MILITIAS AND MILITIA SERVICE The United States of America emerged from the War of Independence in 1783 with two decidedly conflicting images of the militia and the role it should play in the new nation. One side saw the militia as the bulwark of American liberty and freedom, a force of citizen soldiers investing their very lives in their new Republic. The other saw the war as having been won through the skill of the regulars and despite a bumbling and incompetent militia. Too much reliance on the militia could result in disaster.

Those that saw the militia in a positive way strongly believed that a standing army was an unmitigated threat to freedom and liberty. True, America lived in a hostile world still dominated by autocratic monarchs. And there was no guarantee that

the Atlantic Ocean could contain the troubles of Europe or that the English to the north and the Spanish to the south would respect American independence. But supporters of the militia argued that a standing army could not possibly traverse the vast expanses of territory to adequately defend the new nation from foreign enemies. Instead, they chose to rely on the citizens themselves to protect and defend their country.

To veteran commanders of war, George Washington foremost among them, the militia performed poorly on the battlefield and could not be given the sole responsibility of defending the nation. In April 1783 the Continental Congress appointed a committee that asked Washington for a formal report on the future of the American military. Washington recommended the establishment of a regular army that would pull troops from state-organized militia forces. Under Washington's plan, the militia forces would receive from twelve to twenty-five days of training annually. In essence, his proposal called for a permanent standing army in the mold of the Continental forces during the war. Congress, however, failed to enact his plan. In 1784 an army was created to go into the Northwest Territory; its seven hundred troops had been culled from the militias of New York, Pennsylvania, New Jersey, and Connecticut.

A tax revolt known as Shays's Rebellion in western Massachusetts in 1786-1787 proved to many that the militia was unreliable. Massachusetts called up local militia and sent it to restore order and protect the courts, but the militiamen defected to the rebels. When Shays and his men marched on the Springfield armory to gain more weapons for their growing forces, a private army consisting of militiamen and others raised mainly in unsympathetic eastern Massachusetts and financed by merchants dispersed the rebels in a short battle, ending the revolt. The incident in Massachusetts played a leading role in motivating Americans to adopt a stronger national government. The Constitution looked to federal-state cooperation in the militia through its grant of authority in Article I, Section 8 to Congress to call out the militias in cases of invasion or domestic insurrection and to restore law and order when needed, and later, with the Second Amendment and its guarantee of the right to bear arms as a way of promoting militia efficiency.

After the ratification of the Constitution, the militia continued to play an important role in the defense plans of the United States. In 1790 and 1791 President George Washington dispatched militia forces into the Northwest Territory to battle Native

Americans. Twice the force was defeated with embarrassing results. Washington learned his lesson and in 1794 dispatched a force made up of regular troops led by General Anthony Wayne, who defeated the Native Americans at the Battle of Fallen Timbers in 1794.

UNIFORM MILITIA ACT OF 1792

In 1792 Congress passed the Uniform Militia Act of 1792, a compromise measure that left President Washington dissatisfied. He advocated a plan put forth by Secretary of War Henry Knox in 1790. The Knox plan divided the national militia into three grades based on age and physical condition. The youngest group of approximately thirty-two thousand men would provide an immediate reserve force for the standing army after going through a basic training program to last two weeks. Knox wanted to tie the right to vote to successful completion of the training program. The older groups would be called up in case of grave national emergency. Knox's plan and its \$400,000 annual price tag was too controversial for Congress. Instead, the Uniform Militia Act assigned responsibility for organizing and maintaining the militias to the states with almost no standards, minimum training requirements, or federal oversight. White men aged between eighteen and forty-five were required to serve and supply their own weapons and equipment. (The law prohibited free blacks from serving in the militia.) States were asked to turn in a report to the adjutant general on the status of their militia, but most ignored this provision. The Uniform Militia Act did nothing to create an adequate defense force and set the stage for subsequent failings. On the whole, Washington and the Federalist Party lost any faith in the militia and sought to build up the regular army.

The state-organized militias varied in many aspects. Some states had muster dates written into their laws, while others left it to local captains to call their men. Some had fines for failing to show up to the mandatory musters, others did not. Some provided for elected officers all the way up to commander of the state militia, but others gave the governor wide latitude in appointing officers. Most states allowed the men themselves to vote on their immediate officers. Some provided weapons, others required the militiamen themselves to supply their own firearms and accoutrements. In general, units varied in size and were not interchangeable with those from other states.

President Washington did secure from Congress a law that gave the president the power to call out

the militia. The new executive power was first used to summon up the militias of New Jersey, Pennsylvania, Virginia, Maryland, and New York to suppress the Whiskey Rebellion in 1794. Over 12,900 men responded to the call. However, there was widespread resistance, including riots in Philadelphia that led to the unpopular drafting of men. As in Shays's Rebellion, local militia forces supported the rebels, attacking and capturing a small contingent of regular army troops. Although Washington had a low opinion of the militia, he preferred the citizen soldiers to restore order because it was politically less controversial than using the regular army, especially with the support of the governors. As Washington had hoped, the overwhelming display of force ended the rebellion.

In 1798 President John Adams had less success with the militia in suppressing a domestic insurrection known as Fries's Rebellion. Following the creation of new federal taxes on property to finance the Quasi-War with France, rebellion spread through Bucks County, Pennsylvania. Once again the militia sided with the rebels and attacked the federal tax assessors. Adams was forced to use regular troops to restore order. To make matters worse, Virginia made some moves towards preparing its own militia to fight against the federal government, because the state opposed the unpopular Alien and Sedition Acts (1798). This was not the first time a state looked to its militia to defend itself against the federal government. In 1794 the Georgia militia and the regular army had almost come to blows over Indian policy.

If the Federalists of the 1790s distrusted the militia and praised the value of the standing army, Thomas Jefferson strongly held the opposite beliefs. When he became president in 1801, Jefferson greatly curtailed the size of the army and navy and placed more reliance on the militia to defend the nation. Small gunboats consisting of a single cannon and coastal fortifications manned by militia replaced reliance on large naval frigates. During the Embargo of 1807–1809, Jefferson assigned the unenviable task of enforcement to the militia. As with other militia operations, general disorganization and confusion prevailed. Several states refused Jefferson's request to allow the federal government use of their militias to enforce the law. Despite a renewed interest in the militia, little was done to improve efficiency. The one exception occurred in 1808, when Congress voted to provide \$200,000 a year to supply militiamen with weapons.

MILITIA SERVICE

A carnival-like atmosphere, more than a martial one, dominated militia musters. In general, musters occurred only four times a year to train on the local commons or the courthouse grounds. After gathering in some sort of formation, the captain inspected the men, who were dressed in their regular clothes. Some did not have weapons. When they were armed, there was no uniformity in their firearms, which ranged from rifles to muskets to shotguns, all in varied calibers and conditions. Sometimes target practice and drilling followed inspection. On other occasions, the men voted to adjourn early. In any event, training never lasted more than a couple of hours, after which the men visited the many tables hosted by salesmen who peddled all varieties of products, including alcohol. Drunkenness became a significant problem and something of a running national joke prominent in the literature of the day. Women baked pies and cooked food. There were games of chance, races, and other sporting events. Politicians flocked to the militia musters to build support for their upcoming electoral bids. A militia officer's commission was a valuable asset in politics. Their popularity as militia commanders catapulted Andrew Jackson and William Henry Harrison all the way to the presidency.

Not all states had a mechanism to enforce attendance at muster. Also, in states that had a fine, those who could afford to pay it did so and tended to stay home or provide a substitute to take their place. Quakers and other conscientious objectors avoided service in this manner. The Uniform Militia Act provided for some exempt occupations and states added to the list. Generally, these included lawmakers, teachers, tradesmen, and ministers, among others.

WAR OF 1812

The true test of the militia as a defensive force came during the War of 1812. Much like contemporaries of that conflict, historians are not in agreement in their assessments of the erratic performance of militia. To some, the militia was a complete failure as a defensive force. To others, these failures were caused largely at the political level. When the war began there were technically 100,000 militiamen available for service, but disorganization at the state level and poor morale and training made them of dubious value. On the eve of war, Congress strengthened the courts-martial system to better discipline the militia and required militia forces to serve six months from the time they met at their gathering points.

The militia performed best when led by a commander who could motivate them and did not expect

much from them. General Alexander Smyth had no faith in his militiamen and his public statements to that effect got him run out of western New York. The most successful was General Jacob Brown, who used the militia skillfully to defeat the British at the Battle of Sackett's Harbor in May 1813. The militia also served well at the Battles of Baltimore (1814), Horseshoe Bend (1814), and New Orleans (1815).

In many other battles, however, the militia performed poorly and at times disgracefully. The Battles of Detroit (1812), Queenston (1812), and Bladensburg (1814) were the lowest points. Poor battlefield performance was only one part of the general failings of the militia system during the war. Only Massachusetts had a peacetime quartermaster general for the militia. Other states had problems supplying their men. Kentucky marched 2,300 militiamen all the way to New Orleans with less than one-third armed, for example. Moreover, the militia was often poorly led by officers who were either political appointees or were elected by their men without regard to their ability to lead. Even before the battles, the militiamen were notorious for not answering their mobilization. When New York State called out its militia in 1813 to defend Plattsburgh, only 300 showed. With the nation's capital under attack in 1814, only a few thousand militiamen out of the 93,500 called to service were present, and they fled the battlefield as soon as they arrived. Failure to get enough volunteers to fight against the Creek Indians in the Old Southwest required a draft of militiamen. Such a measure, however, did not solve the problem, and entire companies refused to show up at their gathering points.

Cooperation was also hampered by partisan opposition to the war. Federalist governors did not support what was often called "Mr. Madison's War." In New England there was a tendency to retain militia units for use in their own states. Connecticut, for example, used its militia to man coastal fortifications. Rhode Island federalized one company, but would not allow it out of the state. Although Massachusetts provided more volunteers for the regular army than any other state except New York, the militia forces were kept in the commonwealth. This was a severe blow to the war effort, since Massachusetts had the best-trained militia in the United States. New York militia units were willing to fight alongside the federal forces to defend their state but refused to cross over to Canada even in the middle of battle.

In general, the militiamen presented a disciplinary problem as well. Commanders feared that the rowdiness and ill will of the militia would contami-

nate their regulars. Militia felt the federal government took advantage of them. Army volunteers received 160 acres for their service (later raised to 320 acres), yet militiamen were generally paid only a few dollars a month, and in many cases they did not get paid for several months at a time. Some states provided bounties and bonuses, others did not. When their service was up, militia simply left, marching out as a unit. Even a strong-willed leader such as Andrew Jackson eventually had to yield and allow his militia to march back home in the middle of a campaign. These depletions made it difficult for Jackson or any other commander to keep an offensive force in the field.

REGULAR VERSUS VOLUNTEER MILITIA

After the war, the Army Reduction Act of 1815 limited the size of the army and shifted the primary responsibility of defending the nation from the militia to the regular army. Between 1816 and 1835 the various presidents asked Congress no less than thirty-one times to reform the militia, but no substantive action was taken. In 1820 Secretary of War John Calhoun recommended the creation of an expandable army and the phasing out of the militia, but this plan was not acted upon. In 1826 Calhoun's successor James Barbour created a board chaired by General Winfield Scott to examine the state of the militia. The board recommended that the federal government enforce a standard table of organization for the militia, appoint an adjutant general at the War Department specifically for the militia, distribute drill manuals, and operate a ten-day mandatory training camp at federal expense. Despite the soundness of these proposed reforms, they were never acted upon. In fact, the militia became increasingly ineffective. The militia also became a target for social reformers who saw it as a burden on the workingman that was avoided by the wealthy.

Neglect caused the regular militia to fall out of use. By 1850 nine states had ended mandatory militia service and four more had lifted any penalties for failing to be present for muster. Volunteer, privately organized militia companies picked up the slack. Although the oldest volunteer militia was formed in Boston in 1638, most were formed after the War of 1812 ended. Made up predominately of the middle class and the well-to-do, the volunteers spared no expense, presenting a marked contrast to the regular militia. They drilled in elaborately decorated and colorful uniforms. Their equipment was often the best and most extravagant that money could buy. They took their drilling seriously and met on a much more

frequent basis than the regular militia did. Often there was competition between the many volunteer companies in a city. In New Orleans, which had ten volunteer companies in 1843, the most common form of competition was a marksmanship contest. States could and did integrate the volunteers into the regular militia and occasionally paid them as well. It was the municipal level, however, that came to rely most heavily on the volunteers, as they were called upon to perform a wide range of duties from guarding prisoners, providing honorary color guards at important events, marching in parades, manning fire brigades, and suppressing riots.

THE SOUTH

The situation in the South was a little different because the regular militia was called on to act in slave patrols. Much like every other aspect of militia service, the assignment of this duty varied from state to state. Some states and localities placed this responsibility in the hands of the volunteer militia and others in the hands of the police, but in most, the regular militia took on this burden. Each militia company provided two volunteers, who served two nights a week for three to four months during which they patrolled in groups of four. In some areas, slaveholders compensated the patrollers. The duties of the slave patrols included searching slave quarters for contraband, breaking up meetings of slaves, hunting down fugitives, and checking traveling slaves for passes. In urban areas, militias acted as sentries for courthouses and other important public buildings. The patrols had authority to carry out summary punishment and whipped slaves who violated the law. The greatest fear in the South remained slave insurrections. Both volunteer and regular militia forces were called out during threats of slave revolts. Militia troops played an important role in suppressing both the Denmark Vesey (1822) and Nat Turner (1831) revolts.

MILLENNIALISM Millennialism is the belief, based on an interpretation of Revelation 20, that there will be a distinctive one-thousand-year period (the millennium) before the Last Judgment. This belief was especially popular in America from the 1750s to the 1840s.

Because the Book of Revelation is written in highly figurative language, believers differ over the details of the millennium. One fundamental point of difference is whether it will be ushered in by a fiery apocalypse, with only a faithful remnant saved to reign with Christ for one thousand years (premillennialism), or if it will be a peaceful interlude that precedes the Second Coming of Christ (postmillennialism).

The significance of this distinction is that post-millennialists are generally more optimistic about human progress: human agency through the reform of societal ills can help bring about the millennium. Premillennialists are generally more pessimistic about the ability of human agency to effect the millennium and therefore are more likely to focus on cultivating their own spirituality. Protestants were drawn to both kinds of millennialism in unprecedented numbers during the era of the new nation. According to Nathan O. Hatch in *The Democratization of American Christianity* (1989), “the first generation

of United States citizens may have lived in the shadow of Christ’s Second Coming more intensely than any generation since” (p. 184).

Although interest in the millennium in America goes back to the first generation of Puritans, throughout the colonial period most of that interest was confined to ministers. Ordinary laymen and -women wrote next to nothing in their spiritual journals concerning the millennium. The Seven Years’ War from 1756 to 1763 ushered in a period of increasingly widespread interest in the millennium. That war pitted Protestant Great Britain against Catholic France and included a great many battles in the American colonies, where it became known as the French and Indian War. Some ministers in the colonies, in keeping with a 250-year Protestant tradition, argued that the Antichrist mentioned in the Book of Revelation was in fact the Roman Catholic Church. Thus, the Seven Years’ War was a war against the Antichrist and the defeat of France might help usher in the millennium. Because thousands of American colonists fought in this war, the ministerial rhetoric seems to have touched a nerve among the populace.

After the American Revolution (1775–1783) and the ratification of the U.S. Constitution (1787), millennial interest increased. What was once the preserve of learned ministers became a concern for many laymen and -women. In the new Republic, most Protestants were optimistic postmillennialists, believing that if they worked to rid the nation of sin they might help initiate the millennium. This partly accounts for the connection between religion and reform in this period. Many churchgoers participated in reform movements such as abolition and temperance; a large number of them did so with one eye toward the future, hoping their efforts might help begin Christ’s reign on earth. But most mainstream Protestants, though hopeful that the millennium would someday arrive, believed that that day was nonetheless far off. Many in the new Republic still followed the computations of Jonathan Edwards (1703–1758), who had calculated that the millennium would begin around the year 2000.

But there were smaller, more radical groups of premillennialists, many of whom believed the Second Coming of Christ was imminent. Not only was the Second Coming near at hand, but when it came only true believers would survive the fiery apocalypse. The Shakers and Free Will Baptists of northern New England, for example, believed that the millennium was imminent. Indeed, before the death of their founder Ann Lee in 1784, the Shakers had believed that Lee was the messiah, returned to earth to initiate

the millennium. Throughout the early national period, this strain of millennialism persisted, reaching its peak in the Millerite movement of the early 1840s. Followers of William Miller, a Baptist preacher from New York, believed that an apocalyptic Second Coming of Christ was going to occur in 1843 or 1844. The radical possibilities of millennial belief can be glimpsed in the Millerites' openness to female preaching: since they felt that the end times were so near, it seemed imperative for all believers to spread the word, whether they were male or female.

Ultimately, of course, the Millerites were disappointed. Christ did not return in 1844. Indeed, at the time people referred to their situation as the Great Disappointment. But even among mainstream Protestants, active speculation regarding the millennium declined after the 1840s. In two thousand years of Christian belief, interest in the millennium has waxed and waned. Rarely has that interest captured the imagination of a people as it did during the era of the new nation.

MINT, UNITED STATES During the colonial and Revolutionary periods, foreign coins of many denominations circulated in America. In 1782 superintendent of finance, Robert Morris, initiated the first concrete efforts to found a U.S. mint. On 15 January 1782, he sent Congress a plan drafted by his assistant, Gouverneur Morris, for the establishment of an American coinage and a mint to produce it. After Congress approved the proposal in principle, Morris hired metallurgist Benjamin Dudley to create the needed machinery and produce sample coins, which he submitted to Congress in April 1783, along with a request that Congress take action on his coinage proposals. Morris's proposed coinage was the world's first official decimal-based coinage plan, although Thomas Jefferson had earlier suggested the

idea. Morris's plan was based on multiples of a small abstract monetary unit called the mill, equivalent to 25 percent of a grain of silver or .069 percent of a dollar. The unit was designed to facilitate mathematical conversions without leftover fractions between the new monetary system and the old state currencies. When Congress failed to act on the plan, lack of funding forced Morris to suspend his mint operations.

In 1785 Congress approved a decimal-based system but rejected the small monetary unit in favor of the dollar as recommended by Thomas Jefferson, chairman of the committee to which Morris's coinage plan was referred. Congress also authorized the creation of a mint, but except for a private production of copper coins under contract with the Board of Treasury, no action was taken until after the new federal government was established in 1789. On 15 April 1790, the new U.S. Congress directed secretary of the treasury, Alexander Hamilton, to submit a new plan for a mint. In April 1792 Congress, overcoming objections to the expense of a mint and its potential for partisan patronage, approved a bill based on Hamilton's 28 January 1791 report. The bill reaffirmed the dollar as the monetary unit, authorized the creation of a mint in Philadelphia, and required that the design of the new coins bear an image of liberty. Debates in Congress during 1791–1792, when Robert Morris chaired the Senate committee responsible for mint legislation and helped produce sample coins bearing the bust of Washington, led the House of Representatives to reject as too "monarchical" the idea of placing a portrait of any incumbent president on U.S. coins. Pattern silver half dimes were produced in October 1792, reportedly using silver obtained from Washington's household.

The Pennsylvania scientist David Rittenhouse, who had advised Dudley on the design of mint machinery in 1782, became the first director of the U.S. Mint in 1792 and served to 1795. The Mint was initially under the jurisdiction of Thomas Jefferson's State Department. Housed on Seventh Street near Arch in the first building erected for the federal government, the Mint opened in 1793 and delivered its first circulating coins, copper cents and half cents, in that year. Silver coins were first produced in 1794 and gold coins in 1795, using bullion privately deposited at the Mint. With silver overvalued in the coins, most large coins were exported. In 1806 President Jefferson banned production of any coins larger than a half dollar, and no silver dollars were produced for thirty years. The Mint's primary early contribution was therefore relieving the problem of

a shortage of money in low denominations for use in the small transactions in which most Americans were involved. Despite its efforts, a continuing coin shortage meant bank notes, scrip, and lightweight foreign coins continued to circulate to meet the need for small change.

In 1794 a congressional investigative committee led by Elias Boudinot challenged the high cost and low production of copper coins at the Mint, noting that such coins had been produced at far lower cost in New Jersey, Boudinot's home state. Next, Jeffersonian polemicist James Callender attacked the mint as a symbol of Federalist excesses and patronage and claimed that a thousand tons of cents could be struck at Birmingham, England, for the same cost. On his last day in office in January 1795, Hamilton also commented on the Mint's inadequacies, blaming poor management and recommending its transfer to the Treasury Department. When Boudinot's committee reported in February 1795, it recommended various procedural adjustments in the weight of coins, in receiving deposits, and in vending coins. Although the report exonerated the ailing David Rittenhouse from blame, he soon resigned as director. His successor, Henry William De Saussure, quickly resigned. Even after Boudinot took over as director, opposition to the Mint continued, with further complaints of Federalist patronage abuse and proposals for less expensive contract coinage. In 1800 a Senate committee recommended abolishing the Mint; the Senate proposed contracting with the Bank of the United States for coins, but Secretary of the Treasury Albert Gallatin, who took office in 1801, opposed placing coinage in the hands of a private corporation. A copper shortage and decline in bullion deposits resulted in periods of idleness at the Mint, leading to another round of debates in 1802, during which the Mint was again depicted as a "Federalist creation," monarchical, unproductive, expensive, and an embodiment of centralized power. Nevertheless, plans for contracts with the Bank of the United States or with Matthew Boulton's firm in Birmingham failed, and the Mint continued in operation.

Henry Voight was named first chief coiner, Albion Cox was recruited in England to serve as chief assayer, and Robert Scot was hired as engraver. John Jacob Eckfeldt, case-hardener of dies for Morris's sample coins of 1783, established a family dynasty at the Mint. His son, Adam Eckfeldt, began constructing tools and machinery for the mint in the 1790s and rose to chief coiner in 1814; other family members worked there continuously until 1929. Benjamin Rush served as treasurer of the mint from

1797 to 1813, and was succeeded by his son James, who served until 1830. Another long-term employee was assayer Joseph Richardson of Philadelphia, who succeeded Cox in 1795, served for thirty-six years, and was succeeded briefly by his son John, who had been in the department for over ten years. On the other hand, in the 1790s Philadelphia's yellow fever epidemics periodically shut down the mint and quickly claimed the lives of several of its employees, including engraver Joseph Wright, assayer Joseph Whitehead, and mint treasurer Nicholas Way.

In 1799 the mint was made an independent agency in Philadelphia, reporting directly to the president; not until 1873 was the headquarters moved to Washington and placed under the Treasury Department. Until 1816, when steam-operated machinery was introduced, horses or oxen powered the metal sheet-rolling machinery. Planchets were hand fed into the screw coining presses to produce the coins, a hazardous process, but in 1793 Adam Eckfeldt invented a device for automatically feeding and ejecting them. In 1838, branches of the U.S. Mint were opened in Louisiana, Georgia, and North Carolina, and as gold and silver were discovered in the West, various branches and assay offices were established there.

MISSIONARY AND BIBLE TRACT SOCIETIES

Voluntary societies were central to American missionary endeavors during the colonial and early national eras. Most of these organizations were affiliated with a denomination and led by prominent church officials, but they relied on the labor and contributions of both ministers and laity. In spite of occasional competition, they often welcomed interdenominational cooperation in the service of the propagation of Christianity. Usually, they raised money by distributing published texts, such as letters from missionaries, in metropolitan areas of North America and Britain.

The first society devoted to missions in British America was the Society for the Propagation of the Gospel in New England, established by the Long Parliament in 1649. In 1662 King Charles II granted a new charter to the organization, renamed the Company for the Propagation of the Gospel in New England and the Parts Adjacent in America. Known as the New England Company, it supported the work of Puritans among Algonquian tribes of New England. After the American Revolution this group shifted its focus to Canada.

In 1698 Thomas Bray founded the Church of England's Society for the Promotion of Christian Knowledge (SPCK), which distributed religious books throughout Britain and its colonies while building charity schools in the British Isles. In 1701 he founded the Society for the Propagation of the Gospel in Foreign Parts (SPG). Although focused on providing ministers to colonists and their slaves, the SPG also launched several missions to Indians, which had the most success with the Mohawks. At the outbreak of the Revolution, it turned its attention to Canada. The Associates of Dr. Bray, founded in 1717, assisted with the Church of England's efforts to convert slaves.

In 1709 the Society in Scotland for the Propagation of Christian Knowledge in the Highlands and Islands and the Foreign Parts of the World (SSPCK) was chartered. It employed missionaries such as David Brainerd, who preached to Indians in New England, New York, and New Jersey. It also helped organize the visit of Samson Occom, a Mohegan Indian and Presbyterian minister, to Britain from 1766 to 1768. The SSPCK continued to fund missions to the Iroquois and other tribes after the Revolution.

The United Brethren, or Moravians, began American missionary work in 1735. They were very successful in converting Indians, especially of the Delaware tribe. The Society for the Furtherance of the Gospel, which existed from 1741 to 1764, raised money for Moravian missions. When it was established in 1795, the Friends' Indian Committee of the Philadelphia Yearly Meeting also organized some missions, building on the earlier work of individual members of the Society of Friends, or Quakers.

While the first Great Awakening of the 1740s invigorated missionary efforts in already-existing institutions, the Second Great Awakening inspired the creation of new societies in the late eighteenth and early nineteenth centuries. Statewide organizations appeared first, such as the New York Missionary Society in 1796 and the Connecticut Missionary Society in 1798. The first women's missionary organiza-

tion, the Boston Female Society for Missionary Purposes, was established in 1800. Many "Female Cent Associations," in which members contributed one cent a week for missionary endeavors, also were founded in this era. These local groups were focused mostly on missions to both whites and Indians in frontier regions such as western New York, southern Ohio, and Kentucky. In 1826 most of them were absorbed into the American Home Missionary Society, which was officially nondenominational but predominantly Congregationalist. Because their reliance on itinerant preachers had already met with much success in frontier areas, the Methodists developed missionary organizations later than other Protestant denominations, founding the Missionary Society of the Methodist Episcopal Church in 1820.

Many local Bible societies, which distributed free or inexpensive Bibles, also were founded in this era, beginning with the Philadelphia Bible Society in 1808 and the Connecticut Bible Society in 1809. They were combined into the American Bible Society in 1816. Likewise, regional tract societies, such as the New England Tract Society, founded in 1814, were absorbed into the American Tract Society in 1825. Other groups connected with missionary projects, moral reformation, and what is sometimes called the Benevolence Empire were founded in this era, including the American Education Society in 1815 and the American Sunday School Union in 1817.

The emergence of national voluntary societies devoted to foreign missions often is connected with the leadership of Samuel J. Mills Jr., Gordon Hall, and other members of the so-called Haystack Band, who—when they were students at Williams College in 1806—committed themselves to missionary work while conducting a prayer meeting under a haystack in a rainstorm. Their initiative led to the founding in 1810 of the American Board of Commissioners for Foreign Missions (ABCFM), a multidenominational Protestant organization that sent its first missionaries to Calcutta in 1812. It then sent missionaries to Hawaii and to Syria in 1819. After two ABCFM missionaries became Baptists while en route to India, the General Missionary Convention of the Baptist Denomination in the United States of America for Foreign Missions (also known as the Baptist Board of Foreign Missions or the Triennial Convention) was founded in 1814. Missionary goals also provided some of the impetus for the American Colonization Society (ACS), which was founded in 1816 to resettle free African Americans in Africa. In 1818 the ACS commissioned Samuel J. Mills and Ebenezer Burgess to visit England and Sierra Leone in an effort to pur-

chase land for a colony. In 1822 the ACS obtained land in Liberia and sent its first settlers there, along with its hopes that African American colonists would help spread the gospel throughout the African continent. Through organizations such as the ACS and the ABCFM, the United States became a source as well as an object of missionary outreach.

MISSISSIPPI The United States acquired most of the land that became the state of Mississippi (with the notable exception of the Gulf Coast) in 1795 through the Treaty of San Lorenzo. The primary purpose of this agreement was to normalize trading relations between the United States and Spain, but the result was the first major acquisition of new territory since the Revolution and, eventually, the creation of a distinct subregion within the slaveholding South.

In 1798 Congress created a governance plan for the new Mississippi Territory that drew heavily on the Northwest Ordinance of 1787, with the notable exception of permitting slavery. In the years that followed, cotton began to emerge as the major agricultural product. The largest European settlement was Natchez, located on the eastern banks of the Mississippi River approximately 150 miles north of New Orleans. Originally fostered by the Spanish, Natchez was a rough trading outpost that served as the home to the local Creole elite, an aspiring polyglot population of French, Spanish, and British ancestry that had established its wealth primarily through commerce down the Mississippi River or through the Indian

trade. Outside the emerging plantation region along the Mississippi, Indians—most notably the Chickasaw, Choctaw, and the Creek—successfully resisted most European and Anglo-American efforts to extend either settlement or political influence.

Undermining Indian power, promoting white settlement, and eliminating Spanish threats to American security became interconnected goals of federal policy in the Mississippi Territory. The collapse of the Spanish Empire and the War of 1812 (1812–1815) created the pretext by which the United States seized portions of the Gulf Coast. These successes against the Spanish helped the U.S. Army conquer the Mississippi Indians, eventually forcing them to accept peace on American terms, which included major land cessions.

The number of Anglo-American settlers and African Americans grew in direct proportion to the death or eviction of Indians and the ejection of Spanish authority. In 1800 the Mississippi Territory had approximately 8,850 non-Indian residents. By 1810 the total had increased to just over 40,352. Almost 40 percent of the population was enslaved. Meanwhile, the white population was emerging in two distinct cultural regions. Western Mississippi, especially the Mississippi Delta, continued to be a center of wealth emanating from plantation agriculture. Much of the region eventually became home to a slave majority. In sharp contrast, many of the settlers in eastern Mississippi were of more modest means, establishing farms with few or no slaves. Different economies and folkways increasingly distinguished the eastern and western portions of the territory. When Congress permitted the first steps toward statehood, it divided the territory along these lines. The western portion entered the Union in 1817 as the state of Mississippi. The eastern portion entered two years later as the state of Alabama. The population in both states continued to surge. By 1820, Mississippi had over seventy-five thousand non-Indian residents.

Despite their differences, the white populations of Mississippi and Alabama remained united in their defense of slavery. Into the antebellum era, the two states carved from the Mississippi Territory developed some of the most repressive racial regimes. Accordingly, they fostered a political culture that responded with increasingly shrill defensiveness to any criticism of slavery or efforts to limit its expansion.

MISSISSIPPI RIVER The Mississippi River and its basin are vital components of America's natural environment. In addition, they have had a vital shaping influence upon the history of North American Indians, exploration, military campaigns, pioneering and settlement, politics, folk and high culture, civil rights, and economic development.

The Mississippi River drains the North American continent from its headwaters in Lake Itasca, Minnesota, to the Gulf of Mexico. Home to diverse and distinctive species of flora and fauna, it was first civilized between 500 AD and 1500 AD by agrarian, mound-building Mississippian Indians. Beginning in 1541, European explorers, traders, and adventurers traversed the Mississippi Valley in the service of Spain; France; Britain; and later, the United States. Before losing the Upper Mississippi Valley and Canada to Britain in 1763, France briefly delivered its claims to the Louisiana Territory to Spain. France regained Louisiana in 1802, only to sell it to the Americans in 1803. The Louisiana Purchase ended an eighteen-year dispute, at last opening the rich port city of New Orleans to American rivermen and seaman.

From the Revolution onward, the Mississippi River witnessed a microcosm of American history. Revolutionary militia general George Rogers Clark fought at Kaskaskia, in Illinois country, in 1778; Lewis and Clark wintered on the Mississippi in 1803–1804 on their way to explore Thomas Jefferson's Louisiana Purchase; Andrew Jackson defeated the British at New Orleans in 1815; the Missouri Compromise debate of 1819–1821 over the status of slavery west of the river polarized America into proslavery and antislavery forces; Chief Black Hawk's 1832 defeat in Illinois, followed by the forced march of the Cherokees across the frozen Lower Mississippi, marked the extirpation of America's woodland Indians; Mormon prophet Joseph Smith was murdered at Nauvoo, Illinois, in 1844; Ulysses S. Grant turned the tide of the Civil War at Vicksburg, Mississippi, in 1863; and American life was forever marked by the

eras of Mississippi Valley slavery, the Jim Crow laws there, and the civil rights revolution of the 1950s and 1960s.

The economic history of the Mississippi River is one of technological innovation, beginning with Indian canoes and frontier keelboats and flatboats, moving into the steamboat age, and culminating in the twentieth-century development of diesel-powered towboat and barge commerce along the mighty river's banks. The first Mississippi rivermen were Indians, paddling their sleek, wooden canoes and crude "bullboats" up and down its waters. Immediately following the American Revolution, keelboatmen steered sleek, prowed, sixty-foot-long craft swiftly downstream and then worked very hard to inch cargoes of coffee, sugar, and other trade goods upstream. The introduction in 1811 of steamboats on the western rivers, however, quickly ran the keelboats out of business.

Interestingly, the crude, inexpensive nonsteam flatboat (introduced in the late 1700s) endured well past the advent of steam power and the Civil War. Flatboats were flat-bottomed, box-shaped craft averaging fifty feet in length and twelve feet in width. Flatboats carried pork, corn, furs, hardy fruits and vegetables, and whiskey downstream only. Having sold their loads and boats (as scrap lumber), flatboatmen walked home along the dangerous Natchez Trace route or, after 1811, purchased deck passage aboard northbound steamers.

The keelboat and flatboat workers did not always conform to the rough, tough "alligator horse" image portrayed in folktales and published stories about Mississippi River heroes like Davy Crockett (1786–1836) and Big Mike Fink (1770?–1823), the "king of the river." Many early boatmen were coarse and violent frontiersmen, but as time progressed a boating workforce emerged, characterized by more civilized family men and young farm boys. The average nonsteam riverman was a white Ohio and Mississippi Valley male of English or Celtic ancestry, averaging twenty-eight years of age. Antebellum and postbellum lumber raft crews—navigating large log assemblages down the Ohio and Mississippi Rivers—fit most of this description except that this group included more Scandinavian American raftsmen.

The workaday Mississippi steamboat was a small (approximately three-hundred-ton) craft exhibiting little gilt or fancy trappings. As with flatboat and keelboat commerce, peak steamboat shipping time was during high water; the high waters of late fall and early spring greatly reduced the chances of running aground. At those times, the Mississippi

was dotted with steamers, crewed by both white and African American boatmen and carrying pork, whiskey, lead, tobacco, cotton, and ticketed passengers. By the 1850s, however, the railroads had proved the steamboat's economic undoing. The steamers were ultimately succeeded in 1903 by screw-propellered, steam- and, later, diesel-powered "towboats" pushing fleets of lashed river barges up and downstream.

In the realm of American culture and arts, the Mississippi River valley has proved seminal to the work of authors ranging from Mark Twain (1835–1910) to William Faulkner (1897–1962). Its environment, wildlife, and working folk have been painted by George Caleb Bingham (1811–1879), John James Audubon (1785–1851), and Karl Bodmer (1809–1893). And every indigenous form of American music—gospel, blues, country, jazz, and rock and roll—was born along the banks of, and aboard, the boats plying this great river.

Twain, once a steamboat pilot, referred to the Mississippi River valley as "the heart of America." In all aspects of American culture, the Mississippi River and its people reflect the core of the American experience.

system made it both a popular place for settlement and a contested region. In the mid-eighteenth century approximately fifteen hundred French Creoles and African slaves occupying a handful of riverine villages on both sides of the Mississippi coexisted in relative peace with their Indian neighbors, even as rival European powers vied to control their destinies. France's defeat in the French and Indian War (1754–1763) momentarily dashed that nation's imperial ambitions in North America and forced it to relinquish its territories there. The Treaty of Paris (1763) confirmed the placement of Canada and the lands east of the Mississippi under British control and the cession of Louisiana to Spain. The change of regimes did little to alter the fundamental character of Upper Louisiana (present-day Missouri). To the contrary, an influx of Francophone newcomers fleeing British rule reinforced French ways of life in Ste. Genevieve (c.1750) and St. Louis (1764).

Under Spanish rule French remained the common tongue. The Creole villagers were Catholic, communal, deferential, cosmopolitan, reliant on trade and commerce, and generally respectful of Indian customs and sovereignty. More than one-third were slaves. Agriculture, fur trading, lead mining, and salt making produced the commodities of exchange that fueled Upper Louisiana's colonial economy.

The province's sizable Indian populace constituted another vital element. They were the principal suppliers of the valuable pelts that made St. Louis, Upper Louisiana's capital city, a major hub in the international fur trade. The Osage, Upper Louisiana's dominant resident tribe, forged a powerful and mutually beneficial commercial alliance with St. Louis's founding family, the Chouteaus. Members of several other Indian tribes, including the Missouri, Ioway, Sauk, and Fox tribes, also lived or hunted in Upper Louisiana. During and after the American Revolution they were joined by bands of eastern émigré Indians who moved westward to escape the ravages of conflict in their homelands.

Spanish officials primarily viewed Louisiana as a buffer that would protect their valuable possessions in New Spain (Mexico) from British encroachment. Although Spain governed Louisiana for nearly four decades, few Spaniards chose to live there permanently. With limited resources at their disposal, Spanish policymakers sought to strengthen their hold on the sparsely populated and poorly defended province by enticing Anglo-Americans from east of the Mississippi to settle there with offers of free land. The scheme was predicated on a belief that over time

MISSOURI Missouri's strategic location at the confluence of North America's great central river

they could be transformed into Catholic subjects loyal to the Spanish king. But the English-speaking Protestants who accepted the offer were a different breed. Independent-minded and self-reliant, they shunned the existing communal French villages in favor of scattered and isolated farmsteads. They looked on land as the primary measure of wealth and, in contrast with their Creole neighbors, were predisposed to view Indians as menacing savages.

Napoleon Bonaparte's attempts to resurrect the French nation's imperial designs for the Western Hemisphere culminated in Spain's agreement in 1800 to retrocede Louisiana to France; but more urgent imperatives elsewhere soon dashed those dreams. To the Spaniards' chagrin, the French ruler unexpectedly changed course and offered to sell the sprawling western province to the United States. President Thomas Jefferson accepted the offer, and the Louisiana Purchase (1803) ushered in a new era.

When U.S. officials took charge in St. Louis in March 1804, Upper Louisiana's total population probably exceeded 17,000. That figure included more than 10,000 Euro-Americans, perhaps 1,800 African American slaves, a handful of free people of color, and 5,000 Indians divided almost equally between immigrant and indigenous groups. Americans, including famed pioneer Daniel Boone, who had flocked to the territory during the Spanish regime's waning days already outnumbered the old French inhabitants.

The new U.S. authorities faced a daunting task as they set out to build a stable and prosperous society grounded on republican principles in a place that Washington Irving later described as "more motley than Mackinaw." President Jefferson briefly flirted with the notion of temporarily closing Upper Louisiana to further settlement, but that quixotic scheme was quickly cast aside. The decision to place the region under the control of officials in the Indiana Territory drew howls of protest from local residents of all stripes, and in 1805 Congress authorized creation of the Louisiana Territory, not to be confused with the lower parts of Louisiana then called the Territory of Orleans.

Louisiana's first governor, the controversial and self-serving General James Wilkinson, succeeded in exacerbating tensions between longtime residents and incoming Americans eager to make their mark. Competing claims for the territorial lands pitted holders of large Spanish concessions against land-hungry newcomers. The outbreak of the War of 1812 compounded the challenges of defending exposed settlements in the Missouri Territory (renamed

in 1812 when Louisiana became a state) and added to local uncertainty. The end of that conflict doomed Missouri's steadily declining Indian population to further dispossession and relocation and hastened new settlement in the booming Boonslick Country adjacent to the Missouri River.

Of Missouri's territorial governors, William Clark, in office from 1813 to 1820, proved to be the most adept as he steered the fractious territory through the perils of political and economic transformation that prepared it for statehood. In his failed attempt to become the state's first elected governor, the celebrated explorer and scion of Virginia's old republican order fell victim to a populist political dynamic that championed the common man while embracing Indian relocation and removal. Newly elected U.S. Senator Thomas Hart Benton and many other aspiring Missouri politicians quickly acknowledged the new realities and hitched their political fortunes to this rising national tide soon to be dubbed Jacksonian democracy. Missouri's 1818 bid to become a slave state unleashed a contentious national debate over slavery extension that was temporarily resolved with passage of the Missouri Compromise (1820), a measure that paved the way for its admission to the Union as a slaveholding state in 1821.

In the post-statehood era, Missourians were well positioned to capitalize on the looming opportunities of a dawning industrial age. St. Louis, already a major fur trade entrepôt and outfitting place for western explorers, traders, and overland travelers, took advantage of a developing road system and the advent of the steamboat era to become a major manufacturing, wholesaling, and commercial center and the nation's dominant inland city.

To accommodate the new migrants filling up Missouri's unoccupied interior spaces, officials moved the state's capital to centrally located Jefferson City. The opening of the Santa Fe trade in 1821 provided a new economic boost and made places like Franklin, Arrow Rock, and Independence way stations and outfitting places. The trade also presaged Missouri's future as the primary point of departure for the great western trails. Settlers from the Old South reinforced the state's slave base and Southern identity even as a vanguard of German and Irish immigrants along with a small cadre of Yankee businessmen provided added leavening to the border state's already diverse mix. The 1830 U.S. Census listed Missouri's population as 140,455, seventy times greater than the 1791 Spanish count. Official enumerations of all inhabitants (excluding Indians) conducted by Spain in 1791 (2,111) and 1800

(7,125) and the United States in 1810 (19,783), 1820 (66,586), and 1830 (140,455) detailed that growth, but they barely hinted at what lay ahead for a state clearly in its ascendancy.

MISSOURI COMPROMISE The Missouri Compromise (actually a set of congressional acts passed in 1820 and 1821) settled the sectional crisis triggered by Missouri's application to join the Union as a slave state. It permitted this while prohibiting slavery in the rest of the Louisiana Purchase north of 36° 30'. This legislation established the policy for the admission of future states for the next thirty years.

The crisis began when, on 13 February 1819, about three weeks before the adjournment of the Fifteenth Congress, New York Representative James Tallmadge introduced an amendment to the Missouri statehood bill to bar the importation of new slaves and emancipated at adulthood those already in the territory. Tallmadge's amendment sparked an explosive reaction from southern congressmen, particu-

larly from border states, such as Virginia, which looked to the new territories as a market for their dangerous surplus of slaves. This outburst surprised many Northerners, who had accepted at face value Southern, and especially Virginian, avowals of anti-slavery sentiment. After an intense debate employing nearly all the arguments that would be made for and against slavery until the Civil War, the House, by a narrow margin, passed the Missouri bill with the slavery restrictions on 16 February 1819. New York Congressman John W. Taylor's proposal to restrict slavery in the adjacent territory of Arkansas was defeated three days later, and his subsequent proposal to bar slavery in the territory north of 36° 30' never received a vote. The Senate struck out the antislavery provisions of the Missouri bill, but the House stuck by them, leaving the question unresolved when Congress adjourned on 4 March.

Despite the fury of the congressional debates, the Missouri dispute initially attracted little attention in the nation at large, being overshadowed by the Supreme Court's decision in *McCulloch v. Maryland* and a sharp economic recession. Spurred by Federalist activists, including New York editor Theodore Dwight and venerable New Jersey philanthropist Elias Boudinot, Northern antislavery (and anti-Southern) sentiment strengthened over the subsequent months. Incited by anti-Missouri meetings throughout the free states, virtually all Northern state legislatures voted—usually unanimously—to instruct their congressional delegations to oppose the expansion of slavery. Public opinion in the South, on the other hand, was much more muted.

When Maine (then part of Massachusetts) applied for statehood, Virginia Senator James Barbour sought to use it for leverage in brokering a compromise. On New Year's Day 1820, President Monroe and Barbour explained the plan to Maine congressman John Holmes, who reported to Maine's top political leaders that administration leaders felt that "the *Mother* should have *twins this time*." However, the proposed linkage detonated explosive responses in both North and South. Maine's citizens were outraged by their representatives' apparent acquiescence to a move to tie the admission of their state to the extension of slavery, while Virginia leaders angrily reacted to the suggestion floated by President Monroe that he might endorse the proposal by Indiana senator Jesse Thomas to bar slavery in the Louisiana Territory north of 36° 30'—the identical line proposed the year before by antislavery advocate Taylor, now Speaker of the House.

In the face of this surge of outrage from both sections, Monroe abruptly backed away from expressions of compromise, avowing privately to Virginians that he would give up the presidency before supporting restrictions on slavery and explaining his earlier stance as a desperate response to extreme danger to the Republic. Monroe and his associates began to advise receptive Southerners and stalwart Northern Republicans that the campaign to restrict slavery in Missouri was really a cynical ploy by Federalists to regain power by appealing to Americans' humanitarian impulses. Cabinet officials and other influential administration allies, most notably Thomas Jefferson, spread the message that only the selfless statesmanship of anti-restrictionist politicians, such as Maine's Holmes, could save the Union from the machinations of northern conspirators. New York governor DeWitt Clinton and Senator Rufus King were portrayed as the architects of an electoral coup that would oust Monroe from the presidential mansion and close the West to slavery, thus insuring that Upper South planters would be "damned up in a land of slaves," as one Virginian put it. This fanciful sce-

nario gained some plausibility from the facts that Clinton was a cousin of Tallmadge, author of the restriction amendment, and that King's half-brother and two sons, all of whom had close ties to Republican leaders, implicitly endorsed the damaging charges against their kinsman by their silence.

The deadlock in Congress continued through February, although restrictionist unity showed growing cracks. While their constituents overwhelmingly continued to oppose the admission of Missouri with slavery, Northern congressmen began to waver in the face of charges of Federalist plotting, Southern threats to withdraw from the Union, and "the influence of the Palace." To secure support from recalcitrant Northerners, the president and his associates employed moral suasion, bullying and removals, political favors and lucrative public offices. A close reading of contemporary accounts reveals James Monroe as a master of persuasion, but most discreet. Despite his activism, Monroe's historical image remains that of a cautious strict constructionist.

On 12 February, when pro- and anti-restriction sentiment reached a fever pitch, Senator Rufus King took the floor of the Senate and delivered an antislavery speech so stinging that, according to John Quincy Adams, slaveholders “gnawed their lips and clenched their fists as they heard him.” King repudiated “all laws and compacts” supporting slavery as “absolutely void, because contrary to the law of nature.” Thus did he solidify his reputation as the South’s most dangerous foe. Four days later the Senate approved the Thomas Amendment, barring slavery above 36° 30’. On 2 March, after three weeks of furiously escalating rhetoric and action (including fervent nationalist Henry Clay’s declaration that he would “go home and raise troops, if necessary”), the House voted 90 to 87 to strike the slavery restriction from the Missouri statehood bill, and 134 to 42 to accept the compromise line. “I consider myself and associates as conquered,” Rufus King lamented. “The slave States, with their free corps, have subdued us.” Charles Pinckney of South Carolina, an opponent of compromise, nonetheless exulted that the South considered it “a great triumph.” Secretary of State John Quincy Adams, after a discussion with Secretary of War John C. Calhoun, portentously observed of slaveholders, “The discussion of this Missouri question has betrayed the secret of their souls.”

However, not all opponents of slavery were mournful, nor perhaps had slaveholders betrayed all their secrets. Speaker Taylor wrote to his wife, “We have gained all that was possible, if not all that was desired,” calling the outcome “an ample recompense for all the time and labour it has cost us.” The author of the original restriction, James Tallmadge, wrote his colleague Taylor that news of the vote “gives great Joy,” adding, “You have in this business a monument to your fame.” After receiving a unanimous opinion from his cabinet that the bill passed constitutional muster, President Monroe signed it on 4 March 1820.

Many Northerners, however, continued to oppose statehood for Missouri, and the July 1820 draft constitution of the territory, which barred free blacks and mulattos from the state, gave opponents the grounds they needed to reopen the controversy: they viewed the measure as an unconstitutional violation of the rights of black citizens of other states under the rights and privileges clause (Art. IV, Sec. 2) of the Constitution. The opening of the Seventeenth Congress witnessed another fractious stalemate, mirroring the previous year’s discord. In the end, Henry Clay led a hand-picked joint House-Senate committee in drafting a deliberately ambigu-

ous resolution declaring that the antiblack clause in Missouri’s constitution should never be construed as violating the constitutional rights of any citizen. Though in fact designed to be construed differently in different sections, this language, if interpreted consistently, implied that either Missouri’s restriction was in fact unconstitutional or black citizens of other states affected by it were not citizens of the federal government. Although, as a New Hampshire newspaper bitterly observed, “a child might penetrate the flimsiness of the evasion” inherent in the compromise language, the exhausted House members narrowly adopted Clay’s compromise on 26 February 1821 and a week later voted to admit Missouri to statehood.

It is not clear how much the election of John Quincy Adams in 1824 was influenced by the controversy. The election of Andrew Jackson in 1828 and the rise of the Democratic Party constituted setbacks to the policy of containing slavery, which the compromise was designed to promote. Yet the Arkansas statehood bill (1836) generated a nearly equal sectional showdown between the House and Senate, as did the Wilmot Proviso a decade later, demonstrating the continued explosiveness of the slavery issue. The repeal of the Missouri Compromise by the Kansas-Nebraska Act in 1854 galvanized antislavery sentiment and spurred the formation of the Republican Party. The Supreme Court’s decision in *Dred Scott* that the compromise was unconstitutional helped to trigger the Civil War. Thus if the short-term impact of the Missouri Compromise is difficult to assess, in the long run it must be viewed as a decisive setback to slavery and the cornerstone of a later free-state majority.

MONROE, JAMES James Monroe (1758–1831) was a soldier, lawyer, state legislator, ratification convention delegate, governor, diplomat, U.S. representative and senator, secretary of war, secretary of state, and fifth president of the United States. Monroe was born on 28 April 1758 in Tidewater Virginia's Westmoreland County to respectable but not prominent parents. He was fortunate, however, in his maternal uncle, Joseph Jones. This childless uncle stood alongside the other Patriot leaders of the colonial House of Burgesses and ultimately sat in the Continental Congress and on Virginia's highest court. He took young James under his wing and encouraged the nephew's political inclinations.

EARLY POLITICAL CAREER

Monroe attended the finest school in the colony, Rev. Archibald Campbell's Campbelltown Academy, beginning at age eleven. He then became the first in his line to attend the College of William and Mary when he matriculated in 1774, but his schooling was interrupted by the Revolution. Monroe enlisted in the American forces along with many of his classmates.

Monroe's service in the Revolution earned him respect as a war hero. Particularly noteworthy was his role in the Battle of Trenton on 26 December 1776, during which he helped lead a cavalry charge that captured enemy guns well positioned to command the chief road into town. Monroe received a severe wound in helping to ensure one of the Americans' most conspicuous victories of the entire war.

Upon returning to the College of William and Mary in 1780, Monroe began to read law under Governor Thomas Jefferson. Their personal association would reach fruition in the late 1790s, when Monroe bought a plantation two miles from Monticello.

In 1782 Monroe entered the House of Delegates, which elected him to the Confederation Congress the

following year. Much of Monroe's attention in Congress was devoted to issues related to Virginia's western lands claims. Although he grew sympathetic to nationalists' demands that the Confederation government be strengthened, from early on his attachment to the United States included a tincture of the states' rights creed that he, Jefferson, and James Madison later would elevate into the centerpiece of their party's dogma.

Monroe's support for federal reform left him disappointed in the Virginia General Assembly's omission of his name from its distinguished roster of Constitutional Convention delegates at Philadelphia in 1787. Close attention to Virginia's interests, particularly in regard to the western lands and to the apportionment of the new U.S. Senate, drove him into opposition in the Virginia ratifying convention of 1788. It was Monroe who wrote after the state's convention that George Washington's influence had narrowly won the day for the Federalists. Attempting to secure membership in the first U.S. House of Representatives, Monroe lost a hard-fought election to his friend James Madison, the intellectual leader of the new Constitution's advocates in the Old Dominion.

BECOMING A REPUBLICAN

By the end of 1790, Monroe had been elected by the General Assembly to the U.S. Senate, where he soon became one of the leaders of the developing opposition to Alexander Hamilton's Federalist program. At the same time, Monroe staked out a position of strong support for the French Revolution. Thus, when the French government requested the recall of Gouverneur Morris, the U.S. minister to France, President Washington nominated Monroe to replace him in 1794.

In France, Monroe made notorious statements in support of a revolution that had become a bloody debacle. Secretary of State Timothy Pickering of Massachusetts finally insisted that he be recalled, and Washington did so in September 1796.

On his return, Monroe found himself quite popular among Republicans. Defensively, Monroe published a volume of official papers with a self-exculpatory introduction; he also took the opportunity to attack Federalist foreign policy.

In 1799 Monroe was required for his dutiful Republicanism when, on Madison's nomination, the General Assembly elected him to the first of three consecutive one-year terms as governor. As governor, he presided over the delicate work of limiting the political impact of Gabriel's Rebellion, the largest known slave conspiracy in Virginia history until that time, which broke out in the capital of Richmond in the run-up to the pivotal election of 1800. Monroe also prepared the Virginia militia to intervene in case the presidential imbroglio of 1800 did not turn out in Jefferson's favor.

DIPLOMAT AND CABINET MEMBER

In 1803 Monroe was one of two negotiators who exploited Napoléon Bonaparte's unexpected willingness to part with his North American empire by accepting the proffered region that became the Louisiana Territory. The resulting treaty is usually regarded as Jefferson's foremost achievement as president, but in actuality diplomatic brilliance had little to do with it. It simply fell into the Americans' lap.

Before his return to America in 1807, Monroe conducted fruitless negotiations with Spain in 1805; he and fellow negotiator William Pinkney concluded a treaty with Great Britain in 1806, but Secretary of State James Madison considered it inadequate (as did President Jefferson). Monroe believed that Madison and Jefferson's purpose was to deny Monroe the acclaim he believed the treaty would have brought him, and he allowed dissident Virginia Republicans to promote his presidential candidacy in preference to

Madison in 1808; his candidacy, though, came to naught.

Early in his administration, Madison offered Monroe the governorship of Louisiana Territory, which Monroe refused. Instead, Monroe returned to the General Assembly in 1810 and was elevated to the governorship again in January 1811. In March 1811 Madison appointed Monroe secretary of state. When the War of 1812 broke out, Monroe and his political allies were certain that Madison's rejection of his treaty with Britain underlay most of America's diplomatic troubles, but Monroe soldiered on.

Secretary of State Monroe personally scouted the Chesapeake region to ascertain British troop movements in 1814, which symbolized the disaster that Republican foreign and defense policy had become. When the secretary of war resigned in the wake of Washington's capture by British forces, Monroe became secretary of war in 1814; soon thereafter, he was reappointed secretary of state as well. Resigning the secretary of war position in 1815, he considered himself Madison's logical successor.

PRESIDENCY

Monroe took office in 1817 after carrying all but three states—Massachusetts, Connecticut, and Delaware—in the 1816 election. He appointed a very talented group of cabinet secretaries, headed by Secretary of State John Quincy Adams and, in time, Secretary of War John C. Calhoun. His administration was notable for five developments: the Missouri Crisis, the Monroe Doctrine, the Transcontinental Treaty of 1819, the Supreme Court's decision in the 1819 case of *McCulloch v. Maryland*, and the virtual demise of the Federalist Party.

The Missouri Crisis of 1819–1821 found Monroe and Calhoun playing the unusual role of southerners willing to compromise the issue of slavery in the territories. While southern members of Congress nearly unanimously opposed the eventual Missouri Compromise, Calhoun and Monroe both considered it a positive development. Their primary interest lay in ending the dispute over slavery in the western territories rather than in ensuring the prospects for slavery in the enormous Louisiana Territory that Monroe had helped to purchase from France.

The Monroe Doctrine, central to American foreign policy since it was proclaimed, warned European powers to keep their hands off New World territories. It was issued in response to assertions of independence by Spain's former colonies in mainland Latin America. The Monroe Doctrine demonstrated boldness and daring. The United States had first re-

jected a British proposal for a joint statement of policy. Then, although it had no power to enforce its position at the time, the United States issued the Monroe Doctrine alone. From that day onward, the United States would feel free to intervene in opposition to European involvement in American territory south of Canada.

Finally, Federalism, long in decline and extremely weak in the election of 1816, virtually disappeared from the national stage by 1820. Monroe secured reelection with all but one electoral vote, and it seems that that elector's anti-Monroe stance flowed rather more from personal animus than from political opposition. Little could Monroe have realized at the time that his second term would be marred by the contest for the presidency.

All of Monroe's cabinet secretaries, the Speaker of the House, and General Andrew Jackson—America's war hero du jour—fancied themselves his successor. Their political maneuvering went so far as coordinating obstruction of each other's policy proposals in Congress. Monroe, meanwhile, believed himself barely suited to his high charge, confiding at a private dinner at Jefferson's Monticello that he was not intellectually fit for the post.

RETIREMENT

When Monroe retired from the presidency, he returned to Virginia in relative poverty. Therefore, he became a symbol of republican rectitude for those, such as Calhoun, who thought that the succession in 1825 ultimately had been decided by what he and others called a "corrupt bargain." Monroe's political retirement was interrupted only when he served as the titular president of the Virginia Constitutional Convention in 1829–1830. There, in an echo of his performance during the Missouri Crisis, he stood for compromise between Virginia's warring democratic and aristocratic sections.

James Monroe's death on 4 July 1831 came on an appropriate day, exactly five years after that of his political mentor, Jefferson. Monroe was both the last president to have played a part in the American Revolution and the only anti-Federalist to serve as president. While he was always a more practical, less philosophically inclined man than either of his two immediate predecessors (and in this he resembled the other Revolutionary warrior who held the presidency, George Washington), he was certainly a more successful president.

MONROE DOCTRINE From a historians perspective, President James Monroe's proclamation of the Monroe Doctrine—consisting of three paragraphs in his annual message to Congress of December 1823—was perhaps one of the most important moments in nineteenth-century American diplomacy. At the time, however, its significance was not obvious. Within just a few years, it had been largely forgotten, and it would not be taken up again until the 1840s, when it was first referred to as the "Monroe Doctrine."

President Monroe and Secretary of State John Quincy Adams crafted the doctrine as the American response to recent European developments. In the spring of 1823 French troops, authorized by the Holy Alliance of European monarchs, had entered Spain to topple the three-year-old constitutional government and restore King Ferdinand VII to absolute rule. It seemed likely that the Holy Alliance would continue to support Ferdinand by providing military and financial assistance to help him resubjugate his rebellious American colonies. Some Americans even worried that the allies' wars against republican government would eventually extend to the United States. In August, the British foreign secretary, George Canning, proposed to the American minister in London, Richard Rush, an Anglo-American declaration opposing any allied assistance for Spain against its colonies and disavowing any interest in acquiring Spain's colonies for themselves. Over the same months, moreover, evidence mounted that Russia intended to extend its colonial presence along the Pacific Coast of North America.

Rush's report of Canning's proposal reached Washington in early October and formed the principal topic for often-divisive cabinet discussions during November. Historians have offered various explanations of the divisions within the cabinet over the appropriate response to the European developments and the British proposal, ranging from conflicting assessments of the real danger to competing aspirations in the approaching presidential election of 1824. According to Adams's diary (the only internal account of the cabinet meetings), President Monroe and Secretary of War John C. Calhoun leaned toward accepting the British proposal in some form because they genuinely feared an allied assault upon Spanish America. Adams, in contrast, pressed for a unilateral response that would preserve American freedom of action, both in the current crisis and in the future. By taking its stand in the message to Congress rather than through a joint statement with Great Britain, the administration adopted, at least publicly, a position more consistent with Adams's views.

The Monroe Doctrine included three key points. In a section that was directed primarily at Russia, it asserted that the Western Hemisphere was closed to further colonization. Two other paragraphs warned that the European powers should not interfere in New World affairs and pledged that the United States would not interfere in European affairs. By responding to the European threat and the British proposal unilaterally, the administration avoided either entangling the United States with Great Britain or forswearing future expansion at Spain's expense, particularly in Cuba. It also preserved the diplomatic position enjoyed by the United States in the New World as the only established nation that had formally recognized the independence of the rebellious colonies.

Monroe's message was wildly popular at home and among the new nations of Spanish America. But it was largely ignored in Europe, where quiet Anglo-French diplomacy had already defused the crisis even as Monroe's cabinet debated its response. While European developments never required a decision about whether and how to make good on the doctrine, some of the Spanish American governments viewed it as a new pledge of American commitment on their behalf and called upon the administration for assistance. Colombia, and later Mexico, hoped to use Monroe's message to leverage military support—probably aid rather than ships or troops out of the United States—as well as diplomatic support. They pointed to the continuing Spanish denial of their independence and, in the case of Colombia, to French

diplomatic pressures. Monroe and Adams quickly and quietly backed off from their bold stance as they responded to these calls for assistance. When Adams's secretary of state, Henry Clay, referred to Monroe's "memorable pledge" in diplomatic correspondence regarding Mexico, he triggered a fierce backlash in Congress. By the end of Adams's presidency in March 1829, the doctrine had been abandoned.

Scholars have differed over the significance of the Monroe Doctrine in the minds of those who shaped it, describing the doctrine as little more than an attempt to curry favor with American voters; one element of a complex and flexible response to international developments; or a bold blueprint for American empire in the New World. Ultimately, it neither prevented a European invasion nor checked British influence in Spanish America nor established American dominance in the New World. It did, however, testify to a deep fear that the spread of European influence, institutions, and principles in the New World would threaten the United States.

MONUMENTS AND MEMORIALS Historical monuments, particularly those erected publicly rather than on family plots in cemeteries, not only tell their manifest stories but also reveal something of the ideas dominant when they went up. In the new nation monuments went up slowly at first, revealing either an ideological bent against such memorials—Americans having toppled the statue of King George III in New York City during the Revolutionary War—or perhaps a shortage of sculptors. Fewer than twenty-

ty public monuments built before 1830 appear in the Smithsonian Inventory of American Sculpture, admittedly an incomplete list.

REMEMBERING THE REVOLUTIONARY WAR

Americans were slow to commemorate the soldiers and sailors of the Revolution, compared to the dispatch with which they put up monuments after the War of 1812, the Civil War (Union side), the Spanish American or Philippines Wars, and World War I. On Beacon Hill in 1790, Bostonians erected a Doric column designed by Charles Bulfinch and topped by a golden (wooden) eagle, but they had to take it down twenty-one years later because they had removed too much of the hill as landfill. Joseph Warren, who fell at Bunker Hill, got a Tuscan pillar in 1794, but it too did not last. The Bunker Hill obelisk, 221 feet

of granite, begun in 1823, was not dedicated until 1843.

The first monument to bear the names of ordinary enlisted men who fell was at Lexington, Massachusetts. During the war, two to four times as many men died on board twenty-two prison ships in New York harbor as died in battle throughout the conflict. In 1808 the Tammany Society finished a vault holding some of these remains, and a century later the Society of Old Brooklynites put up a monument to these victims of war in Fort Greene Park.

REMEMBERING THE FOUNDERS

More early monuments honor George Washington or the War of 1812. Probably the first statue of Washington was by William Sullivan in wood in 1792. Brightly painted, it stood in Bowling Green Square in lower Manhattan until 1843, adorned a barbershop for a while, and eventually moved to the Delaware Historical Society. In the 1820s statues of Washington appeared at the state capitols of Massachusetts, North Carolina, and Virginia, and atop the Washington Monument in Baltimore. Now they are everywhere, often put up by Masons. Perhaps the silliest Washington monument, at least to modern eyes, was Horatio Greenough's oversize 1830s sculpture showing Washington semi-nude and built like a Greek god. By 1908 it had become an embarrassment and was removed from the Capitol grounds to the basement of the National Museum of American History.

In 1792 a life-size marble statue of Benjamin Franklin went up in Philadelphia; around this time, the Italian sculptor Giuseppe Ceracchi began a series of busts of other founders. A marble Italianate column commemorating America's naval war with Tripoli went up in Washington, D.C., in 1807, but wound up at the Naval Academy. In the 1820s other Italians sculpted classical statues of *War*, *Peace*, and *The Genius of America* for the Capitol. As the century wore on, American sculptors began to get more of these commissions, previously monopolized by Italians and other Europeans.

In the 1840s and 1850s more monuments were erected, honoring national founders including Virginia's Thomas Jefferson, Patrick Henry, and George Mason, but also local heroes such as the Palmetto Regiment in South Carolina and King Gambrinus, the Patron of Brewing, in of course Milwaukee. At about this time, ethnic groups began literally to make their appearance on the landscape, each choosing their hero from among Revolutionary War figures. Thus Casimir Pulaski, a Polish nobleman, is memorialized

in Savannah, Georgia, where he died of wounds, by a monument whose cornerstone was laid by Lafayette during his triumphal 1824–1825 tour of America; in Washington, D.C., by a monument put up by Polish Americans; and in Buffalo, Philadelphia, and Meriden and Hartford, Connecticut—all with sizable Polish American populations. Thaddeus Kosciuszko, a Polish Patriot, is on the landscape at West Point (1829) and Saratoga, where he served, and Chicago, the last surely owing to that city's Polish population. Baron von Steuben, a Prussian captain, made an appearance in 1870 in Utica, New York (where he died after the war), in Washington, D.C., at the site of the Battle of Monmouth in New Jersey, where he played a major role, and at Valley Forge, where the National German American Alliance rather desperately tried to connect Americans and Germans in 1915.

Similarly, Irish Americans supported a monument to Commodore John Barry in Philadelphia and African Americans supported one to Crispus Attucks in Boston. Today we take for granted the glorification of Attucks as the “first casualty of the American Revolution.” In 1888, however, when the black community of Boston after decades of struggle sparked the erection of the Boston Massacre monument, members of the Massachusetts Historical Society declared him “not a fit candidate for monumental honors.” Attucks was a rebel, but more African Americans sided with the British, who offered them freedom; it seems nothing on the landscape tells their story.

Christians also latched onto the founders, sometimes distorting history in the process. The Washington Memorial Chapel at Valley Forge, begun in 1903, is dominated by two matched sets of stained-glass windows—one depicting the life of Jesus Christ, the other the life of George Washington. In the central opening over the door, Washington kneels in prayer at Valley Forge. In the early twenty-first century some fundamentalist Christians claim the United States was founded as a Christian nation, whereas others acknowledge that Franklin, Jefferson, and some other founders were more Deist or Unitarian than Christian.

CONTROVERSIES

Monuments seem silent, consensual, and faithful—history written in stone. But some monuments commemorating early American figures or events, like their late-twentieth-century counterparts in eastern Europe, have been scenes of turbulence. In 1879 transatlantic-cable magnate Cyrus Field erected a monument to Major John André, a British spy in the

Revolutionary War, in Tappan, New York, where he was executed, but angry patriots toppled it three times. An 1889 statue of an earlier founder, John Mason, adorned the site in Mystic, Connecticut, where he led British colonists in exterminating the major village of the Pequots, but in the 1990s remnants and supporters of the Pequots finally got it removed to a less offensive location near his original home site. A zinc obelisk to Tom Quick, erected because he killed perhaps ninety-nine Native Americans to avenge the 1756 death of his father, stood in Milford, Pennsylvania, until vandalized with a sledgehammer in 1997.

Other monuments of the early nation need some turbulence. On both sides of Lake Champlain, a standing Samuel de Champlain towers over a kneeling Native American. These monuments exemplify “hieratic art”—“hier” as in hierarchy—for Champlain is fully clothed with cloak and cape, while the Indian is almost naked. Depending on the weather on that spring day in 1609 when Native Americans showed him the lake he “discovered,” either the Indian was shivering or Champlain was sweating. Of course, it never happened that way; the clothing is simply a way to contrast “primitive” (naked) and “civilized” (clothed).

A 1929 monument in Aurora, New York, commemorates Sullivan's Raid: “Routes of the armies of Gen. John Sullivan and James Clinton, 1779, An Expedition against the hostile Indian nations which checked the aggressions of the English and Indians on the frontiers of New York and Pennsylvania, extending westward the dominion of the United States.” In reality, “the aggressions” were largely American. Washington instructed Sullivan “that the country may not be merely overrun but destroyed. . . . You will not by any means, listen to any overture of peace before the total ruin of their settlements is effected.” Afterward, Sullivan reported, “We have not left a single settlement or field of corn in the country of the [Iroquois] Five Nations.” Perhaps New York might encourage Native Americans to erect a historical marker nearby, providing some of these details.

ABSENCES

Enormous gaps in the public history of America's early years remain. For example, up to 80 percent of the budget during Washington's presidency was consumed by Indian warfare, especially the Ohio wars, yet it is hard to glean an inkling of these campaigns from the landscape. Although Abigail Adams gets a cairn and statue in Quincy, Massachusetts, and Martha Washington gets on the landscape in

several places, the roles women played in the forming of the nation are not well memorialized. In Zionsville, Indiana, for example, a state historical marker reads, "Patrick H. Sullivan, 1794–1879, was the first white settler in Boone County, 1823, and built the first log cabin." In reality, Sullivan entered what is now Boone County accompanied by his wife. Most assuredly, since the first thing a man needs when building a log cabin is someone on the other end of the log, *they* built the first log cabin. Such distortions make a difference: even in the postfeminist era, we still do not typically think of women as log-cabin builders. Yet they were.

With the rise of organized labor in the late nineteenth century have come monuments and memorials put up by unions. By contrast, the working class in the early nation goes largely uncommemorated. Massachusetts has erected two monuments to Daniel Shays and his revolt, in Sheffield and Pelham.

Perhaps the hardest single thing for Americans to face in all their storied past is slavery. Everywhere monuments honor slave owners, but the *s*-word usually goes unwritten. Also nearly invisible is the role of the slave trade, domestic or international, including the triangular trade, which included New England. A small stone titled "Old Slave Block" in Fredericksburg, Virginia, is one of the few sites across America that recognizes a place where people were bought and sold. New Orleans marks no slave auction site, although in some years more people went on the block there than anywhere else in the United States. No memorial reminds Americans that until 1850, slaves were sold in several public areas in Washington, D.C., including at what is now Union Station. In Lower Manhattan a historical marker tells where the first stock market stood, but no marker mentions the first slave market, which stood just across the street. In downtown Philadelphia a historic marker does tell of the slave market at the London Coffee House. Charlottesville, Virginia, has a plaque indicating that an auction block had stood nearby, and a memorial in Charleston, South Carolina, marks the slave market.

In the aftermath of the Revolution, Congress did face slavery, banning it from the Northwest Territory, but that prohibition had loopholes and was not well enforced. Shortly after Illinois became a state, proponents of slavery tried to amend its constitution to allow slavery. Had they succeeded, American history might have been very different, for the free states would have been blocked from the West by slave states stretching from Lake Michigan to the Gulf of Mexico. Governor Edward Coles, a planter

turned abolitionist, organized the opposition, defeating the referendum in 1824. A monument south of Edwardsville erected a century later commemorates Coles, "who by steadfastness and courage kept slavery out of the constitution of Illinois."

Some Americans think the founders banned the international slave trade in the Constitution; actually, they did just the reverse, guaranteeing it against abolition until 1808. In that year Congress did ban the trade, but for the next fifty-three years, to 1861, law enforcement officials in many parts of the country turned a blind eye. As with Prohibition or the later drug trade, the criminalization of slave importation, coupled with erratic enforcement, ensured that it would be profitable by increasing the price differential of slaves in the United States compared to West Africa or Cuba. Tucked away next to a vending machine in a side room at Fort Gaines, Alabama, is almost the only spot on the American landscape that acknowledges the illegal international trade: some timbers from the *Clotilde*, which entered Mobile Bay with an illicit cargo in July 1860. Except for these timbers, a mess kettle on display at Georgia's Jekyll Island State Park from the *Wanderer* (a slave ship that landed there in 1858), and increasing attention to *Amistad* in coastal Connecticut, monuments and memorials ignore this trade.

Slave revolts also go largely unremarked. Possibly the largest single revolt in United States history began on 8 January 1811, near Laplace, Louisiana, west of New Orleans. African Americans killed at least two whites and marched down the river road toward New Orleans, pillaging and killing as they went. At every plantation others joined until they numbered in the hundreds. Two days later, U.S. troops attacked with muskets and cannon, killing at least sixty-six resisters in the fighting or the aftermath. The event has no memorial, however, and Laplace refused to put up a historical marker mentioning it as suggested by the state.

SLAVERY AND PUBLIC HISTORY

In 1848 construction began on America's tallest single monument to a person, the Washington Monument in the capital. Its scale implies the greatness of the nation. Work stalled in 1854, however, not to resume until the end of Reconstruction. The stoppage line, still visible, is emblematic of America's waning ability to unite behind major undertakings as the Civil War approached. A nearby landmark, "Freedom," the bronze woman atop the Capitol, also bears witness to the growing division. The sculptor's prototype wore a "Liberty Cap," worn by freed slaves in

ancient Rome. As a slave owner, Secretary of War Jefferson Davis, the power behind the Buchanan administration, objected. He suggested stars overlaid by an eagle's head and feathers; most tourists infer she is a Plains Indian.

One of America's most famous monuments received its iconic name in the late 1830s. The bell that hung in the Pennsylvania State House when the Continental Congress adopted the Declaration of Independence bore a Bible verse: "Proclaim LIBERTY throughout all the Land unto all the Inhabitants thereof." Delighted by the verse, abolitionists christened the bell the Liberty Bell. During the 1840s and 1850s they adopted the bell as a symbol, to the discomfort of those who wished the issue of slavery would go away. The movement for black freedom inspired America's other iconic monument, the Statue of Liberty. Its creation in 1886 stemmed from connections forged during the Civil War between American abolitionists and the French Anti-Slavery Society. Hence her name, and hence the broken chains at her feet.

The Jefferson Memorial, constructed during the presidency of Democrat Franklin Delano Roosevelt, also shows distortion resulting from conflict over slavery. Its third panel of quotations, which the National Park Service describes as "devoted to his ideas on freedom of the body and to his beliefs in the necessity of educating the masses of the people," is a hodgepodge of quotations from widely different periods in Jefferson's life. The effect of this medley is to create the impression that Thomas Jefferson was very nearly an abolitionist. In their original contexts, the same quotations reveal a Jefferson conflicted about slavery—at times its critic, often its apologist. Neither the memorial's designers nor the Park Service in its videos and handouts seem willing to accurately present Jefferson's views on slavery.

CONTINUITY AND CHANGE

After more than two centuries, Americans are still revising their views of the events and individuals that shaped the new nation. Voices of women, African Americans, and Native Americans, often not heard when early memorials were built, now vie for attention. Americans continue to change how they commemorate these events and individuals on the landscape. Von Steuben's monument at the Battle of Monmouth was dedicated in 2004, for example. Also in 2004, Milford, Pennsylvania, announced it would reerect its monument to Tom Quick. A National Slavery Museum is planned for 2007 near Fredericksburg, Virginia; it will perhaps fill some of the

gaps in the treatment of the slave trade in the new nation. Controversies over the public history of the nation will not soon abate, and surely these debates make Americans better informed about their past.

MORAVIANS After an aborted colonizing effort in Savannah, Georgia, in 1735, the Moravians came to British North America in 1741 to stay. In that year, this Saxony-based pietistic sect founded Bethlehem in Pennsylvania, a communal town that became the center of an ambitious missionary effort in America.

This effort had two components. One was to introduce the gospel of Jesus Christ to Indians and slaves. The second was to reenergize Christianity by bringing the "new birth" to both the church and unchurched.

Followers of the reformer Jan Hus founded the Moravian movement in Lititz, Moravia, in 1457. Disillusioned with a Catholic Church they saw as corrupt, they sought to emulate the early Christians by living a life of simple piety. Membership totaled more than 200,000 on the eve of the Counter-Reformation. The Moravian Church, also known as the *Unitas Fratrum* (Unity of Brethren), grew so large in Moravia and Bohemia that it became a threat to the Roman Catholic Church and was driven underground. In 1722, refugees from Moravia arrived

at the estate of Count Nikolaus von Zinzendorf in Berthelsdorf, Germany; under the guidance of Zinzendorf, the Moravian movement revived and prospered, becoming the largest pietistic sect in the Western Hemisphere and leaving its mark in architecture, in music, in education, and on Wesleyan Methodism.

In 1727, the Moravians began sending missionaries to Europe, Greenland, Africa, the Caribbean, and the Americas for work among blacks, Indians, and whites. The "Diaspora," Zinzendorf's term for the effort to win over Christians to "heart" religion, was at the center of the count's ecumenical vision. Fanning out from Bethlehem, Pennsylvania, Moravian missionaries attracted a following of nearly two thousand people in the northern colonies by 1760, and Moravians there established congregations as far south as Carrollton Manor, Maryland, and as far north as Broadbay, Maine. In 1753, the Moravians established a southern colony as well: a 98,895-acre community in backcountry North Carolina called Wachovia.

The Moravian movement consisted of two settlement types. The first was known as *Ortsgemeinen*, or congregation towns, where church leaders restricted residency to full-time church members and expected inhabitants completely to devote their lives to Jesus and the church. The church owned the land and tightly controlled the economy and the residents' social lives. The second settlement type was the *Landgemeinen*, or farm congregations. In the *Landgemeinen*, diverse groups of German- and English-speaking settlers from a variety of religious backgrounds lived on dispersed family farms with less oversight from church authorities. By 1800, Wachovia's population totaled twelve hundred pilgrims, 88 percent of whom were German speakers from Lutheran, Reformed, and Moravian traditions. The remaining 12 percent were Anglo-Americans, Scots-Irish, Irish, and others.

The ecumenicalism of the Moravian movement produced complex cultural change in the early Republic. The conversion experience enabled "reborn" brethren to forge close friendships with members of different ethnicities that led to intermarriage and the lessening of ethnic and social differences. Religiously inspired intermixing, in turn, set off a wave of cultural change among German and English speakers that resulted ultimately in the Americanizing of German-speaking members.

MORMONISM, ORIGINS OF Although the Mormon church, officially known as the Church of Jesus Christ of Latter-day Saints, was not founded until 6 April 1830, many of its formative events occurred in the 1820s, a decade that saw major social, economic, political, and religious changes in the new nation. Joseph Smith Jr., the founder of the new religion, experienced many of these as an impressionable youth. Born 23 December 1805 in Sharon, Vermont, young Joseph joined his family in their move to a farm near Palmyra, New York, in 1816 in search of economic opportunity. This region of western New York, soon to be traversed by the Erie Canal, came to be known as the "Burned-over District" because of its intense religious revivals. The Smith family experienced these enthusiasms, which touched the village of Palmyra in the early 1820s, with the Methodists, Presbyterians, Baptists, and the Society of Friends (Quakers) competing for the allegiance of the residents. Young Joseph, in his early teens, found the conflicting claims of the various denominations confusing. His mother, Lucy Mack Smith, attended Presbyterian services, while his father, Joseph Sr., avoided all religious affiliation. Unable to make up his mind, the boy retreated to a grove on his father's farm, and in a simple prayer asked God for help. In his report to his parents of what transpired in the grove, he said that he was astonished by a pillar of light in which he beheld a divine personage, of whom he inquired what church he should join. Joseph Jr. received the answer that he should not affiliate with any, all of them having turned away from the gospel and having failed to keep the commandments of the Lord. Several years passed before young Smith had another revelation. In 1823, when he was seventeen, an "angel" who called himself Moroni told Joseph about a record on plates of gold containing the history of ancient inhabitants of North America. Although the plates, Joseph was told, were buried in a hill near his father's farm, it was not until four years later, on the night of 22 September 1827, that he was allowed to remove them along with instructions for

AUTHORSHIP AND SOURCES OF THE BOOK OF MORMON

Virtually from the day of its publication, the authorship and sources of the Book of Mormon became issues of controversy. Alexander Campbell (1788–1866), a founder of the Disciples of Christ, charged that the book was a figment of Joseph Smith’s imagination, comprising within a fanciful story a pastiche of many of the religious opinions of his time—an interpretation supported by prominent biographer Fawn M. Brodie in *No Man Knows My History* (1945). Others charged that the Book of Mormon was plagiarized—either from an unpublished work by Solomon Spaulding dealing with the Israelite origins of the American Indians or from a story by Ethan Smith, *Views of the Hebrews; or, The Ten Tribes of Israel in America* (1823). Modern scholars have rejected the charge of plagiarism, concluding that Smith was indeed the author of the Book of Mormon.

Those unable or unwilling to believe in its divine origins have advanced a number of theories regarding the sources Smith might have used to produce the book—virtually all of them conceding the author’s fertile imagi-

nation. Brodie suggested that the work was a kind of veiled autobiography, an idea pursued by a number of scholars near the turn of the twenty-first century. In *The Refiner’s Fire: The Making of Mormon Cosmology, 1644–1844* (1994), Joseph L. Brooke has documented occult and hermetic influences that can be traced to the New England ancestry of the Smith family, while Clyde R. Forsberg Jr.’s *Equal Rites: The Book of Mormon, Masonry, Gender, and American Culture* (2004) has argued that the Book of Mormon can be read as a Masonic monitor of the Templar persuasion. An interpretation by a non-Mormon scholar that has been embraced by many Mormons is that of Jan Shippo in *Mormonism: The Story of a New Religious Tradition* (1985). Shippo has shifted the focus from the “prophet or fraud” debate to the way the Book of Mormons is understood by believers, who see in it the replication of the biblical story, which was part of nineteenth-century American culture.

their translation. With divine aid he dictated the translation, first some short passages to his wife, Emma, thereafter the major portion to a young schoolteacher, Oliver Cowdery. In March 1830 the Palmyra newspaper announced the publication of the Book of Mormon. The founding of the church followed shortly thereafter.

The essential message of the Book of Mormon was that God had revealed himself to the inhabitants of the New World as well as those of the Old. Analogous to the Bible in style and message, the book appealed to a people familiar with a biblical culture, while bringing certainty to an age in which religious pluralism caused confusion and insecurity to many, such as the Smith family. According to the Book of Mormon, Christ appeared to the inhabitants of the American continent after his crucifixion, teaching the Gospel to the ancestors of the modern Indians. The German church historian Peter Meinhold has suggested that the Book of Mormon was the folk expression of an American historical consciousness. Historian Mario DePillis has argued that Mormonism represented a search for religious authority. In

the opinion of some leading scholars, evangelical religion—by encouraging religious pluralism—was the logical expression of a democratic culture and compatible with an emerging “market revolution.” However, many people found such changes disorienting and threatening. Some may have sought refuge in the certainties of Mormonism. These may have been among the reasons why Mormonism became the most successful new religion originating in early nineteenth-century America.

MUSEUMS AND HISTORICAL SOCIETIES

In October 1784 the dyspeptic painter Robert Edge Pine (1730–1788) opened a gallery in Philadelphia where for twenty-five cents admission, his great allegorical canvas, *America*, along with depictions of scenes from Shakespeare, could be seen. Recently arrived from England, Pine intended eventually to expand his gallery to include portraits of political and military heroes of the new United States and historical paintings of “the most illustrious scenes of the late Revolution.” His efforts met with a warm reception. With the patronage of Samuel Vaughan, he was soon awarded rent-free rooms in the State House, a tacit acknowledgment of the value of his works to the nation.

MUSEUMS

Pine’s short-lived gallery was among the first in a burgeoning number of museums and historical societies that sprang up during the first fifty years of the Republic, a period in which Americans sought to construct and reconstruct memories of their new nation. Motivated by commercial gain, self-promotion, nationalism, and a desire to promote civic virtue and a stable social order, Americans converged on the idea of collecting, preserving, and displaying their past and present for public consumption.

During the colonial era, “cabinets” of natural curiosities and “philosophical apparatus” were largely private affairs, though some could be found at colleges or were associated with scholarly organizations. None of these cabinets, however, adopted the broad educational aims or nationalist aspirations of the museums that came in the wake of the Revolution. The quintessential museum of the early national period, and one of the earliest museums in America, was founded in 1786 by the artist, scientist, and Revolutionary veteran Charles Willson Peale (1741–1827). Like Pine before him, Peale established his Philadelphia Museum as a commercial enterprise featuring portraits of Revolutionary heroes, designed not only to commemorate the events of the war, but to propagate the patriotism and values of that generation.

An ardent republican, Peale aimed to “instruct and amuse” all classes of society, high and low, using his exhibits to limn a narrative of the new nation as uniquely virtuous, powerful, and expansive. By 1796, after he had moved his museum into rented spaces on the top floor of Philosophical Hall (headquarters of the American Philosophical Society), Peale’s ambitions had expanded to include all the nat-

ural world, the contemplation of which he believed, as did many of his contemporaries, would exert a moral influence over young minds. Although the museum included objects collected from around the world (some obtained through Peale’s peers in the American Philosophical Society), his emphasis lay on the distinctive productions of the continent that he believed reflected the American character. In a menagerie behind Philosophical Hall, he kept grizzly cubs and other American beasts, and inside he arranged wildlife, plants, and Indian artifacts in an exhibition based upon the Great Chain of Being, with white humanity at the head.

The museum added other distinctly American displays, including specimens collected by Meriwether Lewis and William Clark during their transcontinental expedition (1803–1806) paired with a life-size wax model of Meriwether Lewis (1774–1809) himself, decked out in buckskin and fringe. The centerpiece at Peale’s museum, however, requiring a separate twenty-five-cent ticket, was the mounted skeleton of a mastodon unearthed in New York state in 1801, an animal that was a natural hymn for the new nation. Prior to the American Revolution the French naturalist, George Louis LeClerc, comte de Buffon (1707–1788), had wounded the pride of American naturalists by theorizing that the North American environment was so impoverished that it could support only a weak and degenerate fauna. The mastodon, called the Mammoth, was the American response, proof positive of native vigor.

High toned and low, museums proliferated in the wake of Peale’s, with a relatively small group of entrepreneurs spreading them throughout the states. The Peale family, for example, established a second branch in Baltimore in 1813, while the industrious wax modeler Daniel Bowen followed the creation of his museum in New York (1789) by opening another in Philadelphia (1792–1794) and then the Columbian Museum in Boston (1795–1803). While many were regional in focus, the nationalist elements that distinguished Peale’s were common. Even Nathan Dunn’s Chinese Museum in Philadelphia had implications for the nation, displaying the material goods reaped from America’s first commercial forays into Asia. After the turn of the nineteenth century, museums also flourished as adjuncts of a growing number of lyceums and scientific societies and, building from rudimentary teaching collections and the private cabinets of faculty members, a few collegiate collections became noteworthy. The faculty at Harvard, Bowdoin, Dickinson, and Yale built important mineralogical collections, for example, while Princeton

pursued a different course, purchasing a private collection in 1805 to form the core of its new museum of natural history.

HISTORICAL SOCIETIES

Paralleling the proliferation of museums was an equal proliferation of historical societies, which merged some of the functions of museums, learned societies, and public archives. One of the key factors fostering the growth of these societies was the wave of nostalgia, peaking in the years around the War of 1812, for the supposed unity and virtue of the Revolutionary generation and the desire, while still possible, to capture the memory of the founding generation. Atypical in many regards, the American Antiquarian Society (1812) was the offspring of Isaiah Thomas (1749–1831), the printer and Revolutionary veteran, who was convinced of the central position of the United States in the providential history of the world and wanted to preserve the written record of the Revolutionary generation and make it available to future Americans.

The earliest historical society in the United States, the Massachusetts Historical Society, was founded in 1791 to collect “things which will illustrate the history of our country.” “Things” initially signaled a hodgepodge of artifacts and curios, but within a decade, the society began increasingly to focus on the written record. Following the Massachusetts Historical Society (MHS), the merchant John Pintard (who had helped found the American Museum in 1790) in 1804 led a group of ten in organizing the New-York Historical Society. It had a mission similar to the MHS: to “collect and preserve whatever may relate to the natural, civil, or ecclesiastical History of the United States in general.” These words were echoed by the seven young Philadelphians who established the Historical Society of Pennsylvania in 1824, which made a special effort to document Indian cultures. After an array of federal institutions began to preserve documents of national importance during the early nineteenth century, historical societies like those in Massachusetts, New York, and Pennsylvania adopted a more strictly regional focus.

MUSIC

The entry consists of four separate essays: *African American*, *Classical*, *Patriotic and Political*, and *Popular*.

African American

The student of African American music of the early national period is immediately confronted with two fundamental challenges. First, compared to many other historical subjects, there is a significant dearth of evidence describing black music of the era. Much that does remain was recorded in passing by white observers who may not have understood or cared about what they heard. Therefore, conclusions about the sound and scope of African American music often must remain speculative. Second, a tension exists within the phrase “African American music.” Scholars have used the phrase to describe music that is unique to, and shared by, the African American population. This definition enables scholars to identify a strong musical tradition and heritage maintained by African Americans, yet it can obscure both differences within the African American population and the extent to which black artists were integral to the development of all aspects of American music.

AFRICAN TRADITION

Many of the unique aspects of African American music derived from the instruments, attitudes, and styles that enslaved Africans preserved across the Middle Passage. African music was very diverse, boasting sophisticated traditions featuring drums, stringed instruments, horns, solo or group vocal performance, and dance. Despite such diversity, African music often shared some conceptual characteristics. First among these was a tendency to understand music as a process rather than a product, a verb rather than a noun. The broad participatory experience of music could foster commonality among participants and blur distinctions between performers and listeners. Often African music emphasized functional purposes, likewise diminishing the division between performance and everyday life. Specific songs or styles often were associated with work, child rearing,

festivals, worship, or other activities. Scholars also have argued that African music often displayed a number of aural characteristics that distinguished it from the musical cultures of Europe. They emphasize the common appearance of rhythmic contrasts and complexities, call-and-response patterns between groups of participants, a valuation of improvisation, and the use of a pentatonic scale in which some pitch values (particularly thirds and sevenths) are ambiguous, falling between the major and minor tonalities common in European tradition.

MAINTAINING TRADITION

North American slave communities maintained African music traditions to varying degrees, depending on several factors: the number of newly enslaved people arriving from Africa or the West Indies (particularly prior to the 1808 ban on the transatlantic slave trade but continuing afterward); the variable strength of oral traditions; the ratio between African and European residents; the level of repression of slave musical practices (including the banning of drums, dancing, or religious services); and amount of exposure to European or Native American repertoires and instruments. Compelled by personal determination or the violent demands of owners, some slaves learned and excelled at the composition and performance of European-derived music, even participating fully in the diverse musical world of the colonies. Yet slaves also fostered a collective memory of African music (and other cultural forms) to articulate a common heritage, to counteract slave owners' attempts at cultural deracination and assimilation, and to resist the institution of slavery as a whole.

THE REVOLUTION

The era of the American Revolution (1775–1783) was a watershed for African American music. Paradoxically, it saw both a growing African American exploration of European musical forms and the institutionalization of distinct African American musical practices. During the Revolutionary War approximately five thousand black soldiers fought against the British, most in integrated units. A common designation for African American soldiers was that of drummer, and many contributed to the martial drum-and-fife music that led the Continental Army into battle, celebrated its victories, and mourned its fallen. Black soldiers sang many of the same songs popular within the white ranks and introduced many white soldiers to African American singing styles.

THE DECLINE OF NORTHERN SLAVERY

With the gradual decline of slavery in the northern states, music flourished among free African Americans, who now found somewhat improved access to musical instruments, education, and professions. Some became featured church organists or prominent conductors. Others were in demand as private teachers. Many more fostered a love for the hymn tradition of the major Christian denominations. The era also witnessed the proliferation of institutions founded and supported by African Americans. Black Christian congregations (including Baptist, Methodist, Presbyterian, and Episcopal) increased in number during the early national era. Often African American churches fell under the governance of local white congregations and ministers. Nevertheless, separate services enabled black congregations some autonomy to worship and sing as they pleased. Many used the same denominational hymnbooks as white congregations, and a significant overlap existed in the songs sung in white and African American churches. This shared tradition expanded with the interracial worship common at camp meetings during the early years of the Second Great Awakening.

NEW REPERTOIRE AND STYLES

Yet African American congregations developed a new religious repertoire which differed significantly from that of white congregations. At the center of this new repertoire was the spiritual. The spiritual tradition that developed in the early nineteenth century combined expanded themes from the Bible and denominational hymnbooks with the tradition of the ring shout. The shout, descended from African traditions, was a religious service featuring singers intoning repeated refrains while dancers moved around a ring in a slow shuffle. Shouts could last a long time, moving participants into a state of religious devotion and excitement. Spirituals, while devotional, could also be used to communicate coded messages among the slaves about plans for secret religious services or even escape from bondage.

African American slaves developed a number of secular styles. Slaves performed dance music for each other—and often for slave owners—using the fiddle and predecessors of the modern banjo, as well as by patting their own bodies in rhythm with the dance. They also developed unique calls and hollers as methods of singing greetings, news, and other information loudly across farms and fields as they worked.

African Americans, in slavery and freedom, established rich musical traditions in the early years of the American Republic. Even as historians struggle to

determine the specific sounds of the era's music, most agree that those years witnessed the concerted preservation of African elements; the emergence of new African American styles; an increasing integration of African, European, and American music; and a significant African American participation in the musical life of the new nation.

Classical

Though growing rapidly, the thirteen colonies had only 1.2 million people in the mid-1750s. By 1829 they had grown to twenty-four states and almost 13 million people. Music could be heard everywhere throughout this period, but in far more variety, and often with far greater expertise, by 1829. This was certainly true of classical music, here defined as music written out with internationally recognized methods of notation and performed by professionals or by talented and experienced amateurs for audiences who listen attentively. Such music requires cities with stores to sell sheet music and instruments, churches willing to pay professional organists and choirmasters, families willing to pay for children's music lessons and audiences willing to pay for, and even subsidize, productions of oratorios, operas, and symphonies. Many of North America's classical musicians were European-trained immigrants performing European music or composing music in America that conformed to European styles. Professional musicians supported themselves with various jobs that included performing, teaching, organizing, composing, publishing, and selling. New music, usually ephemeral but sometimes of high quality, was often commissioned for theaters, dancing schools, and public events.

During this three-quarters of a century, the chief support for classical music in Europe shifted from the high officers of church and state (cathedrals and courts) to the urban middle classes; in British North America the middle classes (including southern planters convening for political and artistic seasons in Charleston, Williamsburg, or Annapolis) supported classical music from the beginning. Opera, ballet, recitals, concerts, and plays with musical interludes were no longer the exclusive privileges of a ruling class; they were open to anyone who could afford the price of a ticket, and impresarios learned how to scale the cost of their tickets so that almost anyone could afford the poorest seats in the house. Meanwhile, classical music itself grew in complexity and expressive power; traditional ideals of form and balance were increasingly subordinated to intensity of feeling, personal expression, and heroic virtuosity—in short, musical romanticism.

Before the American Revolution, small ensembles flourished in coastal cities from Charleston, South Carolina, to Boston, Massachusetts, and in French New Orleans. Domestic music making reached high levels among connoisseurs such as Francis Hopkinson, Thomas Jefferson (a proficient violinist), and Benjamin Franklin, all signers of the Declaration of Independence. Franklin even invented an ingenious instrument, the glass armonica, which consisted of glass discs of varied shape, all arrayed on an axle in a trough that kept them both wet and turning, so the player could draw tones from them with his fingers. One tightly knit religious community, the Moravian Brethren of Bethlehem, Pennsylvania, and Salem, North Carolina, maintained skilled orchestras, choruses, soloists, and composers. Theirs was essentially German sacred music, transplanted to the North American frontier.

Notable among the European professional musicians who settled permanently in the eastern cities of the United States between 1770 and 1800 were William Selby (1738–1798), Rayner Taylor (1747–1825), Alexander Reinagle (1756–1809), George K. Jackson (1757–1822), Benjamin Carr (1768–1831), and James Hewitt (1770–1827), all from England. From Germany by way of England came Johann Christian Gottlieb Graupner (1767–1836). Most settled in Philadelphia, New York, or Boston, which maintained leadership in high culture throughout the nineteenth century. The Northeast also produced over two hundred native composers, mostly self-taught and part-time singing masters, whose typical work was creating, collecting, and publishing thousands of hymns, anthems, and settings of the

Psalms. Some produced music now considered classical in quality and significance, as well as having vernacular authenticity. The most famous of these composers, William Billings (1746–1800), was based in Boston; the great majority, however, were located in small towns of the hinterland.

A major figure rediscovered in the 1970s was Bohemian merchant Anthony Philip Heinrich (1781–1861), who determined at age thirty to make the United States his home and music his career. Settling in Kentucky, he contributed to Lexington's musical life, then took a sabbatical to create *The Dawning of Music in Kentucky; or, the Pleasures of Harmony* (1820). This book contained forty-six original compositions for piano, vocalists, and small ensembles and drew favorable notices in the East. Heinrich moved to New York City, where he composed and performed for several decades. He was the first U.S. composer to exploit extensively American literary, geographic, and ethnic themes in his work.

By 1829 American musicians had performed and American audiences had heard major compositions by George Frideric Handel, Joseph Haydn, Wolfgang Amadeus Mozart, Ludwig van Beethoven, Gioacchino Rossini, Carl Maria von Weber and many other European composers. New York City enjoyed its first full season of opera in 1825–1826, provided by Manuel García's Italian Opera Company. There were eighty performances, among them Mozart's *Don Giovanni* (1787), whose librettist, Lorenzo Da Ponte (1749–1838)—then professor of Italian at Columbia College—was a proud sponsor. Most of the musical organizations of the young nation, whether for teaching, performing, or publishing, lasted but a few years, but those that failed were soon replaced, and new enterprises were always appearing. Among the notable exceptions for endurance was Boston's Handel and Haydn Society (1815), specializing in large-scale oratorio (especially Handel's *Messiah* [1742] and Haydn's *Creation* [1798]). The Society's fame spread across the growing nation with the publication of its *Collection of Sacred Music* (1822, and many subsequent revisions), edited by Lowell Mason (1792–1872), composer, businessman, and promoter of musical education.

Patriotic and Political

American patriotic music in the Revolutionary and Federal periods was heavily influenced by the presence of traditional British military bands during the colonial era. Besides the small squads of fifers and drummers that the British army used for signaling troop movements and duties, separate regimental bands were often subsidized by officers for concerts and entertainment. These bands consisted of wind instruments such as bassoons, clarinets, oboes, and horns and played more sophisticated music than the fife and drum corps. American musicians were familiar with, and influenced by, these bands in their midst. For example, Timothy Swan of Connecticut, one of New England's late-eighteenth-century composers of psalmody, was said to have learned to read music from a British fifer. The outbreak of hostilities between England and the American colonies in early 1775 prompted the establishment of similar bands attached to colonial troops, but only six American regiments had bands. The musicians attached to the Fourth Regiment of Continental Artillery from Pennsylvania, one of the best of the bands, entertained General Washington on his birthday in 1778 at Valley Forge. The move toward independence also elicited the first nationalist tunes such as the instrumental march, "The Road to Boston."

Parody played a large part in Revolutionary-era American song writing as well-known British patriotic tunes were given lyrics that turned their original meaning on its head. The traditional text of "The British Grenadiers" compared these English shock troops with Alexander the Great and Hercules. The American version to the familiar tune, "A Song on Liberty," is attributed to Boston Patriot Joseph Warren, who died in 1775 at Bunker Hill:

Proud Albion bow'd to Caesar,
And numerous lords before,
To Picts, to Danes, to Normans,
And many master more;
But we can boast Americans
Have never fall'n prey,
Huzza! huzza! huzza! huzza!
For free America.

"The Liberty Song," written by John Dickinson of Pennsylvania in 1768, took its melody from the English "Heart of Oak," written by London actor

David Garrick in 1759 to celebrate victories over the French in the Seven Years' War (1756–1763). Dickinson's lyrics stopped short of advocating open conflict but reflected the confrontational spirit engendered by the Townshend Acts:

Come join hand in hand, brave Americans all,
And rouse your bold hearts at fair liberty's call;
No tyrannous acts shall suppress your just claim
Or stain with dishonor America's name.

In a musical repartee, annoyed British soldiers stationed in Boston countered with "Parody upon a Well-known Liberty Song—Come Shake Your Dull Noddles," printed by the *Boston Gazette* later in 1768:

Come shake your dull Noddles,
Ye pumpkins and bawl,
And own that you're mad at fair Liberty's Call;
No scandalous Conduct can add to your Shame,
Condemn'd to Dishonor
Inherit the fame.

"Yankee Doodle," a British lampoon of American soldiers that probably dated from the Seven Years' War, had many textual variants that strayed from patriotic fervor into bawdy camp commentary. It was updated for the American rebellion when it was printed in England in 1780 as "Yankee Doodle, or (as now Christened by the Saints of New England) The Lexington March" and had instructions for "The Words to be Sung thro' the Nose . . ." in imitation of an American accent.

Singing sacred music in this period was a prevalent pastime and a few patriotic hymns became popular. William Billings's "Lamentation Over Boston," published in 1778, connected the Patriot cause with religious enthusiasm and, specifically, the 137th Psalm:

By the Rivers of Watertown we sat down and
wept,
when we remember'd thee, O Boston.
As for our Friends, Lord God of Heaven,
preserve them, defend them, deliver and restore
them unto us.

Billings's "Chester" became the spontaneous anthem of American troops when he rewrote the text for one of his own hymns with words of martial inspiration:

Let tyrants shake their iron rod,
And Slav'ry clank her galling chains,
We fear them not, we trust in God,
New-England's God for ever reigns.

The years immediately after the war brought new verses that celebrated the new nation and its heroes, either with new music or older melodies, but no longer relied on parody. New England composer Abraham Wood's "Hymn on Peace" encouraged

turning "swords to plowshares" while praising God for the success of the American cause. The expanded notion of individual rights was underscored by "The Rights of Woman," printed in Providence in 1793:

Woman aloud rejoice exalt to thy feeble voice in
cheerful strain.
Let woman have a share, nor yield to slavish fear
Her equal rights declare and well maintain.

The near deification of General Washington even before he became the first president found expression in music. Two popular songs were "Washington's March" and "He Comes, the Hero Comes!," celebrating Washington's return to New York in 1783. Philip Phile, a former Hessian soldier who led the pit orchestra in Philadelphia's theater in the late 1780s, wrote "The President's March" in 1789. Possibly played at Washington's first inauguration, the tune was very popular, and when Joseph Hopkinson wrote lyrics for it in 1798, it became "Hail! Columbia," America's unofficial national anthem for most of the nineteenth century. Other paeans to American ideals came from theater musicians, such as Alexander Reinagle's "America, Commerce, and Freedom," written in Philadelphia in 1794. The death of Washington in 1799 prompted the publication of memorials. "Funeral Dirge" by I. Decker was played by the Alexandria Band at his funeral, while "Funeral Dirge on the Death of General Washington" by Peter Von Hagen was played at the Stone Chapel in Boston.

By the mid-1790s political divisions between Federalists and Jeffersonian Republicans were finding expression in song. "Hail! Columbia" originated as a stridently pro-Adams, anti-French exhortation to present a united national front:

Firm—United—Let us be,
Rallying 'round our Liberty
As a band of brothers joined,
Peace and Safety shall we find.

"Ode on Science," written by Deacon Janaziah in 1798 and a very popular tune during the nineteenth century, tried to find a middle ground in resisting both British and French threats to American sovereignty:

The British yoke, the Gallic chain,
Was urged upon our necks in vain,
All haughty tyrants we disdain,
And shout, Long live America.

Other composers tried to appeal to followers of both of the emerging parties with medleys that switched back and forth in allegiance. Perhaps the best-known is Benjamin Carr's "Federal Overture," presented in New York in 1794, which included "Marseilles," "Ca Ira" (both Republican, Francophile

anthems), "O Dear What Can the Matter Be" (a comment on the current political strife) "Rose Tree," "Carmagnole," "President's March," and "Yankee Doodle" (the last two were Federalist favorites). Band leader Carr was rewarded for his lighthearted attempt at inclusion with a near riot and physical assault.

Musical political invective only became sharper with Jefferson's presidency. Set to a martial tune, "Jefferson and Liberty," a response to the earlier "Adams and Liberty," was a celebration of the overthrow of the Federalists. The first two lines refer to the Alien and Sedition Acts and the rest of the Federalist national security panic of 1798–1800:

The gloomy night before us flies, the reign of
Terror now is o'er,
Gags, Inquisitors and Spies, its herds of Harpies
are no more.
Rejoice! Columbia's Sons, rejoice! To tyrants
never bend the knee,
But join with heart and soul and voice, for
Jefferson and Liberty.

The War of 1812 brought a reappearance of anti-British compositions. Francis Scott Key's "The Star-Spangled Banner" was written in 1814 using the melody from "To Anacreon in Heaven," an old British drinking song, but did not become the official national anthem until 1931. Andrew Jackson's victory in New Orleans in 1815 added lyrics and a fiddle melody to American folk music; "The 8th of January," or "The Battle of New Orleans," became a hit song for early rock-and-roller Johnny Horton in the 1950s. Humorous, satirical songs flourished during the presidential campaign of Andrew Jackson, a new brand of politician. In 1822 supporters of Jackson's first presidential campaign sang "The Hunters of Kentucky," which reminisced about the general's victory. Opponents of his second term in office who had been put off by his autocratic style and allegations of corruption sang "King Andrew" in 1834:

King Andrew had an itching palm to finger the
nation's cash;
Most of 'em thought 'twas just the thing but
some thought it'd be rash
The General took his cook's advice and hurried
away the Rhino;
But where it went, aye there's the rub, I'll be
damn'd if you or I know.

Although patriotic songs remained steady sellers throughout the nineteenth and twentieth centuries, electoral satire set to music became a permanent art form in American politics, even if the lyrics were by nature ephemeral.

Popular

American music in the late colonial and early national periods depended greatly on styles, publishing, and performers from England. With various rich traditions of many types of music and a range of venues for performance, Great Britain supplied English-speaking colonists with the cultural elements of three basic categories of music.

SACRED MUSIC

The most widespread form of music found in early America was psalmody, which was used by nearly all Protestant branches and sects. Adhering to the Reformation belief in full participation by congrega-

tions in singing, colonial Americans sang in worship services, including Congregationalists in New England, German Lutherans in the mid-Atlantic region, and Anglicans and Scots-Irish Presbyterians in the Virginia Tidewater and the Deep South. Puritans and other dissenting sects believed in using only scriptural verses from the Psalms of David for services rather than hymns by composers who were their contemporaries, and they also eschewed the use of choirs and instruments as trappings of Catholic excess that distracted from the purpose of worship. These principles began to give way during a century of changes in sacred music that emanated from England beginning around 1720. Sacred music was so important to colonial culture that America's first published book was the Bay Psalm Book in Boston in 1640, a Puritan revision of psalms translated from Hebrew. In New England, colonists sang psalm tunes outside of church while they worked or at midweek gatherings where secular songs might also be sung.

In the mid-Atlantic colonies and the South, German Pietists and Anglicans had no such injunction against instruments or choirs, but organs and bell rings were rare until later in the eighteenth century because of their cost. Throughout the Revolutionary and early national periods, the insular German Moravians in Pennsylvania and North Carolina enjoyed a string of composers trained in Germany who were especially fond of incorporating brass ensembles into their services. Anglican churches used organs in the largest northern cities, but in the South, only the refinement of Charleston, South Carolina, attracted such compositional talents as Charles Theodore Pachelbel (1690–1750, son of Johann), Henry Purcell (1742–1802), Peter Valton (1740–1784), and J. H. Stevens (1750–1828). By the 1760s, the “regular singing” reforms initiated earlier in New England were slowly being adopted by parishes throughout the Northeast and in the South as well. These transitions included moving away from the seventeenth-century practice of “lining out,” in which a deacon or preceptor spoke or sang a line that was then repeated by the congregation, a practice necessitated by illiteracy or a lack of psalm books. It gave way to using separate choirs trained to read music in weekly singing schools for at least part of the service. There was also an expansion in the use of hymns (in which Scripture is only paraphrased or referenced), aided by the waves of revivals in England and America in the 1740s. The use of hymns was championed by English religious lyricists like Isaac Watts (1674–1748) and the brothers John Wesley (1703–1791) and Charles Wesley (1707–1788). Stringed instruments such as violins, bass, and tenor viols began to accom-

pany choirs that were increasingly seated apart in galleries above the congregation. Finally, a more florid, ornamented, and dynamic style of sacred music composition, influenced in part by English theater, found its way to America originally through imported tunebooks and musicians. While indigenous American hymnody had been meager, the Revolutionary period ushered in a dramatic escalation in sacred music composition and publishing that focused mainly in the Northeast. Beginning with the *New England Psalm-Singer* (1770), by William Billings (1746–1800), which contained 127 of his own pieces and no imports, a host of amateur singing masters and composers began a publishing frenzy that continued into the early nineteenth century. The percentage of American compositions in all publications went from less than 5 percent in 1770 to nearly 70 percent in 1800. At the same time, the total number of pieces printed increased by a factor of ten during the same period, from approximately 1,460 to 15,770. Enjoying wide popularity during the Revolution and until the turn of the nineteenth century, these Yankee tunesmiths were almost exclusively rural storekeepers and tradesmen without formal musical training. A few of the more popular hymns had overtly patriotic themes, such as “Lamentation over Boston” (Billings), “Bunker Hill” (Andrew Law, 1748–1821), and “Bennington” and “Trenton” (Daniel Read, 1757–1836). Billings’s “Chester” was more popular with the Patriot troops than was “Yankee Doodle,” and the funereal “China,” by Timothy Swan (1758–1842), was the standard, rather than Chopin’s sonata, at American memorial services for much of the nineteenth century. A popular characteristic of this first American style of music composition was the choral device of “fuguing.” American fugues, as distinct from much more complicated European fugues, were simply sections of staggered, overlapping phrases sung by the different parts of the choir as in singing rounds. Often rendering the words of worship unintelligible, the style was deemed by some critics to be sacrilegious and indicative of moral failing. A final wave of reform in sacred music occurred after 1800, originating in the major urban centers of Boston, New York, and Philadelphia. Influenced by recently arrived European professional musicians and a conservative reform component of the Second Great Awakening, the indigenous American style of folk hymnody came under attack as lacking both sophistication and sufficient reverence. The careening melodies and simplistic use of “fuguing” seemed to a new generation of Americans anachronistic and too oriented toward the enjoyment of singing for its own sake. Advocating strict

attention to European standards of harmonic composition, a younger cohort of American sacred music composers including Lowell Mason (1792–1872), Thomas Hastings (1784–1872), and Samuel Dyer (1785–1835) espoused a simpler, more accessible genre epitomized by Hastings’s classic “Rock of Ages.” Hymnody remained an immensely popular type of music throughout the nineteenth century and continued to be the predominant way in which most Americans participated in making music.

THEATER MUSIC AND STAGE SONGS

Music from the colonial theater did not initially have a large public audience, but by the second decade of the nineteenth century, musical entertainment generated by the stage commanded an enormous following. The period from the Revolution through the first third of the nineteenth century witnessed a gradual legitimization of public theater in America that brought with it an increasingly significant variety of popular music.

Each of the three largest colonial cities—Boston, New York, and Philadelphia—hosted attempts at establishing venues for performing British drama earlier in the eighteenth century. These entertainments, which often took place in taverns, were met with opposition by Quakers in Philadelphia and Puritan sensibilities in Boston. Disapproval of the theater in colonial New York was more politically based and dramatic productions flourished only during the nearly continuous British wartime occupation. As traditional political structures changed and antagonism to British exports waned in these cities in the postwar period, so too did resistance to professional theaters. During the 1790s, each major city eventually had at least two theaters in operation, with satellite circuits of smaller venues in outlying towns. Funded by proprietors drawn from new merchant ranks, theater companies were imported wholesale from the vibrant comic-opera scene in England as scores of professionally trained musicians and singers relocated to America. In addition, during the 1790s émigrés from the French Revolution and the Haitian slave revolt brought French aristocratic talent to these urban centers as well.

This rapid influx of trained European musicians employed in theaters generated a taste, and a market, for music that required instructed accomplishment and reflected the classical and Romantic styles then current in Europe. Music in early national theaters consisted of performances by pit bands before and after plays as well as accompaniment during musical dramas. The selections came from a wide assortment

of styles, from European composers to vernacular ballads and patriotic pieces. Within two decades after the war, music played in a refined manner went from being the province of gentleman dilettantes emulating their European counterparts to a widely available style made accessible through expanding theatrical circuits. The British comic-opera tradition was similar in many respects to modern musicals, and after 1800, favorite songs from especially popular plays gained favor with the public. This development was further promoted through intercity tours by solo European and American male and female actors who were also accomplished singers. These performances were more profitable and easier than participating in dramatic productions and focused public attention on the individual careers of the “stars.” (The use of the word “star” to denote singer and actor celebrities began in late-eighteenth-century England.) Urban circuses, stationary but feeble structures in Philadelphia and New York, competed with theaters in presenting popular entertainments, including music, that lacked the pretense to gentility that theaters strove to offer. This cultural dualism between vernacular and cultivated taste was presented together within single shows in the early national period to American audiences that reflected a broad social spectrum. Later nineteenth-century developments in American fine arts increasingly separated the loci of performances for these parallel tastes. Favorite songs lingered even further in the attention of the public through sheet music-publishing in major American cities. As American printing and publishing expanded exponentially during the 1790s, so too did music publication. Popular songs, including selections from well-known ballad operas like *The Beggar’s Opera* (1728), *Love in a Village* (1762), and *The Poor Soldier* (1783) (George Washington’s favorite), received attention on a national basis as music publishers in different cities traded best-selling sheet music among themselves. Relatively inexpensive single offprints of popular tunes appealed to increasing numbers of owners of the new pianoforte, a keyboard instrument that had been replacing the harpsichord as a popular instrument in prosperous households since the Revolution. After 1800 new generations of aspiring young middle-class ladies were encouraged to acquire the rudiments of singing and piano playing as part of a matrix of social distinction. The Bohemian immigrant composer A. P. Heinrich (1781–1861) commented that his real income came from “teaching little misses on the pianoforte, for small quarter money, often unpaid.” Popular subgenres abounded, including patriotic tunes, sentimental songs, and music borrowed from European countries.

Airs from Ireland and Scotland became very fashionable after the turn of the century, prompting compositions like *Six Ballads from the Poem of "The Lady of the Lake"* (1810), by Benjamin Carr (1768–1831), taken from Sir Walter Scott's just-published epic. By the 1820s the theater had increasingly become a venue for an assortment of music-centered entertainments that featured comic skits, famous scenes from plays, and various types of dance. This variety format moved easily into the minstrelsy phenomenon in music hall circuits that dominated American popular entertainment later in the nineteenth century.

VERNACULAR AND FOLK MUSIC

This ephemeral genre of popular songs has been variously referred to as "folk" or "oral" traditional music and usually ascribed to rural or working-class practitioners. However, late-twentieth-century revisions by musicologists have shown that ballads formerly believed to have been circulated through a shared cultural memory, predicated on illiteracy, were actually often recorded and learned through print and manuscript as well as through oral transmission. In addition, they were enjoyed by all levels of society. Later nineteenth-century conceptions of folk authenticity, deeply colored by Victorian notions of class and gender, have to varying degrees persisted into the beginning of the twenty-first century. Children's songs, often didactic and moralistic, endured as a consistent subgenre for many generations, intertwined with stories and fairy tales. Public singing was often associated with taverns, which were known to have repositories of broadsides and chapbooks containing lengthy verses about tragic and current events. By the second half of the eighteenth century, Americans were recreating ballads in the British traditional style, but with Americanized meanings and words.

One of the earliest known indigenous American ballads is "Springfield Mountain," or "The Death of Timothy Merrick." Originally a memorial for the untimely death of a young man bitten by a rattlesnake in Wilbraham, Massachusetts, in 1761, the ballad was eventually sung to children as an instructive lullaby. By the 1830s, versions of the song that satirized its rusticity spread in print and appealed to an audience several generations removed from the tragedy and inured to the ballad's sentimental roots. Thus, vernacular songs in this period could be transformed according to contexts that complicated simple entertainment: spreading sensational news, warnings to children, and self-deprecating humor. Vernacular instrumental music such as dance melo-

dies on the fiddle or military music for the fife were still transmitted by ear, but even these tunes were formalized in printed songsters that created "official" versions. African Americans, free and enslaved, influenced this colloquial music idiom to greatest effect through self-taught proficiency on European instruments played with African sensibilities. Diaries, letters, and journals abound with anecdotes describing public "street" music in general as well as black practitioners in particular.

Popular music after 1800 began to reflect social changes taking place elsewhere in American society, especially in regard to a lay rejection of artistic expertise and acquiring direct access to new music. Ballad lyrics published in newspapers, magazines, or broadsides invoked well-known melodies that sidestepped any requirements of musical training. While this strategy had long been in use, the rapid expansion of inexpensive print sources after 1790 meant greater selection. Shape-note music, invented in the 1790s, became widespread in the ensuing decades. Also known as "dunce" notes or "patent" notes (for the different notational systems copyrighted), shape-notes relied on note-heads of squares, triangles, diamonds, and circles to represent relative tones in a given key that sidestepped the need for sharps and flats (or even a staff in some systems). This simplification of notational literacy was reviled by many urban commentators, but it remained popular and widely used in regions west of the Atlantic seaboard as the country expanded.

This democratization within popular music worked against the increasing sophistication of taste that the influence of trained European musicians introduced to American music, and it contributed to the gradual bifurcation of venues within public music later in the nineteenth century. It should be emphasized that these categories of sacred, stage, and vernacular music intersected and that all reacted with the others to create a lively national music soundscape.

MUSLIMS, CONCEPTS AND IMAGES OF

Early American understandings of Muslims were shaped by the political power of the Ottoman Empire, the geographical expanse of the Islamic world, and the aura of the exotic found in *A Thousand and One Nights*. New nationals of varied backgrounds found the Islamic world to be a distant site of oriental opposition and licentiousness. By contrast, Americans saw the destiny of their new nation as joining religious and republican worldviews in a majority vision of Christian patriotism. When the Constitution in 1787 protected the religious freedom of officeholders, anti-Federalists feared the opening of American government to “Jews, Turks, and Infidels.”

Early American religious views of Islam as anti-Christian stemmed from the heritage of the Crusades, which cast Muhammad as a false prophet who attracted adherents by appealing to carnal desires and coercing belief through violence. Interpretations of the Books of Daniel and Revelation featured Islam as the smoke from the bottomless pit resulting from the corruption of Christianity. American missionaries in the eastern Mediterranean after 1819 viewed Muslims as cursed followers of a dark delusion whose removal was a promised sign of the coming millennium.

Americans were also influenced by the Enlightenment’s equation of Islamic government with systematic despotism. The eighteenth-century French

political philosopher Charles de Secondat, Baron de Montesquieu, popularized an image of Muslim political authority as an illegitimate empire of passion that negated the ideals of republicanism. The perverse excesses of male Islamic despots who replaced the moral home with the sexualized seraglio symbolized a social order in which the virtue of liberty had degenerated into the vice of passionate license. Montesquieu’s compatriot, Constantin François de Chassebouef Volney, saw Ottoman despotism as causing the social ruin of Mediterranean culture by replacing free inquiry with fatalism. His influential work *The Ruins, or a Survey of the Revolutions of Empires* was first translated into English in 1792 and again, ten years later, by Thomas Jefferson when he was serving as president. During the early years of the Republic, images of Muslim despots included the Turkish tyrant, the Barbary pirate, the Algerine spy, and the treacherous Malay. Americans thought Muslim societies were infested with a host of behaviors associated with public vice—not only political tyranny, but also ambition, corruption, covetousness, ostentation, sensuality, and cruelty—all dangers fatal to the viability of a virtuous republic.

The most sustained American contact with Muslim lands took place during a succession of conflicts between the United States and the North African regencies of Algiers, Tripoli, and Tunis. In 1785 Algerian corsairs sailed out of the Straits of Gibraltar and captured two American vessels no longer protected by British treaties. The plight of these captives attracted public attention in late 1793 when nine more ships and their crews were taken into captivity. A treaty signed on 12 July 1796 with the Dey of Algiers resolved this crisis at a humiliating cost of ransom and tribute. The Pasha of Tripoli’s demand that tribute be paid to him as well led to the Tripolitan War of 1801–1805, which was eventually resolved through the successful exploits of the newly developed U.S. Navy. The presence of Tripolitan prisoners in New York and the six-month tour of a reckless Tunisian ambassador in 1805–1806 helped to deflate images of the fearsome Muslim despot. Widely read works of literary fantasy celebrated how the female virtue and male valor of early nationals converted Muslims from despotism to democracy through the expression of a vigorous American example.

In the crisis of American captivity in Barbary, early abolitionists viewed Muslim practices as a mirror of the dangers that slavery posed to democratic civilization. Benjamin Franklin, less than a month before his death in 1790, satirized a Georgia congressman’s support of the slave trade by assuming

the persona of an Algerian courtier who supported North African slavery on the grounds that Christians were needed to cultivate its lands. The only Muslims living in the United States during the founding period were Africans uprooted from Islamic cultures in West Africa whose heritage, although destroyed by the slave system, helped individuals to deal with the indignities of bondage.

During the Greek War of Independence from the Ottomans (1821–1828), many Americans emphasized the barbarity of Turkish despotism in their eagerness to see democracy exported back to the land of its origin. The victory of the Greeks and the decline of Turkish power in the Mediterranean after 1830 led

to an increase in travel that fostered more romantic images of Muslims, including those of the natural freedom of Arab life.

NAMING OF THE NATION Although the Declaration of Independence marked the first official usage of the name “United States of America” to designate the new nation, the name was not entirely novel in 1776. Its constituent elements had evolved over time in response to changing circumstances in the colonies. Europeans since the early sixteenth century had recognized “America” as a geographic region, owing to the efforts of cartographers such as Gerard Mercator. The term increasingly acquired political connotations after colonization. During the French and Indian War, an abortive attempt to construct a colonial union signaled a growing identification among British Americans. This identity would ultimately be forged in opposition to England during the Revolution, when it became common to refer to the “United Colonies.”

As the crisis with England deepened in the 1770s, some revolutionaries began referring to the colonies as “states,” a word that did not convey the same sense of dependence. Royal officials such as Thomas Hutchinson, the governor of Massachusetts, noted the changing terminology, but its meaning became evident only with the Declaration of Independence. The Continental Congress’s instructions to have the Declaration reprinted and read aloud helped popularize the phrase “United States of America.” And its

subsequent usage in both the Articles of Confederation and the Constitution solidified its status as the official name of the Republic by the end of the 1780s.

Not everyone in the new nation was satisfied with the name, however. The tercentennial of Columbus’s first transatlantic voyage prompted some in the 1790s to suggest renaming the country in his honor. It had not been unusual in earlier centuries to call the New World “Columbia,” and Americans in the post-Revolutionary period were adopting the term for everything from colleges to state capitals. Patriotic clubs even began making toasts to “the United Columbian States.” Members of the newly formed Massachusetts Historical Society would especially champion the cause of Columbia. To them, the name not only provided a new, non-English (yet still European) identity for the nation, but also righted a historical wrong. Early mapmakers, they argued, had mistakenly attributed the discovery of the Americas to Amerigo Vespucci. Well into the nineteenth century, other historical societies would similarly propose to correct the error by removing Vespucci’s name from the country’s official title. The New-York Historical Society recommended “The Republic of Washington,” while the Maryland Historical Society preferred “Alleghania.” Yet neither name captured the popular imagination.

Perhaps no single person expended greater effort to change the country's name than did Samuel Latham Mitchill, a congressman and later senator from New York. Mitchill's thoughts on the issue reflected both his patriotism and his embrace of Enlightenment rationalism. He found the term "United States of America" uninspiring because it merely reflected a formal political arrangement rather than capturing the spirit of freedom that animated the new nation. He accordingly proposed the name "Fredon" or "Fredonia," which he loosely translated as "house of liberty." Despite Mitchill's lobbying efforts among such luminaries as Noah Webster and President Thomas Jefferson in 1803, the name never gained much currency outside of his native New York.

NAPOLEON See **European Influences: Napoleon and Napoleonic Rule.**

NATIONAL CAPITAL, THE In the months leading up to the American declaration of independence from Great Britain, colonists could look to two capitals, or centers of political activity: London and Philadelphia. London was the largest city in Europe as well as the hub of the British Empire. It was home to England's primary political, financial, and cultural institutions, and by implication it represented the imperial capital to the British colonists of North America. Independence necessarily severed the American connection to London.

Then there was Philadelphia. The capital of Pennsylvania, centrally located on the Atlantic seaboard,

and the most populous city in the colonies in 1776, Philadelphia was also the seat of the Continental Congress. By default, it became the national capital when on 4 July Congress issued the Declaration of Independence. In the midst of a revolutionary war, Americans never deliberated on the appropriateness of Philadelphia as the capital city for the fledgling nation, nor would they for at least another decade. Few Americans took notice when the British occupied Philadelphia in 1777; the rump Congress simply fled to Lancaster, some forty miles to the interior. Over the ensuing seven years the Continental and then Confederation Congress met in York, Baltimore, Annapolis, Princeton, Trenton, and again in Philadelphia. After adjourning on Christmas Eve in 1784, the peripatetic Confederation Congress finally removed to New York City, where it met for the remainder of its existence.

New York City thus became the national capital of the nascent United States. Through the 1780s the Confederation Congress conducted the nation's business in lower Manhattan. In 1787 it called for a convention to meet in Philadelphia "for the sole and express purpose of revising the Articles of Confederation." By the end of the summer, the Continental Congress was on its way out to be replaced by a new government. The people of the several states ratified the United States Constitution in the course of the next year, and in 1789 a new national government convened in lower Manhattan. On the steps of the Federal Hall on Wall Street, Chancellor of New York Robert R. Livingston administered the oath of office to George Washington as the first president of the United States. Among its numerous provisions, the new Constitution stipulated that Congress purchase from the several states an area of land no larger than one hundred square miles on which to erect a permanent "seat of government."

The symbolic and strategic importance of the location of the national capital was not lost on the members of the First Congress. A fierce debate raged from September 1789, when the issue was broached, until the final House vote on 9 July of the following year. Congressmen deliberated on some sixteen possible sites. In addition to New York City, Philadelphia, and Baltimore, a number of smaller locations were put forward in Pennsylvania, New Jersey, and Maryland. James Madison proposed the creation of an entirely new city to house the capital, to be erected on the shores of the Potomac River. Ultimately, the final form of the Residence Bill embraced Madison's idea, providing for a new city to be constructed on territory between Maryland and Virginia. In the ten

years it would take to complete construction, the government would reside in Philadelphia.

How Madison's bold proposal became a reality is the stuff of legend. Virginia's and Maryland's gain was New York's and Pennsylvania's loss. No one knows precisely why New Yorkers agreed to forfeit the city's prospect of becoming the permanent capital of the United States. Most contemporaries agreed that Alexander Hamilton, the New Yorker serving as Washington's Treasury secretary, had traded it away in exchange for gaining Madison's tacit agreement to his plan for national assumption of state debts. Known as the Compromise of 1790, this remarkable political horse-trading allegedly transpired over dinner at Secretary of State Thomas Jefferson's residence at 57 Maiden Lane. In order to save his funding and assumption plan then languishing in Congress, Hamilton assented to using his influence to have the nation's capital, its putative heart, shifted several hundred miles to the south. As for the supporters of the various Pennsylvania locations, they were rather easily won over. Not only were they assured of gaining the capital for ten years, but the prospect of its never moving to the mosquito-infested shores of the Potomac River was very great indeed. What one Congress could give, another most likely would take away. Passage of the 1790 Residence Bill was not likely to be the last word.

Fully cognizant that the Potomac location was both unpopular and impractical, Madison and Jefferson sought to distance Congress as far as possible from the entire process. Madison effected this brilliantly by persuading the legislature to recuse itself from virtually all subsequent decisions concerning the capital in favor of the executive. President Washington would be charged with oversight. Despite reservations, including a conflict of interest—Washington actually owned some of the land ultimately settled upon—the president agreed to the terms of the Residence Bill. In subsequent years, he took great interest in and expended a great deal of energy on the plans to create a capital city, which all knew would ultimately bear his name.

What Jefferson and Madison did not know was whether the Compromise of 1790 was worth the price. In 1792 Jefferson confessed that the trade had been a political blunder of the first order. By the time the government actually removed itself from Philadelphia to its new home on the Potomac eight years later, Jefferson had changed his mind. As the first president inaugurated in Washington, D.C., Jefferson already in 1801 could perceive the symbolic, political, and even historic significance of situating the

nation's capital in the South. In the ensuing decades Washington took on the atmosphere of a southern town, with slavery and slave markets, torrid summer heat and humidity, and a leisurely pace that inevitably had an impact on national policy and politicians.

Far more significant than where the capital was placed, perhaps, was from whence it came. By effecting the removal of the capital from New York and Philadelphia, Jefferson uniquely invested his agrarian ideal into American political culture. At the heart of the Jeffersonian vision, which would predominate at least through the nineteenth century, rested the conviction that cities like New York and Philadelphia were "sores on the body politic," full of vice and corruption, and utterly unbecoming a nation of farmers and freeholders. Enconced on the banks of the Potomac River, the bucolic American seat of government might stave off the type of corruption that plagued European courts. In America, it would seem, "country air makes free."

Even as President John Adams reluctantly and ruefully removed from Philadelphia to Washington in the winter of 1800, where he would shortly turn over the ship of state to Jefferson, a deep irony was at work. It took many decades, but as Washington expanded around the wonderfully symmetrical design of Pierre Charles L'Enfant, it increasingly became the symbol of an emerging empire. In 1814 the capital was still sufficiently inconsequential that its burning by the invading British army had negligible impact on either the outcome of the War of 1812 or the Madison administration. Washington never rivaled New York or Philadelphia as the locus of cultural or financial might, but by mid-century it stood for central power utterly antithetical to the American agrarian ideal that had spawned its birth in the first years of the Republic.

NATIONAL INTELLIGENCER Although the *National Intelligencer* began as a party newspaper, the talents, principles, and government connections of its editors soon helped it to develop into one of the nation's most influential periodicals, a position it maintained for much of its early history. In the summer of 1800 Thomas Jefferson and Albert Gallatin encouraged the Philadelphia printer Samuel Harrison Smith to follow the federal government to Washington to start a Republican newspaper. Smith, a strong Jefferson supporter, readily complied, and on 31 October 1800 the first issue of the tri-weekly *National Intelligencer and Washington Advertiser* appeared.

After Jefferson's 4 March 1801 inauguration, Smith and his wife, Margaret Bayard Smith, became members of the Republican government social circle, dining with the president and members of the cabinet and Congress. Smith's political and social access to Congress and the administration led to profitable contracts for government printing as well as insights into the views of the president and the department heads. The *National Intelligencer* was soon known as the "court paper" of the Jefferson administration. Smith supported administration policies but avoided the strident tone of many of his contemporaries, striving for a moderate and balanced presentation of domestic and international affairs. Because of this evenhanded approach, the *National Intelligencer's* detailed reports of congressional debates and executive activity quickly became source material for editors across the country.

After Jefferson's retirement to Monticello in 1809, Smith left publishing for finance, selling the *Intelligencer* in 1810 to his employee Joseph Gales, Jr. Two years later Gales entered into a partnership agreement with his brother-in-law, William Seaton. Gales and Seaton continued Smith's policy of high-minded editorial comment combined with detailed reports of congressional happenings and maintained amiable relations with the Madison and Monroe administrations. Because of the *Intelligencer's* support

for President James Madison and the War of 1812, the British destroyed the newspaper's offices on 25 August 1814 during the invasion of Washington, dealing a severe blow to the partners' finances. To improve their still unstable financial situation, they began publication in 1825 of the *Register of Congressional Debates*, a detailed compilation in book form of the debates of each congressional session. Gales and Seaton's support for the Bank of the United States, to which they were deeply indebted, and for Henry Clay's "American System" led to estrangement from Andrew Jackson and his supporters.

After Jackson's election to the presidency in 1828 they no longer enjoyed close relationships with the administration and received far fewer government contracts. In 1834 they began publication of the *American State Papers*, followed by the *Annals of Congress*, two editions that not only preserved the executive, administrative, and legislative history of the early Republic but also contributed to the prestige of the *Intelligencer*. As the nation became more polarized politically in the decades leading to the Civil War, Gales and Seaton's moderate, compromising style fell out of favor. The paper came to be regarded as respectable but stodgy, and readers drifted away. Gales died in 1860, and in 1864 Seaton sold the *National Intelligencer* to a firm that moved the paper to New York, where it expired.

NATIONALISM On 4 July 1776, the Continental Congress charged a committee consisting of John Adams, Benjamin Franklin, and Thomas Jefferson to devise both a motto and a seal for the newly declared nation. The motto, approved during the 9 September 1776 meeting that also gave the United States of America its name, was "E Pluribus Unum" or "Out

of Many One." The motto was an expression more of hope than of reality. The newly united thirteen states faced a task unique to the world: to create a government whose primary affective ties were voluntary. The very idea of creating loyalty to the nation based not on kinship or ethnicity but on ideas was as revolutionary as the form of governance Americans were proposing. The Declaration of Independence from Great Britain issued that same July in Philadelphia by the delegates to the Continental Congress was one that not only called forth a nation but a war. The priority therefore was rallying domestic support through unity of purpose to defend their political actions on the field of battle. Making the principles outlined in the Declaration manifest was critical to obtaining that domestic support. To do the work of creating not only a nation but a people, it was imperative to forge bonds that would link far-flung Americans to each other and to the new nation-state. Only through the creation and inculcation of an American sense of nationalism could the Congress hope to create a durable state. The project was immense and the solutions often ingenious as the leaders of the Revolutionary effort sought to reshape old allegiances into new patterns. Institutions, rituals, and symbols by which kingdoms had created identification and loyalty in their subjects were reinvented to reflect new ideas about the relationships of citizens to one another and to their government.

The priority in the summer of 1776 was building a cohesive sense of national purpose to fight the war provoked with Great Britain. The Stamp Act Crisis of 1765 and the Townshend Act of 1767 had taught the colonists some important lessons about unity and resistance. The formation of the Sons of Liberty during those earlier crises created an organizational network that gathered around landmarks renamed "liberty trees"; where no suitable tree was available, poles were erected that were similarly dubbed "liberty poles." Used for signals and gathering places, the British searched them out and destroyed them, creating in the process a symbol. The Sons of Liberty were often controversial in their methods of organizing mob actions and enforcing boycotts, but they were effective. Unity was also promoted by ministers who mingled republicanism with millennial Christianity. Casting the Revolution as a sign of Christ's imminent thousand-year reign, various Protestant denominations supported the cause, which resulted in a distinctive cast to American political culture and to American Christianity. Broadsides and pamphlets poured out of the presses instructing the former colonists in the theory and benefits of republican government and shaping an

idea of liberty that drove the engine of popular support.

After the Revolution, campaigns related to the ratification of the Constitution provided an opportunity for public outpourings of political sentiment as supporters of a federal system framed arguments in nationalist terms. The campaign over the ratification itself signaled a shift to a national political culture that functioned through parties whose interests extended beyond the local area and issues. Despite the often bitter battles in the individual states, news in June 1788 that the needed nine states would ratify before Independence Day set off a flurry of planning in Philadelphia. The 4 July 1788 Grand Federal Procession in Philadelphia involved every class, every organization, and every bit of ritual that the evolving nation had to offer. The political culture was public, participatory, and self-conscious, a symbolic enactment of the process of creating the political nation. The frictions of class, gender, and race or of local politics were subsumed in a celebration of an anticipated future. The centerpiece was the Grand Federal Edifice, consisting of a dome supported by thirteen columns adorned by thirteen stars. The democratic spirit was evident to Benjamin Rush, who later wrote that "rank for a while forgot all its claims."

INCULCATING NATIONALISM

Remembrances of the Revolution in holidays and commemorations assumed a new importance in the early nineteenth century as the Revolutionary generation, with its concrete unifying experience of sacrifice, gave way to a generation whose national ties were more abstract. Monarchical governments had long understood the need for events that reinforced allegiance to and identification with the monarch. Holidays as well as symbols assisted in the process of encouraging people to imagine themselves as part of something larger. Sermons, songs, speeches, and monuments focused on the ideas of sacrifice and heroism in service of principle. The idea of nation was reflected in official and unofficial rituals of remembrance at such moments as the death of George Washington in 1799; the dedication of the Bunker Hill Monument in 1825; and in the ultimate in symbolism, the twin deaths of Thomas Jefferson and John Adams on the fiftieth anniversary of independence itself, 4 July 1826, were all directed to that same end.

Independence Day. The preeminent national holiday was Independence Day, celebrated first on 4 July 1777 in Philadelphia to mark the first anniversary of the Declaration of Independence. The Continental

Army camp under the command of Washington was issued a double ration of rum to celebrate the day in 1778. The celebration of 4 July helped create a needed sense of unity that was bolstered by other spontaneous celebrations at the news of American military victories. After the war, the celebration of the day focused both on the birth of the political nation and on local partisan politics. Substituting political debate and demonstrations for potentially violent conflicts over local politics, Independence Day helped domesticate the Revolutionary impulse. But Independence Day did more than provide the citizen with a sense of political participation in the nation: it gave the disenfranchised a political presence. By joining in demonstrations for or against an issue, a candidate, a party, or even non-citizens were given a voice in the public discussion. Such activities provided a general sense of investment in the political future of the nation, even if tangible participation was at best a distant dream. In performing such rituals of respect, they too were participating in a performance of nationalism.

National symbols and newspapers. Visual representations of the nation were an important facet of the ongoing project of promoting a sense of nationalism. National symbols chosen to reinforce the idea of one nation with a unifying set of underlying principles and unique character were under design from the moment of creation. The Great Seal of the United States, whose central figure was an eagle symbolizing strength and vigilance, was adopted by Congress on 20 June 1782. Likewise, a flag to stand as a symbol for the nation both on and off the battlefield was critical. Here the desire to incorporate the idea of thirteen colonies united in common cause resulted in a flag of thirteen red and white stripes to the right of a circle of white stars on a field of deep blue, which was adopted by Congress on 14 June 1777. A federal city where government would be housed and the full force of national iconography would be displayed was designed specifically to be outside of the influence or control of any one state. There, the architecture celebrated ancient republics and the union of the thirteen original colonies.

Newspapers provided a public sphere of their own where editors and printers shaped political culture through their accounts of celebrations, letters from citizens, and selection of items from other newspapers. Ballads, broadsides, and orations all provided reinforcing ideas about the practices of the new national citizenship and its appropriate expression. Popular figures such as Brother Jonathan appeared in stage plays and in newspapers as a repre-

sentative American man who was somewhat rural, more than a bit innocent, but possessed of a combination of optimism, entrepreneurial spirit, and native common sense that bested every confidence man or elitist who tried to get the better of him. Following the War of 1812 (1812–1815), Uncle Sam emerged from soldiers' jokes about the government to become a staple of the proliferating political cartoons. Less a representative man than a symbol of government personified, Uncle Sam dressed in clothing that echoed the iconography of the American flag, hectored citizens into patriotic behavior, and acted as the eternal booster of nationalism.

Educational texts. Noah Webster believed "language as well as government should be national" and set out to create an "American language." But his desire went beyond the simple idea of casting off anything British. Webster stated bluntly in the introduction to his famous speller in 1783 that education was critical to instill in youth "an inviolable attachment to their own country." "A Federal Catechism" was included in some editions so that the future citizen could imbibе stories of patriotism and the principles of republican government as he or she learned to spell. But there were lessons in nationalism even for the literate adult citizen. A critical issue for many whose universe had been decidedly local was the need to understand the parameters of the new nation. Jedidiah Morse, a minister and schoolteacher turned author, had great success with his *American Geography* (1789). Geographies like Morse's helped new citizens envision the boundaries of their new country and, within the discussion of the customs of those Americans in faraway regions, acquaint themselves with their fellow citizens.

The arts. The creative arts too were involved in the cultural work of nation building. Joel Barlow's epic poem, *The Vision of Columbus* (1787), presented the voyage of Columbus as a divinely inspired mission linked directly to the later creation of the American nation. The production of portraits of leading men combined with dramatic commemorative scenes from the Revolution enjoyed wild popularity while reinforcing ideas about sacrifice and unity. In 1786 John Trumbull completed his panoramic painting, *The Death of General Warren at the Battle of Bunker Hill*, which enjoyed healthy sales in prints and in painted copies. Trumbull's *The Declaration of Independence*, finished the following year, also won popular acceptance and, beginning in 1817, was copied onto the rotunda of the Capitol building. Gilbert Stuart of Rhode Island painted George Washington from life in 1797. Full of symbolic trappings such as eagles and

representations of the founding documents, it too was widely copied and sold. The original was the only artwork saved by First Lady Dolley Madison in the 1814 burning of the White House by the British army during the War of 1812, a tribute to its symbolic importance. It became the iconic staple of the elementary-school classroom for over one hundred years. The inculcation of nationalism was as participatory as the political culture.

CONTESTED NATIONALISM

Tests of national unity came early. In the early 1790s, farmers in western Pennsylvania were incensed over a tax they considered unfair because it applied to grain distilled into alcohol but not to grain carried to market in other forms. In 1794 they staged what became known as the Whiskey Rebellion. This test of federal authority was met head-on by George Washington, who sent more than twelve thousand federalized troops to Pennsylvania, not knowing whether the farmers would back down or the countryside would rise up in support. Washington's gamble—or his reputation—paid off as word of the approaching army defused the rebellion. The aborted revolt reminded many that the same energy that fueled the Revolution also resisted full domestication. The most serious crises that threatened the Union in the first decades of its existence came not from the feared uprisings of citizens but from the bridling of states under federal authority.

In his Farewell Address of 1796, President Washington showed that he had no illusions about the nation's potential problems. The valedictory on his eight-year presidency described anything but a triumphant and stable nation. Washington expressed an "apprehension of danger" from both foreign and domestic sources. Internal dangers included division into competing factions that might look to self-interest rather than to the Constitution and the commonweal. Only in devotion to the Constitution, he warned, would the "sacred ties" of unity protect the nation. As Washington entered retirement, he took with him not only the gratitude of the nation but its affections. By establishing a working government, he set the standard for the office of the president and demonstrated that constitutional government could work. But in his final public words there are pragmatic worries that would play out in the next generation as party politics created factions and crises arose over whose interpretation of the principles of the Revolution and the balance of power in government would prevail.

Just two years later Kentucky and Virginia raised the issue of states' rights in reaction to the Alien and Sedition Acts under Federalist president John Adams. The *Marbury v. Madison* opinion of 1803 by Chief Justice John Marshall asserted that the right of final review to determine the constitutionality of all legislation lay in the Supreme Court. Virginia's chief justice Spencer Roane held that the states were the final arbiter of debates on constitutionality, and between 1810 and 1821 the two debated the point bitterly. Roane became a moving force in the creation of both the *Richmond Enquirer* (to advocate in print the Republican position) and the Richmond Junto. The Richmond Junto, with its membership of elite Virginians, was a political machine just as much as Tammany Hall in New York City. Hoping to influence and strengthen the Republican agenda nationally, the battle was not over whether the United States should cease to exist but under what terms. The same debates arose in New England during the War of 1812. Federalists, hostile toward perceived constitutional inequities favoring the western and southern states, met in convention in Hartford, Connecticut in 1814–1815. Connecticut governor Roger Griswold directly challenged the federal government by refusing to surrender the state militia to federal authority. The case reached the Supreme Court, which affirmed the authority of the president to requisition troops from the states. The most radical element involved with the Convention was known as the Essex Junto. It took an extreme position that included favoring a separate peace with Great Britain. The demands, reduced by moderates to a call for the resignation of President James Madison and a list of grievances, were delivered by a delegation to Washington, D.C., in time for the delegates to see the celebrations of the American victory in the Battle of New Orleans (1815). Retreating in humiliation, the Federalists would never recover as a party. The foreshadowing of the nullification crisis at the end of the 1820s and the secession crisis that would split the Union between 1860 and 1861 underscored the ways in which this initial project of creating a sense of nationalism in the American people was, at best, a limited success.

NATIONAL REPUBLICAN PARTY The National Republican Party flourished between 1827 and 1833, though it did not take that name until the last months of 1830. It originated from the coalition that elected John Quincy Adams president in February 1825, and supported his administration and his unsuccessful reelection bid in 1828. It led the opposition to Andrew Jackson's presidency after 1828 and ran Henry Clay as his main opponent in 1832. In the last forty years, historians have tended to deny that National Republicans constituted a real party, but in many states they created the organization and voter support that the Whig party used to oppose the Jacksonian Democrats after 1833.

GENESIS

The term *national republican* was often used after 1815 to delineate those Jeffersonian Republicans who wished to see an active federal government pursuing a positive economic policy. In particular, representatives of the farming majority in the middle Atlantic, border, and northwestern states advocated strengthening the home market and national self-sufficiency through federal appropriations to build roads and canals and through high protective tariffs to encourage domestic industry. Supporters of this American System divided in the 1824 presidential election between Henry Clay and Andrew Jackson. By contrast, Adams gained most of his support from the urge of New Englanders—whether living in the Northeast or in recently settled areas farther west—to secure a president who was not a southern slaveholder. Though New England was still associated with the traditional Atlantic economy, early in 1825 Adams privately committed himself to Clay's policy, attracted Clay's "national republican" supporters, and so won the critical House election of 9 February 1825.

Opposed from the start by the supporters of the disappointed candidates, who gradually rallied behind Jackson's cause, the administration advocated an ambitious program of internal improvements. Under Adams, Congress voted far more money for roads and canals than under all previous presidents put together, though the voting on particular measures often reflected regional as much as partisan support. Despite losing control of the House of Representatives after the midterm elections of 1826–1827, the administration forces pushed through the most protective tariff of the entire antebellum period in 1828, though only with the last-minute assistance of northern Jacksonians. Adams men could reasonably claim that their ranks in Congress had shown a degree of commitment to the American System far surpassing that of the sectionally divided Jacksonians.

In the presidential election of 1828, the Adams men demonstrated a party discipline and organization challenging that of the Jacksonians. From March 1827 a small central committee in Washington organized the interchange of information, raised money to finance the press campaign, and established a campaign paper in Washington titled *We The People*. In twelve states the Adams men used a state delegate convention to name their electoral ticket and legitimize a state management committee, and organized congressional elections along national party lines. They spread the mantle of popular approval over their People's Ticket, stressed the interests of "la-

boring men," and scurrilously damned Jackson for his bloodthirstiness and immorality. Their campaign successfully expanded the Adams–Clay votes of 1824 and 1826, but they were overwhelmed by a massive shift to Jackson among new voters in some critical northern states.

PARTY PERSISTENCE

Under Jackson, the disillusioned Adams men slowly transformed themselves into a major opposition party, as marked by their adoption of the title National Republican in 1830. They seized on the fact that while in 1828 Jackson had been portrayed in each state as supporting whatever policies were locally popular, once he was in power he revealed a pro-southern bias. The opposition rightly portrayed his Maysville Road Veto of 1830 as a betrayal of the American System and condemned his Indian Removal Act of 1830 as both an immoral refusal to maintain the United States' treaty obligations toward native peoples and a corrupt effort to expand the slave economy. When in 1832 he came into conflict with the U.S. Supreme Court and then vetoed the bill rechartering the second Bank of the United States, his opponents severely criticized both his disregard for established constitutional principles and his irresponsible attack on the nation's prosperity.

By this point, however, National Republicans were suffering from a major cleavage in their ranks. A fervent crusade against Freemasonry had taken hold in New England–settled constituencies, and those most aroused began to demand the exclusion of all Masons from public office. Before 1829 this demand had been subordinated to the need to reelect Adams, but thereafter it divided his supporters. Some National Republicans were Masons; many more were suspicious of Freemasonry, but objected to political discrimination based on religious or private affiliations and opposed a crusade that distracted attention from national issues. As a result, the anti-Masons had to pursue their political objectives by forming a third party, which in many northern states became the bitter opponent of the National Republicans in state and local elections. Since the anti-Masons were in part objecting to the aristocratic advantages that Masons supposedly enjoyed in law and politics, the National Republicans inevitably became associated with elite privilege in a way that their broader record entirely repudiated.

This cleavage did not greatly weaken the National Republican campaign in the 1832 presidential election, simply because most anti-Masons who had opposed Jackson in 1828 were unwilling to assist his

reelection. Only in Massachusetts and Vermont, where the Jacksonians stood no chance of winning, did statewide anti-Masonic and National Republican tickets run against each other. In the three electorally powerful states of New York, Pennsylvania, and Ohio, the anti-Masons and the National Republicans agreed on a coalition: in return for a free run in the state elections without National Republican opposition, the anti-Masons agreed to support amalgamated electoral tickets that would vote in the electoral college for the candidate most likely to defeat Jackson.

Buoyed by these arrangements, the National Republicans in 1832 resorted once more to the machinery used in 1828, calling state and district nominating conventions. At the national level they organized the first national convention ever designed exclusively as a nominating device, which in December 1831 produced the first keynote address, the first nominating speech, and the first floor demonstration, all on behalf of Henry Clay. In May 1832 they generated the first formally issued party platform, which laid down the principles upon which the Whig Party would operate in the two decades after 1834. Their vigorous newspaper and broadside campaign, making innovative use of political cartoons, helped draw out a popular vote that correlated very closely with that they had received in 1828, but Jackson won even more heavily in the electoral college.

WEAKNESS

The failure of the National Republicans in both presidential campaigns resulted primarily from the fact that the anti-southern issues that gave them life restricted their reach. They appealed powerfully in twelve states stretching from Maine and Vermont to Maryland and Kentucky, always carrying at least seven of them and challenging closely in at least three others; together, these states elected 53 percent of U.S. Representatives and represented a clear majority in the electoral college. The party won its largest majorities in New England and regularly secured about half the vote in the large states of New York and Ohio, though not in Pennsylvania. The National Republicans also found extensive support in some parts of the South—in the border states, in sugar-growing Louisiana, and in Appalachia—but did disastrously in most of the older seaboard South, in the Cotton Kingdom, and on the farthest frontiers of Missouri and Illinois. This exclusion from much of the South explains why they found national success so elusive: the Jacksonians had so many more safe congressional seats and so many assured electoral college votes

that the National Republicans had to win virtually all the marginal constituencies while the Jacksonian Democrats needed only a few for national victory.

After 1832 it became clear that the name "National Republican" was a major liability, even as Jackson's renewed attack on the national bank in September 1833 brought on a crisis that emphasized the urgency of strengthening the anti-Jacksonian opposition. Anti-Masonry was already losing its force as the number of Masonic lodges declined, but political anti-Masons saw National Republicans as their major opponents in state contests, despite their common stance on national issues. Similarly the appearance of an opposition movement within the South in the wake of the nullification and bank crises created the opportunity for a genuinely national opposition party, but only if the National Republicans could shake off their identification with anti-southernism. Hence the name "Whig" became widely used in 1834 to describe all elements of opposition, but in the states where the anti-Jacksonians of the years 1827 to 1833 had been competitive, the new party used the organizational experience of its predecessor and called upon the same body of popular support. The Whig Party became the major national party opposing the Democrats for the next twenty years, but in twelve states its ideological identity and voter base can be traced back to at least 1828, under another name.

simply building the structures of government. A universe of images needed to be created both to represent the nation to the wider world as a sovereign entity and to promote the inculcation of nationalism among the populace. Devising symbols was a complicated and lengthy process. Formal symbols to represent the nation, including flags, seals, and the buildings that would house the government and its leaders, would arise from the efforts of charged committees and commissioned individuals. Building on old traditions from Europe and symbols of resistance during the decade leading up to the American Revolution, common popular use of such symbols as the liberty tree or liberty pole would also come to represent the nation and build unity as the Revolution progressed and the nation came into being.

MOTTO, SEAL, AND FLAG

On 4 July 1776 the Continental Congress charged a committee consisting of John Adams, Benjamin Franklin, and Thomas Jefferson to devise both a motto and a seal for the newly declared nation. The motto, approved during the 9 September 1776 meeting that also gave the United States of America its name, was "E Pluribus Unum," or "Out of Many One." The eagle, which became the central symbolic element in the Great Seal of the United States, emerged only after three committees spent six years attempting to distill a wide variety of ideas into one effective visual symbol. The eagle was incorporated in each of the designs. First as a detail representing Germans as one of the six primary immigrant groups to arrive in America, next as a small central figure among several in Philadelphia attorney William Barton's drawings, and finally as the centerpiece of the seal's design as described by Secretary of Congress Charles Thomson. Thomson's report combined elements from each of the committees. He specified that the centerpiece of the seal be a distinctly "American Eagle." Critical to this design was a large shield emblazoned with the colors of the flag across the breast of the eagle and standing without supporting figures. Thomson wrote in his report to Congress that he meant the arrangement to portray the United States as standing alone and relying only "on their own virtue." The eagle, which suited the predominance of classical motifs adorning buildings in the designs for the capitol because of its own associations with ancient Rome, symbolized both strength and vigilance. Congress approved the design on the same day it was presented, 20 June 1782. A flag to stand as a symbol for the nation both on and off the battlefield was perhaps the most immediate need. Here the desire to incorporate the idea of thirteen states united

NATIONAL SYMBOLS The creation of an independent nation in 1776 required much more than

in common cause resulted in a flag of thirteen red and white stripes to the right of a circle of white stars on a field of deep blue. This iconic ancestor of the present-day flag was adopted by Congress on 14 June 1777.

LOCAL INITIATIVES

In the immediate wake of the Declaration of Independence, the project of creating national sentiment was largely local and designed to rally the population to continue its resistance. The liberty tree or liberty pole, which originated during the Stamp Act protests of 1765, was reborn as a critical location for organizing resistance up and down the eastern seaboard. The importance of the liberty poles as a symbol was not lost on the British army, which cut them down almost as soon as they rose up. Holidays to replace those like the King's Birthday, which acted as a reminder of allegiances, also got their start in local Revolutionary festivities. Philadelphia chose 4 July 1777 to mark the first anniversary of independence and in 1783 Boston declared the day an official holiday. The creation of a holiday to mark the birth of the political nation served during the war as a rallying point for the development of a truly national sense of purpose. Following the war, the holiday marked national commemoration of the deeds of founding while retaining its political character in the mixing of contemporary politics in local celebrations.

PERSONIFYING AMERICA

Personification of the nation and of its ideals was a more complicated issue. America had long been represented in the Western world by Indian figures, often shown juxtaposed in the British press with the classical female figure Britannia and frequently used as ornamentation on such things as colonial seals, book endpapers, and maps. Portrayed as bare breasted and dressed in feathered skirt and headdress, the Indian was designed to project an "uncivilized" image in contrast to the "civilized" Britannia and was disliked by the former colonists. In its place, an American Revolutionary elite promoted allegorical classical symbols in order to incorporate the authority of ancient republics and desirable national virtues such as independence, strength, and unity into visual terms. Columbia, most commonly used to represent a female "America," made a bow to the discoverer of the New World. Americans preferred classical, or classically inspired figures like "Liberty" or "Columbia" as appropriate representations within which they could invest their own identity and which were deemed appropriate to take their place

with similar European figures. Columbia was chosen to pay homage to Christopher Columbus as the discoverer of America. In Columbus virtues of independence, individualism, and courage could be incorporated into a mythos and a history for a nation with only a dependent colonial past. The immediate post-Revolutionary decades saw writers like Joel Barlow in *The Vision of Columbus* use Columbus as a central figure. "Columbus," "Columbia," and "Columbian" appeared in the name of everything from colleges to towns, newspapers, and the proposed new federal district. By 1829, Washington Irving's romantic biography of the explorer as divinely guided and prevailing against the odds to discover America itself suited a burgeoning sense of American exceptionalism.

VERNACULAR SYMBOLS

The side-by-side development of those formal symbols of the nation and the rise of vernacular symbols fulfilled different cultural needs. Brother Jonathan, his progenitor Yankee Doodle, and his descendant Uncle Sam were used for everything from political commentary to sales advertising. They stood in variously for the average American (the "people") or the government itself. They evolved over time to express certain ideas about who Americans were. Yankee Doodle began his cultural life as a derisive term for colonists by British soldiers. Reclaimed in military victory during the war, he was gradually transformed into Brother Jonathan, a naïve, albeit full of common sense, representation of the new citizen in his new nation. During the War of 1812, Uncle Sam emerged from soldiers' jokes. Uncle Sam represented less the common man than the government itself—a sort of booster and nag regarding duty as the federal government consolidated its power institutionally and culturally. The symbols coexisted for varying periods of time within the newspapers and periodicals of their day.

The emergence of the United States of America came with a series of formal political actions: adopting the Declaration of Independence in 1776; fighting the Revolution; concluding the Treaty of Paris in 1783; and ratifying the Constitution in 1788. To make the principles underlying those actions manifest was critical to obtaining the domestic support necessary to defend the nation, first in war and later in the contentious peace that left competing factions all seeking to define the nation in their own terms. It was crucial to do the work of creating not only a nation but a people with affective bonds that linked far-flung Americans in a sense of interdependent union.

To the wider and more skeptical world, the assertion of sovereignty through the use of well-known symbolic motifs signaled that there was indeed “a new constellation” in the heavens as the Continental Congress formally proclaimed in approving the design of the national flag.

NATURAL DISASTERS A number of major natural disasters struck during the late colonial and early national periods. The various impacts of these calamities reflected both the nature of the event and the particular social circumstances in which they occurred. Americans interpreted disasters as “acts of God,” but the meaning attached to that idea shifted as educated elites increasingly argued that calamities arose from natural, rather than supernatural, processes. Sporadically, disaster victims received various forms of relief to ease suffering or mitigate losses.

EARTHQUAKES, HURRICANES

Earthquakes and hurricanes constituted the most terrifying disasters Americans experienced. Numerous earthquakes rattled the continent during this period, but the most significant occurred in 1755 and 1811–1812. On 18 November 1755 an earthquake shook residents from New England through the Chesapeake. Hundreds of chimneys in Boston collapsed, but there were no deaths and overall damage was minimal, especially compared to the great earthquake that had devastated Lisbon seventeen days earlier. Some viewed the different levels of destruction as a signal of God’s favor for Protestant New England over Catholic Portugal, but others highlighted more mundane social factors: Boston’s numerous flexible wooden buildings withstood the shocks better than the more rigid brick and stone structures common in Lisbon. A far stronger series of earthquakes struck in the winter of 1811 and 1812. Among the most powerful in American history, the New Madrid earthquakes (named for the nearby Mississippi River town) began in December 1811 and continued through March of the next year. Over 1,800 tremors shook an area of 956,250 square miles, ranging from Detroit to New Orleans to Charleston. Most were only minor, but three tremors, all likely measuring above 8.0 on the modern Richter scale, hit on 16 December 1811, 23 January 1812, and 7 February 1812. The earthquakes destroyed the town of

New Madrid and plunged more than 150,000 acres of forest into the Mississippi River. The force of the 7 February shock elevated the riverbed below New Madrid and temporarily reversed the river's current. At least eleven people died from the earthquakes; the total number of casualties is unknown and likely much higher. Although powerful, the tremors struck a sparsely settled region, limiting damage and losses.

Hurricanes struck more often and with greater impact. Dozens of hurricanes and tropical storms pounded the Atlantic coast during this period. Hurricanes were a distinctly American phenomenon—the word itself is derived from the Native American word *hurakan*. By the second half of the eighteenth century, the storms had become an accepted part of life, especially in the Lower South where they struck most frequently. South Carolina planters anticipated hurricanes each year; Henry Laurens warned business correspondents that “there is no depending upon our produce before the Hurricane Season and Harvest are fairly over” (Hamer, *The Papers of Henry Laurens*, p. 511). Storms routinely destroyed buildings, sank ships, and ruined cotton, tobacco, and rice crops, resulting in significant economic losses. Because of the complex infrastructure involved in production and their low-country locations, rice plantations were especially vulnerable to the storms. In addition to economic damage, it was common for hundreds of individuals to perish in major storms, including many African American slaves. Seventy slaves drowned on one sea-island estate during a storm in September 1804. More than three hundred died in South Carolina during a hurricane on 27 and 28 September 1822. In the wake of the disaster, many planters in the Santee Delta constructed hurricane towers (short circular buildings) to provide shelter for slaves on their coastal plantations. The storms also occasionally wrought havoc farther north. A major hurricane pummeled Long Island and New England on 23 September 1815, the worst storm in the region's history until the 1938 tempest. Another storm struck states from North Carolina through Massachusetts in early September 1821, flooding parts of New York City and blowing down church steeples throughout New England.

Other calamities at times threatened individuals and their livelihoods. An infestation of the Hessian fly and market forces that encouraged shipments out of the region combined to limit wheat supplies in 1788 while an unusually cold winter and spring (linked to volcanic eruptions in Iceland and Japan in 1783) delayed spring planting the next year. Panic

set in, exacerbated by eastern merchants who hoarded supplies hoping to profit from the increased demand. As a result, during the spring and summer of 1789 residents of several northern states, the St. Lawrence River Valley in Canada, and Native American villages faced shortages of provisions and hunger. Concern about food shortages also emerged in 1816, the “year without a summer.” Frosts struck as far south as Virginia three times during June, July, and August. The unusually cold weather (again linked to earlier volcanic eruptions) and reoccurring periods of drought threatened crops from Vermont through South Carolina and dramatically drove up the price of flour and other provisions.

INTERPRETATIONS

As they had done throughout the seventeenth and early eighteenth centuries, Americans spoke of natural disasters in providential language, as “acts of God,” and local officials routinely called for days of fasting or thanksgiving in the wake of calamities to encourage reflection on sin and judgment. Providential interpretations of disasters remained common, especially among Evangelicals energized by the mid-century series of religious revivals known as the Great Awakening, who maintained the belief that disasters signaled divine displeasure. The fear generated by large-scale calamities pushed many terrified victims into churches during the late eighteenth and early nineteenth centuries. Methodist churches in the western territories hardest struck by the New Madrid earthquakes experienced a 50 percent increase in membership between 1811 and 1812, compared to just a 1 percent increase among Methodist congregations in eastern states during the same period. Some Native Americans interpreted the earthquakes as a sign to join a pan-Indian alliance, led by the Shawnee chief Tecumseh, attempting to resist further white expansion into the West. The severe cold and drought of 1816 also brought forth proclamations to set aside days for fasting.

By the middle of the eighteenth century, however, arguments based on new scientific understandings of the universe and reflecting unease with the “enthusiasm” associated with the revivals challenged traditional providential interpretations. Although God remained the primary cause of all events and disasters continued to elicit calls for recognition of divine power, many educated elites, including some ministers, increasingly rejected the idea that disasters were supernatural events and argued instead that most arose from natural, or “secondary” causes. Hurricanes in particular lent themselves to such in-

terpretations. The frequency and seasonality of hurricanes and the common belief that various natural signs preceded them all suggested that the storms were part of the natural order rather than terrifying deviations from it. A sense of awe at the majesty of God's creation, rather than fear of his wrath, constituted the proper response to calamities. Indeed, some Americans argued optimistically that despite the devastation that accompanied them, hurricanes and earthquakes actually served the larger good. Harvard professor John Winthrop wrote in 1755 that more people benefited from earthquakes than suffered from them, although he offered few specifics. The southern naturalist Lionel Chalmers suggested in 1776 that hurricanes increased rainfall and purified the air, and that a lack of storms over an extended period was a "great misfortune" to residents (Chalmers, *An Account of the Weather and Diseases of South Carolina*, p. 11).

Despite such confident assertions of natural causation, the actual mechanisms at work in hurricanes and earthquakes remained a mystery. Some theories about earthquakes posited that underground fires or volcanoes were responsible for the tremors. Others suggested that electrical fluid was the prime cause. Not until the latter part of the nineteenth century did the modern science of seismology emerge. The causes of hurricanes, likewise, remained elusive, but by the late 1820s some understanding of the mechanics of the storms had developed. By the middle of the eighteenth century, Benjamin Franklin had ascertained that the movement of storms differed from the direction of their winds. In 1804 a Mississippi planter, William Dunbar, speculated that hurricanes were circular storms that revolved around a central vortex. Credit for this scientific advancement, however, usually goes to William Redfield, who provided evidence to support the theory by noting the different directions in which trees fell in various parts of Connecticut during a hurricane in 1821.

RELIEF

Some disaster relief existed to aid victims of calamities. Private and public efforts to raise money or supplies were most common in the wake of fires, but victims of other disasters also occasionally received assistance. The State of New York donated food to Native American tribes during the 1789 shortages. New York also purchased food to distribute among hungry settlers, although officials expected reimbursement and the amount of assistance paled compared to that offered by the British government to Canadian settlers. In 1815 the federal government

granted new land to victims of the New Madrid earthquakes whose property was destroyed in the disaster. Many, however, lost their claims to speculators. Congress earlier had appropriated \$50,000 to aid victims of an earthquake in Venezuela in 1812, but they did not appropriate any financial assistance for New Madrid victims. Direct financial assistance from the federal government remained minimal during the nineteenth century.

NATURAL HISTORY Natural history—encompassing a suite of subjects now considered distinct, including botany and zoology, paleontology, geology, mineralogy, and ethnography—was the most American of sciences during the early national period and the first in which American scientists other than

Benjamin Franklin attained international stature. It also served as a means for European Americans to conceptualize racial differences.

European gardeners and botanists were eager for specimens of the flora and fauna from exotic North America, and some American botanists exploited this opportunity for tidy profits from the wilderness. By the mid-eighteenth century, the Quaker botanists John Bartram (1699–1777) and his cousin Humphry Marshall (1722–1801) were scouring the colonies from Florida to New York for rare plants for use in agriculture, gardening, and science; were studying Indian uses of plants for new uses in medicine; and were using religious, commercial, and social networks to distribute plants and seeds abroad. Though initially viewed as little more than merchants, Bartram gained respect for his acuity in introducing and describing new species, and Marshall for employing the high science of Linnaean systematics (the Linnaean system of classification) in his *Arbustum Americanum* (1785), the first treatise on American trees written by an American. Indeed, for most practitioners in early national America, natural history was largely a utilitarian exercise, with taxonomy (rarely systematics) enjoying the greatest prestige but economic utility providing the impetus.

As a result of the influence of Bartram and Marshall, Philadelphia became a center of botanical interest and education. In 1789 the University of Pennsylvania appointed Benjamin Smith Barton (1766–1815) as professor of materia medica and later professor of botany, becoming the first American institution of higher learning to dedicate a position to the natural sciences. Barton's students and peers created an extensive network of researchers based on correspondence and exchange of specimens, and supported by the botanical gardens founded by David Hosack (1769–1835) in New York and André Michaux (1746–1802) in New Jersey and South Carolina, as well as by private collections such as William Hamilton's in Philadelphia. Natural history continued to attract Americans. According to many practitioners, natural history offered peculiar advantages over other sciences, requiring little in the way of complex apparatus or theoretical acuity. Moreover, Americans enjoyed a proximity to nature unavailable in settled Europe, and these scientists took the botanical description of America as a national project and point of national pride. Meriwether Lewis (1774–1809) and William Clark (1770–1838), naturalists as well as explorers, collected some of the most distinctly American plants of all, yet ironically and to the dismay of American botanists, the German

botanist Frederick Pursh (1774–1820) absconded with some of Lewis's specimens and published descriptions of them in London, scooping his American colleagues.

The wilderness exerted a formative, though not always positive, influence on the American character. Americans' daily lives brought them into contact with both American Indians and Africans—a situation made possible by slavery and continental conquest and providing a unique empirical basis from which to explore racial biology. Indeed, by the 1790s, race had become a central concern of American natural history. Benjamin Rush (1745–1813), Samuel Stanhope Smith (1750–1819), Charles Caldwell (1772–1853), and Samuel George Morton (1799–1851) systematically delineated how and why different racial types differed, and they used anatomy and behavior to order the races on a linear gradient of social and cultural “development.” In the generations of natural historians extending from Rush to Morton, the center of gravity of scientific opinion shifted from viewing phenotypic differences as a product of the environment to viewing them as an innate and unalterable division marked in body, mind, and character.

NATURAL RIGHTS Together with the companion ideas of the state of nature and the social compact, the idea of natural rights exerted great influence during the Revolutionary era and remained extremely potent in the years of the early Republic, and in somewhat modified form, it remains important even into the twenty-first century.

PREVALENCE OF THE PHILOSOPHY OF RIGHTS

The best-known example of a doctrine of rights is, of course, the second paragraph of the Declaration of Independence, but it is impossible to read very far in other documents and writings of the new nation without finding similar invocations of the philosophy of natural rights and the social contract. Thus Samuel Adams in his 1772 draft of "The Rights of the Colonists" begins with "The Natural Rights of the Colonists as Men." The 1774 Declaration and Resolves of the First Continental Congress declared in its first resolution the familiar triad of rights to "life, liberty and property"—rights said to be held under "the immutable laws of nature." Thomas Paine in his widely read pamphlet *Common Sense* (1776) appeals to "the equal rights of nature" to prove that hereditary monarchy cannot be a legitimate form of government. Some years later, during the French Revolution, Paine wrote another essay, *The Rights of Man*, devoted to defending the doctrine of natural rights against the critique leveled by Edmund Burke. The constitutions of the Revolutionary states contained clear references to natural-rights philosophy, with George Mason's draft of the Virginia Declaration of Rights of June 1776 being perhaps the most significant and most widely copied in the other states. Mason's version affirmed "that all men . . . have certain inherent natural rights . . . , among which are the enjoyment of life and liberty, with the means of acquiring and possessing property, and pursuing and obtaining happiness and safety." This list is obviously very close to the better known triad affirmed in Jefferson's Declaration of Independence: "that all men . . . are endowed by their creator with certain inalienable rights, among which are life, liberty, and the pursuit of happiness."

Although the U.S. Constitution does not contain a comparable recitation of the philosophy of rights, the reason for that is not that the drafters of the Constitution no longer thought natural rights important, but that the Constitution was a union of preexisting states that had already committed themselves to theses of natural rights in their constitutions and bills of rights. When James Madison drew up the draft for the federal Bill of Rights, he proposed that there be "prefixed to the Constitution" a statement patterned after Mason's Virginia Declaration of Rights. This proposal was not accepted, only because it was decided to append the Bill of Rights as a series of amendments following the original constitutional text, rather than, as in many of the state constitutions, to begin with a statement of principle prefacing the Constitution.

ON THE NATURE OF RIGHTS

Although those who appealed to the philosophy of natural rights were otherwise as different from each other as Alexander Hamilton and Thomas Jefferson, George Mason and James Wilson, Thomas Paine and John Adams, there was a great deal of consensus on how to understand natural rights. All agreed that some rights were natural, that is to say, not derived from any human agreement, act, or law. The rights preceded law and established claims that could be raised against existing law and government, as the Americans did in their struggle against Britain. These rights were thus deemed inherent and inalienable. The rights inhered in human beings and thus did not come from an external source. Because the rights were inherent, they could not be alienated, that is, given up or taken away. These rights were also often said to come from God ("endowed by their creator . . ."). This phrase is not meant to deny that the rights are natural or inherent; rather, it means that the rights come to individuals with their creation, with their coming into being within a created order.

Natural rights were frequently said to derive from natural law. Nonetheless, Americans of the early national period were heirs of a conceptual evolution sponsored by the political philosophers who had developed the philosophy of rights—the Dutch philosopher Hugo Grotius and the English thinkers Thomas Hobbes and John Locke in particular—an evolution that had produced a firm theoretical distinction between a law and a right. Laws set down what must or must not be done. They are clearly directive. Rights, however, are permissive and discretionary. They establish a sphere of liberty and choice for the bearer of rights. Such rights were thus frequently spoken of as liberties. The right of free speech, to take an easy example, means that one has liberty to speak or not, as one chooses. A society organized around rights tends to be a liberal society, in the sense of leaving large areas of discretion for individuals to act as they choose.

THE TABLE OF NATURAL RIGHTS

There was also general agreement on the specific natural rights possessed by individuals, as evidenced by the similarity of lists of rights generated at the time. The first right cited in all these formulations was the right to life, the right to what is most one's own. Since life depends on the body, the right to life implies a right to bodily security, the right not to have one's body seized, invaded, controlled, or harmed by others.

The right to liberty extends the right to life. One not only possesses a right against others' interfering

with one's body; one also possesses a right to exercise one's bodily and mental faculties. Liberty is in part a means toward securing life, but more than that it is the way humans express their ability to appropriate their bodies and invest them with purpose. The right to liberty expresses the self-directed nature of being human. A corollary of this right is the responsibility individuals have for their actions and for the foreseeable consequences of those actions.

The right to property involves an extension from rights in the sphere of one's own life, body, and actions to rights in the external world. It is the legal expression of the ability of individuals to make the external their own, just as they can make their bodies their own. In the context of the Revolution and early Republic, the right to property was particularly important, as can be seen in the overwhelming demand for constitutional guarantees of representation for those subject to taxes. This constitutional demand derives support from the natural right to property, since the right of others (even kings) to take property without the consent of the property owners was understood to be a violation of the right to property.

These rights together amount to an affirmation of a kind of personal sovereignty, a right to control one's person, actions, and possessions in the service of one's broader purposes. When seen as an integrated system of immunities and controls, the specific rights sum to a comprehensive right to pursue happiness, to pursue a way of life chosen by the agent as a path to happiness. Of course, this right, like all rights, is not absolute; the rights of others and the common good serve as valid limitations on personal rights.

There was also great, if not universal, agreement on who were the bearers of these rights. As the Declaration of Independence says, the truths about rights apply to "all men." This term was understood almost universally to include women and individuals of other races. In the early years of the nation it was widely recognized that slavery was a violation of natural rights, and for this reason there was a substantial movement to abolish slavery. It was also recognized that the denial of voting rights to women, for example, did not imply that women lacked natural rights. The philosophy of rights distinguished natural from civil and political rights. The first set of rights belongs universally to all humans, but the other two sets do not necessarily belong to them. It was thought that relevant to the bestowal of the latter rights were considerations other than mere personhood or membership in the species, considerations like the organization of civil society.

IMPLICATIONS OF RIGHTS

Natural rights were understood to have a number of important corollaries. The first is natural equality. Since all persons have the right to pursue happiness, to order their lives as they see fit, there can be no question that anyone possesses a natural right to rule over others. All are equal in that no one naturally has authority over another. This natural equality was also spoken of in the literature of the day as the state of nature, that is, as a state lacking any relations of legitimate authority. Authority must therefore derive from "the consent of the governed." Consent was understood to be equivalent to what was also called the social contract. Consent applied in the first instance to the formation of government and the origin of political authority, rather than to the ongoing conduct of politics. The requirement of consent derives from the primal rights, and consent to authority is given primarily to protect those rights. A further implication, then, is that if an authority does not secure but rather threatens rights, it has gone beyond its proper warrant and may be altered or abolished. From this idea flows the right of Revolution, which the colonists affirmed when they revolted.

The philosophy of rights and the ideas of a state of nature and a social contract together had a great impact on political thinking and acting in the new nation. The doctrine served as a general criterion of legitimacy, to be applied not only to the British Empire that Americans rebelled against but also to the new governments they were establishing. Under the tutelage of Thomas Paine, Americans quickly drew the conclusion that only a republican form of government could be legitimate. They concluded that all sovereign power originated in the people and must ultimately remain in the hands of the people (popular sovereignty). Beyond that, Americans perceived that many aspects of society required reordering, although they proceeded cautiously and unevenly in their efforts at reform. The American who perhaps gave the most serious thought to what would be required for a republic founded on natural rights was Thomas Jefferson, who set off to reform the laws of Virginia in a comprehensive way but was only partly successful. His proposals for revising the laws stands as the most thoroughgoing effort at effecting the implications of natural rights for the ordering of society. In his proposals he advocated abolishing slavery (because it violated natural rights), securing republican or popular government, providing basic public education for all and higher education for the most talented, allowing freedom of conscience, and abolishing feudal land laws. This list gives a brief indication of some of the grand implications that were

seen to follow for society at large from a philosophy of natural rights.

FOUNDATIONS OF RIGHTS

There was much less consensus on the basis of natural rights than on the rest of the philosophy of rights. There were a number of competing theories about the grounds of rights. Some theories derived natural rights from the moral sense; others from natural theology. Still others looked to self-ownership or human autonomy or the natural order of the passions. The disagreement over foundations became important later, but it was no impediment to agreeing on rights and their corollaries in the early years of the nation.

reflected larger changes, such as those brought by population growth, improved transportation, land ordinances and agricultural development, shifting relationships with Native American peoples, and westward expansion and exploration. Changes in how Americans viewed nature served as a leading cause, as well as a leading effect, of the growth of the nation.

By the mid-eighteenth century the American view of nature was characterized by a duality that, arguably, still exists: on the one hand, Americans were proud that the wilderness of North America was vast, lovely, and rich; on the other, they prided themselves on their ability to subdue, control, and transform nature to suit their own economic and political goals. Although Americans of this period had in some ways moved beyond the adversarial relationship to nature that had characterized their predecessors, they were deeply committed to a concept of progress that simultaneously celebrated and destroyed the natural world. As Thomas Hallock notes in *From the Fallen Tree* (2003), descriptions of “republican landscapes” commonly reveal this tension, demonstrating that Americans of the period had to grapple with the “paradoxes of expansion” (pp. 5, 4). As Americans intensified their subjugation of the North American wilderness, so too did they heighten their praise of nature and, by extension, their faith in nature as the agent of a great national destiny.

During the late eighteenth and early nineteenth centuries, three major cultural forces were especially important in changing American attitudes toward nature. First, older traditions of natural history were being displaced by a newly secularized and professionalized practice of scientific inquiry. Second, a rising tide of nationalism was claiming American nature as a cultural resource that would ensure the prospects of the young nation. Third, the European landscape aesthetics of the beautiful, sublime, and romantic took root in America, profoundly influencing the ways Americans understood and described nature on their side of the Atlantic.

THE RISE OF SCIENCE

For colonists living before the mid-eighteenth century, religion was the dominant cultural framework within which nature was understood. But whereas in 1721 the Puritan minister Cotton Mather (1663–1728) could argue that comets were created by God as a place to keep sinners for an eternity of punishment, by 1754 the influential Swedish botanist Linnaeus (1707–1778) had already published early editions of his *Systema Naturae* (1735)—a revolutionary

NATURE, ATTITUDES TOWARD Nature serves a cultural function as both a window and a mirror: it allows us to look into a physical world that transcends human limitations, but it also reflects the values, assumptions, ambitions, and fears we bring to our perception of it. Significant changes in American attitudes toward nature between 1754 and 1829

text that set forth a comprehensive system of taxonomic nomenclature and thus encouraged the professionalization of scientific practice. The rationalism at the heart of the American Enlightenment also helped push nature out of the shades of folk superstition and into the light of reason then being focused by the lens of science.

Before the rise of professionalized science in the mid-eighteenth century, misconceptions about American nature were surprisingly common. Because the complexities of bird migration were not understood, for example, many believed that swallows hibernated underwater or even, as some had it, on the moon. Some scientifically incorrect folk beliefs—such as the widely held view that snakes captured their prey by use of a paralyzing gaze—persisted into the late eighteenth century. As science professionalized, errors were corrected, new species discovered, known species better understood, and the mechanisms of migration, feeding, and breeding clarified. There were also substantial changes in how the mechanisms of the cosmos were understood. For example, while Professor John Winthrop (1714–1779) was strongly criticized for introducing the ungodly system of Newtonian science at Harvard College in the 1740s, in 1769 American astronomer David Rittenhouse (1732–1796) was celebrated for accurately recording the transit of Venus across the Sun using an instrument of his own design.

Although Meriwether Lewis (1774–1809) and William Clark (1770–1838) were not professional scientists, their approach to natural history reflected the new attitudes toward nature that characterized American thinking at the turn of the nineteenth century. In sending the Corps of Discovery on its transcontinental voyage in 1804, President Thomas Jefferson (1743–1826) had instructed that “your observations are to be taken with great pains and accuracy,” and he prioritized the methodical collection of data concerning minerals, fossils, flora, fauna, and weather. Despite their lack of scientific training, Lewis and Clark were able to provide a treasure trove of new information, including descriptions of many previously unknown species such as the grizzly bear, bighorn sheep, coyote, and jackrabbit. The observations of plants, animals, and minerals they recorded ultimately made their journals a national epic—one that helped persuade Americans that nature would be at the core of their nation’s future.

NATURE’S NATION: AMERICAN NATIONALISM

Perhaps no cultural force was as powerful as nationalism in changing the way nature in America was

perceived during the late eighteenth and early nineteenth centuries. Even after winning independence from England and establishing a new government, Americans remained insecure about their national identity, with many continuing to identify strongly with British culture into the nineteenth century. As it became increasingly clear that political sovereignty was necessary but not sufficient to inspire a unique cultural identity, Americans began to search their home landscape, history, and customs for material that was distinctively American and might therefore help unify the new nation. Americans soon realized that while their nascent arts and sciences could not compete with the long-established traditions of European culture, they did have one resource that Europe did not have and could not acquire: the vast wilderness of the American continent. Consequently, Americans began to see nature in their homeland—the powerful rivers, oceanic prairies, and lofty mountains—as something promising, rich, and uniquely American. They began to believe that national character was shaped by contact with wilderness and that national prospects could be measured by wilderness, and, paradoxically, the subjugation of it.

The assumption that nature would provide a foundation for a great culture was not, however, widely accepted—especially among Europeans, who had a stake in maintaining the inferiority of the upstart Americans. Instructive in this regard is a famous disagreement between the influential French naturalist Georges-Louis Leclerc, Comte de Buffon (1707–1788), and Thomas Jefferson. Buffon asserted his “theory of degeneration,” which claimed that American plants and animals (including, by implication, humans) were no more than degenerated and degenerating versions of their European counterparts. Jefferson, who was keenly aware not only of the bias and inaccuracy of Buffon’s theory but also of its damaging implications for a budding American culture, explicitly challenged the theory in his book, *Notes on the State of Virginia* (1785). Here Jefferson used the tools of Enlightenment science to carefully document the impressive sizes of American animals and to compare them to their (almost invariably) smaller European counterparts. Rejecting Buffon’s implication that American prospects were weak because American nature was weak, Jefferson argued instead that the impressive diversity and size of American animals actually prophesied the bright future of the young country. America, he argued, would be a great nation long after the “wretched philosophy” that would have ranked its people among “the degeneracies of nature” was forgotten. Jeffer-

son's nationalist science was endorsed by Charles Willson Peale, the curator of the first American museum of natural history, who spoke from the leading edge of American natural philosophy when he claimed that "natural history is not only interesting to the individual, it ought to become a NATIONAL CONCERN, since it is a NATIONAL GOOD."

THE ROMANTIC WILDERNESS

Changes in the American attitude toward nature were also conditioned by evolving environmental aesthetics, including new ideas that entered popular culture through landscape painting, literature, and philosophy. Among these important new landscape aesthetics was Edmund Burke's 1756 distinction between the beautiful and the sublime. The beautiful, according to Burke, described emotions stirred by pastoral landscapes, while the sublime characterized the ennobling feeling of awe inspired by the grandeur of wilderness. Because America was the land of the mighty Mississippi and Niagara Falls, the Great Plains and the Rocky Mountains, Americans were quick to embrace the aesthetic of the sublime as a means to valorize the wild expanses of their country. Following Burke's idea to its American conclusion, they further asserted that the American sublime—a mode of enthusiasm and inspiration specific to the grandeur of the American land—would also have an ennobling effect upon American character and civic institutions.

No eighteenth-century American writer expressed the beauty and sublimity of the American land more eloquently than did Quaker botanist William Bartram (1739–1823), whose *Travels* (1791) described his observations of nature during four years of solitary wandering in the American wilderness. Although trained as a naturalist, Bartram was a gifted writer whose perceptions of the natural world were filtered through the appreciative landscape aesthetics Burke helped introduce to America. "If we bestow but very little attention to the economy of the animal creation," wrote Bartram, "we shall find manifest examples of premeditation, perseverance, resolution, and consummate artifice." And the range of *Travels* is remarkable: Bartram captures both the delicate beauty of rare flowers and the sublime roar of bellowing alligators; he describes plants and animals using the precision of the scientist but animates his descriptions with the lyricism of the poet. Bartram prefigured important changes in the American attitude toward nature in that his approach to the natural world was based in science but inspired by a deep belief in the spiritual, ethical, and aesthetic power of nature.

That belief in the power of nature also signaled the ascendancy of romanticism, a literary and philosophical movement that began in Europe but had, by the turn of the nineteenth century, struck roots in American soil. Romanticism celebrated individualism, imagination, and nature, and thus complemented the new cultural values Americans embraced as the Jacksonian era dawned. The Romantic enthusiasm for wilderness also demonstrated how radically American attitudes toward nature had shifted during the past century. While they still worked with plow and saw to bring nature to the yoke, by 1829 Americans were creating a vibrant nationalist culture that identified nature as the locus of divinity for a new national religion—a secular faith that would dominate American cultural production up to the Civil War.

NAVAL TECHNOLOGY Technological developments during the latter half of the eighteenth century allowed sail-driven warships to reach their apogee. Ironically, within another three decades an invention would end the Age of Sail. In a time of tremendous innovation, billowing canvas would begin to give way to clouds of soot, naval mines would first be seeded, and Americans would take the first tentative steps toward destroying their enemies from below the waves.

TECHNOLOGY AND SAILING WARSHIPS

By 1754, warship design seemed to have reached the limit of existing materials. If hulls were lengthened much beyond two hundred feet, they tended to hog (sag at each end), reducing the seaworthiness of a vessel or even breaking its keel. Hull width was a matter of function, with room to operate the iron cannon evenly spaced along each side of a warship to hurl broadsides at an enemy (with a “chaser” or two at bow and stern) and space to store the supplies and munitions for an extended voyage weighed against the need to keep a low width-to-length ratio for the sake of speed. Similarly, the thickness of the beams and planks armoring a vessel, the size of its cannon, and the weight of its top-hamper (mass at the top of the ship) had been optimized to prevent the capsizing of the ship. Though a myriad of mast and sail plans existed, they had become quite standardized within ship classes.

No matter the correctness of design, all warships suffered deterioration while at sea. Though strategy and tactics could somewhat compensate for the vagaries of wind, current, and tide, they could not stop sea life—barnacles and weeds—from attaching themselves to the bottom of a vessel in warmer waters. Within a few weeks, long strands of weed reduced the speed of a ship to the point of ineffectiveness. The only cure was to dock or careen the vessel and manually scrape the barnacles and weeds from the hull. Each careening took days from sailing and carried the risk of damaging the vessel as it rested on the sand, listing to port or starboard so the crew could reach its bottom. Aside from reducing a vessel’s speed, many forms of sea life, especially the shipworm *Teredo navalis*, actually bore into the wood, thus reducing the overall life of a wooden vessel by years.

The continual battle against wind and sea also wore upon the human component of ships. Communicable diseases ripped through the crowded and less-than-hygienic decks. Scurvy, caused by a shortage of vitamin C, ravaged entire fleets, debilitating and killing sailors by the thousands. Water quickly turned green in wooden barrels, spreading the “bloody flux” among crews. During the French and Indian War (Seven Years’ War in Europe) of 1754–1763, any admiral keeping ships at sea for more than a few weeks found losses to natural causes in both ships and men constantly mounting. The lessons of the French and Indian War would lead to technological change as surely as that war led directly to the American Revolution of 1775–1783.

The rebellion in thirteen of its North American colonies challenged the Royal Navy even before France, Spain, and Holland joined the conflict. With few secure naval bases (notably Halifax, New York, and Jamaica) in or near the colonies the hundreds of ships of the Royal Navy and its supply train quickly began to suffer from foul bottoms. In the early 1770s, the British Admiralty had ordered experiments with coppering, a process introduced in the civilian sector to increase the speed and lengthen the life of ship hulls. The process of coppering called for a layer of forty-eight-inch by twelve-to-fourteen-inch thin copper sheets to be overlapped and fastened to the bottom of the hull. The copper, poisonous to aquatic plants, slowed the growth of seaweed, while the thin metal protected the wood from shipworms. Though the process proved very expensive, its benefits outweighed the cost, and so the Admiralty ordered all new warships to be coppered and began refitting existing vessels. Because of the need to increase the production of copper sheets, the refitting did not approach completion until the end of the war. Though Britain’s enemies quickly began to copy the new technology and though it would become standard in all navies after 1783, the Royal Navy gained a brief advantage over its enemies.

A second technological breakthrough, this time in armament, provided unexpected benefits to Britain. The Carron Iron Company of Falkirk, Scotland, designed a gun that the Admiralty adopted in 1779. The carronade was a third of the weight of similar cannon while firing the same size shot. It required a much smaller crew and less powder per round. Though its range was only two-thirds of the equivalent cannon, it could fire faster and with the same deadly effect at that range. These smaller “smashers,” as the Royal Navy called them, found a deadly place on the upper decks of larger warships. More important, when placed on smaller warships, they not only reduced the number of crew needed for gunnery, but carried the broadside of a ship two to three times their size. Though the United States would adopt the carronade, it would not prove popular with other European nations.

With the addition of coppering and carronades, the Royal Navy managed to better than hold its own against the rebellious colonies and their European allies. In action after action from 1779 onward, logs and journals alluded to the British superiority in both maneuvering and gunnery, while small warships, coppered and armed with “smashers,” ravaged American coastal traffic in the last year of the war. Though the United States won its freedom, the new

technology, coupled with advances in naval medicine (the use of citrus fruits to prevent scurvy, as well as improvements in shipboard hygiene and quarantine procedures) gave the Royal Navy the extended cruising time and the heavily armed small ships to institute year-round blockades of its enemies and to defeat France in wars that spanned the years from 1793 to 1815.

In 1794 the U.S. government saw the need to create a navy to protect its constantly expanding merchant marine as well as its right to remain neutral in the worldwide conflict then raging between Britain and France. It commissioned Joshua Humphreys (1751–1838) to design six forty-four-gun frigates for its navy. Four of these frigates—the *Philadelphia*, *Constitution*, *United States*, and *President*—would eventually be built, incorporating the last major design improvements of the late Age of Sail. Humphreys used extremely close framing as well as stress-bearing diagonal riders and thick, load-bearing planks to strengthen his ships. Between framing and oaken planks, some thirty inches of wood guarded their sides. The strength of the frame allowed the gangways that connected the quarter-deck to the forecabin on most frigates to be replaced by a spar deck capable of carrying the weight of additional cannon. In fact, though rated for forty-four cannon, these vessels often carried as many as fifty-six guns. The *Philadelphia* ran aground and was burned in 1803 during the first Barbary War and the *President* fell prey to a British squadron in the last days of the War of 1812, but the *Constitution* and the *United States* shocked the British people with a string of impressive victories against the Royal Navy, including its seemingly invincible frigates. The Royal Navy quickly copied Humphreys's design from the captured *United States* in order to build its own "superfrigates."

SUBMARINES AND MINES

The American David Bushnell (1742–1824), a graduate of Yale, invented a submersible vessel dubbed the *Turtle* in 1775. Driven by a hand crank connected to a simple propeller and featuring dials lit by phosphorescent witch moss, its single crewman used a periscope to guide the partially flooded craft to an enemy ship. Ideally, he would then use a hand drill to attach a torpedo (a keg of powder with a time fuse) to the bottom of the vessel. Sergeant Ezra Lee attempted to do just that on 7 September 1776, but the hull of his target proved too hard for the drill. (Some accounts blame this on the coppering, but the sixty-four-gun *Eagle* was probably not refitted by that date.) After

releasing the torpedo, which created consternation if not harm when it exploded one hour later, Lee made a successful escape. Subsequent missions of the submarine would also fail, but the concept had been firmly planted.

Robert Fulton (1765–1815), a leading inventor of the early American nation, designed and built a submersible in 1801. With a folding mast and sail to travel on the water and a propeller hand-cranked by its two-man crew while submerged, the cigar-shaped *Nautilus* is evocative of modern submersibles. Fulton demonstrated his vessel to both the British and the French navies. When they refused to purchase the machine, he abandoned the concept for more lucrative pursuits.

During the War of 1812, Fulton designed naval mines with both timed and contact fuses. Though the American government found the torpedoes to be barbaric, numerous local governments and private individuals thought otherwise and numbers of the mines appeared protecting local harbors or aimed at British warships. The Royal Navy called these devices "Fultons," and though none ever damaged a ship, they certainly increased the anxiety of British admirals.

THE COMING OF STEAM WARSHIPS

Fulton also designed the *Clermont*, the first American steamship, which opened operations on the Hudson River in 1807. Though Great Britain had developed and refined the steam engine, in 1814 the American government commissioned Fulton to build the world's first steam warship, the *Demologos*, in New York Harbor. Thirty three-two-pounders provided a powerful broadside, while wooden sides five feet thick and the placement of its vulnerable paddle wheel between two catamaran-style hulls protected the vessel. However, the *Demologos* proved chronically underpowered, and eventually lateen-rigged masts supplemented its steam engine. Completed shortly after the War of 1812 and renamed the *Fulton* in honor of its inventor, the warship had never fired a shot in anger when a powder explosion destroyed it in 1829.

As civilian use of steamships increased, only the first captain of the *Fulton*, veteran commander David Porter (1780–1843), seemed to realize the military potential of steam power. In 1822, he convinced the navy to allow him to purchase the one-hundred-ton Hudson River steamer *Sea Gull* for an anti-piracy squadron. Mounting three guns, its dual paddle wheels allowed the vessel to capture or destroy pirate craft with ease. The *Sea Gull* was the first steam war-

ship used in combat by a navy. On 30 March 1824, the *Sea Gull* justified its purchase by recapturing the schooner *Pacification*.

It would be the 1830s before American interest in steam warships revived. By that date, rapid advances in ship design, protection, ordnance, and propulsion made possible by the industrial revolution would make the changes of the years before 1830 seem tiny by comparison.

NEWBURGH CONSPIRACY One of the Revolutionary War's most dramatic scenes occurred at the Continental Army camp near Newburgh, New York, on 15 March 1783. Five days earlier, an anonymous

letter had urged officers to take bold action against the Continental Congress for its delay in fulfilling promises of pay and pensions. George Washington quickly forbade a meeting toward that end and instead called a general officers' meeting while implying that he would not attend. Just after it began, however, Washington appeared and requested the floor. Speaking from a slightly raised platform, he read a prepared statement that excoriated the anonymous author and reminded officers that the army's steadfastness and acknowledgment of congressional authority had earned it universal respect. Rather than abandon the country or turn against Congress in its own cause, it should rely on his and Congress's pledged faith. Apparently thinking his reception cool, he began to read from a congressman's letter but paused, then reached for eyeglasses few knew he needed. "Gentlemen," he remarked offhandedly, "I have grown gray in your service, and now I am going blind." The emotional pull of this famous, and perhaps spontaneous, aside dissolved the Newburgh Conspiracy.

The conspiracy's real extent and intent remain murky in the absence of much direct evidence, but the army's widely known discontent lends support to some dire suspicions. Continental soldiers had long-standing grievances over arrears of pay, and officers additionally feared for pensions that Congress had promised but for which it had never made provision. Given its dilatory record, officers were surely unhappy at Washington's constant admonitions to trust Congress. Worse, rumors circulated widely in early 1783 of an imminent peace treaty, which would remove any urgency in Congress about the officers' claims and perhaps fatally tempt state governments to ignore Congress's very weak condition, fiscal and otherwise. The country had survived war, but its ability to survive peace looked doubtful, a bitter thought for men who tended to believe that only stronger national government could preserve what their sacrifices had earned. These issues were widely discussed in a nearly idle winter camp; at the same time, Washington's close associate and artillery chief, Henry Knox, was drawing up plans for an association of demobilized officers as he talked up the related problems of pay, pensions, and governmental weakness. But the conspiracy coalesced around Horatio Gates, the victor at the Battle of Saratoga (1777), a senior general and sometime rival of Washington; Gates's aide, John Armstrong, was in fact the author of the anonymously circulated letter of March 10 and another circulated on March 12. Scorning further moderation, the inflammatory first letter proposed that the army refuse to disband and

either march on Congress for satisfaction or, if war continued, retreat to the wilderness and abandon the country to its fate. It was these notions that Washington targeted.

The conspiracy's usefulness to the intrigues of nationalists in Congress, however, raises suspicions that officers were either manipulated or instigated by players in a larger game. These nationalists, led by congressional finance chief Robert Morris, desperately wanted the states to agree to a dependable congressional revenue. That would enable Congress to function as an effective national government and pay its creditors, including officers; without it, Congress might only wither away and the nation face an uncertain future of squabbling among effectively independent states. But nationalists' hopes seemed to recede as a final peace came closer, and by late February they were also being blocked from pushing through a last-ditch compensation plan for the army. Morris and fellow nationalists looked for dramatic strokes to force reluctant hands. Approaches were made in February to Knox, who—though strongly nationalist—finally rebuffed apparent suggestions to use the army to face down Congress. At the same time, rumors of uncertain origin circulated in Philadelphia about the officers' desperate intentions and Morris, the indispensable linchpin of congressional finances, decided to heighten the pressure by announcing his resignation.

Contact seems to have been made between the Philadelphia nationalists and Gates at about this time, and the first Newburgh letter appeared within a few days. Earlier, however, Alexander Hamilton had written to Washington from Congress about rumored plotting among his officers. Washington was on the alert and ready with a response.

Officers and congressional nationalists shared many goals, but opinions vary whether the army plotters were merely pawns or seriously intended a coup, and it is unclear what they would, or could, have done had Washington not stepped in. Congress finally approved compensation shortly afterward, but the states still refused it a dependable revenue; other troops later menaced Congress directly but gained nothing. Nationalists, including many former Continental officers, acted through the Annapolis and Philadelphia Conventions within a few years to achieve the broader goal that had earlier linked Philadelphia and Newburgh.

NEW ENGLAND As one of the distinct cultural and political hearths of colonial settlement in British North America, New England played a decisive role in the shaping of the new American Republic. From the area's initial colonization through the early nineteenth century, New Englanders developed and maintained a strong regional identity that helped give rise to various nationalistic visions, but in many cases they also were a local counterpoint to such larger allegiances. Yet this idea—this sense of identity, of "New Englandness"—operated not only as a defining element of New Englanders' identification with the new American nation, but as a powerful part of their critique of the Republic when they perceived their place within it challenged and threatened. In a somewhat ironic demonstration of the dynamic and evolving nature of the new Republic's nationhood, New England's regional distinctiveness served first to bolster, but then often critically to examine the bonds of union in the early American Republic.

COLONIAL ERA

New England was the second major region of English colonization in North America. Unlike the preceding Chesapeake colonies, the New England settlements were, socially and culturally, initially more stable and homogenous. Founded primarily as Puritan enclaves, these colonies possessed a greater collective identity and sense of purpose than most of their counterparts in England's American domain. This Puritan-inspired sense of mission was summed up most famously by John Winthrop, governor of Massachusetts Bay (founded 1630). Winthrop exhorted his fellow Puritan settlers that they must be "a City upon a Hill. The eyes of all people are upon us." The Puritan "errand into the wilderness," meant to provide a beacon of reform for the unregenerate mainstream of the Anglican Church, ultimately proved a failure, however. Subsequent colonies in the region were founded by dissenters from this ortho-

doxy, testimony to the increasing divergence of views within the larger Puritan colonial community.

Most significantly, the Puritan mission of Massachusetts Bay became a victim of the colony's success. The thin, rocky soil of New England was unsuitable for agriculture beyond the scale of small family farming. But the extensive lumber supplies, rich fisheries, and numerous harbors of the region provided a path to economic growth that looked seaward through such pursuits as shipbuilding, naval stores, whaling, fishing, and commerce. As Boston became a preeminent center of Atlantic trade, the colony's economy grew significantly. This in turn attracted new settlers, many of whom did not share in the original Puritan ethic. Economic growth begat new social and cultural priorities; by the 1660s, Puritan ministers were preaching jeremiads lamenting the increasing worldliness of their flocks, which ultimately threatened the success of the Puritan experiment. These lamentations proved prescient—by the end of the century, New England resembled the other English colonies much more closely in its more secular nature. Most symbolic of this transformation was the crown's reorganization of its American colonies in the wake of the Glorious Revolution of 1688–1689. The new royal charter of 1691 for the colony of Massachusetts combined the original Puritan colonies of Plymouth and Massachusetts Bay into one unit and tied political participation to property ownership rather than membership in a Puritan congregation. Despite the failure of the reformist mission articulated by such figures as Winthrop, the Puritan identity continued to exert a profound influence on the cultural and social development of New England. Much of New England's regional identity in the Revolutionary and early national periods arose from the Puritan legacy.

REVOLUTIONARY AND EARLY NATIONAL ERAS

Bolstering this sense of regional importance was New England's primary role in the events and debates leading to the Revolutionary War and American independence. Boston emerged as the center of colonial resistance to British policies in the years following the Seven Years' War (1756–1763). Many of the prominent figures associated with this colonial resistance were New Englanders. James Otis (1725–1783) first articulated the colonists' constitutional arguments about taxation and representation. Samuel Adams (1722–1803) was the mastermind behind many of Boston's displays of resistance, as well as an early advocate of the Revolutionary Committees of Correspondence. His cousin, John Adams (1735–

1826), was a prominent leader in Boston's Sons of Liberty, as was the silversmith Paul Revere (1735–1818). The wealthy merchant John Hancock (1737–1793) lent wealth and social prominence to the movement, and he served as president of the Continental Congress when it ratified the Declaration of Independence. Many key events along the road to revolution occurred in Boston and elsewhere in New England. Boston was the site of the largest protests against the Stamp Act (1765), protests which set the pattern of popular participation and agitation that would become a hallmark of the era. The Boston Massacre (1770), the Boston Tea Party (1773), the Battles of Lexington and Concord (April 1775) and Bunker Hill (June 1775)—the coming of American independence seemed to be charted by events in Boston and its environs. No other region produced as many of the events and figures associated with the Revolutionary movement in the public imagination.

During the American Republic's first decades, New Englanders—like many other Americans—reckoned with exactly what their Revolution had wrought. Revolutionary ideals of republicanism and liberty eroded many of the norms that had characterized colonial society. Deferring to one's "betters" was no longer accepted protocol, for example; urban centers like Boston saw groups such as merchants, laborers, and even blacks and women lay claim to participation and acceptance within the larger public sphere. Assertiveness by traditionally subordinate groups could turn threatening, and even violent, in the eyes of traditional elites. Shays's Rebellion in western Massachusetts (1786–1787) seemed to embody the uncertain and contested nature of the Revolutionary legacy. The institution of slavery quickly receded throughout the northern states for these same reasons. Leading the way was Massachusetts, whose supreme court (in the celebrated Quok Walker case) declared slavery unconstitutional in 1783. By the end of the decade, slavery had been abolished throughout New England. This "first emancipation" would be a primary reason for New England's becoming the hearth of the abolitionist movement in later years.

After the ratification of the Constitution (in 1788) New England became a consistent base of political support for the Federalist presidential administrations of George Washington (1789–1797) and John Adams (1797–1801). Federalist policy favored the interests of commerce and manufacturing, both of which played central roles in the region's economy. The opposition, led by Virginians Thomas Jefferson and James Madison and dubbed the Demo-

cratic Republicans, did not make much of an inroad into New England until the early 1800s. New England solidly supported native son John Adams in the controversial election of 1800, but Thomas Jefferson won the presidency. Many New Englanders ascribed the Federalist defeat to extra Republican votes gained from the slave population through the operation of the Constitution's "three-fifths" compromise. Without these "slave votes," New England Federalists argued, Jefferson would have lost. The resentment over these issues of slavery and sectional power formed an important part of the emerging New England critique of Democratic Republican rule.

FROM CENTER TO PERIPHERY

Though the Democratic Republicans would control the region's state governments by early 1804, Federalist opposition remained a significant force. New England Federalists decried what they saw as the Republicans' insensitivity to the commercial interests of their region. Key events during the presidencies of Jefferson (1801–1809) and Madison (1809–1817) only served to reinforce this belief. The Louisiana Purchase of 1803 doubled the nation's size, threatening to render New England an even smaller minority in the national government. Indeed, in the wake of the purchase, a group of New England congressmen—led by Massachusetts Senator Timothy Pickering—attempted to put into motion a plan whereby New York and the New England states would secede from the southern-dominated Union and form an independent "northern confederacy." The conspirators even cultivated Vice President Aaron Burr, a native New Yorker, as a gubernatorial candidate in an attempt to win the spring 1804 election in his home state. If Burr had won, they planned to begin the process of secession that would culminate in the confederacy desired by these New Englanders. Burr, however, lost the election (blaming his defeat on Alexander Hamilton, he issued a challenge which led to the notorious duel between Burr and his longtime political nemesis) and the Federalists suffered general reverses in the spring elections throughout New England. In the wake of these defeats, the plans of Pickering and his cohorts evaporated. However, despite the failure of this specific plan for a northern confederacy, anti-Republican and anti-southern sentiment in New England remained strong, awaiting only another threat to the region's interests to fan it into full flame.

Commercial disputes with Britain and France, eventually leading to the War of 1812, created resentment in New England, as various Republican re-

taliatory measures (embargo and commercial nonintercourse) decimated the New England economy and led many in the region to accuse the Republicans of a larger anti-commercial—and anti-New England—animus. The protests emanating from New England had taken on an increasingly sectional tone by this point, a significant contrast to earlier decades. During the War of 1812 itself, New England remained essentially neutral—financiers refused to lend the government necessary funds, governors withheld militias from federal service, and grassroots opposition to a highly unpopular war culminated in a special convention at Hartford, Connecticut, which opened in December 1814. The Hartford Convention, however, was not only the height but the end of New England's sectionalism. The convention demanded constitutional amendments to restrict southerners' political powers and protect what it saw as New England's interests. News of Andrew Jackson's smashing victory at New Orleans (January 1815) and the Treaty of Ghent (signed December 1814) effectively rendered the Hartford Convention moot. New England's Federalists were now seen as opponents to what had become, in the eyes of most Americans, a smashing national triumph, and thus they became tainted in the public mind with an aura of disloyalty and treason.

This remarkable transformation in New England's standing—from the heart to the fringes of the American mainstream—reflected not only the rapid growth of the Republic, but the sense of national consciousness that was evolving beyond regionally centered definitions of "American," like those of New England. New England possessed, throughout this period, a strong and coherent sense of identity. This identity, however, occupied a much different place and served much different purposes by the 1820s than it had during an earlier generation.

With the decline of the Federalists in the wake of the ill-fated Hartford Convention, New England's regional consciousness and self-definition was no longer tied to a specific partisan identity. Taking the place of political agendas was the emerging manufacturing sector of New England's economy, which had its beginnings around the turn of the century in the textile mills of the Rhode Island coast and the Merrimack River valley of Massachusetts and southern New Hampshire. Since the region was never ideally suited for farming on any scale beyond that of the individual family, there was a surplus of population in terms of what was required for farm work; this surplus became a ready-made labor force available for work in the quickly growing enterprises. As

manufacturing spread into other parts of the region, and other types of production, towns like Lowell and Lynn, Massachusetts, and Pawtucket, Rhode Island, became the earliest centers of the United States' emergent industrial economy. The rise and steady growth of New England's manufacturing economy would put the region on a much different path than other sections of the United States, and ultimately play a significant role in a later generation's sectional divisions and conflicts. As the factory operative and "Yankee trader" became increasingly representative cultural types in New England, a clear contrast emerged with the rural, agrarian South of yeomen farmers and slave owning planters. Ultimately, as the American Republic matured, the very real sense of a distinctive New England culture and identity—though it now came from different antecedents—continued to be an important factor in the Republic's collection of regional identities, just as it had been from the earliest days of American nationhood.

NEW HAMPSHIRE New Hampshire in 1750 was a tiny British colony with a population of about 28,000, almost all of English descent. More than half of the settlers lived on or near the seacoast, where they farmed, fished, or worked in the shipyards; most of the rest farmed and lumbered in the forests and river valleys of the interior. Great Britain valued the colony because it provided masts and ships for the Royal Navy. Portsmouth, the largest town and colonial capital, was already a cultural and commercial center with a newspaper, public library, and handsome Georgian-style homes, as well as its shipyards and fishing docks.

The government and the society of New Hampshire were dominated by a mercantile, landed aristocracy, headed by Governor Benning Wentworth, who used patronage and the veto power to control the assembly. Wide gaps separated the Wentworths and their friends at the top of society from the artisans and farmers in the middle, and the poor laborers and some four hundred blacks, one-half of them slaves, at the bottom. Only colonists with estates worth at least fifty pounds could vote, and the inhabitants of each town, regardless of their faith, were required to support an established church—in most cases Congregational. On the outside were perhaps five hundred Algonquian Indians, primarily Pennacooks and Abenakis, all that remained of native groups that had once numbered more than four thousand.

By the eve of the Revolution domestic migration had increased the population to 75,000, many of whom had grown restless under British rule. Late in 1774 a mob attacked the royal fort guarding Portsmouth, and in the summer of 1775 the rebels ousted Governor John Wentworth (Benning's nephew) and established an independent government.

Reforms followed the Revolution. The state constitution in 1784 included a lengthy bill of rights. Although property and religious qualifications were retained for officeholders, all adult males were given the right to vote. The constitution did not abolish slavery, but judges interpreted the opening words to mean that anyone born after 1783 was free. Years later the legislature passed the Toleration Act (1819), granting all Christian denominations the right to be supported by taxes.

New Hampshire was also moving toward market capitalism and democratic politics. Until 1805 there were only two banks in the state; then suddenly there were ten. To get goods to market, entrepreneurs dug canals around the falls of the Connecticut

River and set up scores of road and bridge companies. By 1820, 14 percent of workers in New Hampshire were engaged in manufacturing, and a decade later the state had about one-tenth of all cotton spindles in the United States. Many of the workers in the cotton mills were young women, who were paid less than fifty cents a day for twelve hours of work and lived in company boardinghouses. When the cotton mill in Dover cut wages in 1828, more than six hundred women went on strike, but the strike failed.

Soon after New Hampshire ratified the United States Constitution (1788), party politics began to appear. The turnout for elections was high—81 percent in 1814 and 77 percent in 1828. Federalists controlled the state until 1805, when Republican John Langdon defeated perennial Federalist governor John Taylor Gilman. Although the Federalists regained power during the War of 1812, they were badly beaten in 1816. As soon as the Republicans took over, they passed a bill changing Dartmouth College, which was traditionally Federalist, into a state university. The college trustees, however, won back control of the institution, when Chief Justice John Marshall declared the state legislation unconstitutional (*Dartmouth College v. Woodward*, 1819). By this time the Federalist party had collapsed. In the factional struggle that followed, the newspaper editor Isaac Hill organized a state party that supported Andrew Jackson and won the state election of 1829. The New Hampshire Jacksonians played a major role in the rise of the national Democratic Party.

With its increased democracy, its new industrialization, and its involvement in national politics, New Hampshire was becoming an integral part of the new American nation.

NEW JERSEY New Jersey became a royal province in 1702 when the proprietorships of East Jersey and West Jersey were brought under the control of the English crown. The white population of the colony at the time of the merger was fifteen thousand inhabitants, and by 1750 it had quadrupled to roughly sixty thousand. Most of the population farmed in Hunterdon, Burlington, Monmouth, and Essex Counties along the widely traveled corridor connecting New York City and Philadelphia.

Throughout the colonial period New Jersey remained one of the most diverse colonies in British America. While the largest ethnic group in the colony remained the English, Dutch remnants of the colony of New Netherland were spread out across the New York City hinterland counties of Bergen and Somerset. Scots-Irish settled in large numbers in Morris County and Germans occupied the northwestern counties of Hunterdon and Sussex. The southern portion of the state was largely English Quaker with a smattering of Swedes, Germans, and non-Quaker English in the mix.

On the eve of the American Revolution, the diminishing numbers of Delaware (Lenni-Lenape) Indians were confined to the sparsely populated Pine Barren region where they were ministered to and educated by Quakers and Presbyterian missionaries such as John and David Brainerd. In 1775 New Jersey had ten thousand slaves, most of whom worked for masters in the northern counties. This made New

Jersey the second-largest slaveholding colony north of Maryland, trailing only New York in this category.

New Jersey became a state of the United States of America when its new constitution was put into practice officially on 17 July 1776. After over a decade of internal conflict in the colony between the royal governor William Franklin and the largely Patriotic assembly, the revolutionaries gained control of the colonial government, ousted Franklin from office in June 1776, threw their support behind the Continental Congress meeting in Philadelphia, and began to frame a new constitution. Though New Jersey and its delegates did not take a leadership role in the Continental Congress, the state would play an important part in the Revolutionary War. Several major battles of the war were fought on New Jersey soil, including the much-celebrated conflicts at Monmouth, Princeton, and Trenton. During the war, the Continental Congress met in Princeton in 1783 and in Trenton the following year.

New Jersey established a government with a two-house legislature (known as the General Assembly) and invested most of the state's political power in this branch. The powers of the governor's office were severely limited by the framers because of fears, common in most former British colonies, that strong executive branches were prone to tyranny. It is noteworthy that the New Jersey Constitution was the only state constitution in the United States that offered limited suffrage to women. Single women (married women were represented by their husbands) who owned property were permitted to vote until this right was revoked by the state legislature in 1807.

Following the war New Jersey would play a pivotal role in the framing of the United States Constitution. The state was the first to appoint delegates to the Constitutional Convention in 1787 and was the third state to ratify the new Constitution. During the convention, William Paterson, a member of the New Jersey delegation, proposed what became known as the "New Jersey Plan" for the organization of the United States legislature. The plan, which was eventually rejected, gave each state in the Union equal representation in both houses of the federal Congress.

In 1790 the total population of New Jersey (white men and women and slaves) stood at 184,139. In 1800 the population was 211,149; in 1810 it was 245,562; in 1820, 277,575 persons resided in the state; and in 1830 the population had reached 320,823. The most concentrated area of pop-

ulation remained the central corridor connecting New York City and Philadelphia. New Jersey's population growth in this period occurred more through natural increase than through in-migration to the state, although this trend would change considerably later in the century.

Roughly 90 percent of New Jersey's population was of European ancestry. Most residents lived on medium-sized farms of less than two hundred acres. From the colonial period through the beginning of the nineteenth century, agriculture drove the New Jersey economy. New Jersey agriculture was quite diverse, but grain production and the rearing of livestock were most prevalent. New Jersey residents farmed for subsistence purposes, but the majority of landholders oriented their agricultural practices to meet the demands of markets in Europe and the West Indies.

In 1800 there were just over 12,000 slaves in New Jersey, but that number began to decline rapidly after the passage of the 1804 law that initiated the process of gradual emancipation in the state. By 1820 free blacks outnumbered slaves and by 1830 only 2,246 slaves resided in New Jersey. The Native American population had dwindled to only a few hundred by the turn of the nineteenth century.

NEW MADRID EARTHQUAKE *See* **Natural Disasters.**

NEW ORLEANS New Orleans was founded in 1718 as the capital of the French colony of Louisiana, which embraced a territorial expanse of more than 500 million acres stretching from the Gulf of Mexico to the Great Lakes. The settlement's situation near the mouth of the Mississippi River lent itself to the effective defense of that great continental waterway against European interlopers, and its port linked the capital to the Caribbean economic hub. The French ruled Louisiana until 1763, when the colony was ceded to Spain in the treaty that ended the Seven Years' War (1756–1763). The colony's secret retrocession to France in 1800 was barely made public before the territory's sale to the United States in 1803. The port of New Orleans provided a crucial conduit for the products of the antebellum South's Cotton Kingdom at the same time it supported the expansion of agriculture in the Midwest.

ECONOMIC AND POPULATION GROWTH

For most of the colonial period, New Orleans was more frontier outpost than capital city, with a population of barely 5,000 in 1791. Its population of just over 8,000 in 1805 had more than doubled by 1810, when it reached 17,242 inhabitants. Its population in 1820 stood at 29,865, and in 1830 at 46,310.

The city's population growth was intimately linked to its economy, and neither the city nor the colony enjoyed economic success until late in the colonial period. Successive attempts to identify a profitable cash crop in the Lower Mississippi Valley failed, and inhabitants under both the French and Spanish regimes relied substantially on a frontier exchange economy with Indians fueled by deerskins and on grain cultivated by settlers in the Illinois country well into the 1780s. Two roughly simultaneous developments transformed the colony's capital. Post-Revolutionary expansion of American settlement into the trans-Appalachian West made the utilization of the Mississippi and the port of New Orleans an essential element in the young Republic's economic progress. Even before the Treaty of Paris of 1783 gave the United States a basis for claiming navigation rights on the Mississippi, prescient American entrepreneurs had immigrated to the incipient commercial center. Spanish objections to the Americans' presumptive navigation rights were settled with Pinckney's Treaty in 1795, which guaranteed full navigation rights and a period of tax-free right of deposit at the port. The opening of the port to American commerce coincided with the rise of southern Louisiana's sugar economy, which was indebted to the

outbreak of the Haitian Revolution in 1791. Sugar production on France's wealthiest possession was disrupted for more than a decade, allowing sugar planters in Louisiana to claw out a niche in a market that had long been dominated by the Caribbean colony. Louisiana's sugar industry benefited tangibly, as well, from the arrival of more than ten thousand Haitian refugees who immigrated to the city between 1791 and 1810, bringing both expertise and an experienced labor force of enslaved cane field workers. When Toussaint Louverture's black troops triumphed over Napoleon's final attempt to quash the Haitian Revolution in 1803, Louisiana's utility as a provisioning colony for the Caribbean sugar enterprise vanished and France offered the territory and its port for sale to the United States.

The Louisiana Purchase (1803) and the transfer of New Orleans to American hands, in large part the product of a triumphant slave revolt, ironically marked the emergence of the city as a center of both plantation wealth and the slave trade. During the colonial period, the city competed with limited success against more lucrative Caribbean destinations for shipments of newly enslaved Africans. An initial infusion of Africans imported into the city and its environs during the early French colonial period was followed by the near absence of shipments during the 1740s, 1750s, and 1760s. Senegambians, who were particularly well represented in the early wave of captives, are thought by some scholars to have encouraged the development of a distinctive Afro-Creole culture that influenced both black and white New Orleans even after the resumption of a significant transatlantic slave trade under the Spanish in the last quarter of the eighteenth century. The impact of both Spain's attention to supplying the colony's labor force and the Haitian Revolution's incubation of Louisiana's sugar industry is evident in the growth of the city's enslaved population between 1790 and 1805, when it increased from 1,789 to 3,105. More than three thousand enslaved people arrived with a large contingent of Haitian refugees in 1809, providing a sudden and dramatic growth spurt in the slave population in and around the city. The burgeoning slave population, together with the coercive methods increasingly employed to raise productivity in the cane fields, fueled a revolt of some five hundred slaves just upriver from New Orleans in 1811.

FREE BLACKS

The Spanish colonial period contributed a notable feature to the composition of the city's population

through its manumission laws. In addition to providing a simple emancipation process that required only a notarized declaration, Spanish law guaranteed a slave's right to self-purchase, known as *coartación*. The result of these practices was the growth of a sizeable free black population, numbering 862 in 1791, and rising to 1,566 by 1805, when free people of color made up nearly one-fifth of the city's total population and almost one-third of its free population. During the colonial period, the practice of *métissage* (interracial sexual relationships) produced a significant number of mixed-race individuals who came to constitute a significant proportion of the free black population. Free blacks did not enjoy either de facto or de jure equality with inhabitants of unmixed European descent in either the Spanish or the American periods. Many, however, exercised influence and leadership in some of the city's most prominent institutions. A free black militia was commissioned by the Spanish and survived into the American period, though in diminished form. Free black women, as well as enslaved women, assumed leadership in the religious education and conversion of people of African descent in the city's Catholic Church. A free woman of color, Henritte Delille, founded a Catholic order of religious sisters for women of African descent in the early 1830s.

A HETEROGENEOUS SLAVE COMMUNITY

The free black population constituted one of the city's major Francophone constituencies in the early decades of the nineteenth century, when free and enslaved Anglophones poured into the city. Congress's closing of the international slave trade in 1808 not only ended the influx of native Africans, but also stemmed the steady trickle of slaves from the French and Spanish Caribbean. On the other hand, New Orleans became a center of a burgeoning domestic slave trade that brought thousands of men, women, and children from the Upper South to the city. They were set apart from the city's Afro-Creole population not only by the English language, but also by the evangelical Protestant Christianity to which many had previously been converted. Yet another religious tradition, voodoo, was established and spread by the Haitian refugees who arrived between 1791 and 1810. The city's black population was perhaps the most heterogeneous in the country, differentiated into free and enslaved, Francophone and Anglophone, and divided among Protestant, Catholic, African, and voodoo religious traditions.

BATTLE OF NEW ORLEANS

The Battle of New Orleans, won by troops under the leadership of Andrew Jackson on 8 January 1815, is often recognized as the event that sealed the city's claim to an American identity and a place in American national memory. An army of French and Spanish Creoles and free men of color joined troops from Kentucky and Tennessee to defeat a much larger British force, effecting a psychological confirmation of the statehood that had been conferred in 1812. The dramatic victory, despite being won after a treaty of peace had been signed in Europe, confirmed America's power at a crucial moment in the young Republic's history and made the reputation of Jackson, which ultimately won him the presidency in 1828.

NEW ORLEANS, BATTLE OF On the morning of 8 January 1815, a sea of red coats rushed toward the American lines defending New Orleans. Within a few short hours the extent of General Andrew Jackson's victory over the British was clear. Americans sustained a mere 6 casualties with an additional 7 wounded. The British troops under the command of Sir Edward Michael Pakenham suffered upwards of 2,500 deaths and injuries, with Pakenham among the dead. The victory was the greatest in the nation's brief history and sparked a rampant nationalism that helped to erase the rather pathetic American military record during the War of 1812. The battle also launched Andrew Jackson to overnight stardom. Known as a rough-and-tumble Indian fighter, the

general suddenly became the people's hero. Most historians agree that the gates of New Orleans led Jackson directly to the White House. His popularity was second only to George Washington's.

The actual "battle" of New Orleans was in reality the final assault in a larger campaign. The British had arrived secretly via a bayou leading from Lake Borgne and positioned themselves just miles below the city. Jackson engaged in a risky night attack on 23 December, and the two armies exchanged considerable cannon fire on New Year's Day. The 8 January battle was the last attempt to break through Jackson's line, which ran from the edge of the Mississippi River on the west to an impenetrable cypress swamp on the east. Pakenham knew that the advance guard had chosen a horrible logistical position with absolutely no possibility to engage in a flanking maneuver, but nevertheless attempted to carry the day through sheer force of numbers. Hurling against Jackson's ragtag army thousands of Britain's famed Peninsular veterans, the men who had defeated Napoleon, Pakenham hoped that a well-coordinated attack under the cover of a dense fog would carry his troops to victory. American cannon under the direction of Jean Lafitte's notorious pirate "banditti" proved the British general wrong.

The soldiers on both sides of the engagement were awestruck at the level of carnage. A largely militia army had soundly defeated Europe's greatest fighting force. Many Americans, including Jackson, viewed the victory as a sign of Providence and an acknowledgment that freemen fighting in defense of liberty were equal to the armies of monarchs and despots.

Perhaps the most ironic aspect of the battle is that it occurred after the Ghent peace negotiations had been signed on Christmas Eve 1814. The war did not officially end until the U.S. Senate and British Parliament ratified the agreement in February, however; thus, the battle did occur during the official war. In many respects the history of the War of 1812 would have been quite different had the New Orleans victory never occurred. The battle certainly allowed America to hold its head high even though the nation's capital had been burned in August 1814. Moreover, though historians disagree on this point, there is some argument to be made that had the British taken New Orleans they would have kept it. They had never been terribly pleased with the Louisiana Purchase and officers for an entire civil government were on board their warships.

NEW SPAIN The viceroyalty of New Spain included all of the territory claimed by Spain in North America and the Caribbean from the conquest of the Aztec Empire in the 1520s until the final assertion of Mexican independence in 1821. Although never fully settled or controlled by Spain, this area included the entire modern nation of Mexico, and Central America north of what is now Panama. New Spain also encompassed Florida and much of the western portion of what became the United States, including California, Arizona, Nevada, Utah, Colorado, New Mexico, and Texas.

COLONIAL ADMINISTRATION AND SOCIETY

In 1528 the creation of a high court, the *audiencia*, marked the first step in a long and ultimately incomplete effort to establish Spanish royal authority throughout the region, followed by the appointment of a viceroy in 1535 to oversee royal interests from the capital of Mexico City. Along with its southern counterpart, the viceroyalty of Peru, New Spain was subject to the legislation of the Council of the Indies, a body of from six to ten royal councilors in Seville overseeing the entirety of Spanish holdings in the Western Hemisphere. During the sixteenth and seventeenth centuries, Spanish administration of New Spain centered on the mining of silver, the defense of the colony from other European powers, and the evangelization and assimilation of Native American peoples into the Spanish colonial system.

In addition to the earlier, better-known waves of conquistadors and missionaries, New Spain attracted numerous colonists and bureaucrats eager to exploit the mineral wealth of the New World and the labor of its indigenous inhabitants, known in New Spain as *indios*. Early European conquistadors and settlers established the *encomienda* system, in which individual Spaniards received the right to collect labor or tribute or both from specific *indio* communities. In areas of intensive silver mining, such as Guanajuato and Zacatecas, a separate system of forced labor known as the *repartimiento* required indigenous communities to make a minimum number of laborers available for hire as miners.

Africans had been present in New Spain since the earliest expeditions of exploration and conquest, participating as both conquistadors and enslaved laborers and personal servants. Over the course of the colonial period, New Spanish elites brought in some 200,000 African slaves to supplement an indigenous labor force that had been drastically reduced through diseases like smallpox and yellow fever. While the majority of the enslaved African population in New Spain remained located near the Caribbean and Pacific coasts, individual Africans of both free and enslaved status spread throughout the viceroyalty, establishing themselves in larger cities and municipalities, serving in militias, settling among indigenous communities, and participating in the silver mining booms.

Over time, members of New Spanish society formed new ethnic identities as Spaniards intermarried with Native Americans and Africans. A subtle castelike system developed, with *peninsulares* (natives of Spain) at the top of the social hierarchy. Creoles (individuals of Spanish descent born in the

Americas) also formed part of the colonial elite, while mestizos (people of both Spanish and *indio* ancestry) and *castas* (people of a variety of mixed European, African, and indigenous ethnicities) tended to be excluded from many powerful positions. Although each separate racial classification carried specific privileges and restrictions, all groups had access to the courts. Social mobility for people of mixed ethnicity was limited but possible, as wealth and occupation also played an important role in social status.

During the eighteenth century the population of New Spain grew as mining and agricultural production increased. With the exception of remote missions and military outposts in New Mexico, Spanish settlement of the northern frontier portions of New Spain had remained slow throughout the colonial period. These territories were home to numerous indigenous peoples who often resisted evangelization and “pacification” efforts, and forced labor systems like the *encomienda* and *repartimiento* were never successfully introduced there. Europeans made little effort to colonize these regions until the late seventeenth century, when French explorer and fur trader René-Robert Cavalier de LaSalle landed at Matagorda Bay in 1685. Although his colony was destroyed by disease and warfare with nearby indigenous groups, Spanish authorities from nearby Coahuila responded to the threat of French expansion into New Spain by sending their own expedition into Texas. In the early 1700s the French set up an outpost at Nacogdoches in eastern Texas, and the Spanish responded in kind with a new mission settlement of their own in San Antonio. New missions also appeared in California during this time.

BOURBON REFORMS

During the second half of the eighteenth century, New Spain underwent a series of reforms implemented by the Bourbon dynasty. Spanish monarchs and their administrators attempted to overhaul the machinery of empire and revitalize royal control over the empire’s American colonies. These Bourbon Reforms included the curtailment of ecclesiastical power, reapportionment of colonial territory, restructuring of colonial military forces, and new efforts to increase royal revenues.

Roman Catholic clergy had participated in the colonization of New Spain from the very beginning, with secular clergy (not members of a particular religious order) serving Spanish colonists in towns and cities and regular clergy establishing convents in settled urban areas and missions on the cultural frontier among newly evangelized indigenous communities.

By the mid-eighteenth century the church was increasingly coming into conflict with the interests of the crown, resulting in efforts on the part of the Bourbon monarchs to reduce the power and influence of the clergy, and especially of the regular ecclesiastical orders. The best-known royal action of this sort was the expulsion of the Jesuit order from Spanish territories in 1767. While this banishment was carried out swiftly and without much resistance in many areas of Spanish America, New Spain experienced a period of intense protest following the action.

In order to rule more efficiently their American empire, the Bourbons created a new jurisdictional system in the colonies. In 1776 King Charles III authorized the reorganization of the northern frontier region into a separate semiautonomous administrative district known as the *Provincias Internas* (interior provinces). Northern districts like Texas, New Mexico, and the Californias were all governed by a military commander based first in Arispe, Sonora, and later in Chihuahua. In 1786 Charles III divided the rest of New Spain into twelve intendancies (administrative districts governed by an intendant, or royal governor). These political reforms increased the visible presence of royal administrators in the everyday life of the inhabitants of New Spain and disrupted traditional social relations in many areas of the viceroyalty. Additionally, the fact that most of the officials appointed to oversee these many districts of colonial government were peninsular (born in Spain) rather than Creole led to increased resentment on the part of the colonial Creole elite.

The Bourbons also felt it necessary to restructure colonial militias as a safeguard against aggression from other European powers and internal social unrest. The crown's desire to cut expenses limited its ability to furnish peninsular units for protection and control of the colonies. Thus, permanent Creole regular army units, *ejércitos fijos*, were established, and colonial militias expanded to include free blacks, mulattos, Indians, and mestizos. These military reforms led to increased social status for both *castas* and Creoles in New Spain and eventually provided the basis for the armies of independence. This provided a new degree of social and ethnic mobility and a social base for future revolutionary leadership. In order to fund the formation of these new militias and pay for imperial expenses in Europe, the Bourbons intensified tax collection efforts. Ultimately, their reforms disrupted traditional social relations within the colonial system and contributed to favorable conditions for independence movements.

RELATIONS WITH THE UNITED STATES

After the Seven Years' War (1756–1763), Spain was forced to cede Florida to Britain but received the massive Louisiana Territory from France in return. In the interim, between 1763 and the start of the American Revolution, settlers from British colonies in North America began moving southward into Florida and westward into Louisiana. During this period Spain gave Euro-American merchants the right of deposit in New Orleans, allowing them to use the port for their trade goods. In 1779 Spain joined France in supporting the American Revolution against Britain, and the Treaty of Paris on 3 September 1783 returned Florida to the Spanish Empire. Spanish authorities, concerned about the growing influence of Euro-American traders in Louisiana, attempted to close the Lower Mississippi River valley to U.S. trade from 1784 to 1788 and imposed tariffs on American imports and exports through New Orleans from 1788 to 1795. After the United States and Spain signed the Treaty of San Lorenzo (Pinckney's Treaty) in 1795, the Spanish governor of West Florida required high duties from Americans shipping goods via the Mobile River. Euro-Americans living in the borderlands also resented Spain's failure to resolve disputed land claims in the area, and they accused Spanish authorities of instigating Indian attacks. Although these actions created resentment toward the Spanish among Euro-Americans, settlers and traders from the United States continued to move into Spanish-controlled territory during the last years of the eighteenth century.

With the increased Euro-American settlement in Spanish territory and the increased tensions resulting from Spanish trade and land policies, Euro-American interest in New Spain took on a new form after the turn of the nineteenth century. As a result of the low population density in the northern regions of New Spain, Spanish officials were unable to maintain a regular schedule of border patrols. Spain's North American holdings, particularly the Floridas, seemed to lack enough troops and loyal subjects to repel independent, privately led American invasions, or filibusters. A group of businessmen in New Orleans organized themselves into the Mexico Society with the aim of eventually annexing northern portions of New Spain to the United States. From 1804 to 1807 Aaron Burr (vice president from January 1802–March 1805), disgruntled with his lack of political success in the East, conspired to form a separate nation out of portions of northern New Spain and the newly acquired Louisiana Territory of the western United States. His attempt failed from lack of support and betrayal by a co-conspirator, General

James Wilkinson, but other filibustering expeditions soon followed.

MEXICAN INDEPENDENCE

After Napoleon invaded the Iberian Peninsula in 1808, a crisis of political legitimacy occurred throughout Spanish America. In 1810 a parish priest, Miguel Hidalgo, initiated the independence struggle in New Spain by raising a force of peasant soldiers to wrest control of the viceroyalty from peninsular Spaniards. Thousands of *indios*, *castas*, and even Creoles joined the insurrection, which experienced sporadic success during the subsequent decade. After initial large-scale battles including tens of thousands of rebels, the independence struggle settled into bitter guerrilla warfare in which individuals often changed their loyalties midstream. This chaotic political atmosphere attracted further filibustering expeditions from the United States and the Louisiana Territory as enterprising and idealistic individuals attempted to take advantage of Spain's predicament and capture Texas.

As Mexico's war for independence drew toward its close, Secretary of State John Quincy Adams signed the Transcontinental Treaty on 22 February 1819, fixing the boundary between the United States and New Spain. The treaty surrendered American claims to Texas but arranged for the United States to acquire Florida in 1821. On 24 February 1821 former royalist commander Agustín Iturbide, a Creole, joined forces with the Mexican insurgents and proclaimed the independent empire of Mexico. Iturbide's empire only lasted two years before succumbing to proponents of a republic, but 1821 marked the end of over three hundred years of Spanish dominion in North America. The new Mexican republic continued to claim jurisdiction over the former territory of New Spain, including Texas, but the border between the two new nations would remain porous for years to come.

NEWSPAPERS The local newspapers of the early American Republic are extremely unimpressive specimens to modern eyes. They are even less impressive than their equally simple but rather elegantly presented colonial forebears, such as Benjamin Franklin's *Pennsylvania Gazette*. Physically they were usually only four pages long; if the paper was successful, half or more of those pages were advertisements. There were no maps, no cartoons, usually no illustrations of any kind besides a few stereotyped woodcuts in the advertisements featuring crude drawings of ships, runaway slaves, or stud horses. (Political cartoons did exist, but only as separately published prints.) Sometimes a printer of unusual visual ambition procured a custom woodcut for his masthead, perhaps illustrating the name of the journal. The Pittsburgh *Tree of Liberty* featured a tree with some little faces at bottom, barely discernible to the naked eye, that were meant to represent the people but looked more like a pile of severed heads. More typical was a clichéd American eagle, or nothing at all.

NOT NECESSARILY THE NEWS: THE LIMITATIONS OF THE EARLY AMERICAN NEWSPAPER

There was not much in early American newspapers that a modern reader would recognize as news. Because a typical newspaper's entire staff consisted only of the printer in whose shop it was published along with his journeymen and apprentices—all of whom were too busy with ink and type and paper to do much but print—no active reporting or systematic news gathering was done. Particularly successful printers in the major towns might hire an editor or pay a writer, but it was much more common

for a printer to publish whatever he was handed by the local amateur literati (especially lawyers and other politicians), even if someone stuck it under his door, unsigned, in the middle of the night. Indeed, some political material was purposely delivered this way so that the printers could avoid prosecutions for seditious libel by asserting that they did not know the author and had not actually even read the libelous material, which they printed only to fill up space in the paper.

News was printed as it happened to come to the printer, ideally but by no means universally in the form of a letter that he or one of his neighbors received from a friend or traveling local who had seen or heard something. (This was the original, literal meaning of the term “correspondent” as applied to news reporting.) Sometimes the printer simply jotted down and printed bits of hearsay he picked up in the street or tavern. Thus the *Northampton Farmer* of Easton, Pennsylvania, “covered” a possible change in British foreign policy by clipping a paragraph from a Philadelphia newspaper reporting the opinions of one Mr. Lyman, a passenger on a ship that had just arrived from Boston. The great Lyman expected “a speedy restoration of good understanding” between Great Britain and the United States and was “incredulous as to the report of an approaching peace between Great Britain and France.”

Most news and other editorial material in most early American newspapers was simply copied from other newspapers, especially from the “exchange papers” that printers could mail each other for free. The resulting content was the raw material of news as we know it today: not “stories” written by reporters, but speeches, government documents, political essays, and programs of recent community celebrations. Only occasionally, in the case of foreign events (on which the typical early American newspaper was far more informative than local or domestic happenings) would there be any effort to provide a summary or narrative of the news.

Printers’ arrangements of their papers compounded the difficulty of reading them. Headlines in the modern sense were nonexistent, and the reports and documents were usually classed not according to their subject or importance, but according to where the material was found. Thus, if you were perusing a copy of the *Northampton Farmer*, you might look under the heading “Philadelphia” and find news of a naval battle in the Caribbean. Someone in New York had gotten a letter saying that the French and the British navies had fought a battle near the port of Santo Domingo in the Caribbean; but because the

Easton printer clipped the item out of a Philadelphia newspaper, there it was listed. In terms of placement, only two elements of newspaper design in the early Republic were generally consistent: general interest material (poetry, songs, stories, agricultural advice) went on the back page, and locally produced material, if any, appeared on the second or third page under a heading listing the town of publication. Otherwise items were placed at random or wherever convenient.

These shortcomings were noticed at the time. “I have . . . often been surprized that the most valuable communications in our papers should be in illegibly small type, while news from Leghorn, accounts of rare reptiles and thunderstorms are in long pica,” wrote Connecticut politician and newspaper writer Abraham Bishop, noting that it was usually difficult for the reader “to form some idea, when he has closed one subject and begun on another.” Even Thomas Jefferson, a tremendous supporter of the press who once opined that he would rather have newspapers without government than the reverse, was exasperated by the low quality of the information he found in the newspapers of his time. “I look with real commiseration on my fellow citizens,” the president wrote, “who, reading newspapers, live and die in the belief that they have known something of what has been passing in the world.” The dissemination of commercial information, through price lists, ship notices, and advertisements, was about the only thing the press did to general satisfaction. The rise of “penny press” newspapers, with large staffs of reporters gathering the racy news of the nineteenth-century city, did not even begin until the 1830s.

Before the 1830s, small-town weeklies outnumbered urban dailies 10 to 1 throughout the period. Almost all were sold chiefly by subscription, at a price of a few dollars per year. Circulations ranged from a few hundred to a few thousand. Newspaper bibliographer Clarence S. Brigham estimated that the average circulation was six hundred to seven hundred. The absolute peak was four thousand or so, claimed by the Boston *Columbian Centinel* and the *Albany Argus*, among very few others. Limitations on printing, papermaking, and transportation technology made higher figures nearly impossible to achieve. Someone still had to press every page of every copy.

“IMMENSE MORAL AND POLITICAL ENGINES”

Yet the physical and organizational limitations of early American newspapers are only part of the story, and not the most important part. Collectively,

seemingly pathetic little sheets like the *Northampton Farmer*, *Tree of Liberty*, and their ilk were considered an unstoppable force, especially in politics. “The newspapers are an overmatch for any government,” growled one conservative Federalist after his candidate, John Adams, lost the election of 1800. The paradox was symbolized by the Troy (N.Y.) *Northern Budget’s* masthead illustration: a crudely rendered Benjamin Franklin holding a tiny newspaper labeled with the words, “This is the basis of liberty.”

What did the *Northern Budget’s* woodcut artist mean? As the early Republic’s main form of wide publicity, newspapers filled a tremendous gap in the constitutional scheme of republican government. The whole system failed if voters could not hold elected officials accountable for their performance at a later election. The need for some lines of communication between the people and the rulers led the framers of state constitutions and the federal Bill of Rights to give special constitutional protections to the press. Later legislation and court decisions gave newspapers additional special privileges, including discounted postage rates. Simply put, the media were granted a special place at the political table because their publicity allows democracy to function. The particular means by which this was accomplished was left open. In the early Republic, with the “objective,” news-gathering commercial media far in the future, newspapers performed their democratic functions by acting as working parts of the emerging party system—a convergence that might be called “newspaper politics.”

The Reverend Samuel Miller’s *Brief Retrospect of the Eighteenth Century* (1803), a respected compendium of the century’s achievements, observed that “political journals,” as he headed his chapter on newspapers, had revolutionized their place in American society. Once “considered of small moment,” Miller wrote, newspapers had become “immense moral and political engines” in which “the principles of government, the interests of nations, the spirit and tendency of public measures are all arraigned, tried, and decided.” (Like many later press critics, Miller went on to bitterly attack the incompetence and immorality of the people who ran these all-powerful institutions.) As Miller saw it, newspapers had revolutionized the arts of political persuasion and organization. Formerly, “to sow the seeds of political discord, or to produce a spirit of union and co-operation through an extensive community, required time, patience, and a constant series of exertions.” The advent of “the general circulation of Gazettes” had ushered in a new political era, in which “impressions could

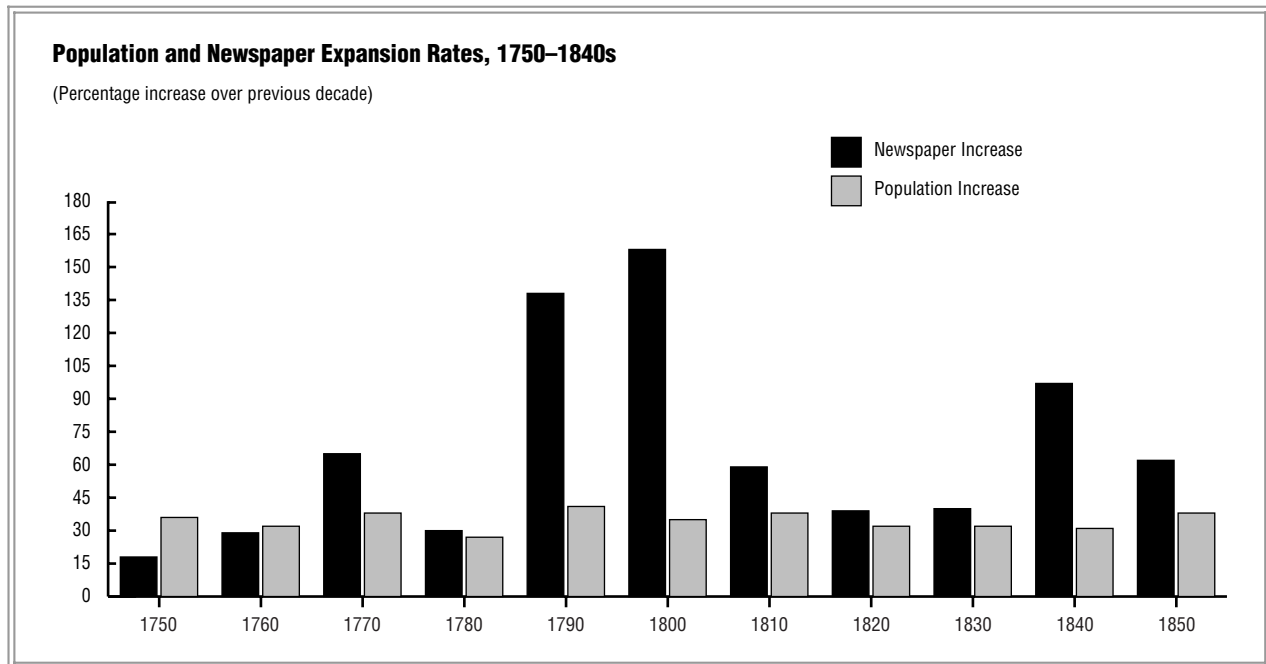

be made on the public mind . . . with a celerity, and to an extent of which our ancestors had no conception.” The effect of this had been to inculcate the habits and values of democratic citizenship in the populace: “to keep the public mind awake and active . . . confirm and extend the love of freedom . . . promote union of spirit and of action among the most distant members of an extended community.”

What was the evidence for the powerfully democratizing and politicizing effects of newspapers? That the basic practices, institutions, and values of the world’s first democracy came together during this period of the political newspaper. At the time Miller wrote, it was generally accepted that the press had been instrumental in fomenting the break between America and Great Britain, especially by persuading the public that the British ministry and army were out to persecute and enslave America. The *Federalist* and hundreds of other newspaper essay series had sold the public a new Constitution that few initially wanted. Newspapers had helped create an opposition political party, the Democratic Republicans (ancestors of today’s Democrats), which brought down the Federalist supporters of George Washington, John Adams, and Alexander Hamilton in the world’s first peaceful transfer of power. Across the ocean, the press had been a powerful player in the revolution that toppled the French monarchy, by many measures Europe’s strongest. All those who wanted to build support for an idea or group concluded that newspapers were absolutely indispensable to their cause. Any serious political party, or faction within a party, or presidential candidate, wanted newspaper representation in as many places as possible, and had to be willing to spend money to get it. Following an old colonial practice that took on an increasingly partisan dimension in the early Republic, one method of financing new newspapers was steering profitable government printing contracts toward friendly printers willing to publish newspapers.

Under this sort of pressure for growth, the newspaper press became one of the most expansive institutions in American society. U.S. population growth was one of the wonders of the world in this time because of heavy immigration and high birth rates, but the growth of the press far outstripped it (see Figure 1).

Political crises and transformations coincided frequently with the establishment of large numbers of new newspapers, with the pace of newspaper creation spiking in such periods as the Revolution, the election of 1800, and the political crisis leading up to

FIGURE 1

Newspaper Growth Outstrips Population Growth

the War of 1812, when the defeated Federalists enjoyed a comeback across the northern states (see Figure 2). Similarly the rates of expansion shown in Figure 1 were greatest in decades of political upheaval, especially the 1780s, 1790s, and 1830s.

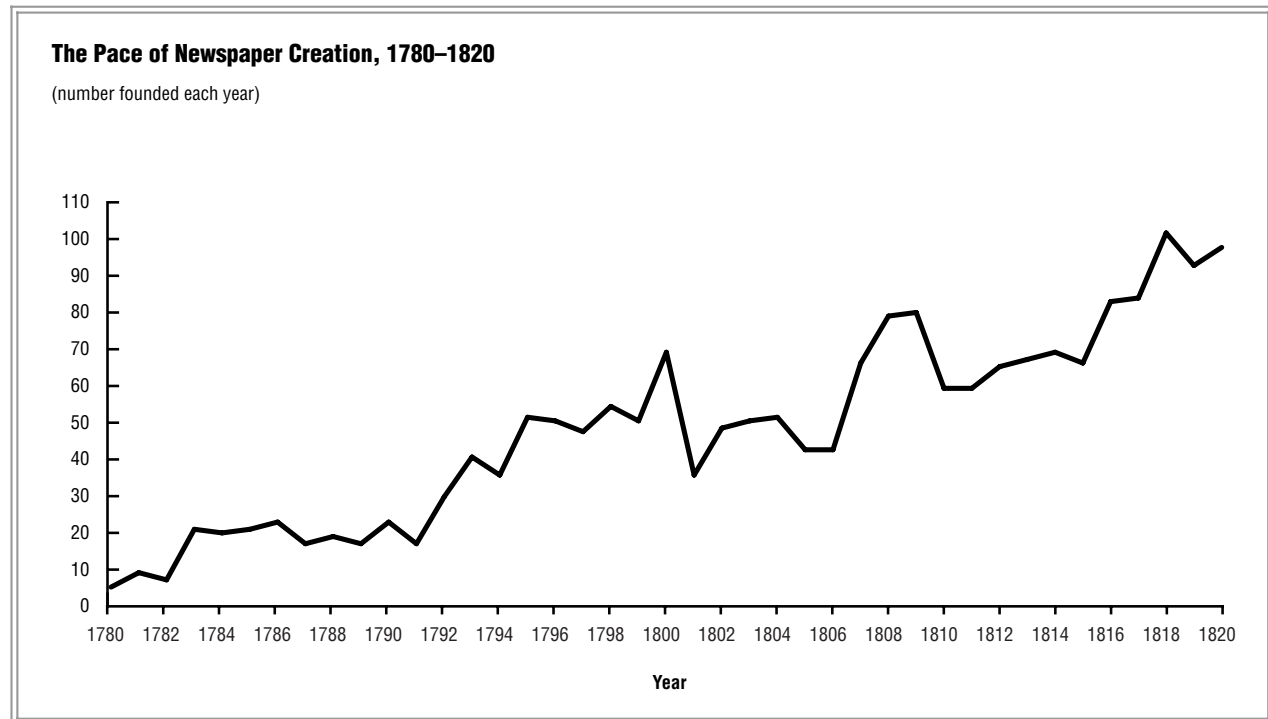

Obviously multiple factors were involved in the expansion of the American press. Population movements carried the press west over the Appalachians during this period and spread it across the interior. At the same time, the newspaper press of the early Republic was highly diversified, with many purely commercial newspapers and around one hundred religious journals by the 1830s. There were also a significant number of newspapers that served particular ethnic communities, such as the extensive German-language press, and beginning in the late 1820s, newspapers published by and for African Americans (*Freedom's Journal*, 1827) and the Cherokee nation (*Cherokee Phoenix*, 1828). Yet it was clearly politics in its broadest sense—public, associational life—that drove much of the press's expansion in this period. Even the religious and ethnic publications often had clear political orientations, like the *Reader's Adler* of Reading, Pennsylvania, whose editor was whipped by Federalist soldiers for his fiery Democratic Republicanism.

CIRCULATION IN THE EXTREMITIES

Echoing the judgment of most other foreign and domestic observers, Samuel Miller concluded that the ubiquity of newspapers was one of the most distinctive features of the American scene. Never before, anywhere, was the number of newspapers “so great in proportion to the population of a country as at present in ours.” This was true in 1802, and the trend grew more pronounced afterward. As shown in Figure 3, in 1800 there were almost 4.5 newspapers per 100,000 citizens, and by 1840, more than 8. In other words, the equivalent of a city of 100,000 people, roughly the size of present-day Topeka, Kansas, would have had 4 to 8 newspapers in this period. These would have represented not the “general public” or the local business community, as do twenty-first century monopoly newspapers, but multiple points in the local political and social spectrum. The situation on the ground was actually a bit more polarized. New York City had thirteen newspapers in 1810, when its population was just under 100,000. Reading, Pennsylvania, and Trenton, New Jersey, with populations around 3,000 each, both had two papers, one Republican and one Federalist. So did even smaller places such as Augusta, Georgia, Annapolis, Maryland, and Worcester, Massachusetts.

The wide distribution of newspapers greatly enlarged the number of people, including many who

FIGURE 2

Newspaper Creation

had never been part of the political class in any previous society, who could be informed about and participate intelligently in the political life of the community. The United States, Miller wrote, “has exhibited a spectacle . . . without parallel on the earth . . . not of the learned and the wealthy only, but of the great body of the people; even a large portion . . . of that class of the community which is destined to daily labour, having free and constant access to public prints, receiving regular information of every occurrence, attending to the course of political affairs, discussing public measures.” Massive voter turnouts and foreign travelers’ accounts of America testify to the accuracy of Miller’s conclusions. Passing through the backwoods of Ohio, the Transylvanian bureaucrat and reformer Alexander Bölöni Farkas marveled as the stagecoach driver hurled out settlers’ newspapers right and left as they passed remote cabins along the road. “No matter how poor a settler may be, nor how far in the wilderness he may be from the civilized world,” Farkas wrote, “he will read a newspaper.”

In hindsight, one may want to take such claims with a grain of salt. Newspapers could reach only literate citizens, who were most likely to be white and male, and only a tiny educated elite would have been

able to fully grasp everything they read. Many working families probably could not afford a yearly subscription to a newspaper in any case.

Yet there were many channels through which the press could breach these limits and reach a percentage of the population that was almost certainly higher than the overall levels of newspaper readership in the twenty-first century. Newspapers were kept on hand in many public gathering places, especially taverns, coffeehouses, and hotels, where they were often read aloud or in groups. Neighbors often shared newspapers with each other, or even subscribed jointly. Information and ideas contained in newspapers moved by word of mouth, and passed hand to hand in clippings and letters. In a time when most people still conducted most of their daily affairs through face-to-face exchanges, even a few newspaper subscribers were enough to spread the word to entire neighborhoods. Even if one assumes that most early Americans would have been unable or unwilling to read the lengthy political essays and documents that dominated the political journals of this period, there were multiple paths that political arguments could take, many of them following what communication scholars call the two-step flow of political communication.

Although the leading “penny press” dailies that appeared after 1830 far outstripped the newspapers of the early Republic in terms of individual circulations, this may reflect as much a concentration of readership as an expansion. Decentralization was one of the hallmarks and great strengths of the early Republic’s press system. Whether serving a political party, religious denomination, a social movement, or simply sharing commercial information, early American newspapers operated as networks of small, independent outlets tailored to the locality, beliefs, and interests of their readers. As a collectivity, early American newspapers outstripped their individual limitations and produced a vast amount of original material. Moreover, the networks showed an impressive ability to move information and arguments around the country.

During the election of 1800, Federalists and other observers were amazed at how quickly and effectively themes, arguments, information, and particular articles moved back and forth across the Democratic Republican press network. The Irish radical refugee William Duane’s Philadelphia *Aurora* was the clear ideological leader and chief source of information for the others on politics at the seat of government. It seems to have taken from two weeks to a month for *Aurora* material to get over the mountains to the network’s extremities in Kentucky and western Pennsylvania, but only a few days to a week to get as far away from Philadelphia as Pittsfield, Massachusetts, and Raleigh, North Carolina. This

was blinding speed by eighteenth-century standards. Duane’s newspaper was “the heart, the seat of life” of the Democratic Republican Party, argued the Federalist *Connecticut Courant*. “From thence the blood has flowed to the extremities by a sure and rapid circulation. . . . It is astonishing to remark, with how much punctuality and rapidity, the same opinion has been circulated and repeated by these people from high to low.”

The *Courant*’s metaphor was a little misleading. To borrow a computer term, the newspaper networks were “peer-to-peer” networks in which all the individual units supplied each other with material rather than taking it from a single, central source. Lateral or upstream exchanges (between hinterland newspapers, or from the hinterlands to the major cities) were just as common as items flowing down from the centers of government and culture. One of the most damaging scandals of the 1800 campaign was the saga of Republican congressman Matthew Lyon’s imprisonment (because of the Sedition Act) in a “loathsome dungeon,” a story that emanated from the press in Vermont. The *Aurora* and other big-city journals like the Boston *Independent Chronicle* and the New York *American Citizen* were the most heavily copied in the Republican press, but these journals copied just as much from each other and from smaller journals in the countryside.

Although social scientists tend to regard centralized command and control as indicators of a strong political organization, partisan newspaper networks thrived and drew some of their effectiveness from their very decentralization. The party’s general message could be filtered or adjusted to suit local predilections. Southern Democratic Republican newspapers tried to justify and refine the states’ rights principles of the 1798 Virginia and Kentucky Resolutions, for instance, while northern Republican journals largely avoided the topic. Perhaps responding to Federalist rhetoric about being ruled by Virginia slave lords, northern Republican editors openly expressed their antipathy to slavery despite their leader Thomas Jefferson’s undeniable Virginia slave-lord status.

The major exception to this decentralization was the rise of so-called presidential “organs” in the new national capital of Washington, D.C. Beginning with Thomas Jefferson’s *National Intelligencer* in 1800, there was always a newspaper in the capital that was regarded as the voice of the administration, essentially performing the functions of the modern White House press secretary and a major national newspaper at the same time. The practice began simply, with Jefferson inviting young Philadelphia printer Samuel

Harrison Smith to start a newspaper in Washington, as a counterbalance to the cantankerous *Aurora*. From there, the presidential organ mushroomed into a prominent but much-resented national institution. While these spokespapers were not public entities or officially connected to the presidency, they originated most official statements and documents the president wished to release. In exchange, the publishers received the lion's share of the major government printing contracts. Thanks to the efforts of longtime *National Intelligencer* proprietors Joseph Gales Jr. and William Seaton, the presidential organ also usually had the franchise for compiling and publishing the records of proceedings in Congress. The *Intelligencer* held its position until 1829, when newly elected president Andrew Jackson, who had been criticized in the paper for years, anointed Duff Green's *United States Telegraph* as his favorite. From there the presidential organ became a political football that changed hands if a new faction or administration came to power. In a White House version of the sort of factional struggle over newspapers that went on everywhere in the political culture of the early Republic, the rivalry between Jackson and his vice president, John C. Calhoun, took out the Calhoun-friendly *Telegraph* as well. Francis Preston Blair was brought in from Kentucky to start the *Washington Globe* and quickly became one of the leaders of Jackson's "Kitchen Cabinet" of advisors. The presidential organ system lasted until scandals forced the creation of the Government Printing Office in 1860. "Newspaper politics" more generally lasted for the rest of the century, albeit with increasing rivalry from other models of publishing and politics.

NEW YORK CITY While the population of New York City at the beginning of the French and Indian War (1756–1763) was just under fourteen thousand, slightly trailing its two rival seaports, Boston and Philadelphia, it would not have been difficult to predict that this community would prosper. New York was fortunate to possess the best natural harbor of the colonies. Protected by the Verrazano Narrows, Manhattan Island offered sheltered docks along both the North (Hudson) River and the East River. It was centrally located among the colonies. Founded in the 1620s by the Dutch as New Amsterdam, the center of their North American trade, it had a unique heritage of commerce and cosmopolitanism that neither Pennsylvania nor Massachusetts could match. The English conquest in the 1660s did not decrease the city's devotion to commerce, and it remained a mixture of nationalities known for its tolerance of minorities, though dominated by the Dutch and increasingly English population.

The French and Indian War was a turning point in the city's history. The decision of William Pitt to drive the French out of North America led to an immense influx of wealth into the city. The British stationed 25,000 soldiers in North America and a fleet that included 14,000 sailors, all of whom had to be provisioned. In addition, New Yorkers could now legally capture French and Spanish ships and keep the spoils. Merchants such as Peter Livingston and Oliver De Lancey made fortunes unheard of prior to the war.

New York too became the center of British trade with North America, now worth 50 percent of its exports to the thirteen colonies, sending flour and livestock and a variety of foodstuffs to the islands in return for molasses for the growing sugar refining industry and bills of exchange. By 1762 its population had reached eighteen thousand. Hanover Square grew famous for its retail wares, and coaches—once a rarity—crossed the city's streets regularly. Numerous elegant mansions arose, such as that of Captain

Archibald Kennedy, with its grand staircase and fifty-foot parlor.

Aside from the city's mercantile elite, New York had a large artisan population, ranging from the elite trades of silversmith and carriage maker to the lower trades of tailoring and shoemaking. There were also a number of white unskilled laborers, including cartmen who hauled goods from ship to shore, and the largest black and slave population of all the colonies outside the South, constituting about 16 percent of the population. The wealthy tended to live in the center of town on Broadway and around Bowling Green, while the artisans and laborers lived in the outer wards, nearer the rivers.

REVOLUTIONARY NEW YORK

Following the end of the French and Indian War, the British enacted legislation to tighten the organizational structure of their empire and increase their income. The Sugar Act (1764), Stamp Act (1765), and Tea Act (1773) met with resistance in all seaports where the tea was sent. Tensions in the street between soldiers at the British army garrison and citizens remained high, resulting in violence at the Battle of Golden Hill in which a seaman was killed when the British tried to prevent construction of a liberty pole. In addition, during the riots caused by passage of the hated Stamp Act, New Yorkers refused to allow the distribution of the dreaded stamps; attacked the home of British commander, Major Thomas James; and held their own tea party in 1774. The artisan population was central to resistance, demanding radical measures against the British, much to the chagrin of the more conservative merchants who, while opposing British measures, were focused on reconciliation. The Sons of Liberty, men who enforced anti-British measures, was composed largely of artisans or merchants of nonelite background such as Alexander McDougall, John Lamb, and Isaac Sears.

As British rule collapsed, two separate committees emerged, a Mechanics Committee and a governing Committee of Fifty-One, that worked together, though not without tension. While artisans did not dominate the governing committee, their pressure for more radical action had to be considered, because their votes held the keys to political power. Their shift of support from the mercantile De Lancey bloc to the landholding, Presbyterian Livingston faction reflected the Livingstons' Revolutionary stand as the De Lanceys moved steadily toward loyalism and exile.

A year after war broke out in April 1775, New York became the center of action. Following Bunker

Hill in June 1775, the British shifted their attention to the middle colonies, attempting to divide New England from the rest of their dependencies. Their first move would be an invasion of New York City. General Charles Lee had constructed a series of forts, batteries, and interior barricades for the Americans early in 1776, but there was no way to fully defend the many approaches to Manhattan Island. In March 1776 Washington moved his army from Cambridge, Massachusetts, to New York and divided it between the city and Brooklyn, across the East River. Brooklyn was protected by its hilly topography, with only a few passes that would permit an army to advance.

The British brought a major show of force to New York. It included 32,000 soldiers, 14,000 seamen, two men of war, and twenty-four frigates. Washington had 23,000 men and no navy to speak of. In August 1776 the British attacked Brooklyn in an all-night march, going through the virtually unguarded Jamaica Pass to the east and forcing Americans to withdraw to Brooklyn Heights, where a final retreat was cut off by the East River. Had Admiral

Richard Howe quickly moved his ships into the river, cut off the troops, and forced their surrender, he might have dealt a mortal blow to the army. But he hesitated, and Washington moved his troops back to the city on the night of 29–30 August. Once again, Howe could have trapped the army by blockading the island through a quick landing of troops, but once more he hesitated, and the American army retreated, eventually into New Jersey and Pennsylvania. The British made New York their headquarters from September 1776 to the end of the war.

The city remained under harsh martial law throughout the war, enforced by a British administration characterized by considerable corruption and ineptitude. The occupation was made all the worse by a major conflagration that destroyed five hundred buildings and created a constant housing shortage for British soldiers, Loyalists, and slaves who had come in search of freedom. British cruelty was sadly apparent in the treatment of the thousands of American prisoners held captive in the city, most appallingly in leaky ships in the harbor including the noto-

rious *Jersey*, almost all of whose inmates died of disease or starvation. The last city to be freed of British rule was New York; the British pulled out on 25 November 1783, a day that would be a major civil holiday for the next hundred years.

REPUBLICAN NEW YORK

After the British exodus, republican government was established in New York City, an urban center of just over 33,000 inhabitants by 1790. It was a conservative republican tide that held sway, however. Tory lands were confiscated, especially the De Lancey holdings, but most of these lands were bought by wealthy merchants. The new president of Columbia College (formerly Kings College) was William Samuel Johnson, son of the college's first president and a quiet revolutionary. New York was the home of one of the nation's strongest antislavery associations, the Manumission Society, founded in 1785, headed by John Jay and including prominent citizens such as Alexander Hamilton. Even so, in the 1790s the absolute number of slaves in the city increased by 25 percent: the number of white homes using some form of black labor tripled. Artisans continued to use slaves during the 1790s, but their use gradually decreased from one in eight to one in seventeen by 1800.

New York played a central role in the political life of the new nation. It was a focus of debate over the new federal Constitution. As opposed to upstate farmers, its residents were largely in favor of a strong central government that would protect commercial interests and uphold national honor; the *Federalist Papers*, the most important defenses of the new Constitution, were published in New York. It was also the nation's first capital; George Washington was inaugurated on 30 August 1789 on the steps of City Hall, which was converted into the first federal building.

Washington spent a year in New York before the capital was moved to Philadelphia in 1790 as part of a political deal between Jefferson and Hamilton. But although New York was no longer the political capital, Hamiltonian economic policy—which the deal preserved—and the monetary capital and commercial expertise of the city's astute mercantile elite allowed the city to remain the nation's financial hub. Gotham, as the city was dubbed, became the home of the country's first stock exchange in 1792 and its center of trade. It housed the nation's most banks and largest credit capabilities (fourteen banks and \$35 million in capital in 1825), the most reliable insurance brokers (\$16 million in capital in 1827), the

most dependable harbor, and the most reliable packet service. British merchants had their best contacts in New York, and as early as 1810, one-fourth of the nation's cotton trade moved through the city. By 1825 New York's exports (\$175 million) nearly equaled those of Boston, Philadelphia, and Baltimore combined. Merchants residing in the city included the likes of John Jacob Astor (1763–1848), Anson Phelps (1781–1853), and Arthur (1786–1865) and Lewis (1788–1873) Tappan. Trade grew so rapidly that wide new streets, West Street and South Street, were built from landfill. Shipbuilding flourished, and it was on the Hudson River that Robert Fulton put his steamboat, the *Clermont*, on display and into operation in 1807.

American republicanism meant new economic horizons for all classes. Artisans expanded their businesses, arranged credit, and sponsored their own banks; a number, including cabinetmaker Duncan Phyfe (1768–1854), became major entrepreneurs. Yet economic growth also meant a greater stratification of wealth. New York was a venue for the growth of the American labor movement as the increasingly large number of long-term wage earners engaged in citywide walkouts, demanding a republican wage, a salary commensurate with American citizenship.

Opponents of slavery, influenced by the Revolution's republican legacy, gained passage of New York's Gradual Emancipation Act in 1799, a decade after the launching of the new government. Although it did not grant immediate release, most bondsmen were now able to purchase their freedom; the number of slaves dropped precipitously as the free black population increased. Blacks did the city's most difficult and undesirable work, including emptying privies and sweeping chimneys, but they also worked in a number of artisan crafts, formed their own churches, newspaper (*Freedom's Journal*), and theaters, and exercised republican rights, including the right to vote—until the Democratic Republican Party disenfranchised most of them in 1821.

Republicanism meant change in municipal government. In the colonial era, the Corporation of the City of New York acted as a private body concerned with real estate and waterfront tracts. The new Common Council aggressively pursued the interest of the city's entire population. So that it could do so, the state granted it the power to tax its citizens. A new city hall was erected, the grandest structure in town, built with sandstone and marble on a Palladian, classical republican, plan. The city took on its future design, initiating the famous grid plan, based on

the idea of reason and order, that gave modern New York its shape. The city supported the poor in a three story Almshouse (1797), then built a new Bellevue complex on the East River in 1816 that included an almshouse and pesthouse, soon to be a hospital, and was responsible for local courts and constables. It paved streets and collected garbage (though the pigs left to roam often did a better job in the poorer neighborhoods); it allocated water supply to a private firm, the Manhattan Company, that proved more adept at banking than pipelines, leaving the city with chronic plumbing and water shortages.

With two elections each year, one for federal and state office, one for city offices, political conflict was nearly constant. The two parties, the Hamiltonian Federalists and Jeffersonian Democratic Republicans, fought for competing legacies of the Revolution. Ultimately, the egalitarian Jeffersonians triumphed over the deferential expectations of the

mercantile Federalists among the pivotal electoral bloc: artisans and young, ambitious merchants. The key victory came in 1800, when the city's ballots brought New York State's electoral votes into the Jeffersonian column, making possible Jefferson's victory. Making the political fights even more intense were the conflicts with France and Britain as they engaged in the Napoleonic Wars. America's quest for freedom of the seas, leading to the War of 1812, was echoed in the streets and on the docks of New York, as the harbor was refortified for the first time since 1776.

With the aid of immigrants from Ireland and the city's hinterlands, New York's population grew to just under 100,000 residents by 1810 and to a metropolis of 197,000 by 1830, dwarfing every other American city. By then, it housed the nation's most elegant residences on Broadway and Park Place, while seeing the growth of severe areas of poverty,

including the Five Points. It became a mecca of the arts with a lively theater scene, hosted numerous musical concerts, and housed the New York Academy of Fine Arts (soon called the American Academy of Fine Arts), headed by the noted painter John Trumbull. With the completion of the Erie Canal in 1825, New York became the portal for immigrants of the coming generation and the center of the country's import and export trade. It was the only world-class metropolis in the new American nation.

NEW YORK STATE At independence New York was a second-tier colony, more important for its strategic location than for its population or its economy. New York City was just a colonial port. New York's boundaries with both New England and Indian country were uncertain. The Six Iroquois Nations loomed large in New York affairs. By 1830, however, New York had become the Empire State, first in population and dominant economically over the Northeast, the emerging "Great West," and in some ways even the South. New York City had become the American metropolis and was on its way to world standing. Many Iroquois had departed and the remnants were struggling to hold on to scraps of land. In 1775 New York had the largest slave population outside the South; by 1830 only seventy-five slaves remained in the state, the last sufferers of a quirk in its gradual abolition law. Nearly 45,000 black New Yorkers were free. Yet both in 1776 and in 1830 New York was a raucous place where people of all sorts mingled and jostled.

REVOLUTIONARY NEW YORK

New York's Revolutionary leaders did not accept independence until 9 July 1776, making it the very last of the founding thirteen to break with Britain. Part of what they called New York, the counties of Cumberland and Gloucester, was about to declare its own independence as Vermont. Until 1791 New York's leaders called Vermont a "pretended state," and its people "revolted subjects." But the state had lost the Green Mountains, as it had lost its weak claim to western Massachusetts and western Connecticut.

But New York did not yet have its familiar shape. Reporting to London in 1774, the last royal governor invoked an Indian treaty of 1702 to claim the Niagara Peninsula, in modern Ontario, and the country beyond Detroit. An official British map, drawn about 1775 and published in 1779, showed western New York ending much farther east, at the "line of property" where the country of the Six Iroquois Nations began. To the Six Nations, that line remained in effect even after the Revolutionary War. Massachusetts claimed part of the Iroquois country under its royal charter. The matter was not resolved until a treaty between it and New York at Hartford, Connecticut,

in 1786. The borders with New Jersey and with Pennsylvania were clear on official documents but had not been completely surveyed. Like much of the rest of Revolutionary America, New York's boundaries and extent were anything but certain.

Its early political life as a state was equally uncertain. The Revolutionary leaders did not proclaim a new constitution until April 1777. They never offered the document for ratification, simply announcing that it was taking effect. By then Manhattan, Long Island, Staten Island, and southern Westchester were in British hands. Loyalism was rife in the Hudson Valley. Civil war raged where white settlement met Iroquois country. Four of the Six Nations (the Mohawks, Onondagas, Cayugas, and Senecas) chose the British side, whereas the Oneidas and most of the Tuscaroras were with the Americans. In 1779 the Iroquois put out their Council Fire, the symbol of a League of Peace and Power that had endured for centuries. Their white neighbors were equally divided.

Even among white Patriots dispute raged. A small group of young men who stemmed from the old colonial elite, including Philip Schuyler, John Jay, Gouverneur Morris, and Robert R. Livingston, expected to take control. But the votes of soldiers gave outsider George Clinton the first of five three-year terms as governor, and in the late 1770s and the 1780s a populist political party came together around him. This party's rule was so successful that New York held off on ratifying the federal Constitution till 1788 (becoming the eleventh state to do so), joining only after it was clear that the Constitution would take effect and that New York City might secede and ratify on its own.

THE EMPIRE STATE

Despite the war's disruptions, New York grew rapidly. Governor William Tryon estimated New York's population in 1774 at 182,000. By the 1790 federal census, that figure had nearly doubled, to 340,241. In 1800 it was 586,182, and in 1810, 959,049. New York City had outstripped Philadelphia by then—96,000 to 91,000—but Pennsylvania remained the most populous state, in 1820 outnumbering New York, 1,549,458 to 1,372,812. Not until 1830 did New York have the largest population, with 1,918,608 people. Of these, 202,589 lived in New York City. By then Newburgh, Poughkeepsie, and Kingston had passed the urban threshold to small city status. Albany had become the permanent capital, and Utica, Rome, Syracuse, Rochester, and Buffalo marked waypoints and industrial centers along the Erie Canal.

These numbers do not include Indians, despite New York's claim that the Six Nations, the Shinnecocks, the Montauks, and others within its now-firm boundaries "belonged" to it. The censuses did count African Americans. Governor Tryon reckoned that, in 1774, 21,549 New Yorkers were black, almost all of them part of the largest slave population north of Chesapeake Bay. Slavery weakened by 1790, when 4,782 black New Yorkers were free. More than 21,000 remained enslaved, however. The state finally began gradual abolition in 1799. The census in 1800 showed 10,374 free black New Yorkers and 20,613 slaves. By 1810 the numbers were tilting, with 25,333 free people and 15,017 slaves. In 1820 there were 29,279 free of slavery, but 10,088 remained in chains. New York's leaders adopted 4 July 1827 as the day for slavery to end. In 1830 the free black population was 44,870.

DEMOCRACY AND DEVELOPMENT

Creating the Empire State required destroying what historians now call Iroquoia. At the end of the Revolutionary War the state maintained that the four Iroquois nations that had sided with the British had forfeited their land. It could not make that claim stick; nor could it claim the land of the pro-American Oneidas and Tuscaroras. Both the state government and the Confederation Congress maintained their claim to sovereignty in relation to the Indians and their right to purchase the land. To complicate matters, so did Massachusetts. Congress aside, the Treaty of Hartford gave legal sovereignty to New York but allowed Massachusetts the right as a private purchaser to preempt Indian land west of Seneca Lake. By the time the federal Constitution took effect in 1789, Massachusetts and New York believed they had negotiated treaties to purchase most Iroquois land. The federal Non-Intercourse Act of 1790 supposedly ended separate state purchases of Indian land, and in 1794 federal negotiators worked out a major treaty with the Six Nations at Canandaigua, in the central Finger Lakes region. Between then and 1846, New York State negotiated a long series of treaties for virtually all the remaining Indian land. Because those treaties did not conform to federal requirements, their legal status has remained open to litigation and is not fully resolved at this writing.

Nonetheless, settlers poured into western New York, which the state was dividing into counties and townships without regard to Indian title. Even colonials had seen that New York possessed a unique opportunity at the Oneida Carrying Place, where the Mohawk River, flowing toward the Hudson, comes

within a mile of Wood Creek, flowing toward Lake Ontario. Build a canal across that low ridge, and a few others around the Mohawk's rapids and falls, and the two water systems would join. Nowhere else between the St. Lawrence and the southern tip of the Appalachian Mountains was such a link possible. By the early nineteenth century some were thinking in bigger terms, proposing a canal from Albany to Lake Erie. Rochester flour dealer Jesse Hawley apparently had the idea first, but credit for the Erie Canal goes to DeWitt Clinton, who pushed the idea ceaselessly as mayor of New York City, governor, and federal politician, including a run for the presidency in 1812. (Not until Martin Van Buren's election in 1836, however, would a New Yorker win the White House.)

Clinton sought federal support, but when President James Madison vetoed a bill in 1816 New York embarked on the project alone. Construction began in 1817, and the canal opened in 1825. It was so successful that it needed enlargement by 1836. It gave New York City access to the whole northern interior, ensuring its primacy over rivals Philadelphia and Montreal. Cleveland, Detroit, and Chicago all became part of New York's system. Land values along the canal soared.

The canal's completion was part of the high tide of white male democracy in New York, as property requirements for voting and officeholding came to an end. But democratic opportunity led straight to machine politics, of which Van Buren was a pioneer, and was joined directly to the exclusion of most black male voters, to whom property requirements for voting still applied. Moreover, the canal's very success brought unrest along its route. Central and western New York were so overrun by religious revivals and reform movements that the region became known after 1830 as the "Burned Over District." Militant abolitionism, prison reform, temperance, women's rights, and the emergence of the Latter-Day Saints as a uniquely American religion all were among the results.

NILES' REGISTER Known as the "News Magazine of the Nineteenth Century" to later generations, *Niles' Weekly Register* was one of the first periodicals in America to systematically gather and organize all the major news of the week. As such, it was widely read by the opinion leaders of its time and became a valuable source for later historians, especially on politics, government, and the economy.

Considerably longer than the newspapers of its era at sixteen pages, the *Register* was the brainchild of Hezekiah Niles (1777–1839), a Quaker printer from Pennsylvania. Having previously tried his hand at several types of publications, including a conventional Democratic Republican newspaper, the *Baltimore Evening Post*, Niles promised readers "Something New" in his 1811 prospectus for the *Register*, and for the most part he delivered. While the *Register* employed no reporters and printed the same basic types of material as all the newspapers of this period—political essays, texts of speeches, letters, official documents, and extracts from other newspapers—Niles made his selections much more carefully, comparing various accounts for accuracy and often summarizing the information or setting the reports and documents in context with commentary of his own. Niles also distinguished the *Register* by refusing to use it for "electioneering purposes," banning the anonymous contributions and personal attacks that dominated many party journals and printing material on both sides of many issues.

While Niles was indeed the “honest chronicler” that the Shakespeare quotation on his masthead seemed to promise, the *Register* was far from nonpartisan. Setting a pattern for later advances in news reporting, the *Register* rose to prominence by chronicling a major war, the War of 1812 (1812–1815), to which it was deeply committed. Niles was ferociously anti-British and bitterly critical of the war’s many domestic opponents. As he saw it, the United States was fighting the “most profligate and corrupt government in the universe, administered by the most finished villains in the world, who make a boast of bribery, laugh at fraud, and cherish all sorts of whoredoms.” Niles also became one of the most influential exponents of the American System of fostering domestic industry through internal transportation improvements and protective tariffs. He stuffed the *Register* with arguments and data in support of protectionism and did not shrink from bitter political invective on the topic. The “free trade party” (code for the Jacksonian Democrats) was full of “British agents” and wanted to “send the laborer ‘supperless to bed,’” Niles warned in 1831. Given that the American System was the signature policy agenda of Henry Clay and the Whig Party, *Niles’ Register* should be counted as a vociferous fellow traveler of that party even if the editor technically kept his promise not to promote candidates in his pages.

A judicious editor, skilled writer, and confirmed workaholic, Niles produced the *Register* until his health failed in 1836. He then turned the reins over to his son, William Ogden Niles, who moved the paper from Baltimore to Washington, D.C., and changed the name to *Niles’ National Register*. William’s tenure as editor was cut short in 1839 when his widowed stepmother sold the paper out from under him. The publication ended up in the hands of Hezekiah’s old friend Jeremiah Hughes, longtime editor of the Annapolis *Maryland Republican*, who ran the *Register* until his retirement in 1848. Hughes sold out to novice editor George Beatty, who moved the office to Philadelphia and tried selling advertising in it for the first time, but mismanaged the famous publication to an early death in 1849.

NONFICTION PROSE Nonfiction prose in the period from 1754 to 1829 is marked by a shift from Calvinist introspection and a preoccupation with spiritual salvation to a focus on the public sphere in which attempts are made to define what an American is and what the American continent is like for curious Europeans and future immigrants. Those already living in America saw in this literature a guide to fashioning a distinctively American political, social, and cultural identity. Thus, the project of description and analysis of America had both a domestic as well as an international audience. Among the modes of expression most suited to this enterprise were autobiographies (of model Americans) and scientific writings describing the natural landscape as well as observations about the American character by recent immigrants. Added to these were popular advice books about how one might succeed in the American environment through rigorous domestic (household) economy and practical (farmer’s) almanacs. And finally, among the characteristic nonfiction prose forms were histories of the American Revolution and political writings about the best modes of governance, supplemented by dissenting polemical writings (orations, sermons, dialogues, and published letters) about the overlooked capabilities of women, Native Americans, and African slaves.

This is not to suggest that intimate, personal writings disappeared, for certainly correspondence was the main form of communication and offered alternative perspectives on the new nation by less public voices, such as those of women (as seen in the correspondence between Abigail and John Adams). Nor is this to suggest that religion had foundered, for there were many revivals that followed the Great Awakening of the 1730s and 1740s, and diverse denominations flourished in the latter half the eighteenth century and the early nineteenth century. Furthermore, spiritual autobiographies, as exemplified by that of Quaker Elizabeth Ashbridge (1713–1755) continued to be written. Rather, it is to suggest that John Winthrop’s vision of America as God’s “city upon a hill” was adapted and naturalized in the descriptions of America by Thomas Jefferson in *Notes on the State of Virginia* (1785) and in William Bartram’s *Travels* (1791). Similarly, spiritual autobiog-

raphies, like Jonathan Edwards's *Personal Narrative* (1765) and Cotton Mather's *Bonifacius* (1710; later reprinted as *Essays to Do Good*) were modified into a moral, secular, and national memoir in the *Autobiography* (1818) of Benjamin Franklin. America remained an exceptional nation, but its exceptional basis as God's chosen people was less immediately the topic of discussion, replaced by the practical exigencies of how to form a distinct and sustainable nation in the eyes of the world. The emphasis had shifted from predestination and God's sovereignty to scientific discovery and human craftsmanship—of the political state, of society, and of cultural artifacts.

AUTOBIOGRAPHY AND THE NATION

Benjamin Franklin's *Autobiography* is in many respects a document of the nation's history, written at important junctures in Franklin's and the nation's development and from the vantage of a global perspective. The earlier parts were written in England (in 1771), where Franklin was engaged in discussions with Parliament, and in France (1784), where he stayed on as minister after the Treaty of Paris (1783) with Great Britain was signed; the last part was written in Philadelphia (in 1788) after the Constitutional Convention. The narrative documented his own attainment of personal independence (just a few years before the nation achieved its own) and his method for building a character of discernment and good judgment, which broadened into ever-widening circles of civic-mindedness, public service, and autonomous identity. The *Autobiography* was partly indebted to spiritual autobiographies that registered a journey through trials to achieve grace (for example, John Bunyan's *Pilgrim's Progress* [1678]) and guides to moral conduct (for example, Mather's *Bonifacius*).

Franklin's *Autobiography* focuses, however, not upon the intractable stain of human sin in the eyes of God, but rather upon the (metaphoric) printer's errata, which can be corrected for each new readership. For Franklin, human agency is effective, and self-improvement means that others can learn from his example. His is a self-consciously rhetorical enterprise: a record of his life in the style that he taught himself from Joseph Addison and Richard Steele's *Spectator* (1711–1712), a style that is "smooth, clear, and short: For the contrary Qualities are apt to offend, either the Ear, the Understanding, or the Patience" (Franklin, "On Literary Style," 2 August 1733). Unlike his Puritan predecessors, he did not dwell on his own imperfections but was willing to accept some limitations and vices. Clearly, what he sought most was not to avoid God's wrath. Rather,

it was—in the famous words of Jefferson's Declaration of Independence—"Life, Liberty, and the Pursuit of Happiness" that this self-made man most desired, "for in Proportion as a Man is vicious he loses the Favour of God and Man, and brings upon himself many Inconveniencies, the least of which is capable of marring and demolishing his Happiness" (Franklin, "A Man of Sense," 11 February 1735"). Franklin's *Autobiography* is a document, then, of a man who felicitously rose to international status through self-improvement and self-discipline, just as his nation had done. Franklin included a letter by Benjamin Vaughan (31 January 1783) urging him to publish his life story because there was a parallel between a wise and upwardly mobile Franklin and the new nation's rise to independence and success; "All that has happened to you is also connected with the detail of the manners and situation of a rising people," Vaughan wrote. Franklin's life story is also the nation's history.

Similarly, Thomas Jefferson's "Autobiography," written in 1821, suggests the deep intertwining of his life with the evolution of the nation, perhaps most clearly revealed in the original draft of the Declaration of Independence, included in the "Autobiography." Unlike the final document, which was heavily revised by Congress and has the qualities of a timeless, universal statement representing a consensus of the American people, the original version reveals Jefferson's passionate anger and exasperation in the historical moment. In the changes that are visible in the deletions and emendations, we see the shift from a heated, polemical, and in many respects personal letter to a heavily negotiated and debated document fashioned into a public performance for a broader, international audience. The meaning of the revisions and the final document are still being debated by scholars. In *Inventing America* (1978), Garry Wills suggests that the phrase "all men are created equal" means that they all possess a moral sense that is equal to all other men's in seeking the beauties of virtue, whereas in *The Lost World of Thomas Jefferson* (1948; 1981), Daniel Boorstin suggests that the original phrase ("all men are created equal and independent, that from that equal creation they derive rights inherent and inalienable") derives its sense of equality from Jefferson's scientific interests in the facts and perfection of God's creation. Indeed, from that supreme design Jefferson infers the human potential for crafting the state and the importance of perfecting the governmental design.

FLORA, FAUNA, AND AMERICANS

To a European audience, America still represented the exotic New World and was one more clue to the entirety of God's diverse and perfect design. Thomas Jefferson wrote *Notes on the State of Virginia* (1785) in response to a request from the French government in 1781. A careful description of the flora, fauna, rivers, mountains, laws, manufactures, religions, and populations of Virginia, *Notes* offers a scientist's and perhaps an anthropologist's analysis of one section of America. In fact, significant sharing of scientific information much like this regularly moved back and forth across the Atlantic. Jefferson's emphasis in his descriptions was upon the landscape's orderly design, its natural wonders, and its virtuous people who derived their grace from their proximity to the land. His descriptions are frequently comparative to the Old World and were measured with a scientist's interest in accuracy. One should not forget Jefferson's—not to mention Franklin's—scientific interests and their roles in a scientific community that included Benjamin Rush (doctor and medical scientist), Benjamin Barton Smith (botanist), David Rittenhouse (astronomer), Charles Willson Peale (museum creator), and Joseph Priestley (the chemist who discovered oxygen).

William Bartram's *Travels Through North and South Carolina, Georgia, East and West Florida . . .* (1791) was the work of a botanist who described himself as "impelled by a restless spirit of curiosity, in pursuit of new productions of nature." Compared to Jefferson's, his descriptions of America are more vivid and sensuous and verge on the poetical as he discovered New World novelties. In fact, Samuel Taylor Coleridge and William Wordsworth were known to have gleaned descriptions from Bartram's *Travels* for their poetry, ranging from the terrifying roar of alligators ("it most resembles very heavy distant thunder, not only shaking the air and waters, but causing the earth to tremble") to the never-ending blossoming of a tree ("with large milkwhite fragrant blossoms . . . renewed each morning . . . in such incredible profusion that the Tree appears silvered over with them and the ground beneath covered with the fallen flowers"). Bartram combined the sort of autobiographical narrative that public figures like Jefferson wrote with the scientific explorer's interest in the exotic and the poet's interest in the lyrical. Besides offering up a landscape of enchantment to Europeans who hungered for such fare, Bartram hoped to be "instrumental in discovering, and introducing into my native country, some original productions of nature, which might become useful to society."

In many respects these descriptive narratives of America, and many others of a more exaggeratedly positive nature, functioned as propaganda to entice immigrants to this country. There was, in fact, a genre of emigration promotion pamphlets that so inflated the benefits of America that Franklin spoofed them in his essay, "Information to Those Who Would Remove to America" (1782), addressed to those who might be gullible enough to believe that in America roofs were tiled with pancakes and "fowls [that] fly about ready roasted, crying *come eat me!*" J. Hector St. John de Crèvecoeur, an immigrant from France to New York, however, wrote a more balanced series of essays titled *Letters from an American Farmer* (1782). The best known, Letter III, or "What Is an American," paints a picture of America as a pastoral land and as refuge for the beleaguered European: "We have no princes, for whom we toil, starve, and bleed: we are the most perfect society now existing in the world." Compared to the Old World, America was open and abundant. "Every industrious European who transports himself here, may be compared to a sprout growing at the foot of a tree; it enjoys and draws but a little portion of sap; wrench it from the parent roots, transplant it, and it will become a tree bearing fruit also." Crèvecoeur presents America as an orderly, self-regulated agrarian landscape and as a peaceful melting pot made up of an internationally "promiscuous [mixed] breed . . . now called Americans."

Although not all his reflections on his adopted country are so unqualified in their praise, and although he was hostile to the forces of progress that came increasingly to characterize the country, Crèvecoeur does explore the process of forging an American identity and thus stands as a significant precursor to Alexis de Tocqueville, whose later observations in *Democracy in America* (1835) characterized America for Europeans. For those who came to this country, there was ample advice in the form of almanacs, the best-known and most popular of which was Franklin's *Poor Richard's Almanac*, published annually between 1732 and 1757. A work of wisdom and humor, it made Franklin's name a byword in the colonies. For women, too, there was advice on domestic economy, including that of Lydia Maria Child's *The Frugal Housewife* (1829), where the rising middle-class woman could learn to make do with thrift, resourcefulness, and diligent economy.

POLITICS, PERSUASION, AND HISTORY

Political pamphlets, newspaper essays, orations, and histories, particularly as they related to the Revolu-

tion, were another among the chief forms of expression in nonfiction prose. Among the pamphleteers, Thomas Paine is perhaps the best known. His series of patriotic and eloquent letters, *The American Crisis* (1776–1783), and his incendiary and highly influential pamphlet in favor of independence, *Common Sense* (1776), earned him the epithet “spark plug of the American Revolution.” In his earlier writings for the *Pennsylvania Magazine* (1775), Paine had advocated for the freedom of slaves and for the rights of women. But others, too, advocated on behalf of women and against slavery, and for Native Americans as well. Using the gently suggestive form of a Socratic dialogue, Charles Brockden Brown wrote *Alcuin; A Dialogue* (1797) on behalf of the legal, economic, and political freedom of women. In “Remarks Concerning the Savages of America” (1784), Benjamin Franklin insisted that Native Americans were not barbarians, as many had portrayed them, but rather a civilized people whose advanced code of etiquette was misinterpreted as simplicity and naïveté. In 1700 Samuel Sewall wrote *The Selling of Joseph*, the first tract in America to denounce slavery, but late in the eighteenth century, many African American voices began to be heard on their own behalf. Benjamin Banneker, in a letter to Secretary of State Thomas Jefferson that was published in 1792, advocated for the freedom of his brothers in slavery by reciting back to Jefferson his own words from the Declaration of Independence and reminding Jefferson of the latter’s own feelings under the tyranny and servitude of an exploitative king. Similarly, William Hamilton’s “Oration Delivered in the African Zion Church on the Fourth of July, 1827, in Commemoration of the Abolition of Domestic Slavery in this State [New York]” (1827) highlighted the contradiction between the republican ideals in the Declaration of Independence and the institution of slavery, for which he called Thomas Jefferson “an ambidexter philosopher.” And while men were active on the stage of politics, elite female historians with access to relevant documents wrote patriotic histories of the events, as exemplified by Mercy Otis Warren’s *History of the Rise, Progress, and Termination of the American Revolution* (1805).

By the early nineteenth century, however, with political independence behind them, Americans faced more squarely the challenge to achieve cultural independence from Britain, a challenge heightened by Sydney Smith’s taunt in the *Edinburgh Review* (1820): “In the four quarters of the globe who reads an American book? Or goes to an American play? Or looks at an American picture or statue?” Partly in answer to this call, Washington Irving wrote his gen-

teel and much-loved *The Sketch Book of Geoffrey Crayon, Gent* (1820), a series of stories set in colonial America along with travel sketches of England. But it would be the writers of the 1830s through the 1850s, including Edgar Allan Poe, Nathaniel Hawthorne, and Herman Melville, who sought to forge a distinctively American literature that was neither an imitation of English modes nor the crude and provincial writing that had provoked the negative characterization by Sydney Smith. These authors more than answered the call to create an American literature in what has come to be known as the American Renaissance of the 1850s.

NORFOLK Norfolk, Virginia, was established in 1680, making it one of the first towns established in the colony. It received a royal charter in 1736, making it an independent borough with local governance and allowing property holders to elect a representa-

tive to the assembly. During the decades leading to the American Revolution, Norfolk was a primary commercial port for the colonies. Because of its geographical location and spacious harbor as well as its many docks, warehouses, and commercial agents it dominated the colonial trade with the West Indies. Products such as beef, pork, tobacco, lumber, and especially grains such as wheat and corn were exported through Norfolk.

In 1791 the town's total population was 2,959, with 1,604 whites, 1,294 slaves, and 61 free blacks. By the turn of the nineteenth century, Norfolk's population had surged to 6,926 residents, including 3,850 whites, 2,724 slaves, and 352 free blacks. In 1810 the population increased to 9,193, with 4,776 whites, 3,825 slaves, and 592 free blacks. Over the next decade, the number of Norfolk inhabitants decreased to 8,608, comprising 4,748 whites, 3,261 slaves, and 599 free blacks. In 1830 the borough could boast of 9,814 residents, including 5,130 whites, 3,756 slaves, and 928 free blacks.

During the Revolutionary era, Norfolknians protested the Stamp Act of 1765, formed their own Sons of Liberty, and in 1774 established a committee of public safety in response to the Intolerable Acts of that year. Support for the Patriots had diminished by the fall of 1775, however, when Lord Dunmore, the royal governor of Virginia, took control of the borough with little resistance as thousands pledged their oath of allegiance to the king. But at the Battle of Great Bridge, eight miles south of Norfolk, Virginia militiamen on 9 December 1775 defeated the British under Dunmore's command and forced their evacuation from the borough. Seeking revenge, on 1 January 1776 Dunmore bombarded the port. Before leaving Norfolk, militiamen set fires to Loyalist businesses and houses, contributing to the destruction of 90 percent of the town.

By the turn of the century the citizens had rebuilt Norfolk, maintaining its place as the largest town in Virginia and prospering in what was a primary commercial port. In 1801 the federal government established a navy yard at nearby Gosport. Navigation, nonintercourse, and embargo laws over the next two decades damaged Norfolk's economic prosperity by restricting trade to foreign ports. In the years following the War of 1812, Norfolk's role in the national economy markedly diminished, with New York emerging as the country's dominant commercial port. Although Norfolk would not regain its colonial trade preeminence, residents worked to expand the city's economic fortunes with internal improvements by investing in railroads, completing the

Dismal Swamp Canal in 1829, and building the first dry dock in America at the Gosport Naval Yard in 1833.

NORTH CAROLINA In 1790 residents of North Carolina lived in five geographic regions: the planter-controlled eastern counties, the Piedmont, the western mountains, and the trans-Appalachian Watauga and Cumberland districts. Collectively, they had rejected the new federal Constitution in 1788, but fear of economic and political isolation led them to reconsider and join the Union in 1789. In 1790 the legislature ceded the trans-Appalachian land to the federal government with the provision that it guarantee land titles, protect the institution of slavery, and otherwise establish a territory under the provisions of the Northwest Ordinance of 1787. This area became known as the Territory of the United States south of the River Ohio, and in 1796, the state of Tennessee.

North Carolina had an extant but not well-developed two party system in the early national period. A limited number of elite families helped establish a Federalist coalition in the 1790s, and party cohesion was strong enough that John Adams obtained electoral votes both in 1796 and 1800. Petitions supporting the Federalist agenda, moreover, made their way to President Adams in 1798. As late as 1808, Federalist presidential candidate Charles Cotesworth Pinckney received three electoral votes out of fourteen. Even so, Federalism was generally limited to eastern counties, persisting longest in the upper Cape Fear Valley, and was undermined by an increasingly organized Jeffersonian coalition. Though present by 1796, it became particularly influential after concerns emerged over the Alien and Sedition Acts of 1798. By the early nineteenth century, Republicans would dominate the political structures of the state.

A new political division eventually emerged out of North Carolina's economic condition. Cotton became a dominant crop in eastern and southern counties, although some profitable plantations existed as far west as Buncombe County. Also notable were the naval stores and lumber trades. Yet most people engaged in general farming, and modest remunerative value meant that North Carolina generally was not an economic powerhouse during the early national period. Its lingering reputation for "backwardness" led Archibald Debow Murphy, a state senator, and other prominent men to propose internal improvements, commercial innovation, and state-supported public education as early as the 1810s. Many North Carolinians remained unconvinced by such measures, however, and after 1830 more formal opposition helped usher in the Second American Party System, a term that refers to the two-party competition that developed between the Democratic and Whig parties.

Gradual population growth did little to enhance the state's relatively limited economy. Numbering 350,000 at the outbreak of the Revolution, in 1790 population was just over 395,000. By 1800 the number had grown only to 478,103, and in 1810 to 555,500. In 1820 the number grew to 638,829, and in 1830 North Carolina had a total population of 737,987. Enterprising North Carolinians understood by 1830 that greater opportunities lay in westward migration. For boosters, outward migration seemed serious enough that they feared it might undermine the state's efforts at improvement.

An important element in this gradual population growth was the high number of African Americans. Despite the state's relatively modest economic status, the institution of slavery nevertheless maintained a powerful presence. In 1790 there were 100,783 slaves in North Carolina, along with 5,000 free people of color. By 1800 the number had grown to 133,296, with 7,073 free blacks; in 1810 there were 168,824 slaves and 10,266 free blacks. In 1820, 205,017 slaves lived in North Carolina, along with 14,612 freedmen. In 1830 the state held 245,601 slaves as well as 19,543 free blacks.

Early nineteenth-century North Carolina is best described as a master-race society—one that became increasingly democratic for that race but remained tyrannical for subordinate groups. Perhaps the North Carolina Supreme Court case *State v. John Mann* best encapsulates the nature of this society. Mann was charged in the 1820s with assault and battery on a female slave whom he had hired. On appeal, the court ruled that Mann had the same rights

as the slave's owner, and therefore could not be prosecuted for cruelty. As Chief Justice Thomas Ruffin wrote in the decision, "the power of the master must be absolute to render the submission of the slave perfect."

Although also subject to this oppressive culture, the state's small free black population held a significant advantage over those in most other slave states: because of a loophole in North Carolina's constitution, they maintained the right to vote. This unusual right was taken away in 1835, when a convention altered the constitution in response to Nat Turner's slave rebellion and the emerging abolitionist movement in the North.

North Carolina also maintained a noticeable American Indian presence. More sizeable in the early eighteenth century, by the early national years the remaining population mostly lived in the western mountains. The Cherokees were the major, although not the only, tribe. Between 1790 and 1830 Cherokees struggled to maintain their land and autonomy against an onslaught of white speculation, settlement, and attempts at "civilization." They finally were compelled to migrate across the Mississippi River in 1838, leaving behind only a small population in the Smoky Mountains.

NORTHWEST In late-eighteenth- and early-nineteenth-century parlance, the term "Northwest" referred to the American region north and west of the Ohio River. This area became the states of Ohio, Michigan, Indiana, Illinois, Wisconsin, and a portion of eastern Minnesota.

The territory comprising what became known by the mid-nineteenth century as the “Old Northwest” was ceded to the newly independent United States by Great Britain in the Treaty of Paris (1783). The region had long attracted the attention of land-starved eastern farmers and speculators. Intent upon an orderly and structured settlement of the area and hoping to compensate Revolutionary War veterans with land for their largely unpaid service, the Confederation Congress convinced the eastern seaboard states to abandon their numerous historical claims to western territory and to create a national domain in the region. Moreover, the fledgling government entered into negotiations with native tribes to gain undisputed control over the land. Though some of these negotiations bore fruit, witness the Treaties of Fort Stanwix (1784) and the Treaty of Fort McIntosh (1785), many other native groups repudiated the land cessions and openly resisted settler encroachment upon their homelands, armed resistance that would wax and wane until 1815. With title to the land secured (in principle), Confederation officials passed laws establishing a systematic pattern of land survey (based on rectilinear units) and public sale (Ordinance of 1785) and organized the region as the Northwest Territory, creating in the Northwest Ordinance of 1787 a framework for territorial governance and outlining the necessary steps for the region’s eventual statehood and full equality with the existing states.

In spite of ongoing tensions with local natives, settlers from the North and South alike streamed across the Appalachian Mountains and began carving out settlements and farmsteads along the Ohio River and its tributaries. In the face of increasing pressure, native resistance in the Northwest stiffened and the federal government was forced to dispatch large armies into the region to protect settlements and to quash the Indians. After a series of early military disasters, the eventual defeat of the northwestern tribes by General “Mad” Anthony Wayne’s Legion at the Battle of Fallen Timbers (1794) and the ensuing Treaty of Greenville (1795) opened the region to full-scale settlement. By 1798 the Northwest Territory’s population surpassed five thousand, and it elected its first territorial legislature that year. In 1803 Ohio, the first state carved out of the Northwest Territory, was admitted to the Union. The remainder of the Old Northwest followed a similar path to statehood with Indiana admitted in 1816, Illinois in 1818, Michigan in 1837, Wisconsin in 1848, and Minnesota (including additional territory obtained through the Louisiana Purchase of 1803) in 1858.

A REGION OF AMERICAN VIRTUES

Although the Northwest attracted a wide array of settlers (New England “Yankees,” migrants from the mid-Atlantic, upland southerners, and immigrants from abroad), shared experience and a common political origin under the Northwest Ordinance of 1787 enabled a collective regional identity to develop quickly. Indeed, regional boosters, such as James Hall of Illinois and Lewis Cass of Michigan, argued that the Northwest’s diverse population forged a discernable “western,” yet undeniably national, culture.

For many self-titled westerners, their region and the culture that it spawned fully embodied the republican values of limitless opportunity, unfettered freedom, independence, and selflessness that had driven the Revolutionary movement. According to this view the Northwest, as the nation’s first experiment in “colonization,” was a vehicle for the dissemination of the blessings of liberty into the wilderness. The Northwest—through the Northwest Ordinance and the principles embedded within it—further institutionalized the ideals of the Revolution and the promise of self-government. Furthermore, many believed that the Northwest and its settlers were defined as the most “American” of all regions by virtue of the selfless cession of western land claims by the eastern states, the democratic access to land via public sale to all comers, the area’s orderly progress toward self-rule and full equality as states, the freedom of religion and basic rights guaranteed by the Northwest Ordinance, the promotion of public education, and the banning of slavery from the region. The region’s fertility, bountiful and relatively inexpensive land, and developing connections to broader markets also induced many westerners to embrace an emerging middle-class, Protestant ethos of capitalistic self-improvement and material gain. This soon became one of the alleged hallmarks of the northwestern persona.

THE DARKER SIDE

This self-constructed identity, however, belied a more complex reality. Though many spoke in terms of a collective “western genius,” a large number of the region’s inhabitants found themselves at odds with its basic precepts or were forced to lead lives on the periphery of western society. Land, the basis for independent living, remained beyond the reach of many. Others, for varied reasons, rejected the Northwest’s burgeoning capitalist ethos and clung to a tradition of self-provisioning agriculture. The region’s vaunted hostility to slavery was also not uniformly shared. Many upland southern settlers harbored no animosity toward the “peculiar institution” and

some went so far as to push for the repeal of its exclusion from the states being carved out of the Northwest Territory. Likewise, the Northwest Ordinance did not free those individuals already enslaved in the region as of 1787, and thus the institution continued to linger on into the nineteenth century, with some slaves held in Illinois into the 1840s. Similarly, the spread of “American” ideals into the West did not proceed smoothly or peacefully and left in its wake many casualties. In the end racism, greed, and prejudice relegated the area’s African American and indigenous residents to marginal existences. Additionally, many “westerners” resented their region’s ongoing subordination and dependency. Protracted territorial status, contentious admission to statehood (Michigan being a prime example), and political powerlessness left many westerners chafing at their perceived inequality and eastern domination.

The Northwest spent many of its formative years as a shadowy western dependency of the established states. Isolated from direct access to the east coast by the formidable Appalachian Mountains, the region’s economic and cultural link to the rest of the nation was the Ohio–Mississippi River system. Unfortunately, during the Confederation era and on into the first years of the nineteenth century, Spain controlled the all-important port of New Orleans and the mouth of the Mississippi River. Spanish closure of the port to American trade and the Confederation’s inability to change Spanish policy produced reoccurring separatist movements in the Northwest until the American acquisition of the river’s mouth through the Louisiana Purchase of 1803. Equally galling to “westerners” was the continued British presence on American territory down to the late 1790s and the inept military policy of the federal government in response to the threat posed by the western tribes. Even with the British gone, the Indian threat diminished, and American control over the Mississippi River ensured, northwestern settlers remained wedded to the region’s river valleys and the area remained an economic satellite of the expanding American South.

BECOMING A POWERHOUSE

In the decade of the 1820s, however, the Northwest began to flex its muscle and the region emerged as a national powerhouse. The construction of the National Road and the completion of the Erie Canal in 1825 provided the region with direct and speedy links to the Atlantic seaboard and the world. Moreover, the development of steam travel on the Great Lakes and western rivers enabled trade to move in an

economical and efficient manner. Consumer goods flooded into the region and the bounty of western lands flowed east to fuel an economic boom. Northwestern farms rapidly surpassed the output of older farms in the Northeast, and the region became the breadbasket for the nation and much of Europe. Likewise, the abundant natural resources of the Northwest—its lumber, fish, and minerals—attracted eastern capital and found ready markets in the East, sparking the birth of new industries. The population of the Northwest also grew dramatically during the decade, jumping from roughly 785,000 in 1820 to over 1.4 million by 1830, which paved the way for the subsequent emergence of the region as a dominant political force.

NORTHWEST AND SOUTHWEST ORDINANCES The Northwest Ordinance and its successor acts outlined the organization of government for the territories created from the land ceded to the U.S. government by some of the original thirteen states, allowed for the admission of new states on an equal basis with the original thirteen, and prohibited slavery in the region north of the Ohio River.

NORTHWEST ORDINANCE

The Northwest Ordinance, passed on 13 July 1787, was the single most important act of Congress under the Articles of Confederation. It created the territorial government and outlined the progression of steps toward statehood for the region north of the Ohio River. The Ordinance served as the basis for organizing other western territories.

Under the Ordinance, Congress appointed a government for the territory consisting of a governor, a secretary, and three judges. The governor was the commander of the militia; a majority of the governor and judges were to create the laws in the territory. When the population reached five thousand “free male inhabitants,” a legislature could be assembled. The Ordinance did not require that these citizens be white. The legislature was to have an upper house, the legislative council, and a lower house, the assembly. The assembly, whose members were to serve two-year terms, could be convened with a membership of one for every five hundred free male inhabitants. After the number of members of the legislature reached twenty-five, it would be allowed to determine its own size. The legislative council was to be made up of five men, selected by Congress from ten men nominated by the assembly, serving five-year terms. Legislation would then become law if passed by both houses and signed by the governor, as long as these laws were not in conflict with the Ordinance. The territory had a right to send a delegate to Congress, who could participate in debate but not vote.

The Ordinance determined that not less than three or more than five states were to be laid out within the territory. When the population of any part of the territory reached sixty thousand, that region could apply for admission to the Union as a state on an equal basis with the original states. Congress could reduce the number of citizens required for admission if it saw fit. Ultimately, five states—Ohio, Michigan, Illinois, Indiana, and Wisconsin—were created.

Congress added a series of articles to the Ordinance placing certain limitations on the territory and establishing a bill of rights. The bill of rights included freedom of worship, protection of the writ of habeas corpus, trial by jury, moderate fines, bail, a ban on cruel or unusual punishments, and protection of property rights. The territory was required to encourage education and show good faith toward Indians, whose land was not to be taken without their permission. It was also prohibited from taxing U.S. property or placing higher taxes on nonresident pro-

prietors. The last article of the Ordinance, Article VI, prohibited slavery in the territory. By defining the North as free and the South as slave territory, this prohibition contributed to the growing divide in the young nation over the issue of slavery.

In 1789 the Congress passed an act effectively reasserting the Northwest Ordinance under the new Constitution while making a few minor changes in the reporting requirement for the territorial government by replacing Congress with the president.

SOUTHWEST ORDINANCE

In 1789 North Carolina agreed to cede to the United States its western territory, which would eventually become the state of Tennessee. In response to such land cessions south of the Ohio River, in 1790 Congress organized the Southwest Territory in its Act for the Government of the Territory of the United States South of the River Ohio. This act was designed to extend the provisions of the Northwest Ordinance to the South, with the important exception of allowing slavery. Georgia’s cession of lands in 1802 also made reference to the Northwest Ordinance but exempted the region from the provisions forbidding slavery.

SIGNIFICANCE

The most important provisions of the acts establishing the Northwest and Southwest Ordinances were those affecting the admission of new states to the Union and the prohibition of slavery. Other than requiring the agreement of nine states, the admissions provision of the Articles of Confederation did not outline how new states were to be admitted to the Union. The Northwest Ordinance and its successor laws outlined a process for admission of the five states of the Old Northwest Territories as well as Mississippi and Alabama in the South.

The ramifications of the slavery provision played a role in the Missouri Compromise (1820–1821), which created a balance in the Union between free and slave states. During the debates over Missouri’s admission, slavery opponents used the Northwest Ordinance and its successor as proof of Congress’s ability to regulate slavery in the territories and to set conditions for admission to the Union, as it had done in prohibiting the Ohio constitution from conflicting with the provisions of the Northwest Ordinance.

OHIO In 1787 the Northwest Ordinance defined the boundaries of what became the future state of Ohio, and Congress authorized the first legal settlements there by white Americans. The Massachusetts-based Ohio Company established Marietta in April 1788, and settlement in John Cleves Symmes's Miami Purchase began in November. Vigorous and successful resistance by the indigenous tribes inhibited in-migration for several years until the United States Army under Anthony Wayne defeated them at the Battle of Fallen Timbers on 20 August 1794. By the Treaty of Greenville of 3 August 1795, the tribes conceded the title to three-quarters of the future state to the federal government, restricting their tribal lands to the northwestern quarter. The process of settlement now began in earnest and federal land sales accelerated. By 1800 the future state had acquired a population of 42,159 (of whom about 14,400 were adult), mainly clustered close to the Ohio and Scioto Rivers.

In 1798 the population of the Northwest Territory was judged large enough to justify the election of a territorial legislature, which made laws for the territory subject to the veto of the federally appointed territorial governor, Arthur St. Clair. In 1800 Congress divided the Northwest Territory by creating the Indiana Territory, and the remaining eastern division

of the Northwest Territory began to debate the desirability of statehood. When St. Clair persuaded the legislature to support a further division of the territory in order to postpone statehood and perhaps gerrymander a pro-Federalist state east of the Scioto, the Republican opposition, led by Thomas Worthington, prompted a massive petition campaign and persuaded the new Republican majority in Congress to authorize the calling of a constitutional convention, even though the territory had not yet reached the mandated size of population.

Elected in October 1802, the Republican-dominated convention voted for statehood and drafted a constitution that prohibited slavery, weakened gubernatorial power, and gave control of the legislature to what in practice amounted to a white adult male electorate. After becoming a state in March 1803, Ohio proved a consistent Democratic Republican stronghold, supporting Presidents Thomas Jefferson, James Madison and James Monroe, though suffering strong internal divisions over the role of the judiciary. In 1812 the state enthusiastically backed the War of 1812 against Britain, which resulted in two invasions of Ohio, in 1812 and 1813, by British troops and the Shawnee leader Tecumseh's native warriors. Security was not restored until late in 1813, with naval victory at Put-in-Bay on Lake Erie in September and military defeat of the hostile forces

at the Battle of the Thames in Upper Canada (Ontario) in October. National victory made possible the treaties of 1817 and 1818 that finally expunged the title of the Indian tribes in northwestern Ohio and restricted the three thousand natives who remained to a few small reservations until the last were moved westward in 1842.

The extraordinary rate of white settlement that followed statehood gave Ohio a population of 230,760 in 1810. The interior of southern Ohio opened up, especially the Scioto, Muskingum, and Miami Valleys, which were settled mainly by people from Pennsylvania and the Upper South. The land between the Scioto and the Little Miami Rivers had been reserved to pay the wages owed to Virginia's Revolutionary War veterans, with the result that although the warrants had largely passed into the hands of speculators, settlers in this military district came disproportionately from Virginia and Kentucky. The process of rapid settlement slowed after 1809 during the years of Indian hostility and war but resumed with even greater intensity after 1813. New Englanders now flooded into northeastern Ohio, on to the lands known as the Western Reserve (or New Connecticut), which had been reserved in 1800 by Connecticut to pay off its Revolutionary War debts. At the same time German farmers from Pennsylvania settled the upland wheat-growing area south of the Reserve. The interior filled as Ohio's population doubled in a decade to 581,434 in 1820, making it the fifth most populous state in the nation. Although varied in religious character and regional origin, its people consisted primarily of white migrants born in the United States, with only a minute proportion of unnaturalized foreigners. The black population also remained less than 1 percent of the whole, thanks largely to the law discouraging black immigration passed in 1807, though numbers began to increase in the 1820s.

Essentially a land of farmers producing for their families' immediate needs, Ohio from an early date generated an agricultural surplus, mainly of corn and pork, for sale outside the state. After 1818 the state's development slowed considerably during the hardships of the Panic of 1819 and the subsequent depression. Then, in 1825, the state government embarked on an ambitious canal program, notably connecting Lake Erie with the Ohio River, which duly stimulated a considerable economic recovery as commercial agriculture expanded. Many backward and frontier areas still remained as population growth now occurred mainly in the older counties, where small market towns developed rapidly. From the

start, Cincinnati had been the major commercial entrepôt, and after 1815 it began to develop some industry. Between 1824 and 1829 its population doubled in size to 24,143, more than the state's other urban centers put together. By 1830 Ohio, with a population of 937,903, was a highly heterogeneous state that supported an active and contentious public life; its voters divided evenly between the Jacksonian Democrats and their National Republican opponents, and as the state with the fourth-largest number of electoral votes and U.S. representatives, Ohio was already regarded as a critical swing state in national elections.

OKLAHOMA Located on the southern prairie-plains and intersected by the Arkansas, Red, Canadian, and Cimarron Rivers, Oklahoma was long an important crossroads. The great Mississippian city of Spiro in eastern Oklahoma dominated the region from A.D. 950 to 1450, and its burial mounds held some of the most remarkable pre-Columbian artwork north of Mexico. By 1700, Caddo and Wichita Indian villages, surrounded by immense cornfields, sprawled along the Red and Canadian Rivers, while Comanches, and later Kiowas, roamed the western regions.

Oklahoma fell within the territorial claims of France's Louisiana colony. In 1719, Bénard de la Harpe became one of the first French explorers to visit Oklahoma Indians. Soon French traders from Louisi-

ana and Arkansas were regulars in the area. Spanish Texas also claimed Oklahoma but could never exert control over it. In 1759, at the Battle of the Wichita Fort on the Red River, a Spanish punitive expedition against the Wichitas, Caddos, and Comanches was driven off with the loss of its artillery.

Oklahoma became part of the United States in the Louisiana Purchase of 1803. Considered to be part of the Great American Desert, politicians saw it as a place to relocate “civilized” eastern Indians. In 1824 the federal government formed what later became Oklahoma, Kansas, and Nebraska into an official Indian Territory. At that time, Oklahoma was home to the Comanches, Kiowas, Wichitas, and Caddos, with perhaps a few Cherokees living in eastern Oklahoma before the 1830s. However, that decade would see the arrival of thousands of southeastern Indians who had been removed to Oklahoma over the Trail of Tears.

OLD AGE Three continuities and three changes characterize the history of old age in the United States between 1754 and 1829. The continuities provide a context for interpreting shifts in the meanings and experiences of being old. Having debated the magnitude of changes that occurred during the era, historians agree that it was no golden age. Developments from 1754 and 1829 set the stage for dramatic demographic, socioeconomic, and political transformations in late life during the twentieth century.

The first continuity worth noting is that throughout history, old age has been recognized as a stage of life. Unlike other stages of life like “adolescence” that were invented, almanacs, newspapers, and artifacts from this period document that scien-

tists, ministers, farmers, and popular writers put the same chronological boundaries around elderhood as had seventeenth-century settlers. Americans at the time agreed that old age began at sixty-five, give or take fifteen years.

Second, because of late life’s elongated, elastic end points, older Americans collectively were the most diverse segment of the population between 1754 and 1829. Some, like Thomas Jefferson (1743–1826) and John Adams (1735–1826), maintained their health and vitality well into their seventh decade. Others became increasingly frail with advancing years. Physicians and philosophers considered senescence a natural process, not a pathological disorder. Nor was mental decline deemed inevitable. Benjamin Rush (1745–1813), arguably the nation’s first geriatrician, opined that a proper diet and exercise in moderation preserved the faculties. Extremes in wealth, as in health, existed in old age. A majority of the country’s wealthiest men were either aged plantation owners and slaveholders or bankers and manufacturers in urban settings. That said, most elders died intestate, having managed to save little over the course of their lives.

Third, attitudes toward old age ranged from positive to negative, by turns ambivalent and ambiguous. Charles Willson Peale’s luminous portraits of contented elderly gentry contrasted with images of widows and the disabled seeking refuge in almshouses or having to accept outdoor relief. Commentators between 1754 and 1829 frequently describe old people with status as “venerable,” while others hurled disparaging invectives at those who were vulnerable and marginal with advancing years.

David Hackett Fischer’s *Growing Old in America* (1977) sparked considerable interest in historical gerontology by arguing that there was a “deep change” in attitudes toward age and the elderly’s behavior between 1790 and 1820. He cited changes in vocabulary and fashion, seating patterns in meetinghouses, and other indicators to substantiate his claim. Subsequent scholarship undermined Fischer’s argument, but at least three changes took place during the period that set the stage for subsequent developments.

First, older men and women worked as long as possible between 1754 and 1829 and then relied on the (minimal) savings they had acquired. In a few instances—notably judgeships in thirteen states—sexagenarians were forced to quit the bench. These are the first instances of retirement in U.S. history. A provision of New York’s 1777 state constitution set a precedent and forced Chancellor James Kent (1763–1847) off the bench; he then wrote his four-

volume *Commentaries on American Law* (1826–1830). Kent did not die until he was eighty-four years old, a year after the state rescinded the rule.

Second, the longevity of Americans became a measure of the nation's health. That there was a relatively higher percentage of octogenarians on this side of the Atlantic than in Europe was considered proof that the climate, food supply, and rural values in the New World were more conducive to salubrity than was the Old World. Graybeard Uncle Sam was an apt symbol, Americans felt, for the young Republic. Historical demographers nonetheless remind us that children born in 1790 had as great a chance of attaining their first birthdays as babies born in 1970 have of reaching age sixty-five. Hence, transatlantic comparisons were more valuable as an ideological tool than as a measure of increased life expectancy at birth during this period.

Third, the vast network of public measures to protect and empower older Americans that grew after the passage of the Social Security Act of 1935 had its humble origins in the early years of the Republic. Thomas Paine and Alexander Everett in 1797 and 1823 respectively proposed nationally funded pensions to prevent old-age dependency, but they mustered minimal support. Then, building on its 1789 precedent for granting disability pensions, the federal government offered old-age pensions in 1818 to Revolutionary War veterans who had served nine months, needed assistance, and relinquished claim to any other pension. Congress liberalized benefits in the 1820s, a pattern of incrementalism that would characterize public policymaking thereafter.

OLIVE BRANCH PETITION Representatives to the Continental Congress in the spring and early summer of 1775 divided into two rival camps. The radicals were predominantly New Englanders led by John Adams, who favored an immediate declaration

of independence. John Dickinson from Pennsylvania was the leader of the moderates, who favored reconciliation. The moderates, however, had been fighting a losing battle ever since the clashes at Lexington and Concord in April, and their support eroded with each passing act of hostility. When news of the Battle of Bunker Hill in June 1775 reached Philadelphia, it had a radicalizing effect on the Congress. The moderates still retained enough strength and influence, however, to keep the concept of a peaceful resolution on the table. The result was the Olive Branch Petition, written largely by Dickinson and addressed to King George III. It stated that the British monarch and his ministers had jeopardized the relationship between the colonies and the mother country by assaulting traditional liberties. It called for a truce in the fighting, repeal of the Coercive Acts, and a restructuring of imperial institutions to allow the colonists more autonomy.

Generally, historians believe that the Olive Branch Petition was less a serious attempt at averting war than a political move to satisfy moderates that the colonials had made one last appeal to the king to preserve the peace. Radicals, such as John Adams, thought it a farcical waste of time and thought more unity could be gained through an immediate declaration of independence. As Congress discussed the Olive Branch Petition, it continued the march toward war, creating the Continental Army, appointing George Washington of Virginia as commander in chief, authorizing an invasion of Canada, and adopting Thomas Jefferson and John Dickinson's *Declaration of the Causes and Necessity for Taking up Arms*.

On 8 July 1775 the Congress adopted the Olive Branch Petition. Richard Penn, a colonial agent, carried it to Britain. The plan was for the agents to present it to the king, but only Penn and Arthur Lee actually attempted to deliver the message. King George III refused to acknowledge the communication of an illegal institution and declared the colonies in rebellion. Parliament was out of session. When it reconvened on 26 October 1775, the king, in his speech opening the session ridiculed the petition in an indirect reference. The errant colonists were not the only ones petitioning the king for peace; towns and cities throughout Britain did likewise, which meant that Parliament could not ignore the issue. In November, Edmund Burke introduced a bill to revoke the Coercive Acts, grant pardons to all those involved in rebellion to that point, and grant the supremacy of colonial assemblies over Parliament regarding the right to tax the colonists. It failed by 210 to 105. This was interpreted as Parliament's agreement with the king

in rejecting the Olive Branch Petition and setting the stage for war.

ORPHANS AND ORPHANAGES Since the seventeenth century, child welfare policy in America has wavered between two principal policies: providing support to keep families together, and removing orphans from their families to care for them elsewhere. The word *orphans*, in the language of the new American nation, meant children who had lost one or both parents and who, because their families were unable to care for them, had become the public's responsibility. Although public leaders during the colonial period had relied primarily on three types of arrangements to care for orphans—outdoor relief, indenture, and almshouses—it was during the era of the new American nation that orphanages first appeared and entered their formative stage.

In 1739 George Whitefield (1714–1770), the charismatic leader of the transatlantic religious revival known as the Great Awakening (late 1730s and early 1740s), traveled to America to care for orphaned children. Inspired by the asylum of the German Pietist August Hermann Francke in Halle, Germany, Whitefield founded Bethesda Orphanage, known as the House of Mercy, in 1740. Located near Savannah, Georgia, it was the first orphanage in the British American colonies. (The first orphanage in all of the territory that would eventually become the United States was the Ursuline convent founded in New Orleans in 1727 by the French for children orphaned in an Indian raid.) Bethesda Orphanage was unique for its time, a product of Whitefield's emphasis on Christian charity and private philanthropy and of his insistence that benevolent giving was not the unique province of the elite. Of the forty-six children who entered Bethesda in 1740, eleven stayed for less than a year, and only nine remained in 1745. The vast majority of Bethesda's orphans returned to their families or were apprenticed to artisan families.

By 1801 seven orphan asylums dotted the Atlantic Coast. In 1790 the only publicly funded orphanage in the United States during the eighteenth century was founded by the city of Charleston, South Carolina, when it opened the doors of the Charleston Orphan House for 115 destitute children. Thereafter, private associations began to appear in northern urban areas. In 1797 one association founded the Society for the Relief of Poor Widows and Small Children in New York City to care for orphans; the following year a Roman Catholic priest established St. Joseph's Female Orphan Asylum in Philadelphia to care for girls orphaned by yellow fever. In 1799 St. Paul's Orphanage was founded in Baltimore for impoverished girls and, a year later, an association of women incorporated the Boston Female Orphan Asylum. In 1801 the Hebrew Orphan Asylum was established to care for poor children in Charleston.

Orphanages began to proliferate in America after 1801. By 1830 there were more than thirty orphan asylums in the United States, most located in northeastern urban areas, twenty-one under the auspices of Protestant churches, and ten established by Catholic churches. Elite and middle-class white women provided the leadership and organizational skills for these early orphanages. The Second Great Awakening (1790s–1830s) spurred them to social activism in this area and in many other public spheres of moral reform. These included interdenominational campaigns to curb drinking, end slavery, and improve the condition of the poor and insane.

The programs of the thirty-odd private orphanages differed radically in their approaches. Some, like the New York Orphan Asylum, sought the permanent removal of children from their indigent or widowed parents, while others, like the Boston Female Asylum, offered short-term facilities as well as long-term care for impoverished mothers during economic downturns. They often admitted as many as from ninety to one hundred children, boys under the age of six and girls under the age eight. All made efforts to educate their young charges. They were instructed in religion, reading, writing, and arithmetic, yet also earned their own keep by knitting stockings sold to benefit the institution. Most boys and girls left the asylum at approximately age twelve (though some left as early as ages nine or ten), when they were placed under indenture. Most of the girls were bound out as domestic servants; the boys were bound out as agricultural laborers to farmers or apprenticed to trades such as cabinetmaking, shoemaking, and tail-

oring. The managers of the Boston Female Asylum placed approximately 4 percent of their charges for adoption.

For orphanages in America, the period from roughly 1754 to 1829 was a formative one. During the antebellum era, public officials and moral reformers investigated almshouses, a popular method of caring for children. They revealed mismanaged and overcrowded institutions where living conditions were squalid. As a result, they urged that “scientifically” administered orphanages replace almshouses. In the following decades, orphanages would mushroom, numbering nearly two hundred on the eve of the Civil War.

PAIN As in previous eras, pain was omnipresent in the new American nation. Americans expected to experience pain and even to be debilitated by it for short or long periods of time, although expressions of this pain varied through gender conventions. By the eighteenth century, women were expected to suffer more than men, as they were considered more delicate creatures. Men who complained too loudly or long about pain ran the risk of being seen as effeminate.

People in pain had recourse to only a few pain medications. By the end of the eighteenth century, large doses of opium were common. Some physicians, called vitalists, believed that the infliction of pain would awaken the patient's vital energy and allow him or her to fight the illness causing the pain. By the early nineteenth century, morphine, a more effective pain reliever, had been isolated from opium. However, all of these attempts to relieve pain did little for most sufferers and ran the risk of creating drug-addicted patients.

For centuries, Christians understood that pain was linked with original sin, an indication of divine retribution. However, with the onset of the Enlightenment, understandings of pain were secularized. Physicians and philosophes separated pain from sin and punishment and searched for scientific under-

standings of the causes of pain. Some believed pain could give the physician indication of how to proceed in treating the illness.

This secularization did not lead to the abandonment of the link between spirituality and pain in the new American nation. American Christians sustained the belief that God meted out pain. While secular humanists tried to divorce understanding of pain and illness from religion, ministers continued to preach that pain originated from original sin and congregants continued to believe in the link between sin and pain. God made this world a vale of tears. Only in the next life would a man or woman be released from earthly pain.

PAINE, THOMAS More than any other writer of the late eighteenth century, Thomas Paine articulated the democratic aspirations of that revolutionary age. His contribution lay less in the originality of his ideas than in his ability to articulate those ideas in a style that resonated with the experiences of ordinary people. Paine's best-selling pamphlets in support of the American and French Revolutions—*Common Sense* and *The Rights of Man*—transformed this former stay maker, sailor, and tax collector into an international symbol of democratic radicalism. To his supporters, he was the heroic leader of a popular movement to eradicate artificial privilege and inequality. His many detractors on the other hand—like John Adams, who once referred to him as a “mongrel between Pigg and Puppy, begotten by a wild Boar on a Bitch Wolf”—worried that Paine's scathing attacks on all forms of traditional authority threatened to engulf the Atlantic world in anarchic mob rule. But whether they hated him or loved him, by the 1790s there were few people in the Atlantic basin who had not at least heard of Thomas Paine.

Paine was born and raised in Thetford, about seventy-five miles from London. At the age of twelve he followed his father into the trade of stay making (stays were the whalebone pieces that gave corsets their shape and stiffness). After a short stint as a sailor aboard a privateer, Paine moved to Sandwich in 1758 where he set up his own stay making shop and married Mary Lambert. Mary and their newborn child died in 1760, and for the next eight years Paine held various jobs in the south of England until finally finding steady work in 1768 as an excise officer in Lewes. That town, with its tradition of political radicalism extending back to the 1640s, transformed this disgruntled laborer into an articulate and radicalized activist.

Several strands of British oppositional thought underlay Paine's political vision. First, his Quaker upbringing taught him to distrust orthodox authorities and instead follow his own “inner light.” Second, during a short stay in London in his twenties, Paine associated with a group of artisans who, in the spirit of Benjamin Franklin, regularly attended public lectures on scientific topics. At these lectures Paine was introduced to the fundamental Enlightenment

tenet that the natural and social worlds operated according to a set of universal laws that any person could discover through the use of their rational faculties. The anti-authoritarian implications of this Newtonian worldview—if reason was universally shared then religious and political leaders had no special access to “the truth”—remained an unchanging feature of Paine's life's work. Finally, thanks to his participation in political debating societies in Lewes and elsewhere, Paine became steeped in Whig opposition thought, which advocated parliamentary reforms to limit the government's power and make it more responsive to the citizenry.

Arriving in Philadelphia only a few months before the battles of Lexington and Concord, Paine encountered a large community of politicized citizens who already spoke his transatlantic language of religious dissent, Enlightenment rationality, and Whig republicanism. After honing his journalistic skills for a year as the editor of the *Pennsylvania Magazine*, Paine wove these ideological threads together to produce the most widely read pamphlet of its day, *Common Sense*. As an idealistic transplant with few ties to any particular locality, Paine was perfectly situated to articulate a sweeping vision of a unified American state that had a world-historical mission to establish representative government and create the conditions for widespread economic prosperity. With rude swipes at the king, whom he referred to as “the Royal Brute,” and inspirational assertions that the colonists had the unprecedented opportunity to “begin the world anew,” Paine channeled the inchoate rage and unvoiced aspirations of ordinary Americans into a growing movement for national independence. When *Common Sense* was published in January of 1776 few Americans had publicly broached the issue of independence. By July of that year, however, the popularity of Paine's pamphlet and the force of its arguments played a major role in pushing a hesitating Continental Congress toward declaring independence. During the war Paine produced, at George Washington's request, a series of *Crisis* papers that boosted the morale of the Continental Army. At the same time he also worked with a diverse coalition of urban and rural radicals in Pennsylvania to write the Revolution's most democratic state constitution.

In the early years of the war, Paine succeeded because he served multiple constituencies. The leadership class needed his abilities as a publicist, and the Patriot rank-and-file appreciated his support for democratic measures that furthered their political and economic interests. By the 1780s, however, Paine found himself at odds both with many Patriot

Tom Paine's Nightly Pest. Paine's detractors worried that his attacks on traditional authority threatened to engulf the Atlantic world in mob rule. He was particularly despised by conservatives in England, where James Gillray produced this engraving in 1792. Paine is shown dreaming of his final judgment, when he will be punished for his revolutionary ideals.

leaders and with urban radicals. Paine was unusual in the 1780s in that he endorsed both highly democratic political arrangements and free-market economics. Most supporters of the free market were established leaders who had little interest in democratizing politics, whereas most supporters of democratic politics were skeptical of the free market and advocated price controls and other economic restrictions to protect laborers from the vagaries of the market. Paine's amalgam of democracy and free-market capitalism would eventually become mainstream in the nineteenth century. When he decided to return to England in 1787, however, he left America having alienated a good number of his former allies.

Paine reemerged on the world stage in 1790 when he wrote *The Rights of Man* to defend the French Revolution against the British statesman Edmund Burke's *Reflections on the Revolution in France*. Paine's pamphlet, the second part of which was issued in 1792, sold an estimated 300,000 copies throughout Europe and America. In the context of America's heated partisan battles of the 1790s, Paine's outspoken support for international revolution made him one of the most controversial figures of the decade. Republicans used his writings to show that any true American patriot should support both the French Revolution and continued democratization at home. The Federalists, especially after Paine's attack on organized religion (*The Age of Reason*) was published in

1795, argued that the Republicans' association with Paine showed that they were too radical to be trusted with political power. In the summer of 1798, in the midst of the Quasi-War with France and immediately following passage of the Alien and Sedition Acts, some Federalists went so far as to claim that Paine was part of an international conspiracy to overthrow all religion, abolish private property, and eliminate national governments. By the time Paine returned to America in 1802, very few Americans would publicly associate themselves with him. Indeed, Thomas Jefferson was viciously criticized for granting Paine passage from France on a navy warship and warmly receiving him at the White House. Paine died in 1809, a poor and publicly reviled man.

His American detractors were right in claiming that Paine had become more radical during his time in Europe, but he was hardly the bloodthirsty, atheistic anarchist they claimed. In 1793, as a member of the French National Assembly, Paine allied himself with a moderate faction and argued against the execution of the king; when the Jacobins took power, they had Paine imprisoned for almost a year. The tract he wrote in jail, *The Age of Reason*, affirmed his belief "in one God" and his hopes for "happiness beyond this life." So although he was neither an anarchist nor an atheist, Paine's writings of the 1790s did extend his vision of democracy into increasingly radical and uncharted territory. In the second part of *The Rights of Man* he argued that the government should institute a progressive taxation system (with a top tax rate of 100 percent) to discourage great inequalities of wealth. He also advocated state pensions for poor men and their widows not as a matter "of Charity, but of right." A few years later, in *Agrarian Justice*, Paine argued that because modern commercial society had created an increasingly "hereditary" class of poor people by robbing them of their right to a portion of the earth, the state had a duty to compensate every citizen for this loss. Most of his contemporaries regarded such ideas as perversions rather than logical extensions of the democratic ideal. But future American radicals would look back to this phase of Paine's career as a source of ideas and inspiration for their own struggles to create a more democratic and egalitarian world.

PAINTING If it can be said that there is a national artistic tradition in American painting, it is true only insofar as it is a tradition that is contentious and conciliatory, direct and convoluted, wildly independent yet eager to demonstrate its urbane and cosmopolitan European associations. How did a relatively young country that derived from thirteen fractious colonies and was physically removed from its European antecedents come to have anything that could be considered a tradition regarding art? It did so by developing a number of artistic practices in which European references were recognizable but were rendered in uniquely American terms. From the functional expressions of sign painters of the late seventeenth and early eighteenth centuries, to the grand gestures of nineteenth-century landscapes that worship nature, Americans certainly were not immune to interpreting their world through painting.

THE SEVENTEENTH CENTURY

Early depictions of the territory comprising the British North American colonies were employed widely as visual aids to stimulate interest in the colonies across the Atlantic, or to sketch for those back in England something of the thriving port towns. Such images may have detailed the workings of systems of labor, or the interactions between Europeans and the local Indians; Indians fascinated and many were eager for their images.

surable contemplation was unthinkable. Thus, in the North American colonies, it was portraiture that first made an appearance in American painting, not landscape. Early portraits—such as those of John

Winthrop or Pocahontas—were largely utilitarian. They were records of the sitter (including the regular practice of noting the age of the sitter in Latin within the body of the portrait) executed in a stiff, frontal

manner in which the subject gazed out at the viewer and the viewer returned the glance. Such portraits carried within them visual clues regarding the status and occupation (not to mention the sensibility) of the sitter. The style owed much to seventeenth-century European painting—notably Dutch and English—demonstrating that American painting did not develop in an artistic vacuum.

EIGHTEENTH-CENTURY PORTRAITURE: EXPLORATION OF CURVE AND SPACE

Early practitioners of eighteenth-century portrait painting such as Robert Feke (c. 1705–c. 1750) and Joseph Blackburn (c. 1730–c. 1774) (and the ever-present Anonymous), ushered in a new age of portraiture, aspiring as they did to the style of the formally trained painters of the wealthier English classes. The placement of the sitter continued to be typically frontal and the gaze continued to engage the viewer. However, rather than the portrait being merely a useful record of the sitter, it became a vehicle for the display of the sitter's newly attained colonial wealth and status, in addition to showcasing the aptitude of the artist. The frontality and adherence to line (resulting in images that were inescapably two-dimensional), so characteristic of the limner tradition, gradually became an artistic exploration of curve, of space and of light in a three-dimensional world. (Untrained artists tended to rely on sharp outlines to delineate form.) By the middle of the eighteenth century, the dimensionlessness of decal-like figures who adhered to the surface of the canvas developed into fully rounded forms who inhabited space.

LINE, SHADOW, AND FORM

It is in the work of John Singleton Copley (1738–1815) where fullness of form is rendered such that the eye sees it as occupying space and having substantive tactility. Although Copley retained the limner's love of line he infused his forms with three-dimensionality. Copley's ability to transcend the limner-folk tradition to which he was heir (though that tradition endured in its own right) guided American painting into a long-standing love of realism. He presided over a period of classical American painting in which the European courtly portrait tradition found its match on the comparatively rough-and-tumble North American shores some three thousand miles distant.

One of the most quintessential examples of Copley's ability to paint fully rounded form is his formal portrait of *Mrs. Ezekiel Goldthwait* (1770–1771)—a

well-to-do matron whose animate hand reaches for inanimate (but nonetheless lifelike) fruit. Copley delighted in surface (the table is hard and highly polished) and shadow (the deep folds of Mrs. Goldthwait's skirts are depicted darkly), both echoes of the limner tradition. Copley's portrait of Paul Revere (late 1760s–1770) is an example of a less formal endeavor: it portrays Revere in his trade as a silversmith years before he became one of the key figures associated with Revolutionary America. (Revere was initially known as an engraver and it is his representation of the Boston Massacre in March 1770, that is familiar.) In Copley's portrait, Revere pauses to consider what he will engrave on the silver teapot resting in his left hand while his right hand, raised to his face, indents the flesh on the side of his mouth as he holds his chin thoughtfully. There is plenty of adherence to line and surface as is typical of Copley, but the portrait can be described as "realistic" or "lifelike" because Copley was a master of life breathed into line. His contemporary, Gilbert Stuart (1755–1828) known, in part, by his various portraits—finished and unfinished—of George Washington, employed a more painterly approach to his realism, eschewing hard linearity in favor of a lighter, comparatively impressionistic hand, though the weight of form and contour did not suffer. Stuart's *The Skater* from the early 1780s is a masterpiece of colonial painterliness. (It was for a time, thought to be a work by the British artist Thomas Gainsborough.) In a similar vein, Thomas Sully (1783–1872) who painted dashing figures set amid romantic landscapes owed much to the English portrait tradition. European art—long considered the chief example of artistic refinement—in short drew numerous late-eighteenth-century and early-nineteenth-century American painters regardless of their artistic style: from Copley and West, John Trumbull and John Vanderlyn to Washington Allston, Samuel F. B. Morse and Thomas Cole.

HISTORY PAINTING AND A BURGEONING LANDSCAPE

While people never tire of having their picture painted, the work of Benjamin West (1738–1820) changed the thrust of American painting in the late 1770s from the predominance of portraiture toward landscape. Initially, in an unfamiliar land, portraits were preferable; the eye did not seek out disorderly vistas, but with the imposition (at least superficially) of colonial order upon the land, vast spaces were less frightening. Portraits contain. Landscapes expand. West clothed that expansiveness in familiar garb, looking to the classical past for inspiration. His ef-

Though he remained within the history-painting genre, Benjamin West angled away from ancient classical subjects and toward contemporary events rendered in grand style. *The Death of General Wolfe*, shown here in an engraving by William Woollett after West, depicts the death of James Wolfe at the Battle of Quebec in 1759. forts at biblical narrative and scenes from ancient Greece and Rome characterized him as a history painter—one who mined the past for lessons useful in the present. The advent of history painting signaled, in part, a new direction in painting as well as in the ways Americans interacted with their world. Gone was the preference for controlled and controllable interiors where evidence of the out-of-doors was either entirely excluded or relegated to a glimpse of a tame, vaguely Claudian (that is, romanticized landscape with poetic ethereal lighting) cluster of trees. Instead, landscape with all of its unpredictability became an important locus of activity. History paintings and the fact that they encompassed great sweeps of space as well as great ideas demonstrated a growing confidence on the part of Americans in their ability not only to survive but to thrive in a vast territory. However, the somewhat romanticized depictions of toga-clad figures as they reenacted scenes of vary-

ing solemnity had relatively little to do with American life in the 1770s.

Though West remained within the history-painting genre, he soon angled away from ancient classical subjects and toward contemporary events rendered in grand style. West's *Death of General Wolfe* (1770), for example, was painted after the end of the Seven Years' War (1756–1763) in which Britain vanquished the French from North America. Wolfe, relatively young and untried militarily speaking, managed to achieve victory on the Plains of Abraham—a highly defensible French field of battle made inaccessible by unscaleable cliffs. Rallying round Wolfe were contemporary figures—all of whom were recognizable types to anyone viewing the painting. Wolfe's swooning figure was both real and symbolic and his death had distinct redemptive value.

Copley, too, tried his hand at history painting as evidenced by his *Watson and the Shark* of 1778. It de-

icted a horrific event in which a young man was depicted struggling to reach the outstretched hands of his rescuers while a shark displayed ferocious rows of teeth as it bore down on the helpless, terrified form. As Americans developing an artistic idiom, it behooved artists drawn to the grand gestures of iconic, historical figures to make those figures accessible to a contemporary viewing audience.

While the grisly and frightening aspect of certain historical paintings can be said to have spun off into a direction that favored Romantic visions of the ghostly and suggestions of the supernatural—as seen especially in the paintings of Washington Allston (1779–1843) who was active in the beginning of the 1800s—the out-of-doors settings of those history paintings helped pave the way toward a visual exploration of landscape for its own sake. Too, over time, the moody, gothic depictions by a painter like Allston that capitalized on moonlight and shadow in fact showcased the land: if the land could offer such moonlit mysteries, what might it have to offer during the daylight hours?

American painters might have discarded the ghostly aspect of Allston's gothic Romanticism, but they nevertheless retained the Romantic sensibility. It was, after all, the early nineteenth century—a time in which industry-advancing inventions came to the fore. And it was those inventions, along with the advent of steam power, the development of canal systems, and the spread of railroads that contributed greatly to the rosy optimism (at least in some quarters) and the expansionist vision that was a key characteristic of the new American nation.

Although it would be some years before the Indian Removals of Jacksonian America (Jackson was elected in 1828 and Congress passed the Indian Removal Act in 1830), and before John L. O'Sullivan wrote convincingly of America being a "great nation of futurity" (1839) or coined the phrase "Manifest Destiny" (1845), the American sensibility was nevertheless focused on the possibility of the unrestricted extension of the nation's western borders—an expansiveness that was reflected in painting.

REVOLUTIONARY LIBERTY AND AFRICAN AMERICAN PORTRAITURE

It was during the Revolutionary period in the 1770s and 1780s that images of African Americans began to appear regularly. (However, it must be said that there were numerous images of Africans throughout western art for centuries, largely because those images pre-dated the equation of Africanness with slavery. Once the two became largely synonymous as a

result of New World bound labor practices, depictions of Africans and their descendents became exceptional.) As a group of people for whom liberty was key, and as eager participants in the struggle for freedom, African Americans appeared in any number of places in the visual record. Paul Revere's engraving of the "Bloody Massacre" included the name of Crispus Attucks (c. 1723–1770) among the brief list of "unhappy sufferers," but there is no known portrait of Attucks. Nevertheless, numerous formal portraits of African Americans were painted during that time.

John Trumbull's portrait of George Washington at West Point (1780) included William Lee, one of George Washington's slaves. Lee was depicted in a turban (a popular eighteenth-century artistic conceit for French and British artists portraying Africans and those of African descent), and thus was exoticized. Nevertheless, Trumbull did not lampoon Lee. Instead, he depicted Lee as an active participant in the events of the time. Similarly, other engravings of Washington included Lee whose presence and assistance during the war campaigns Washington found indispensable. (Washington provided for Lee in his will, explicitly referring to Lee's services during the War for Independence.) Trumbull continued to acknowledge and embrace the presence of Revolutionary-period African Americans in his later work: his *Battle of Bunker Hill* (1786) included the well-known Peter Salem (one of several African Americans fighting), who participated in the fray.

Other artists depicted African Americans as valued soldiers during the American War for Independence. But the presence of those of African descent was not limited to involvement in war campaigns. While the War for Independence could be considered an incomplete revolution as far as the universal application of liberty and natural rights was concerned, the numbers of free African Americans were nonetheless on the rise post-war. There was a variety of African American clergy—including Absalom Jones, Richard Allen, and Peter Williams—whose portraits were made prior to 1820. (Indeed, a ceramic pitcher of English Liverpoolware with Jones's image on it was produced around 1808, to much the same purpose that Josiah Wedgwood's late-1780s medallion of a generic enslaved man "Am I Not a Man and a Brother?" was devised: to further the antislavery cause.) Several members of the Philadelphia-based family of artists and natural scientists, the Peales (notably Charles Willson Peale (1741–1827), the patriarch, and one of his sons, Raphaëlle Peale (1774–1825) painted portraits of African Americans, prom-

Watson and the Shark (1778). John Singleton Copley’s ability to transcend the limner-folk tradition to which he was heir guided American painting into a long-standing love of realism. In this painting Copley depicts an event that occurred near Havana, Cuba, in 1749 when Brook Watson, a young sailor, was attacked by a shark while swimming in the harbor. inent and less so, in the 1810s. Raphaelle painted a portrait in 1810, of the cleric Jones, while Charles Willson Peale depicted an African who retained his Muslim faith—Yarrow Mamout—in 1819. His portrayal of Mamout, who was not famous, was a respectful rendering of an aged, free person of color.

Gradual manumission laws, effective beginning in the 1780s, contributed to the growing number of free African Americans in the early nineteenth century. However, political, social and economic changes in the late 1810s into the 1820s sanctioned the curtailment of African American liberties in all aspects of life: from voting, to housing and education, to occupations. Ironically, it is a period in American histo-

ry frequently characterized as one in which a strong egalitarian impulse prevailed (in part due to the Second Great Awakening). Maryland-based painter Joshua Johnson (sometimes “Johnston”), however, is an exception. Without the benefit of formal artistic training, Johnson painted local Maryland worthies in a naïve style that was charming for its directness. Nevertheless, in this period in general, the recorded artistic endeavors of African Americans were largely in the realm of the decorative arts, especially furniture making and cabinetry. Many African Americans were skilled artisans, such as cabinetmaker Thomas Day who flourished in the period between 1820 and 1860, whose creative impulse endured in three-dimensional, everyday items.

HUDSON RIVER SCHOOL AND THE TRIUMPH OF NATURE

It is the short-lived Thomas Cole (1801–1848) rather than his slightly older and longer-lived contemporary Asher B. Durand (1796–1886), who is considered the father of the Hudson River school—the quintessential American art movement of the first half of the nineteenth century—although Cole’s early paintings were tributes to the dreamy vision of the classical ideal, to Arcadia. Cole was beguiled by artistic invocations of the beautiful and the sublime; some of his works are paintings to uplift the soul and to encourage one toward the recognition and contemplation of the awesome power of God’s world. His well-known series *The Course of Empire*, which outlined for the viewer the cycle of human endeavor from promising beginnings, through a decadent apex, to a desolation of man-made things left standing like a warning (covered as they were in neglect), attests to that vision.

However, in other works, Cole foregoes the contrived lessons of man’s dissolute ways, concentrating instead on the grandeur of nature before him. In America, all nature is new, unsullied—or so it seems when compared with ancient European locales. It is that newness, that hopefulness (recall the “city on a hill” and the beacon of light that America was to be) that finds expression in the landscapes of the Hudson River school. With the help of a higher power (for the descendants of Puritans it is God; for someone like Ralph Waldo Emerson, it is the Universal Being), America’s pristine wilderness was a vehicle for a kind of salvation. It is nature that reveals God’s essence. On the occasions in which the human figure is present in the landscape, it is dwarfed by the size and sublimeness of the natural world. In contrast to the classical American portrait style of Copley in the eighteenth century (or even of Thomas Sully [1783–1872] in the early nineteenth century) where the emphasis is on the ability of artist-as-draftsman, the landscapes of the Hudson River school deemphasize the hand of the artist. Erasure of the artist is the goal; the scene is meant to be unmediated (in much the same way that photography, when new, was said to capture the “truth” of what the eye saw without editorialization). The viewer is meant to stand before the canvas—rendered with authenticity by an artist who has been vouchsafed the essence of the scene—and to commune, fully, with Nature.

Thomas Cole, despite being the father of the Hudson River school, was a transitional figure, although his sensibility lived on in the work of Robert S. Duncanson (1817–1872) who was considered one of the first recognized African American professional

painters; Duncanson flourished in the mid-nineteenth century and was a true practitioner of the Hudson River mood. After Cole, the canvasses of American landscape painting became immense—their sheer size encouraging the viewer to very nearly step into the scene. That monumentality was no accident; it was both a symbol of the endless renewal that a distinctly American Nature afforded its people and a reflection of the reality of the country’s generous proportions and providentially endless boundaries. It echoed the confidence with which the new nation expanded and contained within it the first fears of the result of that expansion—a vanishing wilderness. And it was an assertion—at once nostalgic and expectant—that the errand into the wilderness had been in some sense completed, yet continued to draw the nation ahead into futurity.

PALEONTOLOGY Several currents of thought converged in the 1790s to give new impetus to study

Exhumation of the Mastodon (1806–1808). In this painting Charles Willson Peale commemorated the excavation of a nearly complete mastodon skeleton near Newburgh, New York. of the natural past. Over the course of half a century, American natural historians had shifted from conceiving of the world as governed by an active God to a world governed by a more distant deity operating through immutable natural law. At the same time, the French comparative anatomist Georges Cuvier (1769–1832) capped a long and intense debate by concluding that the recently discovered remains of a gigantic aquatic lizard proved that extinction and faunal change were real phenomena. The static world, created in perfection by God and fixed for all eternity, had given way to a dynamic one in which the past was deeper and eminently more distant.

Although American fossils received little attention prior to the Revolution—and indeed were often not understood as organic remains—one fossil or-

ganism proved an exception, gaining an unusual importance as a symbol of national identity and nationalist aspiration. Fragmentary specimens of mastodons had been known from as early as 1705, when the Puritan divine Cotton Mather (1663–1728) described a tooth as belonging to a human giant. Bones and tusks discovered in Kentucky and New York garnered attention on both sides of the Atlantic as natural historians tried to discern the true identity of this “American *incognitum*,” an animal likened to an elephant, but (to some) with a carnivore's heavily cusped teeth. So great was the interest that Benjamin Franklin (1706–1790) had specimens sent to him in London, and when teeth were uncovered near the Hudson River in 1780, George Washington (1732–1799) took time out from the Revolution to see for himself.

With Thomas Jefferson (1743–1826), however, interest in the mastodon reached its peak. As governor of Virginia, Jefferson received in November 1780 a standard set of diplomatic queries about his state from the French minister François de Barbé-Marbois (1745–1837), and he responded by writing a decidedly nonstandard meditation on his new nation. In a key section of the resulting book, *Notes on the State of Virginia* (1785), Jefferson set out to defend his country against the calumnies of Georges Louis Leclerc de Buffon (1707–1788), a French scientist who had theorized that the American climate was so cold and damp that life there would inevitably degenerate.

To Jefferson, such a judgment on the American nation could not be left to stand unchallenged. To counter Buffon, he assembled data on the size of American animals, demonstrating that American deer, skunks, and weasels were every bit as large as their European counterparts. But the *pièce de résistance* of his argument was the great American mastodon, “six times the cubic volume of the elephant,” fiercer and more virile than its plant-eating kin. Still doubting that extinction could occur, Jefferson—when organizing the transcontinental expeditions of André Michaux (1746–1802) in 1793 and of Meriwether Lewis (1774–1809) and William Clark (1770–1838) in 1803—pointedly ordered them to watch for any mastodon herds the might still be wandering the trackless west.

This paleontological assault continued in 1797, when Jefferson described a giant claw and phalanges from an animal that he named *Megalonyx* (big claw) as belonging to a great lionlike beast, as much at the head of the clawed animals as the mastodon was at the head of pachyderms. It was up to his friend, the anatomist Caspar Wistar (1761–1818), to recognize *Megalonyx* as a giant ground sloth, and up to others to show that the mastodon was in fact an herbivore.

But still the mastodon remained the American star. A nearly complete skeleton excavated near Newburgh, New York, was installed as the centerpiece of Charles Willson Peale’s (1741–1827) Philadelphia Museum in 1801, becoming the most popular exhibit in the foremost venue in the early Republic for the public display of American natural history.

PANAMA CONGRESS The Panama Congress, held in 1826, was intended to form a union among the newly independent Spanish American republics. Simon Bolívar issued a circular letter on 7 December 1824 calling for a meeting to frame a confederation. On 23 April 1825 a Washington, D.C., newspaper ran an article containing an agenda that included a discussion of neutral rights, the three essential principles of which are: free ships make free goods (goods belonging to a belligerent are considered neutral if in a neutral vessel); limited contraband (that is, those goods that a neutral cannot trade to a belligerent and still remain a neutral); and strict definition of a legal blockade (there must be a reasonable certainty rather than a reasonable possibility of capture). Secretary of State Henry Clay had long been an advocate of Pan American cooperation. President John Quincy Adams had been a skeptic, but he supported the idea of a neutral rights convention. The Mexican and Colombian ministers to the United States tendered unofficial invitations to the United States, mentioning neutral rights. In May the cabinet approved American attendance. In November the United States was formally invited.

In December 1825 Adams nominated Richard C. Anderson, then minister to Colombia, and John Sergeant as ministers to the Panama Congress. Martin Van Buren led the opposition in the Senate, submitting a resolution calling attendance at the Congress unconstitutional. The Senate, however, rejected the resolution on 14 March 1826. The House of Representatives approved the mission on 22 April. Clay instructed the ministers to defend neutral rights and the Monroe Doctrine and to prevent the transfer of Cuba to another power. Anderson died en route and was replaced by Joel R. Poinsett, but the legation did not reach Panama until after the Congress, in January 1827. The Congress met from 22 June to 15 July 1826. The nations present agreed to form a confederation and a combined army and navy. However, only Colombia ratified the agreements. The next meeting, scheduled for the following year in Tacubaya, Mexico, never took place.

PANIC OF 1819 Those living at the time of the Panic of 1819 indicated that it was a traumatic experience for the new Republic. In one representative conversation, John C. Calhoun, discussing the situation with John Quincy Adams in 1820, said, “There has been within these two years an immense revolution of fortunes in every part of the Union: enormous numbers of persons utterly ruined; multitudes in deep distress; and a general mass disaffection to the government” (Rezneck, “The Depression of 1819–1822,” p. 29).

What historian Charles Sellers has called the young nation’s “traumatic awakening to the capitalist reality of boom-and-bust” was a complex combination of financial market volatility, swings in international market demand, and the financial activity of the federal government (*Market Revolution*, p. 137). The panic and the following depression saw output stagnate, exports decline 34.5 percent, imports fall 48.9 percent, and a dramatic deflation as prices fell 30.6 percent.

The panic had its origins in the War of 1812 and the boom following the end of hostilities. With the opening of British and European markets in 1815, demand for American commodities soared. As farmers benefited from increased incomes, so did the cities and towns that served them. The only sector not sharing in the boom was the nation’s nascent manufacturing firms, which had blossomed during the embargo and the war. The end of the war meant America was open to British manufacturing goods, which flooded the market and drove prices down sharply. Unable to compete, American manufacturing stumbled as factories closed and unemployment in manufacturing areas rose.

In studies of the panic, the actions of the second Bank of the United States, along with those of a number of state chartered banks, has received much attention. And the monetary collapse of 1818–1819

sounded the alarm for an economy rife with speculation and brought the economic optimism that fueled such speculation to an end. Although dramatic monetary changes were an important component in generating panic across the nation and certainly made conditions difficult for businesses and farmers, ultimately two factors were responsible for the downturn. The most important was the collapse of the strong foreign markets for commodities that had fueled the American economy in the years following the War of 1812. To a lesser extent, the repayment of federal debt, much of it to foreign bondholders, was also a proximate cause of the country’s first modern business cycle.

The banking system played a critical role in the events leading up to the Panic of 1819. In exchange for a return to specie convertibility by state banks, the newly formed second Bank of the United States proceeded to expand credit dramatically. This expansion, combined with a marked increase in western land sales, created a situation in which, despite large imports of specie, the bank could not continue to meet the demand for redemption of its notes. Thus, in July 1818 the directors ordered credit reduced by a total of \$5 million at its Philadelphia, Baltimore, Richmond, and Norfolk offices.

Further complicating the financial picture at the time was the retirement of Louisiana bonds of 1803 scheduled to begin in 1818. Such fiscal action, on top of the over \$20 million in federal debt retired during 1817, meant that substantial government revenues did not reenter the economy directly, particularly the more than half of the bond retirement that went to foreigners. This outflow from the domestic economy decreased potential spending at a critical time and placed additional strains on the second bank as Treasury deposits held there dropped significantly.

With a monetary contraction under way, along with the continued retirement of federal debt, much of it to foreigners, the collapse of the markets for American staples meant the U.S. economy was headed for disaster. Led by an economic downturn in Great Britain, reinforced by recession in Europe, and adversely affected by the operations of the British Corn Laws, the demand for American staples dropped significantly beginning in 1819. The combined circumstances of a sharp credit contraction followed by the evaporation of markets for the nation’s products created hardships for Americans of all classes as businesses closed, land values plummeted, and farmers were forced to abandon their activities.

The Panic of 1819 affected the nation in a variety of complex ways. Because of its origins in contrac-

tions by both state banks and the new Bank of the United States, hostility towards banking in general, and towards the second bank in particular, intensified. Political controversy regarding the bank and its power grew, and many of the anti-bank leaders of the Jacksonian period came to their positions as a result of the panic and subsequent depression.

Also, demands for tariffs to protect American businesses were intensified by the downturn, and while efforts to increase tariffs in 1820 failed by the narrowest of margins, in 1824 protection was increased. The movement for higher tariffs led ultimately to the record high Tariff of Abominations in 1828.

Public policy regarding debtor relief also took center stage, as did concern for the rising cost of poor relief. At the federal level, Congress postponed forfeiture for debt on public lands in 1818, 1819, and 1820 before providing permanent relief in 1821. Debt relief measures were hotly debated in virtually every state as well, with many passing some form of relief. Following the lead of New York, many states also began to review their poor relief systems, which led to substantial changes in most by the 1830s.

In addition, the upheaval of the panic served to strengthen the positions of states' rights advocates and to increase calls for expanding internal improvements. It also sparked a heightened interest in economic thinking, reflected for example in the publication in 1820 of the first American book on economics.

PARADES While parades and processions were not unknown in the colonial era, they assumed national significance as structured expressions of group identity in the early Republic. Before independence, American festive culture often reinforced royal authority with public celebrations of English military victories and ceremonies to welcome newly appointed royal governors. Massachusetts governor Francis Bernard made his carefully orchestrated entrance into Boston in 1760 and was received, as he described it, "in a very Magnificent Manner." However, he and other crown officials would soon find themselves the targets of parades of protest. Opposition to Britain during the Revolution often took the form of public demonstrations. Some were rather spontaneous, as when a street confrontation prompted a Boston crowd to tar and feather the Loyalist John Malcolm before carting him around town. Others were meticulously planned to maximize their propaganda value for the Patriot cause. The elaborate funeral procession for victims of the Boston Massacre in 1770 represented such a spectacle. Parading was a fundamentally democratic means of political expression during the Revolution, incorporating all social ranks as participants and observers.

With independence won, the politics of parades evolved in new directions as part of the debate over the Constitution in the late 1780s. Federalists supporting a change in government found parades to be an especially effective way of promoting their cause. Organized as celebrations of a national community that transcended the locales in which they took place, these events marginalized their anti-Federalist opponents, who were slow to appreciate their utility. Parades, bonfires, and toasts usually accompanied ratification of the Constitution in each state. Philadelphia's celebration produced one of the largest parades that city had ever seen, complete with floats that featured various mechanics plying their trades. Following up their success, Federalist leaders planned a grand procession that carried the new president, George Washington, across the country in an effort to deepen nationalist sentiment. Even his birthday became a festive occasion, much to the concern of the administration's Democratic Republican critics, who feared the treatment of Washington as royalty.

In response, the Democratic Republicans developed their own celebrations that expressed their commitment to the principles of popular sovereignty against elite interests. Many of their fetes revolved around support for the French Revolution in the 1790s and were located in urban centers along the

Atlantic seaboard. Although the French Revolution initially garnered widespread support within the United States, its excesses increasingly alienated Americans. In an effort to maintain public support for the French, Democratic Republican societies organized parades that linked the French cause to America's Revolutionary heritage, especially on the Fourth of July. As relations with France continued to deteriorate, however, these activities were redirected against the rival Federalist Party and helped Thomas Jefferson defeat incumbent John Adams for the presidency in 1800.

Parades in the new nation celebrated America's triumphant past as well as its hopeful future. Those marking the end of the War of 1812 (1812–1815) reflected the sense of rebirth that would fuel the patriotic pageantry of the 1820s. Oftentimes, these parades featured Revolutionary War veterans for

whom the public had gained renewed appreciation, none more so than the Marquis de Lafayette. His return to the United States at the request of Congress in 1824 sparked lavish celebrations wherever he traveled. For instance, officials in New Orleans ordered construction of a sixty-six-foot-high triumphal arch through which to parade the French hero. Local civic and military leaders participated in the procession, while commoners could only watch from amidst the crowds that lined Lafayette's route through the city. New York's festivities were typically more inclusive, especially those that accompanied the opening of the Erie Canal in 1825. The canal was a source of great pride for the artisan community, which figured prominently in the parades that followed its completion. Yet African Americans could no more participate in New York's canal celebrations than they could in New Orleans's fetes for Lafayette, except as passive observers.

Parades in the early Republic were often used either to exclude blacks from the national identity or to assert a black national identity. The growth of free black communities in cities such as Boston, New York, and Philadelphia encouraged blacks to stake a claim to the streets. Denied the franchise, they increasingly expressed their political views through pageantry. The end of the American slave trade in 1808, for example, inspired annual celebrations among northern blacks that included public marches. Ridicule from whites only strengthened their resolve and reinforced the value of parades as a means of forging collective identity in American culture.

PARENTHOOD The birth and early development of the United States were accompanied by fundamental transformations in the way people thought about and practiced parenting. The political, economic, geographic, and cultural forces shaping the new nation profoundly affected conceptions about gender, and thus about motherhood and fatherhood.

THE COLONIAL BACKDROP

In the British colonies of North America, fatherhood and motherhood were shaped by the attitudes and economic arrangements of a preindustrial and agrarian society. Especially in the New England colonies, such attitudes were also shaped by Calvinist Protestantism, which assumed the innate depravity of children. The colonial economies rested on the foundation of the independent household, which was typically headed by an adult white male and included servants and apprentices as well as blood kin. Such households, sustained through the labor of all household members, were large, with eight or more children not uncommon. Because males were

thought to possess greater powers of intellect, moral discipline, and emotional self-control than were women, fathers were recognized as the primary parents. Fathers were responsible for ensuring the physical, spiritual, and moral well-being of their dependents and for providing their sons and apprentices with education, moral values, and the skills necessary for work in farming, handicrafts, or business. Because the village workplace was typically not far from home, most fathers exercised an active role in domestic governance. Fathers also influenced their children's marital choices and helped them achieve economic security through their control and disbursement of family property. Mothers, meanwhile, were responsible for rearing young children, training their daughters in home maintenance, and performing such household tasks as cooking, washing, and spinning. Mothers were presumed to have a tendency toward emotional overindulgence of children such that their parenting was often considered dangerous to a child's spiritual and moral development. Therefore custody of children generally went to fathers in colonial America's rare cases of divorce.

PARENTING IN TRANSITION

During the late eighteenth and early nineteenth centuries, a series of overlapping and mutually reinforcing political, economic, intellectual, and religious developments transformed motherhood and fatherhood. A new power dynamic emerged between fathers and mothers, resulting in the emergence of ideals and practices of parenting often called "modern." Enlightenment thinking had emphasized that the young mind was basically good, rational, and impressionable. Such ideas reshaped Western thought and challenged arbitrary patriarchal authority, pointing toward more democratic family relationships. Parental affection, the encouragement of independent judgment, and an emphasis on voluntary and reason-based filial obedience were increasingly perceived to be the bases of domestic and social stability. Similarly, republican political ideology and the American Revolution that it inspired disparaged monarchical tyranny, encouraging fathers and mothers alike to foster in their children the independence and love of virtue necessary for good citizenship in the new republic. By the early nineteenth century, Romanticism had generated a "sentimental" approach to family relations, which exalted affectionate and emotionally intense family relationships and idealized the mother-child relationship in particular. Meanwhile, a growing challenge to orthodox Calvinist theology, evident during the burst of religious revival activity that characterized the early

nineteenth century, discouraged the stern and emotionally reserved exercises in will-breaking often employed by traditional Calvinist fathers. The new thinking stressed that humans had an innate capacity for morality, the development of which required nurture—understood as the natural talent of women—and an overall gentler parenting style.

The changing physical and economic realities of the new nation reinforced these shifts. Ongoing population growth, out-migration to newly opening western areas, and the abandonment in American law of customary English inheritance practices reduced (though by no means eliminated) fathers' ability to enforce their authority through their control of property. The expansion of market capitalism and growth of industrial production in the early nineteenth century, especially in northern urban areas, eroded the premodern household economy, creating a new white middle class. Fathers in this emergent middle class were defined as breadwinners whose primary parental responsibility was to provide income. In pursuit of that income they were often separated physically, and therefore psychologically, from their

families for significant amounts of time. Although this development enhanced fathers' economic authority and even lent it something of a mystique, it also enhanced mothers' responsibility for day-to-day household governance. At the same time, the demise of the preindustrial economy magnified the importance of the family's psychological and emotional functions over its traditional economic ones and prompted a gradual decrease in family size (from an average of 7.04 children for white women in 1800 to 5.42 in 1850). Smaller families in turn allowed a more intensive approach to parenting. Commentators and authors of parental advice literature increasingly identified mothers, insulated from the amoral world of economic and political activity, as naturally pious beings solely able to ensure the morality of their children and husbands. Mothers remained legally subordinate to their husbands and retained many of the household tasks of their colonial forebears, but by about 1830 the Victorian apotheosis of the mother had begun and, at least for the white middle class, motherhood, morality, and homemaking had become closely identified. For both fathers

and mothers of the white middle class, parenting became—and to a considerable degree remains increasingly focused on educating children and preparing them for middle-class careers and marriages.

REGIONAL, RACIAL, AND CLASS VARIATIONS

For Americans outside the northern white middle class, experiences of race, class, and region counteracted and muted to a considerable degree the impact of the various forces described above. Thus different patterns of fatherhood and motherhood emerged. Southern planters, for instance, shared with middle-class northerners the emerging ideals of gentle parenting, romantic sentimentalism, mothers' moral guardianship, and republican citizenship. However, the presence of slaves and accompanying ideologies of racial hierarchy perpetuated older patterns of patriarchal household leadership, gave mothers responsibility for slaves' children as well as their own, allowed white women to use house slaves to mitigate their own child rearing responsibilities (though they were often mistrustful of their black servants' care), and tied the ideal of the moral, self-sacrificing mother to the requirements of the slave economy.

For slaves themselves, parenthood was shaped by the realities of bondage and, to a degree still debated among scholars, by the legacies of their West African cultures. Many slave women, though often described by whites as lacking the nurturing instincts "natural" to white women, considered motherhood sacred and integral to their identities and mothers as central to family structure. Although some scholars have suggested that reduced fertility was common among slave women in the Caribbean islands, slave populations in the United States began experiencing natural increase by about 1750, and slave women began experiencing increased pressure to reproduce after the new nation withdrew from the international slave trade in 1808. Indeed, slaveowners' often manipulative encouragement of slave motherhood probably explains the fact that slave women tended to have their first children at age eighteen, about two years earlier than southern white women. Yet slave women also became mothers to ensure their own security, to reduce the likelihood of their being sold away from their families and friends, or to augment their family's rations of food and clothing—a point underscored by the fact that they typically had to care for their children in addition to their regular workload.

Reliable statistics on birthrates among slave women do not exist, but research does indicate that about one-third of slave families—a significantly

higher proportion than among white families—were female-headed. This does not mean, however, that slave fatherhood was of negligible importance or fit the white-perpetuated stereotypes of alienation, absence, and irresponsibility. In fact, research has revealed that paternal presence, involvement, and leadership in a two-parent setting were the norm in slave families. To be sure, slave fathers lacked property rights, breadwinner status, and legal control over their children, and lived apart from their families more frequently than did white fathers; but they provided love and attention for their children, served as male role models, transmitted family customs and culture, hunted and fished to supplement their families' modest food allotments, passed on survival and craft skills to their children, and sought to insulate their families from the harshest aspects of slavery and racism.

Working-class parents were usually unable to realize the middle-class ideals of the breadwinner father and homemaker mother. Even when they aspired to achieve middle-class status, father, mother, and children alike were forced to work as a buffer against financial uncertainty. The need for income from all family members tended to perpetuate older patterns of family functioning, with large family size (although, as in the case of African Americans, precise birthrate statistics are lacking) and traditional patriarchal dominance remaining long after these characteristics had begun to fade from middle-class family life. Because men were paid more than women, fathers generally provided most of a working-class family's income. However, their economic vulnerability and the increasing obsolescence of traditional artisanal skills undermined their economic leadership and domestic authority, and the employment of mothers and children often sparked tensions and power struggles among family members. With more mothers at work, children spent more time away from direct parental supervision, preventing the working-class home from becoming the haven of sentimental nurture idealized by middle-class writers.

Yet the ideals and practices of white middle-class parenthood provided a powerfully influential model for nonwhite and non-middle-class groups in the new nation. White middle-class men and women themselves, viewing their parenting as normative and as the key to national economic strength and social stability, began by the 1820s to form voluntary organizations—and would later enlist the state—to export their standards of domestic life beyond their own race and class. Meanwhile, African Americans,

working-class Americans, and others outside the northern white middle class, although in some instances strenuously resistant to white middle-class values, gradually followed the pattern of reduced fertility and drew decisively on white middle-class domestic visions of breadwinning fatherhood and homemaking motherhood as they began in their fledgling unions and other activist organizations to define their agendas for social change in the young Republic.

PARKS AND LANDSCAPE ARCHITECTURE

See **Architecture: Parks and Landscape.**

PARLOR The Anglo-American parlor in the years between 1754 and 1829 was a domestic chamber dedicated to sociability, status consumption, and display. Early a material expression of genteel social status, the parlor after the American Revolution became a symbol of what the historian Richard L. Bushman, in *The Refinement of America* (1992), terms middle-class “respectability.” “Parlor” is derived from the French *parler* (to speak, to talk) and referred both to the chamber created in medieval European monasteries for interaction between residents and the public and to the private room for intimate conversation set apart from the great hall in manor houses. By the mid-eighteenth century, the parlor housed both purposes and bespoke the cultural and social aspirations of its temporary inhabitants.

From the earliest British settlement in what would become the United States through the Age of Jackson, the great majority of families were housed in one- or two-cell houses. In these houses the hall was an all-purpose room, accommodating nearly all of a family’s activities. The sleeping parlor, or best chamber, in the seventeenth and eighteenth centuries served as the master bedroom and housed a family’s prized furniture in the typical two-cell (hall-parlor plan) house. Spaces located in the full or half-story above these chambers were used for sleeping, storage, and other household activities. This pattern continued nationally for a majority of Americans into the early nineteenth century, but an important trend, charted through probate inventories, was the removal of beds from the parlor. This signaled the re-orientation of this space. No longer accommodating to work or sleep, the domestic parlor was dedicated to leisure pursuits and entertaining.

The popular perception of the parlor is that of the formal room of a colonial gentleman’s or merchant’s house. Accessed directly from the outside or through an entry hall, the parlor was situated to offer the best views through its windows and to offer visitors the best of what the household possessed. In such a larger house, the parlor—with its walls, ceiling, and floor well finished; its windows curtained; its location at the front of the house—was decorated in the latest fashion and filled with the accoutrements of genteel sociability: furniture (particularly chairs), mirrors, carpets, portraits and other pictures, and books. Throughout the period the furniture was arranged against the walls, facilitating easy cleaning.

Occasion dictated the movement and use of the parlor’s furniture as etiquette increasingly dictated

the occasion. Perhaps it was the heterosocial tea party ("taking tea") that best symbolized parlor culture. Taking tea was an exercise in gentility. Bodily deportment was tested by chairs that straightened posture and required that feet be planted squarely on the floor for leverage. The tea ceremony required dedicated tea tables and equipage—china pots, cups and saucers, slop bowls, sugar snips, sugar bowls and creamers, silver spoons, white linen napkins and tablecloths—all of which tested the participant's knowledge of decorum (let alone the poise). Tea parties were events dedicated to polite cosmopolitan conversation, to musical performance, and to card playing. (Card tables were another specialized furniture form arising in this era.) By the 1820s the domestic parlor had become established as a marker of class as early industrialization of textiles, furniture, and ceramics brought the material symbols of genteel culture into the economic reach of middling Americans, who in turn claimed—albeit unevenly—not only its trappings but also the cultural power of gentility.

PARSONS' CAUSE The Parsons' Cause was a Virginia legal and political dispute involving the pay of Church of England ministers. Its significance lay in eroding the religious establishment's stature in Virginia and in propelling a previously unknown young lawyer, Patrick Henry, to political prominence.

In colonial Virginia's tobacco monoculture, the vagaries of the world tobacco market affected virtually everyone. When the price of tobacco rose, times were flush; when it fell, serious disruption and suffering might ensue. The Old Dominion, as Virginia was called, suffered from a chronic shortage of specie (money in coin). As a result, in the period after 1748 the ministers' salaries were regulated by a law requiring that they be paid annually sixteen thousand pounds of tobacco. Thus they experienced good economic times and bad right along with Virginia laymen. However, in 1755 and again in 1758, the General Assembly made exceptions to this system. In each of those years, a diminished harvest due to crop failure had driven the price of tobacco to notable heights. In response, the colonial legislature arbitrarily proclaimed that, insofar as meeting a parish's obligation to its minister was concerned, a pound of tobacco was to be understood to have a two-penny value—instead of its actual value of approximately twice that amount in the latter year.

Predictably, the clergymen were displeased with the Two-Penny Acts. They held a convention, appealed for help from the mother country, and asked that the General Assembly do them justice—all without much effect. The King's Privy Council, the institution responsible for overseeing royal colonies, did declare that the Two-Penny Acts were invalid because they had been adopted without the required clause suspending their effect until the king gave his approval. Yet, because the disallowance was not declared to be retroactive, this seemed a victory in name only.

In response, ministers in several counties filed suits against their local parish vestries asking that they be paid back wages to make up the difference between the market value of the tobacco they would have received absent the invalidated Two-Penny Acts and the amount they actually had received. These

suits, as a group, became known as the Parsons' Cause. In the first two damage suits to reach verdicts, the courts refused to find for the plaintiffs despite the clarity of the law.

In Hanover County, however, the court, whose presiding judge was John Henry (father of Patrick Henry), found for the plaintiff. At that point, the more senior lawyer who had tried the case turned the argument on the issue of damages over to young Patrick. To murmurs of "treason," Patrick Henry argued that a king who refused to ratify a law adopted by Virginia's General Assembly to accommodate people who faced economic difficulty (the taxpayers, in this case) thereby ceased to be a fit sovereign and degenerated into a tyrant whose will need not be respected. To the astonishment of the plaintiff in the case, and again despite the clarity of the law, the jury took just five minutes to award damages in the amount of one cent. Patrick Henry was then hoisted onto the shoulders of onlookers and paraded around the courthouse grounds.

No clergyman ever benefited from the Parsons' Cause. The argument concocted by Virginia partisans in response to it, that ultimately it was for the General Assembly to determine what was best for Virginia and that the king must ratify such determinations, would have explosive repercussions—especially as enunciated by Patrick Henry.

PATENT MEDICINES Patent medicines were products that claimed to cure a variety of common illnesses, including many, such as cancer and diabetes, that are still not curable. These products appeared in American homes of the eighteenth and nineteenth centuries because access to medical practitioners was limited, especially in rural areas, and because physicians typically engaged in such frightening practices as bloodletting.

The first patent medicines to appear in America came from England. In mid-eighteenth-century

Great Britain, some producers of medical preparations obtained royal patents for their products. The patents protected the owners' rights to the products and gave some prestige to the medicines. Later, the term *patent medicine* was applied to any product of this type, whether patented or not.

In the eighteenth century medical theorists believed that disease could be driven from the body only by a substance as appalling as the illness. Therefore, the worse a medicine tasted or smelled, the greater its corrective power. These foul-tasting, foul-smelling products had ingredients that had an effect on the body, thus giving the illusion of a cure in action. Bateman's Drops, Dalby's Carminative, and Godfrey's Cordial contained the sedative opium. Hooper's Pills purged the digestive system and induced menstruation. British Oil and Steer's Opodeloc were both liniments containing ammonia that irritated the skin.

The popularity of the English remedies owed much to the fact that, though the ingredients might vary, the shape of the bottle did not. Even an illiterate could identify a favorite nostrum. This allowed enterprising American merchants to refill the familiar bottles with cheaper-selling concoctions of their own creation when the American Revolution interrupted shipments of British products. English medicines never regained their prewar sales once the end of fighting in 1782 permitted their return to the American market.

After the Revolution American physicians began a search to discover American herbs that could relieve ailing Americans of "unrepublican dependence" on European medicines. In 1793 Congress enacted a law granting patents to inventors. In 1796 Samuel Lee, Jr., of Windham, Connecticut, became the first American to obtain a patent on a medicine, for Bilious Pills, which purported to fight biliousness as well as yellow fever, jaundice, dysentery, dropsy, worms, and female complaints. Whereas most patent medicine makers kept their ingredients secret and patented the packaging, Lee revealed that he used gamboges, aloes, soap, and nitrate of potassa. More important, as he emphasized in advertising, he used no mercury.

In 1793 the prominent physician Benjamin Rush attributed all physical ailments to hypertension (high blood pressure) and prescribed bloodletting to the point of unconsciousness as a cure. Rush also recommended such tremendous purgative doses of mercury that patients lost teeth and, occasionally, jawbones. Whereas physicians embraced Rush's stringent methods, which were known at the time as

“heroic medicine,” patent medicine merchants offered frightened patients a mild and pleasant mode of treatment. Such merchants regularly attacked the brutal therapy of the regular doctor while improving the palatability of their concoctions. Swain’s Panacea owed much of its success to a delicious flavor, and sugar-coated pills were first introduced by patent medicine makers. The popularity of patent medicines as a treatment regiment continued to rise throughout the nineteenth century.

PATENTS AND COPYRIGHTS. Modern concern with the protection of intellectual property of authors originates in seventeenth- and eighteenth-century natural rights and mercantilist discourse. Natural rights philosophers taught that the right of individuals to property was inalienable and that they are entitled to the wealth generated by their mental creations. Mercantilism, which judged the relative strength of nations by their balance of trade, prompted rulers to find ways to encourage creativity and innovation at home as a way of besting international rivals. In theory, English law and practice covered the intellectual property of authors and inventors. In practice, however, no enforcement mechanisms to protect intellectual property existed in the colonies and colonial authorities issued very few patents.

Following the American Revolution (1775–1783), the various states tried to foster independent intellectual property policies in line with these beliefs. Noah Webster (1758–1843), author of the best-selling *Grammatical Institute of the English Language* (1783), campaigned to make the protection of intellectual property the law of the land. Webster feared that pirated versions of the book would deprive him of profits and lobbied with each state legislature to protect his ownership. He associated his campaign with the patriotic cause of establishing the legitima-

cy and distinctiveness of American English and enlisted the support of well-respected revolutionaries like Thomas Paine and Joel Barlow to speak out in support of copyright legislation. The copyright movement of the 1780s was triumphant. All states, with the exception of Delaware, passed acts that in principle established their commitment to protecting the intellectual property of authors.

The copyright campaign of the 1780s, however, demonstrated the need for a coherent national policy. Under the Articles of Confederation (1781), Congress could only recommend that the states protect the rights of authors. Whether a policy was enacted or not remained up to the states. Similarly, the right to issue patents to reward a mechanical innovation resided exclusively with the states.

THE CONSTITUTION

Champions of intellectual property thus backed the constitutional movement of the second half of the 1780s. Many Patriots were alarmed by the unquenchable American consumption of imported British goods, feeling that political independence was undermined by the return of economic dependence on the former colonizer. Establishing a unified and effective manner of rewarding authors and inventors promised to foster American innovation and creativity that would wean the citizens of the Republic from their addiction to English manufactures.

The Constitutional Convention (1787) did not disappoint these backers. On 18 August 1787, James Madison (1757–1836) of Virginia and Charles Pinckney (1757–1824) of South Carolina recommended that the Constitution include a clause rewarding creativity in both literary and practical realms by granting exclusive rights over intellectual creation for a specified period of time. On 5 September 1787, the convention unanimously approved Article I, section 8 of the Constitution that instructed the new government “to promote the progress of science and useful arts, by securing for limited times to authors and inventors the exclusive right to their respective writing and discoveries.”

The founding fathers thus provided a mechanism by which individual inventors and authors were rewarded for enriching American society with new devices or writings. Inventors and writers were the only occupational groups given special benefits in the U.S. Constitution. The intellectual property provision in the Constitution was the first legal affirmative recognition of the property right embodied in the process that produced innovation. Even anti-

Federalists rarely criticized this aspect of the proposed Constitution.

The consensus in favor of the clause suggests widespread cultural acceptance of the measure. No one in particular had to push the delegates to include it in the Constitution. The prevalence of intellectual property clauses in the states' constitutions suggests that most American leaders recognized by the 1780s the need to promote literary and industrial creativity in the new nation. In unifying the patent grants on a national scale, the Constitutional Convention created an apparatus that spared authors and patentees the chore of having secure grants in each of the individual states.

FEDERAL INTELLECTUAL PROPERTY POLICY

In his first annual message, in January 1790, President George Washington asked Congress to enact the necessary legislation encouraging "skill and genius" at home and "the introduction of new and useful inventions from abroad." Congress took up the matter and in 1790 passed bills to protect the rights of authors and inventors. The first U.S. Copyright Act followed the British one, granting literary works an initial fourteen-year term of protection, which could then be renewed for another fourteen years for a total of twenty-eight years of protection. Only citizens of the United States enjoyed copyright protection.

The Patent Act of 1790, however, broke new ground. The initial proposal followed the English system, which sought to attract superior European craftsmen to the kingdom. Those who introduced technological innovations hitherto unknown in England were rewarded with production monopolies. Likewise, the initial version passed by the House of Representatives granted introducers of pirated technology the fourteen-year monopoly privileges accorded to original inventors. The Senate, however, amended the bill to grant patent monopolies only to inventors of machines "not before known or used" and deleted the location qualifier of the House version—"within the United States." The first U.S. Patent Act, then, restricted patents exclusively to original inventors and established the principle that prior use anywhere in the world was grounds for invalidating a patent.

The 1790 Act required the formation of a patent board composed of the secretary of state, the secretary of war, and the attorney general and charged it with evaluating the merit of each application. This requirement became too burdensome, particularly for Secretary of State Thomas Jefferson, who was

put in charge of the entire project. The sheer volume of applications made the first patent act an administrative nightmare. In 1793 Congress relieved members of the cabinet from examining individual patents and assigned the duty to a clerk in the State Department. A patent became a registration of a claim any persons could make provided they paid the thirty-dollar fee and that no similar claim was previously registered. Acquiring a patent depended exclusively on prompt completion of the necessary bureaucratic paperwork. The revised system maintained the dual demand for novelty and originality by requiring each patentee to take an oath that he or she was indeed the first and original inventor. The disputes likely to arise from this strictly bureaucratic registration were to be resolved by a board of arbitrators and the courts. A revision in 1800 added the requirement of an oath by all applicants to the effect that their "invention, art or discovery hath not . . . been known or used either in this or any foreign country."

Textual examination of the patent law might give the impression that the young Republic had established a new moral code of intellectual property. The statutory requirement of worldwide originality and novelty, however, did not hinder widespread and officially sanctioned piracy of both technology and literary works. American publishers printed pirated literary works without compensating authors and artisans successfully received patents for devices already in use in Europe. Moreover, the Patent and Copyright Acts explicitly prohibited foreigners from claiming copyright or patent privileges in America for works and innovations they had already patented in Europe. Intellectual property practices in the early Republic favored printers, operators, internal developers, and entrepreneurs at the expense of artists, authors, investors, and inventors.

PATRIOTIC SOCIETIES Coming together, mostly as young men, to fight the Revolutionary War, the officers of the Continental Army considered themselves the essence of the nation. While enlisted men came and went, the officers had served for up to eight years, frequently without pay and at their own expense. The war had been the peak—and for the younger ones, the only—experience of their adult lives. The officers had been promised pensions of half-pay for life, later commuted to five years' full pay, but the new nation was bankrupt. To lobby for benefits and to preserve the memory of their service through meetings and correspondence, on 13 May 1783 the soon-to-be-demobilized officers formed the Society of the Cincinnati, named after a Roman general who returned to his plow rather than be rewarded for his outstanding service. Modeled on the French army's Order of St. Louis, it offered participants badges, ribbons, reunions, and hereditary membership for their descendants.

Aspiring to be a well-respected group whose members would acquire honor and office, the Cincinnati instead provoked a huge public outcry. As a hereditary society the Cincinnati smacked of aristocracy; as an organized lobby it fell under the rubric of "faction," a special interest that set itself against the general good. The public also identified it with other signs of what seemed to be impending military rule: unruly enlisted men had forced Congress out of Philadelphia when they failed to receive their wages, and many officers themselves took part in what is known as the Newburgh Conspiracy of 1783, threatening a coup d'état (scholars argue whether they intended to carry it out) that was forestalled only by General Washington's intervention.

In response, the Cincinnati adopted a low profile. It never attained more than 2,300 members, and although President Washington and five members of his cabinet belonged, its partisanship was limited to electioneering on behalf of some Federalist candidates. Identified with the Federalists, the Cincinnati declined after the War of 1812 and by 1832 were active in only six states. They would remain moribund until the 1880s.

The Masons were another prominent society to which George Washington lent his prestige. Imported into the American colonies from Britain in 1733, the order of Freemasons still exists, uncontroversially, in the early twenty-first century. However, during the eighteenth century it was identified with Enlightenment ideas: belief in a Supreme Being rather than the Christian God (many Jews belonged) and

the brotherhood and equality of mankind—all members called each other brother and were treated as equals with respect to the order. In the 1830s the prominence of many Masons in economic and civic life led to the creation of the anti-Masonic political party. Although it failed to rival the Democrats and Whigs, the anti-Masons were successful in persuading the Masons to protest that they were merely a fraternal, apolitical order, devoted to social betterment and general civic virtue.

Enlisted men, lacking a society of their own, joined the Sons of St. Tammany and, during the 1790s, Republican societies. For a time, George Washington provided an element of unity by serving as the Tammanies' president as well. During these early years, the Tammanies were a general patriotic rather than a partisan group. Unlike the exclusive Cincinnati, these forerunners of modern political clubs were open to most adult white men and produced the first modern political machine in New York under the leadership of Aaron Burr and later Martin Van Buren. In response, young Federalists formed the Washington Benevolent Societies during the early 1800s. Celebrating Washington's birthday (which only became a national holiday much later) by holding festivals and parades, they copied Tammany in many respects, although the latter favored the Fourth of July as its principal holiday. Like the Cincinnati, they too declined after 1815 and were all but extinct by 1830. Reformer societies continued, however, to seek the prestige of the first president, as in the Washingtonian Temperance Societies (Washington himself did not shun alcohol), or the use of mediums by the American Peace Society to evoke Washington's ghost to prove he had converted to pacifism.

In the early Republic voluntary associations, to which Alexis de Tocqueville called attention in *Democracy in America* (1835, 1840), proliferated. Most were fiercely patriotic: volunteer fire companies, for instance, painted beautiful emblems of American heroes and symbols on their engines. In a nation that feared a standing army, private military organizations flourished. They regularly drilled in public, held competitions, and hosted holiday festivals. Entire cities would plan elaborate parades for the Fourth of July in which social groups participated, arranged by occupation—including the clergy, professionals, and artisans. Although frequently excluding blacks, Roman Catholics, or immigrants, their activities otherwise linked people of different classes and religions in a common civic culture.

In the late nineteenth century, Americans descended from the British, German, and Dutch inhabitants who fought in the Revolution feared that their nation's survival and culture were in jeopardy from the foreign influences of new immigrant groups from southern and eastern Europe. John Adams's descendants, for example, included three major historians who feared that European Jewish money and the pope's Catholic minions would soon swamp the declining percentage of "real" or "hundred percent" Americans.

Beginning in the 1880s, new organizations that required members to prove descent from Revolutionary soldiers or other groups emerged as part of a general movement of the traditional elite to insulate and secure itself from the newcomers. These included the Sons of the American Revolution (1883), the Daughters of the American Revolution (1890), the Daughters of the Cincinnati (1894), attaching themselves to that reactivated order, the Society of Colonial Wars (1892), and the Society of Mayflower Descendants (1894). Looking even farther back to European roots were the Aryan Order of St. George or the Holy Roman Empire in the Colonies of America (1892), and the Baronial Order of Runnymede (1897). Other long-established immigrant groups climbed on the bandwagon to distinguish themselves from recent arrivals and to commemorate their ancestors' role in the Republic's formation: the Holland Society, for descendants of Dutch New Yorkers (1885), the Scotch-Irish Society (1889), the Pennsylvania German Society (1891), the American Jewish Historical Society (1894), and the American Irish Historical Society (1898).

Among the initiatives sponsored by these societies was the promotion of laws to prohibit activities the new immigrants imported from Europe. Games of chance (held to benefit Roman Catholic churches), entertainments and saloons open on Sunday, and aid to parochial schools all came under attack from the largely Protestant "old American" groups.

Genealogy was a major preoccupation of these societies. Organizations such as the New England Historic Genealogical Society and other research libraries expanded their publications and space. Numerous histories of towns, counties, and states appeared, most with lengthy sections devoted to biographies of ancestors whose uniform probity boggles statistical probability. The newly formed American Historical Association, after selecting five outstanding scholars as president, turned to John Jay II and William Wirt Henry, descendants of the founders whose sole notable works honored their

ancestors, in 1890 and 1891, to demonstrate its approval of filiopietistic scholarship.

The traditional elite's effort to unite with its ancestors was matched by an equal determination to isolate itself from its contemporaries: exclusive boarding schools, colleges, clubs, communities, and even cemeteries ensured that long-established families did not have to associate with those whose labor made their comfortable lives possible—except, of course, to service their personal needs as clearly delineated inferiors. Although schools no longer exclude Jews or Catholics, exclusivity lives on in country clubs, secret college associations, and the still-flourishing hereditary societies. Far from being quaint or irrelevant, these are important places where the elites meet and continue to influence American history.

PENITENTIARIES Standing at the epicenter of a transatlantic transformation in the practice of punishment, the emergence of penitentiaries altered the penal landscape of the early American Republic. Spreading in two separate waves, first at the turn of the nineteenth century and then during the Jacksonian period, early national penitentiaries helped reshape the theory and practice of punishment. Particularly in the northern states of Massachusetts, New York, and Pennsylvania, new theories and practices of punishment took center stage. Indeed, the efforts of penal officials and theorists in the northern United States made them the objects of intense scrutiny and imitation by their European counterparts. But despite the revolutionary claims of its early proponents and the long-term effects of their penal strategies, the

practical effects of the penitentiary remained limited during the early Republic. In the north, experimental reformatory practices were only implemented in larger prisons, while in the southern states the power of slavery meant that penitentiaries were of limited significance.

In the colonial period, prisons and jails had restricted importance in the criminal justice system. Small, often ramshackle affairs, prisons were largely holding areas. Courts and magistrates deployed prisons to hold prisoners awaiting trial or sentencing, to detain prisoners awaiting their actual punishments, or to confine debtors or vagrants. Imprisonment for debt was perhaps the most significant form of long-term confinement in colonial jails; rarely did the authorities employ prisons as part of criminal punishment itself. Instead, the vast majority of criminal sanctions in colonial America were corporal, capital, or financial. Nor did officials or the public expect prisons and jails to operate as reformatory influences. In fact, critics consistently insisted that jails were sources of infection—both moral and physical. Although not on the scale of London’s notorious Newgate or Fleet prisons, colonial jails were the sites of jail fevers and the launching pads for escapes. Jailers survived on fees for services, a system that hardly discouraged efforts to exploit prisoners and the public for personal gain.

Prisons assumed new importance during the late eighteenth century. A combination of factors provided political contexts for a reconsideration of traditional systems of public, capital, and corporal punishments: a perceived rise in crime during the late colonial and Revolutionary eras; the growing conviction among Revolutionary elites that capital and corporal penalties were unsuitable for a Republic; and a heightened sensitivity to the possible abuse of courts and penalties for political purposes. Intellectually, diverse attachments to notions of enlightened reforms and a transatlantic network of reformers (both religious and secular) helped provide the arguments to justify an increased emphasis on imprisonment and reformation. But despite the obvious importance of the search for a republican form of penalty, it is important to recognize that penal reform occurred in both America and Europe. National pride and republican ideology may have encouraged Americans to experiment with prisons—but Americans were only a part of a wider transatlantic reformation. Complicating matters further, southern states joined in the late-eighteenth-century fascination with penitentiaries, but significant experiments were focused largely

in the North. Penal practice followed regional distinctiveness.

FIRST GENERATION OF REFORM

Although Massachusetts and other northern states transformed their penal systems (and in the case of Massachusetts engaged in pathbreaking prison reform), it was New York and Pennsylvania that quickly assumed center stage in articulating the ideology and establishing the practice of reformed imprisonment. During the 1790s and the first decade of the nineteenth century, these two states engaged in sustained efforts to transform punishment in the direction of reformatory incarceration. First at Philadelphia’s Walnut Street Prison and then in New York City’s Newgate Prison, prison officials and private reformers aimed to establish a new penal system that placed penitence and reform at its heart.

The new developments could be seen most clearly in Philadelphia’s Walnut Street Prison. Built in 1773 under the unreformed system, the jail was used to hold prisoners during the Revolutionary War. But beginning in 1790, Pennsylvania transformed Walnut Street into a state prison dedicated simultaneously to punishing and reforming inmates through a complicated regimen of hard labor, solitude, enforced cleanliness and discipline. Then, in 1794 officials opened a house of solitary cells (known as the “penitentiary house”) in the prison yard.

Although in reality Pennsylvanians were following upon a series of English experiments in solitary confinement, Walnut Street became internationally famous as a laboratory of humane penal practice—linked in the transatlantic mind with Quaker opposition to the death penalty and cruelty in punishment. Visitors from across the new nation and across the Atlantic came to sing its praises. Its efforts were copied around the Atlantic world, most directly, perhaps, in New York’s Newgate Prison under the direction of Thomas Eddy. In both prisons the early years appeared promising—order was sustained, labor was imposed, officials insisted that prisoners were reformed, and humanity’s claims seemed fulfilled.

A new social regime. In these first efforts at reformatory incarceration, the emphasis lay on a social transformation of prisons and prisoners. Although new prison buildings were built (the “penitentiary house” at Walnut Street and new state prisons in Massachusetts, New Jersey, and Virginia), the overwhelming focus was on creating a new social regimen that would transform the habits and characters of inmates. Reformers such as Eddy in New York and Caleb Lowmes in Philadelphia were convinced that

criminality was an effect of bad habits—particularly as regarded labor. They were certain that if they imposed disciplined labor combined with regular oversight and some moral or religious instruction that they could remake inmates and produce productive and disciplined citizens. In their minds the physical plant or architecture of the prison was clearly a secondary consideration to the structure of authority and the social milieu.

Failure. If Newgate and Walnut Street represented the first wave of enlightened penal reform, by the second decade of the nineteenth century both projects were in shambles. Nearly all of the elements of the reformed prison had either collapsed or been undermined through prisoner resistance. The labor system was erratic, discipline was in disarray, silence and solitude were rarely enforced, and disease and death haunted the inmates. A rise in recidivism and a decline in reformation increased the strains on the prison establishments as inmate populations grew without equivalent increases in staffing or resources. Escapes and prison violence increased over time. Inmate riots and arson marked the failure of the first generation of prison reformers.

A SECOND REFORM EFFORT

The crisis of reformatory incarceration led to a dramatic reconstruction of the theory and practice of penitentiaries. In this reconstruction, Pennsylvania and New York again took the lead. In prisons (most famously at Auburn, New York, and Philadelphia) designed and constructed across the 1820s, each state laid out a new vision (and a good deal of state funds) for the proper organization of penitentiaries. These new prisons were bold efforts. Significantly larger than their predecessors, their designs were carefully calibrated for maximum discipline and control of inmates, each built around a philosophy of punitive silence. At the heart of these prisons was the effort to control communication. Prison reformers throughout the early Republic concluded that the first generation of prisons had failed because inmates were able to communicate freely with each other, undermining the authority of prison officials and transforming prisons from “schools of virtue to schools of vice.” The reformers of the 1820s, however, placed less faith in the social relations of the prison and more in their architectural styles. The use of architecture to control space lay at the heart of these new prisons.

Congregate versus solitary regimes. Consequently, solitary confinement played a central role at both New York’s Auburn Prison and Pennsylvania’s East-

ern State Penitentiary. But from this shared premise the two prison systems diverged dramatically. Eastern State Penitentiary aimed to impose solitary confinement on inmates for the entirety of their confinement: each inmate had a separate, individual cell and exercise yard, labor took place within cells, food was delivered in special drawers, and contact was limited to approved prison officials. At Auburn, by contrast, solitary confinement was imposed only at night. During the day, prisoners labored in a congregate setting more akin to a factory. Silence was enforced not by separation but through the whip, while the invention of the lockstep aimed to ensure that prisoners could not communicate while they traveled from cell to workshop. If Eastern State sought to individualize in the aim of repentance, Auburn sought to discipline in the interests of production.

The debate over congregate versus solitary regimes would shape the course of prisons throughout the nineteenth century. In the United States, the congregate system quickly became the dominant prison form—it would prove more economical and productive. Interestingly, Europeans were more drawn to the solitary system developed in Philadelphia. Indeed, from the 1820s onward, leading European reformers such as William Crawford and Alexis de Tocqueville came to America to examine these new penitential systems. In the end, despite dissenters like Charles Dickens, they argued that the solitary system was more humane. The penitential imagination trumped the fiscal imagination in Britain and the Continent.

Penitentiaries transformed systems of punishment on both sides of the Atlantic. Still, their impact remained uneven. Efforts to turn prisons into penitentiaries could only occur in the largest institutions; in most local jails or secondary prisons the new penitential structures were absent. And in the United States, their importance was largely limited to the North. It is true that southern states—with the notable exceptions of the Carolinas—also constructed new penitentiaries in this period. But their importance and their populations remained constrained by the existence of slavery. Slaves continued to be punished largely on plantations, and public punishments remained ever present in the southern states. Penitentiaries were the companions of new liberal, capitalist orders. They would have to wait till after the Civil War for their day in the South.

PENNSYLVANIA As the second most populous state in the Union from 1810 to 1860 after New York, Pennsylvania was at the center of its political and industrial development. The Declaration of Independence and Constitution of the United States were ratified in the "Keystone State's" capital of Philadelphia and the Continental Congress met there. As the nation's capital from 1790 to 1800, Philadelphia was the site of its most bitter political struggles between the Federalists and their Republican rivals. Because of its diverse population and active partisan press, Pennsylvania was among the first states to pioneer a modern two-party system, where each party ran a slate of candidates, had regular campaign workers, and tried to balance tickets ethnically and geographically.

With its large number of electoral votes—fifteen in 1800 (third to New York and Massachusetts) and 28 by 1828 (second only to New York), Pennsylvania was a critical political battleground during the early Republic. In the election of 1800, when Pennsylvania almost did not cast its electoral votes as a lame-duck Federalist state senate and House of Representatives could not agree. Although the Republicans had overwhelmingly won the election, Federalists still controlled the Senate. Only when Jefferson's election was clear did the state cast eight votes for him against seven for Adams. Pennsylvania also made political history in 1824 by holding the first

convention to nominate presidential and vice-presidential candidates: Andrew Jackson and John C. Calhoun were chosen to repudiate William Crawford, the last candidate officially selected by a national caucus. Pennsylvania had twenty-eight electoral votes.

Begun in 1682 as a "holy experiment" and founded by Quaker William Penn, Pennsylvania was the world's only society to date to combine pacifism with almost complete toleration of all religious groups. Penn aggressively recruited German as well as English settlers. As a result, the colony received an influx of mainstream Lutherans and Reformed Calvinists, who comprised over 90 percent of the Germans, along with pacifist groups such as the Amish, Schwenkfelders, Dunkards. Many Germans remained socially insular, continuing to speak their language even into the twentieth century. The presence of the smaller groups can still be noticed in the Ephrata Cloisters, Moravian Bethlehem, and the farm communities of Amish, who dress traditionally and do not use automobiles or electricity.

Pennsylvania prospered as the breadbasket of North America. By 1776 Philadelphia, closer to the West Indies than New York or Boston, which both had a half-century head start, was British North America's largest city, with about thirty thousand inhabitants. Dotting a prosperous countryside were iron forges, supported by the rich deposits of iron ore of the colony. Under the leadership of printer Benjamin Franklin, Philadelphia developed such institutions and public improvements as the American Philosophical Society, the Library Company, paved streets, and the College of Pennsylvania.

Although Quakers numbered but a small minority, they continued to rule Pennsylvania with German support until the French and Indian War. Following the defeat of General Braddock near present-day Pittsburgh in 1755, native Americans attacked all along the frontier. These Lenape (Delaware), Shawnee, Minisink, and other groups had been dispossessed by a series of treaties made with Pennsylvania but enforced by the Iroquois, who were glad to have a pacifist society on their southern border. The Pennsylvania hinterland was devastated, and towns as far east as Bethlehem and Reading became centers of refugees. After the war ended in 1763, a confederation of native Americans led by Pontiac once again pushed back the settlers searching for fertile lands.

Aware that the province needed to defend itself, several Quakers resigned from the Pennsylvania Assembly in 1756. Until the American Revolution, two

major factions blamed each other for the province's lamentable defense. Quakers and their supporters, led by Benjamin Franklin, tried to have Pennsylvania made a royal province; they were opposed by the Proprietary Faction, who blamed the pacifist Quakers for Pennsylvania's defense problems. Meanwhile, the Paxton Boys in 1763 took out their anger by massacring some of the many Christian Indians converted mostly by the Moravians. The frontier people had no use for either faction. When Britain imposed taxes and increased trade regulation in the 1760s, while the other colonies protested, the major political groups in Pennsylvania courted royal favor.

Because the governing elite of Pennsylvania was heavily Loyalist or neutral, Pennsylvanians opposed to British policy and supporting independence had to effect the most radical internal revolution of any British colony. In 1776 a coalition of representatives composed primarily of farmers, Philadelphia working people, at the prompting of a Continental Congress meeting in Philadelphia, ousted the government and established a new constitution. It allowed all male taxpayers over the age of twenty-one to vote, the most liberal franchise in the country. On the other hand, a test oath, requiring voters to swear allegiance to the constitution, disfranchised perhaps half the state's population, including Quakers, who would not swear oaths. Representation favored the more radical western counties. Voters annually elected an assembly (enlarged from 30 to 74), which had to take its laws back to the people for final approval the next year. In the nation's first experiment with rotation in office, representatives could serve for only four years out of seven, to keep them from aggrandizing power. The only check on the assembly was the council of censors, which could call attention to the assembly's abuses and recommend changes in the constitution. The president merely presided over the assembly.

Pennsylvania saw considerable action during the Revolution. In September 1777, British forces from New York under General William Howe defeated Washington's army at Brandywine and then Germantown, occupying the city as the continentals suffered from cold and food shortages at Valley Forge, twenty miles up the Schuylkill River. Although the redcoats left the following year, fighting remained endemic along the western and northeastern Pennsylvania frontiers, where the British supported Indians against settlers who sought their lands. In the Wyoming Valley in the northeast, around present-day Wilkes-Barre, Connecticut settlers claiming the land for their state, with support

from the Revolutionary government, battled Pennsylvania settlers, who received aid from the British and Iroquois. Congress ultimately granted the land to Pennsylvania, but intermittent fighting and conflicting land claims continued in the region until the early nineteenth century.

Support for the radicals declined during the Revolution, as they levied high taxes and seized production to help the war effort. Riots broke out in Philadelphia to protest profiteering and toleration of Loyalists. Pennsylvania soldiers mutinied twice: in 1781 to be released from their enlistments, and in 1783 to be paid, an action that chased Congress out of Philadelphia for two years. By 1786 conservative Philadelphia businessmen were firmly in control, and in 1790 the state promulgated a new constitution: a governor, senate, and assembly checked each other, the governor appointed the judiciary, and Philadelphia returned to its colonial government—a self-perpetuating board of aldermen.

Pennsylvania ratified the U.S. Constitution in 1787, the second state to do so. Its population grew from 433,611 in 1790 to 602,365 in 1800, to 810,019 in 1810, to 1,049,458 in 1820, and to 1,348,233 in 1830. In 1780 Pennsylvania was the first state to legislate the gradual abolition of slavery: children of slave mothers were born free, subject to an indenture until age 28. As a result, Pennsylvania's slave population declined from 3,707 in 1790 to 1,706 in 1800, to 795 in 1810, to 611 in 1820, to 403 in 1830, to 64 as late as 1840, and finally to none by 1850. Meanwhile, the state's free black population rose from 6,531 in 1790 to 14,564 in 1800, to 23,215 in 1810, to 30,202 in 1820, and to 37,930 in 1830. Much of this growth occurred in the southeastern part of the state because of the ease with which both free blacks and escaping slaves could cross over from Maryland and Delaware. Philadelphia had the nation's wealthiest and best established black community. When white churches there refused to admit blacks or seated them in segregated sections, the Reverend Absalom Jones began St. Thomas' Episcopal Church, and the Reverend Richard Allen founded the African Methodist Episcopal Church, both in 1794. Within a year, almost half of Philadelphia's black churchgoers belonged to these congregations. Though the 1790 constitution granted blacks the right to vote, even such worthies as businessman James Forten were intimidated from exercising their franchise before the constitution of 1838 limited voting to white males.

At the first federal census of 1790, Pennsylvania's three main ethnic groups were English and

Welsh (30 percent), Scots (7 percent), Irish (7 percent), Scots-Irish (15 percent), and German (38 percent). Some 26,000 Irish immigrants came to the state in the late eighteenth century, and more after a hiatus during the Napoleonic Wars. Still, there were only 10,000 Catholics in the entire state as late as 1830, mostly in Philadelphia, as many of the Irish were either Presbyterians or anticlerical. The population rose largely through natural reproduction, though there were a handful of German, English, French, and Italian immigrants. Most of Pennsylvania's Native Americans left the state following the American Revolution; under a thousand Iroquois led by Cornplanter lived on the state's one remaining reservation in the northwest.

By 1800 Pennsylvania was the second most populous state after New York, and it led the nation in industry, whereas New York led in commerce. Production tended to be scattered throughout the state rather than concentrated at a handful of sites, like the Lowell Mills of Massachusetts. Philadelphia, the state's largest city with 41,000 inhabitants in 1800, grew to 80,462 by 1830. Lancaster was the second largest with 4,292 inhabitants in 1800, growing to 7,704 in 1830. Pittsburgh, which had only 1,565 people in 1800, was the second largest city by 1830 with 12,568 people. Prominent sites of industry were the textile mills at Manayunk (several miles north of Philadelphia), where rapid running water provided power; Coatesville in the southeast, where Rebecca Lukens (the foremost female entrepreneur in the nation) ran Lukens Steel; Milford in the northeast, where Cyrille Pinchot made a fortune in the lumber business; and numerous rural forges that exploited the state's rich iron deposits.

Collective leadership and state funding were essential to Pennsylvania's economic rise, for the mountainous terrain in the state could be overcome only by roads, bridges, canals, and railroads. Beginning in the 1780s, when sales of Pennsylvania grain to the West Indies brought the post-Revolutionary depression to a quick close, Pennsylvania pioneered new economic institutions that were later adopted by the entire nation. In 1780 Philadelphia merchants established the Bank of Pennsylvania, followed by the Bank of North America, the first banks in the United States. While the Constitutional Convention was sitting in 1787, they founded the Society for the Encouragement of Manufacturers, which offered bounties to develop useful technology. America's first steamboat, designed by John Fitch, plied the Delaware River from 1787 to 1789. Other Pennsylvania firsts included the first turnpike, which connected

Philadelphia and Lancaster with a sixty-five-mile road of macadam (crushed stone) to the first stock exchange (1791), and the first insurance company (1792). The first approximation of a labor union, the Franklin Typographical Society of Philadelphia, a printers' collective, organized the new nation's first strike in 1786. The Pennsylvania Supreme Court declared strikes unconstitutional in 1805.

For most of the 1790s, nonpartisan Governor Thomas Mifflin kept the peace between the Federalists and Republicans on the state level, greatly helped by sales of public lands, which reduced state taxes to the vanishing point. The national Federalist party, however, had not learned the art of coalition building and compromise and provoked the Whiskey Rebellion (1794) and Fries's Rebellion (1798) by imposing a tax on whiskey. In response to the Whiskey Rebellion, protestors closed courts that tried delinquents, tarred and feathered excise officers, and burned distilleries whose owners paid the tax. About five hundred men attacked the house of excise collector John Neville, a native Virginian and thus doubly hated by the western Pennsylvanians; two were killed and six wounded although Neville escaped with his life. Over six thousand "rebels" then marched on Pittsburgh, but they dispersed when President Washington led thirteen thousand federal troops to the region.

Four years later, John Fries led a mob of mostly Pennsylvania German protestors and rescued people who refused to pay their taxes from a jail in Bethlehem. Although called rebels and charged by the government with treason, the perpetrators were continuing the tradition of tax resistance that brought forth the American Revolution itself.

The 1790s were eventful in Philadelphia as well. The new Walnut Street prison sought to rehabilitate, rather than simply incarcerate, the disorderly. It introduced forced labor in a carefully regulated environment, setting a precedent for the Eastern State Penitentiary, founded in 1821, which placed culprits in solitary confinement to give them time to reflect on their crimes. Eight yellow fever epidemics, brought by refugees from the Haitian Revolution, struck the city between 1793 and 1805, killed thousands, and caused thousands more to flee. African Americans distinguished themselves by caring for the sick.

In the early nineteenth century, Pennsylvania was firmly dominated by a Republican party whose main support came from farmers. By the War of 1812, however, they too had adopted the Federalist position that the state should support vigorous economic growth. Bridges spanned the Schuylkill River

at Philadelphia and the Susquehanna at Harrisburg, which replaced Philadelphia as the state capital in 1811. At the end of the war, Pennsylvania had forty-one banks. By 1830 the legislature had chartered over two hundred turnpike companies, which crisscrossed the state with over three thousand miles of paved roads. Canals enabled the burgeoning anthracite coal industry to supply other states and Europe, especially the one connecting northeastern Pennsylvania with the Atlantic. In the late 1820s the first Pennsylvania railroads began shipping coal; in 1832 the first passenger line connected Philadelphia and Germantown. Responding to the state-built Erie Canal in New York, the legislature appropriated funds for a seven-hundred-mile transportation network of roads, railroads, and canals to assure that Pennsylvania's booming industrial and agricultural production would reach lucrative markets.

Not surprisingly, the most distinguished Pennsylvanians of the early Republic were business rather than political leaders. Robert Morris, superintendent of finance during the Revolution, founded the Bank of the United States with his partner, Thomas Willing, who directed it. Albert Gallatin, secretary of the Treasury under Jefferson and Madison, founded the Second Bank of the United States in Philadelphia. This bank, under the capable control of Nicholas Biddle in the 1820s, successfully regulated the nation's money supply between the panics of 1819 and 1837. Writers Charles Brockden Brown and Hugh Henry Brackenridge wrote some of America's earliest novels, reflecting the merits and shortcomings of democracy in Philadelphia and western Pennsylvania, respectively. From the early nineteenth century Pennsylvania became more noted for the collective effort and economic energy of its people, and beginning in the 1830s the state would be deeply wracked by conflicts between business and labor, white and black, and immigrants and the native born.

PEOPLE OF AMERICA Begun in 1790, the decennial censuses of the United States provide basic information about the population. Immigration statistics were recorded by the federal government only after 1820, and data on class have been derived from tax lists. Before 1790, most "statistics" are, in fact, estimates, based on scattered censuses and estimates of population taken at the request of the British government.

POPULATION SIZE AND GROWTH

Between 1750 and 1830, the population of what became the United States grew from 1.1 million to 12.9 million people, as Table 1 shows. When the War for Independence began, about 2.5 million people lived in the thirteen colonies; the population had increased to about 4 million shortly after the new Constitution went in to effect in 1789. Overall, the rate of growth during this period was just over 30 percent each decade, a pattern that emerged about 1700 and would continue until 1860. Two centuries after the first census, the American population totaled almost 250 million. Most of the growth occurred because of the high rate of natural increase. Life expectancy at the time, as favorable as anywhere in the world, was far below modern standards. But American husbands and wives married early and had children rapidly—in the neighborhood of 50 births per 1,000 population each year. This, coupled with a moderate death rate and some immigration, produced an annual rate of increase of about 3 percent, sufficient to double the population in just under twenty-five years. Table 1 also shows the American people were spread thinly across the land, averaging only 7.4 people per square mile in 1830, partly because of the additions of the Louisiana Territory and East Florida in 1803 and 1819, respectively.

POPULATION COMPOSITION

In considering the composition of the population between 1750 and 1830, first attention will go to age and sex. One of the striking characteristics of the population was its youthfulness, as is evident in Table 1. Starting in 1790, and in accord with many colonial censuses, the median age of the white population was about 16, rising slightly by 1830. In 1990 the median age was 36.9, over twice that of the period under consideration. This is not surprising, as high birth rates produce low median ages. At the top of the age pyramid, only about 4 percent of all Americans reached the age of 60.

One reason for the high birth rate was a relatively even balance between the sexes among whites, making marriage possible for all who wanted to marry. In the seventeenth century, the colonial population was often heavily male (about six men for every one woman in early Virginia), but by 1750 there were only 104 men for every 100 women, despite continued immigration favoring males in the eighteenth century. Among African Americans, the proportion of men would have been slightly higher, because there were more men captured and sold as slaves than women, but the decline in slave imports from 1775 to 1803 stabilized sex ratios for blacks.

Both men and children were slightly more common on the frontier than in more settled regions. In 1800, for example, the ratio of men to women in Massachusetts was 99 to 100, compared to 106 to 100 in Vermont. Similarly, while Pennsylvania's sex ratio was about 106, that in the neighboring Ohio Territory was 119. Even though women were rela-

tively scarce in frontier regions, those who lived there had large families, as is evident in the proportion of the population under sixteen. The percent under sixteen in Massachusetts and Vermont stood at 46.9 and 52.7 respectively. In Pennsylvania and Ohio, the relevant figures were 49.9 and 55.5 percent.

The cultural pluralism familiar to twentieth-century American society was evident in the early national period, before the great nineteenth-century influx of immigration. As Table 1 shows, African Americans accounted for about one of every five Americans from 1750 to 1830. Although slavery as a legal status was defined in the middle of the seventeenth century, the majority of Africans sold as slaves in the future United States arrived between 1700 and 1770. With the Revolution, the importation of slaves slowed, and in many localities stopped. Although slaves were imported into places like South Carolina and Georgia after the war, the slave trade was outlawed by Congress in 1808, as soon as permitted under the Constitution. After a surge of immigration from Europe just before independence, the white population grew mostly by natural increase until about 1820. The slight decline in the proportion of blacks from 21.4 percent in 1770 to 18.1 percent in 1830 can be explained by better life chances and higher fertility among whites, and perhaps a slight advantage in immigrants.

One might assume that because the colonies were part of the British Empire, the colonists would have been overwhelmingly English. Table 2 demonstrates that was emphatically not the case. Table 2

also shows that both Africans and non-English whites were not evenly distributed across the colonies and states. The data in Table 2, from the 1790 census, combine recent estimates of the ethnic origins of the white population, for those states where records with names survive, with information on the proportion that was black. Of the non-English whites, the majority were Scots or Scots-Irish, with notable presences in some localities of people with Dutch or German backgrounds. New England was, in fact, aptly named, as three of every four inhabitants traced their origins back to England. Only a few blacks (both slave and free) lived there. From Maryland to South Carolina, settlers with English roots no longer accounted for the majority of the white population, and in most southern states Americans with African origins outnumbered each of the white groups. The middle states of New York and Pennsylvania were dominated by non-English whites, with a small but significant black population, most of whom lived in or around the cities.

Although the federal government never included Native Americans in the census during this period, we must remember that they were a significant presence in 1750 from the Appalachian Mountains westward. In the South alone, there were over 55,000 Native Americans in 1750, including over 12,000 Creeks, 8,000 Cherokee, and 14,500 Choctaws. In the North, the Iroquois and their allies remained a powerful force until after the War for Independence. By 1830, however, most of the native peoples north of the Ohio River had been forced west of the Mississippi, and the Indian Removal Act of that year would

lead to expulsion of most of the remaining native peoples in the South by 1838. The acquisition of the Louisiana Territory in 1803 added significant numbers of Native Americans to the United States.

The emergence of cities will be addressed more fully as part of migrations, but it is worth noting here that the proportion of the population living in urban areas (defined by the census as a place with at least 2,500 people) was only 5.1 percent in 1790. By 1830, the United States was still overwhelmingly rural, as only 8.8 percent lived in what might be called cities. An urban majority was first documented in the 1920 census, with the proportion rising to 75.2 percent two centuries after the first census.

Assessing class distinctions among the American people in this period depends on studies based on tax lists to provide some evidence into the relative wealth of Americans. In Boston, for example, the distribution of wealth, as measured in the tax lists, remained remarkably stable over the period, with the bottom third of all taxpayers holding no property and the top 10 percent owning about two-thirds of the wealth in the city. Elsewhere, increasing concentrations of wealth were common, especially in cities or settled regions. In Hingham, Massachusetts, the share of wealth held by the poorest 20 percent declined from 1.8 percent to 0.05 percent between 1754 and 1830. The share of the wealthiest 10 percent increased from 37.4 to 47.0 percent. Chester County, Pennsylvania, saw the share of wealth held by the richest ten percent rise from 29.9 to 38.3 percent between 1760 and 1802; the poorest 30 percent saw their share decrease from 6.3 to 3.9 percent. Frontier farming regions may have had more equal opportunities, as the wealthiest 10 percent of farmers in Sugar Creek, Illinois, in 1838 held only 25.0 percent of the wealth, compared to 9.7 percent among the bottom 20 percent. Cities and large towns, on the other hand, were places where wealth was often concentrated. In 1810, the richest one percent of the population in Brooklyn held property worth at least \$15,000 and owned at least 22.0 percent of the wealth. By 1841 it took \$50,000 to make it into the top one percent in Brooklyn, by which time that elite held at least 42.0 percent of the city's wealth.

A rare federal property tax in 1798 produced a national assessment of real property. This list shows that the average property holder held land and buildings worth \$1,433, though only 49.4 percent of households held such property. The richest 10 percent held 45.0 percent, while 88.0 percent of the value of all real property was held by only half of all property owners. The average value of houses

ranged from a high of \$426 in Massachusetts to a low of \$41 in Tennessee in 1798. In Vermont, the average house was assessed at \$84, while in Virginia the comparable figure was \$190.

Any discussion of class and wealth must recognize that the system of slavery meant that about one-fifth of Americans in 1750 were considered as property themselves, not legally entitled to own anything. By 1830 there were over 300,000 free blacks in the country; but while no longer property, many were among the poorest of Americans. In fact, slavery might best be viewed as a system of caste laid over a system of class.

Of religion, there is little to say with confidence other than the country was overwhelmingly Protestant, with a few Catholics, Jews, and Muslims (mostly African-born slaves) present. Numerous Protestant denominations contended for communicants in various parts of the country, with Congregationalists remaining strong in New England, Episcopalians in the Tidewater and low-country South, and Baptists and Methodists dominating the rest of the South and the West. The middle states were, from start to finish, a mosaic of multiplying and contending Protestant faiths.

MIGRATION

During the years from 1775 to 1830, immigration may have been slower than at any other time in American history, with the exception of the 1930s. A surge of immigrants from England and Europe after 1760 came to an end with the War for Independence. Scant records suggest only modest numbers of arrivals until after 1820s; the great surge that brought over thirty million new people to the country by 1920 did not begin in a serious way until after 1845. During the first decade after the government thought it worth recording such data, the number of recorded immigrants was about 10,000 per year from 1820 to 1826, with the total more than doubling as the decade came to a close. In 1832, the number of immigrants jumped to just over 60,000 and topped 100,000 for the first time in 1842, about one-tenth of the yearly totals in the decades before World War I. Males accounted for from 65 to 80 percent of the total, most in the prime ages for work between fifteen and forty. This pattern of immigrants being predominantly males of working age would continue until after 1930.

The low level of immigration may have allowed Americans to become a more homogeneous people during the years they were establishing their new republican experiment. The emergence of African

Americans out of a multiplicity of African origins has been well documented, and presumably the same may have happened among Americans of European background, aided by public ceremonies designed to foster national identity.

The transformation of the United States from a rural to an urban society clearly began during this period. In 1750, three cities in the colonies had at least 8,000 inhabitants: Boston, New York, and Philadelphia. Together, they accounted for 3.5 percent of the colonial population. By 1770, the largest city was Philadelphia, with approximately 28,000 residents. By the first census in 1790, another three cities had reached that size, though the proportion of the total population living in those places had declined slightly. The move to cities picked up noticeably after 1800, so that the census of 1830 recorded twenty-six places with at least 8,000 inhabitants, accounting for 6.7 percent of the people. New York had replaced Philadelphia as the largest city, with 202,589 inhabitants. The urbanizing trend was just getting started by 1830, as the 1890 census recorded 447 cities with at least 8,000 people. The 18 million Americans living in such places were 29.0 percent of the total.

The third great flow of migrants during and after this period was the movement from east to west. In 1750 the population of England's colonies was scattered, rarely more than 150 miles from the Atlantic Ocean. Over the next eighty years, a combination of a rapidly growing population, freedom from imperial restrictions, the acquisition of additional territory from France and Spain, and major innovations in transportation sent the American population westward. This migration is shown in Table 3. Although westward expansion is often celebrated in American history, it is important to remember that thousands of slaves were unwilling participants, and the native American population experienced contraction in the face of white expansion. The figures in Table 3 demonstrate not only the remarkable growth in the regions of the country comprised by the original thirteen states, but also the dramatic movement to new areas. Although only 109,368 lived in what became Kentucky and Tennessee in 1790, over 3.6 million people lived in the West by 1830, almost as many as in the United States in 1790. One result was the addition of eleven new states by 1821.

It is evident that, from the early years of the Revolution through the Constitutional Convention in 1787, Americans were unsure of whether they were one people or a collection of sections. No issue so clearly defined sectional differences as the presence or absence of slaves and free blacks. The end of slavery

in the North led to an increase in the free black population, not only from slaves freed locally, but also from freed blacks moving from the South. Although the vast majority of African Americans living in the North were free by 1830, more free blacks lived in the South Atlantic region than in any other part of the country. Because of the internal slave trade, 490,024 slaves were living in the region comprised of Kentucky, Tennessee, Mississippi, and Alabama in 1830, more than the total number of black colonists in 1770.

The addition of the Louisiana Territory in 1803 and East Florida in 1819 brought a few French and Spanish colonists into the American population, but they were quickly overwhelmed by arrivals from the states. In these and later conquests, Native American populations nominally under the control of European empires or independent Mexico after 1821, were exposed to the expanding people of the United States, who considered it their divine destiny to populate and transform the entire North American continent.

PERSONAL APPEARANCE The works of itinerant portrait artists from the early nineteenth century provide some idea of what Americans in the northern states looked like. These vernacular portraits show

William Paca. Charles Willson Peale painted this full-length portrait of the Maryland Patriot and politician William Paca in 1772. Paca poses in an eighteenth-century gentleman's suit, with knee-length coat, waistcoat, breeches, and stockings. THE MARYLAND HISTORICAL SOCIETY, BALTIMORE, MARYLAND.

respectable men and women—merchants, professional men, successful artisans, manufacturers and their wives—in their best clothes, the men in sober black, the women in ornamented caps and collars. They hold books, often Bibles, and sometimes other implements that signify female arts or men's trades. With rare exceptions they are gazing seriously at the beholder. This is the world of the prosperous American parlor. Occasionally there is a revealing lapse from propriety, as in the portrait of Stephen Fitch, circa 1820, that shows him holding not a book but a snuffbox and a handkerchief that he will use to clean up after he has inhaled the tobacco.

Such portraits also reveal changes in personal appearance. Men's hairstyles began to change radically at the turn of the century, along with much else. Wigs, long flowing locks, and hair tied in queues or clubs gave way to short hair—"brush heads" as they were first called. Men sat for their portraits with

hair close-cropped in the Roman style, or brushed back to reveal the forehead. Beards and mustaches, which had disappeared from the American colonies in the late seventeenth century, would not begin their return until after 1830.

Caricatures provide a different view. The drawings and lithographs of David Claypoole Johnston depict men in shirtsleeves, with ill-fitting hats and soiled or missing cravats. Drunkards' bare toes stick out of their broken shoes. In Johnston's "Militia Muster" (1828), the New England citizen-soldiers are an unattractive lot. Some men wear patched and soiled trousers while others puff on "segars." Because the militia spanned class divisions in the community, at least some pictured in this all-male world of the muster are those who might have sat for portraits in their own parlors. Four of the working-class militiamen have open mouths, displaying missing and rotted teeth. This is a striking reminder of the dental difficulties that plagued many, perhaps most Americans.

BODY LANGUAGE

One keen observer thought that the farm people of his native New England in the 1820s were facially inexpressive, "wearing all unconsciously the masks that custom had prescribed." The great physical demands of unmechanized agriculture, he maintained, made men "heavy, awkward and slouching in movement." Other observers likewise found Dutch farmers in New York and Germans in Pennsylvania "clumsy and chill," or "dull and stolid." Poorer rural folk in the South looked "disagreeable and boorish" to English travelers, their faces giving nothing away.

The newly arrived "wild Irish," on the other hand, stood out as too expressive—loud, boisterous, and gesticulating. African Americans were in a different category entirely. Their freer expressions and gestures confused and distracted observers who saw only "antics and frolics," or "savagery." Whether seen as sullenly uncommunicative or childishly merry, they also wore the masks of custom—in this case self-protective strategies for controlling what could be known about their feelings and motivations. Low status and greater physical expressiveness made both groups vulnerable to caricature; their faces were customarily portrayed as coarse and brutal.

American city dwellers, driven by the quicker pace of commerce, were reputed to be easy to distinguish from rural folk. It was already said of New York City that the men hurrying on Broadway shared a universal "contraction of the brow, knitting

A Militia Muster. This satirical 1828 watercolor by David Claypoole Johnston paints an unflattering portrait of the cleanliness of militia soldiers. of the eyebrows, and compression of the lips." It was a popular American saying that "a New York merchant always walks as if he had a good dinner before him, and a bailiff behind him."

The most physically graceful of Americans were thought to be members of the planter aristocracy, who expressed the power of their class in the way they stood and moved. Accustomed to command, at ease on the dance floor or in the saddle, they could be distinguished from men hardened by toil or preoccupied with commerce. An Englishwoman visiting Washington contrasted not the politics but the posture of congressmen from the North and South. She noted the "ease and frank courtesy . . . with an occasional touch of arrogance" of the slaveholders alongside the "cautious . . . and too deferential air of the members from the North." A New Englander could be identified, she wrote, "by his deprecatory walk."

CLEANLINESS

Until well after the Revolution, very few Americans bathed—that is, washed their entire bodies. Custom-

arily, they went no farther than washing the face and hands once a day in cold water in full view of others. Most men and women also washed without soap, reserving it for laundering clothes; instead they rubbed briskly with a coarse towel to scrub off dirt. Only those whose hands and faces were clearly dirty were considered unclean.

Elite American families with transatlantic connections to the British aristocracy first took up bathing in the 1790s in Philadelphia, New York, and Boston. Men and women undressed in their rooms and washed themselves using basin, pitcher, and towel—an ensemble called a "chamber set" that would become increasingly frequent in American bedchambers.

These new practices were influenced in part by considerations of health, in particular the eighteenth-century medical discovery that the skin with its pores was an organ of secretion, with its corollary that the pores needed to be kept clean and open. But the new attitude owed even more to aesthetics—a revulsion from bodily smells, a desire for smooth, un-

blemished surfaces, and a willingness to connect bodily cleanliness with virtue and refinement.

During the first three decades of the nineteenth century, other Americans in city and countryside followed the example of urban elite families. However, the democratization of bathing was gradual. In 1815 the family of a prominent minister in Litchfield, Connecticut, still washed in their kitchen using a stone sink and “a couple of basins.” Historians know this because a young woman from New York City who boarded with them complained in a letter home that she was unable to bathe.

Advice books on health and manners began to recommend bathing, and it is likely that young people were most responsive. Most members of the older generation at the time of transition—those born before 1780, say—may never have been comfortable with it. By 1830 bathing was probably widespread among prosperous families in cities (and to some extent among plantation families as well) and coming into acceptance in rural villages. It remained relatively rare in the countryside; the northern agricultural press would not begin a campaign to encourage bathing until around 1840. Bathing did not touch the lives of the urban poor or the world of the slaves.

PHILADELPHIA Philadelphia was founded by William Penn in 1681 as the seat of government for Pennsylvania, the colony that had been granted to him by King Charles II. Penn hoped to provide a haven for fellow members of the Society of Friends,

otherwise known as the Quakers. The Friends left their mark on America in many ways, but none perhaps was so great as the heritage of tolerance signified by the name Philadelphia, which means “City of Brotherly Love.” The city’s reputation for tolerance made it the perfect location for the cultural, as well as geographic, center of what would one day become the United States.

TRADE

The key to Philadelphia’s phenomenal growth lay in trade. Dozens of charters for new cities were written in the late seventeenth and early eighteenth centuries, but Philadelphia was uniquely situated to take advantage of a growing economic boom in export flour. Delaware Valley farms produced two wheat harvests a year. Unlike tobacco, another major export of the colonies that was shipped in its raw form and finished abroad, wheat was milled into the final product, flour, at hundreds of watermills scattered around the countryside. Barrels of flour arrived in Philadelphia by cart from as far south as Virginia and on small, flat-bottomed boats called shallops from Chesapeake and Delaware Bays.

Flour barrels reexported from Philadelphia had the added advantage of being literally branded as proof that Pennsylvania stood behind the quality of the flour inside. By the end of the colonial period, the government of Pennsylvania recognized seven different grades, the highest called “super fine” and marketed to Europe. Pennsylvania flour was sold in the West Indies, South Carolina, the sugar islands of Madeira and the Azores, southwestern Europe, and even New England.

The city’s most useful product was information at a time when information from overseas markets traveled no faster than a sailing ship. News of the best prices for export flour spread even before an incoming ship had completely docked. Merchants gathered at coffeehouses in the center of the city quickly put together “ventures” to send new shipments out to the most promising market. It did not take long for Philadelphia also to become a center for the reexport of manufactured products such as cloth that was sold first in the city’s hinterland and eventually to coastal cities throughout America.

GROWTH OF THE CITIES

From roughly 1720—around the time when Pennsylvania passed laws to certify the quality of export flour and print a local paper money supply—to the end of the century, Philadelphia grew rapidly. Influenced by the planned rebuilding of London after the

great fire in 1666, Penn had imagined a beautiful city with wide boulevards, attractive city parks, and rows of brick townhouses backing up to gardens and trees. The rapidly growing population, however, apparently wished to settle as near to the city's center at Second and Market Streets as was physically possible. Residents defied Penn's plans by crisscrossing the wide city blocks with alleys and spilling over the city's northern and southern boundaries into the suburbs of Southwark and Northern Liberties.

By 1790, forty-five thousand people lived in Philadelphia and the urbanized area around it, an area defined not by the rectangular plan of Penn's design, but rather by a semicircle two miles along the Delaware River and, at its widest point along Market Street, one mile west of the river. Warehouses crowded along the waterfront, along with tightly packed housing for tailors. Mariners stayed along

the south border of the river, while the shipbuilding industry dominated the riverside to the north.

The city boasted over three hundred inns, taverns, and boardinghouses and five hundred shopkeepers and grocers. Scattered throughout the city and living in shacks along the alleys or on the top floors of sturdier buildings, common laborers (black as well as white) accounted for one in twelve city residents. The city's formal market ran the length of Market Street, which along with Second Street divided the city into identifiable sectors.

PROMINENT PHILADELPHIANS

The city had three hundred self-identified merchants, including seven who specialized in the Chinese trade alone. Twenty-five identified themselves as brokers or dealers, thirty-one specialized in the flour trade, twenty-four in lumber, eight in iron, and eight in tea. Young merchants tended to live in or near the

warehouses on the docks. The measure of success, however, was being able to move to the category of “gentleman” and live in Society Hill.

The enclosure of Dock Street, previously a foul-smelling open sewer, created a boom in building for the upper class in an area still called Society Hill in the early twenty-first century. It was centered on its own smaller market on Second Street south of Market. Thomas Willing, Benjamin Chew, Samuel Powell, William Shippen, and Robert Wharton—all famous merchants in their day—lived on Third and Fourth Streets. Alexander Hamilton and Benjamin Rush also lived nearby. Wealthy widows from the Mifflin, Wharton, Gilpin, Bartram, and Hamilton families were neighbors in this new wealthy enclave.

The role of Independence Hall on Fifth and Chestnut led other wealthy residents to begin to build finer

houses along Market on the western outskirts of the city. The most notable of these new residences was that of financier Robert Morris at Fifth and Market Streets. Morris loaned his home to George Washington during the latter’s two terms as president of the United States. Thomas Jefferson stayed in this neighborhood while writing the Declaration of Independence and later when he was in the new national government. New houses there and in Society Hill were built further apart than elsewhere, and so the wealthy could avoid the chaos that characterized other sections of town. When a household member was ill, for example, sawdust was spread over the cobblestones in front of the house to keep the area quiet. Even sawdust could not have shut out the din of overcrowded blocks through most areas of the city.

OCCUPATIONS

The majority of shopkeepers and artisans operated to the northwest of Society Hill, clustering along Market Street, on Second Street, and also on Sixth Street north of Market. Approximately sixty different types of shopkeepers operated in the block surrounding the permanent market, along with numerous artisans and some professionals.

The variety of occupations offers a glimpse of the complexity of the city in 1790. There were twenty-three ministers, five sextons, twenty-eight clerks, ninety-eight schoolmasters or mistresses, fourteen university professors, fifty-five physicians, twenty-four pharmacists, five midwives, nine bleeders, three dentists, one dispensary, and a “doctress.” Thirty-one manufacturers specialized in carriages, thirty-seven as printers, twenty-four as chandlers, twenty-three as potters, fifteen as watchmakers, ten as clock-makers, thirteen as bookbinders, and ten as brush-makers. There were also comb makers, plane makers, sieve makers, soap boilers, card makers, three umbrella makers, two whip makers, seven pump makers, seven millstone makers, two engine makers, four fan makers, three parchment makers, five engravers, and glassblowers, along with a chaise maker, wire cage maker, cane maker, whalebone cutter, and pottery wheel maker. Other manufacturers made musical, mathematical, and obstetrical instruments; cigars; organs; trunks; hair powder; and hanging paper.

The city had 54 barbers, 192 innkeepers, 110 boardinghouses, 249 shopkeepers, 44 tobacconists, and 61 hucksters. In addition to 153 blacksmiths and 30 ironmongers, the city was home to 18 nail-makers, 25 silversmiths, 16 tinsmiths, 10 copper-smiths, brass founders, typefounders, block makers, gunsmiths, goldsmiths, cutlers, pewterers, and a steelmaker, wire maker, file cutter, and button mold maker. There were 131 butchers, 117 bakers, 34 brewers, and 18 sugar bakers or refiners, along with cake bakers, pastry cooks, chocolate makers, hard-tack bakers, a mustard maker, and a confectioner.

To the southwest of the homes of the wealthy arose a city-within-a-city, home to a growing number of free blacks and slaves who had escaped from southern states across the Pennsylvania border to safety. Dr. Israel Butterfield, the first known African American physician and a leader in the fight against yellow fever, lived here.

City restrictions against “noxious” occupations had forced the wholesale butcher trade into a region of its own, Spring Garden, between the Northern Liberties and Germantown. Tanners and ropemakers

also lived and worked outside the city proper. Carpenters lived on the outskirts of the city next to the new homes being built.

Whereas it was rare in the countryside for a woman to continue maintaining her own household after widowhood, female-headed households accounted for 10 percent of the total in Philadelphia. Wealthy widows, or gentlewomen, lived in Society Hill or the older sections once occupied by the wealthy closer to the river. Widows and women identified by a specific trade lived along with other shopkeepers and artisans in the northwest. It was standard practice in both shopkeeping and artisanal households for women to keep the books (including Debbie Franklin, Benjamin’s common-law wife). After the death of a husband, it was easier for a woman to continue shopkeeping, or even directing the labor of artisans, than continuing to operate a farm on her own. There were also trades such as midwifery, cake baker, and mantua maker that were run by women.

ENVIRONMENT AND INSTITUTIONS

The bulk of the city was crowded and noisy. At its most densely populated point, twenty-four-hundred people lived in a single city block in an era when houses could be constructed only to four stories in height. The poorest of residents squeezed into shanties along alleys in the rain, living outdoors when the weather permitted. The children of the middling and upper classes spent a lot of their time outdoors by choice; those of the lower classes ran in little packs through the streets. By the first decade of the new nation, the city had exceeded a safe rate of population density, leaving it vulnerable to the nation’s first major outbreak of disease, a yellow fever epidemic.

By the 1790s Philadelphia had a university and a medical school; two banks; the nation’s first fire departments, insurance companies, and free library; and Benjamin Franklin’s American Philosophical Society—so named to signify the role of the city as the center of America, not just the Delaware Valley.

THE DECLARATION AND THE CONSTITUTION

The city would become best known for the legislative hall, known as the State House, that was built in the 1730s and 1740s to house the colonial legislature. A bell on top, ordered by the governor, had the inscription “Proclaim Liberty throughout the Land.” Because of Philadelphia’s central location along the coast—and its noted inclusiveness with regard to religion and creed—the city became home to both Continental Congresses through most of their operation.

The Declaration of Independence was written in Philadelphia, signed in the State House—which became Independence Hall—and read to the public for the first time on its steps.

When the loose confederation of nation-states that had successfully won independence from Great Britain began to fall apart after the war, a convention was called in 1787, again in Philadelphia, to write a stronger constitution that would create by peaceful means an effective centralized government. Pennsylvania was the second state to ratify the new Constitution. Ironically, Pennsylvania was also the center of a revolt against the document, ending in a compromise by which a Bill of Rights was appended as the first amendments to the Constitution.

IN THE NEW NATION

Had Philadelphia remained the capital of the new United States, it might have become a city with the size and prominence of Paris, as many educated residents dreamed. However, during the Revolution a group of Pennsylvania militiamen had marched on the Continental Congress, then meeting in Philadelphia, requesting (rather forcefully) that they be paid. From a distance, the request seems perfectly reasonable—but the manner, which Congress found frightening, led instead to its move across the river into New Jersey for a time. When the convention convened in the same building to write the Constitution, members remembered that particular outburst and insisted that there be a separate district for the nation's government so that the real or imagined failings of the state government would not directly impact the workings of the new federal government.

When the Constitution was approved in 1788, the mechanics of Philadelphia mounted a grand parade, by their own accounts, down a street that would forever be known as Arch Street because of the construction of a triumphant arch just for the occasion. Each artisan specialty marched, often with an accompanying float, in honor of the new nation. The first national capital under the new Constitution was New York City, where George Washington was inaugurated as president in April 1789. The following year, however, the federal government moved to Philadelphia. Briefly, the economic, political, and social centers of the new nation were all in Philadelphia. However, the federal government moved south to the new District of Columbia in 1800 and New York City gained primacy in international finance and domestic trade in the nineteenth century, particularly after the opening of the Erie Canal in 1825.

The first decades of the nineteenth century were not easy for Philadelphia, but the city continued to grow nevertheless. Philadelphia merchants continued to prosper in the China and West Indies trade. The city also remained a reexporter to southern ports and, through New Orleans, parts of the Ohio River Valley. The old artisan system of master-journeyman-apprentice died out, but Philadelphia remained a center of specialized manufacture, particularly with regard to machinery and fabrics. The city was no longer the financial capital of the nation, but in a period where the major money supply came from private banks, the city did not lack for either banks or money. Finally, the city grew as a center of abolitionist thought, and as the northern terminus of the Underground Railroad, it drew slaves to the city-within-a-city of free blacks and to numerous surrounding rural African American settlements.

After an ill-fated effort to create its own Main Line Canal westward through the mountains, the city ceded the route to the newly created, private Pennsylvania Railroad, which by the 1850s would dominate inland railroad trade. In the 1840s German and Irish immigration through the port of Philadelphia led to renewed growth in the backcountry and provided a labor force of young adults willing to take on whatever work was necessary. The city's rebirth was not easy. Journeymen struggled to find a niche in the new world of wage labor, and nativist riots led to the establishment of the nation's first Catholic parochial school system. By 1850, however, the city was once again on the rise, a center of international and national trade as well as custom manufacturing in textiles and machinery. Philadelphia's particular gift then and in the future would be the ability to reshape itself as the nation changed around it.

PHILANTHROPY AND GIVING Since the arrival of the *Mayflower* on North America's shores in 1620, millions of Europeans have set sail for the new continent to find a better life. The settlers created communities, organized a social and cultural infrastructure, and—after some time—even established philanthropic networks. None of these structures was entirely new; the settlers often recreated institutions they had already known from their European home. According to historian Robert A. Gross, there were some two thousand benevolent institutions in New England by 1820. German immigrants, for ex-

ample, established aid societies for fellow migrants who had just arrived in New York City or New Orleans and needed assistance in finding a place to live and work. One such association was the German Society of the City of New York, founded in 1784 to relieve the local German churches of their charitable burdens and to take effective steps to deal with problems emerging from the influx of German immigrants.

In the South, philanthropy followed the color line and played its part in preserving a racist society. Visiting the poor and caring for orphans was, according to Gross, at the heart of Southern philanthropy and reaffirmed a patron-client relationship. Philanthropy by free and wealthy blacks for slaves and blacks in need, however, challenged this society. Henriette Delille, a wealthy offspring of one of the oldest families of free blacks, supported by several other women, established the Sisters of the Presentation (later renamed Sisters of the Holy Family). The members of this Catholic order worked among the poor, the sick, the elderly and also among slaves. Delille also founded a school for girls and opened a hospital for needy blacks in New Orleans. When Alexis de Tocqueville toured the United States in 1831, he was impressed by the wide array of these associations, which had been founded to support the poor, build schools and colleges, organize hospitals, and create libraries.

Dartmouth College was such a privately founded college in New England. Chartered in 1769 by Dr. Eleazar Wheelock, it became the center of a legal fight between the state legislature of New Hampshire and the trustees of Dartmouth College—a struggle that defined American philanthropic culture. Since the college received state aid and fulfilled a public task (education), William Plumer, the state's governor (1812–1813, 1816–1819), asserted that the state government had a right to interfere in the administration of the college and its curriculum. The ensuing legal conflict, culminating in the U.S. Supreme Court's ruling in *Dartmouth College v. Woodward* (1819), resulted in the reassertion of the trustees' rights and the clear separation of state and private spheres in the provision of public services. After the *Dartmouth* decision, philanthropy's place in American society was defined. State legislatures could no longer expect to interfere into the operations of private associations. Subsequently, state governments evaluated the importance of certain fields such as education and social welfare and decided to leave aspects of these fields to private and religious associations. The *Dartmouth* decision also ac-

counts for the nation's reliance on philanthropy rather than a comprehensive, state-organized system of social welfare. Private associations, as the legal scholar Mark D. McGarvie has pointed out, did not assume responsibility in matters that would otherwise have been government functions; they occupied spaces left vacant by the local, state, and federal governments. The clergy seized this opportunity and filled the emerging void by creating a dense network of church-affiliated philanthropic institutions. In the early years of the American Republic, clergymen lost the status and political authority that went with representing a state church. But in philanthropy they recognized the potential for the realization of a religiously inspired vision of social organization.

Thus, philanthropy became a force for social change. Some historians go even further in their assessment of philanthropy by suggesting that it constituted some form of "counter-government" to political authority. This aspect of philanthropy was not lost on persons excluded from civil society because of their religion or gender. Long before women received the right to vote, they organized, financed, and ran voluntary associations. For example, they established the Female Society for the Relief of the Distressed in Philadelphia (1795) and the New York Society for the Relief of Poor Widows with Small Children (1797). Within society, philanthropy assumed an exclusionary as well as an inclusionary function. It gave women an opportunity to step out of the domestic sphere and gain a voice in dealing with society's most pressing issues. It even allowed women to shape society. On the other hand, however, it also allowed for excluding Catholics and Jews from Protestant establishments and promoted the creation of ethnically and religiously defined philanthropic spheres in American cities.

PHILOSOPHY Philosophy engages people in dialogue and dispute, seeking insights to questions both compelling and unsettled about human nature and divinity, about what the world is, how we know it, and how to live within it. Philosophical pursuits are common across the generations, but the context of early America shaped these questions and their answers in distinctive ways. The emergence of modern science, the American Revolution (1775–1783), and the creation of representative government blossomed within a nation built on religious foundations. This mix between science, politics, and religion has a rich and distinctive American cast and forged the new American nation.

RELIGIOUS FOUNDATIONS

From the 1750s to the 1830s, American philosophical dialogue was framed primarily by divinity school theologians. They sought to understand the human being's personal relationship to God within a Christian worldview, drawing on the Bible and theological reflection. They also sought to make sense of the new science of Englishmen John Locke (1632–1704) and Isaac Newton (1642–1727). They affirmed the supremacy of the Bible but were committed to reconciling modern science with traditional theological beliefs. Later philosophers would integrate science and speculative thought without Christian theology, but a religious orientation dominated early America.

Jonathan Edwards (1703–1758) is often described as America's first philosopher and most influential theologian prior to the Civil War. Edwards inherited a Calvinist background and breathed new life into its doctrines. He defended basic Puritan beliefs in his writings and sermons, beliefs such as original sin (all humans are born depraved), grace (only God can save people from this condition), and predestination (God determines every aspect of our fate). Edwards confronted the most puzzling theological challenges, including an account of free will and responsibility in a predetermined world.

His writings sustained intellectual speculative conversation from the mid-eighteenth through the

early nineteenth century, creating a distinctive tradition of American thought, often called the New England Theology. Competing theologies emerged at the leading seminaries, such as the New Divinity at Yale, the closest heir to Edwards's ideas. The New England disputes were intense, but they largely shared a religious orientation that all learning is based on theology. History, ethics, philosophy, science: everything is God's work, and so the attainment of knowledge is only possible when it is joined with religious reflection, based on the Bible.

The intellectual debates were fueled significantly by the writings of Isaac Newton, who offered an interpretation of all physical happenings as motions of material points, synthesizing scientific learning into a framework that guided intellectual progress in America for over two hundred years. Newton's science made belief in God seem increasingly unnecessary to explain what happens around us. Further, it raised a puzzle about how to reconcile the seeming impersonalism of a Newtonian universe with belief in the immanence of God.

Edwards's solution was idealism, a philosophical perspective attracting American philosophers ever since, many of whom also drew from a European idealist tradition that included Irishman George Berkeley (1685–1753) and Germans Immanuel Kant (1724–1804) and G. W. F. Hegel (1770–1831). If the world is the motion of material points, then one might infer that reality is material. (Thomas Jefferson embraced this view.) But Edwards's idealism says that atoms, or whatever else science reveals as part of nature, are expressions of God. Ultimately, the world is in fact God, and the motions and movements contained within it are God's Ideas. The implication is that our personal daily experiences of the world are experiences of God. Another implication for Edwards is that the world we observe should be studied with intensity for all of its (divine) insights. Like Puritans before him (especially Cotton Mather [1663–1728]), New England theologians actively embraced science and were scientists themselves.

Leading intellectuals also debated the first Great Awakening (1739–1740) and other religious revivals of the time. How does one distinguish authentic religious experience from emotionalism? How does one come to know God (or anything else for that matter)? What is the best method for interpreting the Bible? Divisions over these and other questions led to the American Unitarian movement, committed to the rational appraisal of Christian beliefs.

One distinctive characteristic of early American philosophy is that intellectual thought from the be-

ginning was deeply religious and communal and yet friendly to science and its investigations. Science tells us how God operates; reason and biblical revelation tell us why and provide further clues about God's purposes. This compatibility was important for supporting the industrial and technological development of the new nation.

POLITICAL PHILOSOPHY

It is astounding that this religious orientation existed alongside America's founding documents, which so carefully draw a separation between church and state. Explaining this incongruity is a deep task, but there are two initial remarks often made: first, that those who created the founding documents saw the terrible violence from a European history that did not separate church and state, and they learned from that experience; and second, that they were influenced by Enlightenment values apart from the orientations of theologians.

Benjamin Franklin (1706–1790) is often contrasted with Jonathan Edwards to symbolize these divergent American sensibilities. A statesman and scientist throughout the Revolutionary period, Franklin abandoned his Calvinist upbringing while a teenager and, after an initial foray in metaphysics, steadfastly refused to be a speculative philosopher. Instead, Franklin emphasized practical achievements and used the tribunal of experience to guide his scientific, moral, and religious beliefs. Thinking was a means to action rather than reflective meditation.

The American statesman Thomas Jefferson (1743–1826) was more interested in speculative thinking, but these speculations led him away from Calvinist beliefs and toward an impersonal Deism. Jefferson was influenced by the eighteenth-century Scottish Enlightenment, with its ideas of humanism, scientific discovery, and morality as a natural science rather than applied theology. He and his political contemporaries absorbed the natural rights and utilitarian traditions of England's John Locke and Scotland's Adam Smith (1723–1790) and David Hume (1711–1776). For these statesmen, the design of political institutions became a matter of debate and rational argument disassociated from biblical interpretation.

The constitutional designers are often called classical liberals. They believed in limited government, its authority resting with the people it serves rather than divine right. Government should secure a basic rule of law that allows people to lead their own lives in accord with their own religious conceptions. Reason showed that people were born free and equal and

that they were endowed with natural rights. Freedom was thought the best means for securing individual happiness. As recounted most famously in Frenchman Alexis de Tocqueville's *Democracy in America* (1835, 1840), Americans both believed and lived these ideas, in contrast to European aristocracies. The great American exception was slavery.

American views about representative government spring from a particular conception of human nature at once optimistic and pessimistic. On the one hand, people left to themselves will create reciprocal and cooperative relations with others that improve the world and themselves. Individuals through their own efforts will foster community, cooperation, and good will. On the other hand, those who wield political power over others are likely to abuse this power. The solution was to devise a system of checks and balances and limited government that they hoped would allow individual efforts to flourish for the good while minimizing despotic tendencies.

Debates in political philosophy in early America were held in newspapers and pamphlets by famous public leaders and local citizens. The essays constituting *The Federalist* (1787–1788) were published in a New York state newspaper. Written variously by Alexander Hamilton, James Madison, and John Jay, they are the most extended defense of the federal Constitution and one of America's great documents of political philosophy. The anti-Federalists (those who opposed the ratification of the Constitution) shot back, and the battle of intellectual ideas took place as pamphlet wars in the public square. Only after the 1830s did the movement of these debates turn to an increasingly smaller circle of university scholars. In early America the location of most philosophical debate was the public.

Remarkably, the greatest political leaders were also the greatest political philosophers. The ideals of liberty and equality were not distinctive to America, but the close relations between philosophical thought and the creation of America's system of government is one of the remarkable developments in human history.

EMERGING AMERICAN TRADITIONS

Early American intellectuals looked to Europe for their sources and then made them their own. The European Romantics emphasized freedom of expression and the greatness of nature, important currents in American politics and religion during the early to mid-nineteenth century. Transcendentalism and pragmatism emerged as America's most distinctive philosophical schools of thought in the nineteenth

century, supplanting the earlier New England Theology. The transcendentalists emerged in the 1830s from the Unitarians, who had reacted against the Calvinists. The pragmatists came after the Civil War (1861–1865) and Charles Darwin's *On the Origin of Species* (1859). They reshaped the exchange between religion and science and combined elements of Benjamin Franklin's (distinctively American) no-nonsense approach and Jonathan Edwards's idealism. These traditions are the beginning of a long arc from a religious to a secular orientation in American philosophy. The exception was the growth of Catholic institutions of higher education from the mid-nineteenth century onward, with intellectual roots in Aristotle (384–322 B.C.) and St. Thomas Aquinas (1225–1274).

Philosophy in early America had another lasting influence by creating two distinctive paths of philosophical thought. One path has a spiritual orientation that focuses above all on one's inner life and personal relationship to the world, a connection to America's religious foundations. The Second Great Awakening in the early nineteenth century was an important religious revival, leading to the establishment of many colleges and seminaries and a distinctive history of camp meetings—associations of thousands of people who camped out in search of spiritual renewal. These camp experiences developed into the American Chautauqua movement in the late nineteenth century. Another lasting historical legacy of religious revivals and their spiritual orientation was their association with and support of the abolitionist, suffragette, and temperance movements of the nineteenth and twentieth centuries.

Another path of philosophy has an empirical and secular orientation that addresses problems of philosophy significantly through the lens of science in disassociation from any religious tradition. This path traces a connection to Enlightenment values of the eighteenth century and is found throughout academic philosophy. But whichever path one traces, the philosophical pursuit is the same, exploring compelling questions about ethics, religion, knowledge, and existence, from one generation to the next.

PHRENOLOGY Phrenology, the practice of reading character from bumps on the skull, has enjoyed a long career as a sideshow amusement, but its origins are rooted in the most advanced currents of late-eighteenth-century neuroanatomy and psychology. Though seldom seen as a product of Enlightenment rationality, it represented a serious attempt to systematize human behavior and provide a material basis for theories of mind.

The founder of phrenology, the Austrian neuroanatomist Franz Joseph Gall (1758–1828), argued that the brain was divided into a number of discrete organs, each correlated with a single mental, behavioral, or physiological function. He assumed that the larger the region, the more strongly expressed that behavior would be. Gall made one additional assumption that was critically important for the popular success of phrenology: he conjectured that the skull conformed precisely to the shape of the brain beneath. In this way, Gall developed a system for using the external signs of the body to read the internal state of the mind, the bumps on the skull precisely reflecting the size and shape of the mental organs.

Gall was not the first to interpret the mind through the body. Before Gall, the physiognomist Johann Kaspar Lavater (1741–1801) claimed that all truths were "truths of the surface" and that all parts of the body reflected all others. Unlike his precursors, however, Gall adopted a rigorously empirical approach to mapping and identifying mental organs. Gall and his followers systematically recorded instances of individuals with pronounced talents to de-

termine whether they displayed any distinctive features of the skull and delved into pathology to record instances of persons who had suffered traumatic head injuries associated with alterations in character. Eventually they mapped as many as forty-two discrete organs with coordinating behavioral traits, including alimentiveness (appetite, relish, greediness), amativeness (sexual love), veneration (worship, adoration, obedience), and vitativeness (clinging to life, resisting disease).

From the time of its introduction to the United States in the 1790s, phrenology found both a ready audience and a steady opposition. Objections to phrenology centered, in part, on its materialism and its implicit reduction of mind to little more than a product of physical conditions. But physicians such as Charles Caldwell (1772–1853) (a student of the pre-eminent early national physician and theorist of the mind, Benjamin Rush [1745–1813]) adopted phrenology as a centerpiece of an overarching medical view of society.

Indeed, the entertainment value of phrenology should not mask the fact that many Americans believed it held profound implications for American society. A raft of social reformers saw in phrenology a means of self-interpretation (resonant, many wrote, with the Protestant right of self-interpretation) and an opportunity to identify and overcome personal limitations. On the other hand, however, a starkly determinist strain emerged in which the phrenological organs were seen as inborn reflections of an unchanging character, and in characteristically American fashion, such deterministic readings became deeply inflected by considerations of race. Caldwell, for example, used phrenological analysis to support his contention that Africans were intellectually and morally inferior to Europeans. Phrenological thinking also underlay the work of craniologists such as Samuel George Morton, who quantified and compared the size of brains among the races while arguing for separate origins for the races. Gall's theory of the localization of cerebral function was a foundational concept in early psychology, but its cross-fertilization with conceptions of race and social hierarchy made it a remarkably resilient discipline for almost a century more.

PIETISTS Pietism refers to a Protestant reform movement that originated in Europe during the seventeenth and eighteenth centuries; the term itself actually was coined by opponents of the movement. Viewing the Protestant churches as legalistic, dead, and unconcerned with personal piety, individuals such as Philip Jakob Spener (1635–1705) and August Hermann Francke (1663–1727) laid out what became the foundational ideas of Pietism. Spener's *Pia Desideria*, published in 1675, advocated the formation of groups or conventicles that stressed personal and group Bible study, the priesthood of the believer by which individuals offered themselves to God as personal sacrifices, an increased effort at harmony among Christians, and the expression of faith through social actions. Spener, who often is referred to as the father of Pietism, elevated personal religious experience over dogma.

As a movement, Pietism influenced individuals who chose to remain within their denominational settings (usually referred to as Church Pietists), as well as those who decided to break with their established churches and form other groups. The latter were known as Radical Pietists, and Francke was particularly influential among many of them. Radical Pietists distinguished between true and false Christianity (usually represented by established churches), which led to their separation from these entities.

In the United States, Pietism affected many religious expressions. The Moravians came under pietistic influence through the leadership of Spener's godson, Count Nicholas Ludwig von Zinzendorf. By 1722 Zinzendorf had given refuge to the Moravians (also known as the Bohemian Brethren or the Renewed Unity of Brethren) from persecution in Europe. Under his leadership, the Moravians became an aggressive international missionary force and eventually the most significant Pietist group. By the 1730s the Brethren were colonizing places in Europe and North America, and by the next decade they had established colonies in Pennsylvania and Georgia. In the early 1750s a group of Moravians under the

leadership of Bishop August Gottlieb Spangenberg began new settlements in North Carolina on a tract of land called Wachovia. In their new society, which sought freedom from persecution, the Brethren also held slaves. In Salem, Wachovia's main settlement, all slaves were considered church property, while in outlying areas individuals could own slaves. Yet the emphasis on universal salvation that included their African and African American slaves, while not leading immediately to their embracing of abolition, did mark a small move toward white recognition of the humanity of blacks.

The Moravians of Wachovia, however, struggled with the implications for freedom raised by the American Revolution. Following Zinzendorf's views that freedom meant, among other things, submitting to church authority, the church owned all property and administered a strict discipline. African Americans participated fully as members in the life of the church, but remained unequal in social relations with whites. In the early nineteenth century, Pennsylvania Moravians ceased holding slaves, while North Carolina Moravians increased their slaveholdings. By 1822 blacks and whites in Wachovia worshiped separately amid rising racial tensions. Pietism, therefore, in Moravian communities took on varying expressions as it developed in different chronological, social, and geographical environments.

The pietistic influence also manifested itself in other religious traditions. Conrad Beissel (1691–1768), the founder of America's first major communitarian group, the Ephrata Cloister, was particularly affected by Radical Pietism's emphasis on personal experience and separation from false Christianity. The emphasis on an individual spiritual rebirth and piety touched Methodism through the Moravians. While traveling to and working in Georgia in the 1730s, John Wesley (1703–1791) was exposed to Moravian religious understandings. He subsequently adopted and modified many of their ideas related to personal devotion, which then shaped Methodism during the early national period.

Other German pietistic groups such as the Mennonites, Dunkers (Church of the Brethren; Dunkards), and Schwenkfelders had come to America in search of religious freedom. The Mennonites first settled as a group in Pennsylvania in the late seventeenth century and established the settlement of Germantown. Dunkers and Schwenkfelders followed within the next few decades. Acting in part from beliefs that stemmed from pietistic thinking, these groups embraced pacifism and denounced the signing of oaths. During the American Revolution the

Mennonites refused to take an oath of allegiance to the state of Pennsylvania and to pay war taxes. They, however, consented to sell grain and other supplies to the American government and to pay fees in place of military service. Dunkers and Schwenkfelders also took similar actions. Not long after the Revolution groups of Dunkers began moving west and established several settlements in Ohio and Indiana.

Moravians in Pennsylvania transmitted pietistic ideas to Native Americans while America was emerging and developing as a nation. Pietism's emphasis on personal experience over doctrinal understanding allowed Native American Christians to develop a distinctive religion. Furthermore, the pietistic stress on ecumenism facilitated relationships between Jews and German Pietists in colonial and national America, although Pietism itself was unable to obliterate prejudice against Jews. These examples illustrate that Pietism transcended denominational boundaries and shaped how many Americans conceived of God, their relationship to God, and their attendant social responsibilities. At the same time, Pietism was shaped by the many contexts in which it arose, and therefore its adherents might develop contradictory expressions of it. Its emphasis on personal experience and ecumenism, along with its experience of persecution and resistance to established religious authority, produced dynamic interactions with the various environments existing in Revolutionary and early national America.

PIONEERING In the first half of the eighteenth century, large Indian populations and the Appalachian Mountains limited the Euro-American population outside the eastern colonies to a mélange of French, British, and American fur traders and small military outposts. Then in 1750 the famed Cumberland Gap in northeastern Tennessee was discovered and by the 1770s it became a route for pioneers through the mountains. In 1775 Daniel Boone marked off the Wilderness Road through the Gap into the Bluegrass region of Kentucky. Concerted American expansion into the region followed, with migrations from east to west along lines of latitude. In addition to Chesapeake natives who followed Boone into Kentucky and Tennessee, New Englanders moved through Pennsylvania into the Ohio River Valley into Ohio, Indiana, Illinois, and later, Michigan and Wisconsin. White and black Southerners formed a third migration stream from the Carolinas and Georgia west into the Black Belt of northern Alabama and Mississippi, so named for the dark, rich soils of the region.

Because western routes crossed tremendously rugged terrain, wagons were an impractical method of travel. Instead, pioneers took to the river courses that traversed the frontier. The intricate network of rivers meant that goods and settlers could eventually travel from Pittsburgh to New Orleans and all points in between by water. In the early decades of westward expansion, numerous flatboats and canoes plied trans-Appalachian rivers, and after 1815 the introduction of the steamboat on inland waterways facilitated and spurred migration. Rivers afforded not only routes of travel but the only supply and communication link with the East.

Numerous Indian peoples lived across the entire Trans-Appalachian frontier. The fear of Indian hostilities did much to shape the character of migrations, as whites faced the threat of reprisal from the formidable Shawnees in the Ohio Valley and the Creek Confederacy in the Lower South. One form of defense was for families to travel in groups, and it was not uncommon for armed guards to join them for extra security. Once they arrived at their destination, frontier militias were organized to protect early settlements, giving rise to an innovative community structure known as a station—a fortified village designed for defense against Indian attacks.

Regardless of their destination, pioneers were interested in one thing: good agricultural land. The earliest settlers established subsistence-level farms, but commercial agriculture eventually blossomed

throughout the Trans-Appalachian frontier. This was particularly the case in the South, where Eli Whitney's cotton gin gave rise to an empire of commercial cotton growers following its introduction in the 1790s. Once a location was chosen, settlers set about the arduous task of turning a forest into a field. The first step was the removal of trees, stumps, and other impediments. Burning the new opening often followed, which both cleared away brush and provided a nutrient-rich base of ash and soil. The first crop planted was typically corn, as it grew well with minimal care. Wheat and other vegetable crops rounded out early pioneer farms. In addition to feeding and clothing themselves, pioneers drew on the cultural hearths of their Eastern origins to establish laws, schools, churches, and a structured social order in the West.

PIRACY Piracy, defined here as larceny at or by descent from the sea, figured prominently in the formative years of the United States. Piracy was associated first with English colonization in an Atlantic world dominated by Iberian powers, then with indiscriminate poaching by colonial outcasts and rebels on the growing plantation economy at large. By the

1660s, Atlantic piracy constituted a seaborne variety of organized crime. Alongside these developments, piracy came to be closely associated with the transatlantic slave trade and with imperial warfare “beyond the line.” Some pirates were former slavers, some were former slaves. Nearly all made frequent stops in West Africa in the course of their plundering voyages. With regard to war and legality, the line between piracy and privateering, or state-sponsored paranaul plundering, could be quite thin. A spate of diplomatic incidents related to privateering abuses in peacetime and against allies led not only to disastrous conflicts such as the War of Jenkins’s Ear (1739–1743), but ultimately to the formation of professional navies and coast guards throughout the Atlantic.

As the United States came into being in the late eighteenth century, piracy was almost universally regarded as a crime not unlike terrorism in the late twentieth and twenty-first centuries. No one wished to be called a pirate. As with terrorism, the use of the term piracy in legal and journalistic circles was broadened substantially to help promote a range of causes. These included the early-nineteenth-century suppression of the transatlantic slave trade and the more effective anticorsairing campaigns of 1801–1805 along the Barbary Coast of North Africa.

Reaching back to early colonial times, Elizabethan corsairs were among the first Englishmen to reconnoiter and settle North America’s eastern seaboard. Their successors, the seventeenth-century buccaneers, found hideouts, markets for stolen goods, and occasional plunder from Cape Cod to Cape Canaveral. By 1700, ports such as Providence, New York, Norfolk, and Charleston served as prime recruiting grounds for Anglo-American raiders, some of them disgruntled and overworked merchant seamen. The so-called Great Age of Piracy (c. 1660–c. 1720) only ended following a concerted and bloody campaign of extermination prosecuted by English admiralty courts both at home and in the American colonies. Governors of Virginia and Massachusetts figured prominently in this process. Captain William Kidd (c. 1645–1701) of New York was an early casualty, dying by execution, and North Carolina-based “Blackbeard,” or Edward Teach (d. 1718), a late one, dying in battle.

PRIVATEERING

Though much reduced as a result of this campaign—and with it the general rise of the British navy—Anglo-American piracy and privateering continued throughout the eighteenth century. Privateering, in

some ways comparable to the extensive military subcontracting of later times, was an accepted if unconventional means of complementing formal naval power. Admiral Edward “Old Grog” Vernon’s failed 1741 siege of Cartagena de Indias, in what would become Colombia, was typical in its blend of formally trained European and colonial paranaul combatants. The policy of commissioning privateers continued through the Seven Years’ War (1756–1763) and well beyond, playing a significant role in the American War of Independence (1775–1783) and the War of 1812 (1812–1815). From the merchant-victim’s perspective, being robbed by privateers was much like being robbed by pirates.

Hundreds of privateers were commissioned by U.S. authorities during the American War of Independence, and they met with some success. New England-based raiders were particularly active off the coast of Nova Scotia, but others ranged as far as the English Channel. American privateers had an early advantage against their British adversaries, as Parliament was reluctant to issue letters of marque and reprisal against a state that it preferred not to recognize. After 1777, when such letters were issued, British privateers found few vulnerable colonial vessels; most were themselves armed and dangerous. Instead, British predators focused on the tacit—and later open—allies of the fledgling U.S.: France, Spain, and the Netherlands. French shipping suffered most: whereas 183 American vessels taken by British privateers were condemned by London’s Prize Court between 1777 and 1783, French vessels numbered 872.

Privateering remained a conveniently cheap but-tress to overextended naval forces on both sides during the War of 1812. Outstanding U.S. privateers such as Johnston Blakely and Otway Burns ranged throughout the Atlantic, pillaging and destroying whatever British shipping they could find. British privateers responded in kind. French-born Jean Lafitte, a privateer and smuggler based in the labyrinthine Barataria bayou of Louisiana’s Gulf Coast, eventually sided with U.S. forces under Andrew Jackson in the decisive 1815 Battle of New Orleans. Multinational privateers such as Lafitte switched sides often, taking advantage of the chaos generated by Latin American independence movements (1810–1824) and shifting post-Napoleonic alliances. After the War of 1812, Lafitte smuggled slaves, some stolen from Spanish vessels, into the southern U.S.

SLAVE TRADE

Piracy was also intimately linked to slavery. The same Elizabethan corsairs who had founded Virginia

and other colonies first entered the transatlantic economy as contraband slavers, illegally supplying Spanish Caribbean planters with Africans kidnapped and purchased in Upper Guinea. The trend continued; the first Africans brought to Virginia in 1619 were carried by Dutch corsairs who had stolen them from the Portuguese (who had in turn bartered for them in Angola). The later buccaneers were also familiar with the growing transatlantic slave trade, some as victims, others as professional slavers. Though not known for their scruples, pirates of the Great Age, such as Blackbeard, occasionally freed slaves or incorporated them into their crews. More often they sold them to planters and merchants. An often-forgotten fact is that England's early-eighteenth-century suppression of Atlantic piracy enabled the rapid expansion of the slave trade that marked the post-1760 period.

Yet the same empire that benefited most from the slave trade eventually turned against it. Although economic reasons such as the industrial revolution have been cited, this British turnabout was in large part due to the efforts of prominent religious figures, many of them Quakers. British and U.S. abolitionists of several religious persuasions agreed that the slave trade was an outrage and must be universally suppressed. Interestingly, both U.S. and British legislators chose to elide slave trading and piracy in the first decades of the nineteenth century, making the former a capital crime for the first time. By 1814 the British were able to commit substantial, war-hardened naval forces—some fresh from epic battles with Napoleon and his allies—to the cause of slave trade suppression. They requested and received help in patrolling West African waters, albeit intermittently, from the infant U.S. Navy.

The United States formally declared slave trading a variety of piracy in 1820. It is often forgotten that this declaration came amidst a wave of widely reported and vicious Caribbean piracy, mostly executed by Spanish Americans rebelling against their colonial overlords. Although Cuba itself remained "faithful," as the Spanish put it, Cuban renegades-turned-pirates in this era were said to have invented the legendary practice of walking the plank, among other tortures much publicized in the U.S. press. Some such miscreants were also said to be slavers. Still, application of the law proved difficult. Many American jurists regarded the Atlantic slave trade as a legitimate, if unsavory, business, and viewed the 1819 law as part of an emotionally driven, moral crusade to undermine slavery. Defenders of the slave trade were not rare, since slavery itself still figured

prominently in the U.S. economy. Throughout the era of suppression, contraband slaves reached southern plantations through ports in Texas and Louisiana.

The crux cases linking piracy and the slave trade, however, involved mostly British interdiction of U.S. and foreign vessels engaged in trading slaves to Brazil, Venezuela, and Cuba. Since Cuba was nearest at hand and because it remained a colony of Spain, the U.S. embargo of slaving vessels inevitably produced significant international incidents. Under Pinckney's Treaty (1795) and other agreements, the United States had promised to respect Spanish laws, vessels, and cargoes—and also to help Spain fight piracy. Thus, seizures and mutinies, including those of the *Amistad* (1839) and the *Creole* (1841), tested the will of U.S. courts to enforce the letter of the 1819 law. On-board rebellions were particularly troublesome for judges and diplomats. Was slave mutiny aboard a foreign vessel piracy or self-liberation? Ultimately, the latter definition prevailed, but suppression of the slave trade as a form of piracy was never seriously pursued by the U.S. Navy or courts and remained a point of considerable friction between North and South.

BARBARY WARS

Perhaps better known than the West African slave trade's links to piracy during America's formative years was U.S. suppression of the so-called Barbary pirates of North Africa between 1801 and 1805. This campaign, also pursued by the U.S. Navy—and the fledgling marines—aimed to secure U.S. commercial access to the Mediterranean Sea. Pursued at first reluctantly by President Thomas Jefferson, the campaign sought to end the long-established Algerian and Tripolitan practices of hostage taking and tribute extortion in exchange for free passage beyond the Straits of Gibraltar. Despite setbacks, the effort proved mostly successful, and it gained popular support in part from a growing literature alleging enslavement of white Americans, some of them women, in Muslim "pirate" compounds. Once again, matters of captivity and redemption crossed over with changing interpretations of piracy and its suppression.

After 1840, sporadic acts of piracy occurred in U.S.-claimed waters and against U.S. vessels abroad, but no significant cycle of piracy would emerge to match those of the eighteenth and early nineteenth centuries. Instead, piracy would become firmly ensconced in U.S. literature and other forms of popular culture. Edgar Allan Poe's short story, "The Gold-

Bug" (1843), is an early example. Since then, the fascination has persisted.

PLANTATION, THE "The plantation" figures among American icons. Like "the cowboy" or "the New England village," both the word itself and the imagery associated with it seem to tell something fundamental about being American. One element is stability, projected in the balanced architecture of the great plantation houses that line the James River in Virginia, the Ashley and Cooper Rivers in South Carolina, or the Mississippi and its lower tributaries. A second element is patriarchal hierarchy. Plantations require planters, and all plantations were organized around the principle that their planters presided over communities with no pretense at equality. White and black alike, a plantation's denizens occupied different rungs on a social ladder, with the planter at the top. A third element is remoteness from the driven, ceaseless transformations of the capitalist world.

Planters carefully cultivated such imagery. The emergence of a permanent, resident planter class had a great deal to do with early Virginia's transformation from a violent, volatile society to a place where white people's lives could be comfortable and stable. Virginia planters developed ways of imposing themselves on the land and on the land's other inhabitants that provided a social template from Chesapeake Bay to east Texas. The notion that the southern ruling class was descended from the cavaliers of Stuart England and that it carried their gracious ways to America acquired great cultural strength and is not completely dead.

Unlike their West Indian counterparts, who often lived in England rather than on their plantations, North American planters tended to be resident. That meant committing themselves to their own communities—a commitment that bore fruit when they persuaded large numbers of nonplanters to go to war in 1861 in order to protect the planters' way of life. To that extent, the received imagery of plantations as organic communities has an element of truth. But for the most part the reality was otherwise. From their beginning, plantations were in fact part of the emerging capitalist world, partaking of all that world's capacity for disruption, profit seeking, and change. Never was that more true than in the early nineteenth century.

The historian Peter Wood has suggested that, whatever their degree of refinement, plantations are best described as "slave labor camps." Robin Blackburn has pointed out that, in its combination of race as a sign of permanent degradation, slavery as a condition of life and work, and large-scale production for distant markets, "the slave plantation complex" of the Western Hemisphere was unique in the history of the Western economy. Any resemblance to the manors of England or mainland Europe was superficial.

PLANTATIONS IN A BOOMING REPUBLIC

The conventional criterion for planter status was the ownership of at least twenty slaves. This was the minimum number necessary to relieve the owner and the owner's family of manual field work. A planter with a slave force of that size was not able to maintain anything like the grand style of conventional plantation imagery. Rather than a "big house," such a person probably occupied a dwelling of only moderate refinement. Rather than a small army of "house slaves," there might be one slave adult and a few slave children to aid in domestic work, and even they would be dispatched to the fields

at sowing or harvest time. Even a very large operation, such as Pierce Butler's rice plantation in 1830s Georgia, might lack most of the symbols of refinement, as Butler's English wife Frances Kemble found when she insisted on visiting it in 1837.

Prior to American independence plantations were characteristic of two separate zones, the tobacco-growing Chesapeake and the rice and indigo-growing Carolina and Georgia lowlands. These were very different places. Tobacco planting meant dividing slaves into separate "quarters" of about twenty-five slaves, the number depending on the size of the holding. The characteristics of the crop required gang labor. By the middle of the eighteenth century the Chesapeake no longer needed the African slave trade to sustain and grow its servile population. Carolina, however, required the trade because of the more demanding conditions of the rice crop and lowland life. Holdings in the rice zone tended to be much larger, in terms of slave numbers, than in the tobacco zone. Because periodic flooding renewed the soil, rice planters, their families, and their slave forces stayed in one place. Slaves generally worked under the task sys-

tem, which limited a day's work and allowed the possibility of free time.

After independence, however, "the South" emerged. The major reason was three new slave crops: hemp, in Kentucky; sugar, in southernmost Louisiana; and, foremost, cotton, because of Eli Whitney's invention of the cotton gin in 1793. Prior cotton production was limited to the sea islands of the Georgia and Carolina coast, where the long-staple variety could thrive. Long-staple seeds are easily separable from the lint, but the short-staple variety that could grow inland was another matter. Production shot up, from 10,000 bales the year Whitney invented the gin to 209,000 in 1815, when the European wars of the French Revolution finally ended. Now England's mills and the emergent mills of the American Northeast could take all the cotton that the South's plantations could produce. In 1830 the total reached 732,000 bales, with far larger totals to come.

Some of this ever-burgeoning crop came from small farms that produced a few bales for cash in-

come. Most came from plantations, as the Cotton Kingdom spread across South Carolina and Georgia, Alabama, into Mississippi, and beyond the Mississippi River. Most of these took shape on formerly public land, which their owners bought as Indians lost it, cleared with slave labor, and put into production with a view to catching a rising market.

THE SPREAD OF PLANTATIONS AND THE TRADE IN SLAVES

Opening a plantation required capital, for purchasing land, for buying equipment and machinery, and often for purchasing slaves. Some cotton plantations amounted to far-flung branches of existing enterprises, as the younger generation of a tobacco or rice family took part of an older slave force westward onto new land. But expanding the plantation South required a lively slave trade. Most of the founding states banned the African slave trade after the American Revolution, but at the insistence of South Carolina and Georgia the Constitution forbade Congress to do so until 1808. South Carolina reopened the legal African trade in 1804.

What followed was not peripheral to the story of forced African migration to North America but rather a major part of it. The historian James McMillin estimates that about 170,000 enslaved Africans entered the United States after the Revolution, nearly double the previously accepted figure. The demand for these people came directly from the rapid growth of plantation agriculture. An illegal trade from Africa went on after Congress's ban, both to serve small farmers who wanted to become planters and to meet the needs of cotton and sugar production.

Congress did act to close the trade as soon as the Constitution permitted. But unlike the British West Indies, where the plantation economy began to die when Parliament closed the trade about the same time, the plantation system in the American South grew and prospered. As soon as the trade in enslaved Africans dropped off, a trade in American-born slaves began to flourish. Between 1790 and 1799 most came from Virginia, Maryland, and Delaware, where the pre-Revolutionary tobacco economy was yielding to the production of wheat, a crop that required less labor. By 1820 the two Carolinas and Kentucky also were exporting slaves. Some traveled by coastal vessel to Mobile or New Orleans, others overland to the Southwest in coffles. Between 1810 and 1829, when Alabama was opening up to cotton production, it imported roughly 90,000 slaves. During the same two decades Virginia exported more than 150,000. The expansion of the plantation sys-

tem required the forced disruption of slaves' lives on a massive scale.

Either way, the experience emulated what the slaves' ancestors had undergone leaving Africa. The original trade underpinned the founding of the Western Hemisphere slave plantation complex. The domestic trade underpinned the expansion of that complex across the southern United States. In the Louisiana sugar zone, the demography of the trade was much the same as it had been to the sugar regions of the West Indies and Brazil. Sugar planters wanted young males whom they could work at a very hard pace. In the colonial-era West Indies the combination of cheap African slaves, a tropical disease environment, and high profits on sugar had created a demographic catastrophe. Planters brought in slaves and worked them to death. Jamaica imported about one million Africans over that period. But it had a population of only about 300,000 in 1800. Louisiana sugar production was demanding, but the high price of slaves gave planters an incentive to treat them better.

But both in the sugar region and on the cotton frontier, the early stages of plantation expansion were likely to lead to a skewed population structure, with adolescents and young adults heavily overrepresented. Census records of the mid-nineteenth century, which make comparative analysis possible, show that this was particularly so in highly fertile areas close to water transport, where land values were high and where high productivity could be expected. Planters moved into such areas in the 1850s in order to grow as much cotton as possible as fast as possible, not to create patriarchal communities. There is no reason to think that the cotton frontier thirty years earlier was different. Slaves being moved by the domestic slave trade into the cotton zone did have one advantage over Africans: they moved in roughly equal numbers of males and females, which permitted the founding of families, assuming that a couple was not separated by a subsequent move. In 1830 white men outnumbered white women in Alabama, 100,846 to 89,560, but the number of male slaves (59,170) and the number of female slaves (58,379) were virtually even.

PLANTERS AND PLAIN FOLKS

Throughout the history of American slavery, the planter class formed a small proportion of slaveholders and an even smaller proportion of white society. The 1790 census is the only count that gives slaveholdings. It was taken prior to the cotton gin and it excludes Virginia, but it provides some sense of the

planter class's dimensions. In South Carolina 5,657 slaveholding families had fewer than 20 slaves. Only 1,267 families had more than 20. Of these, 859 had 20 to 49 slaves; 285 had 50 to 99; 96 had 100 to 200; 21 had 200 to 300; and only 6 had more than 300. In North Carolina there were 10,122 nonplanter slaveholding families and only 804 in the planter category. Of those planters, 701 had 20 to 49 slaves; 90 had 50 to 99; 11 had 100 to 199 slaves, and 2 had more than 200.

The actual difference between a "farmer" or (as Mississippians would come to say) a "second planter" who held seventeen or eighteen slaves and a supposedly "real" planter with twenty-five slaves cannot have been great. Even a large-scale planter who intended to lead his county had to win his fellows' consent, not impose himself on them. When James Henry Hammond, who married into the South Carolina elite, returned *nouveau riche* from Europe in 1837, his neighbors refused to be impressed by the works of art he had acquired and by the gaudy houses he built in Columbia and on his plantation at Silver Bluff.

Whether a plantation had twenty slaves or two hundred, it is best described as a "factory in the fields." Large or small, a plantation produced much of its own food and on a large operation many other day-to-day goods as well. Fields were planted in corn, for human and animal feed, as well as in cotton or rice. This was not "mixed farming" of the sort nonslaveholders and northern free-labor farmers practiced. A plantation's purpose was to produce commercial commodities at the lowest possible cost for a highly competitive market. It required heavy investment and reinvestment in a capital market that did offer other possibilities. Really sizable planters could invest in other activities, or even out of the South. South Carolinians sponsored the Charleston and Hamburg Railroad, completed in 1833, which was the first long-distance line in the United States. Nonetheless, in the early nineteenth century, while the "Old South" was developing, plantations, their owners, and their mode of production dominated southern life, just as in the decades before the Civil War.

POETRY Like politics, poetry was everywhere in the years from 1754 to 1829. And like politics, poetry had both public and private meanings. Americans turned to poetry to amuse themselves and their friends, to pursue and publicize arguments, and to claim membership in real and imagined collectivities. The resultant verses offer a window onto a world of poetic purposes and pleasures that has often been overlooked.

THE COLONIAL ERA

During the late colonial period, educated Americans gathered in formal and informal circles to read and exchange original manuscripts, including poetry. They modeled their works on those of neoclassical English poets, particularly Alexander Pope, and they often signed compositions with pseudonyms such as Leander and Amynta. Women as well as men were prominent in these circles, and for all involved the writing and enjoying of such poetry was a way of proclaiming membership in two communities: the intimate circle of friends who were one's immediate readership, and the larger, Anglo-American commu-

Phillis Wheatley. This engraving by Scipio Moorhead served as the frontispiece for Wheatley's *Poems on Various Subjects, Religious and Moral* (1773). Wheatley, an African-born woman living in slavery in the colonies, penned neoclassical verse that followed English models.

nity of sensibility to which one's mastery of the forms granted membership.

Participants in literary circles wrote poetry to nurture and commemorate their own relationships, as well as to memorialize the occasions of their gatherings. Poets of the day also took on explicitly public themes. Elizabeth Graeme Fergusson, who was an admired poet and conversationalist in both her own mid-Atlantic region and in England, penned poetic responses to both John Dickinson's *Letters from a Pennsylvania Farmer* (1782) and to Adam Smith's *Theory of Moral Sentiments* (1759). John Maylem's "Conquest of Louisburg" described the siege and battle of that fortress during the French and Indian War. And Philip Freneau and Hugh Henry Brackenridge's "The Rising Glory of America," delivered on commencement day at the College of New Jersey in 1771, offered a vision of a prosperous and expansive future for America:

The *Ohio* soon shall glide by many a town
Of note; and where the *Mississippi* stream,
By forests shaded, now runs weeping on,
Nations shall grow, and STATES not less in fame

Than Greece and Rome of old!

Poems such as "The Rising Glory of America" claimed a place for the colonies on the world stage. They also asserted, implicitly or explicitly, that their authors deserved a place on that stage, too, and were not simply rude provincials. These entwined public and personal, emulative and assertive meanings of poetry took on added significance in the verse of the era's best-known African American poet, Phillis Wheatley. Wheatley, an African-born woman living in slavery in the colonies, penned neoclassical verse that followed English models. Yet Wheatley's identity, which was revealed in the published volumes of her work, made her successful adoption of English conventions a challenge to contemporaries who assumed blacks were intellectually inferior. The content of Wheatley's poetry, meanwhile, continues to inspire debate among scholars, who disagree over the extent to which Wheatley challenged Christianity and the social and political mores of her day.

IMPERIAL CRISIS AND REVOLUTION

In the years leading up to the Revolution, political arguments and emotions were often cast in verse. Benjamin Franklin counseled colonists to have patience with England and confidence in the colonies' eventual dominance: "We have an old mother, who peevish has grown," he wrote in the mid 1760s: "She snubs us like Children that scarce walk alone; She forgets we're grown up and have Sense of our own." Such verses made political argumentation more accessible and quotable, and those on both sides of the impending conflict also went further, setting their rhymed disagreements to music. John Dickinson's "Liberty Song"—which began, "Come join hand in hand brave Americans all / And rouse your bold hearts at fair liberty's call"—was published in the *Boston Gazette* in 1768, and it spawned a quick parody, published in the same newspaper and sung to the same tune: "Come shake your dull noodles ye pumpkins and bawl," the parody began, "And own that you're mad at Fair Liberty's call." Not all the poetry of the war years, however, was doggerel. Philip Freneau, ship captain and man of letters, sought to commemorate the events and people of the Revolution in often-ambitious verse, and he movingly evoked the horrors of his own wartime captivity in "The British Prison Ship."

POETRY IN THE NEW NATION

After the Revolution, Americans of all political stripes and social stations wrote poetry celebrating and critiquing the new nation's culture and politics. Philip

Freneau published a revised version of "The Rising Glory of America" in 1786 and continued to pen new works. Also among the era's best-known practitioners of the arts were the Connecticut or Hartford Wits, who included Joel Barlow, John Trumbull, David Humphries, Lemuel Hopkins, Richard Alsop, and Timothy Dwight. Amateur men of letters who had begun their literary involvement before America's independence, the Wits combined a serious devotion to literature with careers that included diplomacy and the ministry. Barlow's work ranged from "Hasty Pudding," a humorous celebration of that dish and of Barlow's New England region, to the more ambitious "Vision of Columbus." Greeted with admiration in its original version, Barlow's expanded and revised epic, *The Columbiad*, fell with a thud when published in 1807. Timothy Dwight's 1794 "Greenfield Hill," meanwhile, offered a vision of New England's past, present, and future, and copious poetic commentary on its landscape, people, and customs. Such poetry combined nationalist ambitions with a wholehearted embrace of English poetic conventions, and the Wits saw no shame in that. In their view, achieving excellence in established poetic forms brought more honor to America than would have the attempted creation of a self-consciously new "American" style.

Freneau and the Wits were perhaps the best-known poets of the early national period, but many other Americans also tried their hand at the form. Women as well as men offered their verses to the public; in 1790, Mercy Otis Warren published cerebral verse on political and religious themes, and the same year saw publication of Sara Wentworth Morton's "Ouabi, or the Virtues of Nature, an Indian Tale in Four Cantos." Newspapers of the day often kept a spot on their back page for original and extracted verse, and readers eagerly sent in their offerings. One of the more widely circulated newspapers of the era, Joseph Dennie's *Farmer's Weekly Museum*, published a variety of poetry, including satiric treatments of American rustics, odes to beautiful maidens, and gently needling lines on the subject of the editor himself: "His flowery road you may rely on," wrote one correspondent, "is but a crooked path to Zion." And although poetry was a particular passion among young Federalist-leaning literati such as Dennie, Jeffersonians, too, expressed themselves in verse. The *Kentucky Gazette*, for example, published poetry that celebrated France and Jefferson, and the Fourth of July regularly inspired poetical commemorations in partisan newspapers of all kinds.

Among poets both well-known and obscure, satire was a favored mode of poetical communication in the early national period; its popularity reflected both the continued influence of the English Augustan poets and the mixture of intimacy and publicity that characterized American uses of verse. Satirical treatments of everything from religious orthodoxy to New Englanders' gift to Thomas Jefferson of a "mammoth cheese" found their way into print, and poetic styles themselves—particularly the rather florid Della Cruscan mode—also became the subject of archly mocking lines.

Even as satires, "occasional" poetry, and nationalist verse thrived in the early Republic, however, other forms were gaining popularity. Like their predecessors, these were influenced by English models, although they were put to what were intended as distinctively American uses. Moving beyond their love of Pope, Americans came in the early national period to admire the poetry of authors such as Thomas Gray, William Wordsworth, and Samuel Coleridge, and they began to write poetry that explored inner states and evoked intense connections to nature. This was not a rejection of all that had come before; Americans had written poetry about nature throughout the colonial and Revolutionary periods, and Freneau's melancholic "The Wild Honeysuckle" had in fact foreshadowed the way in which, in later years, a contemplation of nature would become a contemplation of the observing self. It is the case, though, that what had once been a minor strain was becoming a dominant idiom, and the early verse of perhaps the era's best-known practitioner of the new style, William Cullen Bryant, suggests the changing style and tone of American poetry. Bryant's 1808 "The Embargo" was a poetic attack on Thomas Jefferson's policies. Despite its familiar subject, the poem had an unexpected emotional intensity that, in Bryant's own words, "darken'd satire's page." By the time of Bryant's first significant work, "Thanatopsis," which he began in 1814 and completed in 1821, the poet had more completely left behind Augustan forms and themes for strains both older and newer: "Thanatopsis," written in a meditative blank verse, merged a Calvinist sense of death's dominion with a reverence for nature that feels distinctively nineteenth century:

When thoughts
Of the last bitter hour come like a blight
Over thy spirit and sad images
Of the stern agony, and shroud and pall,
And breathless darkness, and the narrow house,
Make thee to shudder, and grow sick at heart;—
Go forth under the open sky, and list

To Nature's teachings, while from all around—
Earth and her waters, and the depths of air,—
Comes a still voice.

"No one, on this side of the Atlantic," insisted the author Richard Henry Dana on reading the original published version, "is capable of writing such verses." But someone had, and he would be far from the last American poet to venture forth "under the open sky."

can policing changed little. As in England, justices of the peace (JPs) bore the chief responsibility for keeping order, hearing complaints, and jailing malefactors. But for the most part American communities policed themselves.

Night watchmen guarded city spaces, but JPs expected citizens to identify criminals. Grand jurors sometimes informed themselves, identifying the persons they wanted indicted and thereby acting as a kind of citizen police force. State statutes authorized sheriffs and constables to keep the peace, especially in cases of riot or a major crime committed before their eyes. An 1812 New York digest of laws for sheriffs, coroners, and constables compiled by Joseph Backus explained that "when any felony shall be committed," and notice given, "fresh pursuit shall be forthwith made after every such felon, by sheriffs, coroners, constables, marshals, and all other persons who shall be by them commanded and summoned." New York also expected sheriffs and constables to suppress gaming, implying that they might actively seek out gamblers. More often, legislators expected ordinary citizens, acting as a *posse comitatus* or individually, to run down felons. Backus wrote that in cases of forcible entry, justices of the peace should go to the scene of the crime and offer a reward. "And all the people of the county" shall assist the JP in making arrests. Sheriffs and constables most often acted as process servers.

In the early national period, a more secular understanding of crime and misconduct changed how Americans viewed the detection of criminality. Colonials saw crime as sin, and all persons as sinners. Printed crime narratives came in the form of sermons, looking not at the crime or the judicial process but on the criminal's spiritual condition. Ministers asked what small sins, the sort committed by everyone, had led to the bigger sin? The clergy searched for clues not to identify the sinner/criminal, but to reveal the condition of his eternal soul. Americans after the Revolution set apart criminals from the larger population. Ministers' moral policing declined in importance. Published crime stories, especially murder narratives, now invited readers into secret worlds and treated the crime as a mystery with clues and motives to be unraveled. This new view of crime as mystery practically cried out for policing and detectives; but outside the South cities did not organize professional police forces until the antebellum era.

Nonetheless, the roots of modern policing can be discerned in the late eighteenth and early nineteenth centuries. Institutionalized policing has its roots in American slavery. In seventeenth-century South

POLICE AND LAW ENFORCEMENT Between 1754 and 1829 the institutional structure of Ameri-

Carolina, white colonists had passed laws against bartering with slaves and established a curfew for their slaves. Needing a police force to enforce these statutes, white South Carolinians created a night watch of constables and citizens to watch for fires, attacking Indians, and slave gatherings. Virginia organized slave patrols in the eighteenth century. Other states followed.

After the Revolution, the states regularized their patrol procedures. In most, county courts appointed patrollers. Town officials worried that patrols appointed by county government would not adequately patrol urban areas. Columbia, South Carolina, petitioned its legislature for an appropriation for a city "guard." Some towns incorporated so as to organize a "proper police," as Pearisburg, Virginia, officials put it. Historians have traditionally described patrollers as "poor white," but freeholders (estate owners) and slaveholders filled the ranks of these early police forces; from 1805 to 1830, New Orleans used free blacks in its city guard and patrol forces.

Slave patrols policed their jurisdictions. They stopped and interrogated suspects. They entered private homes, searching for evidence. They broke up gatherings they deemed unruly. They administered what a later generation might call "street justice": an unrecorded beating on the spot. They particularly looked for contraband and stolen objects. In rural areas patrollers made their rounds on horseback, in urban areas on foot.

Creation of a federal court system in 1787 changed American policing but little. Federal judges did not believe their jurisdiction included common law crimes. U.S. attorneys and federal marshals identified violators of the revenue laws. In 1802, when three white men murdered three Indians in the Northwest Territory, ordinary citizens identified the killers when the culprits boasted of their acts and displayed the dead Indians' property. As in state cases, detection of malefactors depended largely on the willingness of ordinary citizens to step forward. The appearance of an unaccountably dead body, or any crime committed with the assent of the neighborhood, rarely led to a warrant or an arrest.

In 1829, London established its police department, heralding a new age in crime control. Thereafter Boston, New York, and other cities put their own officers on patrol. Constables had collected fees by serving writs and warrants, acting only in response to citizen complaints. The new officers received a salary and sought out crime and criminals for arrest.

POLITICS

The entry consists of ten separate articles: *Overview*, *Party Organization and Operations*, *Political Corruption and Scandals*, *Political Culture*, *Political Economy*, *Political Pamphlets*, *Political Parties*, *Political Parties and the Press*, *Political Patronage*, and *Political Thought*.

Overview

By the end of the Seven Years' War in 1763, the colonies of British North America had relatively mature political systems. Most were royal colonies whose governors and (often) governor's councils were appointed by the imperial government. Proprietors—the Penn family, for example—appointed the governors of Pennsylvania, Delaware, and Maryland. Only in the corporate colonies, Connecticut and Rhode Island, were they elected. The colonial assem-

were often the only elected officials in the colonies, and those chosen by the voters were invariably men of wealth and power within their colony. The rituals of politics, such as treating—the practice of providing liquor and food for the voters—and the fact that the legislators were not paid meant that candidates had to be wealthy. Viva voce and other open voting procedures heightened the pressure of the “better sort” on the voters of lesser means. Thus, colonial elections revolved around reputation on the one hand and deference on the other.

Intracolony politics involved questions of money and credit, internal improvements, taxes, land, Indians, and ethnic and religious conflict. Sectionalism, rooted in differences between coastal areas and the backcountry or simply East Jersey and West Jersey, and the various—often associated—ties of family and kin generally determined the ways men in the assemblies responded to these local issues. There were no real parties in the assemblies. In fact, the political culture of these years, as can be seen clearly in the debates leading up to the Revolution, reflected a commitment to the form of republicanism which had emerged in mid-eighteenth-century England that condemned parties. Most states, however, had fairly stable factions, such as those associated with the Livingston and the De Lancey families in New York or the followers of Samuel Ward (1725–1776) of Newport and Stephen Hopkins (1707–1785) of Providence in Rhode Island. The elites of Virginia and South Carolina, because of the nature of their economic and social structure, had an exceptional degree of unity on the eve of the Revolution.

The American Revolution was a revolt of the already empowered. As Parliament attempted to reassert its imperial power following the Seven Years’ War through a series of taxes and other actions such as the Intolerable Acts (1774), the colonists resisted. While resistance was sometimes violent or marked by the fake-violence theater of the Boston Tea Party (1773), most often the colonists made use of the normal tools of redress in the imperial system of politics. The members of the colonial assemblies led this resistance and then a rebellion, designed at first to preserve their rights as Englishmen. In a lawyerlike fashion Thomas Jefferson, trained in colonial politics and representing the extralegal Continental Congress, put forth the case against the illegal actions of King George III in the Declaration of Independence. Most of the colonies, over a period from 1776 to 1792, wrote and rewrote republican constitutions for the new states. In 1781 the states were joined in a very loose national government under the Articles

blies often found themselves in direct conflict with the governors. In the course of the eighteenth century, these assemblies—whose members were popularly elected—expanded their legislative role at the expense of both the governors and the imperial government.

PROVINCIAL POLITICS

All of the British North American colonies had relatively large electorates made up of white male freeholders, men who owned their own land. Because of the wide distribution of landholding, common men voted in greater numbers than anywhere else in the world. Outside of New England, the assemblymen

of Confederation. During the 1780s, congressional politics under the Articles of Confederation witnessed divisions between the original federalists, who supported a weak central government, and the nationalists, who wanted to give the federal government greater power.

The unstable factions in the Continental and Confederation Congresses were, except perhaps in the case of Pennsylvania, unconnected with the factions in the state legislatures, which focused on local issues. The new constitutions notoriously limited executive power and emphasized the role of the state legislatures. They also expanded the electorate by allowing taxpayers to vote and lowered the requirements for officeholding. Yet the old colonial politics, a “politics without party,” based on family connections and intrastate geographical divisions, continued. The Revolution stripped off royal appointees, and many of the most conservative Loyalist elements fled. A revolution of expectations among those who had stood and fought, or watched cautiously from the sidelines, led to an increase in voter turnout and a change in the nature of the political elite. More common men became involved and more people at the middle levels of the economic structure gained office. The Revolution had brought neither a democratic political system nor a democratic order, but clearly the new American nation was, in its politics, moving toward a more democratic interpretation of republicanism.

THE EARLY REPUBLIC

The writing of the Constitution in 1787 and the fight over its ratification the following year brought a crucial change in the politics of the early Republic by creating for the first time a national stage for political action. The politicians in the states, who had carried out the Revolution and who were arguing among themselves about various economic questions, had to decide what approach to the Constitution was in their interest. Historians disagree in their interpretations of the conflict between the Federalists, who favored the Constitution, and the anti-Federalists, who opposed its adoption. Was it a matter of ideological conflict or economic self-interest? The obvious answer is that it was a bit of both. Ideologically, Federalists and anti-Federalists mixed together liberal and republican ideas along with long-standing Protestant religious convictions. Clearly, the more commercial and cosmopolitan elements of the society disagreed with those whose local perspective grew out of their reliance on subsistence agriculture and only a modest connection to the marketplace. Yet it is nearly impos-

sible to put even a majority of the men at the time into these categories, and some of the anti-Federalists were very wealthy “men of little faith.” The ideological arguments did have a similarity from state to state, but the economic conflicts did not. As a consequence, neither the Federalists nor the anti-Federalists had the degree of organization associated with modern political parties. The Federalists were led by two very young men, Alexander Hamilton and James Madison, who—along with the slightly older John Jay—wrote *The Federalist* in 1787–1788 and managed the ratification of the Constitution in two of the three most populous states, New York and Virginia. In the end the Constitution was ratified through a system of state conventions and never voted upon nationally. The elections for the state conventions drew only one-quarter of the white adult men.

Through a very complicated process that extended over six months from 1788 into 1789, George Washington was chosen as the first president and John Adams as vice president. While Washington was popular the election was not a democratic affair, the modes of selecting electors varied widely from state to state and turnouts, where white men of property were allowed to vote were low. It is nearly impossible to imagine what the two hundred and twenty men who ran for elector in Massachusetts had in mind or explain why thirty-five electors cast votes for candidates other than Adams for the second (and possibly the first) office or why twelve electors chose not to vote at all.

The critical problem faced by Washington’s new administration was not only to create a government, but also to build a nation. The administration included men who had emerged during the Revolution. When Robert Morris, the financier of the Revolution, refused the post of secretary of the Treasury, Washington chose Hamilton for the post, and then the president called back Thomas Jefferson from France to be secretary of state. The anti-Federalists and their demands for a new constitutional convention passed from the scene, although some were in the First Congress and one of them, James Monroe, would eventually become president.

In the 1790s two issues separated the American people, or at least the political elite. One was related to the old fight over how strong the national government needed to be, and the other involved how the country should align itself internationally, particularly after the outbreak and radical turn of the French Revolution. How would the new government respond to the French Revolution? In Washington’s

cabinet, Hamilton was pro-British and Jefferson pro-French, although they agreed with the president that the best position for the new nation was neutrality. Hamilton created a set of economic policies designed to handle the Revolutionary debt and put the country on an even keel while strengthening the federal government. The Virginians, Jefferson and Madison, who were not happy with the growing power of the federal government, led the opposition in the cabinet and Congress.

Although there were numerous battles on individual issues, it took almost six years before clear and consistent pro- and anti-administration blocs appeared in Congress. In the election of 1796, Jefferson came out of retirement to challenge Adams. In a closely contested election, Adams won the presidency and Jefferson became vice president. Clearly, modern parties did not exist. Over the next four years, however, fairly stable coalitions emerged in Congress. The Alien and Sedition Acts of 1798 showed how clearly the lines were being drawn. In the states, newspapers reflected the contrasting positions of the Federalists and the Republicans.

In 1800 Jefferson won the presidency in what he called "The Revolution of 1800," which began the rule of the Virginia Dynasty of presidents—Jefferson, Madison, and Monroe. Jefferson, who is every modern American democrat, did not win his office because of his great popularity with the American people, but because of the nature of the presidential electoral system. Ten of the sixteen states let their legislatures pick the electors. He won in the electoral college, helped crucially by the fact that the three-fifths clause in the Constitution enlarged the electoral vote in the slave states and the fact that the vote was both close and clearly sectional. The result was a product of elite manipulation and backroom negotiations in the state legislatures, particularly that of South Carolina. If there was a Revolution of 1800, it came in the congressional elections of 1800–1801, during which the Republicans gained twenty-seven seats in Congress and six in the Senate to go from being a minority in both bodies to a clear majority in both. When Jefferson became president, he had a friendly Congress to work with. He took advantage of this fact during his first administration (1801–1805) to replace as many Federalists as he could in the bureaucracy and to realign the federal courts.

Jefferson began his first term decrying partisanship. He declared in his Inaugural Address, "We are all Federalists, we are all Republicans," and he truly believed that he was a president above party. His war

against the North African pirates, his purchase of Louisiana (1803), and his often-ignored Indian policy made Jefferson extremely popular. By the election of 1804, his supporters controlled most of the state governments (even in New England) and held overwhelming majorities in both houses of Congress. Jefferson won a second term against what was only a shadow opposition. Politicians continued to come predominately from the "better sort," or what might be called upper middle class, but the "middling sort" of mechanics, manufacturers, and editors entered the fray and often won.

Jefferson's second term caused grave problems for the Republicans. In response to the return of war in Europe, Jefferson in 1807 pushed Congress to institute an embargo on American foreign trade. This created economic problems in much of the country and, along with its enforcement legislation, produced a Federalist revival. The opposition, led by a younger generation, developed new organizations that addressed voters more directly than before and encouraged them to come out in larger numbers. To add to their appeal, in several areas they took on the name "American" and accused the administration supporters of being the "French" party.

The Federalists became a significant minority during James Madison's administration, which was embroiled in an ongoing foreign policy crisis that led to the War of 1812 (1812–1815). The election of 1812 and the war brought on a high point in American partisanship, affecting both Congress and the electorate. When the war went poorly, the Federalists gained further support. Yet the presidential election of 1812 was one of the most sectional in American history and the "Federalist" candidate was a New York Republican, DeWitt Clinton.

THE ERA OF GOOD FEELINGS

Hostility to the war led a group of New England Federalists to meet in Hartford in 1814–1815 to suggest amendments to the Constitution designed to limit Congress's power to make war and to eliminate the three-fifths clause. Andrew Jackson's victory at New Orleans in January 1815 and the Peace of Ghent (December 1814), which ended the war, doomed the Federalists. In 1816 the Republicans pressed an aggressive set of economic policies. After these were approved by Madison, his secretary of state, James Monroe, was elected president. Early in his presidency, a Boston newspaper referred to the postwar period as an Era of Good Feelings. Later, historian Charles Sydnor called the decade between 1815 and 1825, "The One Party Period of American History." The

presidential election of 1820 was the duller and least interesting in American history and signaled the end of the First American Party System, which off and on involved the contention of Republicans and Federalists. By this time, nearly everyone claimed to be a Republican. Monroe ran virtually unopposed and received all of the electoral votes save one, cast for his secretary of state, John Quincy Adams. The decade of the 1820s was, however, an era of "ill feelings" in which fierce intrastate sectional and factional politics prevailed. "Connections" such as the Albany Regency in New York, the Richmond Junto in Virginia, the Nashville Junto in Tennessee, and Ambrose "Sevier's Hungry Kinfolk" in what became Arkansas, along with barbecues and stump speeches, began to dominate state politics, while sectionalism dominated national affairs.

The postwar era was characterized by conflicts among the Republicans over the economic policies that Henry Clay termed the American System. The sectional nature of these issues was exaggerated by the Panic of 1819, the debate over Missouri's entrance into the Union as a slave state in 1819–1820, the emergence of the industrial revolution in the North, and the spread of the cotton culture across the Lower South. The effects of these events were clearly seen in the fragmentation of the Republican establishment in the election of 1824. All of the contenders were Republicans. John Quincy Adams was the secretary of state, William Harris Crawford the secretary of the Treasury, and John C. Calhoun the secretary of war in Monroe's cabinet. Henry Clay had been Speaker of the House for a decade and General Andrew Jackson, the hero of New Orleans, was a U.S. senator from Tennessee. Ironically, this is the most impressive array of candidates ever assembled for an American presidential election. Calhoun withdrew and became the overwhelming choice for vice president.

Jackson won the most popular and electoral votes, but not a majority of either. Thus, the election went into the House of Representatives, which chose Adams in what Jacksonians called, "the corrupt bargain" because Clay influenced his supporters to vote for Adams and Adams then appointed Clay secretary of state. While this laid the basis for the development of the Second American Party System, the most important aspect of the election was its sectional nature. Two-fifths of Jackson's popular votes came from three states. In this election, each of the candidates represented a separate part of the American electorate and, with a few ethnic overtones, such as the fact Jackson was Scotch-Irish, there was also a

generalized sense of regional economic self-interest. During Adams's administration, the congressional factions that had supported the various candidates in 1824 came together into pro- and anti-administration coalitions to prepare for the next presidential election.

The states tended to be dominated by one faction or the other. There was much talk about organized "political machines." More important probably was the expansion of the newspaper network dedicated to the future candidacy of Jackson. The Virginia editor, Thomas Ritchie, and the New York lawyer-politician, Martin Van Buren, wanted to revive the old Republican Party and use General Jackson's "great popularity" to reunite "the Planters of the South and the plain Republicans of the North." And to a great degree they did. The Old Hero, as Jackson was called, won handily in both 1828 against Adams and in 1832 against Clay and the third party anti-Mason candidate, William Wirt. All of these men with good reason described themselves as Republicans. The election of 1832 led to the development of the nominating convention, initiated in 1831 by the anti-Masons, who had begun as an organization opposed to secret societies.

Jackson's election victories in 1828 and 1832, which have been described as being about democracy and class conflict, were most clearly sectional. The popular vote from 1824 to 1832 shows a clearly correlated and consistent pattern. Certainly New York, and still more so Pennsylvania, yielded Jacksonian majorities, as did New Hampshire, which voted for Jackson in two out of the three elections. But Jackson was overwhelmingly popular in the slave states. What is more important is that while the strands of party were being woven together, the whole cloth did not yet exist.

The same patterns can be seen in Congress during the 1820s and even the early 1830s. The major votes on the important issues of Indian policy, land policy, the Bank of the United States, and of course, the tariff, revealed that section trumped party. There were as yet no clear partisan labels, nor truly national organizational structures. However, the average American voter seemed more interested in politics, a newspaper network that was intensely partisan was growing, more common men were running for office, and the rhetoric of American politics had become much more distinctly democratic.

Party Organization and Operations

The founding fathers accepted the conventional wisdom that political parties or factions are inherently undesirable. Parties, they thought, set one part of the community against the rest and prevented attention to the general good. James Madison and the other framers believed that the U.S. Constitution would prevent any party or faction from taking control of all parts of the new government and would thus encourage interest groups to compromise. The founders were, however, thinking of the political groupings they had experienced, which modern historians see as either unstable leadership factions or broader movements held together only by an immediate crisis or a single pressing issue. What developed in the 1790s were parties of a quite new kind: more organized and coherent; based on the secure loyalty of ordinary voters; and capable of surviving changes of leadership or the passing of the issues that had led to their formation. Ironically, these new formations were a consequence of the Constitution: it had created a center of national power capable of capture through the electoral process at a time when most states had already granted the right to vote to most adult white males, while the complexity of the new constitutional structure ensured that only the broadest coalitions could hope to succeed.

PROTO-PARTIES

Parties did not seriously develop, however, until George Washington's impending retirement produced the first contested presidential election in 1796, after six years of growing disagreement over domestic policy, the French Revolution, and the Anglo-French war had aroused deep passions. The long-drawn-out debates over Jay's Treaty (1794) produced a deep cleavage within Congress and polarized the political classes. Supporters of the Washington administration kept the old name "Federalist" and backed John Adams, while their opponents, calling themselves "Republicans," supported Thomas Jefferson. The Federalists exploited their command of the federal government and its patronage, whereas the Republicans had to develop extraconstitutional means of organization, though in some states they did command the state government. For the Republicans, John Beckley, the clerk of the House of Representatives, corresponded with opposition elements in the various states and ensured the nomination of party tickets. After Adams's narrow victory in 1796, partisanship intensified as the growing international crisis made each side believe that the future of the Re-

public was at stake in the coming presidential election of 1800.

Though at this stage the groupings are best described as proto-parties, the electoral battle of 1800 took on characteristics that were qualitatively different from earlier factional struggles. All participants accepted that the contest was between two distinct groupings. Despite bitter rivalries within each party, the internal factions recognized the need to back the party's candidate, however much they disapproved of him. Both sides saw that it was necessary to organize support in the wider public and stimulate voter turnout, especially in the six states where the electorate chose the members of the electoral college. The Republicans were the more energetic, even intervening in New York in the state election that would affect the makeup of the legislature which would choose the presidential electors, but the Federalists began to develop comparable techniques. In their creation of a committed party press, their use of nominating procedures to unify the party's vote, and their belief that they possessed committed popular support, these political formations were taking on some characteristics of mass parties.

FIRST PARTY SYSTEM, 1800–1824

Taking power in 1801, President Jefferson buttressed Republican predominance by distributing office on a partisan basis, and his supporters in Congress regularized the use of a congressional caucus to maintain party unity there. The effectiveness of the Federalist opposition gradually diminished as Jefferson won overwhelming reelection in 1804 and the Republican majority in the House grew from 69 to 36 between 1801 and 1803 to 118 to 24 between 1807 and 1809. Factionalism among Republicans seemed at times more important than the party contest, and many historians have deduced that the Jeffersonian parties were not well-established, deep-rooted institutions. However, the economic dislocations and social discontent created by Jefferson's Embargo of 1807 revived the opposition party and reinvigorated the party contest. In all the seaboard states north of Virginia, Federalist voters who had been disheartened since 1800 reappeared at the polls and challenged Republican control at the state and local levels. In 1808 the Federalists contested every congressional seat north of the Potomac as well as some in the South and then built up their electoral position impressively, especially after the outbreak of war in 1812. In that year's presidential election, they backed the dissident New York Republican DeWitt Clinton and would have defeated Madison's reelection bid had

they carried Pennsylvania. Similarly, their position in Congress improved, and through the 1813–1815 Congress their 68 members showed far greater cohesion than the 112 Republicans.

Party competition. Even during their revival, the Federalists never seriously challenged the Republican predominance because they could not break into the South and West. In these areas the overwhelming support for the Republicans inhibited party development and politics remained elitist, personal, and informal. By contrast, the intense rivalry in two-thirds of the states, from New Hampshire through Maryland and even reaching Ohio, made this period one of intense partisan experience for many Americans. As Philip Lampi's collection of election data at the American Antiquarian Society reveals, voter turnout increased between 1808 and 1814. Over 70 percent of adult males were voting in states as various as New Hampshire and Pennsylvania.

In New England the Republicans mounted an effective challenge after 1800, using legislative caucuses and local meetings to nominate their candidates and backing them with a committed local press. The Federalist revival sharpened party competition and saw the Federalists adopting Republican techniques. The conflict became so sharp in some states, notably Massachusetts, that each year it seemed control of the state government might change hands.

The middle states were throughout the period the most competitive and politically innovative. In the 1790s the Republicans in Pennsylvania and New Jersey developed a party organization that enabled them to nominate tickets, coordinate action, arouse the electorate, and dictate a strict party line. After 1807, in the area from New York through Maryland, the Republicans—who increasingly called themselves Democratic Republicans or even Democrats—began to encourage the popular election of delegates to meet in local and county conventions to nominate candidates for local office, the state legislature, and Congress, and in some states by 1812 in state conventions to nominate gubernatorial candidates. Similarly, the Federalists, eager to harmonize the party, occasionally resorted to delegate conventions, though they usually met in secret because of their public disapproval of Republican "dictation" to the voters. In presidential elections the Republicans either backed the incumbent or, as in 1808 and 1816, used their wide representation in Congress to name a successor through a congressional caucus. The Federalists, for their part, had to look beyond Congress and, in both 1808 and 1812, called secret meetings

in New York that some have seen as, in effect, the first national nominating conventions.

The acceptance of parties. One consequence of this experience of party contest was that publicists began to develop theoretical justifications for party organization. In the 1790s most Republicans regarded themselves not as a party but as a band of patriots coming together to overthrow the selfish interests that had captured the federal government. After 1800 Republicans continued to regard their party as embodying the general interest, though some argued that voters owed loyalty to party nominations only if the people could influence nominations to office through delegate conventions. The Federalists ostensibly maintained a traditional scorn for parties, but during the War of 1812 they defended the right of constitutional opposition, arguing that an opposition was essential to protect civil liberties against an overbearing government. Only as the Republican Party began to lose its unity and cohesion after the war did its publicists start to argue that a two-party conflict was good in itself.

Federalist demise. The party battle lost its heat and purpose when news of the Treaty of Ghent (December 1814) and the Battle of New Orleans (January 1815) transformed the Federalists from the prudent critics of a foolish war into traitorous obstructionists. As the presidential election of 1816 demonstrated, the Federalist Party now found it impossible to attract new support, and it ceased formal opposition to the new Republican president, James Monroe. In many localities, however, party activists ignored calls for partisan differences to be dropped and tried to organize elections along party lines, though it became harder to maintain unity behind a single candidate. Close state elections returned some Federalist state governments into the early 1820s, and members of the U.S. House of Representatives continued to be categorized as Republicans or Federalists down to 1824.

PARTY REALIGNMENT, 1824–1832

The old party system was finally destroyed by the sectional feelings generated by the Missouri crisis of 1819–1820 and the depression of the early 1820s. In 1824 the Democratic Republican Party could not agree on a single candidate, and four Republicans found strong bases of voter support. The need to find a president obliged John Quincy Adams and Henry Clay—and their supporters—to come together in 1825 to elect the former in the House election and form an administration, prompting their disappointed rivals to raise the banner of opposition. By 1827

these opposition groups had accepted Andrew Jackson as their presidential candidate, and they began to appeal to voters in a manner entirely reminiscent of the late 1790s. Some of their leaders, notably Martin Van Buren, specifically saw this campaign as the recreation of the old Democratic Republican Party, which they argued was the best means of restoring the rule of sound political principle. In this process the Federalists also divided, though most supported Adams. Old political friends now separated, old enemies joined together, and new newspapers were founded in what was in effect the greatest political realignment in American history.

The election of 1828 produced a turnout unprecedented in presidential elections, though not in earlier state or congressional contests. Jackson and his supporters responded to victory as had Jefferson's Republicans thirty years before, moving their own men into office and using the federal government to consolidate their position. The former Adams men maintained their opposition and adopted the new name of National Republicans. The electoral basis of this new party contest was confirmed when the election of 1832 saw most voters voting the same way as they had in 1828.

In this new party competition, the election devices that had been created over the previous thirty years were adopted again, only more systematically, by both sides. If anything, the Adams men of 1828 proved the more innovative in their use of state conventions and the creation of a national campaign newspaper. Once again, overwhelming sectional preferences—for Jackson in the South and the frontier West, for the National Republicans in most of New England—made the adoption of thoroughgoing party techniques unnecessary. Partisan organization advanced at the state level only in states and districts that were competitive. But in battleground states like New York, New Jersey, and Ohio, the parties used all possible devices, swaying public opinion with scurrilous pamphlets and broadsides, introducing national party divisions into state elections, and using delegate conventions to name tickets at all levels, including congressional elections. Finally, in 1831 and 1832, the Democrats, National Republicans, and a third party, the anti-Masons, all used a national delegate convention to nominate their candidates, the beginning of a practice that became the particular hallmark of American electoral politics.

Political Corruption and Scandals

Political corruption and scandals have been recurring themes throughout American history. From Samuel Argall's plundering of the Virginia Company in the early seventeenth century to the Credit Mobilier, Watergate, and countless lesser scandals, each generation of Americans has had its share of public officials who were charged with abusing their positions in the pursuit of money, power, or both. Far from being timeless, however, definitions of corruption and scandal have evolved alongside broader changes in American society and politics.

POLITICAL CORRUPTION AND THE REVOLUTION

For Americans of the Revolutionary generation, corruption connoted much more than private or individual crimes and misdeeds. Influenced by English political debates and by republican ideology, colonial Americans associated corruption with executive dominance over legislatures through the improper use of patronage and other favors for the benefit of private interests at the expense of the public good.

Following the Glorious Revolution, English politics and government were transformed by the growth of state power and public debt, the emergence of new financial interests and institutions, a proliferation of public offices, and newfound political stability. Most Englishmen attributed that power and stability, and the liberty that accompanied it, to the balance of king, lords, and commons in the English constitution. Simultaneously with these developments, however, there emerged an informal system of "influence" through which the king's ministers dominated parliamentary deliberations through the adroit distribution of appointments, contracts, honors, and the like. Opposition spokesmen viewed this crown influence, especially during Robert Walpole's ministry, not as the source of English political stability but as another chapter in the age-old struggle between power and liberty. As the court party solidified its control over the House of Commons through "influence," radical Whigs such as John Trenchard and Thomas Gordon and old Tories like Bolingbroke and other leaders of the country party charged the king's ministers with attempting to corrupt and subvert the mixed and balanced constitution.

This view of politics—with its emphasis on the dangers of corruption and the need for constitutional balance—shaped the colonial response to British imperial policies prior to the Revolution. By 1750 provincial politics had assumed many of the characteristics of British practice. Royal governors used patronage and influence to impose crown authority over newly assertive colonial assemblies, while crown-appointed officials and placemen proliferated, depriving colonial elites of political opportunity and reinforcing oppositional political beliefs. In this context, apprehensive colonials came to view the new British imperial policies of the 1760s and 1770s not as a legitimate attempt to reform the empire but as an extension to the colonies of a corrupt ministerial plot to subvert liberty.

CORRUPTION IN THE NEW REPUBLIC

Such concerns provided a justification for independence and the basis for a vision of a republican society founded on a virtuous citizenry free of corruption. During and after the Revolution, new state constitutions sought to limit undue executive influence over the people's representatives, and some states passed laws to promote virtue and prevent vice. But the fear of corruption was not abated by independence. Believing that successful republics depended on the citizens' selfless subordination of private interest to the public good, many Americans

worried that greed, speculation, profiteering, and the unrestrained pursuit of private gain threatened the moral reformation promised by the Revolution. When some members of the Confederation Congress charged that Silas Deane, Robert Morris, Samuel Chase, and other public officials misused their positions for personal enrichment, such doubts were reinforced. The burgeoning public debt, a source of corruption in the English system, added to the fear that America might yet suffer the fate of past republics brought low by the loss of virtue and by corruption.

The new federal Constitution adopted in 1788 did not immediately allay concerns about the corrosive influence of corruption. Proponents argued that a stronger national government founded on the principle of separation of powers would remedy the “vices of the system” so prevalent in the 1780s. Opponents predicted that such a system would only create new opportunities for corruption. Alexander Hamilton’s fiscal program—with its permanent debt, national bank, and federal subsidies of manufacturing—seemed to confirm the anti-Federalists’ worst fears. Hamilton’s intent was to strengthen the central government and stabilize the nation’s finances by forging an alliance between government and business, exploiting the latter’s self-interest to that end. But to Thomas Jefferson, James Madison, and others of the emerging opposition, Hamilton’s hidden purpose was to impose a system of government in America à la Walpole, with executive dominance over the legislature solidified through patronage, influence, and favoritism to business interests. In the increasingly divisive politics of the 1790s, rampant speculation in government securities and unseemly ties between government officials and public creditors reawakened old concerns about the threat posed by corruption in a republic. The involvement of some of Hamilton’s closest associates—William Duer (sent to jail for his role in the highest-level financial scandal in the history of the Treasury Department), James Duane, Rufus King, and his own father-in-law, Philip Schuyler—fueled such fears. Although Democratic Republicans tried to link Hamilton to such activities and even pushed for congressional censure in 1793 for his alleged misuse of foreign loans, there is no evidence that he ever benefited personally from his policies.

The traditional rhetoric of “ministerial corruption” persisted through the late 1790s and beyond, but its resonance waned. Despite its initial excesses, the Hamiltonian program remained in place. Unsubstantiated charges of soliciting a bribe from the French government forced Secretary of State Ed-

mund Randolph’s resignation in 1795, and questions were raised about House Speaker Jonathan Dayton’s handling of his accounts; but there were no serious instances of corruption in the Washington and Adams administrations. By the late 1790s, moreover, laws had been passed prohibiting many kinds of corrupt practices. Although politically charged in their own way, the two most sensational scandals of the period were of an entirely different nature. In 1797 Hamilton’s opponents revealed that he had earlier had an affair with a married woman, Maria Reynolds, and had submitted to blackmail to conceal it. Five years later, Jefferson’s intimate relationship with Sally Hemings, one of his slaves, was exposed, setting off a firestorm of opposition criticism.

Land speculation was at the heart of two major scandals involving misconduct by state and national officials. In 1797 the U.S. Senate voted overwhelmingly to expel Tennessee senator William Blount for conspiring with western settlers and the British to forcibly oust the Spanish from Florida and Louisiana. Blount, a prominent North Carolinian who became the first territorial governor and first senator from Tennessee, had become deeply involved in land speculation and saw the removal of the Spanish as a way to enhance his investments. His illegal interference in U.S. foreign policy for private gain prompted his expulsion from the Senate and the initiation of formal impeachment proceedings in the House of Representatives. A second scandal involved the Georgia legislature’s sale of 35 million acres of land in the Yazoo River district of present-day Mississippi and Alabama to the Yazoo Land Company for below-market prices. When it was revealed that the 1795 law was the result of rampant bribery and corruption, a new legislature rescinded the sale, whereupon private investors who had purchased Yazoo lands demanded relief and protection of their property rights. After years of controversy, the Jefferson administration settled speculators’ claims with federal funds in 1802, and, in 1810 the U.S. Supreme Court upheld the original land sales in *Fletcher v. Peck*.

CORRUPTION IN THE AGE OF JEFFERSON AND JACKSON

With the Jeffersonian-Republican ascendancy in 1801, the eighteenth-century view of corruption became increasingly anachronistic. Jefferson did replace most (but not all) Federalist officeholders with loyal partisans; but in the new world of party politics, patronage appointments were viewed not as traditional corruption but as an essential ingredient of party government. Apart from the activities of General James Wilkinson and some graft and profiteer-

ing during the War of 1812, the era was mostly free of major scandal. The charge of corruption, however, continued to be an effective political tool in the factional politics of the 1820s. Most notably, Andrew Jackson and his supporters echoed older notions of corruption when they charged John Quincy Adams with having won the presidency in 1825 by means of a “corrupt bargain.” Because no candidate had received a majority of the electoral votes, the election of 1824 was thrown into the House of Representatives. Henry Clay, himself eliminated from consideration by the Twelfth Amendment, threw his support to Adams, ensuring the latter’s election. When Adams subsequently appointed Clay as his secretary of state, outraged Jacksonians charged that Adams had subverted the will of the people through political intrigue and corruption. The Jacksonians’ appropriation of the Revolutionary-era rhetoric of corruption served them well and laid the foundations for Jackson’s electoral victory over Adams in 1828. By that time, however, the nation was already undergoing fundamental social, economic, and political changes that would, among other things, transform the meaning, extent, and character of corruption in American society.

Political Culture

Political culture, a concept popular among scholars, takes an anthropological approach to political life. In other words, rather than concentrate on systematic political theories, the study of political culture is attuned to cultural symbols and “unstated premises.” Studies of political culture often boil down to identifying the implicit rules of political behavior in a given context—the boundaries of legitimate, effective political action. Political culture has been particularly useful for studying the early Republic because only at the end of this period did anything much resembling the familiar U.S. party system take shape.

CONSPIRACY THEORIES

The books often said to have inaugurated the study of political culture among historians of early America were Bernard Bailyn’s *Ideological Origins of the American Revolution* (1967) and its companion volume, *The Origins of American Politics*. Locating the sources of American political thought in a then little-read collection of tracts from the fringes of British politics, Bailyn exposed the founding fathers as conspiracy theorists whose campaign against the British imperial regime was full of hysterical rhetoric and outlandish beliefs, most of them revolving around a secret British design to impose an unconstitutional tyranny on the American colonies—or, as worried American slaveholders tended to put it, to reduce America to slavery. Living far from the centers of a British authority that was rarely exercised before the 1750s, Americans came to regard power itself as a fearsome, evil, hungry thing with an “endlessly propulsive tendency to expand itself beyond legitimate boundaries.”

Colonial Americans still considered themselves Britons, but their reading and often limited experience of the mother country led many of them to believe that the free British constitution had been corrupted by what historians now know were the beginnings of the modern parliamentary system: the consolidation of power in the hands of a “prime” minister who controlled a majority in the House of Commons. Many came to see America as the last bastion of British constitutional liberty and their own local governments as reflecting the “true” British constitution. When the British tried to tighten up

LIBRARY OF CONGRESS.

the governance of the empire a bit, seriously enforcing their languishing customs laws and asking their now-wealthy colonies to contribute some tax revenue for the first time, Americans saw something far

more sinister at work. Building on what by 1776 was a long tradition of over-the-top charges against the British, Thomas Jefferson made the Declaration of Independence into a long conspiracy theory about

the king himself, charging him with introducing slavery and causing America's racial problems with both blacks and Indians.

The success of conspiracy theories in recruiting popular support for the Revolution, and the lurid fears of political power that underlay the theories, made such scare-mongering a permanent part of American political culture. Nearly every major social and political development of the period would generate such theories, which were often central to the political messages and methodologies of major movements in this period and all the early national political parties from the Federalists and Democratic Republicans to the anti-Masons, Whigs, and Know-Nothings. The major conspiracy theory "villains" in the early Republic included the French revolutionaries, the Masons, both the Jeffersonian Republicans and the opposing Federalists, the Irish, the Catholic Church, Andrew Jackson, John Quincy Adams, the Bank of the United States, the abolitionists, southern slaveholders, and more. It often seemed that an all-out plot to subvert liberty was the only thing that could motivate large numbers of Americans to political action.

Historians have differed over whether conspiratorial thinking should be considered a psychological problem, a genuine political philosophy, or something else. What can be said with certainty is that, from the very beginning of American political history, Americans have been notably moralistic and Manichean in their approach to political debate, tending to see politics as a war between the forces of light and darkness, order and chaos, good and evil.

REPUBLICAN VIRTUE, POLITICAL CHARACTER, AND ANTIPARTYISM

Directly related to the outsized fears of conspiracy and corruption was a somewhat paradoxical set of political ideals that many historians have come to label "classical republicanism." These notions had their origins in a certain idealized view of classical antiquity that was encouraged by many of the favorite political texts. Classical republican thought was communitarian in orientation, holding that representative government and republican liberty were safe only when both leaders and citizens virtuously abstained from self-interested behavior and acted for the common good. In terms of political culture, however, republican virtue demanded individualism, more commonly rendered in this period as "independence": a virtuous statesman could never submit his own political conscience to interest, ambition, or external pressure if his actions were to have legitimacy or influence.

Virtuous citizens were also necessary in a republic, and citizens showed their virtue by always putting self-interest and passion aside and choosing virtuous "characters" to lead them. During and after the Revolution, there was much concern among the Patriot leaders about the possible corruption of the citizenry. The anti-British protestors of the 1760s organized boycotts of British luxury goods out of a desire to pressure British merchants, but from that time on there were recurrent campaigns against luxurious living in general, as Patriot agitators like Samuel Adams sought a moral and political regeneration they believed went hand in hand. The first Continental Congress proclaimed a moral code for the new nation that banned theaters, horse racing, and cock-fighting, and local controversies over luxury items and frivolous entertainment broke out periodically thereafter. Dr. Benjamin Rush proposed a system of public education that would "render the mass of the people more homogeneous, and thereby fit them more easily for uniform and peaceable government."

Obviously these conformist political values were not especially friendly to the later American ideal of participatory democracy. The ideal of republican virtue affected political behavior, especially among the members of the Virginia dynasty. A virtuous republican could never actively seek power: candidates did not "run" for office, they were asked by others to "stand." Though lifelong politicians almost to a man, the founders went to great lengths to convey their utter disinterest in political power or financial gain to any who would listen.

The quest for republican virtue made early American political culture rather schizophrenic concerning such basic elements of democratic politics as parties and campaigning. Though many parts of America had experienced vigorous political competition along clear partisan lines since colonial times, most early American leaders did not regard this as a normal or acceptable state of affairs. Thomas Jefferson expressed the feelings of many early American leaders about the idea of joining a political party: "Such an addiction is the last degradation of a free and moral agent. If I could not go to heaven but with a party, I would not go there at all." Nevertheless, Jefferson soon became the figurehead of the country's first political party. And antipartyism remained a common sentiment even as parties became the norm. Americans congratulated themselves on the seeming collapse of national party divisions during the "Era of Good Feeling" in the 1810s, then promptly rejoined them with renewed fervor in the decades that followed while always remaining open to re-

formers' attacks on the corruption and divisiveness of parties. The contradictions are symbolized by the fact that one of the most organizationally aggressive and innovative national parties, the anti-Masons, had antipartyism as a major part of its message.

Antipartisanship shaped actual political behavior as well as attitudes. Candidates for high office could not be seen as active public participants in their own campaigns during this period. (Even the nakedly ambitious Aaron Burr, who campaigned aggressively for the Democratic Republicans in 1800, had to stand for office in a district far away from the scene of his campaign activities in New York City.) Presidential candidates made no national speaking tours until the middle of the nineteenth century, and even then the practice was widely criticized. High officeholders had to rely on friends and surrogates, including newspaper editors, if they wanted to seek broad public support for their actions or win a higher office.

While newspapers, congressional debaters, and other partisans carried out public battles over ideology and policy, American statesmen themselves operated in a highly pressurized environment in which political battles seemed to be more about personal character and "honor." In the absence of any agreed-upon standards or mechanisms for dealing with questions of personal integrity, like ethics laws, aspersions on a statesman's character, and many other political quarrels, were settled according to prevailing social mores. Aaron Burr's killing of Alexander Hamilton in a duel was only one of many political duels and near-duels in the early Republic, though it was somewhat unusual in ending with an actual death. The political duel was largely limited to a subculture of gentlemen politicians who had once been military officers. If someone beneath that station insulted a gentleman or tried to issue a challenge, he was more likely to get "cowed" in the street than to be dueling.

Violence, however, remained an important part of American political culture throughout this period. Teams of thugs at polling places were an integral part of the "get out the vote" (or keep down the vote) efforts in many cities. Rioting mobs were also an occasionally critical political factor, and at several key points, a tool. The Sons of Liberty encouraged mobs to intimidate local British officials during the Stamp Act crisis, a campaign of terror that included the dismantling of Massachusetts Chief Justice Thomas Hutchinson's mansion. During the 1830s prominent politicians in the North and South helped organize mobs that shut down abolitionist meetings and destroyed abolitionist newspapers and pamphlets. Ab-

olitionist editor Elijah P. Lovejoy was murdered during one of these riots in 1837.

CELEBRATORY POLITICS

Although classical republican virtue was a deep strain in American political culture, it was hardly universal. The "disinterestedness" it required could be practiced only by the wealthiest, best-placed politicians in any case, and it had little to say about the more active and democratic forms that early on became a basic part of American political life. Governments that were in the end based on public opinion and popular voting inevitably spawned practices that sought to marshal those forces one way or another. It was only at the end of this period that the familiar institutions of the American party system really took shape.

In the early Republic, therefore, popular political culture was necessarily creative, adaptive, and variable. Because the early political parties were organizationally almost nonexistent, the work of building support for them was conducted by scattered groups of local activists, with little centralized direction or funding. Necessarily reliant on local resources and personnel, these typically self-appointed activists simply made partisan use of whatever existing traditions, institutions, and practices they could, including many that were long-standing features of Anglo-American culture. Among these were holiday celebrations, parades, taverns, toasts, songs, town meetings, petitions, militia company training days, and various products of local printing presses, including broadsides, handbills, almanacs, poems, pamphlets, and, especially, the small-circulation local and regional newspapers that sprang up everywhere after the Revolution.

Some of the most interesting political artifacts of this type are the plethora of songs published on the back pages of partisan newspapers and sometimes as sheet music or in songbooks, many of which were presumably sung in taverns or at partisan gatherings. The musical output included not only "Jefferson and Liberty" and "The People's Friend," but also such unlikely numbers as "Adams and Liberty," "Huzzah Madison Huzzah," and even "Monroe Is the Man." Especially popular among local partisans were innumerable sets of new lyrics to popular tunes such as "Yankee Doodle," "Hail Columbia," and the "Anacreonic Song," better known today as the United States national anthem.

Each region of the country had its own particular local practices that were drawn into partisan politics and became part of a distinctive regional political

culture. In the South, the famous court-day barbecues were transformed from rituals of noblesse oblige into competitive partisan debates, initiating the Southern stump-speaking tradition. In the cities and larger towns, fraternal orders, voluntary associations, and militia companies were politicized, with the so-called Democratic Republican societies and the Tammany Society being two of the best-known examples on the Republican side. These groups formed the beginnings of the highly disciplined neighborhood-based political organizations that would in time become known as urban political “machines.”

In New England, where churches and the clergy had always played an unusually prominent role in public life, many aspects of religious culture were adapted to partisan use. The Congregational establishment was heavily and intemperately Federalist, and its members did not hesitate to put partisan political instructions into their sermons. At the same time, the traditions of the jeremiad and the publication of sermons gave rise not only to a large number of published political sermons and books by the clergy, but also the practice of secular politicians giving and publishing formal orations that often took on a distinctly homiletic tone.

Although always locally controlled and thus highly varied in tone and content, certain practices were nearly universal in this political culture. Among the most important were the holiday celebrations that dotted the civic calendar, each of which brought many of the elements mentioned above together into a single political event. For Republicans, the most important day was the Jefferson-centric Fourth of July, which they had championed as a more republican and democratic alternative to Washington's birthday or government-mandated thanksgiving and fast days. The highlights of such banquets were the toasts, drunk at the end and accompanied by cheers or cannon blasts if possible. Afterward, an account of the celebration would be published in a sympathetic local newspaper, including a verbatim transcript of the toasts. No mere drinking game, political banquet toasts served, and were intended to serve, as informal platforms for the community, party, or faction that held the gathering.

One form of political statement that was unique to Jefferson's Democratic Republicans and befitted a party claiming to champion ordinary farmers and mechanics was the creation and presentation of an outsized foodstuff. As the city's Democratic Republicans prepared for their first March 4th celebration (the anniversary of Jefferson's election to the presidency) in 1801, “a monstrous large ox” was fes-

tooned with flowers and ribbons and the logo “Jefferson and Burr” between its horns and then processed through the streets, “followed,” as one outraged Federalist lady remembered it, “by such a despicable rabble as you never saw.” The Baptists of Cheshire, Massachusetts, established the mature version of the fad with the half-ton mammoth cheese that Elder John Leland had delivered to Thomas Jefferson on New Year's 1802, bearing the inscription: “THE GREATEST CHEESE IN AMERICA, FOR THE GREATEST MAN IN AMERICA.” Be they edible or tuneful, all of these homely, locally produced tributes were part of a significant, democratizing shift in the culture of American political leadership that occurred after 1800. The imagery and iconography surrounding Washington depicted a stern patriarch astride a warhorse, lifted to heaven by choirs of angels, or enrobed and enthroned in the clouds like Zeus. The images of Jefferson that circulated, however, were simple portraits, and the language used to praise him often strikingly intimate. As one song put it in 1801: “Invited, by the friendly voice, / Of freemen, in a prudent choice; / Kind JEFFERSON, with love replete, / Accepts, th' *important* helm of state.”

This was not “merely” a verbal or linguistic change; it reflected and authorized concrete changes in the way that politics was conducted at the local, retail level. Even some Federalists learned to approach voters in a different way after Jefferson's accession. Following the Republicans' lead, it was now imperative for all political activists—whether in how they wrote, spoke, or personally behaved when they encountered citizens in taverns, public meetings, polling places, or homes—to approach the people as friends and equals, not as children or subjects to be guided.

Political Economy

The concept of "political economy" has a long and varied history. Aristotle wrote about the allocation

of household resources and the relationships of individual producers to each other in the city-states of ancient Greece. Modern scholars often employ the term when investigating how larger systems of authority create the means to satisfy the wants and needs of particular groups of people. In the British Atlantic system that developed from the early 1600s to the early 1800s, "political economy" became an important conceptual tool for policymakers, economic agents, and intellectuals concerned with shaping the imperial expansion of competing nations, their control over the people and resources of far-flung colonies, and the production and distribution of wealth within European nations. Among British writers of that era, ideas about political economy coincided with the broad transatlantic appeal of republicanism in political thought, and with the general tenets of the era's moral philosophy.

A TRANSFORMATIVE ERA

The acceleration of Britain's economic transformation toward an industrial revolution was aided by imperial commercial expansion and North American colonists' agricultural prosperity. As a result, the state and social classes underwent dramatic alteration throughout the empire. Rising, ambitious groups of commercial farmers, entrepreneurs, merchants, and manufacturers in England clamored for promotion and protection of their modern interests against traditional interests, often including landed aristocrats and families protected by the patronage of the monarchy. Writers stood back and observed the long view of this transformative era, and what they saw was a paradox: although the British people at home and in the colonies enjoyed relief from the deep structural economic insecurity brought by plagues, scarcities, and protracted wars during previous centuries, the fruits of their expansion and development were uneven and unpredictable in the 1600s and 1700s. The violent disorder that erupted locally, as well as the revolutions and civil wars of the era, often had underlying economic causes, which in turn pointed toward the need for more active government intervention into the nation's—and empire's—economic affairs. "Political economists" in the British Atlantic saw this state of affairs as their particular challenge, just as republicans, or "commonwealthmen," grappled with questions of freedom and obligation. While republicans rediscovered (and reshaped) much older theories explaining that rulers walked a precarious path of wisdom, reason, and virtue, on either side of which lay tyranny and licentiousness, political economists tried to secure social order and material prosperity with a network of pol-

icies addressing economic activities, goods, and services.

THE ART OF MANAGING A STATE

Early modern political economy was at once political and ethical. Before the early nineteenth century, economics was not a pure science, though writers claimed to be investigating or formulating “laws” of economic behavior or development. It was, rather, a branch of moral philosophy and contained numerous assumptions about human nature and the appropriate ethical relationships advancing peoples should exhibit. Just as a republican citizen needed to live virtuously, the political economy of a nation needed to embody economic justice. Of course, abstract principles translated only haphazardly into practice, and more often than not the unfolding litany of mercantile legislation passed by British imperial authorities served one or another special economic interest. By the late eighteenth century, British Americans understood political economy as the art of managing a state, or the means by which a government allocated resources and protected various interests of its citizenry. The Scottish writer Adam Smith defined political economy as “a branch of the science of a statesman or legislator” the primary goal of which was to “enrich both the people and the sovereign.” Smith and other writers believed political economy was directly derived from policies and directly influenced the economic lives of all groups within a state. And although Smith is probably most closely associated with a targeted assault on the mercantilist state (the term first used in Smith’s *Wealth of Nations* in 1776), even Smith believed that there was an important role for government in furthering the economic development of a nation. Government and citizens of a republic were interdependent; as in republican belief, the state could not survive without striving to preserve the well-being of society.

As American Revolutionaries discovered, once they had secured their political independence, their need to secure an economic foundation that would preserve Americans’ republican character evinced a similar patchwork quilt of legislation. How newly independent Americans would create a viable political economy was by no means clear. Optimists and skeptics debated the qualities of the republican character. From the 1780s to 1810s, they also engaged in a vibrant public and legislative discussion about whether there were sufficient resources—people, skills, capital—to launch a republic that could enter the “world of nations” as an independently productive people, and on what basis productivity should

unfold at all. A bewildering array of voices joined this discussion about how to shape the new nation’s political economy.

HAMILTONIAN AND JEFFERSONIAN VIEWS

Scholars tend to cluster the many different ideas and policies of the era, and the numerous shifting alliances of Americans who promoted them, around two poles. One, the nationalist or Federalist or Hamiltonian political economy, was more intimately associated with British development, urban cosmopolitanism exhibited in the American North, and rising entrepreneurship and manufactures. Its adherents identified with many of the economic ideas that gave rise to the mercantilist policymaking of the British Empire; mercantilism was, if nothing else, defined by its reliance on government legislation to secure the most desirable economic activities and to thwart those that were undesirable. Following other British precedents, Hamiltonian political economists also supported such federal institutions as the Bank of the United States and policies designed to raise revenue to fund the central debt.

The other pole, a localist or Jeffersonian political economy, contrasted American simplicity with the degeneration and corruption—concepts inherited from republicanism—of the developing British state, banking system, and industrial revolution. They emphasized the abundance of natural resources in North America, the potential for westward expansion, and the virtues of continuing to exist as primarily an agricultural people. Jeffersonian political economy was associated with “free trade” among southern planters and took a view of international affairs premised on America’s role in nurturing the “natural virtue” of agricultural expansion and the exporting of staples. In this view, Americans would not only provide sufficiency and modest comfort for themselves, but would also enter commerce as the provisioners of war-torn and hungry peoples elsewhere in the world.

Scholars of the late twentieth and early twenty-first century argue that, though such a polarization of views may have appeared in Americans’ spirited discussions during the post-Revolutionary generation, it did not reflect reality. Neither Hamiltonian nor Jeffersonian political economy was a static body of ideas and policies. Both persuasions were more pragmatic than dogmatic in their approaches to shaping the economy; both embodied a range of contentious views; both accepted various degrees of governmental involvement in facilitating economic development; and both anticipated an American future

of economic growth and widespread individual material comfort. Indeed, post-Revolutionary Americans readily adopted many mercantilist measures to stabilize and develop the economies of states and nation, and few of them believed in the efficacy of “economic naturalism” or free-market agrarianism, ideas that had been touted by eighteenth-century French political economists. In reality, individuals and groups throughout America clamored for economic policies at the local and state level that would channel resources, regulate particular privileges, and set the parameters of an economic interest’s activities; the policies were passed in legislatures that combined representatives of Hamiltonian and Jeffersonian views in myriad ways during the early Republic. In reality, too, most Americans lived on the land or very close to farming activities, and most technologies and economic infrastructures reflected preindustrial arrangements for at least two generations after independence.

When differences did emerge among Americans about their economy, they tended to be about how much government intervention in the economy was good to foster; how big the new economic institutions should be; to whom certain economic policies should be addressed; and whether the basis of political authority for economic development should rest at the local, state, or national level. Indeed, the transition from the Federalist presidency of John Adams to the Democratic Republican presidency of Jefferson in 1800, preceded by the political transformation of many local and state legislatures, was more political in nature than economic; Jeffersonians adhered to most of the economic principles and policies laid down by Federalist officeholders in the preceding generation.

THE TRANSFORMATION OF ECONOMIC IDEAS

In important respects the contentious discussion among shifting groups of Americans who struggled to stabilize and develop their economy was not the result of political independence or the initiation of concerns for a new nation’s economic future. It was, rather, the continuation of the more fundamental transformation of economic ideas throughout the Atlantic world during the eighteenth century. Slowly, large numbers of people across imperial boundaries and oceans had begun to understand that the source of value lay not only in accumulating gold and silver, but in the people—who represented the labor and reproductive potential—of a nation; that money could as effectively be made of paper as of specie (gold and silver coin), and that so long as peo-

ple accepted it, paper money could provide a valuable (though temporary) substitute for specie in exchanges.

All along the Atlantic, people began to shed their fear of debt and embraced a tangled web of debt and credit expanding without artificial (government) restraints. Although they distrusted “luxury,” they grew generally less fearful of consuming new, unessential, and foreign goods. Having put the long eras of dire scarcities and unemployment far behind them, great numbers of free white Atlantic peoples began to abandon their long-held notion that the world’s wealth was relatively fixed in quantity (and its corollary that a nation’s wealth increased only by decreasing the wealth of another). In its place they developed an exuberant faith in their ability to transform limitless natural abundance into usable and desirable commodities and to tame the wilderness holding that abundance into valuable real estate and productive farms; moreover, they accepted that government could play some role in bringing all this about. Although they continued to deplore the “bubbles,” or excesses of speculation in the public debt, that developed in eighteenth-century England and during the American Revolutionary War, by the 1780s few citizens doubted the benefits of locally controlled banks and a larger, more widely circulating currency.

The delineation of rights and obligations between rulers and ruled that had provided the basis for many economic concepts before the 1700s was breaking down rapidly during the Revolutionary generation. Increasingly, the growing number of brokers, bankers, insurers, retailers, specialists in commercial services, and representatives of many new trades who functioned in the interstices of the economy, linking small investors to emerging institutions or providing services where economic connections were still tenuous, had to be incorporated into the “system of political economy” that Americans embraced. By the 1820s the Republic had entered another era of its political economy.

Political Pamphlets

In the American colonies of Great Britain and the early United States, printing was of course the only form of mass communication available. With at least one press in every sizeable colony by 1750, the mechanism for an extensive exchange of opinions and information was ready to be tapped when the Crown began in the 1760s to bring the American colonies into "due subordination" to the mother country. The colonists responded to changes in trade regulations and revenue laws by noting the presumed harm to colonial prosperity and imperial trade; but they also argued that the changes violated the British constitution, especially the prohibition against taxing persons not represented in Parliament. In a pamphlet titled *The Rights of the British Colonies Asserted and Proved* (Boston, 1764), the American Revolutionary statesman James Otis gave his opinion on the proper definition of the constitution and its applicability to the colonists. Later John Dickinson wrote a more extensive treatment of this topic, *Letters from a Pennsylvania Farmer . . .* (Philadelphia, 1768) in which he dismissed the difference asserted by some in Britain between "internal" (the Stamp Tax, e.g.) and "external" taxes (import tariffs, e.g.), the former forbidden to the British, the latter permitted. Dickinson argued that both were equally onerous and equally forbidden; taxation without consent was "slavery." In 1774, Thomas Jefferson's *A Summary View of the Rights of British America . . .* (Williamsburg, 1774) denied the existence of little more than a ceremonial tie with Great Britain. Its near assertion of independence was too advanced for the time, but

it served to put Jefferson's name before the general public both in the colonies and Britain. Pamphleteers, often using pen names from ancient Greek or Roman history, presented their arguments as gentlemanly dialogues, buttressing their arguments with references to classical or Enlightenment authors.

THE QUESTION OF INDEPENDENCE

With the outbreak of fighting between royal forces and colonists at Lexington and Concord in April 1775, the controversy moved to a more consequential question: Did Great Britain have any power over the colonies? While a fledgling Continental Army besieged British forces in Boston and royal governors everywhere lost effective power, the Continental Congress moved toward independence. In January 1776 a recent emigrant, Thomas Paine, signing himself "Common Sense," published a violent diatribe against British control, arguing that there was no alternative to independence. Echoing popular arguments, he asked what logic there was in an island

governing a continent; he derided George III as a “royal brute” and urged a simple republican government for the colonies. This pamphlet was immediately popular, selling more than 150,000 copies through 1778 when the sale of a few hundred copies was remarkable. In addition to a readership, many pamphlets reached even wider audiences when read aloud in gathering places; Paine’s crude and harshly expressed language was well suited to oral proclamation. After Paine, other writers dropped their mannerly tone.

STRENGTHENING THE UNION

After independence was declared and until it was won, the principal subjects of pamphlets and newspapers were the conduct of the war, congressional politics, and controversies over state constitutions. After the end of the war, a steady stream of pamphlets and newspaper essays argued for and against the strengthening of the Articles of Confederation. The publication of the draft constitution in the fall of 1787 opened the floodgates of conflicting opinions about ratification. Some of the most widely known essays of the controversy, especially those by the anti-Federalists, who opposed ratification, received only limited circulation. One exception was Melancton Smith’s *Observations . . . the Federal Farmer*. Printed in their entirety only in the Poughkeepsie, New York, *Country Journal* (1788), the observations were later collected into a pamphlet printed four times, for a total of about four thousand copies. Deliberations of the state ratifying conventions were sometimes printed in pamphlet form. The best known of these essays, *The Federalist*, went directly from individual newspaper publication to collection in book form in 1788. Another set of Federalist arguments was in the satirical essays and verses of some of the “Connecticut Wits,” a group of Yale graduates who poked fun at those opposing the new constitution in *American Antiquities* and *The Anarchiad*, appearing intermittently in 1786–88. One particular object of their scorn was the governor of New York, George Clinton, probably the most notable anti-Federalist in the North.

THE NEW REPUBLIC, 1789–1800

Following ratification of the Constitution, the new federal government began operating in March 1789. By the end of Washington’s first term as president in March 1793, conflict between the Federalists and an opposition group, the Republicans, had become public. New, fiercely partisan newspapers and numerous pamphlets argued points of public policy, printed

orations and sermons, and marked events such as political anniversaries. The events of the first three presidential administrations, especially those dealing with foreign policy, polarized public opinion, bringing partisan feeling to extraordinary heights. During a foreign policy crisis with France, from 1798 to 1800, at least twenty-nine pamphlets were printed on the Alien and Sedition Acts. At the height of the crisis in 1798, statements in support of President John Adams were frequently printed and widely distributed. Controversialists did not always confine themselves to political questions. In 1797, Alexander Hamilton revealed his adulterous relationship with the wife of a speculator in *Observations on Certain Documents . . .* (Philadelphia, 1797). The speculator was blackmailing Hamilton, resulting in suspicious payments of money. The payments had led to accusations by a scandalmongering journalist, James Thomson Callender (*The American Annual Register . . .* [Philadelphia, 1797]) that Hamilton had dealt illegally in government securities while secretary of the Treasury. Rather than have his public character smeared, Hamilton chose to smear his private reputation and embarrass his wife. Callender later was the first to publish assertions that Thomas Jefferson had fathered children by one of his slaves.

ELECTION OF 1800

The first strongly contested presidential election was that of 1800. A flood of campaign literature issued from both sides—the Federalists, in support of John Adams, and the Republicans, in support of Thomas Jefferson. The Republicans were particularly vocal, criticizing the administration’s measures restricting freedom of press, speech, and assembly. The Federalists decried Jefferson’s presumed atheism and his intellectual predilections, particularly his “unhealthy” interest in foreign philosophies. This was illustrated by a satirical pamphlet by David Daggett, *Sun Beams May Be Extracted from Cucumbers . . .* (New Haven, 1799). Alexander Hamilton made a curious contribution by writing a pamphlet highly critical of Adams, *Letter from Alexander Hamilton Concerning the Public Conduct and Character of John Adams . . .* (New York, 1800). Somewhat illogically, he concluded by strongly advising that readers vote for Adams. After Jefferson and the Republicans won the White House and control of Congress, Republicans focused on organizing the party to ensure future power, printing the proceedings of county and state committees as much to inform voters about Republican leaders as to put forward party policies and achievements, such as the Louisiana Purchase (1803).

During the War of 1812, the Federalists became identified with antiwar, pro-British policies. When the war ended in 1815 with apparent American success, the Federalist Party began to collapse as a national party. Republican propaganda efforts slackened and so did political publishing of all kinds. However, other topics surfaced, and pamphlets presented discussions on slavery and religious questions.

THE NO-PARTY PERIOD, 1816–1828

After Monroe's election in 1816, with only nominal Federalist opposition, the Republicans were able to put forward the notion of a no-party state. Monroe toured New England in the summer of 1817 and later saw to the publication of *A Narrative of a Tour . . . by James Monroe . . .* (Philadelphia, 1818). Implicitly, the Yankees' acclaim showed the death of Federalism. Monroe's reelection in 1820 with no formal opposition and only one negative electoral vote seemed to confirm it. However the disputed election of 1824 started new political divisions.

Although Andrew Jackson of Tennessee received the highest number of electoral and popular votes, he did not have the necessary majority. The House of Representatives elected the runner-up, John Quincy Adams. Immediately Jackson's supporters protested what they saw as a stolen election. During the four years of his presidency, Adams was subjected to negative propaganda, stressing the supposed corruption and undemocratic character of his election. His presumed aristocratic background was emphasized in pamphlets such as *Who Shall Be President? The Hero of New Orleans [Jackson], or John the Second, of the House of Braintree. . . ?* (Boston, 1828). Jackson supporters also penned many pamphlets in common language and illustrated with crude woodcuts calling for direct election by the popular vote. In the months leading up to the election of 1828, when Jackson challenged Adams, pamphlets (and broadsides) accused both candidates of the grossest personal acts in addition to their supposed public crimes. Pamphlets helped bring forth a voter turnout estimated at near 80 percent, electing Jackson. In the succeeding years, the role of pamphlets would wax and wane depending on the needs of the parties.

Political Parties

The emergence of political parties in the United States in the 1790s was anything but preordained. The nation had risen from a colonial structure fearful and mistrustful of formal institutions of political power. James Madison's famous *Federalist* No. 10 (1787) was an indictment of political parties, or "factions," and his sentiment was shared by all major political figures of the day, regardless of ideological predisposition, from Thomas Jefferson to George Washington and John Adams, and even to Alexander Hamilton. The common belief was that parties produced political divisiveness and a general distrust in government, elements that had no place in a free society, especially a nascent one struggling to survive in a world of Great Powers.

At the time of the Constitutional Convention of 1787, these early American leaders believed that the source of good government lay in the creation of sound formal institutions. Specifically, a national Constitution, with explicit powers being granted to legislative, executive, and judicial authorities, along with clear checks and balances, was key. Hard lessons had been learned under the Articles of Confederation, with the national government given little meaningful authority over state governments, a sce-

nario that hindered the collection of taxes, the payment of the postwar debt, and the stability of the nation's defenses, all of which threatened the viability of the great experiment in American democracy. The founders believed that the new federal system, with its allocation of greater authority to the national government, would be sufficient to generate sound and stable policy and produce the sort of good government that was preferred by all.

INSTABILITY IN THE FIRST CONGRESS

Unfortunately, this optimistic view was not to be realized. Upon the convening of the First Congress under the new Constitution in 1789, it became clear that legislative policymaking was anything but stable. Decision making was extremely difficult, as legislative initiatives waxed and waned because of significant instability in voting. Put simply, the nature of policy proposals could be altered easily by the inclusion of amendments, which would change either narrowly or broadly the general thrust of the legislation. This substantive alteration of proposals would then reshape the respective coalitions in support or opposition. Thus, a bill might appear close to passage at one moment; however, after its provisions were altered with an amendment, it would then be defeated. Moreover, decisions themselves were reversible; that is, some bills were in fact passed but were subsequently revisited, altered, and then defeated. Thus, instability reigned in the legislative process. The only way that stable policies were produced was via "vote trades," whereby coalitions would trade support (and votes) across policy areas and agree that eventual decisions were in fact final (and thus not to be revisited). One such case was the famous Jefferson dinner party of 1790, to which Jefferson invited Madison and Hamilton to discuss and finalize a vote trade on the location of the nation's capital and a federal assumption of state debts incurred during and after the Revolution. Yet vote trades were a highly inefficient way of conducting legislative business, since a significant amount of time and effort was needed to negotiate deals on a case-by-case basis.

Underlying the instability in the First Congress was a growing ideological rift on the primary issue dimension that had structured legislative debate and voting, namely the preferred size and scope of the new federal government. While most major political leaders in the early 1790s had been Federalists in the prior decade, supporting stronger national institutions than those under the Articles, differences in perspective existed, and these differences grew over time. Two coalitions subsequently formed, one

around the views of Madison and Jefferson and the other around the views of Hamilton and Adams. The Madison-Jefferson coalition held that the apportionment of authority between the federal and state governments under the Constitution struck the right balance, believing that the increase in centralization was necessary but also that the rights and authority of individual states should remain predominant. The Hamilton-Adams coalition felt the Constitution did not go far enough in centralizing power at the national level, believing that an activist federal government was necessary to build and protect a burgeoning nation. The Hamilton-Adams coalition possessed a majority in the First Congress, but it was unable to realize its policy goals. Whenever a pro-federal majority was close to passing a legislative proposal, members of the Madison-Jefferson coalition tacked on an amendment, adding a local or regional dimension, that upset the fragile majority coalition. Assumption of state debt, which eventually became part of the "dinner party" vote trade, was one such case where the Hamilton-Adams coalition was thwarted. This pattern played itself out across the first session of the First Congress, generating constant instability and frustrating the will of the profederal majority.

THE FIRST PARTY SYSTEM

Eventually, Hamilton devised a plan to overcome the antifederal resistance. His strategy was to adopt a set of informal mechanisms that together would eventually form the structural basis of a political party. At the time, however, Hamilton had no grand scheme of party development in mind; rather, he acted pragmatically in hopes of achieving the more modest goal of organizing the profederal majority into a consistent voting bloc. If this could be accomplished, Hamilton believed, a consistent stream of legislative victories would follow. His strategy took two forms. First, he set up an informal caucus system so that members of the profederal group could come together, discuss strategies, and learn the benefits of coordinating their behavior. The caucus message was that if they organized and acted collectively, they would win more often. Second, Hamilton established floor leaders in both chambers of Congress to further institutionalize the organization. Their role was to prevent the opposition from introducing sectionally based amendments to split his profederal majority, as well as to serve as proto-whips, keeping members of the coalition informed as to goals and strategies and assuring that they would act in concert. By the second session of the First Congress, his plan was in full swing, and by the third

session, the benefits were clear. Specifically, Hamilton pushed through a set of financial measures—a system of taxation, a mint, and a national bank—that expanded the federal system. The first two measures were adopted rather easily, but the bank bill encountered significant opposition. Nevertheless, Hamilton’s profederal majority hung together, staved off amendments, and passed the bill. Organization had led to stability, and stability had yielded legislative victories.

The success of Hamilton’s coalition became abundantly clear to Madison and Jefferson, and by the Second Congress (1791–1793) they had begun to organize an opposition. Moreover, clear labels began to be used to define the individual coalitions, with Hamilton’s group adopting the “Federalist” label and Madison and Jefferson’s group taking on the “Republican” (or “Democratic Republican”) label. Madison, who had once eschewed political parties, now framed them as democratic devices, egalitarian in nature, that could be used for achieving a greater good. More clearly, he framed his Republicans as the “people’s alternative” to the more aristocratic Federalists. Parties, to Madison, were now an essential part of the American experience, crucial to giving diverse groups an equal voice in the political process.

Thus, by the Third Congress (1793–1795), a political party system was in full bloom, specifically an *institutional* party system. That is, a party-in-Congress had developed, with other national features such as a mechanism for presidential nominations (through congressional party caucuses). The other aspects of a modern party system—a party-in-elections, with clear partisan campaigns and mass party identification and linkages, and a party-in-government, with organized and integrated party-based units at the local, state, and national levels—were still decades from developing fully. Still, by the mid-1790s, the beginnings of such aspects were present, such as the emergence of party press organs, the use of party labels in electoral politics, and the rise of party organizations at the national level (like the New York–Virginia alliance).

For the remainder of the 1790s, the partisan schism between the Federalists and Republicans increased steadily. Events such as Jay’s Treaty (1794), the Alien and Sedition Acts (1798), and the Kentucky and Virginia Resolutions (1798) continued to firm up partisan voting blocs in the Fourth (1795–1797), Fifth (1797–1799), and Sixth (1799–1801) Congresses. In terms of majority control, the Federalists reigned supreme for the first dozen years of the federal system, except for losing the House of Representa-

tives briefly to the Republicans in the Fourth Congress. This Federalist domination changed in 1800 and 1801 as Jefferson was elected president (after an electoral stalemate and a thirty-six-ballot election in the lame-duck Sixth House) and the Republicans swept the elections to the Seventh Congress. The Federalists would continue to vie with the Republicans throughout the first decade of the nineteenth century, but their influence would wane substantially. The Federalists’ electoral strength was in the Northeast, a section that became less influential politically as the nation’s population grew and shifted toward the West and South, which were heavily Republican areas. The reapportionment after the 1800 census captured these population trends as the size of the House increased by nearly one-third, with the seat additions occurring almost entirely outside of the Northeast. Nevertheless, the Federalists maintained their organization and continued to serve as the major opposition party to the Republicans through the mid-1810s.

The ending of the Federalist–Republican system, or the First Party System, can be traced to events surrounding the War of 1812 (1812–1815). This second war with Britain was initiated by the War Hawks, a new group of nationalistic Republicans from the West led by House Speaker Henry Clay. The Federalists, on the other hand, with their historic ties to the British, operated as the antiwar party during this period. As such, they actually saw their numbers in Congress and state legislatures increase substantially, thanks to the growing antiwar sentiment in the nation and an uncertain political-economic environment. In December 1814 and January 1815, the Federalists met in Hartford, Connecticut, and denounced the Madison administration and the war with Great Britain. Unfortunately, the Hartford Convention was ill timed, as General Andrew Jackson won the Battle of New Orleans in January 1815, turning the tide of public sentiment toward the war. Very quickly, the Federalist Party was framed as the anti-American Party, as stories of near-treasonous events at Hartford, such as (unfounded) claims of secession proceedings, were reported in the Republican press. The Federalist organization, which had been relatively weak for more than a decade, could not overcome these accusations and slowly disappeared as a viable national party.

AN UNSTABLE ONE-PARTY ERA

Shortly after his election to the presidency in 1816, James Monroe predicted that the country was entering a new period, an Era of Good Feeling. His belief

was that political battles would cease and that cooperation and concession would be the rule, since the Republicans would be operating as the sole national party. Monroe's prediction proved to be inaccurate, however, as this period of one-party rule was anything but amicable. With the Federalists no longer operating as a serious national party, the Republicans lacked a clear foil against which to organize and coordinate. As a result, regional and sectional issues were placed above national issues, leading to rifts within the Republican coalition. In particular, younger Republicans from the West, many of the War Hawk mentality, championed expansionism and a more activist national government (ironically echoing sentiments expressed by the Federalists), putting them at odds with older Republicans from the South, who supported the traditional party positions of states' rights and limited federal power. Congressional voting during this period was highly unstable, stemming from the lack of party discipline, the constant influx of sectional issues, and the general fluidity of members' policy positions. Indeed, the years between 1816 and 1824 have been called the most unstable period in congressional history, with voting patterns often bordering on chaotic.

In time, groups of these Republicans began coalescing around individuals who would become candidates for the presidency in 1824: John Quincy Adams, the secretary of state; William Crawford, the secretary of the Treasury; Henry Clay, the Speaker of the House; and Andrew Jackson, the war hero and U.S. senator from Tennessee. While Crawford would eventually receive the presidential nomination of the congressional caucus in 1823, this mattered little by that time. That is, the caucus nomination had been criticized as undemocratic for more than a decade, leading the other three potential candidates to reject it as politically definitive. Rather, they turned to "the people" for their nominations, as the Tennessee legislature nominated Jackson, the Kentucky legislature nominated Clay, and various groups in New England nominated Adams. As a result, the lead-up to the presidential election of 1824 was significant in opening up the political process, establishing fresh connections between citizens and candidates, and encouraging new and greater participation throughout the nation.

In the end, the presidential election of 1824 was thrown into the House of Representatives, as no candidate received a majority of electoral college votes. The House ballot was held in February 1825, and John Quincy Adams won a bare majority on the first ballot. Adams's winning coalition combined states

loyal to him with states loyal to Henry Clay (who had finished fourth in the popular canvas and thus was excluded from the House ballot). In short order, charges of a "corrupt bargain" between Adams and Clay were reported in the press, made all the more compelling when Adams tapped Clay as his secretary of state. In reality, Adams and Clay were quite close ideologically, leading to a natural (and rational) joining of forces. Moreover, most of the conspiracy charges were manufactured and distributed by Jackson's cronies, with an eye toward the presidential election of 1828. Between 1824 and 1828, the Republican Party would split into Adams and Jackson wings, as Jackson's coalition began building the nation's first mass party organization. Jackson would go on to win the presidential election of 1828, and the Adams-Clay wing of the party would lead the anti-Jackson opposition for the next decade. By the late 1830s, the large group of nominal Republicans would finally split into two mass parties, the Democrats (the former Jackson wing) and the Whigs (the former Adams-Clay wing), and form the Second Party System.

Political Parties and the Press

While it became common in the late century to complain about the news media inserting itself into the political process rather than just observing it, this complaint would have been nonsensical in the early American Republic. From the 1790s through the Civil War and after, the press was in the thick of politics, not just influencing the party system through its coverage habits, but acting as a basic working component of that system, directly accountable for its outcomes. To a very large degree, party politics in this period was newspaper based.

THE PRESS'S INSTITUTIONAL ROLE: FILLING THE PARTY SYSTEM'S GAPS

One reason for this is obvious: party politics requires communication with the electorate, and newspapers and other products of the printing press were the most significant means available technologically in this period. Another reason may be less obvious: the uneven development of the antebellum party system. In one sense, nineteenth-century political parties were far more popular than today's models—voter turnouts were huge, campaign events were a major form of popular entertainment, and people identified with their parties to the point of regularly naming children after presidents, Speakers of the House, and even failed candidates. On a more concrete level, the antebellum parties were almost nonexistent, despite the fact that they competed fiercely in every town, county, and state. Parties were not legally recognized by government, meaning there were no voter registrations, official ballots, national party offices, or formal party leaders in Congress. The parties possessed no permanent institutional structures, to say nothing of the large office buildings, permanent staffs, and wads of money that they acquired later. Formal party institutions like national conventions and committees were late innovations. National, state, and local campaign committees might be formed for a particular campaign, but these tended to go dormant or disappear once the campaign was over and so were unable to shape the party's response to events as they unfolded between elections. Partly because of their institutional insubstantiality, antebellum parties came, went, and radically transformed themselves with alarming frequency.

Newspapers filled the party system's many gaps, providing a fabric that held the parties together between elections and conventions, connected voters and activists to the larger party, and linked the different political levels and geographic regions of the country. Outside of election time, the party organizations themselves consisted of little more than the citizens, politicians, and newspapers that supported them. In this situation, the local party newspapers were the only corporeal or institutional form that the parties had in many communities. A subscription to a partisan newspaper, or regular readership of one in a tavern or reading room, was the only real form of party membership that existed in this age long before voter registration. Newspaper offices often served as the unofficial clubhouses and reading rooms of local parties, and newspaper columns were the major source of party doctrine and strategy for activists and voters alike. No politician, party, or faction believed that they could accomplish anything without a newspaper, and the first sign of a factional split in a party was usually the founding of a new newspaper. Similar observations could be made not just about parties, but about political associations of all kinds, including religious groups, moral reform movements, ethnic communities, and even the Cherokee Nation. Thus, one should think of the early political parties and the political press as not just intimately associated, but fused together as constituent elements of the same system.

The use of newspapers to accomplish political ends had roots in America going as far back as the 1730s, but the press gained its reputation for tremendous political efficacy during the American Revolution. The leading Revolutionaries firmly believed that newspapers were a crucial tool in their efforts to build opposition to the British in the 1760s and 1770s. After the war, the press was crucial in the selling of the new Constitution to the nation in 1787 and 1788. The pro-Constitution newspaper articles by Alexander Hamilton, James Madison, and John Jay became famous as the Federalist Papers. The early Congresses wrote the founders' reliance on newspapers into national policy when they created favorable postage rates for newspapers, arranged to pay certain newspapers to reprint the laws of the United States, and codified the long-standing custom of allowing newspaper printers to exchange newspapers with each other through the mail without charge. This latter practice allowed a host of small weekly newspapers, each with a circulation from a few hundred to a few thousand, to form together a kind of national network. Each printer needed to supply relatively little original material himself, but

anything he did originate had a potentially large audience extending far beyond his local area. When newspapers began to identify with the Democratic Republicans or Federalists, what was in essence a subsidized national system of political communication sprang into being, with each party, and often each faction within each party, eventually gaining outlets in almost all significant places.

THE ORIGINS OF THE PARTY PRESS: THE 1790s

Though the founders set in place many of the policies that made it possible, they certainly did not intend to create a system of partisan journalism. (In fact, they were opposed to political parties in general.) They knew, as George Mason's Virginia Declaration of Rights put it, that "the freedom of the press is one of the greatest bulwarks of liberty," but the particulars of how such a bulwark should function were hazy or nonexistent. John Adams, Samuel Adams, Thomas Jefferson, Alexander Hamilton, and others had made heavy and often sensationalistic use of the press in the movement for independence from Great Britain. Yet despite their experience rousing the rabble with newspapers and pamphlets, the founders do not seem to have envisioned agitprop as the future of the American press.

Instead, Secretary of the Treasury Alexander Hamilton and his "aegis," President George Washington, began their government under the new Constitution in 1789 with the assumption that all they needed to do regarding newspapers was provide the people with basic information about the government's activities such as laws that had been passed and a presidential speech or two. Thus, it seemed more than enough when Boston businessman John Fenno showed up in the national capital and started the *Gazette of the United States*, a would-be national newspaper intended to "endear the general government to the people" by printing documents and congressional proceedings, along with letters, essays, and even poetry hailing President Washington and Vice President John Adams as gods among men.

Anyone who remembered the vicious newspaper wars of the Revolution, the kind that still occasionally broke out in local politics, might have predicted that the U.S. political press would not remain so gauzy and one-sided. When fundamental disagreements broke out among the leading members of the cabinet, it was only natural that the combatants reached for journalistic weapons. Secretary of State Thomas Jefferson became convinced that Secretary of the Treasury Alexander Hamilton was leading the administration in a dangerously pro-British and an-

tidemocratic direction. Jefferson, however, could not lead the opposition himself and still remain within the administration or retain his status as a respectable statesman. He needed a surrogate, so he and James Madison helped create a newspaper, Philip Freneau's *National Gazette*, to lead the public charge against Hamilton's policies. It was in the *National Gazette's* pages that the idea of an opposition political party was first floated; when exposed as the *National Gazette's* sponsor and confronted by President Washington, Jefferson claimed that Freneau's paper had "saved our constitution" from Hamilton.

The *National Gazette*, which folded in 1793, set a precedent that would be followed again and again in the following century as politicians and parties looked to newspapers as their primary public champions in the bruising battles that followed the Jefferson-Hamilton split. The Philadelphia *Aurora*, founded by Benjamin Franklin Bache, grandson of Benjamin Franklin, took over as the leading Jeffersonian paper and around it developed a loose national network of local newspapers that spread the opposition movement's ideas around the country by copying from each other. The Adams administration tried to crush this network with the Alien and Sedition Acts in 1798, but the attempt backfired. So many printers, politicians, and citizens were outraged by this blatant attempt to destroy press freedom for political gain that the Jeffersonian newspaper network got even bigger, despite the fact that all the most prominent opposition papers were hit and numerous editors jailed or ruined.

Unlike the media of the late-twentieth- and early-twenty-first centuries, early American newspapers usually did not claim to be "fair and balanced," especially after the Alien and Sedition Acts. Firmly believing that their political beliefs were right and the other party's was wrong, editors refused to run their newspapers as though those differences did not matter: the press was too powerful a medium to allow evil ideas to pass through it unchallenged. The New York *American Citizen*, one of the new papers that appeared in the wake of the Sedition Act, editorialized that it could not be impartial in the battle between Adams's Federalists and Jefferson's Republicans: "If by impartiality, it is intended to convey an idea of equal attachment to aristocracy as to republicanism, then this paper rejects an impartiality so ruinous to the best interests of mankind."

NEWSPAPERS AND POLITICS AFTER 1800

Jefferson's victory in the election of 1800, by some measures the first peaceful transfer of power be-

tween ideologically opposed parties in world history, was a watershed in the growth of press-based politics. People at the time were deeply impressed with what the Republican press network was able to accomplish, often flatly attributing to the newspapers not only Jefferson's victory, but also some kind of deeper democratic awakening of the people to the defense and exercise of their rights. "Had it not been for the patriotic exertions . . . of Republican Papers," declared the Trenton *True American*, "the People would have indulged their love of peace and quiet, until the yoke of tyranny would have been insidiously fixed on their necks." From 1800 on, it was more or less accepted that no serious political movement or candidacy could afford to be without a newspaper network like Jefferson's. Without newspapers, a group of politicians or activists were nothing but "uninfluential atoms," one of Aaron Burr's supporters wrote, with "no rallying point" or visible public presence.

As valuable as newspaper networks were, financing them was always a problem, since the basic purpose of seriously partisan newspapers was building political support rather than making money. Party supporters were urged to buy subscriptions (the main way that most newspapers were sold), but this was rarely enough to keep outlets going in every small town. The difference was made up by politicizing the process of printing government documents. There were no public printing agencies, so the work was contracted out—often at generous rates—by party officeholders to allied newspaper publishers.

After the election of 1800, the first business of any party, faction, candidate, or movement was to establish newspapers or recruit existing ones. For instance, when the New York City mayor DeWitt Clinton sought control of New York state politics (with designs on the presidency), he raised \$27,000 to start Clintonian newspapers all over the state. Martin Van Buren's Bucktail faction eventually won the state back, partly through assiduous efforts to develop a Bucktail newspaper network. Within a few years, the Bucktails had forty-nine journals in their camp.

In the chaotic race to succeed President James Monroe in 1824, all five major hopefuls banked on newspaper support. Secretary of War John C. Calhoun had an "understanding" with the *Washington Republican*, while Secretary of State John Quincy Adams looked to the *National Journal*. Secretary of the Treasury William Crawford had the *Washington Gazette* in his camp, in addition to several of the most widely read papers in other regions, including the New York *National Advocate* and Thomas Ritchie's

Richmond Enquirer, the "national" newspaper of the South. Speaker of the House Henry Clay tried to start his own Washington paper but failed, relying instead on a network of papers back home in the Ohio Valley and the partial support of the *National Intelligencer*, the major organ of the Jefferson and Madison administrations.

A MEDIA-MADE PRESIDENT

If there was ever a media-made president, it had to be Andrew Jackson. A popular biography and song ("The Hunters of Kentucky") about his war exploits first brought Jackson to prominence, and Pennsylvania newspaper editors John McFarland and Stephen Simpson invented Jackson as a serious presidential candidate in 1823. When Adams won the election of 1824 over Jackson through an alleged corrupt bargain in Congress, Jackson supporters mounted a newspaper campaign that surpassed even what had been done for Jefferson. Thomas Ritchie's *Enquirer* threw in its support, and a new Jackson journal, the *United States Telegraph*, appeared in Washington. By 1828 every major city and town had a Jacksonian paper, and many new journals appeared, even in obscure places like Easton, Pennsylvania, and Vevay, Indiana, especially for the campaign.

Jackson's presidency marked a major turning point in the history of media politics. Understanding exactly the role that newspaper editors played in his campaigns, Jackson publicly expressed his gratitude to the newspapers that supported him by appointing at least seventy journalists to federal offices and allowing several key editors to play crucial roles in his administration. Among the leading members of Jackson's Kitchen Cabinet, the group of unofficial advisers that some historians have called the first White House staff, were three newspaper editors, including Kentucky editor Amos Kendall, who wrote many of Jackson's speeches and later became postmaster general, and Francis Preston Blair, a Kentuckian brought in to edit a new administration paper, the *Washington Globe*, when the *Telegraph's* loyalty came into question. Blair became one of nineteenth-century Washington's preeminent political figures, spanning decades and administrations much like the lawyer-lobbyist-fixers of the twentieth century.

After Jackson, more and more newspapers became involved in each succeeding campaign, and more and more editors in each succeeding administration, with similar trends occurring in most states. By the 1830s, journalists were starting to run for office in their own right. Hundreds would serve in Con-

gress, and thousands more in positions from postmaster and state legislator to the highest posts in the land. This convergence of parties and the press was most evident between the turn of the nineteenth century and the Civil War, but it remained strong in many rural locations until the twentieth century.

Though always remaining close, the media-politics relationship nevertheless changed a great deal over that period. Like everything else in American life, newspaper politics was severely affected by the industrial and corporate revolution that began during the 1830s and 1840s and reached its peak at the turn of the twentieth century. Vast amounts of money flowed into the political system as campaigning expanded and businessmen sought the myriad benefits that government had to offer. Banks, real estate speculators, and transportation companies (especially railroads) led the way, seeking land grants, financial aid, lenient laws, and favorable decisions on their interests.

The new campaign money flowed especially into the newspaper business. It became increasingly common for local party leaders to publish special newspapers that were wholly devoted to politics and existed only for the duration of the campaign, typically from the early summer to November of a presidential election year. The practice began in 1828 with a few pro- and anti-Jackson papers, including *Truth's Advocate and Monthly Anti-Jackson Expositor*, which spread the tale of Jackson's allegedly bigamous marriage that the president believed killed his wife. The trend exploded during the infamous "Log Cabin Campaign" of 1840, when the new Whig Party, armed with generous funds from the business interests that tended to favor it over the Democrats, created nearly one hundred campaign newspapers across the country as part of their effort to give their candidate, Virginia-born aristocrat William Henry Harrison, the image of a hard-drinking, hard-fighting frontier Indian fighter like Andrew Jackson.

THE MYTH OF THE PENNY PRESS

Despite their focus on news reporting, the new mass-circulation papers that emerged in the 1830s—the so-called penny press—were just as partisan as the party journals, and often much more so because their financial independence from party politics relieved their publishers of any real accountability for their editorial policies. These new journals were sold on the street rather than only by subscription, at a much lower price point that allowed sales of hundreds of thousands copies. Print runs of this magnitude were made possible only by new steam-driven

presses. Outrageous political rhetoric became one more way to entertain readers and boost circulation, and the political independence that penny press lords like James Gordon Bennett of the *New York Herald* preened themselves over often amounted only to the ability to support violently a president or policy one week and then turn around and bash it just as hard the next. The New York penny press also spawned a crop of millionaire celebrity editors who were considerably better known than most of the high-ranking political officeholders of the day. Horace Greeley of the *New York Tribune*, a printer, U.S. representative, and presidential candidate as well as the country's most influential publisher, is the best remembered of these celebrity editors.

The new mass-circulation papers bragged that they had opened up newspaper reading to the masses for the first time and made the press a greater force for political and cultural democracy than ever before. But there was one important way in which this was not true at all: the role of money. Local weekly newspapers were relatively cheap and easy to start; with a one-room shop and some basic equipment, a lone printer and one or two boy apprentices could manage it, and start-up costs could stay in three figures, within reach of an ordinary workman who saved a little money or borrowed from local politicians. The local partisan press thus could be an avenue for relatively ordinary young men to pursue their political beliefs and ambitions. Mass-circulation newspapers, on the other hand, required millions of dollars to start, and that meant banks, investors, and a fundamentally profit-oriented mentality. Though the press was still the only means that the government and politicians had to communicate with the mass of voters, at the highest levels this political role was no longer its reason for being. Grassroots democracy probably suffered as a result.

Political Patronage

Political patronage was an ageless institution, well developed even in the American colonies' earliest years. The British crown routinely appointed court favorites and family to positions of place, power, and emolument. Lord Cornbury, the cross-dressing cousin of Queen Anne in the early eighteenth century, was appointed royal governor of New York, a way for the politically embarrassed monarch to put an ocean between herself and a source of scandalous behavior.

PLACEMEN IN THE COLONIAL ERA

It was a commonplace occurrence by the time of the American Revolution for "placemen" to be appointed to lucrative positions to further political ends. A notorious example, but not an isolated one, was the designation in 1765 of Andrew Oliver as Massachusetts Bay's collector of the new and despised stamp tax. He was named to this post of vast potential profit by Governor Thomas Hutchinson; Oliver was his brother-in-law and a key figure in the Bay Colony's "Court" interest, a designation for Massachusetts's political elite.

When one of the earliest Revolutionary-era crowds reacted to the stamp tax by burning Oliver's house to the ground and then torched Governor Hutchinson's when he reacted by calling out the militia, the events stood as a symbol of many things, one of them being the mob's reaction to entrenched political power rewarding those close to it with lucrative patronage. The Revolution, and then the ensuing U.S. Constitution, which completed the establishment of the new nation, did not end this species of maintaining political privilege through high appointive office. By 1789, in fact, patronage was already a way of life in establishing a new governing network under the just-implemented Constitution. Alexander Hamilton, as secretary of the Treasury and the leader of the Federalist Party, brilliantly adapted the old patronage system to the workings of a self-governing Republic dependent on popular support. The new two-party system inaugurated in the 1790s would include party patronage as an important foundation of political control, regardless of which party was in power. This system operated in the states individually as well as in the federal government. The 1790s, then, saw the new incarnation of an old system, one that would endure for a century.

AFTER THE REVOLUTION

President George Washington was implicitly a supporter of Hamilton's Federalist Party patronage initiatives, and the second president, John Adams, was overtly complicit. Over five hundred party men found their way into federal offices in the respective states in the 1790s, and dozens more held official positions in Philadelphia, the nation's first capital. Both the U.S. Customs Service (1789) and the first Internal Revenue Service (1791) were homes to hundreds of party operatives. As the newly inaugurated President John Adams said in 1797, "if the officers of government will not support it, who will?" The appointees were politically active Federalists, members of the elite, and often veterans of the Continental Army. They worked in their home port cities for Customs and in smaller towns and villages in the backcountry for Internal Revenue in all states.

Postmasters. The most overtly political placeholders were postmasters. The number of weekly newspapers multiplied from less than one hundred in 1789 to more than eight hundred by 1800, a response to the needs of both emerging parties. The Federalists and the Jeffersonian Republicans both lined up printers in the states to establish gazettes overtly aligned with party. The Federalists had the upper hand initially, so perhaps fifty Hamiltonian printers were made postmasters. Party support of partisan newspapers was tangible. Under federal laws, for example, printer-postmasters could frank (send free of postal charge) their papers to subscribers each week, and post offices in print shops created built-in custom—in the form of those who picked up their newspapers weekly—by acting as booksellers and stationers as well as printers.

The nationally renowned printer and publisher, Isaiah Thomas, editor of the Worcester, Massachusetts, *Spy*, was a case in point. His printing establishment was made a federal post office in 1789. Already a local Federalist Party figure, he was able to expand his publishing business, and from his shop he issued a stream of Federalist-oriented publications. The business also trained journeymen printers who apprenticed with Thomas and went on to found party newspapers of their own in various towns in the Northeast; four of them were rewarded in turn with postmasterships to help them as they began their careers.

The Jeffersonian sweep. In 1801 the newly elected president, Thomas Jefferson, having turned the Federalists out of office, needed no prodding to both remove entrenched Federalists from the civil service and replace them with Republican Party men in their

stead. Despite Jefferson's inaugural moderation ("We are all Republicans; we are all Federalists") he displaced scores of opponents in the federal establishment and filled the posts with his own party supporters. President Jefferson even took political patronage a giant step further, unhinging the judiciary and transforming the federal bench at all levels from entirely Federalist-oriented to a slightly more Jeffersonian character. He started with John Adams's last-minute ("midnight") appointees to the new U.S. Circuit Court of Appeals sitting in the several states. The new president was able to get away with the removals of judges appointed for life because the Federalist-dominated U.S. Supreme Court under Chief Justice John Marshall felt it lacked the political clout to oppose Jefferson.

Jefferson also swept the Customs Service clean of Federalists, and did the same with the Internal Revenue Service and the Post Office. He even removed one of the nation's most skilled and experienced diplomats, John Quincy Adams, from federal service. Jefferson brought political patronage to a new level of both sophistication and scope. The Jeffersonian Republicans' "Virginia Dynasty," which ruled for the next quarter century into the Age of Jackson, firmly maintained its principle of using federal office for party purposes. Needless to say, the states, cities, and even small communities across America did the same. Jacksonian Democratic Party men at the end of the 1820s may have coined the term "spoils system," conferring on institutionalized political patronage a new national visibility, but they did not invent the party-oriented use of jobs as political rewards.

Political Thought

American political thought during the era of the Revolution and early Republic was provincial and derivative. No major theoretical works were produced in this period, with the possible and problematic exception of *The Federalist Papers*, newspaper essays by “Publius” (Alexander Hamilton, James Madison, and John Jay) designed to influence the outcome of the debate over New York’s ratification of the federal Constitution. An enormous amount of political writing flowed from American presses, largely in the short, polemical, ad hoc form of newspaper essays and broadsides, and much less frequently as more sustained arguments in pamphlets or books (and these often appeared originally in newspapers). Because this writing was intended to shape public opinion and promote political and military mobilization, it rarely challenged the conventional wisdom or “common sense” of the people. Even when American writers such as Thomas Paine or Thomas Jefferson pushed for radical action, they invoked “self-evident” truths. The Revolutionaries’ conceit was that they were bridging the yawning gap between progressive public opinion—codified in the great treatises of Enlightenment political science—and the benighted institutions and practices of a corrupt old regime. Their success depended on exaggerating the people’s wisdom—and on suppressing and disguising their own originality.

Yet the prevailing view that the Revolutionaries were conservative, practical-minded statesmen is misleading. As Americans justified the break with Britain, constituted new polities on the basis of popular consent, and sought to perfect a federal system that would serve as a peace plan for their state-republics, they developed a new political science that would have a profound impact on thought and practice throughout the West. That provincial Anglo-Americans should derive so many of their ideas from European sources generally and British sources particularly is hardly surprising. The novelty and significance of their contributions to political thought and practice pivoted on that provincialism: in reconceptualizing relations between center and periphery, metropolis and province, the European world and the world beyond Europe, Revolutionary Americans precociously addressed the fundamental problems of modern politics. Rejecting traditional monarchical, hierarchical, and corporatist conceptions of authority, they developed a new conception of popular sovereignty and national self-determination. Revolting against metropolitan despotism, they linked the defense of provincial liberties—the traditional

bastion of entrenched aristocratic privilege—with the radical expansion of popular political participation. Freed from the shackles of imperial rule and the constraints of mercantilism, they devoted their best and most original thinking to interstate relations, within and beyond their new republican empire.

METROPOLITAN INFLUENCES

The major source of political thought for pre-Revolutionary Americans was the British constitutional tradition. Anglo-Americans basked in the reflected glory of a constitution that secured the rule of law by separation of powers and limitations on executive prerogative. But their favorite British writers, oppositionist critics of ministerial corruption, taught that a free people must always be vigilant in defense of their liberties. The tension between the oppositionists’ self-consciously “classical republican” conception of citizenship and modern political realities was particularly acute on the provincial periphery of the British Empire. As the imperial crisis deepened, Americans discovered that they had no effective voice or influence in the British government: because the empire had no true “constitution,” American subjects of George III were powerless to secure their rights. Patriots thus seized on the radical writings of John Trenchard and Thomas Gordon (who published a series of letters, signed only “Cato,” in a London newspaper), Lord Bolingbroke (Henry St. John), and other “real Whigs” who suggested that the ultimate source of legitimate authority was in the “people” themselves. Real Whigs warned that the “sovereignty” of king-in-parliament jeopardized traditional British liberties. American patriots took real Whig logic to another level, arguing that royal and parliamentary efforts to reform imperial administration would subvert colonial “constitutions” that secured the rights of their respective “peoples” to liberty, property, and self-government. A great debate over the constitution of the empire as a whole thus gave rise to corporate constitutional claims in the separate colonies, and this is where the Americans diverged from even their most sympathetic metropolitan friends. British radicals (unsuccessfully) pushed for parliamentary reform, seeking to make the national legislature more representative and responsive—and never questioning the unity of the British nation. American radicals moved in the opposite direction, distinguishing the sovereign people—or peoples—from their governments and securing the corporate integrity of distinct state-republics.

Americans remained indebted to the English common law tradition after independence, but could

draw little practical inspiration from British constitutionalism. The very idea that a constitution could be written (and revised) was itself a bold departure from the British constitutional tradition. At best, the idealized misrepresentation of the British constitution in the works of opposition writers and Enlightenment savants such as Montesquieu (Charles de Secondat)—whose *Spirit of the Laws* (1748) exaggerated the separation of powers—offered a set of general principles that could guide the work of American constitution writers. The most influential body of political and constitutional theory for the Revolutionaries came out of the Scottish Enlightenment. In addition to the seminal work of the great English theorist John Locke, whose *Second Treatise on Government* (1689–1690) was the classic statement of “liberal” social contract theory, the Revolutionaries built on the continental natural jurisprudence of Hugo Grotius and Samuel Pufendorf, Frances Hutcheson, Lord Kames (Henry Home), David Hume, Adam Smith, and other Scottish moral philosophers. These theorists provided a broad theoretical and historical framework for the formation of new political societies on the western side of the Atlantic.

The Scots shared the Americans’ provincial perspective, and their experience since incorporation in the United Kingdom (1707) showed how enterprising people on the periphery could prosper in an expanding Atlantic economy. Unlike the Scots, the Americans would not be incorporated in a greater Britain (though Adam Smith urged such a union in his *Wealth of Nations* [1776]). But they would find Scottish Enlightenment ideas about human nature, political economy, and historical progress congenial. Dependent on a vigorous foreign trade for their very existence, Americans eagerly embraced the idea that commercial exchange and the resulting progress of politeness offered a new template for social and political relations grounded in reciprocity and consent. The Americans’ political and constitutional experiments depended on the demystification—and destruction—of traditional, organic, and hierarchical conceptions of legitimate authority. The Enlightenment generally, and Scots theorists particularly, helped eager American readers clear away the conceptual rubbish and locate the American Revolution in the broader context of the history of civilization. The Scots’ conception of progress through time was critical for provincial Americans who sought to overcome the traditional liabilities of their remote peripheral position, far from metropolitan centers of civility and authority.

Smith and other Scottish writers argued that history was marked by progress through four successive stages of development, from primitive societies of hunters and gatherers, to pastoral, agricultural, and advanced commercial societies. Movement across the Atlantic brought civilized Europeans into contact with savage Native Americans, still living under primitive conditions. Enlightened students of natural history such as the Frenchman Charles LeClerc, Comte du Buffon, concluded that the persistence of New World savagery—and the alleged “degeneracy” of Creole (people of European descent born in the West Indies or Spanish America) populations—indicated that the American environment could not sustain advanced civilization. Mobilizing empirical data on the size of animals to refute the degeneracy thesis, Jefferson’s *Notes on the State of Virginia* (1787) offered a much more optimistic reading. If provincial American civilization had not yet reached the metropolitan standard, the future prospects for a fertile and bountiful New World were boundless. Revolutionaries contrasted this potential with the obstacles to further progress in Europe, where corrupt and avaricious regimes and vast disparities in wealth and privilege stifled enterprise. If America’s native peoples represented the human race’s primitive, yet still uncorrupted past, the continent’s infinite bounty augured a brilliant future: there was land enough, Jefferson claimed in his First Inaugural Address, for the “thousandth to the thousandth generation.”

Enlightenment writers enabled provincial Americans to locate their new societies at the cutting edge of history and so overcome their distance from the centers of political and cultural authority. Commentators on the law of nations provided a more concrete set of guidelines for claiming an independent place in the world. In 1776 Europe constituted the civilized world, and distant and dependent colonies could participate in that world only through membership in European empires. But law of nations writers such as the Swiss Emerich de Vattel, whose *Law of Nations or the Principles of Natural Law Applied . . . to the Affairs of Nations* (1758) was the most influential treatise, showed how legitimate governments, acting on behalf of their respective nations or peoples, could gain recognition from other governments, negotiate alliances, and promote the rule of law for an expanding society of nations. The Revolutionaries’ first great challenge was to destroy monarchical authority and constitute new republican regimes. But leaving the British Empire did not mean turning away from the European world; to the contrary, in claiming a “separate and equal station” among “the powers of the earth” (to quote the Declaration of Indepen-

dence) the new nation would move closer to civilized Europe.

AMERICAN CONSTITUTIONS

The most enduring American contribution to the history of political thought grew out of constitution writing in the Revolutionary years. Controversy over the provisions of state constitutions and over procedures for implementing them raised and resolved fundamental questions of political legitimacy in the new American republics. The Massachusetts Constitution of 1780, drafted by John Adams, provided the template for subsequent charters: specially chosen delegates, meeting in convention, drafted a document that was submitted to the people (organized within their respective towns) for their approval. The genius of this approach—dictated by the failure of a previous effort to ratify a state constitution in 1778—was to implicate the people in each stage of the process while clearly distinguishing constitution writing from ordinary legislation. In the great treatises in the social contract tradition, the “state of nature” was merely notional, a time out of mind when society was first formed: for all practical purposes, the existence of the “people” thus constituted could be taken for granted. But the dissolution of monarchical rule in America threatened anarchy and disorder, compelling Americans to form new polities on the basis of explicit consent. Paine and other Enlightened republicans claimed that “society” was natural and spontaneous and that the elimination of a corrupt imperial government would clear the way for self-government. Such bold pronouncements could not allay fundamental anxieties about the Revolutionary assault on legitimate authority, nor did they explain precisely how the “people” would govern themselves or define exactly who the people were (as separatist new state movements in Vermont and elsewhere made painfully clear). The state constitutions resolved these dilemmas by a combination of transparency and mystification: on one hand, constitution writing became a kind of spectacle as the people observed themselves enacting their new republican regimes; on the other, in a mystifying circularity, constitutions constituted the very peoples who enacted the constitutional spectacle by specifying state boundaries and defining civic communities.

State constitution writers followed more familiar scripts in organizing new governments. John Adams provided an influential primer for constitutionalists in his *Thoughts on Government* (1776), recommending bicameral legislatures and the functional separation and balance of governmental powers.

Authors of new state constitutions invoked the precepts of Enlightenment political science as they elaborated the relationship between citizens, their legislative representatives, and executive authority. The first great American treatise on politics, Adams’s massive *Defense of the Constitutions of Government of the United States of America* (1786–1787), located the state constitutions within the long European constitutional tradition, implicitly downplaying the radicalism of the Revolutionary assumption of authority. Adams’s compendium of historical sources, leavened by his astute, often mordant commentary on human nature, won him few readers, but it did capture the practical, even antitheoretical spirit of American constitutional statecraft.

The state constitutions’ chief novelty was their very existence as written documents, subject to the people’s ratification and amendment. By making this consent foundational, the new republican regimes replaced the traditional subject, who owed lifelong allegiance to his sovereign in exchange for protection, by a new kind of active, consenting citizen who, with his fellow citizens, was himself the source of legitimate authority and who retained the right to move from one country to another. In a famous letter to James Madison (6 September 1789), Jefferson drew the logical conclusion, that “the earth belongs to the living” and that each generation was like “an independent nation” with respect to others, preceding and succeeding. In other words, every generation—that is, every people, bounded in time as well as space—should draft its own constitution. The tension between Adams’s conception of constitutional continuity and Jefferson’s bold articulation of popular sovereignty—and constitutional discontinuity—provided the framework for the subsequent development of American political thought.

State constitution writers drew on colonial experience as well as Enlightenment political science. The state charters in turn provided the delegates who convened in Philadelphia in the summer of 1787 with models for a new federal Constitution. But establishing “a more perfect union” required the framers to meet new challenges. If the demands of collective security required a more “energetic” central government, the separate state-republics sought guarantees of their respective rights and interests. The sorry history of Congress under the Articles of Confederation suggested that a weak alliance would ultimately collapse into an anarchic system of sovereign states, thus Europeanizing American politics. But most Americans were equally wary of the opposite extreme, the consolidation of authority—and the

destruction of the states—in a new American version of British imperial despotism or “universal monarchy.” During the ratification debates, Federalist supporters of the new regime celebrated the framers’ “miraculous” achievement in avoiding these disastrous extremes. American federalism represented a breakthrough in the history of political civilization, a radical improvement on the European balance of power that guaranteed peace among the states by substituting appeals to law for appeals to arms and by promoting the development of harmonious, interdependent interests. The authors of *The Federalist Papers* offered the most comprehensive analysis of the new regime, asserting that this “compound republic” (*Federalist* 51) system met the highest standards of constitutionalism, as developed in the state charters, while best securing the fundamental interests of the states. But anti-Federalists, fearful of encroachments on states’ rights and individual liberties, were skeptical. When the new government was initiated in 1789, their skepticism took the form of a vigilant strict constructionism: the Constitution might be as “perfect” as its advocates had claimed, but it would remain so only if the administration scrupulously observed the letter and spirit of limited constitutional government.

UNION

Federalism constituted the boldest departure in Revolutionary American political thought and practice. The new federal Union enabled Americans to combine the advantages of responsive, local, decentralized government with the concentration of power in a central government that could keep the counterrevolutionary great powers of the Old World at bay. Montesquieu had argued that a virtuous republican government could only survive in a small polity. American Federalists countered that the republican principle was equally applicable to a *community* of republics, and that, as Jefferson claimed in his Second Inaugural Address, there was no limit to “the extent to which the federative principle may operate effectively.” According to the most enthusiastic Revolutionaries, the Americans’ new federal regime, with republican governments at every level, offered a model world order. Thus in 1799 Joel Barlow, a political ally and confidant of Jefferson, urged the European states to follow the American (and French) example by establishing republican regimes and creating a federal union that might appropriately “assume the name of the United States of Europe.” Such hopes for the political regeneration of the Old World were hard to sustain in a period of chronic warfare that constantly jeopardized the New

World’s peace and security. But Americans of all political persuasions learned to cherish the Union as a bulwark against foreign threats—and as the only effectual curb on centrifugal tendencies that otherwise threatened to unleash “the dogs of war” at home.

Yet it was by no means clear in practice what the survival of the Union required. On one hand, Alexander Hamilton and fellow Federalist state-builders sought to construct a powerful fiscal-military federal state capable of defending and projecting American interests in an increasingly dangerous, war-torn world. In response, oppositionist Republicans warned that the preponderance of federal power and the threat of coercion against recalcitrant states would weaken the Union. Montesquieu taught that the genius of a large unitary state was necessarily despotic, and his teachings took on the aura of prophecy during the Adams administration’s military mobilization against France in the Quasi-War (1798–1800). Only by fully embracing the republican logic of consent and eschewing conventional conceptions of state power could the American experiment survive and prosper. Only then, as Jefferson asserted in his First Inaugural Address, would the United States fulfill its promise as “the strongest Government on earth.”

Jefferson had a point. His emphasis on the consensual foundations of the Union pointed to the future of modern nation-states with homogenous populations of (legally) equal citizens willing to make the ultimate sacrifice. But his anti-statist, libertarian tendencies also gave a powerful impetus to fearful defenders of provincial rights who, with the anti-Federalist Patrick Henry, “smelled a rat” in all efforts to strengthen the central government. After the embarrassments of the War of 1812, Henry Clay and other reform-minded National Republicans sought to square neo-Hamiltonian prescriptions for energetic federal government with Jeffersonian scruples about concentrated power. In doing so, however, they provoked an orthodox Jeffersonian, or Old Republican, reaction. The irascible agrarian theorist and Virginia politician John Taylor, known as John Taylor of Caroline, produced the most sustained and influential works in the history of American political thought since *The Federalist*, including *An Inquiry into the Principles and Policy and Government of the United States* (1814), *Constitutions Construed* (1820), *Tyranny Unmasked* (1822), and *New Views of the Constitution* (1823).

Over the remaining decades of the antebellum period, American political thinkers focused their energies on narrowly construed and polarizing ques-

tions of constitutional interpretation. The framers' optimistic hopes for the union as a new order for the ages—and as a model world order—gave way to an increasingly bitter debate about the distribution of costs and benefits along sectional and sectoral lines that ultimately led to the Union's destruction.

PONTIAC'S WAR While the official dates of Pontiac's War are listed as from 1763 to 1776, the conflict emerged out of a tangled web of economic, cultural, and diplomatic issues that extended as far back as the arrival of the first European settlers and lasted, effectively, until 1813 with the death of Tecumseh. The web was spun from the struggles enfolding English, French, and various Indian groups in North America during the seventeenth and eighteenth centuries. With the expulsion of the French in the wake of the French and Indian War (1754–1763), the British were faced with a pan-Indian uprising that stretched all the way from the Great Lakes region to South Carolina and that challenged British control of the land between the Mississippi River and the Appalachian Mountains.

While there are numerous long-term causes, the immediate reasons for Pontiac's rebellion lay in English diplomatic blunders as well as in deep-seated Indian religious beliefs. In the aftermath of the French and Indian War, initial efforts by the English to establish a relationship with the former Indian allies of the French failed horribly. Sir Jeffrey Amherst, director of British efforts in North America, allowed British colonists to flood westward, thus violating the policies of the Proclamation of 1763 designed to protect Indian lands. Additionally, Amherst simultaneously scaled back British aid to Native Americans in an effort to cut costs and to make these native groups more self-sufficient.

In the face of ongoing English failings and increasing land pressures, Pontiac—an Ottawa "great chief"—began to agitate against the European presence. Drawing on the anxiety of the people and on the religious teachings of Neolin, a Delaware prophet, Pontiac called for a rejection of all things European in an effort to purify the peoples of North America, claiming that continued reliance on European goods would lead to the destruction of Indian peoples. Pon-

tiac's message called not only for the rejection of European goods, but also for the expulsion of the British Americans themselves from North America.

Pontiac's forces met with a great deal of success in the early stages of the conflict, destroying almost every British outpost in the Great Lakes region and forcing British American settlers back across the Appalachian Mountains. The planned opening of Pontiac's War was a surprise attack on Fort Detroit in April of 1763. News of this plan was leaked, however, and the British forces were prepared for Pontiac's arrival. When his initial plan failed, Pontiac laid siege to the fort, destroying outlying farms hoping to starve out Fort Detroit's occupants. Despite an eight-month siege, the British held onto the fort for the duration of the conflict. Although successful in defending Detroit, the English forces did not fare as well throughout the rest of the Great Lakes region. Pontiac's forces managed to capture British forts Sandusky and Presque Isle on Lake Erie, Fort Michilimackinac at the junction of Lake Huron and Lake Michigan and Fort Miamis (present-day Fort Wayne, Indiana). The conflict was extremely brutal on both sides, and it was only through exploiting tribal divisions that the British were able to bring an official end to the conflict in 1766. The terms of the peace settlement, provided Pontiac with amnesty in return for acknowledging the authority of the British government. Following the agreement, Pontiac settled near the Mississippi River, only to be murdered a short time later. Despite the settlement with the various tribes, the British government found itself deep in debt and unable to control its colonists as they continued to clamor for western lands. These pressures, as the British attempted to stand between the Indians and the colonists, contributed significantly to the coming of the American Revolution. Ultimately, the American victory over the British in that war left the Indians with a new adversary—the United States government. In the decades following the Revolution, the experience of the American government echoed that of the British during Pontiac's War as a new pan-Indian uprising led by Tecumseh challenged the authority of the new nation.

POPULAR SOVEREIGNTY Few Revolutionary concepts are expressed as succinctly as the principle contained in the first three words of the United States Constitution: "We, the people." By this simple phrasing the federal Constitution institutionalized the "revolution principle" that had rejected the sovereignty of king-in-parliament and replaced it with a structure embodying the sovereignty of the people assembled in conventions and implemented in republican political institutions. Trying to condense his lectures on American law into basic principles, the lawyer and politician James Wilson (1742–1798) found it in popular sovereignty. "Permit me to mention one great principle, the *vital* principle I may well call it, which diffuses animation and vigor through all the others," he explained. "The principle I mean is this, that the supreme or sovereign power resides in the citizens at large." From—or upon—that principle rested the justification for the major achievements of the Revolution: a government that was limited, whose representatives were directly responsible and accountable to their constituents, and in which powers were checked and balanced by function as well as between the states and a central authority.

In its initial practical application in the newly independent states, however, the theory of popular sovereignty had created unanticipated political crises that endangered the survival of republican government. With suffrage expanded, residency required of representatives, and frequent elections, the reformed state legislatures claimed to be a faithful reflection of the popular will. Thus legitimated in their assumption of unmediated political authority based on popular sovereignty, they exercised their powers often erratically and without restraint, threatening property and civil liberties and generating fear for the future of republican government. The cure for the ex-

cesses of popular sovereignty was actually more popular sovereignty, though reconstituted in a federal framework that used the concept as a foundation for changes in the structure of government as revolutionary as anything attempted in 1776. Federalists urging ratification of the Constitution thus rallied behind the maxim, "All power is in the people, and not in the state governments."

In so doing, however, they were not simply redistributing political authority between national and local units, but rather simultaneously enhancing and limiting it at both levels. Vesting all power in the undifferentiated "people" and then shaping political institutions to embody their will constituted the American revolution principle. British government was vested in the king-in-parliament, a structure that embodied the body politic as three distinct "orders," the king, the aristocracy, and the democracy. In a system of "mixed government," each order protected its interest, or estate, against the others. This arrangement did not check power, however, because the actual institutions of government operated without effectual restraint. It was against such a concentration of effectively indivisible sovereign authority as achieved by king-in-parliament that Americans had rebelled, and in place of which they had vainly sought to implement popular sovereignty since 1776.

It was the achievement of the Philadelphia Convention to put this concept into practical form in 1787 and to embody the previously amorphous principle of popular sovereignty in a written structure. Wilson tried to assure doubters that all political authority was limited by what he called the "great truth . . . that in the United States the people retain the supreme power" and reserve the right to restrain or empower government as they see fit. To skeptics who demanded a Bill of Rights, James Madison responded with a proposed declaration that included language "that all power is vested in, and consequently derived from the people." Madison's suggestion was not used, but it had correctly identified the means of putting Revolutionary ideas into practice. Reiterating the American revolution principle that founded all power in all the people, the framers produced a government in which each functional branch of government possessed clearly delimited authority but drew it directly from the sovereignty of the people. The result was government of balanced and limited powers derived from all the people rather than government of mixed social and legal orders possessing ill-defined powers. As "Publius," the pseudonymous author of *The Federalist* explained, the new

American nation was a "compound republic" in which "the power surrendered by the people is first divided between two distinct [state and federal] governments, and then the portion allotted to each subdivided among distinct and separate departments." To each only a portion of the people's sovereignty was allotted, and each was subject to the people. In justifying judicial review, for example, Alexander Hamilton rejected the criticism that it assumed "a superiority of the judicial to the legislative power. It only supposes that the power of the people is superior to both." Popular sovereignty had established fundamental law, which the courts were to interpose to restrain other branches from exceeding the will of the people.

The legitimizing of government as the genuine expression of popular sovereignty, however, subtly but significantly changed American constitutionalism. In his Farewell Address, George Washington lauded a government as resting on popular sovereignty. But he spoke in a political atmosphere of conflict and challenge to many of the actions of his Federalist Party. Washington's words (written for him by Hamilton) testified to the new mantle of popular sovereignty claimed by government in the new Republic—a claim not accepted by all, and even opposed with violence by some. The sovereignty of "the people out of doors," the collective acts of groups deemed mobs by the British but championed as constitutional expressions of the popular will in the 1770s, now lacked the legitimacy of the people as embodied in formal constitutional institutions created under the mantle of popular sovereignty. Washington thus went on to explain that "the constitution which at any time exists till changed by an explicit and authentic act of the whole people is sacredly obligatory upon all. The very idea of the power and the right of the people to establish government presupposes the duty of every individual to obey the established government." With popular sovereignty ratified and given form in written constitutions, the conflict of power and liberty was transformed into contests over politics, government, and law in the new nation.

POST OFFICE "Among the improvements in the United States, there is, perhaps, no one that has advanced more rapidly, or proved more extensively useful, than that of the transportation of the mail." So wrote a contributor in 1810 to the *Port Folio*, a Philadelphia-based literary magazine. Elaborating on his claim, the essayist credited the Post Office Department with an indispensable role in the creation of a geographically extensive public sphere. "In point of public utility, it holds a rank but little inferior to printing. Copies may be multiplied at the press, but, without this establishment, how limited must be their distribution!"

The essayist's observations highlighted a dimension of public life in the United States during the early Republic that is sometimes overlooked. In the decades following the adoption of the federal Constitution, the United States underwent a communications revolution that had enduring consequences for American public and private life. This revolution was predicated on the elaboration of the long-distance information infrastructure: the postal system, the stagecoach industry, and the periodical press. It was fostered by innovative legislation that included the Copyright Act of 1790, the free press guarantees in the federal and state constitutions, and the federal Land Ordinance of 1785. And it was set in motion by the Post Office Act of 1792, a landmark in American communications policy and one of the most far-

reaching pieces of federal legislation to have been enacted in the half-century following the adoption of the federal Constitution.

GROWTH OF THE POST OFFICE

In 1788 the Post Office Department boasted a mere sixty-nine offices, only two more than the sixty-seven offices maintained by the royal postal system in 1765. Most were located in a single seaboard chain on what is today the "Old Post Road," just as they had been prior to the break with the crown. No periodical received a government subsidy and few circulated in the mail. Although postal administrators sometimes permitted printers to trade copies of their newspapers, this practice was merely customary and lacked the force of law. The Post Office Department, as one postal administrator explained in 1788, had been established by Congress "for the purpose of facilitating commercial correspondence," and, as such, had, "properly speaking, no connection with the press."

In the great constitutional debates (1787–1788), few contemporaries regarded the limited character of long-distance communications as a major problem. James Madison articulated the conventional wisdom when, in his *Federalist* essays, he presumed that ordinary Americans would receive the bulk of their information about public affairs when their representatives returned to their home districts to meet constituents face-to-face. In *Federalist 10*, Madison went so far as to hail poor long-distance communications as a safeguard for minority rights. The enormous geographical extent of the country, he conjectured, prevented majoritarian factions from organizing across state boundaries to tyrannize the few.

Madison took for granted the limited facilities for long-distance communications then in existence. At that time, ordinary Americans living far from Philadelphia learned only sporadically about the activities of their congressional delegates. When information did arrive, it often came courtesy of individual delegates, who had the right to transmit or "frank" through the mail an unlimited number of items, making them de facto news brokers for the public.

The only public figure in the 1780s to propose a significant augmentation in the facilities for long-distance communications was the physician Benjamin Rush. To adapt the "principles, morals, and manners of our citizens to our republican form of government," Rush proclaimed in a widely circulated essay published shortly before the Constitutional Convention, it was "absolutely necessary" that the

government circulate “knowledge of every kind . . . through every part of the United States.” Rush hailed the Post Office Department as the “true non-electric wire of government” and the “only means” of “conveying light and heat to every individual in the federal commonwealth.”

With the passage of the Post Office Act of 1792, Rush’s vision acquired a legal imprimatur. To expand access to information on public affairs, Congress admitted every newspaper into the mail at extremely low rates. To ensure that the news was broadcast far and wide, it established an administrative mechanism that guaranteed the rapid extension of the postal network into the hinterland. And to safeguard the sanctity of personal correspondence, it proscribed its surveillance by postal administrators, ending a practice that remained common in Great Britain and France.

No issue proved more contentious than the designation of new post routes. Some wanted to retain this power in the executive, others to shift it to Congress. In the end, proponents of congressional control prevailed. By retaining control, Congress established a legislatively mandated entitlement that was broadly egalitarian and easily adjusted to keep pace with the expansion in the area of settlement. From 1792 onward, popular pressure ensured the expansion of the postal network well in advance of commercial demand. No single piece of legislation did more to create a geographically extensive public sphere.

THE PROLIFERATION OF PRINTED MATTER

Government newspaper subsidies gave printers ample reason to increase their supply. By 1794 newspapers made up fully 70 percent of the weight of the mail, while generating a mere 3 percent of postal revenue. By 1832 newspapers accounted for an astonishing 95 percent of the weight of the mail, but only 15 percent of postal revenue. Without this substantial federal subsidy for the press, the United States could not have emerged in the early Republic as the leading publisher of newspapers in the world. Federal postal policy was particularly instrumental in spurring the rise of the rural or “country” press, which had been virtually nonexistent before 1792.

After 1794 magazines enjoyed an analogous subsidy and received a parallel boost. By the 1830s postal patrons enjoyed a wide range of reading matter that ranged from learned essays in the *North American Review* to fashion tips in the *Lady’s Book*. Writers of imaginative fiction like Edgar Allan Poe, Catherine Sedgwick, and Nathaniel Hawthorne took

advantage of this new literary venue to invent the modern short story. Though fiction-writers preferred to publish books, the steady influx of British imports reduced their marketability in urban centers, as did the proscription of books from the mail in the hinterland. Not until 1851, after the coming of the railroad, was this ban relaxed.

Federal postal policy also encouraged the proliferation of pamphlets, congressional speeches, and government reports. In any given year, public documents constituted approximately one quarter of all the imprints published in the United States. During presidential campaigns, electioneering tracts made up a substantial fraction of the total weight of the mail.

The only form of literary production that postal policy discouraged was letter-writing. The cost of postage on a single letter, which was customarily paid by the recipient, could easily total 50 cents, a substantial sum at a time when a laborer might make one dollar a day. Prior to the 1830s, the high cost of letter postage troubled few Americans, since correspondents (the vast majority of whom were merchants) were presumed to be able to cover the cost. Personal correspondence, of course, was by no means unknown. As one country curate noted in 1820, “a few days carries a communication with mathematical certainty from one point of the Union to the other. Distance is thus reduced to contiguity; and the ink is scarcely dry, or the wax cold on the paper, before we find in our hands, even at a distance of hundreds of miles, a transcript of our dearest friend’s mind.” Judging by lists of unclaimed mail that newspapers routinely ran, women posted as many as 20 percent of all the letters in the mail. Yet if an ordinary American received anything in the mail in the period between 1792 and 1840, it was more likely to have been a newspaper than a letter.

Just as postal policy favored certain literary forms, and not others, so too it hastened the creation of a particular kind of informational environment. In 1800 the postal network included 903 offices; in 1810, 2,300; in 1820, 4,500; in 1828, 7,641. The resulting informational environment was more decentralized—and less biased toward major commercial centers—than its counterpart in Great Britain or France. After 1800 the national capital ceased to be a major newspaper-publishing center, a situation inconceivable in Europe. By 1828 the United States had seventy-four post offices for every 100,000 inhabitants, as compared to seventeen in Great Britain and four in France. Even some hinterland congressmen concluded that the postal network was complete. Yet

Congress opted not to improve mail delivery in urban centers, which remained rudimentary, but instead to press for even better stagecoach service in the South and West. To boost the stagecoach industry, Congress encouraged the postmaster general to lavish generous contracts on stagecoach proprietors.

Throughout the early Republic, it remained illegal for any public officer to open personal correspondence. (The only exception was undelivered mail, which could be opened by a special class of postal administrators known as dead-letter clerks.) The prohibition on government surveillance extended, at least initially, to newspapers, pamphlets, and magazines. Had Congress found it possible in 1798 to enlist government functionaries to police the mailbags—a practice common in Europe—it would have had less need to pass a sedition act to check the spread of malicious ideas. Critics of the Alien and Sedition Acts, such as Thomas Jefferson, preferred to leave the regulation of printed matter to the states.

THE IMPACT ON TRADE AND PUBLIC LIFE

Nowhere were the implications of the communications revolution more fundamental than in the conduct of American trade. Long before the railroad created a national market for goods, the federal government established a national market for information. To move crops to market, merchants relied on the Post Office Department to transmit orders and even banknotes, all of which went uninsured. The high-speed transmission of market information was such a priority that Congress refused to suspend the transportation of the mail on the Sabbath, or even to permit localities to suspend the opening of the post office on this day, an incursion into local autonomy that troubled many, and that prompted the first large-scale petition effort in American history.

Equally far-reaching were the consequences of the communications revolution for public life. After 1792 the public sphere was no longer limited to the relatively small number of people located close to the seats of power, such as Philadelphia or a New England town; rather, it came to be located in the minds and hearts of millions of people. Party strategists relied on the improved facilities for long-distance communications to build the mass party; Evangelicals established voluntary associations on a nationwide scale. When Madison published his *Federalist* essays in 1788, public opinion had yet to emerge as a major category in political theory. By the time the French political theorist Alexis de Tocqueville visited the United States in 1831, it had become a keystone of the new “science of politics” for a democratic age. As

Tocqueville observed in *Democracy in America* (1835; 1840), “there is no French province in which the inhabitants knew each other as well as do the thirteen million men spread over the extent of the United States.” This new, disembodied public sphere was dramatized by painters like John Lewis Krimmel, whose *Village Tavern* (1814) portrayed a crowd awaiting the arrival of the mail at a village post office during the War of 1812.

The principal beneficiaries of this new informational environment were the white men who dominated the electorate. Losers included women, slaves, and free blacks. Discouraged from participating in public affairs, they risked harassment every time they ventured into the post office to pick up their mail. Still, by empowering ordinary white men to join together in countless post offices to discuss public affairs, the federal government had helped establish a national community that a generation of men would fight and die for in the Civil War. Long before the advent of the steam railroad and the electric telegraph, the postal system, the stagecoach industry, and the periodical press had prepared the way for the emergence of the United States, in the twentieth century, as the most powerful media empire in the modern world.

POVERTY Historians have disagreed since the 1960s about the extent of poverty in early America. Social historians have eroded the traditional vision of colonial America as a land of opportunity with grim demographic studies of the widening gap between rich and poor in the eighteenth century and detailed examinations of the lives of ordinary people, indentured servants, and slaves. Late-twentieth-century scholarship has offered a vision of early America in which increasing population decreased the size and viability of landholdings, and promoted impoverished tenancy, especially in the South, as a lifelong state rather than a temporary condition to be corrected by hard work and frugality or moving to the frontier. Ideological conflict among historians is not dissimilar to colonial and early republican ambivalence about economic and political independence, civic responsibility, and the possibility of economic mobility and social advancement for the new country's citizens. The concern of early Americans about the proper shape and character of colonial and early republican society was reflected in debates about the moral character of applicants for poor relief and increasing interest in making distinctions between the poor worthy of support ("worthy" or "deserving" poor) and those who required moral reform as well as public assistance ("vicious" or "unworthy" poor).

When English people first moved to the colonies, the problems of helpless poor citizens, unemployment, and the transient poor moved with them, as did ideas about addressing these difficulties. The colonies modeled their earliest relief practice on the English Poor Laws. Township boards of overseers administered relief, and while relief legislation and administration policies were fairly uniform across counties and within regions, individual communities tended to administer relief on a case-by-case basis, with considerable range in the extent to which they enforced residence and conduct requirements, allowed visitors, and allowed inmates to leave the grounds. In addition to variation between communi-

ties, individual towns and townships sometimes switched from "putting out" paupers individually to boarding them collectively and then back again, depending on how many paupers required support.

COLLECTIVE AND INDIVIDUAL APPROACHES

In the collective system all paupers not receiving "outdoor" relief (assistance in cash or goods given to paupers or the relatives caring for them) were boarded in a house rented or purchased by the township. A member of the township board or someone hired for that purpose, usually the individual providing the lowest bid for cost of the paupers' support for the year, administered the almshouse. In exchange for a set sum, the steward or overseer provided all food, clothing, and shelter for the town's paupers for the year. In some cases medical care was contracted for separately. The able-bodied generally worked on the almshouse premises or on the overseer's farm. Amounts to be refunded to the local government should any of the paupers die during the course of the year were agreed upon in advance.

Under the "putting out" system the paupers were assigned individually to private households, preferably to those of relatives or friends; some households boarded two paupers at once. These "putting out" agreements were renegotiated every year, which could result in individual paupers being shifted from household to household. These arrangements existed side-by-side with cash payments to individuals or to their families on a quarterly basis as outdoor relief.

GROWING NUMBERS OF POOR

By the mid-eighteenth century, poverty was becoming a matter of increasing public concern: increasing numbers of poor people receiving public assistance in cities were joined by growing numbers of dependent poor in nonurban areas. While private charity offered by individuals and by benevolent and religious organizations continued to grow in the eighteenth century, such aid could not keep pace with the growing number of poor people in need. Worse still from an administrator's perspective, many of the people swelling the relief rolls (and prompting increased poor taxes) were not the traditional "worthy" poor (widows, orphans, the sick, the elderly, the disabled, the insane); instead, they were able-bodied but unemployed. Many of these able-bodied unemployed were members of a growing class of landless men who had failed to inherit or acquire land and were forced to hire themselves out as tenants or unskilled laborers. Because women's ability to own property

and act as independent economic entities was restricted by both custom and law, and because women were primarily responsible for child rearing, women were more vulnerable to destitution than men. Thus, another growing category of applicants for relief was women whose husbands had died or abandoned them and who were unable to secure work or subsist on assistance from friends and relatives. Transients in need presented a growing problem for overseers of the poor in both cities and non-urban communities throughout the second half of the eighteenth century. The care of transients strained existing relief resources, especially in periods of epidemic disease such as the yellow fever that devastated Philadelphia in 1741 and 1793, and ravaged Philadelphia, Boston and New York periodically through the 1790s. The inadequacy of existing social welfare resources, especially in urban areas, prompted the creation of poor relief policies that stressed legal residence as a requirement for receiving relief. Paupers who did not qualify as residents could be warned out of town in rural areas, or transported to their counties of residence in order to make room for qualifying members of the community or destitute immigrants. Conflicts like King William's War (1689-1697), the Seven Years' War (1755-1763), and the American Revolution temporarily slowed high rates of immigration, but produced widows, orphans, and veterans that needed care and contributed to the instability of local economies.

AN INSTITUTIONAL RESPONSE

By the late seventeenth century, cities such as Boston (by 1685) and New York (1730s) began to turn to institutions as a more effective way to care for the growing numbers of urban poor. Communities adopted institution-based relief for two reasons: first, because institutional care could be more easily monitored for efficient administration, and second, because institutions offered a setting within which (ideally) the lives and characters of relief recipients could be shaped according to prevailing ideas of appropriate behavior. The first almshouses were usually houses rented or purchased with money from the poor taxes, and poor people were housed there under the care of an overseer and matron. In many communities (New York City's surrounding counties, for example) these poorhouses coexisted with the older "outdoor" relief system.

Poorhouses were important parts of the political, economic, and social lives of their communities. In addition to aiding the poor, poorhouses served as

employers for many of the working poor who would otherwise have become inmates, conducted business with their neighbors, and were lightning rods for controversies over the expenditure of public funds, the outcome of local elections, responses to epidemics, and other issues of public concern.

By the mid-1830s, larger cities such as Boston, New York, and Philadelphia and the towns and cities in their environs had moved to almshouses as their primary response to the problems of poverty in an economically and socially unstable environment. Almshouses occupied an important place in the imaginations of communities throughout the nineteenth century, and they played an important role in the definition of community identity. As places of refuge and employment, sources of object lessons and the temporary homes of objects of pity, almshouses appeared in paintings amid bucolic rural scenery, were embroidered on children's samplers, and were both praised and vilified in the local press. Visitors conducted personal business with the institutions' overseers, evaluated the standards of care for inmates, observed the expenditure of public funds, and contemplated the fragility of material prosperity.

The shift to institutional care for the poor coincided in much of the country with a shift to institutional care for the insane and the construction of the first state penitentiaries. An institution-based system would remain the standard for poor relief for the rest of the nineteenth century and beyond.

PRESBYTERIANS Presbyterianism in early America traced its origins to the Reformed wing of the sixteenth-century Protestant Reformation, and particularly to the teachings of the Swiss theologian John Calvin (1509–1564). Reformed Protestants believed that God was in control, or was “sovereign,” over all of his creation; that human beings by nature were sinners or “depraved”; and that God, as an act of grace, chose to save, or “redeem,” some of his sinful creation through the sacrificial death of Jesus Christ. The Reformed tradition taught that human beings, because of their depravity, were incapable of obtaining salvation apart from a sovereign God who, before the creation of the world, predestined or elected those who would be saved and those who would be damned.

In opposition to the Roman Catholic Church, Presbyterians, like most Protestants, reduced the number of sacraments from seven to two, namely infant baptism and the Lord’s Supper, or communion. Unlike Catholicism, which taught that baptism regenerated an infant by washing away original sin, British Presbyterians believed baptism served as the infant’s initiation into the community faith in the hopes that God would regenerate the child at a later time. Presbyterians rejected the Catholic Mass, affirming that communion was a memorial of the

death of Christ, not a sacrament in which the bread and the wine actually became the body and blood of Christ.

What distinguished Presbyterians from other Reformed Protestants were their views on how the church should be governed. Unlike early New England Puritans who invested power in individual congregations, Presbyterians placed religious authority in the hands of presbyteries. Presbyteries consisted of the clergy and appointed lay representatives from a particular geographical region. A presbytery was responsible for appointing ministers to vacant pulpits, enforcing church discipline, monitoring the financial state of congregations, and educating ministers and laymen and -women. While presbyteries presided over the regular activity of Presbyterian life, they were held accountable by synods (made up of all the presbyteries in a geographical region) and, after 1789, the General Assembly (made up of all American synods).

COLONIAL YEARS

Though Presbyterians could be found throughout the British American colonies, they were concentrated in New Jersey and Pennsylvania. In 1706 eight ministers, led by Francis Makemie, the so-called father of American Presbyterianism, met in Philadelphia to establish the first American presbytery. Dur-

ing its first two decades, this presbytery was faced with the task of merging two distinct forms of early American Presbyterianism into a unified religious body. The earliest Presbyterian congregations in America were made up of clergymen and settlers who migrated to the New Jersey–Philadelphia region from New England. Many of these Presbyterians were descendants of New England Puritans who had adopted a presbyterian form of church government. The other group of Presbyterians was Scots–Irish in ethnic makeup. These were Presbyterians who migrated from Scotland to Ireland and then migrated again from Ireland to America searching for new land and opportunity or else fleeing persecution under the Test Act of 1704, which prohibited all dissenting (non-Anglican) forms of Protestantism in Ireland. The Scots–Irish, or Ulster Presbyterians, would dominate the church in America well into the nineteenth century.

New England–style Presbyterians, who were prevalent in the New Jersey congregations at Newark, Elizabethtown, Woodbridge, and Fairfield, tended to stress personal piety and an adherence to the teachings of the Bible as the sole rule of faith and practice. Scots–Irish Presbyterians, while not neglecting the importance of piety and the Bible, required that ministers subscribe to the Westminster Confession of Faith and Catechism (1647)—a statement of Presbyterian belief that served as a theological litmus test for membership in Scotland’s national church (the Church of Scotland). These differences resulted in several controversies within the early American Presbyterian Church until they were resolved by a compromise between the two groups in 1729 called the Adopting Act.

In 1716 two new presbyteries had been formed at Long Island and New Castle, and the seventeen Presbyterian clergymen then ministering in America formed the Philadelphia General Synod one year later. With the controversy over subscription largely alleviated, early American Presbyterians now became divided over the issue of revivalism. As the first Great Awakening—an evangelical Protestant revival that stressed immediate conversion and aggressive evangelization—made its way throughout the colonies, Presbyterians debated how the church should respond to this new religious phenomenon. Some ministers, known as New Siders, emphasized the importance of personal conversion or the “new birth” as an essential element of the Christian life. William Tennent (1673–1746), the Presbyterian minister at Neshaminy, Pennsylvania, began training clergymen at his Log College to take up the mantle of this

evangelical form of Christianity. His son, Gilbert Tennent (1703–1764), the minister of the New Brunswick, New Jersey, church, traveled throughout the region informing fellow clergy members of their spiritual “deadness” apart from a “born-again” experience.

Not all Presbyterians, however, embraced this Great Awakening. Known as the Old Side faction, Presbyterians such as Francis Alison (1705–1779), who ran an academy in New London, Pennsylvania, believed that this new emphasis on immediate conversion and personal piety undermined the historic Presbyterian commitment to a rational brand of Protestantism informed by the teachings of the Westminster Confession. They criticized the Log College men for making religious experience, rather than the strict adherence to theological standards, the most important qualification for those seeking ordination in the church. In 1738 the Old Side gained control of the Philadelphia Synod and three years later expelled the New Side New Brunswick Presbytery for its continued ordination of clergymen (many of them Log College men) who did not have formal degrees from a European college or from Yale or Harvard. As a result, the nearly one hundred congregations of the Presbyterian Church in British colonial America would remain formally divided between Old Side and New Side factions until they were reunited in 1758.

The first Great Awakening resulted in an increased demand for clergymen who upheld the New Side commitments to the importance of the new birth and experimental piety. Several New Side clergymen sought to alleviate this demand by establishing a college in Elizabethtown, New Jersey, in 1746. Jonathan Dickinson, the minister at Elizabethtown and a New Side sympathizer, was chosen as the first president. Dickinson died in 1747; the second president, Aaron Burr (father of the future vice president), moved the college to Princeton, New Jersey. The College of New Jersey (later Princeton University) would be the first major institution of higher education in the mid-Atlantic region and, under the direction of New Side presidents, would serve as a bastion of eighteenth-century evangelical Presbyterianism.

THE AMERICAN REVOLUTION

As some in the British colonies began to rethink their relationship to England after the Seven Years’ War (1756–1763), Presbyterians became some of the most outspoken proponents of American independence. Official Presbyterian pronouncements on the American Revolution stressed the defense of liberty—

especially religious liberty—against an English government which, they believed, was undermining freedom. Presbyterians understood the American Revolution in moral terms. They believed that for the Revolution to be successful, the American colonists needed to be willing to sacrifice their own self-interest for the greater good of the Revolutionary cause. Presbyterian ministers urged their congregations to confess personal sins and, more broadly, to repent of public sins that might hinder God from answering their prayers for independence and religious liberty.

The College of New Jersey at Princeton became the primary center of Presbyterian Revolutionary activity. In 1768 the college appointed John Witherspoon as its sixth president. Witherspoon transformed the college into a school focused on the training of statesmen and politicians for leadership roles in the new American Republic. During the 1770s students at Princeton (with Witherspoon's approval) engaged in a variety of responses to supposed British tyranny. They wore homespun robes at commencement ceremonies to protest the importation of British-made clothing and staged a tea party similar to the one that occurred in Boston Harbor in 1773. Witherspoon was an outspoken clerical voice in support of revolution, publishing sermons and tracts connecting religious liberty with political independence from England. He was an active member of the Continental Congress, serving from 1776 to 1782, and was the only clergyman to sign the Declaration of Independence.

With the American victory in the War for Independence, Presbyterians began plans to construct a national church. In 1780 the church maintained over 400 congregations under the umbrella of the Synod of New York and Philadelphia, which had been established in 1758 after the New Side–Old Side reunion. With Presbyterian churches forming throughout the new Republic, including many in the southern states and on the frontier, administrative changes were essential. In 1789 the First General Assembly of the Presbyterian Church in the United States met in Philadelphia. The General Assembly would serve as the unifying agent for four newly designed synods—New York–New Jersey, Philadelphia, Virginia, and the Carolinas—sixteen presbyteries, 177 ministers, and 419 congregations.

THE EARLY AMERICAN REPUBLIC

Presbyterians entered the nineteenth century with a new governmental structure in place and a renewed vision for spreading their Reformed faith throughout

the frontier regions of the American Republic. In 1801 the church joined with the Congregationalists of New England in a Plan of Union designed to share the burden of missionary activity in the West. They were also influential in the early years of a new national revival often referred to as the Second Great Awakening. James McGready, a Presbyterian clergyman from Kentucky, led several religious revivals at frontier gatherings known as camp meetings. These revivals, the most famous of which was held in Cane Ridge, Kentucky, in 1801, gained a reputation for the religious enthusiasm of the participants. Reports described new converts falling down, “jerking,” and even barking under the influence of evangelical preaching. In the North, the Second Great Awakening was spread by Charles Grandison Finney (1792–1875), another Presbyterian minister. Finney challenged the traditional Calvinist understanding of a religious revival by suggesting that all human beings had the potential, if they performed the correct procedures, or “measures,” to initiate an awakening of God’s people.

Like the first Great Awakening, the Second Great Awakening also bred controversy. As an increasing number of converts embraced the evangelical gospel, it became clear that for many American Protestants a conversion experience was now becoming a more important sign of authentic Christianity than rational assent to the particular confessional beliefs of a specific denomination. Presbyterian critics of the revival pointed to the 1801 Plan of Union and the ecumenical flavor of the frontier camp meetings as an example of the broad evangelical cooperation that undermined the distinctive beliefs of traditional Presbyterianism.

Moreover, Presbyterian revivalists such as Finney were advocating a theology of conversion that celebrated individual free will. The idea that human beings had the potential to choose whether to accept or reject the gospel meshed very well with the democratic values that were beginning to define the nation in the early nineteenth century, but it largely undermined the traditional Calvinist idea that individual salvation and corporate revival were the works of God, not men or women. Divisions over these issues would eventually lead to another major split in the Presbyterian Church in 1837. New School Presbyterians were those who supported the revivals and cooperation with other evangelical denominations in the spread of the Awakening. Old School Presbyterians opposed the revivals and became staunch defenders of traditional Presbyterian orthodoxy as articu-

lated in the Westminster Confession of Faith and other Reformed confessions.

Early national Presbyterians also began establishing theological seminaries. The number of ministerial students at the College of New Jersey had diminished considerably since the American Revolution, and Presbyterian leaders saw the need to develop a separate theological school designed solely for ministerial preparation. In 1811 the General Assembly approved the opening of Princeton Theological Seminary. Archibald Alexander became the first professor at the new seminary and Princeton would develop a reputation throughout the nineteenth century as a theological stronghold of Old School Presbyterianism. Shortly after the founding of Princeton, the General Assembly opened Auburn Theological Seminary in New York, Union Theological Seminary in Virginia, and Columbia Theological Seminary in South Carolina.

As the Presbyterian Church entered the pre-Civil War era, it remained divided over how to preserve a historically confessional faith defined by limits, order, and subscription to the Westminster standards in an American religious culture becoming increasingly defined by individualism, opportunity, freedom of choice, and democracy. In addition to these theological and cultural differences, regional divisions over the institution of slavery would also rack the church. Many of these theological, moral, and regional disagreements would not be resolved until the twentieth century.

PRESIDENCY, THE

This entry consists of seven separate articles: *Overview*, *George Washington*, *John Adams*, *Thomas Jefferson*, *James Madison*, *James Monroe*, and *John Quincy Adams*.

Overview

The first sentence of Article II of the Constitution (1787) states, "The executive Power shall be vested in a President of the United States of America." The nature and scope of the presidency depends, in large measure, on the meaning and connotations of the words "executive power." The discussion of the executive department early in the Federal Convention of 1787 resulted, James Madison recorded, for the only time during the convention, in a "considerable pause." The topic was so important, and so unsettled, that the convention seemed "unprepared for any decision on it." What was there, in the previous understanding and experience of the members, that might have caused such uncertainty about the executive? How was this unpreparedness resolved in order to form Article II of the Constitution? And how did the conduct and understanding of the first six presidents (through 1829) give shape to the office that, at the start of the twenty-first century, is generally acknowledged to be the most powerful and important in the world?

TRADITIONAL CONCEPTS OF LEADERSHIP

Leaders, those who exercised executive power, in the eighteenth century and for ages before that, were ordinarily monarchs or chieftains who were supposed to rule in the interests of all "their" people and to be above factions, regional or special interests, and aristocratic family privilege. Instead, they were to be guided by wise moral precepts defined as natural

law, God's word and will, the mandate of heaven, immemorial custom, or some other version of higher law. The biblical prophet Samuel or his anointed King David, Pericles of Athens, the Roman emperor Trajan, Queen Elizabeth I of England, and King Henry IV of France were the often-praised and -studied exemplars in the West. Each was deemed great and good, and his or her realm blessed, because each was seen as disinterested, intent on ruling according to the welfare of the polity as a whole, eschewing factional bias, dynastic ambition, personal gain, or any other corrupt (partial, selfish) motive. Jezebel, Alcibiades, Catiline, the emperor Nero, and Richard III of England were for opposite reasons reviled as bad rulers. Thus, nearly all political philosophy and nearly all history teaching by example before the eighteenth century judged political life qualitatively by results, not procedurally by the number who ruled.

At the time of the American founding, moreover, the word "democracy" still had its Aristotelian connotations of demagoguery, mob rule, and inevitable decline first to anarchy and then to tyranny. The fondest hope for improving the lives of the people of a nation rested in a benevolent despotism of the sort upheld by Frederick the Great of Prussia or Catherine the Great of Russia. Since government could best be improved through the good character and wisdom of the ruler, much attention was given to the education of the prince who would hold power. John Adams, Thomas Jefferson, and other early American leaders were familiar with famous books on that subject by St. Thomas Aquinas, Erasmus, Cicero, and rather oppositely and perversely, Machiavelli. Plutarch's *Parallel Lives* served the same purpose.

In the minds of those who fashioned the executive office at the Federal Convention of 1787, then, were long-admired examples of good leadership and learned works explaining how such leaders might be obtained or cultivated—as well as equally long-hallowed arguments that democracy, any sort of direct government by the people, led inexorably to opposite results. The task of the convention, and of government in the new nation, was to resolve this dilemma: Could self-government somehow be organized to achieve good government? The footprints of this question are all over the efforts of the convention to frame executive power and the attempts of the first six presidents to conduct their new office.

THE REVOLUTION AND EXECUTIVE LEADERSHIP

The immediate context of the quandaries over executive authority was the struggle with its exercise by King George III, his ministers, and the colonial gover-

nors that led to the American Revolution (1775–1783). When George III seemed to persist in tyrannical measures despite Patrick Henry's warning that he might thus share the fate of the tyrants Caesar and Charles I, when Lord North and other ministers manipulated Parliament to ignore utterly colonial interests, and when governors such as Thomas Hutchinson of Massachusetts and Lord Dunmore of Virginia prorogued legislatures and called in occupying British soldiers, the North American colonists saw arbitrary executive power as the very face of tyranny. Fear of executive power in general, and emphasis on legislative power as an antidote, were thus the monitory lessons of Revolutionary struggle. As a result, many of the constitutions of the newly independent states created very weak governors, hemmed in by councils, legislative election, and severely limited function, while the Articles of Confederation (1781) provided for no executive authority at all except that formed by statute of the Continental Congress itself and thus of course subordinate to the Congress.

Along with the widespread disgust regarding arbitrarily exercised executive power, however, a powerful tradition of respect for active, public-spirited leadership persisted in Anglo-America. It was conveyed, Alison G. Olson has noted, in a pattern of thought in England "stretching from the country gentlemen of the 1630s through Shaftesbury, the Tory writers of Queen Anne's time, and Bolingbroke, to Jefferson" that emphasized both a "country agrarian populism" and a need for patriot leadership to stand above the commercial spirit, favoritism, and factionalism (*Anglo-American Politics, 1660–1775*, p. 174). Robert Walpole, Britain's first real prime minister, was generally understood to embody this rule by parties. Henry St. John, Lord Bolingbroke, condemned him as "the Minister [who] preaches corruption aloud and constantly, like the impudent missionary of vice" as he manipulated Parliament and the king to exalt the interests of the Whig oligarchs then making Britain into the world's richest and most powerful nation. By "corruption" Bolingbroke meant not only bribery, theft, and so on, but any intention that sought, deliberately or otherwise, the selfish benefit of any person, class, or group rather than the public good; the opposite, to seek the public good, was what eighteenth-century political thinking meant by virtue, the essential quality of good government whether by one, the few, or the many.

In a tract entitled *The Idea of a Patriot King* (1738), Bolingbroke condemned Machiavelli explicitly for requiring of the prince "no more than the appearance of virtue" rather than possession of real vir-

tue and for extolling not genuine wisdom, but merely its counterfeit, cunning. Bolingbroke insisted that a patriot king would “purge . . . the crowds of spies, parasites, and sycophants [who] surround the throne under the patronage of [corrupt] ministers.” After choosing virtuous advisers, the king would “govern like the common father of his people,” as in a patriarchal family where “the head and all the members are united by one common interest and animated by one common spirit.” Such a monarch could “renew the spirit of liberty” in the minds of his people by banishing “corruption [as] . . . an expedient of government, [and] . . . set the passions of their hearts on the side of liberty and good government.” The public good and the welfare of the people, Bolingbroke explained, might come from good executive leadership that could overcome the corrupt and factional tendencies of ministerial and parliamentary government. Under such a patriot leader, “concord will appear, brooding peace and prosperity on the happy land, joy sitting in every face, content in every heart, a people unoppressed, undisturbed, unalarmed, busy to improve their private property and the public stock.” Americans connected this idealized model with their hopes (soon shattered) on the accession of George III in 1760 that he might be the patriot king who would banish ministerial misrule of the colonies. Present at his coronation in London, Benjamin Franklin hoped the new, young king’s “virtue and . . . sincere Intentions . . . [would] make his People happy; will give him Firmness and Steadiness in his Measures.” Thinking of the good such a monarch might accomplish, Franklin recalled an old Latin saying, “*Ad Exemplum Regis, etc.*,” meaning, in a full version, “the manners of the world are formed after the example of the King; nor can edicts influence the human understanding, so much as the life of the ruler.” John Adams, reading George III’s first speech to Parliament in 1761, noted his promise to “patronize Religion, Virtue, the British Name and Constitution, in Church and State, the subjects’ Rights, Liberty, Commerce, Military Merit—these are the sentiments worthy of a King—a Patriot King.” Fourteen years later, on the eve of the Battle of Bunker Hill, General George Washington scorned the redcoats as “Ministerial Troops, [not] . . . the King’s Troops,” while Sons of Liberty, beginning to shift allegiance, toasted “A patriot King or none, over the British colonies.” Abigail Adams expressed the final shift two weeks after the Declaration of Independence: “We have in George a match for a Borgia or a Catiline, a wretch callous to every Humane feeling.” Such sentiments, both the aspirations for an active, virtuous executive and the condemnation of

corrupt ones, remained powerful in the minds of Americans after the Revolution (even though George III was by then thoroughly disqualified) as they sought to reshape executive authority. Abigail Adams again expressed the sentiment writing to her husband in 1783: the nation needed “a Solomon in wisdom, to guide and conduct this great people . . . at this critical era.”

THE CONSTITUTIONAL CONVENTION

As the Convention of 1787 began its discussion of the executive, uncertainty prevailed. When it took up the resolution in the Virginia Plan that “a national Executive be instituted, to be chosen by the National Legislature,” James Wilson “moved that the Executive consist of a single person.” After discussion stalled for a while, one delegate supported Wilson’s motion as likely to secure responsibility and efficiency in the executive. Another opposed it in order that Congress be empowered both to elect the executive and to determine the number to compose it. After Wilson again supported a single executive to achieve “energy, dispatch, and responsibility,” another delegate proposed to “annex a Council to the Executive,” and yet another condemned a single executive as “the foetus of monarchy.” The motion was then postponed, James Madison noted, because the convention seemed “unprepared for any decision on it.”

The convention resumed debate on the executive after the contentious decision to make the states equal in the Senate had been taken. Gouverneur Morris argued that election of a single executive by Congress would “be the work of intrigue, of cabal, and of faction” and make it a “mere creature of the Legislative.” Instead, election by “the citizens of the United States” would “never fail to prefer some man of distinguished character.” Roger Sherman still thought legislative election best because “the people at large . . . will never be sufficiently informed of characters,” a point reinforced by George Mason, who declared such an election was like referring “a choice of colours to a blind man.” A few days later, after Morris, Wilson, and others had again argued that, despite Mason’s caution, election by the people, for a relatively long term, with reeligibility, was the most purely republican form of election, Madison analyzed the problem. The alternatives were election by the people themselves, by some existing body or group, national or state, or by “some special authority derived from the people.” Election by some existing authority, whether Congress, state legislatures, or even state governors collectively, was, as many delegates argued, sure to be hopelessly entangled in

cabal and intrigue, foreign and domestic, like the elections of the king of Poland or the Roman pope. After approving the idea of an electoral college as less subject to cabal and more likely to seek good characters than other modes, Madison nonetheless supported election directly by the qualified part of the people (under state law) because the Convention seemed not to countenance the electoral college idea. However, the first draft of the Constitution, presented on 6 August, returned to the earlier mode: a single executive would be elected by Congress for a term of seven years, but could not be elected a second time. With many delegates still undecided, and relatively wide powers conferred on the executive (though not to make treaties or to appoint ambassadors or judges of the Supreme Court), the convention left many questions to be resolved in the clause-by-clause debate of the draft.

In arguing for both broader powers and a more direct election of the executive, James Wilson again explained that the previous association of tyranny with a king and “really formidable” executive power was no longer relevant in a constitution where the executive was elected, directly or indirectly, by the people and was carefully restrained by constitutional authority. Under such circumstances, especially in a constitution with a powerful legislature partly “aristocratic” (i.e., the Senate), the danger of tyranny might come from it rather than the president. The presidency, on the other hand, might advocate for the people and be itself a center of the republican principle of government by consent of the governed. As the force of this understanding more and more impressed other delegates, the election and powers of the president were in the last days of the convention gradually revised to assume the configuration in the final document. Election would be by an electoral college (weighted largely in accord to population) to avoid legislative cabals. In the absence of a majority in the college for any candidate, the matter would be decided in the House of Representatives (voting by states) to avoid too much Senate power. Also, a shorter term and reeligibility were established to bring elections closer to the people. Furthermore, the president was given treaty-making and appointive powers with the Senate relegated to providing “advice and consent,” in order to enhance his standing as a republican rather than a monarchical authority. The office, though modeled in some degree on the relatively strong governors of Massachusetts and New York and even on the prerogatives of the rejected British king, was in fact perhaps the most creative part of the convention’s work, a new office for a new frame of government, resting, as “Publius” noted in

The Federalist No. 1, not on “accident and force,” but on “reflection and choice.”

ESTABLISHING THE PRESIDENCY

As the convention finished its work, it became clear that the presiding officer, George Washington, would almost certainly be the first to fill the executive office. Indeed, the delegates had often shaped its dimensions with the expectation that the Revolutionary hero before them, without monarchical ambitions, would be the first president. Though there was some worry about whether the considerable powers thus conferred would be safe in the hands of his successors—whoever they might be—Washington’s universally acknowledged patriotism, good judgment, understanding of public affairs, and republican vision were often behind the convention’s decisions. The same proposition loomed through the ratification debates: if Washington would almost surely be the first president, then anti-Federal complaints about the commander-in-chief’s powers, the veto, making appointments to office, and so on were all blunted by the question “Can Washington be safely trusted with these powers?” Alexander Hamilton’s vigorous defense of the mode of election and the powers of the executive in *The Federalist* Nos. 67–77 carries the implicit assumption that Washington would first fill the office—and the hope that his successors would learn from his understanding and conduct of the presidency. There was widespread agreement that the United States did not want a king (thanks to the reviled George III), but an almost equal agreement on wanting somehow to gain for the polity the admired ideals of monarchy: an above-party, energetic, morally respected, principled, and visionary executive, mindful of the other branches of government but nonetheless himself providing firm, active leadership.

A critical test of understanding of executive power came when Congress faced the question of removal from office: Did the Senate have to “consent” to removals as well as appointments? Or was removal, by implication, only possible through impeachment? Or should Congress, in defining each office, also define a removal procedure? Or did the “executive power” vested in the president by the Constitution implicitly leave removal to the discretion of the president? In arguing for the president’s implicit removal power, members of Congress first rejected any senatorial role in removal power as limiting and confusing necessary executive responsibility and opening the door for “cabal” and “discord.” It would “reduce the power of the President to a mere vapor,”

Representative James Madison stated. Members pointed out that while the legislative power was in Article I limited to powers “herein granted” and the judicial power in Article III “shall extend to” only enumerated cases, the executive power was simply “vested,” implying a breadth and discretion in some ways similar to the prerogative given to the British monarch, even under Lockean definitions of distribution of powers. Fisher Ames observed that “the executive powers are delegated to the President, with a view to have a responsible officer to superintend, control, inspect, and check the officers necessarily employed in administering the laws.” He should be able, then, to remove officers “he can no longer trust with safety.” Madison added that under such an understanding, with the president elected at least indirectly by the people, “the chain of dependence . . . terminates in the supreme body, namely in the people.” When the views of Madison, Ames, and others prevailed in the fashioning of the executive departments, it was clear that even Congress had in mind an exalted, responsible executive power exercised independently of partisan legislative contentions and protective of the public good—always the role of the good ruler from Plato and Cicero to Erasmus and Henry IV of France.

THE FEDERALIST PRESIDENTS

Washington sought to maintain this active, nonpartisan approach to his office, but was soon surrounded by intense conflict, especially in his own cabinet between Hamilton and Jefferson. The president was appalled, and he begged his secretaries to cease. Without a willingness to subordinate differences to the public good, Washington warned, “every thing must rub; the Wheels of Government will clog,” and he feared that “the Reins of government [could not] be managed, or . . . the Union . . . much longer preserved.” Though Washington, because he came to believe Federalist policies best for the country, was himself drawn into partisan politics, he continued to resist any enshrinement of partisanship in the presidency (in contrast to presidents from Andrew Jackson and Theodore Roosevelt to Franklin Roosevelt and George W. Bush, who would proudly tie the presidency to extreme partisanship). In his Farewell Address (1796), ironically a form of partisanship itself, Washington warned against “the baneful effects of the spirit of party generally” and noted that already “the alternate domination of one faction over another . . . has perpetuated the most horrid enormities, [and] is itself a frightful despotism.” Instead, he urged the public to support “consistent and wholesome plans, digested by common counsels and modi-

fied by mutual interests.” Washington began and ended his presidency believing this was the essential role of the national executive.

When John Adams became the second president in 1797, he proclaimed his

wish to patronize every rational effort to encourage schools, colleges, universities, academies, and every institution for propagating knowledge, virtue, and religion among all classes of people . . . as the only means of preserving our Constitution from its natural enemies, the spirit of sophistry, the spirit of party, the spirit of intrigue, the profligacy of corruption, and the pestilence of foreign influence, which is the angel of destruction to elective governments.

These are sentiments with which neither his predecessor nor his successor would have disagreed. Adams intended to be an active, above-party leader, respectful of the legislature and mindful of the needs of the people and in charge to defend and seek the public good. In his lifelong compulsion to list good and bad leaders, even before the Revolution he had “warmly recommended” Cicero, Demosthenes, the duc de Sully, Sir Robert Cecil, and the elder William Pitt as model public servants, while he condemned Tiberius, Iago, and Richard III as unworthy leaders—a list to which he later added Napoleon Bonaparte, Hamilton, and Aaron Burr. The distinction in every case was not mode of election nor extent of power, but rather service to the public good, not corrupt power lust, dynastic ambition, nor factional intrigue.

With these standards in mind as president, Adams retained what he regarded as honorable public servants, left over from the previous administration, in his own cabinet despite policy and political differences with them, encouraged militant patriotism in response to the XYZ affair, and most notably, sent off a peace mission in 1799 to end the Quasi-War with France (1798–1800) that, by damping war fervor in the country, probably cost him and his party electoral victory in 1800. (This and other public-spirited actions so angered Alexander Hamilton, the de facto leader of the Federalist Party, that he published, during the 1800 election, a vicious pamphlet condemning Adams so severely that it too contributed to Adams’s electoral defeat.) Long after leaving office, reading again the works of the author of *The Idea of a Patriot King*, Adams reflected that patriotism included

piety, or love and fear of God; general benevolence to mankind; a particular attachment to our own country; a zeal to promote its happiness by reforming its morals, increasing its knowledge, pro-

moting its agriculture, commerce, and manufactures, improving its constitution, and securing its liberties; and all this without the prejudices of individuals or parties or factions, without fear, favor, or affection.

Since Adams understood the president to be a patriot leader, he had defined as well the guidelines for that office.

THE FIRST REPUBLICAN PRESIDENTS

When Thomas Jefferson became president in 1801, he declared, in his to-become-world-famous Inaugural Address, that “we are all Republicans—we are all Federalists,” that “though the will of the majority is in all cases to prevail, that will, to be rightful, must be reasonable,” that he sought to “restore to social intercourse that harmony and affection without which liberty and even life itself are but dreary things,” and that he believed the republican government he had been chosen to lead, rather than being too weak to rule or even survive, was “on the contrary, the strongest government on earth” because of the willing support of its citizens. Though Jefferson set about to reverse or reduce some Federalist programs (for example, taxes, military preparedness, expansion of the judiciary, and the Alien and Sedition Acts [1798]) in order to create “a wise and frugal government” and “compress [its powers] within the narrowest compass [it] will bear,” he also pledged to preserve “the general government in its whole constitutional vigor.” He wrote a friend at the same time that since it was “impossible to advance the notions of a whole people suddenly to ideal right, we see the wisdom of Solon’s remark, that no more good must be attempted than the nation can bear.” Though Jefferson thus urged a certain patience in his conduct of the presidency and insisted that it be in accord with public understanding, he just as clearly signaled the president’s responsibility to discern the nation’s “ideal right” (natural law; the public good?) and to lead toward it. (Theodore Roosevelt, a century later, would make the same point more bluntly: “I simply made up my mind what [the people] ought to think, and then did my best to get them to think it” [Hughes, *Living Presidency*, p. 166].) He thought this could be done in accord with standards of “wise and frugal” government held to a “narrow” rather than an expansive sense of national and presidential power. His cabinet members (James Madison and Albert Gallatin at State and Treasury, respectively, were especially important) were generally like-minded. Administrative actions, diplomatic dispatches, and especially, leadership of Congress carried out through meetings and presentation of pro-

posals to friendly legislators, thus carried the stamp of Jefferson’s guidelines for the executive.

The signal events of his administrations, the Louisiana Purchase (1803) and the embargo (1807–1809), reveal his understanding of constitutional leadership. Jefferson believed that under a proper “narrow” understanding, Congress and the president needed a constitutional amendment to make such a purchase. He had, however, no hesitation in moving ahead rapidly to resolve the diplomatic crisis leading up to the purchase treaty and then in carrying through on it with Congress, even without an amendment (both Madison and Gallatin thought it was unnecessary anyhow); active executive leadership required such.

Then, as the injustices and depredations of the world war between France and Britain increased dramatically after the Battles of Trafalgar (1805) and Austerlitz (1805), Jefferson sought almost desperately to avoid the war in order to avert its inevitable anti-republican features: the dangerous aggrandizing of both federal and executive power. With Madison’s urging and support, Jefferson asked Congress to close American borders to trade with belligerents and to require American ships to leave the high seas where their presence seemed certain to involve them, and American naval vessels, in strife sure to mean war with Britain or France or possibly both. He and Madison saw the Embargo Act of 1807 as a peaceful way to persuade the belligerents, whom he thought needed American trade, to stop their depredations; that is, they saw it as a republican (unwarlike) means of national defense. Jefferson was quite willing to exercise huge powers, carried out by the executive branch, when he thought the common defense required it, but almost as readily he asked Congress to rescind the embargo when he saw its deeply divisive effect in the country and recognized that harsh measures were needed to enforce it. Both the divisions and the harsh measures were deeply antithetical to what for Jefferson were hallowed republican principles of public harmony and mild government.

One can understand the Jefferson and Madison administrations as divided into three periods: (1) 1801–1805, when a fortunate, relatively peaceful interlude in the Napoleonic Wars allowed the president to lead and govern in a principled but “mild” way; (2) 1805–1815, when the clamored demands of world war intruded on all efforts at republican government; and (3) 1815–1817, when Madison had the opportunity again to exercise executive power in ways he and Jefferson had designed before the war crisis. In 1809, then, Madison entered the presidency

facing desperate international circumstances with a republican, constitutional system little geared to a world at war. Saddled with a weak cabinet because of the intricacies of politics, with constitutional restraints that required deference to Congress, and with assaults from both belligerents that demanded forceful response, Madison struggled to sustain republican guidelines while also defending the nation. He gradually strengthened his cabinet, persuaded Congress to enact some preparedness measures, and exhausted diplomatic channels for peaceful resolution. Though he did not, in the style of an Andrew Jackson or Winston Churchill (or even an Alexander Hamilton), find ways to be a commanding, inspiring war leader, he managed to conduct the war, finally successfully, while maintaining the forms and spirit of republican government. French minister Louis Sérurier, in Washington throughout the War of 1812, asserted that “three years of warfare have been a trial of [American republican] institutions to sustain a state of war, a question . . . now resolved to their advantage.” Secretary Gallatin had noted the need, as the war began, to avoid “perpetual taxation, military establishment, and other corrupting or anti-republican habits or institutions,” while retired President John Adams observed simply at the end of the war that “notwithstanding a thousand Faults and blunders, [Madison’s] Administration has acquired more glory, and established more Union, than all his three Predecessors Washington, Adams, and Jefferson, put together.” Madison emerged from the war not a dictatorial republican executive, but rather an executive convinced of the need for active leadership and of the president’s authority to do so within the republican forms defined in the Constitution. With the dangers to those forms presented by Hamilton’s domination in the 1790s of the executive (and what Jefferson and Madison regarded as its corrupt influence on Congress) now allayed by fifteen years of republican experience, Madison led confidently. He proposed recharter of the National Bank, an equitable commercial treaty with Britain, a mildly protective tariff, a small but high-quality defense establishment, a national university, and a program of internal improvements—but this last only by constitutional amendment.

THE RISE OF PARTIES

James Monroe’s accession in 1817 to the presidency—deserved, he and his two predecessors thought, for his patriotism in war and peace and for his long service in government—marked the culmination in practice of the executive office’s standing above party. Virtually unchallenged entering office (he lost

only 34 of 217 electoral votes in 1816 and 1 in 1820), Monroe declared in his first Inaugural Address that “the American people . . . constitute one great family with a common interest” and hoped the nation might “soon attain the highest degree of perfection of which human institutions are capable.” He asserted his intention as “Chief Executive to . . . not be the head of a party, but of the nation itself.” His model was Washington, under whom he had served heroically in the Revolution; thus, Monroe was “the last of the cocked hats,” guiding the nation, he hoped, to peace, prosperity, and harmony. His able secretary of state, John Quincy Adams, negotiated an 1817 treaty providing that no warships or forts be on either side of the Canadian border (still in effect today), negotiated another that acquired Florida and for the first time drew a transcontinental boundary between Mexico and the United States (1819), and promulgated with British support the Monroe Doctrine (1823) forbidding expansion of European despotism in the Americas. Despite this remarkable foreign affairs record, Monroe generally was bypassed in the nation’s public life by zealous partisanship both in the legislature and within his own cabinet. Bitter sectional battles in Congress, especially over the Missouri Compromise of 1820, and incessant quarrels and maneuvering in his cabinet over the presidential succession clouded the scene at Monroe’s retirement in 1825. Noting what was going on, Jefferson wrote “do not believe a word that there are no longer parties among us; that they are now all amalgamated.” Monroe still hoped there might be “sufficient virtue in the people to support our free system of republican government” (that is, transcend the corruption of party), but Madison—no longer “sanguine” that an “engendered and embittered spirit of party” could be avoided in the United States—wrote his predecessor that he hoped only that it might be “so slight or so transient as not to threaten . . . permanent [damage] to the character and prosperity of the Republic.” After twenty-four years of earnest effort by Jeffersonian Republican presidents to fulfill a nonpartisan ideal in the presidency (and in fact, twelve years of effort by Federalist presidents before that), it was moribund in practice and under increasing challenge ideologically.

In a presidency that can only be called paradoxical, however, John Quincy Adams—child of the Revolution, son of John and Abigail Adams, master of half-a-dozen languages, the United States’ premier diplomat for thirty years, and in American public life through his post-presidential service in the House of Representatives where he was a colleague of Abraham Lincoln’s—sought doggedly to remain a nation-

al president even as all the forces around him, in the country, in Congress, and even in his own cabinet, had become aggressively partisan and sectional. His first annual message to Congress in 1825, with, as he thought, liberty won and Union assured, proposed a broad program in the public interest. He asked Congress (echoing his father) for laws to promote “the improvement of agriculture, commerce, and manufactures, the cultivation and encouragement of the mechanic and of the elegant arts, the advancement of literature, and the progress of the sciences, ornamental and profound, . . . [including] a lighthouse of the skies” (a national observatory). The proposals, offered so earnestly and fulfilling, he thought, his duty as a republican leader above party, went nowhere, ridiculed and lost amid personal and sectional controversies seething everywhere. Virtually ignored in the White House as the political vitalities of a free and democratic nation burgeoned in all directions, Adams lost the presidency to Andrew Jackson overwhelmingly in the 1828 election.

In fact, the nature and authority of the presidency was undergoing a basic shift as the very idea of democratic leadership altered in the 1820s and 1830s. Martin Van Buren and others began to articulate a new, positive conception of party and of its relationship to presidential leadership far different from the purposes of the first six presidents. Their upholding of nonpartisanship, the new view asserted, generally had the effect of maintaining an elitist status quo against changing and more democratic ideas of the needs of the country. Instead, those who aspired to leadership, especially the presidency, should draw strength from new and diverse forces and form or work with a political party to organize and give effect to what it saw as the public good. This organization, a political party proudly called such, giving voice and coherence to the will of the people, would become a permanent, ongoing presence and would itself embody democratic processes. It would then support a president who in office would be the leader of the party, carrying out its purpose and policies; a real fulfillment of the idea of government by consent, not a counterfeit as Washington, Jefferson, and Madison would have thought. Such partisan activity would, argued Martin Van Buren, “rouse the sluggish to exertion, excite a salutary vigilance over our public functionaries, . . . [and by] the very discord which is thus produced, may in a government like ours, be conducive to the public good.” The president would be both the beneficiary of this partisan activity and the leader and perpetrator of it in executing his office. In forming what became the Democratic Party in the 1820s, in helping to elect Jackson

in 1828 as its first president in office, in supporting him while president (1829–1837), and then in succeeding him in office as the next leader of the party (1837–1841), Van Buren reconfigured the place of both political parties and the presidency in American public life. The first American presidency, from 1789 to 1829, above party in conception, was over; the second, party-based presidency, from 1829 to 1901, was beginning; and the third, active or imperial presidency, from 1901 to 1981, and the fourth, managed and less active presidency, beginning in 1981, were in the future, with signs of a return to the first, above-party conception nowhere in sight.

George Washington

George Washington, the first president under the U.S. Constitution of 1788, was sworn into the new office on 30 April 1789 after being elected to that post, created with him in mind, by a unanimous electoral college.

Washington took unique prestige into the presidency. Since early 1775, he had been the living embodiment of American nationality. The Continental Army was the first national organization, and Washington was from the beginning its commander in chief. Washington insisted throughout the war that American military officials must defer to their nominal superiors in Congress. It is to him more than to anyone else that America owes its tradition of subordination of the military to the civilian authorities. The immortal illustration of this was Washington's voluntary surrender of his sword and commission to the Confederation Congress at the Revolution's end.

Washington also had presided over the Philadelphia convention which drafted the Constitution. As James Monroe put it in 1788, Washington's prestige had been the key to the ultimate ratification of the new federal charter, especially in his native state of Virginia—the most populous, most extensive, and wealthiest state.

ESTABLISHING THE NEW GOVERNMENT

Once elected president, Washington had his choice of all the leading men in American politics to fill positions in his cabinet and in the new federal judiciary. Employing three tests for office—eminence, geographic diversity, and support for the ratification of the Constitution—Washington selected a "who's who" of American leaders to fill the new government's top posts. Thus, his friend John Jay of New

York became the first chief justice of the United States. Others appointed to the Supreme Court included John Rutledge of South Carolina, a leading framer of the Constitution and his state's most significant politician, and James Wilson of Pennsylvania, who had played key roles both in the Philadelphia convention and in the ratification contest.

As in the days surrounding the Philadelphia Convention, Washington's foremost adviser in the early months of his first term was James Madison of Virginia, a newly elected member of the first House of Representatives. Besides drafting Washington's inaugural and first annual addresses, Madison also assisted Washington in assembling his cabinet. Madison persuaded Thomas Jefferson to serve as secretary of state and suggested his recent fellow contributor to *The Federalist* (1787–1788), New York's Alexander Hamilton, to be the first secretary of the Treasury.

The First Congress adopted several measures of enduring significance. Of most immediate importance was its creation of the major executive agencies: the departments of the Treasury, of state, and of war. Besides the heads of these agencies, the original cabinet also included Attorney General Edmund Randolph, the former attorney general, then governor, of Virginia.

Also of lasting importance was the Judiciary Act of 1789, which fleshed out the sparse provisions of Article III of the Constitution by creating a three-tiered judiciary very similar to the one that existed two-hundred-years later. Where Article III provided for a U.S. Supreme Court with a chief justice and such inferior courts as Congress cared to create, the new law established a six-member Supreme Court, at least one district court in each state, and six circuit courts of appeal.

The Judiciary Act of 1789 had two other provisions that bear mention as well. One, section 25, said that questions of federal law decided in state supreme courts could be appealed to the federal Supreme Court. Therefore, in matters of federal law the U.S. Supreme Court would have a supervisory role over all state courts, which would allow it to police the interpretation of federal law in all the state systems, thus theoretically ensuring that federal law would have a uniform meaning throughout the country. The other provision said that cases brought into federal court under federal diversity of citizenship jurisdiction would be decided according to the law of the forum state (the state in which the court sits); thus, there would be no federal common law of torts, contracts, or other everyday matters; making policy in

these important areas would be reserved to state governments.

Bill of Rights. Madison had only narrowly been elected to the House of Representatives, and that after seeing his candidacy for the Senate defeated in Virginia's General Assembly. In order to ensure his election to the House, Madison had assured his constituents that he would pursue adoption of constitutional amendments as a congressman. Thus, to the consternation of many of his colleagues, Madison repeatedly drew their attention to the idea of adopting a bill of rights. He had opposed this idea when it was bruited by moderate Federalists and anti-Federalists during the ratification contest. Yet Madison had concluded that this politically expedient step might have the positive effect of winning the Constitution the support of men who might otherwise oppose it.

Anti-Federalists, including Virginia's two U.S. senators and Patrick Henry, the eminence of the General Assembly, wanted amendments that would more carefully define and limit the federal government's powers. Madison had no interest in that, but wanted simply to offer moderate men a harmless placebo of amendments to quiet their fears on the question of the new government's threat to individual liberties. He also futilely attempted to win approval of an amendment allowing federal courts to enforce select individual rights against state governments, thus inverting anti-Federalists' hopes for amendments limiting federal power.

Ultimately, Congress referred twelve amendments to the states. Ten of those amendments were ratified in 1791, and an eleventh—the Twenty-seventh Amendment—won ratification two centuries later, in 1992. Virginia's senators expressed their disappointment in the proposed amendments, saying that they would do nothing to limit federal power. The First Congress's amendments were rarely the subject of litigation in the eighteenth or the nineteenth century, and even more rarely did they affect the outcome of a case or the interpretation of a law, state or federal.

Formalities. The First Congress and President Washington were uncertain precisely how a republican government should behave. Washington, for his part, believed that he should be more accessible than was George III, yet he realized that his own fame made it impracticable for him to maintain the open-door policy of the presidents of the Continental and Confederation Congresses. One result was the famous levees, stilted social affairs held by Washington at his house in order to keep in contact with members

of Congress and local notables. If the description of Pennsylvania's sardonic senator, William Maclay, is to be believed, the levees were so formal as to serve no purpose other than making Washington and his invited guests alike uncomfortable and impressing extreme democrats with the monarchical tendencies of the new government.

For its part, Congress could not even decide how the president should be addressed. In Europe at the time, monarchs—their countries' chief executives—commonly were addressed with long strings of titles indicating God's role in selecting them to reign and the territories over which they ruled. Vice President John Adams insisted that Congress should address Washington in a similar way, to ensure that his new office, and thus the new government of which it was the most visible symbol, received the proper respect.

This seemingly innocuous, not to say trivial, matter tied up the Senate for several days. Wags referred to the short, corpulent vice president as "His Rotundity." Finally, Madison led the House in refusing to accede to the Senate's desire to give Washington a title other than "President of the United States." For both Madison and Washington himself, as the president had confided, that was enough.

HAMILTON'S FINANCIAL POLICIES

Constitutional reformers of the 1780s had desired to strengthen the central government chiefly to empower it to raise armies and taxes without the states' cooperation. The first concerns with which the fledgling government had to deal were financial. Hamilton believed that the United States needed to provide for the prompt repayment of its war debt. Since the states had amassed substantial debts during the Revolution as well, Hamilton also recommended that the Congress move to assume those debts. His goal was to concentrate responsibility for and power over those debts in the federal government.

One instrument for the management of the federal debt was to be the Bank of the United States, established in 1791, in which the federal government would be the most substantial, but still only a minority, shareholder. Hamilton believed that the United States could follow the British example in funding its debt, thus tying the economic interests of holders of debt instruments throughout the country to the success of the new federal government. Virginia's preeminent representatives, Madison and Jefferson, drove a hard bargain, however: in exchange for allowing the assumption bill to pass the House in 1790, they secured the permanent site of the federal capital on the Potomac River, Virginia's northern

boundary, and a very favorable system of calculating the states' debts that ultimately made the Old Dominion a creditor of the federal government instead of—what it deserved to be—a significant debtor.

Secretary Hamilton differed from the other significant officers of the executive branch in having been born abroad. Since he had no felt affinity for any particular state, but was instead a patriotic American, Hamilton could see the interests of America generally in a way that few other Americans of his day could. Thus, the idea of having the federal government assume the states' debts, an obvious expedient for improving the country's creditworthiness, did not strike him as especially dangerous; localism or particularism simply did not factor into his mental makeup.

Once the federal government had assumed the state debts, a question arose concerning the extent to which the government debts should be repaid. Hamilton argued in favor of redeeming the government's debt instruments at face value, because to pay less than face value likely would affect American credit adversely. Hamilton's opponents, led by Representative James Madison, called this proposal unfair, and they said that only the original holders of wartime debt instruments should be able to redeem them at face value. Hamilton called his opponent's schemes for discriminating among debt holders impractical, besides potentially ruinous to the new government's fiscal reputation, and he won the debate in Congress.

Hamilton also wanted to follow the British government in funding the government's debt—that is, in providing a perpetual stream of government income dedicated to payment of the interest on the government's debt. His opponents considered this a maneuver to give the Treasury influence over the financial markets, thus over the Congress, and argued against the idea.

CONSTITUTIONAL ISSUES, SLAVERY, AND REBELLION

For some other leading players in American politics, the vector of Hamilton's policies seemed dangerous. Thus, when his bank bill came before Congress, Madison stood up in the House to argue against its constitutionality. There was no clause of the Constitution granting Congress power to charter a bank, or indeed a corporation of any kind, Madison noted. Madison said that only the enumerated powers were granted. Thus, he concluded, Congress had no power to charter a bank.

When the matter came before President Washington, he expressed his doubts on the question of constitutionality. Having Madison's objections in mind, the president asked his cabinet for written opinions. Jefferson, in a classic "strict constructionist" essay, essentially repeated his friend Madison's argument. Washington passed it on to Hamilton.

In his response, which subsequently formed the basis of Chief Justice John Marshall's opinion in the crucial Supreme Court case of *McCulloch v. Maryland* (1819), Hamilton spelled out the "broad constructionist" reading of the Constitution. If the ends were clearly constitutional, Hamilton counseled, and the means were not prohibited, the means were permissible. Thus, he concluded, Congress's bill to charter the bank was constitutional. Washington, who sympathized strongly with Hamilton's financial goals for the government, signed the bill into law.

Hamilton also proposed that the federal government should adopt various excise taxes as part of its fiscal plan. Among the items he proposed to tax were carriages and whiskey. Both would become significant flash points.

Lurking behind the growth of organized opposition to the Washington administration, which historians generally date to 1793, was concern about the effect of Hamilton's approach to the Constitution on the future of slavery. As early as the First Congress, southern congressmen expressed grave concerns about slavery's future in the federal Union. Virginia pamphleteer John Taylor of Caroline linked the issue to concerns about the excise on carriages.

The carriage tax, Taylor said, was unconstitutional and unjust. He rested his claims concerning the tax's unconstitutionality on Madison's reasoning in the bank bill debate: there was no express grant of power to levy a carriage tax in the Constitution, and the Tenth Amendment stated that all undelegated powers remained in the states; therefore, only the states could tax carriages. His claim of injustice reflected the tax's sectional incidence: significant planters throughout Tidewater Virginia owned carriages, he said, but only two people in the entire state of Connecticut owned taxable carriages. Thus, Congress had chosen an item possessed almost entirely by people in one region to tax. If this precedent were allowed to stand, Taylor warned, there was another type of property whose owners lived principally in one part of the country; he did not have to say that he was referring to slaves.

In July 1794, opposition to federal excises took a far less refined form. The Whiskey Rebellion in western Pennsylvania saw violence launched against

federal excise agents. In response Washington, at Hamilton's urging, amassed a force of fifteen thousand militiamen to enforce the federal law and mounted his horse at their head. Hamilton's purpose, besides cowing the opponents of what remained an experimental federal government, was to prove to European observers that the United States would take energetic measures, even use the military, to enforce its taxes.

The Whiskey Rebellion dissipated quickly in the face of Washington and, once the army had reached some distance from New York, Hamilton, but its effects were long lasting. It cemented for the administration's opponents what they had long suspected: that the Treasury secretary wanted to convert the Republic into an empire.

FOREIGN POLICY

Understanding that suspicion requires understanding the international context of the Washington administration. In 1789, the same year the new Constitution took effect, the French Revolution began. At first, Americans sympathized with what they understood to be a move toward constitutional monarchy in the country that had aided them indispensably in securing their independence. Soon, however, the French king was overthrown, then executed; his wife and thousands of noblemen and clergymen followed him to the guillotine; Christianity was outlawed in France; and the new republic attacked all of its neighbors.

The chief dividing line in American politics, namely over constitutional interpretation (especially federalism), coincided with a principled division over foreign policy. In general, advocates of an energetic federal government, like Washington and Hamilton, favored neutrality in the European wars, while those who tended to favor the idea that legislative powers had been reserved to the states favored the French.

Hamilton's advocacy of neutrality had two bases: growing revulsion with the French Revolution and recognition that the financial prospects of the new government rested on a stable relationship with Britain, America's chief trading partner. On the other hand Madison, Jefferson, and their fellows believed that America owed France a moral debt for its assistance in the Revolution, considered the treaty of alliance signed in 1778 legally binding despite France's change of government, and sympathized with French efforts to establish a republic over first the objections, then the violent opposition, of other European nations.

Hamilton did not help matters with his repeated observations, in private settings and in political gatherings (most notably the Philadelphia Convention of 1787), concerning the great merits of the British Constitution. Jefferson, on the other hand, maintained an astounding equanimity as a number of his friends suffered death at the hands of French revolutionary authorities. Vice President Adams, too, told the two Virginia senators that the United States would soon find it necessary to establish a monarchy, fanning the flames of Republican suspicion.

For Jefferson, then, Hamilton's financial measures, explicitly modeled on those of Britain, smacked of monarchism; for Hamilton, Jefferson's and Madison's opposition to the Washington administration was "Jacobinical" (after the most radical, bloodiest, most warlike faction in the French Revolution). Hamilton had his way in 1793, when the European conflict elicited Washington's Proclamation of Neutrality over Jefferson's vociferous objections. Despite the treaty of 1778, any American who assisted either side would be prosecuted. Republicans were furious.

Jay's Treaty. Reactions to the Whiskey Rebellion of 1794 perfectly summed up the situation on both sides, as Jefferson brooded concerning Hamilton's militaristic intentions for America and Hamilton gloried in the opportunity to employ the federal government in intimidating lawless Jeffersonian tax dodgers. The following year, Chief Justice John Jay returned from England with the treaty that soon would be known by his name. Passed on by President Washington to the Senate in secret, then ratified in executive session, Jay's Treaty seemed to implement the program Jefferson had feared of making the United States the tail of the British dog. Americans had chafed over British restrictions on American trade and over impressments of American sailors into the Royal Navy, and the treaty that Jay brought home did nothing about those complaints. It also forswore any American intention to use differential tariff rates to coerce Britain economically—a favorite scheme of Madison's.

What Jay did achieve, on the other hand, was a firm British commitment instantly to withdraw from military bases in the Old Northwest, along with a binding mutual obligation to maintain peace in an international environment that bade fair to draw the two Anglophone countries into armed conflict. From Washington's point of view, as from Jay's and Hamilton's, the essential point was that America remain aloof from European wars for an-

other fifteen to twenty years, after which it could—to borrow a phrase—bid defiance to all the world.

The Democratic Republican opposition staged popular protests throughout the country upon learning the particulars of Jay's Treaty. Washington's acceptance of it made even him anathema to his administration's opponents. Although Jefferson and Hamilton had long since left his cabinet, only to be replaced by far lesser figures, they remained the guiding lights of their respective parties. Jefferson was happy to see the Democratic Republican clubs that supported him mushroom in the days after Jay's Treaty, and John Jay said that he could have walked from Charleston, South Carolina, to Boston by the light of his burning effigies.

FAREWELL ADDRESS

The partisan press, launched by Jefferson and Madison and somewhat effectively countered by Hamilton and his supporters, tore into Jay's Treaty. Washington, who had thought of retirement in 1792, determined that he had certainly had enough by 1796. He went to Hamilton for assistance in composing a farewell address.

That address, published in September 1796, served as a valedictory. Americans must maintain a strong union of the states, Washington wrote. Sectionalism in politics threatened the breakup of the United States, according to the retiring president. Washington also cautioned against entanglement in foreign alliances; neutrality was the best policy for a weak young country that must soon wax very strong. He also averred that the proper role of the average person in republican politics was to help in electing officials, then to let them run the country.

Washington's administration was very successful. The federal government's three branches were organized on lasting bases. The financial system established by Washington, with Hamilton's able assistance, made America fiscally stable and put the federal government at the financial center of what had always been a state-centered political culture—and would remain so for many decades to come. The Washington administration's policy of neutrality in international affairs was prudent, despite the heated insistence of Secretary of State Jefferson that America lend its slight weight to the feckless and sanguinary course of the French Revolution. Most important, Washington left office voluntarily, thus establishing a precedent that all of his successors have been bound to follow, whether they wanted to or not.

John Adams

On 1 May 1812, as the nation teetered on the brink of war with Great Britain during the Madison administration, John Adams penned a letter to his “founding brother” and former vice president Thomas Jefferson, chastising the Democratic Republican policies imperiling the moment. “In the Measures of Administration I have neither agreed with you or Mr. Madison,” Adams wrote. “Whether you or I were right posterity must judge. . . . You and Mr. Madison had as good a right to your Opinions as I had to mine, and I must acknowledge the Nation was with you. But neither your Authority nor that of the Nation has convinced me.” The two had resumed

their correspondence only a few months earlier, breaking a silence that had spanned a dozen years. During the hiatus Jefferson acknowledged to Abigail Adams that partisanship, not personality, had driven the wedge between them. "The different conclusions we had drawn from our political reading and reflections were not permitted to lessen mutual esteem, each party being conscious they were the result of an honest conviction in the other." Their warm and lively correspondence that revived over the last fourteen years of their lives testified to the competing philosophies of their presidential administrations, but also to their admiration for one another.

John Adams met Thomas Jefferson when they were delegates to the Continental Congress. Staunch advocates for separation from the crown, they served together on the committee that drafted the Declaration of Independence and joined again in Paris to negotiate the peace. Together they began and ended the American Revolution, and in 1796 they were elected president and vice president of the nation they had founded. Theirs could have been the most remarkable administration in history were it not for the partisanship and international developments of the intervening years. During the administration months passed—once even more than a year—when the two men could not speak or even write to one another.

THE EMERGENCE OF POLITICAL PARTIES

During the Washington administration, for which Adams had served as vice president, Jefferson, as secretary of state, along with James Madison in Congress, had opposed the economic schemes of Treasury Secretary Alexander Hamilton, in which the federal government assumed the state's debts and funded it with a national bank. They also opposed the president's Proclamation of Neutrality during the Anglo-French War, demanding that the United States honor the Franco-American Treaty of Alliance to support France's democratic revolution as France had supported America, and the Jay Treaty, which they believed would unfairly assist the British in their war against France and tie the economic interests of the United States back to the imperial monarchy. Citizens siding with Jefferson and Madison issued petitions, remonstrances, and toasts in clubs they called Democratic Republican societies. By 1796 this opposition to the Washington administration galvanized into the Democratic Republican Party, with Jefferson at its head voicing the rhetoric of liberty and democracy while decrying monarchy and aristocracy. Devotees of Washington, including

Adams, championed the need for order that a vigorous federal government could provide. Federalists, as they called themselves, wanted to save the nation from a descent into democratic licentiousness. Adams, a Federalist, and Jefferson, a Democratic Republican, would form the only presidential administration in American history split between two parties. Partisanship, and the foreign policy that underlay it, would define the Adams administration.

In the election of 1796, Adams in republican fashion refused to campaign, and though he was a faithful supporter of Washington administration policies, he was determined to stay above the partisan fray. As vice president he had been an active member of the Senate, casting deciding votes on thirty-one occasions, most often in support of his president. Yet powerful Federalist insiders, particularly Hamilton and then Secretary of State Timothy Pickering, distrusted Adams. Hamilton was the spokesperson for a conservative wing of the party known as High Federalists, who feared the expanding democratic threat of the French Revolution, demanded closer economic ties with Britain, and called for the formation of a permanent, professional fifty-thousand-man standing army. Some High Federalists also clamored for war with France. Although Adams supported the Jay Treaty, he was suspicious of "standing armies" and favored the "wooden walls" of naval protection. In the election Hamilton and Pickering worked behind the scenes to support rival Federalist candidate Thomas Pinckney from South Carolina. Although Adams secured enough electoral votes to narrowly defeat Democratic Republican rival Thomas Jefferson as well as Pinckney, the split in his party would dog his presidency.

TENSIONS ABROAD AND AT HOME

When Adams took office on 4 March 1797, the French navy was busy attacking American commercial vessels in the Atlantic and the Caribbean in retaliation for the Jay Treaty. This undeclared conflict was known as the Quasi-War. In February the French had refused to receive the American diplomat Charles Cotesworth Pinckney, and Adams's cabinet called for stern action. Adams had retained the four department heads from the Washington administration: Secretary of State Timothy Pickering, Secretary of Treasury Oliver Wolcott, Secretary of War James McHenry, and Attorney General Charles Lee. The first three were High Federalists who took marching orders from Alexander Hamilton. But Hamilton wanted to avoid war and favored the dispatch of a so-called Extraordinary Commission to negotiate

with France, whereas Pickering and Wolcott thought such a move would tarnish the national honor. It was one of their few disagreements.

In May Adams addressed the Fourth Congress and called for a vigorous preparation for defense and for negotiations. Over the summer, Federalists C. C. Pinckney and John Marshall of Virginia, along with Democratic Republican Elbridge Gerry, left for France to bargain for peace. Meanwhile, Congress struggled over the nature of defensive measures. The president and his moderate congressional allies, known as Adams Federalists, favored a massive and expensive naval program. High Federalists demanded even more expensive and dangerous plans for a standing army and war, and Democratic Republicans pushed for less expensive fortification of ports and harbors and at least neutral trading relations between France and England. What resulted was a compromise combination of the three visions. Congress approved the funding of the three warships *United States*, *Constitution*, and *Constellation*, approved an act to fortify the country's ports and harbors, authorized private vessels to arm themselves for protection against French predators, and consented to call the states to be ready to supply eighty thousand volunteers for armed duty in the event of war. All this came at a cost. Treasury Secretary Oliver Wolcott drafted reports to suggest methods of taxation for Congress to consider. Congress passed a stamp tax in the summer of 1797, an indirect tax on legal papers and documents relative to international trade, and began discussing the implementation of a direct tax on the property of U.S. citizens to fund a \$6 million loan from the Bank of the United States.

During this time the president and vice president stopped communicating. Jefferson vehemently disagreed with the borrowing, taxing, and militarizing policies; the disagreement would only intensify in 1798 when word came that the French Directoire, the five officials who governed France from 1795 to 1799, refused to receive the American Extraordinary Commission without a payment of tribute, a bribe demanded by three French officials identified in code as X, Y, and Z. When news of the so-called XYZ affair broke in March in the Federalist press, Democratic Republicans dismissed it as Federalist propaganda intended to fan the flames of war, and they demanded release of the "XYZ Dispatches." Adams complied in a 19 March address to Congress, and much of the American public responded with outrage.

In Congress, High Federalists clamored for war and an army, but the president and his moderates, working with Democratic Republicans, staved them

off. They created a provisional army of ten thousand men, about half the size Hamilton wanted, and at Adams's instigation they created the Department of the Navy and approved funds to raise his "wooden walls." All told, the mostly naval defense measures of the Fifth Congress cost over \$10 million, more than 60 percent of the budget and almost \$4 million more than all other normal expenditures for the year. To fund these measures Congress passed and Adams signed the Direct Tax Act, the federal government's first attempt to lay direct levies on the property of its citizens, their lands, houses, and slaves.

NATIONAL SECURITY LEGISLATION

Congress passed and Adams signed other national security legislation. The Naturalization Act extended from five to fourteen years the length of time necessary for immigrants to naturalize, and the Alien Act and Alien Enemies Act gave the president the authority to deport legal and illegal enemies at his own discretion. The Sedition Act, prohibiting the utterance or publication of "any false, scandalous, or malicious writing . . . against the government of the United States or the President . . . with intent to defame . . . or to bring them into contempt or disrepute," was perhaps the darkest moment of Adams's presidency. Although clearly an affront to the First Amendment rights of "freedom of speech" and "freedom of the press," the law did, for the first time, admit truth as a defense. Many Democratic Republicans went along with these laws, collectively known as the Alien and Sedition Acts, though some like Jefferson foresaw that the Federalist-dominated Congress and administration would use the laws as political clubs to thump their partisan adversaries. Indeed, Federalist prosecutors zealously prosecuted Democratic Republican newspaper editors to silence their critics. Hamilton had agreed with the Alien laws but worried that the Sedition Act could create a partisan backlash that might dash his hopes to build his army. He was right.

CLASHING POLICIES AND PERSONALITIES

In the fall of 1798 Adams worked feverishly to avoid war with France and, against the near unanimous advice of his cabinet, sent a second delegation of three Federalists, the Ellsworth Commission, to negotiate peace. Democratic Republicans were pleased with the overtures for peace but concerned that they had no representation on the commission. Furthermore, in response to Federalist prosecution of the Sedition Law, Jefferson vehemently attacked the president and his party by authoring the Kentucky Resolu-

tions, a series of resolves advocating the states' right to nullify federal laws violating the precepts of the Constitution, and calling on other states to ratify them and follow suit. Madison helped author the Virginia Resolutions, less strident measures appealing to states for a nationwide petition campaign to repeal the Alien and Sedition Acts. Most states rejected the Kentucky and Virginia Resolutions, but petitions with thousands of signatures poured into Congress from all across the nation demanding repeal of the acts.

Meanwhile, Adams had appointed George Washington to lead the Provisional Army, and Washington, who had no desire to take the field, suggested Alexander Hamilton as his second in command. Adams, fearing Hamilton's zeal to create an army, instead appointed his son-in-law. Washington and McHenry responded with outrage, and Adams appointed Hamilton under pressure. Adams's dispatch of the Ellsworth Commission was meant in part to undercut Hamilton's military ambitions.

But Hamilton would get the chance to flex the muscle of his "New Army" in the winter of 1799, when Pennsylvania German farmers—who raised liberty poles, burned mock copies of the Alien and Sedition Acts, petitioned for repeal, and opposed the professional army—obstructed the assessment of the Direct Tax on their lands and houses less than fifty miles from the nation's capital in Philadelphia. When a federal marshal arrested and jailed some of the farmers in Bethlehem, Pennsylvania, an armed force of four hundred led by Revolutionary War veteran John Fries first offered bail and then threatened violence to secure their release on 7 March 1799. President Adams issued a proclamation demanding that the insurgents "cease their treasonable activities," and he authorized the activation of the "Eventual Army," a law he had signed five days earlier to federalize state militia in the event of a French invasion or French-inspired insurrection. Secretary of War McHenry, acting on advice from Hamilton, overstepped the president's order and added Provisional Army troops to the volunteer force. Adams, as was his custom, had withdrawn to his home in Quincy, Massachusetts, and left his secretaries to manage the country. In April thousands of soldiers were mobilized in and around the Delaware and Lehigh River valleys. Scores of resisters were arrested and charged with sedition and obstruction of process. Taking the cue from the president's proclamation, Federalist prosecutors charged John Fries and two others with treason, and after two sensational trials convicted and sentenced them to death.

Following Fries's Rebellion Adams conducted his own investigation and determined that the offenders were guilty only of a "most unreasonable riot 'n rescue" and were not traitors deserving of the rope. On 21 May 1800, following the lead of his predecessor (Washington had pardoned those convicted during the Whiskey Rebellion), Adams, against the unanimous advice of his cabinet, issued full pardons to all convicted. Pickering and McHenry railed against the president; he fired them both. Hamilton believed that the move was politically calculated to win Democratic Republican votes in the fall, and that there was a "coalition" between Adams and Jefferson in which the two planned to reverse positions after the upcoming election, an unfounded charge. Hamilton decided to cut his losses with the Adams Federalists and worked to elect the rival Federalist candidate, Charles Cotesworth Pinckney. Hamilton published a twenty-seven-page letter, "Concerning the Public Conduct and Character of John Adams," excoriating the president for "deviating from the high road of Federalism" with his resistance to the army, his dispatch of the Ellsworth Commission, his firing of Pickering and McHenry, and "the pardon of Fries . . . the most inexplicable part of Mr. Adams' conduct." In the election, Democratic Republican candidates Thomas Jefferson and Aaron Burr tied for first place in electoral votes, shutting the Federalists out of the executive office once and for always. The House of Representatives would decide for Jefferson in what Democratic Republicans called "the Revolution of 1800." It took thirty-six ballots and concluded just two weeks before the scheduled inauguration.

THE FINAL YEAR

Adams's last year in office was one in which he could take pride. In February 1799, despite critics' fears that he would encourage slave uprisings at home, he received a representative from the new republic of Haiti, which had just overthrown French rule in a slave insurrection. Of great importance to Adams was his stewardship of the United States Navy; he also in this year signed the bill creating the Library of Congress and became, when the capital moved to its current site, the first resident of the President's House, later called the White House.

In signing the controversial Judiciary Act of 1801, he doubled the number of circuit courts to six and increased the power and independence of the federal judiciary. Democratic Republicans claimed that Adams rushed to appoint Federalists to the court before he left office. He appointed numerous men to local offices in the newly created federal city, includ-

ing William Marbury as a justice of the peace. Jeffersonians called all these appointments “midnight judges.” Secretary of State Madison’s refusal to honor Marbury’s appointment not long afterward led to the Supreme Court decision *Marbury v. Madison*. Under Chief Justice John Marshall, an Adams appointee whom Adams called his “gift” to the American people, the Court further increased the power and independence of the judiciary by establishing the precedence of judicial review.

To Adams, no achievement surpassed the news that he received on 7 November 1800 from the peace convention at Mortefontaine. A treaty with France had been negotiated a month earlier. By remaining a president above party, Adams had kept the nation at peace, rebuffed the military machinations of the Hamiltonians, and yet still provided for the nation’s security. Although Jefferson later pardoned all those prosecuted under the Alien and Sedition Acts, secured the repeal of the Judiciary Act, and dismantled the Federalists’ tax structures, Adams believed that he was leaving the country better than he found it, “with its coffers full” and “with fair prospects of peace with all the world smiling in its face, its commerce flourishing, its navy glorious, its agriculture uncommonly productive and lucrative.” He left Washington at 4:00 A.M. on the morning of 4 March 1801, refusing to witness Jefferson’s inauguration and missing his successor’s famed pronouncement that “we are all Republicans, we are all Federalists.”

More than a decade later, with both of their presidential administrations behind them, Adams and Jefferson resumed their correspondence and their friendship in a series of letters that are perhaps the most instructive debates about the philosophy of republican and democratic forms of government ever recorded. In one of his last letters to Adams, Jefferson referred to himself as Adams’s “amicissimi,” his dearest friend, to which Adams replied that he would be Jefferson’s “friend to all eternity.” On 4 July 1826, the fiftieth anniversary of their Declaration of Independence, Jefferson and Adams died within hours of one another. It was reported that Adams, unaware that his colleague had preceded him in death, uttered, among his last words, “Thomas Jefferson survives.”

Thomas Jefferson

Thomas Jefferson’s inauguration as the third president on 4 March 1801 marked the first successful transfer of power in the new nation’s history. The previous Federalist administrations were dominated by proponents of “energetic” national government, including department heads appointed by George Washington (1789–1797) and kept in office by his successor John Adams (1797–1801). As the candidate of the increasingly well organized Republican opposition, Jefferson promised a radical transformation of men and measures. Incumbent Federalists, anticipating a massive purge, warned that Jefferson’s election would undercut their state-building efforts, unleashing centrifugal forces that would destroy the Union. The new president signaled a moderate course in his conciliatory First Inaugural Address, however, and his performance in office reassured most rank and file Federalists that the federal regime would survive.

The tie in the electoral college between Jefferson and his putative running mate, Aaron Burr of New York, set the stage for the transfer of power. Before passage of the Twelfth Amendment of the Constitution in 1804, votes for president and vice president

were not distinguished; because Republican electors, anxious to secure their fragile interstate alliance, failed to withhold one of Burr's votes, the two candidates each tallied seventy-three votes. When, as the Constitution required, the election was thrown into the lame-duck, Federalist-controlled Sixth Congress, Federalists sought to exploit the impasse by cutting a deal with Burr or gaining concessions from Jefferson on Federalist officeholders. While the outcome remained uncertain through thirty-five ballots, rumors circulated that Jefferson's enemies planned to steal the election and thus thwart the people's will. By raising the specter of a High Federalist coup, the electoral crisis of 11 to 17 February—finally resolved by Jefferson's election on the thirty-sixth ballot—underscored the moderation of the new Republican administration. Jefferson's most obdurate opponents finally capitulated, recognizing that their further resistance would jeopardize the survival of the regime they so ostentatiously sought to preserve.

PARTISAN PRESIDENT

Jefferson's status as party leader proved crucial in smoothing the transition. The new president demanded unswerving loyalty from his subordinates on the basis of subscription to party principles, the "federal and republican" values he sketched out in his Inaugural Address. Jefferson would thus eschew the more personal mode of leadership that secured support for the great Washington—but not for Adams—and the "corrupt" appeals to personal interest that marked Alexander Hamilton's tenure as secretary of the Treasury (1789–1795). Jefferson's new cabinet, led by his close political ally James Madison at the State Department and Albert Gallatin, a leading Pennsylvania Republican, at Treasury, epitomized the new regime of principled partisan "friends." Madison and Gallatin remained in place through both Jefferson administrations, providing stability and continuity that had eluded preceding Federalist administrations. (Less important appointees, such as Henry Dearborn of Massachusetts at the War Department, also stayed the course with Jefferson.)

The demands of party loyalty were more modest at lower levels of the bureaucracy and at a greater distance from Washington. On one hand, Jefferson had to satisfy demands of party functionaries for a share of the loaves and fishes that had long been denied them; on the other, it made sense to placate suspicious Federalists and recruit as many as possible into the Republican coalition. Jefferson's policy therefore was to purge Federalist officeholders who would not trim their sails, relying on the resulting

vacancies to provide his followers with a fair share of federal patronage. This prudent approach could not make everyone happy: some disgruntled Federalists believed that Jefferson had (at least tacitly) agreed during the electoral crisis to leave the bureaucracy largely intact, and Republican loyalists were distressed to see so many of their former enemies still in office. But Jefferson succeeded in keeping most of his troops in line while preempting the development of an effective Federalist opposition party.

The most serious challenge to the Republican ascendancy came from entrenched Federalist judicial appointments who were beyond the new president's control and therefore immune to his emollient appeal. The Republican Seventh Congress moved quickly to repeal the Judiciary Act of 1801, a blatant attempt by lame-duck Federalists to secure control of the judiciary by reducing the number of Supreme Court justices to five (so preempting Republican appointments) and establishing sixteen circuit courts, with federal judges and other personnel (the "midnight appointments") named by the outgoing Adams administration. Jefferson and his congressional followers also launched impeachment proceedings against the most obnoxiously partisan (or incompetent) federal judges, including John Pickering of New Hampshire (convicted and removed from office in March 1804) and Supreme Court judge Samuel Chase of Maryland (acquitted in March 1805). The outcome of the Republican war against the judiciary was ambiguous: Chief Justice John Marshall of Virginia (Jefferson's distant cousin) and his Federalist-dominated Court survived but kept a low profile, avoiding further risky political confrontations. For his part, Jefferson remained deeply hostile to an undemocratic and unresponsive Court that would remain a bastion of Federalism—and a threat to states' rights—long after Jeffersonian Republicans had consolidated their control over the rest of the federal government. The war against the judiciary revealed the limits of Republican party-building, thus sustaining the ideological animus against counterrevolutionary enemies that inspired Jeffersonian oppositionists in the 1790s. The much exaggerated threat of the Marshall Court served to counter centrifugal tendencies within an increasingly tenuous Republican coalition that may have been too successful for its own good.

Jefferson was most successful managing Congress during his first term when the threat of a Federalist revival remained most compelling. Jefferson's "friends" in Congress—including Virginians John Randolph, William B. Giles, and Wilson Cary Nicho-

las, and Caesar Rodney of Delaware—kept Republican troops in line as they orchestrated majorities for administration measures. Jefferson led with a light hand, reinforcing commitment to party principle by cultivating his political friends and promoting the inspiring fiction that the administration truly represented—and spoke for—the American people. Jefferson’s famous White House dinner parties where he entertained guests with fine food and wine and dazzling conversation strengthened bonds between Republican congressmen and the administration while neutralizing—or at least blunting the edge of—hostile Federalist partisans. Strengthening the link between the executive and the legislature served simultaneously to limit, though not altogether preempt, the emergence of hostile Republican factions in Congress. High turnover in Congress also mitigated against factionalism, as did the tenuous links among highly volatile Republican factions in the states.

The key to Jefferson’s success was a unified cabinet. Jefferson dispensed with weekly cabinet meetings, thus minimizing conflict and collusion among his subordinates. Department heads’ primary relationship was with Jefferson, not with cabinet colleagues. Secretaries were thus less likely to combine to influence, or undermine, Jefferson, and they were also secure against the kind of humiliation Jefferson had experienced at Hamilton’s hands during his unhappy years in Washington’s cabinet (1789–1793). Jefferson’s Circular Order of 6 November 1801 was important in setting up procedures that guaranteed good behavior and preempted ministerial turf wars. Directing all executive correspondence to flow through his secretaries to his own desk, Jefferson could be assured that his administration would speak with a single, unified voice. Ideological and political harmony meant that department heads enjoyed a high degree of operational autonomy within their respective spheres; dealing directly with the president, they were in turn drawn into his widening circle of political friends, reinforcing their loyalty to Jefferson and thus participating in his imaginative identification with the American people.

FEDERALISM AND FOREIGN POLICY

Jefferson did not dismantle the administrative apparatus—including the first Bank of the United States—established by his predecessors, but he did reverse strong Federalist tendencies toward political centralization and intrusive federal governance. Jefferson eliminated the controversial direct taxes that had spurred Republican mobilization in the late 1790s and allowed other emergency measures

adopted by the Federalists during the war scare with France to lapse. Import duties continued to provide the bulk of federal revenues, but Treasury secretary Gallatin now used them to pay down the consolidated Revolutionary War debts, which—despite major expenditures such as \$15 million for the Louisiana Purchase—were reduced from \$83 million at Jefferson’s inauguration to \$57 million at the end of his second term. Taking advantage of a brief interval of peace during the Napoleonic Wars, the administration economized on defense and scaled back on the new nation’s diplomatic establishment.

Fearful Federalists imagined that Jefferson, the “Jacobin” atheist, would follow the radical lead of the French revolutionaries in revolutionizing American society. But despite his well-known Francophilia, Jefferson had always had reservations about the French Revolution, particularly concerning its destruction of provincial liberties and consolidation of authority in a powerful central government. Jefferson’s goal as president was to redress the balance between federal and state governments that the Federalist centralizers, like the French, threatened to destroy. Jefferson and Madison defined the proper role of the states against federal encroachment in the Kentucky and Virginia Resolutions, the “Principles of 1798” that became the Republicans’ creed. But if the sovereign states had their own legitimate sphere of authority, the federal government was sovereign within its own domain, notably in providing for collective security. Relations among the states—the character of the federal Union itself—remained ambiguous in the Jeffersonian scheme. In theory, the Union was consensual and noncoercive: the states were drawn together by shared republican values and common interests. But the theory was tested when Jefferson’s embargo on foreign commerce (1807–1809) imposed unequal burdens on different parts of the country. The great question for Jeffersonian federalism was whether the spheres of state and federal authority could be clearly defined and secured in practice.

Invoking the memory of the Americans’ victory over Britain in the Revolution, Jefferson called the United States “the strongest government on earth” in his Inaugural Address. Jefferson’s faith in the American people’s ability to mobilize against any external threat justified demobilizing the conventional navy, relying instead on a new generation of “gun-boats” for a first line of defense. Jefferson also authorized the establishment of a new military academy at West Point, New York, to expedite mobilization in the event of any future land war. He had no doubts

about the federal government's constitutional authority over war and peace, nor about his own role as commander in chief. If, in the absence of any immediate foreign threat, the national interest was best served by scaling back on defense expenditure, when a clear and compelling interest seemed to be at stake Jefferson did not hesitate to fight and spend. Certainly he was willing to stretch the definition of "defense" when he launched a naval campaign in the distant Mediterranean in response to the depredations of the Barbary states on American merchant vessels. Jefferson's bold strike led to a peace treaty with the pasha of Tripoli in June 1805, though Americans continued to pay tribute to Algiers, Morocco, and Tunis for the next decade.

Jefferson's greatest accomplishment in his first term, the completion of the Louisiana Purchase Treaty—signed by American negotiators James Monroe and Robert R. Livingston in Paris on 2 May 1803 and confirmed by the U.S. Senate on 20 October—also demonstrated his readiness to act decisively in the national interest. The Purchase accelerated a process of territorial expansion—adding 828,000 square miles and doubling the nation's size—that set the stage for the emergence of the United States as a continental and hemispheric power. But Jefferson's immediate concern was defensive: the prospect of a strong French presence at the mouth of the Mississippi and the volatility of loyalties in its vast hinterland threatened the survival of the American Union. The first law of nature, self-preservation, demanded decisive action. Jefferson's misgivings about Louisiana focused on incorporating "foreign" territory into the Union without violating a strictly construed federal Constitution: Jefferson's robust conception of executive authority over foreign affairs thus seemed to come into conflict with federalism. Heeding Gallatin and congressional advisors, Jefferson suppressed his scruples, recognizing any delay would give Napoleon the opportunity to change his mind and Federalists in the Senate the opportunity—and the arguments—to defeat the treaty.

SECOND TERM

The successful outcome of the Louisiana crisis led directly to Jefferson's landslide victory in the 1804 presidential election, with New York's George Clinton now taking Burr's place as vice president. Jefferson and Clinton amassed 162 of 176 electoral votes in the contest against Federalists Charles Cotesworth Pinckney of South Carolina and Rufus King of New York: in New England, the Federalist heartland, only Connecticut held out against the Republican juggernaut.

Jefferson sought to cement the new Republican ascendancy in New England by actively promoting and defending the region's mercantile interests, embracing a broad conception of "neutral rights" when the Napoleonic Wars resumed and American shipping was under assault from both the British and the French. As depredations mounted and diplomatic efforts to protect American interests failed, Jefferson initiated a ban on all foreign shipping in his Embargo Act, effective 22 December 1807. Jefferson's motives remain ambiguous: certainly he hoped that the embargo, by forcing concessions from combatants desperate for American staples (and increasingly reliant on American shipping) would be an alternative to war; but an embargo could also signal a determination to prepare for war. In 1812 Jefferson's successor, James Madison, led the United States into another war with Britain—for which the nation was woefully unprepared. Meanwhile, the embargo wreaked havoc in mercantile centers, particularly in New England, raising demoralizing questions about the costs of commercial warfare and reviving sectional tensions. Jefferson's quixotic effort to avoid or postpone war led to draconian enforcement measures that subverted the rights of local and state governments and jeopardized individuals' civil liberties. Enforcing the embargo was the moral equivalent of making war, and war—by creating a large military establishment and expanding executive authority—threatened to subvert the federal and republican principles that Jeffersonians had sought to vindicate in their struggle against Federalism.

The success of Jefferson's first term, culminating in the Louisiana Purchase, contrasts markedly with an increasingly troubled and politically incoherent second term. In both cases, foreign affairs were determinative, suggesting that it would be a mistake to give the third president too much credit or blame for developments beyond his control. A second-rank neutral power on the periphery of the European balance of power could hardly hope to shape the outcome—or avoid the implications—of the Napoleonic Wars. As Federalist critics (and some Republicans) argued, an earlier accommodation with Britain might well have been prudent: surely the War of 1812 could have been avoided. But though Jefferson and his Republican successors squandered considerable political capital, particularly in the commercial Northeast, they continued to command the loyalties of the majority of patriotic Americans across the continent. The Republicans successfully articulated a new political consensus: the federal government would rule with a light hand (in peacetime at least), state governments would vigorously promote inter-

nal improvements and economic development, and ordinary (white) American men would pursue happiness according to their own lights. The measure of Jefferson's success was the perpetuation of the Republican ascendancy with the transfer of authority to his lieutenant Madison in 1809 and then to Monroe in 1817. The botched Quasi-War with France in the late 1790s led to Jefferson's "Revolution of 1800." The foreign policy failures of Jefferson and his successors gave Federalism a lease on life in various parts of the country but did not lead to serious challenges to the Republican regime.

James Madison

James Madison took the oath of office as the fourth president of the United States on 4 March 1809. During his presidency Madison worked with a fractious majority party in Congress, which created challenges for a president who believed that the legislative

branch, not the executive, should predominate in a popular government. The British government, too, caused problems for Madison, engaging in a war with the United States from 1812 to 1815. While Madison's leadership was suspect at times, by the end of his administration the nation was more secure than it had ever been. The former president John Adams summed up Madison's presidency by writing that "notwithstanding a thousand Faults and blunders, his Administration has acquired more glory, and established more Union, than all of his three Predecessors, Washington, Adams and Jefferson, put together." Madison served two full terms as president and retired to his Virginia estate in 1817.

EARLY CHALLENGES

Madison came to the presidency with impressive credentials. He had been an architect of the Constitution, the author of the Bill of Rights, an adviser to President George Washington, a founder of the Democratic Republican Party, and Thomas Jefferson's secretary of state. Jefferson's support for Madison secured his nomination in a congressional caucus. In turn, this nomination practically guaranteed Madison the presidency, as the rival Federalist Party was comparatively weak. Madison won 122 electoral votes in 1808, while the Federalist Charles Cotesworth Pinckney garnered only 47.

Challenges to Madison's leadership arose even before he assumed office. A small group of senators objected to his preferred nominee for secretary of state, Albert Gallatin. Instead of alienating them by nominating Gallatin, Madison accommodated the group. He retained Gallatin as secretary of the Treasury, where he had served President Jefferson, and appointed Robert Smith, the brother of the group's leader, to be secretary of state.

The appointment of Robert Smith turned out to be a serious mistake. Smith was neither a capable administrator nor was he loyal to Madison. In early 1811 Gallatin threatened to resign if Madison did not fire Smith, and Smith undermined Madison's foreign policy by discussing the administration's diplomatic strategy with the British. Madison relieved Smith of his duties in March 1811 and selected James Monroe as his successor. Smith promptly published a scathing pamphlet denouncing Madison. The pamphlet's tone was so harsh that it discredited Smith and increased sympathy for the president.

The most troubling issue facing the nation as Madison took office was the long-standing tension with Great Britain. Britain had blockaded Europe to prevent trade with nations at war with it. Madison

understood international law to give neutral nations like the United States the right to trade with anyone, even nations at war. The British navy also harassed American vessels, insisting that some American sailors were deserters and forcibly taking them from American ships. The United States placed an embargo on Britain in 1807 to force it to recognize American rights on the high seas, but the embargo hurt the domestic economy more than Britain's. It also heightened sectional tensions because it disproportionately harmed the shipping-oriented economies of the northeastern states.

That this "republican" attempt at peaceful coercion was not working disturbed Madison. He was, however, eager to improve relations with Great Britain. He seemed to have a willing partner in the British envoy David Erskine. Madison and Erskine concluded a tentative agreement in the month Madison took office: the embargo would be lifted and American vessels would not be searched nor their goods seized on the high seas. Unfortunately, when the terms of the agreement reached England, it was rejected as too generous. Many Americans interpreted this rejection as another affront. The British seemed unwilling to accept the United States as an equal.

With the collapse of the Erskine agreement, Madison advocated closing American ports to both British and French ships while still allowing American ships to carry goods to and from the United States. Congress did not agree to the proposal, but in May 1810 it passed Macon's Bill No. 2, which gave the president power to impose nonintercourse on either France or Great Britain if one nation lifted its restrictions on American shipping and the other nation did not. The French emperor Napoleon saw an opportunity in this policy. He pledged to lift restrictions, expecting Britain not to respond in kind. Napoleon hoped to provoke an active break in British-American relations. His gamble succeeded. In November 1810 Madison declared that all commerce with Britain would cease. France did not abide by its pledge, but by the time the Americans realized this, the United States was already heading toward war with Great Britain.

THE WAR OF 1812

In November 1811 Madison called for the nation to prepare its military for war, something he and Jefferson had scrupulously resisted for a decade. To pay for increased military expenditures, Secretary of the Treasury Gallatin favored reauthorizing the national bank, raising tariffs and other internal taxes, and borrowing the remainder. Congress voted to add

twenty-five thousand troops to the army (Madison had asked for ten thousand) and to raise revenue almost exclusively through borrowing. Despite the problematic state of both military and financial preparedness, congressional leaders increasingly pressed for war. When Madison was sure diplomacy had failed, he suggested that Congress declare war against Great Britain, which he already believed to be at war with the United States. Most northeastern legislators were against the declaration, but they were outvoted. On 18 June 1812 the nation went to war with Great Britain for the second time.

The War of 1812 was fought on three fronts. The most action occurred on the United States's northern frontier. Madison hoped to invade British Canada and either take possession of it or use it as a bargaining chip. This hope proved to be naïve because of the poor initial coordination of American forces and the extensive alliances the British had established with the area's Indian tribes. Land and water battles occurred from Lake Champlain across the Great Lakes and into the Michigan Territory. The American navy performed well, but the majority of both British and American land attacks were repelled, leading to a virtual stalemate in this theater by 1814.

In August 1814 a British fleet sailed up the Chesapeake, where three thousand veterans of the Napoleonic Wars (1801–1815) disembarked and marched toward the poorly defended American capital. The British easily took the District of Columbia, burned the president's mansion, and took control of the Capitol building. President Madison and the rest of the government fled ahead of the British troops. Put in charge of evacuating the White House while the president was with the army, First Lady Dolley Madison saved critical government documents and a portrait of George Washington that still hangs in the White House in the twenty-first century. But the sacking of Washington was humiliating. Luckily for the Americans, Washington, D.C., was not much of a prize. Its population was so small that there was no advantage to holding it. After an attempt by these same troops to take Baltimore, where the bombardment of Fort Mchenry in September 1814 inspired Francis Scott Key to write the song that became America's national anthem, they withdrew to the northern theater. The third front of the war was on the Mississippi River at New Orleans. General Andrew Jackson commanded the American troops there and produced a decisive victory in three battles in December 1814 and January 1815.

The war produced a stalemate, but that was a good outcome for the United States. It meant that the

world's foremost military power could not overrun the United States or appropriate its territory. The American military, woefully ill-prepared as the nation contemplated war, had proven its mettle. The peace brought by the Treaty of Ghent (1814) did not alter American boundaries at all. With the British unable to defeat the Americans, the nation had won its "second war for independence."

Of equal importance was the fact that the national government fought a war without restricting domestic freedom. Committed to the popular government he had helped create, President Madison protected civil liberties as scrupulously as any wartime president has. He had ample provocation to do otherwise, as most New Englanders did not support the war and many actively opposed it. Additionally, in the decades after the war, military heroes like Andrew Jackson, William Henry Harrison, and Winfield Scott became prominent political leaders.

DOMESTIC POLITICS

Federalists viewed "Mr. Madison's war" as an opportunity to regain their former strength. They hoped to exploit the growing rifts within the Democratic Republican Party to form an anti-Madison majority. A willing partner in this effort was Madison's vice president, George Clinton. Clinton was the most powerful New Yorker of his time and a Federalist-Clintonian alliance seriously challenged Madison's reelection in 1812. Clinton had disappointed the president by casting the deciding vote against reauthorizing the National Bank in 1811, but he could not run against Madison. He was old and infirm and died in April 1812. The New York mayor DeWitt Clinton, the deceased vice president's nephew, was selected to run against Madison. The electoral college tally was close, but Madison won a 128 to 89 victory.

As the war dragged on, a number of Federalists advocated secession. To prevent such talk from getting out of hand and to produce policies more favorable toward New England, leading Federalists called for a convention of their party. The Hartford Convention met in December 1814 and January 1815. Its conclusions were moderate, but it met in secret just before the United States triumphed in the Battle of New Orleans and news of the peace treaty with Britain reached America. Holding a private convention when they might have been rallying around the flag made Federalists look bad, and thereafter the party ceased to be a serious rival to the Democratic Republicans.

The Democratic Republican majority did not support Madison on all matters, however. Supreme Court nominee Alexander Wolcott Jr. was rejected decisively by the Senate 24 to 9, for example. Wolcott was a solid Madisonian, but that was part of the problem in many senators' eyes. A subsequent appointee, Joseph Story, became one of the nation's most distinguished justices, but his thinking was often contrary to Madison's. Few of the Court's decisions during Madison's presidency are remembered, but the president's inability to shift its ideology set the stage for important nationalist-oriented decisions of later years.

The Union expanded during Madison's presidency. Louisiana became a state in 1812; four years later Indiana joined the Union. With the authorization of Congress, Madison gained control of "West Florida" and made a serious bid to secure all of Florida for the United States before the War of 1812 intervened. Territories grew in population and several were ready to become states as Madison left office. The settlement of territories and their admittance to the Union as states was of great interest to Madison. He shared Jefferson's preference for an economy dominated by independent small farmers, and admitting new states seemed to ensure the economic predominance of agriculture. Unfortunately, as settlement spread, so did the practice of slavery. During Madison's presidency neither the U.S. government nor Madison himself displayed the political will required to check its advance.

Madison's hopes of getting Native Americans to farm were largely unsuccessful. The refusal of American Indians to abandon their traditional ways of life led the administration to negotiate land cessions with them instead. The removal of British support after 1814 and the dwindling of the fur trade facilitated this policy, making Indians desperate for the money they could make from the sale of land. In 1813 and 1814 Andrew Jackson led a band of west Tennessee militia to intervene in a civil war among Creek tribes. Jackson routed the Creeks hostile to white expansion. These developments facilitated white settlement but yielded ill will between white and native cultures that Madison was only marginally successful in tempering.

James Madison grew and learned in office. His annual message of December 1815 most clearly demonstrated his growth. In it Madison asked Congress to do several things he had not previously favored. He urged that the nation maintain a continuous commitment to a viable defense force and a professional military; he suggested a protective tariff

to safeguard American industries; and he proposed allocating federal money for improving roads and canals. Madison's critics charged him with hypocrisy, but the president seems genuinely to have come to a new understanding of how best to pursue the national interest.

Even so, Madison maintained his constitutional scruples. When he was presented with a public works bill in the last days of his presidency, he vetoed it because the nation had not ratified a constitutional amendment allowing Congress to spend money in this way, as he had suggested it do. Madison also asked Congress to reauthorize the National Bank and it finally did so in a way satisfactory to him in 1816. The new bank spurred commerce and added tax revenue to help pay down the \$120 million debt incurred during the war. James Madison left office on a high note. The nation was prosperous and secure. It was poised to become an economic powerhouse, and even most Democratic Republicans had gained an appreciation of national power.

James Monroe

James Monroe's two terms as president (1817–1825) represented the culmination of a long public career that began on the Revolutionary battlefield and included service as a U.S. senator, governor of Virginia, and secretary of state. Monroe's presidency coincided with generational and organizational changes in national politics, as a younger group of regional politicians sought to succeed the venerable founding fathers and the political organizations of the founding period, particularly the Federalist Party, began to lose their national clout. These tensions defined many of the issues and debates that occurred within and during Monroe's presidency.

MONROE'S TOURS

Monroe's election to the presidency was largely a foregone conclusion thanks to his long political association with Thomas Jefferson and James Madison and the continued strength of the Republican Party as the Federalists collapsed nationally. Facing the prospect of single-party rule for the first time in the nation's history, Monroe saw an opportunity to eliminate political parties from republican government altogether. He dedicated his presidency to the promotion of this nonpartisan vision of government and had limited success in this pursuit. Symbolically crossing the political aisle, Monroe modeled his presidency after George Washington's, rather than Jefferson's and Madison's, by presenting himself as a virtuous republican president who remained detached from the political infighting occurring in his cabinet and in Congress.

Monroe's decision to promote the message of partisan healing and national unity through national tours—as Washington had done during his first term—was the catalyst for the nation's first major political transition. During his northern tour of 1817, Monroe made his boldest gesture, reaching out to his Federalist opponents in their own regional stronghold of New England. The Federalists reaffirmed their national loyalty during the northern visit but were less successful in obtaining political appointments from Monroe. Thus his visit to New England confirmed the demise of the Federalists as a national force and compelled the younger members of the party to contemplate a new political home.

The younger members of Monroe's own Republican Party, many of whom served in Monroe's cabinet, were less moved by the message of nonpartisanship, imagining a political future that placed them at the pinnacle of the nation's government. In a government without parties, as Monroe envisioned it, men

like Henry Clay, John C. Calhoun, William H. Crawford, and Andrew Jackson had everything to lose. Power-sharing with the Federalists would have greatly weakened the Republicans' political base. The southern tour of 1819 provided an opportunity for younger, regional politicians like Calhoun, Crawford, and Jackson to share the spotlight with the respected president while raising their own national profiles. Old met new during these tours, as the nation saluted a venerable founding father and prepared for a new generation of political leaders and party organizations.

During the northern tour, an overly optimistic Federalist newspaper editor coined the phrase "Era of Good Feelings" to describe Monroe's Boston visit. The phrase reflected the Federalists' wishful thinking rather than the end of partisan tensions, as Republican newspaper editors throughout the northern and southern states were quick to point out. Although many historians have employed this expression to describe Monroe's first term, the source of this statement, along with the sectional and partisan conflicts evident as early as 1817, raises serious questions about its usefulness in summarizing Monroe's presidency.

Despite Monroe's limited success in eliminating political parties, he continued to follow Washington's presidential example and remained above the political infighting in his administration and in Congress. Monroe's intentional aloofness did not mean he was disengaged from the nation's political debates or that he delegated important decision-making to his cabinet members. Monroe played an active role in formulating domestic and foreign policy during his two terms, but after a long career in public service, he believed that avoiding political intrigue was the best way to fulfill his mandate as the nation's Republican president.

DOMESTIC POLICY

The War of 1812 had exposed weaknesses in the U.S. economy and its military fortifications, and like his predecessor, James Madison, Monroe embraced aspects of the nationalist program that had previously belonged to the Federalist Party. Monroe supported the Bank of the United States and the imposition of protective tariffs on imported goods. He opposed using federal money for internal improvements such as roads and canals because of an absence of constitutional authority for such projects. With the exception of the National Road, internal improvements such as the Erie Canal were paid for using state and private funds.

When the Missouri territory petitioned Congress for permission to form a state government in 1819, slavery became an unexpectedly important issue during Monroe's presidency. The slavery issue, which had remained largely dormant since the Constitution's ratification in 1788, triggered an explosive debate that nearly destroyed the Union. The Missouri territory remained committed to slavery, but a majority of northern congressmen supported the Tallmadge Amendment, which would have required the gradual abolition of slavery in Missouri as a requirement for statehood. The debate over Missouri statehood quickly became a referendum on slavery's continued existence in the United States. Northerners opposed the expansion of slavery, particularly into the Louisiana Purchase territory, whereas southerners saw the Missouri petition as an opportunity to affirm their rights as slave owners.

The political fireworks over the Missouri petition occurred largely in Congress. Monroe played a low-key role, consistent with his presidential style, to achieve a compromise. Privately, Monroe supported the gradual emancipation of slaves and their eventual relocation to either the western territories of the United States or to Africa. The latter position eventually formed the basis of the American Colonization Society, an organization that Henry Clay, the congressional architect of the Missouri Compromise, also supported. For the purposes of the Missouri debate, Monroe made it clear to his fellow southerners that he refused to support any statehood legislation that required Missouri to abolish slavery. A compromise presented itself when the Maine territory (at the time part of Massachusetts) also sought statehood: Missouri would enter the union without any restrictions, while Maine would join as a free state, producing an equal number of slave and free states (eleven each) in the nation and in Congress. Furthermore, slavery would not be permitted in the Louisiana Purchase territory north of the 36°30' latitude, a major triumph for antislavery northerners who wanted to keep this western land free from slavery. Monroe supported the Missouri Compromise because it defused a larger national controversy by balancing the needs of free and slave states. The Missouri Compromise deflected the more difficult question of slavery's future in the United States, but the legislation Congress and Monroe worked out succeeded in preserving national unity, at least for the time being.

FOREIGN POLICY

The most enduring achievements of Monroe's presidency, in part attributable to his able secretary of

state, John Quincy Adams, came in the area of foreign affairs. Monroe provided the overall policy direction of his administration, and Adams handled the detailed negotiations. With the resolution of the European conflicts that had circumscribed American foreign policy, Monroe saw an opportunity to assume a more forceful role in the Americas. First, Monroe wanted a reluctant Spain to sell Florida to the United States and also clarify the boundaries of Louisiana. Monroe quietly supported General Andrew Jackson's decision to pursue southern Indians into Florida, an aggressive policy that forced Spain to negotiate with the United States. Jackson was reprimanded for overstepping Monroe's explicit orders, but the raid produced the concessions from Spain that Monroe and Adams had been seeking. The resulting Adams-Onís Treaty of 1819 gave the United States control over Florida and resolved boundary disputes with Spain.

Monroe further asserted American control over the Western Hemisphere with his Annual Message to Congress in 1823. Eventually known as the Monroe Doctrine, this bold statement served as a stern warning to Spain, France, England, Russia, and other European countries that the Americas were no longer available for colonization and that any attempt by Europe to interfere in the Western Hemisphere would be regarded as a hostile act. In 1823 the doctrine reflected the nation's desire to be independent from European affairs; as the century progressed and the United States grew in power, the doctrine gained in significance.

THE ELECTION OF 1824

As a result of the generational change in politics, coupled with the shifting party structure, no clear frontrunner emerged to succeed Monroe. Following in the tradition of Washington and Jefferson, Monroe refused to designate a successor. Even if Monroe had been willing to act as a political powerbroker, there was no obvious choice to succeed the founding generation. Instead, it was up to the nation's electorate to determine which regional politicians and what party organizations were qualified to lead the nation into the future. The 1824 election became a wide-open contest among four of the rising stars of the aging Republican Party: John Quincy Adams of Massachusetts, Henry Clay of Kentucky, William H. Crawford of Georgia, and Andrew Jackson of Tennessee. Although each of these candidates had strong regional support, none had the national following to produce an unqualified victory. Thus, with no one winning a majority of electoral college votes, the na-

tion's first presidential election that did not feature a distinguished founding father was resolved in the House of Representatives.

After a long career in public life that culminated with the presidency, James Monroe worked diligently to uphold the ideals of the American Republic while fulfilling his domestic and international responsibilities. His enduring legacy was a distinguished career that exemplified service, integrity, and sound judgment.

John Quincy Adams

The four years spent in the White House by John Quincy Adams, the nation's sixth president (1825–1829), was a miserable experience for him both politically and personally. Adams, while a man of great personal integrity and intelligence, was completely lacking in the political skills necessary to be even mildly successful as president.

As a political candidate, Adams did not inspire or excite attention and seemed to be above the politicking required for public officeholders. He was elected president in 1824 in one of the most peculiar elections in U.S. history. None of the four candidates—William Crawford of Georgia, Henry Clay of Kentucky, Andrew Jackson of Tennessee, and Adams of Massachusetts—received the majority of electoral votes required to be elected president. It was, by the terms of the Constitution, left to the House of Representatives to choose the nation's next president. Clay, then the Speaker of the House, threw his sup-

port behind Adams, whom he personally disliked but thought to be the most qualified of the three remaining candidates. Once elected, Adams showed his political ineptitude by nominating Clay to be secretary of state. Supporters of the other two candidates, as well as those of newly elected vice president, John C. Calhoun, spoke and wrote of "corruption and bargain," charging a deal had been struck between Adams and Clay.

Another early example of Adams's political naiveté, yet also of his great character, involved his attempt to set an example of integrity in government by declaring that no employee of the executive branch would lose his job for any reason other than incompetence. He was, in other words, willing to leave political opponents in office, provided they performed competently. Crawford and Jackson refused offers to serve in Adams's cabinet, though Jackson supporter John McLean, originally appointed postmaster general by President Monroe, continued to serve in that capacity in the Adams administration. In that post he actively aided the Jackson coalition through the influence and patronage of his office. When Jackson later became president, he used the first vacancy on the U.S. Supreme Court to reward McLean for his efforts.

DOMESTIC POLICY AND AFFAIRS

Adams's first annual message, delivered to Congress in December 1825 (in written form, as State of the Union speeches were not given at the time), was grandiosely ambitious; it failed to take into consideration the political dynamics of the day. The type of message he gave was suitable for a president who had been elected with a mandate, not one elected against the wishes of nearly two-thirds of the nation. Prior to sending the message to Congress, Adams assembled his cabinet, but he ignored its members' caution about its overambitiousness.

The message, a bold declaration of what the national government could do to advance the well-being of the nation, proposed an extensive system of roads, canals, bridges, and highways, known then as internal improvements. Adams called for the founding of a national university and a naval academy, along with the erection of an astronomical observatory. Few of his domestic proposals were ever adopted. For example, his proposal for an observatory was laughed at and then voted down. The proposal for a Naval Academy passed the Senate but not the House, while the national university plan passed neither house. A few ideas in his message of 1825 became reality, mainly infrastructure improvements that

passed because congressmen saw a chance to bring money and new projects home to their constituents. Congress defeated virtually everything else that promoted national development through federal funds.

Adams failed to take advantage of an opportunity to get public support for his programs when he opposed lowering the price of public land sold to settlers. He wanted to maintain the price and use the proceeds for internal improvements, such as those proposed in his 1825 message. Senator Thomas Hart Benton of Missouri wanted to make obtaining the land easier by either lowering the price or simply giving it away. Benton's proposal failed, with Adams getting most of the blame, which resulted in a further decline in his support in Missouri, Illinois, and Indiana.

The midterm congressional elections of 1826 enlarged the anti-Adams faction in Congress, whose primary goal was making life even more difficult for the president. An extremely unfair tariff bill was written in the House Committee on Manufactures. It was quite favorable to farmers, but not so to manufacturers. The tariff had been drafted to make Jackson appear as a free trade advocate in the South and a protectionist in the North. Behind this was a Jacksonian strategy based on the expectation that New England congressmen would defeat the bill so that the Jacksonians could then claim that they had tried to meet the needs of farmers and manufacturers but were blocked by Adams and his supporters. Adams reluctantly signed the bill, recognizing he was being made a scapegoat by his enemies. He gave little if any thought to vetoing the measure, because at that time the veto was rarely used. This bill, the Tariff of 1828, bearing Adams's signature, effectively ended whatever slim hopes he had of reelection.

FOREIGN POLICY AND AFFAIRS

John Quincy Adams was one of the greatest diplomats in U.S. history. His exemplary service as a diplomat, along with his eight years of effective service as secretary of state during the Monroe administration, matches the career of any government servant. But not even in foreign affairs could he be successful as president, in part because of a coalition against him of Jackson, Crawford, and even Vice President Calhoun.

In his December 1825 message to Congress, Adams wrote that the United States had accepted an invitation to the Panama Congress. There was much opposition, with Jacksonians and others claiming that Adams was getting involved in the affairs of other nations and arguing that this was contrary to

the principle of avoiding unnecessary foreign entanglement put forth in George Washington's farewell address. Congress eventually authorized the necessary funds for the mission, but purposely did so too late for the United States actually to participate.

One foreign policy success during the Adams administration was blocking Colombian and Mexican efforts to seize Puerto Rico and Cuba from Spain, which could have resulted in independence for Cuba. Adams and Clay deemed it in the best interest of the United States to keep Cuba in the hands of Spain. Another foreign policy success was the promotion of free trade. With several countries in Europe as well as Mexico, Adams and Clay negotiated deals giving the United States either most-favored-nation trading status or, at least, reciprocity in trade with those countries.

International trade, however, was also the realm in which the Adams administration made quite possibly its greatest diplomatic blunder. Britain and the United States were in an ongoing dispute about whether the United States should have the same trading rights with the British West Indies as did Britain and its colonies. Clay, however, disagreed with this position, and so Adams sought help from Congress, which provided none with the intent of leaving Adams to dangle by himself. Congress then watched Adams lose a great economic opportunity by "forcing" Britain to close its ports to the United States and then having to reciprocate in kind, again without congressional support. From Jacksonian supporters there then came sarcastic description of the president as "Adams the Great American Diplomat." The entire reason for the action, or inaction, of Congress was the humiliation of the administration and the demonstration of its ineptitude.

NATIVE AMERICAN AFFAIRS

Adams's handling of Native American affairs was no more successful than any other area of activity during his presidency. The primary reasons for his failure were lack of support from Congress; the disposition of George Troup, the governor of Georgia, against cooperating with the federal government; and the lack of political savvy or capital on Adams's part to do what he knew was right.

The Treaty of Indian Springs with the Creek Indians was approved by the Senate the day before Adams took office in March 1825. Adams signed the treaty although warned that it had been unethically negotiated. The treaty involved the Creeks leaving their land in return for compensation and a delay in leaving it until Georgia began to survey the land for

settlement. As time passed, Adams realized the Creek Nation in Georgia had been cheated by chiefs of other Indian groups and their white allies, led by Troup. An investigation was ordered by Adams, as well as instructions to Georgia on how to proceed, which were ignored. Only through the threat of force could Adams get Troup to cooperate. Had the Treaty of Indian Springs been allowed to remain in effect, it would have resulted in bloodshed, so a new treaty was negotiated in Washington, D.C., and submitted to the Senate, where it lacked sufficient support. Negotiations were reopened, the Treaty of Washington was modified, and the Treaty of Indian Springs was declared void. Conflict continued between Georgia and the Adams administration, with Congress giving only limited, and sometimes no, support to Adams in the matter. In the end, Adams's lack of political skills prevented him from helping the Creeks in any significant way.

A FAILED ADMINISTRATION

The presidency of John Quincy Adams was clearly not a success. All that he wished to accomplish was blocked by an antagonistic Congress. The public perceived the manner of his election to be questionable, and one political blunder after another did nothing but embolden his opponents. Yet while the great majority of the domestic proposals contained in his message to Congress in 1825, as well as the overriding philosophy behind them, seemed grandiose at the time, many were eventually implemented over the course of the next 125 years.

PRESS, THE The press experienced tremendous growth between 1754 and 1829. Its expansion outpaced economic growth, impelled by an outsized be-

lief in the cultural and especially the political significance of print communication, and by favorable government policies. Colonial North Americans, especially in the northern British colonies and among the gentry in the southern ones, hailed print communication as “the art preservative,” a technology profoundly transforming the ways that a society might conserve and extend its texts, values, and history. They understood it as the engine of Enlightenment, expanding the intellectual and scientific frontiers of civilization.

First among the uses of printing in British colonial North America, however, was religion. The famous attachment of the Puritan settlers of New England to pious reading made that region the center of print production through the seventeenth century and the sole host of newspaper production in the first two decades of the eighteenth. New England’s, and especially Boston’s, primacy lasted till the end of the colonial period.

In the early Republic, as the political concerns generated by the Revolution interacted with commercial interests in the rising cities of the mid-Atlantic region, Philadelphia (and later New York) overtook Boston as the center of print culture. At the same time, biases in print culture against women and members of lower social classes began to fade, as women’s literacy levels moved toward parity with men’s and as popular styles became more common in newspapers, pamphlets, and chapbooks (literally, cheap books).

Benjamin Franklin embodies these shifts. Born in Boston and raised in a highly literate family, he experienced rebellion against the theocracy of New England firsthand as an apprentice at his brother James’s newspaper, the *New England Courant*. After breaking with James, he moved to Philadelphia, where he spearheaded a variety of civic improvements, won fame for his experiments with electricity, and transformed himself from an artisan into a gentleman political leader and later a diplomat. As the most famous printer of the colonial period, he symbolizes the role of the press in commerce, politics, and Enlightenment, as well as its migration to the mid-Atlantic region and its increasing secularization.

Franklin’s print output also captures the various uses of printing in the late colonial period. His two most famous imprints were *Poor Richard’s Almanac* and the *Pennsylvania Gazette*, which remain among the most readable colonial publications. The *Almanac*, which sold ten thousand copies a year, was the lead title for Franklin’s large and successful publish-

ing and bookselling enterprise, which included an American edition of Samuel Richardson’s *Pamela*—the first novel published in North America—and a series of popular pamphlet versions of the sermons of the evangelist George Whitefield. In addition to printing and publishing titles, Franklin and his London partner, William Strahan, also imported and sold British imprints. The North American colonies still looked to London as their cultural metropolis, and the logistics of printing in the colonies made it far easier and cheaper to import long works, especially full-length books. The first full-length English-language Bible to be printed in America, published by Mathew Carey in Philadelphia, did not appear until 1782. For the most part, early American printers simply could not afford to tie up so much of their scarce type in a long work.

The *Pennsylvania Gazette* was a more typical production for a colonial printer. If one counts each edition of a newspaper as an individual imprint, then newspapers were by far the most common kind of printed good in the late colonial period, except perhaps for job printing, the printing of ad hoc items like handbills or legal forms. Franklin’s *Gazette* was archetypical. The largest and most successful newspaper of its day, it performed four basic tasks. First, it was an authoritative source of “official” information, carrying true texts of government proclamations and reliable shipping news. Second, it guided its readers through the available “intelligence” copied from British newspapers and informed letter writers, ship captains, and other informational middlemen. In this task, its work was aided by Franklin’s position as postmaster for Philadelphia (appointed 1737) and later for the colonies (appointed 1753). These patronage posts also point to the typically close association of colonial printers with governing authorities; for Franklin and other printers, official government printing, the second task, was a crucial revenue source. But they also performed a third task that separated them from the government in providing a platform for letter writers arguing about public affairs. By printing and monitoring such discussions, colonial newspapers provided an incipient public sphere in the colonies. Since at least the acquittal of John Peter Zenger for seditious libel in New York in 1735, colonial printers had claimed the right to publish honest criticism of corrupt officials; by providing a forum for public criticism, the press worked as the “palladium of liberty.” Colonial printers always exercised discretion in publishing controversial pieces, however. Freedom of the press, a phrase that meant different things to different people, was best enjoyed in moderation. Fourth, the *Gazette* carried advertis-

ing. In a prosperous colonial newspaper, advertisements could fill half the space.

By the 1750s almost every colony had a newspaper. In the southern colonies newspapers usually were printed by state-supported printers, who had been brought to the provincial capital to do the official printing of the laws. Such newspapers, which were usually local monopolies, claimed to be printed "By Authority"; their printers took great care not to offend the government. In a few northern cities, competitive newspaper markets had appeared. In 1775 Philadelphia had six newspapers, Boston five, and New York three. In between these two models were situations of moderate competition, like Connecticut, where four newspapers were published in different cities, or Rhode Island, where newspapers were published in Providence and Newport.

THE PRINTING PRESS AND THE REVOLUTION

As the Revolution approached, the political work of these newspapers changed dramatically, and a raucous pamphlet literature circulated transatlantically. A key moment of change occurred with the Stamp Act crisis in 1765. The Stamp Act was in part a tax on printing. Even though their business was targeted by the tax, printers moved slowly to oppose it, reined in by their habit of deferring to authority. Franklin himself, working in London as a colonial agent, lobbied against the tax, but also nominated his friend and business associate John Hughes to be a stamp distributor. Only after angry popular protests exploded throughout the colonies did printers realize that this was not business as usual. Pressure forbade publishing on stamped paper, and, ultimately, printers rallied in opposition, printing illegally or stopping publication.

From then until the outbreak of actual warfare in 1775, printers were caught between a traditional avoidance of partisan attachment and the demands of activists on the one hand and authority on the other. The ambiguity in the opposition movement regarding independence and loyalty could throw printers off balance. Printers who misread the situation by favoring the Loyalist cause, like John Mein in Boston and James Rivington in New York, became targets of mob violence. Mein published cargo manifests appearing to show that John Hancock had violated nonintercourse agreements by importing enumerated British goods. Rivington published a series of pamphlets ridiculing the Patriot leadership. Both claimed "impartiality" but, simply by displaying disunity in colonial opinion, undermined the resistance. Colonial publications also circulated in Britain and

were included in governors' reports as records of public opinion. In fact, Rivington and Mein both received financial subsidies from the British as well.

The Revolutionary controversy politicized printing. Intensifying with the committee movement in the early 1770s, Patriots policed public sentiments, even while producing a mountain of printed arguments about legitimate government in pamphlets and newspapers. This propaganda campaign climaxed with Tom Paine's *Common Sense*, the publishing sensation of the age, which, Paine claimed, ran 120,000 copies in its first few months—one copy for every ten adults.

Throughout the period of active warfare, neither side tolerated opposition publishing in territory it controlled. Freedom of the press was not a key goal of the Revolution. Rather, the revolutionaries concentrated on presenting a convincing depiction of public sentiment to, as the Declaration of Independence put it, a "candid world." A key part of this candid world was the British public, including Parliament. Both sides battled for support through the press. The newspaper habit of copying news directly from other newspapers meant that any circulating publication might be the equivalent of a wire service story today.

The Revolution confused the question of freedom of the press but heightened the sense of the press's importance to republican government. After the Revolution, printing was overwhelmingly framed as an instrument of self-rule, and all sectors of political opinion concurred on its importance. Culturally, this meant that literary production, including novels and plays, was assigned a political mission. Women were drafted into the project of literary nationalism, in part through the institution of "republican motherhood." The Republic became the template for understanding any work in the realm of print, including religious newspapers. When such newspapers began to appear at the turn of the century, they styled themselves and their evangelical mission after the political work of the revolutionaries.

A NATIONAL PUBLIC SPHERE

An overriding concern with the successful functioning of the Republic was manifest in the extension of the postal system. In the first federal administration, when congressional leaders had difficulty agreeing on any of the key institutions of the national government, they quickly and consensually passed sweeping postal legislation, creating the department with the greatest number of officeholders, the largest amount of available patronage, and the most contact

and influence on the everyday lives of ordinary people. The postal system was designed as an information infrastructure. It was, in other words, designed to support a dramatic expansion of printing. Thus Congress authorized the postal system to subsidize the circulation of printed goods through reduced postage for newspapers and periodicals. Printed matter, then as now, constituted the overwhelming bulk of material in the system. The postal system also subsidized the circulation of information by stipulating free exchange of newspapers and periodicals among editors. Until the advent of telegraphic news in the mid-nineteenth century, the work of editing a newspaper largely consisted of reading the “exchanges” and copying interesting items.

The new federal and state governments also subsidized printing through requirements for publishing the laws. The federal government required the secretary of state to publish laws at advertising rates in two newspapers in each state; state governments had similar requirements. In addition, legislatures, including the U.S. Congress, contracted with printers to publish their proceedings, and all levels of government generated a great deal of job printing. Thus printers, competing in the early Republic for government patronage, served as intensifiers of partisan competition.

PARTISANSHIP AND THE PRESS

All the informational initiatives of the early Republic were rooted in a recognition of the importance of a national public sphere. Because legitimate government, as thinkers like Thomas Jefferson explained, came from the informed consent of the people, it was necessary to create a system by which information and opinion circulated. Such a public sphere would also produce a national identity, an imagined community. But this line of thinking did not reckon on partisan divisions. Coming out of the Revolution, leaders expected citizens, as well as printers, to approach national issues as rational individuals seeking a common good. This ideal conflicted with the recent reality of a revolutionary movement deploying heated propaganda. In other words, the Revolution’s ensemble of advocacy practices contradicted its ideology of rational liberty.

This tension played out in the work of printers in the 1790s and was resolved by the 1820s. The so-called first party system produced a vicious pamphlet and newspaper war, radiating outward from Philadelphia to rival networks of printers in state capitals. The Federalist administrations of George Washington and John Adams patronized printers like John

Fenno and tried to find ways to stifle the opposition printing of Philip Freneau and Benjamin Franklin Bache, who enjoyed varying levels of support from Thomas Jefferson and James Madison. Because republican mores condemned the personal participation of government leaders in partisan attacks, the printers and pamphleteers fought a kind of proxy war. Their marginal status allowed opposition publicists to deploy the old advocacy tools of the Revolution; but, because they now used them against a legitimately elected government, their patriotism was continually challenged. The partisan conflict climaxed in the controversy over the Alien and Sedition Acts, passed in 1798. The outcry against these attempts to muzzle the opposition was vehement enough to contribute to Jefferson’s election as president in 1800.

Jefferson’s election seemed to validate partisan newspapering. Ironically, his administration also began to withdraw from the practice by establishing the *National Intelligencer* as its official newspaper. Although a staunch Republican organ, the *Intelligencer* was also a steadfast source for authoritative reports of the proceedings of the federal government and was used as a resource by printers of every political persuasion. A parallel national source was Hezekiah Niles’s *Weekly Register*, founded in 1811 in Baltimore. These two newspapers sought to embody a national consensus on public discussion.

But the middle ground was never secure. Although at times national politics quieted during the two decades following Jefferson’s election, and although in many states and localities a single party dominated politics, the national public sphere turned toward permanent division. In the 1820s, with the rise of the second party system, in which Jacksonian Democrats competed against National Republicans and later Whigs, the press solidified the partisan allegiances and practices that would characterize it for the rest of the century.

Andrew Jackson’s six-year campaign for the presidency marked the maturation of partisan newspapering. Beginning with a cadre of editors including Amos Kendall and Francis Preston Blair—his famous “kitchen cabinet,” a term coined in 1832 to refer to an informal group of advisers to one in power—Jackson’s organization created a national network of party papers that would coordinate the presentation of a spectacle of public support. His media campaign did this first by producing representations of Jackson—descriptions of his principles, proposals, heroic personal history, and prodigious character—and then of the people spontaneously acclaiming Jack-

son. Just as in the Revolution, the newspaper editors actively participated in movement activities, coordinating caucuses and conventions, acting as secretaries at meetings, producing official reports, and then printing them in their newspapers, which propagated all this material through the national system of postal exchange. Niles, the *Weekly Register* editor, would later refer to this system as “manufacturing public opinion.”

Partisans in the 1820s justified their action as participating in a healthy contest for public opinion. They argued that competition in politics promoted freedom in the same way as competition in the marketplace. Unlike the first party system, Jacksonian politics did not itch to treat opposition as treason. However, the majoritarian impulse in Jacksonian democracy subsequently encouraged a deep hostility toward antislavery activism; Jacksonian publicists like Amos Kendall urged federal action to silence abolitionists.

A PLURAL PRESS

The republican impulse, federal policy, and party competition drove the development of the newspaper press and pamphleteering. This sector of the press was the most public, numerous, and ideologically wrought. But other sectors of the press developed in different ways and in a different direction. Print offices “graduated” apprentices at a higher rate than markets could support, and the political enthusiasms of new printers, enhanced by government patronage and subsidies, encouraged them to start financially shaky newspapers. Printers constantly scrambled for new projects to add revenue.

In addition to job printing, which grew steadily, printers took on more and more book and periodical publishing. Entrepreneurs often sought to publish books “by subscription,” selling copies before they were printed. Anne Royall, perhaps the nation’s first female literary celebrity, notoriously coerced famous people into subscribing to her work in progress, threatening to ridicule them in it otherwise; she then publicized the names of her subscribers to get more subscribers. Many authors and publishers made arrangements with colporteurs (peddlers) like Mason Locke Weems. From 1794 to 1825 Parson Weems, the author of a biography of George Washington that spawned such legends as the cherry-tree incident, traveled from town to town selling books, pamphlets, and periodicals. Evangelical groups were especially good at this form of publishing and marketing books. Methodist circuit riders carried material printed by the Methodist Book Concern (est.

1789). The American Bible Society (est. 1816) and the American Tract Society (est. 1825) used similar techniques to try to put religious texts, including the Scriptures, into the hands of ordinary people, giving these religious organizations a claim to have invented the idea of mass communication.

More security for printers was to be found in publishing “steady sellers.” Most reliable were practical books like schoolbooks and almanacs. Because printing remained relatively decentralized in the early Republic, profitable franchises in this kind of publication could be found in towns scattered throughout the country. John Prentiss, who founded the Keene, New Hampshire, *Sentinel* in 1799 with only seventy subscribers, secured his business by publishing a series of successful schoolbooks. Economies of scale involving expensive new technology eventually caused book printing to centralize in metropolitan areas, leading to the rise of mammoth firms like Harper and Brothers.

Religious publication and “steady sellers” opened the way for the development of reform publications and literary culture. Both were originally peripheral to the dominant republican mission of the press. Reform publications often developed out of the religious press and grew as positions were rejected by the mainstream. The most famous reform periodicals of the period appeared as the second-party system took shape. Benjamin Lundy’s pioneering abolitionist paper, the *Genius of Universal Emancipation*, established in 1821, recruited William Lloyd Garrison, later the editor of the *Liberator*, as a collaborator. Frances “Fanny” Wright, the celebrated feminist, abolitionist, and socialist, and Robert Dale Owen, founder of the New Harmony colony in Indiana, edited the *New Harmony Gazette*, then moved it to New York City and renamed it the *Free Enquirer* in 1829. The *Free Enquirer* would later become associated with the Workingman’s Party, and its staff would participate in founding the *Workingman’s Advocate*, one of the nation’s earliest important labor papers.

The rise of a literary print culture relied on the republican impulse to develop an autonomous national culture, a religious interest in elevating morals, and a commercial interest in selling fiction to expanding audiences. Ladies’ magazines, often supported by religious publishers, were an important early resource and helped to launch the sentimental novels that were best sellers by mid-century. Before 1829, however, writers of the British Isles continued to dominate American bookshelves; the popularity of Hugh Henry Brackenridge’s *Modern Chivalry* series, published beginning in 1792, was far

exceeded by the *Waverley* novels, the first of which appeared in 1814, by the Scottish Sir Walter Scott.

By the late 1820s the press had also begun to recognize the nation's ethnic and racial diversity. There had been a thriving German-language press since the colonial period but relatively little publishing by other minority groups. In 1827 Samuel E. Cornish and John B. Russwurm established *Freedom's Journal*, the nation's first African American periodical, and in 1828 the first Native American periodical, the *Cherokee Phoenix*, appeared. These and other "group" media accepted the dual task of providing a separate identity for their readers and simultaneously trying to be a voice for the group in the larger public sphere.

PRINT CULTURE The impact of printing and print culture on the emergence and consolidation of the new nation can hardly be overstated. All through the eighteenth century, printing, nation building, and forging a national identity went hand in hand in America. Few commentators on the history of the book subscribe to older notions of printing as an unequivocal agent of change; but it is now generally accepted that, to a great degree, America is a nation that printed itself into being. More than any other Western nation, the United States, in terms of culture and ideology, developed out of a dynamic process of self-definition and self-invention in which the production, dissemination, and consumption of print played a crucial part. Thus, dismissing the idea that the American Revolution had started with the outbreak of hostilities between Britain and the colonies, John Adams argued in a letter to Thomas Jefferson in 1815:

The Revolution was in the Minds of the People, and this was effected, from 1760 to 1775, in the course of fifteen Years before a drop of blood was drawn at Lexington. The Records of thirteen Legislatures, the Pamphlets, Newspapers in all the Colonies ought [to] be consulted, during that Period, to ascertain the Steps by which the Public Opinion was enlightened and informed concerning the Authority of Parliament over the Colonies.

Although printing and the press are instrumental in nation formation generally, America's rise to nationhood was unique in the close symbiosis between print culture and the emergence of a republican ideology. Through the mediation of printing and print culture, the republican public sphere was created in which such iconographic texts as the Declaration of Independence, the Constitution, and the *Federalist Papers* could be conceived, written, disseminated, and debated. The history of America's print culture can be divided roughly into three stages: the imperial crisis of the 1760s and 1770s; the Revolutionary War; and the post-Revolutionary period of consolidation.

BENJAMIN FRANKLIN, "EPITAPH" (1728)

The Body of
 B. Franklin,
 Printer;
 Like the Cover of an old Book,
 Its Contents torn out,
 And stript of its Lettering and Gilding,
 Lies here, Food for Worms.
 But the Work shall not be wholly lost:
 For it will, as he believ'd, appear once more,
 In a new & more perfect Edition,
 Corrected and amended
 By the Author.

FREEDOM OF THE PRESS: FROM DUTY TO RIGHT

Printing in eighteenth-century America was more commercially competitive than in Europe, where much of the print trade still depended on patronage from the state, church, or affluent citizens. Combining the activities of printer, bookseller, and publisher in one person, the colonial printer earned his living by printing almanacs, stationery, business forms, and, most important, newspapers: 75 percent of American printers between 1700 and 1765 printed newspapers. Yet many colonial printers regarded their trade not just as a livelihood but as a calling, seeing it as their civic duty to spread reliable information and useful knowledge to the population at large. This made freedom of the press from early on an issue of national and ideological significance, rather than of mere personal and commercial interest. Benjamin Franklin spoke for many of his colleagues when, in his "Apology for Printers" (1731), he defended himself against the censure of a controversial handbill he had printed by asserting that as a printer he was a disinterested, neutral mediator whose aim was first and foremost to promote the common good of society. Seeing that the "Business of Printing has chiefly to do with Mens Opinions" and "most things that are printed tending to promote some, or oppose others," it is the task of the printer to ensure that all sides get equal access to print. A free press being a guarantee for the democratic access to knowledge and "public opinion," the question of what should be printed and what suppressed should be decided solely by whether it was conducive of "general Utility."

This being the general mood among printers in America, it is not surprising that when the Stamp Act was introduced in November 1765 it was met with a barrage of criticism. Widely denounced as a

repressive measure aimed at curtailing the liberty of the press, American printers again based their case against the legislation on the "public good" argument. Yet this time the "common good" was redefined as the republican common good, and the freedom of the press would from now on be a republican right, not merely a utilitarian duty of a printer to society. A "free press" and a "free people" were henceforth interchangeable phrases. "Can our Liberties be secure," a correspondent in the *New Hampshire Gazette* wondered, "when that great and essential one of the PRESS is daily attacked, and PRINTERS and BOOKSELLERS are so terrified by uncommon RIGOUR, that they will neither Print nor Publish?" Although repealed in 1766, the Stamp Act had politicized the issue of the freedom of the press for good (though not for the first time) and had thus fundamentally changed relations between the American colonies and the British authorities. More important, it had given the American colonies a powerful weapon in their future struggle with Britain—a body of staunchly republican printers and writers who were no longer satisfied to enlighten and inform the reading public but sought to make it politically independent as well. During the imperial crisis America's printers thus assumed a new prominence; between 1764 and 1783 the number of printers more than doubled, and similarly the number of newspapers in those years went from twenty-eight to fifty-eight.

Before tensions arose between the colonies and Britain, colonial American newspaper printers mainly copied items from London newspapers, publishing imperial and foreign news, rather than domestic. But during the Revolutionary crisis they increasingly began to copy news items from each other, thus spreading accounts of significant events. News of the clashes at Lexington and Concord spread like wildfire across thousands of miles; citizens in South Carolina could promptly read about decisions in New England legislatures. During the War of Independence, printing developed into a technology of revolution. Skirmishes, boycotts, and incidents of law-breaking were certainly important instruments of expressing and organizing republican resentment, but the most effective Revolutionaries by far were the ones who provided the copy for the newspapers and pamphlets and the printers who printed it.

Empowered by the very medium they used to distribute their Revolutionary ideas, it was the republican writers and printers who crucially helped to mobilize an intercolonial and protonational public—which was, essentially, a public of readers. Whereas during the imperial crisis pamphleteers had tended to

write for an educated elite, the burgeoning print culture democratized the American people's involvement in the Revolution. This is borne out by the rise in the sheer numbers of American publications in this period: the number of American imprints rose from around 350 in 1765 to close to 500 in 1770 to almost 1,000 in 1775. Even more impressive is the circulation of certain key texts: the Declaration of Independence was printed in at least seventeen American editions in 1776 and 1777, and in virtually all the newspapers, while Thomas Paine's *Common Sense* (1776) sold approximately 120,000 copies in its first three months after publication, and an estimated total of 500,000 copies in 1776, to a population of around 3,000,000 (20 percent of whom were slaves and 50 percent of whom were indentured servants).

THE LIMITS OF PRINT

But the democratizing and unifying impact of print had its limits. Print culture and technologies of print are structured; they derive that structure from the dominant culture, which seeks to further its ideological agenda. That is, while printing helps to shape a culture and a society, it is also true that culture shapes print. Even before the Revolution, American printers had occasionally used the power of the printed word to "correct" certain developments they considered undesirable. Thus in the 1740s and 1750s Benjamin Franklin had fought a particularly bitter print war against the German-language print empire of Christoph Saur. Franklin feared that the independent German-language printers of Germantown might become too influential among the large German immigrant community of Pennsylvania and thereby frustrate his mission of ethnically engineering the population of the state: "While we are . . . *Scouring* our Planet, by clearing America of Woods, and so making this Side of our Globe reflect a brighter Light to the Eyes of Inhabitants in Mars and Venus, why should we in the Sight of Superior Beings, darken its People?" Franklin pondered in his essay "Observations Concerning the Increase of Mankind" (1751). Franklin on several occasions started German-language newspapers in order to force his German competitor out of business. During the Revolutionary War, the Whig printers that zealously defended the freedom of the press as being of paramount importance to civil society were by no means prepared to extend that freedom to Tory printers like James Rivington, printer of the *New-York Gazetteer*.

After the Revolution printing was the arena for the bitter struggle between Federalists and Republicans over the ratification of the Constitution. During

this struggle the evolving relation between print and political culture ushered in a fundamental change in the symbolic value of print. Crucially, both the emerging political language of Anglo-American republicanism and the emergence of a post-Revolutionary public sphere were grounded in a new way of perceiving printedness. Thus, in the course of this process the Constitution was understood as a printed form of legitimate government, and the free republican press as the embodiment of the *res publica* and the sovereignty of the people. In *Federalist* 84 (1788), Alexander Hamilton defended the omission from the Constitution of a bill to protect the freedom of the press by saying it would be "impractical" to implement it; the Bill of Rights of 1791 corrected this. An acrimonious print battle then erupted between Federalists and Republicans over the Republic's political alliance with the Jacobin administration in France, once more threatening to tear the nation apart. In response, President Adams signed the Sedition Act of 1798 into law, effectively limiting freedom of the press again by threatening opposition printers with heavy fines and imprisonment.

Print culture is inextricably bound up with America's rise to sovereign nationhood and its emergence into a distinct cultural domain. Yet it is important to realize that print is not *prior* to the culture of colonial America or of republican America, but was shaped and conditioned by it. This process continued into the early decades of the nineteenth century. As American printers endeavored to consolidate the prominent position in the public sphere they had gained during the Republic's formative years, they were experiencing major transformations in their trade. The introduction of new materials (notably machine-made paper), technologies (such as the steam-powered press) and dissemination channels (improved mail and transportation networks, and the invention of the telegraph), as well as sharp increases in literacy rates and overall readership numbers, forced American printers to adopt more mass-market oriented activities and strategies. While many in the print trade ventured into large-scale commercial newspaper publishing, the early nineteenth century also saw the emergence of the modern publisher. Replacing the eighteenth-century master printers and booksellers, the new publishing entrepreneurs increasingly came to dominate the entire process of the financing, production and dissemination of printed material. Levels of capital investment steadily rose, and more industrial labor practices were introduced. What once was a craft rooted in European practices and dependent on Old World materials and machines, quickly became an energetic and

innovative industry. By the 1840s, the domestic American print market had come of age.

PRINTERS Printers were the intellectual elite of the early American working class. They needed to be literate, unlike most other artisans and laborers, and they often had the chance to edit and write their own publications. Many were like Benjamin Franklin, who was made a printer rather than a soap maker like his father for the greater intellectual opportunities printing seemed to afford. "From a child I was fond of Reading, and all the little money that came into my Hands was ever laid out in Books," Franklin wrote in his autobiography. "This Bookish Inclination," he continued, "at length determined my father to make me a Printer." Printing provided many a young workingman with a substitute for the college education that only a tiny minority of early Americans could obtain.

Printers also enjoyed a more visible role in their communities than most artisans. Their offices were a community's major source of reading material, sometimes including a bookstore and a newspaper that a printer not only produced but controlled. Their daily business brought them in contact with those who had writings or documents to print, meaning government officials, political leaders, and educated professionals such as clergymen and lawyers. In the colonial period they typically printed with the government's official sanction—"by authority"—and often as government officials themselves.

Greater visibility and a close relationship with the powerful did not necessarily translate into great influence or prestige for the printer himself. The literary training one could acquire in a print shop conferred neither the classical learning nor the polished manners that were the mark of an eighteenth-century gentleman. Moreover, though printing was more cerebral than most other crafts, it was still a dirty, backbreaking job, on the wrong side of the traditional sociopolitical divide between those who worked with their hands and those who did not. (American printing presses ran by human power until the steam-driven press began to be adopted during the 1830s.)

Even Benjamin Franklin, whose tremendous talents were recognized while he was still a teenager, had to make his fortune and retire from printing before he could take up his later career as a politician and scientist. Somewhat hypocritically, Franklin advised young printers, including his grandson Benjamin Franklin Bache, to stay out of politics, or at least openly avoid choosing sides in the material they printed. Freedom of the press, as colonial printers used the term, tended to mean something closer to

free access to print rather than absolute freedom of expression for journalists themselves. Needing to please as many customers as possible in a limited market, most printers tried to follow Franklin's advice, avoiding controversy and focusing on commercial endeavors as much as they could.

THE RISE OF NEWSPAPER POLITICS

Nevertheless, because they controlled access to print and because print was the only means of mass communication available, printers sometimes found themselves sucked into politics, usually in the service of their chief customers, the local elites who controlled the colonial assemblies. Going back at least as far as the famous Zenger case of 1734–1735, colonial politicians relied on the press as one of their chief weapons when conflicts arose with royal governors and the British imperial bureaucracy. This was particularly true leading up to the American Revolution, when colonial printers were forced to abandon any semblance of their traditional neutrality and choose sides. Enthusiastic patriot printers like Benjamin Edes of the *Boston Gazette* found themselves “working the political engine” together with Harvard men like Samuel and John Adams, while printers who refused to join the cause, or actively supported the British authorities, eventually found it more prudent to flee the country. After the war it was the Revolutionary officers, attorneys, and clergymen who enjoyed the resulting power and honors, not the printers.

The rise of newspaper politics—the convergence of the press and the nascent political parties during the mid-1790s—pulled many additional printers into politics on a more permanent basis. The outbreak of partisanship placed the trade under immense pressure. A small network of printer-operated urban newspapers led by the Philadelphia *Aurora* and Boston *Independent Chronicle* took over from Thomas Jefferson and James Madison's *National Gazette* as the chief critics of Hamilton and Washington's policies after 1793. Many other commercial printers and young aspirants who tried to be evenhanded in the conflict were attacked and boycotted if they allowed opposition pieces into their papers at all, even if balanced with pro-government material. The administration of John Adams tried to stamp the Democratic Republican network out with the Alien and Sedition Acts, only to have the network grow larger instead. Young printers radicalized by the Federalist repression rushed to politicize existing newspapers or start new, fiercely partisan journals. When Jefferson unseated Adams in the so-called Revolution of 1800, the “great political change in the Union,” as one Dela-

ware writer put it, was widely attributed to the “unremitting vigilance of Republican Printers.” After 1800, conventional political wisdom dictated that any serious movement or party needed to have its own network of newspapers.

Inadvertently, this development brought a certain amount of democratization to American political life by setting up printers, immigrant radicals, and similar folk as the country's chief political spokesmen. President Jefferson distanced himself from his more radical newspaper supporters and kept them out of his administration, but the political culture had changed irrevocably. Printers and other editors now set the terms on which other politicians were considered loyal to the Jeffersonian Republican cause, and they had control of weapons that could do great damage to the reputations of those gentleman statesmen who went against them. Philadelphia politics in particular became notorious for laboring under what some called the “tyranny of the printers,” especially the Irish refugee radicals William Duane and John Binns of the *Aurora* and the *Democratic Press*, respectively. For many it was a horrifying development to have accidentally set up “uneducated printers, shop-boys, and raw school-masters” as “the chief instructors in politics.” Efforts were made to gentrify the partisan press by placing printers under the editorial guidance of more refined men, especially lawyers, but these had only partial success. Hundreds of newspaper editors held public office through the 1830s, and most of them began their careers as journeymen printers. As horrifying as the rise of newspaper politics was to some, it was a godsend to others, namely to young, ambitious printers who could now become artificers of political movements and colleagues of great statesmen in addition to their work with ink, type, and paper. It was one of the great glories of the United States, William Duane wrote, that it was possible for a printer, an artisan, to become “a writer on American affairs, a politician . . . worthy of the regards of men distinguished by their talents and their virtues in an age like this.”

FROM THE PRINTING TRADE TO THE PUBLISHING INDUSTRY

Unfortunately, for most ordinary printers, particularly in the urban centers, prospects were considerably less glorious than those painted by Duane. They faced a steady decline in their status after the Revolution as their trade slowly was transformed into the lowly production arm of a commercial publishing industry. Mirroring the trends in other industrializing trades, the entrepreneurial act of selecting and ed-

iting material increasingly became separated from the physical process of printing. Journeymen printers found it more and more difficult to complete the traditional artisan's path of upward mobility through the life cycle, from apprentice to journeyman to master and shop owner. The craft became identified ever more firmly with its manual labor aspects as the intellectual activities associated with publishing were taken over by educated editors and entrepreneurs who soon gained exclusive use of the title "publisher." Some of the first successful commercial publishers were former printers, but by the 1830s or earlier, this possibility had been largely foreclosed. The vast majority of apprentices and journeymen could expect to spend their lives as wage laborers, with the jobs that were available increasingly under pressure from cost- and labor-saving technology that included better printing presses, stereotyping, and ink rollers that allowed boys to do the former adult journeyman's job of beating ink onto type. A class of underemployed, semi-nomadic "tramp printers" grew.

In response to these trends, the beginnings of a labor movement grew up among journeymen printers. Among numerous other job actions across the period, twenty-six Philadelphia journeymen staged the American trade's first strike in 1786 to get a pay cut rescinded, and New York journeymen walked out in 1799 to win their first complete wage scale. Formal "typographical societies" were established in New York in 1795 and Philadelphia in 1802, and from there they spread to many other cities. In the 1830s one organization of journeymen printers tried to convince its brethren to refuse to work for those editors, publishers, and other nonprinters who were held to be merely exploiting the labor of journeymen printers.

BETTER LIVING THROUGH POLITICS

The expansion of the country press, where older technology and traditional print shops were still the rule, became the major means of escaping the industrialization trap for printers of sufficient verbal ability. Following the old colonial pattern of Franklin and his apprentices, experienced journeymen borrowed or saved enough money for (often previously used) printing equipment and set up shop in underserved population centers, especially on the frontier. Politics greatly expanded these opportunities. Newspaper-dependent political parties required small weekly newspapers to represent them in as many places as possible. Political needs inspired the creation of many more such small papers than economics alone would

have dictated and opened sources of credit and income (from local party supporters) that would likely not have been available otherwise. A fast track to master or some equivalent status was thus opened for many journeymen printers who otherwise might not have achieved that goal at all. Young Thurlow Weed, later the architect of Abraham Lincoln's Republican Party, was an Albany journeyman and labor activist until 1818, when supporters of DeWitt Clinton loaned him money to buy a newspaper in tiny Norwich, New York. The Norwich *Republican Agriculturalist* was the beginning of a political career that would see Weed become one of the country's most powerful politicians and take him very far from the problems and values of early American artisans.

PRINTING TECHNOLOGY Some historians argue that technologies of print precede cultural transformation. That is, printing conditions and shapes the emergence of a new political and social order and the creation of a new form of collective subjectivity, as well as an enlightened public, rather than the other way around. Other historians have argued to the contrary that society, science, capitalism, and republicanism have not so much been shaped by print as they have shaped print. Navigating a path between these two views, one can more accurately describe the relationship between printing technology and culture as dynamic and reciprocal, rather than as static and sequential. The idea that printing technology had a democratizing and rationalizing impact on the new nation is therefore only one side of the coin: the politics and culture of the new nation produced and structured the practices of printing technology, turning it into a highly efficient medium for republican ideology.

Throughout the eighteenth century, the commercial character of printing in America was its key distinguishing feature. In comparison to their European colleagues, American printers faced several obstacles in their struggle to survive, causing fierce rivalry in the domestic American print market. Their main disadvantage was a chronic lack of capital, making colonial and Revolutionary American printers dependent on importing key technologies from Europe. Thus commercial printing-press building as well as type-founding did not gain a firm foothold in North America till the end of the eighteenth century.

Further, until 1800 American printers had to import most of their ink from England or Germany. Another difficulty was the production of paper. Before the technique of using wood pulp was developed in 1849, paper mills depended on a constant supply of rags, ropes, and other flax- or hemp-based materials. The quality and supply of the paper were sufficient for the production of newspapers, broadsides, pamphlets, almanacs, and other short and ephemeral works, but books intended for longer use were printed on imported Dutch or English paper. The shortage of type and the cost of paper (up to half the cost of printing) were inimical to the production of relatively long books, such as novels. Thus it took Benjamin Franklin two years (from 1742 to 1744) to print the first American edition of Samuel Richardson's *Pamela*. In fact, no other unabridged English novel would be reprinted in American until the Revolution. The Peace of Paris opened up the trade with Britain again, and book production in America was restarted; but type, paper, and capital remained in short supply, hampering book production through the 1790s and into the early decades of the nineteenth century.

The first printing press to be established in the British North American colonies was founded at Harvard College in 1639. By 1760 there were forty-two printers in America, some owned by individual entrepreneurs and others by groups, such as the Puritans in New England or the Germans in Pennsylvania, who used printing as a medium to enhance group cohesion. Most American printers adhered to the universal enlightenment ideal of disseminating news and useful information to the nation. During the Revolutionary and early national periods, Americans used printing technology to shape the public political discourse of independence and republicanism. By 1820 more than two thousand newspapers and more than three hundred journals had been published.

The use of print to shape national identity was facilitated by developments in printing technology itself. Throughout the eighteenth century most printing offices in the United States owned only one or two presses. The largest printing shop was that of Isaiah Thomas, who had twelve presses in his Worcester printing office and five in a Boston subsidiary. Printers who could afford an English press imported it; others bought their presses secondhand (most of which had been imported before). Even as late as the 1790s there were only one or two American press makers, but this number increased rapidly during the first two decades of the nineteenth century, when new technological and scientific knowledge

enabled many advances: the wooden press became an iron press, rollers instead of balls inked the type, horsepower and steam power replaced manpower, stereotyping became a normal procedure, and lithography began to be used for illustrations.

The transition to power presses evolved in fits and starts. The first experiment with a steam-power press in 1819 was a failure, but in 1822 Jonas Booth of New York built the first successful one in the United States; Booth's abridgment of Murray's English grammar is said to be the first book to be printed by such a press. One of the most successful early power presses, relying on horsepower as steam engines were still hard to come by, was the one designed by David Treadwell of Boston in 1829; about fifty Treadwell presses were built before 1830. Rapid developments in type founding, font designing, paper production, stereotyping, and lithography led to an industrial revolution in print technology in the early national period.

PROCLAMATION OF 1763 The conclusion of the French and Indian War in 1763 brought vast new territories and complex problems to the British Empire. To establish governments for the new territories and to address the complex state of the trans-Appalachian west, King George III issued a royal proclamation on 7 October 1763. The proclamation placed the territories won from France and Spain under four distinct governments: much of French Canada was placed within the province of Quebec, the former Spanish colony of Florida was divided into East and West Florida, and the Caribbean conquests were combined into the province of Grenada.

Because the Crown was unprepared to extend representative government to populations that had been hostile to British power for over a century, the proclamation provided only for the appointment of governors and councils, with the promise of assemblies at a later date.

More controversial were the provisions governing Indian policy and western expansion. The expulsion of the French from the Ohio Valley left the British government solely responsible for organizing a region that was already the object of bitter dispute among colonial governments, high-powered speculators, unscrupulous Indian traders, and a host of prospective settlers. Yet much of this land remained, by treaty, under the control of Native American tribes. Angry over the penetration of their lands and the shady activities of some of the traders, tribes allied under Pontiac began a series of attacks leading to Pontiac's War. These attacks made the Crown see the need for a conciliatory approach toward Native Americans, an approach manifested in the Indian policy of the proclamation.

While no definitive line was drawn, the proclamation prohibited all settlement on trans-Appalachian Native American lands, to the extent of ordering that all present settlement be abandoned. To protect the Native Americans from future fraud, the proclamation authorized only the colonial governors and the commander-in-chief to purchase Native American lands. Finally, the Indian trade was to be regulated and conducted under licenses assigned by the governors.

The proclamation was a temporary expedient designed to give the Crown time to pacify the Native Americans and obtain the fair and orderly transfer of their lands. Meanwhile, the conflicting claims of colonial governments and private speculators could be investigated and adjudicated. Americans, however, viewed the proclamation in a different light. Unconcerned with Indians' rights, the American assemblies, speculators, and settlers joined in protesting the closure of the lands that had been the objective and, in their minds, the just prize of the late war. A growing number of Americans resented the closure of the trans-Appalachian west as evidence that London officials were determined to expand their power and authority at the expense of colonists' rights. That parliamentary taxes were imposed to support the implementation of the proclamation solidified this view in the minds of many Americans.

The Proclamation of 1763 achieved mixed results. The policies concerning Canada and the Florida proved successful, as these populations remained

peaceful during the revolution developing in the seaboard colonies. The provisions concerning the trans-Appalachian west failed, however, as the British were unable to enforce them and the British western policy served largely to provoke and sustain resistance to British rule.

PROFESSIONS

This entry consists of three separate articles: *Clergy*, *Lawyers*, and *Physicians*.

Clergy

Like every other American profession, the clergy confronted massive political, social, and cultural upheavals in the years between the late colonial and Jacksonian periods. To adapt to these changes, denominations had to innovate in the recruitment and training of young men for the ministry. While ministerial roles evolved, the clergy's overall cultural importance suffered no diminution. Indeed, the American churches rose to the challenges of the times. To take just one measure, the per capita supply of clergymen outpaced the rapid growth of the American population during the early Republic by more than three times.

THE LATE COLONIAL BACKGROUND

Regional variations differentiated the place of the clergy in colonial America. Congregationalism was established throughout New England outside of Rhode Island, although Anglicans, Baptists, and Quakers were tolerated. The region was the best supplied with ministers, because they could receive the requisite liberal arts education at Harvard or Yale. Local pastors encouraged promising young men to study for the ministry, as did families who viewed it as an appropriate station for their sons. After grad-

uation, aspiring ministers lived with a clergyman for several months, in order both to study theology and to observe day-to-day pastoral work. Following this training, a young ministerial candidate would begin preaching with the hope of receiving a call from a local church that, if accepted, would lead to his ordination. It was the expectation of minister and townspeople alike that his settlement over that church would be for life. In the eighteenth century, the local Congregational minister played a central role in town life, was accorded the status of other social leaders, and typically enjoyed the deference of his flock.

In the colonies from Maryland southward, the established Anglican minister likewise enjoyed status among the gentry. Anglican clergymen were educated at both American colleges and British universities, but they all had to be ordained overseas, since there was no American bishop. In part because of this requirement, the Church of England suffered from a chronic undersupply of clergymen in the colonies, which prevented it from expanding with the frontier. The social pretensions of the Anglican leadership also inhibited evangelization of the large slave population.

Diversity of religions characterized the middle colonies, where there was no single dominant denomination or established church. Quakers did not require formal education for the ministry, relying instead on the Spirit to equip believers. They competed for adherents with Anglicans and a host of immigrant denominations, such as Dutch Reformed, German Lutheran, and Scottish Presbyterian, which often still had significant ties to European ecclesiastical bodies. Newly arrived clergymen sometimes complained about their ambivalent status amid middle colony diversity, but they were nevertheless critical anchors for their communities.

The Great Awakening that struck various locales throughout the colonies from the 1740s through the 1770s often divided the clergy as factions disputed the theological meaning of the revivals and the propriety of itinerant preaching. Such infighting may have lessened the clergy's social standing. Baptists, relying on a part-time ministry, recorded substantial gains in both New England and Virginia. The Awakening inspired a number of enslaved men and women to take up preaching, and their efforts led to the first large-scale conversions of African Americans to Christianity. The Awakening also led to the founding of several new colleges for the training of ministers, including the College of New Jersey (founded by Presbyterians in 1746 and now known as Princeton

University), Rhode Island College (Baptists, 1764, now Brown University), Queens College (Dutch Reformed, 1766, now Rutgers University), and Dartmouth College (Congregationalists, 1769).

REVOLUTIONARY TRANSFORMATIONS

The loyalism of many Anglican clergymen forced them to flee during the Revolutionary War. This, combined with the libertarian logic of the Revolution, led to the Church of England's disestablishment after independence. Patriot ministers, meanwhile, often served as military chaplains, and their preaching provided important ideological sanction for the rebellion.

During the early national period, New England Congregationalists sided with the Federalist Party, which eventually undermined their position in a closely divided region. As a result of this political contention and the surging number of dissenters, they too were disestablished during the first third of the nineteenth century. Moreover, lifetime pastorates declined, and clergymen found new career paths in the early Republic's proliferating voluntary organizations, missionary societies, and educational institutions. Education for the ministry took a giant step forward with the founding of theological seminaries, starting with Andover in 1808. Congregationalists, the Dutch Reformed, and Presbyterians jointly supported the American Education Society, founded in 1815, to fund the training of aspiring ministers of modest means. Still, these denominations struggled to train enough educated ministers to keep pace with the nation's demographic and geographic expansion.

The new nation's small Jewish community faced an even more drastic problem of a total lack of any traditionally trained rabbis prior to the 1840s. Into this vacuum, a synagogue's *hazan*, or "salaried reader" (Faber, p. 19), often stepped forward as not only its liturgical leader but also its publicly recognized spokesman to the community at large.

INSURGENTS OF THE SECOND GREAT AWAKENING

The shortage of Protestant clergymen would be more than filled by the Baptists and Methodists. These denominations did not require a college education for the ministry and instead emphasized spiritual experience and preaching ability. The young, single men who were usually recruited into the ministerial ranks could relate to the early Republic's ordinary folk. Their preaching largely fueled the revivals of the Second Great Awakening during the first third of the

nineteenth century. Among the Methodists, ministers worked their way up the hierarchy from class leader to exhorter, local preacher, and itinerant. Bishop Francis Asbury (1745–1816) modeled the life he expected from his circuit riders by crisscrossing the nation repeatedly. By the 1820s, however, both of these denominations were placing greater emphasis on respectability and education and accordingly founded colleges.

By not requiring a college degree in their early phase, the insurgent denominations of the Second Great Awakening for a time opened a door to the participation of women and African Americans. More than one hundred women used their spiritual authority to become exhorters among the Christian Connection, Freewill Baptists, and Methodists, although they did not press for ordination. Black preachers too played a critical role in the evangelization of African Americans, both free and enslaved. However, African Americans often found themselves relegated to subordinate roles; among Methodists, for instance, they could exhort but not become licensed itinerants. As a result, the early nineteenth century saw the founding of numerous independent "African" churches and the organization in of the African Methodist Episcopal denomination with Richard Allen (1760–1831) elected as its first bishop in 1816.

Lawyers

The making of the legal profession in the new American nation took place largely in the law courts. Law-

yers established bar associations comparable to the contemporary medical societies and ministerial associations, and they set up a variety of educational enterprises to train students for the profession. However, these institutions proved to be short-lived and were clearly outweighed by the courts in forming the bar. Unlike the work of doctors and ministers, lawyers' day-to-day work brought them together in a spectacular forum where they could contend, collaborate, fraternize, and develop the cohesiveness of common customs of the law. It was particularly in the circuit courts, formed during the eighteenth century in the colonies in rough imitation of the English *nisi prius* system, that such professional bonds were formed. Through such courts some of what was then called the king's justice was brought to the provinces. In both England and America, the judges and lawyers of these superior courts on circuit usually traveled, ate, lodged, and caroused together, and the agreeable good fellowship of this experience was acclaimed on both sides of the Atlantic.

Much of the impetus for setting up the higher courts in the American colonies came from British policy. The attempt to assert control over the colonies and bind them more closely to the mother country predisposed British officials toward measures of centralization. This was particularly true of the superior courts, where judges were usually appointed on the approval of the king. The higher courts quickly adopted some of the pageantry, technicality, and doctrine of the courts of Westminster. Chief Justice Hutchinson of Massachusetts introduced the distinction between barrister and attorney, permitting only barristers to plead before the superior court. Such barristers were chosen from among the most learned and respected attorneys in the province. Where ranks were adopted in the other colonies (New Jersey went farther than most in setting up the grade of sergeants as well), the upper ranks were also usually distinguished homegrown lawyers. Only in South Carolina did most of the barristers who prevailed in the higher courts actually attend the Inns of Court in London. Where distinguishing titles were not adopted, as in Maryland and Pennsylvania, the gap between the attorneys who gained a hold on practice in the higher courts and those who worked amid the simpler, less polished justice of the country courts widened sharply. When Massachusetts higher courts took up wearing legal gowns and wigs, the New York Supreme Court quickly adopted the costume, and the practice spread throughout the colonies. Even Patrick Henry, scorned by Jefferson for his triumphs before amateur judges and rural juries of local courts, knew enough to discard his buckskin

for dignified black dress and a freshly powdered wig when he came before the General Court of Virginia.

Moreover, these higher courts brought with them not only rank, pageantry, and a new observance of technical matters, they also provided a forum for the consideration of principles of social order usually designated under the heading "fundamental law." Initially, this legal concept dealt primarily with persons and their property. However, during the upheavals of seventeenth-century England, it was given broad political meanings. This was the legacy of Sir Edward Coke, a lawyer skilled in the crabbed scholarship of feudal holdings and at the same time a man of affairs active in the great political contests of the day. His *Institutes* enjoyed an extraordinary reputation among the learned and ambitious American lawyers. In arguing that the common law, which embodied fundamental law, placed limits on royal prerogative and seemingly on the powers of Parliament, Coke identified the services of the common law with the blessing of liberty. Fundamental law consequently moved closer to that homologous notion of the era, "the constitution." This did not refer to any particular document but rather to a body of fundamental principles revealed in a long series of accepted customs, statutes, and judicial decisions. It was what Jefferson meant when, in 1776, he charged that the king subjected the colonists to a "jurisdiction foreign to our constitution." Both the constitution and fundamental law were held to be invaluable defenders of liberty. Furthermore, for many eighteenth-century American lawyers, liberty became, in Daniel Dulany's overcharged words, "salvation in politics."

Liberty, famously, was one of the watchwords of the American Revolution. During that conflict and its aftermath, delegates in the various colonies set up new rules of governance, fusing the concepts of constitution and fundamental law in written documents set out in statutelike form. The framers of the federal Constitution of 1787, most of whom were lawyers, went even farther in describing their work, within the text itself, as "the Supreme Law of the Land." In construing this Constitution as law, the framers provided the momentous option of interpreting and enforcing the fundamental principles of national government through routine judicial processes. The legal profession, therefore, could become an *ex officio* interpreter of the national credo. Yet such lofty interests were mixed with the most matter-of-fact enterprise in the workaday world of American lawyers in the post-Revolutionary era.

Both the conservative and transformative lineaments of the Revolution became apparent in the workings of the legal profession. The rankings in the profession, reflecting the aristocratic conceits of English traditions, quickly collapsed. The usages of attorneys, with their apprenticeship training, fee-bills to set the standard of payment, and direct dealings with clients (but, in America, with the right of audience in all courts), became the general characteristics of American lawyers. The English common law, somewhat simplified and adapted to local conditions, remained the basis for legal practice in the courts. The most transformative effect of the Revolution was indirect. As the French Revolution provided the basis of a new social order by the confiscation and sale of the lands of the church and the émigrés, so in a somewhat analogous manner the American Revolution provided the basis of a society of medium-size property owners through the confiscation and sale of the lands of the Native Americans. The social transformation was less apparent in America than France because the church and the aristocrats were preeminent in France whereas the Native Americans were on the margins of American society. Nonetheless, after the War of 1812, when the Indian "barrier" was largely removed, the wide-ranging characteristics of a society based on medium-size landownership became apparent. This was clearly visible in the North, though obscured in the South by the relatively small class of splendid plantation owners at the top of society and the large class of black slaves at the bottom. American lawyers were prime agents in setting up and maintaining the rules for this new social order.

Land law became a principal part of the lawyer's day-to-day business. Know-how about the trial of title to land, ejectment, trespass, writs of entry, and remedies for the recovery of real property became essential skills. Men with land to sell came to county courthouses during trial days, and litigation over estates and inheritance brought marketable land into lawyers' hands at other times as well. Lawyers were not only agents but sometimes venturers themselves. The papers of eighteenth-century and early-nineteenth-century lawyers often hold as many documents relating to their own real estate activities as to their legal cases. For some lawyers bold speculation on the fundamental principles of government was accompanied by bold speculation in land. James Wilson, for example, pursued an illustrious career in law and politics that took him from the Revolutionary struggle against Britain to the deliberations of the Constitutional Convention and to a position on the new Supreme Court. Perhaps the acme of that ca-

reer was his public lectures delivered on American government and fundamental law before an audience that included President Washington, Vice President Adams, and leading members of Congress. Yet shortly after he was at the nadir, dying ignominiously in the Carolina backwoods, hiding from the creditors of his land speculations.

Aside from the land market and the legal practice that accompanied it, the other growth industry that created opportunities for lawyers was the development of democratic politics. With the spread of republican institutions, producing many new elective offices, the lawyers who found that they were adept at swaying juries seemed equally adept at swaying electorates. Men of legal training soon came to predominate in American government. Entry into law and politics became increasingly open to men of native wit and cunning though they might have little formal education and meager income. Yet the legal profession seemed to provide something akin to a homespun elite. William Wirt, son of a tavern keeper who rose to the position of the attorney general of the United States, claimed that men of talents in this country were generally bred to the profession of the law: "I have met with few persons of exalted intellect whose powers have been directed to any other pursuit." In the more egalitarian age that was to come, Alexis de Tocqueville, one of the most perceptive of the many foreign visitors who flocked to this country, commented with some amazement that the American lawyer seemed to be a peculiar kind of aristocrat particularly congenial to democracy.

Physicians

From the colonial period to the 1820s, a profession of medicine existed only in a fragile and nebulous way. As late as 1776 there were perhaps 3,500 more-or-less recognizable “doctors” in the thirteen colonies, but only a tenth held a medical degree. Most of the many practitioners were highly individualistic healers. Those few who tried to distinguish themselves by education and qualification, however, turned to others of the same kind to try to establish a working identity. They always hoped for social recognition. But in a time when a physician functioned largely on the basis of personal authority, a social identity as a professional was usually a secondary consideration for him and his patients.

BECOMING A PRACTITIONER

Many women practiced healing, but none would have been accepted as a professional at that time. Moreover, men claiming professional competence relentlessly displaced women from the mid-eighteenth century to 1830. In the cities, even midwives were losing out to male physicians.

The colonists brought with them the customs of rural practice in England. In London and other cities there were, from medieval times, formal guilds of physicians (learned people), surgeons (especially trained in manual procedures), and apothecaries (specialists in the chemistry and dispensing of medicines). But in the countryside and the colonies, all practitioners, no matter how trained, had to serve as general practitioners and acquired the identity, earned or not, of “doctor.”

By the middle of the eighteenth century, the training of doctors by an apprentice system was well established. Recognized physicians (most famously Dr. John Redman of Philadelphia) took numerous students whom they exploited and instructed in a family setting. Young men who later became leading figures typically after apprenticeship went to Europe, especially to Edinburgh, for further training and a formal degree. More than a hundred physicians had returned from Edinburgh by 1800.

In 1765 John Morgan and other young physicians with Edinburgh degrees persuaded the trustees of the College of Philadelphia to open the first medical school in North America. Others followed in New

York and Boston. After the War of 1812, proprietary schools began to appear.

ESTABLISHING A PROFESSION

Meantime, local groups of medical men had already begun to organize before 1763. Like other professionals, they wished to gain special social recognition for their roles and to exclude others and control competition. They issued “fee bills,” trying to set charges for standard medical procedures. Usually, local groups had only temporary successes. A medical society for a whole colony, New Jersey, was formed in 1766. It was the only colonywide society to survive the American Revolution. The attempt of John Morgan to found an intercolonial medical society in the late 1760s was unsuccessful; the group became simply another local organization in Philadelphia.

Formal licensing by government entities was first simply an endorsement of some person or another as someone with recognized qualifications as a healer. Only in the 1760s and 1770s did colonies respond to consumer concern as well as pressure from leading practitioners to use a license as a requirement rather than just an endorsement. New York passed a law for New York City in 1760. In New Jersey beginning in 1772, practitioners had to be examined by two judges to be permitted to practice.

As the decades passed, in the developed states it became customary to let the state medical society examine candidates and issue licenses (for a fee). And as medical schools were chartered, graduation often automatically entitled the graduate to a license without examination. As yet, enforcement was very weak—except that unlicensed practitioners found it difficult to collect fees in court.

As states that once belonged to France or Spain came into the Union, the highly regulated systems of licensing that had existed did not carry over very well. Furthermore, these states, and Louisiana particularly, suffered from often unseemly competition between the French and Anglo-American practitioners, so that a unified medical community did not exist.

PROFESSIONAL INSTITUTIONS

Insofar as there was a medical profession, then, the formal institutions of medical organizations and medical schools, both utilized for licensing, were fundamental. By 1800 nine states had state medical societies. Six more appeared before 1820, and after that, midwestern and southern state societies formed. The Revolutionary War had interrupted the functioning of the medical schools, and in 1800 there

were schools only at the University of Pennsylvania in Philadelphia, Columbia in New York City, Harvard in Massachusetts, and Dartmouth in New Hampshire. Over the years, only about 250 students had graduated from those schools. By 1829, over 4,000 students had graduated from American medical schools. Since a cheap and easy medical education, including a formal degree, was available by the 1820s, the institution of apprenticeship began slowly to diminish as a source of trained medical practitioners. Daniel Drake of Cincinnati in 1832 asserted, only partially inaccurately, that a license without a degree was a "certificate of inferiority."

A number of physicians in Revolutionary America and the new nation were members of the intellectual elite of the North American colonies and the new nation, contributing—like Alexander Garden of South Carolina, after whom the gardenia was named—to natural history. But their medicine remained practice oriented. Virtually all innovation came from Europe. The first medical journal, the *Medical Repository*, was not founded until 1797, and it included many matters that were not strictly medical, including perhaps the last major defense of the phlogiston theory, by Joseph Priestley, a refugee then living in Pennsylvania. By 1822, twenty-two more medical journals had been established. Most were short-lived, but they helped establish a community within which there was a growing consensus on what a medical practitioner should do, however much their actions varied in detail and application.

By the nineteenth century, there was a sufficient professional community that it could become the object of dissent and even competition. As early as 1811, Samuel Thomson of New Hampshire began to establish a botanic medicine movement as an alternative to "regular" medicine. He was able to patent his system in 1813, and he published his *New Guide to Health* in book form in 1822. Thomson also sold rights to purchasers to practice according to his system and join in "Friendly Societies" with other purchasers. After 1830 other sects, particularly the hydropaths, with their water cure, and homeopaths also began to compete with the regulars in the United States. Insofar as the botanics and the later sectarians criticized the heroic practice of the regulars who bled and purged their patients, they helped draw lines of contestation that stimulated profession formation even more than the usual empirics and quacks who abounded.

PROPERTY According to James Madison, property has two meanings. Sir William Blackstone (1723–1780) defined it as "that dominion which one man claims and exercises over the external things of the world, in exclusion of every other individual." Land, merchandise, or money might thus be called one's "property." But Madison rejected that narrow concept for the Republic and preferred "a larger and juster meaning" that "embraces every thing to which a man may attach a value and have a right; and which leaves to every one else a like advantage." Madison was referring to what we might classify as rights, such as the right to one's religious opinions and their exercise or to "the safety and liberty of his person." For that reason, the American Revolution had begun with calls to protect "Liberty and Property," and after more than a decade and a half of political experiment with republican government, Madison in 1792 was reiterating the guiding principle that "Government is instituted to protect property of every sort; as well that which lies in the various rights of individuals, as that which the term particularly expresses." Liberty and property were inextricably connected, each necessary to the other, each an aspect of the other. Looking forward to the federal Republic newly established under the Constitution, he set the standard for evaluating the fulfillment of the Revolution: "If the United States mean to obtain or deserve the full praise due to wise and just governments, they will equally respect the rights of property, and the property in rights."

THE FOUNDERS AND PROPERTY RIGHTS

The founders of the Republic were drawing on a long tradition in which property guaranteed personal independence and enabled an engaged citizenry to resist the encroachment of arbitrary government power.

John Adams and others were fond of quoting Englishman James Harrington (1611–1677), who in the preceding century had written “Power always follows Property, and if the Republic was to survive, private property must be secured as a counterweight to the power of the state.” Events in the newly independent states under the Articles of Confederation, however, had called that capacity into question, despite efforts to guarantee property rights. Several state constitutions had declared property a natural right or had declared that no one could be “deprived of his life, liberty, or property but by the law of the land.” The new state courts largely continued to follow the common law, accepting the orthodox principle as delineated by Blackstone: “So great . . . is the regard of the law for private property, that it will not authorize the least violation of it.” Nevertheless, legislative responses to military necessity and postwar economic difficulties forced legislatures to confiscate estates and to adopt policies that had the practical effect of taking property. They issued unsecured paper money and made it legal tender for the payment of debts regardless of its depreciated value, or stayed judicial execution of debt judgments. In the minds of many, such acts were tantamount to confiscation of property contrary to the purposes of government and threatening to the cause of liberty. “Property must be secured,” warned John Adams (1735–1826), “or liberty cannot exist.”

The Federal Constitution. The framers of the Constitution, therefore, had property rights in mind among their many concerns when they met in Philadelphia in 1787. In urging its ratification, the authors of *The Federalist* (1787–1788) referred to “property” no less than sixty-four times, concluding with Alexander Hamilton’s praise in *Federalist* No. 85 of proposed constitutional “precautions against the repetition of those practices on the part of the State governments, which have undermined the foundations of property and credit.” Although the Constitution itself did not use the word “property” except in reference to federal property, it contained numerous indirect protections for private property. It barred the federal government from ending the slave trade for twenty years, gave federal protection to the recapture of fugitive slaves, and denied it the power to enact export duties or bills of attainder. More extensive were its limitations on the states: addressing two of the most worrisome threats to property by the states under the Articles, the Constitution denied states the authority to issue bills of credit or impair the obligations of contract.

Even so, reluctant ratifiers demanded a written bill of rights to make explicit protections of liberty and property. Madison responded to the suggestions of the state ratifying conventions with a list of prefatory statements, including the declaration “that government is instituted, and ought to be exercised for the benefit of the people; which consists in the enjoyment of life and liberty, with the right of acquiring and using property, and generally of pursuing and obtaining happiness and safety.” Congress rejected such statements, but in what became the Fifth Amendment, it declared, “No person shall . . . be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use without just compensation.”

Property’s social utility. No state convention had requested a “just compensation” clause, though many states had such provisions of their own or followed the lead of the federal Constitution by enacting them in a second wave of state constitution writing. A long common law tradition, as well as the lessons of colonial experience, had demonstrated the importance of private property as the guarantor of individual freedom and the foundation of society. The sanctity of private property, that is, rested as much on its social, or public, utility as on its personal nature. Legal guarantees of the security of private property, according to the standard formulation of the time, were a socially granted right resting on a compact of the people with each other for their collective good. Throughout the colonial period, therefore, assemblies had acted in the public interest by placing limits on land speculation, on interest rates, and on the price of necessities, just as they had granted incentives to encourage the development of necessary public services. They had exercised the common law power of eminent domain for public needs, though always confined by the obligation to provide just compensation to affected owners. Vermont expressed this doctrine in 1786 when it included in its Declaration of Rights the inarguable statement “that private property ought to be subservient to public uses, when necessity requires it; nevertheless, whenever any particular man’s property is taken for the use of the public, the owner ought to receive an equivalent in money.”

REDEFINING PROPERTY RIGHTS

The Revolution placed new and ultimately unbearable demands on traditional concepts such as the “public good” and on the balance between public purpose and private gain. James Wilson, lecturing on property at the new College of Philadelphia while

serving as associate justice of the U.S. Supreme Court, expressed traditional doctrine when he explained, "Property, highly deserving security, is, however, not an end, but a means. How miserable, and how contemptible is that man, who inverts the order of nature and makes his property, not a means, but an end!" Post-Revolutionary economic and jurisprudential thought, however, was calling into question the ability—or authority—of the state to decide whether gain from a particular use of property was an end in itself or a means to social progress. The founders had drawn their ideas of private property rights from political theory, religion, and morals, but these ideas were gradually replaced by looking at their historical origins and their general social utility.

The impulse to growth and development thus challenged ideas of property rights. Though not as complete a break as the abandonment of state involvement in religion, the state abandonment of mercantilism meant a retreat from government's former level of involvement in economic matters ranging from freedom of contract to concepts of liability. And just as religious activity exploded, so, too, did economic enterprise. The progress of the new republican society remained the goal and purpose of government and law, but its pursuit was increasingly devolving on individuals and the private sector. In the interests of national progress and the public interest, a new instrumental conception of property would change traditional notions of property rights, ranging from concepts of quiet title, vested rights, and even just compensation.

"Public interest": A broadening concept. What was "in the public interest," however? What was a "public use" and what test might apply to determine the proper instrumental achievement of that goal? Popular sovereignty broadened the concept of "public use" to embrace economic "improvement" and granted to private individuals authority once jealously guarded by the state. Eminent domain had once been the exclusive power of the sovereign state, but the sovereign people, acting through their elected representatives, began to grant such power to private individuals acting, presumably, in the public interest. Legislatures did not bow to all demands, and patterns of favoritism toward special interests are difficult to demonstrate. Nevertheless, in the transition from an agricultural economy to one with a vigorous commercial and manufacturing sector, development through eminent domain necessarily took place at the expense of farmers and established economic interests. If, therefore, a private enterprise increased national wealth, it arguably served the public

interest and legislatures allowed private takers to do what only the state had had the authority to do—that is, to take private property, allowing for just compensation. But what was "just compensation"? This, too, was difficult of solution, and many owners of farms felt aggrieved by the methods and principles used to calculate such value by private takers.

The impact of eminent domain on quiet title to property thus epitomized the emerging principle that private gain served the public welfare, but it was only one of many legal changes that challenged traditional ideas about property rights. The creation of the modern business corporation paralleled that development. Once a feature of municipal governance or mercantilist statism by virtue of performing a service for the state, the corporation quickly evolved in the early national period. Constitutional guarantees of the sanctity of contract, initially conceived as protecting contractual obligations between private parties, were extended to corporate grants by states to private individuals or groups. This principle was articulated most famously in the U.S. Supreme Court's decision in *Dartmouth College v. Woodward* (1819), which protected legislative grants of incorporation against revocation by a subsequent legislature unless express provision for rescinding them had been made. No such single case advanced the next vital principle, that of limited liability, but by the first quarter of the nineteenth century, courts were protecting the property rights of investors by shielding them from the traditional remedies of creditors against their personal assets. Investors also benefited from the enactment of state bankruptcy laws. Though two attempts at a federal bankruptcy law failed in this period (statutes of 1800 and 1841 were quickly repealed), the Supreme Court helped define the scope of state laws that overcame traditional suspicions and moral disapproval of business failure. Though bitterly contested, such laws obtained the necessary sanction of public approval as conducive to the general progress of society.

One person's enjoyment of greater choice and security of property, of course, might mean another's diminished enjoyment. Although Supreme Court decisions upholding the sanctity of contract supported the principle of vested property rights, the interests of economic advancement worked against them. In the case of *Charles River Bridge v. Warren Bridge* (1837), vested rights were forced to yield to expansion and "improvement." According to the majority opinion of Chief Justice Roger Taney, some property rights had to be sacrificed to others if the new nation was to join the ranks of world powers. The law, he

wrote, must sometimes intervene on the side of progress and enable states “to partake of the benefit of those improvements which are now adding to the wealth and prosperity, and the convenience and comfort of every other part of the civilized world.” Dissenters might assail such decisions as infringements of existing property rights and principles of moral obligation, but the meaning of property itself had changed and its purpose would be subject to the play of politics.

market economy, unprecedented social and geographical mobility—seemed far more pressing than spiritual ones.

Yet judging by the popular interest in millennialism evident in publications, journals, and newspapers of the period, the revealed word continued to provide the yardstick by which Americans judged themselves and their new society. The United States was in the midst of a new “age of prophecy” in the 1790s and early 1800s, one which had its roots in the fears and hopes of the Revolutionary generation but which would outlast the crisis of war to become a fixed feature of public life in the new Republic. Millennialism was a legacy of the Puritan conquest of the New World, of course, but the Revolution brought long-standing millennial aspirations to a boil. Millennialism added the critical element of eschatological urgency to the Patriot cause and turned a war for national independence into a holy war against the British Antichrist. While a stream of publications prophesied doom for America’s cities and the corrupt imperial establishment in the 1760s and 1770s, feeding Revolutionary demands for a greater popular voice and an end to aristocratic tyranny, a class-inflected millenarianism fueled the agrarian rebellions endemic in the backcountry until the 1820s.

Prophetic visions continued to thrive even after the heat of battle had passed. Though it is difficult to make a precise count, more than 120 men and women considered themselves, or were considered by others, to be prophets in the period from 1780 to 1815. Republican prophets tended to come in two varieties: the genteel and the vulgar. Primarily the preserve of ministers, genteel prophecy was the art of translating biblical metaphors of cataclysm and rebirth into republican analogues. Just as the American Republic promised to usher in a new age of expanded knowledge and enlightened citizenship, so too would the Second Coming of Christ inaugurate an era of universal religious enlightenment. As Samuel Hopkins described it in his *Treatise on the Millennium* (1793), the “conversation of friends and neighbors” will reform monarchical habits and create a universal brotherhood out of newly constituted citizens. This brotherhood will eventually transcend national and linguistic barriers, aided by the creation of a single universal language. “In the Millennium,” he enthused, “all will probably speak *one language*.” And in time, this “universality of language will tend to cement the world of mankind so as to make them *one* in a higher degree” (Juster, *Doomsayers*, p. 159). Hopkins and his fellow republicans were cosmic optimists, preferring to spin utopian visions of global fel-

PROPHECY The early Republic is something of an anomaly in American religious history. Until the Second Great Awakening arrived to revive America’s flagging piety, the citizens of the early nation did not seem especially interested in religion: church attendance was at an all-time low; Anglican ministers had fled the colonies in large numbers during the Revolutionary War, and secular concerns—the formation of new governments, the explosive expansion of the

lowship rather than apocalyptic scenarios of universal destruction.

More common, perhaps, than these gentlemen scholars were the plebian prophets who combined traditional apocalyptic warnings with the language of social grievance. A typical plebian prophet is Nimrod Hughes, the scrappy ex-felon whose one publication, *A Solemn Warning to all the Dwellers Upon Earth*, published in 1811, was an instant best-seller. Federalist newspapers hailed what one called this “extraordinary prophet” who uncannily predicted the War of 1812 (even while denigrating the democratic tendency to trust the visions of ordinary men over the counsel of learned gentlemen), while republican newspapers dismissed Hughes as a “miserably dirty looking creature.” Hughes’s pamphlet is a fair representation of the social and economic woes of the underclasses in the early Republic. The violence, poverty, and oppression he saw all around him was caused by the machinations of “great men” (lawyers, legislators, judges, merchants, shopkeepers) who exploited the economic and political opportunities available in America’s new democratic society. Christ will return in a blaze of glory (on 4 June 1812) to restore the common man to his rightful place, and when he does, the wicked will be destroyed along with the arbitrary and oppressive instruments of man’s justice: “the laws shall be few, and those who compose them shall be few, and those who administer them shall be few.” The voice of outraged populism that narrates *A Solemn Warning* would be heard even more loudly in the 1830s as prophets like Joseph Smith and Robert Mathews made this critique of America’s new commercial and social order the cornerstone of their millenarian movements.

Disaffected Anglo-Americans were not the only ones envisioning a fiery end to the world in the early Republic. The flowering of Native America’s “age of prophecy” in the 1790s and early 1800s also coincided with acute economic distress and political uncertainty in Indian country. Unlike Anglo-American millenarians, however, Indian prophets such as Handsome Lake and Tenskwatawa attached their visions to concrete political and social programs of reform; they told their followers not only to await the avenging Spirit, but to stop drinking, stop trading and intermarrying with whites, avoid intertribal violence, return to a subsistence economy, and shun all white ways. And their followers listened, creating pan-Indian alliances with other tribes in pursuit of these goals, even taking up arms in response to the prophets’ calls for renewal. The fusion of visionary and military aims made the Indian age of prophecy

a far more potent political force than any movement headed by a white American in these years.

However congruent their visions, there is little evidence that these various prophetic worlds overlapped in any meaningful way in the early Republic. Each spun in its own orbit around the sun of the new federal union, generating more heat than light in the wider public culture. But if men like Nimrod Hughes and Handsome Lake do not fit comfortably with our image of the early Republic as an aggressively modernizing era, prophets from a wide variety of social and racial positions did contribute to debates over how Americans should constitute themselves as a nation and what their role should be in the new democratic world taking shape around them—debates at the very heart of public life at the dawn of the new century.

PROSLAVERY THOUGHT The new American nation began with an assertion that “all men are created equal” and that they were all entitled to “life, liberty, and the pursuit of happiness.” These philosophical underpinnings of the nation challenged the legitimacy of slavery. As threatening as the philosophical challenge was the practical challenge. Slavery existed in all of the thirteen new states, but it was clearly weaker in some than in others. Many northerners found slavery immoral and in conflict with the ideology of the Revolution. The Revolution threatened slavery in other practical ways. The Continental Congress expected the states to contribute soldiers and money to the cause and wanted to assess each state’s contribution according to its population.

The critical question, for southerners, was whether that population would include slaves or just free people. This issue reemerged at the Constitutional Convention of 1787. By the end of the early national period, southerners would have begun to develop a clear defense of slavery.

THE REVOLUTIONARY PERIOD

In 1775 the Continental Congress began to discuss how to pay for the ongoing Revolution. John Dickinson, a Delaware Quaker, offered a draft proposal to assess a tax on each state according to its population. Southerners objected, asserting that the population count should not include slaves. Samuel Chase of Maryland, for example, argued that slaves should not be taxed any more than should the cattle of New England. John Adams answered that laborers, free or slave, all produced wealth for the state. When southerners objected, saying that slaves were not as productive as free people, James Wilson of Pennsylvania suggested, perhaps sarcastically, that perhaps, then, the slaves should all be emancipated. This led Thomas Lynch of South Carolina to assert that if the delegates were to question whether slaves were property, the entire idea of a national government would be ended.

This debate illustrated one aspect of early proslavery thought: that slaves were property and could only be considered as property, and that if anyone suggested otherwise, southerners would walk out of the nation and form their own country. Rather than defend their right to own slaves, Lynch, Chase, and other slaveholding southerners simply took the issue off the table. No one had the right, they asserted, to even question the legitimacy of slavery.

THE CONSTITUTIONAL CONVENTION

Such tactics may have worked in the rough-and-tumble of the Continental Congress, but at the Constitutional Convention of 1787, more articulate arguments had to be made. Behind the closed doors of the Philadelphia Convention, where posturing was pointless, southern delegates demanded protection for their slave property and indicated they would not support a new government without specific constitutional provisions supporting slavery. They also offered two new defenses of their institution. The first was economic. South Carolinians asserted that they could not survive without their slaves, that slavery was essential to their economy. In a debate over the African slave trade, General Charles Cotesworth Pinckney of South Carolina asserted that a prohibition of the trade would force South Carolina and

Georgia “to confederate” on “unequal terms” and would in effect be “an exclusion of S. Carola [sic] from the Union.” He declared “S. Carolina and Georgia cannot do without slaves.” Edward Rutledge and Pierce Butler, also of South Carolina, as well as Abraham Baldwin of Georgia and Hugh Williamson of North Carolina, made similar arguments. Oliver Ellsworth of Connecticut, who would serve as chief justice of the U.S. Supreme Court after the Constitution was ratified, accepted this economic argument, refusing to debate the “morality or wisdom of slavery” and simply asserting that “what enriches a part enriches the whole.” The second argument was historical. Charles Pinckney, a cousin of Charles Cotesworth Pinckney, explained to the convention that the great civilizations of the ancient world, Rome and Greece, had been slave societies and that slavery was “justified by the example of all the world.”

A THREE-PRONGED DEFENSE

The new nation thus began with a three-pronged defense of slavery that would serve southerners for more than six decades. First was a political defense of the institution, which began with an implicit bargain at the Constitutional Convention. The Constitution in the end did protect slavery in many ways. The three-fifths clause, the fugitive slave clause, and the protection of the African slave trade for at least twenty years all strengthened slavery. Southerners could legitimately claim that they supported the Constitution because it acknowledged the importance of slavery. Tied to this was the claim, which held up through most of the early national period, that an attack on slavery would undermine the Union itself. Second was the emerging economic argument: the South could not survive without slavery, and so slavery was vital to the success of the nation. Southerners were quick to point out that the nation’s most important exports were tobacco and rice and, after 1800, cotton—all produced by slave labor. Finally, there was the historical argument that slavery had been part of the great classical societies and so must be legitimate. The importance of so many slaveholders in the Revolution, starting with Washington and Jefferson, seemed to confirm that slavery made the American Republic possible. The argument that slavery was a “positive good,” however, was not widely employed in its full-fledged version until the 1820s.

ARGUMENTS FROM SCRIPTURE

Opponents of slavery turned to the Bible to attack the institution, but as early as the 1770s, ministers in

the colonies and in England were using the Bible to defend bondage. Biblical arguments would become more fully developed in the antebellum period, but at the time of the Revolution, slave owners could draw spiritual comfort from ministers and scholars who pointed out that slavery was sanctioned by the Bible. Richard Nisbet's *Slavery Not Forbidden by Scripture*, published in Philadelphia in 1773, was just one of a number of tracts and essays defending slavery on biblical grounds. Similarly, *Scriptural Researches on the Licitness of the Slave Trade*, published in London in 1788, provided ammunition for slaveholders in the United States and the Caribbean, as well as slave traders in England.

PROSLAVERY AND RACE

Ultimately, slavery, especially in the United States, was about race. In the early national period scholars on both sides of the Atlantic began to consider why Africans were different from Europeans, and if that justified slavery. Well before the Revolution, David Hume argued that mankind stemmed from separate creations. Hume was not a defender of slavery, but his theory was attractive to those who were. Scientists in the antebellum period would elaborate on this theory and conclude that blacks were innately inferior to whites. This theory was in opposition to the single Creation described in the Bible. Religious defenders of slavery rejected the idea of a separate creation. They used the story of Noah to explain the existence of Africans. They argued that blacks were the descendants of Noah's cursed grandson, Canaan. The curse of Canaan was blackness, which led to a new proslavery argument, because the curse implied that Canaan would be the servant of his brothers—in other words, a slave. Thus, by the end of the early national period proslavery theorists were arguing that the Bible not only sanctioned slavery, but that blacks were created by God after the Flood to become slaves.

Perhaps the most important proslavery argument to emerge from the new nation came from Thomas Jefferson, the man who had drafted the Declaration of Independence. The Declaration may have asserted that "all men are created equal," but in his own writings Jefferson argued otherwise. In his *Notes on the State of Virginia* (1785), Jefferson asserted that "in general, their existence appears to participate more of sensation than reflection. To this must be ascribed their disposition to sleep when abstracted from their diversions, and unemployed in labour. An animal whose body is at rest, and who does not reflect, must be disposed to sleep of course." Absurdly,

he suggested blackness might come "from the colour of the blood." He even suggested that blacks might inbreed with the "Oran-ootan." He argued that bondage did not prevent Roman slaves from achieving distinction in science, art, or literature because "they were of the race of whites"; American slaves could never achieve such distinction because they were not white. Jefferson argued that American Indians had "a germ in their minds which only wants [lacks] cultivation"; they were capable of "the most sublime oratory." But he had never found a black who "had uttered a thought above the level of plain narration; never saw an elementary trait of painting or sculpture." Jefferson found "no poetry" among blacks. He wrote that

comparing them by their faculties of memory, reason, and imagination, it appears to me, that in memory they are equal to the whites; in reason much inferior, as I think one could scarcely be found capable of tracing and comprehending the investigations of Euclid; and that in imagination they are dull, tasteless, and anomalous.

Jefferson conceded blacks were brave, but this, he believed, was due to "a want of forethought, which prevents their seeing a danger till it be present."

Jefferson's Declaration may have undermined slavery and provided a philosophical basis for anti-slavery in the generation after the nation's founding. But his *Notes on the State of Virginia* helped create a scientific and racial defense of slavery that would serve masters until the Civil War and segregationists for a century after that.

PROSTITUTES AND PROSTITUTION Prostitution—here defined as commercial sexual relations between male buyers and female sellers—developed slowly in the colonial era, but by the mid-eighteenth century it had become quite noticeable in colonial cities. Boston, Newport, New York, Philadelphia, and Charleston had prostitutes by the 1750s who worked out of taverns and brothels, catering primarily to sailors and other transients. All port cities had brothels near the waterfronts, and additional establishments were scattered elsewhere in the communities. New York, for instance, had near the future location of City Hall a brothel section called the Holy Ground (because of its proximity to St. Paul’s Chapel). Rural prostitution no doubt existed in a limited way, especially with a barter arrangement between male and female, but records yield very little information about such activities. Homosexual prostitution, if it existed at all, is missing from historical accounts.

FORMS OF PROSTITUTION

The presence of British soldiers in the colonies in the 1760s and 1770s increased the demand for prostitutes, as did the stationing in the cities of soldiers during the Revolutionary War. Commercial developments that led to a growing market economy in the early years of the nineteenth century and further economic stimulation by the War of 1812 brought thousands of unmarried men and women to port cities and industrializing towns and villages. Not only did greater numbers of women enter this line of work, but it became more diverse and specialized. By the 1820s in New York, for instance, hundreds of women prostituted themselves in dockside brothels in lower Manhattan. Above them in the prostitutes’ own rankings were the streetwalkers who offered their favors to men along Broadway and other fashionable streets. They also frequented theaters, taverns, and similar businesses, finding customers to take to nearby assignation houses. Still higher in the prostitute’s world were the young women with more education and refinement who lodged in the so-called fancy brothels, often located in respectable neighborhoods. These women catered to the city’s elite, who came to the brothels not only for the

women, but also to enjoy the lifestyle of rich furnishings and champagne. Boston and Philadelphia had similar prostitute communities.

Southern Americans boasted in the early nineteenth century that prostitution was not a problem in their region, mainly because the slave system gave white men all the sexual outlets that they needed. In New Orleans and Charleston, however, prostitutes not only operated in the usual manner, but slave and free quadroons (women who were at least three-quarters white with some African ancestry) created another occupational variation. Annual balls brought these women of color into contact with wealthy planters and businessmen, who then took the women as their mistresses, offering them homes, clothing, and other refinements and often sealing the bargain with signed contracts.

MONEY AS THE LEADING MOTIVE

Whether a waterfront prostitute or an elegant mistress, these women chose their occupation primarily for the money. By the early nineteenth century, a new prudery concerning female sexuality put a greater value on chastity, which in turn led to “fallen” women being scorned by family and community and ending up as prostitutes, but the money factor outranked even this as a cause of prostitution. As late as the 1820s, women’s jobs outside the home were few and usually offered very poor compensation. Seamstresses in American cities seldom earned more than a dollar per week, and factory workers rarely earned more than two dollars. Even educated women working as schoolteachers earned about a dollar per week. Prostitutes in waterfront dives, in contrast, made as much as twenty dollars per week, streetwalkers as much as fifty dollars, and those in elegant brothels as much as one hundred dollars. The lack of well-paying jobs for women of all classes would continue to add to the prostitutes’ ranks for the remainder of the nineteenth century.

CONTROLLING PROSTITUTION

Unless they became public nuisances, prostitutes seldom drew the attention of colonial authorities. Boston banned brothel keeping as early as 1672, not just because of the sinful behavior of prostitutes and their customers but because they were disturbing the peace. From time to time, city governments had night watchmen and marshals close the most flagrant of prostitute resorts, and mobs from the neighborhood sometimes attacked brothels as well. By the 1800s, though, as the cities began rapid expansion and population growth, prostitution drew

more opposition. In 1823 in Boston, Mayor Josiah Quincy himself led raids on the Hill, a section of the city also called Mount Whoredom. Over a hundred cases were brought to court, many involving charges of keeping a disorderly house or being a public nuisance. Occasional raids in the other cities brought arrests on similar charges.

Another approach to the problem came from the Protestant religious groups influenced by the Second Great Awakening, a sustained revival during the first three decades of the nineteenth century. Attacking the sin by reforming the sinner, male and female Evangelicals supported the founding of asylums for penitent prostitutes, places where the women could be instructed in religion and trained in a respectable occupation. Based on a British institution founded in 1758, the Philadelphia asylum opened in 1800, and one in New York began operations in 1812. Although neither asylum lasted more than a few years and they redeemed no more than a few prostitutes, a major shift in dealing with prostitution was under way. Prostitutes over the next few decades would increasingly be seen not as public nuisances but as victims of poor economic conditions and male lust. Better opportunities for women seeking employment would be one goal of the men and women trying to eradicate prostitution. The other goal would be to eliminate the sexual predation of men, whether as seducers of women or as the prostitutes' customers. Also of great importance would be the growing control of the antiprostitution drive by women, who by the 1830s would see both the reclamation of prostitutes and the prevention of prostitution as reforms belonging distinctly to females.

PROVIDENCE, R.I. In 1730 the population of Providence was 3,916, and the town included all of present-day Providence County west of the Blackstone River. However, so many farmers had moved into the “outlands” of Providence that three large towns (Scituate, Glocester, and Smithfield) were set off from the parent community in 1731. Before the colonial period came to a close, an inner ring of three more farm towns (Cranston, 1754; Johnston, 1759; and North Providence, 1765) were carved from Providence's territory. What remained (less than six square miles) at the head of Narragansett Bay was predominantly commercial and increasingly cosmopolitan in character.

By the 1760s Providence had a population of four thousand, a flourishing maritime trade, a merchant aristocracy, a few important industries, a body of skilled artisans, a newspaper and printing press, a stagecoach line, and several impressive public buildings. Great Britain's passage of the Sugar Act in 1764, levying a duty on sugar and molasses imports so essential to Providence distilleries and to the “triangular trade” in rum and slaves, set in motion a wave of local protest that crested in 1776. As the colonies edged toward the brink of separation with England, the town of Providence, urged on by local pamphleteers calling for autonomy, became a leader of the resistance movement.

In June 1772 Providence merchants and sailors burned the customs sloop *Gaspée*, and in June 1775 they burned tea in Market Square. Providence citizens led the way in calling for the Continental Congress and in founding a Continental navy. Providence escaped enemy occupation, a fate that arrested growth in Newport, the colony's largest town. French troops moved in and out of Providence from July 1780 to May 1782, and it was from this point, in June 1781, that Rochambeau's army began its fateful march southward to Yorktown. After the war ended, Providence resumed its pattern of growth. When American ships were barred from the British West Indies in 1784, local merchants replaced this important colonial trading partner with ports in Latin America and Asia.

Providence moved into the front rank of the new nation's municipalities, first as a bustling port and then as an industrial and financial center. Providence merchants, especially the Brown family, accumulated the investment capital to sponsor experiments in manufacturing. In 1790 Samuel Slater, the Browns' protégé, initiated the transition, completed by the 1830s, from maritime to manufacturing activity as

the heart of Providence's economy. Providence's four major areas of manufacturing endeavor—base metals and machinery, cotton textiles, woolen textiles, and jewelry and silverware—were established by 1830, and for the next century they dominated the city's economy, making Providence the industrial leader of the nation's most industrialized state. Providence owed this primacy to its superior financial resources and banking facilities, its position as the hub of southeastern New England's transportation network, and especially to its skilled workforce and enterprising business leaders.

In January 1801 the city suffered a disastrous fire that destroyed thirty-seven buildings on South Main Street. The Great Gale of September 1815 left the entire waterfront in shambles. The War of 1812 brought hardship to commerce, and the Panic of 1819 interrupted economic recovery. Most serious, however, were the town's internal growing pains. In 1820 the population of Providence reached 11,745. By 1830 the number of inhabitants had jumped to 16,832, of whom 1,213 (7.2 percent) were black. During the 1820s, tensions increased between the white working class and the black community. The fact that blacks were stripped of the right to vote in 1822 and were segregated by the Providence School Law of 1828 intensified their resentment.

In September 1831 a race riot erupted, beginning with a clash between some rowdy white sailors and blacks living in Olney's Lane. This four-day episode, in which five men died, was the final catalyst for municipal change. A town meeting on 5 October 1831 decided to adopt a city form of government, and the General Assembly agreed. In November the charter was issued and ratified by the town's electorate. In 1832 Providence became a city with a mayor-council form of government that replaced the traditional town meeting.

PUBLIC OPINION On 16 April 1816 the *Washington National Register* carried a bitter comment by Napoleon Bonaparte, as he was departing for exile: "A new power has started up in every country, which is called public opinion, from the empire of which no person can withdraw himself, and to whose tribunal governments themselves instantly appeal." The rise of this new power of public opinion was a central part of the history of the United States from the 1750s to the 1820s. As in Europe, the ideas and practices of public opinion in America emerged with the rise of the newspaper press and the civil associations of what is now called the public sphere. But in the early United States the concept of public opinion had both a longer history and a more complicated relationship with revolution and nation building. And by 1829 the question of who exactly the American public was, and what sorts of opinions it might have, was about to explode in complexity.

AN EMERGING COLONIAL PUBLIC AND THE AMERICAN REVOLUTION

The idea that a "public" existed and might have an "opinion" had begun to develop by the mid-eighteenth century. The basis of government in colonial America lay in charters guaranteeing rights to representation in assemblies, confirmed to the colonies at large in the Glorious Revolution of 1688-1689. But such rights were limited to men of property, and even they did not necessarily have the information that would allow them to form opinions that would mark them as "public men." Opinions abounded, but they were effectively the privileges of officially recognized bodies: judges, juries, assemblies, governors, churches. Public authorities deferred to what they called the "sense of the people" or the "minds of the people," but not to "public opinion." But by the early eighteenth century, as in English provincial towns, a specific but unrecognized public began to appear within the ranks of the "people." By 1760 there was a total of eighteen newspapers being printed in the colonies. Distinct public spheres comprised of these newspapers and small clubs and societies began to emerge in the leading colonial seaport towns, providing a field of information, commentary, and debate to an emerging "informed public." In the highly literate northern seaports this public spread beyond the bourgeois respectability of the merchant and master artisan to include women and laboring men. But in the vast stretches of the early American farming towns and counties the emergence of such a public was far more limited, both by the lack of print and a variable litera-

cy: stronger in rural New England, it was weakest in the plantation South and the arc of the frontier back-country.

These colonial patterns shaped American politics during the imperial crisis and the opening of the Revolution. The emergence of an American public was just strong enough to fool the British, but just weak enough to permit divisions among the colonials. The British government, under the ministry of George Grenville, assumed that Americans were divided by colonial boundaries and unable to generate a unified resistance to the Stamp Act in 1765. These assumptions were foiled by the network of newspapers, themselves targeted by the act with a wide array of other paper documents, which worked to shape a common resistance in the seaport towns and circles of planter gentry. On the other hand, people in more remote regions poorly supplied with news often had only the vaguest notions of the issues at stake. During the ensuing era of the Townshend Act resistance beginning in 1767, and then under the Articles of Association in the fall of 1774, opinion certainly was shaped by the growing number of newspapers, thirty-seven in 1775, but also by the threat of force. Individuals throughout the colonies were confronted with the demands of committees that they sign articles of nonconsumption or Continental Association, while printers not supporting the American cause were driven out of business. Once the war broke out state legislatures imposed a level of censorship on print to maintain the cause. Although Thomas Paine appealed to the “Common Sense” of the American people, that sense was shaped by the imperatives of revolutionary and counterrevolutionary force. During eight years of war that “sense of the people” was sharply divided: historians still accept the basic thrust of John Adams’s sober assessment that during the Revolution a third of Americans had been Patriots, a third Tories, and a third disaffected.

CONFEDERATION AND CONSTITUTION: COMPETING UNDERSTANDINGS OF THE PUBLIC

During the Confederation that followed the war, American opinion was fragmented, volatile, and controversial. Within the federated states the ranks of the public had been widened as much by Revolutionary mobilization as the growing number of newspapers. It manifested a spirit of populist democracy, and in state after state majorities of voters elected legislatures that protected the assets of poor households against the pressure of private and public debt. This Confederation-era state politics, unfolding in small, face-to-face legislative districts, derived more from the militia field than the newspaper.

The campaign to write and ratify a national constitution in 1787–1788 tipped the balance toward the beginnings of a recognizably modern understanding of public opinion. The Federalist proponents of the Constitution won ratification in critical states, most importantly New York, by the narrowest of margins, and after a full-scale effort in the press, where the printers almost uniformly supported the Federalist cause. This advantage contributed to their sweeping victory in the first federal elections, and in the first years of the 1790s the printers of what were now roughly ninety newspapers worked to shape a remarkable consensus of support for the new federal Republic.

PUBLIC OPINION IN THE EARLY REPUBLIC

The federal constitution had established not just a national government but a national context of publicity, shaped by a new national system of mail. As a national politics emerged, the old corporate language of the “people” began to give way rapidly to a new language of the “public”: the terms “public opinion” and “public mind” appeared in American newspapers and magazines with accelerating frequency, surging with each presidential election. The Federalists in power attempted to manage this opinion with the founding of the *Gazette of the United States*: they hoped to build a political order in which voters chose lawmakers but articulated no opinions regarding the policies of government. Opposition soon emerged: as soon as Alexander Hamilton presented his plan for a national bank, Jefferson and his Democratic Republican followers demanded that voters think for themselves and form their own independent opinions, the central goal of the Democratic societies of 1793–1794. Although the Federalists decried the Republican efforts as factional—raising “passion” and “party” against “reason” and good government, and “inflaming” and “corrupting” public opinion—they themselves mobilized public opinion in organizing a wave of petitioning to ensure the funding of Jay’s Treaty in 1796.

Jeffersonian appeals to opinion—and the possibility of war with France—precipitated the Federalist effort at suppression, the Sedition Act of 1798, which made the writing or publishing of criticism of the government punishable by fines and imprisonment. The Jeffersonians were not cowed. The historian Jeffrey Pasley has demonstrated that Republican newspapers spread even more rapidly after the Sedition Act than before it, and the arrest and conviction of twenty-five editors merely provided a wider sense of outrage. A host of young men taking up political

printing in the months before the election of 1800—publishing many of the roughly 230 newspapers in circulation—narrowly swung the popular vote to Jefferson’s Republicans. This generational experience launched the career of many a political editor, as this cohort became the foundation of political opinion making for both Democratic and the National-Republican/Whig Parties.

The seesaw of repression and mobilization of 1798–1800 crystallized the emerging role that the scholar David Waldstreicher has ascribed to the early political parties: Federalist and Republican visions became the vehicles for competing understandings of the nation and the purposes of its government. But the concept of public opinion retained an ambiguity that it may not have shed to this day. Although made up of millions of individual opinions, “public opinion” was still conceived in monolithic terms. Even after Jefferson’s election, political parties were seen as illegitimate factions of interested men that in some way violated the reason of the true public. The press labored under the threat of libel suits brought by both Republicans and Federalists for partisan purposes. Exactly when Americans began to be truly comfortable with the legitimacy of opposing opinion is a matter of some debate among historians. Whereas the historian Richard Hofstadter has argued that partisan opinion was accepted in the United States by the 1820s, a number of other historians have dissented, arguing that many Americans into the 1830s were uncomfortable with party and organized political opinion, and saw it as undermining a broader, more legitimate public opinion.

Throughout this era, stretching back into the mid-eighteenth century, the emerging idea of public opinion had had other limits and boundaries. It was still assumed to be the domain of propertied, literate respectability. But in the 1820s the boundaries around public opinion were beginning to be challenged by “counter-publics,” as women, free blacks, and unpropertied labor were beginning to be heard and read in public. These first tentative developments in the 1820s anticipated an explosive transformation of public discourse in the 1830s, and the emergence of a truly modern configuration of public opinion.

QUAKERS Quakers, also known as the Society of Friends, began as a religious movement in 1652 in northern England. Religious persecution, harassment, arrest, and execution led the followers of George Fox, the pioneer of the faith, to the colonies in search of religious freedom. Seeds of the faith were first planted in the mid-Atlantic in the late seventeenth century, when the Quaker colony of West Jersey was founded. This colony was managed by William Penn (1644–1718), who in 1681 established Pennsylvania on land granted to him by King Charles II. In spite of continued persecution, the Friends moved southward to Virginia, Maryland, the Carolinas, and Georgia. The popularity of the faith reached its peak during the Revolutionary era. At that time, Quakers numbered 50,000 among the total colonial population of 1,580,000.

On the question of independence, the Quakers faced trouble from both sides. The British questioned the Quakers' loyalty to the crown. The new American Patriots assumed all Friends were Tories because, as pacifists, members refused to take a stand on independence and Quaker men refused to enlist in the Continental Army. Quakers also refused to pay war taxes. Large numbers of Quakers throughout the colonies did in fact side with the Patriots. Those few

Quakers who fought in the war were no longer allowed to attend meetings.

Quakerism in America did not catch on quickly or develop easily. "Missionaries" and their converts were routinely ostracized. Because of the perseverance of such Quakers as martyr Mary Dyer, hung in Boston for her beliefs in 1660, William Penn, and John Woolman, who advocated an end to slavery among fellow Quakers, the Friends made a significant impact on the development of the new nation.

ASPECTS OF QUAKERISM

Throughout the religion's history, differences in beliefs have resulted in splits within the faith. However, the basic tenet of the faith is the concept of inner light, which holds that anyone is capable of a direct experience with God through quiet seeking and diligent searching. Quakers view men and women as equals, and both sexes participate in leading services, called meetings, whenever they are moved to speak. They do not use trained clergy. Quakers do not observe traditional sacraments like communion. They sing hymns at some pastoral meetings, but otherwise services are unusually quiet, with members searching through solitary introspection to connect with God.

Quakers in early America wore stark dress and shunned material goods such as lavish furnishings,

jewelry, and colorful clothing. Many members, through thrift and successful business practices, became wealthy and were known for purchasing goods of the finest quality but the plainest nature. Some members of the Society of Friends took strong stances on social issues: they opposed slavery, espoused pacifism, expressed concern over the treatment of Native Americans, and supported education and care of the impoverished.

QUAKER ANTISLAVERY MOVEMENT

Before and after the Revolution, Quakers spoke out loudly against slavery. Members first denounced the idea of owning slaves, then encouraged members to emancipate their slaves and eventually ousted members who refused to do so. The politician John Dickinson (1732–1808), called the “penman of the revolution,” succumbed to the pressures of his local meeting in Delaware and the desires of his Quaker wife and provided gradual emancipation of the slaves on his Delaware plantation.

Two leading Quaker antislavery advocates in the late eighteenth century were John Woolman, the author of *Some Considerations on the Keeping of Negroes* (1754), and Anthony Benezet. Their influence extended throughout the mid-Atlantic region. After the Revolution, Quakers increased their abolitionist work. Lucretia Mott (1793–1880), an early advocate for women’s rights, spoke out against slavery and the consumption of goods produced by slave labor. The journalist William Lloyd Garrison (1805–1879) was imprisoned for his outspoken attacks against slavery while writing for *The Genius of Universal Emancipation*, edited by the abolitionist Benjamin Lundy (1789–1839).

Quaker efforts resulted in organizations dedicated to abolishing slavery: the Society for the Relief of Free Negroes, Unlawfully Held in Bondage (1775); and the Pennsylvania Society for Promoting the Abolition of Slavery, the Relief of Free Negroes Unlawfully Held in Bondage and for Improving the Condition of the African Race (1787). By 1784 Yearly Meetings of the Society of Friends had followed the lead of the Philadelphia Yearly Meeting to ban the ownership of slaves among their members. In 1790 Friends presented a petition to Congress calling for the abolition of the slave trade and mounted a concerted antislavery effort to pressure the federal government in Philadelphia.

This activism caused many Quakers to be forced out of their communities in the southern colonies. As southern Quakers emancipated their slaves, they faced harsh criticism from the proslavery communi-

ty. Yet the antislavery urgings of such early leaders as Woolman and Benezet kept Friends focused on ending human bondage. In many instances, the decision to free their slaves left southern Quakers destitute, while others spent small fortunes to bring lawsuits against neighbors who simply bought the slaves as quickly as the Friends freed them.

The opening of the Northwest Territory appealed to many Quakers, and a large migration began toward Ohio and Indiana. Once established in these locales, some Friends became involved in the Underground Railroad, putting Quakers in the forefront as the group most friendly to slaves. A network of safe houses and routes to freedom and Canada were established in the Midwest, out of the South, and along the mid-Atlantic coast. Quakers, non-Quakers, blacks, and whites risked their safety for the antislavery cause. One of the best-known Quakers associated with the Underground Railroad is Thomas Garrett of Delaware, who helped hundreds of runaway slaves to freedom.

QUAKERS AND NATIVE AMERICANS

Whereas most Euro-Americans viewed Native Americans as savages, Quakers, according to their belief that all people are precious in the eyes of God, approached Native American relations with the same level of respect they offered to their fellow Society members. During the period of Western expansion, Quakers lived in harmony with Native Americans and established trade and business relations with them. Non-Quakers’ disdain for Native Americans sometimes resulted in violent conflicts, but Quakers had no such problems on the frontier.

FACTIONALISM

As some Quakers started to place emphasis on evangelical matters and called for meetings to develop more fundamental interpretations of the Bible, rumblings of discontent spread through the Quaker community. Historically, Quakers shunned the idea of forced doctrine. A relatively uneducated but pious farmer, Elias Hicks, vehemently opposed the changes being forced upon the faith. In 1827, when a resolution could not be reached and the more powerful elders of the Philadelphia Yearly Meeting blasted Hicks, the Quaker church split into two factions: the Hicksite Movement and the Orthodox. Further divisions took place during the years to follow.

QUARTERING ACT The Quartering Acts of 1765, 1766, and 1774 were among the measures implemented by Parliament to reorganize the empire after the Seven Years' War (1756–1763). In 1764, the commander in chief of the British Army in America, Thomas Gage, asked Parliament to extend the Mutiny Act—the constantly renewed law that allowed Britain to retain a peacetime standing army inside the realm—to the colonies. Gage hoped that the law would clear up any uncertainty as to how the army would be housed in peacetime, since Americans had never before had to consider the infrastructure problems caused by the presence of a standing army. During war, local officials had quartered and supplied troops according to necessity, an informal arrangement that traditionally had included the practice of quartering troops in private homes. Gage sought to formalize this ad hoc system.

Parliament passed the first Quartering Act in March 1765 for a two-year term. It required the American colonies to provide housing and supplies for the army. The following year, a second, more extensive act instructed officials in America to purchase any available vacant buildings for troop quarters—at provincial expense. Despite popular misunderstanding, the act actually banned the policy of using private homes as a cheaper alternative to quarter soldiers. In the charged atmosphere of 1766–1767, many Americans interpreted the Quartering Act simply as another form of unjust taxation.

Because the Quartering Act left the details up to the colonial assemblies, it proved easy to evade: legislatures simply did not have to grant the needed funds. This is exactly what the New York assembly did in December 1766. Even though several colonies had resisted the act, Parliament decided to make an example of New York, passing the Restraining Act of 1767, which suspended the New York assembly until it complied with the Quartering Act. While compromise prevented the actual dissolution of New York's legislature, Americans understood the dangerous implications of the Restraining Act.

Parliament passed a third Quartering Act on 2 June 1774 as one of the Intolerable Acts to punish

Boston for its Tea Party. Because Boston had no barracks, British troops since their arrival in 1768 had been quartered in Castle William, a fort on an island in the harbor, rather than in the city itself. The Quartering Act of 1774 sought to amend this situation, stipulating that colonial authorities provide quarters on the spot of their assignment. Officers were also given the right to refuse unsuitable housing and permission to possess vacant locations if requests were not granted within twenty-four hours.

Although Americans generally condemned the Intolerable Acts, reaction to the Quartering Act was mild compared to the other measures. Still, the act and the threat of a standing army that it represented constituted part of the revolutionaries' justification for resistance. The Declaration of Independence included both the Quartering and Restraining Acts in its list of grievances against the king. The Bill of Rights, moreover, reassured Americans that they would not have to face a similar threat. The Third Amendment states that “no Soldier shall, in time of peace, be quartered in any house, without the consent of the Owner, nor in time of war, but in a manner to be prescribed by law.”

QUASI-WAR WITH FRANCE The first foreign war fought by the United States under the Constitution was an undeclared naval conflict with France known as the Quasi-War (1798–1801). The young Republic was nominally allied to France under a 1778 treaty negotiated during the American Revolution. Although French leaders did not expect the United States to enter the French Revolutionary Wars (1792–1801), they did expect the new nation to pursue a pro-French foreign policy. When the

United States in 1794 signed the Jay Treaty, a commercial agreement with Great Britain, France felt betrayed. When the young Republic ratified the treaty the following year, France severed diplomatic (although not consular) relations and unleashed its warships and privateers on American commerce around the globe. France's aims were to bully the United States into repudiating the Jay Treaty and to loot American commerce.

In 1797 President John Adams sought to negotiate an end to the depredations by dispatching a diplomatic mission to Paris. But as a price for talking to the American delegation, the French government demanded an apology, a \$220,000 bribe, and a \$12 million loan. The American envoys rejected these demands. Because the secret agents who delivered the French demands were designated X, Y, and Z in the diplomatic report sent back to the United States, this matter was ever thereafter known as the XYZ affair. Many Americans responded with the defiant slogan "millions for defense, but not one cent for tribute."

Outraged by the French shakedown attempt as well as the continued depredations at sea, Congress in 1798 authorized limited hostilities. American warships were authorized to attack armed French vessels, and American merchant vessels were permitted to arm for defense. This response proved remarkably effective. Under the direction of the newly created Navy Department, American warships, operating mainly in the Caribbean (where most of the French depredations had occurred), captured or defeated eighty-six armed French ships and recaptured seventy American merchantmen while losing only one warship. Armed merchantmen took eight additional armed French vessels and recaptured six prizes. More important, they fought off or scared off countless French cruisers that threatened them.

France had no interest in waging a war that might undermine its war effort against Great Britain. Hence, in 1799 France's new leader, Napoleon Bonaparte, indicated an interest in peace. Against the

wishes of many fellow Federalists, Adams responded by sending a diplomatic mission to Paris. The result was the Convention of 1800, which called for the United States to waive millions of dollars in claims for the French depredations that had occurred since 1795. In exchange for this concession, France agreed to suspend the treaty of alliance (as well as a companion treaty of commerce) that had bound the two nations together since 1778. The ratification of the Convention of 1800 the following year brought the Quasi-War to an end.

This limited war was soon forgotten, although it demonstrated how, given just the right circumstances, a second-rate power might work its will on a great power. Not only was France preoccupied with its British war, but the Royal Navy kept the French navy in check. This allowed the U.S. Navy to conduct a successful campaign in the Caribbean, shutting down the French war on American commerce there and driving down marine insurance rates. The navy also showed the flag in European waters as well as the Pacific and Indian Oceans. In addition, American merchantmen demonstrated that with a few naval guns and the will to use them, it was possible to scare off the small French privateers that were looking for easy prey. All in all, the war was a remarkable vindication of sea power for the fledgling Republic and served notice on Europe of a rising naval power in the West.

RACIAL THEORY European prejudices against Africans are ancient. But systematic, socially significant explanations of racial difference—racial theory—began in the late eighteenth century. Such rationalizations of race played an increasingly important role in the escalating race and slavery debates that ran from the Revolution to the Civil War.

In the eighteenth century, as long before, most Europeans and European Americans believed that Africans descended from Adam and Eve and were thus fully human. Departures from the supposed white human norm were seen as functions of environment. In keeping with the idea that acquired characteristics are inherited, the hot African sun and African “savagery” had made “blacks” biologically distinct, ugly, and stupid. Only in the era of “all men are created equal” and the American Revolution was antiblack prejudice first seriously challenged, and only then did Anglo-Americans countenance the idea of universal emancipation. Intellectually, the challenge to prejudice came in terms of instances of accomplished blacks. According to the Enlightenment philosopher John Locke, humanity was defined by the possession of reason and imagination. Hence African Americans of high achievement—such as the Boston slave poet Phillis Wheatley and the Maryland mathematician Benjamin Banneker, who helped sur-

vey the site of the District of Columbia and published a noted almanac—seemed to prove that blacks were fully human, created equal. So did the tens of thousands of African Americans who fled to British lines and were promised freedom during the Revolution itself.

The initial white response was not to deny human unity and descent outright. Instead, prominent European Americans like Thomas Jefferson argued that, whatever explained black inferiority, blacks were now too distinctly marked ever to become American citizens with full political rights. Either they had to remain in bonds or they had to be sent away through some sort of program of gradual emancipation and forced emigration. Otherwise, as Jefferson proclaimed in his intensely prejudiced 1785 book, *Notes on the State of Virginia* (which came close to denying human unity), race war would ensue:

Indeed, I tremble for my country when I reflect that God is just: that his justice cannot sleep for ever: that considering numbers, nature, and natural means only, a revolution of the wheel of fortune, an exchange of situation, is among possible events: that it may become probable by supernatural interference! The Almighty has no attribute which can take side with us in such a contest.

One of Jefferson’s harshest white critics, the College of New Jersey (later Princeton) president Samuel Stanhope Smith also feared slave insurrection and

race war, and championed an all-white America. Smith's *Essay on the Causes of Variety of Complexion* (1810) was the most important early American scientific statement on race; according to Smith, blacks could become true Americans only if they whitened up or intermarried with whites.

Thus, as American racial lines hardened into a stark black-versus-white divide, people of African descent became a fundamental challenge to the existing social order. Among Africans in the New World, a consciousness of "blackness" across the Atlantic world grew in response to the horrors of the Middle Passage and New World slavery as well as to the unfulfilled promise of "all men are created equal." Soon blackness combined with egalitarianism to yield a new "black" nation. The first great successful slave rebellion in world history, the Haitian Revolution, destroyed the French sugar colony of Saint Domingue and established the "black republic" of Haiti in 1804. American slave rebels like Gabriel Prosser wanted to follow suit in the United States. Slaveholders made the "horrors of Saint Domingue" into a bogey; American white abolitionists and early African American protest writers like the Freemason Prince Hall and, later, the contributors to the first black newspaper, *Freedom's Journal*, published from 1827 to 1829, championed the Haitian rebels as black George Washingtons. All the while, the complex multiracial—black, mulatto, white—dynamics of Haitian events were ignored. By the 1820s African Americans like the *Journal* writers were drawing on the same French Enlightenment sources cited by Haitians to argue that the founders of civilization themselves, in Ancient Egypt, had been black. In this view, black people were fully equal and deserved a place in the new nation without having to whiten up. If anything, Bostonian David Walker proclaimed in his incendiary 1829 *Appeal*, a call for messianic slave rebellion in the United States, blacks might claim racial superiority over whites, who had always been "an unjust, jealous, unmerciful, avaricious and bloodthirsty set of beings, always seeking after power and authority." Walker, however, also held the door open to racial reconciliation in the United States.

It is hard to know to what degree Walker's brand of African American black racialism was deeply felt or whether he was being provocative. It is, however, indisputable that such blackness shaped white racial thought. Walker and the *Journal* writers were instrumental in convincing William Lloyd Garrison and other white reformers to abandon gradualism and emigration and champion immediate emancipation and black citizenship. Hence the radical aboli-

tionist movement was multiracial from the start. The path of racial theory was one of constant intensification. The ambiguity and hypocrisy of the Jeffersonian era gave way to increasingly sharp and explicit expressions of "hard" racism, antislavery, and proslavery, leading to the Civil War and Emancipation.

RADICALISM IN THE REVOLUTION "Radical" stems from the Latin *radix*, root. Politically it means addressing matters from their roots. Within the American Revolution there was no single radical position from beginning to end. The word radical can apply equally well to deep criticism of both the British-American social order and British policies during the pre-Revolutionary crisis. It also can describe the various visions people formed of the new America that the Revolution made possible.

COLONIAL TENSIONS

Broadly speaking, pre-independence radicalism was "conservative," seeking to turn back changes that Britain sought to impose. But colonial radicalism also drew on presumptions that a great deal was wrong with the world as it was. One source, especially among New England intellectuals, was the heritage of Puritanism, which had overturned the mon-

archy, beheaded King Charles I, and abolished the House of Lords. "Commonwealth" or "real Whig" English writers were profoundly suspicious of all political power and the people who wielded it. Provincial American readers devoured their caustic criticism of "Old Corruption," as they described the political settlement in Georgian Britain.

Underpinning these (and other) intellectual traditions was a generalized belief that good communities were small, cohesive places where local customs governed relations among neighbors and kin. White colonials believed in private property and took part in long-distance markets; but they had not become fully capitalist. Colonial plebeian culture drew on Britons' deep popular suspicion of country lords, city financiers, and others who lived on poor people's labor. Just as British pamphleteers helped fuel elite colonial suspicions, migrants and seafarers helped keep popular traditions alive. Pre-Revolutionary English "liberties" were privileges that went with a given situation. White colonial males could tell themselves that the "liberty" of having their own political institutions gave them British freedom under the crown equivalent to the freedom their fellows "at home" enjoyed under Parliament. Their "liberty" of owning slaves was denied to Britons within "the realm" of England, Scotland, and Wales. Native people dealing with the invasion of their land had no love for the colonial order. Nor did Africans and their American-born children, who were enslaved to make that land productive. Given any chance, they said so. Kingship did offer a way to comprehend the whole situation: society was unequal, and liberties were uneven, but a benevolent British monarch, limited by Parliament, did protect his people. Or so official ideology maintained.

REVOLUTIONARY PROTESTS

During the imperial crisis elite protest writing was distinctly provincial, responding to problems of taxation, legislation, and power that the British authorities posed. Consider the Boston politician and pamphleteer James Otis. Although his fundamental attitude toward British power was outrage, he remained trapped within the notion that Parliament, the source of English liberty, remained the ultimate voice in determining the colonials' version of British freedom. The contradiction between that belief and the hard reality that Parliament claimed the power to bind colonials "in all cases whatsoever" helped tear his unstable mind apart.

Thomas Jefferson's first pamphlet, *A Summary View of the Rights of British America* (1774), cut

through much of the tangle. He abandoned all the complexities of internal and external taxation, taxation and legislation, colonial privilege and parliamentary power that had bedeviled previous protests. He asserted a full equality of rights between (white) Americans and Britons. They were separate peoples, linked only by a shared monarch, who reigned over them on their own terms by their own consent. Jefferson's pamphlet prefigured both his tone and his arguments in the Declaration of Independence two years later. Without fully realizing it, he was opening the question of how an independent America should structure itself. His style was forceful: "Let those flatter who fear, it is not an American art." He understood that a deep crisis had opened and that old arguments had become useless.

Thomas Paine published his great pamphlet *Common Sense* in January 1776, after crisis had turned into war. His prose was ferocious, not gentlemanly. The king was a "royal brute." "The weeping voice of nature" cried "'tis time to part." Jefferson and Paine alike were ardent republicans, believers in political liberty and in the idea, at least, of equality. But Jefferson tripped on the contradiction that ran through both his America and his own life, slavery. Drafting the Declaration of Independence in June 1776, he tried to blame slavery on the hapless king. It did not work, foreshadowing his lifelong failure to address the question adequately. Paine saw more clearly. In this matter the king was not at fault. As he wrote in "African Slavery in America" (1774), "We," not the king, had "enslaved multitudes," and the act was a "crime."

By 1776 many people were raising their own voices in their own interests, within a general sense that equality and liberty ought to apply to them. A New Jersey farm woman asked her soldier husband why she "should not have liberty whilst you strive for liberty." A poor Boston shoemaker who once had groveled in the presence of the wealthy merchant John Hancock now faced down both British officials and American privateer officers. Farmers in New York's Hudson Valley debated among themselves which side to choose. So did Iroquois Indians not far west of them, breaking their centuries-old Confederacy as four of their six nations chose the British side and two chose the American. Chesapeake slaves invited Virginia governor Lord Dunmore to recruit them and rallied to join his "Aethiopian Regiment." Their badges proclaimed, "Liberty to Slaves." Many other black men found freedom under American arms. After initial opposition, George Washington welcomed them. In 1781 he recognized their contri-

bution by giving a heavily black Rhode Island regiment pride of place in the final attack on British emplacements at Yorktown.

FUTURE VISIONS

People agitating for liberty and equality did not necessarily get what they wanted. For Indians the Revolution became a disaster, whichever side they chose. After independence they faced an implacable Republic bent on acquiring their land. For black Americans it was a partial success. Slavery started to break up, and free black communities began to take shape, at least in what became "the North." Within these communities, antislavery could generate and flourish. But in the South slavery expanded and prospered, fueled by a vicious African slave trade that did not end until 1808. For many women the Revolution was a moment of opening possibilities, but it was not a moment of institutional change. Yet all of these groups were beginning to develop and press a public agenda that turned on rights and equality rather than privileges and hierarchy. They were addressing Jefferson's proposition that "all men" indeed "are created equal."

In immediate terms ordinary white men enjoyed the greatest success in asserting rights and equality for themselves. Between 1776, when the old institutions of government finally collapsed, and 1789, when the United States Constitution took effect, the fourteen separate states (including Vermont) provided the arena where such men worked out their visions and their fears. In both thought and practice one problem was giving real meaning to the abstract idea of "the People." Farmers in western Massachusetts and "mechanics" in New York City demanded in 1776 that new state constitutions be written by special conventions and ratified in special elections, rather than simply proclaimed. But only Massachusetts carried that ritual through, and it did not do so until 1780.

More than ritual was involved. In general, the state governments drastically expanded white men's political possibilities. Pressure from outside forced leaders to enlarge both representative institutions and the pool of candidates and voters. Elections would be frequent rather than at long intervals. Most states made their legislatures the dominant branches of government, on the assumption that these would do the people's will. Men who never would have gotten near the old centers of power found themselves making, interpreting, and enforcing laws.

The model of the good community continued to be the small communities people knew. But another truly radical force was emerging around those communities and their people: a national capitalist economy. Such an economy demanded stability and predictability over long distances and long periods of time. One way or another, most of the states passed laws during the late 1770s and the 1780s that tried to restrict and hamper capitalist development. Where they did not, unrest followed, most notably in the case of Shays's Rebellion in central and western Massachusetts (1786–1787).

The United States Constitution met the needs of the young nation's emerging economy. It would be a "supreme law of the land" governing all citizens equally and directly. Binding contracts, not local customs, would govern economic relationships. For that reason it won the firm support of city folk who were enmeshed in trade. The Constitution also expressed the belief of many national leaders that broad, frequent political involvement and state autonomy did not serve America's real needs. In this sense, it marked a reaction against the Revolution's radicalism. But it was completely consistent with the idea that "the American people" ought to govern itself. It left open the problem of who actually comprised that people. Thus in principle, at least, the possibility remained open that people who were excluded or made marginal during the Revolution still could claim its radical heritage for themselves.

RAILROADS Although railroads dominated the American transportation network by the eve of the Civil War, their origins during the early Republic were quite modest. The first railways in the United States developed from crude systems developed by miners to transport bulky coal and ores from the mouth of the mine to a river or canal. These early rail lines consisted of wood planks placed along the route with iron rails on top to provide durability. Most of these systems were less than one mile long and used gravity—as one full cart descended the route it pulled an empty car to the top—as a form of power. The first true “railroad” appeared in Quincy, Massachusetts, in 1826. Called the Granite Railroad, this three-mile-long line, which transported stone from a quarry to nearby docks, used a raised track on wooden ties and cars with flanged wheels. This line was soon followed by similar systems in Pennsylvania’s anthracite coal-mining country. Although technically railroads, these early efforts used mules or a stationary steam engine to pull carts.

Early American railroads rarely came into direct competition with turnpikes or canals, which were the preferred forms of transportation through the 1830s. The comparative advantage of rail systems over water or wagon travel was the ability to climb or descend higher altitudes. Thus, many early rail lines complemented existing canal networks; for example, Pennsylvania’s ambitious State Works used a railroad link on its Main Line from Philadelphia to Columbia on the Susquehanna River and employed an ingenious system of stationary steam engines pulling cars on inclined planes to provide a link over the mountains from Hollidaysburg to Johnstown. These early efforts, although costly, demonstrated that railways were more practical than boats or wagons for reaching certain areas. The replacement of horse or mule power with steam-engine locomotives by 1829, moreover, made railroads the cutting edge of transportation technology in the early Republic.

Entrepreneurs from large cities found state governments unwilling to fund the construction of railroads that could handle both passenger and freight

travel, so the main investors in this new technology came from the private sector. In 1828 the Baltimore and Ohio Railroad began its ambitious project of linking Baltimore to the Ohio River by railway. By 1830 the B&O had completed only thirteen miles of track; nevertheless, its directors demonstrated the viability of rail travel during a time when canals and turnpikes dominated the nation’s transportation network. Investors in Boston soon followed with a plan to link Boston and Worcester with a railroad. In the year the B&O opened, only about twenty-five total miles of railroad track were in use in the United States, but several projects such as New Jersey’s Camden and Amboy, South Carolina’s Charleston and Hamburg, and New York’s Mohawk and Hudson were under way. By 1835 more than one thousand miles of track had been created and the railroad’s place as the future means of transporting passengers and goods had been established.

RAPE Early Americans understood rape to be a crime of forced heterosexual sex—in their words, carnal knowledge of a woman against her will. Most states set ten as the age of consent, which meant that sex with a girl under ten years old was rape, regardless of her consent or resistance. For an adult victim, a rape prosecution generally required proof that she had resisted with all her might; that she had visible injuries; that she had attempted to call for help; and that she had no way to escape her attacker. Men’s most common defense to a rape accusation was that the woman had consented to the sex.

For most of the eighteenth century, rape was a capital crime, punishable by death. Beginning in the

1790s many states revised their criminal codes to abolish the death penalty for many crimes. Instead of a death sentence, many states punished convicted rapists with incarceration for anywhere from ten years to life. However, southern slave states continued to punish black—slave and free—rapists with death sentences if their victims were white, even as they abolished the death penalty for white rapists. Overall, about three-quarters of the men executed for rape in the eighteenth and early nineteenth centuries were of African descent. Black men were also sometimes executed for attempted rape, whereas white men were usually punished with a fine, whipping, or, more commonly after the Revolution, imprisonment.

Indeed, the clearest determinant of the outcome of a rape prosecution was the racial identities of the victim and defendant. In both the North and South, black men were far more likely to be charged, convicted, and executed for rape than were white men. In the eighteenth and early nineteenth centuries, black men were convicted of rape at least twice as often as were white men. Part of the reason for this discrepancy is that enslaved blacks were often tried at separate courts without the standard legal protections afforded to whites. Many colonies and states also passed laws specifically condemning to death or harsh corporal punishments slaves who attempted to rape white women. Because most states did not have statutes about white men's crime of attempted rape until after the American Revolution, many incidents of white men's attempted rapes were prosecuted as lesser charges such as fornication, lewd behavior, or simple assault.

Rape cases were often difficult for any victim to bring to court. In order to complain about sexual assaults, young victims frequently had to overcome fear, manipulation and an attacker's social or economic power over her and in the community. White women who accused white men of rape might be humiliated in public court trials that regularly disparaged the victims' chastity and virtue. Nonwhite (especially African American) victims almost never brought successful prosecutions against white or black rapists. More than 95 percent of identifiable victims in rape prosecutions in the eighteenth and early nineteenth centuries were white. Although African American women could theoretically ask for legal redress for a rape, white communities and courts generally did not value African American women's sexual chastity enough to prosecute such cases. Further, many colonies and states did not allow slaves to testify against white defendants,

which made rape convictions of such men exceedingly difficult. Accordingly, historians have been unable to find a single conviction of a white man for raping an enslaved woman during this period. Courts and law enforcement officials usually ignored the rape of slaves by other slaves, although some individual masters punished such behavior.

RATIONALISM Rationalism was a cultural movement from 1750 to 1820 that questioned social and intellectual traditions. Although rationalism did not reject tradition completely, it encouraged criticism of traditional laws, ideas, and social practices. Such criticism helped precipitate social and political change after 1750. One such change concerned the traditional privileges of aristocracy. Most rationalists were not aristocrats but were associated with the trading or commercial classes of the bourgeoisie. As such, rationalists often criticized aristocratic practices such as using birth or family lineage to determine a person's social position. In his *Autobiography* of 1771, the rationalist and American Revolutionary Benjamin Franklin boasted that his talent and merit, not his lineage, determined his social position in late-eighteenth-century Philadelphia. He suggested that talent and social mobility, not birth and traditional privilege, should characterize American society.

In addition to aristocratic practices, rationalists criticized intellectual traditions. Rationalists particularly opposed traditional religious ideas about human nature. The most influential of these ideas in 1800 were the orthodox Protestant ideas of Calvin-

ism. Although originating with the sixteenth-century reformer John Calvin, Calvinism remained influential in America even after 1800. Calvinists held that human nature was inherently sinful and that human beings depended on God's grace for moral improvement. Rationalists scorned such ideas. They even replaced the traditional religious language of sin and grace, which suggested human dependence on God, with secular words like virtue and vice, which suggested human free will. One such rationalist was the American Founder Thomas Jefferson. Jefferson argued that human beings were not inherently sinful because they possessed "moral sense." This sense, he maintained, was part of human nature, enabling human beings to recognize virtue and pursue moral improvement without special grace or redemption from God.

For rationalists, such particular criticisms of aristocratic convention or traditional religion were not unrelated. They both derived from the rationalist principle that society was of human origin. Rationalists argued that the laws and institutions of society were not of divine origin or reflections of God's will, as many traditional writers had asserted. Instead, rationalists argued that society's laws and institutions were the product of human history, or the result of human decisions in history.

This emphasis on the human origins of society informed rational criticisms. By insisting that society's institutions and laws were the result of human decisions, and not part of an immutable order, rationalists challenged those institutions and laws as mere human creations. Rationalists thus challenged the legal privileges of aristocracy as merely the product of aristocratic decisions in political history. The aristocracy, they charged, made the laws of aristocratic privilege. Rationalists similarly criticized the clergy. They viewed the clergy as possessing power and prestige because clerical leaders had influenced the political decisions of history. One rationalist who expressed these critical views was the American Revolutionary John Adams. In 1765 Adams published *A Dissertation on the Canon and Feudal Law*, in which he condemned the history of aristocratic and clerical power as a history of "civil and ecclesiastical tyranny."

The rational view of society also promoted confidence in reform. By describing institutions and laws as the product of past decisions, rationalists expressed confidence in the human ability to change those decisions and reform their society. Such confidence was evident in the writings of Thomas Paine. In *Common Sense*, published in January 1776, Paine

characterized the long-established institution of monarchy as merely a form of tyranny. He thus sought to convince Americans to reform their politics not simply by declaring independence, which they did in July 1776, but also by creating a new kind of government based on rights rather than kings.

Rationalists expressed a confidence in human ability both in their religion and their politics. By the early nineteenth century, religious rationalism developed into Unitarianism. Unitarians were optimistic about human nature and encouraged individuals to use reason and moral sense rather than traditional doctrines as guides to individual and social life. Unitarians thus sought to replace the traditional Christian doctrine of the Trinity—God as Father, Son, and Holy Spirit—with a "united" or indivisible notion of God, which they viewed as more rational. Unitarianism was particularly influential among the merchant classes of Boston. The leading Boston Unitarian was William Ellery Channing (1780–1842). In 1819 Channing published *Unitarian Christianity*, in which he expressed many essential features of rationalism. He emphasized the human ability to use the free and rational faculties of human nature for moral self-improvement and social reform.

RECREATION, SPORTS, AND GAMES By 1750 sport and recreation had become an important part of everyday life in colonial America. The settlers who came to North America brought with them the love of games and amusements that characterized "Merrie Olde England," but recreation had to give way to the creation of a new society in an intimidating and dangerous environment. Early on in both the

Massachusetts Bay Colony and Jamestown, leaders felt compelled to “suffer no Idle persons” and to adopt laws “in detestation of idleness.” During the early decades of settlement, strict proscriptions against dancing, bowling, dice and cards, and the playing of games of ball were imposed, although enforcement was sporadic. As the colonies developed stable economic and social foundations, however, such prohibitions broke down and colonists of all classes engaged in a wide range of games and amusements.

By the mid-1700s distinctive regional patterns for individual and organized sport had taken root. Attempts to enforce seventeenth-century laws prohibiting popular leisure activities had long since ended. Interest in sports grew with rising income levels and a growing colonial economy that made leisure activities more attractive. To their credit the Pu-

ritans in Massachusetts and Connecticut had sought, with varying degrees of success, to outlaw “butcherly sports” like cockfighting and animal baiting, although it has been said that they banned them not so much because of the sufferings of animals but the pleasure the practice gave spectators. Such prohibitions grew out of the essential work ethic of Calvinism: games might provide amusement, but they detracted from the labor that had to be accomplished in field and shop. Nonetheless, the erosion of theocratic control meant that New Englanders increasingly enjoyed their dancing, cards, and dice, even an occasional horse race. Children were encouraged to engage in vigorous activities, especially hunting and fishing for the boys. Young males also played a ball and stick game of “rounders,” the precursor to baseball, and “foot-ball,” which was somewhat akin to modern soccer and rugby. Swimming was a popular

summer pastime, as was ice skating in winter. Girls were generally cautioned against vigorous exercise after reaching puberty and encouraged to prepare for early marriage by playing with dolls and learning from their mothers the skills of housekeeping and cooking. By the eve of the Revolution, New Englanders regularly participated in dancing and parlor games, challenging traditional Puritan values. In the mid-1750s the young Boston lawyer John Adams found such dalliances disconcerting but inevitable: "Let others waste their bloom of life at the card or billiards table among rakes and fools," he grumbled. Nor did he appreciate the popular pastime of dancing: "I never knew a dancer good for anything else."

In the middle colonies the Dutch Calvinist and Quaker influences initially put a damper on exuberant play, but later people enjoyed whist, croquet, tennis, lawn bowling, and badminton, even a rudimentary game played with "gouff sticks." In both

New England and the middle colonies, taverns served as a center for organized events, their owners arranging horse races, cockfights, wrestling matches, and bowling contests to attract customers. The taverns also were the natural home for ongoing games of checkers, dice, darts, shuffleboard, and cards, serving as precursors of the organized men's athletic clubs that would appear in the mid-nineteenth century. The increased number of laws passed during the early eighteenth century in New England prohibiting popular recreations suggests that more people were engaging in these activities more often.

As the Calvinist leadership valiantly but vainly sought to focus its people on a life of solemn industriousness, conversely the dominant Anglican culture in the Tidewater encouraged the playing of games. From the earliest days of settlement, members of the southern aristocracy consciously sought to emulate the landed aristocracy of England, where

life revolved around horses, hunting, drinking, and gambling. The slave-owning classes of Maryland and Virginia felt compelled to work hard at their play because their slaves did the arduous work. Women supervised the household and went on continuous rounds of visiting, card parties, balls, and banquets; men oversaw work in the tobacco fields and enjoyed gambling (often high stakes) at cards, dice, backgammon, cockfights, lawn bowling, and especially horse races.

Quality horses were central to the lives of the slave-owning class. Ownership of a spirited and elegant horse in colonial America was the equivalent of possession of a sleek automobile in the twentieth century—it set a gentleman apart. In emulation of the British country gentry, the southern male aristocrat relished riding to the hounds in pursuit of a frightened fox. George Washington was proud of his stable of fast horses and his pack of trained hounds, and he imported the best hunting firearms from England along with buckskin riding breeches and brilliantly colored riding frocks. His diaries report frequent forays for “ducking” and fox hunting. During the first two months of 1769, for example, he rode to the hounds no less than fifteen times, and he enjoyed the many balls, receptions, and banquets that he attended in Alexandria, Williamsburg, and Annapolis. Thomas Jefferson equally enjoyed the life of a gentleman slave owner: “I was often thrown into the society of horse-racers, card-players, fox hunters,” he once wrote approvingly. His advice to a friend on the perfect life was, “Get a pair of keen horses, practice the law in the same courts, and drive about to all the dances in the county together.” That Virginia common law included a code for the conduct of races and the settling of wagers afterward attests to their centrality in the life of colonial Virginia. After the American Revolution the first thoroughbred horses of Arabian origin were imported from England, and urban newspapers would report as early as 1820 on major races conducted at enclosed tracks in New York and Virginia.

Lower-class whites in the South pursued their own games, largely unfettered by the religious constraints of the northern colonies. At small roadside taverns they enjoyed food and plenty of drink, quoits, cards, dice, and shuffleboard. Tavern owners attracted business by holding wrestling matches and bare-knuckle fights, cockfights, and dog baitings. Similarly, in the middle and northern colonies during the eighteenth century people enjoyed drinking and wagering at table games in taverns. One popular entertainment was “gander pulling,” at which a tavern

owner would tie a poor goose to a tree limb, its head slathered in grease, and patrons, fueled by hearty drink, rode past on their horses in an attempt to pull off the squawking bird’s head. The winner got to take the goose home for dinner.

On the eve of the American Revolution, sporting events remained informal and local, with little resemblance to the heavily organized and regulated amateur and professional sporting activities of today. Except for firearms, most equipment was handmade, and rules were created locally. Many contests—bare-knuckle fights, foot races, shooting contests—often occurred spontaneously as a means to resolve disputes but also provided amusement for onlookers. In a predominantly rural society, work naturally melded with play. The average citizen found amusement in corn huskings, quilting bees, and community harvests, frequently with music and dancing. Local fairs often featured demonstrations of strength and agility necessary in everyday life—wrestling, target shooting, plowing contests, horsemanship, wood cutting, log rolling. Often the distinction between work and play disappeared entirely as community activities like a barn raising included socialization, demonstration of carpentry skills, and physical prowess. Hunting and fishing required special skills and merged the worlds of work and play until they were indistinguishable.

The Revolutionary era put a damper on popular sport and recreational activities. Opposition to colonial rule from abroad inspired attacks on members of the native privileged class, who were closely associated with the sporting life. Thus horse racing virtually ceased after the First Continental Congress passed legislation urging the states to “discountenance and discourage every species of extravagance and dissipation, especially all horse-racing, and all kinds of gambling, cockfighting, exhibitions of shows, plays, and other expensive diversions and amusements.” Several state legislatures enacted similar legislation, and informal Revolutionary groups, such as the Sons of Liberty, served as extralegal enforcers of these prohibitions. The ardent revolutionary Sam Adams urged that each of the thirteen states seek to become a “Christian Sparta.” This zealous republican Revolutionary spirit spent itself by the late 1780s, after which the American people comfortably resumed their public pursuit of amusement.

The end of the War for Independence unleashed a heavy migration into the trans-Appalachian frontier. There popular recreations, such as target shooting, often revolved around hunting. Other activities, especially wrestling, emphasized physical strength.

The peculiar phenomenon of “rough-and-tumble” developed in western Virginia, Kentucky, and Tennessee. A particularly violent form of human combat, it was part wrestling, part fisticuffs, part pure mayhem that included kicking, clawing, and gouging. Tearing off body parts—testicles in particular—was a primary objective, although the ultimate victory occurred when an adversary’s eyeball was extracted. To that end, local champions grew their fingernails long and filed them to a sharp point. These gruesome contests were sometimes scheduled at shooting matches, fairs, and by entrepreneurial tavern owners, but most often they simply grew out of a dispute between two hot-blooded young men who saw their honor as at stake and sought to gain “respect.” Spectators joined in the fun, naturally betting on the outcome. Visitors to the old Southwest long after the Civil War reported observing surprising numbers of aging men with badly scarred faces and empty eye sockets.

Following the War of 1812 the growing tide of modernism altered popular recreations. By 1830 machine technology, steam power, and major innovations in transportation had led to factory manufacturing and a new urban environment. The emerging corporate economy influenced the games Americans played. Local and regional sports organizations were formed to establish standards of play. The time when sporting events were spontaneous extensions of the rigors of daily life and labor would be replaced by structure, bureaucratic organization, written rules, and formal records. A wealthy gentleman no longer rode his own prize quarter horse in an informal sprint for glory, but instead owned a thoroughbred ridden by a professional jockey wearing attire specifically prescribed by the Jockey Club of America. Newspapers and magazines began to provide national coverage of horse racing and other sporting events, encouraging the standardization of rules, methods for setting betting odds, and the keeping of records.

By 1820 the indigenous middle-American sport of harness racing emerged. It was first reported in New York City in 1803. Men gravitated after work to the five-mile graveled stretch of Third Avenue to show off their family horse and buggy. The animals were of common stock, not the fancy thoroughbreds of the elitist Jockey Club set. Informal races often ended at one of the many taverns along the thoroughfare. By the 1820s this “roadster” phenomenon had given way to oval tracks for “trotters” where organized competition was scheduled. The new sport of harness racing quickly spread; by the 1830s sever-

al race tracks for trotters and pacers had been opened in the West and South. Harness racing remained a sport of the middle class, becoming a constant at county fairs, an American tradition that continues to this day.

Not only horses attracted public attention. In Boston, New York, Baltimore, and Philadelphia, rowing clubs were formed to sponsor various forms of small craft racing as well as to provide exercise for the desk-bound, urban middle-class male. Long-distance foot racing—popularly known as “pedestrianism”—was also the rage. In 1835 a twenty-four-year-old Connecticut farmer, Henry Stannard, thrilled the nation when he won \$1,000 put up by New York’s leading sportsman, John Cox Stevens, by finishing ten miles in less than the prescribed sixty minutes; Stannard beat the clock by just twelve seconds.

By 1830 sport in America had thus begun to make a grand transition from an emphasis on localism and spontaneity to standardization, routinization, and organization. By 1845 the simple informal game of rounders played by youngsters in colonial times had been transformed into the formal game of baseball—complete with written rules, an umpire dressed in judicial black, and manufactured equipment—played before cheering spectators by grown men wearing distinctive uniforms. Within another decade the “New York City Game” had become professionalized with top players now being paid by team owners who charged spectators admission to see the action.

REFINEMENT AND GENTILITY In the eighteenth century, “refinement” and “gentility” were used interchangeably to refer to the inner qualities of sensibility, taste, and virtue and their outward manifestation in the kinetics of the body, dress, conversation, and manners. Men and women demonstrated their refinement not only in their persons, but through the built environment, religion, and literary culture. Although refinement was often thought to be innate and to vary enormously among individuals, most commentators agreed that education, exposure to other refined persons, and rigorous self-scrutiny could enhance one’s capacity for it. The culture of refinement simultaneously excluded the vulgar, invited the participation of anyone who possessed a modicum of gentility, and then ranked the participants according to their performance. This combination of hierarchy, inclusiveness, and competition was well suited to the social and economic aspirations of many Anglo-Americans. As those aspirations changed, so too did the cultures of refinement and gentility.

EIGHTEENTH-CENTURY GENTILITY

Eighteenth-century standards for gentility owed much to British conduct manuals and didactic novels, which derived from the manners that distinguished European court society. These books emphasized the salience of social rank, control over one’s body, and regard for the feelings of others. They also encouraged the performative dimensions of gentility by urging readers to imagine how they appeared to others and by focusing on sociability as the litmus test of refinement. In theory, gentility drew sharp distinctions between the rude masses and the polite few, most of whom had been born to their station. But in practice the boundaries were more porous than didactic literature allowed. And conduct manuals themselves held out the promise that refinement—or at least its outward manifestations—might be acquired. Accordingly, readers devoured the advice dispensed in *The Spectator*, a literary magazine; Samuel Richardson’s *Sir Charles Grandison* (1753–1754), a novel whose hero is an ideal eighteenth-century gentleman; and especially Lord Chesterfield’s *Letters to His Son* (1774), which portrays a social realm of ideal conduct and deportment. By the mid-eighteenth century, Anglo-Americans of the middling and better classes had integrated much of this advice into daily life: They championed deference and avoided the appearance of overt social climbing; they monitored their table manners, posture, and penmanship; and they read not only for their own

edification, but to enrich their conversation with other refined individuals. They created new spaces like parlors and formal gardens to serve as settings for polite leisure. This concern with refinement extended beyond the secular world, prompting Anglo-Americans to embellish their churches with paintings and draperies. Not coincidentally, the spread of gentility intersected with the eighteenth-century consumer revolution, which made the props of refinement—mirrors, tea sets, books—available to growing numbers of Anglo-Americans.

REPUBLICAN REFINEMENT

During and after the Revolution, when manners and ideals derived from aristocratic courts became suspect, Anglo-Americans creatively revised the meaning of refinement to correspond with the values and practices demanded by a republic. Historians disagree about the broader implications of this process. Some, like Richard Bushman, suggest that the aristocratic origins of refinement presented persistent, vexing contradictions for Americans bent on establishing a republic. Others, including C. Dallett Hemphill, argue that men and women harnessed older codes of conduct to the aspirations of a more fluid society, partly by extending the promise of refinement to growing segments of the population and partly by replacing idealized deferential social relationships with egalitarian ones.

In the wake of the Revolution, Anglo-Americans expressed new anxieties about excessive refinement, associating it with aristocratic pretense and decadent luxury. But Americans never abandoned “refinement” and “gentility” as ideals. Instead, they infused them with republican meaning. In effect, Americans displaced the potential dangers of gentility onto others: the pretensions and vices of European aristocrats and avaricious elites closer to home served as foils for a distinctly American, supremely virtuous refinement. Republican refinement demanded taste, simplicity, and sincerity and manifested itself in what Jay Fleigelman called “natural theatricality”—the painstaking orchestration of posture, facial expression, and voice so to appear natural and unaffected. Mastery of these codes of behavior took on new, explicitly political significance. Manners were no longer simply an index to an individual’s character. They were the social glue that bound citizens together, ensuring that Americans avoided both affectation and servility.

The material world also registered this republican refinement. Political leaders dressed down, abandoning bright colors and exuberant trimmings in

favor of the somber colors and plain style depicted in Gilbert Stuart's famous portraits of George Washington and Thomas Jefferson. Neoclassical architecture and design and Empire dress, which recalled the ancient republics, allowed elite and middling Americans to partake of fashion, novelty, and virtuous simplicity all at the same time. Never mind that these styles were wildly popular on both sides of the Atlantic; Americans read them as particularly suited to and evocative of the new nation.

DEMOCRATIZATION OF REFINEMENT?

The first decades of the nineteenth century saw both the democratization of refinement among the middle class and new efforts to exclude members of the working class and African Americans from the ranks of the genteel. Growing numbers of conduct manuals made the increasingly arcane rules for genteel behavior accessible to growing numbers of readers, helping them to negotiate the social encounters that accompanied geographic and social mobility. Refinement extended beyond cosmopolitan centers. Members of the rural middle class, though careful to distinguish themselves from "aristocratic" urban excess, began to incorporate the props and rituals of refinement into domestic life, sociability, and self-presentation. As refinement became the special preserve of the middle class, it became infused with domestic values. Parlors, for example, became sites for family gatherings rather than worldly sociability. And middle-class women gained new visibility as exemplars of domestic gentility. Although Evangelicals cast genteel pretense as a distraction from Christian duty, by the end of the 1820s even Methodists and Baptists sanctioned politeness. At the same time, social arbiters stridently condemned attempts by the working class and African Americans to appropriate refinement for themselves. Conduct manuals drew sharp distinctions between the genteel and the lowly, and clearly advocated servility from the latter. In *Life in Philadelphia* (1828–1829), the caricaturist Edward W. Clay viciously lampooned the dress, manners, and sociability of upwardly mobile blacks. Such evidence indicates the challenges that confronted the hegemony of an explicitly white, middle-class culture of refinement and the urgency with which that culture was defended.

REFORM, SOCIAL The great social reform movements in U.S. history took off in the 1790s. Movements for the abolition of slavery, temperance, education, assistance to poor people, voting rights for women, civil rights for African Americans, and land rights for Native Americans galvanized large numbers of women and men to their causes and demanded responses from elites, government officials, and businessmen alike. Though major northern cities such as New York, Boston, and Philadelphia were home to hundreds of organizations, news of reform activities circulated widely in newspapers and in person by activists, ministers, and others who traveled. From Akron, Ohio, to Baltimore, Maryland, from Rochester, New York, to Fredericksburg, Virginia, organizations of various structures and causes sprang up in towns everywhere—few were untouched by the prophetic zeal of those devoted to change.

Such well-organized, financed, and sustained efforts to alleviate pain, regulate behavior, attain rights, or in some other way alter the situation of a specific group of people were largely absent prior to the Revolutionary era. In the early eighteenth century, few people with the capacity to bring about change perceived poverty, slavery, crime, or drinking as social problems. The rigidly hierarchical social structure enabled the community elite to rest assured that poor people were merely needy, not threatening. Few organizations or social structures existed to assist people in their times of need. Tax dollars were the source of charity money in most locales, and it was offered on an individual basis to those in need, regardless of cause. Fundamentally changing social re-

lations and structures was not on the agenda for much of the eighteenth century. Opposition to slavery on moral grounds grew among some religious groups before the Revolution. Quakers John Woolman and Anthony Benezet vehemently spoke out against slavery in the 1760s. Methodist leaders such as John Wesley also attacked slavery. The Declaration of Independence's promise "that all men are created equal, that they are endowed by their creator with certain unalienable rights, that among these are life, liberty, and the pursuit of happiness," stimulated political opposition to slavery. During the Revolution abolitionist societies emerged in the North and the Upper South. In the North these societies helped lead the passage of gradual abolition acts in Pennsylvania and later New York and New Jersey.

THE ENLIGHTENMENT

The fact that many social reform organizations began in the post-Revolutionary, newly formed nation of the 1790s is no coincidence. Historians point to the collusion of two great forces: the Enlightenment and the Great Awakening. Many speak of the Enlightenment as the "age of reason," or as philosopher Immanuel Kant (1724–1804) described it, a time characterized by the pursuit of truth. Rather than restrict the definition of the Enlightenment project to a handful of well-known European philosophers who published and spoke on such issues, many historians have a wider view that encompasses all who engaged in questioning the received teachings of religion, and particularly the focus on the afterlife as the driving force for human behavior. In an enlightened world, human progress would be achieved through advances in science, medicine, culture, education, technology, and even politics.

THE GREAT AWAKENING

The Enlightenment empowered people to seek truth—and question the order of things. But it was the other powerful force of the eighteenth century—the Great Awakening—that inspired mass numbers of Protestants to do so. One of the most famous revivalists was English preacher George Whitefield, who toured America in 1739 and 1740. The staged revivals drew thousands and Whitefield, like Jonathan Edwards before him and others after him, appealed to their emotions, emphasized the value of spiritual rebirth and personal salvation, and downplayed the importance of religious doctrine. By encouraging people to reject the formal teachings of the churches and by re-centering the afterlife as the focus of human existence, the teachings of the

Awakening appear to have challenged those of the Enlightenment. In reality, however, the Great Awakening may have furthered some beliefs at the heart of the Enlightenment—the values of human reason and of learning by experience. The growth of colleges and spread of education throughout the country was largely a result of Old Light Protestants who rejected the teachings of the New Light evangelical preachers and sought to further integrate knowledge and faith.

REPUBLICANISM AND REFORM

Just prior to the Revolution, the first movement to abolish slavery in the United States was initiated by the Quakers in Philadelphia, who made the buying or transfer of slaves grounds for disownment by the Quaker community in 1774. They formed the Society for the Relief of Free Negroes Unlawfully Held in Bondage in 1775, though it was soon disrupted by the Revolutionary War. Philadelphians concerned for the plight of prisoners organized in 1776 as the Philadelphia Society for Assisting Distressed Prisoners, but their efforts too were thwarted by the war. Like most of the first benevolent and reform associations, they were organized by men and restricted membership to men.

The Declaration of Independence of 1776 was followed by nearly a decade of war and even more years of political uncertainty and economic instability. Debates over the possible structure and function of a national government in the newly independent colonies resulted in the triumph of the political theory of republicanism. Republican theorists knew that the political, social, cultural, and familial spheres were not isolated units. In calling for the reform of human institutions, they instilled a responsibility for the success of the new nation in everyone. It turned out to be good timing—the period from the 1780s to the 1820s was one of great change and uncertainty. The post-Revolutionary era ushered in decades of economic, political, and social upheaval, with which many women and men—particularly middle- and upper-class white Protestants—took it upon themselves to deal. Responsibility for the fate and character of the nation and the manifestation of republican values seemed up for grabs—or at least up for the shaping by passionate individuals with a range of means and motives to do so.

SLAVERY

The most pressing social issues to the first generation of post-Revolutionary reformers were poverty, slavery, and education. The antislavery cause picked up momentum after the Revolution. Some saw the hy-

pocrisy of allowing African Americans to fight for the Revolution while denying them the right of liberty promised by the Declaration of Independence, not to mention their apparent exclusion from the phrase, "All men are created equal." Individuals spoke against the institution of slavery, from Abigail Adams to John Jay, the first chief justice of the U.S. Supreme Court. Organizations formed throughout the Northeast, namely the Pennsylvania Abolition Society (1784), the New York Manumission Society (1785) and the New Jersey Abolition Society (1793). Having already taken a position against the enslavement of Africans in their own community, Quakers turned to the larger society.

Sidestepping the issue of slavery, groups formed to determine the future of Africans in America who were freed from enslavement. The American Colonization Society (ACS), formed in 1816, advocated the removal of blacks to Africa. The ACS even purchased land, named it Liberia, and sent freed slaves there beginning in 1822. The colonization movement was spearheaded by white men, particularly in the North. Antislavery groups, however, fought against colonization efforts. Abolitionist women, black and white, including members of the Philadelphia Female Anti-Slavery Society (1833), allied with the free black community in opposition to colonization. These more radical abolitionists wanted freedom and equality for African Americans in the United States, the land where most of them were born. Exile to Africa seemed like a racist compromise and an unfair proposition for people who had labored without reaping its benefits for generations in the American colonies.

The most significant difference between southern and northern organizations was the absence of explicitly antislavery associations run by women in the South. The Virginia Abolition Society formed in Richmond (1790) and Quakers spearheaded abolition activism in North Carolina. Such activism persisted in the face of great local resistance. Southern women were more likely to participate in the less radical female colonization societies that organized petitions in favor of removing African Americans to Liberia premising their arguments on the racist notion of protecting white women from blacks. Southern women's organizations were also less likely to challenge class inequalities among women than their northern counterparts. Providing education for those Africans who did move to Liberia, however, appeared to be a less politically charged issue, and both northern and southern organizations worked for this end.

POVERTY

While men spearheaded major reform organizations for abolition, colonization, prison reform, temperance, and education, the 1790s were a critical decade in the establishment of permanent women's organizations, laying the groundwork for future generations to collectively mobilize for political, social, and religious purposes. The promotion of radical social reform was on the agenda of very few of the new organizations, which can be classified as religious, benevolent, charitable, mutual aid, and reform projects. Leaders of women's reform organizations combined the traditional female role of concern for the health and well-being of others with the evangelical zeal that defined Protestantism in the early decades of the nineteenth century. Nowhere is this more apparent than in efforts to help poor people.

From the 1780s until around 1815, Protestants largely viewed the poor with sympathy and as deserving of assistance. Dozens of benevolent organizations were formed as people directed their religious convictions to relieving the plight of the poor. They included the Society for the Relief of Poor Widows with Small Children (1797) and the Orphan Asylum Society (1806), both in New York; the Boston Female Asylum (1800) and the Fragment Society (1812), also in Boston; and the Female Society for the Relief of the Distressed (1795) in Philadelphia. While some individuals may have taken aim at the structures that perpetuated poverty, most organizations were satisfied to raise funds; distribute resources such as food, clothing, and supplies; and visit homes of the sick, widowed, and disabled. This work was perceived as an outgrowth of Christian piety until an economic downturn and rising numbers of poor people and immigrants to the cities led many to reconsider the purpose of poor relief and the cause of poverty. The 1820s marked a turn away from concern for the material needs of the poor toward the belief that a spiritual bankruptcy often led to a financial one.

Women's benevolent and reform associations were less common in the South than in the North, in part because southern ministers were less supportive of benevolence work in the name of religion. The wealthy women of Charleston, South Carolina, and Wilmington, North Carolina, however, did form several organizations, and one of them became a pioneer in the area of public education. Incorporated in 1817, the Wilmington Female Benevolent Society aimed to educate "poor children and destitute orphans" and apparently was quite successful over the years.

PRISONS

In the aftermath of the Revolution, state and community leaders in many states relished the opportunity to revise the common laws and what they believed to be an outdated penal code. Influenced by the writings of Cesare Beccaria, the Italian author of *On Crimes and Punishments* (1764), many became convinced that crime was the result of an ineffective punishment scheme, writing, "that a punishment may not be an act of violence, of one, or of many against a private member of society, it should be public, immediate and necessary; the least possible in the case given; proportioned to the crime, and determined by the laws." An Englishman, John Howard, wrote a widely circulated book on prison abuses and model prison practices called *The State of the Prisons in England and Wales* (1777). Greatly influenced by both Beccaria and Howard, leading religious, scientific, and political figures in Philadelphia formed the Philadelphia Society for Alleviating the Miseries of Public Prisons in 1787 to implement a series of changes to the penal system. Similar societies formed later in Boston (Boston Prison Discipline Society, 1825) and in New York (Prison Association of New York, 1844). Prison reform organizations are one of the few social reform movements that restricted the participation of women during this period. Women were not admitted to the Philadelphia Society until the famed reformer and philanthropist Dorothea Dix was granted corresponding membership in 1844.

WOMEN AND POLITICAL POWER

Political and social reform often went hand in hand. After Washington became the nation's capital in 1800, some women had unusual access to the political sphere through their husbands, fathers, and brothers. Though they were relegated to the sidelines of official business, they were active observers in Congress and chief organizers of the social sphere in which a great amount of politicking was done. Elite women with ties to powerful men were not denied access to the public political sphere in a way that is commonly thought for this period. The public sphere that emerged in the coffeehouses, reform societies, and reading libraries of the new republic was a predominantly male phenomenon. Women were sometimes able to secure legislative votes they desired by networking with female family members of congressmen. Occasionally, they applied their energies and skills to benevolent associations, such as the Washington Female Orphan Asylum, which was started in 1815 by Marcia Burnes Van Ness, with significant help from Dolley Madison. Unlike similar organizations in other cities, their organization re-

ceived extensive publicity for its services and the organizers held their meetings in the House chamber in the Capitol building.

TEMPERANCE

The temperance movement was at first an initiative of a small group of ministers to regulate the drinking of working-class men. Founded by men in 1826, the American Temperance Society began to characterize drinking as representative of and responsible for all that was decaying in American life, specifically deference by workers to employers, by women and children to men, and by everyone to ministers. Images of abused and neglected wives were widely circulated to bolster the arguments for temperance, playing on fears that were all too justified for some women. Leaders recruited women to the cause as the organization blossomed to about 100,000 members by 1836. In later years, women became prominent leaders of their own temperance organizations, which would lead some to the more radical antislavery and women's rights movements.

REGULATORS The North Carolina Regulation was a farmers' reform movement in the pre-Revolutionary period. Between 1766 and 1771, North Carolina farmers sought to combat corruption among local officials and to increase their participation in the political system. The Regulators lived in the Piedmont, the area west of the coastal plain and east of the mountains. This region had first been settled by Europeans starting in the 1740s as part of a vast interior migration from the middle colonies to the southern Piedmont. Rising land prices in the middle colonies, dangerous warfare with Indians, and a desire to live life according to their own dictates drove colonists into the southern backcountry, where the native population had shrunk to almost nothing as a result of epidemics, warfare, and migration further west.

INSURGENCY IN NORTH CAROLINA

Eager for cheap land, religious freedom, and economic security, newcomers were deeply disappointed to find that their dreams were threatened by corrupt local officials eager to enrich themselves. Such officials engrossed the best land and drove up land prices; failed to pass people's tax monies on to the provincial treasury; and made government expensive by charging higher fees than the law allowed. Inspired in part by the protests against the Stamp Act in 1765, Piedmont farmers first organized in Orange County in 1766, led by a Quaker named Herman Husband. Husband's powerful ideas about social justice combined religious radicalism with the country or real Whig political philosophy increasingly adopted by the Patriot movement. In 1768 farmers joined under the name of "Regulators" to indicate that they intended to "regulate" and reform government abuse. The term "regulator" had first been used in this way in England in 1655 and had since entered into common usage.

Regulators pursued both legal and extralegal means to reform their local government. They tried to set up meetings with local officials, who rebuffed them. They repeatedly petitioned the governor and assembly, hoping to interest them in their cause, with little success. They brought suits against extortionate officials but could not get convictions. When such legal means did not bring results, Regulators resorted to illegal actions: they refused to pay their taxes; repossessed property seized for public sale to satisfy debts and taxes; disrupted court proceedings; and tried officials at people's courts. In September 1768 Governor William Tryon and his militia con-

fronted a large number of Regulators outside of Hillsborough, but violence was avoided. Two years later, a large group of Regulators brought proceedings at the superior court in Hillsborough to a halt; beat up a number of lawyers, merchants, and officials; and destroyed the home of the most hated Piedmont official, Edmund Fanning. Government officials retaliated swiftly and powerfully.

Battle of Alamance Creek. When the assembly opened later that fall Herman Husband, who had been elected a legislator for Orange County in 1769, was accused of libel, expelled from the assembly, and jailed. Next, the assemblymen passed a sweeping Riot Act that, among other things, gave Governor Tryon the authority and funds he needed to raise the militia against the Regulators. On 16 May 1771, about eleven hundred militiamen, commanded by many of North Carolina's prominent Patriots—men who would soon lead North Carolina into independence—confronted upward of two thousand farmers on a field near Alamance Creek, about twenty miles from Hillsborough. In a battle that lasted less than two hours, from 17 to 20 farmers were killed along with 9 militiamen; more than 150 men on both sides were wounded. One Regulator was hanged on the spot without benefit of trial. Six more were executed on 19 June in Hillsborough after a hasty trial. After the battle, the governor and his troops undertook a punitive march through the Piedmont, forcing some six thousand men, the great majority of adult males in the area, to take the oath of allegiance to the crown. Some of the best-known Regulators fled the province, and by summer the Regulation had been suppressed.

Regulation and Revolution. Once news of the Battle of Alamance spread, sympathy for the Regulators grew outside of North Carolina. Many incipient Patriots stressed the parallels between themselves and the Regulators, who had also stood up for their right as freeborn Englishmen, had patiently tried to redress their grievances by peaceful means, and had finally been driven to war by the governor and his friends. North Carolina's leading Whigs, most of whom had opposed the Regulators, labored hard to undercut this initial impression beyond the colony. To them, there were no parallels between legitimate opposition to Britain and the Regulators' resistance to oppression by local elites. It would not be long before Patriot elites elsewhere would understand the dilemma of North Carolina leaders: how to galvanize popular support for the Patriot cause while limiting people's aspirations for independence and justice at home. In this respect, the North Carolina Regulation consti-

tutes an important and early example of the limited nature of the radicalism embodied in the independence movement. While North Carolina farmers did not secure their broadest goals in the Regulation or in the subsequent Revolution, their dreams of economic justice in an agrarian setting surfaced again and again in the South, finding its most explicit reincarnation in Populism in the 1880s and 1890s.

REGULATORS OUTSIDE NORTH CAROLINA

The terms "Regulation" and "Regulators," while most prominently associated with the North Carolina farmers' movement, were used in various other struggles in Revolutionary America, such as in South Carolina, Pennsylvania, and Massachusetts. While North Carolina farmers intended to create a local government respectful of the law, South Carolina backcountry elites took the law in their own hands between 1767 and 1769. These men called themselves Regulators, but their aims were nothing like those of their North Carolina namesakes. The South Carolina Regulation was a vigilante movement led by slave owners aimed at disciplining horse thieves, bandits, and marginal people who made their living by hunting and trading rather than by farming. Thus, rather than a movement of common people trying to make government more responsive to the people, the South Carolina Regulation consisted of elite men trying to impose their values and way of life on the rest of the population.

The Pennsylvania Regulation (usually known as the Whiskey Rebellion [1794]) and the Massachusetts Regulation (better known as Shays's Rebellion [1786–1787]) bore a close resemblance to the North Carolina Regulation. Farmers in those states protested structural economic inequality much as did their North Carolina counterparts.

RELIGION

This entry consists of three separate articles: *Overview*, *The Founders and Religion*, and *Spanish Borderlands*.

Overview

The early Republic witnessed major changes that forecast religion's exceptional vitality in America well into modern times. By 1830 the religious diversity that typified Britain's colonies in 1776 had developed into a far more expansive spiritual pluralism that became a touchstone of modern American life.

DIVERSITY OF BELIEF

From the 1740s to the Revolution, the highly variegated populations in Britain's mainland colonies exhibited confusing patterns of religious diversity, revival, and indifference. Surviving Indian groups often synthesized new customs as they merged under the impress of disease and constant British territorial expansion. For example, the Catawbas of the Carolinas mixed several different native customs with Christianity learned from missionaries in a culture they sustained largely by living away from British settlements. Slaveholders in Britain's mainland colonies suppressed most African religious customs because they feared religion as a source of slave rebellion. African burial practices survived into the next century, but none of the great national African religious systems themselves—Ashanti or Ibo, for example—resurfaced in British America.

In contrast, European Christian groups thrived in British North America. By 1770 eight Protestant denominations—Congregational, Presbyterian,

Church of England, Baptist, Quaker, German Reformed, German Lutheran, and Dutch Reformed—counted between one hundred and seven hundred congregations. Another five—Methodist, Roman Catholic, Moravian, Dunker, and Mennonite—counted between fifteen and one hundred congregations, while Jews clustered in the colonial cities and a variety of sects, such as British Rogerenes and Sandemanians, sustained worship in British America despite very small numbers.

Two-thirds of Revolutionary-era congregations had been formed after 1700, demonstrating how thoroughly eighteenth-century migration from Scotland, Wales, and continental Europe fractured the homogeneity of English Protestantism in British America. The variety of religious expression among Europeans also revealed the weakness of the traditional state church tradition in the colonies. Nine of the thirteen mainland colonies enacted some form of formal church establishment—Congregationalism in Massachusetts, New Hampshire, and Connecticut, and the Church of England in New York, Maryland, Virginia, North and South Carolina, and Georgia. But religious dissent and diversity spread nonetheless. Varied revivals in the 1740s and 1750s—later homogenized under the label the Great Awakening—threatened established Congregationalists and the Church of England, who saw their authority questioned; another threat came from dissenting Baptists and Presbyterians, who divided over revival methods and theology. Opponents sometimes used coercion against revivalists, usually without success. When Virginia authorities attempted to suppress Baptist preaching in 1771—a sheriff and a Church of England minister caught one Baptist preacher, in the words of one witness, “by the back part of his neck, [and] beat his head against the ground, sometimes up, sometimes down”—public regard for the Church of England fell rather than rose.

Yet most colonists did not belong to any religious congregation, contrary to modern myths about a past more “religious” than the present. Only about 15 to 20 percent of British and other European colonists actually belonged to a congregation or attended services (in the year 2000, roughly 55 percent of adult Americans belonged to a religious congregation), and only the tiniest number of enslaved Africans had been converted to Christianity. This pattern actually paralleled church attendance throughout early modern Europe, where laypeople often did not attend except on the great holidays of Christmas and Easter. Laypeople were not necessarily atheists or anti-religious in either Europe or America. But they

held their religious convictions in a very general sense and reacted warily to the pronouncements and power of the state-supported clergy. The variety of European religions in America probably confirmed colonists’ spiritual standoffishness. The itinerant Church of England minister Charles Woodmason described the situation in North Carolina in 1767: “by the Variety of Taylors who would pretend to know the best fashion in which Christs Coat is to be worn[,] none will put it on.”

CONSEQUENCES OF THE REVOLUTION

The American Revolution dealt organized religion severe setbacks. Although some historians in the 1960s and 1970s argued that controversies over revival religion in the 1740s and 1750s shaped the Revolution and its rhetoric, most historians at the start of the twenty-first century agree that the Revolution focused not on religion but taxes, representation, and politics—themes confirmed throughout the Declaration of Independence. Princeton president and Presbyterian minister John Witherspoon signed the Declaration of Independence, and some other ministers backed the Revolution vigorously. But many clergymen did not. In 1775 the Presbytery of Philadelphia made it a point to note that it was “well known . . . that we have not been instrumental in inflaming the minds of the people.” Indeed, the Presbytery worried that the conflict with Britain could become a civil war “carried on with a rancour and spirit of revenge much greater than [a war] between independent states.”

The Presbyterians were not far wrong. War wreaked havoc with organized religious life in many colonies, if not all. By 1781 membership in Baptist congregations in and around Philadelphia dropped from three thousand to fourteen hundred, and easily more than half of the Church of England congregations closed, tainted because the king headed the church. Pennsylvania Patriots exiled to Virginia some Quakers who espoused pacifism. Both American and British troops sometimes burned and ransacked church buildings, and the tombstones broken off for oven hearths by British troops on Long Island produced death inscriptions baked into the soldiers’ bread. Although patriotic army chaplains likened the Revolution to “spiritual warfare,” soldiers attacked their ineffectiveness in salving the agonies of death and injury; as one soldier put it, a chaplain was “as destitute of employ . . . as a person who is dismissed from their people for the most scandalous crimes.”

Religion changed dramatically after the Revolution, as did America itself. Part of that change in-

volved a revolution in relations between religion and government. Every colony with a formally established church abandoned the practice or severely altered it. New York, Maryland, Virginia, and North and South Carolina abolished the legal privileges and tax revenues previously given to the Church of England, and while Connecticut and Massachusetts continued to support Congregational churches with tax revenues, they provided exemptions for Baptists, Quakers, Episcopalians (the new name for the Anglicans of the Church of England), and members of "any other Denomination."

Virginia's debate about disestablishment carried national implications. After Virginia disestablished the Church of England, Patrick Henry proposed a "general establishment" for Christianity that authorized Virginia's state government to determine which specific churches and ministers actually qualified and could be supported. George Washington initially supported Henry's bill as a middle ground between the old establishment and none. But Washington changed his mind, fearful that contests over supporting specific groups would "rankle, and perhaps convulse the state." When Henry's bill failed, Virginia passed Thomas Jefferson's bill "for Establishing Religious Freedom," which was guided through the legislature by James Madison in 1786. It prohibited taxation for "any religious worship, place, or ministry whatsoever" and upheld freedom of worship for all religions, not just Christianity.

The First Amendment to the federal Constitution, ratified in 1791, followed in the wake of successful disestablishments in all but Connecticut and Massachusetts. Rejecting narrow clauses that would have prohibited government support for a specific "religious doctrine" or for a national church, the Congress settled on sixteen words that spoke broadly and clearly to the religion question: "Congress shall make no law respecting an establishment of religion or prohibiting the free exercise thereof." In short, the amendment protected the free exercise of religion, not just Christianity, and it prohibited "an establishment" in broad terms, rather than merely prohibiting a single national church.

INSTITUTIONAL PROLIFERATION AND SPIRITUAL CREATIVITY

If a few Americans, such as Yale president Ezra Stiles (1727–1795), worried that the abolition of a formally sanctioned religion cut America loose from any secure moral and religious foundation, most American religious groups and leaders reversed Stiles's fears. They believed that religion arrived at voluntarily was

morally superior to religion guided by government. Indeed, the need for moral virtue in a republic only increased the need for religion, and precisely the kind of religion that now would prosper in America because government no longer determined its shape or directly or subtly formed the ways citizens expressed their faith.

The opening provided by disestablishment in the states and the strictures of the First Amendment against federal involvement in religious matters brought a near orgy of proselytizing that fueled exceptional denominational growth into the 1830s. Between the 1790s and the 1830s, a series of highly emotional revivals, sometimes called the Second Great Awakening, merged with exceptionally astute denominational organizing drives, especially among Methodists, Baptists, and Presbyterians, producing congregational growth and a rising in membership that outstripped even the vigorous population growth in the new Republic. Methodist congregations increased from fifty to three hundred, and Baptist congregations almost doubled from seventeen hundred to nearly three thousand between 1780 and 1820. In all, America's superheated religious denominations constructed more than eight thousand church buildings in the United States in the five decades after the Revolution, and the church membership rate for adults probably increased into the mid-20-percent range by 1830.

Voluntary associations that emerged most prominently from America's rapidly expanding congregations and denominations set models for American civic life. Mission, literary, temperance, education, women's rights, and abolitionist societies, such as the American Bible Society (1816), American Tract Society (1823), American Colonization Society (1816), American Sunday School Union (1824), and American Temperance Society (1826), quickly typified the American reform style. They bespoke the religious foundations of innumerable American reform movements, offered leadership opportunities for women who were denied formal posts, including ordination, within denominations, and engaged every major social issue in nineteenth-century America.

New spiritual expressions and institutions accompanied the expansion of familiar religious groups in the new Republic. Formerly enslaved Africans led by Philadelphia's Richard Allen (1760–1831) opened the Bethel African Methodist Church in 1794, which in 1816 became one of the founding congregations of the new African Methodist Episcopal Church. Together with the African Methodist Epis-

copal Zion Church and increasing numbers of Baptist congregations formed in the early national period, they constituted the major Christian denominations attracting African Americans up to the Civil War and well beyond. Methodist preachers outstripped businessmen in understanding and mastering the early Republic's local and regional markets and added a visionary enthusiasm to the mix. Methodist itinerants related their dreams about heaven and hell and conversations with Jesus to their listeners because, as Freeborn Garrettson (1752–1827) noted, “great discoveries were made to Peter, Paul, and others in their night visions.” Unordained women preachers, such as Nancy Towle (1796–1876) and Salome Lincoln (1807–1841) and the African American Jarena Lee (b. 1783), preached with an effectiveness that questioned but did not yet overturn the prohibition against women's ordination in almost all denominations except the Quakers, which alone among major Protestant groups had allowed and even fostered female preaching.

Protestant and Roman Catholic proselytizing among Indians increased and achieved some particular successes, most notably among the Cherokees of the western Carolinas and northern Georgia. Other Indians responded to new prophecies. The Seneca prophet Handsome Lake (1735–1815) offered a new teaching called the Gaiwiiyo, or Good Word, to set Indians on a new moral path. Neolin (fl. 1760–1766), a Delaware prophet, demanded that Indians reject European civilization and its products, especially alcohol. Tenskwatawa (1775–1836), the Shawnee prophet, denounced Europeans as descended from a lesser god and demanded a return to traditional native culture and the expulsion of Europeans.

In a Republic that represented the “new order of the ages,” it scarcely is surprising that reform overtook, and split, many religious groups. New England Baptists who rejected the traditional Calvinist theology of predestination formed a new denomination called Free Will Baptists. Universalists emphasized the breadth of Christian salvation, not its narrowness, and drew believers from urban and rural New England alike. Revivals that began in 1801 at Cane Ridge in Kentucky produced converts to evangelical Protestant groups, especially Methodists, Baptists, and Presbyterians. They also spawned yet more movements and denominations. Followers of Barton Stone and Thomas and Alexander Campbell, disaffected Presbyterians, sought to recover the spirit of the early Christian church, forming the Disciples of Christ in 1832. A “unitarian controversy” split several hundred New England Congregationalist

churches between 1805 and 1835 over the question of the Trinity. The argument also led to the demise of America's last state church establishments in Connecticut in 1818 and Massachusetts in 1833 as state lawmakers and lawyers reeled from the spectacle of congregants suing each other over tax revenues rather than simply worshipping together.

The new Republic's spiritual hothouse sustained prophets as fully among Europeans as among Indians. The followers of the Shaker visionary and millennialist Ann Lee, who migrated from England to New York in 1774, expanded to their greatest number in the four decades after Lee's death in 1784. Freemasonry won an enormous following among middle-class men fascinated by mystical spiritual teachings, alchemy, and alleged Egyptian secrets. Prophets and short-lived sectarian movements popped up almost everywhere. New York City witnessed two prophets in the late 1820s: Elijah the Tishbite (Elijah Pierson), an affluent merchant and evangelical reformer who sought to raise his wife from the dead, and the Prophet Matthias (Robert Matthews), who headed an authoritarian Christian commune that included Pierson as well as the African American reformer and visionary Sojourner Truth, but which ended when Matthews was charged with Pierson's murder (although he was later acquitted).

The history of New York's Joseph Smith Jr. exemplified all the themes of reform, prophecy, and renewal that invigorated religion in the early Republic. Disaffected by the competition of religions in America and sensitive to evangelical revivalism, Smith initially imbibed occult techniques to locate buried fortunes in the late 1810s. Later, Smith's visions of visits with the angel Moroni resulted in the 1830 publication of *The Book of Mormon*, which he described as a translation of hieroglyphic texts engraved on golden plates or tablets presented to him by Moroni that described God's dealings with ancient groups of people called Jaredites, Lamanites, and Nephites. Smith's writings and beliefs became the foundation for the Church of Jesus Christ of Latter-day Saints. The controversies stirred by *The Book of Mormon* and its adherents not only capped the lively assertiveness of religion in the early Republic but prefigured Protestant, Catholic, and Jewish expansion and the rise of new groups such as Spiritualists, Seventh Day Adventists, Christian Scientists, and Jehovah's Witnesses in the later nineteenth century.

The Founders and Religion

Within cultures, religion evidences a paradoxical character. It provides humans with meaning and purpose, thereby supporting social stability and maintaining the status quo. But it also offers notions of the ideal social order, thereby serving as an agent for social change. Both dynamics were at work during the American Revolution and the early Republic. Both buttressed the move towards independence, albeit in different ways.

PURITANISM AND REVOLUTION

One clear understanding of religion's links to order and stability emerged in the New England Puritan colonies. Inherent in the Puritan worldview was the sense of deference that prevailed in the British social order. Just as ordinary folk should defer to those of higher rank, especially the monarch, all human life should demonstrate deference to God. Influenced by John Calvin (1509–1564), Puritans believed that

those God elected to salvation should exercise political power; God could entrust only to them oversight of society. Magistrates became God's agents to maintain order; rebellion against them was thus rebellion against God.

By the mid-eighteenth century, countervailing forces complicated this sense of deference and order. The evangelical revivals of the Great Awakening represented one such force. Preachers such as Jonathan Edwards (1703–1758) and George Whitefield (1714–1770), both Calvinists, unwittingly stressed the equality of all humans as sinners separated from God. Likewise, election to salvation evinced an equality rooted in divine grace. A commitment to social order remained, but with a difference. Deference was not automatic, as in the hierarchy sustaining monarchy, but due those who acknowledged their sin and testified to God's work in their lives.

Puritanism's evangelical dimension also nurtured the challenge to deference accompanying independence. Advocates of breaking with king and Parliament included many clergy. But the individualism of personal conversion resonated with larger democratic impulses, thus undermining Puritanism's Calvinist base and spurring rapid growth of more democratic denominations (for example, Baptists and Methodists) in the early Republic.

The second force centered on abuse of power. Even Puritans displeased by evangelical, emotion-laden revivals believed all power had limits. When power became tyranny, rulers forfeited legitimacy. Allegiance to God superseded devotion to despotic power that rendered true worship impossible. Commitment to social order could require overthrow of demonic power. When leaders likened parliamentary tax policy to enslavement, the king became a symbol of oppression and revolution a sacred duty. Such thinking influenced founders like Samuel Adams, John Adams, and James Otis, though they were more inclined to emergent Unitarianism than to traditional Congregationalism.

REFORMED REALISM

Support for order alongside support for rebellion against Britain found a different basis in the Reformed Protestantism gaining ground in the middle colonies. The beliefs of New Jersey's John Witherspoon, the sole clergyman signing the Declaration of Independence, illustrate both aspects. Witherspoon, Scots by birth, espoused the evangelical Calvinism associated with middle colonies Presbyterians, but he tempered that with the philosophy called Scottish common-sense realism.

This heritage meant Witherspoon appreciated the primacy of personal religious experience that gave authority to individuals rather than institutions. He therefore believed that local congregations and not denominational authorities had absolute authority to choose pastors. He transferred this belief to the political sector when he endorsed American independence. Belief and common sense called for social change.

Yet when Witherspoon helped Presbyterians organize a denomination in the new Republic, he worked to secure assent to traditional doctrine and consent to a single church order and liturgy. Here Witherspoon's belief and use of common sense called for order and maintenance of the status quo.

ENLIGHTENMENT INFLUENCES

The paradoxical dynamic of sustaining social order while planting seeds of social change likewise influenced those founders more directly affected by Enlightenment rationalism. Many, but not all, came from the southern colonies. There, legal establishment of the Church of England epitomized institutional ties between religious order and political stability, at least until independence. During the Revolution, many priests serving these churches remained loyal to the crown and took refuge in Canada, the Caribbean, or the mother country. Although their departure left Anglicanism in disarray, neither religious nor social disorder followed. Rather, a vibrant evangelicalism stood poised to fill the void left by the demise of colonial Anglicanism.

Enlightenment rationalism bolstered a different type of social change than had Puritanism or Reformed realism. Precepts of reason caused many, such as Benjamin Franklin (a nominal Presbyterian) and Thomas Jefferson (a nominal Anglican), to reject much traditional doctrine as superstition. They thought religious beliefs based on revelation or miracle lacked rational grounding and were therefore unreliable.

If orthodox belief was suspect, so was any legal tie between a particular denomination and the state. Although James Madison, his friend and collaborator, secured adoption of Jefferson's statute establishing religious freedom in Virginia in 1786, Jefferson embodied the Age of Reason's dislike of religious establishments and support for religious liberty. An agent for social change, rational religion helped erect what Jefferson later called a "wall of separation" between church and state.

At the same time, the religious style of Enlightenment advocates buttressed social stability in its

conviction that religion, even when superstition, provided moral codes essential to public order. In his famous Farewell Address in 1796, George Washington, another nominal Anglican who served as a parish vestryman, argued that without religion, society lacked the moral foundation essential for harmony and stability. Pennsylvania's Benjamin Franklin remarked in his *Autobiography* that religion's value lay in making persons good citizens, not devotees of a particular denomination.

This commitment to morality had other implications for the public square. Some analysts brand founders influenced by rationalism as Deists because they jettisoned traditional views other than simple belief in a providential, creator God who left humanity to its own devices. Others regard them almost as twenty-first-century fundamentalists because they saw moral values as basic to society and were at least nominal church members. Neither view is entirely accurate. Washington, Jefferson, Franklin, and others of like mind believed religion and common life connected in a way similar to what their French contemporary Jean-Jacques Rousseau called civil religion. That is, they saw a Divine Providence undergirding the nation's destiny that was most obvious when citizens followed a common-sense moral code sustained by religious belief and practice. Differences of doctrine remained but counted for little. What mattered was moral living so social stability could prevail.

In the age of American independence, forces as diverse as Puritanism, Reformed realism, and Enlightenment rationalism reveal the complex ways religion maintains order. They also demonstrate how religion at the same time can promote social change.

Spanish Borderlands

In the early 1500s Spain had nominal claim over a region that stretched from present-day Florida to California. Franciscan missions in New Mexico were first established in 1598 but were pursued inadequately. By 1775 the area had been made part of the Diocese of Durango, and twenty friars administered to Spanish colonists and a dwindling native population. Another segment of borderland territory, later called Arizona, benefited from work begun in 1687 by Eusebio Francisco Kino, S.J. Work continued among his successors until 1767, when Jesuits were suppressed within Spanish jurisdictions.

In 1769 authorities sent Don Gaspar de Portolá northward into California to counteract further Rus-

sian movement into the area. Junípero Serra, a Franciscan missionary of wide experience, accompanied this expedition. Under his determined, energetic guidance, nine missions were built along the Pacific Coast: San Diego (1769), San Carlos Borromeo (1770), San Antonio (1771), San Gabriel (1771), San Luis Obispo (1772), San Francisco de Assisi (1776), San Juan Capistrano (1776), Santa Clara (1777), and San Buenaventura (1782). Serra's records indicate that he baptized more than six thousand Indians and confirmed more than five thousand of them. He was convinced that the mission-colony plan of churches, farms, industry, and permanent dwellings was the best means of converting natives to Christianity and of improving their chances of survival in a European-dominated society.

Nine additional missions were founded between 1786 (Santa Barbara) and 1798 (San Luis Rey) under the administration of Serra's successor, Fermín Francisco de Lasuén. Three more were added in the early 1800s, making a total of twenty-one establishments. They formed the context in which four presi-

dios and three secular colonies, together with adjacent ranches, constituted the only Christian settlements in California between 1769 and 1840. Incorporated into the Diocese of Sonora, mission efforts continued until Mexican independence from Spain in 1821. All activities associated with missions and church life declined after that, and the missions were secularized in 1833. This exacerbated the situation, which became even worse with the entry of Americans into California in 1845 and the subsequent ceding of the land by Mexico to the United States in the Treaty of Guadalupe Hidalgo (1848).

Louisiana had been a mission field since the 1600s, administered by the bishop of Quebec. Spanish authorities took control of the region in 1769 after it was ceded to them by France in the Treaty of Fontainebleau (1762). One ecclesiastical figure who became active there was Antonio de Sedella (also known as Father Antoine), and his agitations were at the center of a fifteen-year dispute over jurisdiction and proper authority in church matters. His superior, Luis Ignacio de Peñalver y Cardenas, became the first ordinary of the Diocese of Louisiana and the Floridas in 1793. He worked strenuously to revive an indifferent population, and besides establishing new parishes he laid the foundations for the Cathedral of St. Louis. In 1803 Louisiana was ceded back to France and thence to the United States. By 1809 the last canonical link between Spanish personnel and the churches there was severed.

co's first Catholic bishop, much of what would be printed in America would have a distinctly religious flavor. A century later, the Puritans continued this linkage between religion and print by establishing the first printing press in the British colonies in the Massachusetts Bay Colony. Largely because of the Puritan commitment to literacy, American publishing in general—and religious publishing in particular—went on to establish itself most prominently in the northeastern region during the ensuing two centuries. By the early decades of the nineteenth century, the Puritan-inflected Boston had become a major religious publishing center. In these decades, Philadelphia and New York City also rose to prominence in the area of religious publishing, due largely to their deep roots in the publishing industry more generally and to the fact that both cities played host to a number of Protestant denominational headquarters, major churches, and religious benevolent societies.

By 1755 there were twenty-four printing establishments in ten of the British colonies. A decade later, every one of the original thirteen colonies had an active publishing enterprise. Religion, politics, and printing were so intertwined during these years that nearly all of these mid-eighteenth-century American printers published religious material, but they published other kinds of material as well. At this point, strict specialization in printing rarely existed. The Ephrata cloister of Pietists near Lancaster, Pennsylvania, established a printing enterprise around 1743 and became a rare example of a publishing enterprise almost totally dedicated to religious publishing. Other strictly “religious publishers” hardly existed at this time, and printers took a wide variety of work to remain financially solvent. Perhaps the most famous American printer of the eighteenth century, Benjamin Franklin, serves as a useful illustration here. Franklin used his printing presses to produce newspapers, books, pamphlets, and almanacs of a more secular hue. He also printed many extremely popular religious works, including sermon collections originally preached by George Whitefield, the most famous traveling evangelist of the eighteenth century.

To be sure, certain publishers did make a name for themselves by printing religious materials. Prior to the American Revolution, Christopher Sower produced a German Bible in 1743, and his son produced later editions in 1773 and 1776. After John Eliot's translation of the Bible into an Algonquian language in the early 1660s, Sower's was the second Bible edition to be printed in the United States, and its produc-

RELIGIOUS PUBLISHING Dating back to the sixteenth century, religious publishing has had a long and vibrant history in North America. From the time Juan Pablos arrived in Mexico City in 1539 to set up a printing office under the patronage of Mexi-

tion distinguished him as one of the leading religious publishers of his day. Mathew Carey was yet another publisher who came to distinguish himself as a producer of Bible editions. Until the rise of the American Bible Society in 1816, Mathew Carey was the largest single printer of Bibles in the United States.

The 1770s and 1780s saw the rise of denomination-based publishing. The Methodists took the lead in this area. Before the 1770s, Methodists employed local Philadelphia printers to produce hymnbooks and other works. These printers profited by producing these works, something that outraged the Methodist leadership in England. In 1773 the Methodists determined that only officially approved publications and publishers would be used, and all the proceeds would go toward mission work. This led to the establishment of the Methodist Book Concern in 1789, the first denominational printing enterprise in the United States.

Other denominations followed suit in the nineteenth century. The Baptists established a publication society in 1824, the Unitarians set up a book and pamphlet society in 1827, the Episcopalians began American publishing in 1828 through the New York Episcopal Press, and the Congregationalists set up a tract and book printing enterprise in 1829 to service its loosely confederated circle of churches. By the mid-1830s every major American denomination recognized the need for a publishing enterprise to produce materials for their missions activities and educational curriculums, and to facilitate denominational coherence. Denominations were also largely responsible for the proliferation of religious newspapers in the first half of the nineteenth century. The first newspapers dedicated strictly to religion began to appear in the second decade of the century, but nearly three hundred religious newspapers (most often sponsored by a specific denomination or religious body to help facilitate communication within its ranks) existed by the time of the Civil War.

The opening decades of the nineteenth century also gave birth to a new kind of interdenominational publishing. The American Bible Society (1816), the American Sunday School Union (1824), and the American Tract Society (1825) came to represent cooperation among various denominations, which allowed for a flood of religious material to be released throughout the country. These societies took full advantage of changes in papermaking technology, stereotyping, centralized mass production, and power presses to become the largest publishing enterprises of their day. By the late 1820s the American Bible Society was producing 300,000 Bibles a year,

the American Tract Society was producing over six million tracts a year, and the American Sunday School Union was embarking on a 100-volume Sunday school series to help facilitate its Bible class curricula across the country. This spirit of interdenominational cooperation signaled a significant shift from the decentralized religious publishing of the mid-eighteenth century to a more centralized and powerful religious publishing presence in the United States by the 1830s.

RELIGIOUS TESTS FOR OFFICEHOLDING

In the aftermath of England's Glorious Revolution of 1688, Parliament imposed on members of colonial assemblies and councils the obligation to take an oath renouncing allegiance to all foreign powers, political and spiritual. This oath effectively barred Roman Catholics from holding political office in all the colonies, except Rhode Island and Connecticut, which were essentially self-governing. However, Rhode Island passed a law in 1719 against Roman Catholic officeholders and, it is safe to say, Connecticut elected no Catholics to office. Jews also did not serve in colonial legislatures. At least in theory, foreign-born Catholics could not become naturalized British citizens, vote, or hold property. The exclusion of Roman Catholics from political power occasioned no debate, and the French and Indian War against Catholic France and the Quebec Act of 1774 led to increased anti-Catholic sentiments. It is a safe conclusion that on the eve of the American Revolution, most colonists saw America as a Protestant country.

A second form of religious test came in requirements to swear an oath of office (“so help me God”). Rhode Island, New Jersey, Delaware, and Pennsylvania allowed an affirmation (omitting the name of God), but other states followed the British practice of allowing an affirmation for legal matters while deeming it insufficient for holding high office. Maryland and the Carolinas allowed an affirmation for officeholders in the seventeenth century, but subsequently repealed that provision as a way of reducing Quaker influence.

DURING THE REVOLUTION

After independence was proclaimed, all the states except Connecticut and Rhode Island wrote new constitutions. Virginia was unique in having no religious test and no naming of God in oaths of office. Yet it kept its established church. Georgia had no religious test, but did invoke “so help me God” in the oath of office from 1777 until a new constitution in 1789 dropped this requirement.

Six states’ constitutions—North and South Carolina, New Hampshire, Delaware, New Jersey, and Georgia—restricted officeholding to Protestants. New York effectively barred foreign-born Catholics from becoming naturalized state citizens by a law requiring an oath renouncing allegiance to a foreign political and spiritual power, that is, the papacy. Even though Massachusetts’s constitution of 1780 restricted officeholding to Christians, its legislature and New York’s effectively banned Catholics. Against Benjamin Franklin’s opposition, the ministers in Pennsylvania persuaded its convention in 1776 to allow only Christians to hold office. Maryland passed the same restriction that year and did not revise its constitution to allow Jews to serve until 1851 and even then insisted that all officeholders believe in a future state of rewards and punishment.

The states feared religious strife and sought to protect their citizens by forbidding practicing ministers from serving in the legislatures. Six states banned ministers exercising their pastoral vocation from serving in the legislature (South Carolina, North Carolina, Georgia, Maryland, Delaware, and New York). New York wished to be delivered from “bigotry and ambition of weak and wicked priests,” but South Carolina noted that “a profession dedicated to the service of God and the cure of souls, ought not to be diverted from the great duties of their function” (Thorpe, *Federal and State Constitutions*, vol. 5, p. 2636; vol. 6, p. 3253).

All of the state constitutions included a loyalty oath or affirmation. Six states required the naming

of God in their oaths, while only two did not mention the deity in the prescribed form; the others did not stipulate the form of the oath. In theory, the “so help me God” formulation was not meant to enlist the aid of God in telling the truth but to acknowledge that God would deal with the person in this or the next life in a manner congruent with whether he or she told the truth. Several state constitutions made this explicit by requiring officeholders to acknowledge a future realm of rewards and punishment (heaven and hell).

EASING REQUIREMENTS

The most secular constitution of 1777 was the Articles of Confederation, which did not mention God nor require an oath of loyalty. The Federal Constitution made no mention of God either in the preamble or the oath of office, created no religious test, and allowed an affirmation.

The individual states also eased their requirements before and after 1787, showing widespread but by no means universal opposition to some religious tests, particularly those against Catholics and Jews. The Pennsylvania constitution of 1790 ended the restriction upon Jews, but still required a belief in God and in a realm of rewards and punishments after death. This provision would remain in the state’s constitutions until the twentieth century. The South Carolina constitution of 1790 dropped the name of God and the religious test for electors and officeholders. The Delaware constitution of 1792 also dropped religious tests. Georgia’s 1789 document continued the state’s policy of no religious test. Kentucky in 1792 banned ministers from officeholding but required the naming of God in its oath; the state dropped the latter requirement in 1799. In 1777 and 1786, Vermont restricted officeholding to Protestants who believed in heaven and hell. After becoming a state in 1791, however, it required only belief in God and in heaven and hell. Many of the religious tests endured long into the nineteenth century. Massachusetts ended them in 1833, North Carolina in 1835, and New Jersey in 1844. Invoking the name of God in oaths of office remained common even when states allowed an affirmation.

What should one conclude about the significance of religious tests? At the time of the Revolution, eleven states and Vermont proclaimed their devotion to religious liberty even while maintaining a religious test for office. The citizens wanted to guarantee that honest, God-fearing men held office, but feared the influence of church organization on politics. Ironically, the 1776 constitution of Virginia, the most

secular state document, did not bar ministers from serving, while South Carolina's constitution of 1778, filled with religious sentiments, did. At first, only Georgia accepted the Virginia pattern, but it became increasingly influential even before the Constitution of 1787. The impact of the federal Constitution and the First Amendment was felt because while many Americans had already concluded that religious tests were unnecessary or an infringement on religious liberty, no one had argued that they were illegal.

REVIVALS AND REVIVALISM The period in American history stretching from the mid-eighteenth century to the early nineteenth century was marked by many dramatic bursts of revivalism. Revivalism is a movement within modern Christianity, particularly but not exclusively Protestantism, that calls on individuals to repent of their sin, believe the Gospel, and enter a proper relationship with God. Revivals are generally experienced communally, but they stress, by rhetoric and ritual, the individual's spiritual standing. Revivals shaped the lives of countless Americans and deeply affected the character of colonial and early national religion and society. Revivalists challenged the conventional hierarchies of religious culture, and they advanced an egalitarian, voluntaristic, and inclusive social order that was often international in scope.

Yet revivals polarized as much as they consolidated, leaving a long tradition of controversy in their wake. These events were highly contested in the eighteenth and nineteenth centuries and have stimulated a wide spectrum of interpretation ever since,

both among their supporters and detractors. Most scholars today see the revivals as an important storyline in the unfolding narrative of American history, and certainly they receive prominent treatment in American history textbooks. But some have challenged the notion of revivalism's centrality to American history. In 1982, for example, the historian Jon Butler argued that the so-called Great Awakening of the mid-eighteenth century was an "interpretive fiction," a creation of mid-nineteenth-century evangelicals overly eager to give their nation a sanctified past. As such, Butler urged that the notion of a Great Awakening reveals more about subsequent evangelical aspirations than about eighteenth-century realities. By employing a homogenizing concept like the Great Awakening, scholars assume a religious and political unity that does not exist, and the formation of the American nation can become something of a stepchild of evangelicalism. Historians of American religion have generally appreciated Butler's careful attention to the historical construction of the category of revivalism and to religious diversity, but subsequent studies have shown that the Great Awakening was not merely a product of the nineteenth century; the concept was "invented" while the revivals were happening, the historian Frank Lambert has argued, by evangelicals like Thomas Prince, the editor of *Christian History* (1743–1745), eager to see God's hand in the surprising and gracious revivalist events of the day.

DEFINITIONS AND ORIGINS

As a distinct form of modern religious experience, revivals, as explained by the historian Russell Richey, can be identified by the following ten traits: a firm grounding in the Pietist tradition, a proselytizing tendency, a soteriology of crisis (that is, the conversion experience), the assumption of religious declension, the presence of crowds, an emphasis on voluntarism, a dramatic ritual form, charismatic leadership, confidence among participants in the fact of God's presence, and a strong communication network. As Richey points out, one or two of these factors may be absent and people may still wish to call something a revival. But where all exist there is usually little doubt about whether a revival has occurred.

Yet the ambiguities surrounding revivalism's importance to American history point to a deeper confusion about revivalism's definition. Implicit in the term itself is a notion of spiritual decline from which one might be revived. It is this quality that set the revivals apart from the cultural institution of the

Camp Meeting. Between the 1790s and the 1830s a series of highly emotional revival meetings and denominational organizing drives, especially among Methodists, Baptists, and Presbyterians, produced a rise in membership. This 1829 lithograph by Kennedy and Lucas is based on a painting by Alexander Rider. LIBRARY OF CONGRESS.

biannual Presbyterian communion seasons, which were popular in America, Ireland, and Scotland. The revival tradition grew out of the rituals of these communion seasons, in which congregants would gather together for a week or more, hear preaching, and, most important, receive the sacrament of the Lord's Supper. These holy fairs shaped a distinct revival experience centered in personal introspection and communal renewal. However, because most contemporary scholarship debunks the long-entrenched notion that religion was in fast decline in the early eighteenth century, historians have had to look elsewhere to account for revivalism's considerable appeal. The Pietist and Puritan movements in western Europe and North America, which preceded the era of revivals, help scholars to understand that the revivals emerged as a challenge to the new emphasis on rationality in the Western Enlightenment. Revivals, then, are a distinctly modern form of religious practice that gave new attention to individual subjectivi-

ty, centering religion in the heart rather than the head.

THE GREAT AWAKENING

Revivals occurred as early as the late seventeenth century, most notably under the ministry of Solomon Stoddard in Northampton, Massachusetts. During the period between the 1730s and the 1770s, however, these efforts intensified into a broader movement known as the First Great Awakening. In the process, the revivals initiated a slow but steady transformation of religion and society in America. The period prior to the 1730s was characterized by clerical religion and sundry attempts on the part of the clergy to bring the laity into conformity with orthodox religious practice. The period beginning with the Great Awakening represents a triumph of lay religion—a shift, as Mark Noll put it in his 1993 article, "The American Revolution and Protestant Evangelicalism," "from the minister as an inherited authority

figure to an effective mobilizer, from the definition of Christianity by doctrine to its definition by piety, and from a state church encompassing all of society to a gathered church made up only of the converted" (p. 626).

The colonial revivals of the mid-eighteenth century (especially from the 1730s to the 1750s) were one part of a transatlantic phenomenon that stretched from Scotland to Boston, and from Saxony to South Carolina. The English-speaking phase of this movement centered on the ministry of the Anglican itinerant George Whitefield (1714–1770), who made seven trips to North America and traveled widely in the United Kingdom. Whitefield was a committed Calvinist who believed and preached that the "new birth," or conversion, could occur only through God's initiation. But his Calvinism did not keep him from doing all he could to ensure that his revivals would be a worldly success. Whitefield's agents would send news of the surprising works of God ahead to the next town he would soon visit, stimulating intense interest in the event and laying the groundwork for hearts to be changed. According to Harry Stout, Whitefield pioneered technologies of communication (appropriating theater techniques) that would not only alter the future course of American religion but also spread into other arenas of culture including politics and entertainment. Far more than others, Whitefield was a master at making the complexities of faith simple—even simplistic—and his popularity grew as a result. A person of celebrity status, Whitefield was first to be seen by a majority of the colonists. In 1739 the skeptic and printer Benjamin Franklin heard him in Philadelphia and was duly impressed, willing to support Whitefield as much for the publishing business he generated as the morality he inculcated in the population through his evangelical Calvinism. Franklin was astounded by the size of the crowd that gathered in Philadelphia to hear him, a testimony to his unusual skill in voice projection as well as to his phenomenal success in bringing religion into the marketplace of ideas in the Atlantic world.

Whitefield was only the brightest star in a constellation of other lesser but noteworthy lights, and these revivalists' diverse backgrounds indicate the complex ways in which revivals mixed with American culture. Revivalists and those affected by the revival fell along a range of theological positions and denominational standpoints. Some pro-revivalists, like Whitefield, the Presbyterian Gilbert Tennent, and the Dutch Reformed Theodore Jacob Frelinghuysen, moved safely within a Calvinist orbit, even though

they nevertheless challenged long-established ecclesiastical traditions and put a new emphasis on religious experience. Others, particularly those under Wesleyan and later Methodist auspices, articulated their gospel as a challenge to Calvinism: God's grace had made it possible for humans everywhere to repent and live holy lives. The revivals also generated a cohort of religious radicals that famously challenged established hierarchies and conventions with a call from God. In the mid-eighteenth century Andrew Croswell and James Davenport both bordered on antinomianism in their defenses of the saving graces of God, calling into question the spiritual validity of the established Christian ministries and earning for themselves much public opprobrium throughout New England and beyond. As the wing of the Awakening occupied by Croswell and Davenport became increasingly strident and radicalized, the colonial ministry split on the question of revivals. Pro-revivalists, or "New Lights," were opposed by the conservative "Old Lights," with the Old Lights taking offense at the way that revivals were undermining traditional social values. The Congregational clergyman Jonathan Edwards (1703–1758), a New Light moderate and the grandson of Solomon Stoddard, carried on a long debate with the Old Light conservative Charles Chauncy, resulting in Edwards's *Treatise Concerning the Religious Affections* (1746). In this defense of the revivals, Edwards spent most of his pages chronicling all the ways religious experience may be false and thus destructive to religion and society. Similarly, the colonial Presbyterian tradition underwent a temporary schism between its "New Side" and "Old Side." But for all the love lost between fellow denominationalists, pro-revivalists found a refreshing new camaraderie with others from outside their own traditions and regions who also supported the awakenings. Thus the intercolonial religious discourse took place across a range of Protestant viewpoints.

THE RISE OF THE METHODISTS AND BAPTISTS

While evangelical Calvinists of Congregationalist, Presbyterian, Anglican, or Dutch Reformed background dominated the early phase of the Great Awakening, the Separates, Baptists, Methodists, and Disciples of Christ laid the revivalist groundwork of the Revolutionary era. These Protestant traditions were sympathetic to experimental revivalism and thrived in the democratic atmosphere of the early decades of the new American Republic. They gave voice to religious enthusiasm, appealed to the individual conscience, nurtured egalitarianism, and, not least, tapped into a burgeoning entrepreneurialism.

Francis Asbury (1745–1816), a tireless itinerant and America's first Methodist bishop, was one of these religious entrepreneurs, traveling thousands of miles on horseback each year bringing Methodist institutions like the class meeting and its distinctive connectionalism to the American countryside. Methodism relied on a dedicated and involved laity for its growth and provided just enough clerical leadership for the laity to flourish. Under Asbury's leadership, American Methodism came to feature a highly centralized episcopal polity with a remarkably flexible institutional culture; hence its early expansion occurred with relatively few growing pains. By 1830 it would be the largest denomination in the country.

Religious historians have been increasingly attuned to the presence and cultural role of evangelical revivalism in the American South, looking in particular at the way that religion and race intersected. The revivals of the 1730s and 1740s had a limited impact in the southern colonies despite the best efforts of Whitefield and others. In the years surrounding the Revolution, however, the appeal of the Methodists and Baptists began to strengthen among the South's largely unchurched populations. Baptist ministers in North Carolina and Virginia, who took up preaching as an avocation with little remuneration, gained a following among the poorer frontier farmers and even some free and enslaved blacks. The worshipping culture of the evangelical churches was an affront to the refined manners of the southern gentleman. Not only were evangelical services emotional and full of improprieties, but evangelical ministers denounced the worldly amusements and values of the planter class, their social and religious hierarchies, and even their standards of manliness.

As evangelicalism became more of a force in the South in the early years of the nineteenth century, even winning adherents among the planting class, it did so by making several conspicuous concessions. Whereas ministers prior to 1740 rarely challenged the slave system, the notion of absolute equality before God implicit in evangelical religion gradually made slavery a problem. Quakers and other radical Protestants were the first to articulate slavery as a problem, but evangelicals were not far behind, and early Methodists and Baptists in the South ruffled feathers by implicitly and explicitly challenging dominant race ways. In fact, scholarship suggests that the Christianization of the South occurred less as a product of intense conversions among Americans of European and African descent than as a result of the construction of lasting communal structures that evangelicals introduced: churches, the class

meetings of Methodists, and a reconstruction of marriage, slavery, and commercial relations. But as Christianization proceeded apace, evangelicalism especially in the South eventually shed its critiques of slavery and of entrenched traditions of honor in exchange for cultural dominance.

THE SECOND GREAT AWAKENING

There is no way of knowing exactly how many lives were influenced by the revivals of the early nineteenth century. It is known, however, that the denominations that carved out a space for revivalist culture fast outpaced the denominations that opposed it. Methodists, Baptists, and the Disciples of Christ (the "antiformalists") eclipsed the Congregationalists, Presbyterians, Episcopalians, and Unitarians (the "formalists"). In the process, many of the former denominations spawned smaller sects and movements that imparted to the Second Great Awakening its trademark diffuse and fragmented character. Particularly in the 1820s and beyond, sectarian groups tapped into the revivalist ethos to create what the historian Paul Conkin calls "American originals," religions and sects that trace their origins to the cultural ferment of the early national period. Nevertheless, most of the revival activity associated with the Second Great Awakening had a strong evangelical core, creating a dominant evangelical Protestant culture in the United States by the second half of the nineteenth century.

The revivalist cultures that proliferated in the early nineteenth century resembled colonial revivalism, but a few subtle shifts were increasingly apparent. Early national revivalists were more willing to posit the right and duty of every Christian to search the Scriptures for themselves and individually to discern the truth. Some of the most effective ministers had little if any formal theological training and wielded tremendous spiritual authority in people's lives by virtue of their charismatic appeal. The traveling Methodist itinerant Lorenzo Dow was famous for his dramatic preaching, in which he would amaze audiences by his jerking bodily movements as well as his denunciations of established churches and their pastors. Preachers such as Dow liberally applied what they took as the lessons of the American Revolution to religious life. The validity of republican and democratic principles, they claimed, was self-evident, and all that was necessary for a vital religious life was for Christians to think and to act for themselves and to band together voluntarily in communities and churches of their own making. Such themes were the ideological fuel of the Second Great Awakening.

On the other end of the evangelical spectrum were revivalists like Lyman Beecher (1775–1863), a man committed to the established order as well as to revivalism. Beecher sought in more modest ways to adapt his native Calvinist Congregationalism to the new democratic republican ethos of the nation. His concern was that Calvinism, if not moderated by good common sense, could lead people to spiritual lethargy and despair. With his friend Nathaniel William Taylor of Yale College, Beecher sought to re-fashion Calvinism so as to make sense of the revival experience of personally accepting or rejecting grace. In fact, one general pattern that emerges in the history of revivals from the Revolutionary period through the early Republic is a shift from a Calvinistic to a pragmatic framework for understanding the revival's origins and function. Ministers in the mid-eighteenth century spilled much ink defending the notion that revivals were works of God, even "surprising" works in Jonathan Edwards's formulation. By the early Republic, many evangelicals became convinced that Calvinism produced apathy and so, with Charles G. Finney, urged that revivals and the "new heart" that they were calculated to change were the proper domain of human agency. In both the radical and conservative wings of the Second Great Awakening, the importance of individual experience emerged.

Diplomacy

For the United States, the key problem of the diplomacy of the American Revolution was to secure aid from abroad without sacrificing independence. With the outbreak of war in 1775, many Americans in and out of Congress presumed that some foreign aid was necessary. On 29 November 1775, the Continental Congress created the Committee of Secret Correspondence (renamed in 1777 the Committee for Foreign Affairs) to communicate with friends of America in Great Britain, Ireland, and elsewhere.

The main questions regarding foreign alliances were whether independence should come before or after such agreements, what America had to offer foreign powers, and what commitments America should make to them. Leaders as different as John Dickinson and Patrick Henry believed that independence without an alliance in place would put America at the mercy of France. Samuel and John Adams believed that other nations would not sign alliances until America declared its independence and that the offer of trade would bring alliances without political commitments. In *Common Sense* (1776), Thomas Paine argued that American agricultural productions would force European concessions "while eating is the custom of Europe." Agreeing with this assessment, John Adams in March 1776 proposed a commercial alliance with France that would accept no

French troops or ministers, taking only French arms and supplies. On 6 April, Congress opened American ports to the world. Congress sent Silas Deane, a Connecticut merchant and former member of Congress, to France to purchase munitions.

On 11 June, Congress appointed a committee to draft a plan of a treaty that would be offered to other powers. Adams completed the Model Treaty in July. It would grant the United States and the other nation most-favored-nations status in each other's ports. Adams borrowed this provision from the Treaty of Utrecht (1713). Adams also included provisions traditionally favored by small navy powers, such as a limited contraband list (of items that neutrals could trade to belligerents and still remain neutral) and the principle that free ships make free goods, meaning that all goods carried in a neutral ship are considered neutral. The only military provision stated that the United States would not seek a separate peace if Great Britain declared war on the other signatory. Congress adopted a slightly modified version as official policy on 17 September 1776. Military setbacks led Congress to abandon the Model Treaty by the end of the year. In December 1776 Benjamin Franklin joined Arthur Lee and Silas Deane as an American envoy in Paris. They were authorized to do whatever was necessary to bring France into the war.

SEEKING FRENCH SUPPORT

France was the natural choice for an ally. Since its humiliating defeat in the Seven Years' War (1756–1763), France had sought a way to regain its power and prestige. France sent several secret agents to the American colonies during the 1760s and 1770s to determine if the colonial crisis might be turned to French advantage. In September 1775 France's foreign minister, the Comte de Vergennes, sent Julien-Alexandre Achard de Bonvouloir to Philadelphia. Bonvouloir reported back that Congress was seeking French aid. Upon receiving this report, Vergennes moved toward supporting the American Revolution. In March 1776 Vergennes prepared his "Considerations" on the colonial rebellion, recommending that France and Spain prepare for potential war with Great Britain, that France assure Great Britain that it had no hostile intentions, and that France should secretly supply the American Revolutionaries with munitions. King Louis XVI approved the policy in April. Vergennes then directed his deputy, Joseph-Mathias Gérard de Rayneval, to draft another paper, "Reflections," which argued that British power and wealth depended on the colonies. American success would increase French power and trade while perma-

nently damaging Great Britain. The French government set up a dummy corporation, Rodrigue Hortalez and Company, led by Pierre-Augustin Caron de Beaumarchais, to funnel munitions to America. By 1777 France was paying for the bulk of the war.

Soon after Franklin's arrival in Paris in December 1776, he, Deane and most of the Americans in the mission to France moved to a residence at Passy, which became the Americans' headquarters. The mission was far from unified. Lee's heightened sense of his own republican virtue led him to be overly suspicious of the motives and actions of those around him. He soon suspected that Franklin and Deane were plotting against him. Meanwhile, the mission was also riddled with spies, double agents, and others of questionable loyalty. The most notorious double agent was Edward Bancroft, who met with Deane in Paris in July 1776 and subsequently served first as Deane's secretary and then as secretary of the legation. Franklin never knew of Bancroft's activities and tended to dismiss the danger of spies. Others around the mission, such as William Carmichael, who served as Deane's secretary and later as John Jay's secretary in Spain, sometimes acted in ways that cast doubt upon their loyalties.

Benjamin Franklin was already the most prominent of the Americans and so naturally took the lead in diplomacy. He recognized that France was in a delicate position and sought to help the American cause through what later generations would call public diplomacy. He avoided the court of Louis XVI and instead concentrated on the salons of Paris, appealing to the intellectuals and wooing the ladies there. French Enlightenment thinkers tended to have an idealized view of America as an unspoiled utopian wilderness. Franklin played on this image and portrayed himself as a simple backwoodsman. He appeared around Paris in a coonskin cap, which certainly would not have been part of his wardrobe in London or Philadelphia. In these ways he kept the American cause before the eyes of influential Parisians without embarrassing the French government.

Franklin agreed with the moderates in Congress that the United States should rely on France for foreign aid and not seek other entanglements. Arthur Lee, like the radicals in Congress led by the Adamses and the Lees, sought to balance other allies against France. In February 1777 Lee left for Spain. He was not officially received but was promised aid. Between May and July he was in Berlin seeking permission to use Prussian ports for American privateers. King Frederick II had some sympathy for the United States, but could not risk hostilities with Great Brit-

ain. In May, Congress decided to expand diplomatic activities, naming Arthur Lee commissioner to Spain, his older brother William as commissioner to the Holy Roman Empire, and Ralph Izard as commissioner to Tuscany. The commissioners received their appointments in September.

Vergennes hoped to keep the American war at a low level while preparing for a wider conflict with Great Britain. In the spring of 1777 Rayneval concluded that the navy would not be ready until March 1778. The aggressive American use of privateers out of French ports threatened to bring a premature war. On 23 July, Vergennes presented a memorial to the king that France could no longer prop up the American cause through secret aid. The time had come for a formal offensive and defensive alliance. The king agreed, provided that Spain join any such alliance. Spain, however, preferred to avoid an open war with Great Britain and advocated a truce between America and Great Britain guaranteed by France and Spain. The American victory at Saratoga, New York, on 17 October 1777 changed the diplomatic situation. Word of the victory reached Paris on 3 December. The week before, Deane had suggested threatening to reconcile with Great Britain if France did not offer recognition. Soon after the news of Saratoga, the North ministry in Britain sent Paul Wentworth, a former colonial agent for New Hampshire, to try to get a settlement short of independence. Fear of a deal between the Americans and the British contributed to Vergennes promising recognition on 17 December 1777. He had wanted to wait until Spain was on board.

THE FRANCO-AMERICAN ALLIANCE

The United States and France concluded two treaties on 6 February 1778. One was a treaty of amity and commerce based on the Model Treaty. The other was a treaty of alliance. The alliance provided that France and the United States would fight together against Great Britain if Britain declared war on France. The United States was free to conquer Canada and Bermuda, and France could keep any islands it took in the Caribbean. Neither would sign a separate peace with Great Britain. France and the United States agreed to guarantee each other's territory in America. The king appointed Conrad-Alexandre Gérard as minister to the United States and formally received the American commissioners on 20 March. In November 1777 Congress replaced Deane with John Adams, who arrived in Paris in February. Formal recognition made the commission system obsolete and even counterproductive. In September 1778 Con-

gress named Franklin minister to France and recalled all other commissioners.

The Franco-American alliance turned the American war into a transatlantic conflict. The goals of the United States, however, remained the same: independence with a minimum of outside interference. Many Americans assumed that French interest in American independence would lead France to do what the United States wanted. For France, the U.S. alliance was a part of a wider strategy against Great Britain. France wanted to create a client state, completely independent of Great Britain but reliant on France for its survival. France had its own objectives in the Caribbean, India, and Africa that had little or nothing to do with American independence. The problem for France was how to confine American ambitions to a framework compatible with French policy and France's European allies.

Political divisions within the United States made France's task easier. For the first two years after independence, Great Britain failed to make any counteroffer that might have divided the Continental Congress. In 1776 the Howe brothers were authorized to offer only a partial amnesty. In the spring of 1778, a commission led by the Earl of Carlisle offered some home rule, but not independence. French policy opened divisions the British had closed. Congress recalled Deane for issuing too many army commissions to French officers who did not speak English. In September 1778 Congress took up charges by Arthur Lee of Deane's corruption. Deane had heavily invested in Rodrigue Hortalez, mixing his personal and official accounts to the point where they could not be untangled. Franklin and the moderates in Congress believed Deane innocent of any wrongdoing. The Lee-Adams faction believed the charges. In response, Deane accused the Lee family of disloyalty to the alliance.

The dispute came at an opportune moment for Gérard's efforts to moderate American peace demands. Congress began to discuss peace ultimata in early 1779, and on 23 February approved independence, possession of territory to the Mississippi, free use of the Mississippi below thirty-one degrees north latitude, British evacuation of American territory, access to the Newfoundland fisheries, and either the cession or independence of Nova Scotia. These ultimata threatened French goals in Newfoundland and would have frightened Spain. On 12 April 1779 France and Spain signed the Treaty of Aranjuez in which Spain joined the war against Great Britain. Gérard attached himself to the moderates, subsidized a newspaper campaign against American claims to the

fisheries, and sought to moderate American demands in the West. His work paid off on 14 August, when Congress reduced its demands to independence and possession of territory to the Mississippi north of thirty-one degrees. Congress then debated electing someone to the joint post of minister to Spain and peace commissioner. Moderates supported John Jay. Radicals abandoned Arthur Lee for John Adams. On 26 and 27 September, Congress voted to split the position, sending Jay to Spain and naming Adams peace commissioner. Gérard resigned his position for health reasons, and the Chevalier de la Luzerne arrived as his replacement in August 1779. Vergennes cautioned Luzerne against becoming too identified, as Gérard had, with any one political faction.

SPAIN AND THE NETHERLANDS

Jay and Adams arrived in Spain at the end of 1779 and proceeded to their respective posts. Jay's main goal was to secure a Spanish alliance and loan while preserving American claims to the West and access to the Mississippi. Spain did not favor American independence but did wish to hurt Great Britain, so it funneled money to the United States through American agents in Europe. In February 1780 the Conde de Floridablanca, Spain's foreign minister, told Jay he would have to give up claims to the West. Floridablanca did not formally receive Jay until 11 May 1780. Again, Floridablanca was willing to loan money in exchange for an American retreat from the West. Jay had always held the Mississippi to be a vital American interest. He appealed to the Comte de Montmorin, the French ambassador to Spain, for assistance. When none came, Jay concluded that France dictated Spanish policy. In October, Congress reaffirmed the claim to the Mississippi. Military setbacks led Congress in February 1781 to allow Jay to back off the claim to navigation below thirty-one degrees north. Jay learned of his new instructions in May. On 19 September 1781, Jay offered to abandon the lower Mississippi in exchange for an alliance. The offer was good only for the duration of the war.

John Adams's mission was no more successful. Adams wanted to reveal his commission to the British to see if Great Britain would negotiate. Vergennes believed such a move premature. Adams believed that France was wasting resources on its abortive invasion of Great Britain and the failed assault on Gibraltar when deployment off New York would end the war. Adams defended Congress's 18 March 1780 decision to devalue the currency and refused Vergennes's request to intercede for French merchants. Vergennes concluded that he could no longer negoti-

ate with Adams and broke off communication with him. Franklin also considered Adams a disruptive presence and believed that the United States needed to treat France with deference, making no demands.

Adams wished to bring as many nations as possible into the conflict. In July 1780 Russia proposed an Armed Neutrality, a league of the neutral powers of northern Europe dedicated to maritime principles similar to those in the Model Treaty. Adams urged the United States to apply for membership. Congress sent Francis Dana as minister to Russia, but he was never received. In August 1780 Adams left Paris for the Netherlands to serve as acting minister until the arrival of Henry Laurens. Laurens was captured by the British a month later. Adams's main goal was to secure loans and so he set up his mission at Amsterdam rather than The Hague. Adams constantly appealed to the Netherlands as a fellow republic and a fellow small navy power, but to no avail. The Netherlands did not grant a loan until June 1782, after news of Yorktown had reached Europe.

THE TREATY OF PARIS

By 1781 the expense of war and a string of battlefield defeats led France to explore a negotiated settlement. In May, Russia and Austria offered to mediate between Great Britain and "the colonies." Vergennes was willing to accept only if all of France's allies accepted as well. As peace commissioner, Adams refused to attend any conference that did not recognize American independence. Great Britain refused any direct negotiation with the United States. Vergennes believed that Adams was the main obstacle to peace and instructed Luzerne to lobby Congress for Adams's removal. The first half of 1781 saw a series of military disasters, and Congress had begun to panic. On 15 June 1781, Congress revoked Adams's single commission and approved a five-member commission of Adams, Franklin, Jay, Laurens, and Thomas Jefferson. Congress instructed the commission that France was to take the lead in all negotiations.

Cornwallis's surrender at Yorktown on 19 October 1781 started the chain of events that concluded in the Treaty of Paris. On 4 March 1782 Parliament voted to suspend offensive operations. On 20 March the North ministry fell and was replaced by a government under the Marquis of Rockingham and the Earl of Shelburne, both American sympathizers. Franklin sent peace feelers in March and in April began unofficial negotiations with Richard Oswald, a Scottish merchant. Oswald was formally appointed on 17 June. Jay arrived in Paris on 23 June. Rock-

ingham died on 1 July, leaving Shelburne as chief minister.

On 10 July, Franklin presented a peace proposal that went beyond the ultimata of 1779 to include access to the fisheries as a necessary article and the cession of Canada as a desirable one. Shelburne was willing to grant a generous peace, particularly regarding western claims and the fisheries. Oswald arrived with a commission on 8 August, but Jay objected to the fact that the commission did not formally recognize American independence. Two days later, Jay and Franklin met with Vergennes and Rayneval. The French diplomats informed the Americans that the claim to the Mississippi was extravagant and should not be a necessary article. Jay concluded that the commissioners must violate the 15 June 1781 instructions and sign a separate peace. Franklin reluctantly agreed.

Oswald returned to Paris on 27 September. On 5 October, Jay submitted a draft treaty that would give the United States much of New Brunswick and lower Ontario. Great Britain rejected it on 17 October, but it did serve as the basis of the final treaty. Adams arrived in Paris on 26 October, having concluded a treaty of amity and commerce with the Netherlands on 8 October. Laurens did not join negotiations until the final days, and Jefferson never left for Europe. On 30 November 1782 Great Britain and the United States concluded a preliminary treaty that recognized American independence and granted territory to the Mississippi, granted some access to the fisheries, and allowed British merchants to collect prewar debts. The Americans had hoped for a commercial treaty that restored trade patterns in the West Indies. The peace brought down the Shelburne ministry and the new government took a harder line. The final Treaty of Paris, signed on 3 September 1783, read the British-American articles into a general settlement. France never did see the economic benefits it expected. The British did not completely evacuate American territory until 1796. The Maine boundary was not completely settled until 1842, and the fisheries remained a contentious issue until 1871.

European Participation

Both individual foreigners and foreign governments aided the Patriot cause during the Revolutionary War. The individuals who served were motivated by a wide range of factors, including idealism, the desire for professional military experience, and personal financial gain. Those who came to America to assist in the fight against Britain include some of the most important figures in the Continental Army.

Four Europeans stand out for their notable contributions to the Patriot cause. Marie-Joseph-Paul-Yves-Roch-Gilbert du Motier de Lafayette, the Marquis de Lafayette, came from one of the most prominent noble families of France. He rose to become one of the Continental Army's major field commanders as a major general and virtually an adopted son of army commander General George Washington. Friedrich Wilhelm von Steuben was neither a baron nor a general as he claimed when he arrived at Valley Forge from Prussia in February 1778, but he had served as a junior officer on the staff of Frederick II (the Great) of Prussia. Washington immediately recognized his value and appointed Steuben as the drill master of the Continental Army and then its inspector general. Steuben played an important role in training the army. He greatly simplified the Prussian drill, and he produced the first drill manual for the army. Thaddeus Kosciusko of Poland was the first major foreign volunteer for the American cause. Congress made him a colonel of engineers. In this capacity he provided great assistance to the Continental Army, especially in the construction of defensive works, including the design and fortification of West Point on the Hudson. Promoted to brigadier general at the end of the war, Kosciusko played an important role in subsequent Polish history, as did Lafayette in

France. Kosciusko's fellow Pole, Count Casimir Pulaski, was a fearless leader who as a brigadier general helped develop cavalry in the Continental Army. He died in the cause of American independence at Savannah in October 1779. Johann de Kalb (also not a baron, nor authorized to place the "de" before his name), born in Bavaria, retired from the French army in 1763. As a Continental Army major general and highly effective commander in the field, Kalb was mortally wounded in the August 1780 Battle of Camden. There were of course many other foreigners serving in the Continental Army in lesser capacities, many of whom gave their lives for the cause of American independence.

Among foreign governments supporting the Patriot cause, France was far and away the most important. As early as September 1775 French agents were in America to assess the rebellion and its course. American privateers operating against Britain soon found welcome in French ports, and, beginning in March 1776, the French government extended financial assistance to the rebels. That same year the French government ordered the shipment of weapons and munitions to the West Indies for transshipment to North America. In the process, France became the chief source of arms supplies for the Patriot cause.

France did not aid the rebels out of interest in the ideals of the American Revolution. Louis XVI could hardly be expected to favor rebellion by a people against their sovereign. Rather, French support was prompted by French foreign minister Charles Gravier, the Comte de Vergennes, who sought to weaken Britain internationally, advance France's interests abroad, and secure revenge for the humiliating defeat suffered by France in the Seven Years' War (1756–1763).

The French aid was handled by the well-known playwright Pierre de Beaumarchais, who came up with a scheme of a bogus trading firm known as Hortalez and Co. Ultimately Beaumarchais dispensed twenty-one million livres in French government funds during the years 1776 to 1783. He secured, mostly from government arsenals, more than two hundred cannon and twenty-five thousand small arms. The latter included the excellent .69 caliber "Charleville" musket, named for the principal French arsenal producing it. The Charleville was an excellent weapon and remained the standard American infantry weapon well after the Revolutionary War. The French also provided 100 tons of gunpowder, 20 to 30 brass mortars, and clothing and tents sufficient for 25,000 men. This was a tremendous amount of

aid, and its importance cannot be overstated. Its impact was clear in the September and October 1777 Battle of Saratoga in New York. One source estimates that nine-tenths of the arms used by the Americans there came from France.

The surprising Continental Army victory and surrender of British forces at Saratoga convinced French government leaders at Versailles that the Americans had a chance of winning, and they now decided to bring France into the war openly. In February 1778 France concluded with the United States both a Treaty of Amity and Commerce and a Treaty of Alliance. In the latter, both parties agreed to fight on until American independence was "formally or tacitly assured." Neither power was to conclude a separate peace. In June 1778 hostilities began between France and Britain.

The entry of France in the war was a threat to every part of the British Empire, including India and especially the West Indies. The war now ceased to be wholly a land operation and became largely a contest of sea power. From 1778, except in North America itself, Britain was on the defensive, compelled to surrender the initiative. This change was further accentuated in 1779 when Spain declared war on Britain. In December 1780 rising tensions over its claim to search Dutch shipping led the British government to declare war on the kingdom of the Netherlands. Although the Royal Navy was adequate to secure the Atlantic sailing lanes, it was not sufficiently dominant to meet all possibilities, the most worrisome of which was that France might actually invade the British Isles.

On paper the Royal Navy was in 1778 still more powerful than the French navy, but the latter was more efficient. In that year the Royal Navy had seventy-three ships of the line at sea or in good repair. France had some sixty ships of the line, but many of these were better ships than those of the British. When Spain entered the war in alliance with France in 1779, it added another forty-nine ships of the line. In 1780 the Dutch added another fourteen. The British weathered the threat of a Bourbon invasion in 1779, but this was more from poor allied leadership and disease than any action by the Royal Navy. Spain's interest was chiefly in securing Gibraltar. Although the British managed to hold on to that important possession and indeed maintain their empire outside America, it meant that fewer resources would be available for major offensive operations in North America.

French support was crucial and marked the turning point in the war. In July 1781 a French

navy squadron arrived at Newport, Rhode Island, bringing four thousand French troops under the command of Lieutenant General Jean-Baptiste-Donatien de Vimeur, Comte de Rochambeau. It was the participation of regiments of the French army in conjunction with squadrons of a powerful French fleet that made possible the defeat of Britain in the war. French troops took the leading role in the critical siege operations at Yorktown in September and October of 1781. Indeed, that land victory was made possible by a brief period of French naval supremacy and success in the Battle of the Chesapeake the month before. In all, some 44,000 Frenchmen took part in the war: 31,500 in the navy and 12,700 in the army. Of these, 5,040 died in the cause of American independence: 3,420 in the navy and 1,620 in the army.

The irony of French support is obvious. The vast sums necessary to fight the war, especially in the naval sphere (total expenditures estimated at some forty million livres), bankrupted France and led directly to the government's decision to tax the nobles. Their resistance to this decision triggered the calling of the Estates General and the French Revolution of 1789.

Some have argued that the United States would not have won its independence without French intervention. Perhaps if the states had been forced to rely entirely on their own means, they would have voted to approve the allocation of the resources necessary to continue the war. But without this, the Continental Army sooner or later would have disbanded. Resistance would have been possible only by guerrilla warfare. Because a large percentage of the population was either opposed to or indifferent to independence, it is doubtful that resistance could have been continued for very long.

Following the British defeat in the Battle of Yorktown, London adopted a policy of cutting its losses and treating both the United States and Spain generously so as to wean them from France. London ceded Florida to Spain, along with the island of Minorca, but it kept Gibraltar, which the British had successfully defended during the war. United States leaders ignored their treaty with France and concluded a separate peace with Britain. In the settlement of 1783, the new Republic obtained territory as far west as the Mississippi. For all its efforts, France secured only the Island of Tobago in the West Indies and Senegal in Africa.

Finance

The rebellious colonies successfully financed the first stages of the Revolution as they had their colonial wars, by issuing fiat paper money called bills of credit. By May 1781, however, both state bills of credit and continentals (bills issued by the Continental Congress) were so numerous as to be almost worthless. In January 1782, a joint-stock commercial bank called the Bank of North America, a financial institution new to America, commenced operations. Its notes and deposits supplanted bills of credit as the major medium of exchange, and its loans to governments and merchants helped to finance the final phases of the war. Forced and voluntary domestic loans and foreign loans also helped to finance the war effort and formed the greater portion of the national debt funded under Alexander Hamilton's funding and assumption plans in the early 1790s.

SOURCES OF GOVERNMENT REVENUE

Colonial governments generated revenue by selling assets, taxing, borrowing, and issuing bills of credit. In the first stages of the Revolution, only the last method was readily available to the rebel governments.

Colonial governments often owned valuable assets, including public lands. Some colonies, like Maryland, invested budget surpluses in financial securities like Consols (British government bonds) and Bank of England stock. However, titles to such government assets became tenuous after the Declaration of Independence, so the assets could not be sold at favorable prices. In the final years of the war, the sale of confiscated Loyalist estates became a significant revenue source in some places.

Colonial taxes took various forms. The perennial favorite of colonies with large seaports was tariffs, duties on imports (and occasionally exports). Relative to other types of taxes, tariffs were easily collected and the ultimate sources of the revenue were easily obscured: importers paid the duties to government collectors before silently passing the taxes on to their customers in the form of higher prices. Britain's blockade of the American coast severely disrupted international trade, and most wartime imports were destined for government use anyway, so the war severely curtailed tariff receipts.

Colonial governments also taxed real and personal property (land, buildings, slaves, and personal property like kitchen utensils and bedding), as well as certain types of income (rental income and government salaries). Per capita (head) taxes were also imposed in some places. Levying taxes was fairly easy, but even in peacetime actually collecting them was difficult. During the Revolution direct taxes became even more difficult to collect, especially in areas with Loyalist sympathies. Fearful of driving neutrals to the king's side, rebel governments were reluctant to use coercive collectors, sheriffs, and courts, even in patriotic districts. Use taxes, like court and recording fees, were still collected in many areas, but they funded only the specific services provided.

Some colonial governments had established strong credit ratings. After currency reforms in the early 1750s, for example, Massachusetts successfully borrowed specie (gold and silver) and serviced its debts to lenders' satisfaction. Pennsylvania too successfully borrowed on bonds, but not as extensively as Massachusetts did. Especially early in the war, the rebel governments found borrowing difficult because their legitimacy was suspect and their tax receipts and receipts from sales of assets were anemic. As a result, every state informally borrowed from suppliers, contractors, and even soldiers, receiving goods, wares, and services for the promise of later payment.

Beginning in earnest in 1780 and 1781, the military essentially forced Americans to lend by seizing their corn, pigs, and horses in exchange for IOUs. In the last years of the war the soldiers themselves regularly received IOUs in lieu of wages. The rebel governments did not, however, force people to lend specie to them. Instead, they tried to coax people into lending by appealing to their patriotism. The sums offered were insufficient to prosecute the war, largely because lenders feared that they would never be repaid. Throughout the war the United States Loan Office garnered only about \$11.6 million in specie from the sale of certificates.

Rebel governments had a final, well-understood expedient open to them: issuing paper bills of credit. At one time or another, every colony, anticipating tax receipts, had issued such bills as a form of scrip rather similar to modern Federal Reserve notes. As government IOUs that bore no interest, the bills were both a form of borrowing and a form of taxation called seigniorage. Governments used them to purchase goods and services, redeeming them later, when bill holders tendered them for taxes or government assets. People who would not consider holding government bonds held bills because they were a medium of exchange—bearer instruments that passed from hand to hand as cash in a wide range of economic transactions.

Bills of credit could also indirectly tax the citizenry with inflation. By the end of 1781, state governments had issued bills totaling about \$246 million in terms of nominal or face value. By the time that Congress finally stopped printing continentals in 1779, it had put some \$241.5 million into circulation. As early as 1777, the nominal value of bills in circulation far exceeded the demand for money at prevailing price levels, so putting more bills into circulation simply caused inflation. Holders of bills were subject to a type of "tax" when the purchasing power of their bills decreased. Some scholars have pointed to the progressive nature of this tax: those who held the most money suffered the greatest inflationary losses. At first Americans endured the tax of inflation without much discomfort. Moreover, early in the war it was possible to mitigate the tax by refusing to accept the bills. However, with increases in the tax rate (the rate of depreciation or inflation), the rebel governments found it necessary to strictly enforce their legal tender laws. So avoiding the tax became more difficult just as inflation reached its highest levels. Specie, which had been acquired by trading with the British and French armies, disappeared into hoards as people frantically sought to rid themselves of their rapidly depreciating paper money. The end came in April and May 1781, when continentals lost almost all of their remaining value. State bills of credit held up little better. In May Congress repealed its legal tender laws and asked the states to do likewise.

Since it was impractical to issue any more paper money and the troops in the field were in a perilous condition, state governments buckled down and began collecting taxes, first in kind (wheat, horses, gunpowder) and later in gold and silver, which began to emerge from hoards after repeal of the tender laws. Some of the funds the states turned over to Congress, which did not have the power to levy di-

rect taxes. Moreover, the new Republic had fought well enough and long enough to convince European allies that it was creditworthy. In 1781 and 1782 French, Dutch, and Spanish loans totaling some \$7.8 million became available.

ROBERT MORRIS AND THE BANK OF NORTH AMERICA

Increased tax collection and foreign loans were insufficient, however, to continue to prosecute the war. Philadelphia merchant-statesman Robert Morris, whom Congress appointed as superintendent of finance in May 1781, helped to stave off bankruptcy by issuing IOUs backed by his personal credit. Several of his lieutenants, including Treasurer Michael Hillegas, another Philadelphia merchant-statesman, did likewise.

Morris also helped to establish the Bank of North America, the continent's first bank of issue, discount, and deposit. This commercial bank, which began operations in Philadelphia in January 1782, portended the future. Unlike the rebel federal and state governments, the Bank of North America was a business, a private corporation owned by stockholders. Also unlike the rebel governments, the Bank of North America issued not one but two types of liabilities: checking deposits, much like those in use at banks today, and banknotes. Though superficially similar to bills of credit, banknotes were a very different form of cash that most thought vastly superior. For starters, banknotes were not a legal tender for private debts. They circulated because people valued them, not because the government proclaimed that they should. People valued them because they could convert them into specie on demand. Moreover, banknotes were also backed by high-quality, short-term loans to private individuals, not future taxes or land, as bills of credit had been. In addition to supplying the economy with superior cash instruments and merchants with loans, the Bank of North America made numerous short-term loans to the government in the final years of the war.

Due to Congress's continued inability to levy direct taxes, however, the nation's finances remained precarious until after passage of the Constitution and the implementation of Alexander Hamilton's funding and national bank plans. Not including interest on the national debt, Americans paid approximately \$163 million (specie) for their independence, roughly 15 to 20 percent of the gross national product, about the same level that they would commit to fighting the Civil War and World War I. Of the total cost of the war, bills of credit (including the taxes and sales

of assets that redeemed some of them) bore about 67 percent of the financial burden (\$110 million, specie); voluntary and forced domestic loans (\$43 million) and foreign loans (\$10 million) accounted for the remainder.

Home Front

Two fundamental circumstances shaped the lives of civilians during the Revolutionary War. First, while Britain enjoyed unchallengeable military superiority at sea, it lacked the power either to conquer or to control effectively more than isolated outposts and a few cities on the American mainland. This made for a prolonged, inconclusive war. Second, the persistence of regional-colonial economies in North America during the war denied the Revolutionaries the benefit of an integrated, national economy while the struggle lasted.

THE EIGHTEENTH-CENTURY COLONIAL ECONOMY

Colonial economies produce surpluses for distant, overseas markets in exchange for imported goods not available in their home markets. Throughout the seventeenth century, such long-distance exchanges suffered because the value of American exports was low in relation to their volume while the value of de-

sired imports remained high in relation to theirs. That made it difficult fully to load vessels in both directions. Since the overhead on each voyage remained the same, American producers met the added cost by foregoing some imports they might otherwise have consumed.

During the first half of the eighteenth century, four gateway ports emerged that addressed this inefficiency. Boston, New York, Philadelphia, and Charleston encouraged British merchant capitalists to fill vessels carrying European merchandise to the colonies through the extension of credit. Besides providing a range of local services like safe harbors, wharfage, warehousing, and low prices for refits, wholesale merchants saw to distributing imports to the interior and assembling return cargoes. All four gateways also served as the judicial centers of their provinces and thus facilitated the collection of local debts. Finally, the gateways encouraged specialization in the West Indian trade, thus diminishing the inefficiencies of the triangular trade in seeking remittances on Europe, by providing a site where the two trades were integrated. The rising standard of living enjoyed by Americans during the first three quarters of the eighteenth century derived principally from the gateways' success in making their respective regional economies more efficient.

Though the Chesapeake Bay region possessed tobacco, the most valuable staple produced in North America, it lacked a gateway because British merchants controlled its marketing in Europe. The merchants valued decentralization because it preserved the distinctive qualities of the leaves grown in each of the bay's estuaries. Tobacco exports also more than balanced the Chesapeake's demand for European goods during much of the colonial period. Only after 1750 did Norfolk and Baltimore start emerging as commercial centers to market the expanding wheat production of Maryland and Virginia in the West Indies and southern Europe. By the Revolution, the Chesapeake was moving in the direction the other regional economies in the colonies had already taken.

THE REVOLUTIONARY ECONOMY

The colonists initially hoped to bring Britain to terms by denying it the benefit of their trade. When hostilities broke out in 1775, the British navy replaced Congress's Continental Association as the principal barrier to contact with overseas markets. In addition to blockading choke points along the coast like the mouth of the Delaware River and the Virginia Capes at the entrance of Chesapeake Bay, Britain's sea power eventually enabled it to seize all the conti-

nent's gateway ports. After being driven from Boston in March 1776, the British held New York from September 1776 until the end of 1783 together with at least one other gateway for most of the rest of the war. Overseas trade never entirely ceased because Americans proved adept at bypassing both the gateways and choke points and the British navy lacked the resources to blockade the entire coast. But the increased risks and costs involved in maintaining contact with overseas markets adversely affected the production of domestic surpluses and dramatically inflated the price of the few imports that continued to trickle in, discouraging the production of domestic agricultural staples still further.

Congress sought to cushion these economic dislocations by issuing continental bills of credit. It hoped a common currency would create a national economy to replace the regional ones. But the means proved inadequate to the end. Britain's navy also threatened the coastal trade, the principal avenue for national economic integration. Even had it not, paper credit instruments by themselves would have experienced difficulty in overcoming the geographic impediments standing in the way of the emergence of a truly national economy. The bills also lost value at the first hint that the debt they represented might not be paid. Since Congress lacked the authority to tax and the state governments were reluctant to do so, there was no way individuals could secure the value represented by the bills besides exchanging them for domestic produce. This raised the price of supplies that the army and urban residents depended upon and forced Congress to issue more bills for progressively less return. The resulting runaway depreciation led to the creation of a nominal debt by 1779 that exceeded anything Americans could conceivably pay. In 1780 Congress repudiated 97.5 percent of it in an effort to retain a remnant of its former credit.

Chronic shortages began plaguing the army well before the currency repudiation and persisted through much of the war. Most civilians also experienced a severe reduction in their standard of living. While some contractors and privateersmen prospered, the vast majority endured economic privation. Few perished from want—North America's poor were more likely to succumb to the winter's cold than to die of starvation—but the moral tone of civil society declined dramatically as civilians competed with the army and among themselves for a shrinking quantity of goods.

FARM LIFE

During the first year of the conflict, disease affected agricultural production more than the diversion of manpower into the army. In the absence of an effective hospital department, the army sent unseasoned soldiers who sickened in camp back to their homes, thereby communicating camp fever to the civilian population. The larger military mobilizations of 1776 and 1777 cut more directly into agricultural production, but prewar surpluses delayed the full impact of the resulting shortages until 1778–1779. Civilians fared better than the army because labor shortages never threatened subsistence, and families could support their members in the ranks by forwarding supplies through networks of camp visitors. Such assistance was less available when the army was mobile or when detachments embarked on distant expeditions like that launched against Quebec in September 1775. Most men taking part in the early operations of the war, however, benefited from the support of their families and communities.

In an effort to minimize the costs associated with rotating large numbers of short-term recruits through the ranks, Congress decided in September 1776 to raise a permanent army in 1777. This improved its health, though at the expense of its connection with the society from which it was drawn. Efforts by state legislatures to assist families whose principle breadwinners had enlisted failed either to temper the emerging gulf between the army and society or to sustain enlistments. During the last four years of the conflict, the Continental Army shrank steadily in response to adverse economic conditions. After 1778 the collapse of market incentives proved more significant than labor shortages in limiting agricultural production. The brief revival of the grain economy in Philadelphia's hinterland during 1780 and 1781 demonstrates the point. This expansion in production was a direct response to Spain's opening the Cuban market to North American grain imports during the summer of 1780. That revival in turn insured a grain harvest in 1781 sufficient to sustain the concentration of French and American forces around Yorktown that forced Lord Cornwallis's surrender. However, the British navy quickly put an end to this bonanza in 1782 once British officials realized what had happened.

Congress hoped foreign intervention would relieve Americans from their economic difficulties. But initially the French alliance aggravated Congress's currency problems by forcing it to behave in a fiscally irresponsible way to meet the demands of combined operations. The inconclusive results of the campaign of 1778 left Americans embroiled in a con-

flict they were powerless to extricate themselves from without additional foreign aid. France intervened more effectively in 1780 when it committed Rochambeau's expeditionary force to North America. Provisioning this force provided some economic relief to New England. But despite the military assistance and generous financial subsidies of 1781, France failed to provide a naval umbrella under which America's overseas trade might have recovered. France did supply most of the capital for the Bank of North America, but the tight British blockade of the Delaware River during the first half of 1782 compromised that institution's ability to revive the Patriot economy.

URBAN LIFE

The capture of gateway ports by the British provided local residents with powerful motives for migrating to the countryside. The British brought disease, especially smallpox, with them, making the cities they occupied far less healthy than they had previously been. Smallpox presented a greater danger to Americans than it did to Europeans because residence in the New World diminished one's exposure and therefore one's resistance to the affliction. Most urban residents had kin in the countryside with whom they could seek refuge, so only the need to protect substantial property or strong political commitments persuaded them to risk health and compete with unfriendly soldiers for housing and fuel in the occupied cities. Because those fleeing a British occupation had many more options than Loyalists fleeing Patriot regimes, New York City's out-migration was more than balanced by Loyalist immigration. If refugees lacked a taste for serving as recruits in Britain's armed forces, they could still find economic opportunity on privateers or in occupations that served the British forces. African slaves fleeing their masters from near and far flooded the city and were formed into a Black Brigade.

Fire partially destroyed New York City in September 1776 and again in August 1778. However, it suffered less of a decline during the war than Boston, Charleston, and Philadelphia experienced. Charleston, occupied from May 1780 to December 1782, had little time to recover. Boston and Philadelphia experienced shorter occupations but failed to recoup their prewar prosperity because of the anemic state of overseas trade. Urban refugees often hesitated about returning from the countryside to dependence on a diminished urban market. As the command center of British operations, New York fared better than the other ports because it was constantly receiving

fresh infusions of supplies both locally and from abroad and enjoyed a hard money economy throughout the war.

IRREGULAR WARFARE

The inability to hold more than limited amounts of territory plagued the British and Revolutionaries alike. Though Patriot regimes claimed control over most of the continent, neither they nor their army could defend the civilian population near British bases. Even the armies could only protect themselves from surprise by each other by taking positions of natural strength that were sufficiently distant from enemy bases to allow ample warning of impending assault. That left the population in between largely at the mercy of marauders. The British occupation of New York entailed prolonged suffering for the inhabitants of modern Westchester County and northeastern New Jersey. In addition to being subject to periodic forages by both armies, rival militias vied inconclusively for control of the terrain while outlaw elements plundered the inhabitants. Connecticut's shoreline fared only slightly better after of the formation of the Associated Loyalists in 1780. Long Island then became a staging area for refugee raiders bent on seeking compensation for choosing the wrong side.

While irregular warfare often led to lethal violence in the neutral ground of New York and New Jersey, in Connecticut it yielded an epidemic of kidnapping. Long Island, only nominally under British control, was more vulnerable to Patriot retaliation than Manhattan and its environs, while Long Island Sound lent itself to a thriving illicit trade that the chaotic violence closer to New York City would have threatened. The coast of Maine resembled the Connecticut shoreline after the British seizure of Castine in 1779. Though local Loyalists used it as a base for plundering coastal shipping and conducting an illicit trade with Patriot communities, it failed to spawn conflict of any intensity.

Instead, the most virulent irregular warfare of the Revolution emerged in North Carolina, South Carolina, and Georgia, where the dispersed demography of the interior precluded the development of significant commercial exchanges that might have restrained the violence. Dispersion also obstructed the exercise of political control. The British, sensing military opportunity in the region's large slave population, had tried unsuccessfully to seize Charleston during June 1776. Another attempt, begun with the invasion of Georgia in the winter of 1778–1779, finally succeeded in May 1780. Leading Patriots then

accepted British protection in exchange for the promise to remain neutral. But the British wanted more than a passive submission, and on 3 June Sir Henry Clinton ordered all enjoying the king's protection to swear allegiance to the crown. Many thought Clinton had released them from their paroles. When the British subsequently treated them as rebels, it initiated an escalating cycle of murder and revenge. Cornwallis's attempt to eliminate Nathaniel Greene's southern army by chasing it through the backcountry magnified the mayhem. By adroitly maneuvering his smaller force, Greene prevented Cornwallis from giving the Loyalists of South and North Carolina the kind of support they needed. After a pyrrhic victory at Guilford Courthouse in March 1781 forced Cornwallis to retreat to the coast, Greene was able to assist the insurgencies that Thomas Sumter and Francis Marion had organized in Cornwallis's rear. The Patriots then eliminated British outposts in the Carolina backcountry and Georgia one by one. Only when this task was completed did the chaos in the Deep South begin to subside.

Virginia, Maryland, and Pennsylvania fared better than their northern or southern neighbors. The British army found Philadelphia, which it occupied from September 1777 to June 1778, a far less secure position than New York City, though Pennsylvania's frontier suffered from British-sponsored Indian raids as much as New York's did. Maryland fared best, being only briefly visited by a British force in 1777 as it made its way toward Philadelphia. During 1782 Loyalist remnants like those based around New York pillaged the state's commerce and even defeated the Maryland navy in pitched battle, but otherwise Maryland's grain and stock remained in high demand among allied forces throughout the war. Virginia survived its first taste of war in 1775, when its last royal governor summoned the slaves to rebel against their Patriot masters, relatively unscathed. After that the state was spared more than an intermittent blockade of the Virginia Capes until the British raided inside the bay during 1779. Convinced that Virginia was powering the American war effort, they returned again in 1780 and 1781. Virginia's dispersed demography hampered defense against enemy penetrations, and in June 1781 Jefferson narrowly escaped capture by an enemy force operating seventy miles from its base. But most of the state was spared the virulent partisan warfare that afflicted the Carolinas and Georgia.

CONCLUSION

The prolonged traumas experienced by the civilian population during the Revolutionary War remained

part of the social memory of American society for several generations and complicated the approach of the successor generation to a second war with Great Britain in the early nineteenth century.

Impact on the Economy

In the decade prior to the American Revolution, the value of annual imports to the thirteen mainland colonies exceeded exports by £1 million per year. At the same time, the British colonies of North America were undergoing rapid economic growth, thus over-

shadowing any apparent negative aspects of the continuing trade deficits. As a result of both immigration and natural population growth, the population of the colonies rose from approximately 1 million in 1750 to nearly 2.5 million by 1775, thus rapidly increasing the availability of needed labor, both free and bound. The value of land and resources, through fast and steady improvements, also increased, spurring the development of a domestic market for locally produced agricultural and manufactured goods. Indeed, not only were the thirteen mainland colonies generally prosperous, their domestic economy was growing more rapidly than any other sector of the British Empire.

Despite this growth, the colonies were not self-sufficient. The prosperity of the colonies remained in every way dependent on their collective position within the British mercantile system. First, the colonies relied on trade with other parts of the British Empire, including the home country, the West Indies, Canada, Scotland, Ireland, and the Indian subcontinent. Goods obtained through trade allowed the colonies to concentrate on those areas of economic development that would benefit them the most—subsistence and cash-crop agriculture, mineral extraction and processing, craftwork for local markets, shipbuilding and the carrying trade.

Second, the colonies benefited from immigration during the 1760s and early 1770s precisely because they were part of the British Empire and thus havens of economic growth and opportunity. Servant and slave populations poured into the colonies in this period because their labor was required to increase economic development. Third, the colonies relied on British entrepreneurs. Although domestic capital was becoming more readily available for investment, British investors supplied a vital proportion of the monies and credit necessary for commercial and industrial development in the colonies. Trade deficits aside, in the 1760s the mainland colonies, particularly because of the greater availability of land, for the first time rivaled the West Indies as a growth area for future profits.

Despite attempts to avoid unwanted regulation and taxes, most American colonials realized that continued association with Britain was to their economic advantage. For their part, neither Parliament nor English merchant-manufacturers saw any reason to share economic power with the American colonies. By 1775, a war that was not economically advantageous to either side became unavoidable. The American economy was particularly hard-hit, and it was only the tremendous potential of the former col-

onies that allowed for the reestablishment of a vibrant economy within a decade after the Revolution.

IMMIGRATION AND LABOR

From the outbreak of war in the spring of 1775 until 1781, immigration to the thirteen rebellious colonies by both free and bound fell to a trickle. Natural increase during the war raised the free population by over 200,000, but far more British regulars arrived in the colonies than migrating settlers. Although natural increase among slaves continued during the Revolution, the evaporation of new imports plus the escape of slaves and some emancipations caused the slave population to decline by nearly 1 percent a year. Shortages of servant labor were more acute. Nearly all servant indentures required four to five years of service; approximately 20 percent of all servant indentures expired each year. Without immigration, the normal replacement pool of servants was not available. As a result, by 1780 the servant population was less than 20 percent of what it had been five years earlier.

Also, approximately 20 percent of all servants and slaves used the upheaval of the Revolution to attempt escape from bondage, and nearly half of them were ultimately successful. Even unsuccessful flight, however, deprived masters of labor for a period of time. Because bound labor was vital to production and the stability of the economy, the decline in new arrivals signaled an inevitable decline in the economy. The absence of free peoples migrating to the new United States also severely limited economic expansion.

WAR PRODUCTION AND MILITARY SERVICE

The war placed an enormous strain on the economy. The population, cut off from supplies formerly obtained through imports, was pressed to support a wartime economy without the immediate means to do so. Armies needed to be supplied while the colonial labor force was declining. Militias called up men to serve, and the newly organized Continental Army offered bounties for enlistment to attract both free men from among common laborers and servants and slaves who saw service in the military as an avenue toward freedom. Thus the workforce necessary to carry on war production was drained to create a fighting force to carry on the war itself.

AGRICULTURE AND INDUSTRY

Nearly half of all men between the ages of sixteen and forty-five served in some capacity during the war. This put a tremendous burden on women, who

for long periods had to manage their own farm labor while taking on as much of the work of absent males as they could handle. Their burden was especially heavy given the shortage of servants and slaves due to reduced immigration. Agricultural production could not keep up with demand.

Industry faced similar problems. Despite the fact that the Continental Congress and individual states exempted industrial workers from military service so as to maintain production, at least 20 percent of workers from mills and ironworks turned up on muster rolls for the militia and Continental Army. Moreover, before the Revolution servants or slaves made up over 40 percent of the full-time workforce; the rapid decline in the availability of these workers between 1775 and 1781 not only impeded industrial production of supplies, but also caused the failure of a significant proportion of businesses.

WAGE AND PRICE CONTROLS

Labor and production shortages as well as imminent inflation led the Continental Congress to attempt to set wage and price controls. With these measures they hoped to stabilize work and prevent profiteering. Congress also recommended that local assemblies ensure that needed goods were produced at fair prices and made available to the army. In the spring of 1776, however, the Albany committee of correspondence, one of several anti-British bodies throughout the colonies, questioned the concept of fair pricing: Were fair prices to be determined in relation to prewar prices or within the context of the war? Lacking the power to impose universal wage and price controls, Congress left it to the assemblies themselves to set restrictions while continuing to strongly suggest them.

Initially, assemblies followed a general plan that allowed for wages and prices to inflate slowly, based on the rates of 1774. By early 1777 New England states had tentatively agreed to hold the wholesale costs of imported goods to approximately 250 percent of their 1774 prices, with retail prices held to 20 percent above wholesale. Wages were to be limited to 20 percent above the 1774 rates. Despite the initiatives, the states had little capacity to enforce these controls. Beginning with payments to skilled workers, wages quickly rose beyond the limits, and prices rose even faster.

In New York in 1777 representatives from the mid-Atlantic, Maryland, and Virginia gathered for a convention intent on imposing a coordinated series of wage and price controls. All proposed plans, however, were rejected. This did not end attempts to im-

pose controls, but none were effective. Mainly because of spiraling inflation caused by the overdistribution of paper currency and its subsequent devaluation, by 1779 assemblies were trying to put limits on wages and prices that were only fifteen to sixteen times higher than in 1774. There was a universal distrust of the common currency and uncertainty in anything but a barter value for goods and services.

TAXATION

The Second Continental Congress in May 1776 took what power it could onto itself to carry on the war. But there were many things the Congress simply could not do without the acquiescence of the individual colonies. One of the key powers it lacked was the power to tax; it could only request funds from the colonial assemblies. It was up to the individual assemblies to decide whether and how much to tax so as to meet the needs of Congress.

Supporters of the Revolution and Loyalists alike had been force-fed a philosophy of “no taxation without representation” for nearly a decade. In this tax-averse climate, few people wished to take on wartime tax burdens. Members of each colonial assembly had to weigh their desire to hold on to their seats against the need to impose new taxes. For the first year of the war, not only was victory uncertain but independence was not even the goal; most colonists simply sought a redress of grievances. Taxing a divided people to support a war whose goal was, in 1775, at best vague was a difficult proposition.

Acting cautiously, colonies (and later states) initially imposed new taxes that would raise barely half of what Congress asked—if in fact they were all collected. Assemblies seemed to pass tax bills that matched congressional requests only when it was understood that a large proportion of the taxes would never be paid.

CURRENCY

With no treasury to draw from, no power to tax, and no initial credit on which to borrow, the Continental Congress was faced with the nearly impossible task of financing the rebellion. In June 1775 the Congress determined to create, print, and issue a national currency—legal tender for the payment of debt—to pay the debts Congress itself incurred. Beginning that month, a total of \$2 million was issued, and thereafter Congress essentially had monies printed and issued as needed—but backed by nothing. In the crisis of war, Congress tried to exercise as much fiscal responsibility as possible, but budgetary

concerns were secondary to the primary task of paying for needed supplies. By the time Congress ceased new issues of currency, nearly \$250 million had entered circulation in the form of Continental dollars, all of it virtually worthless. In a perverse twist, Congress had imposed acceptance of the currency through desperation: if farmers, manufacturers, carter, craftspeople, soldiers, and common laborers were to be paid for goods and services at all, they had to take the rapidly depreciating continental dollars and hope they would be worth something after a not-too-certain victory. In 1781, because it took \$146 in Continentals to buy what \$1 had purchased in 1775, even victory in the war could not reverse the devaluation.

At the end of 1781 even the most ardent rebels questioned the economic state of the fledgling nation. Could the new nation ever fulfill the potential it had shown in 1775? The situation looked grim as the peace talks in Paris began.

PROPERTY: CONFISCATION AND DESTRUCTION

The most obvious tax-evaders from the very beginning of the war were Loyalists. Although at least half the colonial population did not support the war, most of these people were neutral rather than in opposition. They may have questioned new tax burdens and refused to pay some or all of them, but they were not necessarily trying to undermine the war effort. Loyalists, however, viewed any effort to confront Great Britain militarily as treason and were not about to support such an effort financially.

For a time, Loyalists who were not vocal in their protest faded in with other tax evaders. But by 1777 Loyalists were being targeted to have their taxes collected; they faced imprisonment if they refused. In 1778 individual states began to pass confiscation acts that initially centered on the seizure of Loyalist property for nonpayment of taxes, but these acts quickly became another method to finance the war. Loyalists were labeled traitors to their states and to the new country to which they had never sworn allegiance; agents of the state assemblies confiscated their properties and auctioned it off to raise money for support of the Revolution.

The confiscation of Loyalist property did not adversely affect Loyalists alone. The process of claims against individuals for treasonous actions took time, and many personal grudges took on the aspect of loyalty tests. Many business owners were harassed by competitors and workers over other issues, but questioning the loyalty of someone who had taken a neutral stance in the war often resulted in boycotts

and physical attacks on individuals and property. Such activity slowed production and negatively affected the economy.

Confusion over ownership and use-rights also caused production delays and economic distress. For example, in 1774 George Taylor, an ironmaster who leased the Durham Iron Company in Bucks County, Pennsylvania, renewed his lease of the operation from the chief shareholder of the Durham Company, Joseph Galloway. In 1775 Taylor was the first ironmaster in the colonies to agree to the manufacture of ball and shot for the Continental Congress. The Durham Company produced ammunition for the Continental Army for two years, until the British invaded Philadelphia and the surrounding countryside. British soldiers attacked and damaged the Durham furnace, which remained out of operation for over a year until the British abandoned Philadelphia.

In the meantime, Joseph Galloway had declared his loyalty to Great Britain and fled Philadelphia with the British army in June 1778. When Taylor returned to Durham and attempted to get the ironworks operating again in the service of the United States, he found that Galloway's property had been confiscated under orders of the Supreme Executive Council and was to be inventoried and sold at public auction. It took Taylor nearly a year to plead his case through piles of red tape in order to begin operations and produce the supplies the rebel armies so desperately needed.

Destruction of property was a common consequence of the war. The coastlines of New York, New Jersey, Delaware, Maryland, and Virginia were the scenes of continuous raids by both rebels and the British, with both sides attacking and destroying the properties of their enemies—wharves, warehouses, ships, and mills. As the zones of battle moved through the states, destruction in the countryside followed. In New Jersey, eastern Pennsylvania, and Delaware, both armies scavenged for food and destroyed the farms, fields, fences, and livestock of those they determined to be supporters of the other side. The American armies usually distributed scrip (paper currency for temporary use) or continentals to pay for what they took from farmers (for what it was worth), but the British typically confiscated what they needed and moved on. When the war moved to the South, the Carolinas and Virginia were ravaged, particularly by the British under Lord Cornwallis, who, in frustration, instituted a scorched-earth policy against supposed rebels. The destruction of cities like Norfolk, Virginia, caused both immediate and long-term economic distress.

DEBT

The American Revolution was a time of severe economic hardship. The war left a legacy of economic problems that lasted for a dozen years after its conclusion. In late 1781, as the war wound down, the new United States could begin to calculate the price of independence. The debt to France, including direct subsidies and credit extended for supplies, was approximately £12 million, with interest accruing. Another £500 thousand was owed to the Dutch and Spanish. Congress had sold \$3,330 million in bonds to private citizens at between 4 and 6 percent interest; with an empty treasury, it had no immediate means to meet its postwar obligations. Congress was indebted to the suppliers of goods and services to the army for scrip written by quartermasters to the tune of more than \$100 million.

The debt situation in the states was just as bad. Most states had printed their own currencies to pay for supplies locally, and by 1781 over \$200 million in state-issued paper was in circulation. Although locals usually trusted their own state's currency more than the overly inflated continentals, most paper currency had lost at least 75 percent of its value, led by Rhode Island's issues, down about 87 percent. The states collectively were in debt to private citizens for over £5 million in unredeemed bond issues, which were accumulating interest at rates between 8 and 18 percent.

THE AFTERMATH OF INDEPENDENCE

In short, the economy of the new nation in 1781 was a shambles. The United States had combined debts of nearly £40 million, no national treasury, and a national government, under the Articles of Confederation, with no power to tax. It had no international credibility to borrow monies against. Its devastated countryside, including a manufacturing base that even at its previous best had supplied 10 percent of consumer needs, would take several years to recover. It was at least temporarily barred from its place within an international commercial network on which it had been dependent for 150 years.

The United States has a remarkable ability to rebound from disaster. Based on the state of the economy in 1781, the Revolution would likely have destroyed the future of most peoples. Little more than one decade later, because of the immediate efforts of Robert Morris, the superintendent of finance under the Articles of Confederation, and the fiscal vision of Alexander Hamilton, the constitutional United States was on the verge of two centuries of unprecedented growth.

Military History

The American War for Independence (1775–1783) began more than a year before the self-designated leaders of colonial political resistance to Britain could bring themselves to take the much more radical—and more revolutionary—step of declaring independence to be their goal. This fact had important implications for the progress and outcome of the Revolution. After resistance was abandoned as the only

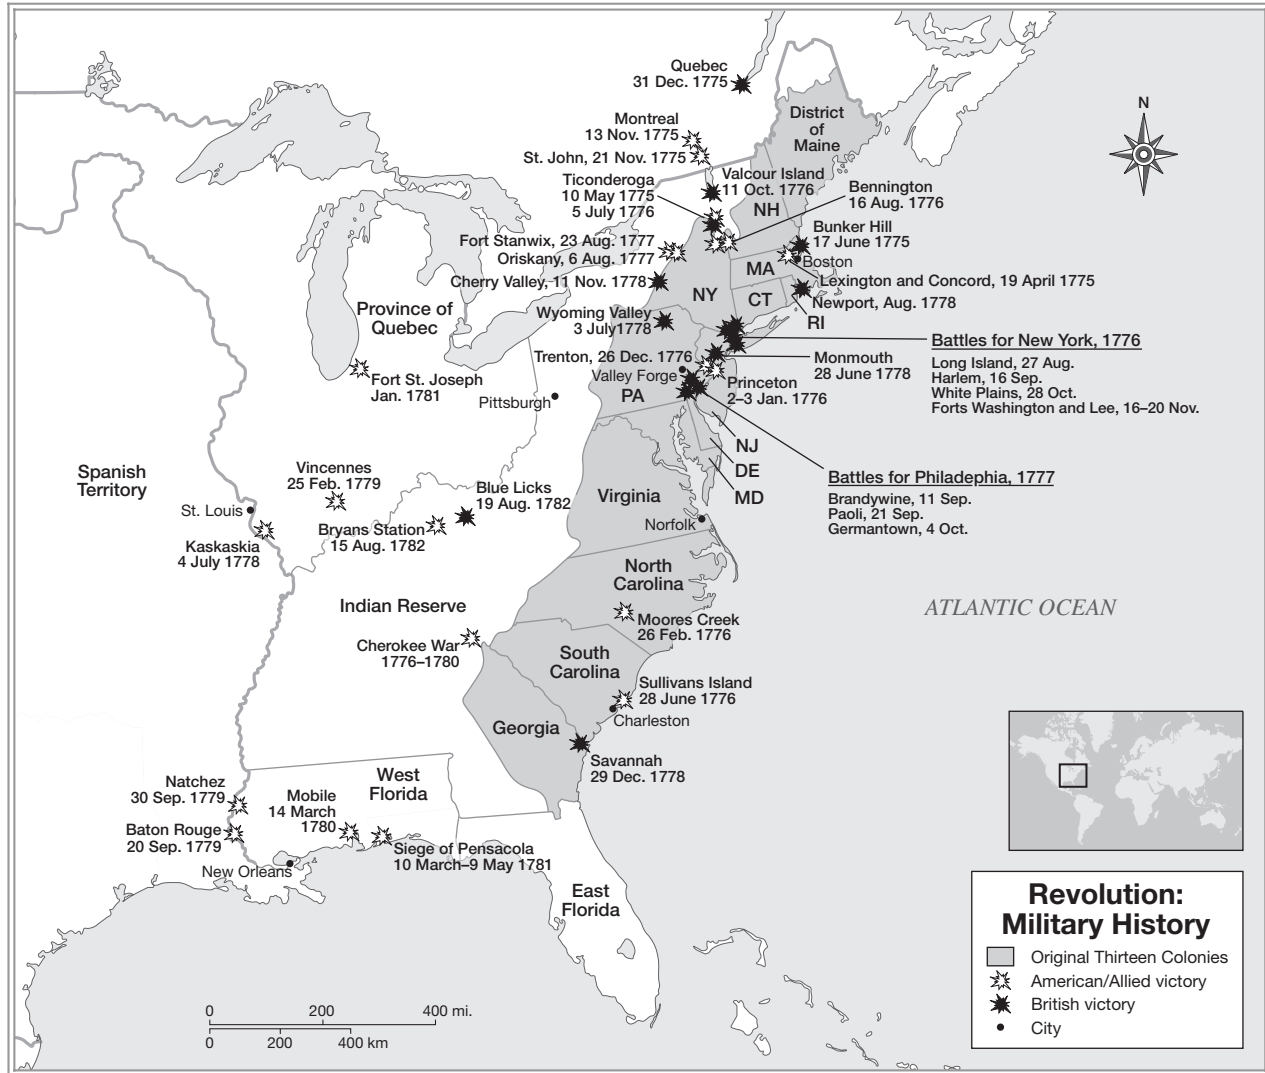

admissible objective of intercolonial organization, the tension between war-making imperatives and political operations assumed a life of its own and shaped the rest of the Revolution.

NEW ENGLAND

Each colonial region had its own military experience and culture, significant variations of a common British heritage. This complexity preoccupied Patriot leaders long before it landed in George Washington's lap when he accepted command of the projected Continental Army in June 1775. The war, if not the Revolution itself, began in New England, where communal solidarity, ethnocentrism, and a Puritan-derived variation of republican ideology colored its origin and influenced its character. Century-old traditions of town-based militia training, galvanic popular responses to external military threats, and what Fred Anderson has called a "contractual" approach to defense obligations shaped the region's behavior when British commander Thomas Gage sent redcoats from Boston into the nearby countryside on 19 April 1775. Regular British troops and minutemen unexpectedly and indecisively clashed several times that day at the Massachusetts towns of Lexington and Concord. Then the British withdrawal into Boston became a small calamity as waves of militia responders from southern New England harassed their movements, obstructed their retreat, and spontaneously besieged the town.

The Second Continental Congress, convening in Philadelphia in early May, hardly welcomed news of colonists and redcoats fighting near Boston. After taking steps to affirm their commitment to a political solution of the imperial crisis, the delegates faced up to the implications of Lexington and Concord and voted to adopt New England's "army of observation" and mold it into a continental army that could be kept under political control. George Washington, a forty-three-year-old Virginian with a mixed service record in the Seven Years' War (1756–1763), seemed the likeliest delegate to accomplish that objective. He left Philadelphia in mid-June and arrived near the lines around Boston on 2 July.

New plans by British ministers in London changed the situation in America. Three British generals—William Howe, Henry Clinton, and Charles Cornwallis—arrived in Boston to take charge of the army from the discredited Gage. On 18 June an effort to drive American forces from Breed's and Bunker Hills on the north shore of Boston Harbor ended inconclusively, with the redcoats controlling the battlefield but suffering heavy casualties. Yankee troops

surrendered the ground but gained a new regard for their own abilities. Washington, arriving at Cambridge, Massachusetts, two weeks later, made a fumbling start at the task of remodeling the army. He conceived, and imprudently disclosed, a distaste for New England’s insular communal culture and the kinds of fractious, self-directed soldiers that it produced. He also was uncomfortable with the large number of blacks serving in the militia.

NEW YORK AND CANADA

During 1775 other military actions—spontaneous and planned—spread from New England to the north and west. On 10 May, as the Second Congress convened, an awkward amalgam of irregular New England troops led by Ethan Allen and Benedict Arnold (separately commissioned by regional authorities acting privately) seized the isolated British garrison

at Ticonderoga in New York. They captured some old artillery, inflamed latent tensions between New England and New York, and embarrassed a Congress which still insisted that peace was its goal. In late June, Congress authorized an effort to seize Canada and bring it into the Revolutionary coalition. Adopting a pattern from late colonial-era wars, American forces advanced through the Hudson River–Lake Champlain corridor to Montreal and across the wilderness of northern Massachusetts (modern Maine) against Quebec. General Richard Montgomery, a veteran British officer in the Seven Years’ War, commanded the force from New York. Arnold led the expedition across Maine. Montgomery seized Montreal in November. In a blizzard on 31 December, the combined forces attacked Quebec but were repelled with heavy casualties. Montgomery was killed, becoming America’s first tragic hero of the Revolution.

Near Boston, Washington trained the New England troops while Congress struggled to make the army truly continental. In March 1776 the arrival of cannon from Ticonderoga broke the stalemate. Washington placed the guns on hills overlooking Boston harbor. General Howe and his brother, Admiral Richard Howe, in command of British naval forces, decided to abandon Boston rather than expose their forces to bombardment. They evacuated the city on 17 March and went to Nova Scotia to await reinforcements while the ministry in London forged better plans to crush the rebellion.

MIDDLE COLONIES

Both commanders eagerly moved the seat of war from New England to the mid-Atlantic region. That area was the economic engine of late colonial America, but its political complexity and social pluralism made it most resistant to independence and for both sides a difficult place in which to fight.

Washington placed his army in Brooklyn on western Long Island. The British, arriving by sea in July and August 1776, landed thirty-two thousand men on Staten Island. On 22 August, the redcoats crossed New York harbor to Long Island. Howe outmaneuvered Washington and on the evening of 26 August flanked his forces and badly defeated the Americans. Washington withdrew the survivors to Manhattan, then conducted a month-long retreat north into Westchester County. After the British won a less decisive clash at White Plains on 28 October, the Continentals crossed the Hudson River and retreated into New Jersey. On 16 November, Howe captured almost three thousand rebel troops at Fort Mifflin in northern Manhattan, then slowly pushed the Continentals southward across New Jersey toward the Delaware River. The Howe brothers had commissions as peace negotiators, and—hoping to avoid casualties or political bitterness—offered pardons to civilians who would swear allegiance to the crown. Thousands of Jerseyans emerged to declare their loyalty.

In December 1776, Washington sat with a few thousand men in Bucks County, Pennsylvania, fearing that, as he wrote to his brother in Virginia, the “game” was “pretty near up.” The Continental Congress adjourned that month to Baltimore while fleeing civilians virtually emptied Philadelphia. Then, with most Continental enlistments due to expire at year’s end, Washington crossed the icy Delaware on Christmas night and surprised a garrison of Hessians at Trenton, New Jersey. He followed this victory by defeating British reinforcements rushing toward

Trenton at the Battle of Princeton on 3 January 1777 and then marched his evaporating army into the hills of Morris County. The reversals in New Jersey demoralized British officers and especially American Loyalists. Many New Jerseyans quietly reversed themselves and signed oaths of allegiance to the Continental side. Congress returned to Philadelphia in March and accepted Washington’s plan for a permanent army, staffed by better officers and made up of economically poorer soldiers on long-term enlistments. Washington desperately tried to organize this new army while Howe again sought more reinforcements from his superiors in London.

The British strategic plan for 1777 called for an army to invade New York from Canada along the Hudson-Champlain corridor and sever radical New England from the more loyal Middle Colonies. That force was led by Howe’s subordinate, General John Burgoyne. Howe acknowledged the need to support Burgoyne, if necessary, but he heeded the advice of Pennsylvania Loyalist Joseph Galloway that his province could be reclaimed if the redcoats would only go there. Howe believed that he could capture Philadelphia, install a Loyalist government, and still have time to return to New York if Burgoyne needed assistance. These plans all failed disastrously.

The 1777 campaign began awkwardly. Burgoyne packed heavily and moved slowly down Lake Champlain toward Albany. Howe tried unsuccessfully to lure Washington into a decisive action on the plains of eastern New Jersey and then in July took fourteen thousand troops to sea in his brother’s fleet, leaving seven thousand redcoats in New York under Henry Clinton. In August, Washington marched his troops back and forth across New Jersey, seeking to protect both the Hudson Valley and Congress in Philadelphia.

Delegates from New England and the southern states feared that their regions were the real target. In late August, Howe appeared in Chesapeake Bay and landed his army at Head of Elk, Maryland. As he moved toward Philadelphia, Washington raced into Pennsylvania and placed his army in Chester County. On 11 September 1777, the two armies clashed along the Brandywine Creek. Howe again outflanked the Continentals and battered them badly. Washington extracted the army from destruction and retired toward Philadelphia. Two weeks later Howe outmaneuvered him and marched into the city. The Continental Congress fled again, this time to York, Pennsylvania, beyond the Susquehanna River.

On 4 October, Washington attempted a reprise of Trenton. He launched a complex overnight assault

on the main body of British troops, which was camped at Germantown, northwest of Philadelphia. The operation began well but unraveled in fog, smoke, and the confusion of inexperienced American troops. Howe secured his winter quarters. In December the Americans limped to the nearby village of Valley Forge, committed to protecting the security of Pennsylvania's radical government and Whig citizens. Meanwhile, in New York State, American general Horatio Gates and a technically independent Northern Army twice defeated Burgoyne's force at Saratoga in October with the help of Benedict Arnold. A negotiated convention required that the British troops be sent to Britain, but Congress reneged on the agreement, and they were eventually interned in Virginia for the duration of the war. The American triumph at Saratoga gave Benjamin Franklin, negotiating in Paris, the credibility to persuade France to recognize American independence and intervene in the war. In Pennsylvania, Washington labored under the widespread perception that his own campaign had failed and under criticism from rival officers and politicians.

The Continental Army spent the winter of 1777–1778 in hardship at Valley Forge, keeping eastern Pennsylvania pacified and depriving the British of the easy fruits of their victory the previous fall. France's entry into the war on the rebel side in March 1778 changed the dynamics of the rebellion. Britain went on the defensive in the mainland colonies, determined to protect the invaluable Caribbean sugar islands. Howe resigned, and his successor, Henry Clinton, abandoned Philadelphia in June 1778. Washington's retrained troops chased him into New Jersey, where the two armies fought to an intense draw at Monmouth Courthouse on 28 June. The British retreated to their garrison in New York City while the Continentals took up positions around northern New Jersey and southeastern New York. For the next five years the two sides faced each other across a no-man's-land in the Lower Hudson Valley, but the war's most intense fighting was over in the North.

FRENCH ALLIANCE AND SOUTHERN WARFARE

The arrival of French land and naval forces in America and the contest over the West Indies drew the

mainland war southward and toward the sea. Even after disappointments in New Jersey and Pennsylvania, British strategists hoped that the South might offer a bastion of loyalism that armies could mobilize for the restoration of civilian government. In the fall of 1778, Clinton detached thirty-five hundred troops to invade Georgia and end the rebellion there. They succeeded at first, capturing Savannah in December, then turned their sights to South Carolina. In May 1780, Clinton led a siege that captured Charleston, where more than five thousand American defenders surrendered. In August a British force crushed an American relief army under Horatio Gates at Camden, South Carolina, and British opinion sensed victory. In 1780 the North experienced currency inflation; bitter winter cold; war weariness; mutinies in the Continental camps at Morristown, New Jersey, in May; and in September the treason of Benedict Arnold in his failed attempt to allow the British to take West Point.

But the British forces detached from New York were already spread thin and had little hope of significant reinforcements from home. Clinton pardoned southern rebels in exchange for oaths of allegiance, which enraged Loyalists and reignited guerrilla warfare as the regular redcoats moved away. Local rebel forces crushed a small army of their Loyalist neighbors at King's Mountain in western North Carolina in October 1780. Washington detached a force of Continentals into the South under Nathanael Greene, one of his most trusted subordinates. Greene confronted the aggressive British commander, Charles Cornwallis, and outmaneuvered and outwitted him. The frontier Virginia rifleman, General Daniel Morgan, defeated Loyalists under Banastre Tarleton at Cowpens, South Carolina, in January 1781, and Greene and Cornwallis fought to a savage draw at Guilford Courthouse in North Carolina during March. Francis Marion, a South Carolina militia officer, contributed to these successes in the South by disrupting British supply lines, supplying intelligence, and suppressing Loyalist activities.

YORKTOWN

After this point, organized British strategy broke down against a rising tide of irregular conflict, reflecting the Appalachian South's complex late colonial settlement history and ethnic composition. Benedict Arnold, finally given a command by the British, entered Virginia to support the teetering Cornwallis, who took command of Arnold's men and moved east to the Chesapeake coast, on the peninsula between the James and York Rivers. Washington, still occu-

pying the Hudson Valley and hoping for a decisive clash with the British in New York, learned that a French fleet in the West Indies would operate along the mainland coast. Seizing the initiative in August 1781, he joined with a French army in Rhode Island, under the Comte de Rochambeau, and made a forced march to the head of Chesapeake Bay. General Clinton, in New York, belatedly realized Cornwallis's jeopardy and sent a fleet to his rescue. The French fleet got there first, however, and sealed the mouth of the bay. Washington's and Rochambeau's forces were ferried down the Chesapeake to the York Peninsula, where they besieged Cornwallis's force at Yorktown. On 19 October 1781 Cornwallis surrendered, ending the last realistic hope of successfully ending the rebellion by military means.

Thus, the British Empire in mainland North America ended a few miles across the peninsula from the site of the first permanent English colony at Jamestown 174 years before. The Revolution had become a global war with France by then, however, and while that contest dragged on, the rebels remained in limbo. Occasional British successes at sea against French fleets revived hope that the colonies might be restored. Washington returned to New York and New Jersey and, with a diminishing army in chronic financial crisis, resumed watching the British headquarters in New York.

BACKCOUNTRY AND INDIAN WARFARE

Intramural conflict among civilians in the backcountry South, having been ignited by the presence of regular armies there, flared long after they departed. Some of the war's least noticed, but enduringly important, combat arenas were in the interior of both the North and the South. In 1779 Washington decided to put an end to native resistance on the northern frontier by sending General John Sullivan of New Hampshire northwest from Pennsylvania into the Finger Lakes region of New York State. Supported by other columns launched from the Mohawk and Allegheny valleys, Sullivan's forces conducted a burn-and-destroy mission aimed at native agricultural subsistence systems. Forty towns were burned and an exhaustive quantity of foodstuffs captured or destroyed. While no one could claim victory in the episode, and while raiding continued along the northern frontier, the attacks significantly weakened the ability of the Iroquois to play a meaningful part in the postwar American Republic. From Kentucky in 1778, George Rogers Clark led frontier forces west into the French-settled, but British-controlled, Illinois country, where he captured old colonial towns

and harassed pro-British Indians. These and other interior campaigns and conflicts did not tip the military balance of power in the war, but they showed the direction for the American military after the war.

FUTURE ISSUES

In 1783 the Treaty of Paris was signed and the last redcoat soldiers left America. The newly independent nation faced its first military problems in learning how to dismantle a small, poor, core Continental Army whose privates had not been paid for years and whose officers were disgruntled. That problem was solved by a combination of creative paperwork and citizen-soldier virtue, but the American government proved as reluctant as it was fiscally unable even to have a real national army. Deciding how to balance conflicting needs for security, liberty, and thrift occupied the imaginations of the best political actors and thinkers who emerged from the experience of the Revolutionary generation. Many of the same problems, in different combinations and guises, continue to haunt Americans today.

Military Leadership, American

In 1775, the year of revolution, the Constitution's clear delineation of military authority was still twelve years in the future. An untried political body, the Continental Congress, combined what would later be defined as executive and legislative authority. Revolutionary leaders had a profound fear of a standing army, a permanent establishment maintained by government and supplied by public treasury. They believed it was the path to tyranny and well knew that throughout history tyrants arose from the ranks of successful military leaders. Yet to win the war Congress had to create a standing army and appoint men to lead it. The tensions between political beliefs and military necessity seriously impaired the rebels' war effort.

ORGANIZING FOR WAR: THE FIRST APPOINTMENTS

In June 1775 Massachusetts delegates asked the Continental Congress to accept responsibility for the New England militia who were blockading the British in Boston. Congress agreed and appointed George Washington as the army's commander in chief. Congress also created the ranks of major general and brigadier general to serve as Washington's senior subordinates.

Congress commissioned all officers, but individual states actually nominated candidates up to and including the rank of colonel. The states chose men who were prominent leaders in their local communities. The basis for their selection was experience, the ability to raise men, and political reliability. These qualifications did not necessarily equate with military talent or even competency. In addition, each state was anxious that it receive its "quota" of senior leaders.

The first set of appointments demonstrated the importance of political considerations. Congress named Artemas Ward of Massachusetts first major general. Ward had an excellent record as a militia administrator and was an experienced politician. Because Massachusetts supplied the most men to the so-called Boston Army, it was politically prudent to make him the senior major general. There was less

consensus regarding Washington's recommendation that Charles Lee be the second major general. Lee had served as an officer in both the British and the Polish armies and was politically reliable. However, his arrogant personality offended many. Only the staunch backing of John Adams confirmed Lee. Horatio Gates was another former British officer with the right political connections. Gates filled the position of adjutant general with the rank of brigadier general. Congress hoped that his staff experience would provide Washington with strong administrative assistance.

Trouble came when northern delegates observed that, although Virginia had yet to enlist a single Continental soldier, Virginians held three of the army's four top positions. A furious political scuffle ensued. Each colony strongly promoted its own favorite sons, with men being nominated and confirmed largely on the basis of which colony they represented. Congress even doubled the number of major generals to appease New York and Connecticut.

Philip Schuyler belonged to one of New York's leading families. He had served as a major in the

French and Indian War, specializing in logistics. Schuyler's combination of political connections, extensive business interests in the Albany area, and friendship with Washington made him a logical choice to command the northern army on the Canadian–New York border. Also a French and Indian War veteran, Israel Putnam was appointed because of an impasse among the Connecticut delegation. Putnam was an early, vocal leader of the Connecticut Sons of Liberty, but he was fifty-seven years old and wore his years hard. Ultimately, his status as a folk hero trumped doubts about his age.

Having dealt with the politically tricky business of creating major generals, Congress tackled the challenge of selecting brigadier generals. Again politics reigned supreme. Three were granted to Massachusetts (Seth Pomeroy, William Heath, John Thomas), two to Connecticut (David Wooster, Joseph Spencer), and one each to New York (Richard Montgomery), New Hampshire (John Sullivan), and Rhode Island (Nathanael Greene). Congress gave little regard to these men's seniority within their respective colonial establishments. This proved a serious

blunder as rank-conscious officers quarreled with one another about who deserved to command what. Joseph Spencer of Connecticut went home when he learned that his former subordinate, Putnam, was senior to him.

The newly appointed brigadiers all had military experience of some kind. Many had fought in the French and Indian War although none had particularly distinguished himself. When making its first selections, Congress had tried to bridge the gap between provincial jealousy and Continental unity. The result was a mixed bag of military leaders. Some had been promoted beyond their capacity. Others lacked either the physical or moral courage necessary for high command. The sixty-nine-year-old Massachusetts brigadier, Seth Pomeroy, lacked the physical stamina required for field service. Among the most egregious displays of ego, Charles Lee believed that because of his service in the British army he deserved the highest appointment. He proceeded to undermine Washington's standing with Congress. Eventually, Washington replaced Lee after his notable blunders at Monmouth (28 June 1778).

Under British rule American officers had little chance to gain military experience at the higher command levels. Consequently, Congress had to choose among men who had yet to prove themselves. Not surprisingly, many were unequal to the challenge. Yet among the original appointments were several rough gems. Greene developed into one of the best American strategists. Montgomery showed brilliant potential before his death at Quebec (1 January 1776). Heath, through his stewardship of the vital Hudson Highland post, became one of the few generals Washington could entrust with independent command.

The wrangling associated with the selection of only thirteen generals dissuaded Congress from selecting the hundreds of field-grade officers necessary to lead the army at the regimental level. Instead, Congress decided merely to confirm the colonies' recommendations. Like the generals, the field-grade officers needed time and experience to learn the art of command. On 8 December 1775 Congress created a standing committee, composed of one member from each colony, whose job was to review applications for field-grade officers and to report on their qualifications to the full Congress. Thus Congress, although it had the power to appoint and promote all officers above the rank of captain, carefully weighed the preferences of the thirteen states when evaluating officers.

As the war progressed the power to select field-grade officers became subsumed in a greater political debate. Congressmen recognized that they were setting a precedent by laying the foundation for an American army and defining that army's relationship to civil rule. Those who wanted a stronger central government wanted more congressional control over the army. Those who wanted to preserve the autonomy of the colonies, and later the states, wanted to retain the power of selection. This debate interfered with the purely military requirement to put the best men in leadership positions.

By the start of 1776, new Continental regiments from the southern and middle colonies had formed. Congress organized four administrative departments: Southern, Middle, Northern, and Canadian. It placed a major general in charge of each department, with Washington retaining his position as commander in chief. Because the expanding war effort required more general officers, Congress elected six more brigadiers: John Armstrong and William Thompson of Pennsylvania, James Moore and Robert Howe of North Carolina, Andrew Lewis of Virginia, and Lord Stirling of New Jersey.

In the summer of 1776, the main army under Washington comprised 31,000 officers and men, its peak strength for the entire war. On 9 August 1776 Congress promoted Heath, Spencer, Sullivan, and Greene to major general and added six more brigadiers. Unique among the original brigadiers, Wooster was passed over for promotion—Congress's punishment for the brigadier's quarrelsome conduct in Canada. In addition to the Continental generals, the militia, which composed some 57 percent of the Main Army, came with their own brigadiers. The states had the power to select officers for the militia.

GENERALS FROM ABROAD

When the Americans revolted against British rule, the conflict attracted a host of European military men. Some sincerely sympathized with the rebel cause; others were mere mercenaries who saw better opportunities for promotion in America or impoverished minor nobles seeking to restore their fortunes. Unfortunately, neither American diplomats in Europe, most notably Silas Deane, nor congressmen could evaluate a candidate's true military experience and capabilities. Armed with letters of introduction of dubious validity, European officers swarmed the halls of Congress demanding high-ranking positions. Too often Congress obliged. For example, Congress angered several rank-conscious American generals by elevating Thomas Conway, an Irish veteran

of the French army, to the position of inspector general with rank of major general. To make matters worse, Conway was an opinionated officer and a severe critic of Washington's leadership. Congress later defused the volatile situation by backing Washington over Conway when the latter challenged Washington's leadership during the so-called Conway cabal in the winter of 1777–1778.

Overall, Washington considered very few of the foreign officers useful. Most prominent among the exceptions was Friedrich von Steuben, a Prussian veteran who had served with Frederick the Great. Steuben began his service as an unpaid volunteer, reporting to Washington at Valley Forge in February 1778. Steuben introduced a new drill system and began personally training the Continentals. Washington recommended and Congress approved his promotion to major general with the position of inspector general. Because of Steuben's invaluable contribution to American military proficiency, he is recalled as the "the first teacher" of the American Army. Another foreign officer who served with distinction was the Marquis de Lafayette, a wealthy young French nobleman whose idealism brought him to America to volunteer. Congress commissioned him major general without command in July 1777. Washington took an immediate liking to the nineteen-year-old. Lafayette behaved gallantly and was wounded in battle at Brandywine, in Pennsylvania, on 11 September 1777, establishing his reputation among Americans.

The second tier of useful foreign officers includes Johann Kalb, known as Baron de Kalb, a remarkable Bavarian soldier who died gallantly at Camden, South Carolina (16 August 1780); the Polish nobleman Casimir Pulaski, a fiery, quarrelsome cavalry leader who received a mortal wound during a foolish cavalry charge at Savannah (9 October 1779); and the Frenchman General Louis Duportail, who taught the rebels the science of military engineering. Another Pole, Thaddeus Kosciuszko, also provided useful engineering expertise when planning the Delaware River forts, fortifying the heights at Saratoga, and planning the defense of West Point. He received a brigadier general's brevet in 1783.

PARTISAN LEADERS

The Revolutionary War featured relatively few formal battles in the European style. Instead the war was fought by means of innumerable outpost battles, ambushes, and raids involving partisan operations. Rebel partisans provided American leaders with useful military intelligence while making life

for the British outside of their own picket lines insecure and dangerous. By threatening British supply lines, the partisans largely restricted the British to coastal enclaves and fortified positions. One of the first successful partisan officers was Ethan Allen. Allen achieved national reknown when he led the "Green Mountain Boys" against Fort Ticonderoga in May 1775. Later in the war in the Northeast partisans were active in the Lake Champlain valley during the Saratoga campaign and made the area around New York City a ravaged no-man's-land.

It was in the South that American partisan leaders demonstrated a particular aptitude for guerrilla warfare. After the fall of Charleston in May 1780, Francis Marion kept the war alive through his partisan operations in the coastal swamps and forests of lower South Carolina. In the disputed backcountry, three great partisan leaders, Thomas Sumter, William Davie, and Elijah Clark, fiercely resisted British occupation. Sumter was a wealthy South Carolina planter. Although sometimes careless of routine security and guilty of poor tactical judgment, he fought seven set battles against the British and Loyalists. His tenacity made his name a rallying cry for the rebels throughout the Carolinas. Davie was a prominent North Carolina lawyer who outfitted a mixed cavalry and infantry force at his own expense. A skilled swordsman, Davie led his partisans with dash and courage and is reputed to have personally slain more foes with his saber than any other American officer. Clark was a prosperous Georgia farmer. Although overshadowed by more flamboyant leaders, Clark proved a steady and effective guerrilla leader and almost single-handedly kept the rebel cause alive in Georgia after the British conquered the state.

ASSESSING THE LEADERS

Because militia made up such an important part of the rebel force, the ability to use them effectively was crucial. Not all senior officers had this talent. Washington mishandled them during the New York campaign. Gates suffered a rout at Camden when his ill-positioned militia broke on first contact. Yet under the command of generals who understood their weaknesses and strengths, militia provided vital service. One week after receiving a militia commission as brigadier general, John Stark raised 1,492 militia, some 10 percent of all men on New Hampshire's list of enrolled voters. He then led them to victory against German professionals at Bennington, Vermont (16 August 1777). Daniel Morgan's fight talk before battle at Cowpens, South Carolina (17 January 1781), perfectly addressed his militia's anxiety.

His brilliant tactical placement led to overwhelming victory. Greene followed Morgan's tactical notions regarding the use of militia to inflict serious losses at the pyrrhic British victory of Guilford Courthouse, North Carolina (15 March 1781).

On the formal battlefields, energy, drive, and the determination to win or die separated the top tier from the rest. Benedict Arnold possessed these qualities and contributed enormously to rebel success from the war's start through to the decisive action in New York at Saratoga (19 September 1777). When Congress failed to reward Arnold adequately, the sting of thwarted ambition led him into treachery and treason.

When the war began rebel officers gained leadership positions largely on the basis of their political rather than military credentials. Even those men such as Washington who had a lengthy service record were untried at the higher command levels. In the first two years of war, military blunders very nearly undermined the patriot cause. Then, with fortunes at low ebb, Washington conceived and led his brilliant counterstrokes at Trenton (31 December 1776) and Princeton (3 January 1777). But for these victories there would have been no army to win the decisive battle at Saratoga in the summer of 1777 or the final triumph at Yorktown in 1781.

From 1777 on American military leaders displayed increasing competence. Experience nurtured latent talent while combat exposed the cowards, drunks, and weak leaders. The commander in chief learned which men he could trust and placed them in positions of responsibility. By delegating authority to capable subordinates, Washington could attend to higher strategy. Washington gained the strategic insight that as long as he could maintain an effective Continental force, the British could not win the war. Despite the incessant problems created by having too few men and weapons, insufficient supplies, and widespread hunger and disease, he consistently displayed composure and an unwillingness to accept defeat. Washington and the rebel cause became synonymous. Although not a great strategist and an even poorer battlefield tactician, Washington truly was the indispensable leader of the American Revolution.

Naval War

In 1775 Britain had the largest navy in the world and as recently as the Seven Years' War (1756–1763) had defeated both the French and Spanish navies. The Americans had no navy. Thus the Royal Navy could sweep American merchant ships from the oceans, bringing economic pressure to bear on the rebellious colonies. The British could also transport military supplies and troops to North America, move them at will along the coast, and extract these forces if necessary.

At the beginning of the war Continental leaders were divided about the wisdom of sending out ships against the British, but in October 1775 they voted to outfit two vessels to intercept transports carrying British troops and military supplies. Congress also established a Naval Committee to oversee this activity. It purchased merchantmen for conversion to warships and in December 1775 authorized construction of thirteen frigates (five of thirty-two guns, five of twenty-eight, and three of twenty-four), to be built by March 1776 as commerce raiders. Progress was slow and only the *Randolph*, *Raleigh*, *Hancock*, and *Boston* and a few smaller warships were able to get to sea in 1777.

In February 1776 the commander of the fledgling Continental Navy, Commodore Esek Hopkins, set sail with a motley collection of small warships. On 3 to 4 March, in the only successful large American fleet operation of the war, Hopkins captured Nassau in the Bahamas, securing guns and supplies. During their return voyage, on 6 April the Americans fell in with the British frigate *Glasgow* and its tender but took only the tender.

For the first two years of the war the British were able to move by sea at will. In March 1776 they evacuated Boston, which the Continental militias had blockaded from the land. In July 1776 Admiral Lord

Richard Howe's fleet landed 32,000 British troops on Staten Island to begin the New York campaign. British naval control of the Hudson River brought the surrender of Fort Washington in November 1776, with 3,000 prisoners, 100 cannon, and a large quantity of munitions. The British again used their navy to land troops to capture Fort Lee, New Jersey. Continental commander General George Washington then withdrew what remained of his army across the Delaware.

The British had planned a secondary offensive from Canada to isolate New England. To meet this threat, Brigadier General Benedict Arnold supervised construction of a force of gondolas and galleys on Lake Champlain. Although the Continentals were defeated in two naval battles on the lake on 11 and 13 October, Arnold delayed the British sufficiently that they postponed their offensive.

The British also conducted naval operations in the American South. In June 1776 Admiral Sir Peter Parker sailed to Charleston, South Carolina, with an expeditionary force under Major General Sir Henry Clinton. Poor British planning and a stout Patriot defense from Fort Sullivan repelled them. Several British ships grounded, and accurate American fire led to destruction of the new frigate *Actaeon*.

Some American captains, notably John Paul Jones and Lambert Wickes, also carried the war to the British Isles and attacked British merchant shipping. Jones also won the most spectacular engagement of the war, the sanguinary 23 September 1779 contest between his converted French East Indiaman *Bonhomme Richard* and the British frigate *Serapis*. But for the most part the Continental Navy accomplished little. The navy continually suffered from a lack of experienced captains, inadequate funding, and the attractiveness of privateer service.

Eleven of the thirteen colonies also raised navies. These were limited to very small craft, many of them barges, employed primarily in coastal defense and along rivers. The state navies had little impact on the war.

The Americans did experiment with new types of weapons. On the night of 6 to 7 September 1776 they employed inventor David Bushnell's primitive one-man submarine, the *Turtle*, in an unsuccessful attempt to attach a mine to Admiral Howe's flagship, the *Eagle*, in New York harbor. The Americans also sent floating mines against British ships but with little effectiveness.

American privateers were, however, highly successful. This type of combat fit well with the decen-

tralized and individualized character of the colonial military effort. During the years 1776 to 1783 Congress authorized 1,697 privateers with 55,000 crewmen and mounting 15,000 guns. State-sanctioned privateers added another 1,000 ships.

For the first two years of the war, the Royal Navy had the resources to combat most privateers,

but after 1778 colonial privateers took advantage of the reduced British naval presence off the American coast and their ability to use French bases. During the war, colonial privateers took some 2,200 British ships valued at £66 million. Insurance rates for British shipping increased 30 to 50 percent, adding to pressure on the British government.

British naval weaknesses, including numerous ships in poor repair, were not apparent as long as the nation was fighting a weak naval power, but the entrance of France into the war on the side of the colonies in 1778 dramatically changed the situation. The French had spent a decade rebuilding their naval strength and their fleet approached that of the British in size. This forced the British to defend both their home islands and empire, and they did not have the resources to do both. In 1778 France had some sixty ships of the line, a number of which were better ships than those of the British. The Royal Navy had seventy-three ships of the line at sea or in good repair. When Spain entered the war in alliance with France in 1779, it added another forty-nine ships of the line. The Dutch were drawn in a year later. What had been a localized struggle now became a world war with the North American theater only a secondary one for the British navy. Worse, Britain had no continental allies, and the French could focus on the war at sea. The British were forced to fight in the Channel, in the Caribbean, off North America, and in the Mediterranean, and they lacked the resources to be everywhere successful.

It could have been worse for the British. French and Spanish attacks on the British Isles and on Gibraltar foundered on a combination of inept admirals, intra-allied squabbles, and effective actions by outnumbered British forces. In the Western Hemisphere the French first concentrated in the Caribbean, where they seized a number of British-held islands and even threatened Jamaica.

French expeditions to North America were at first hesitant and unsuccessful. Vice Admiral Charles Hector Comte d'Estaing demonstrated a lack of aggressiveness off Delaware, New York, and Rhode Island in the summer of 1778. D'Estaing allowed British Admiral Howe with numerically inferior forces to drive him off. Still, the French managed to land ground troops in America under General Jean-Baptiste-Donatien de Vimeur, Comte de Rochambeau.

In July 1779 Commodore Dudley Saltonstall led an attack by Massachusetts on a British fort at Bagaduce (Castine) on the Penobscot River in Maine. With seventeen warships and twenty-four supply vessels,

it was the largest colonial naval expedition in the war and the largest American amphibious assault until the Mexican-American War. A British squadron from New York arrived on 13 August; all the American ships were destroyed, and five hundred men were killed or taken prisoner.

In 1778 the British had shifted their military operations to the American South. In December 1778 they took Savannah and by early 1779 had secured Georgia. In 1780 General Clinton took advantage of the departure of the principal French fleet for France and assembled 14,000 troops for the largest British offensive force since 1777, landing it south of Charleston that February. Charleston capitulated on 12 May with the loss of 5,466 officers and men, 400 cannon, and half a dozen small warships. It was the greatest military disaster to befall the Patriots during the war.

The French naval presence was decisive in 1781. Admiral François Joseph Paul, Comte de Grasse, sailed north from the West Indies and blockaded what remained of Clinton's Charleston force that had moved to Yorktown, Virginia, on the Chesapeake Bay. Washington and Rochambeau, meanwhile, brought troops down from New York to contain the British on land, while de Grasse blockaded the bay. Although the Second Battle of the Chesapeake of 5 September 1781, fought between twenty-eight French ships of the line and nineteen British ships of the line under Admiral Thomas Graves, was tactically indecisive, de Grasse achieved a strategic victory in that he was able to continue the blockade of Yorktown. At the same time d'Estaing arrived with additional ships and heavy siege guns, whereupon Graves returned with his ships to New York. Blockaded by French and Continental Army forces by land and sea, more than eight thousand men at Yorktown surrendered on 19 October. This British defeat brought the fall of the government in London and a decision to seek peace. The British had lost naval control of the coast for a brief period at this decisive moment. In the Battle of the Saints in the West Indies on 12 April 1782, Admiral Sir George Brydges Rodney's British fleet defeated de Grasse and the French fleet, but it came too late to affect the war's outcome.

Meanwhile, the Continental Navy had all but ceased to exist. Of fifty-three ships in the navy during the war, only two frigates—the *Alliance* and *Hague*—were in service at war's end. Despite its failings, the navy had captured or sunk almost two hundred British ships, carried dispatches to and from Europe, transported funds to help finance the Revo-

lution, forced the British to divert naval assets for the protection of commerce, and helped to provoke the diplomatic confrontation that brought France into the war. Nonetheless it was the French naval intervention that had made possible the conclusion of peace in 1783.

Prisoners and Spies

Prisoners in the Revolutionary War suffered unnecessarily from the bitter political debate over their legal status that the British and Americans carried on throughout the conflict and also from administrative mismanagement and neglect on both sides.

PRISONERS: NUMBERS, FACILITIES, AND TREATMENT

The records are incomplete, but the best scholarly estimations are that the British captured 15,427 American officers and soldiers and as many as 8,000 American sailors (both from the navy and from privateers). In addition, the British seized many American sailors and impressed them into naval service. The number of British, German, and Loyalist prisoners in American hands is even more uncertain. The available evidence suggests that the overall prisoner totals were roughly equal between the two sides.

Both the British and Americans made large hauls of prisoners for which they were not fully prepared to care. The British took about 1,200 in Canada dur-

ing 1775-1776; 4,430 in the New York campaign of 1776; about 1,000 in the Philadelphia campaign of 1777; 453 at Savannah, Georgia, in December 1778; and about 4,700 in South Carolina during 1780. The Americans captured 918 at Trenton, New Jersey, in December 1776; about 5,800 at Saratoga, New York, in October 1777; and about 8,000 at Yorktown, Virginia, in October 1781.

The British established local prison facilities wherever their operations required, but New York City served as their main detention center in America from 1776 to 1783. Although a variety of buildings in the city were used, most American soldiers were confined in three multistoried stone sugar houses, while their officers usually were allowed to lodge at their own expense in private homes in the city and on nearby Long Island. American seamen were imprisoned in obsolete warships and transports stripped of their rudders, masts, and rigging, most of which were anchored in Wallabout Bay on the Brooklyn side of the East River. The highest number of army prisoners held at New York at any one time was 4,430 in December 1776, and for the prison ships it was about 4,200 in 1778. Sailors captured in European and African waters were sent to one of two prisons in Britain—Mill Prison near Plymouth and Forton Prison near Portsmouth—where the combined inmate population peaked at about 2,200 men in 1779.

Survivors of the British prisons accused their captors of imposing excessive and deliberate suffering, but the scholarly consensus is that while their sufferings were often severe, they were seldom the result of cruelty. The hardships endured by American prisoners, Larry G. Bowman says, were caused principally by British inattention and haphazard organization, a desire to minimize costs, and the limitations of eighteenth-century technology and medicine. Prisoners received only two-thirds of the barely adequate food ration issued to British soldiers and sailors, while bedding and winter clothing were not regularly supplied at all. The worst conditions existed on the twenty-two known New York prison ships, most notoriously the *Jersey*, where overcrowding, poor ventilation, and unsanitary handling of food and human wastes resulted in an extraordinarily high death rate from disease.

For want of adequate resources and organization, Americans did not treat prisoners significantly better. Most captured British and German soldiers were sent to interior parts of Pennsylvania, Maryland, and Virginia to be quartered in log barracks inside wooden stockades. The troops taken at Saratoga,

however, were initially marched to Cambridge, Massachusetts, because the convention that British general John Burgoyne (1722–1792) and American general Horatio Gates (1728–1806) signed on 17 October 1777 allowed them to sail from nearby Boston to Great Britain with a promise not to serve again in North America. Realizing that sending them to Britain would free other troops there, in Ireland, and at Gibraltar to come to America, Congress avoided implementing the terms of the convention. In late 1778, therefore, the Convention Army, as it was called, was sent to a prison camp near Charlottesville, Virginia.

The prisoners' hardships were prolonged by the failure to negotiate a general exchange of all captives until the last months of the eight-and-a-half-year war. Although both sides agreed that trading prisoners made good sense for practical and humanitarian reasons, the seven meetings that they held on the subject between March 1777 and September 1782 ended in stalemate over the political issue of American independence. The Continental Congress insisted on negotiating a formal written exchange agreement—a cartel—while the British ministry refused to let the matter be discussed on grounds that cartels could be negotiated only by sovereign nations, not by rebelling colonies. While classifying captive Americans legally as rebels, the British nevertheless treated them as prisoners of war in practice. On the local level, British commanders reached informal agreements with their American counterparts to permit some humanitarian aid—food, clothing, and money—to be sent to prisoners, and they also arranged numerous partial exchanges. It was not until the eighth prisoner exchange meeting in May 1783, however, that the way was cleared for the release of all captives.

SPIES: THREE CASES

Apprehended spies were not treated as prisoners of war; rather, they normally were hung without trial. The discovery in September 1775 that Dr. Benjamin Church (1734–1778), director of the Continental Army hospital, had tried to send a coded letter containing information about American forces to his brother-in-law in British-occupied Boston caused Americans much consternation because of Church's prominence and because the Continental Congress had not explicitly made spying a capital crime. Although Congress took that step in November 1775, Church could not be sentenced to death retroactively. After being confined in various jails, he was permitted in January 1778 to go into exile. His ship was lost at sea on the way to the West Indies.

The American martyr spy, Nathan Hale (1755–1776), was hung by the British without much ado at New York on 22 September 1776, but his bravery in the face of death earned him lasting fame. A captain in a Continental ranger regiment, Hale volunteered in response to a request from George Washington to go to Long Island to obtain information about British dispositions. He was caught in civilian clothing with drawings of fortifications and freely confessed his mission to British general William Howe (1729–1814), who ordered his execution. Hale's famous last words regretting that he had but one life to give for his country were based on either a passage in the popular play *Cato* (1713), by Joseph Addison (1672–1719), or a quotation from the English Leveler John Lilburne (1614?–1657).

British major John André (1750–1780), unlike Hale, had considerable experience in intelligence work but died a similar death. As adjutant general at New York, André managed all correspondence with British secret agents in America and with American General Benedict Arnold (1741–1801) about his proposed betrayal of the strategically important fortress at West Point, New York. After meeting with Arnold near Haverstraw, New York, on 22 September 1780, André became trapped behind American lines. Changing into civilian clothing and using an assumed name, he was captured by American militiamen the next day with incriminating papers in his boots. A court of inquiry determined that André was a spy, leaving General George Washington no choice but to deny the personable young officer's request to be shot a soldier and to order him executed in the usual way for spies by hanging. André was executed at Tappan, New York, on 2 October 1780, dying, like Hale, with remarkable composure.

Slavery and Blacks in the Revolution

In the late colonial period, slavery pervaded British North America. It was legal in every colony. Along the seaboard south of Delaware, African bondage was central to society and the economy. But slaves could hardly follow the North Star to freedom, as they later did, for slavery was only becoming more entrenched in the northern colonies. Slaves were a vital element of the workforce in such cities as New York and in the countryside of New York, northern New Jersey, and parts of Pennsylvania. As evidenced by sporadic flight and revolt, black colonists valued freedom and spoke its tones amongst themselves. But they had little opportunity of acting on this desire.

The American Revolution gave them the openings they needed. Its rhetoric provided them a language with which to appeal to whites for freedom. And the competing armies and dislocations of the war offered them chances for flight. The path of flight was fraught with great risks, and not all who took it gained liberty. But the Revolution expanded the freedom of black Americans beyond anything previously imaginable.

LANGUAGE OF FREEDOM

As white colonists began demanding liberty from British tyranny in the 1760s, their slaves saw that they now spoke a common language. To be sure, not all slaves found appeals to libertarian rhetoric fruitful. Patriots in Charleston protested the Stamp Act in 1765 by surrounding the stamp collector's house chanting "Liberty! Liberty and stamp'd paper." In short order, a group of black Charlestonians alarmed the city by raising their own cry of "Liberty."

This application of Revolutionary rhetoric did not secure these slaves their freedom, but others were

more successful in the heady atmosphere of the Revolution. In 1776 a slave man named Prince rowed George Washington across the Delaware River. In 1777, as his master, Captain William Whipple of New Hampshire, again went off to fight the British, he noticed Prince was dejected. When Whipple asked him why, Prince responded: "Master, you are going to fight for your *liberty*, but I have none to fight for." Whipple, "struck by the essential truth of Prince's complaint," immediately freed him (Berlin and Hoffman, eds., *Slavery and Freedom*, p. 283). Whipple was unusual in his haste, and a slave rowing Washington across the Delaware illustrated some of the ironies of the Revolution. But Whipple was far from alone. In Massachusetts, for instance, African slaves and their white allies brought freedom suits against the slaves' masters. They argued that the egalitarian language of the 1780 state constitution rendered slavery unconstitutional. A series of judges ruled in their favor, bringing slavery to an end in Massachusetts by the middle of the 1780s. In other Northern states lawmakers rather than judges abolished slavery in the midst or wake of the Revolution. In 1777 Vermont's constitution enacted gradual emancipation; in 1780 Pennsylvania did so by statute, as did Connecticut and Rhode Island in 1784, New York in 1799, and finally New Jersey in 1804.

Nor was the effect of Revolutionary ideas confined to the North. In 1782 Virginia passed a law giving slaves easier access to manumissions by reducing restrictions on their masters. In the decade following the act, Virginia masters freed roughly ten thousand slaves. So liberalized did Maryland's manumission laws become after the Revolution that some slaves reversed the traditional assumption that African descent conferred slave status by suing (sometimes successfully) for their liberty on grounds of descent from at least one white person.

OPENINGS FOR FLIGHT

When the war of words became a protracted military conflict, slaves took advantage of the chaos of war. Most chose flight over revolt, partly because commanders on both sides offered freedom in exchange for their services.

On 7 November 1775, faced with a solid Patriot phalanx in his colony, Virginia's royal governor, Lord Dunmore, proclaimed that any slave or indentured servant who could bear arms would secure freedom by doing so for the crown. Dunmore's proclamation set slaves in motion up and down the seaboard seeking freedom with the British.

The slaves who sought out British lines took enormous risks. There was always the possibility of recapture and reprisal by masters. Moreover, most British soldiers were hardly abolitionists and did not welcome fugitives who had no military usefulness, such as family members fleeing alongside young men. Sometimes they sold runaways, in a number of cases to loyal planters to keep the latter's allegiance. British commander Lord Charles Cornwallis mercilessly abandoned the black laborers who had dug his trenches at Yorktown, driving them out to face their masters when food ran low during the siege there. Such unreliability made the decision to flee to the British perilous.

But tens of thousands of slaves, especially in the Lower South, judged some manner of flight worth the risk. Whether by death or flight, South Carolina masters lost an estimated twenty-five thousand slaves during the eight years of the war. Georgia's prewar slave population was about fifteen thousand, of which an estimated ten thousand decamped. Thousands left the new nation along with evacuating British troops to an uncertain, but free, future.

Especially in the North, other black colonists chose the Patriot militias and the Continental Army as their route to freedom. The slaveholding commander George Washington was initially loath to admit black troops. But in response to troop shortages, Dunmore's proclamation, and the urgings of some of his subordinates, Washington abruptly reversed course late in 1775, favoring their recruitment. Congress did not follow his lead, but after 1777, when it imposed troop quotas on the states, towns and states from Maryland northward created black battalions. They had no trouble filling them with slaves eager for freedom. Black northerners thus helped all Americans win their freedom even as they seized their own. The chaos and opportunities of the war may have eroded northern slavery even more than the ideology of the Revolution.

But it was the combination of ideas and openings on the ground that gave the American Revolution its significance for slavery. In particular, it struck a death blow to slavery in the North. It thus not only gave thousands of black people freedom in the short term, but created a haven for fugitive slaves of future generations. Northern abolition also laid the groundwork for the Civil War by making the institution peculiar and sectional. For this reason alone, the Revolution might be said to be second only to the Civil War in importance for the history of American slavery and abolition.

Social History

The American Revolution destroyed a monarchy and established a republic. It transformed republicanism from a failed idea to an enduring reality. It sundered one empire and began another. The Revolution worked itself out over the whole space from the Atlantic to the Mississippi and from Florida to the St. Lawrence. The Treaty of Paris of 1763 defined that zone as "British." The Treaty of 1783 defined it as "American." The differences were enormous.

An economy of provinces and regions centered on London yielded to one of states and regions linked to one another. Uncertain boundaries gave way to definitive lines on maps. The Revolution began slavery's destruction. It also fostered slavery's expansion. It reshaped the use of private property, opening the way to full-blown capitalism. It replaced uneven "subjection" with equal "citizenship," but it left well over half the population with lesser rights or virtually no rights at all. Individuals and whole groups challenged their situations, and many improved their lives. But for others the Revolution brought loss and frustration.

CONSERVATIVE BEGINNINGS, TRANSFORMING CONSEQUENCES

The Revolution began among white colonial males who wanted only to conserve a good situation. They believed they were Britons who happened to live outside the “Realm” of England, Scotland, and Wales. They accepted British authority and prospered under British protection. They had access to British markets and could afford British goods. Their British liberty was a tissue of unequal privileges. But they believed that it set them and all Britons apart. They had no problem reconciling their liberty with the unfreedom of others, including the slavery of captured Africans and their American-born descendants.

Beginning in 1763 Britain insisted that colonials were incapable of running their own societies. The surface issue was taxation by Parliament, supposedly acting for all Britons everywhere, rather than by local assemblies speaking for local communities. Beneath that issue lay a sense that the colonial economies needed to be subordinated and that colonial people were inferior. Colonials resisted and Britain retreated twice, repealing the Stamp Act in 1766 and most of the Townshend Taxes in 1770. As ordinary white colonials they found their own voices and asserted their own interests.

After Bostonians destroyed East India Company tea at the end of 1773, Britain decided to make the colonials submit. Instead of that, colonials brought down the whole structure of British power, beginning in rural Massachusetts in the summer of 1774 and culminating with the Declaration of Independence. During the collapse many more individuals and groups found their chances to assert themselves. Not all chose the American side. From New England to Georgia both elite and plebeian white men divided. Many slaves saw that their own best chances lay with the king, whose officers welcomed and armed them. So did native communities, who knew the rebels threatened their land. Yet some black people and some Indians joined the American side, insisting that its claims about equal freedom applied to them. White women began to find their own voices. Abigail Smith Adams’s insistence in 1776 that her husband, John, “remember the ladies” is only the most famous instance.

WAR AND TRANSFORMATION

The new order was born in war. The colonials had to organize and fight it themselves, though direct aid from France, indirect aid from Spain, and loans from the Netherlands proved vital. They fought the war everywhere except the New England interior. Despite

patriotic images of embattled farmers springing eagerly to arms, most regular soldiers were the sort of people for whom society had little place. These included white men with no civilian prospects, slaves who substituted for masters to gain their own freedom, and even Deborah Sampson, who disguised herself as Robert Shurtliff and served undetected for more than a year.

For most of the war the supply service was a shambles. But meeting the army’s needs forced producers, merchants, and supply officers into a single structure, from which the American national economy began to emerge. One problem was localism, including people’s firm belief that good communities were small and protected the needs of their own people first. The constitutions of four states allowed embargoes on exports and control over prices and supplies. Other states acted on that principle, particularly when inflation beset continental and state currencies in 1778 and 1779. By forbidding the states to interfere with “obligations of contract” explicitly prohibiting states from levying import or export taxes, and giving Congress the power to regulate interstate commerce, the U.S. Constitution ended such practices, at least in theory. The needs of a national capitalist economy, not of local communities, would come first.

When the war ended the army had to be paid. So did creditors within America and abroad. One source of revenue was to tax imports. States did so until the Constitution took effect; thereafter tariffs would be federal. But land was more important in the long run. The Treaty of 1783 ceded “sovereignty” to the United States, including the exclusive right to “extinguish” the title of Native Americans to their ancestral lands. Some states claimed sovereignty over Indians “belonging” to them. The lines of authority and claims of sovereign right overlapped. Aware of the new situation, Indians resisted losing their lands, both by legal means and by force of arms. Not until the Indian Removal Act of 1830 and the many “trails of tears” that it caused did the United States consider the job done. Even at that, Indian claims persisted, to be revived in a later day.

Nonetheless, what Indians had held as tribal commons became public treasure. From public domain, in turn, it became private property as governments sold it off. One goal was to pay off soldiers. Another was to establish a realm of independent farmers, good citizens who could take part in public life without fear. Another, never openly stated but very real, was to enrich privileged men who could buy large quantities and sell it off at good prices.

Under both federal and state auspices, the land would be surveyed, divided, and secured. Many colonial-era landholders had seen their property in family terms, to be passed on to sons and sometimes daughters. But in the new order land became potential capital, to buy, “improve,” and sell if the price became right.

A CAPITALIST ORDER

White people surged west to make the land their own, taking slavery with them in the South. A quarter of all the Africans brought to the British colonies and then United States—about 170,000—came during the Atlantic slave trade’s final years, between 1783 and its closing in 1808. Thereafter a domestic trade flourished, taking slaves from the Chesapeake states and the Carolinas to the emerging Deep South. Some even came from the North, sold by masters and mistresses before gradual abolition could free them. These people’s forced labor turned Cherokee, Creek, Choctaw, and Chickasaw land into the Cotton Kingdom.

American agriculture, in the North and South alike, sought markets. Cotton found its greatest market in England, but northern mills wanted it too. In the Northeast the consequence was rapid urbanization and industrialization. When the wars of the French Revolution, including the War of 1812, finally ended in 1815, free white migrants began crossing to America. By 1825 it was clear that New York would be a world metropolis. Philadelphia and Boston changed from regional ports to centers of industry and capital. Villages turned into small cities, particularly along major trade routes. Improved roads, canals, railroads, and steamboats allowed people and goods to cross American space in days instead of weeks or months. After 1836 the beginnings of a telegraph system allowed news to travel instantly. Invention and innovation became prized American qualities. The Erie Canal (constructed 1817–1825) brought the Great Lakes Basin into New York City’s commercial hinterland. The first long-distance railroad in America linked Charleston and Hamburg, South Carolina. The eighteenth-century colonies had been prosperous, at least for white settlers. But the early Republic saw a burst of creative energy that no colonial, not even the farsighted Benjamin Franklin, could have predicted.

EQUALS AND UNEQUALS

The biggest problem the Republic faced was the terms on which people belonged to it. For white men the answer was equal citizenship, defined by the right to vote and to seek public office. The initial state consti-

tutions, adopted between 1776 and 1780, held on to old-order beliefs about the need for voters and office holders to have property, sometimes in large quantities. They were republican, resting on their citizens’ consent, more than democratic, resting on open participation. South Carolina, Rhode Island, and a few other states held on to property qualifications well into the nineteenth century. But most states abandoned them by about 1820, or weakened them to the point of meaninglessness. European visitors like Alexis de Tocqueville and Charles Dickens believed that America had become truly democratic. As far as white males were concerned, the observation was close to correct.

Even among them, however, social class meant very real distinctions. A genuine elite of white men had created the United States Constitution in 1787, and most of them expected to rule the new order. Initially they did. From George Washington to John Quincy Adams, traditional “gentlemen” filled the presidency and most other high offices. Thereafter, national power fell into the hands of professional politicians such as Martin Van Buren, Andrew Jackson, Henry Clay, Daniel Webster, and James K. Polk. But class continued to count. In the industrializing, urbanizing North a new reality of owners and lifetime workers jibed uneasily with the belief that all men were equal. Tenant farming on great holdings remained a reality of northern agriculture. In the South the slaveholding planter class and plain-folk farmers inhabited different worlds. What united them all was that they were white.

Slavery and racism had been simple facts in the colonial period, when nobody presumed human equality. For a Republic of supposed equals, however, they were major flaws, in the North as much as in the South. The Revolution did begin slavery’s destruction. Vermont abolished it in 1777, at the very moment of its own separation from New York, and Massachusetts followed six years later. The Northwest Ordinance of 1787, which laid out the process by which “territories” could turn into new states, forbade slavery north of the Ohio River. But the remaining northern founding states went slowly. New York adopted a gradual abolition act in 1799 and ended all slavery on 4 July 1827. Pennsylvania, Connecticut, Rhode Island, and New Jersey adopted gradual abolition acts between 1780 and 1809, but a few aging blacks remained in slavery in those states until 1840. As late as 1850 there were still three hundred blacks in New Jersey classified as servants for life.

Quick or slow, slavery's death in the North had many consequences. Free black communities emerged, their people determined that slavery itself should end. But white "democratization" in the North was accompanied by black exclusion from many job markets, and even from public places, justified by unashamed racism. Blacks voted in most of the northern coastal states, but the newer states to the west—Ohio, Indiana, and Illinois—would not enfranchise blacks until after the Civil War. Pennsylvania and New Jersey, which allowed blacks to vote in the early national period, would take that right away from them in the Age of Jackson. New York restricted black voting with high property requirements at the same time that it was abolishing such requirements for whites. In the South slavery weakened and free communities did emerge, especially in the cities. Black people in the South did struggle for freedom, by legal means, escape, and revolt. But in large terms slavery became the South's "peculiar" institution, a source for white southerners of profit, identity, and danger alike. By the 1820s southerners were defending slavery as a positive good, rather than saying they regretted it.

The Revolution changed the lives of American women, opening possibilities that the colonial era barely imagined. The likes of Abigail Smith Adams, Deborah Sampson, and the writers Judith Sargent Murray and Mercy Otis Warren raised questions about women's place in republican society. So did novelists, who used their fiction to imagine a better world.

In the cities, particularly, it became increasingly possible for a woman to be economically free on her own terms, particularly if she chose not to marry. "Ladies Academies" began providing demanding schooling. But colleges and professions remained closed. A married woman's property became her husband's. Like Indians, whom the Supreme Court would define as "domestic dependent nations," and like black people, whom law and custom excluded where they did not enslave, women belonged to the new Republic more in the sense of being possessed by it than in the sense of being members of it. The unsatisfactory short-term result was an ideology of "republican motherhood" that valued women's role in training sons as full citizens. But like the problems of class and race, the social meaning of gender was on the new Republic's agenda, however much the Republic's white masters tried to ignore it.

Supply

When the Continental Congress assumed the task of prosecuting war against Great Britain it faced the challenge of reconciling the political culture of revolution with a necessity to adapt imperial methods for providing manpower, equipment, and supplies for American military forces. This tension resulted in an ill-managed administrative system characterized by divided authority and responsibility between various congressional committees, state authorities, and military leaders who often worked at cross purposes to meet the military needs. This organizational conflict was manifested at the lowest levels in the regiments, where soldiers then, as today, could not fight unless they were properly supplied with food, weapons, and clothing.

At the beginning of the Revolution, the Americans lacked domestic sources for most provisions ex-

cept food and forage. Military transportation did not exist and there was no central control of supply within the colonies. The Continental Congress sought to provide for the army but organizational difficulties and lack of money resulted in American forces having just enough supplies to remain operational. The American economy was primarily agricultural and manufacturing was inadequate to supply large forces with ammunition, clothing, cannon, tents, shovels, and other items required for life in the field. Throughout the war, however, the Americans obtained some supplies by capturing them from the British. Another source of supply was aid from France, but American ships had to run a British navy blockade in order to deliver their cargoes. The most critical challenge throughout the war was transportation, because the road network was primitive and many areas had no roads at all. When supplies could be obtained, they often sat in storage depots due to lack of transportation to move them where needed.

In 1775 the Continental Congress authorized the quartermaster general and commissary general departments to provide the necessary food and supplies to the army formed at Boston. The quartermaster had responsibility for the procurement and distribution of supplies other than food and clothing as well as for the movement of troops and maintenance of wagons and boats. Major General Thomas Mifflin served as the first quartermaster general but quickly became frustrated by having to beg Congress and the states to provide funds, materials, and food. During operations in 1776 and 1777 the fighting consumed tons of munitions, food, and forage, and much more was lost when the British overran American positions. Horses died of wounds and wagons broke down under hard use and enemy fire. On 8 October 1777, Mifflin quit his position because of his conflicts with Congress and the bureaucratic frustration of trying to make the supply system functional. As a result, when the American army went into camp at Valley Forge in the late fall of 1777, the soldiers suffered severe shortages of food and clothing, mainly because of the breakdown of transportation.

In spite of these difficulties, some important shipments of French arms, munitions, and clothing, along with supplies captured from the British, were forwarded to the army at Valley Forge. General George Washington took a personal interest in all supply matters and authorized impressments of civilian provisions, but with proper receipt for later payment. In 1778 Washington urged Congress to appoint Major General Nathanael Greene, one of his more able officers, to replace Mifflin. Greene reorga-

nized the quartermaster department to more adequately manage the funding, purchasing, and storing of supplies and equipment. By 1780 the department had over three thousand personnel to oversee logistics operations in the areas of clothing, food, forage, and transportation, which resulted in more regular deliveries to the army. The pressure on Greene may have eased somewhat as the Continental Army became a seasoned force and accepted the supply problems as routine. The regiments learned to make do with less of everything and gradually found ways to get more out of what they had.

More than anything else, the shortage of money continued to hinder operations, and Washington often had to dismiss troops from the field or encamp them in dispersed areas to reduce the regional logistics burden. Lack of money also led to pay and enlistment grievances demonstrated by several troop mutinies in 1781. In May 1781 Congress appointed Robert Morris, a Philadelphia merchant and Pennsylvania delegate in Congress, to the new post of superintendent of finance, and his actions greatly influenced supply matters. He believed that if the country could mobilize enough funds and credit to keep the army in the field, the British would eventually quit. Morris even pledged his own personal funds to arrange for flour shipments to the army. By mid-1781, when the Yorktown campaign began, the supply situation of the Continental Army had greatly improved. Morris successfully gathered provisions and equipment, made transportation arrangements, and managed the finances that paid for it all. From a logistics perspective, the coordination of material, financial, transport, and other supply resources was almost perfect at Yorktown.

In spite of all the difficulties, procurement of supplies occurred, transportation lines remained open, enough imports got through, and every supply crisis passed. The Continental Army had enough supplies to get the job done, and they contributed to the American victory.

Women's Participation in the Revolution

While generations of historians virtually ignored the role of women in the American Revolution, hordes of schoolchildren grew up on the exploits of Molly Pitcher and Betsy Ross. Recent scholarship reveals that the folk wisdom of the elementary school classroom has some merit.

TRADITIONAL ROLES AND REVOLUTIONARY CONSCIOUSNESS

Women played a number of important roles in the American Revolution (1775–1783). The outbreak of protest against British policy in the mid-1760s quickly evolved to include women. Although limited by tradition to roles within the household, women's roles in the household economy combined with an emerging revolutionary consciousness to produce organizations calling themselves the Daughters of Liberty, the female counterpart of the Sons of Liberty. The boycotts of British goods that emerged as part of the colonial strategy to produce a change of policy in Parliament hinged on women's participation. The nonimportation of products such as tea and English fabric could not succeed unless American women provided substitutes. Women displayed their political preferences by eschewing tea in favor of coffee or local herbal teas. More important were the activities of the traditional sewing circles. Long an opportunity for women to gather while producing for the household economy, the boycotts infused these social gatherings with a political purpose. Women's sewing circles, a traditional form of female socializing, became essential to the radical Whig cause because of their ability to replace needed goods with homespun.

The Whig leadership in many colonies recognized their contribution by urging husbands to encourage their wives' efforts, and in some colonies Revolutionary organizations endorsed the boycotts and encouraged both men and women to sign Association manifestos proclaiming their refusal to consume British goods. In some cases women issued their own petitions. Perhaps the most famous of these was dated 25 October 1774, when fifty-one women of Edenton, North Carolina, signed an Association which pledged that "we, the Ladys of Eden-

ton, do hereby solemnly engage not to conform to the Pernicious Custom of Drinking Tea." At the outset of the conflict, Anne Terrel wrote to the *Virginia Gazette*, exhorting the wives of Continental soldiers to support the war effort through boycotts and prayer as their husbands supported the "glorious cause of liberty."

NEW ROLES

In some colonies, women went beyond the confines of the sewing circle, participating in riots and mass meetings. This was particularly true for artisan women, whose role in the streets had been established by custom and gender-determined economic practices. Rioting was a traditional Anglo-American form of political protest, and women played an important role in it and in other street activities. After the first shots at Lexington and Concord in 1775, women were important participants in organized protests. Hannah Bostwick McDougall of New York, for example, organized parades in an effort to free her husband from arrest. Other protests took on more violent overtones. This was particularly true of the many food riots led by women during the Revolution. Chronic food shortages caused by wartime conditions led some merchants to hoard needed supplies and hike prices. Such efforts were met with active opposition. While many of the food rioters were men, the central role played by women in the household economy of the eighteenth-century American home often placed women in the vanguard of mob protest. Women's participation, clearly shows involvement at the popular level, with women equating fair prices with support for the Revolution. Women's participation was not isolated to popular street protest. Elite women also supported the cause. In 1780 Elizabeth DeBerdt Reed, a member of the Philadelphia elite, and Sarah Franklin Bache, daughter of Benjamin Franklin, organized a women's fundraising organization for the Whig cause. George Washington responded to the organization by requesting that instead of providing money for his soldiers, women produce clothing for them. They responded with over two thousand linen shirts by the end of 1780.

WOMEN IN THE ARMY

Women directly supported the war through service in the army. Although women posing as men violated both law and custom in eighteenth-century America, a number of women secretly ignored this taboo and fought with Revolutionary forces. Deborah Sampson (or Samson) was among the most fa-

A Continental Soldier. Thousands of women accompanied the Continental Army as cooks, laundresses, nurses, and guides. This 1779 woodcut shows an American woman armed for battle during the Revolution. THE GRANGER COLLECTION, NEW YORK.

mous women who saw combat. Assuming the name Robert Shurtliff in 1782, Sampson served in a light infantry unit of the Continental Army during the waning months of the war, suffering two wounds before her honorable discharge in 1783. Most women served the military in conventional ways that did not violate standard gender roles. Both the British and American armies had substantial complements of women in their ranks. Women performed many of those tasks considered outside of men’s domain, laundering and mending clothing, preparing food, nursing the sick and wounded, and even bringing supplies to soldiers during combat. Such were the circumstances that led Mary Hayes to become known as Molly Pitcher following the Battle of Monmouth (1778) in New Jersey. The essential role that women played in supporting the soldiers eventually led Washington to set an unofficial quota of one woman for every fifteen soldiers in Continental Army regiments. Such “women of the regiment” drew regular rations (any children they brought drew half rations) and were subject to military disci-

pline. In the southern theater of operations, the British employed substantial numbers of African American women, who served in virtually every department of the army. Additional women traveled with the Continental force in unofficial capacities. The wives of officers, enlisted men, and refugees often accompanied the force during campaigns.

VICTIMS OF CONFLICT

Many women were caught between the two sides during the conflict. The destruction of property occasioned by the war left many women destitute and homeless. Perhaps typical was the treatment described by South Carolinian Eliza Wilkinson. She feared the worst with the approach of British cavalry, and indeed the soldiers ransacked her home, looting every thing of value. While most armies fighting in the Revolutionary campaigns respected certain rules of war, violence and rape were not uncommon occurrences. Such risks led many women to flee at the news of an approaching enemy army.

Loyalist women were subject to much the same treatment. Continental forces practiced systematic destruction of property and rape of Native American women during their campaigns against the Iroquois in upstate New York. Loyalist women lacked the organizational structures that helped to unify their Whig sisters, and the former often found themselves abandoned by their husbands or stripped of property. In some instances, Whig legislatures passed legislation to strip Loyalists of their property. Women’s status was further complicated when husbands and wives took different sides during the Revolution. Due to laws of coverture, under which the wife was “covered” or legally subordinate to her husband, wives often discovered that they had no legal claim to property in the event of abandonment by a spouse.

A NEW STATUS FOR WOMEN?

Women embraced the concepts of Whig liberty from the earliest stages of the Revolution, but these views were filtered through uniquely feminine lenses. Membership in organizations such as the Daughters of Liberty and participation in boycotts had fostered a sense of virtuous sacrifice on behalf of the cause. Prior to the war, women’s perspectives on Revolutionary ideology were scarce. Although Mercy Otis Warren published fictional satires of British officials before the war, they did not reveal a specifically female viewpoint. But during the conflict American women were clearly expressing their own distinct conceptions of liberty. Nowhere was this clearer than in the 1780 manifesto, *Sentiments of an American*

The Birth of the Flag (1912). Woman, which called upon women to support the quest for liberty through boycotts, household production, support for the troops, and virtuous self-sacrifice. In many ways, *Sentiments* captured the dilemma of the American Revolution as it applied to women; prevailing gender roles limited them to the position of helpmate in the struggle for liberty. Many women recognized this conundrum and sought greater rights for their gender. But aside from the extension of the franchise to New Jersey female heads of household in 1776 (a right revoked when universal manhood suffrage was granted in 1807), real political gains were few and far between. Despite efforts by Abigail Adams and Judith Sargent Murray to advance women’s liberties, the women’s revolution generally stopped at the door of their household. Despite the limited changes in political status, the Revolution did produce some changes in legal status.

Women gained greater independence from husbands, greater access to and ability to control property, and greater availability of divorce. The struggle for women’s liberty did not end with the American Revolution; it was only beginning.

REVOLUTION, AGE OF The American Revolution marked the beginning of what has been called the Age of Revolution. What began as a protest over taxation in an extended empire exhausted by seven years of warfare against Catholic France gradually turned into a crisis that altered all political and social relationships not only in the British Empire but throughout the Western Hemisphere and northwest Europe, in what is now called the Atlantic world. The American Revolution profoundly influenced revolutionary rebellions in France, Haiti, Poland, Ireland, and eventually Latin America, while creating intellectual ferment in a dozen other societies in the Atlantic basin.

ROOTS OF THE AMERICAN REVOLUTION

The British Empire emerged triumphant from the long and desperate struggle against France known as the Seven Years' War (1756–1763). France was expelled from Canada, frustrated in its designs in Germany, and largely stripped of its influence in India. Britain's triumph had been fueled by a sophisticated fiscal-military bureaucracy that funded its forces by means of deficit spending. In 1763 these debts began to come due, and the British ministry rightly believed they could not be borne by the home islands' heavily taxed populations. This conclusion, reached with no malice toward British Americans, led to the Stamp Act and the subsequent eruption of a ten-year-long protest movement.

The ideological core of that movement and the society that began to emerge from it in 1776 has been described alternatively as liberal, republican, or based on natural rights philosophy. It was in fact a fusion of a number of clearly identifiable strains of political thought. Initially, at the center of this thought lay

the desire to restrict the central state's power by means of actual representation, in which representatives would be voted into office by distinct and geographically definable electorates whose interests they would serve.

The deterioration of the empire's political situation after the Boston Tea Party, the resulting Intolerable Acts, and the Quebec Act, which seemed to establish Catholic government in Britain's new Canadian colonies, led to a fundamental shift in the ideological structure of provincial thinking. What had begun as an effort to preserve the British constitution, as provincials understood it, became a movement for the establishment of an independent republic. With this shift in thinking came universalist views of human rights and human nature that profoundly challenged the assumptions of monarchical Europe and for that matter the slaveholding patriarchy of the American provinces themselves.

This challenge to preeminent beliefs and social structures were based on the regenerative and even utopic qualities of republicanism and natural rights thought. This thinking encouraged Americans in the restructuring of political institutions. The republican state governments that appeared between 1776 and 1780 reflected this republican utopianism and amounted to a radical experiment in self-government. Three of the states, Pennsylvania, Georgia, and what became Vermont, adopted constitutions that provided for unicameral (single) legislatures, rather than legislatures with upper and lower chambers; these state constitutions proclaimed a radical egalitarian vision of republican citizenry. Upper chambers like the colonial councils were deemed unnecessary, as were governors as they had existed in the empire. The designers of the unicameral governments threw over institutional hierarchy because, they believed, it would allow a few in power to block the collective will of a free republican citizenry. All, or at least all white male property holders, were now considered brother citizens and thus equal. Even those new states that maintained the bicameralism inherited from the colonial period weakened the governors and upper houses, established annual elections in many cases, began to do away with multiple office holdings, initiated the process of abolition in the North, and proclaimed the sovereignty of a republican people free from historical restraints of royal patriarchy and deferential traditions. Based as they were on the startling notion that human nature could be molded into a better, more virtuous form under the right, revolutionary circumstances, these governments reflected and furthered the utopian and

universalist ideals within revolutionary thought. It is these impulses that gave the American Revolution its transatlantic appeal.

THE FRENCH REVOLUTION AND THE BRITISH ISLES

European intellectuals who had been studying classical history and philosophy throughout the eighteenth century now saw these ideals put into effect in a new and revolutionary society. Their fascination took on a real political force, with drastic consequences in a number of societies. The improbable, if not miraculous, American victory against a world superpower only enhanced the notion, as a contemporary put it, that the American Revolutionaries were to be “the Vindicators of the Rights of Mankind in every Quarter of the Globe.” The spread of revolutionary republicanism to France greatly amplified their impact in the Atlantic world and northern Europe. After 1789 political unrest came to define life in that huge expanse. Clearly, part of what drove this unrest was knowledge of republican revolutions in America and France.

The explosion in France that began in 1789 profoundly affected all Western societies and indeed beyond. Large numbers of French subjects participated in the American cause on their own account; hundreds of French officers and tens of thousands of men fought with the formal French expeditionary force that aided the American cause after 1778, and French intellectuals studied American Revolutionary principles in reading clubs, Masonic lodges, and salons. Those who had fought in America discussed the American Revolution with friends and neighbors; American writings including the state constitutions were published in French and other languages, allowing the European intellectual caste to discuss them; and Americans themselves visited Europe and spread word of their revolutionary accomplishments. Perhaps the most famous and influential of these “visitors” was the English-born author of *Common Sense*, Thomas Paine, whose *Rights of Man* (1791) became a central text in the defense of the French Revolution from its all too numerous critics. Paine explicitly linked the French and American revolutions in his dedication of the English-language version to George Washington, whose “exemplary Virtue” in defense of freedom had helped create the preconditions where “the New World” might by its example “regenerate the old.”

In America initial near-universal support for the French Revolution eventually gave way to acrimony and disagreement. In 1794 the Massachusetts Con-

stitution Society declared that on the French Revolution’s success “depends not only the future happiness and prosperity of Frenchmen, but in our opinion of the whole world of Mankind.” The Charleston Society of Charleston, South Carolina, petitioned the Jacobin Club of Paris for membership, which the Frenchmen quickly granted. By then, though, the radical turn of that revolution, signaled by the execution of America’s former ally Louis XVI, had fractured the American body politic severely enough to lead to the rise of the first party system. The French example was blamed for much disorder in America, including the Whiskey Rebellion and the appearance of the party system itself, still seen as an undesirable development in a republican society.

The bitter struggle between the Federalists and the Democratic Republicans that dominated American society in the latter half of the 1790s was in large part driven by the question of the degree to which, if at all, the American Republic should support revolutionary France. Jefferson and his supporters among the Democratic Republicans urged assistance to a sister republic as part of a broader goal of global republicanization, whereas Washington, Hamilton, and the Federalists urged strict neutrality and leaned toward Great Britain in terms of commercial policy as manifested in Jay’s Treaty. The resulting controversies almost led to civil war in America.

In Britain response to French developments quickly took on reactionary tones and led to a rallying around George III and the royal family. Although the new revolution across the Channel initially had support in some circles, the revolutionary excesses after 1792, the repudiation of Christianity, and the outbreak of war between revolutionary France and the remaining European monarchies (including Britain, which declared war against revolutionary France in 1793), steered British opinion onto a decidedly conservative path. English and Scottish intellectuals who embraced Enlightenment ideals recoiled at the bloodshed across the Channel.

However, the rejection of the radical egalitarianism associated with the American and French revolutions was not universal in the British Isles. In Ireland religious and national resentments, combined with admiration for the French, encouraged a widespread but failed uprising in 1798, the so-called Year of the French. Despite the bloodshed and anticlericalism in France, support for republicanism and revolutionary France was strong among Belfast Presbyterians, who, together with other groups, formed the United Irishmen in 1791 with the goal of establishing an

Irish revolutionary republic. By 1797 the United Irishmen had 100,000 members.

A rebellion near Dublin in May 1798 was put down by British authorities, led by the same Lord Cornwallis defeated by the French and Americans at Yorktown in 1781. Soldiers of France's revolutionary army landed in county Mayo in August 1798 in an effort to pry it from English control, but the effort came too late. Dissent continued for years thereafter, and a republican underground came into being that would exist in various guises in Ireland thereafter.

REVOLUTIONARY MOVEMENTS IN POLAND AND NORTHERN EUROPE

To imagine the effects of this republican intellectual upheaval as limited to America and France, or even America, France, and the British Isles, would be a serious error. A fourth nation, Poland, also erupted into a violent upheaval, one that would be used by its neighbors as an excuse to dismember it. Perhaps the least known (to Americans) of the republican revolutions, this unrest grew directly from the American and French examples and again involved soldiers who fought in the American war. In 1791 the Polish assembly ratified the Constitution of 3 May that in effect turned the nation into a constitutional monarchy. Prussia and Russia dismembered the Polish nation in 1792 by means of military invasion. In 1794 Thaddeus Kosciuszko, who had served with distinction in the Continental Army in the southern campaigns, entered Poland and issued the Act of Insurrection, calling for a free and republicanized Poland. His rebellion was crushed by the Prussians in October 1794, and he was forced to flee to America. Republicanism, democracy, and various forms of constitutional monarchy became subjects of current discussion in intellectual and political circles throughout Northern Europe in this same period. By 1781 the constitutions of all thirteen states had been translated into Dutch, and intellectuals associated with the so-called Patriot party cited the Massachusetts constitution of 1780 in their calls to reform the government of the Netherlands in 1785. In the German-speaking nations of central Europe, a mixture of German newspapers and French, English, and German-language pamphlets carried both information about the course of events in the American rebellion and the principles of the Revolutionaries to German readers. According to one German writer, "during the American Wars, the only talk in Europe was about liberty." As in France and the Netherlands, the intellectuals of otherwise tradition-bound societies found a source of fascination and endless debate in American developments, which seemed an experi-

ment in the enlightened ideas then afoot in learned circles in Europe. Little did they know that the end result of the embrace of these ideals in France and elsewhere would be a defeated Prussia and Austria dominated by the emperor Napoleon. Significant republican intellectual and political ferment even spread to Scandinavia, where a wave of change and reform took place and was directly linked to the earlier republican ferment in America.

THE CARIBBEAN AND LATIN AMERICA

The impact of republicanism in the Caribbean and Latin America was no less profound. The most immediate reaction occurred in the French-owned part of the island of Saint Domingue, in what became Haiti. There, the oppressive plantation system dominated by a small group of white planters who exploited hundreds of thousands of African slaves to provide sugar and coffee to European markets was destabilized by the spread of revolutionary ideals from Paris. Although the initial meeting of the French National Assembly did not directly attack slavery in the French Caribbean, it did raise the question of political rights for mulattos, which became the first crack in the edifice of slavery. Soon the *blancs* began fighting among themselves, some resisting revolution, others wanting a cautious revolution, still others pushing for a radical revolution including some or full political rights for the mulatto population. Finally, in August 1791 the explosion came. A huge servile rebellion, eventually involving hundreds of thousands slaves, drove the planter class from the island. Attempts by French, British, and Spanish forces to intervene failed, and Haiti was established as a free republic, much to the horror of slaveholders in the United States and elsewhere.

The continuation of republican revolutions in the nineteenth century in Latin America and Europe, the actors in which repeatedly invoked the American example to justify their own actions, speak to the profound alteration in world politics that began in the 1770s. From this period forward, movements proclaiming the ultimate sovereignty and welfare of a disembodied "people" were seen as legitimate challengers to the monarchical and oligarchic orders that dominated western society.

REVOLUTION AS CIVIL WAR: PATRIOT-LOYALIST CONFLICT

The American Revolution was not simply the uprising of united American colonists fighting for independence against a British Empire unified in its desire to impose its will upon the colonies. Instead, the war involved the complex internal squabbles of a diverse population, with allegiances often hinging on uncertain circumstances. In a civil war, hostile action erupts between two groups

(usually fielding conventional armies) within the same country, groups whose claims to political power and identity have proven irreconcilable. By this standard, the American Revolution often partook of the characteristics of a civil war.

OUTLINES OF THE CONFLICT

Historians who have focused on the political ideology and religious beliefs of the colonists have illustrated several points of divergence among Americans. Congregationalists, Presbyterians, Low Church Anglicans (who sought a Church of England independent of state apparatus), those who sought to foster America's economic independence, and those who supported westward expansion tended to side with the Patriots. Many of these groups eagerly participated in the revolutionary movement, with its ideas about representative government, popular sovereignty, and religious and political liberty. While these supporters of the rebellion might be found throughout the British Empire, they were concentrated most heavily in New England, the Chesapeake, and interior lands stretching southward from Pennsylvania.

Loyalism tended to flourish among High Church Anglicans (who sought greater fusion of church and state), employees of the crown, strategists who sought to limit American expansion, civilians who depended upon British military protection, and those who supported British mercantile policy. These groups were more common in the Lower South and the middle colonies, though they were significant minorities in New England and the Chesapeake as well. The British also found allies among the inhabitants of Canada and the Caribbean, important Indian tribes such as the Iroquois and Cherokee, and thousands of southern blacks who believed that the British Empire held a greater promise of freedom.

There were numerous exceptions to these generalizations; nevertheless, this broad split represented significant ideological and denominational rifts within the British Empire. Such divisions were evident on both sides of the Atlantic Ocean, and they helped to raise the stakes in the minds of many Americans about the consequences of this civil conflict.

THE CHAOS OF INTERNECINE WAR

The American Revolution resembled a civil war most clearly in the sphere of military action. In some areas, civil war was less apparent because one side or another predominated. In much of Virginia, Pennsylvania, and New England, rebellious Americans successfully suppressed Loyalism, just as the British effectively squelched any pockets of sympathy for

the Patriots in Canada and elsewhere. On the other hand, both sides waged an often bloody civil conflict in many other places: the coastline, the Lower South, New Jersey, New York, and the lands west of the Appalachian Mountains. The Revolutionary War was not merely the unanimous uprising of Americans against a distant and monolithic British Empire, but something more divisive and complex.

Any civil war polarizes the two warring sides; in addition, civil war also creates gray areas and gray loyalties of various kinds. Apathy, hesitation, self-interest, and pacifism abounded, particularly in a war where English-speaking Protestants were fighting one another. (On the other hand, many focused on the participation of blacks, Indians, Hessian mercenaries, and French allies as a reason to fight for one side or the other.) Many Americans simply wanted to be left to their own devices. Patriots often tried to shock these fence-sitters into commitment by requiring loyalty oaths. Yet thousands of Americans clung to a desire for neutrality—during an early British siege attempt on Charleston, South Carolina, in 1779, a group of civilian leaders asked Great Britain to grant the city neutral status.

Perhaps a fifth of all people in the thirteen rebellious colonies were Loyalists, and as many as nineteen thousand Americans may have enlisted to fight for the crown. Some Americans found themselves aligning or collaborating with whichever party was more powerful in the area where they lived. Loyalty and Patriotism might spring from vengeance, resentment, fear, coercion, local disputes, opportunism, or short-term financial incentives in addition to broader ideological or economic reasons for supporting or opposing Great Britain.

British leaders could never decide whether to prosecute a relentless, destructive war or adopt a more conciliatory posture. Many Loyalists and British officers gained reputations for advocating a “fire and sword” approach toward fighting the Americans, while the Americans themselves occasionally destroyed Indian and white settlements, including large cities such as Norfolk, Virginia, during the course of the war. On the periphery of armed conflict, both sides engaged in ambushes, raids, plunder, brutality, banditry, depredations, and the settling of private scores. Cooler heads on both sides deplored such actions. Many Patriots believed that irregular war undermined the new nation’s claims to civility, while some supporters of the crown hoped to reconcile the rebellious element in America. This conciliatory attitude clashed with more aggressive ap-

proaches, and Great Britain’s inconsistent policy hindered its war effort.

The role of the Loyalists in the American Revolution has been both underestimated and overestimated. On the one hand, the presence of Loyalists and neutrals demonstrates how tenuous the rebels’ influence might have been in North America had the British been willing and able to exert their full military might. On the other hand, Great Britain never took full advantage of the inchoate mass of Loyalists and their military potential. After 1778, when the British began attempting to mobilize Loyalists more fully, they leaned too heavily on these scattered groups of supporters, undermining any chance of military success. Through its initial hesitation, Britain failed to drive North America into full-blown civil war. Through its subsequent miscalculations, the British ministry failed to prosecute a civil war effectively.

The American Revolution pitted neighbors and families against one another as surely as any civil war. Military exigencies and deeper sources of disagreement fractured North America during the course of this long and bloody conflict.

REVOLUTION OF 1800 *See* **Election of 1800.**

RHETORIC Rhetoric is the art and theory of persuasive speech and argument. A branch of scholarship that dates back to the Greek democracy, rhetoric has long been associated with service to public life and civic engagement. It is best symbolized by the idealized figure of the orator, who represented the finest characteristics of a culture and who, through eloquent speech, articulated the culture's public affairs in a manner that reflected its values. Classical rhetoricians believed that public language must be educated and refined but also approachable, free of jargon, and designed for the nonspecialist, a belief that was continued into the early national period in the United States.

During the early American Republic, rhetoric became an essential aspect of higher education for lawyers, politicians, and ministers, who formally addressed the public. In addition, male and female students at all educational levels studied rhetoric because, educators believed, it enhanced the civic engagement of the young. Whereas later in the nineteenth century rhetoric would come to have negative connotations, Americans during the early Republic felt that rhetoric taught youth to be proper members of a democratic public. The pedagogical emphasis on instruction in rhetoric reveals the extent to which the United States at that time remained a culture powerfully reliant on oratory and orality.

The Stoic philosophers of ancient Greece are credited with having caused rhetoric to be considered a significant branch of philosophy. They thought that knowledge from philosophy and other disciplines was, by itself, inert and therefore in need of rhetorical persuasion to propel it into effective use in the arena of human affairs. Early American public-speaking manuals particularly celebrated the Roman orator Cicero (106–43 B.C.) as a model of eloquence and incorruptible morality and suggested that his oratory had helped to protect the Roman republic from tyranny. Americans also idealized Quintilian (35?–? A.D.), a Roman teacher posthumously famous for his writings on rhetoric in *Institutio Oratoria* (*The Orator's Education*), for his advancement of polished speech and personal integrity.

Although most refer to it as an “art,” rhetoric was generally understood as a body of rules to be learned by students. According to classical practice, rhetoric was divided into five parts, each of equal importance: invention, arrangement, style, memory, and delivery. This formula meant that the orator treated the logic of an argument or the development of an idea as standing on equal ground with matters

of style, such as the verbal flourishes and metaphors or the orator's vocal inflections and gesture. The orator must master all of these “parts,” so the reasoning went, in order to fully engage and persuade an audience. By the mid-eighteenth century, educational institutions came to rely on classically inspired works like *A System of Oratory* (1759) by the British rhetorician John Ward, which relied heavily on the ideas of Cicero and Quintilian. Ward's *System* became the most popular text on rhetoric in American colleges until the end of the century.

Americans' eighteenth-century embrace of the classical model of rhetoric represented a sharp break with seventeenth-century American practice, which idealized a far less elaborate, plain style of delivery and made a firm distinction between “style” and “substance.” This earlier view was best expressed in the rhetorical theory of Petrus Ramus (1515–1572) of the University of Paris, whose writings were imported by instructors at Harvard and other American colleges during the seventeenth century. Ramus considered logic to be the central characteristic of a good sermon, and rhetoric to be only so much verbal display. As Americans moved away from Ramistic rhetoric and toward classical rhetorics, they came into line with current European and especially British public speaking and scholarship.

This shift also reflected much broader cultural changes toward an emphasis on public opinion and the engagement and persuasion of audiences. With an upsurge in the popularity of evangelical religion and participatory politics, Ramistic rhetoric—which paid little attention to adapting a speech to specific audiences or situations—now appeared out of step with a dynamic and complex society. In keeping with these developments, American colleges began to shift in focus from primarily training ministers to providing a liberal education for men with other professional intentions, such as the law or commerce. Beginning in the mid-eighteenth century, colleges placed rhetoric at the center of instruction and emphasized its public and civic characteristics. Students took rhetoric in all four years, participated in daily oral disputations and oral examinations, and usually culminated their degrees with a public oration before an audience of local dignitaries. Students also formed extracurricular debating societies to further develop these skills. Such a focus within higher education reflected not only the growing sense that all well-educated men must be adept at oratory but also that they must learn to persuade diverse audiences. Neither was this a movement limited to the privileged or highly educated; in most American cities and towns

after the Revolution, groups of noncollegiate young men formed debating societies to practice skills in argument and delivery.

The new emphasis on gauging one's audience and respecting public opinion did not fundamentally change the long-standing hierarchical relationship between an orator and his audience, but it did provide new political possibilities in the American colonies. Public speaking became a key art form for Americans before the Revolution, when oratory helped to galvanize the American public and to establish an argument for independence. Annual speeches commemorating the Boston Massacre of 1770 and the fiery oratory of Patrick Henry helped to create a convincing narrative of intolerable British tyranny. Americans came to see oratory as so important that, after the Revolution, when constructing buildings for Congress and for state governments, architects added galleries from which visitors might enjoy legislative address and debate. In turn, Americans learned to associate their leaders with fine oratory and to criticize them when they failed to live up to the public's standards.

Alongside the growing importance of neoclassical rhetoric, two other important rhetorical movements arose and gained influence during the late eighteenth century. The first was the elocutionary movement, which taught adherents to convey ideas and emotions successfully to their auditors by focusing extensively on the delivery of public speech. Elocutionists provided methods for modulating one's voice, gesture, and facial expression in ways that were believed to capture emotions and "natural" expression. They argued that better training in graceful and persuasive delivery would correct the dry, logical argument that had limited the effectiveness of both secular and religious speech in the past. All forms of speech were seen to benefit from this instruction—from everyday conversations to formal public oratory—making this a far more inclusive movement than one directed solely at the high-born or to aspiring formal orators.

In part because of its seemingly universal applications, elocution became particularly influential at the American common-school level and in academies and was prescribed for both male and female students. Schools had long employed oral recitation as a fundamental aspect of daily lessons, but during the early Republic, recitation became strongly allied with elocutionary techniques to the extent that most schoolbooks contained instructions for vocal inflection and gesture reprinted from prominent elocutionary writings. Indeed, elocution was so ubiqui-

tous in childhood education that schoolbook compilers defined reading as an oral exercise, and "correct" reading as "founded upon the principles of elocution," as did Montgomery Bartlett in his *The Practical Reader* (1822).

The second rhetorical movement to become prominent in the late eighteenth century was belletristic rhetoric, which displayed a new concern with the aesthetic experience of persuasive speech. Belletristic theorists brought together rhetoric and the belles lettres (from the French for "fine letters"), a broad category often referred to as "polite literature" or "fine learning" and that encompassed a knowledge of philosophy, literature, history, biography, and linguistics. Influential Scottish writers such as Adam Smith and Hugh Blair advocated an elegant style of address that revealed the speaker's knowledge of literature. Many of the orators who came to the cultural forefront during the early nineteenth century and saw their speeches reprinted for broad dissemination, including Daniel Webster and Edward Everett, made use of this fine and lofty style. These speakers and their political contemporaries in the years leading up to the Civil War were so famous for their carefully wrought arguments and inspiring speech that this would later be called "the golden age of American oratory."

Both elocution and the belles lettres were rhetorical movements that were shared across the Atlantic; more distinctive to the American context was the middling oratorical style, or "democratic idiom," as the historian Kenneth Cmiel has termed it. This style married elements of the grander belletristic style with less formal aspects, such as colloquial language and folksy charm more common to ordinary people. As Henry Ward Beecher, one of the most popular speakers of the antebellum era, famously put it in 1835, "he is sure of popularity who can come down among the people and address truth to them in their own homely way and with broad humor—and at the same time has an upper current of taste and chaste expression and condensed vigor." The middling style of address indicated to listeners that an orator put on few airs about an elite background or education, yet retained the ability to elevate the thoughts and feelings of the audience.

One of the sources of this "democratic idiom" was the fiery religious oratory of the Second Great Awakening of the early nineteenth century, when some of the most popular speakers were uneducated people with great skills in persuasive, direct address. Although this style would flower most fully in the 1830s, the contrast between it and the belletristic

style played an important role in the 1828 presidential election. John Quincy Adams, who had previously held the position of Boylston Professor of Rhetoric and Oratory at Harvard, ran against the plain-talking Tennessee lawyer and military hero Andrew Jackson. The candidates' supporters played up the great differences in style between the two men. So, although neither candidate ever electioneered on his own behalf, Jackson's election helped to usher in a new era of popular politics that eschewed refinement and elitism.

These changes in American political culture would eventually contribute to a fundamental shift in the common understanding of rhetoric. Rather than referring to public-spirited speech by the honorable orator, "rhetoric" came to connote the inflated, empty, and even deceptive words of speakers who had their own interests at heart. During the early American Republic, however, rhetoric remained associated with virtuous eloquence that galvanized the public to unified action toward the common good.

towns of Tiverton, Little Compton, Warren, and Bristol. Newport continued to prosper commercially, but Providence, at the head of Narragansett Bay, began to challenge it for supremacy. This rivalry assumed political dimensions, and by the late 1740s a system of two-party politics developed, with opposing groups headed by Samuel Ward and Stephen Hopkins. Generally speaking, the merchants and farmers of Newport and South County (Ward's faction) battled with their counterparts from Providence and its environs (led by Hopkins) to secure control of the powerful legislature for the vast patronage at the disposal of that body.

By the end of the colonial era, Rhode Island had developed a brisk commerce with the entire Atlantic community, including England, the Portuguese islands, Africa, South America, and the West Indies. Rhode Island merchants outdid those of any other mainland colony in the lucrative slave trade. Though agriculture was far and away the dominant occupation, commercial activities flourished in Newport, Providence, and Bristol and in lesser ports. In 1774 the colony had 59,707 residents, who lived in twenty-nine incorporated municipalities (up from 32,773 in the census of 1748).

THE REVOLUTIONARY ERA, 1763–1790

Rhode Island was a leader in the American Revolutionary movement. Beginning with strong opposition in Newport to the Sugar Act (1764), with its restrictions on the molasses trade, the colony engaged in repeated measures of open defiance, such as the burning of the British revenue schooner *Gaspée* in 1772. Gradually Ward's and Hopkins's factions came together to endorse a series of political responses to alleged British injustices. On 17 May 1774, after parliamentary passage of the Coercive Acts, the Providence Town Meeting became the first governmental assemblage to issue a call for a general congress of colonies to resist British policy. On 15 June the colony became the first to appoint delegates (Ward and Hopkins) to the anticipated Continental Congress. In April 1775, a week after the skirmishes at Lexington and Concord, the colonial legislature authorized raising a fifteen-hundred-man "army of observation" with Nathanael Greene as its commander. On 4 May 1776 Rhode Island became the first colony to renounce allegiance to King George III. Ten weeks later, on 18 July, the General Assembly ratified the Declaration of Independence. During the war, Rhode Island furnished its share of men, ships, and money to the cause of independence, and helped to create the Continental Navy. Esek Hopkins (broth-

er of Stephen, a signer of the Declaration of Independence) became the first commander in chief of the Continental Navy and Greene became Washington's second-in-command and chief of the Continental Army in the South.

The British occupied Newport in December 1776. An unsuccessful five-week campaign to evict them in July and August 1778 was the first combined effort of the Americans and their French allies. The highlight of that campaign was an American victory on 29 August in the Battle of Rhode Island—a ten thousand-man engagement that is the largest battle ever fought in New England. The British voluntarily evacuated Newport in October 1779, but in July 1780 the French army under Rochambeau landed there and made the port town its base of operations. It was from Newport, Bristol, Providence, and other Rhode Island encampments that the French began their march to Yorktown in 1781.

In 1783 the General Assembly removed the arbitrarily imposed disability against Roman Catholics (dating from 1719) by giving members of that religion “all the rights and privileges of the Protestant citizens of this state.” Most significant of several statutes relating to blacks was the emancipation act of 1784, a manumission measure that gave freedom to all children born to slave mothers after 1 March 1784.

Newport's exposed location, the incidence of Loyalist sentiments among its townspeople, and its temporary occupation by the British led to its decline. In 1774 its population was 9,209; by 1782 that figure had dwindled to 5,532. From this period forward, Providence—more sheltered at the head of the bay and a center of Revolutionary activity—and its surrounding mainland communities grew and prospered.

In 1778 the state had quickly ratified the Articles of Confederation, with its weak central government, but when the movement to strengthen that government developed in the mid-1780s, Rhode Island balked. Because of the state's individualism, its democratic localism, and its tradition of autonomy, it resisted the centralizing tendencies of the federal Constitution. Rhode Island declined to dispatch delegates to the Philadelphia Convention of 1787, which drafted the United States Constitution, and then delayed ratification until 1790. The ratification tally on 29 May 1790, thirty-four in favor and thirty-two opposed, was the narrowest of any state.

RHODE ISLAND IN THE NEW REPUBLIC, 1790–1830

During the early years of the Republic, the always romantic and sometimes lucrative China trade flourished, then declined, and finally expired in 1841. Rhode Island weathered both a major hurricane (the Great Gale of 1815) and a locally unpopular confrontation with England (the War of 1812). Providence evolved from town to city (1832), and its political party system experienced two phases of opposition: Federalists vs. Democratic Republicans (1794–1817) and National Republican/Whigs vs. Democrats (1828–1854). In two momentous changes, the state's economy transformed from an agrarian-commercial to an industrial base, and, after a long period of reform agitation and a serious political upheaval known as the Dorr Rebellion (1841–1842), government transformed from colonial charter to written state constitution.

In 1790 a cotton-spinning frame similar to those used in England was reconstructed and put to use in a mill at Pawtucket Falls on the Blackstone River. This marked the first time cotton yarn was spun by waterpower in America. The men chiefly responsible for this promising venture were Providence merchants Moses Brown, Smith Brown, and William Almy, and Samuel Slater, a young English immigrant with technical knowledge and managerial experience acquired in the cotton mills of his native land. By the late 1820s the processing of cotton displaced commerce as the backbone of the Rhode Island economy. From the mid-1820s onward, Irish Catholics came to Rhode Island in ever-increasing numbers to labor on public works projects, such as canals and railroads, or to work in the textile mills and metals factories.

For a century cotton production, woolens production, a base-metals industry, and the manufacture of precious metals, especially gold and silver jewelry, steadily expanded and dominated the state's economic life. Meanwhile agriculture declined, and many rural towns experienced a substantial emigration. With an 1830 population of 97,210, tiny Rhode Island was emerging as America's first predominantly urban-industrial state.

RICHMOND Founded in 1742, Richmond became the capital of Virginia in 1780. The initial city charter allowed male property owners to elect a council, known as the “Common Hall,” twelve citizens who appointed the mayor from their membership. After the first Continental Congress met in Philadelphia in 1774, delegates to the Virginia Convention descended on Richmond to organize defenses and a provisional government. In support of independence, Richmond provided soldiers, guns, gunpowder, and ship rigging. In 1776 the Declaration of Independence was read publicly in Richmond, and in 1788 the Virginia Convention, meeting in Richmond, ratified the Constitution of the United States. Richmond’s population grew from 600 inhabitants in 1770 to 5,706 in 1820. Early settlers included Germans from Philadelphia seeking land and Scottish tobacco merchants, but after the Revolution, European immigrants arrived from Haiti, Ireland, France, Spain, Portugal, and Holland. Settlers included Jews, who founded the Beth Shalome synagogue, and blacks, who made up around one-half the population.

Tobacco, coal, wheat, and black laborers were essential to Richmond’s economy. Tobacco was Richmond’s oldest economic sector; in the city it was warehoused, shipped, and manufactured into chewing tobacco. Between 1790 and 1830, coal output near Richmond grew from 22,000 to 100,000 tons annually. Richmond shipped coal to American cities, the West Indies, and Europe. As wheat became Virginia’s major crop, Richmond increased its production of flour and shipped it to South America and California. Richmond manufacturers produced iron, gunpowder, ceramics, beer, musical instruments, paper, cotton textiles, coaches, soaps, and candles. Black slaves worked not only as domestic servants, but also in the flour, tobacco, and coal mining industries. Free blacks dominated the skilled crafts, includ-

ing blacksmithing, coopering, masonry, and carpentry. At Richmond’s slave auctions, traders sold Virginia-born blacks locally, but also sold them south to cotton plantations. The foreign trade embargo of 1807–1809, the War of 1812, and the Panic of 1819 weakened Richmond’s industries and export businesses, which did not recover until the 1830s.

In the early national period, Richmond experienced technological and political change. Transportation and communication improved with the introduction of stagecoaches, canals, bridges, and steamboats. Politically, the Republican Party prevailed in the state as a whole, but Federalists dominated Richmond. In 1800, however, Jefferson carried Richmond in the presidential election. Operating from the capital, the Richmond Junto controlled Virginia’s Republican organization. The three-man junto, including Judge Spencer Roane, the newspaper editor Thomas Ritchie, and Dr. John Brockenbrough, made officeholders dependent upon their backing and, by influencing financial decisions, controlled the party’s purse strings. Junto members served on the boards of the Bank of Virginia and the Farmers Bank of Virginia, both based in Richmond.

In 1800 Gabriel Prosser secretly planned an insurrection involving thousands of other slaves in Richmond and throughout slaveholding areas of Virginia and North Carolina. Betrayed at the last minute, the conspirators delayed their plans, giving whites time to respond. Gabriel’s Rebellion forced whites to abandon naïve conceptions of blacks as contented within a violent slave labor system. In 1829 and 1830, delegates to a constitutional convention debated slavery and the low representation of nonslaveholding western counties in the state legislature and, ultimately, adopted a new constitution. In 1831 Nat Turner’s slave insurrection reignited these issues. When the Virginia General Assembly convened in Richmond, state legislators narrowly voted down a proposal to abolish slavery.

RIOTS Between 1754 and 1829, Americans violently hammered out their new national identity. From the Regulator Movement in North Carolina in the late colonial period to labor strife in New York City in the 1820s, the inhabitants of what became the United States continually invoked violence to voice social and political discontent. As often as people rioted to reshape their communities, they rioted to preserve what rioters considered acceptable behavior. Whatever their goals, most people turned to rioting only when nothing else worked.

Authorities in North America in the late eighteenth and early nineteenth centuries usually considered riotous any unauthorized crowd of several people that tried to establish its will through the use of force. Force included outright violence, including physical assault on a person or persons, and intimidation. Who authorities labeled a “rioter” depended on local circumstances; they preferred to prosecute leaders of riots. Although wealthy men led some crowds, leaders usually emerged from among the crowd. The rioters’ methods and aspirations did not fundamentally change from 1754 to 1829, but the Revolution qualitatively transformed rioting as participants used revolutionary language to legitimate new riots.

COLONIAL AND REVOLUTIONARY ERAS

In the late colonial period, (1754–1775), rioters drew on various traditions of violence. Many built on the European tradition of “rough music” to correct the sometimes deviant behavior of their neighbors. In a typical example of the rite in 1754, a crowd of women in New York City chased a Mrs. Wilson and pelted her with rocks for allegedly committing adultery. Other rioters looked elsewhere for models of ritual violence. In 1763 the Paxton Boys murdered several peaceful Conestoga Indians to protest the

Pennsylvania government’s refusal to fund a militia to protect farmers from attacks by hostile Indians. They used the same kind of stylized violence that Indians had utilized to kill white settlers.

During the Revolutionary era (1763–1789), crowds built on these traditions of violence when they protested political and social injustice. The Stamp Act protests illustrate that although elites sometimes led crowds, they withdrew their support when riots threatened their interests. In Boston during August 1765, Samuel Adams built on celebrations of Pope’s Day (5 November)—which commemorated an attempt to blow up Parliament in 1605—to protest the Stamp Act. Approximately two weeks after the crowd action he had organized, however, Adams called for the arrest of men responsible for another crowd action to protest growing disparities in wealth and power in Boston, a crowd that sacked the house of Lieutenant Governor Thomas Hutchinson. Rural rebels of the same period, including land rioters in New York’s Hudson Valley and Regulators in North Carolina, invoked the language of the Sons of Liberty when they rioted, hoping to legitimate their struggles for political and economic equality by aligning with struggles against Parliament. Authorities, some of whom were Sons of Liberty, reacted harshly to these rural riots in large part because these rioters often rejected their leadership. Rioting against British imperial rule culminated in the Boston Tea Party in December 1773 when some Bostonians refused to pay a tax that provided funds to cover the costs of colonial government. The rioters disguised themselves as Indians, boarded three ships in Boston Harbor, and dumped three hundred chests of tea into the water.

During the Revolutionary War (1775–1783), crowds made demands for subsistence part of the movement for independence. In nearly thirty instances during the first four years of the war, men and women rioted to control prices of vital commodities such as bread. In uprisings reminiscent of European bread riots, crowds of mostly women delivered ultimatums to their victims, couching their demands in the language of liberty and independence. They then assaulted these allegedly disloyal and unpatriotic shopkeepers for refusing to lower their exorbitant prices or for stockpiling goods to create false scarcities so they could then raise prices. These rioters disguised themselves, blackened their faces, and like participants in the Boston Tea Party, dressed like Indians to avoid identification.

AFTER THE REVOLUTION

The drive for independence forever changed rioting in the United States by giving rioters a new language drawn from that politically, socially, and culturally transformative event. After the war, rioters combined Revolutionary rhetoric with a European tradition of violence to legitimate their often-violent attempts to determine either who would rule the nation or how the nation should be ruled. Rioters who took part in Shays's Rebellion (1786–1787), the Whiskey Rebellion (1794), and Fries's Rebellion (1798) all invoked Revolutionary language to address local, state, or federal abuses of power. Similarly, Gabriel Prosser legitimated his slave rebellion in 1800 with words drawn directly from the pens of revolutionaries such as Thomas Jefferson. Animosity toward Britain lingered and exploded when rioters in Baltimore in June 1812 destroyed the presses of a printer who opposed war with Britain.

In the 1820s native-born whites, worried that immigrants jeopardized their welfare, attacked their economic opponents throughout the country, especially in cities such as Boston, New York, and Philadelphia. In 1824 and 1825, ethnically motivated violence marked New York and Philadelphia as riots broke out among canal workers, weavers, and dockworkers, with the latter destroying ships to force employers to meet their demands. Independence and liberty meant different things to these groups, but the words bore meanings forever attached to them in the Declaration of Independence and the Constitution of 1787.

From 1754 to 1829, riotous crowds utilized European traditions of violence to voice their discontent with their rulers, their material condition, or their sexually deviant neighbors. Rioters often tried to establish their brand of authority, or their notion of what society ought to be, by temporarily turning their world upside down and by using highly ritualized institutions to attack their opponents. Some of these rioters attacked victims and took over official institutions because they knew that officials would not address the rioters' grievances and that insurgents would not receive equitable treatment in any official proceeding such as a court. These crowds used the terror and violence of rioting to achieve their aspirations. The Revolution provided those who approved of rioting with a new language to express themselves and a new tradition to justify their violence. At the same time the Revolution inspired an egalitarianism that challenged hierarchy, it prompted many Americans to try to better their status or, at the very least, preserve their position. Some did so by rioting.

ROMANTICISM The late 1790s through the 1820s constitute the early or introductory period of romanticism in the United States, when radically new ideas about literature, philosophy, and theology coming out of England and Germany were first transplanted to American soil. The published works of the English poets William Wordsworth and Samuel Taylor Coleridge, in particular their *Lyrical Ballads* (1798), proclaimed a self-consciously modern literary and artistic esthetic. Inspired by the social idealism of the French Revolution, Wordsworth and Coleridge celebrated unbounded creativity and individual genius over mundane pursuits, the primacy of feelings and intuition over the rational intellect, and an awe-inspiring, infinite Creation over the finite, mechanistic universe of eighteenth-century natural philosophy. Despite this early introduction, it would be a full generation before the more serious philosophical and theological aspects of romanticism bore mature fruit on American soil in the transcendentalist movement, in the "higher criticism" of the Bible, and in the abolitionists' "higher law" arguments against slavery.

The romantic fascination with the marvelous and mysterious found popular expression much earlier, however, in the “romance” (also known as the “historical romance”), a literary genre first introduced in the 1810s by Sir Walter Scott’s immensely popular *Waverley* novels. Scott’s richly woven Scottish narratives led some American critics to lament the absence in North America of a feudal past peopled by chivalrous knights and ancient ruins, or of mist-shrouded forests filled with gloomy shadows and ghostly apparitions. Other American writers, however, most notably Washington Irving (1783–1859) and James Fenimore Cooper (1789–1851), were inspired by Scott’s example to find in the nation’s rough-hewn frontier settlements, dwindling American Indian population, and mythologized colonial and Revolutionary eras subjects suitable for distinctly American romances.

American romanticism’s mature period is centered unavoidably in New England. It is important to note, however, the mid-Atlantic and Southern ori-

gins of many early American romantic writers and artists. Charles Brockden Brown (1771–1810), whose supernatural tale *Wieland* (1798) is considered the earliest American romance, was born in Philadelphia and spent most of his adult life in Pennsylvania and New York. Cooper’s *Leatherstocking Tales*, a series of five novels begun in 1823 with *The Pioneers* and continued over the next decade in *The Last of the Mohicans*, *The Prairie*, *The Pathfinder*, and *The Deerslayer*, together with Irving’s *The Sketch Book of Geoffrey Crayon, Gent.* (1820), represent the coming of age of the American romance. Both Cooper and Irving lived nearly their entire lives in New York State. Edgar Allan Poe (1809–1849), born in Massachusetts, spent most of his life in New York City, Philadelphia, Baltimore, and Richmond; the poet William Cullen Bryant (1794–1878), also from Massachusetts, lived and wrote in New York City. Washington Allston (1779–1843), considered the father of American romantic painting, was a native son of South Carolina.

The transition from the early, popular period of American romanticism to its mature philosophical and theological phase is best exemplified by the career of Edward Everett (1794–1865), a Massachusetts-born scholar considered by many contemporaries to be the foremost intellectual of his generation. While a student at Harvard College, Everett, like many of his classmates, first read about German romantic or post-Kantian scholarship in Madame de Staël's *De l'Allemagne* (1813) and in the works of British writers such as Coleridge. After graduating with highest honors, in 1815 Everett accepted an invitation from Harvard to become the Eliot Professor of Greek Literature and negotiated a three-year preparatory trip to Europe. Traveling to Germany with his friend George Ticknor (1791–1871), Everett studied at the University of Göttingen under the direction of Johann Gottfried Eichhorn, Germany's foremost scholar of the Hebrew Bible and the leading exponent of biblical "higher criticism." Ticknor returned home after a year abroad to assume the positions of Professor of Belles Lettres and Smith Professor of the French and Spanish Languages and Literatures at Harvard. Everett completed his studies in 1817, making him the first American to earn a doctorate at a German university.

In January 1817, Everett published a long essay on Goethe in the *North American Review*, the first significant essay on German romantic literature to appear in an American periodical. Later, as editor of that journal from 1820 to 1824, Everett published a series of influential essays that celebrated the American romance as the first indigenous national literature. A lengthy review essay on Cooper's historical romance *The Spy* (1821) triumphantly asserted that "there never was a nation whose history . . . affords better or more abundant matter for romantic interest than ours." Everett's critical promotion of German romantic literature made a lasting impression on the rising generation of New England intellectuals, in particular the young Ralph Waldo Emerson (1803–1882), who lauded Everett's intellectual influence as "comparable to that of Pericles of Athens." Everett, Emerson noted in his journal, was "the first American scholar who sat in the German universities and brought us home in his head their whole cultured methods and results."

After Everett's resignation as editor of the *North American Review*, the periodical's essayists slowly reversed their earlier positive interpretations of the American romance. Dismissing the genre as overly fantastic and cliché-ridden, critics applauded the novel's greater narrative and emotional verisimili-

tude. This portentous shift, which reflected the growing cultural influence of Boston's Unitarian intellectuals, set the stage for the emergence of transcendentalism in the 1830s and for the full flowering of American romanticism in the 1840s and 1850s. James Marsh (1794–1842), a Vermont Congregational minister, was the first American transcendentalist to respond critically to this transformation of New England culture. In a long "Preliminary Essay" to the first American edition of Coleridge's *Aids to Reflection* (1828), Marsh condemned the arid mixture of British empiricism and Scottish common sense philosophy that dominated American intellectual and religious life. "So long as we hold the doctrines of Locke and the Scottish metaphysicians," Marsh observed, we "can make and defend no essential distinction between that which is *natural*, and that which is *spiritual*." Breaking decidedly with the Unitarians' authorization of scientific naturalism and philosophical realism, Marsh argued that self-inspection, reflecting upon "the mysterious grounds of our own being," was the only means by which individuals could arrive at certain knowledge "of the central and absolute ground of all being."

Younger New England intellectuals such as Emerson, who rejected the "corpse-cold" rationalism of their parent's generation, quickly embraced Marsh's belief that Coleridge provided the philosophical framework for a spiritually reinvigorated religious experience. Fredric Henry Hedge (1805–1890), a student at the University of Göttingen in the late 1810s and a founding member of the Transcendental Club, wrote an 1833 essay on Coleridge that presented the first clear exposition by an American writer of Kant's *Critiques* and of the post-Kantian philosophies of Johann Gottlieb Fichte and Friedrich Wilhelm Schelling. By 1850 New England was awash in romantic and transcendentalist philosophy and theology. Hedge's literary anthology, *Prose Writers of Germany*, was followed quickly by the monumental, multivolume *Specimens of Foreign Standard Literature*, and reviews of British, German, and French romantic writers regularly filled the pages of the *Christian Examiner*, the *Dial*, the *Harbinger*, and other progressive literary and religious periodicals.

Several other important manifestations of mature American romanticism emerged in the antebellum period. In the 1840s perfectionist strands of romantic thought inspired George Ripley (1802–1880), founder of the *Dial* and a former Unitarian minister, to organize and head the utopian community called Brook Farm in Concord, Massachusetts. Similarly, the social reformers John Humphrey Noyes (1811–

1886) and Robert Owens founded, respectively, the Oneida Community in upstate New York and New Harmony in western Indiana. Theodore Parker (1810–1860), a radical Unitarian minister and a devoted student of German philosophy and biblical criticism, stunned Bostonians in the early 1850s with the assertion that an intuited higher moral law took precedence over the recently passed Fugitive Slave Act and the U.S. Constitution. Darker romantic impulses, in turn, drove the writers Nathaniel Hawthorne (1804–1864) and Herman Melville (1819–1891) to explore the more mysterious and irrational recesses of the American psyche and to produce the literary masterworks of the American Renaissance.

fifty-two additional members had been elected from the North American British colonies, nineteen of them royal governors and hence in a position to encourage investigations in "natural philosophy." The remaining thirty-three were chosen because their interests made them likely to carry out such investigations. Winthrop—Connecticut's governor for eighteen years—satisfied both expectations. The telescope he gave to Harvard College made possible observations that were useful to Isaac Newton (1642–1727), and among his own contributions on subjects ranging from alchemy to zoology was a paper showing that maize, or Indian corn, is a nutritious human food.

Winthrop was in London seeking a royal charter for his colony when he was elected, but most other colonials were nominated by society members and elected *in absentia*. Since few of them could attend meetings, for ninety years these overseas members were treated like other Englishmen living forty miles or more from London; they were exempt from all membership fees. Beginning in 1752, however, the colonials also were assessed to help pay for the society's publication of its *Philosophical Transactions*. Colonial residents vied to put "F.R.S." after their names, and the society continued to welcome those qualified to contribute to its *Philosophical Transactions*, which printed at least 260 papers from the British colonies of North America prior to the American Revolution.

The most significant American contributor of the next generation was Cotton Mather (1663–1728), who sent his *Curiosa Americana* to the society over the course of twelve years (1712–1724) in the form of eighty-two letters. Mather's observations, both original and copied from ephemeral publications, were read to the society, although only a few were published in its *Transactions*. Many of his reports embodied the superstitions of his time, yet Mather did describe smallpox inoculation in Boston, of which he himself had learned from the *Philosophical Transactions*, and he was one of the first to study plant hybridization. He also differed from earlier colonial contributors by his willingness not merely to collect data, but to speculate on its meaning as well.

The Royal Society not only received and disseminated the observations of its members, but also guided research in directions thought to be rewarding. Resident members helped to provide supplies needed for experiments overseas. Benjamin Franklin (1706–1790) was stimulated by the apparatus for demonstrating static electricity sent to Philadelphia by society member Peter Collinson (1694–1768), who had earlier motivated the plant collecting of the American

After being read to the society, some of his letters were published in London's *Gentlemen's Magazine*, then collected in his 1751 pamphlet *Experiments and Observations on Electricity*. In 1753 the society awarded Franklin its highest honor, the Copley Medal, for his electricity studies. Transatlantic collegiality was further underscored when the reorganized American Philosophical Society, for which Franklin was the leading promoter, was established in 1769 in Philadelphia and patterned on the Royal Society of London.

SABBATARIANISM Most early Americans regarded Sunday as a day of rest, but they disagreed about how best to observe the day. Some colonists, following popular custom dating back to the Middle Ages, passed the day with feasts, ales, dances, fairs, and sporting events. Puritans and the more pietistic colonists, in contrast, regarded Sunday as the biblical Sabbath, set apart for bodily rest and worship. Conflict between these traditions continued into the early national period, gaining increased urgency as Americans debated the duties of republican citizenship.

Like their Puritan forebears, Congregationalists and Presbyterians generally embraced covenant theology, insisting that liberty was a blessing enjoyed only by those people who faithfully obeyed the commandments of God. Assuming the binding force of the Mosaic Law upon Christians, they attached particular significance to the fourth commandment (on keeping the Sabbath), which they regarded as a sign of the perpetual covenant between God and his people. From this perspective Sabbath violations threatened the foundation of civil and religious freedom.

As the nineteenth century opened, ministers tirelessly decried the widespread desecration of the Sabbath. During the War of 1812, countless state and local morals associations appeared, often spearheaded by Congregational and Presbyterian leaders, to

lobby for strict enforcement of state laws against intemperance, profanity, and Sabbath breaking. From 1810 through the 1830s this Sabbatarian impulse came to focus with special intensity upon the U.S. postal system, which had routinely transported and delivered mail on Sunday since the origins of the Republic.

In 1809 Hugh Wylie, the Presbyterian postmaster of Washington, Pennsylvania, was excommunicated from his church for sorting and delivering the mail on Sunday. Wylie, who had acted in conformity with the orders of Postmaster General Gideon Granger, appealed this action to the Ohio Presbytery, the Pittsburgh Synod, and ultimately the General Assembly of the Presbyterian Church, only to have his excommunication upheld. Wylie had to choose between his job and his church. His dilemma prompted Congress in April 1810 to enact legislation requiring all post offices receiving mail on Sunday to be open at least one hour for delivery during the day.

Sabbatarians regarded this action as a violation of the “rights of conscience” and an improper expansion of federal power into the local arena. A broad coalition of ministers, including Boston Unitarian William Ellery Channing, joined in urging Congress to repeal the new postal law. Soon, however, evangelical Sabbatarians broadened their goals to include not only repeal but also legislation prohibiting even the

transportation of the mail on Sunday. During the following decade Presbyterian and Congregationalist churches sent hundreds of petitions to Congress demanding action to end Sunday mails.

Sabbatarian efforts intensified in 1826 when the Presbyterian General Assembly urged all members to boycott transportation companies that persisted in operating steamboats, stagecoaches, or canal packets on Sunday. The following year Josiah Bissell Jr., a Presbyterian merchant in Rochester, New York, launched a Sabbatarian stagecoach and canal packet company—the Pioneer Line—between Albany and Buffalo. Soon similar companies appeared in other parts of the United States. In May 1828 Bissell joined with Lyman Beecher, Arthur and Lewis Tappan, and several hundred other evangelical ministers and laymen, in founding the General Union for the Promotion of the Christian Sabbath (GUPCS), which spearheaded a second national petition campaign against Sunday mails and worked to transform American attitudes toward the Sabbath.

The Sabbatarian war on Sunday mails had less appeal than most other evangelical crusades of the era. Many Christians believed that in an expanding capitalistic society, transportation of the mail on Sunday constituted a reasonable and even necessary public service. The petition campaigns failed to gain congressional support, while the boycott of non-Sabbatarian businesses sparked deep resentments in many communities and helped to generate an anti-Sabbatarian backlash, especially in western states and inland commercial centers like Rochester. Anti-Sabbatarians, who tended to identify with the emerging Democratic Party, rallied around U.S. senator Richard M. Johnson from Kentucky, who in 1829 gained national fame for his widely reprinted report denouncing the petition campaign as an unconstitutional effort to transform Congress into a sectarian religious body.

Despite the failure of the petition campaign, the Sabbatarian movement helped generate the persistent devotion to the Sabbath that continued to characterize American society right through the Civil War era. Moreover, many Sabbatarian leaders later entered the ranks of the abolition movement, where they applied to the antislavery cause tactics first employed in the fight against Sunday mail. Sabbatarians like U.S. senator Theodore Frelinghuysen from New Jersey, former president of the GUPCS, helped to establish the Whig Party and shape the moralistic ideology that characterized Whiggism.

ST. LAWRENCE RIVER Flowing 750 miles northeast from Lake Ontario to the Atlantic Ocean, the St. Lawrence River shapes the fate of the peoples on both of its shores. The river, despite its difficult rapids, has long served as a vital transportation conduit for trade, migration, and exploration. Long before European colonization, the river provided fertile hunting and fishing grounds for members of the First Nations. In 1535 Jacques Cartier officially named the river and claimed the area for France. Seventy-three years later, Samuel de Champlain founded Quebec City and settled Montreal in 1611. With these settlements, the river functioned as a barrier between New France and Great Britain.

On its waters, empires have risen and fallen, wars have been fought, and peace has been negotiated. Access to the river helped the British secure victory in the French and Indian War (1756–1763). It allowed the British to scale the cliffs outside Quebec City in 1759, destroy New France, and claim the area for Britain. In 1776 Americans sailed down the St. Lawrence in an attempt to capture British Canada. With the American Revolutionary victory, the river became the border between parts of the new Republic and British Canada. During the War of 1812, President James Madison attempted to annex British Canada by sending a fleet of ships, under the command of General James Wilkinson, down the St. Lawrence River. The Long Sault Rapids prevented Wilkinson from proceeding. On 13 November 1813 he anchored his ships; British and Mohawk warriors soundly defeated his men in the Battle of Crysler's Farm, giving the British control of the river. With the American defeat, the St. Lawrence continued to act as a buffer

and a trade conduit between the Republic and British Canada.

The war highlighted the need for an effective navigation system. Attempts at canal and lock building began and failed as early as 1689. In 1819 the Erie Canal in New York State drew trade away from the St. Lawrence. In response, work began on the La-chine Canal, which was completed in 1821. Serious modifications continued until the completion of the St. Lawrence Seaway, a system of canals, dams, locks, and channels connecting the Great Lakes, in 1959. In the 1820s the Underground Railroad moved human cargo from the United States across the river and into the freedom of British Canada. Vital trade and transportation continue along the St. Lawrence River.

ST. LOUIS St. Louis, known as the Gateway city, is located near the confluence of the Mississippi and Missouri Rivers. Its location made it the natural center of economic and political activity for the region as well as the logical starting point for the western expansion of the United States beyond the Mississippi. St. Louis served as the economic and political center of Spanish Upper Louisiana, the starting point for Lewis and Clark's Corps of Discovery, and the economic and social center of what would become the state of Missouri.

Settled in 1764 by Pierre Laclède, St. Louis was named for King Louis XV of France and his patron saint, Louis IX. Laclède was unaware that France had transferred its claims to the part of Louisiana west of the Mississippi River to Spain in 1762. Nevertheless, the region remained under French control until the Spanish governor arrived in 1766, after the French and Indian War (1754–1763). St. Louis then served as the seat of government for Spanish Upper Louisiana until the transfer to the United States in 1804.

The city was also the logical economic center for the fur and pelt trades up both rivers, but especially up the Missouri and its drainage. In fact, city resi-

dents were so caught up in trading with the Indians that they took little interest in farming. There were some efforts at agriculture and cash crops in the region, but St. Louis was primarily a commercial city.

In May 1780 the city was the site of one of the battles of the American Revolution. A small British force, along with a few Canadians and Native American allies, assaulted Fort San Carlos. The British were repelled, but the area was on guard for some time after. The conclusion of the American Revolution brought Spain a new, unwanted neighbor, the Americans. The Spanish sought to limit the threat of the Americans to their North American possession. In 1789 the solution was to allow the migration of non-Spaniards into the region on the condition they become Spanish citizens. This offer played a role in the shift of the ethnic makeup of the region away from French and to American, so that by the time of the Louisiana Purchase there was a significant American population already in the region. The city's population growth, not fast by modern standards, was nevertheless steady during the Spanish era, growing to approximately one thousand by 1800.

In 1800 colonial Louisiana was "returned" to the French by the Second Treaty of St. Ildefonso; but France never took effective control of St. Louis or Upper Louisiana. In 1803 France sold Louisiana to the United States. As quoted by William Foley in *The Genesis of Missouri*, U.S. Army captain Amos Stoddard described St. Louis as containing "upwards of 200 houses, mostly very large, and built of stone; it is elevated and healthy, and the people are rich and hospitable. They live in a style equal to those in the large sea-port towns, and I find no want of education among them" (p. 85).

In 1804 St. Louis served as the starting point for Lewis and Clark's Corps of Discovery. In 1803–1804 the corps' winter camp was outside of the city in Illinois, but both leaders spent significant time in St. Louis preparing for the trip. In 1806 it served as the finishing point of the expedition. Between 1807 and 1820 both Meriwether Lewis (1807–1809) and William Clark (1813–20) would serve the region as territorial governor.

St. Louis remained central to the new district of Louisiana, which was put under the Territory of Indiana in 1804. When Louisiana became a state in 1812, the region in which St. Louis lies was renamed the territory of Missouri. St. Louis's growth accelerated under the new U.S. government as the city's location continued to make it a trade center for the Missouri, Mississippi, and Ohio Rivers. In 1810 the city had an estimated population of 1,400, out of an

approximate regional population of 20,000, and by 1830 the city's population had grown to approximately 5,000. The county's population, including slaves, grew from 5,677 in 1810 to 10,049 in 1820 to over 14,125 in 1830. Slaves made up 18 percent of the population of St. Louis in 1820 and had grown to about 20 percent by 1830. In 1820 St. Louis County was second, behind Howard County in both total population and slaves; by 1830 it was first. The free black population of St. Louis County made up about 2 percent in 1820 but was down to 1.5 percent in 1830.

St. Louis County would remain a significant commercial, cultural and political center throughout the territorial and early statehood period. The United States government's 1810 "Statement on Manufactures" showed the county as the heart of the Louisiana Territory's limited manufacturing capacity (with the notable exceptions of blacksmiths, shoemakers, and distilleries). As the West was opened, commerce accelerated in St. Louis, and the city became an important center for provisioning and preparing those heading out to the frontier. The arrival of the steamboat contributed to this activity. According to the 1820 census, over 45 percent of the people reported as being involved in commerce in the state of Missouri, as well as over 30 percent of those in manufacturing, lived in St. Louis County. The year 1818 saw the arrival of Louis William Valentine DuBourg, bishop of Louisiana and Floridas, making St. Louis a Catholic See city, as well as the founding of what became St. Louis University, the oldest university west of the Mississippi. When the Diocese of St. Louis was created in 1826 Joseph Rosati became its first bishop.

William Clark lost his 1820 bid to become the first governor of the State of Missouri to Alexander McNair as Missouri entered the Union as a slave state in 1821. The capital moved first to St. Charles and eventually to Jefferson City, but St. Louis continued as an important center of commerce and manufacturing in the state. Among the other significant figures with St. Louis connections were Thomas Hart Benton and Auguste and Pierre Chouteau. In 1823 the city of St. Louis changed its form of government, moving from a board of trustees to an elected mayor.

SALEM Settled in 1626 by a small band of English Puritans, Salem, Massachusetts, like most early New England towns, originally encompassed a broad geographic area that was later divided into numerous smaller communities. By 1754 the town encompassed about 8.5 square miles and was one of the most prosperous ports in New England. Salem's densely populated center, which took up less than one-eighth of the town's area, faced Salem Harbor. Surrounding the town core were farms owned by Salem merchants and professionals and smaller plots owned by or rented to Salem's numerous artisans and shopkeepers, who used these lands for grazing and planting.

In 1754 Salem contained 3,462 people. Subsequent censuses reveal that the population grew to 5,337 in 1776 and to 7,291 in 1790, when Salem was the new nation's sixth most populous community. The population reached 12,613 in 1810, when a combination of factors, including the outward migration of some of Salem's most prosperous merchants and the War of 1812, slowed commercial activity in the town. Thereafter its population growth tapered off, reaching only 13,895 in 1830.

During Salem's growth years, various developments in the Atlantic world, the British Empire, and the new nation influenced its economy. Originally the community engaged primarily in "codfish commerce," where fish caught off the New England coast and timber cut from nearby forests were shipped throughout the North Atlantic and the Caribbean in exchange for goods of the West Indies, Spain, France, England, and a variety of other trading partners.

Later Salem's economy underwent a series of transitions as a result of the French and Indian War, independence, and the War of 1812. During the French and Indian conflict, enemy privateers drove much of Salem's fishing fleet from the seas and seized many Salem merchant vessels, but war-generated demand created offsetting opportunities for the town's traders as well. By 1763 Salem's fishermen were back on the water and the town's population rose, although somewhat irregularly, until 1774. Even before the Continental Congress declared American independence, Salem merchants sent out privateers. During the war for independence the town ultimately supplied over 20 percent of privateering vessels from Massachusetts and about 10 percent of all such ships in America. Following independence, Salem developed a complex trade with Europe, Africa, South America, the Far East, and the West Indies.

Although some Salem families had French, German, or African roots, the town population remained rather homogeneously English throughout these years. The African American population was less than 4 percent of the town total in 1754, and less than 2 percent in 1830. In the later year there were only eighty-eight nonnaturalized aliens in town.

From the Revolution through the War of 1812 Salem experienced a variety of political divisions. Several wealthy landed families, which prospered from salaries and fees earned as civil officials, opposed independence, while the merchant, artisan, and seafaring classes in the town supported separation from England. Most Salemites embraced the Constitution, but during the early years of the nation, when party divisions emerged, both Federalists and Democratic Republicans developed strong followings in the town.

SANTA FE Santa Fe, New Mexico, is the oldest established capital city in the United States. Founded in 1608 by Governor Pedro de Peralta on the site of a Native American ruin, the Villa Real de Santa Fe (the Royal City of the Holy Faith) served as the governmental, military, and cultural headquarters of the northern province of New Spain. In 1680 Native Americans living in pueblos in northern New Mexico revolted against the Spanish and drove them out of Santa Fe and New Mexico in the most successful uprising against European settlers in North American history. The Spanish, led by Don Diego de Vargas, reconquered Santa Fe in 1692 and reestablished it as the capital of New Mexico for Spain. In the eighteenth century Santa Fe remained on the periphery of the Spanish Empire, but Hispanics and Native Americans found ways to live peacefully in the capital. In 1776 Father Silvestre Velez de Escalante and Father Francisco Domínguez set off from Santa Fe to blaze an overland trail to Monterey, California. They abandoned their exploration in the badlands of Utah and returned to Santa Fe. In 1821 Mexico won its independence from Spain, and Santa Fe became the capital of the Mexican state of New Mexico.

According to the Spanish censuses in the eighteenth century, Santa Fe grew from a population of 1,285 in 1760 to 4,500 in 1799. As the capital of the colony, Santa Fe attracted settlers from Mexico as well as Native Americans from the nearby pueblos, from the Navajos and the Plains tribes, and from tribes in Mexico. Many mixed-heritage people also lived in Santa Fe.

From its founding in 1608 through the nineteenth century, Santa Fe served as the terminus of several important transcontinental trails. First, El Camino Real de Tierra Adentro (the Royal Road to the Interior Lands) connected the colony with the rest of the world. The 1,500-mile (1,900-km) trail from Mexico City to Santa Fe delivered immigrants, priests, governmental officials, and goods to the city. Even though Santa Fe was the major city on the northern frontier of New Spain, authorities forbade trade with the other European settlements to the east. In the contest for colonial territories, Spanish officials used Santa Fe and New Mexico as a buffer between New Spain and the French, British, and then the United States territories. After Mexican Independence in 1821, Mexican authorities allowed trade with the east, and William Becknell, a bankrupt farmer from Missouri, opened up the Santa Fe Trail. In addition to bringing immigrants and trade goods to the city, the Santa Fe Trail also was the route of con-

quest taken by the United States Army during the Mexican American War in 1846. Santa Fe then became the capital of the United States territory of New Mexico in 1850.

SARATOGA, BATTLE OF In 1777 the British high command attempted to win the Revolutionary War by seizing control of Lake Champlain and the Hudson Valley, isolating the Patriot movement in New England. General John Burgoyne led an army of over 8,000 men (4,000 British regulars, 3,000 Brunswickers under Baron Friedrich von Riedesel, 650 Canadians, and 500 Native Americans) from Canada into upstate New York.

Burgoyne began well and captured Fort Ticonderoga on 5 July. Things broke down quickly thereafter. Though less than one hundred miles from Albany, Burgoyne's progress was slowed to a near standstill by rugged and dense terrain, the difficulties of transporting excessive equipment and personnel, and the efforts of American militia, who placed downed trees and other obstacles in his path. The brutal murder of Jane McCrea (ironically a Loyalist) by Burgoyne's Native American auxiliaries on 27 July drove thousands of enraged inhabitants to the Patriot army being organized by General Horatio Gates. By early August, Burgoyne was in serious trouble, as evidenced by the near annihilation of a detachment of nearly 1,000 Germans under Lieutenant Colonel Friedrich Baum sent to Bennington, Vermont, for supplies. As Gates's army swelled to 11,000 and more, Burgoyne appealed to Sir William Howe in New York City for assistance. But Howe had left New York to capture Philadelphia. To compound matters, Howe inexplicably took the sea route to Philadelphia, allowing Washington to interpose the Continental Army between the two British armies. With no assistance from New York, Burgoyne at-

tempted to fight his way to Albany. At Freeman's Farm on 19 September and Bemis Heights on 7 October, Burgoyne was repulsed by forces under General Benedict Arnold and Colonel Daniel Morgan, losing almost 1,500 men to less than 500 for the Americans. By mid-October, Burgoyne was left with few supplies and no prospect of either escape or relief. Thus, on 17 October, Burgoyne surrendered his army of 5,800 men to Gates at Saratoga.

The victory at Saratoga convinced the French government that the United States might be an effective ally. The conclusion of the French alliance in February 1778 transformed the American Revolution into an international conflict, bringing the new nation a powerful ally and forcing the British to reconsider their military strategy.

SATIRE Satire, the art of ridiculing human vice and folly, was arguably the most popular and politically important literary form during the Revolutionary and early republican periods. In fiction, drama, and particularly poetry, satire emerged during this time as a crucial means for shaping American social and political discourse, intervening in virtually every major controversy from the Stamp Act crisis to the War of 1812.

Befitting the political turbulence and fervor that characterized the era, early American satirists envisioned their works as weapons in a literary and ideological war to decide the future of the new Republic. During the Revolution, anti-British satires appeared regularly in newspapers or as broadsides, responding to specific events and depicting King George III and his supporters as villains or buffoons. The most prominent satirical writers of the Revolution included John Trumbull, author of *M'Fingal* (1776), a burlesque of a typical Tory magistrate, and Philip Freneau, who published dozens of burlesque portraits of the king and various colonial governors and generals. Satirists on the Loyalist side, meanwhile, employed comparable tactics against the Patriots, as in

Jonathan Odell's *The American Times* (1780), a vitriolic assault against George Washington, John Hancock, and other Revolutionary leaders.

As with much eighteenth-century American poetry, verse satire from the Revolutionary and early republican periods was highly allusive, even consciously imitative, of English Augustan masterpieces by Alexander Pope, John Dryden, and others. Still, the Revolutionary period introduced a number of uniquely American characteristics and themes. American satirists were especially drawn, for instance, to writing verse parodies of other printed texts such as newspaper articles or official government documents. During the war, broadsides proclaiming martial law or demanding the arrest of rebels were frequently answered by anonymous verse parodies, such as William Livingston's "Burgoyne's Proclamation" (1777), ridiculing not only the colonial official who issued the proclamation but the language of political authority itself. This capacity of satire to alter or subvert the meaning of other printed texts would, in turn, make possible the principal literary dynamic of the early national period: poets representing one political perspective would engage in satiric exchanges with poets from the opposing side.

After the Revolution, satirists weighed in on the numerous social and economic challenges facing the new United States, and soon individual authors were identifying themselves with specific policies and parties. During the debate over the Constitution, a group of poets later known as the Connecticut Wits (Trumbull, David Humphreys, Joel Barlow, and Lemuel Hopkins) collaborated on "The Anarchiad" (1786–1787), which ridiculed the the Articles of Confederation and its defenders as unable or unwilling to resolve the social and economic crises that arose. After the federal government was formed, writers suspicious of Washington's administration, including Freneau and St. George Tucker, commenced a satiric counterattack in the pages of Freneau's *National Gazette*. At the same time, a new assemblage of Connecticut Wits (Hopkins, Richard Alsop, and Theodore Dwight) collaborated on a series of satires directed against the emerging Jeffersonian party, particularly for their sympathy toward the French Revolution (see, for instance, "The Echo" [1791–1798] and "The Political Greenhouse for 1798"). The 1790s thus constituted the high point of verse satire in the early national period, with writers engaged in often bitter personal attacks over issues ranging from the Jay Treaty (1795) to the election of 1800.

Not all satire from this period was political; nor was it limited to poetry. John Trumbull's first important work, "The Progress of Dulness" (1772–1773), took aim at Yale College and New Haven society, while his friend Timothy Dwight ridiculed the theological doctrines of Deists and Universalists in *The Triumph of Infidelity* (1788). In drama, Royall Tyler's *The Contrast* (1787) portrayed various American stock figures in a lightly satirical, though affectionate, light, while in fiction, Hugh Henry Brackenridge's early novel *Modern Chivalry* (1792–1797) responded with more caustic irony to the social implications of increasing democratization.

After the election of Jefferson, some Federalists, such as Thomas Green Fessenden in *Democracy Unveiled* (1805), continued the earlier strategy of unmasking Jeffersonian Democracy as a false ideology that primarily benefited demagogues and Southern slave owners. More generally, however, writers after 1800 turned away from the satiric ideal of literature as a means of political intervention and toward a contrasting notion of literature as refuge from the ruthless world of politics. Thus, although satire would live on in the 1810s and 1820s, it would appear chiefly in the guise of works written to entertain rather than to spur political action, as in the essays and stories of Washington Irving.

SCIENCE The earliest scientific discoveries in North America were made by investigators sent from Europe, where they returned to publish their reports. Among them were such early explorers as Thomas Harriot (1560–1621) and Mark Catesby (1679?–1749) from England. Their mission was to explore the biosphere of a little-known part of the world, an enterprise for which Linnaeus, the great systematizer of the time, also sent from Sweden his

VENUS'S-FLYTRAP

Found only in nitrogen-poor bogs along the Carolina coast, this little insectivorous plant was brought to the attention of European naturalists in 1759 by Arthur Dobbs (1689–1765), royal governor of North Carolina. John Bartram made several unsuccessful attempts to supply his English friends with viable seeds of what he called the “little tipitiwitchet,” and finally a living plant reached John Ellis in 1768. Ellis, an English correspondent of Linnaeus, wrote that the leaf of the clever plant has “many minute red glands, that cover its inner surface, and which perhaps discharge sweet liquor, tempt the poor animal to taste them: and the instant these tender parts are irritated by its feet, the two lobes rise up, grasp it fast, lock the rows of spines together, and squeeze it to death.” Such apparent volition in the vegetable kingdom caused Charles Darwin a century later to call this plant “one of the most wonderful in the world.”

Ellis was wrong about the function of the red glands (they secrete digestive juice), and he got the commonplace white flowers wrong (they are in cymose clusters), but in Uppsala, Sweden, Linnaeus published his description and the scientific name he gave it. In 1768, in a letter to *The St. James's Chronicle*, Ellis wrote that “I shall call it *Dionaea Muscipula*, which may be construed into English, with humble Submission both to Critics and foreign Commentators, either *Venus's Flytrap*, or *Venus's Mousetrap*.” Today it is commonly called Venus's-flytrap.

own emissary, Pehr Kalm (1716–1779). Dating from 1662, the Royal Society of London provided a natural focus for such information coming from the colonies in North America and elsewhere in the expanding British empire.

European interest centered on New World fauna and flora, especially on plants having economic or medicinal potential and, to a lesser extent, those that

might enhance gardens or diversify forests. By the eighteenth century, resident naturalists were available to carry out these tasks of discovery and collection. Most notable was John Bartram (1699–1777), whose garden near Philadelphia became the major depot for the exchange of plants between the new world and the old. Bartram supplied at least two hundred new plants to English gardens, and he received from England countless new fruit trees and flowers in return. With the financial assistance of an English friend, Peter Collinson, Bartram collected plants from as far north as Lake Ontario and as far south as Florida. Collinson also encouraged Bartram's correspondence with such luminaries as Buffon in France, Gronovius in Holland, and with Linnaeus himself. Collinson published extracts from Bartram's letters in the *Philosophical Transactions* of the Royal Society and got him appointed Botanist to the King. Yet the time was not ripe for colonists to publish independent scientific papers. Even after independence, the Lutheran clergyman Gotthilf Henry Muhlenberg (1753–1815), who proposed a nationwide census of America's flora, continued to send his own botanical discoveries to Carl Willdenow for publication in Berlin.

Although the term “natural philosophy” originally included all varieties of scientific endeavor, by the eighteenth century a pragmatic distinction had been reached between natural philosophy (mathematics, astronomy, chemistry, and, roughly, what physics includes today) and natural history (botany, zoology, and, to some extent, geology). Individuals might practice in both categories, but contributions in natural philosophy clearly brought them greater prestige. The centerpiece of the age was Isaac Newton's *Principia Mathematica* (1687), which expounded the theory of gravitation and required an exceptional grasp of mathematics even to understand it. Mathematics was the weakest area of learning in American colleges, both before and after the Revolution. One who tried to excel in both areas was New York's Cadwallader Colden (1688–1776), educated in Scotland and best known for his *History of the Five Indian Nations* (1745–1755). Colden mastered the Linnaean system of classification so well that his catalog of plants was published by Linnaeus in Sweden; but Colden's speculative theory about the source of gravitation, which he thought improved upon Newton, was scorned by Europeans and only puzzled Americans.

Sciences in Boston by 1780. These two professional organizations, as well as a few specialized societies such as those for the promotion of agriculture, gave new momentum to American science. By providing publication outlets they also began to perform locally what earlier had depended on the Royal Society's *Transactions* and other European learned journals. They made possible, especially in Boston and Philadelphia, greater attention to natural philosophy, which often required apparatus a lone investigator could ill afford.

The first important opportunity for a significant North American contribution to natural philosophy came with the 1769 transit of the planet Venus across the sun's surface, a phenomenon that would not occur again for 105 years. This rare astronomical event could be observed in entirety only in the Western Hemisphere. In all, twenty-two sets of ob-

servations were made in the British colonies, many of them reported both in the *Transactions* of the Royal Society and in those of the American Philosophical Society. Accurate measurements of the transit from widely separated observation points on earth were necessary for the calculation of the specific distances between bodies in our solar system, which had been known only as relative distances. For the observations in Philadelphia alone an impressive array of instruments was assembled, including four telescopes, a sextant, and the most accurate clock available. There David Rittenhouse (1732–1796) built an observatory for the event. Second only to Franklin as a natural philosopher, Rittenhouse went on to experiment in magnetism and optics. As an accomplished clockmaker, he also built mechanical models of the solar system called orreries.

Similar astronomical work was carried out by Harvard's Hollis Professor of Mathematics and Natural Philosophy, John Winthrop (1714–1779), scion of a family of natural philosophers. Winthrop not only enriched Harvard's mathematics curriculum by his introduction of calculus, but he also was a supporter of Benjamin Franklin's theory of electricity and the teacher of Benjamin Thompson (1753–1814). During the Revolution Winthrop remained a staunch Patriot, while his student Thompson, a Loyalist, eventually became Count Rumford in Europe, where his experimental work anticipated the replacement of the caloric theory of heat by the vibration theory. It remained for Benjamin Franklin (1706–1790), whose experiments enabled him to explain electricity as a single "fluid" having a positive or negative charge, to become the first American scientist universally admired by Europeans.

EARLY REPUBLIC

Once it became an independent country, the United States could encourage science by financing it, though Congress long remained reluctant to do so. The first federal project of real consequence was the Lewis and Clark expedition of 1804–1806, for which Meriwether Lewis (1774–1809) was briefed by members of the American Philosophical Society on making scientific collections, while William Clark (1770–1838) was already an accomplished surveyor and map maker. Others had to describe and interpret the data they brought back, an effort attempted by several members of Philadelphia's Academy of Natural Sciences, organized in 1812. After that, much of the early scientific exploration of the trans-Mississippi West was conducted by Europeans like the Englishman Thomas Nuttall (1786–1859). Like

Benjamin Franklin. Franklin, shown here in an engraving (1761) by James McArdell after a painting by Benjamin Wilson, became the first American scientist universally admired by Europeans. LIBRARY OF CONGRESS.

Nuttall, some of them were financed by the private philanthropy of members of the Academy, who, in turn, expected to reap the intellectual benefits of their investment. There resulted a struggle between the field naturalists, who did the work and wanted credit for their own discoveries, and the sedentary naturalists, who controlled the press, the libraries, and the museums that were essential for the interpretation and publication of data discovered in the field.

Because of the paucity of college courses in the natural sciences, medicine long served as a training ground for naturalists, and the nation's earliest medical journal, Samuel Latham Mitchill's *Medical Repository* (which ran from 1797 to 1824) published more on natural history than it did on medicine. In 1818 it was joined by a periodical of wider scope, the *American Journal of Science*, edited by Benjamin Silliman at Yale, where he made that university a leading center for chemistry and geology. Mitchill (1764–1831) and Silliman (1779–1864) were the chief American advocates of the transformation of chemistry being carried out by Antoine Lavoisier in France that clarified the nature of combustion and introduced the terminology for elements and compounds still used today. However, Joseph Priestley (1733–1804), who had disputed Lavoisier, continued to defend the earli-

er phlogiston theory of combustion after he left England in 1794 and settled in Pennsylvania.

In geology William Maclure (1763–1840) published a geological map in 1809 that covered the nation up to the Mississippi River; it derived from his own fieldwork based on the surface collection of rocks. In 1822 Amos Eaton (1776–1842) had the advantage of the cuts made for the Erie Canal to attempt a stratigraphic analysis of a portion of New York State. Both geologists relied on the mineral classification scheme devised in Saxony by Abraham Gottlob Werner. Though geology remained tied to mineralogy, C. S. Rafinesque (1783–1840) suggested in 1818 that sedimentary strata could be classified by the fossils they contain. The chemical analysis of minerals had been advanced in 1801 by the invention of the oxyhydrogen blowpipe by Robert Hare (1781–1858), who later became a professor of chemistry at the University of Pennsylvania. Like Rittenhouse before him, Hare also excelled in the construction of instruments for his experiments, including those for generating electricity.

Philadelphia and Boston remained the principal centers for scientific research. Also of great importance was the Lyceum of Natural History, established in 1817 in New York City, which changed its name to the New York Academy of Sciences in 1876 and survives as a general scientific society. Less enduring scientific societies were started in Albany, Charleston, Cincinnati, New Orleans, and St. Louis to channel professional interests as college curricula also broadened to include botany, zoology, geology, and the application of science to such utilitarian fields as surveying. The marriage of science and industry took place in 1824, for in that year was founded in upstate New York the forerunner of the Rensselaer Polytechnic Institute and in Philadelphia the Franklin Institute—both institutions designed to provide scientific underpinning for the advancing industrial revolution.

SECTIONALISM AND DISUNION In early 1783 Alexander Hamilton wrote to George Washington, beseeching the retiring general to remain active in the public arena. The successful conclusion of the war had not secured the blessings of independence because the “seeds of disunion [are] much more numerous than those of union.” Only Washington’s ongoing efforts might offset the regrettable fact that the “centrifugal is much stronger than the centripetal force in these states.”

The belief that the perpetuation of the union was at once indispensable and problematic was common currency in the early republic. Indeed from the War of Independence to the end of the War of 1812, no subject was more productive of genuine concern or more likely to be contested than the threat of disunion. The best-known assertions of states’ rights and sectional interests in this period are the Virginia and Kentucky Resolutions (1798, 1799), the latter of which first employed the term “nullification” with

respect to federal laws, and the Hartford Convention (1814–1815), which was preceded by loose talk of secession by extreme Federalists. But other confrontations predictably gave rise to similar discussions of the differences that separated Americans from one another, culminating in suggestions of dividing the union into discrete, smaller, and more homogeneous confederacies. During the Revolutionary War, interstate quarrels were so frequent and so fraught with mutual distrust—especially on matters of food and supplies for the Continental Army, allotment of votes in Congress, apportionment of expenses in the Confederation, and disposition of land claims in the West—that friends of the union feared it might be a mere “Rope of Sand.” And each succeeding contest from the 1780s to the 1810s seemed only to confirm Hamilton’s assessment of the strength of “centrifugal” forces in America.

THE COLONIES

An examination of the “seeds of disunion” in the early Republic must begin with the colonial backgrounds of the Revolutionary states. By 1776 all of the rebellious colonies had developed separate identities and territorial claims that they had jealously nurtured over long periods. Having matured at different rates and along different lines, and with limited opportunities for interaction, the colonies were, as John Adams observed in the Second Continental Congress, “several distinct nations almost.” Furthermore, political and economic rivalries, some of which had been cultivated for more than a century, predisposed these colonies to competition rather than cooperation. Even when confronted by what appeared to be an imminent threat of French invasion in 1754, not a single colony would ratify the Albany Plan, whose principal purpose was the establishment of a defensive alliance. Not surprisingly, prominent colonial commentators and imperial officials alike subscribed to the conventional wisdom of the period, which assumed that deeply ingrained differences rendered the colonies incapable of forging a union, however necessary.

The long history of the colonies as independent entities dovetailed nicely with the Revolutionary generation’s distrust of power in the hands of weak human beings. Convinced that people were naturally selfish and therefore unable to resist the temptations of self-aggrandizement and avarice, the Revolutionaries were wary of surrendering superintending power to a distant authority. For radicals who had protested to no avail the actions of a parliament far removed from themselves, geographical proximity

was crucial in maintaining effective checks on rulers. They took to heart the maxim of the political philosopher Montesquieu that republics must be geographically tiny lest the public good be sacrificed to myriad conflicting private views. The federal structure created under the Articles of Confederation reflected this ideology. Small republics in isolation were easy targets of foreign invasion; a confederation of petty republics might combine the best features of internal harmony and external security. However, the league of friendship proved especially unreliable in meeting the challenge of discriminatory actions taken against it by Britain and Spain. In fact, the British exclusion of American ships from the West Indian trade in 1783 only aggravated existing fissures in the federal union. Some states contemplated separate retaliatory measures that targeted other states as well as foreign countries. Spain's closing of the Mississippi River to American traffic in 1784 further strained sectional relations after the Jay-Gardoqui negotiations produced a proposal for the United States to forgo navigation rights in exchange for Spanish commercial concessions.

Inhabitants of the western territories were particularly aggrieved by the support that John Jay—the confederation congress's secretary for foreign affairs—garnered in the North for his plan to occlude the Mississippi. Had they known of projections at the time pertaining to their permanent status in the Republic, their distress would have deepened. In Congress and in the federal Convention, northern representatives seemed to share an anti-West bias, which held that western frontiersmen, averse to work and addicted to fighting, were poor candidates for republican citizenship. Therefore, irrespective of the number of states that might eventually be carved out of the West, northerners asserted that the Atlantic states must control a majority of all votes in any future legislative assembly. Nothing came of these suggestions because a southern coalition, led by Virginia, refused to go along. Instead it welcomed the prospect of creating new states out of the western territories and admitting them into the Union as equal partners of the original thirteen. Unfavorable discriminations, it was argued, would be contrary to the logic of the Revolution. At least as important in determining southern opposition, however, was the assumption that emerging patterns of migration established an affinity of interest between the South and the West.

SLAVERY

An inventory of centrifugal forces operating in the early Republic would be incomplete without a con-

sideration of slavery. The entrenchment of the institution in the South in the century before independence was fundamental to the eventual alignment of the sections; that alignment, however, became fixed only after the War of 1812. To be sure, in 1787, when delegates from large and small states brought the business of the Constitutional Convention to a standstill over the issue of proportional versus equal representation, James Madison famously observed that the states were divided into separate interests not by their size but by "their having or not having slaves." The ensuing debate over the three-fifths compromise, during which unyielding opponents and proponents openly broached the subject of disunion, seemed to substantiate Madison's contention. And yet the division between slave and free states was not as obvious as these actions might suggest. In 1790 all of the states save Massachusetts were slaveholding states. Although it is also true that the other New England states and Pennsylvania had recently enacted gradual emancipation laws, New York and New Jersey, each with at least 6 percent of its population enslaved, had not and would not for another decade.

The line of demarcation is clearer if a distinction is drawn between societies with slaves and slave societies. In the former, slaves were present but slavery was neither central to the economy nor paradigmatic of social relationships; in the latter, they were. Such a distinction undoubtedly underlay Madison's 1787 identification of five slave states: Virginia, Maryland, North Carolina, South Carolina, and Georgia. But this division is not without ambiguity. An analysis of Convention votes reveals that Massachusetts was more often in agreement with Virginia, North Carolina, South Carolina, and Georgia than it was with Connecticut, and Virginia more often in agreement with Pennsylvania, Massachusetts, and New Hampshire than with South Carolina. The debate over the importation of slaves from abroad is especially instructive. No state was more spirited than Virginia in condemning the international slave trade, but South Carolina and Georgia, whose economies relied heavily on imported slaves, were quick to point out the self-interested motives of the Virginians. With a surplus of slaves, Virginia hoped to profit from a prohibition of slave imports, which would simultaneously increase the value of domestic slaves and stimulate a market for them.

A UNION OF OPPOSING INTERESTS

In the end, something of a paradox remains. If centrifugal forces were so numerous and evidently pow-

erful, why did the Republic not dissolve into its constituent parts? The answer lies in the combination of two interrelated circumstances that ironically exerted a kind of centripetal force on the nation.

First, although separating into sectional confederations appeared logical to many, there was no consensus on their composition. Few thought in terms of a fixed North-South split; instead, members of the Revolutionary generation most often singled out the New England states by designating them "Eastern," as in east of the Hudson River, in order to differentiate them from New York, Pennsylvania, and New Jersey. And if there were two Norths, there were at least that many Souths. The Chesapeake and the Lower South, as noted above, did not form a consolidated interest in spite of their common status as slave societies. By adding to this compounded union the newer western and southwestern states, whose allegiance could not be taken for granted, the basis for a minimum of five regional confederations existed.

Second, the mutual distrust that afflicted the states tempered all talk of disunion, for it was commonly understood that the process of secession, once initiated, must lead to catastrophe by unleashing pent-up resentments. Each regional confederation would either succumb to internal divisions, leading to successive secessions into ever smaller polities that invited European encroachments, or become engaged in armed encounters, which in turn resulted in the creation of standing armies and ended inevitably in collapse under dictatorial rulers. In short, the very dissimilarities that made the persistence of the Union problematic rendered the prospect of disunion even more dubious.

All of this changed after the War of 1812, as sectional identities came to be articulated with greater clarity. Thomas Jefferson wrote in 1820 that the Missouri crisis awakened him "like a fire bell in the night" and sounded the "knell of the Union," principally because "angry passions" had fixed a geographical line separating the sections that "will never be obliterated." Although he attributed these "unworthy passions" to the sons of the revolutionaries, Jefferson's own loyalty to states' rights and the slaveholding class was by this time no longer in doubt. Even his enthusiasm for the University of Virginia was grounded in part on his belief that it was a needed antidote to the doctrine of national supremacy and "anti-Missourianism" that southern youths were otherwise exposed to at northern colleges. Jefferson's transformation was reflective of two larger changes apparent in America by the 1820s. First, the presence or absence of slaves overrode all other variables, thus

allowing a consensus to be formed in determining the possible shape of rival confederations. Second, the South, now outside the mainstream of an increasingly democratic America, seemed destined to constitute a permanent minority in a political system dedicated to majority rule. Together these two conditions made secession and disunion more plausible than ever before.

SEDUCTION Seduction is, most simply, a misleading, in the sense of leading astray. The word was used in the late eighteenth and early nineteenth centuries to denote misleading of various kinds and in various venues: social, political, and personal. Although in the 1600s and early 1700s seduction referred almost exclusively to religious error—being seduced by Satan, for example, or by the "diabolical"

Catholic Church—by the 1770s the word was used in secular arenas. In the years leading up to and including the American Revolution, political tracts referred to the “schemes” of Great Britain in terms of seduction. “To the Freeholders, and Freemen, of the City and Province of New York,” published in 1769, excoriates those English Lords of Parliament who succumb to the “sordid Seductions of Bribery” to consolidate their own wealth and privilege at the expense of Americans.

In the 1780s and 1790s, with the advent of new “American” novels of seduction, the term became most popularly, and lastingly, associated with the misleading of a woman by a man. Even these novels of intrigue, illegitimate pregnancy, and death, however, have been read by literary critics as metaphors of political power and deception. Of Samuel Richardson’s *Clarissa* (1747–48), one of the best-known English seduction novels of the eighteenth century, John Adams famously declared, “Democracy is Lovelace and the People are Clarissa”—a claim that puts representative government in the role of the seducer, and the common man in the role of the naive and vulnerable woman. Ideologically speaking, seduction can be said to represent anxieties about actions and emotions uncontained, as opposed to emotions organized around a central, and usually patriarchal, figure (God, parents, the state) who will keep order and balance through rule and hierarchy.

In its popular, interpersonal form, seduction and its dangers represented prevailing turn-of-the-century Anglo-American attitudes about gender. Women were considered the primary victims of seduction because they were deemed more naive, less worldly, and more impressionable than—but just as passionate as—men. Thus in his work of moral philosophy, *The Beauties of Sterne* (1788), the novelist Laurence Sterne condemned the seducer who, “Though born to protect the fair [sex],” plunges the “yet-untainted mind into a sea of sorrow and repentance” by his “alluring . . . temptations.” In submitting sexually to a man who had no intention of marrying her, the woman sacrificed her peace of mind, her reputation, and her chance for marriage to anyone. As William Paley, the British theologian and philosopher, made clear in his *Principles of Moral and Political Philosophy* (1785), these losses were compounded by the “injury” done to family and to the broader community. Under the laws of coverture (which declared all women legally subsumed in, or covered by, the rights of the man who took care of her), a seduced woman’s family suffered as they would if “a robbery [had been] committed upon their

property by fraud or forgery,” while the “public at large” lost the “benefit of the woman’s service in her proper place and destination, as a wife and parent.” Although seduction clearly and severely upset the social balance of the community, Paley complained, no criminal law provided for a male seducer’s punishment beyond “a pecuniary satisfaction to the injured family.” Paley’s critique became part of a mid-nineteenth-century movement in America to award women the right to sue their seducers.

Although in the mid-nineteenth century the “true” woman was one who was “passionless,” self-sacrificing, and morally superior to men, in the late eighteenth and early nineteenth centuries women were often depicted as particularly susceptible to the “passions”—to desires rooted in and fueled by one’s mental and emotional sensitivity to one’s own and others’ feelings. Though a potential good in itself, such sensitivity could lead the woman astray when it was manipulated by an artful and conniving man. Speaking from the male point of view, Samuel Johnson, the literary eminence of the second half of the eighteenth century, declared in *The Beauties of Johnson* (1787) that there is no thought more painful “than the consciousness of having propagated corruption by vitiating principles” in a woman who becomes, in consequence, “blinded . . . to every beauty, but the paint of pleasure; and deafened . . . to every call, but the alluring voice of the syrens [sic] of destruction.” Johnson’s sentiment is echoed in American literature for the next several decades, where novels of seduction depict the woman as equally the victim of male machinations and her own unguarded and powerful emotions.

Following Richardson’s lead, the first American novels took seduction as their theme. The subject had political as well as personal connotations: having rebelled against their “Mother Country,” England, Americans were now vulnerable to the seductive lure of liberty. Seduction novels, as they have become known, attempted to counter the dangers of unregulated freedom (and their own reputation as novels as being “fanciful” and “frivolous”) by inculcating in their readers a serious regard for social responsibility and respect for parental authority. To this end, they proclaimed their own brand of “female education” often couched in melodramatic and sentimental language designed to outspoke the romantic eloquence of the would-be seducer. The first American novel, William Hill Brown’s *The Power of Sympathy* (1789), and the two most popular novels of the age, Hannah Foster’s *The Coquette* (1794) and Susannah Rowson’s *Charlotte Temple* (1797) all share a basic element of

plot—innocent women who are ruined by seduction and who die as a result—and in each of the novels it is the strength of the woman’s emotions that lead to her destruction. In *Charlotte Temple*, the narrator tells us that when Charlotte’s secret suitor “earnestly in-treat[ed] one more interview,” Charlotte’s “treacherous heart betrayed her; and, forgetful of its resolution, pleaded the cause of the enemy so powerfully, that Charlotte was unable to resist.” Charlotte eventually runs away with her lover, Montraville, breaking her parents’ hearts; she becomes pregnant by him and, unwed, dies in childbirth. Charlotte is seduced not only by her lover, the novel consistently suggests, but by her own desire. This, of course, is the essence of seduction: the manipulation, on the seducer’s part, of the other’s weakness or desire to lead him or her astray. In the early Republic, such vulnerability spelled trouble not only for the woman herself, and her family and her community, but for the nation itself, which relied, both literally and symbolically, on the virtue of its women (particularly mothers). In the wake of revolution, seduction represented an unregulated passion that threatened to unravel the experiment in freedom that was America.

SEMINOLE WARS The first Seminole War, which began in 1817, was a continuation of tensions stemming from conflicts with the Creek Confederacy during and after the American Revolution and from the presence of runaway and freed slaves in border settlements in Spanish Florida. The Seminoles were a group of Muskogee- and Hitchiti-speaking tribes

living in towns along the frontier. They incorporated within their population the militant Red Stick Creeks, refugees from the defeat of the Creeks by Andrew Jackson in 1814. These Creeks refused to acknowledge the stringent land cession terms of the Treaty of Fort Jackson (1814) and continued to occupy lands on both sides of the Spanish Florida–American border. Under the protection of the Spanish, and the British as well, the Seminoles took in not just Creeks, but slaves fleeing plantations, which infuriated their white owners.

From the American perspective, the situation was exacerbated by the continuing presence of British agents during the War of 1812 (1812–1815), notably Lieutenant Colonel Edward Nicholls of the Royal Marines. He armed the Red Stick Creeks and their African American allies but was prevented from using them by the British defeat at New Orleans and the Treaty of Ghent. Instead, Nicholls—recruiting two British expatriates and merchants, Alexander Arbuthnot and Robert Ambrister—kept up agitation amongst the Red Sticks regarding their ceded land and lands that part of the tribe had ceded to Forbes and Company and now wanted considered an illegal transaction. Many of the former slaves belonging to Nicholls’s force left with the evacuating British, but some stayed, increasing American anxiety that their armed presence would encourage slaves in the United States to revolt or flee.

Open warfare began when Andrew Jackson, acting on petitions from slaveholders, ordered his subordinate, Major General Edmund Gaines, to destroy what was called Negro Fort, a Seminole and freed slave settlement fortified by the British and located over the border in Spanish Florida on the Apalachicola River. The attack, which occurred on 27 July 1816, destroyed the fort, with refugees fleeing to join other Seminole communities. In October and November 1817, American officers at Fort Scott ordered the arrest of Seminole leaders living at Fowl Town, a settlement just north of the Spanish border; they were accused of being banditti and of threatening the Americans when they attempted to harvest timber. When the Seminole leaders refused, Fowl Town was destroyed in a series of raids. Survivors retaliated with devastating force, ambushing a transport boat on the Apalachicola River and killing fifty-one Americans, four of them children. Meanwhile, raids continued to be made by both the Fort Scott soldiers against Seminole towns and Native Americans against Georgia plantations.

Jackson replaced Gaines on 9 March 1818 and proceeded to invade Spanish Florida, sacking the town of Suwanee on 16 April. Although the Seminoles did not suffer high casualties, they were driven out of settlements and lost substantial amounts of stored food to Jackson's deliberate policy of destruction. Arbuthnot and Ambrister were captured by Jackson, court-martialed for treason for their role in encouraging the tribes, and executed. The international controversy generated by the execution of these British subjects was compounded on 24 May 1818, when Jackson seized Pensacola, deposed the Spanish governor, and forced the surrender of all those Seminoles who had fled there to Spanish protection. En route to Pensacola, Jackson looted and destroyed British plantations, Seminole villages, and Spanish property, even though he faced virtually no opposition.

In 1821 Spain implemented the Transcontinental Treaty of 1819 by leaving its Florida possessions, which placed the Seminoles, Creeks, and the former slaves allied with them at the mercy of Jackson and the American government. The British, also not wanting conflict, overlooked the deaths of Arbuthnot and Ambrister. Some Seminole leaders, under pressure, accepted a series of treaties promising annuities and a reservation and agreed to return runaway slaves. However, these treaties, which specified that the Seminoles would join with the Creeks and also placed a limit on the annuities, proved impossible for the American governor to enforce. That only some

tribal leaders had signed also gave rebellious Seminoles reason to feel themselves not bound by the agreements, which led to further conflicts beginning in 1835.

SENSIBILITY Sensibility, declared the Scottish moralist Hugh Blair (1718–1800), is the "temper which interests us in the concerns of our brethren; which disposes us to feel along with them, to take part in their joys, and in their sorrows" (*Sermons*, p. 24). Blair, whose work on aesthetics and morality would later become staple reading for Harvard undergraduates like Ralph Waldo Emerson in the 1820s, took Romans 12:15 as his text for this particular sermon: "Rejoice with them that do rejoice, and weep with them that do weep." But the social efficacies of sensibility were not confined to the religious realm. Drawing on John Locke's theory that early sense impressions ultimately determine character, writers and moral philosophers of the eighteenth century sought to place sensibility in a social context to determine its role in shaping an ethical, productive and happy citizenry. "Sweet sensibility!" writes the anonymous author of *The Hive* (1795), "Tis from thee that we derive the generous concerns, the disinterested cares that extend beyond ourselves, and enable us to participate [*sic*] the emotions of sorrows and joys that are not our own." Sensibility was, these writers averred, the emotional glue that held society together, countering the tendency to self-love. Blair's essay was published in New York and Philadelphia in 1790, and the Scottish common sense school of moral philosophy (including the earl of Shaftesbury [1671–1713], Francis Hutcheson [1694–1746], David Hume [1711–1776], Adam Smith [1723–1791], among others) to which he be-

longed was instrumental in defining American notions of sensibility and sentiment well into the 1830s.

Sensibility, the heightened awareness of the senses, both emotional and physical, became a popular subject not only for moralists, but also for novelists and poets in the latter half of the eighteenth century. The English author Laurence Sterne's *A Sentimental Journey* (1768), about a man who travels through France encountering painful scenes over which he empathetically weeps, initiated a series of publications on the virtues of sensibility whose influence crossed the Atlantic. As the historian Roy Harvey Pearce discovered, diaries of Americans in the 1770s revealed men and women who self-consciously tried to imitate Sterne's hero. And the first American novels published in the 1790s took as their subject the joys, and the sorrows, of sensibility. The two—joy and sorrow—were, in fact, considered inextricable, since the generous nature that moves one beyond the self makes one susceptible to grief as well as to happiness. But in the emotional economy of the eighteenth century, such a trade-off was by and large represented as worthwhile. As Hannah More put it in her poem, *Sensibility* (1795), "Would you, to 'scape the pain, the joy forego, / And miss the transport to avoid the woe?"

By the end of the eighteenth century, the cult of sensibility had produced its share of critics and detractors, at first mostly British. Since, as Sterne and More implicitly suggested, even sorrow itself could become a source of pleasure, sensibility was considered, dangerously, a possible end in itself. Although ideally a vehicle to compassion and thus social harmony, extreme delicacy of feeling could devolve into emotional self-indulgence. Artificial feeling, rather than genuine and active care for another, threatened to make a mockery of sensibility. Moreover, delicacy of feeling was potentially at odds with "manly rigor." Though the true man was popularly represented in British fiction from the 1760s through the 1780s as someone capable of generosity and benevolence, writers began to worry about the effects of refined feeling on the human constitution. "The only ill consequence that can be apprehended from [sensibility] is, an effeminacy of mind, which may disqualify us for vigorous pursuits and manly exertions," wrote Vicesimus Knox in his *Essays, Moral and Literary* (1792). Women, who were believed already more susceptible to emotional instability than men, were particularly at risk in indulging their fantasies of feeling through such things as excessive novel reading. But the danger to society of overly

sensitive men posed an even greater threat. As Johann Wolfgang von Goethe's widely read *The Sorrows of Young Werther* (1774) showed, along with a feminizing of the mind and spirit was the tendency of self-reflection to produce an unhealthy desire for solitude and an aversion to the pleasures and needs of the community. Sensibility, then, while denoting at first blush one's capacity for socialization, could—when indulged too freely—result in estrangement, melancholy, and finally, even madness or death.

American writers at the turn of the century acknowledged the dangers to the body and the body politic of, as one of them said, a "too great delicacy and sensibility." But by and large, the potential for sensibility to create a feeling of community and nationhood remained a grounding principle throughout the early national period. The death of George Washington in 1799 occasioned numerous discourses on the necessity of public mourning and the bond of "social sympathy" produced by mutual grief; in one funeral oration by Samuel Bayard, such grief was declared to be a confirmation of Americans' "sensibility as men." Critiques of such views of feeling and of justice based on feeling—in the writings of Immanuel Kant (1724–1804) and Samuel Taylor Coleridge (1772–1834), for example—would not be taught at American universities until the 1830s. Prior to that time, notions about the relationship between politics and sentiment were predominantly framed by mid-to-late-eighteenth-century ideas that confirmed the sensitive man, embodied in the artist or poet (Longfellow, for instance), as the true American, both in his own example of sensibility, and his ability to cultivate it in others.

SENTIMENTALISM Sentimentalism in arts and letters gained prominence in the eighteenth century as a particular rhetorical and literary style that sought above all to create a sympathetic connection between the author's object and audience. Sentimentalists emphasized emotion over reason and sought to ameliorate harsh Puritan morality with benevolence. Although sentimentalism pervaded various genres, it gained prominence in the English sentimental novel, a form imitated by aspiring American writers in the early Republic. A distinctive sentimental strain also ran through captivity narratives and Revolutionary rhetoric that aimed to unite the country behind the cause of independence. Sentimentalism remained a valuable rhetorical device in political rhetoric in the early nation, but increasingly in the nineteenth century it came to be associated with domestic rather than public life.

THE SENTIMENTAL NOVEL

The first sentimental novels to arrive in the colonies were those of the Englishman Samuel Richardson (1689–1761). In 1744 Benjamin Franklin published an edition of Richardson's *Pamela* (1740). Both *Pamela* and Richardson's *Clarissa* (1747–1748) were in demand at colonial lending libraries in the 1750s. *Pamela*, with its story of the reformation of a rake by a virtuous woman, and *Clarissa*, with its story of the ruination of a virtuous girl by a rake, became the two great formulae for the sentimental novel. The novels of Laurence Sterne (1713–1768), *Tristram Shandy* (9 vols., 1760–1767) and *A Sentimental Journey Through France and Italy* (1768), while not as popular as Richardson's, also found their way across the Atlantic. Sterne departed from Richardson's exaltation of domestic sentimental truths to explore a broader range of sensuous emotion.

These novels spawned many American imitations. The generation that survived the Revolutionary War demanded books, and as Parson Weems (1759–1825)—employed by a Philadelphia printing house to scout southern American markets in 1798—reported, they demanded mainly novels. From the 1780s to the 1810s, American writers, primarily women, produced scores of novels that followed the sentimental formula of Richardson and Sterne. Chief among these works were *The Power of Sympathy* (1789), by William Hill Brown (1765–1793), widely recognized as the first American novel, *Charlotte Temple* (American edition, 1794), by Susanna Rowson (c. 1762–1824), one of the best selling

sentimental novels of the period, and *The Coquette* (1797), by Hannah Foster (1758–1840).

These novels attracted a number of critics. Moralists, taking especial note that both the readers and writers of sentimental literature were women, charged that they corrupted moral sturdiness by encouraging romance and passion rather than revering the duties of marriage and child rearing. A wide range of republican critics such as John Trumbull (1756–1843), Thomas Jefferson (1743–1826), and Noah Webster (1758–1843) all lambasted the novel as trivial reading that bloated the imagination and detracted from the seriousness of life.

Sentimental novelists both responded to and anticipated this criticism by casting their novels as didactic moral lessons. Writers advertised their stories as “based on true life,” a claim enhanced by their universal use of the literary device of letters and diary entries.

CAPTIVITY NARRATIVE AND REVOLUTION

While the American sentimental novel of the 1790s was based almost entirely on English models, the innovative form of the captivity narrative had evinced sentimental traits earlier. Mary Rowlandson (c. 1635–1711) wrote the first North American captivity narrative, *The Sovereignty and Goodness of God*, in 1682, and its enormous popularity would result in multiple editions and countless imitations in the eighteenth century. Unlike the sentimental novel, Rowlandson's narrative was a spiritual story about salvation through faith. But by creating a sympathetic identification between the narrator and the reader, Rowlandson had anticipated one of the most important features of sentimental literature. This registered potently with the colonial divine Cotton Mather (1663–1728) who reported in his *Decennium Luctuosum* (1699) that he could not write of such narratives without weeping. By the 1790s, captivity narratives had accumulated many more sentimental characteristics. They focused on the sensational threat of rape and the drama of rescue, becoming far more secularly moral than spiritual. Notwithstanding their primary function as entertaining reading, these captivity narratives also negotiated difficult issues in colonial society, such as the possibilities of communication with Native Americans and the realities of an interdependent exchange economy.

As Michelle Burnham has argued in *Captivity and Sentiment* (1997), the captivity narrative's sentimental form transformed into a metaphor for the nation during the Revolutionary period and the early Republic. Mary Rowlandson's narrative went

through seven editions in the 1770s, and the title page of the 1773 edition included a picture of Rowlandson pointing a rifle at her would-be captors, who aimed rifles at her. This cross-pollination of literary and political themes was consciously designed to analogize Rowlandson's captivity by Indians to the colonial captivity by Britain. Numerous authors picked up this trope. In his *Common Sense* (1776), Thomas Paine (1737–1809) likened the rebellious colonies to an enraged lover whose mistress (liberty) had been ravished by Britain. Images such as these became commonplace in Revolutionary rhetoric that was often designed to rouse sentiment as well as appeal to reason. Similarly, Paul Revere's famous engraving of the Boston Massacre of 5 March 1770 affectively created a psychological representation that sentimentalized the cause for independence.

Sentimental rhetoric remained important throughout the early republican period. Andrew Burstein has argued that Americans developed a culture of sentiment that emphasized compassion in order to establish "a pattern of philanthropic mission, spiritual renewal, and global conversion" (*Sentimental Democracy*, p. xiv). Masculine sentimentalism became a dominant rhetorical style in abolitionist literature after 1790, invoking the "poor Negro" to create sympathetic identification between the reader and the subject. Americans recasting citizenship and virtue in a republican mold imagined citizenship as a sentimental tie of benevolence and goodwill that bound different men together.

SENTIMENTALISM AND DOMESTICITY

These uses of sentiment did not signal its dominance in arts or rhetoric, however. Critics regarded effusive sentimental displays as effeminate and weak, possibly threatening the vigor and discipline required for self-government. In the first decades of the nineteenth century, sentimentalism became increasingly associated with domesticity. Advice manuals, evangelical pamphlets, and women's magazines identified women as mistresses of the home, responsible for nurturing the sentimental ties that held the family together. This was in large part a reaction to the economic transformation of work in the early Republic. The growth of cities, decline of artisans, and growth of a middle class of bankers, professionals, and merchants forced men into a workplace outside the traditional boundaries of the home. In the process of redefining masculinity in the sphere of the competitive workplace, they relegated sympathetic virtues and sentimental truths to the domestic sphere of their wives.

SEVEN YEARS' WAR See **French and Indian War.**

SEXUALITY Sexuality, or the realm of human experience that encompasses sexual feelings and sexual expression, was in a period of transition in late-eighteenth-century America. Despite the prudish reputation of New England Puritans, there was no time when colonial Anglo-Americans were sexually repressed. They thought of sexual expression in marriage as legitimate and healthy. Throughout the eighteenth century, popular medical guides advocated regular sexual intercourse between married couples to keep bodies, minds, and marriages in a healthy balance. They envisioned particular attributes as sexually attractive: well-developed legs in men, ample breasts in women. But between the late seventeenth and late eighteenth centuries, profound changes took place, both in ideas about the relationship between sexual feelings and the self, and in customs surrounding sexual expression during courtship.

Before 1750 Americans imagined sexual feelings as "passions," fleeting and superficial. They did not

see such feelings as essential to personal identity. Unless kept within bounds, they could disrupt a healthy, stable, virtuous psyche. Moreover, early or excessive indulgence in sexual intercourse was thought to endanger physical health, especially for young men. Hence, parents closely supervised children's sexual behavior before marriage, courtships were short, and romance was discouraged. In popular literature, it was usually women who threatened men's stability by luring them into unhappy marriages, or demanding that men satisfy their insatiable lusts. Colonial writers portrayed women of color as particularly threatening and warned that intimacies with women of color would make white men more bestial, less civilized, and less European. Unbridled lust directed toward same-sex partners was thought to have the same destructive consequences as excessive passion toward the opposite sex.

Beginning around 1750, young people gained new control over their own marriage choices and, to a certain extent, new freedom to develop their sexual imaginations. Often with parental approval, they gained the ability to explore sexual desires within courtship through practices such as bundling and overnight visiting. Sexual experimentation became a normal feature of courtship, and in some American regions by the early 1800s more than 25 percent of married couples conceived their first child before marriage. Popular literature featured romantic heroines who expressed articulately their feelings about prospective lovers. Meanwhile, cultural changes also transformed ideas about sexual feelings within courtship. Sexual desire, when accompanied by deep feelings of love and mutual sympathy, became respectable, even ennobling—a civilizing rather than a destabilizing force.

Yet, at the same time, sexual feelings outside the context of courtship became increasingly differentiated from legitimate or "virtuous" desire. Novels depicted men who remained true to their fiancées as manly and men who seduced women without marrying them as base, foppish, and effeminate. White women who pursued their sexual desires in the context of virtuous courtship were admirable, but women of color (who were often legally forbidden from marrying white men) were brazen and lustful. Simultaneous changes occurred in the realm of homoerotic sex, and men who experienced sexual desires for other men were increasingly coming to be thought of as innately different from heterosexual men.

SEXUAL MORALITY Sexual morality in the early Republic was sustained by biblical, legal, and customary injunctions that in theory restricted sexual activity to heterosexual, monogamous, lifelong marriage. In practice, such restriction was never fully successful, and parts of the country's population ignored or even resisted official norms. But a general presumption of the moral value of premarital chastity and postmarital sexual fidelity provided the basic framework governing normative private sexual conduct.

Biblical prohibitions on fornication derived from key chapters in Paul's First Corinthians, as in 1 Corinthians 6:18: "Flee fornication. Every sin that a man doeth is without the body; but he that committeth fornication sinneth against his own body." Adultery, that is, sexual congress between a married person and someone not the lawful spouse, found prominent denunciation in the Ten Commandments. Many of the early colonial governments imported these moral offenses into their legal codes, criminalizing fornication and adultery to a far greater extent than was the case in England. By the time of the American Revolution, however, legal prosecution of sexual offenses had gone into a steep decline. For example, the court at New Haven, Connecticut, prosecuted 112 cases of fornication in the 1730s, the all-time decade high, while in the 1780s only 3 offenses were tried in that court. The Commonwealth of Massachusetts averaged 72 fornication cases per year in the decade before the Revolution, but only a handful of cases came to prosecution in 1790.

DECLINE IN PROSECUTIONS

Available evidence indicates that fornication itself was not at all in decline, at least not before the 1790s. Indeed, a widespread and dramatic rise in premarital

pregnancy (measured as the percentage of first births occurring within the first seven months of a marriage date) can be tracked in towns with good vital registration data, which show a rise before and during the decades of the war with Britain and a gradual decline setting in by 1800. In some jurisdictions in New England, the proportion of brides pregnant on their wedding day approached 40 percent; since marriage ensued and regularized these prenuptial pregnancies, however, families and communities seem to have tolerated the deviation from biblical prohibitions on fornication. A popular courtship practice called "bundling," in which a courting couple was allowed nighttime privacy in bed together, likely facilitated the upsurge in early births. The new state governments, some with and some without fornication statutes, backed away from prosecuting consensual sexual acts, perhaps in response to this period of relaxed attitudes about premarital chastity, or perhaps in response to a growing sense of the importance of separation of church and state. Some churches took sexual infractions very seriously, bringing up unwed mothers and, less often, putative fathers for disciplinary action such as sanctions and fines. But the days of whipping fornicators were a half-century or more in the past.

RENEWED ATTACKS ON PREMARITAL SEX

Around 1800, a renewed emphasis on premarital chastity as the standard for respectable womanhood becomes visible in the historical record, not only in the decline of premarital pregnancy rates but also in works of popular fiction and in court cases arising over seductions. Two best-selling sentimental novels—*Charlotte Temple* (1790), by Susanna Rowson, and *The Coquette* (1797), by Hannah Foster—featured heroines ruined and reduced to death by unprincipled libertine men, and the theme of the seduced and abandoned woman emerged as a staple in light fiction published in literary and ladies' periodicals and eagerly read by rising numbers of literate females. A common plot line of romantic fiction placed a trusting, naïve young woman in the hands of a heedless rake whose promises of love and marriage mask his real intention, that of sexual conquest and satisfaction.

While the novels portrayed male rakes as unsavory characters, in real life libertine men benefited from a double standard of morality in which women alone seemed to suffer the consequences of illicit sex in the form of unwed motherhood and ruined reputation. Concern over sexual seduction and the victimization of young women became manifest in

growing numbers of legal suits for seduction, in which an aggrieved father or master of a seduced woman brought action under the civil law of torts against an alleged offender. In such cases, the plaintiff had to ground the suit on a claim for compensation for lost service or labor from the young woman. But starting around 1815, judges' opinions openly acknowledged that loss of service was a legal fiction and that the real injury addressed was the serious harm to the reputation of the girl and her family. Courts thus added momentum to the idea, gaining popularity in these early decades of the nineteenth century, that "respectable" women by nature had lower sexual energy than did men and could not easily be construed as aggressors or even equal partners in instances of illicit sex. Newspapers frequently publicized such suits, and the news that seduced women, always framed as victims, could collect damages ranging from five hundred to fifteen hundred dollars from judges and juries sent a message that a high price was now attached to white female virginity.

SLAVES AND THE WORKING CLASS

In many states, and universally in the South, interracial sex was restricted both by laws against fornication and interracial marriage and by religious injunctions against adultery. Yet sex across the color line was a common southern occurrence, and legal intervention rarely ensued. Careful local studies have found that interracial sexual activity was often a matter of wide community knowledge. The spectrum of interracial sex ranged from long-term, child-producing unions to coercive sexual assault. In view of the unequal power relations between free white men and enslaved black women, even the most benign and familial of these relationships contained inherent coercion. Clearly, for some white slave owners, sexual entitlement over slaves overrode legal and religious canons of morality.

Blacks in bondage were not subject to the dominant white culture's laws of sexual morality and were only subject to customs and traditions insofar as individual white owners insisted on them. Legal marriage was denied to enslaved couples, as was the expectation of lifelong monogamous marriage. Under these circumstances, slave communities developed their own codes of sexual morality, with distinct features such as a tolerant view of children born to mothers not yet settled into coupled relationships.

Working-class neighborhoods in the rapidly growing cities of the early Republic supported a bawdy culture of unruly sexual relations, where

bastardy, prostitution, self-marriage and self-divorce were not uncommon. City leaders erected almshouses and houses of refuge to contain and support unwed mothers judged to be worthy of public aid; prostitutes were notably excluded. Benevolent and church-based women's organizations targeted poor urban women with their messages of the value of chastity, domesticity, and religiosity. Yet exposés and studies of prostitution in the 1830s made it clear that the male clientele for prostitution was cross-class. The foundational elements of sexual morality—premarital chastity and marital fidelity—were thus far from monolithic.

because they sang, dance, and spoke in tongues in imitation of the practices of the French enthusiastic group, the Cevenoles, who had come to England in the early eighteenth century. In 1762 Lee married; she bore four children, all of whom died in infancy. Deeply troubled by their deaths, Lee believed they were punishment for her sins, particularly sins of the flesh. Sin had entered the world, according to Lee, when Adam and Eve had sexual knowledge of each other.

In 1770 Lee was acknowledged as the leader of the Shakers. The Shaking Quakers took to the streets of Manchester preaching a gospel of repentance, regeneration, and the celibate life, attacked the worldliness of the churches, and refused to take oaths or observe the Sabbath. They were persecuted for their beliefs, and Ann Lee was imprisoned in 1772–1773. She later stated that Christ had appeared to her in prison, telling her that she was Jesus Christ in the female form. In 1774 eight members left for America. Lee believed that it would be in the New World that her vision would take hold and that a chosen people awaited her arrival.

After a brief stay in New York City, Lee and her small band went north to Albany. In 1776 they established their first congregation at nearby Watervliet, New York, and began to attract other converts by their preaching and celibate lifestyle. In the Shakers' early days, they gathered for enthusiastic meetings, with Lee preaching the Shaker gospel throughout New England from 1781 to 1783. They had occasional conflicts with local authorities, who suspected the Shakers' pacifist tendencies and thought they were British spies. The Shaker societies that developed over the next century held several core beliefs: that Mother Ann Lee had ushered in a period of spiritual rebirth; that she was the manifestation of Jesus Christ in spiritual form; that salvation would come through the Shaker family; and that sexual intercourse was at the root of evil and a covenant with the devil.

There were five separate periods in Shaker history. The first (1774–1783) was characterized by Lee's messianic style and premillennial beliefs. In the second period (1784–1803), two elders, Joseph Meachem and Lucy Wright, became leaders of the sect, organizing new colonies, requiring the membership to sign formal covenants, and regularizing the sect's practices. During the third phase (1803–1837), the Shakers moved westward, establishing colonies in Ohio, Indiana, and Kentucky under the guidance and direction of the central ministry at Watervliet. By 1826 nineteen permanent communities had been es-

SHAKERS The United Society of Believers in Christ's Second Appearing (commonly called the Shakers) was organized in the United States in 1774 under the prophetic leadership of Mother Ann Lee (1736–1784), who had fled religious persecution in England. Lee, the daughter of a Manchester blacksmith, had little education and worked in a textile mill and an infirmary. In 1758 she joined a religious society formed by two dissenting Quakers, James and Jane Wardley. The Wardleys formed a group that was derisively known as the "Shaking Quakers"

established. At Pleasant Hill, Kentucky, for example, the Center Family Dwelling House contained forty rooms and took ten years to complete. In this period the communities were organized into "families" of thirty to one hundred members. Within each "family" there were deacons and deaconesses who oversaw the temporal work while elders and eldersses supervised the spiritual life. An additional layer of elders (two men, two women) led the community and reported to the elders at the lead ministry in New Lebanon, New York.

As the Shaker societies grew and the older generation of Shakers passed away, a fourth phase (1837–1848) of intense spiritual and religious revivals, known as "Mother Ann's Work," occurred in all the societies. This revitalization movement was part of the evangelical upsurge following the Second Great Awakening, a period of renewed religious revivals in the early nineteenth century. During this phase members conducted seances, made spirit drawings and paintings, and created songs and poems to exalt Mother Ann Lee's mission. However, revitalization proved to be disruptive for the Shakers. In the final phase (1848 to 1875), the Shaker societies began to lose members and found it increasingly difficult to recruit new ones, particularly males. Earlier they had been able to attract adult converts and accept orphans abandoned by their families. At their height in the 1850s, the Shakers had about four thousand members in over twenty separate colonies. By 1880 the membership stood at 1,850, by 1900 at 850, and by the mid-1930s less than a hundred, as many of the communities closed their doors.

SHAYS'S REBELLION The event that became known as Shays's Rebellion stemmed from the widespread belief in western Massachusetts that the new state government was no better than the government of King George III. Thousands of western Massachusetts men had fought in the Revolution. But what had been accomplished? Power, in the judgment of the chief justice of Berkshire County, had just been shifted from one set of "plunderers" to another. Even clergymen who denounced Shays's Rebellion blamed it on the "venality" and unrealistic demands of the legislature.

Since 1782 town leaders had pleaded with the state legislature to address their concerns. Their petitions had been polite, deferential, and at times groveling, but again and again they had raised embarrassing questions. How, for example, were farmers to pay debts and taxes with hard money when no hard money was available? What about the "poor soldiers" who had actually fought the war? Were they to be taxed at outrageous rates to pay off a handful of government favorites who did nothing during the war? And where was the tax money going? To pay off a handful of Boston speculators who had bought up the state's war debt for virtually nothing? Why did honest men have to cope with so many layers in the court system? Was it just so that well-connected lawyers and court officials could collect fees at every step of the way? Why was there a state senate? Was it created to provide just another bastion of power for the privileged and well-born? And why was the government in Boston anyway? Was it to allow the mercantile elite to pass oppressive laws when distance and bad weather kept the people's representatives from getting to Boston?

Such thoughts had circulated in western Massachusetts for years, and each year the legislature ignored the complaints. So in the summer of 1786, roughly ten years after the Declaration of Independence, the selectmen of Pelham and a handful of other towns called for countywide protest meetings. The largest took place in Hatfield on 22 August 1786. The plan, according to one of the fifty delegates, was to list a set of grievances against the state government, call for a new state constitution, and then seize the county court, the one symbol of state authority, the following week. That they did. A week after the Hatfield meeting adjourned, hundreds of armed men converged on Northampton and stopped the judges from holding court. In the weeks that followed, other armed men prevented the courts from convening in other shire towns.

The participants in these court closings called themselves "Regulators," thus identifying themselves with the backcountry and the Revolutionary tradition that the people had a duty to rebel when their government got out of control. Needless to say, Governor James Bowdoin and the Massachusetts legislature rejected this idea. They deemed the rebellion "horrid and unnatural." At first the governor called on the militia to defend the courts. To his dismay, however, one militia unit after another refused to serve. Finally, in desperation, the governor and 153 Boston merchants hired a mercenary army under General Benjamin Lincoln to put down the uprising. As Lincoln's men marched west, the Regulators tried to seize the federal arsenal at Springfield on 25 January 1787. Had they succeeded, they would have been armed better than the state. But a militia unit under General William Shepard seized the arsenal first and turned its cannons on the insurgents, routing them and leaving four dead on the field. Ten days later General Lincoln caught up with the main rebel army at Petersham, surprised them at daybreak, and forced them to scatter, the leaders fleeing to Vermont, the rank and file returning home. Thus ended what state authorities came to call "Shays's Rebellion."

In calling the uprising Shays's Rebellion, Governor Bowdoin and his followers were clearly attempting to discredit the entire affair. As a rule, they blamed it on the down-and-out, and in many respects Captain Daniel Shays, a Continental Army officer from the small hill town of Pelham, fit the bill. His contingent was the largest, and he was a debtor. But he neither instigated the rebellion nor controlled it. He was just one of many veteran Revolutionary officers who led troops in battles of the uprising. Well over four thousand men later confessed to taking up arms against the state, and it is clear that most of them had been called to arms by someone other than Daniel Shays. Some were "hard-pressed debtors," like Shays, but others were clearly men of considerable wealth. Over half were veterans. Most marched alongside relatives and in-laws.

As for what happened to Shays and other participants who took part in the rebellion, for some, the immediate outcome was dire. The nominal leader, Daniel Shays, fled the state, lost his farm, and eventually settled in western New York. John Bly and Charles Rose, two minor rebels, were hanged, and sixteen others spent months anticipating a hangman's noose before being reprieved. Judge William Whiting, the chief justice of the Berkshire County court, had his judgeship taken away from him for

blaming the rebellion on the state's leadership. Similarly, State Representative Moses Harvey was kicked out of the legislature and forced to stand an hour at the Northampton gallows with a rope around his neck for blaming the rebellion on his fellow legislators. Hundreds of others had to cope with indictments filed by the state, or damage suits filed by neighbors, and some four thousand temporarily lost their right to vote, sit on juries, hold office, and work as teachers and tavernkeepers. Within a matter of months, however, most of these Regulators regained their former positions within their communities. Indeed, from their standpoint, they emerged victorious, as the new 1787 state legislature passed a moratorium on debts and cut direct taxes 'to a bone.'

The Massachusetts uprising had far-reaching effects. In Massachusetts, it ended the effort to pay off the state debt at the expense of backcountry farmers. For George Washington and other conservatives, it symbolized the unruliness of the backcountry in general. One of his key advisors blamed it on the "licentiousness spirit" prevailing among the people; another on the "leveling principle" that had captured the hearts of the poor and desperate. Were all men of property thus in danger? Was the Republic in peril? Nationalists seized upon such fears, pointed out the weaknesses of the Articles of Confederation, and convinced Washington to attend the Philadelphia convention in May 1787 that dispensed with the Articles and wrote the Constitution. They also used the specter of Daniel Shays to get the Constitution ratified by the states. Shays's Rebellion and the Constitution have been thus linked ever since.

SHIPBUILDING INDUSTRY The shipbuilding industry played a critical role in the economic and political development of early America. From the arrival of the first colonists to the formation of the new nation, America relied on the sea for subsistence, transportation, commerce, and communication. The necessity of maritime travel demanded a strong shipbuilding tradition.

EARLY DEVELOPMENT

The first vessels built in the colonies were small craft for local travel and fishing. Sponsors of the new colonies sent shipwrights from England to build ships, as most of the colonists did not know anything about their construction. While most vessels of the early

seventeenth century were small, a few larger ships were built for transatlantic crossings.

As the colonies grew, the need for supplies from England and communication with the rest of the empire increased. Different regions became known for specific exports. The southern colonies produced agricultural products like tobacco, cotton, rice, and indigo. The middle colonies, such as Maryland and Pennsylvania, exported flour, wheat, and corn. New England traded fish, furs, and timber, but initially British merchants did not actively seek these products. Without a desirable commodity, the New England colonies soon found difficulty in attracting English ships for trade. Specie, or currency, was hard to come by, and colonial merchants were unable to obtain credit from their British associates. With little

purchasing power, the colonists could not trade for manufactured goods from the mother country.

These difficulties in New England provided the impetus for the development of the shipbuilding industry; born out of necessity, it rapidly became an important facet of the economy. Several early building sites rose to prominence, including Salem and Boston in Massachusetts; New London and New Haven in Connecticut; and Newport, Rhode Island. Shipbuilding in the middle colonies lagged slightly behind, but it was well established in New York City and Philadelphia by 1720. In the south, where British merchants regularly sent vessels to trade for agricultural goods, the industry was much slower to develop and did not become significant until the late eighteenth century.

Local shipowners and merchants in Britain represented the major market for colonial vessels. Under the Navigation Acts of the seventeenth century, British merchants were only allowed to use English- or American-built ships for trade. Because of the ready availability of timber, American vessels were usually less expensive than those built in England, making them popular with British shipowners.

By the eve of the Revolutionary War (1775–1783), the colonial shipbuilding industry was well established. While values are difficult to determine because of the nature of available records, scholars have estimated that at least one-third of the British merchant fleet at that time was American built. Americans were selling approximately 18,000 tons (a measurement of vessel size or capacity) or £140,000 worth of vessels each year to Britain, out of a total production of about 40,000 tons per year.

SHIPBUILDING IN THE NEW NATION

The onset of the Revolutionary War meant major changes for the shipbuilding industry. Its fate was closely tied to the success of shipping and trade in general, so when British blockades and the dangers of war brought shipping to a near standstill, American shipbuilding suffered as well. After the Revolution, shipwrights soon found that their best market was no longer available; under the British Navigation Acts, American ships were now excluded from legal use by British merchants. To assist the ailing shipbuilding industry, the new American government implemented regulations, including tax breaks, that favored American-built ships. In addition, trade soon resumed between the two nations and reached an all-time high in 1807.

During the period following the Revolution and into the nineteenth century, Boston, New York, and

Philadelphia remained top shipbuilding sites. The development of larger shipyards in these cities allowed some builders to receive national attention for their work, including Henry Eckford, Adam and Noah Brown, Christian Bergh, Stephen Smith, Donald McKay, and Isaac Webb. Locations in the Chesapeake also began to rise to prominence, particularly Baltimore. In the South, shipbuilding remained a minor industry.

Critical developments for the industry during this period included the invention of steam-powered ships and the creation of a network of inland canals. Although side-wheel steamboats were in operation on the East Coast by the 1790s, their use did not become practical until Robert Fulton's designs of 1807. The western river steamboat, with its rear paddle wheel, was not commonly used until the 1820s. The utilization of steam power, which allowed vessels to travel upstream, and the construction of inland canals opened up the interior of the country to water transportation and provided a new direction for the shipbuilding industry.

At the peak of trade in 1807, political upheaval caused another major disruption in shipbuilding. In response to harassment by Britain, President Thomas Jefferson placed an embargo on all trade with that country, hoping to resolve the conflict by economic means rather than by force. When these measures failed and war was declared in 1812, dangers at sea and the dramatic decrease in trade brought the shipbuilding industry to a virtual halt. A few shipwrights were able to find work building privateers and naval vessels, but many remained unemployed. According to U.S. Bureau of the Census statistics, in the years preceding the war from 1801 to 1807, the shipbuilding industry was producing an average of 110,000 total tons per year. At an estimated value of \$55 per ton, annual sales would have averaged over \$6 million. During the war, annual production fell to a mere 30,000 tons.

The shipbuilding industry was quick to recover after the war, however, with an average of 100,000 tons being built each year through the 1820s. With most American cities located on the sea or on rivers, the nation still depended heavily on maritime activity for food, transportation, and trade. Western expansion made shipbuilding as essential as ever to provide steamboats, barges, and passenger ships to reach new regions of the nation. Shipwrights remained focused on small-scale carpentry and carefully handcrafted vessels, leading to a high demand for quality ships. By the end of the 1820s, the industry was

poised to begin the golden age of America's merchant marine from 1830 to 1860.

ORGANIZATION OF THE INDUSTRY

From the colonial period to the early nineteenth century, the organization of the shipbuilding industry remained fairly static. Most shipwrights built vessels only after receiving an order, although occasionally they built on speculation. To purchase a vessel, a colonial merchant chose a shipwright, and after they had agreed on the size and type of the ship, a written contract was signed. Payment was usually made in installments, with part of the cost paid up front as cash. To amass the total capital needed for the construction of a new ship, investors purchased shares ranging from one-half to one sixty-fourth of the vessel's cost.

After the contract was signed, the master shipwright would plan the vessel's design based on what the merchant wanted and then purchase the supplies. A variety of tradesmen were needed to complete a ship, including additional shipwrights, joiners, caulkers, painters, sawyers, carvers, and plumbers. For the most part, these tradesmen worked "freelance," taking temporary jobs as they became available. In some cases, trained free blacks and slaves filled some of these roles in the shipyard, most often working as caulkers. Escaped slaves, such as Frederick Douglass, could later use these skills to earn a living as free men. Work in the maritime industry, either on the wharves or at sea, provided free African Americans with a much greater degree of equality and pay than most other jobs available to them in the early nineteenth century. Shipwrights were trained by an apprenticeship, usually from four to seven years in length, followed by temporary work until the shipwright found a permanent position or had the opportunity to purchase his own yard. Entering the industry was relatively easy for the prospective master shipwright, as little capital was needed. The only requirements were a small plot of land located near the water, a set of tools, and the necessary timber for a vessel. Except for perhaps a small supply of seasoned wood, timber was usually purchased as needed for orders. Shipyards tended to be small throughout this period, and because vessels were built by hand, production was generally low. By 1820, a successful yard completed between two and five oceangoing vessels a year, measuring from two hundred to three hundred tons each.

SHIPPING INDUSTRY The shipping industry was vital to the early American economy. Before the Revolutionary War, the colonies' annual exports averaged £2,846,000, while imports totaled £4,233,844. Only the South maintained a favorable balance of trade; that region mainly focused on growing and exporting its extremely lucrative crops: tobacco, rice, and indigo. The situation was different in the North. Though the middle colonies had a staple crop in wheat, merchants there still imported twice as much as they exported. New England's rocky soil did not permit a staple crop; the region had to import foodstuffs from other colonies, and its imports were triple its exports. Lacking the valuable agricultural products of the South, northern merchants turned to shipping and merchandizing services. Between 1768 and 1772 colonial shipping earnings averaged £610,000, a figure second only to tobacco exports, which had an annual value of £766,000. (This was followed by bread and flour, £410,000; rice, £312,000; fish, £115,000; indigo, £113,000; corn, £83,000; pine boards, £70,000; staves and headings, £65,000; and horses, £60,000.)

COLONIAL ERA

Philadelphia and New York City were the major ports of the middle colonies; merchants varied in

their income and prestige, but some of them, such as Stephan Girard and Robert Morris of Philadelphia and Peter Livingston of New York, were among the richest men in the colonies. Wheat was the main middle colony export, but merchants also dealt in flour, flaxseed, barrel staves, and meat, dividing their trade among Britain, southern Europe, and the West Indies. Like their New England counterparts, middle colony merchants (with the exception of Quakers) dealt in slaves. Early on, merchants used British-owned ships, but by 1770, three out of five ships clearing New York and three out of four in Philadelphia were locally owned, giving rise to an active regional shipbuilding industry.

Of New England's exports (which included livestock, salted and preserved fish, wood products, rum, and potash), 60 percent went to the West Indies, 19 percent to Britain and Ireland, 15 percent to Europe, and 3 to 4 percent to the African slave trade. Boston and Newport were the region's primary ports; secondary centers included Portsmouth, Salem, and Gloucester, Massachusetts; Providence, Rhode Island; and New Haven and New London, Connecticut. Such New England merchants as Thomas and John Hancock of Boston, the Tracy and Jackson families of Newburyport, and Robert "King" Hooper of Marblehead amassed substantial wealth and built palatial homes from their earnings in shipping.

In the Chesapeake, the main crop was tobacco, shipped primarily through Scottish and English factors employed by British merchants. By the 1770s Chesapeake farmers had diversified into wheat production and were exporting 100 million pounds of tobacco and 3,000 tons of flour and bread annually. The grain trade produced new settlements, including Alexandria, Fredericksburg, and Richmond, Virginia, and Baltimore, Maryland, which had become the nation's leading flour market by 1800. These cities did not approach northern urban centers in size, but they offered more commercial services than the small towns where tobacco factors worked.

In the Lower South the main port was the wealthy city of Charleston, South Carolina. Rice was by far the most valuable export; merchants shipped two-thirds of the crop each year to Britain and sold the remainder to southern Europe and the West Indies. Other products included indigo, naval stores, and lumber products, which went mainly to Britain, and grain and meat products, sold in small quantities to the West Indies.

The French and Indian War (1754–1763) profoundly affected American shipping. An influx of

money accompanied British troops to America. The House of Hancock in Boston, for example, owed much of its considerable fortune to supplying British forces during the war. However, with peace the general prosperity ended. In 1764 and 1765 Parliament imposed the Sugar and Stamp Acts, which attempted to tax the colonies to help pay for the war, and in 1767 they passed the Townshend Act, which imposed import taxes on tea, glass, lead, and paper. These actions prompted American merchants, some more willingly than others, to sign nonimportation agreements. The Tea Act of 1773 had a similar but even more devastating effect on shipping; when a group of Bostonians destroyed a valuable shipment of tea in protest, Parliament passed a bill closing Boston's port. This and other Coercive Acts (1774) prompted the newly formed Continental Congress to curtail shipping (except for the lucrative rice trade) to Britain and the British West Indies.

THE REVOLUTION AND AFTER

When war broke out officially in April 1775, American overseas trade shut down completely; later that year Congress authorized trade with the West Indies, and in 1776 trade resumed with other non-British areas. However, until 1778 British ships blockaded New England (except Boston) and middle colony ports; after 1778 the British moved the blockade south to Savannah and Charleston. Some American merchants gave up their ships to the fledgling American navy, but others turned to smuggling or privateering or ran blockades to trade with France, Spain, and Holland, though commerce never reached pre-war levels.

After the Revolution, the nation experienced numerous economic problems, some directly linked to the struggling shipping industry. Britain prohibited American trade with the West Indies, placed high duties on rice and tobacco, and declared American-built vessels (no matter who the owner) ineligible for imperial trade. Spain and France also withdrew or curtailed their wartime trade agreements. Moreover, now that America was no longer under Britain's protection, pirates from the Barbary States in North Africa harassed American ships and demanded bribes in return for safe passage.

American exports rose after 1793, when France and Britain went to war; both countries converted their merchant vessels to warships, and American shippers found markets for food and other supplies in Europe. However, trade came at the risk of losing ships and sailors to the French and British navies, as each side resented America doing business with the

other. (From 1798 to 1800 America and France waged a Quasi-War over this issue.) The problems of ship seizures and impressments continued when France and Britain resumed hostilities in 1803 after a two-year lull. In response, President Thomas Jefferson imposed the Embargo of 1807, which prohibited American ships from engaging in any foreign trade. The disastrous embargo particularly affected New England, where reliance on shipping was greatest; it was lifted in 1809 with certain restrictions. Continuing interference with shipping led America to declare war on Britain in 1812, and exports fell drastically until the war ended in 1815. (The crisis prompted some northern merchants to invest in manufacturing, especially textile and shoe production, to ease reliance on imports.)

Despite these interruptions, in the early nineteenth century American ships were involved in the China tea, California hide, international whaling, and cotton trades, as the shipping industry benefited from the technological, transportation, and managerial innovations that characterized this era. With the invention of the cotton gin, cotton became the South's major crop. Between 1793 and 1815, annual production rose from 3 million pounds to 93 million pounds; by 1840 cotton comprised half of all U.S. overseas shipments. New designs in ships meant increased efficiency and cargo space; capacity grew from an average 300 tons in the 1820s to 1,000 tons by the 1850s. As Americans expanded further west, new canals, turnpikes, and steam-powered riverboats streamlined the movement of farm products to eastern and southern ports. In 1818 New York's Black Ball Line introduced regularly scheduled transatlantic crossings, a move that helped New York surpass Philadelphia as the nation's premier port. By 1829 the nation was poised on the brink of a golden age of American shipping, symbolized by swift, tall-masted clipper ships and expansion into distant markets. The British development of an iron-hulled, oceangoing steamship signified that even more change was imminent, but until 1860 wooden sailing ships continued to dominate the industry.

SHOEMAKING Shoemaking was the most ubiquitous of all crafts in the new American nation. Since nearly everyone, including slaves, wore shoes, shoemaking was arguably the most typical manufacturing occupation in the early United States.

The craft of shoemaking occupied the lower reaches of the craft occupational hierarchy. Easily learned and requiring scant physical labor, shoemaking paid poorly and most shoemakers lived only a few steps above poverty for most of their lives. In times of widespread economic distress, shoemakers' families often joined the families of tailors and day laborers in the nation's poorhouses. Even the small handful of shoemakers who produced custom shoes and boots for the wealthy elite only earned a place near the middle of artisan incomes, making little more than a successful carpenter or stonemason.

Until the middle of the nineteenth century, the technology of shoemaking was little changed from what it had been in the Middle Ages. A skilled master shoemaker used a pattern to cut the pieces of leather that would come together as a shoe. This was the most critical part of the production process, for ill-cut pieces would ruin a shoe and make the costly leather into scrap. Once cut, the master formed the leather over a three-dimensional mold called a last, pulling and curving the leather into the shape of a shoe. The most skilled work completed, the master typically passed the cut and formed leather to a journeyman, who stitched the parts of the shoe together and then sewed the upper part of the soon-to-be shoe to the sole, using an awl to push heavy thread through the accumulated layers of leather. At this point the new shoe only needed finishing—

trimming, making holes for laces, and polishing. These tasks were left for apprentices or, more often, to family members. The kitchen tables of many shoemakers' homes were perpetually covered with half-finished shoes as wives and children worked on them at free intervals between their daily household chores.

Living at the margins of self-sufficiency, shoemakers were not surprisingly at the forefront of America's first labor movement. By the 1820s, a growing number of crafts had succumbed to the economic pressures of central shops and early manufacturing, which produced goods at costs well below what artisans could manage. While shoemaking would not be mechanized until the 1850s, the reorganization of labor in central shops posed a serious threat to the long-standing trade. Central shops were usually owned by master craftsmen or wholesale merchants, who used a simple division of labor to produce large quantities of shoes at reduced prices. Breaking craft traditions, shop owners either cut the leather shoe pieces themselves or hired a skilled master shoemaker to perform that critical task. The shop owner then hired semi-trained journeymen or apprentices, paying them weekly wages to perform routine tasks under their direction. By having their employees perform a small set of tasks repetitively and then passing their work on to the next worker, central shop owners were able to take advantage of the economies of divided labor to outproduce small, independent shoemakers using the traditional craft organization of labor.

In this way, growing numbers of would-be shoemakers became permanent employees in central shops. As these central shops proliferated, competition brought shop owners to push down wages in an attempt to remain solvent. Wage cutting thus became a way of life for workers employed in central shops. Still tied to the traditions of independence that lingered in the declining crafts, journeymen shoemakers soon began to protest the constant shaving of their wages by their employers. Reasoning that their labor was the bedrock of the new nation itself, a number of journeymen shoemakers, tailors, and cabinetmakers in America's largest cities began to organize, threatening to withdraw their labor entirely if livable wage levels were not maintained. For their efforts, in 1806 the leaders of Philadelphia's journeymen cordwainers society were arrested, tried, and convicted in the city's mayor's court for common law conspiracy in restraint of trade. The cordwainers' trial was the first labor law ruling in the new nation, and it established a precedent effectively outlawing

workers' organizations until it was overturned in 1842.

The 1806 trial ended the cordwainers' strike, but it was not forgotten in the ensuing years. When, in 1827 and 1828, William Heighton, a Philadelphia journeyman shoemaker, organized the nation's first citywide union, the Mechanics' Union of Trade Associations (MUTA), overturning the precedent set by the cordwainer's case was one of his major concerns. In the face of legal threats, the MUTA and its shoemaker leadership fought a long and often successful battle with Philadelphia's employers and in the process set a model for union organization that would last into the twenty-first century. Thus, although the weakest of the new nation's trades, shoemaking established one of the most important and enduring legacies in the history of American labor.

SIBLINGS In the large households of early America virtually everyone had siblings, and they must have mattered a great deal, but this has not promoted the study of siblicity by family historians or scholars of the history of childhood. Lateral functional, affective, and power relations have been neglected in family narratives organized around the rise, dominance, and erosion of "patriarchal" systems of household government. Formidable problems of evidence help to explain this neglect, but the price paid in distorted understandings of the evolution of the American social structure may be considerable.

Everywhere historians look between 1750 and 1830, brothers and sisters are found shaping each others' lives and fortunes. Jane Martin was orphaned near Philadelphia in 1747. Her siblings scat-

tered through a network of foster families, but for five decades—as a disowned Friend, the separated wife of a Loyalist refugee, and a single mother and businesswoman—her life oscillated around that of her brother John. The emergence of Joseph Brant (1742–1807), the Mohawk warrior, as a leader of Iroquois resistance to colonial expansion was mediated by his sister, Mary, the wife of a British imperial official. Throughout his life, Benjamin Franklin (1706–1790) considered his younger sister, Jane Mecom, to be one of his closest allies. Charles Wollstonecraft was sent to America in 1792 by his English sister, Mary (1759–1797), to become a farmer. He remained her “favourite” sibling, although his subsequent career as a soldier in an army raised for the Quasi-War against revolutionary France might not have gratified her radical political sensibilities if she had lived long enough to know about it. In New England seaports like Salem, during the generation after independence and before the emergence of institutional merchant banking, strategic marriages between sets of siblings in merchant families provided capital and guarded against legal liability for members of small firms engaged in international commerce.

Anecdotal cases, alas, do not bodies of knowledge make, and most generalizations about sibling relations are based on little more. What systematic study has been done has paid more attention to southern societies than to northern ones, despite the wealth of demographic and genealogical data in the latter regions. There are hints that the practice of “putting out” northern children for socialization or apprenticeship purposes disrupted intragenerational ties, while the prevalence of orphanages and blended households intensified fraternal-sororal bonds in the South. Some scholars assume that there was an inherently oppositional tension between sibling and patriarchal dynamics. Relatively equal power among sibling cohorts, it is thought, allowed their members to interact in less deferential ways than those required between parents—especially fathers—and children, or husbands and wives, possibly helping to soften or even subvert long-standing imbalances of gendered power among adults.

Scholars may mistake snapshot data samples from particular times or places for evidence of either enduring structures or meaningful trends. Sibling dynamics under some circumstances may have facilitated the reproduction and intergenerational transmission of familial power structures that scholars call patriarchal, but under others undermined them. The absence of mature household heads or young

adult men from farms and shops caused by the Revolution—or by post-Revolutionary efforts to settle the trans-Appalachian frontier—may have begun processes of change by which the authoritarian family types experienced by Cotton Mather (1663–1728) and Abigail Adams (1744–1818) evolved into the more companionate ones familiar to the generations of Noah Webster (1758–1843) or Mary Todd Lincoln (1818–1882). These conjectures, speculations, and “may have beens,” while hardly congenial to the sensibilities of encyclopedic curiosity, show the need for historical attention to this subject. When stronger generalizations are found, it will be in studies that begin with cohorts of children being socialized in nuclear hearths, rather than with adult siblings already operating in their own separate worlds. The latter actors may generate more accessible and articulate evidence, but the former harbor the secrets of siblicity.

SLAVERY

Overview

During the Revolutionary era an array of forces combined to strike a powerful blow against the institution of slavery. Foremost among them was a burgeoning and well-articulated, Quaker-led, religious attack on slavery. This religious opposition combined with the political philosophy of natural rights embedded in the Declaration of Independence, as well as a growing anti-British sentiment, increasingly associated with human traffic between Africa and Britain's colonies, to produce a Revolutionary philosophy that espoused not only freedom from British oppression, but also political and personal freedom

for all Americans. The demands for freedom from British “enslavement” were not lost on those who were locked in slavery. During the political and military conflict, enslaved African Americans acted in ways that further loosened the bonds of slavery and forced a national reevaluation of the place of slavery in national life. What had appeared to be a smooth and unwavering development of human slavery was halted in some parts of the new country; in others it was stopped in its tracks. Where slavery did not end immediately or gradually, it would receive more legal and political support in the new nation than it had ever enjoyed under British supervision.

Resistance to British authority was intense in cities like Boston and Philadelphia, which were also centers of agitation against the international slave trade. Before the 1770s, few American voices had been raised against slavery, and those most frequently heard were directed not at domestic slavery but at the African slave trade. The quick and easy convergence of anti-British and antislavery sentiment brought thousands to the cause of antislavery. American patriotism, as Thomas Jefferson’s first draft of the Declaration of Independence had revealed, could accommodate a throbbing antislavery vein. The early activism of the Quakers and other religious groups, such as the Presbyterians in Pennsylvania, Methodists in the Chesapeake region, and Baptists in New

England, provided the physical and moral platform on which a more radical antislavery could be built. At the same time, however, Revolutionary agitation also came from planters in Virginia, Maryland, the Carolinas, and Georgia, as well as slaveholders with smaller holdings in New York, New Jersey, and Delaware. Slavery was of course legal in all of the thirteen colonies when they declared independence from Britain, and the overwhelming majority of Patriot masters saw no contradiction between fighting for their own liberty and continuing to hold other people as slaves. Indeed, many masters would have said that their liberty was tied to their status as owners of property, including slaves.

Military leaders on both sides of the conflict soon recognized the benefits of recruiting enslaved African Americans into their ranks as soldiers, sailors, or ancillary workers. African Americans were equally quick at sensing an opportunity to win their freedom. Many slaves in Virginia answered Lord Dunmore’s call in November 1775 to join the British army to help suppress their Patriot masters. This was the first of many ironies attached to the status of slavery during the Revolution: freedom for slaves was as likely or more likely to come from the “tyranny” of Britain than the “liberty” of the American cause.

On the other hand, in New England hundreds of slaves and free blacks answered the call to fight the British, and in so doing helped destroy slavery in that region. Initially General George Washington was shocked by the black faces among his troops. A Virginia planter who owned a considerable number of slaves, he could not fathom the idea of arming black men. By the end of the war he had come to rely on his black soldiers. At Yorktown he relied on a mostly black unit to charge a key British position. Indeed, military necessity made armed black soldiers a common sight throughout the duration of conflict. In return for enlisting, slaves received freedom, sometimes freedom for their families, and a vague promise of more.

The war undermined slavery throughout the North. By the end of the war Massachusetts, New Hampshire, and what would become the fourteenth state, Vermont, had adopted constitutional provisions to abolish slavery. Pennsylvania had passed a gradual abolition act that would end slavery over a number of years. Connecticut and Rhode Island passed similar laws in 1784. In the next two decades New York (1799) and New Jersey (1804) passed similar legislation. The slow pace of abolition in those two states reflected both conservative politics

and a larger slave population. In 1790 New York had more than 21,000 slaves and New Jersey more than 11,000.

In the South thousands of slaves escaped to freedom during the war, while thousands more joined the British or, less frequently, the American Army, to gain their freedom. In 1782 Virginia allowed masters the right to free their slaves, and the state's free black population grew rapidly, from about 2,000 in 1780 to over 30,000 by 1810. For most southern slaves, however, the Revolution meant little. The rights of life, liberty, and the pursuit of happiness that southern whites claimed for themselves were not available for their slaves.

THE RISE OF SLAVERY

In 1790, 94 percent of the 698,000 slaves in the United States lived in what would emerge, in the coming decades, as "the South." In spite of this crucial demographic, the frequent denunciations of slavery by Southern political leaders suggested a general move toward the curtailment of human slavery. It soon became clear to antislavery Northerners, however, that the southern slaveholders' position on slavery and abolition was fundamentally at odds with their own. For Southerners, the "evil of its con-

tinuation had to be compared with the problem and consequences of its abolition" (MacLeod, p. 29). However powerful the moral or political impetus, pragmatic considerations predominated.

Leading Southerners, like Virginia's Patrick Henry, for example, were, as Henry put it, "drawn along by the general inconvenience of living without them." A fellow slaveholder, Charles Cotesworth Pinckney of South Carolina, was adamant that "without them South Carolina would soon be a desert waste." These and other Southern states, having witnessed firsthand the fighting ability of their slave population, were uniquely concerned about the economic and social cost of emancipation. Supporters of slavery were soon equating emancipation with economic disaster, personal danger, and social chaos. Not surprisingly, the moderates in Southern legislatures were those who considered it unnecessary to reopen the African slave trade. There was little support for measures that would undermine rather than repair and strengthen the institution of slavery.

Although not completely absent in the South, antislavery sentiment took on a distinct hue. One of the South's leading antislavery supporters was St. George Tucker of Virginia, who advocated for equal justice for free black Americans yet like most slaveholders in the South supported black removal. If black people were to remain in the North it would be as second-class citizens; in the South, they had to be enslaved. The natural rights philosophy of the Declaration of Independence would not apply in any meaningful way to the masses of black Americans, slave or free.

REVOLUTIONARY IDEALS AND ECONOMIC AND POLITICAL REALITIES

In compromising their principles of human freedom in the new and egalitarian society, the founding fathers created a constitutional legal order that protected both black slavery and white male supremacy. The very principles that had propelled and supported the Revolutionary struggle and struck a body blow to the institution of slavery would succumb to the exigencies of nation building. Although the United States Constitution never mentioned the words "slaves" or "slavery," it acknowledged and protected the property rights of slaveholders. Among the several compromises was the federal ratio (Article I, section 2). Better known as the three-fifths clause, this provision counted slaves on a three-fifths basis in allocating representation in Congress and also in allocating votes in the electoral college. The three-fifths clause would give the South extra political muscle in

Congress and provide the margin of victory in the vote over the Missouri Compromise in the House of Representatives. More important, perhaps, Thomas Jefferson's electoral college victory in 1800 came from the presidential electors created by the three-fifths clause.

The federal ratio gave to the slave states a voting power in the House of Representatives and in the electoral college (ultimately responsible for the election of the president) far beyond that to which their free population entitled them. Effectively, every 20,000 free white persons with 50,000 slaves controlled the political representation equal to 50,000 free white persons outside the slave states. The anti-slavery promise of the Revolution was sacrificed in the name of national unity.

In addition to the three-fifths clause, the Constitution protected the rights of masters to recover runaway slaves through the fugitive slave clause, prohibited taxes on exports such as tobacco and rice (which Southerners viewed as a way of taxing slavery), and guaranteed that the national government would suppress insurrections and rebellions (which included slave rebellions). The Constitution prohibited Congress from ending the African slave trade for at least twenty years but did not guarantee an end to it after that. In the heated debate over this clause, Connecticut's Oliver Ellsworth explained that he would support the demands of the Deep South, because "What enriches a part enriches the whole, and the states are the best judges of their particular interest."

Most important, the Constitution created a government of limited powers, and those powers did not include the regulation of the domestic institutions of the states, which included slavery. As General Pinckney told the South Carolina House of Representatives, "We have a security that the general government can never emancipate them, for no such authority is granted and it is admitted, on all hands, that the general government has no powers but what are expressly granted by the Constitution, and that all rights not expressed were reserved by the several states." While the Constitutional Convention met in Philadelphia to write the Constitution, the Congress meeting under the Articles of Confederation passed the Northwest Ordinance, which prohibited slavery in the territories north of the Ohio River and implicitly allowed slavery in the territories south of the river.

When the new government was established under the Constitution, slavery was firmly entrenched in the nation. With a total population of

just under four million, the new nation had about 700,000 slaves, almost all of them concentrated in the states south of Pennsylvania.

PLANTATION SLAVERY IN THE SOUTH

In Delaware, Maryland, Kentucky, and Virginia, plantation owners faced different demands. Tobacco farmers in the Chesapeake region of Maryland and Virginia increasingly turned to wheat as a money crop—the labor needs associated with growing this grain, when combined with liberalized ideas on slavery and freedom, sometimes led to a willingness to end the slave trade. During the mild agricultural depression of the 1780s and early 1790s, these sentiments grew as there actually seemed to be a region-wide surplus of black slaves. It was a different picture farther south, where the flight of tens of thousands of bondsmen to British and Spanish lines had caused a substantial decline in the number of black workers available to tend damaged and neglected plantations. Here, agricultural output suffered, causing the production of tobacco, rice, and indigo to fall well below prewar levels. In the rice and indigo regions of the Carolinas and Georgia, the desire to replace wartime slave losses and rebuild levees and rice irrigation canals triggered a demand to keep the African trade open.

In 1793 Eli Whitney of Connecticut, while visiting the Georgia plantation of Nathaniel Greene, made a simple refinement of the old roller gin and thus removed the main obstacle to large-scale production of cotton in the Southern states. The early spread of cotton was slow but steady as farmers made the adjustment from other more familiar staples. Between 1800 and 1808 the Deep South would import about 100,000 new slaves from Africa to help satisfy its seemingly insatiable demand for more laborers. The nation would gain another 30,000 slaves through the Louisiana Purchase in 1803. The closing of the African slave trade in 1808 shut off legal importations, although the nation would gain another 10,000 slaves with the acquisition of Florida in 1821. After 1808, however, cotton production in the United States was so widespread that planters demanded more labor, and an illegal African slave trade brought perhaps another thousand slaves a year to the nation. The high birth rate among slaves, as well as the last burst of legal importations, led to a growing slave population. Between 1790 and 1830 the slave population nearly tripled, from about 700,000 to over two million.

The expansion of cotton into the Old Southwest—Georgia, Alabama, Mississippi, and Louisi-

ana—led to a huge migration of slaves and masters. Some slaves were moved west as their owners abandoned depleted land in the east for the rich soil of the Black Belt and the Mississippi Delta. Other slaves were simply sold away, marched west in chains to carve out plantations in the emerging Cotton Kingdom. Mississippi, for example, had about 3,000 slaves in 1800 and over 65,000 by 1830; Louisiana went from 34,000 slaves to 109,000 in the same period. Maryland, Virginia, and the Carolinas were the main sources of slave migration, and the main importing states were first Kentucky and Tennessee and later, with the opening of the West, Georgia, Alabama, Mississippi, and Louisiana. So rapid was the expansion of cotton production, with its insatiable demand for black labor, that in a few short years parts of the South became unrecognizable. Many areas that only a generation earlier had been characterized by white family farms were drawn into cotton cultivation and slavery. One result of this change was a decline in the number of manumissions and the slow disappearance of antislavery sentiment in the region.

WESTWARD EXPANSION

Despite the constitutional agreement on slavery, the subject was never far from the center of most political issues. The slave rebellion in St. Domingue (Haiti) and the ever-present specter of slave rebellion at home struck a chord at all levels of American society. It gave the enslaved hope of their own liberation, buoyed the growing band of antislavers, and deeply disturbed slaveholders who imagined themselves surrounded by would-be rebels. The Gabriel Prosser slave insurrection in Richmond, Virginia, in August 1800 only added to the national tension and intruded in the upcoming elections. Southerners were quick to distinguish their man, Jefferson, who owned slaves, from incumbent President John Adams, who did not. Jefferson did not discourage this new development, authorizing his leading spokesman in South Carolina to point out his conviction that the Constitution “has not empowered the federal legislature to touch in the remotest degree the question respecting the condition of property of slaves in any of the states.”

With the Louisiana Purchase in 1803, Jefferson’s first major act as president, the United States more than doubled its boundaries, and once again the issue of slavery in the nation crept slowly to center stage. Of course, the South shared Jefferson’s excitement at the opportunity to extend the nation’s frontier so far, so quickly. Whereas slaveholders envisioned a “boundless agrarian empire,” most people in the

North had in mind an expanding nation of family farms, towns, and cities. Indeed, the years from 1810 to 1819 saw the population of the trans-Appalachian region more than double, and five new states joined the Union.

THE MISSOURI CRISIS

In 1790 some 47 percent of the nation’s population lived in the slave states. Excluding the slave population, the region constituted only a little more than a third of the whole. Thus, aided by the growing number of black slaves, a third of the nation’s white population controlled 46 percent of the seats in the House of Congress. By 1820 the region’s share was still a high 42 percent despite the decline in the relative size of the slave states’ white population. The near political parity was a direct result of the federal ratio, without which the slave states would have had a clear minority status and far less influence in Congress and the electoral college. In 1820 the slave states had twenty more seats in the House of Representatives than they otherwise would have had if their slaves had not been counted toward their representation. As Senator Rufus King of New York argued, under the unfair rule of slave representation, the vote of five Southerners was equal to that of seven Northerners in selecting both the president and members of the House.

On the eve of Missouri’s application for entrance into the Union as a slave state, the Senate had an equal number of senators representing free and slave states. Missouri’s entrance would tip the balance in favor of the slave states and so upset the equilibrium in the Senate. There was no obvious reason why the Southern politicians should have anticipated any difficulty with Missouri’s application. That the territory’s constitution protected slavery caused no great alarm. Slavery had been legal in Missouri under both the French and Spanish. As a part of the Louisiana Purchase, the United States government had guaranteed the preservation of slavery. Between 1803 and 1819, therefore, slavery had been a legitimate part of the American Missouri. Indeed, prior to 1819, Kentucky (1792), Tennessee (1796), Louisiana (1812), and Mississippi (1817) had all gained admission with little discussion. Even the recent admission of Alabama in December 1819 had presented few problems.

Missouri’s entrance caused such a stir in part because Missouri’s petition for statehood was the first attempt to allow slavery in a state that lay north of the implicit dividing line of the Ohio River established by the Northwest Ordinance. As Missouri lay direct-

ly west of Illinois, a free state created out of the Old Northwest Territory from which Congress had barred slavery in 1787, it appeared to some people that its admission as a slave state would take slavery beyond its traditional bounds. For the first time since the constitutional debates, supporters of slavery and its expansion would face a sustained attack on the institution. Southern politicians took a stand and made a public and passionate defense of their system of slavery; in so doing they deepened their region's commitment to the institution. For the second time, the slave states declined the opportunity to begin the process of gradually loosening their attachment to human slavery and chose instead to tighten their grip on what would become known as "the peculiar institution." The main element in the compromise reached over Missouri's entrance into the Union was that the nation would be formally divided into free states and slave states.

Slave rebellions, such as the Haitian Revolution abroad and Gabriel's rebellion at home, made Southerners increasingly fearful of any antislavery agitation. In the 1820s the forces for and against slavery became increasingly entrenched. The publication of the *Appeal* (1829) by David Walker, a free black man, encouraging the enslaved to rise up and throw off their chains, and radical abolitionism under the leadership of William Lloyd Garrison threatened the institution of slavery. When slave rebel Nat Turner led his band of the enslaved against their enslavers, Virginia's response was brutal. After a short period of postrebellion calm, Virginia legislators conducted a debate on the states' future attachment to human slavery not unlike those that had taken place four decades earlier in Northern states.

While Virginians argued over slavery, the political and moral center of Southern leadership and its defense of slavery shifted to South Carolina. Under the leadership of John C. Calhoun and a growing band of Southern nationalists, Southern slaveholders pursued a "positive good" defense, which originated in the 1820s, in an articulation of the general benefits of slavery. This defense would soon become Southern orthodoxy. In a desperate need to retain their influence in the national political arena and so protect their institution, Southern leaders would shift the battleground to the western territories and employ a new strategy: the geographical extension of slavery.

CONCLUSION

The ideology of revolution had a profound impact on the institution of slavery. It triggered the first na-

tional debate that pulled together nascent antislavery individuals and groups and witnessed the geographical fall and rise of the institution. Revolutionary ideology allowed religious folk to combine their Christian principles with the natural rights philosophy of the Declaration of Independence. This offered large numbers of the enslaved the opportunity to aspire to freedom and armed their supporters with a powerful new political weapon. Wartime cracks appeared in a system, which under the British government had not yet coalesced into a social system driven by racial subordination. What was the racial norm in regions of the South was largely unfamiliar in most areas of the North. Revolutionary ideology shook slaveholder and slave alike, sharply dividing the country. Indeed, by 1819, when the nation engaged in a second national debate on slavery, it could only agree to formalize the status quo and require supporters of slavery and its expansion to provide a positive justification for what they now considered a fixture on the American economic, political, and racial landscape. The new nation had drifted a long way from the lofty ideals of its Revolution.

Runaway Slaves and Maroon Communities

From the beginning of slavery in colonial Virginia, slaves ran away from their owners for a variety of reasons. Some were dissatisfied with working conditions; others had been severely punished; others attempted to follow loved ones who were sold to distant locations; still others simply wished to take a break from the drudgery of bondage. Although the motives of runaways were as varied as slavery itself, the profile of those who ran away varied little over time. The great majority were young men in their teens and twenties. Because of the dangers and difficulties of taking children along, only about one in five was female. Most who ran away were described in advertisements as intelligent, cunning, active, bold, artful, friendly, or polite. Some were thought to have forged passes. They ran away during every season of the year and they ran off in every direction.

Beginning in the early years of Virginia and South Carolina slavery, and continuing after the colonial period, some African- and Caribbean-born slaves ran away to the woods, swamps, mountains, or dense forests near their plantations, where they established settlements. Called "outliers" or "outlying slaves," they sometimes absconded to negotiate concessions, such as improvements in food, housing, living conditions, work routines, and family visitation privileges, from their owners before they would return on their own. As time passed, it was rare that owners dealt with slaves by striking a bargain for their return. Although their numbers fluctuated over time, pockets of outlying slaves, in the Caribbean known as Maroon communities, were always a part of the region's landscape. During the 1730s some fugitives fled to Spanish Florida. In 1765 some forty runaways, including women and children, lived in a settlement with four substantial buildings in the swamp north of the Savannah River in South Carolina. In the Chesapeake region the terrain and majority white population made establishing runaway encampments difficult. One group of African-born slaves ran away to the mountainous backcountry. There men, women, and children attempted to recreate an African society on the frontier.

Over time, the main change in the population of runaway slaves was the decline in the number of African-born slaves. By the nineteenth century, most runaways were American-born and ran off alone. They often headed for the nearest town or city and hoped to blend in with other slaves and free blacks. Another difference between the eighteenth and nineteenth centuries was that in the early period more runaways were described as "black" or "negro" (usually meaning black) than in the later period, when a significant proportion were described as persons of mixed racial origin. In fact, an analysis of newspaper advertisements in five states during the 1850s found the more than 40 percent of the slaves who absconded were described as mulatto, light-skinned, brown, yellow, copper, red, "rather light," bright yellow, or "a negro, but not of the blackest cast." At the same time, persons of mixed origin, according to the census, represented only about 10 percent of the slave population. Mulatto slaves were often given positions as house servants, maids, cooks, tailors, waiters, and barbers; with such skills, they could more easily attempt to pass as free blacks.

From the colonial period until the end of slavery, bands of runaways, living in isolated, heavily wooded or swampy areas, or running to the mountains and beyond, attempted to maintain a separate existence. Some of these groups sustained their cohesiveness for several years, a few for longer periods. They made forays into populated farming sections for food, clothing, livestock, and trading items. Sometimes they bartered with free blacks, plantation slaves, or whites who owned no slaves. Only the Great Dismal Swamp, on the border of Virginia and North Carolina, and the marshes and morasses of south-central Florida sheltered generational communities of outlying slaves in North America, and even these two were not comparable to Maroon societies in other parts of the New World. The primary reason outlying bands failed to sustain themselves in the United States was the concerted effort on the part of slave owners, militiamen, and patrollers to find and destroy the outliers. It was only when the terrain was impenetrable that fugitives were able to remain at large.

If runaway gangs seldom lasted more than a year or two and often ended with many among them being killed, some individual slaves managed to sustain themselves by posing as free blacks. In the towns and cities of the South, a number of escaped slaves, especially the most skilled, were able to hire their own time and sometimes meld into the free black population. Although there were ebbs and flows in

the economies of Southern cities, in most periods hired slaves were in demand. In many urban areas, as competing whites pointed out, slaves dominated certain occupations. Although prohibited in most places by law, self-hire was widespread; if runaways could convince a potential employer that they had been sent by their owner to find work, they could often be hired with few questions asked.

A few runaways, often the most ingenious, persistent, and lucky, made it to the North. Some of them received assistance from Quakers, the Underground Railroad, and antislavery whites. Traversing the great distance from the Deep South to the North was extremely difficult, but some were able to find assistance along the way and in the North or Canada.

Owners, of course, had the right to pursue their human property. In 1793 and again in 1850, the Congress passed fugitive slave laws outlining the procedures of how owners could claim their slaves in the North and return them to the South. Those who persisted in absconding usually paid a heavy price. Most contemporaries affirmed that what were called habitual or perpetual runaways received cruel and brutal punishments. Slaves escaped with the mark of the whip on their backs, irons on their ankles, missing fingers and toes, and brands on their cheeks and forehead. Indeed, the power of those in control was brought to bear with rapid efficiency against slaves who sought to sustain themselves in freedom. What is surprising, given the odds against them, was the growing stream of runaway slaves that continued unabated over many decades. Conservative estimates put the number at about fifty thousand blacks each year during the antebellum period, with perhaps two thousand making it to freedom. Despite their lack of success, runaways served as a constant reminder to the slaveholding class that the property they were seeking to control was not controllable and the image they were trying to project, as benevolent paternalistic masters, was false.

Slave Insurrections

Resistance to slavery in the early national United States took a form very different from the large-scale slave insurrections that arose in South America and the Caribbean. Massive slave rebellions were far less common than day-to-day resistance or individual acts of violence for a combination of reasons: the presence of a heavily armed white majority in every state except South Carolina (and, toward the very end of the antebellum period, Mississippi); the lack of an impregnable hinterland to accommodate Maroon colonies from which runaway slaves could besiege plantations; the relatively dispersed nature and small size of slaveholding; and the fact that the landlord class was in residence, not absentee. In the years after the Revolution, slaves achieved living space enough to build stable families and rich spiritual communities. Given the odds against success, it is hardly surprising that the handful of slaves bold enough to rise for their freedom found their rebellions reduced to unsuccessful conspiracies and their fellows doomed to die in combat or on the gallows.

Insurgent slaves in the eighteenth and nineteenth centuries, far from uniformly sharing the same vision and goals, differed from one another as much as did white Revolutionaries in the same era. Jemmy, an Angolan who led an agrarian uprising in 1739 near Stono River, South Carolina, tried to hasten his African followers to freedom across the border into Spanish Florida. Caesar Varick, who only two years later conspired to burn New York City and flee with other bondmen to French Canada, which was then at war with the colonies, lived in one of North America's largest urban centers with an Irish wife. In 1800 Gabriel, a young, secular rebel who had turned away from African traditions, hoped to stay and work in a more egalitarian Virginia. Denmark Vesey, an aged free black who bought his freedom the year before Gabriel died, expected to achieve a limited exodus for his family and followers by leading them out of Charleston to Haiti. In 1822 Vesey and his chief lieutenant, "Gullah" Jack Pritchard, an East African priest, fused African theology with the Old Testament God of wrath and justice, whereas in 1831 Nat Turner relied on Christian millennial themes and hoped to bring on the day of jubilee for black Virginians. Beyond their obvious abilities as leaders and

their equally obvious desire to breathe free, bond rebels in America fit no simple pattern.

METHODS AND AIMS

If slave rebellions in North America correspond to any single model, it is that they proliferated during times when the white majority was divided against itself. Colonial insurgents in South Carolina and New York City turned to violence at a time when their masters were at war with France and Spain. Gabriel, the most politicized of all the slave rebels, formulated his plans during the divisive election of 1800, when Federalists and Republicans threatened to take up arms against one another. The rebels in the Tidewater area of Virginia, despite the memory of the repression that followed Gabriel's death, began to organize again during the chaos of the War of 1812. Having read of the Missouri debates in Charleston newspapers, Vesey prayed that Northern whites would prove tardy in riding to the rescue of the estranged Southerners. Slaves near Natchez, Mississippi, began to plan for their freedom in 1861, following the outbreak of the Civil War.

Most of all, slaves, who well knew what they were up against and rarely contemplated suicidal ventures, plotted for their freedom only when safer avenues had been closed to them. For most of the seventeenth century, for example, when the high death rate in the southern colonies made inexpensive white indentured servants far more numerous than costly African slaves, enterprising bondpersons relied more on self-purchase than the sword. It was only after landless whites and hard-used white indentured workers under the command of Nathaniel Bacon burned Jamestown in 1676 that southern planters made a concerted effort to replace white servants with African slaves. The comprehensive Virginia Slave Code of 1705, the first of its kind in colonial North America, crushed the hope of industrious slaves that they might be upwardly mobile. Only then, as North American racial walls rapidly hardened, did desperate slaves turn to physically hazardous paths toward freedom. In April 1712 twenty-five Coromantee Africans burned several buildings in New York City and killed nine whites. Several rebels committed suicide before they could be captured, but those taken alive were broken on the wheel and hanged in chains as a warning to future rebels.

In the early eighteenth century, mainland revolts rarely posed much real danger to the slaveholding regime. Because the Atlantic slave trade was at its peak, every colony included large numbers of native Africans who sought to escape from bondage by building

isolated Maroon communities in remote areas. There they tried to re-create the African communities they had lost. Even the two most significant rebellions of the period—the 1739 Stono River uprising and Varick's 1741 plan to torch New York City—were led by Africans who dreamed only of ending their own bondage, not of ending unfree labor in general. The price of failure was high. New York authorities ordered Varick and twelve of his followers burned alive; eighteen others were hanged and seventy more bondmen were banished from the colony.

SLAVE REBELLION IN THE AGE OF REVOLUTION

The American Revolution alternately discouraged and stimulated slave rebellions. Although the British invasion and the animosity between Patriots and Loyalists presented slaves with a unique opportunity to organize, most slaves chose instead to take advantage of the dislocation of war to escape with their families into the growing cities or behind British lines. (The Revolution was the one time in North American history when equal numbers of female and male slaves ran away.) The aggressive bondmen who cast their lots with the military forces of King George were precisely the sort of bold, determined slaves who tended to organize slave conspiracies; thus the bloody fighting in the southern states after 1778 actually diminished the prospect that a mainland counterpart of Toussaint Louverture, the Haitian liberator, would rise out of the tobacco plantations.

Nonetheless, as Eugene D. Genovese suggests in his influential study *From Rebellion to Revolution* (1979), the age of revolution, and especially the slave revolt in Saint Domingue (Haiti) in 1791, marked a change in patterns in black resistance. The Caribbean rebels under the leadership of Boukman and Toussaint Louverture sought not only to destroy the power of their Parisian absentee masters but also to join the societies in which they lived on equal terms. For black Americans determined to realize the egalitarian promise of the American Revolution, the news from the Caribbean reminded them that, if they dared, the end of slavery—not only their own freedom—might be within reach. Born in 1776, the blacksmith Gabriel, who with his lieutenants in 1800 instigated the most extensive plot in Virginia history, hoped to force the white patriot elite to live up to its stated ideal: that all men were created free and equal. Leading a small army of slaves in Henrico County, he planned to march into Richmond under a banner proclaiming, "Death or Liberty." Governor James Monroe and other white authorities did not doubt that Louverture's victories had an enormous effect on blacks in the early national South.

In several cases, bondmen who had been carried from revolutionary Saint Domingue by their masters participated in North American slave revolts. In 1792 slaves on Virginia's Eastern Shore proposed to "blow up the magazine in Norfolk, and massacre its inhabitants." Although the rebel leader Caleb, a favored servant and driver, was evidently American-born, several of his recruits were Haitian refugees, and all—according to trial testimony—had been inspired by the example of Saint Domingue. Two decades later, in 1811, one of the most extensive conspiracies in the history of the United States erupted in southern Louisiana, only a few miles upriver from New Orleans. Slaves led by a mulatto driver named Charles Deslondes, reputedly aware of events in Saint Domingue, announced their intention of marching on the city "to kill whites." Eyewitness accounts placed the number of rebels at 180 to 500.

ISOLATED REBELLIONS

After Gabriel's execution and the death of twenty-five of his followers in the fall of 1800, slave rebellions on the eastern seaboard became both less common and less politically conscious. Slaves who worked along the rivers in southern Virginia and Halifax County, North Carolina, under the leadership of Sancho, a ferryman, formed a loosely connected scheme to rise on Easter Monday of 1802. But Sancho, despite having been involved in Gabriel's plot, shared little of Gabriel's dream of a multiracial republic. Even when the dislocations of the War of 1812 and a second British invasion of the Chesapeake once more gave bondmen in Virginia an opportunity to rise for their liberty, an ideological dimension was lacking. Gloucester County authorities jailed ten slaves in March 1813, and the following month found rebels in Williamsburg "condemned on a charge of conspiracy and insurrection." By the late summer and early fall, rumors of revolt unnerved inhabitants of Norfolk and Richmond as well.

White authorities crushed these isolated rebellions with relative ease, reminding leaders in the slave community that the determined white majority in the American South posed a formidable obstacle to insurgents. Denmark Vesey of Charleston, perhaps the most pragmatic of all the rebel leaders, realized that Gabriel's dream of forcing mainland elites to accommodate blacks' aspirations to freedom and economic justice was impossible. Vesey plotted, therefore, not to end slavery in South Carolina, but instead to lead a mass escape from Charleston to the Caribbean, where he had lived and worked as a boy. Hoping to take control of the city on the night of 14

July 1822, Vesey's recruits—many of them Africans—intended to slaughter the inhabitants of the city and seize bank reserves before fleeing to Haiti, an embattled black republic sorely in need of capital and skilled labor.

Despite the overwhelming amount of evidence testifying to black rebelliousness, some historians attribute servile conspiracies to white paranoia, or even to Machiavellian plots on the part of white authorities to eliminate potential black leaders. One scholar suggests that insurgents never planned for their freedom in New York City in 1741, Antigua in 1736, the Chesapeake in the 1790s, and southern Virginia in 1802. Another historian, Michael Johnson, argues that "the evidence cannot sustain a credible interpretation that the Stono Revolt was a slave rebellion," and he also doubts that Gabriel's conspiracy and Vesey's plot constituted "incipient rebellion[s]."

No modern scholar, however, has challenged the reality of Nat Turner's bloody revolt. Fifty-seven dead white Virginians are hard to explain away. Yet the Southampton uprising of 1831 stands as the least practical of the nineteenth-century revolts. Unlike Gabriel, who believed it possible to fight his way into Richmond's political society, or Vesey, who simply planned to flee the country, the isolated geography of southern Virginia raises questions as to what the black general planned to do with his soldiers. Quite possibly, Turner hoped to march east and establish a Maroon colony in the Dismal Swamp. Equally possible is the prospect that the evangelical Turner avoided careful planning and preparation as he expected to leave the aftermath of rebellion in the hands of God.

More than four decades later, by the end of the Civil War, 180,000 African Americans (one out of every five males in the Republic) had served in Union forces. Those former slaves who marched back toward the plantations of their birth singing "General Gabriel's Jig" rightly understood themselves to be a part of the largest slave rebellion in the history of the United States.

Slave Life

The roughly three-quarters of a century between 1754 and 1829, during which United States nationhood evolved and consolidated, also witnessed an extraordinarily dynamic period of change and development in the lives of slaves. Although slavery existed in all of the North American British colonies, by 1750 it was clear that slavery was evolving differently below what would later become the Mason-Dixon line. With nearly 90 percent of slaves concentrated in the southern colonies, slavery was undeniably more important to the economic and social order in the Chesapeake and Lower South than it was in the middle colonies and New England. Generally speaking, the work, culture, and treatment of slaves varied according to geographic location and historical progression.

Slave life shifted not only across geographic space but across time as well, as is evident in cultural differences between slave generations. Slaves of the Plantation Generation, which ran from 1700 to 1775, were more likely to have direct personal ties to Africa. Slaves of the Revolutionary Generation, which lasted from 1776 to roughly 1829, inherited a more synthesized African, European, and Native American way of life that was truly African American. National events and politics played a role in defining the boundaries of this developing African American culture. Most noticeably, the mixed economies of societies with slaves such as those of the middle colonies and New England rapidly gave way to free labor after the American Revolution. Additionally, when the direct importation of slaves was banned in 1808, the domestic slave trade flourished, as slaves largely from the Chesapeake were sent to clear land

and produce cotton in the rapidly growing Deep South. Daily life changed radically for many forced migrants, who were separated from family and community and thrown into plantation labor to which they were not accustomed.

WORK

With most of their waking hours for six or more days per week spent in uncompensated labor, the lives of slaves revolved around work. In New England and the middle colonies, outside the plantation system, slaves performed a variety of tasks in a mixed economy. Often concentrated in major port cities such as New York, Philadelphia, or Newport, slaves worked in a variety of skilled and unskilled positions as craftsmen, artisans, and domestic servants. Slaves made significant contributions to the maritime industry by making sails, barrels for merchandise, repairing ships, and sometimes as crew. For these slaves in the North, daily labor was often in small, racially heterogeneous, independent groups and usually alongside free laborers.

Slave labor and life was much different in the South. Whether producing tobacco in the Chesapeake region of Virginia and Maryland, rice in the swampy low country of South Carolina or Georgia, or cotton in the emergent Deep South, most slaves from both the Plantation and Revolutionary Generations worked in a gang system of labor that demanded participation irrespective of gender or physical maturity to produce staple cash crops for sale in a global market. Slaves in these regions lived in communities in which blacks usually vastly outnumbered whites, sometimes by a margin of ten or more to one. Typically, an enslaved black driver worked under the direction of a white overseer, who was employed by a plantation owner. In the Chesapeake, plantation owners tended to live on-site, whereas those in the Lower South were generally removed from the plantation's daily routine and thus maintained less regular contact with slaves.

Because depleted soil in the tobacco-producing Chesapeake could not yield a sufficient crop for more than three consecutive years, slaves in this region not only worked within the monotonous yearly cycle of standard tobacco production but also engaged in the backbreaking toil of clearing and preparing land in the hilly piedmont region for the expansion of plantation agriculture. At the American Revolution's onset in 1775, this extraordinarily wealthy region held over half of the new nation's slaves. In 1790, just three years before Eli Whitney's cotton gin would begin to revolutionize global capitalism and

Oppression of the Exiled Sons of Africa. The possibility of being sold was a constant threat to slaves' bonds of family and community. This engraving from the antislavery tract *Oppression of the Exiled Sons of Africa*, printed in Philadelphia in 1804, depicts a "husband and wife, after being sold to different purchasers, violently separated . . . never to see each other more." THE GRANGER COLLECTION, NEW YORK.

stimulate America's cotton boom, the lives of most slaves in South Carolina and Georgia revolved around rice. Work in rice paddies regularly entailed arduous manual labor under a hot subtropical sun while wading up to one's thighs in mosquito- and reptile-infested swamps. Rice required constant attention in planting, irrigating, weeding, and protecting from birds. In the winter off-season, slaves on low-country rice plantations erected and repaired the massive irrigation system of dams and levees that this labor-intensive crop demanded. In both the tobacco- and rice-growing regions, gang labor was a central facet of the daily life and cultural development of slaves. That blacks were a visible majority in these regions was also a significant feature of slave life.

Time off was granted at the discretion of plantation management. For most slaves working under the gang-labor task system, Sunday was a break from the week of compulsory labor. This is not to say that it was a day of traditional rest and relaxation. Rather, Sundays were often spent working on a variety of chores including mending clothing, hunting or fishing to supplement relatively meager dietary rations of corn meal or rice, and tending one's small personal plot of vegetables, fowl, or cash crop for sale at the local market. Rural slaves also used Sunday time to acquire a pass to visit friends and family on a neighboring plantation; slaves in and around cities such as Charleston and New Orleans gathered at well-known public squares to exchange goods, dance, and socialize.

CULTURE

Slave culture drew largely from a shared African heritage and, with the passing of generations, developed into a unique African American slave culture. In regions with a greater concentration of blacks and first-generation African slaves, slave culture was more distinctly African; the culture of slaves with deep heritage on the North American mainland, who lived and worked as a minority among whites, was more distinctly European American. Nevertheless, a creolized African American culture was recognizable by the onset of antebellum slavery. This developing African American culture is evident in slaves' hand-made pottery and cooking techniques; musical instruments, syncopated rhythms, and fluid dance; folk tales; root medicine; and courtship patterns. Even in New England, Africa's presence in the development of late-eighteenth-century slave culture is noticeable in the mimicry of African royalty during the election of southern New England's slave gover-

nors. Winners of these annual elections, which fused Yankee local democracy with some aspects of African royalty, had authority over minor issues within the slave community.

By the late eighteenth century, one of the most important cultural institutions of slave life was an extensive network of kin and fictive kin. In its fully developed stages, this kinship network bound adult slaves together in a community of mutual obligation in which the entire slave community was responsible for rearing and socializing slave youth, supporting widows, and ensuring the general well-being of fellow slaves. Increasing immunity to both malaria and respiratory infections, coupled with the relative increase in material comfort connected to Revolutionary-era humanism, helped slave families to consolidate and regenerate. Although slaves were not granted the legal protection of marriage, many of them were involved in long-term monogamous relationships with slaves from their own or neighboring plantations or nearby free blacks. The bonds of family and community were constantly threatened by outside forces such as sale or a master's decision to relocate. After the 1808 ban on American participation in the international slave trade, the domestic slave trade sharply increased, shattering slave families and entire slave communities. At the same time, the rise in the domestic slave trade caused African American slave culture to spread into new territory. The names of slave children born in America, many taken from the names of close kin who were lost, reflected the lingering bonds of family.

The amount of daily interaction slaves had with whites, as well as the proportion of Africans with whom they lived, affected their acquisition and mastery of English-language skills. Many slaves from Delaware to Georgia spoke an invented pidgin form of African-influenced English that was barely decipherable to the untrained white ear, but slaves reared and working in the mixed economies of New England and the middle colonies often fully mastered spoken English. Likewise, domestic servants who maintained close contact with masters had a firm grasp of English-language skills. Advertisements seeking the return of runaway slaves often commented on the slaves' English-language skills, revealing that many slaves used English as a tool for liberation. Indeed, runaways with advanced English skills could hope to pass as free blacks on their journey toward liberty.

RELIGION

Deciding how much English they would learn was just one of many choices slaves made in the dynamic

cultural times of the Plantation and Revolutionary Generations. Like language, slaves' choice of religion was also a major component of their identity and helped determine their degree of acculturation. Slave religion, especially for those who had just survived the Middle Passage, was deeply infused with African spirituality that sometimes included Islamic monotheism. African Muslims were a distinct minority, and well into the eighteenth century most slaves had never heard of Jesus. Despite a language barrier and the inability of most slaves to read Scripture, the London-based Society for the Propagation of the Gospel in Foreign Parts began actively proselytizing slaves during the mid-eighteenth-century Great Awakening. Presbyterians, Baptists, and Methodists made early inroads into converting members of the slave community with an emphasis on the spontaneous worship and experiential spirituality characteristic of African religions. By 1776 Virginia's Baptists had effectively courted many slave converts. By 1829 slaves and free blacks in the North were developing their own formal religious institutions and consolidating their form of Christianity. For these slave converts, a deep African worldview fundamentally influenced their synthesized version of Christianity. Indeed, it was rare for slaves to adopt fully Christian forms of religious practice. Despite efforts at conversion, most common slaves from this era maintained a fundamental reluctance to compromise or alter their religious worldview.

RESISTANCE

Slave culture incorporated both accommodation and resistance. Although slaves might obey orders and defer to an owner, they could and did resist slavery. A massive slave rebellion like those that occurred in the Caribbean and South America never transpired; but slaves did resist or subvert their bondage through covert arson and poisoning, direct challenges of overseers, and small but significant acts such as sabotage. Although owners often interpreted a slow pace of labor, destruction of tools, or malingering to laziness or stupidity, these individual acts of subversion were part of a spectrum of slave resistance that included Gabriel's Rebellion of 1800 in Virginia, and the 1811 uprising of five hundred New Orleans slaves armed with hand weapons that was squelched by federal forces cooperating with the local militia. Gabriel Prosser's co-conspirator, Jack Bowler, summed up the spirit of slave rebels across generations, testifying that "we had as much right to fight for our liberty as any men."

Slave revolts became more organized and aggressive when changing racial demographics meant that

slaves were no longer drastically outnumbered by whites. In short, the racial imbalance that developed as a direct result of the plantation system provided fertile ground for violent slave rebellions.

One of the more frequent methods of slave resistance was absconding. Especially in the Deep South, where the absence of a free black community virtually equated skin color with slavery, running away was a logistical nightmare; slaves had to traverse unfamiliar and hostile terrain, avoid regular slave patrols, and rely almost exclusively on other slaves for sustenance. In light of these objective difficulties, many slaves fled for only a few days or a week, using this time away from work to visit friends and family on nearby plantations or take a break from the labors of slave life. In some cases, truancy was a method of resisting changes in the daily regimen such as an increased workload under the task system or the denial of an expected day off during harvest time.

American independence represented both a birth of freedom and an extension of slavery. Although Enlightenment ideology and a changing economy effectively smashed slavery in the North, the removal of British limitations on trans-Appalachian settlement allowed chattel slavery to spread well beyond the eastern seaboard. The federal ban on imported slaves in 1808 had an enormous impact on slave culture, yet the new federal government did nothing to protect the slave family by regulating the interstate slave trade. Likewise, no early federal legislation extended civil rights or equal protection to enslaved African Americans. As demonstrated by their willingness to fight alongside both Patriots and the British, slaves did not hold allegiance to any country. Rather, their allegiance was to freedom.

Slave Patrols

The slave societies of the American South formed slave patrols to control their slaves and enforce the slave codes, laws that attempted to regulate slave behavior. Slave patrols were usually locally organized groups of young white men, both middle-class slave owners and lower-class yeomen farmers. Patrollers generally had three main duties: searching slave quarters; dispersing slave gatherings; and safeguarding white communities by patrolling the roads.

Fear of growing slave populations and the threat of foreign invasion drove southerners to institute and later expand slave patrols. Due to its early black majority and threats from Native Americans and the Spanish, South Carolina established the earliest slave patrol in 1704; Virginia followed in 1727, North Carolina in 1753, and Georgia in 1757. As new territories and states formed across the Deep South and West in the early nineteenth century, they too established slave patrols. The Territory of Mississippi formed patrols in 1811, as did Missouri in 1823. The city of Washington, D.C., established citizen patrols in 1838; in 1842 they became an auxiliary night police to patrol the city's streets and enforce a "colored curfew."

Slave patrols reinforced a sense of white solidarity in the South between slave owners and non-slave owners, all of whom shared a desire to keep the non-white population under control. However, conflict sometimes arose between slave owners and patrollers. Some planters felt that patrollers abused slaves

who had permission to travel, while other planters neglected to write the required passes. Much of the burden of patrolling fell to non-slave owners, who sometimes resented what they saw as serving the planter class.

It is unclear how effective slave patrols were at actually regulating slave behavior. However, it is quite clear that slaves feared and learned survival skills to thwart patrollers. Francis Henderson was nineteen years old when he escaped slavery in 1841. He recalled,

The slaves are watched by the patrols, who ride about to try to catch them off the quarters, especially at the house of a free person of color. I have known the slaves to stretch clothes lines across the street, high enough to let the horse pass, but not the rider; then the boys would run, and the patrols in full chase would be thrown off by running against the lines.

A number of post-Revolutionary changes created more work for patrollers. African Americans understood the Revolutionary rhetoric of liberty and many slaves made escape attempts after the Revolution. Other slaves became free through manumission. In the Upper South, some masters freed their slaves because they believed slavery conflicted with Revolutionary ideals, while other masters freed or sold their slaves because of economic changes that reduced the need for slave labor. Those who sold their slaves often took part in the new domestic slave trade to the Deep South, which slaves greatly feared and from which they would flee. Patrollers therefore had to track runaway slaves and investigate the activities of the growing free black communities.

In this atmosphere of change and with the inspiration of abolitionist activities and the Haitian Revolution of 1791, free and enslaved African Americans throughout the South rebelled against slavery. Among the most noteworthy slave rebellions were Gabriel Prosser's planned rebellion in Virginia in 1800; a large rebellion in Louisiana that lasted for three days in 1811; a battle between slaves, Indians, and the U.S. Army at Fort Blount in Florida in 1816; and Nat Turner's Virginia rebellion in 1831, during which slaves killed at least fifty-five whites. White leaders brutally put down each of the rebellions, but not before fear spread throughout the slave societies, which responded with stricter laws and severe penalties for any hint of rebellion. After the Nat Turner rebellion, much of the South became an armed camp in which slave patrols were stepped up and black movement, gatherings, and the presence of free black communities were limited.

Slavery and the Founding Generation

The United States was founded upon an apparent paradox: the new nation was conceived in liberty but preserved slavery. In 1780 about half a million people, one-sixth of all Americans, were enslaved; 40 percent of southerners were slaves. The institution was not confined to the South: in the Revolutionary era, for example, slaves made up 3 percent of the population in Connecticut and 14 percent in New York. Historians still struggle to document and understand the political, social, legal, and moral aspects of how the founders dealt with slavery. Some modern-day observers have taken the founders to task for not abolishing slavery; others say that the founders deserve credit for putting slavery on the road to ultimate extinction.

Thomas Jefferson and John Jay, two leaders of the time, both wrote that in the decades prior to the Revolution the majority of white Americans, in the South and the North, had little cause to question the justice of slavery. Even the deeply religious communities of Puritans and Quakers held slaves in the colonial era. The evangelist George Whitefield, who owned a plantation in Georgia worked by seventy-five slaves, said in 1751 that slavery was lawful, that God had made the colony of Georgia an ideal place for slave labor, and that slaves should be treated with Christian forbearance. David Brion Davis has written that, in the worldview of many people of the time, slavery "conformed to the natural structure of the universe, which evidenced an infinity of gradations and subordinations" (1975, p. 152).

By the 1760s, however, slavery was being denounced by religious leaders like John Wesley and political thinkers like the Boston patriot James Otis. Otis's pamphlet *Rights of the British Colonies* (1764) proclaimed, "The Colonists are by the law of nature free born, as indeed all men are, white or black. . . . Does it follow that tis right to enslave a man because he is black?" As the Revolution gathered momentum, the moral contradiction between slavery and the ideals of the Revolution became more and more evident to the founders. In 1775 Abigail Adams wrote to her husband, John Adams, "I wish most sincerely there was not a single slave in the province; it always appeared a most iniquitous scheme to me [to] fight ourselves for what we are daily robbing and plundering from those who have as good a right to freedom as we have."

When Jefferson wrote in the Declaration of Independence that "all men are created equal," he likely meant to include African Americans as among those who possess the rights to life, liberty, and the pursuit of happiness. In an earlier statement of grievances against the Crown, the *Summary View of the Rights of British America* (1774), Jefferson declared, "The abolition of domestic slavery is the great object in [these] colonies, where it was unhappily introduced in their infant state. But previous to the enfranchisement of the slaves we have, it is necessary to exclude all further importations from Africa." In 1776 he unsuccessfully proposed a clause in Virginia's new constitution whereby "no person hereafter coming into the state would be held in slavery." Jefferson thus sought the emancipation ("enfranchisement") of the slaves, though he wanted them to enjoy their rights elsewhere—his subsequent proposals for emancipation hinged on forced exile of the people freed.

THE GATHERING MOVEMENT TOWARD EMANCIPATION

Thousands of African Americans bore arms for the American cause from the first day of fighting at Lexington to the last at Yorktown. When George Washington took command of the American army at Cambridge in July 1775, he found black men, both free and enslaved, among his soldiers. In a series of orders issued in the summer and fall of 1775, Washington barred recruiters from accepting any blacks. In December Washington reversed himself and allowed free blacks to serve. Amid acute manpower shortages later in the war, Washington initially supported a plan put together by his aides John Laurens and Alexander Hamilton to emancipate thousands of slaves in South Carolina and Georgia, with compensation to the owners, and form the freedmen into

battalions. As Hamilton wrote, the army will “give them their freedom with their muskets.” The Continental Congress unanimously approved the plan, which William Whipple of New Hampshire declared would “lay a foundation for the Abolition of Slavery in America.” At a critical moment Washington withdrew his support from the plan, which at any rate the legislatures of South Carolina and Georgia also rejected. Numerous slaves served in the Continental Army as substitutes for their owners. The British offered freedom to slaves who could reach their lines, and after the war the British evacuated some thirteen to fourteen thousand former slaves over vehement American objections.

Military service by blacks exposed, for the first time, a North-South divide on the subject of slavery. In the autumn of 1775 Southern delegates to the Continental Congress, led by Edward Rutledge of South Carolina, demanded the expulsion of all blacks from the army. Though Congress voted down the proposal, thereafter some northern political leaders hesitated to take any action that would incite Southern slaveholding interests. Fearful of offending the South Carolinians, John Adams spoke against the abolition of slavery in Massachusetts and opposed the formation of an African American home guard unit in New Jersey. The need to preserve national unity began to emerge as the overriding factor in any political discussion regarding slavery.

George Washington seems to have believed that the Revolutionary War presented an opportunity to launch some broad mechanism of emancipation, but the moment was lost. He wrote that “the Spirit of Freedom” evident early in the war, a spirit that would have sacrificed anything, had subsided by 1779 and was replaced by “every selfish Passion.” After the war Washington expressed the hope that support for emancipation would “diffuse itself generally into the minds of the people of this country” so that an emancipation “by degrees” might be effected “by Legislative authority.” Washington’s cautious, gradualist approach—grounded on a desire for a structured, legally sanctioned process of emancipation supported by a consensus of whites—probably reflected the thinking of other whites sympathetic to the idea of emancipation. The Revolutionary ideal of liberty for all collided with another ideological tenet—the sanctity of private property. Freeing some slaves, with the consent of their owners, would jeopardize the slave property of other owners, since people remaining in bondage would grow restive and attempt to escape or rebel. The ideological conflict was summed up in the remark of a judge who rejected

one slave’s claim to freedom: “I know that freedom is to be favored, but we have no right to favor it at the expense of property” (quoted in Finkelman, p. 39).

A patchwork of emancipation plans emerged. In 1782 Virginia passed a law allowing private manumissions, overturning a ban that had stood since 1723; Delaware and Maryland enacted similar legislation. Vermont, Massachusetts, and New Hampshire abolished slavery in their constitutions, but those states had relatively few slaves. Pennsylvania enacted a gradual emancipation plan in 1780, followed by Connecticut and Rhode Island in 1784 and by New York in 1799. In 1784 Jefferson proposed an ordinance for territorial government that would have banned slavery after 1800, but the bill failed in Congress by just one vote because a New Jersey representative was sick; in 1787, however, Congress passed the Northwest Ordinance, which banned slavery in the territory that would form the future states of Ohio, Indiana, Illinois, Michigan, and Wisconsin. (After attaining statehood in 1824, Illinois held a referendum to legalize slavery, which was voted down.)

This fragmented, halting movement toward emancipation confronted an onrushing economic tide. Popular belief has long held that slavery as an institution was waning in North America during the Revolutionary period and that it was revived only by the invention of the cotton gin in 1793, but the opposite was the case. Even before the cotton gin, slavery was rapidly expanding into the southern piedmont and new western lands. Slaves formed about one-sixth of the population in Kentucky and the Southwest. So at a time when the institution might have been challenged politically, slavery was growing and becoming more entrenched in the economy than it had ever been. After the Revolution the slave trade revived; indeed, it accelerated. With New England providing most of the ships and Georgia and the Carolinas receiving most of the cargoes, more enslaved Africans were brought into the United States between 1790 and 1807 than in any previous twenty-year period.

Foreign visitors to the new Republic were appalled by slavery and its consequences. With some shock, the Polish traveler Julian Niemcewicz wrote of seeing slaves clad in rags, described wretched housing at Mount Vernon, and wrote that most Virginia masters “give to their Blacks only bread, water, and blows.” In his will Thaddeus Kosciuszko left funds to emancipate American slaves, a bequest that was

not carried out. The marquis de Lafayette begged both Washington and Jefferson to end slavery.

SLAVERY IN THE CONSTITUTION

As the founders hammered out a new constitution in the summer of 1787, the issue of slavery was discussed, but no one proposed abolishing it. Delegates denounced the injustice and immorality of slavery and the slave trade, but the main thrust of Northern antislavery arguments was against the extra political power that slave states would obtain by virtue of possessing slaves who could be counted in apportioning representation. Southern delegates feared any clause that *might* at some future time be used against the institution of slavery, but no one proposed any language aimed at abolishing or limiting slavery in the future, except a ban on the international slave trade after 1807. In general, Southerners adamantly protected slavery; Northerners were largely indifferent, except in cases where they believed proslavery clauses gave the South too much power. The issue of how to count slaves in determining a state's representation in Congress, and thus in the electoral college as well, was resolved by a compromise: three-fifths of the slave population would be added to the white population of a state.

The morality of slavery surfaced most powerfully in the convention in the debate over the slave trade. Luther Martin of Maryland declared that importing slaves "was inconsistent with the principles of the Revolution, and dishonorable to the American character." John Rutledge of South Carolina replied, "Religion and humanity have nothing to do with this question. Interest alone is the governing principle with nations. The true question at present is whether the Southern states shall or shall not be parties to the Union." He added that it was in the financial interest of the Northern states to allow an increase in Southern slaves: "If the Northern states consult their interest, they will not oppose the increase of slaves, which will increase the commodities of which they will become the carriers." Oliver Ellsworth of Connecticut agreed: "Let every state import what it pleases. The morality or wisdom of slavery are considerations belonging to the states themselves. What enriches a part enriches the whole, and the states are the best judges of their particular interest." Pennsylvania delegate Gouverneur Morris said that a compromise was needed if the Southern states would not yield: "These things may form a bargain among the Northern and Southern States."

Slave interests won important victories in several clauses of the Constitution, beginning with the

manner of electing the president. James Madison preferred a direct election, but realized that this method would give the advantage to the North, and so he threw his support to the electoral college system, in which the added three-fifths weight of the slave vote gave the advantage to the South. The ban on taxing exports, ardently sought by the South, favored their international commerce in slave-grown tobacco, cotton, and rice. The fugitive-slave clause allowed owners to pursue escaped slaves in free states. The slave-trade clause, an exception to the federal power to regulate commerce, allowed slaves to be imported for another twenty years. The guarantee clause compelled the federal government to put down slave rebellions.

The compromise in the Constitution over slavery was challenged in 1790 when a Quaker group petitioned Congress to consider an immediate end to the slave trade and a gradual emancipation. The proposals enraged Southern representatives, who asserted that the Constitution had settled the issue of slavery, that slavery was a necessary evil, and that prejudices held by both blacks and whites precluded the two races from ever peacefully getting along together—an idea most famously developed by Thomas Jefferson in *Notes on the State of Virginia*. The Southerners heaped ridicule on the Quakers, asking whether they would mind having their sons and daughters take black spouses. The House passed a resolution declaring that Congress had no authority to promote the emancipation of slaves or to interfere in the treatment of slaves within any of the states, further tightening the protections given slavery in the Constitution.

GEORGE WASHINGTON'S DILEMMA

Just before taking office as the first president, George Washington spoke to an aide of his regret over slavery and his wish to see it end. Twice during his presidency Washington planned in secret to free his own slaves and those held by his wife's family. He likely had in mind the pleas of Lafayette, who had urged Washington to free his slaves and set an example that might render manumission a general practice. Washington was frustrated in his attempts to free his slaves while in office. In a private letter he expressed fears over the political repercussions of a sitting president freeing his slaves, an act which might divide public opinion. He had earlier stated that the greatest evil faced by the nation was disunion, though he would also say that nothing but the rooting out of slavery would preserve the Union. Washington freed all of his slaves in his will, written in

1799. A quarter century later, Jefferson, at his death, freed a handful of slaves but left about 130 to be auctioned. Both Washington and Jefferson foresaw that slavery would bring catastrophe upon the United States. Their fellow Virginian George Mason had said that slavery would “bring the judgment of Heaven.”

AFTERMATH

The founders’ intent with regard to slavery became an issue in the nineteenth century. In deciding the *Dred Scott* case in 1857, Chief Justice Roger Taney found that, for African Americans, the Constitution recognized “no rights which the white man was bound to respect.” Taney stated that the Constitution gave Congress the power and the duty to protect the property rights of slave owners. In his Gettysburg Address and other statements, Abraham Lincoln gave primacy to the principle of equality in the Declaration of Independence over the recognition of slaveholders’ property rights in the Constitution. Ironically, John C. Calhoun, an apologist for slavery, shared Lincoln’s view that the Declaration included blacks in its proclamation of individuals’ rights, but this, he said, was a grave error by Jefferson. Contrary to the wishes of the founders, but perhaps not contrary to their expectations, the issue of slavery was finally decided not by legislative or judicial deliberation, nor by a popular consensus attained through the political process, but by war.

Slave Trade, African

The African slave trade to North America began in earnest about 1700 and reached its peak in the third quarter of the eighteenth century. The trade declined dramatically in the decades following the Revolution, was resurrected in 1803, and then experienced a “political death” with federal abolition on 1 January 1808 and subsequent suppression.

Modern estimates of the total number of Africans imported vary widely, from a low of some 292,000 to a high of about 650,000. About one-third were taken to the Chesapeake region (Virginia and Maryland), while over half (53 percent) went to South Carolina and Georgia. In general, between 4 and 5 percent of all enslaved Africans taken across the Atlantic were bound for the territories that became the United States.

The advertisement indicates that “the utmost care” had been taken to prevent the Africans from contracting smallpox. LIBRARY OF CONGRESS.

WAVES OF IMPORTATIONS

New evidence based on shipping records suggests that there were four waves of importation. Between 1716 and 1740 traders brought 85,500 new slaves to the various colonies, with about half taken to Virginia. In the colonial golden age (1751–1775), at least 115,000 Africans were shipped, with about two-thirds intended for South Carolina. In the 1780s and 1790s Louisiana under Spanish administration was the major receiving region, where planters and merchants brought about 25,000 Africans to develop new sugar plantations. It is also likely that in the eastern states during the early national period there was relatively significant smuggling, perhaps bringing numbers equal to those legally imported to Spanish Louisiana. Finally, in the first decade of the nineteenth century, tens of thousands of Africans were imported in one final tidal wave, mostly through the port of Charleston. And though the decade after federal abolition saw some smuggling, perhaps amounting to 10,000 Africans illicitly imported, suppression after 1820 was effective. Hence a large statistical sample of over 310,000 Africans imported into colonial and early national North America gives an indication of likely distributions over time and space as well as of the approximate coastal origins of

Africans thrown by force or by circumstance into the slave trade.

PROVENANCE AND DISTRIBUTION

In Virginia, settlement of the piedmont region and the consequent expansion of tobacco production (from the 1720s to 1760s) brought nearly 80,000 Africans to the colony. A large sample of some 50,000 slaves shows that nearly half (47 percent) were from the Bight of Biafra in West Africa, with another quarter from Greater Senegambia and one-sixth from West-Central Africa.

In South Carolina during the colonial golden age (1751–1775), rice became king and low-country plantations produced great wealth for the larger planters. In these two and a half decades the slave trade shifted southward, and Carolina planter-merchants brought some 72,500 Africans to the colony. A comprehensive sample of some 65,500 imported slaves shows that a clear majority (56 percent) originated in Greater Senegambia. The next major coastal grouping was from West-Central Africa, representing one-sixth of those sent to the colony in this time.

In Louisiana during the Spanish period (roughly 1763 to 1803), perhaps 25,000 Africans were imported. Though no comprehensive shipping records exist for this branch of the slave trade, indirect evidence strongly suggests that West-Central Africans, especially “Congo,” formed a large proportion, with some number from Greater Senegambia and others in smaller numbers originating in the hinterlands of the Bights of Biafra and Bénin.

Finally, pent-up demand in the early national period, following two decades of post-Revolutionary restrictions and state-level prohibitions, and the impending federal abolition, exploded in the first decade of the nineteenth century. In just five years (1803–1807), over 55,000 Africans were transported to Jeffersonian America. The vast majority were taken to South Carolina, in particular through the port of Charleston. A sample of some 40,500 Africans whose coastal provenances are known shows that nearly half (48 percent) were from West-Central Africa, with about a quarter from Greater Senegambia. Perhaps half of all of these newly imported Africans were re-exported, likely bound for rapidly settling Deep South territories and states such as Alabama, Louisiana, and Mississippi but also for the emerging cotton black-belt of the eastern piedmont regions.

In short, the flows of people in the large-scale forced migration that was the African slave trade suggests the importance of captives from the Bight

of Biafra (and Senegambia) in the Chesapeake; and from West-Central Africa and Senegambia in the Carolina low country and in the emerging Deep South, including Louisiana. The relative scarcity of peoples from the hinterlands of the Gold Coast, the Bight of Bénin and Southeastern Africa (Madagascar and Mozambique), respectively, in the African trade to North America is striking. Of the six basic Atlantic African regions, however, three were closely integrated with the slave trade to the U.S.: the Bight of Biafra, Greater Senegambia, and West-Central Africa. About 85 percent of Africans bound for North America came from these three regions. Though the African trade to North America was always a relatively marginal one in the larger Atlantic world context, colonial and early national planters established important commercial relations with merchants, factors, and brokers in particular Atlantic entrepôts (intermediary trade and shipping centers) in the modern countries of Great Britain and France, Nigeria, Senegal and Gambia, and Congo and Angola.

“THIS EXECRABLE COMMERCE”

As was the case in Great Britain itself, the early anti-slavery movement in America began as a moral and religious issue among dissenting Evangelicals. The conversion of first Quakers and then Methodists to antislavery, between the 1750s and 1770s, however, was followed by the rise of a natural-rights critique of both the slave trade and slavery by late-Enlightenment propagandists such as Thomas Jefferson.

In America opposition to the slave trade quickly became politically popular. Some colonial assemblies in the 1760s and early 1770s repeatedly sought to restrict importations by imposing tariffs and customs duties, nearly all of which were vetoed by royal governors and the Crown. It also became convenient to blame the Crown for the trade itself. Jefferson’s bill of particulars against George III, published as “A Summary View of the Rights of British America” (1774), included a strong condemnation of “this infamous practice” of slave trading. In the original draft of the Declaration of Independence (June 1776), Jefferson expanded his political use of antislavery to rhetorically lash the Crown for “suppressing every legislative attempt to prohibit or to restrain this execrable commerce.”

Of course, for the larger slaveholders (including Jefferson), limiting importations of new Africans also reflected a basic economic rationale. In an economy such as late-colonial Virginia, where planters were heavily in debt to metropolitan merchants, any

Thomas Jefferson, in “A Declaration by the Representatives of the United States of America, in General Congress Assembled” (June 1776), included the following clause in his indictment of King George III. Congress struck it from the final Declaration of Independence:

He has waged cruel war against human nature itself, violating its most sacred rights of life and liberty in the persons of a distant people who never offended him, captivating and carrying them into slavery in another hemisphere, or to incur miserable death in their transportation hither. This piratical warfare, the opprobrium of INFIDEL powers, is the warfare of the CHRISTIAN king of Great Britain. Determined to keep open a market where MEN should be bought and sold, he has prostituted his negative for suppressing every legislative attempt to prohibit or to restrain this execrable commerce. And that this assemblage of horrors might want no fact of distinguished die, he is now exciting those very people to rise in arms among us, and to purchase that liberty of which he had deprived them, by murdering the people on whom he also obtruded them: thus paying off former crimes committed against the LIBERTIES of one people, with crimes which he urges them to commit against the LIVES of another.

sustained increase in the value of one’s property in slaves similarly increased financial equity against which it was possible to borrow further. In general the slave trade tended to depress prices because new Africans were comparatively cheap, thus lowering the financial value of slaveholdings as capital assets. The quickest way to inflate prices and increase the value of slave property was to restrict the slave trade. No doubt many of Jefferson’s contemporaries in the southern colonies, canny merchant-planters that they were, implicitly understood their common economic interest on this issue. Jefferson’s genius was to converge the failure to enact such restrictions with the rising tide of ideological and religious antislavery thought and then to put it all to specific political purposes: blaming the Crown.

REVOLUTIONARY CRISIS

The *rage ideologique*, the ideological fervor, of the Revolutionaries—fired by the sense of striking a daring blow for liberty against an impending slavery of tyr-

anny—bubbled over to a conditional antislavery position throughout the colonies. In December 1774 the First Continental Congress imposed a ban on slave imports. Effectively instituted in Virginia, where the slave trade ended in 1775, and implemented in Connecticut, it was followed in 1776 with a comprehensive prohibition by the Second Congress. Between 1776 and 1780 a number of the former colonies either banned such importations or abolished slavery or both at the state level, and only a handful of slave shipments made it through the British naval blockade.

During the war an estimated 100,000 slaves ran away from their masters. Between 1781 and 1790 the new southern states wrestled with balancing Revolutionary ideology and economic exigency. It was a confusing time of variously enacting and then repealing restrictions on the slave trade, but by 1786 only South Carolina and Georgia still allowed importations. In the 1780s some 10,000 Africans were legally imported and probably an equal number illicitly smuggled, mostly to South Carolina.

CONSTITUTIONAL COMPROMISE

By 1787 a half-dozen states had abolished slavery either directly or by gradual emancipation schemes. Slavery had been prohibited in the newly organized Northwest Territory north of the Ohio River; and the African slave trade was restricted to just two states. The next decade would see another wave of state-level restrictions on slave trading, including temporary prohibitions on imports into South Carolina, the emergence of a new organized antislavery movement, and further state-level abolitions, so that by 1790 all states in New England had formally ended slavery. When Vermont was admitted to the Union (1791) it entered as a free state and was immediately followed by Kentucky (1792) as a slave state.

The framers of the new Constitution, however, reached a working compromise on the issue of the African slave trade. In effect they relegated its regulation to the states, where such restrictions generally were popular if porous, and thereby put off any substantive federal action for twenty years. Even South Carolina suspended its participation in the trade in 1787. On the federal level, the Constitution merely stated (article I, section 9) that Congress was prohibited from enacting any ban on the “Migration or Importation of such Persons as any of the States now existing shall think proper to admit,” without specifically mentioning slaves. This constitutional compromise was set to expire in 1808.

A POLITICAL DEATH

In the fifteen years between 1787 and 1802, the African slave trade to the United States slowed to a relative trickle, though it boomed to unprecedented heights elsewhere in the Americas. By 1793 Georgia was the only remaining state officially to allow importations, though imports from the West Indies and Spanish Florida were prohibited. In the 1790s some 7,500 slaves were taken mostly to Georgia, and likely an equal number were smuggled.

By the end of the decade, when Congress refused to prohibit slavery in the Mississippi Territory (1798), and especially with the Louisiana Purchase (1803), pressure mounted to reopen the African trade. In 1803 South Carolina formally did so, also allowing importation from Latin America and the Caribbean. Though Louisiana and Georgia also permitted slave imports, Charleston merchants nearly monopolized this last tidal wave of the African slave trade, controlling over 90 percent of the shipments and making several new fortunes in this human commerce. But following President Jefferson’s formal encouragement to Congress (1806) to end the trade as soon as the Constitution permitted, on 22 March 1807 Congress abolished the African slave trade to the United States, effective 1 January 1808.

Total suppression of actual trading took nearly a decade, though it was relatively effective even in the first ten years. With the 1819 Slave Trade Act, in which, though the act was short-lived, the United States joined England in sending a small naval squadron to patrol the coasts of West Africa, as well as Congress’s definition of slave trading as piracy in 1820, the African slave trade to the new American nation died a largely political death. In the antebellum era very few slaves were smuggled; an occasional ship did run the American gauntlet. In 1842 the United States signed the Ashburton-Webster treaty with England and through 1861 sent between three and eight warships annually to West Africa to suppress the Cuban branch of the trade. During the sectional crisis just before the Civil War, some prominent Southerners argued for reopening the slave trade to the nascent Confederacy, largely for political reasons and to little end. The last recorded slave ship was the *Clothilde*, which arrived in Mobile Bay, Alabama, in 1859.

Slave Trade, Domestic

The domestic slave trade, for much of the eighteenth century a small-scale localized activity, grew exponentially during the late colonial and early American years. The tremendous growth of this practice was aided by a combination of political and technological factors in post-Revolutionary America. Chief among these are Eli Whitney's 1793 invention of the cotton gin and the resulting entrenchment of cotton as a staple agricultural cash crop, the 1808 federal prohibition of importing slaves through the international slave trade, and the rapid rate of western settlement in the early nineteenth century. By the antebellum period the domestic slave trade had fundamentally altered America's racial demographics, acting as a "Second Middle Passage" that yearly relocated thousands of African American slaves who had established deep generational roots on the eastern seaboard of mainland North America.

Until the early nineteenth century the economy of Virginia and Maryland relied almost exclusively on tobacco cultivation. The plantation system's torrid pace of raising this notoriously nutrient-

depleting crop left soil in these traditional slave societies seriously eroded. Planters were left with a significant surplus in their slave labor force as the less profitable and labor-intensive seasonal cultivation of wheat replaced tobacco as the Chesapeake's primary crop. Outnumbered by their slaves, planters constantly feared slave rebellions, for they recognized the latent revolutionary potential in a mass of underemployed bondsmen. Chesapeake planters such as George Mason vehemently opposed the international slave trade partly because the ubiquitous threat of revolt was intensified with each shipment of Africans arriving on America's shores. Ever conscious of their surplus in bound laborers, Thomas Jefferson and other members of the Chesapeake planter elite aggressively advocated opening the recently acquired Louisiana Territory to slavery. The line between self-interest and altruism was nearly indistinct as 1808 federal legislation closed America's shores to the international slave trade. Many of the most vocal advocates for withdrawing from the international slave trade were members of the elite Virginia vanguard, acutely aware of their own self-interest. Despite their opposition to importing slaves, Chesapeake planters left little doubt of their support for slavery by taking the lead in exporting over 200,000 slaves between 1790 and 1829.

THE RISE OF COTTON

The rise of cotton as a staple cash crop in the Southern economy coincided with the agitation to close America's borders to slave importation. Profits from cotton were seemingly boundless, limited only by how much space was available for its cultivation and how much labor was available to work the land. No one could have predicted that in less than half a century the crop would have so great an impact on America's economy, settlement patterns, race relations, and politics. This enormously profitable cash crop left no part of the Southern interior untouched; Georgia, Louisiana, Mississippi, Alabama, Arkansas, Florida, and Texas all eventually provided an unquenchable demand for the surplus of bound laborers in the Chesapeake and Upper South.

Of course, cotton plantations could not spread south and west into largely uncultivated land without significant federal involvement. Free from British restrictions against settling beyond the eastern seaboard, settlers flooded into the trans-Appalachian West with the aid of federal troops who aggressively cleared Native Americans from what would eventually become known as the Black Belt. With indigenous peoples out of the way and seemingly un-

bounded land available, planters utilized a largely enslaved labor force to clear forests and prepare grassland for producing cotton. By the 1820s much of what is now Kentucky, Tennessee, Alabama, Mississippi, and Louisiana was gainfully settled and quickly incorporating slaves into the plantation system.

EXPANSION OF THE SLAVE TRADE

Cotton production, the conclusion of America's involvement with the Atlantic slave trade, and westward expansion would together stimulate the voracious demand for slavery in the Deep South. As planters who exported their human chattel from declining slave economies in the Upper South and Chesapeake readily met this demand, professional slave traders rose to act as middlemen. Although before the Revolution a living could be made in transporting bound servants away from New England, the middle colonies, and the Upper South, the profession flourished when the only significant source for slaves could be found in the dense surplus of slaves inhabiting the Chesapeake. Slave traders and speculators generally used inland waterways and coastal shipping routes to transport this human traffic to Georgia, where a consistent average of over two thousand slaves were received every year, and onward toward larger markets in Alabama, Louisiana, and Mississippi. A standard coastal route for antebellum slave traders departed from Norfolk and arrived in New Orleans after stops to pick up or drop off human cargo at southern port cities such as Baltimore, Alexandria, Richmond, and Charleston.

By the 1820s New Orleans filled a role previously played by Charleston during the international slave trade's heyday by becoming the domestic slave trade's central hub. Ideally situated in the burgeoning Deep South and located at the mouth of the Mississippi River, New Orleans was easily accessed via both coastal and inland waterways. Louisiana's slave population grew as New Orleans's eager participation in the domestic slave trade coincided with the rise of plantation-based sugar cultivation in and around the flourishing city. Given the growing tendency of owners to use sale as a punitive measure for unruly slaves, it is not surprising that in 1826 Louisiana closed its harbor to the domestic slave trade as a measure of public safety. With large profits slipping away the ban was short-lived, and by 1829 New Orleans reclaimed its position as the destination of choice for slave traders and prospective buyers throughout the Deep South. The only change made was a bureaucratic reform requiring all slaves enter-

ing the city's slave market to be certified for good conduct by a previous owner.

While New Orleans's domestic slave market flourished because of its relatively easy access through established trading routes over waterways, inland routes of the Upper South transported slaves chained or roped together in "coffles" of thirty to forty slaves that marched over twenty miles per day. While coffles were generally used for covering shorter distances, it was not uncommon for prolonged journeys from Virginia to Louisiana to take over a month. Regardless of how they arrived at trading centers, slaves involved with the nineteenth-century domestic trade often occupied the same or similar rigidly controlled slave pens that were made infamous by the campaign to abolish the international slave trade.

IMPACT ON SLAVES

America's 1808 decision to criminalize participation in the Atlantic slave trade was a pivotal event in the lives of African Americans throughout the nation. This decision had an impact on slave culture by virtually ending the introduction of "saltwater" Africans to America's shores. More important, it meant that slaves from the older slave states—mostly from Virginia, Maryland, and the Carolinas—would be used to satisfy the seemingly insatiable demand for human chattel throughout the Deep South's budding slave societies. In the North the security of free blacks was constantly jeopardized as kidnappers became a prime threat to their precious liberty. Free blacks vigilantly defended their freedom by ensuring that their free papers were in order and spreading word throughout the community when suspected kidnappers were in town. In the Upper South and Chesapeake, slaves could no longer realistically hope for paternalist-minded owners to offer manumission as a reward for prolonged meritorious service. In short, although new slaves were no longer legally allowed to penetrate America's borders, obtaining freedom within the nation was becoming more difficult.

With relatively easy sale as an option, rebellious or unruly slaves often faced sale and forced migration as a punitive measure. By the antebellum period this method of labor management had solidified, and being purged "down the river" was one of the most dreaded fates that could befall a slave. Rebels and troublemakers were not the only slaves to endure the Second Middle Passage. The typical slave involved in the domestic trade was a young adult, physically healthy, and potentially productive as both a laborer and a parent for future slaves. Although not all

slaves relocated through the domestic slave trade, the internal slave trade affected nearly all slaves by shattering established communities and kinship networks that had developed over generations along the eastern seaboard. Those who were sold faced the intimidating prospects of forced relocation and an uncertain future. Remaining members of these now bifurcated slave communities that had lined the Chesapeake and Upper South had to readjust to life without the presence of loved ones who had provided crucial support throughout the trials of enslavement.

Because the deep bonds of African American slave kinship and community regularly transcended the boundaries of one's immediate plantation, any plantation's closure or en masse liquidation affected slaves' lives by the hundreds. The transfer of just one slave sold to transform a wilderness into a commercially viable plantation could rob the community of a parent, grandparent, sibling, or uncle or aunt. Multiplied by the thousands each year during the early nineteenth century, such reciprocal losses nearly obliterated entire communities. For enslaved women, the trauma of sale could be much deeper. In addition to separation from their family and community en route to an unknown land, advertisements highlighting their reproductive capabilities reveal that African American women's fertility had been transformed into a marketable commodity.

The American Revolution and ensuing nationhood had a profound impact on the domestic slave trade's establishment and rapid development. By removing the trans-Appalachian barrier on settlement and aggressively relocating this region's indigenous population, the federal government provided an ideal environment for the steady westward expansion of slavery below the Mason-Dixon line. Although the Constitution explicitly allowed federal oversight of interstate commerce, the 1808 prohibition on participating in the international slave trade also ensured that the internal slave trade would remain undeterred and unregulated. The Cotton Kingdom's brisk growth throughout the Deep South firmly debunked the notion that westward diffusion of slaves would lead to the institution's gradual demise. Thus the new American nation never passed legislation protecting slave families or regulating the terms and conditions of chattel slavery. Stimulated by an insatiable appetite for surplus bondsmen in the eroding slave societies of the Chesapeake and Upper South, driven by colossal profits from plantation cultivation of cotton, and unimpeded by federal supervision, the Second Middle Passage tore apart African American

families and shattered slave communities while simultaneously spreading slave culture throughout the Deep South and forever changing the racial landscape of America.

SMALLPOX Smallpox is a highly infectious disease whose normal mode of transmission is through inhalation. Case mortality can be as high as 30 percent, and the disease is also feared for the permanent scarring it leaves. It was introduced to the Americas by Spanish explorers. Credited with the extinction of the indigenous Amerindian populations of the Caribbean islands by 1519, smallpox also contributed to the conquest of Mexico and Peru. In the 1760s Sir Jeffrey Amherst ordered the deliberate spread of the disease among Native Americans participating in Pontiac's War in western Pennsylvania.

The British also inadvertently brought smallpox to the territory of what would become the United States. As early as 1633, William Bradford noticed severe cases among Indians living near the Plymouth colony. The spread-out population of the English colonies—with regular replenishment of new smallpox cases disembarking from transatlantic voyages—meant that smallpox was sporadic but also more dangerous to nonimmune populations. Throughout the eighteenth century, natural outbreaks continued to afflict Indian populations. In 1763, for example, a group of Indian converts to Christianity who lived in Philadelphia lost one-third of their members to the disease.

Many Old-World cultures developed the practice of deliberately inoculating smallpox in order to confer lifetime immunity. Around the same time that this procedure was brought to England, the Puritan clergyman Cotton Mather independently learned of it from his slave, Onesimus. With the assistance of the physician Zabdiel Boylston, Mather began inoculating in Boston during an epidemic in 1721. During a 1731 epidemic in Philadelphia, Benjamin Franklin hailed inoculation, and over the course of the following decades, the practice became more popular in the Philadelphia region than elsewhere in the colonies.

Inoculation was a dangerous procedure since it bore the risk both of killing the inoculated person and of spreading the disease. As a consequence the procedure was generally restricted to more substantial members of the community, who could be more easily isolated and better cared for. In 1774 Philadelphians established a Society for the Inoculation of the Poor, whose work was soon suspended because non-immune delegates to the Continental Congress (mainly from the South) were concerned about infection. During the War of Independence, George Washington had himself and his troops inoculated, in part because the British were rumored to be deliberately spreading smallpox. The fact that an eminent Virginian encouraged the practice may have led to inoculation becoming official policy of the Continental Congress.

In 1798 Edward Jenner published his *Inquiries*, detailing how inoculation with the relatively mild cowpox (or *vaccinia*) would immunize the patient against smallpox. Inoculation with smallpox now became known as “variolation” (*variola* being the Latin name for smallpox), and was gradually replaced by vaccination. Vaccination was introduced to the new Republic in 1800 by Benjamin Waterhouse of the Harvard Medical School, and President Thomas Jefferson immediately became an advocate of the

new procedure. In 1802 Valentine Seaman of New York organized a system to provide free vaccination to the poor.

During his administration, James Madison encouraged the distribution of smallpox vaccine, and public health statutes from the colonial period into the early nineteenth century were concerned primarily with isolating smallpox patients among immigrants. In Pennsylvania, for example, it was only in 1824—when variolation was outlawed—that smallpox became a reportable disease and the isolation hospital within the city began receiving smallpox patients.

Although it had its opponents, vaccination gained general acceptance rapidly, and smallpox incidence in the United States declined significantly during the first three decades of the nineteenth century. Unfortunately this led to complacency, and after 1830 the United States experienced a number of devastating epidemics.

SOCIAL LIFE: RURAL LIFE Throughout rural America, as the New Englander Lyndon Freeman recalled, families “found occasions to meet together.” At the level of detail, these ways of socializing differed substantially by region and cultural tradition. But there are broader patterns that can be distinguished, rooted in an ox- and horse-drawn world of pre-telegraphic communications, unmechanized agricultural and household labor, and an only partially commercialized rural economy.

Beyond the limits of each family’s house or farmstead was a village or a country neighborhood, a small community that set the bounds for daily social experience. However, the meanings of “neighborhoods” and “neighboring” differed importantly

across the United States. Much depended on the density of settlement and the difficulties of local travel.

THE NORTH

The villages and neighborhoods of the settled northern countryside had comparatively dense social webs. "It was a uniform custom," wrote Freeman of his Massachusetts boyhood, "for the women to visit . . . from house to house, to take tea and enjoy a social afternoon." Men were brought together by frequent exchanges of work and goods and by trips to tavern and store. Children knew each other from attending school.

The densest rural settlements were central place villages—small hubs for commerce, transportation, professional services, worship, and local government. A growing number were mill villages, small settlements built around waterpowered textile factories. More dispersed country neighborhoods had vaguer borders but were named and thoroughly known by their inhabitants. In some places they were roughly defined by the boundaries of rural school districts. A sizable minority of families never stayed long enough in any community to become deeply enmeshed in its life. But those who remained for any length of time in well-established settlements visited and traded with their neighbors weekly, if not daily.

Although the reach of rural sociability was broad, it did not transcend class and race. Elite rural families sometimes socialized widely with their neighbors and sometimes held aloof. The poorest and most transient, along with free people of color generally, were for the most part excluded.

THE WEST AND SOUTH

In the more geographically dispersed settlements of the West and South, the structure of social life was inevitably different. Migrating families often felt it intensely. To move from New Jersey to Kentucky around 1800, wrote Daniel Drake, was to leave "the village and public roadside, with its cavalcade of travellers, for the loneliness of the wood, a solitude which was deeply felt by all of us." In response, widely scattered families sought to create a social web across the distances that separated them. Their "desire for society," Drake recalled, was like "the desire of a hungry family for food."

These families defined their neighborhoods more widely in space than those living in denser settlements, and they built their social networks on more intermittent contact. This desire for society was shared by the masters and mistresses of great planta-

tions as well as yeoman farmers. A Southern planter's "notions of space" were "so liberal," the *Universal Traveler* noted in 1835, "that he will readily ride a dozen miles to dine." If less frequent, sociability was often more intense. Southern and western families embraced customs of open hospitality to strangers as well as acquaintances that surprised northern observers.

In these more thinly settled parts of America, the problems of distance bore most heavily on women. They were tied to children and a daily round of domestic tasks and were constrained by custom from traveling far on their own. Men spent much of their time in solitary labor in the fields but could find intermittent occasions to leave the farm while hunting, trading, or attending public gatherings.

On the plantations, enslaved communities had a social life that was only partially known to their masters. After their day's work, families passed their evening hours in visiting, moving freely in and out of each other's cabins on the street, or talking and singing outdoors. Young men going courting and those bent on seeing separated kinfolk often took to the road to visit other plantations.

Although some masters tried to curtail evening socializing and off-plantation travel, enslaved Americans showed great tenacity in maintaining an autonomous social life. Even when cabins were locked to keep out late-night callers and patrols guarded the roads, young black men climbed down chimneys and walked across the fields.

PLACES AND OCCASIONS OF SOCIABILITY

Across the regions of America, weddings and funerals, held at home and usually marked by both drinking and rituals of hospitality, involved community as well as kinfolk. Critical locations of rural sociability were the church, the tavern, the country store, and the county courthouse. For millions of churchgoers in the countryside, Sunday meetings offered not only worship but abundant opportunities for visiting, courtship, and quarreling. Because economic transactions and social relations were deeply intertwined in rural life, stores offered similar opportunities for men and women to meet; purchases could be long, conversational transactions.

Taverns were perhaps the most widespread rural institutions of all, the centers of an almost exclusively male sociability. They brought men together for heavy drinking, smoking, and alcohol-fueled talk—and often gambling and fighting. The rural calendar was punctuated by militia training days, yearly state and local elections, and the periodic sessions of cir-

cuit-riding courts. On court days, training days, and election days, men—and some women—poured in from the countryside to township centers and county seats, as much to socialize as to do public business.

Rural Americans came together for many occasions of cooperative labor: corn huskings, house and barn raisings, “logrollings” for clearing timber, “stone bees” for ridding fields of rocks, even “dunging frolics” for spreading manure on the fields. There were also all-female gatherings: spinning frolics, quiltings, apple-paring bees. Farm families usually kept these gatherings outside the explicit web of the rural economy; even farmers and artisans who carefully recorded the most minute transactions with neighbors in their account books almost never charged the time spent in “mutual assistance.”

The social patterning of these cooperative activities varied from region to region, but overall they gave American rural life a distinctive texture. Everywhere they allowed neighbors to accomplish a large task quickly and to mark its completion with a kind of festival. In varying degrees they emphasized competition and courtship. Male corn husking teams in Kentucky contested, sometimes violently, for first place; in New England’s mixed husking parties, the men sought to find the occasional “red ear” that would earn them a kiss from the women.

THE SEASONS

Sociability in the American countryside moved inversely with the seasons of agricultural work. This occurred most dramatically in the rural Northeast. In July, during the exhausting labor of getting in the hay crop, most other activities were suspended. Stores, shops, and taverns stood almost empty, visits sharply declined, few couples married, and few children were conceived. Cutting against the grain was the one universally observed American holiday, the Fourth of July. Independence Day came at a remarkably awkward time for a nation of farmers, in the midst of the heaviest work of the summer. Probably it was all the more valued by country people on that account.

The end of the growing season marked the beginning of greater leisure. Winter was the courting season, a time often pleasantly remembered for its parties and frolics, singing schools and dances. It was also “marrying time” in most communities. The months just after harvest or just before spring planting showed the highest number of marriages. Yet in the North it was also a time of growing discomfort. Family life contracted into a room or two, and even routine outdoor chores grew increasingly difficult as

the temperature dropped. In severe cold and storm, households could spend weeks in isolation. At times the leisure could be enjoyed; when traveling was good, on sleighs over frozen roads, “alternating visiting through a neighborhood in the evening was quite common,” as Lyndon Freeman remembered. At times it could only be endured: “tavern haunting, tipping, and gaming,” Samuel Goodrich declared, “were the chief resources of men in the dead and dreary winter months.”

CHANGES OVER TIME

Well-established as they were, these patterns were not permanent. By the 1820s there were clear signs of change, particularly in the rural Northeast. Temperance reform was not only diminishing tavern clientele but changing the character of socializing for many men. Huskings and frolics were beginning to disappear under the pressure of more instrumental and progressive ways of organizing farm work, although house and barn raisings—whose economic logic could not be assailed—endured for many decades. Traditional forms of neighborhood sociability were now competing with the claims of the new voluntary organizations—lyceums and debating societies; charitable, missionary, and maternal associations; and groups devoted to temperance, antislavery, and other reform causes. For some rural families, weddings and funerals were becoming more private occasions, focused more narrowly on immediate family and close friends and excluding wider community participation.

A few decades later, there was a sense that the old world of rural sociability had disappeared entirely in some parts of America. In the communities of his Vermont boyhood, wrote Horace Greeley in 1859, there had been “more humor, more fun, more play, more merriment . . . than can be found anywhere in this anxious, plodding age.”

SOCIAL LIFE: URBAN LIFE Despite their rarity, early America's towns served a vital role as social centers for much of period before 1820. Prior to 1783, large cities with ten thousand or more residents were distributed across the eastern seaboard, from Boston in the north to Philadelphia in the middle colonies, and Charleston in the South. The immediate post-Revolutionary decades witnessed a reorganization of this hierarchy. By 1800 Charleston had lost ground while Baltimore had joined this elite of urban centers with twenty-seven-thousand residents; furthermore, Philadelphia and New York, with over sixty-thousand residents each by that time, were easily the largest cities. Overall, just 5 percent of the early American population lived in towns, a proportion that would not increase until well into the nineteenth century. As social hubs for both townsmen and the residents of their hinterlands, however, these cities fulfilled a role much greater than their relative size would suggest.

RURAL AND URBAN SOCIABILITY

For many Americans, social life revolved around the rural homestead. Among whites, social calls to the houses of their neighbors (who often resided at some distance) provided entertainment and cemented a sense of community. In highly rural areas of the South, such as Virginia, centers of sociability that had, in the Old World, been situated in or near towns—churches, racecourses, and courthouses, for example—were also located in the countryside. Deprived of the freedom to move away from their rural places of work, many enslaved black Americans of this era had little choice but to create a social life that revolved around agricultural labor and plantation life. The function of towns as economic and political centers, however, meant that many black and white Americans could at least sometimes engage in social activities there. And, over the course of the eighteenth century, social amenities unique to the townscape started to spring up throughout the colonies, making certain leisure pursuits possible only in an urban environment. As the American population became more stratified by race and class in the years after 1750, cities also proved essential as the only

places offering socializing opportunities to all sectors of society.

ELITE AND MIDLING AMERICANS

In the decades before the Declaration of Independence, towns across the English-speaking Atlantic became indispensable to the leisure activities of elites and middling classes. Taverns, theaters, assembly rooms, public gardens, teahouses, and coffeehouses were for the most part exclusive to towns and constituted the main spaces in which wealthy free men and women sought company, entertainment, and conversation. In particular, towns assisted the New World's privileged classes in fashioning themselves as "genteel" individuals: people with good manners, a graceful posture, a fashionable appearance, a keen appreciation of the arts, and a font of educated conversation at their fingertips. In taverns, clubs and societies convened in the name of a wide variety of causes: drinking, literary discussion, celebration of a shared nationality, charity for the poor, Masonic rituals, and political debate. Mostly homosocial in character, these organizations represented the extension of a British sociability to early America; but, at the same time, they also reflected unique facets of New World society. Hence, Scottish, German, or French societies were indicative of the colonies' ethnic diversity, and the conflict between the elitist "modern" Freemasons and their more populist "ancient" brothers exposed the more democratic character of club life in America from the 1750s onwards.

Outside of clubs, elites and middling sorts passed much of their free time participating in dancing assemblies, promenading in gardens, attending concerts and plays, and drinking tea. By the 1760s, all of early America's largest cities had the amenities necessary to the pursuit of such activities, and some towns, like Charleston, South Carolina, thrived precisely because they were an essential refuge for gentry (the agricultural elite) seeking entertainment and a healthier environment away from their plantations. As central marketplaces and shopping centers, moreover, America's towns were also essential to the provision of the accoutrements of the genteel lifestyle; towns hosted shopping districts where strolling, buying, and socializing could be combined into a single leisure activity. Throughout the Revolutionary period, and into the era of new nationhood, America's cities continued to play this central part in the social lives of the wealthiest citizens.

THE POOR

Because of their physical size and the diversity of their spaces, towns also furnished special social op-

portunities for poorer early Americans—slaves, free blacks, and whites alike. In the harbor areas of all port towns on the eastern seaboard, there was a plethora of legal tippling houses and taverns, as well as innumerable illegal, temporary establishments. There, sailors, workers, apprentices, free blacks, and urban slaves all gathered to enjoy drinking, gambling, or popular games such as dice, billiards, and bowling. Increasingly, theaters proved to be sites of entertainment for those working poor whites who could afford the price of an entrance ticket.

All of these social activities, however, cost money that many did not have, and for this reason the open, shared spaces of towns were also favored as gathering places. Greens or fields provided the ideal location for slaves to come together in cities, a habit brought to light by the discomfort that this caused among white authorities. Streets also served as social spaces among the urban poor, and there one could often find traveling entertainers or tricksters surrounded by their audiences. Importantly, such offerings represented socializing opportunities for slaves unimaginable on the plantation, and for blacks fortunate enough to be sent to sell produce at town markets by their owners, even the commercial spaces of early America's towns could be turned into hubs of conversation, gossip, and entertainment.

Such activities, of course, were all a very long way from the genteel urban environment that elites were striving to fashion, and the conflict between their social goals and the culture of the lower sorts went far beyond protests against slave gatherings on the town green. Until the nineteenth century, America's cities were not divided into clear districts distinguished by the wealth of their residents. In southern towns, free blacks and poor whites lived in tenement housing that was frequently situated between—or behind—the townhouses occupied by the wealthy. In these circumstances, wealthy whites were forced to make a conscious effort to erect barriers between their genteel social lives and the popular pursuits of the poor, something that they achieved by instituting high subscription fees and entrance restrictions for their clubs, and even by cordoning off open spaces within towns for their exclusive use. Such actions merely reflected the increasing chasms between rich and poor, and black and white, that were emerging in American society before 1783.

THE EARLY NATIONAL ERA

During the early Republic, two new trends manifested themselves in the social lives of the new nation's burgeoning cities. Before independence, cities

had been the focus for many annual social events that linked Americans to the British Empire of which they were a central part. From Boston to Charleston, fireworks and dinners in honor of the king's birthday and the celebration of British victories against the French and the Spanish studded the urban social calendar. With new nationhood, however, such events were transformed into landmarks of independence, with Fourth of July commemorative feasts, balls, and parties becoming quickly established as annual celebrations of identity and unity. Elsewhere, independence made itself felt in urban club life. Masonry, with its emphasis on fraternal values, flourished in these decades, its values practically inseparable from those of the new nation. As well as embodying a new national unity, urban social life also began to display more of the features of class division than ever before. Most noticeably, the social lives of urban middling sorts emerged as a clear strand all of its own. This was a sociability characterized less by the drinking, gambling, and dancing enjoyed by elites and more by a quest for improvement of morals among poor or black citizens. Often, this middling drive for reform stemmed from a collective identity founded around evangelical religion, temperance, and a growing sense of gentility and propriety.

SOCIETY OF ST. TAMMANY The Society of St. Tammany, or the Columbian Order, originated in New York City in the late 1780s. During the Revolu-

tion, Tammany Societies, so called in honor of a mythical Delaware Indian chief, Tamamend, had appeared in Philadelphia and elsewhere to spread patriotism and republicanism and as a counter to more elitist organizations like the Society of the Cincinnati. When its early aspirations to become a national organization withered after independence, the society came to be associated most closely with New York. The first Tammany Society appeared in the city in 1786 or 1787 but attracted few recruits until 1789, when John Pintard, a merchant, and William Mooney, an upholsterer, assumed its leadership. Initially a fraternal order dedicated to the preservation of the art and natural history of the United States and the commemoration of the country's history, the society came to see itself as a bulwark of republicanism and democracy against aristocracy. Modest initiation fees and annual dues ensured a broad membership. Artisans and mechanics made up the bulk of members by the mid-1790s, but the organization also included lawyers and merchants. In keeping with its Indian motif, the society was organized into "braves" and "tribes," who elected a board of directors made up of thirteen "sachems." They, in turn, selected a grand sachem, a position held first by William Mooney and then by William Pitt Smith. The Society held monthly meetings where members debated current events over dinner and drinks; supported local charities; and, in Indian regalia, marched in parades celebrating patriotic holidays.

As partisanship intensified in the early 1790s, the society's political activities grew. The city's artisans and laborers became disenchanted with Federalism and gravitated to the emerging Democratic Republicans. During the debates over the French Revolution, Tammany sided with France, organizing pro-French demonstrations in New York in 1793 and 1794 and denouncing the Jay Treaty the following year. In 1795 Federalist members withdrew when the society refused to endorse Washington's denunciation of the new Democratic Societies, leaving the Republicans in control. Over the next decade, pro-Jefferson Tammany Societies were revived in several states, but in most places they retained their fraternal character and were rarely a major political force.

Tammany's emergence as a political organization dates from the intense factionalism of New York politics in the early nineteenth century. By 1807 the supporters of Aaron Burr, known as Martling Men because they met at Martling's Tavern, had gained control and turned Tammany into a base of opposition to DeWitt Clinton. For more than a decade there-

after, New York politics revolved around the struggle between Clintonians and Tammanyites. In 1812 the society moved to the corner of Nassau and Frankfort Streets, the home of Tammany Hall until 1868. By 1820 Tammany had allied with Martin Van Buren's Bucktails against Clinton. Together they successfully pushed for state constitutional reform and universal male suffrage and built the political organization that carried New York for Andrew Jackson and the Democratic Party in 1828. Despite scandals and internal divisions in the 1830s and beyond, by mid-century Tammany Hall was well on its way to becoming one of the most formidable political machines in American history.

SOCIETY OF THE CINCINNATI In May 1783 officers of the Continental Army, led by Henry Knox and Frederick von Steuben, created a veterans organization named the Society of the Cincinnati, after Lucius Quinctius Cincinnatus, the legendary general and patriot who led the Roman army to victory, then returned to his farm. Their aim was not only to preserve the fraternal bonds between the officers, but also to pursue their common interest in outstanding pay and pensions during peacetime. George Washington, while uninvolved with the society's formation, agreed to serve as its president. Soon, the Cincinnati numbered over two thousand members, including many prominent figures such as Alexander Hamilton, George Clinton, and James Monroe.

The society was open to all officers of the Continental Army who had served for three years or, regardless of length of service, to those who had served to the war's conclusion or had been rendered supernumerary. It also offered hereditary membership from father to eldest male offspring. The original charter provided for a general society with annual

meetings in Philadelphia and thirteen state societies with local chapters. It also permitted membership for selected officers of the allied French army and navy, who soon formed a French society of their own. Furthermore, the society provided for a charitable fund, honorary memberships, and a commemorative medal, which Peter Charles L'Enfant changed into a bald eagle decoration to be worn.

The society proved highly controversial. In *Considerations on the Society or Order of Cincinnati* (1783), Aedanus Burke of South Carolina denounced the Cincinnati as a nascent hereditary nobility that would inevitably subvert the American Republic and possibly establish a corrupt monarchy. Burke's pamphlet was spread nationwide, and soon others joined in the outcry. John Adams despaired that nobility would replace republicanism in America, Elbridge Gerry feared the Cincinnati would rule the nation covertly, Thomas Jefferson urged Washington to separate himself from the organization, Stephen Higginson feared that the society was a tool of the French, and Benjamin Franklin mocked the officers for mimicking European nobility. Congress declared that the Cincinnati was not an official knightly order of the United States.

The Cincinnati were not even a political faction, much less an aristocratic conspiracy, yet they had to react. Washington persuaded the general society in 1784 to propose a reform dropping hereditary membership and other controversial features. This revised charter was well publicized and did much to muffle criticism, but it was never ratified. Only a few state societies endorsed the reform, others insisted on retaining hereditary membership. Consequently, largely unnoticed by the public, the revised charter never took effect. Still, the general society practically ceased to function in the following years, and in subsequent decades several state societies withered. The Cincinnati came close to vanishing, but revived in the late nineteenth century. At the start of the twenty-first century, the general society, the thirteen state societies, and the French society are alive and well, the oldest of American patriotic societies.

At times the anti-Cincinnati rhetoric, which was especially widespread between 1783 and 1785 but persisted sporadically until 1790, verged on conspiracy theory. It resembled the anti-Illuminati hysteria of the late 1790s and the anti-Masonic movement of the 1820s. Why did one part of the Revolutionary leadership effectively accuse another of anti-republican subversion? The answer lies in the difficult situation of the mid-1780s, when it often seemed that America had won the war but might lose

the peace. For American politicians who had been reared on radical Whig ideology and thus had learned to distrust concentrated power, the machinations of ambitious men, and all things military, the society seemed a threat to the Republic. The members of the Cincinnati, while innocent of the crimes they were accused of, had made themselves vulnerable by adopting the unegalitarian principle of heredity.

As the young American Republic stabilized, the most dire accusations against the Cincinnati faded. By the 1790s, many Democratic Republicans, including historian Mercy Otis Warren, continued to associate the largely unpolitical society with conservative Federalist politics. However, the controversy never regained its old strength.

SOLDIERS From colonial times through the nineteenth century, the colonies and later the United States usually eschewed creating large formations of regular soldiers to engage in wars and skirmishes. This was due, in large part, to historical antipathy toward the expense and to fear of maintaining a regular standing army.

COLONIAL MILITARY UNITS

As a result, three early types of units were organized for both defensive and offensive colonial military operations: local militia, provincial units, and rangers. During the French and Indian War (1754–1763), the colonies supplemented the regular royal regiments sent to North America with these types of troops. The militia and provincial soldiers, with the notable exception of a ranger force established by Robert

Rogers of New Hampshire, did not enjoy an especially high reputation with the regular British military establishment. However, historical scholarship has demonstrated that the colonial militia was an effective defense against Native American or local military threats on a variety of occasions.

The standard militia laws of nearly every colony required all able-bodied adult white males between ages sixteen to sixty to serve in the militia. (In most colonies, the laws made it illegal for slaves, indentured servants, and Native Americans to serve as part of any militia organization.) They allowed some conspicuous exemptions from service for community members deemed critical to the economic health of

the locality, such as political leaders, judges, bakers, and millers. The militia usually trained in a formal session at least once a month, with each man providing his own weapon, powder, and shot. They were paid from local treasuries for their training time and were sent, if ordered by the colonial governor, on campaigns that usually did not extend beyond a single season. In reality, they were best suited for local defense for periods of short duration.

However, ranger forces, such as that of Rogers’ Rangers, were paid on a full-time basis. Rogers trained his rangers in the tactics and style of Native Americans, fighting in loose formation; he also adapted their dress and weaponry for woodland

fighting. Rangers could operate in austere wilderness conditions for extended periods of time, a tradition continued by modern U.S. Army Rangers and Green Berets. While colonial rangers proved to be effective against the hit-and-run style of their Native American opponents, they were very expensive to maintain on a long-term basis; therefore, most colonies opted to rely on their own local militia.

Of the three types of units, provincial forces had the worst reputation for discipline, morale, and battlefield effectiveness during the colonial era. They were usually recruited from the lowest rungs of society and were essentially contracted for a specific period of service or campaign duration. Most had only rudimentary training in the use of their weapons and in military drill. In order to attract men to such dangerous service, colonial officials usually offered enlistment bounties and promised to clothe and feed these provincial soldiers for the duration of their service. When these promises failed to materialize, many of these soldiers deserted.

CONTINENTAL ARMY

During the first year of the American Revolution, the colonies relied nearly entirely on local New England militia forces. However, it soon became apparent, after a disastrous winter campaign to seize Canada, that the lax discipline and irregular military habits of part-time soldiers would no longer do and that well-trained, long-termed, disciplined soldiers were now necessary. Commanded by General George Washington, Congress created a Continental Army of eighty-eight battalions. Each state was given a quota based on its prewar white adult male population. All the states failed to meet their quota for Continental troops, forcing Washington constantly to harangue state governors for augmentation of the Continental Army with state militia units, which were usually available for only very short durations of service.

In return for their agreement to serve faithfully and continuously for three years (or the duration of the war), Continental recruits were initially given an enlistment bounty of approximately \$20, promised an annual suit of clothes (a uniform, shoes, and a blanket), and a specified ration of three daily meals in addition to a monthly salary of about \$6.67. Many men formed informal "messes" and combined their rations in order to barter for supplements to their bland and meager daily diets. A typical soldier's mess consisted of anywhere from four to eight soldiers who would share just about everything they had in camp. As the war lengthened and inflation robbed soldiers of the value of their bounties and sal-

aries, the difficulty of finding agreeable recruits increased and enlistment bounties being offered for both Continental and state service skyrocketed. Life in Continental Army camps like those at Valley Forge, Pennsylvania, and Morristown, New Jersey, proved to be especially arduous. Frequently lacking adequate shelter, clothing, and food, the soldiers were known to have suffered from great privation and desertion. Occasionally, Continental Army command even had to contend with mutiny.

Following the Revolution and indeed throughout much of the nineteenth century, the United States continued its traditional policy of maintaining a miniscule regular army establishment, and the federal government called for state militia and volunteer augmentation only during times of national emergency or to fight local Native American wars. However, these units began to be augmented by state "volunteer" units that were clothed and equipped by either the state or federal government. Regular soldiers still served for lengthier periods of service than state regiments or militia units, were furnished a monthly salary, and were provided with an agreed-upon ration and regular replacements of military uniforms.

A typical day in the life of a soldier in camp during this era consisted of reveille in the morning, followed by camp police details (cleaning), breakfast, morning guard mount (where soldiers detailed to guard posts received their assignments, usually for a period of twenty-four hours) for some and drill for everyone else, dinner (in the afternoon), more drill and other details, supper and evening "tattoo." Life on the march during wartime was more arduous. During the War of 1812 (1812–1815), Captain Henry Brush noted that soldiers were given "unbleached, tow-linen hunting shirts and trousers. On their heads they wore low-crowned hats, on the left side of which were black cockades about two inches in diameter." Each soldier carried a musket, bayonet, a cartridge box, a knapsack, and a "quart-sized tin canteen." The knapsack and blanket were covered with an oilcloth to protect them from rain. "A soldier's arms and pack weighed about 35 pounds, and troops traveled about 25 miles a day on foot." Despite official attempts to standardize army clothing and equipment, most soldiers modified their outfits as they saw fit. Militia units were the most notorious for this practice and arrived at the Battle of New Orleans (1815) wearing a wide variety of apparel and carrying equally diverse weaponry.

The practice of combining regular federal, state militia, and volunteer units for military service dur-

ing wars and emergencies and using small numbers of regular forces as constabulary units on the American frontier between wars continued until the end of the nineteenth century. It was not until nearly the beginning of World War I that this hodgepodge system was eschewed in favor of a more professional and “regular” standing military force.

events would mythologize them as the original revolutionaries, their goals were far from radical, seeking only to convince the British to restore the imperial Constitution. The Sons' methods of mobilizing protest, including the participation of many diverse socioeconomic groups, the development of effective propaganda and communication networks, and a concern for restraining violence and wanton destruction, would become the formula for the movement leading up to the Revolution.

Beginning in the summer of 1765, groups that identified themselves as the Sons of Liberty appeared in several American cities, including Boston, New York, Providence, Newport, Baltimore, Philadelphia, Norfolk, and Charlestown. In many cities the Sons of Liberty grew out of established urban clubs and societies, most famously the Loyal Nine in Boston. As these organizations became known as the Sons, they also broadened their social bases to include politicized artisans, shopkeepers, and tradesmen. During the Stamp Act riots, the Sons made alliances with mob leaders like Ebenezer McIntosh, leader of Boston's South End gang, for the dual purpose of mobilizing mass resistance and keeping their own participation hidden. Perhaps the most important constituency in the Sons, however, was newspaper printers. Printers Benjamin Edes (*Boston Gazette*), William Goddard (*Providence Gazette*), Samuel Hall (*Newport Mercury*), and William Bradford (*Pennsylvania Journal*) were all members of their local Sons of Liberty; the printers' participation ensured that the Sons' message would reach a wide audience.

Although attention has generally focused on the role of the Sons in Boston's Stamp Act riots, the attempts of Isaac Sears, John Lamb, and the New York Sons of Liberty to organize intercolonial communication networks were also significant. Beginning in November 1765, the New York Sons sent representatives to chapters in Connecticut, Pennsylvania, New Hampshire, and Massachusetts proposing alliances and establishing avenues to share information. Although short-lived, the importance of this initial effort by the New York Sons to make connections with colleagues in other colonies would later become clear: it was a first step toward continental unity and the creation of a common cause.

The Sons of Liberty movement declined after Parliament repealed the Stamp Act in March 1766. Having achieved their goal, many groups, including the pivotal New York Sons, saw no need to continue resistance. Devoted to maintaining order and restoring “balance” to the British Constitution, the Sons were not yet revolutionaries. Still, they did not com-

SONS OF LIBERTY The Sons of Liberty were the first broad-based, intercolonial organization to encourage American resistance to Britain. Emerging suddenly during the latter half of 1765, chapters of the Sons of Liberty formed throughout the American colonies for the singular purpose of forcing Parliament to repeal the Stamp Act. Although future

pletely disappear. The Boston Sons remained intact; in fact, by the late 1760s its membership had evolved from its artisan roots to include many elite leaders, including Samuel Adams, John Hancock, James Otis, Joseph Warren, and John Adams. In 1768 the Boston Sons began corresponding with John Wilkes, a popular English radical whose political persecution made him a celebrity in America.

By the 1770s, however, the term *Sons of Liberty* had lost its specific meaning. Instead, it became a general label like *patriot* or *Whig* that referred to a supporter of American rights. Symbolic for its reference to one of the clearest successes of American resistance, the label did resurface at certain points during the imperial crisis, most importantly as the name of the group responsible for the Boston Tea Party in 1773.

The Sons of Liberty movement of 1765–1766 would become a model for future American protests against the British. Later organizations would follow the Sons' strategies of focusing political energy, loudly broadcasting grievances, restraining violence, establishing communication networks between the colonies, and mobilizing broad groups of people to support the common cause.

CLIMATE, TOPOGRAPHY, SOIL, AND CROPS

“Let us begin by discussing the weather,” wrote the eminent southern historian, Ulrich B. Phillips, as the first words of the best-known book on the South, “for that has been the chief agency in making the South distinctive.” Certainly, the South’s sultry climate has always set it apart from the rest of the nation. Lying roughly between thirty-nine and thirty degrees north latitude (thus covering some five hundred miles from north to south) aside from Florida, the summer temperatures in much of the South stay consistently over ninety degrees during the summer months, with nearly 90 percent relative humidity in the Lower South states. While the border area receives nearly the same amount of precipitation—twenty-four inches—as the southern Piedmont during the warm seasons, it receives between ten and fifteen inches less precipitation, so vital to most staple crops, than do most of the Deep South states in their warm seasons. Conversely, the South’s winters vary more widely in degree: while the Upper South has at best two hundred frost-free growing days per year (even less west of the Appalachians, which shelters Virginia and Maryland from the driving cold fronts that chill the Middle Border subregion), the Deep South boasts some forty or fifty more than that, allowing the Deep South states an extra six growing weeks or more between the last killing frosts in spring and first killing frosts in the fall. The average minimum temperature in the Upper South is as much as thirty degrees colder than in much of the Lower South (even more than in the coastal Sea Islands area and Florida), meaning nearly twenty more inches of frost penetration into the soil. Although western migrants who began moving to the border states as early as the 1770s may have attempted to replicate or even better the society of their former homes, the distinctive climate of the Upper South forced adaptations upon the social landscape.

The South’s topography varies as widely as its climate, and it influenced migratory patterns that resulted in distinct intraregional cultures. The Appalachian Mountains slash southward through the easternmost southern states, forming a barrier of sorts between the Atlantic seaboard and the country further west that influenced migratory patterns. Settlers who moved westward from the Upper Chesapeake along with those from the mid-Atlantic states most often used the Ohio River for westward transportation, settling predominantly in the border regions of Kentucky and Missouri and creating a cultural admixture of northern and southern influences. Settlers from southwestern Virginia and North Carolina more often traveled through the

SOUTH A southern migration, commencing during the American Revolution and producing six states (Kentucky, Tennessee, Louisiana, Mississippi, Alabama, and Missouri) by 1821, led to great changes in the westernmost parts of the southern United States. The result was the growth of not one South, but a set of discrete subregions.

Cumberland Gap, settling Tennessee and central and southern Kentucky, while settlers from South Carolina and Georgia avoided the mountains completely by migrating to the Gulf States. The Appalachians themselves, along with the Ozarks, became a destination for later settlers, often Scots-Irish, who set up distinctive and often isolated communities separated by mountain valleys. The Lower Mississippi Valley was a place apart from the rest of the South, largely as a result of its French and Spanish heritage (the area did not become a part of the United States until 1803), but this Latin South had a slave population that was far more Africanized in the nineteenth century than in other parts of the South.

The South's soils vary widely as well: rich loess in the Missouri and Ohio River valleys; rich alluvial soil in the Mississippi Delta; flinty limestone in the Appalachian and Ozark Mountain highlands; sandy loam in the Tidewater and coastal lowlands; and distinctive red clay in the Appalachian Piedmont. While soil did not in itself influence the resulting economy as much as did climate, the thin soils of the mountain and sand-hill areas proved less capable of producing the staple crops that characterized large subregions of the South. Those crops, in many historians' estimation, and more specifically the cultures that evolved from their prolonged production, gave the South its most distinctive character. Tobacco, colonial North America's first export crop, dominated in southern Maryland, Virginia, Delaware, North Carolina, Kentucky, and Missouri, ultimately sharing preeminence there with hemp as well as wheat, the latter of which by the 1820s had replaced tobacco as the subregion's largest export crop. Farther south, rice dominated the South Carolina and Georgia low country, while sugar reigned over much of lower Louisiana. Cotton, which became the South's signature cash crop after 1810, extended through the Piedmont plantation belt and between the too-cool tobacco belt and the too-wet rice and sugar belts, extending westward by 1830 into the Old Southwest. Needing 180 growing days, and with cultivation periods that complemented those for food crops such as corn (thus maximizing labor efficiency), cotton had by the 1820s already become the nation's leading export, earning it the designation King Cotton. Remarkably, the output of cotton doubled every decade after 1800, the largest growth rate of any agricultural commodity in the nation; by 1830, southern cotton constituted two-thirds of the value of the nation's exported commodities.

MANUFACTURING AND CITIES

Though more agricultural in nature than much of the North, the South developed its own manufacturing base, one that illustrated the stark differences between the Border and Upper Souths on the one hand and the Lower South on the other. Eighty percent of the South's manufacturing capacity lay in the Border South. The industrial growth of the Border South drove urbanization and stimulated the growth of the area's population. By 1830, three of the South's five largest cities—Baltimore, St. Louis, and Richmond—lay in the Border and Upper Souths, their populations eclipsing all other southern cities save New Orleans and Charleston. Their trade networks extended northward and eastward by rail lines far more than by any traditional river or ocean links with the Lower South and Europe. Some 45 percent of the South's population lived in the Border States alone.

RELIGION

The South's religious heritage profoundly influenced its distinctive culture away from the cultures that characterized the northern states. Nowhere was this more evident than in the intense revivals that erupted throughout the region, especially in the Border and Upper Souths, at the outset of the nineteenth century, reshaping these subregions' religious contours and helping to develop their unique character. Where the Great Awakening of the early eighteenth century had introduced a class-based evangelicalism that replaced the Baptist and Methodist sects as egalitarian alternatives to the elitism of the Anglican church in Virginia, the Revolutionary era and its aftermath empowered them (along with Presbyterians) as denominations throughout the South. The rapid rise of the western states and the proliferation of a slave-based, staple crop economy soon brought on personal uncertainties about material advancement just as rampant secularism caused church attendance to decline precipitously. Initially suspect, itinerant ministers soon softened their condemnations of such "declension" as they sought communicants. Meanwhile, western settlers, and especially women, were seeking relief from the burdens and vicissitudes of frontier life. What resulted was a series of revivals that swept the Border and Upper Souths over several decades, the largest of which occurred at Cane Ridge, Kentucky, in August 1801, when some twenty thousand persons assembled for an immense outdoor, interdenominational camp meeting marked by emotional preaching and mass conversions. This religious fervor soon spread and swelled the congregations of the evangelical churches throughout the entire South as they eagerly reached out to black and

white, male and female converts. Ironically, evangelical religion set down the rhythms of southern religious culture just as it linked the new subregions of the South with the older seaboard states and helped to distinguish all of them from the culture of the North.

SLAVERY

Above all other regional aspects, and in tandem with the development of the staple crop economy, slavery shaped the South's distinctiveness from other regions of the country. Yet the "peculiar institution" also magnified the South's intraregional variances. Between 1790 and 1830, as the South's overall white population nearly tripled from 1.3 million to 3.7 million, its slave population kept pace, increasing from 675,000 to more than two million. As the Border and Upper Souths' transition from staple crops to food crops and industry changed their economic bases, so the population density of slaves shifted southward. Where in 1790 slaves comprised one-third of the Upper and Border Souths' populations (including the District of Columbia), by 1830 that figure had fallen to 30 percent; meanwhile, the Lower South's slave population increased from 41 percent of the subregion's whole to more than 47 percent. The proportion was lowest in the Border and mountain Souths, where but 14 percent and less than 5 percent of their overall populations, respectively, were bondpeople. Though it boasted only a quarter of the South's white population in 1830, slaves in the Lower South comprised 47 percent of its states' populations; in some coastal areas, slaves constituted as much as 90 percent of the residents. Facilitated by the internal slave trade, which would move some half-million slaves southwestward from the Border and Upper Souths, and the economic transitions underway in those subregions, the South was fast becoming a region comprised of white belts and black belts, with the blackest belts in the Lower South, the Mississippi Valley, and the Tidewater area of Virginia (where slavery had begun in the early seventeenth century).

Subregional variation. Although slaves labored in the South's factories, on its docks, and in its fashionable homes, agricultural labor chained some 90 percent of its bondpeople to the southern countryside. The Lower, Upper, and Border Souths had remarkably different slave cultures, depending on their staple crops. The dependency on slavery varied greatly, distinguishing the regions, as the historian Ira Berlin has argued, as being either slave societies or a societies with slaves. The Lower South was clearly a slave

society. Its plantations often encompassed thousands of acres and held as many as a hundred slaves each, often working in gangs (especially on cotton plantations) and living apart from their owners' homes in discrete, concentrated slave quarters. Conversely, in the Upper and Border Souths, plantations and farms (as they were invariably referred to west of the mountains) were often smaller and boasted far fewer slaves, who commonly worked side by side with masters and hired white workers in the fields, even living in their masters' homesteads.

Slavery and power. Slaveholding created a unique culture of power in the South. Planters, or those who owned substantial holdings of land and slaves, dominated the economy and the society of the region. Many were sons and grandsons of men in the colonial era who had made substantial beginnings on the family position and fortunes by way of staple production as well as, especially in the Upper South, mercantile and banking activities. Always few in number, such planters held disproportionate shares of political and economic influence, especially in the Lower South and the Tidewater, and zealously protected them through intermarriage with other gentry families and by largesse offered to the white lower classes. Below the planters were the yeomanry, independent landholders and small slaveholders who sought upward mobility but who clung doggedly to their hard-won freehold status, even above slave ownership. Most numerous among the populations of the Upper and Border Souths, these yeomen acceded to the local planters' political dominance in part for the economic advantages the latter afforded them in return, but more as a check against those below them in their respective subregions, namely restless and landless poor whites and black slaves. Indeed, the South's most notorious (and by the 1830s regionally distinct) cultural ritual—the duel—not only reflected all of these social constructs of power (patriarchy, class status, masculinity, personal honor, clannishness, and violence) but was itself dying out in all but the Lower South.

After the colonial period, few class upheavals occurred in the South, in contrast to the North, where they grew more common. Historians generally explain this phenomenon as a product of the South's "herrenvolk democracy," which guaranteed white men equal access to political participation (especially after the decline of property requirements in the 1820s) while excluding African Americans, free and slave, from the rights of full citizenship. This entire social system, based upon deference, patriarchy, reciprocal rights, obligations, coercive violence, and

perhaps above all racial hierarchy and chattel slavery, sustained the South uncomfortably as it matured in the years of the early Republic.

SECTIONALISM

The last decade of the early national period witnessed the emergence of national and even intraregional divisions that would soon come to be characterized as “sectionalism.” As the nation reeled from its first national economic downturn beginning in 1819 (and felt particularly by cotton-growing states like South Carolina, where the Panic of 1919 severely depressed cotton prices), the congressional debate of 1819–1820 over Missouri statehood revealed that national politics had begun to sectionalize over the issue of slavery. In 1822 South Carolina was shocked by the discovery of a widespread rebellion planned by Charleston slaves and led by a literate free black named Denmark Vesey. The plot was aborted and during subsequent trials, testimony implicated northern antislavery politicians as having influenced Vesey by way of printed speeches. An “Old Republican” states’ rights political stance was articulated by leading Virginians such as John Randolph. They sought to curb the nationalizing tendencies of the Virginia Dynasty—presidents from Thomas Jefferson to James Monroe as well as Supreme Court chief justice John Marshall—which had strengthened the power of the national government, presumably at the expense of the states and, more specifically, the southern states. Like the members of that dynasty, Andrew Jackson of Tennessee and Henry Clay of Kentucky stood as conflicting symbols to southerners. They were at once large slaveholders and “southern” leaders, but they were also principled advocates of a nationalism that seemed to ignore states’ rights principles. The Tariff of 1816, decried by southerners as favoring northern industries at the expense of southern exporters, provided a powerful and enduring symbol for southern anger. In 1828, when Congress raised the tariff to its highest level yet (earning for it the southern epithet “Tariff of Abominations”), John C. Calhoun of South Carolina, Jackson’s vice president, secretly authored a sectional response. His *South Carolina Exposition and Protest* reinvigorated the doctrine of states’ rights (originally articulated by Jefferson and Madison in their Kentucky and Virginia Resolutions [1798]) by offering a mechanism through which a state could check federal power: conventions that would “nullify” within their states’ borders any harmful actions by the federal government. Although white southerners had not yet fashioned strong polemical defenses of slavery such as those that would emerge immediately after 1830,

political and social events during the last decade of the early national period shaped the emerging proslavery ideology that would ultimately most characterize the South as a distinct region.

SOUTH CAROLINA From 1754 to 1829, South Carolina evolved from a politically divided colony to a state united in defense of slavery. During the seventeenth and early eighteenth centuries, South Carolina grew slowly, with black slaves outnumbering white inhabitants: in 1761 around fifty-seven thousand blacks lived in the colony, compared to thirty thousand whites. Slavery was strongest in the low country and Charleston, the state’s only significant city; only 4 percent of slaves lived in the backcountry (defined in the eighteenth century as beginning fifty miles inland). During the 1770s, white farmers from Virginia and Pennsylvania began to move south and settle in the backcountry districts of South Carolina. By the 1770s the colony’s total population was around 180,000. But low country planters, worried that new residents in the backcountry were not sufficiently concerned about protecting slavery, retained political control. It would take a radical shift in the distribution of slave ownership before low country leaders were willing to share power.

For their part, backcountry residents chafed at the political power of the low country elites. While

numerous parishes (election districts for the Commons House of Assembly) served the small white population of the low country, only one—created in 1757—served the backcountry. Since the parishes provided, in addition to legislative representation, the services of local government, the result was a lack of order in the backcountry. One source of conflict was a general lawlessness that went unchecked given the lack of law enforcement personnel and courts. Another source of conflict was the Cherokees on the northwestern frontier. In October 1767, Regulator groups sprang up to provide order where the royal government did not; they demanded that courts, jails, and schools be provided. Although Regulators were an extralegal force, they were largely small planters and property owners, not vagrant thugs. Regulators remained strong until the low country power structure began to make concessions to the movement, deflating the Regulators' power. In 1768 two additional parishes were established in the backcountry, and courts and jails were established by the Circuit Court Act of 1769.

It was in this context that South Carolina entered the Revolutionary War, which had the feeling of a civil war in the backcountry. After the Declaration of Independence, an armed force had to be sent to subdue Loyalists there. Backcountry residents also battled the Cherokees in a war that concluded in 1777 with the latter ceding their land in the state. In 1780 the British laid siege to Charleston, which signaled the initiation of sustained southern hostilities in the war. The city fell on 12 May 1780, but the British were unable to capitalize on their success. British tactics in the countryside, exemplified by the ruthless Banastre Tarleton, added to the popular support for Patriot partisans led by men such as Francis Marion and Thomas Sumter. The British could not root out the partisans or destroy General Nathanael Greene's Continental Army, and so they withdrew from the state in December 1782. The intense fighting across the state left it in economic ruin.

South Carolina's Charles Pinckney was a leading critic of the Articles of Confederation, and when the Constitutional Convention met in 1787, he played a major role in designing the new document. Pinckney and his cousin and fellow delegate, Charles Cotesworth Pinckney, helped insure that slavery was protected in the Constitution. Many of Charles Pinckney's proposals, such as counting slaves as three-fifths of a person for the purposes of apportioning representatives in the federal legislature, were adopted by the convention. Although some in the South Carolina backcountry opposed the new Constitution,

South Carolina's ratification of the document was never in doubt, thanks to a power structure that still privileged the low country. The ratification convention overwhelmingly approved the document in May 1788.

With war and independence decided, South Carolinians focused again on political conflict between backcountry and low country. A redistribution of the slave population helped bring about political changes in South Carolina. Slaves were rapidly being brought to the area north of the fall line as backcountry farmers began adapting to cotton production; whereas only 14,415 slaves lived in this area in 1790, 43,578 did in 1810. The integration of the backcountry into the plantation economy and the rapid growth of slavery in the area finally made low country elites comfortable with extending political power to the remainder of the state. In 1785 county courts were created to help establish legal structure in the backcountry. The following year, the General Assembly moved the state's capital from Charleston to the middle of the state in the new city of Columbia. The compromise of 1808, a constitutional amendment, apportioned the state's house of representatives on the basis of population and wealth, finally bringing more equitable representation to the backcountry. The state's population reached 249,073 in 1790, 345,591 in 1800, 415,115 in 1810, 502,741 in 1820, and 581,185 in 1830.

This period also saw the Denmark Vesey plot, which garnered a swift response from the state. In May 1822, a slave exposed the plot to his master: a free black, Denmark Vesey, supposedly intended to lead an army of thousands of slaves against the whites of Charleston. The city council responded with a series of trials that resulted in the hanging or expulsion of dozens of slaves. The state also passed an act that December making it illegal for free black seamen to associate with slaves, and the African Methodist Episcopal Church in Charleston was demolished.

Events in 1828 brought South Carolina to the center of the national stage: native sons Andrew Jackson and John C. Calhoun were elevated to the presidency and vice presidency, respectively, and Congress passed the "Tariff of Abominations," which sparked the state's nullification movement. Although South Carolina's attempt to nullify federal law ultimately failed, it laid the groundwork for South Carolina's eventual departure from the Union in 1860.

SPAIN Charles III came to the throne of Spain in 1759 as its third Bourbon monarch. Under his enlightened reign Spain experienced growth by almost every measure of national success. His death in 1788, however, brought an abrupt end to this era of expansion and prosperity. The reign of Charles IV, who ruled from 1788 until 1808, was marred by a series of governmental blunders, incompetent ministers, and the successful efforts of Napoleon to assume control of his neighbor to the south. By the time Charles III's equally incompetent grandson, Ferdinand VII, came to the throne in 1808, Spain was in serious decline. Under Charles IV and Ferdinand VII, Spain lacked the political, military, or diplomatic means to block Anglo-American expansion into the Spanish Borderlands of North America during the late eighteenth and early nineteenth centuries.

THE REIGN OF CHARLES III (1759–1788)

Charles III assumed the Spanish throne during the initial stages of the Seven Years' War (1756–1763) in Europe. Spain entered the war during the final year of fighting; militarily Spain did not fare well. The loss of Havana to the British in January of 1762 brought Spain to the peace table in Paris as a defeated nation anxious both to regain its major Cuban port and also to distance its future foreign policy from that of France. Charles III accomplished both tasks at the Peace of Paris in 1763, where he gained France's

Louisiana colony while ceding Spanish Florida to the British. With peace restored, Charles III surrounded himself with a talented group of ministers and advisors, all of whom were university-educated adherents of the Spanish enlightenment. They embarked on an ambitious program of urban renewal, educational development, the revision of taxation, a reorganization of the military, and the implementation of free-trade regulations throughout the Spanish empire. They also began to formulate a foreign policy that would be more independent from that of their long-standing ally, France.

The international crisis precipitated by the American Revolution became a major diplomatic concern for Charles III and his ministers. The Spanish government adopted an official policy of neutrality while issuing secret instructions to Spanish military commanders in Cuba and Louisiana to provide covert assistance to the rebels. Spain instructed a wealthy Bilbao merchant, Diego de Gardoqui, to create a fictitious merchant house that would serve as a secret conduit for military supplies and munitions to the Continental Army; much of these supplies eventually passed through Havana or New Orleans. Spain did not wish to enter the conflict until it had fully prepared its New World forces. At the same time, ministers at Madrid already worried at this relatively early date about the territorial pressures the infant United States might bring to bear on the lower Mississippi Valley and Gulf Coast. Finally, during the summer of 1779 Spain entered the war but did not sign a treaty of alliance with the Continental Congress. The Spanish court sent Juan de Miralles to Philadelphia as an unofficial envoy. The Congress appointed New Yorker John Jay to represent the interests of the United States at Madrid. Jay, who arrived in Spain during 1780, was never fully accepted by the Spanish government and accomplished little of diplomatic import. Spain's entry in the war did provide an opportunity for Bernardo de Gálvez, the governor of Spanish Louisiana, to achieve a series of important victories. His armies took the entire lower Mississippi Valley and northern Gulf Coast in a series of daring campaigns between 1779 and the Battle of Pensacola in May 1781.

The Peace of Paris in 1763 favored Spanish interests. Charles III regained possession of Florida while the Mississippi River became the western boundary of the United States, with the City of New Orleans remaining under Spanish control. The treaties, however, did not adequately define the southern boundary of the United States. Spain believed the boundary fell north of Natchez on the Mississippi, whereas the

United States thought it fell much farther south. This proved to be a long-standing point of diplomatic contention between the two nations. Diego de Gardoqui arrived in the United States two years after the Peace of Paris as Spain's fully accredited chargé d'affaires. Gardoqui worried about the western movement of frontier settlers from the United States, in the process employing the concept of "defensive colonization" for Spanish territory west of the Mississippi. He invited English-speaking American land agents to organize settlements of people from the United States, who would take loyalty oaths to the Spanish king in exchange for land. George Morgan was the first of these agents, founding the settlement at New Madrid south of St. Louis.

THE REIGN OF CHARLES IV (1788–1808)

The ascension of Charles IV to the throne marked a drastic change in the fortunes of Spain and its monarchy. Unlike his father, the new king was an inept, incompetent, and indolent individual with few, if any, qualities of leadership. His wife, Queen Maria Luisa, proved to be strong-willed and opinionated, an activist who constantly meddled in affairs of state. Charles IV inherited several of his father's most accomplished ministers; after a few years of frustration, they left their offices as an unlikely successor, Manuel de Godoy, became the king's chief minister and major advisor. A dashing young army officer, Godoy had caught the eye of Queen Maria Luisa and reputedly became her lover. With her support and powerful royal patronage, he advanced rapidly at court, becoming chief minister while still in his early twenties. Godoy presided over Spain's reaction to the French Revolution. Most Spaniards at court, including Godoy, naturally worried about the spread of French republicanism to Spain. These distractions created a favorable atmosphere for the United States to negotiate a treaty with Spain to resolve the disputed Florida boundary and secure free navigation of the Mississippi River. Godoy accordingly signed the Treaty of San Lorenzo on 27 October 1795 with American envoy Thomas Pinckney, an accord known in United States history as Pinckney's Treaty. This agreement set the northern boundary of Florida at the thirty-first degree of latitude and gave United States citizens free navigation of the Mississippi.

The rise of Napoleon presented Spain with serious foreign policy problems, which Godoy resolved by signing the Treaty of San Ildefonso with France in 1796. By this accord, Spain rejoined its Bourbon neighbor as a diplomatic and military ally. This strategy proved to be a disaster for Spain and the be-

ginning of the end of its international power. In 1803 Napoleon bargained Louisiana away to the United States; although Spain strongly disagreed with this transfer, it was powerless to stop it. In the wake of the Louisiana Purchase, a circle of discontents that had formed at court around Crown Prince Ferdinand sought to place the younger Bourbon on the throne. A palace coup in March 1808 resulted in the indolent king's abdicating to his son, who became Ferdinand VII.

THE REIGN OF FERDINAND VII (1808–1833)

The new king had little chance to establish himself before Napoleon summoned both him and his father to France. Napoleon compelled Ferdinand VII to abdicate the throne of Spain as well. Both former monarchs found themselves under arrest while Napoleon declared his own brother, Joseph Bonaparte, to be the new king of Spain, José I. Many Spaniards immediately greeted their new French king as a pretender, launching the Spanish War of Independence, or the Peninsular War as the British styled it. The country split into regional factions while José I and his French-backed army controlled major urban centers. Napoleon temporarily appeared in Spain during 1809 in an unsuccessful effort to bring order to the situation. This resulted in a British intervention, with the duke of Wellington leading a British army in support of Spanish resistance to French intervention. Battles fought at Talavera and Victoria marked major French defeats at the hands of the British army.

A government in support of the exiled Ferdinand VII eventually appeared at Cadiz in 1812. Known as the Cortes de Cadiz, this government wrote a new constitution for Spain that retained the monarchy but promised some reforms. The disarray of the Peninsular War guaranteed that Spain could not sufficiently protect its American colonies, especially those bordering on the United States. Between 1810 and 1814, Americans made several attempts to take Spanish territory along the lower Mississippi and Gulf Coast. The West Florida Revolt of 1810 and the intervention of the United States Army at Mobile in 1813 successfully brought these areas under American control. The unsuccessful Patriot War in East Florida during 1812 and 1813 was a similar incursion. The Cortes de Cadiz did dispatch a diplomat, Luis de Onís, to the United States as its representative to protest these occurrences. President James Madison, however, refused to extend diplomatic recognition to Onís because he was not the envoy of an accredited government, which in theory still rested

with the exiled monarch Ferdinand. Onís nonetheless remained in Washington, where he unofficially spoke for Spain and provided his government with much information about events in the United States. The Spanish diplomat finally received recognition when Ferdinand VII returned to Spain after the abdication of Napoleon in 1814. Onís thereafter continued vigorously to protest events in Florida but also began to believe that Spain might profit from negotiating a treaty definitively defining a boundary between the United States and Spain's North American colonies. The Spanish envoy's views caught the attention of John Quincy Adams, whom James Madison named as his secretary of state after his election to the presidency in 1817. Onís and Adams entered into informal discussions, which soon accelerated. The following year, Adams and Onís signed the Transcontinental Treaty giving both East and West Florida to the United States while drawing a boundary line across the entire continent. Onís returned to Spain, where he worked diligently to win ratification of this treaty by the government of Ferdinand VII, an approval that eventually came in 1821.

The resolution of Spain's boundary problems with the United States constituted the least of its international concerns during the ten years following the Peninsular War. The restoration of the monarchy, upon Ferdinand's return to Spain in 1814, did not go smoothly. Once home, the king rejected the liberal reforms of the Cortes de Cadiz and ruled as an absolute monarch. This disgusted many of his former supporters, including many Creoles in Spain's New World colonies. The restoration of the monarchy under such circumstances inflamed the colonial independence movement, which had already begun to fester for a variety of reasons. Already in 1810 a Mexican priest had launched an unsuccessful coup against the royal government in that colony. The movement for independence spread rapidly throughout the Spanish Indies. The early 1820s saw the loss of every important Spanish colony located on the mainland of North and South America. For a short while at the start of the decade, a group of European nations known as the Holy Alliance, composed of conservative monarchs in Europe, including the czar of Russia and the king of Prussia, contemplated sending an expedition to the Spanish Indies for the purpose of restoring Spanish colonial rule. The Monroe Doctrine, however, put Europe on notice that the Americas remained closed to further colonization. Hence, by 1825 the Spanish colonial era in the Western Hemisphere had essentially come to an end, as only a few small possessions (especially Cuba) remained in the hands of the weak Ferdinand VII, who

would reign until 1833. Thereafter, the independent successors to Spain in the Americas, especially contiguous Mexico, continued to deal with the United States and its westward expansion.

SPANISH BORDERLANDS The historian Herbert Eugene Bolton coined the term "Spanish borderlands" in his 1921 book of that title. The Spanish borderland colonies included Florida, the northern Gulf Coast, Spanish Louisiana, Texas, New Mexico, present-day Arizona, and California, along with the northern provinces of Mexico that bordered them. Borderlands historians examine these provinces from a Hispanic viewpoint as the "other" colonial history crucial to understanding national development. The Spanish borderlands are customarily divided into two geographic areas: the eastern and western borderlands. The eastern grouping includes Florida, the Gulf Coast, Louisiana, and the Mississippi Valley drainage system—all areas controlled by Spain by the end of the eighteenth century. The western grouping includes Texas, New Mexico, Arizona, and California.

Spain's first attempt to put colonies in the borderlands was Panfilo de Narvaez's unsuccessful effort in the 1520s to plant a settlement near present-

day Tampa, Florida. In quick succession came the expeditions of Francisco Vázquez de Coronado and Hernando de Soto; in 1565 Pedro Menéndez de Avilés founded St. Augustine. Spanish settlers pressed into New Mexico a little over thirty years later with the expedition of Juan de Oñate. Throughout the seventeenth century, the Spanish established a number of settlements in both Florida and New Mexico. In spite of some spectacular setbacks, such as the Pueblo Revolt of 1680, Spain came to view these colonies as territorial buffers between the rich heartland of Mexico and the expanding North American colonies of France and Great Britain. The settlement of Texas, starting in the 1690s, further expanded the Spanish borderlands; at the same time, missionaries began to push into present-day Arizona. Alarmed by the French incursion into Louisiana during the late seventeenth century, Spain reacted with the founding of Pensacola. Hence, by the eighteenth century the Spanish borderlands encompassed Florida in the east, including fortifications on both the Atlantic and Gulf Coasts, with French Louisiana sandwiched between and the two main Spanish colonies to the west, Texas and New Mexico.

THE SPANISH BORDERLANDS AND THE AMERICAN REVOLUTION

The Seven Years' War (1756–1763) forever changed the territorial balances of the major European colonial powers in North America. With the Peace of Paris (1763), Canada passed to the British while France surrendered all of its Louisiana colony to Spain, a former ally during the war. The British, who had defeated both Bourbon adversaries during the conflict, wanted Spain to administer Louisiana as a drain on its international resources. Additionally, all of Spanish Florida went to Great Britain, as the British organized two new colonies, East and West Florida, with their respective capitals at Pensacola and St. Augustine.

The territorial shifts of 1763 ensured that Spanish Louisiana would play a significant role in the American Revolution. New Orleans quickly became a supply depot for the Continental Army once the military phase of the revolt began in 1775. Starting in that year, regular shipments of supplies to Fort Pitt found their way up the inland conduit of the Mississippi and Ohio Rivers to supply the troops commanded by George Washington. An Irish merchant, Oliver Pollock, served as an agent of the Continental Congress at New Orleans for most of the Revolution, working in liaison with Governor Bernardo de Gálvez, who supported the rebel cause. With Spain's entry into the conflict in 1779, Gálvez began

a series of campaigns against British positions in West Florida, capturing Baton Rouge in 1779, Mobile in 1780, and Pensacola in 1781. By the time of Yorktown, the entire Gulf Coast and the whole Mississippi Valley had come into Spanish hands. Spanish participation in the Revolution, however, did not create a new ally for the United States. King Charles III and his ministers in Madrid worried that frontier pressures created by a new nation in North America would only be a substitute for their traditional territorial rivalry with Great Britain. Hence, although Spain declared war against the British, there was no alliance with the United States. Spain did send an unofficial representative, Juan de Miralles, to the Continental Congress, and he monitored Spanish interests there.

The Peace of Paris, which ended the War of Independence in 1783, created additional territorial shifts in this region, further confirming the fears of the Spanish court. The peace settlement legitimized territorial rivalries in the borderlands that would determine the nature of United States–Spanish competition for the next fifty years. Spain regained control of both East and West Florida and received undisputed title to the entire west bank of the Mississippi River and the Isle of Orleans, where the great city stood. Great Britain ceded the east bank of the Mississippi above New Orleans to the United States. However, the boundary along the east bank of the river differed in the respective treaties the British negotiated with Spain and the United States, guaranteeing diplomatic problems. For fifteen years thereafter, Spain and the United States wrangled over the boundary between Spanish Louisiana and the United States, with the dispute not resolved until the Treaty of San Lorenzo in 1795. Two years later the Americans took possession of Natchez.

UNITED STATES EXPANSION INTO THE BORDERLANDS

The Spanish borderlands of the Floridas, Louisiana, and Texas became a region of enduring controversy between Spain and the United States, motivated in large part by the frontier expansion of the young Republic. From the 1780s to the 1820s, thousands of English-speaking frontier folk from the United States moved into Spanish territory. This process began in the late 1780s when Louisiana governor Esteban Miró began a policy of “defensive colonization,” which permitted migrants from the United States to receive land grants in Spanish territory if they swore a loyalty oath to the king and officially professed Roman Catholicism as their religion. Defensive colonization became an intermittent part of Spanish poli-

cy well into the 1820s, when the governor of Texas allowed Moses Austin and other entrepreneurs to settle Americans there. The Louisiana Purchase of 1803 did not slow the process of expansion because this important territorial transfer did not include either the Floridas or Texas. In fact, as early as the 1790s an American resident of Natchez, Philip Nolan, had begun leading filibustering expeditions west of the Sabine River into Texas. (The term “filibuster,” from the Spanish *filibustero* [freebooter], was applied to Americans stirring up insurrections in lands controlled by Spain.) His execution by the Spanish in 1801 did not stop these incursions, either in Texas or elsewhere throughout the borderlands. Indeed, the period from 1803 until the 1820s can properly be called the filibustering era, as almost a half-dozen major American expeditions, sometimes characterized as “revolts,” had as their object Spanish territory bordering on the southern and southwestern United States.

The territories in Spanish Florida north of New Orleans became the first objective for some of these expeditions. After an unsuccessful uprising in 1804, a group of Anglo-Americans raised the Stars and Stripes at Baton Rouge as they declared the Republic of West Florida in 1810. Some historians view this act as a cover for United States expansionism that was legitimized the following year when President James Madison incorporated this region into Louisiana. The War of 1812 also provided opportunities for expansion by Americans into the borderlands. Most notably, General George Mathews led a group of insurgents into East Florida in 1812, taking possession of Fernandina and laying unsuccessful siege to St. Augustine. Some historians have argued that this so-called Patriot War in East Florida had the unofficial yet explicit support of the United States government. In addition, Americans took control of Mobile from the Spanish in 1813 and added it to the Mississippi Territory. In that same year, a frustrated Mexican independence fighter, Bernardo Gutiérrez de Lara, led a major military incursion into Spanish Texas. Gutiérrez organized an unsuccessful filibustering expedition that counted many Americans in its force. Six years later, Dr. James Long led another group of adventurers into Texas.

Perhaps the most spectacular of all these incursions, however, was the invasion of East Florida by General Andrew Jackson in 1818. All this activity helped motivate the Transcontinental Treaty of 1819, signed by Luis de Onís, the Spanish secretary of state. By this treaty, Spain ceded all of the Floridas to the United States and agreed to a transcontinental

boundary line that ran from Sabine Bay on the Texas Gulf Coast northward up the Red River of the East, westward to the Rockies, and then north to the Pacific Northwest. This 1819 boundary, however, did not stop American expansionism; English-speaking settlers began to spill across the Sabine into Texas, brought there by legal immigration agents known as *empresarios*. This settlement continued during the 1820s, culminating in the Texas Revolution of 1836. By that time, however, following the War of Mexican Independence in 1821, Spain had left the borderlands. It thus fell to Mexico to deal with the final chapters of United States expansion into the western borderlands of Texas and California, culminating in the Treaty of Guadalupe Hidalgo in 1848.

SPANISH CONSPIRACY The Spanish Conspiracy involved a plot to open the Mississippi River by a Kentuckian angry at the economic impact caused by Spain’s closing of the waterway to American trade. The conspiracy began with James Wilkinson (1757–1825). A brevet brigadier general during the Revolutionary War until he participated in a plot to replace George Washington, Wilkinson moved with his family to Kentucky in 1784. During the same year, Spain closed the Mississippi River to American commerce. The United States made no effort to restore the right of navigation, much to the anger of settlers in Kentucky and Tennessee. The lack of a good road system left settlers on the frontier dependent upon waterways. Without access to the Mississippi, settlers had difficulty getting goods to market and acquiring necessary supplies. Wilkinson suffered a severe financial setback and soon amassed huge debts.

In July 1787 a desperate Wilkinson sent a cargo of tobacco and other Kentucky products down the Mississippi River to the Spanish port of New Orleans. Typically, the Spanish would confiscate American goods. When Esteban Rodríguez Miró, the Spanish governor of Louisiana, attempted to do just that, Wilkinson made a number of questionable claims. He declared that Kentucky was near separation from the United States and that he could determine what course his fellow settlers pursued. He insisted that he could prevent an invasion of westerners set on opening the Mississippi by force and bring Kentucky into the Spanish orbit if only Spain would open the river. Failure by the Spanish to cooperate would force Kentucky to turn to Britain for protection. With its weak defenses, Louisiana would undoubtedly fall to the British.

Wilkinson persuaded Miró to change the policy of confiscation to give him a monopoly of American trade on the Mississippi. He also obtained the promise of a royal pension and a suitable position when Kentucky became part of Spain. For his fellow Kentuckians, Wilkinson requested that they be granted religious liberty and their own English-speaking government. When the Spanish agreed, Wilkinson signed a declaration of allegiance to Spain and began to supply Miró with information. However, considerable doubt exists as to whether Wilkinson ever planned to do more than enrich himself.

As the only outlet in New Orleans for Kentucky produce, Wilkinson reaped enormous profits and spent vast amounts on a lavish lifestyle. Questions about his activities were raised in Kentucky, but he commanded enough respect to participate in its politics. During debates over the ratification of the U.S. Constitution in 1787, Wilkinson proposed independence for Kentucky under the protection of Spain. But other Kentuckians failed to support separation and Wilkinson quickly stopped advocating it, except to the Spanish. For the next ten years, Wilkinson continued to write to the Spanish in Louisiana, hinting that Kentucky might abandon the United States for Spain. The Spanish assigned Wilkinson the title of Secret Agent No. 13 and promised him a pension for his efforts. In 1795 Pinckney's Treaty opened the Mississippi to free navigation and the need for Kentucky independence evaporated. Wilkinson was acquitted of treason in 1811.
