern in the spring of 1774, the burgesses called for a congress of all the colonies. The resulting first Continental Congress met in Philadelphia in September 1774. Among the Virginia delegates to the Congress were Patrick Henry, Peyton Randolph—who was elected president of the Congress—and George Washington.

Back in Virginia, Lord Dunmore briefly won public support by mounting an expedition to secure the frontier from Indian raids. In October 1774, Colonel Andrew Lewis defeated a force of Shawnees on the westernmost border of Virginia at the Ohio River. But support for Dunmore was short-lived. In March 1775 a Virginia convention met in Richmond to address the growing breach with Great Britain, placed the colony on a war footing, and voted to raise troops. The next month, Dunmore ordered the seizure of a store of gunpowder, and Patrick Henry led the militia to Williamsburg to confront the governor. Dunmore fled to a British warship. In May, a Virginia delegation went to the Second Continental Congress. There the delegates voted to raise a Continental Army, with George Washington as its commander in chief.

Dunmore ordered British regulars to occupy the town of Norfolk and raid coastal plantations. In November 1775 he offered freedom to slaves who would flee their owners and join a Loyalist regiment. The following month, British forces marched out from Norfolk and met a Patriot militia force at Great Bridge. This engagement, called the second battle of the Revolution, drove the Dunmore contingent from Norfolk. The royal governor and his men fled to British warships. Dunmore ordered the ships to fire on Norfolk, and the town was destroyed. This action turned most Virginians against Great Britain.

THE COMMONWEALTH AT WAR

On 15 May 1776 the convention, meeting in Williamsburg, declared Virginia an independent commonwealth. The convention also resolved to propose independence from Great Britain at the next session of the Continental Congress. Accordingly, Richard Henry Lee of Virginia proposed independence in Phil-

adelphia, and the Congress passed the motion on 2 July 1776. Thomas Jefferson played the leading role in drafting the Declaration of Independence.

In Virginia, Patrick Henry served as governor from 1776 to 1779 and again from 1784 to 1786. Thomas Jefferson served as governor of Virginia from 1779 to 1781. The results of his efforts in the 1770s and 1780s to bring about significant changes in Virginia law bore fruit most notably with passage of the Statute for Religious Freedom (1786) and the abolition of entail (1776) and primogeniture (1785). He failed, however, to establish his proposed public education system. By 1776 the population of the newly declared commonwealth had increased to about half a million, maintaining the ratio of 60 whites to 40 blacks.

The British invasion of the Chesapeake Bay in 1779 spurred Virginians to move their capital from Williamsburg to Richmond. Frequent movements of troops across Virginia depleted supplies of food, tobacco, and livestock. As many as thirty thousand slaves left Virginia plantations, either voluntarily or by force, during the war. Yorktown, Virginia, saw the American Revolution's last major campaign in 1781.

After several years (starting in 1781) during which the thirteen states were loosely organized under the Articles of Confederation, James Madison and other leading Virginians pushed for a constitutional convention to establish an enduring central government. The resulting Constitution, however, contained clauses that many Virginians found objectionable. One such clause permitted the transatlantic slave trade to continue to 1808. Virginia had abolished the importation of slaves, in part to protect the economic value of Virginia's existing slave population, so the state's planters opposed that provision. After lengthy and heated debate, Virginia by a close margin became the tenth state to ratify the new United States Constitution on 26 June 1788.

VIRGINIA AND THE NATION

Virginia was the largest and most populous state in the new nation, even though it had ceded its trans-Ohio territory to the national government in 1784. Virginia's territory included what became the state of West Virginia in 1863. The census of 1790 reported the total population of Virginia at about 692,000. This figure included about 306,000 blacks and the more than 55,000 individuals living in western Virginia. The west Virginian population included only about 2,000 blacks because the mountainous region could not support many large plantations. About

15,000 German immigrants had settled in western Virginia by 1790, and the Virginia government soon began publishing laws relating to the frontier in both German and English. In 1790 the ancestry of Virginia's white population was 68.5 percent English, 10.2 percent highland and lowland Scottish, 6.2 percent Scots-Irish, 5.5 percent Irish, and 6.3 percent German. There were also small numbers who were of French, Dutch, and Swedish ancestry.

Subsequent censuses reported Virginia's total population at about 808,000 in 1800 (of whom about 45 percent were blacks); 878,000 in 1810 (48 percent black); 938,000 in 1820 (49 percent black); and 1,044,000 in 1830 (nearly 50 percent black). Richmond remained the state capital while Norfolk became the largest city, with a population of about 7,000 and a thriving port. By 1830 the white population of the Piedmont and Tidewater was steadily declining. At the same time, Virginia's black population lived almost entirely east of the Blue Ridge Mountains, where the ratio of blacks to whites was in many counties more than 2 to 1.

Virginia's increasing black population caused enormous social turmoil. A law of 1782 made it easier for owners to free their slaves. To prevent owners from abandoning less valuable slaves, who might then become public charges, the law limited manumission to healthy and fit slaves of prime working age. Popular reaction to the resulting increase in the free black population caused legislators to amend the law in 1806. The act of 1806 declared that blacks freed after passage of the law who remained within the state for more than a year would forfeit their freedom and could then be taken and sold for the benefit of the poor. Effectively, the free black population thenceforth could only grow by natural increase. Still, some thirty thousand free blacks lived in Virginia in 1810, a tenfold increase over a thirty-year time span. Over the same period, the slave population increased by nearly 50 percent.

On 30 August 1800, Virginia's governor received word of a slave conspiracy, later called Gabriel's Rebellion. The plot involved some one thousand poorly armed slaves who planned to march on Richmond and capture the city, killing white people along the way. In the event, a violent storm and floods prevented the conspirators from assembling. The authorities called out the militia, made hundreds of arrests, and executed more than two dozen. Gabriel's Rebellion increased fears of slave insurrection and conspiracy. The Virginia legislature enacted laws restricting the activities of the free black population, although free blacks had not been party to the upris-

ing. In addition, in 1801 Virginia legalized the practice of transportation, the selling of slaves convicted of crimes to distant markets. Thereafter, Virginia largely relied upon the threat of transportation to deter disorderly behavior. Virginia also grew fearful that outsiders—namely northern abolitionists—would assist slaves in suing for freedom or escaping. A series of statutes addressed this concern. For example, an act of 1805 defined any assistance to escapees as slave stealing and imposed harsh penalties. Over the ensuing decades, Virginia strengthened its runaway slave laws and campaigned for a stronger federal fugitive slave law.

Four of the first five U.S. presidents were Virginians: George Washington, the first president, from 1789 to 1797; Thomas Jefferson, the third president, from 1801 to 1809; James Madison, the fourth president, from 1809 to 1817; and James Monroe, the fifth president, from 1817 to 1825. Jefferson and Madison formed a political party, the Democratic Republicans (often called simply Republicans, it was actually the forerunner to the modern Democratic Party) in opposition to the ruling Federalists. During the nation's formative years, the early presidents divided along party lines, with Washington favoring the Federalists and a stronger central government and Jefferson, Madison, and Monroe supporting the Democratic Republicans and greater state authority.

Bipartisan conflict over state and federal authority boiled over when Congress under the Federalists passed the Alien and Sedition Acts of 1798. These laws provided for the monitoring of foreign nationals, the deportation of foreigners deemed to be dangerous, and the suppression of written or spoken dissent. The Federalists promoted these laws primarily to squash political opposition, while Democratic Republicans saw them as a threat to civil liberties.

Southern Republican leaders sought to oppose this show of federal power with an assertion of state authority. Jefferson, while serving as vice president of the United States, anonymously drafted a set of resolutions calling the Alien and Sedition Acts unconstitutional and urging the states to annul such laws. The Kentucky legislature passed a modified version of Jefferson's draft in 1798 and 1799. Virginia's Democratic Republicans introduced a similar but milder set of resolutions, drafted by James Madison, and the state legislature approved them in 1798. Fearing federal reprisal, Virginia also authorized a military buildup. Indeed, the Kentucky and Virginia Resolutions carried an implied threat of secession from the Union. The resolutions set a precedent for

the southern states to defend the institution of slavery by asserting states' rights.

In 1801 the Virginian John Marshall became chief justice of the U.S. Supreme Court; he served for more than thirty years. Marshall established judicial review, the right of the Supreme Court to rule on the constitutionality of laws passed by Congress (*Marbury v. Madison*, 1803). He also established the right of the Court to review and overrule decisions of state courts, including the supreme court of his home state. For example, in *Martin v. Hunter's Lessee* (1816), the U.S. Supreme Court overruled a Virginia supreme court decision that had allowed the confiscation of a Loyalist's property.

Beginning in 1800, Virginia's Democrat Republican leaders in Richmond established a statewide party organization. The party leaders came to be called the Richmond Junto because of their political effectiveness. The junto supported many successful candidates for seats in the state legislature and the U.S. Congress. The group also invariably persuaded Virginia voters to back the Democratic Republican candidate for president. However, Virginia's influence on national affairs began to decline with the election in 1825 of a non-Virginian to the U.S. presidency.

During the opening decades of the nineteenth century, Virginia's economy stagnated as tobacco prices languished. Planters, however, continued to control the state government, and they resisted change, including the construction of internal improvements that was sought by westerners. Capital that might have been used in businesses other than raising staple crops remained tied up in land and slaves. Additionally, the failure of Jefferson's plan for public education denied the poor an important avenue for economic advancement. Virginia's population began to fall in relation to the rest of the nation as thousands of citizens left to pursue opportunity elsewhere. By 1830 a series of economic depressions had left Virginia with only one reliably profitable export commodity—slaves—and with an underclass of struggling, poverty-stricken farm laborers.

VIRGINIA STATUTE FOR RELIGIOUS FREEDOM When the Virginia General Assembly enacted the Statute for Religious Freedom on 16 January 1786, it was the most comprehensive statement on religious freedom in the new American nation. Thomas Jefferson had originally drafted this measure during the Revolution as part of a general revision of Virginia's laws. It comprised three sections. The preamble provided a long and eloquent argument for the absolute right of religious conscience. It defined religion as a matter of opinion that could properly be formed only by reason and persuasion. No legislature or magistrate, therefore, had any legitimate authority to establish or compel religious belief or to require people to contribute to it. Jefferson concluded the preamble with a ringing affirmation that the human mind set free would ultimately discover the truth for itself. Then came a brief enabling clause that forbade any restraint on conscience, guaranteed complete free exercise of religion, and declared religion irrelevant to one's civil rights. The final section stated that religious freedom was a matter of natural rights, and that any future legislature which revoked or limited the freedom inherent in the statute would violate those rights.

Jefferson's statute was first introduced in the legislature as part of the revised law code on 12 June 1779, but consideration of it was postponed. Later that year the assembly considered another measure that would have effectively established Christianity as the state religion. That, too, was tabled, but religion was revived as a major concern when the war ended in 1783. Some definitive settlement was needed. During the colonial period, the Church of England had been established in the Old Dominion. Public taxation and grants of public lands had supported its clergy, colonial law had required attendance at its services, and lay vestries in the parishes had managed both civil and religious affairs. Dissenters from the established church, mainly Baptists, Presbyterians, and Quakers, had enjoyed only limited toleration. The sixteenth article of the Virginia Bill of Rights, approved by the Revolutionary Virginia convention in June 1776, had acknowledged the right to "free exercise of religion" but failed to appreciate the implications of that right. The following autumn, the new state legislature did not disestablish the church, nor did it remove all restrictions on other religious groups. The only major change during the Revolution was the decision to end religious taxes.

By the time peace came the established church, newly renamed the Protestant Episcopal Church in Virginia, was in desperate financial and organizational straits. A clergy convention in June 1784 petitioned the legislature for an act of incorporation so that it could manage church affairs. The following fall the General Assembly did just that. Meanwhile, Patrick Henry proposed a general assessment bill to support "Teachers of the Christian Religion" that would allow each person to designate the clergyman or religious body that would receive the tax money. With Jefferson serving as American minister to France, James Madison led the anti-assessment forces. Before Henry's measure could pass, he maneuvered the election of Henry into the governor's seat and out of the legislature. He then persuaded the assembly to postpone the assessment bill until the people could be consulted.

In the spring and summer of 1785 a massive petition campaign swept Virginia. Madison drew up his Memorial and Remonstrance against the assessment and it was widely circulated. But for every person who signed Madison's protest, ten others signed explicitly religious petitions (petitions that expressed a predominately religious [ecclesial, scriptural] set of arguments), principally the work of Baptists and Presbyterians, that also opposed the assessment. To those who had been labeled dissenters, the incorpora-

tion of the Episcopal Church appeared as a sign of renewed legislative favor for what had been an oppressive colonial establishment. Now the assessment seemed deliberately designed to enable that church to revive. Their petitions asked that religion be made entirely voluntary. When the assembly met in the autumn of 1785, the petitions to the legislature overwhelmingly opposed the assessment. The assessment bill was never even considered. Instead, Madison brought forward Jefferson's statute and, after minor revisions to the preamble, it became law in January. In 1787 the assembly voided the incorporation act and in 1799 it repealed all laws concerning religion except Jefferson's statute, which it made the sole basis for interpreting the state's bill of rights and constitution. At the state's next constitutional convention in 1829–1830, Jefferson's work was formally incorporated into Virginia's constitution.

The Virginia statute provided for complete religious freedom in Virginia. It also served as a major impetus for the passage of the religion clause of the First Amendment to the U.S. Constitution and as an important reference for that amendment's subsequent interpretation by the U.S. Supreme Court. Jefferson was so pleased with his accomplishment that he ordered his authorship inscribed on his tombstone.

VOLUNTARY AND CIVIC ASSOCIATIONS

Voluntary associations are groups of people who organize themselves into bodies of a quasi-

parliamentary character in which the members elect the leaders and vote democratically to adopt resolutions and take actions. They were rare in the colonial era although tolerated in the case of dissenting churches and encouraged when they provided charitable services and mutual aid. Still, many lacked official sanction and their legality was seriously questioned during the Revolutionary period. Despite the notoriety of political clubs in the 1790s, voluntary associations would gain legitimacy, particularly after 1800. By 1829 thousands of voluntary associations were performing a variety of benevolent, missionary, and reform services in all the states.

COLONIAL AND REVOLUTIONARY AMERICA

The most common voluntary associations were churches, although most colonies supported an established church with taxes. Boston had a neighborhood association to fight fires, which became the model for similar clubs in other cities. A small number of mutual aid societies, the most predominant being the Freemasonry lodges, began forming in the 1730s and 1740s and were largely composed of local elites. Mutual aid societies kept common treasuries to which members paid a yearly subscription and from which they could draw during emergencies; these also performed a certain amount of charity work.

Benjamin Franklin became an active organizer of various kinds of voluntary societies in Philadelphia. He established a self-improvement society called the *Junto* in 1726; the Library Company of Philadelphia in 1731; the Academy of Philadelphia, which opened on 7 January 1750; a hospital in 1751; and America's first fire insurance company, which he called the Philadelphia Contributorship, in 1752. His most ambitious undertaking was to organize in 1747 a voluntary militia for Pennsylvania's defense during the War of the Austrian Succession, or King George's War (1744–1748), when the Quaker leaders of the colony refused to do so.

After passage of the Stamp Act (1765), radical colonists organized voluntary associations to protest royal policy. In Boston they called themselves the Loyal Nine, and the New York City organization adopted the name Sons of Liberty. These societies worked to direct popular action, and many communicated with each other in order to coordinate resistance. Beginning in 1772, towns in the Massachusetts interior held regular conventions of the people and formed militia units and committees of correspondence to keep in touch with events across the colonies. These societies were all extralegal in the

sense that no British authority—neither the colonial governor, privy council, nor Parliament—had given these groups sanction. Loyalists denounced them as dangerous usurpations of legitimate authority.

POLITICAL CLUBS IN THE 1790s

With the close of the Revolutionary War, leaders were ambivalent about the existence of voluntary associations in a republican government. Many of the leaders were Freemasons, and they supported the spread of organized Freemasonry as a movement designed to inculcate virtue in its members and to benefit the community. Freemasons pledged themselves to mutual aid and kept a common treasury out of which members could draw in times of crisis. They kept their proceedings and practices secret, and this would raise suspicion by the 1830s that the lodges were undemocratic. General Henry Knox (1750–1806) first suggested that the officers of the Continental Army form the Order of the Cincinnati in 1783. The society established a fund for the support of widows and the indigent, but the fact that membership was restricted to Revolutionary War officers and their male heirs raised charges of aristocratic pretension.

Mutual aid societies became more numerous in the 1790s. The Society of the Sons of St. George was formed in 1788 specifically to help English immigrants adjust to life in America and provide monetary relief when necessary. The Hibernian Society for the Relief of Emigrants from Ireland founded in 1793 expressed a greater social mission by providing legal and medical services in addition to a common treasury.

While mutual aid societies were generally applauded, others saw a danger in what they regarded as an organized substrata of government unauthorized by legislatures. This was particularly acute when people voluntarily associated for political purposes. After the outbreak of war between France and Britain in 1793, pro-French partisans and British refugees formed at least forty political clubs, variously calling themselves “democratic” or “republican” and modeled primarily after the Revolutionary committees of correspondence and the Jacobin clubs of France. They publicly denounced the Washington administration's policy of neutrality and criticized other aspects of the government. In his address to both houses of Congress on 19 November 1794, George Washington blamed the Whiskey Rebellion of the summer of 1794 in part on “certain self-created societies” that had condemned the excise on whiskey.

Washington's anger did little to curb the people's enthusiasm for voluntary association. During the presidential election of 1800, independent political clubs published newspapers and pamphlets advocating either the Democratic Republican or Federalist candidates, although neither side's efforts were centrally managed. Many of these clubs organized pre-election and postelection celebrations and processions that served, as David Waldstreicher has argued in his *In the Midst of Perpetual Fetes* (1997), to create sympathetic and ideological connections across partisan communities.

OTHER EARLY REPUBLIC ASSOCIATIONS

The Democratic Republicans not only achieved the election of Thomas Jefferson in 1800, but also returned majorities in both houses of Congress. In office, they both expanded the size of the nation with the Louisiana Purchase of 30 April 1803 and limited the growth of the national government by repealing direct taxes, retiring much of the debt, and reversing the Federalist expansion of the U.S. judiciary. As Americans rapidly settled the western territories, they formed voluntary associations to create churches, schools, libraries, and lyceums and to fulfill other needs left unattended by the absence of an energetic central government.

Voluntary associations did not appear only on the frontier; they expanded across the oldest settled regions of the United States as well. Independent of any central mandate, the number of voluntary associations in New England to provide mutual aid, promote religion, and support benevolent causes jumped from under one hundred in 1772 to nearly fifteen hundred by 1817. Over one thousand of these were established after 1808. These societies often wrote and published their constitutions and also passed resolutions advertising their public services in the community newspapers. In *Inheriting the Revolution* (2000), Joyce Appleby has argued that the generation born after the Revolutionary War used the form of the voluntary association both to provide for self-government and as an ideological tool to unite communities, and by extension, a diverse nation.

Excluded from the mutual aid societies and political clubs that marked the voluntary associations of the 1790s, women became prime organizers and members of benevolent and missionary societies after 1800, including the first organizations that provided charity on a routine rather than a piecemeal basis. Among others, they founded orphan asylums, societies for the care of elderly widows, and other homes for chronic care.

Both women and men were active in founding missionary and reform associations, and hundreds were formed after 1800. These societies sought variously to introduce Christianity to Native Americans, revive interest in religion, campaign for the revival of laws enforcing observance of the Sabbath. Antislavery societies sprung up in both the North and the South, petitioning Congress for an end to the slave trade and publishing pamphlets in support of the abolition of slavery. The first national organization advocating the gradual abolition of slavery was the American Colonization Society, founded in 1816. It operated on both a national and branch level and advocated compensated emancipation of slaves and the transporting of all blacks to Africa.

One of the largest reform efforts in the early Republic targeted alcohol use. Churches in the early Republic despaired about increased use of alcohol and many demanded of their members that they abstain from drinking altogether. In 1826 a group of men founded the American Temperance Society, whose goal was the complete abstinence of its members from alcohol. The Society used aggressive evangelical tactics, sending its members out on the lecture circuit to distribute temperance tracts and convince social drinkers to "pledge" to give up booze forever. It spawned thousands of local chapters and by 1834 boasted over a million and a quarter members, both men and women, across America.

VOTING The right to vote forms the basis of the democratic ideal. For the individual, it symbolizes the fundamental requisite of citizenship; for the polity, it provides legitimacy without which governing institutions in a democratic society could not function. Voting is thus the currency of the social contract formed between the government and the governed in any democratic nation. When individuals vote, they tacitly consent to be governed by those who win elections—no matter for whom they vote. When individuals are granted the right to vote, the democratic nation reaffirms the compact with its citizenry to remain a government—in the words of Lincoln—“of the people, by the people, and for the people.”

An analysis of voting rights in the United States from the late colonial period through the early decades of the nineteenth century reveals a good deal about the limited nature of democracy in the United States at that time, about existing concepts of citizenship and who counted as one of “the people,” and about the social contract formed by the Declaration of Independence and the Constitution that lie at the basis of America’s liberal system of government. Ultimately, however, a look at voting rights during these formative years tells the United States how far it has come to make good on the promise of the democratic ideal of inclusion and participation.

Throughout the colonial period, British-style class hierarchies dominated the concepts of political rights and voting. To be sure, each colony had leeway in crafting its own sets of laws and regulations, but the one outstanding requirement for the franchise across the thirteen colonies consisted in some form of landed property qualification. This requirement essentially disenfranchised all servants and laborers. The first colony to put in place a property qualification for voting was Connecticut in 1715; Delaware followed in 1734. Later in the eighteenth century, a handful of the colonies began to relax these laws—mostly to sustain the support of lower-class Englishmen. These changes usually occurred in the more populous colonies. On the eve of the Revolution, however, only five colonies had lowered personal property requirements as well as landowning requirements. Furthermore, throughout the colonial period, and throughout the colonies themselves, laws were constructed to reinforce the notion that “citizenship” in America really meant “British citizenship.” For example, in 1762 Virginia passed a statute denying the right to vote to free blacks, mulattoes, women, minors (under twenty-one), Native

Americans, and non-Protestants—especially Catholics, who were specifically banned.

The Revolutionary War swept away the shackles of the British Crown, but not necessarily the property qualifications for voting. The universal equality Thomas Jefferson so eloquently referred to in the Declaration of Independence extended only so far. And yet some states were less restrictive than others. In its state constitution of 1777, Georgia allowed any white male to vote who had lived in the state for six months and who “possessed in his own right of 10 pounds value, and liable to pay tax in the state, or being of any mechanic trade.” The year before, Maryland had declared any “freeman” eligible to vote if he owned fifty acres of property above the value of thirty pounds. He also had to have been in the country for more than one year. In 1784 New Hampshire permitted any male to cast a ballot who paid a poll tax at the time of voting. By contrast, in 1778 South Carolina barred anyone from voting who was not a white male, who had not been in the state for at least a year, and who either did not own fifty acres of land for six months or was not eligible to pay a tax at least six months before the election. During the Revolutionary era, only four states did not disenfranchise women by state statute or constitutional provision: Connecticut, Delaware, New Jersey, and Rhode Island. Of these, only New Jersey explicitly allowed women to vote, but just until 1807.

THE CONSTITUTION

In 1787 the federal Constitution was written. It consolidated power in the national government and created a federalist system in which two sovereign entities—the national government and the state governments—acted upon the citizen, sometimes simultaneously, and at times even ambiguously. For example, it took more than a century after the ratification of the Constitution for the courts to settle the question of whether the Bill of Rights actually applied to the state governments (what is known in jurisprudence as “dual citizenship”). Yet, nowhere are these ambiguities clearer than in the area of voting rights. To be sure, the original document is almost totally silent on some of the fundamental questions of voting rights—who has them, who does not, who should have them, who should not, and so on. Article I, section 2 states that “the House of Representatives shall be composed of Members chosen every second Year by the People of the several States, and the Electors in each state shall have the qualifications requisite for electors of the most numerous Branch of the State Legislature.” Thus, while the “people” in

each state have the right to elect their representatives to Congress, it remains up to the states to determine who the “people” are. Issues such as race, gender, and age are left unaddressed, and would remain unaddressed until the ratification of, respectively, the Fourteenth, Fifteenth, Nineteenth, and Twenty-sixth Amendments.

Article I, section 3 states: “The Senate of the United States shall be composed of two Senators from each State, chosen by the Legislature thereof, for six Years; and each Senator shall have one Vote.” Not until the ratification of the Seventeenth Amendment in 1913 did “the people” have the right to directly elect their senators. This task had previously been left to the state legislatures who, once again, were elected by “the people” as determined by state law. As early as the 1820s, however, individuals running for the U.S. Senate were campaigning amongst the “people” in their states, imploring them to elect as state lawmakers only those who would in turn elect them to Senate.

Finally, and perhaps best known, the president of the United States was originally chosen through the electoral college, a group of individuals who were chosen, as stated in Article II, section 1, by each state “in such Manner as the Legislature thereof may direct.” In the early national period, the state legislatures chose the electors directly; over time, state after state changed its laws so that the presidential candidate receiving the most popular votes in the state would receive all the electoral votes of the state. (At the turn of the twenty-first century, only Maine and Nebraska do not have this winner-take-all system.)

This brief review of how the Constitution dealt—or did not deal—with the voting rights of American citizens is significant because to a large extent it left the status quo in place: After the ratification of the Constitution, it was still left to the states to determine who was eligible to vote in all elections—state and federal. A person qualified to vote for the House of Representatives in one state might not be qualified to vote for the same office in a different state simply because the qualifications for voting were different from state to state.

RACE AND SUFFRAGE REQUIREMENTS

In fact, the qualifications varied markedly from state to state. And yet, as the eighteenth century closed and the nineteenth century commenced, a set of patterns began to emerge across the country, cutting across state lines. First, state after state began to drop the property qualifications for voting as they had applied to the largely white male electorate. Vermont

States Restricting the Franchise to White Males

State	Year Enacted
Virginia	1762
Georgia	1777
South Carolina	1790
Delaware	1792
Kentucky	1799
Maryland	1801
Ohio	1803
New Jersey	1807
Louisiana	1812
Indiana	1816
Mississippi	1817
Illinois and Connecticut	1818
Alabama	1819
Missouri	1821
Tennessee	1834
North Carolina	1835
Arkansas	1836
Michigan	1837
Pennsylvania	1838
Florida and Texas	1845
Iowa	1846
California	1850
Minnesota	1858
Oregon	1859
Kansas	1861
West Virginia	1863

dropped its qualification in 1786, five years before statehood. Kentucky followed in 1792, the year it attained statehood. Maryland followed shortly thereafter. As the nineteenth century progressed, most states decided to follow suit. By 1855, only three states had some form of property qualification for voting: New York, Rhode Island, and South Carolina. In 1860, on the eve of the Civil War, South Carolina finally dropped its property qualification, the last state to do so.

At the same time property qualifications were being lowered, however, another pattern emerged: racial barriers to voting were put in place by state legislatures in all regions of the country. Table 1 reveals the states restricting the franchise to white males along with the years that they were enacted.

In a constitutional amendment of 1821, New York allowed black males to vote, provided they had \$250 worth of property. Only four states did not disenfranchise blacks throughout this period: Massachusetts, Maine, New Hampshire, and Vermont. Rhode Island disenfranchised blacks in 1822 and then reenfranchised them in the wake of the Dorr War in 1842, primarily because a black militia patrolled the streets of Providence during the insurrection, thus

proving their loyalty. The Law and Order Party rewarded blacks by granting them the right to vote after the rebellion was quashed.

Once again it should be emphasized that these two developments—the move toward universal white male suffrage on the one hand, and the racial restriction on suffrage on the other—happened state by state over the course of the opening decades of the nineteenth century. The national government played no role in these developments. Given the way in which these two developments unfolded during this period, what explanations can be offered?

Three different but related factors can be identified in seeking to understand how voting rights changed in this period. While all revolve around the issue of slavery and race, the first is economic in nature, the second is political, and the third is ideological.

From 1790 to 1820, the size of the country increased by two and one-half times. Landless white immigrants flooded to the United States in this thirty-year stretch. Slavery was proliferating in the South while blacks were being freed through gradual manumission in the North. At the same time, there was a small but significant free black population in the South. Blacks and poor whites began to compete at the lowest rung of the economic ladder in the North and parts of the South. The economic competition bred racial conflict.

Landless whites began to push for changes in voting laws across the states. In the early decades of the nineteenth century, political leaders saw the potential of this new stream of voters into the electorate and took advantage of it. Democratic Republican leaders like Martin Van Buren in New York pushed vigorously for the lowering of the property requirements in their home states. Many scholars have looked to Van Buren as one of the architects of Jacksonian democracy, built upon a white working-class ideology and fueled by the sustained electoral mobilization of landless white male voters. In 1824, about 365,000 votes were cast for president. Four years later, that figure tripled. Politicians—mainly Jacksonian Democrats—seeking to build a solid political party base saw the enormous potential of universal white male suffrage and moved on it.

But in order for them to do so, two things had to occur: first, a wedge had to be placed between poor whites and poor blacks. The economic conflict mentioned above was a natural starting point. Second, there had to be a justification for disenfranchising blacks and relegating them to second-class citizenship. Here the ideological component becomes vital.

It is no coincidence that, at the very moment poor white males were granted the vote and black males were disenfranchised, the “science” of white supremacy emerged. Reginald Horsman’s *Race and Manifest Destiny* (1981) speaks eloquently to this movement. In order to justify slavery in the South and deny blacks the rights of citizenship in the North, whites had to make the case that blacks were inferior and that the United States should be a “white republic.” This sentiment reached its apex when Chief Justice Roger Taney declared in *Dred Scott v. Sandford* (1857) that blacks were never considered citizens of the United States because they were an inherently inferior race.

In many ways, then, the expansion of voting rights for white men and the contraction of voting rights for black men have their origins in the same movement. That movement was the creation of mass-based political parties and the advent of Jacksonian democracy.

Christopher Malone

WAR AND DIPLOMACY IN THE ATLANTIC WORLD

In 1754 the thirteen colonies belonged to Britain. By 1829 they were the core of an independent nation becoming a burgeoning power in the Atlantic world. The United States' capacity to impose its will beyond its borders had become manifest. From 1754 to 1829, this transformation occurred in four periods.

1754–1776

By 1754 the thirteen colonies had experienced decades of cooperation with Britain. During the eighteenth century Britain taxed, borrowed money, and waged war in unprecedented fashion. As it did so, the colonies helped to extend the British Empire. In 1754 war again erupted in North America between Britain and France, and the colonists contributed to the imperial war effort as never before. The French and Indian War (1754–1763) ended with utter French defeat. Anglo-American cooperation allowed Britain to achieve mastery in North America. The skillful diplomacy of William Pitt, the first minister of Parliament and, after the king, the most significant representative of the British Empire, fostered this cooperation. Pitt's successes demonstrate the great "what could have been" in the relations between Britain and the colonies.

In 1757 Pitt realized that it was impossible to render the colonists—most of them independent landowning heads of household or members of such households, at a distance from Britain of three thousand miles—obedient inside their colonies. Such independence was rare in Europe, where webs of dependencies shaped society and ordered people in relations of superiority and subordination. Unlike Europeans, Americans had to be convinced to voluntarily cooperate.

Pitt accepted the limits of his (and Britain's) coercive power, and despite those limits, forged a mutually beneficial connection between the colonies and Great Britain. His achievements show that skillful diplomacy might have prevented the American Revolution. Pitt wanted the colonists to help pay for the war. He knew that the colonists jealously guarded their colonial assemblies, the only bodies that they believed should tax them. Thus he announced that he would not tax the colonies but instead asked the assemblies to tax themselves. He then set aside £200,000 and pledged to return a proportion of about one-third of a pound in gold and silver for every pound of voluntary taxation. After 1758 the colonies eagerly taxed themselves at record levels and so turned the tide of the war. Between 1758 and 1761 the colonists taxed themselves above the levels Parliament demanded after 1763. The conflict that

led to war by 1776 began in 1764 with Parliament's insistence that it could tax the colonies. Pitt showed that the colonists would pay voluntarily if Parliament respected their assemblies.

After 1763 the ministers who followed Pitt replaced his cooperative diplomacy with coercion, precipitating the greatest failure of diplomacy in the period. In 1763 the affection colonists felt for Britain had never been greater; by 1776 it was gone, and the new United States fought the most powerful country in the world. The war necessitated diplomacy with Britain's enemies, particularly France. This situation had been unimaginable just thirteen years earlier, and Pitt's successes—assuming continuing high levels of subsidies—suggest that it need never have arisen.

1776–1789

The American Revolution established two principal themes that shaped war and diplomacy from 1776 to 1829. First, the war showed how difficult it would be for the United States to project power and influence beyond its borders. Second, it showed that, to survive, the nation would have to participate in a dangerous, triangular relationship with Britain and France. At times, after 1776, Spain too forced the United States into difficult diplomacy, but it never managed to pose the threats to American foreign policy that Britain and France did.

The fighting after 1776 showed that the British armed forces could control whatever part of the Atlantic world they cared about most. Before 1778 it was the U.S. coast, particularly New York and Philadelphia. Both fell to the British in the first two years of fighting. British naval supremacy meant that the United States would have difficulty asserting its sovereignty, especially on the oceans. This weakness demanded allies and led the United States to enact what became known as the "model treaty" with France in 1776 and to forge a formal alliance with that nation in 1778. The model treaty, the work of John Adams, showed that despite the danger of the triangular relationship, the United States was determined to observe the codes of international law. The treaty was a commercial agreement that gave France special status but that maintained the dictum of the law of the seas that free ships made for free goods. This dictum, which became the cornerstone of U.S. commercial policy and diplomacy until 1829, meant that the United States reserved the right to free trade with any nation, excluding trade in contraband.

The 1778 alliance forced Britain to rethink its priorities because the French navy could now threat-

en the British West Indies. The British proved unwilling to jeopardize their sugar islands. Transferring resources to the Indies meant that, though the fighting was protracted, after 1778 independence was highly probable. Britain could not defeat France, Spain, and its former colonies. With the Treaty of Paris of 1783, the United States claimed all the land south of Canada, north of New Spain, and east of the Mississippi River.

Yet the two realities emerging from the Revolution—the difficulty of projecting power and the need to maneuver between Britain and France—had not changed. During the 1780s the United States sought to consolidate its independence while Britain attempted to reduce it to neocolonial dependency. These incompatible agendas made for difficult diplomacy. Britain out-manufactured the United States and exported cheap, high-quality goods, causing ruinous harm to American craftsmen. Britain's goal was to keep the United States a simple producer of agriculture, a society dependent on Britain. During the 1780s Britain closed off the West Indies, making any access to what had been the colonies' principal market either strictly temporary or illegal. British hostility forced the United States to find new partners in diplomacy. Though the alliance with France remained significant, the United States also sought diplomatic relations with Spain.

The most revealing example of U.S.-Spanish relations was the Jay-Gardoqui Treaty of 1786, which the Articles of Confederation government ultimately rejected. Desperate to promote foreign trade, John Jay agreed to Spanish control of the Mississippi River for thirty years in exchange for access to Spanish markets. Had the United States accepted the terms, Westerners would no longer have been able to use the Mississippi River to get to market. The extraordinary terms Spain felt comfortable demanding, reminded Americans that independence was hollow if the nation had to give up so much to make its way in the world. The 1780s were years of economic depression and uncertainty. Given the weakness of the new nation, diplomats could do little to improve the situation.

1789–1815

The diplomatic problems of the 1780s prompted the ratification of the Constitution and the formation of a stronger national government. President George Washington's inauguration signaled a new era in the nation's affairs. This early national period soon produced new diplomatic complexities and ended with a second war with Britain. The years 1789 to 1815

were dominated by the French Revolution and the wars that followed; throughout the period, the United States needed to maintain its difficult relationships with France and Britain. Also significant for future diplomacy was the Constitution's declaration that the slave trade could become illegal in 1808. After 1815 this abolition would have a major impact on American diplomacy.

Before 1793 Americans were preoccupied with domestic concerns. In Europe war returned in 1792 as revolutionary France fought Britain. By 1794 the seas were again unsafe, both belligerents sought to prevent the United States from dealing with the other, and Americans divided over whether to support Britain or France. This division reinforced the growing rift between the Federalist Party and the Jeffersonian Republican opposition.

The Federalists, led by Washington and Secretary of the Treasury Alexander Hamilton, sought order and stability and viewed France as the graver threat. In 1793 the Federalists moved the nation closer to Britain, an effort that culminated in 1794 with Jay's Treaty, which partly vitiated the 1778 alliance with France. The treaty created a close commercial relationship with Britain and, at the very least, suggested that the United States favored Britain over France. The treaty intensified the divisions within the United States caused by disagreements about the desirability of Hamilton's economic and financial programs. Jay was so hated that he joked he could travel at night illuminated by his burning effigy.

Debate over whether to support Britain or France continued to be connected to domestic disagreements between Federalists and Republicans. Federalist John Adams's presidential election in 1796 did not temper this conflict, and by 1797 France waged undeclared war against the United States. Most Federalists felt the United States should declare war on France and forge a military alliance with Britain. Instead, Adams tried diplomacy, insisting that France honor the international law dictum that free ships made for free goods. The United States was an independent nation; thus France violated its rights under international law when it attacked ships that peacefully and lawfully traded with Britain. Unfortunately, in the XYZ affair Adams's negotiators were treated so contemptuously by the French that war appeared inevitable. Yet by 1798 it was clear that Britain preyed on American ships at least as much as did France. In addition, Adams distrusted the extreme war voices in his own party. With an election looming, Adams honorably refused to call for a war he might not be around to fight.

In one of the closest elections in the nation's history, Thomas Jefferson defeated Adams in 1800. The Federalists were swept from power and never regained it. Though the major diplomatic issues remained, the new administration had a different perspective. The differences began with domestic policy, which was intimately connected to foreign policy. The Republicans rejected the Federalist plan to create a powerful national state on the European model and a dynamic economy based on high finance and manufacturing, associating such policies with dependence, inequality, and loss of liberty. The Republicans sought a society of independent farms that could spread west and replicate a simpler, more egalitarian and republican, social order.

Building this "empire of liberty" shaped foreign policy during Jefferson's years as president (1801–1809) and during those of his successor James Madison (1809–1817). Both presidents envisioned a nation of farmers producing agricultural surpluses. This foundation for a republican society necessitated worldwide free trade and full U.S. access to foreign markets because farmers could not sell their surpluses domestically to each other.

Free trade was the *raison d'être* of Jefferson's diplomacy, with the free ships–free goods dictum at the core of his foreign policy. A nation of republican commercial farmers required complete access to foreign markets and land to farm. In the most stunning achievement of his presidency, Jefferson secured that land in 1803 by purchasing the Louisiana territory from Napoleon. For \$15 million, the United States added 828,000 square miles to the nation—a price of roughly 3 cents per acre. Jefferson now had his nation of farmers, but could he use diplomacy to secure foreign markets for their wares?

It proved difficult. By 1805 war between Britain and France engulfed the Western Hemisphere. Both nations sought to deny the other any advantage, particularly access to American agriculture. After 1805 Napoleon, with his Berlin and Milan Decrees, and the British, with their orders-in-council, declared that the Americans could not trade with the other. Thus there was no free trade, and the Republicans had to worry about idle farmers and failing farms.

In 1808 and 1809 Jefferson and Madison responded with forceful diplomacy that stopped short of war. The Republicans enacted a two-year embargo that prevented virtually all commerce. They reasoned that the United States produced agricultural necessities that war-ravaged Europe needed, but Europeans exported luxuries that Americans could temporarily live without. With peaceful coercion,

Britain and France would accede to American demands that they honor international law and especially the free ships–free goods dictum. Commercial coercion and diplomacy would eradicate the need for war. This plan might have worked had Britain and France been less desperate to defeat each other. But by 1810 the situation had not changed, and Madison understood that he could not again suspend foreign commerce. The only option left seemed to be war, though Republicans had believed that an agrarian republic would never have to fight one.

War came in 1812. From the Great Lakes to the Gulf of Mexico, the United States fought Britain until 1815. The war clarified several things, resolved some concerns, and introduced new ones. The war demonstrated that the United States was a regional power and possibly more. The war also emphasized Britain's continued dominance on the oceans and its ability to hamper U.S. pursuit of its sovereign rights beyond its borders. After 1815 the nation's leaders turned inward as never before. With protective tariffs and internal improvement bills, they encouraged the rapid development of the domestic economy, turning their backs, to a certain extent, on the oceans and British hegemony.

1815–1829

Thus by 1815 the war had clarified the nation's position. The United States was a burgeoning regional power. This new status led to the two biggest issues for diplomacy in the period from 1815 to 1829. First, the United States insisted that Europe stop interfering in the affairs of the Americas. Second, the United States decided to act on its stated opposition to the international slave trade. U.S. conduct regarding both issues continued to be influenced by the difficulty the nation had asserting its sovereignty beyond its borders.

Its new status as a regional power shaped the U.S. position on South America. By 1820 the farsighted perceived that the United States would be the dominant economic force in the Americas. During the 1820s about 15 percent of U.S. exports went to Latin America, and the United States was increasingly committed to removing the European presence from the New World. In 1822 President James Monroe (1817–1825) announced that the United States would recognize Latin American nations that gained independence. For once, U.S. and British interests coincided. After 1815 Britain sought to weaken its rival European empires and concluded that U.S. prominence in the Americas was preferable to the continued presence of France and Spain.

The British stance helped make possible the Monroe Doctrine of 1823, which was the culminating statement of U.S. policy regarding the Americas. In his address, Monroe announced that Europe would no longer direct the affairs of the Americas. Henceforth, American states would be free to shape their own destinies, Monroe concluded, with the United States the likely leader and dominant partner.

British acquiescence was due in part to the impact the Monroe Doctrine had on other European empires. But also important was the hostility Britain felt for the Atlantic slave trade. The abolition movement in Britain captivated both the elite and the ordinary. Britain took the lead in challenging slavery, and no nation was more responsible after 1815 for creating the Atlantic world consensus that the slave trade should be illegal.

The United States remained committed to slavery domestically, but after 1815, with diplomacy and moral pressure, Britain convinced the United States to oppose the slave trade. Britain was able to embarrass the United States by challenging its claim to promote liberty and freedom. Indeed, as Britain became associated with abolition, the British claimed that their constitutional monarchy pursued justice more capably than did the democratic Republic. Britain suggested that limited monarchy was superior to republicanism.

Jefferson's administration had kept the Constitution's vague promise by an act of Congress declaring the slave trade illegal from 1808. But enforcement was difficult. From 1815 to 1829 all the mistrust in the Anglo-American relationship interfered with policing the slave trade. In 1824 Britain made slave trading punishable by death (though no one was ever executed) and urged the U.S. to enter into treaties of similar stringency. The constant stumbling block was that enforcement required allowing Britain to board and search U.S. vessels. For U.S. policymakers such as Monroe's Secretary of State (and president from 1825 to 1829) John Quincy Adams, such searches were reminders of the U.S. weakness beyond its borders. Since 1776 U.S. diplomacy had been a long quest for legitimacy and sovereignty, especially on the oceans. Anxiety over sovereignty prevented many meaningful anti-slave trade treaties. In 1823 the U.S. seriously considered a treaty with Britain that would have made the slave trade an act of piracy. Fears over allowing Britain to search U.S. vessels doomed the treaty. Not until 1862 did the U.S. execute a participant in the international slave trade, and between 1808 and 1850 perhaps 50,000 slaves were illegally imported into the U.S.

Still, after 1830 these illegal imports were seriously curtailed as the U.S. fully embraced the Atlantic world's anti-slave trade consensus. By 1829 U.S. diplomacy, and the U.S. itself, had matured. From 1830 U.S. diplomats bargained from a position of strength in a world that recognized both the nation's right to exist and its growing status as a world power.

WAR HAWKS It is one of the enduring myths of American historiography that the Twelfth Congress was dominated by a faction of “War Hawks” who seized control of national policy and pushed President James Madison into a war with Great Britain he would otherwise have avoided. Generations of historians have analyzed the speeches, correspondence, and voting records of these “War Hawks” to determine their identity and their reasons for bringing about the War of 1812. The result was a portrait of the typical “war hawk” as a young man, drawn from the rising generation and representing a frontier district whose settlers sought to expel the British from Canada, either to control hostile Indians or to annex land for future expansion.

This traditional picture cannot withstand close scrutiny. Analyses of voting patterns in the Twelfth Congress reveal that no particular Republican faction consistently pushed for war. Nor were “War Hawks” any younger than the average age of the members. It is, nevertheless, true that some Congressmen— notably Peter B. Porter, John C. Calhoun, and Felix Grundy—regularly took the lead in justifying war in 1812, but they were united not so much by age or regional background as they were by their membership on committees responsible for introducing preparedness legislation for debate. The legislation itself, though, originated with the administration, which had decided between March and July of 1811 to prepare for war with Great Britain. It was to implement this decision that President Madison summoned the Twelfth Congress into an early session in November 1811.

The “War Hawks” were not, therefore, responsible for the War of 1812. While they provided belligerent

erent rhetoric to justify that conflict, they played only an intermediary role in policymaking as advocates for measures of the Madison administration.

WAR OF 1812 The War of 1812 is undoubtedly America's least known war. The average American cannot name the two participants, the United States and Great Britain, let alone discuss what prompted President James Madison and Congress to declare war on 18 June 1812. In contrast, Canadians regard the war as among the most important events in their history. The underlying reasons concerning how the War of 1812 is regarded at the start of the twenty-first century is based not only on the failures and successes of the conflict, but also on events that followed decades later. For America, the vast majority of the war was characterized by dismal failure. Not only was the nation's capital put to the torch by British forces in August 1814, but campaign after campaign was lost due to either blunder, poor military leadership, lack of supplies, or the refusal of militias to cross into Canada, the occupation of which was the one strategic objective of the United States. In the wake of the U.S. Civil War, the War of 1812 seemed a minor affair to Americans. Canadians, on the other hand, successfully defended their homeland and in the process built a strong sense of nationalism. The one saving grace for Americans was the Battle of New Orleans in January 1815, an unparalleled victory led by General Andrew Jackson that allowed the young Republic to walk away from the War of 1812 with a sense of accomplishment in an otherwise lackluster performance.

AMERICAN GRIEVANCES

The war's causes were rooted in the Napoleonic Wars. This European struggle between Great Britain and France was essentially a world war that bridged

the late eighteenth and early nineteenth centuries. Engaged in a death struggle for supremacy, these two colossal powers embroiled their many neighbors, as well as the United States, in the conflict. The United States attempted to avoid involvement, but the lucrative trade to be had as a neutral nation enticed American shipping to brave the dangers of war. The end results were violations of neutral trade rights, illegal blockades, and extensive impressments (the seizing of sailors from American vessels to serve on foreign war ships). Both England and France engaged in these practices, though impressment was largely a British policy.

These varied maritime issues had been of concern in the 1790s but became even more problematic during and after 1803 when Britain and France disputed provisions of the 1802 Treaty of Amiens, which had ended the previous war between 1793 and 1801. Britain released a significant portion of its armed forces in the expectation that the peace would last more than a year and as a result was in a difficult position when the war resumed. Fighting for its very survival, Britain stepped up violations of neutral trade and impressments. Some of the trade violations were veiled in classic English legal tinkering. The Rule of 1756, a holdover from the Seven Years' War (1756–1763), decreed that any nation failing to have a trade agreement with a nation in time of peace did not have one by virtue of a war. This essentially meant that America could not act as a neutral in the French carrying trade between its West Indian colonies and the French mainland. Americans worked around this with the 1800 *Polly* case, in which British admiralty courts determined that goods taken from French colonies and returned to America, then re-exported to France, were considered "naturalized" American goods. The British closed this loophole with the 1805 *Essex* decision, which held that all such goods must be off-loaded and must have duties paid on them in America. Much of this was legal game playing, but it was a game backed by the firepower of the British navy, and thus Americans had to play by British rules.

Further trade violations came from both France and Great Britain. In 1806 Napoleon issued the infamous Berlin Decree, which announced a blockade of the British Isles and the right to seize all British goods even when on a neutral vessel. The British responded in January 1807 with an Order in Council requiring all vessels bound for certain ports in Western Europe to stop in Britain and pay a duty. Napoleon retaliated later in the same year with the Milan Decree, in which he declared that any ship paying the British

duty would be considered an enemy and treated as such. These varied orders and decrees resulted in the seizure of some nine hundred American ships between 1807 and 1812.

Impressments were also a major source of American dismay. On 22 June 1807 they reached an extreme when a British warship, the HMS *Leopard*, attempted to stop and ultimately fired on the USS *Chesapeake*, killing three sailors and wounding another eight. The British subsequently boarded the vessel and removed four sailors who, they claimed, were English citizens. The British did not normally violate a nation's sovereignty by impressing sailors from a war vessel, and the crown offered to pay reparations and later returned three of the four impressed sailors. Nonetheless, Americans were outraged by this affront to their liberties.

THE ROAD TO WAR

There is little wonder why America determined that immediate action was necessary. What, however, should be done? President Thomas Jefferson believed that war was hardly an option and instead decided upon a fifteen-month embargo that shut down American ports from 22 December 1807 to 1 March 1809. The idea was to hurt Britain and France economically by refusing them American goods and thereby forcing a respect for U.S. rights. Though the embargo hurt both nations, it was not enough to alter their policies, and Jefferson was faced at home with intense hostility to the embargo, which ended just days before James Madison's inauguration.

The new president did little to change British and French policy toward America. The young Republic was merely a pawn in a much bigger chess match. Violations of trade and impressments continued

throughout Madison's first term, and on 16 May 1811 a new clash between an English and American ship fanned anti-British sentiment. This time, however, the recipient of the pounding was the HMS *Lille Belt*. This incident, combined with the continuation of the Orders in Council and the belief that Indian depredations on the western frontier had been encouraged by the British, caused Americans to look for satisfaction from their former mother country.

In reality, the French were as guilty of neutral trade violations and illegal blockades as were the British; however, there remained lingering hostility against the British from the Revolutionary War. Moreover, with Britain's command of the seas, it was its warships that plied the U.S. coast. Thus, the June 1812 decision to engage in war was based not only on very real violations of American sovereignty, but on an emotional animosity as well. The irony is that the British foreign secretary Lord Castlereagh had announced on 16 June, just two days prior to the American declaration of war, that the Orders in Council would be rescinded. Even when this information became known in the early days of the war, the United States was in no mood to engage in fur-

ther diplomatic dicker. The Second War for Independence, as some called it, was designed to make Britain stop treating America like a colony.

The declaration of war focused primarily on maritime issues, though historians for many years have asked a very basic question about the war's causes: If it was fought to defend maritime rights, why did the Northeast, the area most affected by violations of those rights, oppose the war so vehemently? Scholars have theorized that a number of additional factors may have been at play: western land greed and the potential conquest of Canada; an attempt to end British influence over Native Americans; Republican Party hostility to Great Britain; and preservation of national honor and a desire to prove the strength of republican institutions. It is likely that all of these factors had some influence on the American decision to engage in war, but foremost were the maritime violations.

Congressional War Hawks may have been eager for retribution, but America was no more ready to prosecute a major war in 1812 than it was in 1807, when Jefferson imposed the embargo. During the in-

tervening years the nation's leaders had done little to prepare for conflict. America had achieved success in the Revolution only through the help of France and had failed to reform a militia system that George Washington criticized on many occasions. Part of the hope, no doubt, was that British forces would be tied up in Europe fighting Napoleon, and that Americans would therefore have an easy time of it. Additionally, many wrongly believed that Canadians would quickly unfurl American flags and jump at the chance to join the Union. Nothing was further from the truth, and the reality of war hit the nation hard. The War Department was badly organized and weakly staffed, the system for the pay and supply of troops was manifestly inadequate, and the army was littered with incompetent and geriatric officers. Most troops lacked discipline and had no real military experience, and a number of militia units in the North argued that they were solely a defensive force and therefore refused to march across the border into Canada. Finally, just when the nation needed a national bank most in order to finance the war, Alexander Hamilton's embattled institution ran the course of its charter in 1811. It is doubtful that the nation could have been less prepared for war.

THE CONFLICT

Nevertheless, Americans prepared for an offensive into Canada. The plans called for attacks all along the border. Yet in the Northwest, William Hull, fearing an Indian massacre, surrendered Fort Detroit on 16 August 1812 to a smaller British force and was later found guilty of cowardice and neglect of duty by a court martial. At the Raisin River on 22 January 1813, some three hundred Americans were killed by a superior British and Indian army. Thirty Americans who had surrendered were slaughtered by Indians after the battle. The massacre was so ghastly that Americans later attempted to excite troops by announcing, "Remember the Raisin!" Military action in the East was equally bad. Campaigns on the Niagara front at Queenston Heights (13 October 1812) and Fort Erie (27 November 1812) were also failures. The planned attack on Montreal never achieved any kind of meaningful momentum. In most of these actions militiamen refused to cross the border into Canada. William Henry Harrison had better luck in September 1813 when he defeated the British in the Battle of the Thames, in which the infamous Indian Prophet Tecumseh was killed. Though this was a victory for the United States, it was fleeting. Just two months later General James Wilkinson's attempt to capture Montreal ended unsuccessfully when his

army was defeated by a smaller British force at Chrysler's Farm.

American navy sailors did far better than the army soldiers. American ships were faster and sturdier, though certainly fewer in number than the British, and U.S. sailors were second to none. On 19 August 1812 Captain Isaac Hull, commanding the USS *Constitution*, defeated the HMS *Guerrière*, and on 15 October 1812 Captain Stephen Decatur of the USS *United States* captured the HMS *Macedonian*. On 29 December the *Constitution*, this time under the command of William Bainbridge, once again vanquished a British ship, the *Java*. The American navy also performed well the following year, when victory on the Great Lakes inspired Captain Oliver Perry to utter his famous words, "We have met the enemy and they are ours." Unfortunately, the American army failed to capitalize on the navy's control of the lakes by once again botching its forays into Canada.

The American campaigns in the South were more successful. In 1813–1814 an American army engaged the Creek Indians and a little-known but tenacious general named Andrew Jackson defeated the hostile Red Sticks, known for the red clubs they carried, in several successive battles—Tallushatchee (3 November 1813), Talladega (9 November 1813), Emuckfau (22 January 1814), and Enotachopco (24 January 1814)—before virtually annihilating them at Horseshoe Bend (27 March 1814).

On the East Coast, things went badly in 1813–1814. Using their superior naval power, the British blockaded the entire seaboard south of New England. That region was at first excluded because of its opposition to the war and because it was a source of supplies for British troops in Canada. But as the war progressed New England, too, felt the wrath of British might. Also, early in 1813 British raids on Chesapeake Bay and on Hampton, Virginia, struck fear in the American countryside. By 1814 the British had the opportunity to unleash their full force on the United States. Napoleon had been defeated and a wave of battle-hardened veterans sailed across the ocean. Americans nevertheless held their own in battles on the Canadian border, such as Chippewa (5 July 1814), Lundy's Lane (25 July 1814), and Plattsburgh (11 September 1814) but the year would be noted more for its losses than gains. The Chesapeake region was once again invaded, and although Baltimore was successfully defended, inspiring Francis Scott Key to pen the words to the "Star-Spangled Banner," Washington City, the nation's capital, was put to the torch.

The highlight of the war for Americans came with a major British offensive against the Gulf Coast. Expecting to roll into New Orleans virtually unimpeded, the British army met the formidable General Jackson and were summarily slaughtered on the field. Jackson's troops sent forth such a hail of fire on 8 January 1815 that some 2,500 British troops were killed and wounded. With only 6 Americans losing their lives and another 7 wounded, the victory was remarkable and touted as the greatest moment in the young nation's military history.

Ironically, the battle actually occurred after the peace treaty, the Treaty of Ghent, had been signed on Christmas Eve 1814. Once ratified in February 1815, the treaty ended all hostilities, but it said virtually nothing about the maritime issues that had triggered the war. For the most part, those issues had disappeared with the cessation of the Napoleonic Wars. There was no longer any reason for Great Britain to harass American ships, and the U.S. delegates at Ghent, like their counterparts, simply wanted to end the conflict. Thus, matters of impressments and violations of neutral trade were swept under the rug. Some historians state that as a result, America failed in the war. Yet one could argue that standing up to Britain and not suffering utter defeat was success for a fledging Republic attempting to steer a course around monarchical giants.

The War of 1812 lasted for nearly three years and cost the United States \$158 million. Total American deaths amounted to 17,000, though only 2,260 of these were combat deaths, the remainder caused by disease. Another 4,505 were wounded. The ultimate results of the war were myriad: the conflict revealed the limited nature of the Republican Party's policies and encouraged it to adopt many Federalist views; Republicans suddenly favored a national bank, internal improvements, and tariffs; the war marked the end of the first party system with the demise of the Federalist Party, which had opposed the war at every point and whose hostility culminated at the Hartford Convention in December 1814–January 1815; the war broke the Indian power in the Northwest and the South; and the Battle of New Orleans generated significant American nationalism—military, political, and economic. This nationalism, combined with their stance on the war, carried several politicians, such as John C. Calhoun and Henry Clay, to national prominence. The success at New Orleans also carried Andrew Jackson to the White House in 1828.

WASHINGTON, BURNING OF During the War of 1812 (1812–1815), the British raid against Washington in 1814 represented the second act of a two-part drama. The first began on 27 April 1813, when U.S. forces captured the Upper Canadian capital of York (now Toronto), torched the parliament buildings and governor's residence, stole private property, and abused civilians and wounded prisoners. York's citizens demanded revenge, and to their voices were added those of other Canadians who experienced war's traumas at the hands of often-undisciplined Americans. Some retribution ensued locally when British forces burned New York settlements along the Niagara River in December 1813 after Americans had torched nearby Canadian villages. Nevertheless, the governor-in-chief of British North America, Sir George Prevost, asked that retaliation be taken to the Atlantic coast of the United States to deter further outrages.

In 1814, once the British had defeated Napoleon and reinforced North America, they expanded operations along the Atlantic seaboard to avenge the Canadians, draw U.S. forces away from the Great Lakes front, and encourage an early end to hostilities. On 19–20 August 1814, forty-five hundred men landed at Benedict, Maryland, forty-five miles from the capital. At the same time, the Royal Navy campaigned on the Patuxent River in Maryland, causing the loss of U.S. gunboats and civilian vessels, which were either seized by the invaders or destroyed by retreating defenders. At Bladensburg, Maryland, on 24 August, twenty-six hundred British regulars and sailors led by Major General Robert Ross quickly defeated a seven thousand-man American force composed

mainly of militia under Brigadier General William Winder. As the victors marched on the capital later that day, the government and most civilians fled while American authorities burned the Washington Navy Yard, with its stores and vessels, and blew up a fort at Greenleaf's Point. Some people tried to save the nation's records and treasures but abandoned much because they had waited too long to obtain the necessary vehicles. Dolley Madison emerged as something of a hero in the popular imagination by demanding that the famous portrait of George Washington in the president's mansion be destroyed or saved rather than captured before she fled the capital. A cart was found to carry it away and so the painting continues to grace today's White House.

Aside from a few shots fired against an advanced party, the British entered Washington unopposed. They set fire to government buildings, including the Treasury, the Capitol, and the President's Mansion, and took large quantities of military supplies before starting back to their ships on 25 August. The redcoats maintained comparatively good order in respect to civilians and their property, although they burned the strategically important ropewalks and sacked the office of the semiofficial newspaper, the *National Intelligencer* (as U.S. forces had destroyed the *Upper Canada Gazette* in York). As the British withdrew, lawless Americans exploited the confusion to loot their own federal capital. Meanwhile, another part of the British expedition sailed against Fort Warburton on the Potomac, but its garrison blew it up and retreated on 27 August rather than face the Royal Navy. Consequently the British seized Alexandria, Virginia, on 29 August, took vessels and goods along the river for several days, and then sailed back to sea despite dangerous waters and fire from American batteries along the way.

The raid on Washington gave satisfaction to Canadians and added humiliation to the woes of the administration of James Madison. However, his government (like that of Upper Canada) was sufficiently resilient to return to a burned capital and maintain authority through to the end of hostilities. As in York, public buildings in Washington were rebuilt shortly after the war while Anglo-American relations entered an era of cordiality, in contrast to the tensions of 1807 to 1815.

WASHINGTON, D.C. The origins of Washington as the federal capital hark back to the events of 21 June 1783, when about three hundred soldiers, primarily of the Pennsylvania line, marched on the State House in Philadelphia (a venue shared by both the Confederation Congress and the Pennsylvania Assembly) demanding back pay. No blood was spilled, but the mutiny sparked the first public discussion of Congress's right to exercise exclusive jurisdiction over its meeting place. Between June 1783 and January 1785, Congress was "on wheels," meeting successively at Princeton, Annapolis, and finally New York. At Princeton, Congress passed a resolution creating two seats of government, one on the Delaware River near Trenton, the other on the Potomac River near Georgetown. But regional rivalries reasserted themselves, and the dual residence plan was soon abandoned.

At the Constitutional Convention in Philadelphia in 1787, the delegates crafted a federal district ("ten miles square"), endowing the national government with exclusive jurisdiction in all matters within its boundaries and with "like authority . . . for the erection of . . . needful buildings." The actual site of the "ten miles square" was left up to the First Federal Congress. The subsequent contest in New York over the location of the federal seat culminated in a dinner-table bargain struck on 20 June 1790 between Secretary of State Thomas Jefferson and Secretary of the Treasury Alexander Hamilton. To secure northern support for the removal of the federal government to the Potomac, Jefferson and his Virginia ally James Madison, the most influential member of the First Congress, accepted Hamilton's proposal that the federal government assume the states' Revolutionary War debts. The Residence Act of 16 July 1790 confirmed the compromise, designating Philadelphia as the temporary seat until 1800. On 24 January 1791, President Washington, acting in accordance with the powers given to him by the Residence Act, announced the boundaries of the federal district. In early February, Andrew Ellicott and his free black assistant Benjamin Banneker began a preliminary survey of the district, which included Alexandria,

Georgetown, and the yet-to-be-created national seat. On 24 March, after the government purchased the land from local proprietors, Washington announced the official boundaries of the federal city as covering “all the land from Rock Creek along the [Potomac] from the Eastern Branch” (today the Anacostia River) and “so upwards to or above the Ferry including a breadth of about a mile and a half, the whole containing from three to five thousand acres.”

Although Jefferson, Madison, and Hamilton are credited with the compromise of 1790, as Pennsylvania Senator William Maclay so aptly put it at the time, “It is the interest of the President of the United States, that pushes the Potowmack.” Washington envisaged the Potomac seat as part of a larger plan for national development. He believed that in addition to being centrally located between north and south, the “proximity of the Potowmack . . . to the Western Waters” would also help to strengthen the ties—commercial, political, and cultural—between the original thirteen states and the growing number of emigrants to the Ohio Valley. During his presidency and into his retirement, Washington maintained a consuming interest in the federal city. In early 1791 he hired Peter L’Enfant to draw up the official plan of the seat of government (a plan covering six thousand acres). It was Washington, however, who, after consulting with Jefferson, chose the site of the Capitol, the Executive Mansion, and the executive department buildings. In keeping with his vision of the federal seat as a commercial center, L’Enfant included in his plan a Washington City Canal as the terminus of a projected all-water route to the west.

Washington appointed three commissioners to oversee the building of the federal district and city, which they named “Columbia” and “Washington.” Unfortunately, the commissioners soon locked horns with L’Enfant—a circumstance that resulted in his departure in early 1792. Washington subsequently induced the commissioners to employ William Thornton to design the Capitol and James Hoban to design the Executive Mansion (or President’s House, as it was then known), but construction progressed slowly. There were also constant money problems. Although Washington preferred to fund the public buildings through private means, several lackluster lotteries and an ill-fated speculative venture in city lots involving his Revolutionary War ally Robert Morris forced Washington to turn to Congress in 1796. By 1800 about \$500,000 had been spent, not without criticism in and out of Congress.

In November 1800, when the federal government consummated its long awaited move to the Po-

tomac, the City of Washington numbered a little over three thousand inhabitants, almost a quarter of whom were slaves and free blacks. Continuing construction on the Capitol forced senators and congressmen to share the north or senate wing; the Supreme Court took an upstairs room. Meanwhile, President John Adams and his wife, Abigail, found that the Executive Mansion “had not a single apartment finished.” Abigail, attributing the lack of energy and initiative at the federal seat to the institution of slavery, remarked, “Two of our hardy N. England men could do as much work as twelve southerners.” Despite its shortcomings, the national city figured prominently in the presidential and congressional politics of 1800 to 1801: the Democratic Republicans accused John Adams and the Federalists of profligate spending on public buildings, including a proposal for spending \$200,000 to build a mausoleum for the late President Washington.

Thomas Jefferson, the first president to reside in the federal city during the entire length of his term, pursued a more democratic style in etiquette and protocol, doing away with the levees introduced by Washington and continued by Adams during his short stay on the Potomac. Although a firm believer in smaller government, Jefferson resisted efforts in Congress to modify Washington’s plans for the public buildings. In 1803 he convinced Congress to appropriate \$50,000 to renovate the Capitol and the Executive Mansion and hired Benjamin Henry Latrobe as supervisor of public buildings. Latrobe completed the House wing of the Capitol, which opened for occupancy in 1807, and commenced work on the colonnades extending from the east and west sides of the Executive Mansion. In addition to building roads, Latrobe was employed in 1804 as chief engineer in the revived Washington City Canal project, which had lain dormant since 1792.

The federal city encountered a number of challenges during the Republican administrations of Jefferson and his successor, James Madison. Congress’s exclusive jurisdiction over the district left the residents of the City of Washington with no right of self-government. Responding to local demands, in 1802 Congress gave Washingtonians a charter to establish a municipal corporation, although they were still denied suffrage in national elections and representation in Congress. Washingtonians did not dare protest too much, however. Citing lack of facilities, limited amenities, and poor climate, in 1804, 1808, and 1814 there were three separate resolutions in Congress to remove the national seat of government northward. The last was a response to the British invasion of

Washington in August 1814, which resulted in the burning of the Capitol and the Executive Mansion and forced Madison to flee temporarily. Among those who opposed the move was Dolley Madison, who helped convince disgruntled congressmen to remain in Washington after the burning of the city.

The surge of national pride following the War of 1812 redounded on the City of Washington. The Capitol, reconstructed under the supervision of Latrobe and, after his departure, Charles Bulfinch, impressed even the most jaded foreign visitors. Continuing on with Washington's vision, Madison also hired Hoban to rebuild the Executive Mansion. Both the Executive Mansion and the Capitol opened for occupancy in 1817. Although reduced to living in temporary quarters, Dolley Madison continued to preside over Washington social life, offering a much needed distraction for government officials, many of whom passed lonely months away from their families in boardinghouses. Still, Monroe and his successor, John Quincy Adams, incurred criticism for behaving in a manner inconsistent with republican simplicity. Andrew Jackson and the Democratic Party were swept into office in 1828, after a campaign that attacked Adams, a National Republican, for the purchase of a billiards table for the East Room of the Executive Mansion.

Yet when Jackson's delirious Democratic supporters converged on the President's House following his inauguration in March 1829, they found that the federal city was hardly the impenetrable wall of gold feared by anti-Federalists in the late 1780s. Money would flow into Washington in the form of revenues and flow back out to the states and territories via government programs. The stain of slavery in the national city no doubt discouraged private investment in the federal district. Although President Washington had hoped that growing trade would make it a magnet for northern white emigration, the fact that Washington tolerated emancipated slaves more than most southern cities made it a magnet for blacks. By the late 1820s the city's population of nearly nineteen thousand included over five thousand blacks, most of whom were freed slaves. Perhaps the abandoned Washington City Canal and the elegant Capitol best testify to the partially met dreams of the eponymous founder of the city. Many contemporaries would have agreed with the British actress Fanny Kemble that Washington was a "rambling, red brick image of futurity, where nothing is, but all things are to be" (p. 87).

Rubil Morales-Vazquez

WASHINGTON, GEORGE George Washington is rightly known as "the father of his country." No figure had a more central role during the American Revolution and early national period. Even after his death he remained the preeminent embodiment of national character. To understand the trajectory of Washington's career is to understand that of early American history.

EARLY YEARS

Washington was born 22 February 1732, the son of a wealthy Virginia planter. He received irregular schooling from the ages of seven to fifteen. His father died when he was only eleven, and he became the ward of his half-brother Lawrence, who was married to Anne Fairfax. The Fairfax family was one of the wealthiest and most influential in early Virginia, and young Washington benefited from their patronage. Washington's early years were spent as a surveyor, a profession that kindled his enduring interest in

George Washington. This mezzotint, made by Charles Willson Peale in 1787, was one of numerous portraits made of Washington during his lifetime. LIBRARY OF CONGRESS.

western land development. Lawrence died in 1752. Washington eventually became the heir to Lawrence's estate, including Mount Vernon, which would serve as Washington's lifelong home; his inheritance made him one of the wealthiest planters in Virginia. In 1759 he added significantly to his holdings when he married the wealthy widow Martha Dandridge. The couple did not have children.

Washington spent his early life as a very successful planter. He was an assiduous caretaker of his own property, often experimenting with new farming techniques. Over time, Washington shifted his farm production from tobacco to wheat, which helped save him from the crippling debt that affected so many other Virginia planters. He served in a number of local offices as well as in the Virginia House of Burgesses.

In contrast to many other Virginians, Washington, though a slaveholder, eventually charted what was a somewhat progressive path for his time. Despite eventually having more slaves than he could productively employ and their upkeep added to his expenses, he refused to sell his slaves because he did not want to break up slave families. In his will, he stipulated that all of his slaves (with the exception of

his wife's dower slaves) were to be freed upon his wife's death.

Washington gained military experience during the French and Indian War (1754–1763). He served in a number of posts, including as British General Edward Braddock's aide-de-camp; his coolness, bravery, and resourcefulness when Braddock's force was ambushed gained him the confidence of his fellow Virginians. He was eventually appointed commander in chief of all of Virginia's troops during the conflict. After the war he resigned his commission. He retired once again to life as a planter and seemed likely to finish his life as a wealthy, respected Virginia gentleman. The looming imperial crisis would change all of that and make Washington one of the most famous figures in the Western world.

THE AMERICAN REVOLUTION

After Washington resigned his commission during the French and Indian War, he tried to get a regular commission in the British army. If he had been successful, the course of the future nation would likely have been substantially different. His attempt reflected the common aspirations of elite provincial Americans for acceptance among the elite of British society. The unwillingness of British gentlemen to give their American cousins what Americans felt was their due helped sow resentments that eventually led people like Washington to choose the path of resistance.

Washington quickly showed himself to be an ardent Patriot. He was chosen to be a Virginia delegate to both the First and Second Continental Congresses and, in 1775, was chosen commander in chief of the Continental Army. His appointment was, in part, due to bargaining with the delegates from New England, who were willing to give the honor of command to a Virginian so as to tie that powerful colony firmly to the cause of Revolution, most of the burden of which New England had borne up to that point. Washington accepted the appointment and rode north to oppose the British forces that had gathered at Boston.

Washington was not a superior tactician; if judged solely by his performance on the battlefield, he was a mediocre general. He showed daring and élan with his nighttime crossing of the Delaware and his surprise attacks and victories at Trenton and Princeton, and his decisive plan to capture Lord Cornwallis at Yorktown was a model piece of strategy. But he also blundered repeatedly, most severely during the Battle of New York in 1776. He divided his force in the face of superior numbers and almost allowed his army to be trapped by the British navy. If

Life Mask. The French sculptor Jean-Antoine Houdon, who was commissioned to sculpt a statue of Washington, made a life mask in October 1785 by applying wet plaster directly to Washington's face. This engraved illustration of Houdon's mask appeared in the 26 February 1887, issue of *Harper's*. PICTURE HISTORY.

not for the British failure to follow up their initial victory quickly, the Continental Army would likely have been destroyed, and the Revolution might have ended before it had scarcely begun.

Washington's greatness lay not in his tactical brilliance but in his strength of character, which was largely responsible for holding the army together. As long as Washington could keep a viable army in the field, the Americans were, in some sense, winning the war. Washington did just that, despite tremendous challenges. His original recruits were raw, untrained colonials who often signed up for short enlistments, yet he managed to create a disciplined fighting force, even though his army was rarely supplied with the food and equipment it needed. It was said that, during the winter, you could follow the path of the army by the bloody footprints left by shoeless feet. The Continental Congress not only failed to supply him adequately but frequently complained about his generalship. Subordinates made at least two at-

tempts to displace him. Through his adroit management, he also managed to prevent a mutiny at the end of the war by disillusioned and discouraged officers. Despite all of these difficulties, Washington persevered and, by doing so, brought the army to eventual victory.

After the Treaty of Paris had been signed in 1783, officially ending the war, Washington rode to Annapolis, Maryland, and, appearing before the Continental Congress, resigned his commission. Echoing Cincinnatus, the Roman general who did not attempt to seize power but returned to his farm after leading his army to victory, Washington's gesture gained him immeasurable fame and admiration. That act alone increased his prestige as much as anything else he did in his lifetime.

PRESIDENCY

Washington knew that the work of the Revolution was unfinished. His personal experiences under the Articles of Confederation convinced him that a stronger union was the only safeguard for the future of the nation. But he himself did not expect to take part in this work. After pledging to retire from public life, he did just that and returned to Mount Vernon to repair his fortunes, which had been severely damaged by the war. But the 1780s proved a turbulent and difficult time for the new nation. At the behest of several friends, Washington eventually agreed to take part in the constitutional convention at Philadelphia. When he arrived, he was quickly elected president of the proceedings. Although he played almost no part in the debates, his silent presence played an essential role in the eventual shape of the government. Everyone expected Washington to be the first president, and thus the delegates were willing to give the office powers that they would never have bestowed on another man. In addition, his prestige was essential to the eventual ratification of the Constitution. Although many were frightened by the additional powers being given to a central government only a few short years after concluding a war against another centralized power, a great many of those people trusted Washington to pursue a moderate course.

After the document was ratified, Washington was unanimously elected to the presidency and, as he traveled north to New York City, was met by cheering crowds along the way. When he arrived, he and others had to invent a new government almost from whole cloth. The Constitution is remarkable for its brevity, and many of the crucial details of governing had to be established.

Washington at the Smithsonian. This collection of personal items belonging to George Washington was given to the U.S. government after Washington's death. The collection was displayed at the Patent Office until 1883, when it was transferred to the Smithsonian. PICTURE HISTORY.

One of Washington's first tasks was establishing what sort of tone he would take as president. No one was certain how a chief executive should be treated in a republican government. He was not a king, but neither was he a common man. Washington eschewed some of the trappings of high office: he expressed a preference for a simple title, "Mr. President," rather than some of the elaborate titles proposed. But he limited his availability to the public to weekly receptions. He also wore a sword and rode in a carriage and four. He attempted to establish a proper sense of dignity for the office; but some began to whisper against him, seeing his actions as signs of creeping royalism.

During his two terms (1789–1797), although Washington tried to keep himself above partisan disputes, he leaned more and more heavily to the side of the Federalists, supporters of the administration who advocated a stronger central government and a

more deferential society, as well as a foreign policy that favored Great Britain. He backed Secretary of the Treasury Alexander Hamilton's financial plans, including the assumption of state debts and the creation of a national bank. He insisted on neutrality when war broke out between Great Britain and the newly republican France despite America's original treaty with France (1778), which had promised perpetual alliance. These actions and others earned him the enmity of the Republican Party, which had emerged in opposition to the Federalists. He found himself the butt of vicious partisan attack in the newspapers. For someone who considered himself above party, who longed for retirement, and who worried constantly about his reputation, this partisan controversy was galling.

Even after retiring to private life, Washington was called on one more time to be commander in chief of the provisional army in case of a possible war

with France, although in the end war was avoided. He died on 14 December 1799, an appropriate date for a man who was so thoroughly of the eighteenth century.

NATIONAL SYMBOL

After his death, Washington's symbolic importance to the nation remained. Freed from the partisan bickering that had dogged his final years, he quickly became not just father to his country but a role model for its people. During his lifetime, Washington unavoidably became entangled in the nation's political divisions; but Washington as symbol served a unifying role. No one played a more important role in re-fashioning his character to fit the new political realities than Mason Locke Weems, an itinerant preacher and bookseller—and inventor of the story of young George Washington and the cherry tree—who wrote the astoundingly popular *Life of Washington*. Weems remade Washington as a common man who could serve as a proper role model for the nation, and this formulation provided the grounds for future generations' veneration. Throughout the history of the United States, Washington has continued to serve as a symbol for the nation and its ideals. Although his eighteenth-century manner now seems stiff and foreign to us, he remains the symbolic father of his country, the indispensable man.

preeminence, it is waterpower that provided the foundation for the nation's industrial successes. New England's abundant waterpower sites—combined with an increasingly sophisticated understanding of how to apportion and capitalize on the power at those sites—enabled the young nation to evolve into an emerging industrial giant.

COLONIAL BEGINNINGS

The image of the lazily turning waterwheel—a favorite image in eighteenth-century depictions of country life—belies the convergence of sophisticated technology and natural forces embodied in the watermill. The use of shafts and gearing to transmit power, the choice of site (close to a suitable drop in stream or river level, and near enough to woodland that rainwater runoff is gradually dispensed into the watercourse), and the building of other structures such as flumes, dams, and storage ponds (to sustain operability at times of lower water)—all speak to the miller's understanding of how technological elements and natural processes could interact to perform useful work. This is not to say that the integration of mills into the environment was seamless: the building of dams caused disruption of fish migrations and often caused flooding of upstream farmlands.

Waterpower technology was also enmeshed in community development. Mills were among the first structures built in a community; in fact, it was a potential mill site that often prompted the establishment of a settlement. The building of watermills was driven by fundamental issues of food and shelter—the grinding of grain and the preparation of wood for construction. The colonial gristmill, whether wind or waterpowered, was a natural continuation of English mill practice; the colonial sawmill owed more to practice in continental Europe. Waterpower was also employed to drive fulling and carding machines as well as bellows and trip hammers in the metal trades.

SCALE AND REFINEMENT

By the close of the eighteenth century, the self-sufficient rural community was appreciated as a kind of American ideal—sharply contrasted to the blighted industrial towns of northern England. This ideal was seductive but barely tenable given the former colonies' continued reliance on many imported materials; it became an impossibility following the 1807–1809 trade embargo with France and England. The mill equipped by Samuel Slater (1768–1835) in Pawtucket, Rhode Island, in 1790 was the first siz-

WATERPOWER Despite the vivid association of steam power with the United States' manufacturing

able application of modern English textile manufacturing machinery in the New World. Slater's mill was a centrally powered, interdependent group of machines that converted cleaned cotton into spun yarn. The mill's structural materials, power source, and construction methods were all traditional, but its equipment and interconnectedness placed it at the cutting edge of American industrial development. Slater's expertise, rooted in a passive form of industrial espionage (as an apprentice in England he had become familiar with Richard Arkwright's textile machinery) underpinned the building of further mills: a larger installation for Oziel Wilkinson and Moses Brown in 1792, and then several of his own. It should also be noted that Slater's success derived to a great degree from the employment of children—a course of action that was appealing not only in terms of the low wages they could be paid but also for their ability to move about within cramped mechanical installations.

The basic understanding of watermill machinery—derived from European practice and to a certain degree perhaps intuited—moved forward significantly during this period, impelled for the most part by *The Young Mill-Wright and Miller's Guide* by Oliver Evans (1755–1819). First published in 1795, this work combined surveys of various mills, tables of calculations, and explanations of building methods, and was in some ways a written accounting of what had been up to that time an essentially oral tradition. But this publication was not simply rooted in practical experience—it also included full explanations of Evans's own groundbreaking work in mechanically integrated mill design: the gristmill as a multistory, building-sized, elevating, conveying, grinding, sifting, and bagging machine—all of it centrally powered. The *Guide* remained a popular reference into the mid-nineteenth century and undoubtedly played a major part in the proliferation of American watermills (from approximately 7,500 in 1790 to 55,000 in 1840), many of them built on the Evans principle.

The most advanced application of waterpower during this period was the installation begun adjacent to the Pawtucket Falls on the Merrimack River, in Massachusetts, in 1821. The roots of this development lay in Francis Cabot Lowell's 1813 mill in Waltham, Massachusetts, which was the first factory capable of processing cotton from its raw state through to finished cloth. The workforce at this factory consisted of young farm women, boarded in company buildings next to the textile mills. This approach, later known as the Waltham system, allowed for the concentration of a large workforce

close by a factory; frequent turnover avoided the creation of an entrenched proletariat. The Pawtucket Falls site was named for Lowell, who had died in 1817. A carefully planned network of power canals was built in stages. Alongside these canals independent companies could build mills, and power, measured in "mill powers," was leased from the owners of the canal system. By 1836 twenty-six textile mills, plus additional workshops, had been established on the site. Lowell not only placed the United States at the forefront of waterpower development but also laid the groundwork for New England's preeminence in machine tool building. A generation of mechanics and engineers were trained in the on-site machine shops built to maintain Lowell's textile machines, and the methods developed in these shops drove American mechanical engineering to new levels of accuracy.

At the close of this period the Lowell system was still under expansion, but its scale and sophistication had already placed it far beyond the subsistence-based mills that characterized waterpower in the mid-eighteenth century. It should be noted, however, that rudimentary mills were still being built in pioneer communities, indicating that the advancement of waterpower technology did not necessarily end the use of primitive forms and modest solutions. And inevitably Lowell shared many of the problems of these sites: a site defined by geography rather than proximity to markets, predictable disruptions from freezes and freshets, the unpredictability of floods and droughts—in short, the types of problems inherently associated with the use of a natural power source, regardless of the ingenuity employed.

WATER SUPPLY AND SEWAGE Fresh water supply and waste water disposal were much the same in both urbanizing and rural areas in early America. Most inhabitants of the largest cities took fresh water from local wells or springs and disposed of waste in the nearest convenience: privies, streets, or rivers. The beginnings of modern water supplies from distant sources emerged at the turn of the nineteenth century in those cities where natural supplies became inadequate, unhealthy, or both.

After 1800 New York became the most populous city, but its sixty thousand people, clustered at the low southern tip of salt-ringed Manhattan Island, still relied on hundreds of public street wells, which had always been hard or brackish and were increasingly polluted. For six decades beginning in the 1740s, many New Yorkers had paid for "tea water" carted from a privately owned pump over a suburban spring just south of today's Chinatown. The quality of the Tea Water Pump declined precipitously around 1800 as habitation encroached. After the most devastating of the city's regular yellow fever epidemics killed two thousand people in 1798, Aaron Burr formed the Manhattan Company, ostensibly to pipe water from the mainland Bronx River. Through Burr's own influence as a state assemblyman, the company received a liberal state charter, including monopoly water rights and unprecedented banking privileges. Instead of pursuing the costly and technologically challenging Bronx plan, the company built a small reservoir and deep well fed by the same subterranean sources of the nearby Tea Water, laid a haphazard network of leaky hollowed pine-log pipes, and opened a bank, which flourished and thrives today as J. P. Morgan Chase. The growing city's water problems only worsened for three decades. After a devastating cholera epidemic in 1832, which killed 3,500, and a disastrous fire in 1835, city and state leaders united to build an aqueduct from the Croton River forty miles north in rural Westchester County. The gravity-fed Croton Aqueduct, completed in 1842, became the model for urban public water supplies and remains a component of the city's now vast water infrastructure.

Philadelphia, situated between two fresh rivers, had better wells and early water fortunes. In 1798 Benjamin Henry Latrobe conceived an ingenious public supply that raised water by steam engines from the Schuylkill River; the Centre Square Waterworks proved costly and inefficient but gave rise in 1811 to the Fairmount Waterworks on high ground a mile upriver. Put into operation in 1815, Fair-

mount by 1830 was world-renowned for its neo-classical waterworks buildings and river-powered waterwheels, which raised two million gallons of water a day into reservoirs for distribution by the first cast-iron pipe in the country. By 1837, 1,500 Philadelphia households had become the nation's first to have bathrooms with running water.

Boston, like New York, initially cast its lot with a private company, incorporated in 1796 to pipe water by gravity from nearby Jamaica Pond. Forty years later, the company sporadically supplied only 1,500 homes, at a time when a quarter of the city's 2,700 public wells were deemed foul. An adequate public supply was not completed until 1848, when an aqueduct brought water twenty-five miles from Long Pond. Baltimore, which overtook Boston as the nation's third-largest city at the opening of the 1800s, was supplied by excellent local springs and a civic-minded private company that operated a complex suburban pump works. Watering New Orleans, the country's fifth-largest city through the early 1800s, proved a deadly task. In 1811 Benjamin Latrobe secured the exclusive privilege of supplying water by steam engine from the mucky Mississippi, but yellow fever killed both Latrobe and his son Henry before the works' completion. Outdated when the city completed them in 1822, the works survived into the late 1830s when a private company built an expanded system. In Cincinnati, incorporated in 1819, a local association in the 1820s laid a tunnel from the Ohio River to a well on shore from which steam engines pumped water into reservoirs for distribution by gravity in iron mains and oak pipes. The city took over the works in 1839.

Smaller communities developed simpler water supply systems. Completed in 1755, the first pumped water supply in America served the Moravian settlement around Bethlehem, Pennsylvania, into the 1830s. Just before the Revolution, two private water companies briefly supplied Providence, Rhode Island, with water piped by gravity from springs a mile distant.

In communities large and small, sewage planning and sanitation generally lagged far behind fresh water solutions. When fresh water came from local sources, per capita consumption was only several gallons a day; when abundant distant waters were brought, per capita use jumped into the tens and eventually hundreds of daily gallons, and the waste issue became pressing. The words sewage and sewerage were not coined until 1834. New York did not start building underground sewers until the 1850s. Far beyond the early American period, waste disposal

was mired in centuries-old solutions: the general citizenry disposed in backyard privies and street gutters; municipal scavengers carried or carted to proximate rivers and outlying dumps.

WEALTH As used here, wealth is synonymous with net worth, the value of an individual's assets (things owned) minus the value of his or her liabilities (things owed). Individuals with an unusually high net worth, like George Washington and Robert Morris before 1790 or so, were "rich" or "wealthy."

In the new American nation, assets tended to be quite visible. Sums that individuals owed to others were relatively difficult to discover, however, so many early Americans who owned considerable assets, but who owed equally considerable debts, were incorrectly identified as wealthy. Thomas Jefferson and Robert Morris after about 1790 are prime examples. Only with painstaking research, and a good deal of luck, can scholars be certain that particular individuals were indeed wealthy and not merely credit-worthy. Usually, only a careful review of a subject's probate records can conclusively demonstrate that the value of his or her assets greatly exceeded the value of his or her liabilities.

LIABILITIES

In the colonial and early national periods, liabilities consisted largely of various types of debts: book accounts, promissory notes, drafts, bills of exchange, bonds, and mortgages. The vast bulk of colonial and early national economic transactions were conducted via book account rather than with cash. As the name implies, book accounts were accounting notations made in books. The notations tracked the value of goods or services received and given over a period of weeks, months, years, or even decades. Farmer Brown, for example, credited the account of day laborer Obadiah Smith for thirty-seven days of work and fifty-five cords of wood. Brown debited Smith

for the food, liquor, tobacco, shoes, clothes, and other goods that Smith received from him. Book account entries referenced the money value (in local pounds or dollars) of the traded goods, so scholars err when they claim that Americans in this period engaged in barter. Cash payments were indeed rare, sometimes made only on the balance due at the end of an exchange relationship, but the goods and services traded were almost invariably assigned a money price.

Promissory notes and drafts were short-term IOUs. Unlike book accounts, they were readily transferable from person to person and often made explicit promises about repayment dates and interest charges. Drafts and their foreign exchange equivalent, bills of exchange, were used like modern-day checks to transfer funds to distant persons. They could also be used to borrow for a few weeks or months.

Bonds were IOUs for significant sums and long terms, typically one year, with the holder maintaining an option to "call" the principal thereafter. Bonds almost always stipulated the payment of interest and stiff penalties in case of default. Like IOUs, they were negotiable or transferable to new parties. They differed from mortgages in only one important respect, namely that mortgages offered a specific piece of real property as collateral for the loan.

The fact that creditors could call for the principal of a bond or mortgage after the maturity date helps to explain the angst felt by many early Americans regarding indebtedness. Borrowers suffered the existence of such onerous terms because lenders insisted on them. Usury laws capped the legal interest rate too low, well below the usual market rate. Lenders therefore demanded valuable concessions, like call provisions and stiff default penalties, to compensate them enough to induce them to lend at the legal rate.

Calls for repayment usually came at the worst time, during economic slumps. Delinquent debtors were often sued for the principal, unpaid interest, and damages; they usually lost. If they could not pay the judgment, the sheriff seized their real or personal property, or both, and tried to sell it at auction. If the judgment remained unsatisfied, the debtor could be imprisoned for being bankrupt, that is, having negative wealth. Only at the end of the period did debtors' prisons begin to disappear from American life.

ASSETS

One person's liability was another person's asset. A bond, for example, was a liability of the borrower but an asset for the lender or subsequent owners of

the bond. In closed economies, therefore, the value of financial assets and liabilities exactly cancelled each other out. The liabilities of many early Americans, however, were owned by foreign investors, primarily in Britain and Holland. A Philadelphia merchant, for example, might owe several Liverpool merchants on account and a large bond to a London capitalist. A New York patron might owe a mortgage on one of his estates to a consortium of Dutch investors, while a Virginia or Mississippi planter might be in hock to a British tobacco or cotton factor. In the period under study, net financial claims were usually negative. In other words, Americans owed more to foreigners than foreigners owed to Americans. Individual Americans, nevertheless, could hold a significant percentage of their assets in the form of financial claims. In 1774 about 17 percent of colonists' total assets were financial. The share of financial assets as a percentage of all assets grew over the period, especially after the financial revolution spurred by Alexander Hamilton in the 1790s.

Physical assets like land, buildings, ships, slaves and indentured servants, livestock, tools of the trade, and personal and household items such as clothes, furniture, and cookware were the preferred assets of most early Americans. In 1774 about 55 percent of colonists' nonfinancial assets were invested in land, 20 percent in slaves and servants, 10 percent in livestock, and 15 percent in producer and consumer goods. Aside from land, which was important everywhere, tremendous regional variations existed. In 1774 slaves composed a much higher percentage of assets in the South than anywhere else and livestock and producer goods predominated in the middle colonies, while New Englanders invested relatively heavily in consumer goods. Over the entire period, occupation dictated the proportion of assets held: farmers owned mostly land and livestock; planters held land and slaves; artisans and manufacturers held producer goods and buildings; and merchants owned ships, buildings, financial assets, and consumer goods. Similarly, region, occupation, and age largely determined the aggregate value of an individual's assets.

WEALTH ACCUMULATION

Most early Americans accumulated wealth by buying or producing low, selling high, and avoiding the converse. Merchants and retailers sought to buy low in one market, or at one time, for resale at a higher price in another market, or at a later time. Physiocratic notions of the sterility of commerce induced many early Americans to look down upon such activities, but they were important to the economy

nevertheless. Just as crucial were the activities of artisans and farmers, which added value to goods by transforming them. Ironworkers, for example, turned labor, iron ore, wood, and other raw materials into useful products like stoves, musket balls, and horseshoes. Milliners transformed cloth, thread, ribbons, and other fineries into fashionable dresses. Farmers turned land, labor, and seed into wheat, apples, and pigs. Farmers' wives ultimately made butter from the corn and grasses fed to their milk cows. Similarly, professionals created value by adding their expertise to goods, as when a midwife used her experience to help a mother give birth, or an accountant used his mercantile training to create order out of a jumble of accounts. In all of those cases, if the sale price of the output exceeded the costs of all the inputs, the net worth of the producer increased. If costs exceeded the price, the producer's wealth decreased.

Some Americans seeking easy riches engaged in what modern economists call rent seeking. Basically, that entailed obtaining valuable assets, usually land or corporate charters, from the government gratis or at bargain prices. Sundry land companies, including the Scioto and Yazoo, were tainted by such insider scandals which smacked of old world nepotism, favoritism, and corruption. Other early Americans eager for quick riches engaged in outright theft, fraud, or counterfeiting. Sometimes such activities paid off handsomely, but often they ended in shame, imprisonment, or death. Some individuals inherited their fortunes. Rent-seeking activities, theft, and gifts did not create new wealth, of course, but merely transferred it to new owners.

Early Americans naturally resented those who accumulated wealth through gift or graft. Many believed that high net worth individuals like Philadelphia merchant-banker Thomas Willing (1731–1821) or New York furrier-speculator John Jacob Astor (1763–1848) must have obtained their wealth through illicit or at least unethical means. America's rich, who were not so numerous nor opulent as in Europe, responded by asserting that their wealth stemmed from luck and pluck, not theft, inheritance, or government favor. Importantly, most early Americans aspired to increase their personal net worth at least enough to become "comfortable" or "independent," so that no matter what they thought of Philadelphia merchant-banker Stephen Girard (1750–1831) or New York's land-rich Van Rensselaer or Livingston clans, they generally disdained wealth redistribution schemes.

Ambivalence towards wealth had deep religious roots too. Christianity, particularly the Protestant

varieties that permeated early America, espoused the virtues of asceticism and poverty but also gave impetus to Lockean views toward property acquisition and Weberian attitudes toward hard work. It is not surprising, then, that some members of the most pious sects, including the Quakers, were among the early nation's wealthiest individuals.

WEALTH DISTRIBUTION In *Albion's Seed* (1989), David Hackett Fischer described early regional differences among the four waves of English colonists that swept into America regarding the appropriate distribution of wealth. While the Puritans believed wealth was a sign of divine grace and poverty a signifier of depravity, they also passed sumptuary laws (which tried to regulate extravagance in dress or personal habits). They reproduced from England a predominantly rural, middle-class culture ruled by an elite bound by blood and marriage. The Quakers, too, preferred a public display of austerity but brought many servants (and thus more poverty) with them. The raucous Scots-Irish established a more aggressive form of rural individualism on the western frontier, battling each other and the Native Americans with equal enthusiasm. After initially re-

lying upon indentured servants to grow tobacco, the aristocratic Cavaliers created a slave economy based upon race.

Slavery demonstrates the need to define “wealth” as more than immediate material well-being. Over the coming centuries, many slave owners provided some or all of their slaves with more creature comforts than many workers and servants received elsewhere in America or in England, but the slaveholders often sexually exploited their victims and destroyed families by selling off family members. The wives of the elite lived a life of luxury and had great power over servants and slaves, but women had few legal rights anywhere in the colonies and even less access to employment outside the home. Native Americans consistently lost wealth (despite obtaining access to western conveniences), population, and power. Overall, the four cultures of rural English capitalism created a more powerful political economy than their French or Spanish rivals, who never generated as many colonists and who generally preferred to gather beaver skins and mine gold and silver. Ironically, the continuing political and religious chaos in England made its colonies stronger as members of various losing factions fled to the New World.

GROWING CONCENTRATION

Despite the initial differences among the British colonists, the four economies had much in common: in every colony the wealthy—unified not just by capital but also through extensive intermarriage—ran the government. For instance, two-thirds of New Jersey's 256 assemblymen between 1703 and 1776 were among the wealthiest 7 percent of the population. In the South the elite relied upon two forms of capital: land and slaves. By the eve of the Revolution, the richest 10 percent of Virginia's population had increased its share of the colony's wealth from 40 percent (starting in the middle of seventeenth century) to 70 percent (ending just before the American Revolution). All the colonial legislatures facilitated the transfer of open land to the powerful. By 1774, virtually all colonial lands were in private hands. Although the colonists had yet completely to conquer the frontier, their most powerful members already owned it. In her article “A New Look at Long-Term Trends in Wealth Inequality in the United States” (1993), Carole Shammas describes the distribution of wealth in 1774; her results demonstrate not only the economic weakness of women, slaves, and Native Americans, but also of many white males and a few unmarried females. The top 6 percent of the white male population controlled 59 percent of the wealth,

while the bottom 60 percent had less than 10 percent. The rich and powerful gained more land when smaller farmers succumbed to debt. These reallocations of wealth help explain Shays's Rebellion (1786–1787) and Rhode Island's attempts to protect debtors by altering the terms of existing contracts and inflating its currency. The response of Fisher Ames, a Federalist Party leader, was eloquent:

We shall see our free Constitution expire, the state of nature restored, and our rank among savages taken somewhere below the Oneida Indians. If government do worse than nothing, should make paper money or a tender act, all hopes of seeing the people quiet and property safe, are at an end. Such an act would be the legal triumph of treason.

THE CONSTITUTION AND HAMILTON'S PLAN

These class tensions provided a major impetus for creating the new Constitution. James Madison explained in *The Federalist* that majorities were most likely to tyrannize either religious minorities or the wealthy. Wealth was important not just for the individual, he argued, but also for society: people should be encouraged to develop their faculties and the opulent provided an inspiring role model. Alexander Hamilton believed that the nation needed access to capital in times of crisis. Some anti-Federalists portrayed the Constitution as a plot to oppress the poor, but the country quickly rallied around the new system. After all, there were rich and poor on both sides of the debate—a fact that significantly undercut the famous claim of Charles Beard (which he later repudiated) in *An Economic Interpretation of the Constitution* (1913) that the Constitution was a simple plot by holders of depreciated governmental debt to cash in their holdings.

The general consensus over the Constitution's legitimacy did not resolve the enduring question of wealth distribution. Whether they relied upon principle or were motivated to undercut their rival Alexander Hamilton, Thomas Jefferson and James Madison unsuccessfully fought Hamilton's plan for the new federal government to fully reimburse existing holders of state and federal debt. The Virginians took a more communitarian approach: some of the proceeds should go to the soldiers who fought and suffered during the war and received worthless scrip at the time—not all the windfall profits should go to speculators, many of whom had recently purchased the debt instruments from unknowing veterans. While Benjamin Franklin and Jefferson always worried that excessive concentration of wealth would undermine the Republic, Hamilton saw an alliance between

the wealthy and the national government as a key component to future national greatness.

WEALTH AND A DEMOCRATIC ETHOS

While the Constitution provided significant protection to the wealthy; it could not protect the status quo of an entrenched, informal aristocracy. A more egalitarian ethos, based upon the principles of the American Revolution, quickly extended universal suffrage to all white men. The average white male was not content with the right to vote. Andrew Jackson's rise to the presidency from the hills of Tennessee confirmed a new consensus about the distribution of wealth and power: white males from any background had an equal opportunity to become as rich (and as poor) as possible. The debate over slavery, which temporarily exploded in 1820 during the Missouri crisis, was deferred to a later, bloodier day, while Native Americans continued to suffer. Manufacturers began to emerge as a new elite that would transform the northern economy. However, these seismic developments obscure the continuing realities that most wealthy individuals were sons of prosperous or powerful families and that relatively few lower-class citizens could rise more than one rung in the social ladder during their lifetimes. It is difficult to find reliable data on wealth distribution during this period, which the economic historian Diane Lindstrom, in her article "Macroeconomic Growth" (1983), described as the "statistical dark ages" (p. 704). Nevertheless, she concluded that per capita income increased at approximately one percent per year from 1800 to 1840. Nor is there any indication of an interruption in the long-term trend of increased wealth disparity during the early nineteenth century: the top 5 percent of the population enhanced its share of the nation's bounty from 59 percent of the wealth in 1774 to 86 percent in 1860.

WEIGHTS AND MEASURES The colonists who came from England, carrying with them to North America their language, religious beliefs, and culture, also brought their system of weights and measures. This system had developed in an organic, unregulated fashion for centuries, some of the units and their names dating from before the Norman Conquest of 1066. Examples included the rod (16½ feet), furlong (40 rods), and acre (160 square rods). By the time of the first settlements in the early seventeenth century, the system of length measures had become stable and well-defined for the purposes of commerce, with its units close to those used four hundred years later. The official English standard yard bar made in 1588, for example, is only 0.01 inch shorter than the yard of the twenty-first century. The statute mile of 5,280 feet was so defined in England in 1593 and seems to have been adopted readily in the colonies.

Two parallel systems of weight were brought over. Troy weight, the older one, was used only for gold and silver and, with somewhat different subdivisions (apothecaries' weight), for drugs. For all other commodities, the avoirdupois system came into wide use in the fourteenth century and remains the customary system. Like the length units, the

weight units were relatively stable and well-defined, both the colonial and the U.S. standards being in principle based on official standards of the English exchequer until 1893.

The system of capacity in England was less orderly. There were several gallons and bushels, originating from old statutes that defined them with insufficient precision or clarity. The legal definitions often did not agree with the measures actually in use, and it was difficult to make the latter with sufficient accuracy. There was confusion between dry measure and liquid measure. Furthermore, in the case of dry measure, a bushel of wheat, for example, might in some cases be measured heaped and in others "struck" (with a flat upper surface).

STANDARDS IN AMERICA

The individual colonies generally adopted as the legal standard for liquid measure the Queen Anne wine gallon, defined by British law in 1706 as 231 cubic inches. The beer gallon (282 cubic inches) was used concurrently, but it seems to have gradually yielded to the wine gallon and by 1821 was going out of use. For dry measure, the usual unit was the Winchester bushel (legally defined in 1696–1697) of 2,150.42 cubic inches (the contents of a cylinder 18½ inches in diameter and 8 inches deep). But there were anomalies. Connecticut, until 1850, maintained its legal bushel equivalent to 2,198 cubic inches. Kentucky's was in 1798 defined to be 2,150⅔ cubic inches.

By the mid-eighteenth century the individual colonies had laws making the exchequer standards their own. They had acquired official copies of them, and had ordered their counties and towns to obtain their own copies for testing the weights and measures of merchants. Although there is no evidence of conflict or dissatisfaction with these provisions, as soon as the colonies united, the Articles of Confederation transferred to the national government "the sole and exclusive right and power of . . . fixing the standard of weights and measures throughout the United States." The Constitution likewise gave Congress the power to "fix the Standard of Weights and Measures."

Jefferson's proposals. The new nation promptly adopted an innovative decimal money system worked out by Thomas Jefferson, but the federal government hesitated in dealing with weights and measures. At its request, Jefferson in 1790 developed two proposals "for Establishing Uniformity in the Coinage, Weights, and Measures" of the nation. The first was to define the foot already in use in terms of the length of a special pendulum; fix the gallon arbi-

JEFFERSON'S DECIMAL SYSTEM OF WEIGHTS AND MEASURES

Thomas Jefferson's 1790 "Plan for Establishing Uniformity in the Coinage, Weights, and Measures of the United States" proposed that the standard of length be based on "a uniform cylindrical rod of iron" making one-second swings. The more radical proposal in his plan defined a new foot as exactly one-fifth the length of the pendulum, with a new system of other units based on it, all subdivided and multiplied in a strictly decimal fashion. In the table below, each unit in a section is ten times as large as the one preceding. Equivalentents in the second column are given in terms of the customary system (unchanged since Jefferson's time), slightly rounded from his figures.

Unit	Equivalent
<u>Length</u>	
Point	0.01174 inches
Line	0.1174 inches
Inch	1.174 inches
Foot	11.74 inches
Decad	9.787 feet
Rood	97.87 feet
Furlong	978.7 feet
Mile	9787 feet
<u>Area</u>	
Hundredth	95.69 square feet
Tenth	957.9 square feet
Rood	9579 square feet

Double acre	2.199 acres
Square furlong	21.99 acres

<u>Capacity</u>	
Metre (cubic inch)	1.62 cubic inches
Demi-pint	16.2 cubic inches
Pottle	162 cubic inches
Bushel	0.9375 cubic feet
Quarter	9.375 cubic feet
Last or double ton	93.75 cubic feet

<u>Weight</u>	
Mite	0.04102 grains
Minim or demi-grain	0.4102 grains
Carat	4.102 grains
Double scruple	41.02 grains
Ounce (weight of one cubic inch of water)	410.2 grains = 0.9375 ounces avoirdupois
Pound	0.58596 pounds
Stone	5.8596 pounds
Kental	58.596 pounds
Hogshead	585.96 pounds

<u>Coins</u>	
Dollar (weight: 1 ounce)	410.2 grains total (11/12 silver alloy)

Roger E. Sherman

trarily at 270 cubic inches, with all the other capacity units to correspond; and define the ounce as the weight of one-thousandth that of a cubic foot of water. Except for the abolition of troy weight and the adjustment of the capacity measures, this plan in practice would have involved minimal change.

Jefferson's more radical second plan was to extend the decimal principle that had already been successful in the coinage. All the units, would be changed, although they would retain the names of the closest old ones. (See sidebar.) The new foot, for example, one-fifth the length of Jefferson's pendulum, would be 0.978728 old feet, and the new inch, one-tenth of the foot, would be 1.174 old inches. A few new terms would be introduced, such as the "decad" (10 feet), the "metre" (1 cubic inch), and the "kental" (100 pounds). By a very slight adjustment

in the silver content of the dollar, Jefferson was able to make his system combine elegantly with the existing decimal money system, so the dollar coin would weigh exactly one new ounce.

Congress adopted neither proposal, setting a pattern of reluctance to exert its power to fix weights and measures that has continued ever since. One reason, no doubt, was that France at this very time was developing the metric system and in Great Britain, too, reforms were being discussed. American legislators waited to see the results. The metric system progressed slowly and was adopted by few other countries, and the British did nothing. For a quarter-century after Jefferson's report, the American states awaited action by Congress, but in the meantime they passed their own laws, mostly setting standards for the size of barrels. In 1814 Louisiana abol-

ished its old French measures and adopted the English ones; six years later, though, the transition was still incomplete.

Up to this time the government had been concerned with weights and measures exclusively in their relation to trade and commerce. But when Ferdinand Hassler was sent to Europe in 1811 to buy precision instruments for the geodetic operations of the Survey of the Coast, scientific considerations became significant. Hassler obtained accurate copies of the British yard and the meter, and one of his meter bars became the de facto standard of the Coast Survey, not being supplanted until 1890.

John Quincy Adams's report. In 1817 the Senate and in 1819 the House asked Secretary of State John Quincy Adams to prepare "a plan for fixing the standard of weights and measures." After a thorough and thoughtful investigation that duly appraised the advantages of the metric system, Adams in 1821 recommended even less change than Jefferson's conservative plan. The government, Adams declared, should specify the standard of length to agree with the British one, define the avoirdupois pound according to the existing relation that thirty-two cubic feet of water weigh two thousand pounds, keep the corresponding troy weights, and keep the existing wine and ale gallons and bushel.

But Adams went beyond Jefferson in several important respects. He recommended that physical standards of the units be made and that official copies be distributed to the states. The government should consult with foreign governments to work toward a universal system and correlate the meter to the foot, he suggested. Finally, Adams collected data showing that the standards used in the customhouses varied significantly from each other.

Government response. For several years, Congress failed to act on Adams's straightforward suggestions. The Treasury, however, concerned about the standard of weight for coinage, obtained a certified copy of the British troy pound, and in 1828 an act of Congress made it the official standard for the U.S. Mint. This was the first true exercise of Congress's power to fix standards and a sign that the legislators were at long last ready to grapple with the entire problem.

Disturbed by the evidence of discrepancies in the customhouse standards such as had been revealed by Adams, the Senate in 1830 ordered an investigation. Hassler was called in to carry it out. He duly reported embarrassing irregularities and, with the support of the Treasury department, began working energeti-

cally to correct the situation. Hassler's efforts—resulting in the establishment in 1836 of the Office of Weights and Measures, the fixing of standards based on those he had brought from Europe, and the dissemination of accurate secondary standards to the customhouses and states—marked the beginning of a new era in the story of the weights and measures of the United States.

WELFARE AND CHARITY Attitudes toward, and treatment of, the poor in colonial and early national America had obvious English origins. Assistance on both sides of the Atlantic was provided only to the so-called "impotent poor"—the elderly, sick, disabled, and orphaned, who were unable to care for themselves. Among healthy adults only widows with small children received public support. Men were expected to find work to support their families. As in England, poor taxes—taxes levied on the local population to fund poor relief, where the tax was on property, not income, so it was generally paid by the wealthy—were raised locally, but only in the South were Anglican parish vestries the preferred administrative body. Elsewhere, town councils, county courts, and orphan courts administered poor relief. The day-to-day distribution of relief was normally delegated to Overseers of the Poor, to whom the poor would apply for assistance. These men made judgments about the worthiness of individual paupers to receive relief not solely on the basis of need; they also

took into account the reputation and moral character of the applicant. Those who were thought to have brought their poverty down on themselves, perhaps through promiscuity or through drunkenness, might be refused aid altogether or receive a lesser amount than those deemed to have led a blameless life (the “deserving poor”).

In general, as compared to England, less emphasis was placed on settlement laws in America, whereby poor relief was available only to those born locally or long-term residents and not to transients or immigrants. In some wealthy southern communities with relatively few paupers, relief policies might even be described as generous. By contrast, some New England communities went to great lengths to deny as-

sistance to those such as recent arrivals or residents of neighboring towns who were deemed to be the responsibility of others. Among those most likely to be “warned-out” (a formal process that indicated to the community that a particular individual would not be eligible for assistance) were nonwhites: free blacks and those of Native American descent. This restriction of relief to whites who were well-established residents therefore helped to foster a sense of community identity among those who were eligible for aid and to marginalize those who were not.

With the ending of the formal link with Great Britain in 1776, the involvement of Anglican parish vestries in poor relief ceased. But in general the welfare policies of the colonial period were continued in

the early Republic. The vast majority of public paupers received “out-door relief,” goods or cash that enabled them to either feed and clothe themselves or to pay for board and nursing care provided by a third party. In order to keep down costs, rural authorities sometimes auctioned the poor to those who required the least public subsidy to keep them, a practice that allowed some individuals to make their living by caring for public paupers. However, the rapid growth of cities in the eighteenth century brought a commensurate increase in the numbers of paupers, many of whom were immigrants, concentrated in a small area. Authorities in the largest cities gradually determined that the only way to cope with these increases was to open poorhouses. Boston, New York, and Charleston all had such institutions by 1750. However, in the last decades of the eighteenth century and the first decades of the nineteenth century, the trend toward institutionalization accelerated, and many more poorhouses were built—for example, in Baltimore (1773), Savannah (1809), Wilmington (1811), and Mobile (1824)—and for the first time public hospitals were opened—for example in Philadelphia (1752), New York (1790), Natchez (1805), and Boston (1821). These institutions served two functions: they were intended to be cheaper to run than the out-door relief system, and so save the money of local taxpayers; and they were supposed to reduce the visible number of paupers and beggars on the streets that detracted from a vision of American prosperity that many city authorities wished to project.

Once in the poorhouses paupers were subjected to strict regimens of cleanliness, morality, and education. The managers of these institutions hoped that the poor would be reformed by this experience and, after a short period inside, would be able to live independent and productive lives. Despite the high hopes for institutionalization, it was actually more expensive than out-door relief because salaries had to be paid to matrons, doctors, and poorhouse keepers and new buildings financed. Moreover, poor people showed a marked reluctance to go to the poorhouse. The willingness of Overseers of the Poor to continue out-door relief, despite rules to the contrary, undermined the efficacy of the system.

A new development following the American Revolution was the amount of attention paid to poor and orphaned children by city elites increasingly concerned that the achievements of the American Revolution might be lost by a generation of poorly educated youths. Charleston opened a city orphanage in 1790, but elsewhere residential care for children was normally provided by private benevolent societies.

Orphanages gave basic tuition and training to the children in their care, girls as well as boys, to enable them to function as future citizens of the new Republic—boys as workers and voters, girls as mothers. City and state authorities also started to make the provision of education a priority for all children, orphaned or not. Funds were provided for a wide range of private and public school initiatives, and education of the poor was, for the first time, seen as something that concerned society as a whole. These trends of institutionalization and the free provision of education continued to shape welfare policy in America for the rest of the nineteenth century.

WEST Throughout the early Republic, the definition of what constituted “the West” in the United States underwent numerous changes. This occurred for the obvious reason that the western boundaries of the United States shifted dramatically and that white settlement moved from the trans-Appalachian to the trans-Mississippi region and finally to the Plains. But changes in definition also reflected equally dramatic demographic shifts as well as fundamentally colliding perspectives. The results were western experiences that were hardly uniform and often contradictory. Throughout the early Republic, people most often understood the West as a series of places between the Appalachian and the Rocky Mountains and would describe those places in terms of rapid resettlement, uncertain social rules, and regular outbursts of intense violence.

These varied experiences emerged in part as a result of three very different forms of western development in both political and social terms. After initial

ad hoc efforts by state and national leaders in Kentucky and Tennessee (which became states in 1792 and 1796, respectively), the newly installed federal government took a more planned approach in the Old Northwest and Old Southwest. Experiences there in turn informed federal responses to the new challenge in western government that emerged from the Louisiana Purchase. The experience of western residents was equally varied. Kentucky and Tennessee saw the fastest shift from a world of Native American villagers and interracial contact to a place dominated by whites. In sharp contrast, the Northwest and the Southwest would be the sites of racial conflict between whites and Native Americans that continued for a generation. Finally, much of the region west of the Mississippi River remained a place of Indian control well into the nineteenth century.

Differences in policy in different times and places notwithstanding, the broad contours of government and society remained the same. The West would be a place where, ironically, the greatest form of continuity was the regularity of great change. After decades in which European empires, Indian villagers, and Anglo-American migrants had reached varying forms of accommodation, the United States in the years of the early Republic pursued more aggressive policies designed to establish federal sovereignty and, in the end, secure racial supremacy. The people living in the midst of these political developments were redefining themselves in the process.

REGIONAL DISTINCTIONS

The overlap of white migration, interracial contact, and national politics first emerged in the trans-Appalachian West, where the American Revolution had been a war for racial supremacy as well as the site of a vicious civil war. White settlers, many of whom joined the Patriot movement in response to British efforts to restrain incursions onto Indian land, joined or initiated a series of military ventures against Indians as well as Loyalists. Those efforts enjoyed considerable support among Patriot leaders because it furthered their strategic goal of defeating a broader British alliance while requiring only minimal resources from the Continental Army or the state militias.

A very different situation was emerging to the north. In the Great Lakes region, Indians remained both numerous and powerful. During the eighteenth century, they had built elaborate trade relationships with the French, in large part because the French had been eager parties in this arrangement. Rather than promote migration from Europe, the French had

hoped to generate revenue through the Indian trade. French-speaking settlers were indeed scattered throughout the Illinois country (a region corresponding roughly to modern Illinois and Indiana), but they had never come in the same eager rush as the Anglo-American settlers who came to Kentucky and Tennessee. While the French surrendered the Illinois country and Canada to Great Britain as a result of the Seven Years' War (1756–1763), many of the institutions and practices constructed during the French period remained in place after the American Revolution. The first signs of change came when George Rogers Clark led an expedition of Virginia militiamen to the Illinois country in 1778. In his efforts to defeat both the British and the Indians, he drew on his experiences in the trans-Appalachian West, hoping to replace the old multiracial system with a racial hierarchy that placed whites clearly in charge.

In stark contrast to the trans-Appalachian West and the Illinois country, where Europeans and Anglo-Americans were struggling to secure sovereignty from Indians, much of the land west of the Mississippi was clearly under Indian control. Throughout the Missouri River valley, a series of large, permanent Indian settlements controlled trade and set the rules of cultural contact. The same held true in the eastern Plains, with the Osages enjoying particular power over their Indian neighbors as well as the small number of Europeans and Anglo-Americans there. The Europeans remained the weakest power in the region. Only in the Lower Mississippi Valley were whites securing real power over Indians. Meanwhile, in the western Plains and the Rocky Mountains, relations between independent Indian villages remained dominant. White visitors occasionally observed developments there but rarely influenced them in any substantive way.

The greatest catalyst for change in these western regions would be the arrival of white settlers, most of them Anglo-American migrants from the eastern United States. At a time when land ownership was nearly synonymous with liberty and opportunity in the United States, white settlers often concluded that their prospects were dim in an East where land prices continued to rise and where intensive agriculture was exhausting the soil. Many saw their own future in the West, and they demanded that the state and federal governments make that future secure. In addition to these pressures, state and federal leaders worried about defending western boundaries against European powers and Indians. Western policy would be among the most important forces shaping the politics, institutions, diplomacy, and demography of

the new Republic, with ramifications that extended long after the early years of the nation. It defined the contours of federal policymaking and created a cohesive vision of the Union premised on commercial development, an aggressive foreign policy, and racial supremacy.

SETTLEMENT, CONFLICT, AND CONQUEST

The process of settlement and government began soon after independence. States increasingly realized they lacked the means to control their western reserves. Kentucky was formed out of Virginia territory, and Congress created Tennessee after North Carolina reluctantly surrendered its western lands. In

1787 Congress, operating under the Articles of Confederation, combined land ceded by several states into a single Northwest Territory, containing Ohio, Indiana, Illinois, Michigan, Wisconsin, and part of Minnesota. The Northwest Ordinance defined territorial policy for over a century. In a radical break from the European colonial model, the ordinance provided for the eventual incorporation of new states with rights identical to those of other states. Article II of the ordinance also provided for the eventual elimination of slavery.

The federal Constitution, written at the same time as the Northwest Ordinance, offered the means to implement this plan for the West. Unlike the Arti-

cles of Confederation, the Constitution provided the fiscal resources for the government to fund direct civil administration. The Constitution also created a diplomatic structure that would enable the United States to negotiate more effectively with Europeans in an effort to settle western boundary disputes. Finally, the Constitution made possible a military that could assert federal sovereignty and racial supremacy in the Old Northwest. Indeed, no sooner was the Constitution ratified than the federal government dispatched a series of increasingly large armies to the Northwest.

As western settlement caused profound changes in Anglo-American politics and culture, similar changes were emerging within Indian communities lying in areas where there was increasing contact with whites. While the village remained the fundamental locus of Indian social organization, increasing pressure from the United States and from Anglo-American settlers would lead a growing number of Indians to endorse stronger alliances between villages. Congress dispatched those ever-larger armies to the West because they were repeatedly challenged and often defeated by an increasingly organized Indian response. And as military conflicts consumed whole villages, many Indians were forced to create new communities and social practices as a means of survival. These changes were most dramatic in the Northwest Territory, where older systems of contact and exchange gave way to an increasingly violent racial landscape.

Nothing reflected the intersection of domestic governance, racial conflict, and foreign policy in the West more clearly than three treaties signed within a year of each other: Jay's Treaty (1794), the Treaty of Greenville (1795), and the Treaty of San Lorenzo (1795). Although Jay's Treaty is known primarily for creating political disputes over relations with Great Britain that fueled the creation of the first political parties in the United States, the British made important concessions by agreeing to surrender forts on American territory and by forswearing aid to Indians at war with the United States. The end to old British-Indian alliances proved crucial to the American victory at Fallen Timbers in 1794 and the collapse of the militant Indian coalition in the Ohio country. The new state of affairs in the Northwest enabled the United States to impose the Treaty of Greenville, through which a series of Indian tribes surrendered claims to land in much of Ohio.

While the Jay Treaty and the Treaty of Greenville secured American concerns in the Northwest, the Treaty of San Lorenzo redefined power in the

South. In addition to normalizing trading relations between the United States and Spain, the agreement also ceded Spanish lands, including what became Alabama and Mississippi, with the notable exception of the Gulf Coast. Forced to govern yet another vast western domain, in 1798 Congress passed legislation creating a separate Mississippi Territory and moved "to establish therein a government in all respects similar to that now exercised in the territory northwest of the river Ohio, excepting and including the last article of that ordinance." The "last article" in the Northwest Ordinance prohibited slavery. That vital passage from the Mississippi governance act not only guaranteed that slavery would remain in place in Mississippi, but also extended a rough North-South line separating free and slave territory.

Throughout the 1790s, the number of white settlers and slaves grew in direct relation to the declining power and population of Indians. The federal government focused on securing its existing western holdings, and while white settlers might covet land further west, the constant demands and expenses of governing existing territories left federal leaders unprepared to consider any major acquisitions. In 1803 Ohio became the first new state to emerge from the Northwest Territory, and this seemed to suggest an orderly process of western government for a United States whose West ended at the Mississippi River. But the Louisiana Purchase of the same year transformed that definition of the West by adding a vast new space to the national domain.

The federal government responded by extending the general principles of the Northwest Ordinance and the Mississippi governance act to Louisiana. As had been the case in the Northwest and later in Mississippi, the Purchase territories would become the sight of unending racial conflict caused primarily by white settlers and the federal government. A series of federal military ventures combined with epidemic diseases to decimate Indian populations and destroy Indian power. The United States made sovereignty a reality in the land immediately west of the Mississippi River during the 1810s and 1820s, just as a new surge of white settlers descended on the Mississippi Valley and the eastern Plains. The policy of removal, first developed by President Thomas Jefferson (1743–1826) and implemented by General Andrew Jackson (1767–1845), emerged accordingly as a means to force Indians off the first areas of white settlement. In sharp contrast, early federal expeditions farther west to the Plains and Rockies failed to achieve clear authority over Indians.

CHANGING CONCEPTIONS OF THE WEST

For white settlers, slaves, and Indians, the West increasingly became a place of dislocation and redefinition. Whites might seek western land to settle, but once they arrived they immediately longed for communal connections. They rushed to create churches, social organizations, and other institutions. Slaves in the Southwest faced new physical hardships as they were driven to carve farms and plantations from land that had never seen intensive agriculture. Meanwhile, Indians continued to seek a means of responding to the death and forced relocation brought on by the federal government and white settlers.

These developments together contributed to changes in the ways that Anglo-Americans conceived of the West. After decades in which public officials had doubted whether the United States could successfully expand into the West, they began to conclude that expansion was not only possible but necessary. This outlook would reach fruition in the principle of Manifest Destiny during the antebellum era and attained its most tangible expression when the United States declared war on Mexico in 1846 in pursuit of a new western domain that stretched clear to the Pacific.

The people who most consistently espoused the notion that the West was a place of opportunity were white settlers. Resettlement to the West remained a difficult and dangerous process for whites, many of whom failed to find prosperity or success in their new homes. But the promise of the West as a place where whites could achieve independence, prosperity, and respectability remained a powerful tug for people who concluded that life in the East had its own drawbacks. The western settlers also created an increasingly democratic political culture that an emerging class of western politicians struggled to navigate. Henry Clay (1777–1852) of Kentucky and Andrew Jackson of Tennessee, young men in new states, exemplified the possibilities and limitations of their society. Both born to modest means, they concluded that their own success as attorneys and planters at the turn of the nineteenth century reflected the tremendous opportunities that abounded in the West. But where Jackson embraced the rough-and-tumble politics of frontier democracy, Clay early on feared that frontiers settlers needed an orderly system of public and private institutions to preserve a stable society. Both men, however, believed in the West as a place of equality and opportunity, despite the fact that both owned slaves and both endorsed near-genocidal campaigns against Indians.

Jackson and Clay could emerge as national leaders because, by the end of the early Republic, their outlook had spread beyond the West. This happened in large part because western migration was rapidly making the region an increasingly powerful political constituency. After a generation of presidents from the East, Andrew Jackson was the first in a series of western presidents who dominated national politics through the Civil War. In 1861, when Kansas joined the Union, the thirteen western states equaled the number of colonies that had declared independence in 1776. Secession in 1860 and 1861 also resulted in two governments run by men from the first federal territories, Abraham Lincoln from an Illinois carved out of the Northwest Territory and Jefferson Davis from Mississippi. By the close of the nineteenth century, the passage from Indian control to territorial status to fully incorporated state had become the normative experience for the vast majority of the politics that together constituted the United States.

WHALING The American whaling industry started on Long Island in the mid-1600s and by the end of the century had expanded to Cape Cod and

Nantucket Island in Massachusetts. Colonists off the coasts of North Carolina, Delaware, and New Jersey also developed fledgling whaling operations, but it was New England that came to dominate the industry. In the period from 1754 to 1829, the New England whale fishery far outpaced the rest of the world in expertise and in the size, geographic reach, and economic productivity of whaling enterprises.

A ready supply of Atlantic right whales in New England waters, combined with knowledge of an existing demand for whale products in Europe, gave colonists the initial idea that whaling might be profitable. Whale oil fueled lamps and lubricated machinery. A fat, it served as an ingredient in the manufacture of soap. Right whales, humpbacks, and several other whale species also had baleen plates in their mouths. Like modern-day plastic, baleen was firm yet flexible, making it a valuable component in women's corsets, umbrellas, and luggage. Sperm whales lacked baleen but had a waxy oil in their heads that proved to be ideal for candle making.

At first, New Englanders targeted right whales and set up shore stations from which men kept lookout, with whaleboats and try-pots for boiling blubber into oil standing ready on the beach. American Indian men, sometimes by their own choice but often by the more coercive means of debt indenture, made up the majority of the whaling industry's first labor force. By the mid-eighteenth century, New England's right whale population had become scarce from overhunting, which led to two transformations of the industry. In Nantucket folklore, one turning point occurred in 1712, when Captain Christopher Hussey caught Nantucket's first sperm whale. Sperm whales increasingly became the most desired of whales, a trend that would continue into the first half of the nineteenth century, when the American whaling industry reached its peak. The second innovation developed around 1750 and involved putting try-pots permanently on board oceangoing vessels, thereby freeing the manufacturing process from its prior dependence on shore stations.

Although American shorewhaling continued into the early twentieth century, deep-sea whaling for sperm whales emerged as the major type of whaling activity in the 1750s. Oceangoing vessels increased in size and spent longer periods away from home ports; by the 1820s a whaling ship typically had twenty to twenty-five men aboard and went on voyages of about three years. Otherwise, in the decades preceding and following the American Revolution, the economic and technological aspects of

whale hunting showed continuity over time. Upon sighting a whale, whether from shore or from a ship, crews of six or eight men rushed to whaleboats to give chase. They attached a line to the whale by throwing a harpoon at it and then lanced it to death, after which they towed it back to the ship. They boiled the blubber into oil and stowed it away in barrels below deck. As the whaling industry grew in size and wealth, American Indians still labored as whalemens but as part of crews composed largely of white and African American men drawn from New England and the mid-Atlantic states. The dangers and enormous risks entailed in a whaling venture probably explain the unusual pay structure: instead of earning wages, whalemens received a "lay" or share of the whaling profits after the owners and other investors had taken their share—that is, if there were any profits.

IMPACT OF THE AMERICAN REVOLUTION

From the Seven Years' War (1756–63) to the War of 1812, war wreaked havoc on the whaling industry as privateers attacked and appropriated whaling vessels and American whalemens faced impressment. The American Revolution had a particularly devastating impact on the American whaling industry, for Britain had bought most of the whale oil that American colonists produced. Whaling communities tended to be Loyalist, especially Nantucket, which had little other industry besides whaling. When the Revolutionary War started, Nantucket's merchants and shipowners made protestations of neutrality and schemed to keep alive their trade with Britain. Immediately after the Revolution, the British adopted a punitive duty on American imports of whale products, and many Nantucketers were seduced away to Nova Scotia, France, and Wales in hopes of rebuilding their whaling enterprises out of a European port. American whaling all but disappeared during the war and did not embark on a full recovery until the War of 1812 ended, in 1815. Most American whaling families eventually returned to the United States, to Nantucket itself or to the more recently founded whaling cities of Hudson, New York, and New Bedford, Massachusetts.

EXPANSION TO THE PACIFIC

The American whaling industry was in flux in the 1790s for another reason: the opening up of the Pacific Ocean as a rich new territory ripe for sperm whaling. The first generation of American whaling vessels to return from the Pacific arrived back at New Bedford and Nantucket in 1793, kicking off several

decades of rapid expansion of the industry. From the 1810s to the 1820s, whaling voyages out of American ports more than doubled, from about four hundred voyages to over a thousand. Also in the 1820s, New Bedford, Massachusetts, overtook Nantucket to become the whaling capital of the world. The other most active whaling ports at that time were Fairhaven and Westport located near New Bedford; New London, Connecticut; Provincetown on Cape Cod; and Sag Harbor on Long Island, New York. Besides bringing wealth to elite whaling families such as the Coffins, Rotches, and Howlands, whaling led Americans to venture into distant seas, where they played an influential role in the expansion of American influence abroad and in disseminating knowledge about Africa, South America, the Pacific Islands, Australia, New Zealand, and Japan to those Americans who remained at home.

WHISKEY REBELLION An uprising in western Pennsylvania sparked by a tax on distilled spirits, the so-called Whiskey Rebellion of 1794 tested and ultimately affirmed the power of the national government. The roots of the conflict reached back to the severe depression that beset rural America during the 1780s. As urban elites enriched themselves with banknotes and government certificates left over from the Revolution, farmers were left with heavy debts and scarce currency. Economic distress—and anger towards “moneyed men”—grew the further one traveled from the Atlantic coast. The crisis stretched from Maine to Tennessee and triggered the New England Regulation, or Shays’s Rebellion, of 1786–

1787. Western Pennsylvania suffered as much as any region; in some counties, a majority of households faced debt prosecutions and foreclosures. When, in 1791, the new federal government imposed an excise tax on whiskey—a major commodity as well as libation on the frontier—western farmers refused to pay. Invoking the memory and message of the American Revolution, frontiersmen decried the invasions of “corrupt” government and called for a more equitable legal and economic order.

From 1791 to 1793, settlers in rural Pennsylvania and elsewhere used protest petitions, scare tactics, and simple foot-dragging to defy the excise. Few farmers who owned a distillery registered it; local constables and justices of the peace refused to enforce foreclosures on their neighbors’ farms. On more than sixty occasions between 1787 and 1795, Pennsylvania farmers blocked roads to keep out tax collectors. Tax men who made it through these social and physical barriers risked tar and feathering, hair shaving, and other forms of public humiliation. Over the course of a decade, frontiersmen fused revolutionary and evangelical values into a logic of resistance. Engaged in chronic warfare with Indians and enmeshed in labor obligations with neighbors, they defined their “public” in opposition to a remote, oppressive government. Living close to survival’s edge, they embraced an emotional form of Christianity that underscored the frailty of human will and effort. Itinerant preachers told frontier seekers that God did not respect earthly titles, that the wealthy and powerful had once persecuted Jesus, and that the meek and lowly would soon inherit the earth. Why, then, should patriotic citizens heed the unjust decrees of distant magistrates? Did they not have the same right to resist arbitrary power that their colonial forbears had so recently exercised?

Federal authorities in Philadelphia, however, insisted that popular defiance of the law was no longer legitimate once the United States had established a republican government with ratification of the Federal Constitution in 1788. For President George Washington, Secretary of the Treasury Alexander Hamilton (author of the excise tax), and other Federalist power holders, the Revolution was definitively over: it was something to be defended, not reenacted. Indeed, they viewed dissent of any kind as seditious. Drawing from a cultural register that privileged “conspiracy” as an explanation for events, the Federalists believed that their Republic faced enemies within and without during the 1790s. Hence their reactions to western unrest: Hamilton wanted to suppress it with “super abundant” force. Washing-

ton initially took a more moderate tack, but when a furious crowd destroyed an inspector's mansion on the Pennsylvania frontier in July 1794, he declared that the frontier rebels menaced "the root of all law and order." The president was particularly alarmed by reports that some westerners had met with Spanish and British agents, perhaps to foment secession all along the frontier.

The Pennsylvania backcountry thus became the focal point of the government's response to rural discontent. From July to August 1794, Washington's cabinet mobilized a force to cow or crush the farmers. The state government of Pennsylvania, meanwhile, pursued negotiations with its distraught citizens. Early in September, rebel leaders agreed by a vote of 34 to 23 to the state's demands of loyalty oaths and the gradual payment of taxes. But the high number of nays, along with the continued harassment of customs officers, convinced Washington that force was still necessary. After mobilizing nearly fifteen thousand militiamen from four states, Washington and Hamilton personally led the troops westward in late September. Intimidated by this army and by the apparent turn of public opinion against them, the rebels offered little resistance. Federal troops arrested 150 men and sent 24 back to Philadelphia for trial; two were convicted, and Washington pardoned both. The defeat of the rebels continued (and continues) in the collective memory of the new nation. The name "Whiskey Insurrection"—coined, it seems, by Hamilton—suggests that the unrest was sudden, knee-jerk, and alcohol induced. Aggrieved farmers who had disputed profiteering and "speculation" since the 1780s became intoxicated, paranoid yokels who shook a fist at progress itself. By defeating the insurrection and then trivializing its roots, Federalist elites narrowed the scope of legitimate popular action to the ballot box.

WHITE HOUSE The first official home of the president of the United States was not white but red. When George Washington assumed the presidency in 1789, his official residence was in what was called Government House, a two-story red brick building in lower Manhattan. This was the first of two official residences—the second in Philadelphia—to which Washington was assigned while the new federal city was being constructed on the Potomac.

The Residence Act of 9 July 1790 proposed a Congress and a president's house to be built in what would become Washington, D.C. Inspired by the residence of a Dublin nobleman, Irish-born architect James Hoban based his design on the traditional Palladian palazzo, proposing a large rectangular house much grander than any other mansion in the new nation. The final plan called for several staterooms on the lower story surrounding a distinctive oval room, with space for private family quarters on the two upper floors. The cornerstone was laid on 12 October 1792, and the house gradually took shape over the next eight years.

The nation's second president, John Adams, was the building's first occupant, and when he moved in on 1 November 1800, he found his new home far from finished. Despite a lack of staircases and an abundance of damp, cold rooms, the Adams family soon adapted, making the most of the six livable rooms. Early in 1801 they were finally able to entertain and opened their state rooms to the public. Many marveled at the grandeur of the president's home, but there were detractors who quickly dubbed the residence "the president's palace."

Indeed, when Jefferson superseded Adams, he saw the president's house—which, because of its whitewashed walls, was becoming known as the White House—as an awkward monument to federal monarchicalism. To disassociate the residence from any palatial associations, Jefferson immediately sold the coaches, horses, and silver-mounted harnesses Adams had bought and abandoned the rounds of levees and parties that had made the White House such an important center of polite society. Ever the improver and, besides, pressed for additional office space, Jefferson added the East and West Wings, marked by a matching pair of colonnades designed by Benjamin Henry Latrobe.

While it remained for some a reminder of the excesses of federal power, the White House slowly emerged as a symbol of national identity. Certainly this was the understanding of the British commanders who burned the building's interior, along with

the U.S. Capitol, on the night of 25 August 1814, at the height of the War of 1812.

Humiliated but energized, President James Madison pledged to restore the White House. James Hoban returned to supervise reconstruction, adding the north and south porticos. The rebuilding was funded by a \$500,000 appropriation from Congress, a sign of the public's growing affection for what was becoming a symbol of the new Republic. Few architectural changes were made following this reconstruction, and the White House passed into Andrew Jackson's hands in a form that would remain essentially unchanged until the 1880s.

WIDOWHOOD Brides and grooms in the late colonial, Revolutionary War, and early national periods took to heart the words “until death do us part” when exchanging vows. Women in that era usually were several years younger than the men they married. Most marriages did not survive intact, however, until couples attained a ripe old age.

The death of a spouse in the prime of life affected more women than men. “[It is] the most Forlorn and Dismal of all states,” wrote Abigail Adams in 1778, nearly half a century before her own husband died. Widowhood altered family arrangements, transforming women's economic and legal status. Having rarely been able to make autonomous decisions, or even to hold possessions in their own name, women had to learn new survival skills. Letters from the period indicate that some widows adapted reasonably well, while others withdrew from society, angry and depressed. Once widowed, many women began a sad decline into senectitude.

The religious commandment to “honor thy father and mother,” usually reinforced by the courts, in principle gave widows and widowers the right to expect their children to care for them until they

died—or, depending on their age and wealth, at least until they remarried. Custom dictated that at least one (adult) child remain with the surviving parent, providing labor and support. In return, she or he received in due course a disproportionate share of the estate.

Economic realities reinforced filial piety. Especially in farming communities, men's assets on average increased with advancing years, peaking around age sixty. Women's prosperity or poverty depended on their spouses' success or lack thereof—regardless of how much the wives had contributed as household managers and producers of goods. Control of the land and other property gave the parents authority over their children's future sufficient to ensure the former a basis for financial assistance in later years. Household heads generally retained control of familial wealth until they died—though many fathers gave loans, bequests, and gifts to mature offspring as they were starting out. Unless otherwise stated in the will, a woman would count on her “widow's third,” even in situations where her husband died intestate. This was the single most important source of financial security for widows during the period. Even if the third was modest in value, it typically sufficed, providing a widow enough leverage to exert a measure of control over her offspring.

Some husbands were very precise in stipulating what they were leaving to their widows. They even specified the names of the livestock their surviving spouses were to receive. They warned their children that failure to care for their widowed mothers might result in their loss of valued possessions. Some men went a step further, naming their wives guardians or trustees of their estates. Yet detailed wills did not always work to the widow's advantage. By specifying the room in the homestead in which the widow would sleep, a woman's primacy in the household often passed to a younger family member. Rich men sometimes privileged certain children to the detriment of their wives. Those concerned with the intergenerational transfer of their estates and property could stipulate that their spouses would forfeit their designated assets should they choose to remarry. In the Maryland court of appeals, Martha Griffith in 1798 won her right to one-third of her husband's personal property, though her late spouse had pointedly left all his possessions to his children and excluded her.

Widows unacquainted with familial finances often were shocked to find that they had inherited considerable debts. To make ends meet, widows relied on the acumen of their adult children or neigh-

bors. During a period in which a majority of families struggled to eke out a living, financial insecurity heightened most widows' sense of vulnerability.

Most widows crafted ways to remain as independent as possible. Typically, this meant retaining possession of the family homestead as long as possible. When that was no longer feasible, women moved in with their children, doing domestic duties for room and board. Arrangements rarely were permanent: widows moved from the residences of siblings, offspring, and friends as circumstances warranted.

With advancing years, many widows were forced to rely on outsiders for assistance. Under the Elizabethan Poor Law of 1601, which became the basis of most state welfare provisions, local officials had to support the needy in the community. Typically, agents provided poor widows with food, money, and wood so that they could remain in their homes. Sometimes, women were placed in the residence of the householder who made the lowest bid for their upkeep. Over time, an increasing number of cities and counties erected poorhouses, where the sick, deaf, blind, lame, orphans, and criminals shared shelter with widows. “Of all the classes of the poor,” declared Josiah Quincy in an 1821 report on welfare in Boston, “that of virtuous old age has the most unexceptionable claims upon society.” Young widows who were unwilling to work while in the almshouse would not be viewed so favorably as infirm, impoverished women.

Revolutionary War pensions provided some relief for eligible widows. The first pensions, authorized in 1780, provided officers' widows half of their late husbands' salaries for seven years if their spouses had remained in the Continental Army until the end of the war. These widows' provisions were abolished in 1794. Revolutionary soldiers in need (presumably, widowers were in this pool) were granted pensions in 1818; their widows, on proof of marriage, became eligible for pensions in 1832. Congress thereafter liberalized widows' Revolutionary War benefits.

WIGS During the seventeenth century, men of the upper classes shaved their heads and wore long elaborate wigs that grew shorter and simpler during the early decades of the eighteenth century. By 1750 these, too, gradually went out of fashion as men began to give up shaving their heads and natural hair became more popular, although it was usually curled and powdered to look like a wig. The powder could be brown, gray, or white, although the latter was preferred. If the natural hair was worn unpowdered and short, a hairpiece with a braided or tied queue could be attached at the back of the crown to fill out the hairstyle. By the 1790s soldiers in the American army were ordered to wear their hair tied and powdered when they appeared for review. From 1770 to 1800 hair styles among American men ranged from natural hair worn short to natural hair worn long and tied back to natural hair crimped and curled and powdered to full formal wigs. By 1800 wigs had universally died out among men except for older or more conservative men, especially those in the clergy, lawyers, and doctors, some of whom continued wearing wigs through the first three decades of the nineteenth century.

At his second inauguration in 1793, George Washington wore his own hair tied back and powdered, but his successor, John Adams, wore a wig which, it was said, he hurled to the ground in anger when his cabinet displeased him. Thomas Jefferson wore his reddish hair natural and his successor, James Madison, powdered his receding locks. By the time of Andrew Jackson's election in 1828, most men wore their hair short to medium in length and natural in color. Vanity also played a role in the choice to wear a wig or not, and former Secretary of the Treasury Albert Gallatin was described in 1832 as wearing "an ugly wig" that was intended to hide his baldness.

Women, on the other hand, rarely wore wigs from 1750 to 1800. The high, elaborate hairstyles of the time were constructed by brushing one's own hair, well greased with pomatum, over rats or puffs, and powdering it. When shorter hairstyles became popular among women after 1790, wigs, too, became more popular and were frequently worn to eliminate the necessity of styling one's own hair for

President Adams's Wig. John Adams, shown here in a painting (c. 1770) by Joseph Badger, reportedly had a habit of hurling his wig to the ground in anger when his cabinet displeased him. © BETTMANN/CORBIS.

formal occasions. President Jefferson's married daughters asked him to have wigs made to match their natural hair for their visits to Washington in 1802 and 1805, and Dolley Madison and her sister ordered wigs in 1807 and 1809. Women whose hair was turning gray would often wear natural-colored wigs to hide the fact. From 1810 to 1830 women wore full wigs less often than partial wigs, with false curls, ringlets, and bangs being utilized to fill in hairstyles where needed. Also, the high-piled curls so popular about 1830 were frequently augmented by false ringlets attached to combs. Wig use gradually died out among women also, and by 1830 wigs were seldom worn by either sex.

WISCONSIN TERRITORY The Wisconsin Territory was not formed by act of Congress until 1836. It was a part of the Northwest Territory beginning in 1787, the Indiana Territory in 1800, the Illinois Territory in 1809, and the Michigan Territory in 1818. The Wisconsin Territory stretched north to the British-Canadian border and was originally bounded to the west by the Missouri River, although in 1838 an act of Congress made the Mississippi River the official western boundary.

Over twenty thousand American Indians resided in the Wisconsin region in 1768. They belonged to a number of tribes, the largest being the Ojibways, Winnebagos, Potawatomis, and the Sioux river bands in the West. Indians traded furs with British and Montreal-based French traders, who continued to dominate the fur trade even after the United States assumed sovereignty by the Treaty of Paris in 1783. The United States did not begin establishing factories to regulate the fur trade in Wisconsin until one was built on Mackinac Island in 1809. The British quickly captured this factory during the War of 1812 but abandoned it after the Treaty of Ghent in 1814.

The fur trade economy relied on buffalo hunts and the importation of foodstuffs to support hunters and traders. White traders often married into Indian families and settled in villages where their mixed-race children were known as Métis. Indian and Métis women had key roles in negotiating accommodation in this society, were included in gift-giving ceremonies, and largely dominated the important process of maple sugar production.

The Fox Indians mined lead in southern Wisconsin in the eighteenth century and in 1788 permitted

a French Canadian, Julien Dubuque, to mine there as well. In 1822 a U.S. Indian agent reported to the secretary of war that southern Wisconsin had large quantities of lead ore, and the report subsequently leaked. Over five hundred Missouri, Kentucky, and Tennessee miners came to southern Wisconsin between 1822 and 1825. By 1829, over four thousand European Americans and one hundred African Americans had arrived from the eastern states and Illinois. Lead miners intruded onto Indian lands secured by treaty, and the Winnebagos began scatter-shot raiding of white settlements. In 1827 a raid led by the Winnebago warrior Red Bird prompted the quick formation of a force numbering over one thousand infantry and cavalry. Red Bird surrendered and the Winnebagos distanced themselves from his raids. In 1829 the United States reached a treaty with the Ojibways, Ottawas, Potawatomis, and Winnebagos that resulted in their surrender of the mining region east of the Mississippi.

WOMEN

This entry consists of eight separate articles: *Overview*, *Female Reform Societies and Reformers*, *Political Participation*, *Professions*, *Rights*, *Women's Literature*, *Women's Voluntary Associations*, and *Writers*.

Overview

In the period from 1754 to 1829, virtually every facet of women's lives—from politics to the economy to their own sexuality—underwent dramatic change. Although women's historians have long debated whether these changes benefited women, the developments were complex and ambiguous, and

Molly Pitcher at the Battle of Monmouth (1854). The Pennsylvania heroine Mary Ludwig Hays, pictured here in a painting by Dennis Malone Carter, won her nickname, Molly Pitcher, by carrying water to the troops during the Battle of Monmouth in 1778. © BETTMANN/CORBIS.

they affected different women in different ways, especially when one takes into consideration class, race, and region.

EDUCATION AND INTELLECT

Nowhere was the change for women more dramatic than in the realm of education. Enlightenment thinkers asserted that man was a creature of reason, and although they often meant males rather than humankind more generally, there was enough ambiguity in their discussions to allow others to assert, more explicitly, that women had the same intellectual capacity as men. "Will it be said that the judgment of a male of two years old, is more sage than that of a female's of the same age?" the Massachusetts author Judith Sargent Murray (1751–1820) asked rhetorically. If women appeared less learned than men, advocates of women's education argued, it was only for the lack of opportunity, not innate ability. In

order to remedy this deficiency, almost four hundred female academies were established between 1790 and 1830, in the North and South both. Indeed, a higher percentage of women were enrolled in female academies than men in academies and colleges both. Among the most important of these institutions were the Young Ladies' Academy of Philadelphia, chartered in 1792 but training women for perhaps a decade before that, and Sarah Pierce's Litchfield Female Academy, begun the same year.

The advances in women's education were stunning. By 1850, the literacy gap between white men and women was closed in New England and narrowed in the South, and at the female academies, women received advanced training as well. Yet if the academies trained a generation of women and made many of them, as Mary Kelley has argued, not only active readers, but truly learned, they also illustrate the limitations of Enlightenment notions of female

Lady with a Harp, Eliza Ridgely (1818). Eliza Ridgely, daughter of Baltimore merchant Nicholas Ridgely, was a teenager when she posed for this portrait by Thomas Sully. THE GRANGER COLLECTION, NEW YORK.

equality. Enlightenment optimism was undercut by a pervasive fear that too much education would make women “pedants,” unfit them for their domestic duties, and make them unattractive to men.

POLITICS

Like men, women were drawn into the political conflict that led to the American Revolution (1775–1783). Women actively participated in the boycott of tea and other goods taxed by the Townshend Act of 1767. Indeed, because women were avid consumers of just the sorts of luxury goods that were the focus of this and subsequent colonial boycotts, the boycotts could not have succeeded without women’s involvement. Moreover, such boycotts were part of the process of political mobilization that helped colonists see themselves as Patriots and devote themselves to the Revolutionary cause. Women, such as the fifty-one women in Edenton, North Carolina, who in

1774 pledged to do “everything as far as lies in our power” to support the “publick good,” played an important part in this effort, as did the many women who, during the Revolution, raised funds to support the effort and rioted to protest what they considered unpatriotic price gouging.

Republican thought, one of the sources of Revolutionary ideology, placed a premium upon self-sacrifice for the common good and imagined the paradigmatic citizen as male. In the Revolutionary maelstrom, however, republicanism lost some of its historically misogynist elements. Both women and men committed themselves to the patriotic cause, and Revolutionary thinkers began to carve out a gendered role for female Patriots. Benjamin Rush, the Philadelphia physician and Revolutionary, suggested that mothers could instruct their children in “the great subjects of liberty and government.” He also noted that “the opinions and conduct of men are often regulated by the women,” and that “the principal reward” for male acts of valor was female “approbation.” Magazines and novels encouraged young women and men to marry only those who were the living embodiments of republican virtue. It is not clear that such injunctions actually shaped behavior: curricula at the female academies placed more emphasis on Enlightenment principles and sensibility than republican concepts of domesticity, for example, and there is little evidence that suitors sought out Patriots for their mates. Nonetheless, such discussions drew women into Revolutionary discourse as both participants and subjects, and there is abundant evidence—from their attendance at political events, their support of nascent political parties, and their letters and journals—that many women were deeply interested in the Revolution and the political affairs of the new nation.

Revolutionary ideology drew from liberal notions of equality, and they, too, would affect thinking about women. So pervasive was the doctrine of equality that most Revolutionaries seemed to take it for granted that women were in some measure equal, but just what that would mean in practice was problematic. Revolutions by their very nature raise questions about established patterns of authority. We can see this process at work when Hannah Lee Corbin asked her brother, the Virginia Revolutionary Richard Henry Lee, why single, propertied women (who were not encompassed by the principle of coverture, which placed daughters and wives under the rule of the male head of household) could not vote, and he could not make an effective answer. Abigail Adams famously instructed her husband John, then

attending the Continental Congress, to “Remember the Ladies” in “the new code of Laws which I suppose it will be necessary for you to make. . . . Do not put such unlimited power into the hands of the Husbands. Remember all Men would be tyrants if they could.” Abigail Adams gave the republican commonplace about the corrupting tendencies of power a gendered gloss. Just as famously, John Adams made light of his wife’s concerns. “I cannot but laugh,” he told her. “We have been told that our Struggle has loosened the bands of Government every where,” provoking uprisings among children, apprentices, slaves, and Indians, “but your letter was the first Intimation that another Tribe more numerous and powerfull than all the rest were grown discontented.” John Adams treated the issue more seriously, however, in an exchange with his fellow Massachusetts Revolutionary James Sullivan. Sullivan wanted to know how Lockean theory, which held that people can only be bound to laws to which they have consented, could be squared with the customary exclusion of women and other groups from the franchise. John Adams accepted the principle of consent “in Theory,” but worried about it in practice. “It is dangerous to open So fruitfull a Source of Controversy and Altercation. . . . There will be no End of it.”

Yet without either a genuine feminist movement or a fully articulated doctrine of female political inequality, both ideas and practices were in flux. In the furthest reach of Revolutionary egalitarianism, New Jersey, as if in answer to Hannah Lee Corbin’s query, permitted unmarried, propertied women to vote from 1776 to 1807, when, in a narrowing of the Revolution’s democratic possibilities, the franchise was withdrawn from free blacks, aliens, and untaxed men, as well as women.

Although the Constitution nowhere mentions women explicitly, records of the debates in the Constitutional Convention make it clear that women were to be included when congressional representatives were apportioned and hence that women, even though they could not vote or hold office, were to be represented by the new government. Likewise Bill of Rights guarantees such as freedom of religion, assembly, speech, and trial by jury all applied to (free) women. At the same time, as Linda K. Kerber has shown, women were not allowed to perform the duties of citizenship, not only (with the exception of New Jersey) voting and holding office, but also serving in the militia or on juries. Women’s relationship to the new government was, hence, ambiguous. In one sense, they were the paradigmatic citizens, construed, like children, as weak members of society, in

Mrs. John B. Bayard. *Portrait of Mrs. John B. Bayard* (1780) by Charles Willson Peale. © PHILADELPHIA MUSEUM OF ART/CORBIS.

need of government’s protection. At the same time, although they could lobby and petition government—which they certainly did—they were precluded from representing themselves. Indeed, this exclusion from formal participation only made them more worthy, or so it appeared. The presence of women at political ceremonies, in the halls of Congress, or even in the U.S. Supreme Court seemed to assure that whatever took place there was done for the benefit of society more generally, and not just for the presumably self-interested men who exercised power in their name.

LAW

The years after the Revolution witnessed several small improvements in women’s legal status. For the most part, however, the legal reforms of the post-Revolutionary era were not designed for women’s relief, even if that was sometimes their effect. For example, the elimination of primogeniture worked to the advantage of younger brothers as well as women. Consider also the case of divorce, which both Thomas Paine and Thomas Jefferson justified in liberal terms of consent and contract. “No partnership can oblige continuance in contradiction to its end and design,” Jefferson wrote, and the principle applied both to governments and marriages. By

1800 divorce, which before the Revolution had been rare except in the Puritan colonies of Massachusetts and Connecticut, was legal in twelve states and the Northwest Territory. Yet as Norma Basch has shown, liberalized divorce laws benefited primarily those women whose husbands had already abandoned them; now they were afforded some legal protection. Divorce, however, remained rare, and if it provided relief for the occasional wife with an adulterous or abusive husband, it did almost nothing to redress the imbalance of economic and legal power under which many more women suffered.

There were other small improvements in women's legal status. For example, in some states, married women gained expanded rights to enter into business, and in 1808, married women in Connecticut secured the right to bequeath real estate. Significant change for women would not come, however, until the middle of the nineteenth century.

ECONOMY

The economy in this period was shaped by several significant trends. The "consumer revolution" of the eighteenth century put an array of consumer goods, ranging from tea and teapots to mirrors, linens, and chests of drawers, into the hands and homes of perhaps half the colonial population. Women were avid consumers of such items. At the same time, there were significant gains in productivity over the course of the century in advance of the technological innovations that accompanied the industrial revolution. Although economic historians are not yet certain how these gains were made, they believe the advances were the result of an "industrious revolution" in which people worked longer and harder. In an economy still based upon the family, significant gains in productivity could come only from the work of women and children (and of slaves of both sexes).

Overcrowding, particularly in New England, and a series of imperial wars dislocated numbers of young people of both sexes and made widows out of young wives. The Revolution only exacerbated this trend as countless young people flocked to the cities, where they hoped to make a living. There they were joined by emancipated slaves, who created the first urban, free black communities. These new urbanites, many of whom, of course, were women, constituted the United States' first working class. The women found employment in a variety of manufacturing and service occupations, ranging from domestics in wealthier women's homes to prostitution.

The heightened pace of economic change after the Revolution affected other segments of the female

population in different ways. As paid work increasingly moved out of the home, the labor of middle-class white women was obscured. To be middle class meant not to work for pay, and hence domestic labor, from caring for children and making clothing to taking in boarders, was—in Jeanne Boydston's term—"pastoralized," or redefined as love rather than work.

During the same period, slavery was eliminated, sometimes immediately and sometimes gradually, in every state north of Maryland. And even in those states where slavery remained legal, thousands of slaves, some the mistresses or daughters of their owners, were freed by their owners, especially in the Chesapeake region. The result was a new class of free blacks, which was disproportionately female. Most of the women among them faced a life of hard work as domestics, cooks, seamstresses, and laundresses, but freedom enabled them to associate with whom they wanted, to move more or less freely through the North, to marry and maintain families, and to join churches and voluntary associations, all of which would have been difficult if not impossible under slavery. At the same time, as slavery became more entrenched in the South, conditions for slave women generally worsened. New, skilled positions generally went to men, leaving slave women with the drudge work. The spread of slavery, however, and the development of larger plantations generally made family life more secure for women, although the separation of families by sale and forced removal was so common that a term such as "secure" has only relative meaning.

The condition of Indian women in this period deteriorated. All Indians were losers in the Revolution, and many found their lands seized and their homes destroyed. Others would face defeat by the American army and eviction from their lands in the decades to come. The wars left countless Indian women widows. Also, increasing dependency on the market altered gender relations in Indian country. Men traded undressed skins and pelts to whites and too often spent the proceeds on liquor. Women's work was no longer vital to their communities.

SEXUALITY

By the middle of the eighteenth century, the power of fathers was in decline as a rapidly changing economy and new doctrines of equality limited their control over their children. This change should have been more beneficial to women than it was. Although the ideal of companionate marriage suggested that marriage should be a union of equals, and while increas-

ing numbers of young people hoped to find a soul mate, young women had very little power and even less protection should they succumb to the entreaties of a faithless suitor or marry unwisely. Once again the promise of the Revolution remained unfulfilled. Women, particularly those of the middle class and the elite, benefited from ideals of equality and even increased freedom. But without the power to protect themselves or to secure their own livelihoods, such gains were only partial.

Female Reform Societies and Reformers

Women's efforts to change and improve American society—and in the process alter their own status—began to develop significantly at the end of the eighteenth century. One reason for this was that the patriarchal attitudes toward women's roles in society, whereby women were seen largely as domestic drudges confined to the home and inferior to men in every way, began to yield to the idea that women in the new Republic needed to become more active in making the family a bedrock of republican virtue and a repository of religious instruction for the children. This elevated women to a distinct position of authority concerning morality and gave them the opening to define not only moral standards in the home but in the community.

REVIVALISM AND REFORM

Aiding this development was the emergence at the turn of the century, from New England to the Mississippi, of the Second Great Awakening. This revivalism, particularly as it developed in the Congregational, Presbyterian, Methodist, and Baptist churches, not only produced large numbers of female converts but instilled in them the belief that sin and vices such as intemperance, gambling, and prostitution were voluntary activities that the new converts could eradicate. Moral suasion, a reform technique whereby sinners were persuaded by preachers, lecturers, and religious publications to give up their vicious ways, was a major development of the Second Great Awakening outlook and would inspire thousands of reformers of both sexes to improve American society.

In the cities, religion-inspired charity, in which women played a major role, developed extensively in the 1790s and 1800s. As the nation entered the industrial revolution and embraced a market economy, the soaring urban population brought with it a growing number of widows, orphans, and other groups needing assistance. Men and women from the upper and middle classes, often inspired by the new religious developments, began to organize efforts to succor the needy and at the same time bring them into religious institutions. Caring for the poor, especially the "worthy" poor, emerged as one of the earliest reforms in which women could participate. In 1797 Isabella Graham, a wealthy New York City woman, took the lead in establishing the Society for the Relief of Poor Widows with Small Children. Graham and other members found jobs for the women, gave them food and clothing, and provided fuel for

their fires. In addition, they tried to “improve” them by providing lessons in household management and instructing them in religion. A Boston female association founded in 1812 noted that by the 1840s it had aided more than ten thousand families. By the 1820s, not only in the larger cities but in places such as Rochester, New York, and New Orleans, women had set up hundreds of relief societies, orphanages, charity schools, and poorhouses. The New Hampshire Missionary Society established more than fifty local female auxiliaries to support its efforts to find and place domestic and foreign missionaries and to help distribute Bibles and religious tracts. Between 1810 and 1815 across the nation, thousands of women joined “cent a week” societies where their savings when pooled went to support more missionaries and to distribute more religious materials.

REFORMING PROSTITUTES

Relief efforts brought evangelical women and men into contact with the lower classes, where they found not only widows and orphans in need of help but also women being exploited, especially by prostitution. A male-controlled prostitute asylum, where penitent prostitutes could be reformed, opened in 1800 in Philadelphia. Eleven years later, Isabella Graham and her wealthy matron friends joined with men to found a similar asylum in New York City. The asylum approach to reform came from the religious belief that all people, regardless of their sins, could be converted to Christianity and trained to live moral and productive lives. In the controlled environment inside the asylum, female instructors, aided by male preachers, taught the penitents religion and encouraged them to convert. At the same time, the inmates were trained to be seamstresses or domestic servants, “respectable” occupations that they could enter after leaving the asylum. Although the asylum approach failed to redeem many prostitutes and the asylums themselves had short lives, women increasingly took the lead in the movement against prostitution. By the 1830s, when the asylum approach to prostitution revived, women would dominate every aspect of the reform effort.

EDUCATIONAL REFORM

Women also became deeply involved in educational reform. Since colonial times, girls had received a smattering of elementary education—enough to be able to read the Bible—but had seldom had any instruction beyond that level. Private academies in the eighteenth century sometimes enrolled girls as well as boys, and the all-female academy or finishing

school emerged in the second half of the same century. All too often, the finishing schools instructed girls in household matters, good manners, and correct posture and in nothing else. By the 1820s, however, women reformers such as Catharine Beecher, Emma Willard, Zilpah Grant, and Mary Lyon called for more rigorous education for women to prepare them for the moral guardianship of the younger generation. Willard proposed in 1818 that girls receive religious and moral training in their schools and education in natural philosophy and literature. She and others also demanded that girls receive instruction in algebra, geometry, history, geography, and the natural sciences. Beecher, Grant, and Lyon used their own female academies to create rigorous curricula and to promote their new approach to female learning throughout the nation.

Women’s education, while it continued to develop and spread during the early national period, caused considerable alarm among people who feared that educated women would forget that they were in a sphere that revolved around the home. For every Emma Willard who called for more education for girls, there was someone, usually a male authority figure, who warned that women’s brains were too small and too fragile to handle the rigors of subjects such as philosophy. This theory of female inferiority indeed had long been used to prevent more educational opportunities for women and had provoked from some women stinging counterarguments calling for female equality. Judith Sargent Murray, a Gloucester, Massachusetts, education advocate, argued in the 1770s that the supposed superiority of male intellect arose from nothing more than men having more education than women. The anonymous female author of *The Female Advocate* in 1801 claimed that God and Nature had given both sexes “equality of talents, of genius, of morals, as well as intellectual worth” and that only male arrogance had deprived women of this equality by keeping them from education and experience.

Such ventures into a feminist critique of society remained daring—and rare. When Mary Wollstonecraft’s *Vindication of the Rights of Woman* (1792), calling for equality for the sexes, appeared in Britain, American women largely ignored her plea and continued to strive for change in the form of aid to the needy, vice eradication, and expanded educational opportunities for women rather than for sexual equality. A fully developed crusade for women’s rights would not emerge until the 1840s.

Political Participation

Once, an entry on women's political participation would have been absent from an encyclopedia such as this one, on the assumption that women had no political presence in this historical period because they lacked the vote. But scholars, in addition to uncovering rare and proscribed examples of voting by women, have shown that women were indeed active in a continuum of political activities ranging from acts of patriotism, to work with voluntary associations (which often involved personal dealings with governments), to appearances at partisan gatherings, to more publicly organized efforts to influence the distribution of power or resources in their communities, their states, and their nation.

Before the war, most colonies' laws allowed only propertied, often only white propertied, men to vote. Women were thus part of a large category of the excluded that also contained nontaxpayers, slaves, the poor, and, in some colonies, free blacks, Catholics, and Jews. In a few towns in Massachusetts and a few counties in New York, propertied widows voted in local elections.

The colonial protests that became the American Revolution, however, forced everyone to consider arguments regarding the government's legitimacy. Women with Revolutionary sympathies supported the boycott of British products; they drank herbal teas and made clothes from homespun cloth. In poems, plays, essays, letters, and diaries women on both sides of the war advocated for their political views. After the war, in 1788, Mercy Otis Warren, whose brother James Otis had been a leader in the tax rebellion, published a pamphlet opposing ratification of the new federal constitution, thus engaging directly in political advocacy, albeit anonymously.

The war's justification—no taxation without representation—supplied obvious arguments in favor of widening the suffrage to taxpaying men and single taxpaying women (married women were thought to be represented politically by their husbands). Nevertheless, only one state, New Jersey, did so: its 1776 state constitution specified that black and white unmarried and widowed women in possession of fifty pounds could vote.

In the opening decades of the nineteenth century, women found themselves under increasing pressure to redirect their political energies into raising their children to be good citizens. The distinction between public and private spheres established the banishment of women from the civic arena as a moral good. (In response, New Jersey ended single wealthy women's suffrage in 1807.) Organized benevolence, however, was considered a proper quasi-public endeavor for women. Working in partnership with men and on their own, black and white women founded orphanages and asylums and lobbied individuals and local governments for funds to maintain the new institutions. They also worked for temperance, antislavery, and education.

Women's engagement in organized benevolence drew them into policy arguments that only Congress could settle. The tool they chose to influence the federal legislature was the petition. This ancient method, originally intended to redress individual grievances, had become a political means as early as the 1780s, when men in Massachusetts petitioned their state legislature for tax relief and women seamstresses in Charleston petitioned the South Carolina legislature to impose a duty on imported ready-made clothing to protect their industry. The first women's petition to Congress was on behalf of the Indian tribes in Southern states. That two-year campaign began in 1829 when the educator Catharine Beecher wrote a pamphlet urging women to petition Congress not to remove the Indians from their lands and orchestrated its circulation among "benevolent" women. Beecher, aware of the controversial nature of these efforts, undertook them anonymously. But the deed spoke for itself. Women's use of the petition for political purposes expanded in the decades to come, as did their use of other soon-to-be-discovered methods of nonvoting political participation.

Professions

In the eighteenth and nineteenth centuries, female participation in professional fields was limited to areas related to the household and family, or those that emphasized nurturing skills. A woman might routinely step out of her traditional role and take over her husband's profession, trade, or shop while he was away on business because the family's livelihood depended on it. Other women worked in the medical profession; midwives such as Martha Ballard delivered babies, tended new mothers, and treated illness in both female and male patients. By the 1820s, though, most states enacted laws requiring practitioners to be graduates of medical schools, and this effectively limited the practice of medicine to men only.

Even as the medical profession contracted, the fields of education, writing, benevolence, and reform opened to women. Following American independence, the physician Benjamin Rush argued that mothers were the perfect people to teach republicanism, patriotism, and virtue to their sons while passing on domestic skills to daughters. This renewed emphasis on domesticity and the added emphasis on goodness enabled women to move into new types of work, related to their assigned roles as family educators and moral guardians. In 1792 Sara Pierce opened a female academy in Litchfield, Connecticut; over the next decades, Emma Willard, Catharine Beecher, and Zilpah Grant also established schools in New York and New England for young women. By the 1830s, when a newly established public school system faced a teacher shortage, an army of educated young women filled the void. (The influx feminized the profession, and teachers' salaries were halved.)

Writing was another professional choice for some women. In the late eighteenth century, Mercy Otis Warren defied convention by writing plays; in 1805 she completed a three-volume history of the American Revolution. In this same period, Judith

Sargent Murray published essays, plays, and poetry on women's education and equality, but she wrote under a male pseudonym to avoid criticism. By contrast, early-nineteenth-century authors Catharine Beecher, Lydia Maria Child, and Sarah Josepha Hale gained popularity, not by taking on a male persona or writing on typically male subjects, but by focusing on women's issues such as the domestic economy and child rearing. In fact, Child supported her husband, a struggling attorney, by writing. Hale was particularly influential as the editor of *Ladies Magazine* from 1827 to 1836 and *Godey's Lady's Book* from 1837 to 1877.

Benevolence and reform also offered a professional path related to what were seen as women's moral and domestic roles. Southern women were less likely to attend seminaries or become teachers than those in the North, but women in both regions were involved in benevolence. In 1812 women in Petersburg, Virginia, started a female orphan asylum; New York women organized a society to aid widows and children as early as 1797. After 1830 some Northern women adopted such causes as abolition, temperance, saving prostitutes, and woman suffrage. These experiences paved the way for women to become organizational managers and social workers, as well as teachers and writers, though professions such as medicine, law, and the ministry remained closed.

Rights

Natural rights were a topic much discussed in the early years of the Republic. Modern scholars study-

ing these debates have sought to identify early advocates for women's rights, determine the extent to which they judged men's and women's rights to be different, and assess women's place in early American republicanism.

THE IDEA OF NATURAL RIGHTS

For most of the eighteenth century, the rights usually invoked in popular discourse were constitutional rights, those having to do with law and procedure. The British colonists were aware of John Locke's writings on natural rights, but the idea did not take on political valence until the 1760s, and then mostly among the leaders of the Revolution, such as James Otis. The phrase "rights of man" and "women's rights" were not in widespread use until the 1790s, following the publication of Thomas Paine's treatise on the French Revolution, *The Rights of Man* (1791, 1792) and Mary Wollstonecraft's *A Vindication of the Rights of Woman* (1792).

The idea that all human beings possess equal rights to autonomy, property, and happiness, advanced by Locke and others, was as potentially revolutionary for the new Republic as the theory of "consent of the governed" had been when the colonies were under British colonial rule. The issue now became just how far rights advocates could push the argument. By 1829 white, unpropertied, and untaxed men were well on their way to achieving full political rights in all the states. For women, however, voting rights were barely under debate. (Only New Jersey had seriously considered the issue, having granted and then rescinded the vote to landowning single women between 1776 and 1807.) The first question was whether they possessed natural rights at all. Judged to be men's inferior, particularly in matters of intellect and civic virtue, women were expected to embrace dependence on, and obedience to, men as the proper arrangement.

In the midst of the Revolutionary War, a twenty-eight-year-old woman, Judith Sargent Stevens (later Murray), began work on a manuscript, "The Sexes," in which she argued for the natural equality of women's minds and for providing mentally challenging education to all girls. The first portion of this manuscript, on which she continued to work throughout the 1780s, was published anonymously in 1790 in a prominent literary magazine with the title, "On the Equality of the Sexes." Frustrated by society's neglect of women's intellects, Murray set out several arguments in favor of educating girls. Some arguments, most of which were in general circulation by the 1780s, were purely practical—that

women would be less coquettish, vain, and frivolous, better companions to their husbands, better mothers to their children, happier, and be brought closer to God, if their minds were trained. But Murray, while avoiding the word "rights" and generally favoring women's traditional role as obedient helpmeet, argued that women's minds were naturally equal, that they possessed immortal souls and that they ought to be able to realize their full potential—all ideas advanced by natural rights theory. Whether Murray was America's first advocate for women's rights is still in dispute.

WOLLSTONECRAFT'S CONTRIBUTION

Two years after Murray's essay was published, the phrase "women's rights" was boldly laid on the table by the British philosopher and essayist, Mary Wollstonecraft. Her book, *A Vindication of the Rights of Woman* (1792), shocked and excited readers on both sides of the Atlantic. Three American editions of this first major work of feminist political theory were immediately in print, and the book was excerpted in several literary journals, including the one that had published Murray's essay. Wollstonecraft used natural rights arguments to conclude that women belonged in the republican vision of citizenship. The rights of humanity also belonged to the female side of the population, she wrote; women, too, should enjoy independence, cultivate their virtue through the exercise of their reason, and realize their "full potential." Like Murray, her primary focus was on why women's minds should be educated; unlike Murray, she extended the implications of the rights argument into other areas. Talented women, she argued, should be able to take up the professions, such as medicine, or to practice business, or even to be elected to represent other women in legislatures. Although Wollstonecraft affirmed that women's duties were different from men's and that they included managing her family, educating her children, and helping her neighbors, she continually repeated the point that these duties flowed from women's natural rights. If a woman's rights were not honored, then her duties were cancelled.

WOMEN'S RIGHTS REDEFINED

The early years of the nineteenth century were years of consolidation and retrenchment for issues related to women's rights. As the century turned, the traditional gender hierarchy—of women dependent on men and under their authority—reasserted its influence through the ideal of the republican mother and through the distinction drawn between public and

private spheres and the theory that men's place was in public and women's place at home. But rights had entered the national vocabulary. Hannah Mather Crocker in her *Observations on the Real Rights of Women* (1818) voiced the new assumption that women were equal and that women and men had different rights, with women's centering on their domestic duties.

Still, the argument for educating girls made some progress. A few academies for young ladies sprang up in the 1780s, and their numbers increased in the 1790s. By the second decade of the nineteenth century, such schools were entirely noncontroversial. Many taught dancing, French, and good manners, and a little mathematics; the best ones, however, taught rhetoric, philosophy, and history. The natural rights argument that had helped produce this educational revolution was hidden from sight but not forgotten. A second generation of Wollstonecraft's readers, those equipped with a better education, would expand the arguments for women's rights in the near future.

Louise W. Knight

Women's Literature

Throughout the eighteenth and nineteenth centuries, women read and wrote in every conceivable literary form despite prevailing laws and customs. Most Americans believed that only men could be active citizens, a role that included participating in political discourse in newspapers, pamphlets, or other such forums. Women were denied participation in political forums such as town meetings and could not hold political office. However, they seized opportunities available to them to write for a wide audience.

The American Revolution helped bring women into the world of published literature. When the first crises between the American colonies and Great Britain arose in the 1760s, women wrote about their political opinions and in some cases sent these opinions to newspapers. In their writings women often apologized for violating gender customs. They justified their publications by arguing that they were defending their honor from insult or argued that specific female roles, such as manufacturing and mending of clothing, gave them the right to write in the midst of a crisis that rendered these roles political.

Women were acutely aware of gender boundaries. Mercy Otis Warren (1728–1814), in a published poem titled "Primitive Simplicity," averred that if she exceeded what she called the "narrow bounds" of womanhood, she would put her pen down and gladly fit herself into her proper place as wife and mother. Warren was not alone. Most women who wrote for public consumption conformed to the social standards of the time with the exception of their published writing.

POETRY

American women have a long relationship with poetry. Anne Bradstreet began publishing her poetry in the mid-seventeenth century, paving the way for later female poets. In the early American nation, one of the most renowned poets was Phillis Wheatley (1753?–1784). In her lifetime she published at least forty-six poems and was the author of many more that have since been published. The poem that brought her recognition was one she published in 1770, the subject being the death of George Whitefield, the famous itinerant preacher who captivated audiences in England and America during the religious revival known as the Great Awakening. A volume of her work, *Poems on Various Subjects, Religious and Moral*, was published in London in 1773. Wheatley's accomplishments are particularly remarkable as she was born in West Africa and stolen into slavery in 1761. She was taken into the Massachusetts

household of John Wheatley where, by all accounts, she was treated kindly and taught to read and write. Although much of her poetry is conventional, it was highly praised at the time.

At the onset of the American Revolution, poetry was used for propaganda purposes, with writers on both sides arguing their case. Although Mercy Otis Warren is less well known today for her poetry than for her incendiary plays and her history of the American Revolution, poetry was one of the forms she used to help wage the ideological war against the British. Following the Boston Tea Party in December 1773, John Adams encouraged her to write a poem commemorating the bravery of the participants. Adams sent her an outline of the poem, which Warren used as a starting place. With Adams's help the poem, "The Squabble of the Sea Nymphs," was published in a Boston newspaper, intensifying anti-British feeling. Warren, encouraged by prominent men, became a mouthpiece for the American cause.

In the period after the American Revolution, women's poetry focused less on politics and more on morality and sentiment as these characteristics were increasingly seen as inherently female. The most successful of the early-nineteenth-century American poets was Lydia Howard Sigourney (1791–1865), who published her first work, *Moral Pieces in Prose and Verse*, in 1815. She followed this first work with almost seventy more books and more than a thousand articles. Her poetry and prose embraced gender conventions, focusing on moral and religious issues and women's roles in society.

PLAYS

Like poetry, plays were used as propaganda pieces in the cause of the American Revolution. Mercy Otis Warren was one of the United States' first playwrights, playing a key role in the development of the genre. Her three political plays, *The Adulateur* (1772), *The Defeat* (1773), and *The Group* (1775) worked to rouse Americans in opposition to British policy. Published in newspapers and pamphlets, they were not written to be performed but to be read out loud. All three focused on the evils of the Tory government in Massachusetts, particularly the actions of Governor Thomas Hutchinson. Placing the action in fictional Servia, Warren thinly disguised the leading Massachusetts political figures. Hutchinson became the conniving Rapatio, contrasted in the play with the characters who stood in for virtuous Whig colonists. Although not of high literary value, the plays served their purpose, winning support for the American cause.

In 1794 the first dramatic works by women were performed on the American stage. The libretto for the opera *Tammany; or The Indian Chief*, performed in New York, was written by a Welshwoman, Ann Julia Hatton (1764–1838). *Slaves of Algiers; or, A Struggle for Freedom*, written by Susanna Rowson (1762–1864), was performed in Philadelphia. Its setting was the North African Barbary Coast, where the United States Navy was running into trouble with pirates. Although specifically focused on a white slave trade that involved selling girls and women into prostitution, the play was broadly anti-slavery. Rowson's play engaged in the ongoing debate of the new American nation on the nature of freedom, particularly the ideals of the Revolution as opposed to the institution of chattel slavery.

THE NOVEL

The most controversial literary form in the early American nation was the novel. Americans worried about its allure, fearing that fiction might pull readers into false worlds, detaching them from necessary involvement in the New Republic. Doctors proclaimed that reading too many novels could cause madness and cautioned parents to steer their children toward history and other works of nonfiction. In 1807 Dr. Thomas Trotter wrote that men were, in part, guarded from the risk of madness induced by novels as they had natural outlets in their work life. Women, in the opinion of Trotter and other doctors, were far more vulnerable to the supposed dangers of novel reading. Women in the new American nation were warned repeatedly against reading novels because novels could lead them to put passion before reason and to neglect their womanly household duties. Immersed for hours in stories of love and romance, women might lose touch with reality, causing them to commit moral indiscretions. Because being a good American woman had become tied to morality, some believed that this failure on women's part would do nothing less than bring the new American nation to ruin.

Nevertheless, the novel took off in the new United States. The first American novel, *The Power of Sympathy, or the Triumph of Nature Founded in Truth* (1789) was written by a man, William Hill Brown (1765–1793); but because it was published anonymously, many believed it had been written by a woman. *The Power of Sympathy* and other early American novels largely detail stories of the seduction and ruin of young women. Running beneath the theme of seduction were broader themes that reflected authors' and readers' anxieties about the new na-

tion. Who would speak for the people? Who had power? Had democracy gone too far? Americans were far from united in the period following the Revolution; the novel grappled with the problems and highlighted the dangers and upheavals of the new nation.

Novels were an accessible form and could be read by people who had little formal education. In addition, novels focused on the everyday life of female characters, allowing women readers to place themselves within the action of the stories. Early American novels all emphasized better education for young women as a way to empower them to make decisions that would lead them away from damnation and toward morality. The plot lines emphasized that if women received adequate education they would be able to guard themselves against rakes and flatterers. These early American novels showed the restrictions of women's lives but entered into a debate about women's status and rights, particularly as it concerned female education.

BEST-SELLERS

Susanna Rowson's *Charlotte Temple* (1794) was the best-selling American novel until Harriet Beecher Stowe's *Uncle Tom's Cabin* surpassed it in 1852. Not only did American readers buy more than fifty thousand copies by 1812, but they identified so completely with Charlotte that they flocked to the Trinity Church graveyard in New York City to visit a grave that was allegedly hers.

Rowson's heroine is a young, innocent English-woman who has been seduced by Montraville, an army officer, brought to the United States, and then left with her shame as well as with decreasing support from her lover. When finally her morality and goodness seem lost forever, and her monetary support is cut off owing to the connivance of Montraville's friend, Belcour, Charlotte dies in childbirth, destroyed as much by her emotional state as by the poverty and hunger that surrounded her because of the abandonment by her seducer.

Although Rowson's heroine is passive, except in her initial choice to run away, the message of the novel spoke against female passivity. The story warned young women not to follow Charlotte's path. As in most American seduction novels, the author's message was that Charlotte's path could be avoided only if women received a good, solid education. Charlotte's downfall was ignorance and dependence.

The Coquette; or, The History of Eliza Wharton, by Hannah Webster Foster (1758–1840), ran second to

Charlotte Temple in sales. In the novel Eliza Wharton is troubled over the choice between coquetry and married life. The story is based on the story of Elizabeth Whitman (1752–1788), an educated woman from a prominent family who died at the Bell Tavern in Danvers, Massachusetts, where she had checked in under a false name. She had delivered a stillborn baby out of wedlock, and her story became widely circulated in New England as a cautionary tale. Whitman became a symbol of what too much of the wrong kind of reading could do to a woman.

The fictional Eliza Wharton worried about the constraints married life would put on her. She would lose her women friends, and her life would focus entirely on her husband and children. What other choice did she have? In the end she chose the path of the coquette, becoming involved with a married man. Like other American novels, *The Coquette* raised important questions about the nature of the new United States. What role did women play in the new nation? Were their freedoms to be constricted? The dilemmas faced by Eliza Wharton were compelling enough that the book went through thirteen editions before the end of the nineteenth century.

Several trends in the new American nation affected the development of women's literature. In the eighteenth century, print culture expanded rapidly. The revolution in printing made mass production of literary works possible, and the production of a mass market allowed books to be passed along established commercial networks. White women had increased access to education, particularly in the North, which gave them the skills they needed to read and write. The Revolution and the nation-making that followed opened up further avenues for women as women participated in the debates over the shape of the new nation and women's role within it. Women of the middling sort had more leisure time as consumer goods became more available and as servants took over some of the household work. In addition, ladies' magazines furthered women's opportunities to become published writers. By the early nineteenth century, women were fully participating in writing for publication, although no American woman or man was able to make a living from writing until the 1820s.

Women's Voluntary Associations

The history of women's voluntary associations begins during the Revolutionary period, when everyday domestic pursuits became politicized as defiant opposition to mercantilist policies imposed on the North American colonists by the British Empire. Groups of women called Daughters of Liberty met, usually in ministers' homes, to produce homespun in order to sustain economic boycotts of British goods. The urgent need to outfit General George Washington's army during the Revolutionary War (1775–1783) further eroded customary barriers to the movement of women in public spaces; ladies' associations collected donations for the Revolutionary cause by going door-to-door.

Voluntary associations were few in number and short-lived until the confluence of two ideologies, republicanism and evangelical Christianity, altered women's relationships to family and community. Women had no political status, but their claims to moral authority from active participation in churches and religious movements were imbued with new meanings in the new nation. Improvements in women's education occurred in the nascent Republic of the 1780s and 1790s as reformers used the rhetoric of republicanism and assumptions about women's moral authority to argue that they, as men, must be prepared to assume civic duties. Although women were not schooled to enter public life but to oversee the spiritual training of their sons in order to ensure a virtuous citizenry, education nevertheless raised women's expectations for having a public role in the new nation. Many of the first generation of leaders of early-nineteenth-century benevolent societies had attended female seminaries.

In the first third of the nineteenth century, benevolent societies founded by middle-class northern and southern white women and free black women proliferated to serve the indigent in rapidly growing

towns and communities. Many benevolent societies, initially organized as auxiliaries to churches to provide crucial financial support to local clergy and religious missions, became an indispensable apparatus of social welfare, especially for widows and orphans. Isolated by racism, African American women organized for mutual spiritual, intellectual, and material benefit in groups such as the Colored Female Religious and Moral Society founded in Salem, Massachusetts, in 1818, but these organizations also provided charity to those in their communities living in dire poverty. Associations of white women acted as the guardians for the most vulnerable members of the community. Along the Eastern seaboard, benevolent societies cooperated to establish orphan asylums and schools.

The spiritual fervor of the Second Great Awakening in the 1820s and 1830s, with its emphasis on conversion and combating sin, transformed female benevolence into a broader movement for moral and social reform. While many associations remained committed to good works though local charity, some women banded together in public crusades against alcohol abuse and prostitution. Collective efforts for reform included types of public activism previously pursued only by men, including petition drives, rallies and conventions, public lectures, and published broadsides. The New York Female Reform Society, founded in 1834 to reform prostitutes and discourage their clients in New York City, published a newsletter and empowered its members to visit brothels. Susan B. Anthony's first introduction to politics was through her involvement in a local chapter of the Daughters of Temperance in central New York during the 1840s. And as her long career in public life as a leader of the suffrage movement demonstrates, the early women's rights movement in the mid-nineteenth century owed its beginnings to female associations in the new nation.

Writers

During the years from 1754 to 1829, American women writers made many contributions to the shaping of the nascent American nation. Their voices speak through private diaries and journals, and in their letters one discovers a record of the events of their lives. Their poems, novels, and sermons unite religious teachings with domestic themes, as they question their place in the emergent social, political, and geographical landscapes of the United States. Some women's writing reflects the "cult of domesticity," which suggested that a woman's place in the domestic sphere was actually the locus of her power. Other women's writing explores the psychological struggles of women in their relationships with men—especially in novels of seduction, which became popular at the turn of the century. High society women expressed an interest in "polite letters"—newspaper articles, essays, and manuscripts largely circulated in literary salons and coffeehouses—as they attempted to infuse social discourse with their aesthetic concerns. Most important, women's writing during the Revolutionary era illustrates an emerging sense of self-awareness. The inward focus of much of their work in the mid-eighteenth century turned outward by the beginning of the nineteenth century. As women gained self-confidence in their abilities and access to education, their writing reflected an evolution in thinking about significant issues, including religion, attitudes toward Native Americans, racial and gender inequities, and human relationships with the natural world.

Phillis Wheatley (1754–1784), an African slave educated by her American masters, was a highly regarded young poet in Boston. Wheatley's poetry pays homage to her religious faith and to her training in classical education; it does not fully engage

with the issue of slavery. After the Revolutionary War, many women writers expressed their support for the abolitionist cause, which led them to question gender inequities within the dominant religious framework of the times. By the early 1800s, Jarena Lee (1783–1849) challenged a patriarchal system in which women were not allowed to be preachers, claiming that her personal conversion prepared her for the role. Her spiritual autobiographies tell the story of how she became the first African American female preacher for the Methodist Episcopal Church. Many women also began to interrogate their own religious beliefs. For example, in her 1822 novel, *A New-England Tale; or, Sketches of New-England Character and Manners*, Catherine Maria Sedgwick (1789–1867) chronicles her conversion from Calvinism to Unitarianism. Such later works demonstrate an emergent sense of personal religious freedom for many African American and European American women.

In most stories white women told of their experiences being held captive by Native Americans, such as *A Narrative of the Captivity of Mrs. Johnson: Containing an Account of Her Suffering during Four Years with the Indians and French*, published by Susannah Willard Johnson (1730–1810) in 1796, white women's religious convictions are tested during captivity. In Mary Jemison's *A Narrative of the Life of Mary Jemison* (1823), however, Jemison recalls her adoption by her Seneca captors and her assimilation into native culture. At the same time, Native American women of the era were losing their personal religious freedom. As the new nation experienced the inception of its own political independence, some women writers began to question the treatment of Native Americans by white settlers. Unlike earlier captivity narratives, the novel *Hobomok* (1824), by Lydia Maria Child (1802–1880), suggests that Puritan ideology oppressed both Indians and women. Sedgwick's *Hope Leslie; or, Early Times in Massachusetts* (1827), scrutinizes the Puritans' approach to relations with Native Americans. As women writers explored the subjugation of Native Americans, so too did they consider their own oppression within the same patriarchal system.

As early diaries and journals of the period suggest, women increasingly turned from concern with domestic affairs to curiosity about the possibilities for women in civic and political arenas. The diary of Elizabeth Sandwith Drinker (1734–1807), a member of the Philadelphia Quaker elite, is a quotidian domestic record of life during the Revolutionary era. Yet novels of seduction, such as the *The Coquette; or,*

Yet haste the era, when the world shall know,
That such distinctions only dwell below;
The soul unfettered, to no sex confined,
Was for abodes of cloudless day designed.
Meantime we emulate their manly fires,
Through erudition all their thoughts inspires,
Yet nature with *equality* imparts,
And *noble passions*, swell e'en *female* hearts.

From "On the Equality of the Sexes,"
Judith Sargent Murray, 1790.

The History of Eliza Wharton (1797) by Hannah Webster Foster (1758–1840), emphasized the limitations of the domestic sphere for women. During and after the Revolutionary War, many women were challenged to consider broader social and political concerns in their writings. Judith Sargent Murray (1751–1820) was one of the earliest women to question the role of women in American society. In her 1790 essay "On the Equality of the Sexes," Murray advocates for equal educational opportunities for women, and in her three-volume collection of published and unpublished writing, *The Gleaner* (1798), Murray discusses a variety of topics, including politics, American history, morality, and the intellectual equality of women and men. The poet, playwright, and author Mercy Otis Warren (1728–1814) wrote *The History of the Rise, Progress and Termination of the American Revolution, Interspersed with Biographical, Political, and Moral Observations* in 1798, taking a political stance in support of American Revolutionaries. In 1814, Sarah Savage (1784–1838), a Massachusetts schoolteacher, wrote *The Factory Girl*, one of the first works to examine the impact of industrialism on female workers. Women writers also considered the injustices of slavery. The poet and novelist Sarah Josepha Hale (1788–1879) explored themes of slavery and regional identity in her 1827 novel *Northwood*. This awareness of women's roles in social and political spheres would later galvanize early feminist, labor reform, and abolitionist movements.

Women writers also explored their relationship to the American landscape, exhibiting the knowledge they had attained through formal and informal education in the arts and sciences. The letters of Eliza Lucas Pinckney (1722–1793) provide a detailed natural history of a South Carolina plantation, which she deftly managed after inheriting the operation from her parents at age sixteen. After the Revolutionary

War, women's mobility increased, and their perspectives on their place in the world broadened. Frances Hornby Barkley (1769–1845) ventured around the world for eight years with her sea captain husband and penned one of the earliest travel narratives about her adventures. Almira Hart Lincoln Phelps (1793–1884) examined landscapes closer to home in her work *Familiar Lectures on Botany, Practical, Elementary, and Physiological* (1829). She was one of the earliest advocates for women's education in the sciences.

During this seventy-five year period, women writers set the stage for a future revolutionary era of women's rights. In 1848, a group of women and men convened in Seneca Falls, New York, to discuss women's equality. Their *Declaration of Sentiments*, following the structure of the Declaration of Independence, called for the rights and privileges of men to be extended to women. In the language of the new declaration are echoes of many women writers' voices from an earlier revolutionary age.

WOOL Techniques for the home production of cloth from natural fibers were common knowledge in early America. Like all fibers, wool had to be cleaned, combed, spun into yarn, and woven into cloth. The card, spinning wheel, and loom had a place in most homes, along with a flock of sheep in many pastures. Woolens were the most commonly used fabric for making clothing. During the colonial period fine woolens, such as broadcloth, were imported from Britain, but the girls and women of America's households produced most of the rougher homespun and flannel.

Wishing to suppress any competition, Britain passed laws aimed at preventing woolen production in the colonies. The laws barred textile machinery and machine operators from leaving Britain and, for a time, prohibited the importation of sheep or wool into America. However, most colonists used whatever coarse wool they could obtain from their existing sheep to fill their household needs.

The boycotts of the pre-Revolutionary years and the war itself encouraged greater home textile production and, by necessity, decreased reliance on British textile imports. At the same time, the Continental army desperately needed woolens for uniforms. American households could not begin to fulfill that need, and the slaughter of many sheep to feed the army made matters worse. A lively wartime trade in smuggled British woolens ensued. When the war ended, Americans resumed the importation of fine British woolens but bought considerably less of the coarser grade. As a patriotic gesture, George Washington wore a domestic homespun suit for his inauguration as president.

Carding, the laborious hand-combing process, was the first wool production task to be mechanized in the new nation. People increasingly took advantage of mechanical advances to produce finer cloth. Carding machines were developed in Britain and probably smuggled to America; they were operating in New England by the late 1780s. Householders brought their wool fiber to carding mills for machine processing and then took the processed fiber home for spinning. In 1810 more than seven hundred wool-carding mills were operating in New England alone. Improvements to the spinning wheel considerably sped up home production of wool yarn as well. After weaving cloth at home, people brought their home-produced woolen cloth to local fulling and finishing mills.

Although a commercial mill began producing woolen cloth from homespun yarns in Connecticut

in 1788, the enterprise lasted just a few years. Not until Colonel David Humphreys imported a flock of fine-wooled merino sheep from Spain in 1802 did domestic flocks begin to improve and commercial woolen manufacture become economically viable. Whereas American-grown wool was relatively coarse, merino wool fibers were finer and better suited to the new spinning machinery from Britain. Humphreys began woolen production in a Connecticut factory in 1806. Others soon followed, and by 1812 at least two dozen woolen mills were operating in the United States. The Embargo Act (effective 1807–1809) and the War of 1812 (1812–1815) again cut off foreign trade and further boosted domestic woolen manufacture. One estimate values factory-made woolens during this period at about \$19 million a year.

The estimated total factory production in 1812 of 200,000 yards accounted for only about 4 percent of all American woolen production. As late as the 1820s, two-thirds of all woolens in New England were still homemade.

The gradual introduction of merino sheep and improved machinery, aided in 1828 by a hefty tariff on woolen imports, led to the expansion of woolen manufacturing in America. By 1830 it was well established as a profitable industry.

WORK

This entry consists of seventeen separate articles: *Labor Overview, Agricultural Labor, Apprenticeship, Artisans and Crafts Workers, and the Workshop, Child Labor, Domestic Labor, Factory Labor, Indentured Servants, Middle-Class Occupations, Midwifery, Overseers, Sailors and Seamen, Slave Labor, Teachers, Unskilled Labor, Women's Work, and Work Ethic.*

Labor Overview

Like most aspects of American life in the post-Revolutionary decades, work in the new American nation underwent a prolonged state of transition. Even as older, established ways persisted, new ways of working and of thinking about work slowly took shape, spreading over decades rather than months or years. Because the connections among national markets in goods and labor were still weak, rapid change, when it did occur, was usually limited to isolated cases. One of the most significant changes was the decline of traditional craft production as factories redefined the methods and means of production of goods. Tensions over the role of free and unfree labor in the workforce began to divide the nation. Women entered the workforce, challenging society's understanding of male and female roles. These changes were profound and would come to define American work.

REGIONAL LABOR SYSTEMS

Taking the early national period as a whole, the most striking change in the nature of work was the increasingly regional concentration of labor systems. Colonial America had been rich in land but poor in labor. Those who needed labor, whether temporary labor for fall harvests or permanent labor for year-round agriculture and craft manufacturing, were generally forced to take whatever labor they could find. For this reason, colonial labor tended to be a mixture of free and unfree labor systems, with free workers often working side by side with indentured servants and slaves. This all changed in the wake of the Revolution. Building on changes that were already under way during the French and Indian War (1754–1763), rapidly expanding population in the early nineteenth century and the Revolutionary rhetoric of freedom combined to place considerable pressure on unfree labor systems. In the end, the issue of unfree labor divided the new nation into two sections, each with its own distinctive labor system. In the North, states gradually or immediately abolished slavery and indentured servitude became both economically infeasible and ideologically unpopular. As a result, free labor became the norm. In the South, slavery remained the keystone of the southern labor system, especially after the spread of cotton agriculture in the 1790s. This trend toward distinctive sectional labor systems would continue through the first half of the nineteenth century and would become one of the central issues leading to the Civil War (1861–1865).

CHANGING PRODUCTION SYSTEMS

If labor in the South remained constant in the years following the Revolution, the opposite was true in the North, where both its labor system and the economic relations that supported it underwent profound change. Industrialization began to transform production in the new nation almost immediately after the Revolution. Improving on mill technology borrowed from industrializing Britain, early American manufacturers consolidated mechanized production of textiles in rural factories sited along the Northeast's major watercourses. At the same time, and with even greater impact, small groups of merchants and master craftsmen created urban manufacturing in which they divided traditional craft production into discrete tasks and used the resulting gains from the division of labor to increase production of a wide variety of goods, ranging from cutlery to shoes. Taken together, these early forms of industrialization virtually transformed the nature of work in the early nation.

DECLINE OF CRAFT PRODUCTION

The most significant change took place at the level of traditional craft production. As late as 1800 nearly all American manufacturing took place in artisan shops employing the skilled labor of master artisans, their journeymen, apprentices, and families. This craft system, with its roots stretching deep into the European past, had provided work and a way of life to tens of thousands of craftsmen since the beginning of English colonization in the seventeenth century. Resting on a tiered system of education and training, the craft system promised a life of economic well-being (competence, as people at the time put it) and social and political independence. For artisans, the skill they learned in their youth was a form of property; in a society in which rights devolved from the ownership of property, their skill entitled them to the same active voice in community political affairs that were claimed by modest landowners. If any one word described artisan identity, that word was "independence."

This independence was severely challenged by the new organizations of work and manufacturing that developed during the early national era. Competition from factories and manufactories—both of which could produce goods faster and more cheaply than artisans—drove prices down and forced artisans to work faster and longer in an increasingly futile attempt to maintain their standard of living. In time, most artisans simply could not keep pace with mechanized factories and more labor-efficient manufactories and were forced to seek work in these new

workplaces themselves or follow some other line of employment. Whatever path they chose, however, their expectations of lifelong economic independence were usually dashed by the new productive systems.

WORK AND NEW GENDER ROLES

One of the most profound social and cultural changes occasioned by the dissolution of the craft system and the rise of manufacturing was the redefinition of gender roles that the new work regimes forced on the new nation. Factories employed women as well as men, and this situation presented one of the most important challenges to established gender roles in American history. Since before colonial times, masculinity had been rooted in a concept of male independence and female dependence, and society had operated along patriarchal lines. What, then, did it mean to have independent working women and dependent wage-earning men in the new nation? Would the relations between the sexes be turned upside down? Would anarchy ensue? These fears dominated discussions of men's and women's roles in the post-Revolutionary era. In the end, traditional male and female norms were preserved by translating the meaning of masculinity and patriarchy from one anchored in artisan independence to a new norm in which a man fulfilled his masculine role by being employed, working diligently at his job, and supporting his family. Masculinity was redefined in ways that maintained male dominance in society. So long as women's work was largely isolated and peripheral (which it was throughout this period), women commanded meager resources. This alone prevented them from mounting a serious challenge to the received patriarchal system. In the new world of work, working women came to be seen as deviant, and the domestic ideal came to dominate early nineteenth-century conceptions of women.

Agricultural Labor

Agriculture was the backbone of American life in the new American nation. More than 85 percent of the American people participated directly in agriculture, making agricultural labor arguably the most important single factor in the early national economy. In an age that relied on human and animal muscle to accomplish virtually all farming tasks, a regular supply of labor was always a crucial consideration. Agricultural labor was performed in four contexts: family labor on family farms; hired labor on family farms; hired labor on commercial farms; and slave labor on plantations.

FAMILY FARMS

For the majority of people in the new American nation, agricultural labor was family labor. Family farms dominated the northern, mid-Atlantic, and western states, but even in the South, despite the high visibility of plantation agriculture, family farms far outnumbered tobacco, rice, and, later, cotton plantations. Although conditions varied slightly from region to region, family farming followed a common life and labor cycle. Newly formed families and families with children younger than seven or eight years of age often did not have enough labor for the myriad tasks—plowing, planting, harvesting, pruning, and building—that early national farming required. This was especially true in frontier areas, where trees had to be felled, land cleared of boulders and stumps, fences erected, and farmhouses and outbuildings constructed. Lacking family labor in these early years, young couples usually hired labor from surrounding farms, young women to help the new wife and mother and young men to help the husband and father. In most rural areas, these “helps” (as laborers were called) were teenaged men and women from surrounding farms who spent from two to three years working for neighboring farmers to save for their dowries or to help them purchase land for their own future farms.

Once a family's children reached an age when they were capable of regular farm work, parents let

their “helps” go and introduced their children to the routines of farm labor. As children grew through childhood and into the teenage years, their labor became an essential component of the family’s well-being. Beginning with simple, easily learned tasks, children mastered the regime of labor, and by the time they were eleven or twelve years old, they had become full-fledged family workers, supplying at least as much labor as their fathers and mothers.

As the family aged and children neared adulthood, the family labor cycle shifted again. Now children had to be launched into lives of their own. Better-off parents kept their older children at home, helping the family until they married. In less prosperous families, older children left home to work as “helps” for others. In both cases, when sons reached their early-to-middle twenties and daughters their late teens or very early twenties, they married and left the family homestead. Most farm families were large, however, and the departing older children were replaced by their younger brothers and sisters, who quickly took on their siblings’ former role as laborers.

The final stage of the farming labor cycle came when the youngest children reached maturity. By this time both parents were aging and less able to keep up with the labor demands of the farm. Just as they did in their early child-rearing years, farm families needed help in middle and old age. This help often came from the youngest son, who stayed in the home with his own family, helping his parents and eventually inheriting the family farm when his parents died. Where the youngest son was unable or unwilling to stay, parents turned again to hired labor from surrounding farms, much as they had done when they were first married.

This family labor cycle described the lives of the majority of Americans in the new American nation, but in areas where land had been worn out and families grown too large to provide for, life held out a different and less pleasant future. Faced with few prospects at home, young adults by the early 1790s could be seen roaming the countryside, looking for work far from home. These surplus men and women walked from farm to farm and from town to town in hopes of finding employment as farm laborers or household servants or in the rural textile mills that were beginning to dot the American countryside. Little is known about the fate of this growing body of displaced men and women, but they were an increasingly visible and troublesome phenomenon in long-settled agricultural regions, especially in New England.

COMMERCIAL FARMS AND PLANTATIONS

Even less is known about agricultural labor on northern commercial farms. Large commercial farms producing grain for national and overseas markets existed in small numbers near the ocean ports of New York City, Philadelphia, and Baltimore. Work on these commercial farms was performed with hired labor, the workers most likely coming from the flow of displaced agricultural workers mentioned above or from the growing number of Irish immigrants, who began entering the new nation in the early nineteenth century.

Southern plantations were the largest agricultural enterprises in the new nation. Growing tobacco, rice, wheat, and—by the mid-1790s—cotton for export, these plantations relied by the mid-eighteenth century almost exclusively on the labor of African American slaves. Agricultural work on southern plantations was arduous and often unrelenting. Unlike the labor cycle of family farms, which was regulated by the shifting priorities of the seasons, plantation owners demanded constant work from their slaves, putting them to nonagricultural work when crops did not need attention.

Continuing the labor regimes of the colonial period, plantation owners worked their slaves following one of two labor systems. In the gang system, large contingents of slaves were marched to the fields by overseers and given specific tasks to perform. Oversight was intense and slaves had little freedom under the unrelenting gaze of the overseer. The task system allowed much more freedom and self-direction and was much preferred by slaves. In the task system, slave foremen were given a list of tasks and an expected time of completion. The organization of tasks and laborers, as well as the apportionment of work time, was left to the slaves themselves. Both labor systems were in common use throughout the early national period; George Washington, for example, worked his male slaves by the task system and his female field hands by the gang system.

Wherever one traveled in the new American nation, one found men and women working in fields, orchards, and gardens. Not until the advent of the McCormick reaper in 1831 did the age of mechanical agriculture begin. And with it came a new kind of agricultural work unthought of in the new American nation.

Apprenticeship

As the main path to the acquisition of a skill in the early modern world, apprenticeship was an important custom throughout the colonial American and early national period. Although the institution continued to be the main means of attaining a skill, changes in the early American economy, the Revolution, and the experience of new nationhood diminished the importance of apprenticeship and, by the nineteenth century, it was less vital than ever before.

OPERATION OF THE SYSTEM

Throughout the Old World and the New, apprenticeships had lain at the core of the production of a skilled labor force. They represented the first stage in a system in which workers began as pupils, progressed to the status of journeymen, and finished their careers as masters. Usually, at the age of thirteen or older, children would be sent away from home to live in the household of a master tradesman. Following seven years of training, workers would then “journey” around looking for employment from those with established shops, aiming to accumulate enough capital eventually to purchase their own workshops and tools and take on their own apprentices. Parents paid a fee for their sons (and sometimes daughters) to enter into an apprenticeship, with the amount charged linked to the status and earning potential of the chosen profession. One of the most prized placements was an apprenticeship with a merchant, and many British and colonial American middling sorts would quite happily pay large sums to get their sons taken on at a prestigious trading house in London, Bristol, Philadelphia, or Boston. Cheap apprenticeships for poorer people were to be found in shoemaking or tailoring, where profits would always be modest and capital requirements were low.

At the beginning of the eighteenth century, when large numbers of Britons were departing the metropole for the nation’s colonies, certain elements in this traditional working structure had already begun to break down. Most notably, the power of guilds to regulate the cost of apprenticeships, the price of goods, and the number of masters and journeymen working under their jurisdiction was disintegrating. The weakness of the English guilds had a strong impact on the structures of skilled work in eighteenth-century America, as they were too ineffective by this time to reestablish their authority in a New World setting. For one thing, weak government authority meant that terms of apprenticeship did not always last for the full seven years, and by the 1750s shortened terms of five years had become common. In the southern American colonies, training became further curtailed by the prominence of slave labor. Plantation owners often sent some of their slaves to local artisans to learn a trade, with carpentry, bricklaying, tailoring, and shoemaking proving to be the most popular skills. Artisans also purchased slaves themselves and trained them to work in their own shops. However, African Americans rarely received the full seven years of instruction and often obtained as little as two years. For early America’s slaves, however, an apprenticeship nevertheless proved to be one of the few routes to a measure of economic independence. Equipped with a specialist skill, African Americans in northern and southern cities were able to earn money on their own account, despite the best efforts of their white masters to prevent them from doing so. A few slaves used such wages to buy their freedom, while many more were able to run away safe in the knowledge that they were in possession of a means to earn a living.

The institution of apprenticeship in America received boosts that kept it vital at least to the last quarter of the eighteenth century. In particular, apprenticeships proved to be an excellent tool for emerging public institutions seeking ways to make poor and orphaned children support themselves. Throughout colonial and early national America, church vestries, orphanages, and charities placed their destitute charges with local artisans to learn a trade, ensuring a steady stream of new trainees. At the same time, as long as the household maintained its position as a building block of early American society, apprenticeship was firmly woven into the social fabric. Often, apprentices were the sons or daughters of family friends, and they lodged with a master and dined with his wife and offspring. As close acquaintances, apprentices sometimes became more than mere employees: many married into their

master's family and were then entrusted with the running of the business following his retirement.

DEMISE OF THE SYSTEM

At about the time of the American Revolution (1775–1783), however, growing industrialization began to threaten the traditional structures of skilled work, apprenticeship included. Despite mercantilist restrictions imposed by Britain and designed to stop New World manufacturers from competing with their metropolitan counterparts, colonial American industrial development accelerated significantly from the mid-eighteenth century onward. Especially in the large northern cities of Philadelphia, Boston, and New York, workshops increased considerably in size and in some industries—shoemaking, for example—the unit of production began to resemble a small factory. Political independence accelerated this process of industrialization. In the new Republic, Americans not only had the freedom to manufacture their own goods, but had also a strong patriotic desire to free their young nation from dependence on British imports as quickly as possible. Boycotts against the buying of British goods during the 1770s, and again during the War of 1812 (1812–1815), were designed to prevent all purchase of British goods and encourage their replacement with American-made manufactures.

The resulting growth of factories gradually led to the disappearance of the highly skilled and intensely personal working culture embodied by apprenticeship. Unskilled men and women workers began to fill factories. Masters became distanced from their employees, and they no longer hosted them in their households or counted them as part of their families. The position of journeyman also became threatened, and newly qualified apprentices had difficulty finding long-term employment as masters sought cheaper sources of labor and required fewer skills. The wealth gap between masters and journeymen became ever wider, creating a class of dependent workers who had no prospect of being in control of the means of production. And, as the upper echelons of traditional skill structures disintegrated, the institution of apprenticeship was swept away too, as there was little hope of such training leading to a secure income. In the luxury trades (such as cabinetmaking and silversmithing) and in the American South, the demise of apprenticeship was undoubtedly slower, but was under way nevertheless. As the early national period drew to a close, apprenticeship was, if not completely extinct, severely under threat.

Artisans and Craft Workers, and the Workshop

Craftsmen were the largest sector of the population in America's seaports. They were central to the political and economic life of its emerging municipalities.

LATE COLONIAL AMERICA

Though found throughout the colonies, artisans were most heavily concentrated in towns and cities, especially the major seaports. They worked in a panoply of trades ranging from goldsmithing, silver-smithing, and cabinetmaking at the top to baking, butchering, and carpentry in the middle to tailoring and shoemaking at the bottom. The trades with the largest numbers of artisans were the building crafts, particularly carpentry and masonry, which might employ 40 percent of craftsmen during construction season. Tailoring and shoemaking followed in size.

Mid-eighteenth-century artisans could be classified as either wage earners, the beginning of a working class, or as master craftsmen, incipient bourgeois entrepreneurs, since in the course of a colonial career they were often both. Normally a lad of thirteen or fourteen would contract with a master craftsman to learn a trade as an apprentice. He boarded with his master, who was responsible for his rudimentary education and clothing as well as teaching him the secrets of the trade. Learning the mysteries of the most demanding trades, such as cabinetmaking or watchmaking, took many hours at the hands of the ablest craftsmen, who passed down knowledge gained from centuries of craftsmanship. The more rudimentary trades, such as shoemaking, which required awl and hammer skills, took less time to master. Following release from indentures at the age of twenty-one, the apprentice would become a wage earner, or jour-

neyman, often working in various cities for master craftsmen. If competent and savvy, he would open his own business. A master's dwelling commonly included a lower-story shop and an upper floor where his family lived.

While the vast majority of artisans in colonial America remained craftsmen throughout their lives, upward mobility was possible within the middling or lower middling ranks of society. Expert cabinetmakers, for example, participated directly in colonial trade, shipping thousands of Windsor chairs. Other highly skilled artisans worked closely with merchants in a nascent capitalist economy operating under the rules of British mercantilism.

Within the poorest trades, notably, shoemaking and tailoring, however, mobility to master craftsman standing was not the rule. Moreover, even masters owning small shoemaker or tailoring shops often earned a subsistence living, with little security in times of personal crisis or economic recession. This

was particularly true of Boston, a city impoverished by wars for empire, where many craftsmen sank to subsistence levels. Shoemaker George Robert Twelves Hewes, the last survivor of the Boston Tea Party (1773), was imprisoned early in his career for small debts; such were the perils of his trade. Poorer artisans, like other economically weak urbanites, were also prey to the scourge of epidemics, especially smallpox and yellow fever, that decimated the nation's seaports.

English guild traditions that limited admission to a trade, controlled prices, supervised craft practice, allowed for the building of elegant headquarters, and provided artisans a respected place in their city's life did not survive the transatlantic crossing. While a few trades established benevolent societies to provide social security and camaraderie for master craftsmen, and some traditions of apprenticeship indentures and workshop practices persisted, colonial America had no guild tradition, nor did it develop one. Artisans, possessing demanding skills and well-fashioned tools, were clearly above the level of laborers on the docks, indentured servants, and the slaves who made up 10 percent of the population of New York and Philadelphia and much more of Charleston. Wearing their noted leather aprons, they dressed in a common manner, kept common hours, and shared common social customs. Yet they were subject to a tradition that classified anyone who performed manual labor, however refined, as beneath the rank of gentlemen. Lacking breeding, wealth, and education, they were expected to defer to their mercantile and professional betters, who regarded mechanics (as artisans were commonly known) with a measure of condescension. There were no guilds to mediate that pejorative standing.

On the other hand, the absence of guilds allowed for a more open society in which many artisans gained freemanship. As independent entrepreneurs who owned their shops, freemen were entitled to vote, an important part of the political mix of eighteenth-century urban politics. If they seldom attained significant political positions, their voices were nevertheless considered by elite factions seeking office. They could easily make the difference in factional struggles such as that between the De Lanceys and Livingstons in New York. Within this role, artisans were generally literate, politically aware, and proud of their craft skills. If not a class consciousness, they developed a sense of their own interests and a readiness to see that their concerns were addressed.

Skilled craftsmen lived in rural communities as well as in urban society. In those communities they

were most likely to be a jack-of-all-trades artisan, such as a joiner who could fix a wheel, mend a coach, or build a chair. There were only a few craftsmen in farming communities, though occasional villages, such as that of the Moravians in Rowan County, North Carolina, were known for their craftsmanship, male and female, in leather and textile.

THE AMERICAN REVOLUTION

During the Revolutionary era, skilled craftsmen became central players in the movement toward independence. Not that there were no Loyalist artisans; those with strong Anglican roots or allegiance, as well as Scottish or recent (except for Irish) immigrants, often inclined to the British position. Overall, however, artisans tended to be more radical in opposition to British measures compared to the other sectors of the urban population. In Boston the mercan-

tile and professional elite, including John Hancock and John Adams, remained in power to become Revolutionary leaders. The role of craftsmen was largely played out within the Sons of Liberty, an association that enforced anti-British measures, through coercion if necessary, as at the Boston Tea Party (1773).

In New York a sizable number of merchants, though against British measures, remained loyal to the crown; there, artisans took on a stronger political role. Besides enforcing anti-British measures, they rallied behind three incipient merchants with plebeian background—Alexander McDougall, John Lamb, and Isaac Sears—to form their own political party, one that allied first with the DeLancey and later with the Livingston party. As British-American relations deteriorated and the British lost control of the city and colony, artisans formed their own Mechanics Committee that consistently advocated more radical

New York Mechanick Society Certificate (1791). The central theme is taken from the English blacksmiths guild. COURTESY, WINTERTHUR MUSEUM.

measures than the mercantile leadership, from the calling of a continental congress to a boycott of British imports to a call for independence. As in Boston, craftsmen were willing to use force. When the Stamp Act (1765) was in effect, they required one printer to publish only on unstamped paper, while in 1776 craftsmen and others burned a bookseller's pamphlets that were critical of the artisan hero Thomas Paine. They were supporters of democratic reform, petitioning the state legislature that New York's new constitution be ratified by a popular vote and that property restrictions be lifted for suffrage.

In Philadelphia, a power vacuum occurred as the two governing parties relinquished office, the Quakers from pacifist orientation and the Proprietary Party from Loyalist inclinations. In its place young merchants, supported by the city's artisan population, took power. As in New York, in the years pre-

ceding the outbreak of war Philadelphia's artisans participated in many ad-hoc governing committees such as the Committee of 43, that included artisan members. With Benjamin Rush and Thomas Paine, they backed a radical state constitution that eliminated property requirements for voting and called for free public education and ratification of important legislation by the public and a unicameral legislature. This party and the radical politics it stood for were strongly opposed by more conservative Whigs. Moreover, during hard economic times that was exacerbated by wartime inflation, in 1779 violence broke out at the home of noted conservative Patriot jurist James Wilson over an attempt by large sectors of the artisan population to implement a traditional moral economy of price controls in opposition to the laissez-faire outlook of the mercantile elite and some master craftsmen.

THE NEW REPUBLIC

The period from 1790 to 1830 was the golden age of the American craftsman. The era left a great legacy in craftsmanship, as Federal furniture maintains its standing into the twenty-first century as the greatest craft work produced in the American experience. In this period, too, artisan crafts gave birth to the American labor movement and to manufacturing and entrepreneurial innovation. Also, artisans emerged as a major players in American politics.

The craft work produced by such cabinetmakers as Duncan Phyfe and Charles-Honoré Lannuier, to name but two, command very high prices in the early-twenty-first-century antique market. Replacing the eighteenth-century Chippendale fashion, a style that combined Chinese, rococo, and pseudo-Gothic fashions in heavily and ornately carved furniture, Federalist design possessed a manner that emphasized grace, linearity, and proportion based on neoclassical models. This approach first became popular in England in the 1770s. American furniture and craftsmanship drew on the English, Greek, and Roman models, making subtle differences in proportions. It was known for its grace, delicacy, and artful display of color, and used inlays, painted designs, and fine upholstery. Given the spirit of republicanism that pervaded the era, it is not surprising that much of the furniture and silver and many of the grandfather clocks and other fine works displayed American eagles and other symbols of the American Republic, blending easily with classical republican symbols.

From master to employer. The business of a craft in the early national period was far more extensive than in the colonial era. First, the economic ambitions and horizons of craftsmen were enhanced by the Revolution. Independence meant more than political rights; it denoted the opportunity to enter the marketplace and prosper subject only to the limitations of one's abilities in craft and business skills. Craftsmen were deft users of advertisement, credit, and banking. Indeed, New York in 1810 incorporated the Mechanics Bank, the city's highest capitalized bank at \$1.5 million, with the specification that \$600 thousand be devoted to the state's mechanics. Successful artisan entrepreneurs hired many employees and used division of labor; Duncan Phyfe employed over one hundred journeymen, divided among departments of inlay makers, turners, upholsterers, carvers, and gilders. His quarters included a workshop, a warehouse, and display rooms. Large amounts of furniture—of both high and low quality—were built and stocked in the city for sale to the mercantile elite there and to bro-

kers in the West Indies, the hinterlands, and other American cities.

Many other crafts prospered within the period thanks to the strong economic growth during the Napoleonic Wars (1799–1815). Shipbuilding contractors employed large numbers of craftsmen in the production of clipper ships and naval vessels. In construction, master builders contracted to construct a home and then hired carpenters, masons, and stonecutters. A number of crafts remained small businesses; many bakers, butchers, and watchmakers still had their own shops. On the other hand, the city's largest crafts—printing, cabinetmaking, construction, shoemaking, and tailoring—became large-scale enterprises requiring considerable capital investment. Type and printing presses, for example, cost well beyond the means of an aspiring journeyman. In these trades masters tended to become cost-conscious employers rather than the paternal master craftsman who nurtured journeymen and apprentices on their way to master standing. (While small enterprises remained, they were more and more the exception.) More and more journeymen lived in boardinghouses rather than with masters, and more and more apprentices left their indentures early for wages in crafts that demanded less skill than the trades they abandoned.

From journeymen to laborers. In the new American economy, journeymen had to accept that they were unlikely to become master craftsmen. In so doing, journeymen printers, shoemakers, cabinetmakers, carpenters, and masons in American seaports formed their own benevolent associations. These provided benefits in case of illness or death and also negotiated conditions of employment with employers. As masters sought to maintain lower prices for labor, journeymen responded by demanding negotiated wages either by the hour in construction or by piecework in tailoring and shoemaking. When the two sides could not agree, the journeymen were not unwilling either to walk out of a single master, stage a citywide walkout, or even open their own stores. They demanded that masters hire only those who belonged to their journeymen societies. It was this demand, and the walkouts that ensued when violations of this principle occurred, that led to major labor conspiracy trials against shoemakers in both Philadelphia and New York in 1806 and 1809. Journeymen were charged with conspiring under English common law against the rights of other journeymen who wanted to work. The trials ended in convictions, and though the fines assessed were not severe, they limited the ability of journeymen to establish a powerful coun-

tervailing force in the marketplace. Labor strife continued, however; at stake for journeymen was no less than the right to maintain republican standing, a station that demanded economic independence. If land ownership or master status was unattainable in the new economy, an acceptable replacement was to be secure wages that offered an opportunity to raise a family within a decent standard of living, a standard faithful to and within the Revolution's legacy.

For masters, at stake in labor conflict was the right to organize their businesses as they saw fit and to fully engage within the new marketplace. Also at jeopardy was their sense of artisan republicanism, in which they saw themselves as the paternalist guardians of the artisan trades. In this light, aside from organizing for labor conflict, which they denounced as harming the unity of the trades, they formed venerable artisan societies like the General Society of Mechanics and Tradesmen in New York, an ongoing institution, that provided libraries for its apprentices, schools for the children of its members, death and illness benefits, a place of fellowship, an organization to lobby for protective tariffs, and a forum for personal advancement. Stephen Allen, later the mayor of New York, entered public life as president of the Mechanics Society.

Political allegiances. Politically, artisans became the pivotal voting bloc in the nation's seaports. Supporters of the U.S. Constitution as a compact that offered trade protection and an advantageous market position, they were originally strong followers of the Federalist Party. However, Jeffersonian egalitarianism soon made strong headway, especially against the deferential expectations and arrogance of Federalist leaders. The Jeffersonian appeal to artisans was not the agrarianism espoused by John Taylor of Caroline. Rather, in pivotal states such as Pennsylvania and New York, it was based upon a sense of equal opportunity and entry into the marketplace and an attack against economic privilege. Artisan masters must be allowed to exploit the new economy without cumbersome restriction or regulation. (However, monopolistic factorylike organizations were not acceptable in a republican marketplace.) Artisan journeymen also had the right to be free of intimidation by Federalist employers who expected them to vote as instructed, as the Republicans were quick to point out through an active press. Also, many artisans joined the Democratic Republican societies in support of the French Revolution, which the Federalists staunchly opposed. A number of artisans followed the deism of Thomas Paine, and these were welcomed into Republican ranks, while others, al-

though still Jeffersonian, formed the backbone of new Baptist and Methodist congregations. Enough artisans had shifted their votes in Philadelphia and New York City by 1800 to give Jefferson the presidency and maintain Jeffersonian political dominance in the mid-Atlantic, even into the hard years of the War of 1812; at that time many craftsmen were willing to temporarily sacrifice their economic welfare for the greater good espoused by President James Madison.

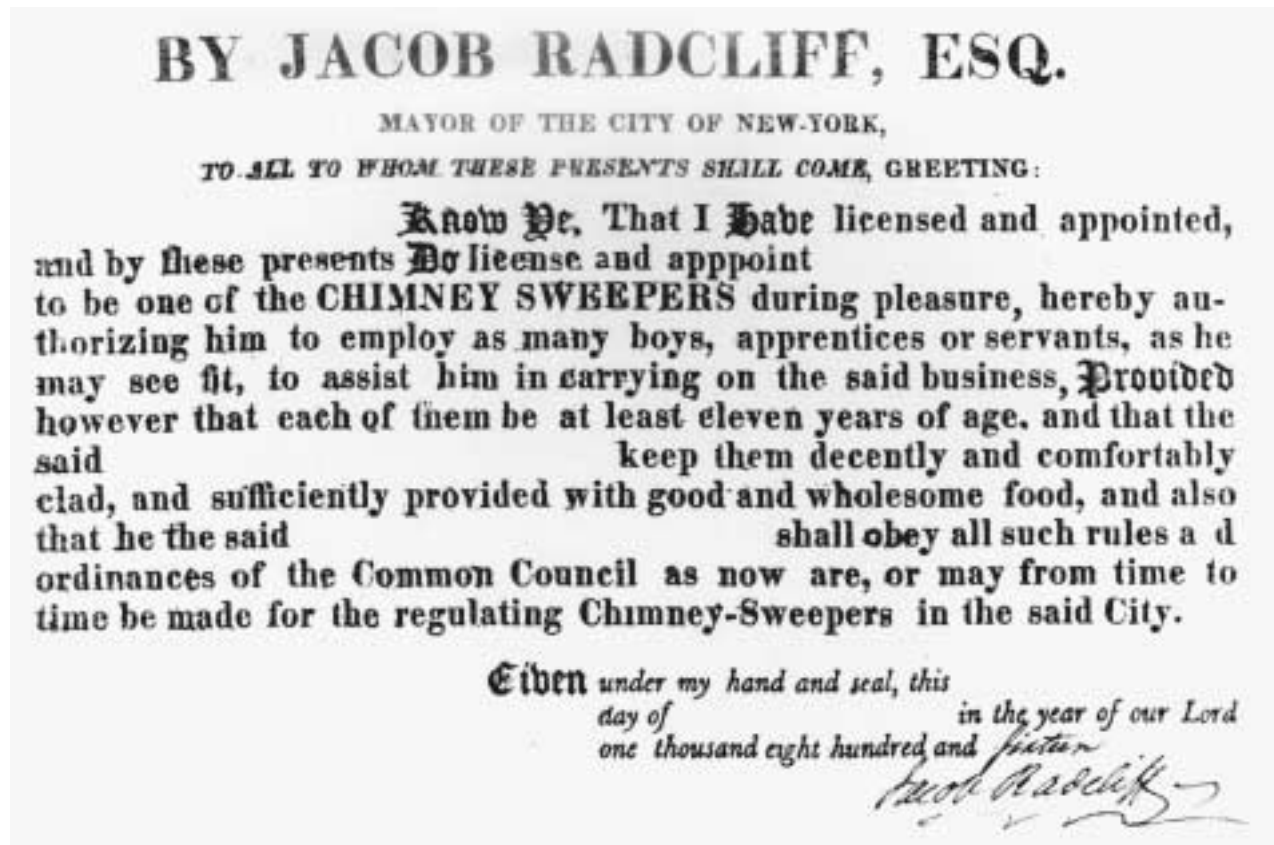

With the rise of the industrial revolution, party machines, and mass immigration, the influence and role of the nation's artisans would soon diminish. The early years of the nineteenth century represented its zenith in American history.

Chimney Sweep Certificate (1815). New York City was determined to improve the lives of young chimney sweep apprentices, usually black children of eight to ten who climbed chimneys and were subject to both disease and abuse. A number of masters, also African American, opposed regulation. NEW YORK CITY MUNICIPAL ARCHIVES.

Child Labor

In the early Republic, adults expected most children to labor as soon as they were physically able to do so. Typically, free white boys and girls began by helping out their parents on farms. Slave children went to work early on plantations. By the time free white youngsters reached their early teens, the parents of many had apprenticed them to learn skilled trades, although this practice began to decline in importance after the American Revolution. Public welfare authorities interceded and arranged for the indenture of poor free white and black children at a young age to work until their late teens or early twenties.

FARMS AND PLANTATIONS

In the early Republic, most Americans were farmers. To survive, white farm families required the labor of all family members, although the tasks that each person performed varied by gender and age. Between the ages of six and twelve, white boys began to help their fathers in the fields and girls began to assist

their mothers with domestic tasks. Nonetheless, such gendered roles varied, depending on the makeup of the family: if there were no daughters, sons also helped out in the garden and kitchen, and if there were no sons, daughters helped in the fields. In a society that depended more on barter than on cash, parents of large families sometimes exchanged the labor of their youngsters with neighboring families in need of child labor.

Enslaved black children in the South went to work at about the same age as white children, although they did not labor for their own parents but for white masters and mistresses. While young slave boys might learn from their fathers how to stack wheat or pick worms off tobacco plants, and slave girls might learn to dust and clean silver alongside their mothers in plantation homes, for black children labor in family groups was short-lived. As soon as they were physically able, most slave boys and girls became field hands, where they worked directly under the control of white slave masters and their overseers. Only a few slave children, most girls,

worked in plantation homes, and there they worked not for their mothers but for their white mistresses. White owners could punish black slave children harshly or sell them away from their families. As cotton became the dominant crop in the South in the early nineteenth century, whites moved from Virginia and the Carolinas south to Georgia and Mississippi and west to Texas. They took their slaves with them or purchased young slaves to work in the cotton fields. Many slave children were sold away from their parents and put to work picking cotton far from their family homes, a work experience unlike that of any white children.

THE AMERICAN REVOLUTION

During the American Revolution, children frequently had to take over the work of fathers who had gone to fight. In some cases, the work of children was not enough to keep a family solvent. Then, or when a father died, families were broken up. Mothers often became live-in servants and welfare authorities placed children in other families to work.

During the war, some boys enlisted in the military. While the minimum age for service was sixteen, some boys lied about their age, while others served as waiters to their fathers or as substitutes for them. Few actually engaged in battle. Many were fifers at a time when the fife was used to broadcast signals to the military, including the time to get up, eat meals, assemble, and turn lights out. Fifers were also used to position troops and signal them to turn, halt, and march.

YOUNG PEOPLE, FAMILIES, AND APPRENTICESHIP

By the time their children were in their early teens, parents in all but the poorest white families sought to prepare them for self-sufficiency by apprenticing them to learn a trade. Parents typically searched for a place that suited the youngster's interests and inclinations. If the father were himself a skilled craftsman, sometimes he took his son as an apprentice. More commonly, parents contracted with a skilled craftsman for a set number of years. The craftspeople who took on the children promised to feed, clothe, house, and educate the youngsters. Some slaves learned trades as well, but few ever became self-sufficient, in contrast to white boys and girls. Instead, they worked to learn a skill and then plied that skill for their white masters, not for themselves.

Apprenticeship was highly gendered. Only boys were apprenticed to a whole variety of crafts, including furniture making, shoemaking, printing, candle

making, blacksmithing, weaving, and others. Girls were typically apprenticed as domestics or seamstresses—about the only jobs outside the home then available to females.

Apprenticeship began to decline in importance after the American Revolution. The war challenged patriarchal relationships and led some apprentices to rebel against their masters' treatment. The economy changed after the Revolution as demand for various products fluctuated. Masters proved reluctant to take on apprentices for long periods when demand for their service might not be needed, and apprentices were less willing to spend long years learning a craft that might be outmoded. By the 1820s masters increasingly paid wages to apprentices and refused to promise them room, board, and clothes.

Children who were not apprenticed sometimes found jobs in textile mills. Samuel Slater opened one of the first in Pawtucket, Rhode Island, in 1790. There he employed children from ages seven through twelve. By 1810 there were eighty-seven textile mills in the United States employing thirty-five hundred women and children. In the 1820s new cotton mills opened in Lowell, Massachusetts, and employed many children under the age of fifteen, mostly girls.

INDENTURING BY PUBLIC AUTHORITIES

Throughout the early Republic, impoverished white and free black children were removed from their families and placed out to live and work with more prosperous adults. In this way, public officials sought to take care of needy children, provide families with needed labor, save money on welfare in the short term, and forestall applications for relief in the future. The children were placed out through an indenture, a contract that was signed by local welfare authorities and the families that took in the children. In contrast to apprenticeship, parents of poor children and the children themselves had little choice in the matter of indenturing. Boys were typically indentured to age twenty-one and girls to eighteen, presumably because boys supposedly took longer to become self-sufficient farmers or craftsmen than girls took to learn how to keep house.

Domestic Labor

Between the birth of the new Republic and the advent of the Civil War, a great transformation occurred in domestic labor. This transformation was not a result of inventions that made housework easier but rather of market penetration and the reallocation of tasks within the household. The American colonial farmstead, although never self-sufficient, had been the site of much household production. However, by the 1840s and 1850s the market revolution had taught women that it was to their advantage to buy many mass-produced items (including candles, soap, and cloth) rather than making them at home. Domestic labor was transformed from an integral part of the family economy, producing goods that could be obtained nowhere else, to a vaguely discredited activity that paid no wages. In North and South alike, most middle- and upper-class families, and many farm families, had always had servants, but the nature of servitude was changing as the definition of domestic labor changed.

DOMESTIC LABOR IN THE NORTH

In the North the allocation of tasks within the household depended on location and social status. Frontier women, assisted by children, had the most onerous domestic burden, as is evident in documents like the diary of Martha Ballard, a Maine midwife. Their labor was unrelenting and thought to be detrimental to health, with tasks like washing, brewing, or baking consuming entire days' work. Daily cooking required the kindling and tending of fires and the provision of vast amounts of wood—theoretically a man's job that devolved onto women when men were absent. Cooking, laundry, and personal hygiene also required large amounts of water, often carried in from wells some distance from the farmhouse. In addition to these daily tasks, women were

responsible for child care, sewing for clothing production and maintenance, animal husbandry, gardening, and seasonal or occasional work, such as candle making, soap making, and butter and cheese making. Although some tasks, like warping looms in preparation for weaving, were farmed out to specialists, frontier households also engaged in spinning and weaving their own cloth, especially if there were teenage daughters at home needing to outfit their own future households.

In contrast with toiling farm women, urban middle-class women hired household "helps" to do heavier tasks while they supervised. In the first decades of the Republic, as in the colonial period, many native-born teenagers were sent out to service other households, either as a form of domestic apprenticeship or out of economic need. These young women, who formed emotional bonds with the families they served, coexisted alongside wives of "cottagers" who got paid to help with household work.

By the 1820s and 1830s, the stigma of heavy and dirty domestic work, and the appearance of opportunities for factory work and work outside the home, or outwork, led native-born white women to desert domestic jobs. They were replaced by Irish immigrants. Although their work schedules kept them moving from dawn until late in the evening, Irish women were said to prefer domestic work, which enabled them to earn money to pay for the migration of family members, to save money for their old age, and to donate to causes they found worthy. The expectation that a live-in domestic worker would be a member of the household (although not an equal member) did not disappear, despite yawning cultural differences between mistress and maid. Households that were unable to find and keep live-in domestic servants relied on a piecework system, in which women living within their own homes did extra washing, sewing, and other such chores for families in the community. This arrangement allowed women to participate in the cash economy while still retaining autonomy over the way in which these chores were completed.

DOMESTIC LABOR IN THE SOUTH

Southern domestic labor was organized on a two-track system. Yeoman households without slaves resembled farm households throughout the North, with women still accomplishing much of the household production and heavily weighed down by their tasks. In contrast, in Southern planter households domestic labor was largely carried out by slaves. House servants included not only women but also

children who were too young to work as field hands. Slaves worked in Southern households as cooks, provided child care, and even served as wet nurses. Many of these slaves had a double burden, as they were responsible for cooking, sewing, and cleaning within their own households in the slave quarter as well as for the maintenance of the Big House. Plantation mistresses taught the slaves their tasks, superintended their work, and planned household consumption, including the feeding and clothing of the workforce.

Like their Northern counterparts, many antebellum Southerners felt that it was more ladylike for women to devolve the heavier tasks of household upkeep onto servants if they could afford to do so. As a result, even yeoman households rented single slave women or children to work at domestic tasks. Hirers had to pay these slaves' owners an annual hiring fee and also provide the slaves with food, shelter, and clothing. Hiring slaves to perform domestic tasks did not necessarily help yeoman families climb the economic ladder by acquiring more land and slaves, but it did help them to feel as though they were higher up in the hierarchical social order of the South.

Jeanne Boydston, one of the most prominent historians of domestic labor, has pointed out that as the division between the public world of commerce and the private world of the house became more distinct, women took less pride in, and received less credit for, their unpaid work around the home. At the same time, however, housework done well contributed to the family economy, as when working-class women took in boarders and their children scavenged fuel from local docks. Furthermore, for many rural and urban women alike, "domestic labor" meant labor performed for the market within the home, as well as unpaid labor to keep the family economy running. Whether they were shoemakers' wives stitching shoes or rural women plaiting straw hats and straw brooms, women and girls prefigured much of the tenement-based outwork that would characterize the second half of the nineteenth century.

Factory Labor

Industrial systems are evolutionary. While seventeenth- and eighteenth-century manufacturing and labor systems in British North America did not, in many ways, resemble nineteenth-century factory systems, they were the building blocks on which the processes of the industrial revolution were built.

COLONIAL MANUFACTURING

Early American manufactories, where commodities were processed or produced in large quantities for designated markets, both local and far away, included iron furnaces and forges, tanneries, glassworks, and various types of mills. The greatest difference between colonial manufactories and those of the nineteenth century and beyond was that their operations were seasonal. Prior to the advent and application of the steam engine to American manufacturing in the 1790s, ironworks and mills were dependent on waterpower from fast-moving rivers, creeks, and streams. Nearly 75 percent of the water sources suitable for effective milling were located from the Upper Chesapeake Bay region (the northern counties of Maryland) northward through the New England colonies. In this region, winter freezes limited the availability of waterpower to run the mill wheels to approximately nine months in northern Maryland and southeastern Pennsylvania and to little more than seven months in New England. The seasonal dependence on waterpower not only placed limits on the extent of production but also ultimately dictated the relationship between entrepreneurial owners and managers of manufactories and their workforces.

Free men, whether landowners, tenant farmers, or landless, could not depend on factory work as a

constant source of income. Landowning farmers needed industrial jobs the least, while landless men most needed any type of work to live. Work at an iron company or a mill could be a source of supplementary income for farmers, particularly for those with older children whose labor was not constantly needed at the farm. Farm work, however, had to come first, meaning that a balance had to be achieved between the need or desire for work and its seasonal availability. Landless men sought work both on farms and at manufactories, hiring on where and when labor was needed. Given the seasonality of colonial manufacturing, in either case most men worked part-time in manufacturing. Across all the colonies, at least 50 percent of families had at least one member working in industry in any given year, but the work was overwhelmingly part-time. Even if one considers an eight-to-nine-month industrial work year as the basis for full-time employment, over two-thirds of industrial laborers worked only part-time in manufacturing prior to the American Revolution.

Owners, realizing that they did not have access to a sufficient full-time labor force of free men during peak manufacturing seasons, turned to bound workers—both indentured servants and slaves. In all regions, servants and slaves formed the core of full-time workers at ironworks, mills, and tanneries, but there were regional variations. In New England, approximately 20 percent of full-time manufactory workers were slaves (5 percent of all workers) and 65 percent of full-time workers were servants (20 percent of all workers). In the middle colonies, 60 percent of full-time workers were slaves (17 percent of all workers) and 25 percent of full-time workers were servants (7 percent of all workers). In Virginia, 80 percent of full-time workers were slaves (60 percent of all workers) and 13 percent of full-time workers were servants (10 percent of all workers). These regional differences were directly related to seasonality and the relative value of various types of labor.

In New England the costs of bound labor, particularly slaves, were prohibitive in industry, as they were in farming. To buy a slave for seven months' work at a manufactory without enough work to keep that slave busy the other five months of the year was economically inefficient. The availability of slaves for hire in New England was also limited because of their overall rarity, so that manufacturers could not access slave labor only at times when needed. The purchase of an indentured servant's contract was generally much more common, and servants for

hire could more easily be found. In the middle colonies the manufacturing season was longer, as was the growing season. There, it was more feasible to purchase a slave for nine-months' work in industry and also find them work for another month or two during the year. The greater number of slaves in the region from northern Maryland through New York, approximately 12 percent of the overall population, also made it easier to hire slaves as needed—for a month or a year at a time. In Virginia, a manufacturer could count on a ten-month productive season, and winter was not so severe that work could not be found in the off-season for slaves. Therefore, a much greater number of slaves were purchased for full-time manufacturing work than further north.

MANUFACTURING AFTER THE REVOLUTION

The American Revolution acted as a watershed of a kind for industry. While no technological changes of any consequence occurred, labor patterns during the War for Independence and the war's effects caused both entrepreneurs and laborers to view industry and industrial work differently beginning in the mid-1780s.

The disruptions of war as well as its length created opportunities for bound servants and slaves to run away from their masters. Beginning with the call of Lord Dunmore, the last royal governor of Virginia, for bound workers to run to the British lines to seek their freedom, successful flight encouraged others to run. While flight affected production in all areas, industrial production, necessary for the war effort, was hurt the most. Ironworks and mills, particularly in the mid-Atlantic and the South, had constructed their core, full-time workforces around slaves and servants. Commercial operations lost over 20 percent of their total workforces during the war and nearly 35 percent of their full-time workers. The realization that bound labor was not always dependable hit home with force. In the mid-Atlantic region generally, which was the center of early American manufacturing, there was an impetus toward a full-time workforce of free labor by the Revolution's end.

If this could be achieved, factory owners would save on the up-front investment in bound workers and remove the possible loss of that investment should the worker escape from bondage. Also, free wage earners were not paid for their labors until after production was completed, which would enable manufacturers to exert more quality and production controls. The question was whether a conversion to a free labor base could be done.

Workers proved to be generally cooperative in the decades immediately after the Revolution. The economic crisis of the 1780s put both landless workers and tenant farmers in a very poor position, and many landed farmers felt the pressures of high inflation and sagging markets. Immigration after 1785 also began to have an effect, as many newcomers sought work in industry as a possible step toward land ownership in the future. The availability of workers allowed owners and managers to slowly move toward a larger full-time workforce of free workers. The only thing many could not offer until the 1790s was year-round work. Beginning at that time, however, the opportunity for converting to steam power, the availability of loans for conversion and expansion made possible by the new Bank of the United States, a stabilizing currency, and increasing support for manufacturing by the federal government made it possible for full-time, free industrial labor slowly to become a reality and opened the way to the industrial revolution.

Indentured Servants

Indentured servitude was an important form of labor utilized in British North America during the colonial and early national periods. Bound laborers came in a variety of forms and their experience changed significantly over the time period, both in type of labor

performed and in opportunities for advancement. The term "indentured servant" applied to the largest and broadest group of European immigrants who sold their labor for a period of years in exchange for passage to the New World. Indentured servants first appeared in the Chesapeake colonies, but they also were present in the middle colonies and the Lower South. The term "redemptioner" applies to eighteenth-century immigrants, usually from Germany and Switzerland but also from England and Ireland, who traveled to the colonies in family groups and sold their labor upon arrival to repay the cost of passage. This group was most common in Pennsylvania. A third group, transported convicts, became more prevalent after the Transportation Act of 1718 permitted the banishment of convicted felons. They usually went to Virginia and Maryland, were of English, Scottish, or Irish descent, and were the least popular form of bound laborer in the colonies. Colonists complained about the questionable character of convict servants and were thus more reluctant to purchase their services.

LEGAL STANDING AND CONTRACTS

Likened to slaves in that masters had almost complete control over them, including the right to control their labor and the ability to severely punish them, indentured servants nevertheless possessed some legal rights that clearly distinguished them from lifetime chattel. Reflecting the colonies' British heritage, as did the impulse to enter into an apprenticeship or servant relationship in one's teens and early twenties, servants negotiated contracts, owned property, sued their owners for abuse, and testified in court while in service.

Servant contracts varied in length. For adults, who were sometimes able to negotiate their contract based upon their skill level, periods of service usually lasted from four to seven years. For minors, indenture lasted until they reached adulthood. In reality, this meant that most servants did not achieve their freedom until they were in their early to mid-twenties. Until they were free, servants could not marry without the consent of their master. This restriction had long-term consequences on colonial population growth. At the end of their indenture, servants received their freedom and "freedom dues," which consisted at various times and different locations of land, clothing, corn, tobacco, a musket, blankets, or tools—or some combination of these.

MIGRATION

Indentured servants played a critical role in the process of populating the North American colonies, and

their motivation to migrate changed over time. Estimated to have made up 75 percent of the seventeenth-century migrants, servants were critical both to population growth and to successful tobacco cultivation in the Upper South. They continued to arrive in significant numbers during the eighteenth century, especially in the middle colonies. Most seventeenth-century servants were drawn from the mass of the increasingly mobile English population unable to find work because of enclosure, economic instability, and overpopulation. Eighteenth-century bound migrants came from more diverse backgrounds and for a variety of reasons. With many of the previous century's challenges in England resolved by the eighteenth century, English servant migration waned. Scottish Covenanters and Jacobites from the 1715 and 1745 uprisings were deported to American plantations as an expediency. Irish from Ulster traveled out of Belfast as indentured servants and redemptioners. Restrictions on Irish trade, the rack-renting of absentee landlords, and anti-Catholic fervor made survival in Ireland difficult and many saw emigration as an appealing alternative. Famine in the late 1720s gave particular impetus to emigration. Germans from the Rhineland and Palatinate, having survived decades of war, found themselves persecuted for their Protestant practices as the eighteenth century unfolded. The British government also sent thirty-two-hundred Germans to New York in 1710, hoping to provide a labor force to produce naval stores. Convict laborers were also more common in the later period. An estimated two-thirds of British felons were transported between 1715 and 1775, with estimated total numbers varying from twenty thousand to fifty thousand. There was a particularly intensive period of migration between the end of the Seven Years' War and the American Revolution (1763–1775).

CHANGES IN OCCUPATION

As the southern colonies came to rely upon African slave labor in the eighteenth century, the type of labor in which indentured servants engaged and their opportunities for advancement changed. Most worked as agricultural laborers during the seventeenth century, learning the skills they hoped would one day enable them to establish their own farms. Although seventeenth-century bound laborers faced grueling conditions and high mortality rates, their opportunities for advancement and economic independence were reasonable. By the end of the early eighteenth century, however, reduced availability of land, a more complex economy combining agriculture, nascent industries, urban commercial ventures,

and a more diverse and plentiful supply of labor changed the nature of servitude and the opportunities for freed servants.

While some servants still engaged in agricultural work, the shift to slave labor meant that they increasingly worked as skilled laborers and in supervisory positions on farms or plantations. Indentured servants appeared with much greater frequency in craft shops and as workers for merchants and retailers either in their businesses or as domestic workers. In *White Servitude in Colonial America* (1981), David W. Galenson noted a rise in the eighteenth century in the percentage of servants who had skills. An estimated 60 percent of registered servants during the period from 1725 to 1750 described themselves as skilled, and that proportion jumped to 85 percent in the 1770s. Similarly, servants identifying themselves as having an agricultural background declined significantly. In northern Maryland, servants worked alongside slaves and wage laborers in the growing iron industry. In cities like Philadelphia, servants made up an increasing proportion of workers in small craft shops and in domestic trades. Bound labor in Philadelphia peaked in the mid-eighteenth century, when it accounted for nearly half of the city's workforce. (This percentage includes slave labor.) During this period, artisans purchased two-thirds of the indentured servants in the city. Given high wage rates for journeyman workers, servants were a better economic investment and were more manageable in the domestic shop structure at that time.

WANING OF SERVITUDE

An important shift occurred during the Revolutionary period, especially in cities such as Philadelphia. With growing economic instability, increasing stratification of wealth, and the gradual move toward a more capitalist wage-labor economy, the proportion of bound laborers in the city shrank while that of wage laborers grew. Artisans no longer purchased long-term servants because their cost grew while that of wage laborers fell. The greater number of journeymen unable to raise the capital for their own businesses provided a ready supply of wage earners whose costs were tied to supply and demand. Wage laborers also permitted a greater flexibility in hiring that was valuable during periods of economic instability. Sharon Salinger has noted that in Philadelphia less than 15 percent of those who owned servants were artisans by 1791. As they disappeared from craft shops, servants appeared with greater frequency in the homes and businesses of merchants and re-

tailers. This transition also signaled the end of a need for skilled servants. Servants now functioned as unskilled workers and domestic help. Concomitantly, those masters seeking servants requested and purchased female servants in much greater numbers.

The shift to a market economy after the American Revolution and in the early nineteenth century signaled the demise of bound labor (apart from slaves) as an appealing choice for employers. The market revolution guaranteed the dominance of wage labor in areas where slaves were not owned, and the practice of indenture became less economically viable and desirable for most immigrants and workers.

Middle-Class Occupations

The occupations that characterized the American middle class included many jobs that predated the market revolution as well as a few that were created as a result of it. A list of middle-class occupations would include physicians, lawyers, educators, merchants, and ministers. But it would also have includ-

ed new kinds of businessmen, whose jobs resulted from the decline of artisanal production. In general, middle-class occupations were defined by nonmanual, or what came to be called "white-collar," work. Over the course of the antebellum period, these jobs, available mostly to Euro-American men, were increasingly associated with upward mobility, proprietorship, and respectability.

Early-nineteenth-century city directories reveal few new job titles. But new forms of business organization and, to a lesser extent, technological innovation transformed the component tasks, status, and cultural meanings of older occupations. By the 1820s many successful artisans were no longer master craftsmen, working alongside journeymen and apprentices on shop floors. Instead, they had abandoned the practice of their crafts to become businessmen who concentrated on supervising employees and monitoring increasingly complex accounting systems. Many of these men continued to identify with their artisanal origins, describing themselves as tailors or cabinetmakers in city directories. Still, the nonmanual work they performed, and the opportunities it afforded, served to increase their social and economic distance from the laborers they employed.

This distance was reflected in several ways. As early as the 1820s, some firms created specialized retail spaces, whose clean, well-lit interiors and architectural embellishments marked a sharp contrast to the noise, smells, and dirt of artisans' shops and factories alike. White-collar work environments conferred a status that was underscored by salaries: in general, nonmanual proprietors and salaried employees in the early nineteenth century enjoyed higher incomes and accumulated more wealth than did manual workers. The elevated status of white-collar work even extended to entry-level clerical employees—clerks, salesmen, and bookkeepers—who typically earned less than skilled journeymen and who often performed manual labor, including stocking shelves, sweeping the store, and distributing handbills. Focusing on the prospect of upward mobility, these young men identified themselves as future businessmen and proprietors. At the same time, they exaggerated the differences between themselves and manual laborers.

Perhaps most important, white-collar occupations derived social prestige and economic power from their association with proprietorship. By the end of the Jacksonian era, cities like Philadelphia witnessed a growing correlation between white-collar work and business ownership on the one hand and manual work and permanent wage labor on other.

Small firms owned by manual laborers did not disappear, although proprietorship became more elusive and more precarious. But over the course of the antebellum era, especially in urban areas, they would be overshadowed by firms whose owners devoted themselves to management. Middle-class occupations thus derived their status partly from economic benefits, including income and proprietorship, and partly from their growing spatial, cultural, and economic distance from manual labor. By emphasizing that they worked with their heads, not with their hands, artisans who had developed into businessmen and their salaried employees aligned themselves with members of the nascent professions—lawyers, physicians, educators, and ministers.

The segmentation of labor markets by gender and race ensured that the majority of middle-class occupations were dominated by white men. Nevertheless, many middle-class women found themselves drawn into the labor market, despite the rise of a domestic ideology that relegated them to privatized, sentimental homes and that emphasized their roles as wives and mothers. Married women took in boarders and sewing. Single women most often found work as teachers. Although large numbers of middle-class women worked for money, if not for wages narrowly defined, their opportunities were restricted by domestic ideology. Women's occupations replicated the unpaid labor that they performed for their families; even teaching was cast less as a career than as an extension of child nurture. Many middle-class women worked to pay for the educations and support the early careers of male kin who struggled to establish themselves in a white-collar world.

Racism all but prohibited free blacks from securing most of the nonmanual jobs that defined the northern, white middle class. Pervasive, deeply rooted prejudice undercut the respectability that might have been accorded to African American teachers and ministers by northern society at large. But some ministers, teachers, and entrepreneurs attained relative economic security and exerted considerable influence in their communities. Members of these occupations formed the core of the black middle class that would emerge after the Civil War.

Midwifery

Midwives cared for women during and after childbirth and provided advice on other problems related to female reproduction, including breast-feeding and infant care. They also served as general medical advisers and practitioners.

THE WORK OF MIDWIVES

The most common and well-known work of midwives was delivering babies. A woman in labor called the midwife when she entered what modern physicians call "active labor," the early stage of childbirth when the contractions become regular and strong. Usually the midwife would encourage the woman to remain active as long as she could at this stage, believing that activity such as walking made labor shorter. Midwives rarely used medicines, allowing nature to take its course.

In the system of "social childbirth" that dominated this period, births were attended not just by a midwife but by a group of female neighbors and relatives. At some point—usually when the birth seemed imminent—the woman or her husband would "call the women." The women took an active role in assisting the midwife. Often a woman gave birth supported on either side by other women; some accounts describe women delivering babies while seated on another woman's lap. Midwives sometimes used birthing stools, a horseshoe-shaped raised chair on which a woman could sit while giving birth, but even then the birthing woman would be held or supported by other women. The midwife's job was to catch the infant, cut the umbilical cord, and deliver the afterbirth.

After the birth and the delivery of the placenta, the midwife would wrap the mother's abdomen and legs with linen bands, a practice thought to prevent postpartum complications. Mothers would then "lie in" for a week or so to recover from the birth, but midwives rarely cared for their patients during this

Social Childbirth. In the system of social childbirth, births were attended not just by a midwife but by a group of neighbors and relatives, as shown in this picture, which dates to around 1800. © BETTMANN/CORBIS.

time unless complications arose; instead, new mothers were attended by an “after-nurse,” who could be a paid caregiver or an unpaid relative.

In addition to attending childbirth, midwives provided advice and remedies on breast-feeding and postpartum complications. Midwives supplied medicines to increase the flow of breast milk, made ointments for sore nipples, and sometimes even lanced breast abscesses. If childbed fever set in, as it sometimes did, midwives nursed the invalid and provided what medicines they could until the woman either recovered or died.

Although midwives were primarily birth attendants, their responsibilities often went further. Many midwives acted as general practitioners, making medicines, nursing the sick, and even setting broken bones. At a time when physicians were some-

times in short supply or beyond the purses of many patients, midwives filled the gaps in available medical care.

MIDWIVES' TRAINING

A midwife was typically a married or widowed woman past menopause who had borne children herself. Most often, she was of middling rank or class, although elite women also became midwives. All of these characteristics were considered crucial for midwifery. The midwife must be respectable and well-thought of by her neighbors, or they would not trust her; she must be past childbearing herself, or her own pregnancies and the care of young children would interfere with her duties; and she must have given birth in order to properly empathize with her patients.

Most midwives did not have formal education or training. Instead, they served informal apprenticeships with older midwives. Often this apprenticeship was as simple as merely attending many births as one of “the women,” learning from the midwife, and gradually taking on more and more responsibility. Women also learned home remedies and herbal medicines from their older female neighbors and relatives, especially mothers and grandmothers. Such knowledge was passed down through families along with other household practices and family remedies.

MIDWIVES IN NON-EUROPEAN COMMUNITIES

Enslaved African American women also served as midwives. Like their European American counterparts, African American midwives provided general health care as well as obstetrical services. Slave midwives took care of their own families, their fellow slaves, and sometimes the white family as well, using herbal remedies and homemade medicines. They relied on oral traditions to learn their skills, although occasionally a master provided more formal training. On large plantations, masters often built specialized slave hospitals or infirmaries, with slave midwives and nurses in attendance.

Midwifery was one of the few specialized skills reserved for female slaves. As such, it sometimes conferred unusual privileges. Some slave midwives were called not just to their fellow slaves but to neighboring white families as well. As a result, they had unusual freedom of movement. Such mobility enabled midwives to see friends and relatives on other plantations and to act as messenger or go-between for other slaves. Midwifery could also be a source of outside income for an enslaved woman if her master allowed her to keep some of her fees. Because of their skill and their privileges, slave midwives were deeply respected in their communities. Their fellow slaves looked to them for wisdom as well as healing.

Less is known about Native American midwives. Research on Native American childbirth customs suggests that they, like other cultural practices, varied considerably from culture to culture. In general, Native American women were attended by other women, often kin, who assisted and supported the mother during childbirth. If a birth was complicated, a traditional healer or shaman might be called in, and in some tribes these healers were women. Shamanistic healers used sweat baths, herbs, roots, and prayer to ease the birth.

CHANGES BETWEEN 1750 AND 1820

The years from 1750 to 1820 were a critical period in the history of midwifery. Shortly after the Revolution, male physicians trained in Europe began attending the births of wealthy urban women. Male physicians could offer services that midwives could not, specifically the use of forceps and painkillers such as opium. Patients felt these techniques made childbirth safer and less painful, and women who could afford to do so chose male physicians over midwives.

As time passed, physician-attended birth became more and more common, even in rural areas and among the middle class. At times, a woman called both a midwife and a physician to attend her. Midwives and physicians thus negotiated a delicate balance between traditional childbirth and the new physician obstetrics. What did not change, however, was the female domination and control of childbirth. As long as births remained in a woman’s home, as they would until the early twentieth century, women remained in charge of their own birth experiences, and the tradition of social childbirth continued. Midwives themselves continued to practice throughout the nineteenth and twentieth centuries, although their practice became more and more marginal, often limited to remote rural areas, new immigrants, and the poor.

Overseers

Overseers supervised the slave plantations of absentee owners or planters who could not themselves manage a large agricultural enterprise.

In the Deep South, absentee planters with more than a few slaves were legally required to hire overseers. In the rice-growing region of the Southeast, overseers enjoyed higher salaries and more prerogatives than their counterparts in the Upper South. Depending on local customs and laws, overseers might share planters' authority to permit slaves to travel, conduct business, purchase liquor, assemble in large groups, or possess weapons.

In the Upper South, many overseers earned modest salaries and lacked the prerogatives and privileges of a trusted manager. They were financially liable for harm to their employers' property, including damage caused by slaves, regardless of the overseers' fault. On a Virginia plantation during the 1820s, Charles W. Jones and O. L. Fowler lost their jobs because they injured slaves while punishing them and negligently caused the death of livestock. Planters were not required by law to hire overseers, and the social distance between the two classes discouraged collegial relationships.

Most overseers were mature white men, some of them neighboring farmers. If they were aspiring planters—like Maryland's James Riggs, who worked for Charles Carroll for several years during the 1770s, and Jordan Myrick, who once managed thirteen South Carolina rice plantations simultaneously—then they frequently performed their duties capably and enjoyed job security. Planters' sons and other relatives performed less predictably. Itinerant, propertyless overseers who lacked relevant aspirations and skills gave the occupation a bad name but nonetheless found positions when cotton planting became profitable in the Deep South during the early 1800s.

Some planters appointed slaves to manage plantations rather than merely lead work gangs, but they often bore the title of "overlooker" or "driver" rather than "overseer." In Louisiana, they were called "commandeurs." This arrangement was not unique to the Deep South. Thomas Jefferson sometimes used an enslaved overseer named Jim. At the end of his life, George Washington relied solely on slave overseers, as he prepared all his slaves for their eventual freedom. In times of revolution or invasion, black overseers replaced white counterparts whose militia units were called to active duty.

Wary planters insisted that overseers sign highly restrictive contracts. These contracts spelled out in detail an overseer's duties, from times and methods of cultivation to care and feeding of slaves and livestock. These contracts also imposed an isolation on overseers by restraining them from leaving the plantation and entertaining visitors. Accounts by both planters and former slaves attest to overseers' cruelty and degradation, including the despicable but legal exploitation of female slaves. Nonetheless, after the Revolutionary War, planters grew cautious about slave revolts. As a result, overseers gained enhanced power, including the authority to deny slaves' basic needs and comforts such as hunting for meat or gathering for religious worship.

Overseers plied their trade amid several conflicts. Planters insisted that they produce bumper crops while not exhausting plantation resources, notably the slaves. Absentee employers appointed relatives, friends, and neighbors to scrutinize overseers' performance even as they entertained slaves' complaints. At the same time, slaves devised clever methods of resistance.

Sailors and Seamen

Maritime work and labor in America from the 1750s to the 1850s was predominantly a world of men from poor working families. However, there were variations in the socioeconomic backgrounds of sailors. The third son of a well-to-do farmer, lacking the prospect of a lucrative inheritance in the future, was just as likely to go to sea as the firstborn son of a destitute urban mechanic. There were also variations in race and ethnicity. In the two major branches of maritime employment, the American merchant marine (commercial shipping) and the navy, crews regularly comprised men from various nations around the globe. In addition, African Americans also carried

cargo across the oceans and fought to keep shipping lanes open to American commerce. The motley workers of “the wooden world” made key contributions to the commercial and industrial expansion that took place in America up to and beyond the Civil War.

For the most part, the terms “sailor” and “seaman” were used interchangeably throughout the Age of Sail, or roughly from the sixteenth to the nineteenth century. Any sailor could be given the moniker Jack Tar, taken from the maritime weather-proofing agent that frequently covered worker’s clothing. On a warship the quarterdeck was the space reserved for the captain and the officers; those not permitted to walk along the quarterdeck were sometimes called fore-the-mast men. This phrase was also used to describe the people on board merchant vessels, generally those common seamen who lived in a ship’s forecabin. Although the term “mariner” applied to anyone at sea, it could specifically designate a ship’s captain.

Women sometimes masqueraded as males at sea, working in the merchant marine and in the navy. Wives followed husbands in their berths and performed a variety of functions, from carrying water to gun crews in battle to washing clothes and preparing medicinal cures for the many diseases that afflicted seamen. In certain circumstances, women even became pirates.

Through the first half of the nineteenth century, different wooden worlds awaited an American Navy seaman or a sailor in the merchant marine. Work on an American warship was typically more demanding than work on a merchant marine vessel. In addition to the manual labors associated with the day-to-day art of harnessing trade winds and ocean currents, naval seamen conscientiously prepared to engage in battle at sea. Regular military training, including gunnery exercises, and constant order were required. To ensure discipline, the captain had the authority to inflict corporal punishments on the crew. Punishments for poor work performance in the naval service ranged from isolation in iron chains to flogging with the cat-o’-nine-tails (a whip of nine knotted lines that left scars resembling cat scratches) and, in extreme cases, hanging. Impressed men, those who served involuntarily, frequently equated naval service with slavery. Owing to their propensity to mutiny or desert, these coerced laborers were confined to quarters below deck when not at work; their movements on board were closely monitored, and they were typically denied shore leave or liberty. Upward mobility, not uncommon in the merchant ma-

rine, was rare in the navy. As had been the custom in the British Navy, commissioned officers were almost exclusively politically connected, educated, and propertied. By contrast, meritocracy remained the sole province of the merchant marine up to the American Civil War. Naval service also took individuals to sea for longer periods than did the merchant marine. As a result, families were separated and naval seamen were forced to endure greater isolation than most merchant mariners. Yet, for the patriot, naval service brought honor and glory. Moreover, naval vessels were generally better provisioned with food and drink than trade ships. Regular rations of rum were given to naval seamen to help boost morale and dull the pains associated with hard manual labor.

A maritime laborer at the turn of the nineteenth century would have encountered a different life in the American merchant marine. Whereas the navy ranked its seamen, sailors in the merchant marine rated, or classified, themselves. There were three types of sailors: workers with no prior maritime experience, known as landsmen, landlubbers, green hands, and waisters; regular or common seamen, who had some experience or who were previously employed with another merchant; and the able-bodied seamen, veterans with deep working knowledge of nautical matters. (An able-bodied seaman past his prime was often called an old salt.) A sliding pay scale afforded able-bodied seamen the best wages. Typically, wages were higher in the merchant marine than in the navy, especially during wartime periods of greater risk. Merchant mariners could also supplement their wages by using the trade ship to transport private cargo for separate sales. On average, however, sea work paid less than most landed occupations. Signing on for a trading voyage required a sailor to come to terms with a captain, a merchant, or a merchant’s agent, or supercargo. This process of negotiation sharply contrasted with the hardships endured by pressed men in the navy. In addition, crew sizes and ship tonnages were smaller on average in the merchant marine than in the navy.

Despite these differences, sailors or seamen on naval vessels and merchant ships engaged in comparable work. On both merchant ship and naval vessel, maneuvering a wooden sailing vessel on the open sea required coordinated activity between those in charge of navigation—usually the captain, sailing master, or hired pilot—and the crew. It was the crew that set and reefed, or unfurled and furled, sails. The crew also maintained and altered the ship’s rigging,

including the cordage, block, and tackle, to suit varying sail positions. Even the most seaworthy vessel took on water that had to be pumped, and the sturdiest craft required routine cleaning. Scrubbing, or “holystoning,” the decks involved rigging hoses to pumps, wetting the decking, coating them with sand, using stone blocks that resembled Bibles (thus “holystones”), sweeping the planks free of sand, and swabbing everything dry. Additionally, both merchant vessels and warships had to be ever vigilant against the threat of attack at sea. Crews were therefore split into two watches, which were further divided into groups with alternating four-hour shifts. Two two-hour shifts, called dog watches (a corruption of “docked,” meaning shortened), ensured that the same group would not have a monotonous work schedule. Laboring in this manner, sailors and seamen safeguarded American commerce and transported manufactured goods and raw materials around the world.

Slave Labor

Slave labor was vital to the economy both of Britain's North American colonies on the eve of the

American Revolution and of the new nation. Most slaves toiled in obscurity, but the visible work other slaves did in prominent places—from making the colonial port towns go to building the independent Republic's new capital in Washington, D.C.—underscored their economic importance. But if the significance of slave labor to the economy as a whole was a constant, the years between the late colonial and early antebellum eras witnessed sweeping changes in the type and scope of the work. And given that labor molded the entire life—in nonworking as well as working hours—of every enslaved person, the transformations of slave labor shaped the lives of millions of black as well as white Americans.

BROAD CHANGES

The Revolutionary and early national periods witnessed a massive growth in the American slave population as well as in the population as a whole. At the time of the American Revolution, roughly 1 in 5 Americans—just under 500,000—was of African descent, the vast majority of these enslaved. By the 1820 census, the enslaved population had more than tripled to over 1.5 million. (There were 1.8 million black Americans altogether, however, with 13 percent of this total being free.) However, the general population had grown so quickly between 1770 and 1820 that the proportion of slaves had dropped to 1 in 6, and African Americans made up 18 percent of the American people.

The geographic outlines of American slave labor also shifted dramatically in this half century. In the Revolutionary era, almost all slaves, along with their masters, lived in settlements hugging the Atlantic coast. They could be found in every colony, however, and in significant numbers in the northern port towns and the mid-Atlantic countryside as well as on southern plantations and farms. By 1820, the abolition of slavery in the North, though gradual, was well under way. This took longer in parts of the mid-Atlantic than elsewhere in the North. In the greater New York City area, for instance, slaves were still a central component of the labor force well into the nineteenth century. When New York State and New Jersey passed gradual abolition acts in 1799 and 1804 respectively, about one-third of all households in New York City and the surrounding countryside employed slave labor. By the 1820s, the transition to free labor was advanced but not complete. Meanwhile, southern plantation and farm agriculture had spread to the Mississippi River and beyond. Slave labor had become a “peculiar,” sectional institution, but it gained more territory in the South than it lost in the North.

Sectionalization was not the only alteration in slavery's place in the American economy and society. In the colonies, African bondage was only one of many forms of unfree labor. Indentured servants and convicts from Britain, as well as bound apprentices, all worked alongside slaves. But in the 1780s, the newly independent nation was not about to continue accepting shipments of convicts from the erstwhile mother country. And legal changes in the early Republic struck down indentured servitude and gave new rights to apprentices, making all white people (except home-grown criminals) free. This left black slaves essentially alone in the category of unfree labor by the 1820s.

UPPER SOUTH

As abolition proceeded in the North, the Chesapeake states and their western satellites became the northern boundary of slave labor. But while the labor regime transmogrified in the face of crop changes and ideological attack, it hardly wilted. Indeed, it remained entrenched in old bastions like Virginia and expanded to Kentucky, Tennessee, and beyond in the early Republic. Slave labor thus demonstrated its durability and adaptability.

In the decades surrounding the Revolution, Virginia and Maryland transformed themselves from predominantly tobacco colonies to predominantly grain-producing states. As tobacco proved its ability both to exhaust the soil and to plunge planters deeper in debt as its price stagnated, slaveholders explored the possibilities of wheat and other grain crops. Those possibilities were great, especially in the form of exports to the hungry, war-torn Europe of the late eighteenth century.

As the crop changed, so did most Chesapeake slaves' labor regime. Tobacco had required painstaking year-round labor, but wheat did not. The latter did, however, bring in its train all manner of new tasks relating to maintaining draft animals (which planters were using in more abundance with the crop change) and to transporting, processing, and marketing flour. This switch imparted much greater variety to most slaves' work routines, requiring that they learn new skills and become jacks of many trades.

The lack of demand for year-round intensive work on a staple crop, however, convinced many Chesapeake slaveholders that they were now saddled with an excess slave population. For some masters, this made the antislavery ideas circulating in the Revolutionary era seem like common sense. These men and women manumitted their slaves in large num-

bers; ten thousand went free in Virginia alone in the 1780s. Maryland and especially Delaware saw an even greater proportion of slave laborers manumitted; by 1820 free people made up 27 percent of the black population in the former and 74 percent in the latter.

But other slaveholders saw a more lucrative way of unloading these surplus hands as slave labor expanded across the South in the early Republic. To be sure, the slave population of the Chesapeake grew in the period between 1770 and 1820. Virginia's quadrupled in that time, and the Old Dominion still had more slaves than any other state at the time of the Civil War. But the Chesapeake also supplied the rising domestic slave trade. "Movement," as historian Ira Berlin has phrased it, "became the defining feature of black life in the postwar Chesapeake" (*Many Thousands Gone*, p. 267). This included the growing practice of hiring slave laborers in pursuits both urban and rural, industrial and agriculture; but the main form of movement was a new migration to the interior South.

One place masters and slave traders dragged enslaved workers was the newly settled region directly to the west. In the late eighteenth and early nineteenth centuries, white Americans poured into Kentucky and Tennessee, utilizing slave labor to establish and run new operations there. These were overwhelmingly agricultural as they were in the Chesapeake, but they took different forms. Kentucky, for instance, replaced Virginia as the epicenter of American tobacco cultivation and also made a name for itself producing hemp. The slaves' lives changed to suit the new crops as well as the exigencies of settling new territory.

DEEP SOUTH

The Lower South became the Deep South in the early national era. Rice cultivation in coastal South Carolina and Georgia was the main experience of slaves south of the tobacco colonies, but their lives in the new nation centered on cotton cultivation in new states and the up-country of the older states. As in the Upper South, the long-settled region's slave population persisted, but it also formed a terminus of the domestic slave traffic.

In both the colonial and the early national low country of South Carolina and Georgia, rice was king. Like all crops, its unique rhythms and conditions patterned the lives of the slaves working it. The combined effects of drudgery in knee-deep water and a pestilential disease environment, for instance, made for a higher mortality rate amongst slaves on rice

plantations than obtained anywhere else except the sugar parishes of Louisiana.

Moreover, the low country's slave population hammered out a distinctive form of labor: the task system. Low country masters and overseers found that the difficulty of supervising their large black majority militated against working their slaves in gangs from sunup to sundown as in the archetypal model of American slavery. They therefore assigned their workers plots of land to cultivate every day. Once that task was complete, the slave's time was his or her own. The tasks were not easily completed for most slaves. But this system did allow a certain autonomy for slaves both during working hours and afterward; indeed, for some it increased the number of hours not spent working for the master. Some of these turned this time to growing their own produce, which they traded in local markets both clandestine and open.

But by the early nineteenth century, the main event for slave labor in the United States was neither rice nor tobacco nor wheat; it was cotton. Aided by a new gin that allowed for easier processing, cotton culture spread rapidly in the up-country of South Carolina and Georgia in the 1790s and 1800s, then in subsequent decades to newly conquered territories in the interior—what would become the heart of the Cotton Kingdom in Mississippi, Alabama, and Louisiana.

The rising planters of the cotton frontier employed slave labor in carving out plantations in the new regions. They required mostly young and mostly male laborers to clear trees and brush in preparation for planting. Even such workers managed to clear only twelve acres every four months, so this stage stretched laboriously on for a long time. Furthermore, it was a new type of work for slaves who had worked staple crops before moving to the cotton frontier. Accordingly both their lives and communities had been forcibly restructured.

The adjustments were by no means finished once cotton cultivation was under way. The low country task system extended to cotton in some of these new settings, but gangs of slaves predominated, forcing migrants from the Lower South into new rhythms. Furthermore, whether from the Upper or Lower South, slaves had to learn new skills to cultivate and harvest cotton. The new work routines, together with the separation slaves experienced from kin and familiar surroundings, rendered forced entrance into the Cotton Kingdom a bitter experience. It was a trauma that as many as a million African Americans would endure before the Civil War.

Teachers

Ideas about teaching and education circa 1750 drew heavily on the cultural and religious heritage of the colonists. The earliest civic legislative call for the compulsory education of all children came in theocratic New England in 1642, and was followed by the organization of compulsory public (though not universal) education in 1647. In the middle colonies, however, denominations tended to establish school-

ing systems to inculcate pupils in the virtues of the doctrine of the particular faith. Thus, schooling tended to be parochial and in the hands of individual churches rather than the state. In the southern colonies, the upper-class distinction and Anglican faith of the ruling property owners forged a private and philanthropic model for education. The upper class educated their own children through private tutors or tuition schools, and philanthropic efforts provided “pauper schools” to some families without means.

Just as these three models of education varied in the early national period, so did the roles and status of teachers. In New England teachers often were preachers and college-educated. Most teachers, and nearly all of the Latin grammar school instructors, were men. The most important qualification was religious and moral character. Of secondary importance were his skills at reading and writing and, more rarely, ciphering. In towns with at least one hundred families, school law required the instruction of Latin, though compliance was not universal.

Children achieved basic literacy before entering these schools, either at home or sometimes at a petty or dame school. Dame schools provided an arrangement of day care and basic education for younger children, probably under the age of eight. As the name suggests, a woman, typically a widow, earned small fees from parents by taking in young children and teaching the older ones to read and write. By the time of the American Revolution, the practice of having women teach the fundamentals and men the more advanced curriculum was probably quite common.

There is less comprehensive information available about teachers in the middle and southern colonies, but records suggest that many were local clergymen, farmers, or individuals who used teaching to supplement their incomes. Others were indentured servants who worked to pay back their passage from Europe. But some were highly qualified and provided high-quality instruction in a broad array of subjects. Overall, the work and social roles of teachers varied significantly across and within the colonies depending on the role of the state, the size of the community, the education of the instructor, and the preparatory orientation of the school.

As the ideologies of independence and equality came to be seen as central to the new Republic, George Washington, among others, called for the development of institutions that “enlightened” public opinion. Still, free public schools, or “common” schools, did not emerge until the late 1830s. In the early Republic, it was parents’ responsibility to pay

fees for their children to go to school; sometimes local communities helped them pay for the schoolhouse and some of the materials. During this time, two trends set the direction of education: First, education became increasingly secular, and “Rithmetic” replaced “Religion” as one of the three Rs. Second, education also began to shift its focus from the classics—a curriculum that aimed to prepare students for college—toward practical education. Useful subjects such as bookkeeping and gunnery were common additions to the curricula, and records suggest that pupils learned practical skills such as writing receipts and bills of sale.

Even in the absence of significant government involvement, education grew increasingly important. For men, in this period of high mobility, having an education became increasingly important in obtaining employment off the farm in a new city or new town. For young women, school-keeping became a viable option to escape the drudgery of housework and child rearing. The incomes of these young women often enabled families to send yet more children to school.

Teaching was seasonal and often itinerant work. Teachers traveled far and wide in search of better schools, more supportive communities, and better pay. Nahum Jones (born 1779) used money from teaching to buy a farm near his father’s in Massachusetts. After failing to make a living at farming, he returned to teaching, although he complained of having to “walk around” New England. The increasing presence of women as “schoolmarms,” the term common for a schoolmistress, in the summer months when men were occupied with agriculture, allowed them to make inroads into teaching in the winter season and, in turn, a more advanced curriculum to older children.

Without a system of teacher certification, the credentials and skills of teachers varied widely, as did teaching conditions and pay. Either out of need or lack of ability to verify teacher credentials, many communities hired young teachers who could read but barely write. A teacher might have been qualified after only a few seasons of formal learning. As time passed, more teachers became trained, and some had studied in the newly emerging “academies,” which would have required advanced study of the classics as well as basic skills.

During the early national period, teacher contracts also came to govern the community-teacher relationship. Many specified the number of days to be taught and the methods to be used. Typically, teachers would assign individual lessons and would

monitor pupil progress through listening to their recitations. In addition to the single schoolmaster model, the “monitorial” system (as was adopted in New York) became a popular and inexpensive teaching methodology from around 1800. In these schools the oldest and best pupils were responsible for conveying lessons to approximately five hundred to one thousand younger pupils.

In turn, school trustees or parents often provided a schoolhouse, the children’s materials, and textbooks, which became increasingly secular and American in character. (Popular at that time were Noah Webster’s *American Speller* and Nicholas Pike’s *Arithmetic*.) Teachers were paid wages and sometimes board. Although compensation was rarely enough to justify teaching as a primary or even permanent vocation, it did offer a way to make a modest living and provided a stepping stone to other careers or marriage.

The common school movement, a public initiative to provide free, universal public education for all, grew over the course of the nineteenth century, and created the need for greater numbers of qualified teachers. This demand was partly met in the establishment of new teacher training schools. *Lectures on Schoolteaching*, notes on the “art of teaching” by Samuel R. Hall, the founder of a private teacher-training school in Concord, Vermont, constituted the first American professional textbook for teachers in 1829. The demand was also met by a growing teaching force of women. Teaching provided one of the very few jobs in which a woman could use her education. Skilled women not only expanded the supply of teachers, but they reduced the cost at which communities might provide education to local children, thus securing low-cost schools for the future.

Unskilled Labor

After the American Revolution (1775–1783), economies in the North and South changed and grew. In the North, manufacturing and industry emerged, while in the South industry and agriculture diversified. These developments required a pool of unskilled laborers. The unskilled workers, while facing new and difficult work environments, nevertheless created lively communities and maintained an ideology premised upon independence. Many, however, would find that their condition conflicted with their ideas.

THE NORTH

In the North, numerous economic factors pushed men and women into the unskilled labor force. The scarcity of land in parts of the North forced some rural Americans to move to cities in search of higher wages, where they found work in the emerging manufacturing economy. This dearth of land led aspiring male farmers into the workforce, and it had a similar effect on women. The propensity of young men to search for better economic opportunities created a labor shortage in some areas. There, women and children filled the void, especially in textile mills. After the American Revolution, merchants also invested capital in manufacturing. They centralized production into small factories and attempted to make the job process more efficient. This required the existence of a large mass of unskilled workers, filled by hopeful young farmers, women, and children; European immigrants; and free and enslaved African Americans. Thus, race, gender, and ethnicity segmented the unskilled workforce.

Unskilled workers in the North had a diverse array of occupations. In maritime-oriented cities, such as New York, Boston, Philadelphia, and Baltimore, men and women found jobs as seamen, longshoremen, carters, and domestic servants as well as

in ship construction, woodcutting, and road building. Workers also found jobs in the emerging factories. In Massachusetts, for instance, men and women worked in cotton mills and the shoemaking industry. These jobs were monotonous and repetitious and lacked individuality. Under the outing system, whereby manufacturers advanced the raw materials of shoes to women living on farms, the workers mass-produced shoes, working long hours and frequently finding themselves indebted to their employer.

Unskilled workers also faced capricious job conditions. Since they lacked a discernible skill, employers could fire them on a whim. Unskilled ironworkers in New Jersey, for instance, faced termination for drinking, negligence, or defiance. Fishermen in Massachusetts worked long hours and faced the dangers of the sea. Construction employees paid canal workers with alcohol (either on credit or in lieu of wages) or with credit, forcing them into a system that resembled debt peonage. The nascent capitalist system fully exploited unskilled workers. Because of the poor working conditions, many unskilled laborers were notoriously mobile. They moved from city to city in search of good wages. While this mobility enabled the laborers to escape places where work conditions were deteriorating, it also prevented effective efforts to organize them.

Despite their mobility and the dangers associated with work, unskilled workers created a common community life and ideology. Canal workers, for instance, typically lived near their job sites in shantytowns or temporary work camps. After the workday had concluded, canal workers entered a male bachelor subculture. They imbibed alcohol and participated in a variety of rough-and-tumble sports, including horse racing and boxing. Naturally, this subculture had a dark side. Excessive alcohol consumption led to fights between workers. This too was a world riddled with crime. Thefts, robbery, and assaults were common in the canal workers' camps. Yet men and women flocked to unskilled jobs, primarily because they still believed that wage work was temporary. Men aspired to own land and believed that working for wages in their youth would enable them to save enough money to purchase land in the future. Women, too, considered unskilled labor temporary because they expected eventually to marry someone and leave the factory. Still, by the 1830s many men and women were becoming life-long wageworkers.

THE SOUTH

In the South, many unskilled workers were slaves, and their conditions varied according to region. After the American Revolution, mixed farming, with an emphasis on wheat, replaced tobacco cultivation as the primary economic enterprise in the Upper South. Wheat production required fewer year-round workers than tobacco. This precipitated two important changes in the lives of unskilled slave workers. For one, mobility and movement was the norm. Some slaveholders sold African Americans into the Deep South because they no longer needed their labor. Other slaveholders, however, moved blacks into skilled jobs, both in the countryside and, increasingly, in the city. Since most men became skilled workers, women worked in the fields and, sometimes, in iron factories in unskilled jobs. Second, the agricultural revolution broadened job opportunities for slaves. Rather than working in a monoculture, slaves worked in a diversity of crops, freighted goods, and tended to livestock. Lastly, slaves in Upper South towns who worked in the ironworks earned cash wages for working overtime.

In the Deep South, on the other hand, rice production returned to prewar levels, and the expansion of cotton spread slavery into the interior Southeast. The expansion and intensification of slavery required slaveholders to import slaves from the North, Upper South, and Africa (until 1808). In rice-producing areas, the number of skilled workers increased slightly, which forced more women into the fields. In the cotton regions, however, slaveholders required many unskilled workers and thus brought men and women, young and old, into the fields. Unskilled slave workers contested changes in their workday. In the rice areas, tasking still dominated production, mainly because slaves resisted efforts to change the pace of the workday. However, in cotton-producing areas, slaveholders moved to a gang labor system, which irritated slaves removed from the rice areas of South Carolina.

Unskilled slave workers created a community life. After the American Revolution, slaves flocked to Christianity in increasing numbers. Upper South slaves utilized their newfound mobility to travel to other plantations and create a pan-plantation community life. This freedom of movement allowed Upper South slaves to maintain families, even when slaveholders sold a spouse to another plantation. Lastly, the American Revolution and emancipation in the North had opened the door, if slightly, to the possibility of freedom. Slaves resisted the efforts of slaveholders to limit their freedom and opportunities. When masters attempted to speed up the pace of

work, slaves fought to maintain tasking, which granted them some free time, and instituted stints, whereby slaves agreed among themselves the amount of work they would accomplish in a given day.

After the American Revolution, economic changes in the North and South made America's unskilled workforce expand. It absorbed landless young men, single women, children, and enslaved African Americans. Women, both free and unfree, entered the unskilled labor force in increasing numbers. Yet the Revolution's rhetoric of freedom captivated some workers. Young men believed that wages were the ticket for landed independence, while African American slaves gravitated to the messages of the Revolution and northern emancipation. Still, unskilled workers faced dangerous and exploitative work environments and faced a future where they would labor in perpetuity.

William J. Bauer Jr.

Women's Work

In the mid-eighteenth century, the colonial economy was centered on the household. Although tasks were usually divided along gender lines, all members of the family contributed essential labor. Importantly, this labor did not typically generate income. In an agricultural society the home was a center of production for the family's needs, with both women and men performing nonwaged labor that sustained the family. Men had primary responsibility for agricultural labor. Among women's many responsibilities were spinning thread and sometimes weaving cloth, keeping gardens, taking care of poultry, milking cows, and producing butter. Excess produce might be bartered or sold. In addition, women prepared and preserved food, made soap, washed and repaired

clothing, bore and raised numerous children, and kept their large households clean and running. These varied tasks filled the days of the overwhelming majority of colonial women. Such time-consuming and essential labor was the norm; the required, specialized skills defined a good wife. Although largely confined to a single household, some tasks involved communal labor, as when women gathered to sew quilts.

Women's labor in the farming household complemented that of their husbands. When their spouses were away, married women also acted as what the historian Laurel Thatcher Ulrich has termed "deputy husbands," conducting family affairs to the best of their ability. During harvest times, women joined men in the fields, although such labor was not considered ideal for women of European descent. On a temporary basis or for indentured servants, fieldwork was more acceptable. Enslaved women performed both fieldwork and a range of domestic tasks. Throughout the colonies, they contributed essential labor, whether of an agricultural nature on plantations and farms or as domestic or household servants.

In nonfarming families, women often worked alongside their spouses in their trades and in their shops, assisting in the production of goods and attending customers, while remaining responsible for child care and other housewifery tasks. In his autobiography, for example, Benjamin Franklin noted the helpful labor that his wife, Deborah Read Franklin, provided in his print shop, where she folded and stitched pamphlets. Such labor has been rendered largely invisible in the historical record by the legal position of married women in the colonial period. Under the doctrine of coverture, which dictated that a woman's legal identity merged with her husband's upon marriage, married women had no right to enter into contracts, keep their own wages, make wills, or sue debtors. For this reason, many married women who worked in family enterprises did not show up in contemporary records, unless someone commented on their labor, as in Franklin's case, or they continued to run businesses as widows. Widowhood was a common means of a woman assuming control of a business in her own name. Also, in some colonies, femme sole trader statutes allowed married women to conduct trade in their own right.

Throughout the colonial period, while most women worked within the context of the farm household, there were other women who ran or engaged in a range of enterprises. They obtained licenses to dispense alcohol and became tavern keep-

ers; many of these women were poor widows. Others taught school, took in boarders, or ran printing presses, like Mary Katherine Goddard (1738–1816). After taking over her brother's Baltimore press, Goddard became a notable printer, the first to print a copy of the Declaration of Independence with the names of the signers; she also served as the first postmistress of the colonies in 1775. Elizabeth Murray set up her own business in Boston in 1750, taking advantage of rising consumer demand for British goods to run her own shop and later setting up other women in business. Generous credit and the availability of inexpensive, high-quality cloth and ceramics prompted many women in colonial ports to pursue shopkeeping in the decades before the Revolution. Imported goods began to replace some domestically produced items, such as cloth. One of the most lucrative trades in the colonial period, as well as in the early Republic, was midwifery, a field in which women held a near monopoly.

THE LEGACY OF THE REVOLUTION

Although the Revolutionary War years interrupted prewar patterns in some regards—with women like Abigail Adams assuming more responsibility for running family farms, for example, while their husbands were away and eventually asserting a sense of ownership—the Revolution itself did not signal a dramatic turning point in women's economic endeavors. Although, the disruptions that accompanied it led to the relocation of many single women, who became part of a new, cheap labor pool, most women continued to run households and raise children; the average birthrate remained high, at 7.04 in 1800. The Revolution challenged women to make political commitments and follow them up with economic actions, such as producing homespun cloth during boycotts of British imports in the 1760s and 1770s, but its effects were limited in the short term.

One important legacy of the Revolution, however, was an increased attention to the content of women's education. Reformers argued that women needed to be better schooled so as to raise their sons to be good citizens; women would exercise their political influence within the domestic sphere. This ideal, which the historian Linda Kerber has termed "republican motherhood," contributed to a shift in female education. Although much of the schooling girls received remained oriented toward the skills of housewifery and ornamental accomplishments, new subjects entered the curriculum. Ultimately, the combined domestic and political rationale for women's improved education lay the basis for the

emergence of female academies in the early Republic. Subsequently, women began to apply their educational achievements outside of their own homes, entering the teaching profession in large numbers.

THE MARKET ECONOMY AND THE DOCTRINE OF SEPARATE SPHERES

Larger changes in industrial development and the market itself led to profound changes in work and the perception of it. In the late 1700s the putting-out system, a phase of industrial development that preceded the integrated factory, brought income-generating labor directly to the household. This process, which historian Jan de Vries characterizes as part of an "industrious revolution," signaled both an increase in the labor of women and children in the home and accompanying increases in overall productivity. In some industries, like shoemaking, women constituted a significant portion of the workforce, using their skill with the needle to stitch together shoe parts at home. Such work, also found in clothing production and hat making, was generally poorly paid.

Household production began to decline gradually as the market economy expanded. As waged labor grew increasingly time-oriented and separated from household production, men's nonagricultural work became distinguished by taking place outside the home and generating wages. In contrast, for the majority of women, work remained within the domestic sphere and was task-oriented rather than delimited by time. Crucially, such female labor was unwaged, and paid labor was increasingly privileged over unpaid. With the emergence of an ideology of separate spheres, where women were confined to a domestic sphere supposedly untouched by the market and where men left the sanctuary of the home to gain income for their families in a competitive, cut-throat public work space, women's contributions to sustaining their families and households were minimized. The historian Jeanne Boydston describes the "pastoralization" of housework that occurred in the early Republic; a rhetoric emerged that idealized women's domestic endeavors and characterized them as duties lovingly performed in an idyllic sphere, rather than as labor. As contemporaries drew increasingly sharp distinctions between "home" and "work," this dichotomy discounted the economic value and necessity of housework.

The doctrine of separate spheres ignored important facets of women's work experience in the early Republic. First, this pervasive ideology was most applicable to middle-class women; working-class

women of necessity went outside of their homes to work for their families' subsistence. Second, women's household labor constituted an essential, if unpaid, contribution to their families. Third, the birth of industrialization in the United States witnessed the intentional incorporation of large numbers of women into the market economy. In the early decades of the nineteenth century, widespread efforts were made to develop the industrial base of the United States, with the interruption of trade during the War of 1812 adding fuel to the drive to industrialize.

In Lowell, Massachusetts, mill owners in the 1810s and 1820s hired a largely female workforce in an effort to balance agrarian and economic aims; men could stay on the farm while women toiled in factories. Lowell itself became a leader in the textile industry in terms of numbers of workers and volume of cloth produced. By 1828, 90 percent of textile workers in New England were female. The "mill girls," who lived in company boardinghouses, earned wages much lower than those of male mill workers, yet they earned enough to supplement their wardrobes, save money, and send funds home, sometimes paying for the professional education of brothers. The growth of professional school and accreditation negatively affected some female trades. As states began to license medical practitioners, for example, midwives found their position challenged by the institutionalized training that came to define medicine, schooling from which they were excluded.

The period was one of flux, with new possibilities for some women's employment and deteriorating circumstances for others. The rationale for paying women less than men in the mills, and in other trades as well, lay in the notion that men's labor and income supported their families. The laws of coverture remained intact, and women's labor, wherever they performed it, was seen as either nonessential to their families' livelihoods, as in the case of mills, or as non-work, as in the household.

Work Ethic

The work ethic is a debased, vulgarized version of a moral vision that the German sociologist Max Weber conceptualized a century ago as the Protestant ethic. In the Reformed Protestantism of the sixteenth-century Geneva theologian John Calvin, an inscrutable God predestined men and women to salvation or damnation yet withheld from them the ability to read his design or discover their eternal fate. They could only hope to have intimations of an answer to that most urgent of all questions. The capacity for steady work seemed such an intimation, because Calvin's God wished to be worshipped in the world, not in monasteries and other such retreats from it. Work was, for Reformed Protestants, a way of worshipping their God and easing their anxiety.

In Weber's ingenious formulation, Protestants who dedicated themselves to unremitting labor were decisive in the creation of capitalism because they believed God disallowed pleasure as much as he demanded industry among his faithful. Their ascetic reluctance to enjoy the fruits of their labor left them nothing to do with the mounting wealth that came of their diligence but to put it back into their businesses. Thus they inadvertently—and systematically—amassed capital.

Weber took Benjamin Franklin and his Poor Richard maxims as the epitome of the Protestant ethic. And observers before and since have seen America as a culture singularly wedded to work and peculiarly convinced that work was the core of the moral life.

But Weber probably misread Poor Richard and certainly misread Franklin. Franklin was no Puritan. He pursued the pleasures of the flesh from his youth to his dying days. He gave up work itself at an early

age, quitting the printing business for what he unabashedly called leisure and philosophical amusements.

Franklin was hardly alone in his aversion to the laborious and his enjoyment of the carnal. Few of the richest men in early America embraced an ethic that made moral significance of work. Few, indeed, did much work. Southern planters had squadrons of slaves to clear the land and till the soil; they spent most of their time exchanging social visits with one another. Northern merchants enjoyed an equivalent leisure; their ledgers reveal that they rarely made more than three or four sales a day, their letter books show that they rarely wrote more than three or four letters a day, and their diaries indicate that they spent the better part of their time dining and chatting with fellow merchants. Common people in all the colonies similarly sought relief from the biblical curse on labor that attended the expulsion from Eden. Promotional pamphlets routinely promised those contemplating migration to the New World that they would find there a life of Edenic ease. Hogs and cattle multiplied marvelously, without human effort. Crops flourished in fertile soils. Fish ran so abundantly in the rivers that a single netting would feed a man for a week. Birds flew so thickly in the air that a single shot fired into the flock would bag half a dozen. Men and women went to colonial America for the prospect of wealth and leisure that it offered more than for the work that it required.

After the Revolution the emphasis shifted. In the staple-producing South, work remained a slave's affliction and exemption from physical labor remained a mark of gentility. But beyond the regions where tobacco, rice, and cotton absorbed men's ambitions, the pace of business quickened. North of the Mason-Dixon Line, a veritable revolution in transportation—scheduled transatlantic shipping, turnpikes, canals, steamboats, and, at the end of the era, railroads—opened a vast new access to the market. Farmers responded to the incentive to produce more for it. An emergent middle class set standards of respectability that increasingly centered on a new gospel of work.

The norms themselves were not new. The Puritans had brought them to New England, the Quakers to Pennsylvania. But they had been confined to Puritan and Quaker precincts in the seventeenth and eighteenth centuries. In the young Republic they overspread much more of the North.

Everyone noticed. European visitors commented in tones at once acerbic and astonished on Americans' obsession with what the novelist Charles Dickens

would later call the "almighty dollar." Almost without exception, such observers complained of meals frantically wolfed down so as to lose no time that might be spent making money. They remarked on the meager fare of amusements and the absence of a substantial class of men and women devoted to them. As Alexis de Tocqueville, the great nineteenth-century French observer of American life, noted, even the wealthy considered themselves obligated to persist in "some kind of industrial or commercial pursuit." A rich man "would think himself in bad repute if he employed his life solely in living."

Americans themselves testified to the same effect, in their words and in their actions. The mill girl turned poet Lucy Larcom recalled New England childhoods "penetrated through every fibre of thought with the idea that idleness is a disgrace." Merchants withdrew from the politics they once dominated because commerce demanded all their time in the nineteenth century as it never had in the eighteenth. Artificers in the 1820s petitioned for ten times the number of patents they had thirty years before. The very beverages that Americans drank made manifest the changes: coffee, a stimulant, displaced whiskey, a depressant.

Needless to say, there were those who did not embrace the new ethos or give themselves enthusiastically to incessant labor. Urban artisans still celebrated "Saint Monday" and punctuated the rest of the work week with booze breaks and other premodern rituals of conviviality. Farmers sometimes disdained the opportunities that new markets offered. A Pennsylvanian remarked that he had thought to move to Kentucky till he heard that there was no winter there so people had to work all the time; "that was not his fancy." But such common folk did not occupy, or even have access to, the command-posts of middle-class opinion.

The work ethic of the new nation was not the Protestant ethic that Weber delineated. It was far more broadly diffused: a secular faith rather than a sectarian one. It was essentially disconnected from anxiety over salvation: the notion that work was a "calling" in which the worker glorified God virtually vanished from common parlance.

This work ethic justified work by its usefulness to the early Republic and, more, by its advantage to the worker himself. Work built character. Work kept a person from the debilities of idleness. And work was the way to a new American dream of success. As the idea of the "calling" disappeared, the idea of "the self-made man" came to the fore. By diligent application, men of modest origins could become rich.

By industry alone—"plain, rugged, brown-faced, homely clad, old-fashioned industry," as the mid-nineteenth-century minister Henry Ward Beecher would later put it.

There was an irony in all that. The crux of the work ethic was that labor in a social context made economic life more than mere drudgery by the sweat of the brow. Such labor conferred moral meaning on toil. But the more that men worked harder for private gain—for success and self-advancement—the more they dissolved the social context that could make their labor meaningful. It was a conundrum that would only be exacerbated with the advent of the factory system in the years ahead.

Michael Zuckerman

XYZ AFFAIR The decade of the 1790s was a perilous era for the new federal government of the United States. The economy only slowly emerged from the Revolutionary War slump, international commerce flagged, and the nation faced a crushing foreign and domestic debt. In addition, France—its former ally—had launched its own democratic revolution that slid into a bloodbath and led to resumed naval warfare with Britain in the Atlantic and the Caribbean. The American army and navy were woefully unready to protect their own vessels, rendering the nation's ill-prepared ports and harbors virtually defenseless. In 1793 the Federalist administration of George Washington sought to navigate these treacherous waters by proclaiming American neutrality in the Anglo-French War, seeking trade with both sides. Instead, however, it succeeded only in incurring the wrath of both and also of its emerging domestic opponent, the Democratic Republicans.

Then, in 1794 Washington sent John Jay to London to negotiate with Britain for the settlement of issues unresolved since the Treaty of Paris (1783) and to broker a trade agreement that would open British ports in the Caribbean to American commerce. Jay's Treaty (1794) outraged the French, who claimed that the Franco-American Treaties of Amity and Commerce (1778) still bound the Revolutionary

allies. A French minister to the United States, Jean Fauchet, was so outraged he demanded that Americans be made to hear "the voice of France thundering against the treaty and demanding justice." When trade resumed with Britain in the Caribbean and beyond in 1796, the French began attacking and confiscating American merchant vessels in a conflict that became known as the Quasi-War. Hundreds of thousands of tons of American merchant vessels were lost and all-out war with France seemed imminent.

In May 1797 President John Adams, another Federalist, determined to stave off disaster by sending a bipartisan Extraordinary Commission to France consisting of three ministers: Federalists John Marshall and Charles Cotesworth Pinckney and Democratic Republican Elbridge Gerry. The commission arrived in France by the fall to discuss settlement for American commercial losses and to pursue an agreement that would secure neutral trading rights for the United States and preclude further French attacks. After they had waited a considerable time to be received by the French Directory, Charles-Maurice de Talleyrand-Périgord, the French minister of foreign affairs, sent three lesser, anonymous officials to receive the American delegation. However, the operatives, identified only as X, Y, and Z, refused officially to receive the Americans without payment of tribute to the French government. When Marshall and

Pinckney returned to the United States and reported the slight, the Democratic Republicans suspected a Federalist plot to instigate war with France and challenged the Federalist Adams administration to prove the allegations. With that, Adams released the XYZ dispatches in March 1798, to general American outrage. Letters, memorials, petitions, and declarations of support poured into the capital at Philadelphia vowing "Millions for defense, but not one cent for tribute!" Citizens pledged to stand behind the president, even in the case of war, to protect the honor and security of the Republic. Many wore black ribbons or cockades on their hats to exhibit support for the president and their disapproval of France. Republicans, however, took to wearing red, white, and blue cockades, opposing war with their ally from the American Revolution.

Federalists manipulated the popular attitude of the "black cockade fever" to draft defense legislation fortifying ports and harbors, creating a Department of the Navy (1798), authorizing the construction of three new warships, and augmenting the army with a provisional force of ten thousand troops. The administration also secured passage of the Alien and Sedition Acts (1798) to stifle domestic dissent and remove suspected foreign agitators. The Fifth Congress in 1797 and 1798 appropriated more than \$10 million for defense, \$4 million more than the normal expenditure would have been for the entire nonmilitary federal budget. As a result, Congress also used the XYZ affair and fear of French invasion to levy the first federal direct tax (1798), a rate collected from the value of lands, dwelling houses, and slaves. Many in Congress demanded a declaration of war against France, but Democratic Republicans and moderate Federalists following the lead of President Adams refused to go that far. In 1799 the president sent another delegation, the Ellsworth Commission, to France to seek a peaceful solution. By the autumn of 1800, the French had received the American commission and reached a peaceful settlement at the Convention at Mortefontaine, just before President Adams's loss to Democratic Republican Thomas Jefferson in the presidential election.

Partisan intrigue, the Anglo-French War, and popular hysteria over the XYZ affair cost the American people their civil liberties and millions in tax dollars in 1798. But cooler diplomatic heads among moderate Federalists forestalled a potentially disastrous war and bought the young nation another decade of growth and stability until a similar crisis led to a Democratic Republican declaration of war against Britain in 1812.

YORKTOWN, BATTLE OF In 1778 the British shifted their military emphasis to the American South. Lieutenant General Charles Lord Cornwallis had waged an aggressive campaign there. Defeating Continental Army forces in the Battle of Guilford Courthouse in North Carolina in March 1781, he then moved north into Virginia. Continental Army commander General George Washington was preoccupied with New York and had positioned at White Plains his main force of four infantry regiments, a battalion of artillery, and the four-thousand-man French Legion commanded by Lieutenant General Jean-Baptiste-Donatien de Vimeur, Comte de Rochambeau.

In May 1781 French admiral the count de Barras arrived with a small squadron at Newport, Rhode Island, with news that Admiral the count de Grasse was on his way from France with a powerful fleet. At sea the British and French were each chiefly interested in the West Indies, with each seeking to deprive the other of the valuable sugar trade. Barras told Washington, however, that the French fleet would come north during the hurricane season.

Meanwhile, raids by turncoat British brigadier general Benedict Arnold in the Chesapeake Bay and along the James River west to Richmond led Wash-

hard-liner Lord North and ushered in a new British policy of cutting losses immediately and seeking peace.

Synoptic Outline

This outline provides an overview of the conceptual scheme of the encyclopedia. It is divided into twenty-two parts:

Cultural Contexts; Biographies; The Revolution and the Revolutionary War; Constitutionalism and the U.S. Constitution; Law, Legislation, and the Courts; Government and Politics; Social Problems, Social Control, and Reform; Foreign Relations; War and the Military; Economic Life; Slavery and the Slave Trade; Cities and Urbanization; Places and Regions; Education; Religion and Religious Groups; Science, Technology, and Medicine; Arts and Letters; Daily Life; Gender and Sexuality; Peoples and Population; African Americans; American Indians.

Reflecting the interconnectedness of American Studies, many entries are listed under multiple subject headings.

CULTURAL CONTEXTS

Ideas, concepts, symbols, and miscellany that help to define the emergence of American nationhood.
