Despite the lack of quality records regarding the status of African American education in the early Republic, some generalizations can be made. The educational opportunities were greater for free blacks than for slaves, greater for northerners than for southerners, and greater for city dwellers than for rural people. Overall, however, educational opportunities for African Americans were either nonexistent or substandard. This assessment stems primarily from the significant obstacles placed in the path of African Americans, but it does not negate the tireless efforts of many African Americans, and some white reformers, to make significant strides in education.

In the absence of public education, religious institutions took the lead in African American education, either by establishing schools or by providing general education in Sabbath schools, which often supplied the only educational opportunity for African Americans. For instance, in Philadelphia the Society of Friends developed the first black schools in 1770, and in 1784 Anthony Benezet's will set aside money to endow an African American school. Other denominations, particularly Presbyterians, Baptists, and Methodists, also supported black education, especially the literacy required to read the Bible. Additionally, as black and white churches separated, the African Methodist Episcopal Church often took the lead in education. Schools, second only to churches, provided the bulwark for both the African American community and an African American identity during this period.

Schools, whether religious, private, or public, were concentrated primarily in urban areas, and pri-

marily in the North, though some southern cities, such as Charleston, Richmond, and New Orleans, also had schools for free African Americans. Regardless of the location, these schools suffered from a dearth of funding. African Americans were excluded from most public facilities, and when separate facilities were provided, in most cases they were unequal in terms of both their physical structure and their curriculum. Nevertheless, contemporary observers gave great credit to the efforts of the African American community; given its lack of resources, even small gains represented significant sacrifices. African Americans clearly recognized the role that education could play in their elevation in society. Nevertheless, schools lacked not only funds but students. Although African Americans valued education, the need for children to work, the unwillingness of employers to allow children to attend school, and society's unwillingness to allow educated African Americans to move up in the world combined to keep enrollment low. For example, in 1813, out of Philadelphia's African American population of approximately 11,000, only 414 were enrolled in schools, and in New York in the 1820s, only 600 to 800 out of more than 10,000 African Americans were enrolled.

Although the totals for African American education may not have been impressive during this period, individual achievements did stand out. Schools represented a first step for the emerging African American leadership during this period. In the 1820s the United States saw its first African American college graduates: Alexander Lucius Twilight (Middlebury), Edward Jones (Amherst), and John Russwurm (Bowdoin). In North Carolina John Chavis, a well-educated Presbyterian minister, operated a prestigious day school for whites and an evening school for children of his own race. Additionally, people who would later become prominent in the abolitionist movement, including Henry Highland Garnet and Samuel Ringgold Ward, received their formative schooling during the years of the early Republic.

In the early nineteenth century, southern whites often divided in their attitude toward African American education. Religious leaders emphasized the need for African Americans to be able to read the Bible, whereas others denied the need for African American education. Opponents expressed two contradictory claims: that blacks could not be educated, and that educated blacks (whether slave or free) represented a threat to society. In the wake of the publication of David Walker's *Appeal* in 1829, an African American tract calling for slaves to violently resist slavery, and

Nat Turner's 1831 revolt, the second claim triumphed, and most southern states passed laws that either outlawed the education of slaves or banned group meetings, which prevented any organized slave education. Prior to 1830, however, most southern states did not have such laws, and thus slaves may have had better access to education than in subsequent years.

The percentage of slaves who were literate will never be known, but most estimates place this number at below 5 percent. They received their education from their owners, missionaries, or fellow slaves, or through subterfuge—or through a combination of methods. For example, in the 1820s in Baltimore, Frederick Douglass learned through a combination of the aid of his female owner and by using bread to bribe white neighborhood children to teach him. Based on the records of slave literacy, slave owners may have had good reason to be leery of literate slaves, as not only Douglass, but also the leaders of revolts, including Gabriel, Denmark Vesey, and Nat Turner, learned to read and write during this period.

The overall record of the education of African Americans during this period would receive a low grade, but two key themes must be remembered. First, in some ways, African American opportunities in this period exceeded those of the subsequent thirty years. Some northern public schools were integrated, and in most southern states it was still legal for African Americans to congregate and to teach slaves to read and write. Second, the record must not be judged against an ideal but rather against the reality of African Americans' low status in both the South and the North. The overwhelming majority of African Americans were either slaves themselves or had been slaves until the North passed emancipation laws, and thus they had neither the resources nor the time to devote to schooling that other groups had. Measured against their privation, the achievements of African Americans in education are commendable and hard-won.

Education of Girls and Women

Prior to the American Revolution, few avenues of formal education were open to girls and young women. Throughout the colonial period, young boys and girls typically learned to read at “dame schools” run by women in their homes. Beyond this rudimentary level of instruction, educational options for young women were limited. “Adventure schools” offered training in “ornamental” subjects such as music, drawing, needlework, and dancing, and boarding schools (sometimes referred to as “finishing” schools) sought to prepare elite women for their entrance into polite society. Given the haphazardness of women’s education, those well-educated women who came of age prior to the Revolution—notably Abigail Adams, Elizabeth Graeme Ferguson, and Mercy Otis Warren—tended to be largely self-educated, or relied on the support of male relatives to provide them with access to books and other learning materials. On the whole, little formal attention was paid to the education of women in the mid-eighteenth century.

During the early national period, education for both men and women became linked to patriotism and thus a subject of national importance. Social and political thinkers asserted that the success of the young Republic rested in an enlightened, well-educated citizenry. Advocates of education insisted that citizens had the right—indeed the duty and responsibility—to acquire various forms of “useful” knowledge. Both men and women benefited from this belief in the strong importance of education. The decades following the Revolution were known as “the age of the academies,” as hundreds of new schools were created to meet the political and practical needs for educated citizens.

Between 1780 and 1820, educators established approximately four hundred female academies and seminaries, offering white middle- and upper-class women unprecedented access to educational opportunities. Female academies could be found in all parts of the nation, including both larger cities and smaller towns. Like the male academies founded during this time period, most of these academies were single-sex institutions, although a sizable minority were coed-

ucational, such as the Bradford Academy in Massachusetts. Both women and men founded and taught at academies for women. In the 1790s Susanna Rowson in Massachusetts and Sarah Pierce in Connecticut established well-known and highly regarded academies for young women. In Philadelphia the physician Benjamin Rush and other leading male citizens lent their support to the Young Ladies’ Academy of Philadelphia, a prestigious school that attracted women from all parts of the nation. Often, female academies were associated with existing male institutions, such as the Female Academy in New Brunswick, New Jersey, whose trustees were affiliated with Queen’s (Rutgers) College.

More comprehensive than most existing adventure or boarding schools, these academies provided women with instruction in grammar, history, geography, rhetoric, composition, moral philosophy, and, in some cases, Latin, botany, chemistry, and astronomy. The curricula offered at female academies were similar to those offered at most male academies, attesting to the growing belief in women’s intellectual equality with men. Although some female academies continued to offer music, dance, needlework, and painting, these subjects were no longer thought to comprise the main purpose of women’s education. Rather, education aimed to prepare women to become both “useful” and “ornamental” members of society. Properly educated for their roles as lively, articulate, and entertaining companions, women would set the tone for early national society, providing harmony and stability for the young nation.

By infusing women’s domestic and social roles with political and patriotic significance, proponents of women’s education celebrated the intellectual attainments of women. Yet despite this enthusiasm, the subject of women’s education was marked by a fundamental tension between the recognition of women’s intellectual capacity and concerns about the uses women might make of their education. Prescriptive writers worried that women might become so distracted or interested in education that they would neglect their families and domestic duties. Despite their enlightened faith in women’s intellectual equality with men, prescriptive thinkers generally believed that men and women were dissimilar beings with contrasting manners, morals, and dispositions. Ultimately, this belief in sexual difference worked to sustain and justify prescribed gender roles for men and women. Whereas men sought exclusive access to political and economic spheres, women were urged to limit themselves to the domestic and the social.

In an effort to resolve this tension, proponents of women's education insisted that educated women would not seek access to traditionally male spheres of power and prestige. Female educators strenuously championed women's intellectual capacities while simultaneously expressing ambivalence about prescriptive ideas about gender roles. Summarizing this trend, the educator Emma Willard (1787–1870) insisted that women and men's education needed to reflect their "difference of characters and duties." Yet when Willard petitioned the New York State legislature for state support and funding of a female seminary in 1819, she hoped to ensure that women's education received the same "respectability, permanency, and uniformity of operation" as male colleges and institutions. Although her proposal was rejected, Willard established the Troy Female Seminary (later the Emma Willard School), which served as a leading institution of women's education throughout the nineteenth century. In the years that followed, educators opened similar schools, including the Hartford Female Seminary (founded by Catharine Beecher in 1823) and Mount Holyoke (founded by Mary Lyon in 1837). These seminaries offered women the equivalent of a college education without explicitly referring to themselves as colleges. Successors to the female academies first founded in the early national period, these schools were clear precursors to the women's colleges that emerged by the mid-nineteenth century.

Women's increasing access to education had far-reaching effects. Literacy rates for white women rose from approximately 50 percent in the eighteenth century to approximately 90 percent by the mid-nineteenth century. Throughout the nineteenth century, educated women showed determination to expand their roles in society. Some women chose to become teachers themselves—either temporarily teaching school for a few years before marriage, or in some cases creating professional, lifelong careers for themselves as educators. Other women became successful authors, producing textbooks, fiction, poetry, and other influential works. There was also a connection between women's education and the growing reform movements of the antebellum period. Elizabeth Cady Stanton (1815–1902), known for her work in the abolitionist and women's rights movements, was a graduate of Willard's Troy Seminary. Many educated women saw reform and activism as ways to increase the scope of their influence in society. By emphasizing women's intellectual capacity and equality with men, early national ideas about education offered women increasing avenues for empowerment and opportunity.

Education of the Deaf

The Connecticut Asylum for the Education of Deaf and Dumb Persons (later the American School for the Deaf) opened its doors in Hartford, Connecticut, on 15 April 1817, with Thomas H. Gallaudet (1787–1851) as principal and Laurent Clerc (1785–1869) as head teacher. Aside from a short-lived school in Virginia, there previously had been no provision for the formal education of deaf children within the United States. Gallaudet, an evangelical minister, had visited British schools two years earlier at the behest of a group of parents in and around Hartford to study the methods of teaching deaf children in use there, with the aim of opening a school in the United States. The private schools of Britain, however, treated their techniques—which focused on oral communication and permitted no use of signed language—as proprietary secrets. Gallaudet then traveled to the Royal Institution for the Deaf in Paris, a publicly supported school that pioneered the use of sign language in the instruction of deaf students. Impressed by what he saw, Gallaudet convinced Clerc, an instructor and former student at the Paris school, to return with him to Hartford, where Clerc taught Parisian sign language to Gallaudet and other teachers at the new school. The language that later became known as American Sign Language resulted from the fusion of Parisian sign language with existing regional American sign languages.

Clerc was instrumental in helping to establish schools for the deaf in several other states as well, while his former students founded or taught in

schools around the nation using his methods. By 1829, schools had been established in New York, Pennsylvania, Kentucky, and Ohio; altogether, more than thirty were established during Clerc's lifetime. The schools used what today would be termed a bilingual approach, making use of natural sign language along with finger spelling and written English, in addition to an invented system known as "methodical sign language" designed to represent English vocabulary and grammar on the hands. (This proved to be too unwieldy for effective instruction, however, and was largely abandoned by the 1850s.)

Similar to many such institutions founded during the Second Great Awakening of the early to mid-nineteenth century, the schools for the deaf were intended in part to serve as Protestant missions. Just as evangelical churches sent missionaries to Africa, Asia, and American Indians in the West, so did they support schools for the deaf as missions to deaf people, who were described by Henry B. Camp as "a community of heathen at our very doors." The emphasis on religious education, along with the employment of both hearing and deaf instructors using bilingual methods, continued until the late nineteenth century.

Due to the relatively low incidence of deafness, the schools were necessarily residential. Students from rural areas—the great majority—met other deaf people for the first time and learned how to communicate beyond the level of pantomime and gesture. They encountered the surprising knowledge that they shared an identity with others. From their new common language and common experience, they began to create an American deaf community and culture that has persisted to this day.

Proprietary Schools and Academies

Proprietary schools and academies were the dominant institutions of professional and practical education in the early American Republic. Because the U.S. Constitution contained no provisions for a federally funded system of schools, and since most states sup-

ported only the barest minimum of primary schools, Americans turned to private enterprises like proprietary schools and academies to educate the citizens of the new nation. As a result, much of the support for proprietary schools and academies relied upon the initiative of individuals, the resourcefulness of communities, the zeal of religious denominations, and the beneficence of the wealthy.

PROPRIETARY SCHOOLS

Proprietary, private venture, or entrepreneurial schools were secular, tuition-supported private schools that offered specialized and practical instruction in medicine, law, or business. Like the operators of academies, proprietors frequently incorporated their schools by petitioning the state for a charter. In contrast to academies, these schools were not the primary occupation of their proprietors. Instead, proprietors established proprietary schools with other professionals in their field who wanted to supplement their income and augment their status in the community.

Medical schools. In colonial America, those seeking medical training had few options beyond an apprenticeship with a local physician or enrollment in a European medical school. By the end of the eighteenth century, few American colleges had medical faculties; furthermore, collegiate medical training was unsystematic and academic standards were low. Lacking competition from early American colleges, proprietary medical schools flourished in the early Republic.

Proprietary medical schools such as the College of Physicians and Surgeons of the Western District of New York (1812) and the Castleton Medical College in Vermont (1818) emerged as an alternative to the apprenticeship system, which was often a protracted and inconvenient arrangement for the physician and a haphazard experience for the student. These schools were cooperative enterprises of two or more local physicians. Cooperation permitted the physician-instructors (called preceptors) to maintain a medical practice while supplementing their income with student tuition fees.

Proprietary medical schools often had few books, limited equipment, and no clinical facilities. The quality of the instruction depended upon the training of the preceptors and the variety of ailments that the preceptors had encountered. Proprietary medical schools rarely issued degrees, and the licensing of graduates was practically nonexistent. The rapid increase in the number of schools in the 1820s and the ensuing competition for tuition dollars

pushed many proprietary medical schools to offer superficial training programs. By the 1830s, the declining quality of these schools prompted calls for reform in medical education.

Law schools. Like proprietary medical schools, proprietary law schools faced few initial challenges from early American colleges, which had inadequate law faculties and no systematic legal curriculum. Early legal education in the colonies borrowed from the British traditions of self-education and clerkship, but the increased demand for lawyers after the American Revolution necessitated new institutions for legal training. Thus, between 1782 and 1828 enterprising judges, usually state court judges in the North, chartered proprietary law schools both to address the new demand for lawyers and to supplement their meager salaries.

Proprietary law schools varied in size but not in quality. Unlike proprietary medical schools, law school proprietors often required students to have a liberal arts education before commencing legal study. These schools commonly featured excellent law libraries and an outstanding, systematic program of lectures, tutorials, moot courts, and informal examinations. Proprietary law schools did not issue diplomas or degrees, and its graduates usually took the bar examinations after completing the course of study.

The superiority of the training that students received in proprietary law schools enhanced the popularity of the schools and the reputation and influence of the proprietor and his graduates. The first proprietary law school was Litchfield Law School in Connecticut, founded by Judge Tapping Reeve in 1782. Over a fifty-year span, hundreds of its graduates served in the highest levels of federal and state governments. Collectively, these schools scattered thousands of competent public servants, lawyers, businessmen, and educators to every region and state of the new nation.

Despite their success, proprietary law schools had begun to decline by 1829. Colleges that sought the financial gains enjoyed by proprietary law schools reproduced the latter's format of legal instruction, luring instructors and students away from the proprietary schools in the process. Other colleges, like Washington College (later Washington and Lee University) and Yale, simply incorporated nearby proprietary law schools into their own law faculties.

THE ACADEMY MOVEMENT

The terms "academy," "institute," and "seminary" refer to schools with any number of different courses of study, sources of financial support, and types of administrative organization. Because of this variability, there is no consensus among historians as to the characteristics that define an academy. Generally, academies were flexible, independent, and often transient enterprises that adapted to the educational needs of its students and local communities. The curriculum of any academy was ultimately contingent upon the education and aptitude of the schoolmaster. Yet depending on the proximity of the academy to other schools, academies provided a community with any course of study its citizens required, from elementary instruction to a college preparatory curriculum. Most academies served as secondary schools, offering an education in practical subjects to students who already knew how to read and write but had no desire to attend a college in the future.

Although academies occasionally received money or equipment from the state, tuition fees, lottery proceeds, and endowments were their primary sources of revenue. Academies relied upon a self-perpetuating board of trustees to manage the finances of the school. In most cases, trustees incorporated the academy by petitioning the state legislature for a charter. A charter authorized the trustees to act as a corporate body to raise funds for the school by lottery, manage the school's endowment, hire or fire a schoolmaster, and prosecute parents who refused to pay a tuition debt.

Franklin's proposed academy in Philadelphia. Benjamin Franklin published the first plans for an academy in the American colonies. In *Proposals Relating to the Education of Youth in Pennsylvania* (1749) and *Idea of the English School* (1751), Franklin blended seventeenth-century British educational thought with his own brand of materialism and individualism to envision a school that could fill the niche for practical and professional studies necessary for success in the mercantile economy. Franklin proposed an academy that would teach an "English" curriculum through experiments, exercises, and observations. The English curriculum featured an assortment of course options, including accounting, geometry, astronomy, English grammar, writing, rhetoric, history, geography, ethics, natural history, gardening, commerce, and mechanics.

Franklin's proposal challenged the two dominant educational institutions of the period, the Latin grammar school and the colonial college, both of which regarded the classical curriculum to be the

only acceptable course of study. Like most academies founded in the early Republic, renowned institutions like Phillips Academy at Andover, Massachusetts (1778) and Philips Academy at Exeter, New Hampshire (1781), modeled themselves after Franklin's English school. More broadly, Franklin legitimized the democratic and pragmatic character of the academy, thereby aligning the institution with the prevailing values of the early American Republic and guaranteeing its popularity among the middle class.

Denominational academies. Soon after Franklin published his *Idea of the English School*, religious denominations began a massive program of establishing academies that persisted well into the mid-nineteenth century. The religious revivals of the 1730s and 1740s, known as the Great Awakening, partly inspired this effort, and the Presbyterians were, by far, the most active denomination, establishing sixty-four academies in seven states by the end of the eighteenth century. Roman Catholics, Anglicans, Congregationalists, Dutch Reformed, Baptists, and Methodists collectively founded hundreds of academies throughout the United States. Nevertheless, financial difficulties, fluctuating enrollment, and inadequate staffing forced most of them to close. Although the character of religious academies varied from denomination to denomination, their greatest legacy was offering educational opportunities to women, free blacks, American Indians, and the poor.

Education for women. One lasting contribution of the academy movement was the popularization of education for women. In the early Republic, most Latin grammar schools and colleges steadfastly refused to admit women students. Beyond the common practice of hiring a tutor, female academies, seminaries, and institutes became the sole institutions for educating women. As with academies for young men, there was a great deal of variation among the courses of study in female academies. They ranged from ornamental subjects like embroidery and music to the rigorous academic subjects featured at elite academies for men.

Reform-minded male intellectuals were the early proponents of opening academies to women. In the mid-1780s theologian and poet Timothy Dwight founded one of the first academies to admit women students at Greenfield Hill in Connecticut. In 1787 physician Benjamin Rush, a leading advocate of female education in the early Republic, helped to establish the famous Young Ladies' Academy of Philadelphia. With the founding of Sarah Pierce's Litchfield Female Academy in 1792, women emerged as proprietors and instructors, rather than merely stu-

dents, of academies. The extraordinary success of Pierce's academy inspired other women to open female academies and seminaries. Two of the most important female academies in the early Republic were Emma Willard's Troy Female Seminary (1821) and Catharine and Mary Beecher's Hartford Female Seminary (1823). By the end of 1820s, female academies were a permanent part of the educational landscape in rural and urban communities throughout the North and the South.

Military schools and mechanics institutes. Military academies and manual labor schools emerged as two variants of the academy movement. The earliest military academies, the United States Military Academy (1802) at West Point, New York, and the American Literary, Scientific, and Military Academy at Norwich, Vermont (1819), offered a course of study suited for training military engineers and officers. Despite their beginnings in the North, military academies flourished in the South between 1839 and the Civil War.

The other variant of the academy movement, the manual labor school, or the mechanics institute, began as an experimental school offering systematic instruction in agriculture or mechanics. One of the first manual labor schools was established at Lethe, South Carolina, in 1786, but these institutions did not become prevalent until later in the nineteenth century when large manufacturing industries emerged in northern cities.

Classical versus practical education. In 1828 the faculty of Yale College issued its famous report that defended the virtues of the classical curriculum against the superficiality and expediency of academy education. The tension between colleges and academies, as well as the opposition of classical and practical studies, was nothing new. Nevertheless, criticisms like those presented in the Yale Report of 1828 did little to thwart the growth of academies in the early Republic. Challenges to academy education in subsequent decades came from advocates of public education, whose campaigns for a free, comprehensive, and state-supported system of schools led to the demise of the academy movement.

Terry L. Stoops

Public Education

Education was an important issue in the new American nation. Luminaries like Thomas Jefferson, John Adams, and Benjamin Rush talked about it at length because all of them associated ignorance with tyranny. Jefferson took great pride in his contributions to education, especially the founding of the University of Virginia. His innovative *Plan for the More General Diffusion of Knowledge* (1779) eventually earned him a place in the pantheon of American public education. But Jefferson did not live to see his now-famous plan implemented. Truth be told, the progress of education in the new American nation owes as much if not more to the efforts of local officials, civic leaders, and community activists. Between 1780 and 1830 they laid the groundwork for the system of public schools and colleges that would emerge in the United States in the antebellum era and after.

Whether well known or not, those who worked on behalf of education had one thing in common. They all agreed that America's future was at stake. Education would not only make Americans better citizens but also better parents, workers, and reli-

gionists. But although all might agree on the importance of education, there was no consensus about how it should be defined or delivered. Was the home or the school to bear primary responsibility? To the extent that schools were needed, what kind of institutions should they be? Public schools were not a given. There was no common understanding in the new American nation that government should provide for essential needs. Nor was a sharp distinction made between public and private—between that which concerned everyone and that which concerned individuals or minorities. Over the half-century between 1780 and 1830, Americans would come to recognize something that the French writer Alexis de Tocqueville called the tyranny of the majority. As they did, they saw the importance of distinguishing between public and private in many spheres of American life, including education.

SERVING THE COMMON GOOD

As long as most Americans believed that the interests of the individual were synonymous with those of the group, there was no reason for them to make a sharp distinction between the public and the private domain. Nor was there reason to object when only a handful of people were deemed suitable for leadership roles or when government extended to individuals or small groups those prerogatives and privileges associated with institutions charged with acting for the common good. For example, colonial legislatures sometimes incorporated bridges, roads, canals, and banks, making them in effect the exclusive partners of the state in exchange for providing indispensable services. But as economic activity expanded and competition increased, expectations changed. By the beginning of the nineteenth century it had become apparent that the marketplace could be relied on to meet many of society's most pressing needs. Now government could promote the common good by acting as an arbiter or even as an agent for those pursuing private gain. At the same time, the courts discouraged politicians from interfering unnecessarily in the affairs of individuals or established organizations. Arguing for his alma mater, Daniel Webster convinced the United States Supreme Court in 1819 (in *Dartmouth College v. Woodward*) that the New Hampshire legislature had to respect the original charter of Dartmouth College. Government and the courts also began to treat corporations not as instruments of the state but as entities beholden to their shareholders. In other words, Americans now began to distinguish between the public and the private domain.

When the state took an active interest in education in the eighteenth century, it was because leading Americans believed that the future of the Republic was at stake. It could not survive if its citizens were ignorant. Being well informed may not have been a sufficient condition for practicing the rights of citizenship, but government had to make sure that all Americans were educated nevertheless. First and foremost, it had to protect the free flow of information. Nothing could be allowed to stand in the way of free speech, a free press, and freedom of association. Government could also contribute to popular education indirectly by encouraging volunteers to create and endow learned institutions such as libraries, museums, and lyceums. It could multiply its impact by providing incentives for the establishment of schools, colleges, and universities.

Of course, some Americans wanted government to do much more for the cause of popular education. Jefferson's *Plan for the More General Diffusion of Knowledge* called for a state-supported system of elementary, secondary, and higher education that would not only ensure an informed citizenry but also provide educational opportunities for talented youth from impoverished families. In 1786 the physician Benjamin Rush proposed a similar plan for Pennsylvania. It called for a three-tiered system consisting of township schools, regional colleges, and a state university. When the American Philosophical Society sponsored an essay contest on education in 1795, the co-winners, Samuel Knox and Samuel Harrison Smith, both argued for a comprehensive system of national education. But these plans failed to gain any traction because many Americans still believed that education was primarily a family responsibility. Associating it with personal goals such as economic success and social standing, they resisted the idea that anyone should have to pay for the education of other people's children. Public education meant to them nothing more than that training or socialization which took place outside the home.

However, a growing number of Americans either needed or wanted to be educated outside the home by the beginning of the nineteenth century. In the back alleys of Boston, New York, Philadelphia, and Charleston there were many neglected children who would receive no education at all if the matter were left entirely to the discretion of their families. All across the United States, but especially in the nation's towns and villages, there was also a gathering demand for the kind of academic and practical training that would help those on the cusp of respectability open opportunity's door. Civic and religious lead-

ers responded by seeking philanthropic contributions as well as municipal and state assistance for elementary education. In Charleston, South Carolina, for example, the city's Orphan House ran a school that many would have regarded as a public institution. That Philadelphians were of like mind can be demonstrated by pointing to the work of the Philadelphia Society for the Free Instruction of Indigent Boys, established in 1799, and the accomplishments of the Friends' (Quakers') "public" schools. Although not accountable to the community as a whole, the schools run by these organizations constituted an informal educational system that taught literacy to the children of different classes and races in separate schools. The Philadelphia English and Latin Academy, on the other hand, exemplifies a different concept of what public education meant in the second half of the eighteenth century. Opened in 1751 and chartered four years later as the College, Academy and Charitable School of Philadelphia, it anticipated the development after 1780 of countless proprietary schools for adolescents and young adults who hoped that a practical education at a more advanced level would improve their prospects.

Many proprietary schools began as private ventures whose primary purpose was to make a living for their schoolmasters. Some evolved into academies, an institutional type that proved to be much more stable, in part because the demand for their services persuaded many local and state governments to shower them with money, land, or legal privileges. Incorporating forty by 1817, New York also invested directly in many academies. Farther west, Ohio chartered about one hundred between 1803 and 1840. As corporations, they were expected to have a self-perpetuating board of directors, which was usually composed of local leaders. The typical academy had such a close economic and social relationship with its community that even though it was privately controlled (and most likely charged tuition), it was still perceived as a public institution—a perception that was reinforced by its practical curriculum, which served the common good by facilitating private gain.

EVOLVING CONCEPTS OF PUBLIC EDUCATION

Beginning in the 1790s, the concept of "public" in American education gradually began to mean much more than schools that served the common good. As Americans drew a sharper distinction between the individual and the community, they also began to associate certain characteristics with public institutions, including and especially schools. But it would take some time for these characteristics to gain wide

acceptance. More than two generations would pass before most Americans would understand public education to mean schools that were publicly supported, publicly controlled, open to all, and tuition-free. Nevertheless, movement toward this consensus commenced even while the Republic was new. In the Land Ordinance of 1785 Congress set an example by providing that one section of public land in each township of the Northwest Territory should be designated for the support of primary schools. Some state governments followed this lead by creating common school funds to encourage public support by local authorities. Using receipts from the sale of land in its Western Reserve, Connecticut established such a fund in 1795, and both New York (1805) and Virginia (1810) did the same not too long thereafter. Massachusetts did not create a permanent school fund until 1834, but it was a pioneer in another way, enacting legislation in 1789 that provided for a system of town schools. The Massachusetts Education Act called for reading, writing, and grammar schools to educate boys and girls, age seven to fourteen, at public expense. Building on the initial steps it took in 1784 when it established the University of the State of New York, Albany attempted in 1795 and then more successfully in 1812 to bring about the realization of a state educational system. The Michigan territorial legislature took similar steps in 1817, passing a bill for a comprehensive system of elementary, secondary, and higher education, but the promise of this legislation was still unfulfilled in 1835 when Michigan became a state and the state constitution charged the legislature with implementing a system of common schools. These reforms notwithstanding, public education was still struggling to establish its identity in the 1830s.

Although there was no consensus about what public education meant, some conceptual patterns had begun to emerge by 1830. In rural areas a communal concept existed; it combined public control with more than a little public support and open access. District schools in Massachusetts, Ohio, and New York received both state and local revenue, practiced some form of local governance, and admitted all white comers, though they sometimes made up for budget shortfalls by charging tuition. Some local schools admitted blacks and Indians, but many, especially in Ohio, did not. Enrollments in these schools were high, but their terms were brief and attendance was usually inconsistent. In Philadelphia and New York City, on the other hand, the average citizen would have equated public education with charity schools that received public support. Founded in 1805 by a small group of public-spirited

citizens, the privately controlled Free School Society presided over schools in New York City that concentrated on the education of the poor. It provided some schooling for poor blacks from 1834 until its demise in the 1850s. By then the city had an elected school board and a more democratic approach to public education. In 1818 a board of "controllers" was established in Philadelphia whose job was to help local directors operate schools for the poor at public expense. Indigent children of African descent were completely excluded at first, but by the end of 1826 two segregated schools were up and running for them. The board's mission remained unchanged until 1834 when new legislation made it responsible for publicly supported and publicly controlled schools that, theoretically at least, were open to high- as well as low-income children.

In Boston the situation was quite different. At first, public education there seemed to mean publicly supported and publicly controlled schools for children from respectable families. Established in 1789, the city's School Committee did not make provision for the education of the poor until it organized a Primary School Board in 1818. Modeled after the Boston Society for the Moral and Religious Instruction of the Poor, the Primary School Board accepted mostly illiterate children. But enrollments grew slowly because many poor children worked, and their immigrant parents found the cultural bias of the city's public schools to be off-putting. Nevertheless, more than a few transferred to these public schools from other institutions during the first two or three decades of the nineteenth century. When Horace Mann came on the scene in the 1830s, he promoted that form of public education, which combined public support with public control and open access. Mann's efforts met with great success in Massachusetts. Elsewhere, his conception of public education attracted considerable attention, especially in Connecticut, New York, Pennsylvania, and the upper Midwest, but it had to compete with one that tied together at least some public support with private control and open access. By the 1830s many academies operated on this basis. Anticipating public high schools, they provided a broad and practical education that went beyond the basics. Although they were often the objects of intense local pride, their survival usually depended on the degree to which they met the needs of their students. The end result was an all-purpose institution.

HIGHER EDUCATION

As late as 1850 academies and colleges in the United States had more than a few features in common.

Above all, they were exclusive—that is, most Americans had no direct experience with them. In this respect they fell outside the borders of public education. But long before that, the most important colleges in the United States had exhibited at least some of the features of public institutions. For example, they received special treatment from the state even though they were also free to set their own direction. Having self-perpetuating boards of trustees from their inception, both Harvard and Yale enjoyed considerable independence, but over the years both schools came to expect substantial amounts of government oversight and assistance. In 1780 the new Massachusetts constitution committed the Commonwealth to looking after Harvard College and placed the governor, lieutenant governor, and several members of the legislature on the Board of Overseers. Twelve years later Yale accepted \$30 thousand from the state of Connecticut in exchange for having eight civil servants on its nineteen-member board of directors. New York renamed King's College in 1784, making it Columbia, and put the school under the aegis of the University of the State of New York, but the college regained some of its institutional independence when it obtained a self-perpetuating board of trustees soon thereafter.

These developments notwithstanding, more than a few Americans had come to believe by the end of the eighteenth century that higher education should be a government responsibility. Between 1785 and 1820 ten states (Georgia, South Carolina, North Carolina, Virginia, Maryland, Kentucky, Tennessee, Michigan, Ohio, and Vermont) chartered their own institutions of higher education, although provisions for state support and state control were usually slow in coming. After 1810 the ties between government and many established institutions of higher education began to weaken. Harvard received its last regular appropriation from the Commonwealth of Massachusetts in 1823; state grants to Columbia and Yale ended in 1819 and 1831 respectively. The Dartmouth College case raised questions about the degree to which government could exercise control over colleges with existing charters. But these developments were not definitive, and the distinction between public and private in higher education would remain a work in progress until at least the middle of the nineteenth century.

In the fifty years between 1780 and 1830, public education in the United States was in transition. Although a few people equated it from the beginning with schools that were publicly supported, publicly controlled, tuition-free, and open to all, most took a

while to associate it with something more than that which took place outside the home. They were encouraged, even forced, to recast their views because Americans were becoming more diverse, more competitive, and more committed to individualism. As these changes gradually took hold, public education approached and eventually crossed an important conceptual and institutional threshold. It became more akin to what most Americans would come to regard as public education.

Tutors

Private education arranged by parents for their children was especially popular in elite southern families in the late eighteenth and early nineteenth centuries. In the North, schools—rather than private tutors—were more common both in the colonial and early Republic eras. Colonial New England towns often pooled resources to create common schools, institu-

ELI WHITNEY

Needing to repay some debts before pursuing a career in law, Eli Whitney—a young Yale graduate—left New England in 1792 to work as a tutor on a Georgia plantation. This seemingly prosaic journey proved incalculably important to the social and cultural history of the young nation. In less than a year's time Whitney had invented the cotton gin and sealed the fate of both northern and southern societies. In the late eighteenth century, a glutted tobacco market had caused many planters to rethink the value and utility of growing that crop. An alternative crop, long-staple cotton, a variety that could easily be separated from its seeds, only grew in coastal territories. In contrast, short-staple cotton could be grown much more widely but was extremely difficult to clean. Whitney's cotton gin mechanically removed fiber from seed, spurring enormous growth in the cultivation of cotton and thereby greatly increasing the demand for slaves.

Rodney Hessinger

tions where children were provided with the language skills necessary for reading the Bible; the towns thereby promoted moral order in their communities. Northern states organized teaching much more systematically in the early nineteenth century as public schools became the norm and tutoring declined further in significance. Nonetheless, one could expect to find tutors in elite families in both North and South in late-eighteenth- and early-nineteenth-century America. Generally, young men—and sometimes women—who had yet to become settled in marriage or occupation filled such roles for well-to-do families.

In theory, tutoring can be seen as distinct from apprenticeship, which involves instruction by a master craftsman in pragmatic labor skills. In practice, however, the distinction was murkier, for apprenticeship often included instruction in reading and writing as well as training in a trade. In ideal form, tutors were hired by wealthy families to provide education and cultural polish for young members of the gentry. The South relied on tutors longer and more fully for several reasons. For one, families were more scattered in settlement, making collective education less workable. In addition, southerners did not develop the penchant for the public financing of eco-

nomie development as northerners did; in northern eyes, education was thought to spur economic progress and social stability. Finally, in the agricultural and stratified South, only the elite could afford to spare the labor of their children, so private education with a tutor became a privilege of those living within the great plantation houses. Ironically, southerners often employed northern young men as tutors, since the North educated a much larger share of its population. For example, Eli Whitney (1765–1825), best known as the inventor of the cotton gin, worked as a tutor for a family in Georgia shortly after graduating from Yale.

Tutoring promoted important family and gender dynamics. In late-eighteenth-century planter families, tutors were often expected to assume disciplinary control of young children, allowing fathers to develop more affectionate bonds with the young. While sometimes using force to implement discipline, tutors could also serve as a model to emulate, assuming the role of a wiser, older brother. Young men and women received distinctive types of training from tutors. While such instructors provided young men with education in utilitarian fields such as mathematics and Latin, equipping the young man for crop sales and courthouse transactions, household educators were more likely to give young southern belles instruction in skills such as French, music, and dancing. Yet even for young men, the goal was more to create a complete gentleman who could drop classical allusions into conversation than equip him for a career in the marketplace.

Another distinct type of tutoring evolved in the colleges of the young nation. Professors relied on the assistance of young men to teach lessons to the students enrolled in their schools. These young men were most often recent college graduates themselves, only a couple years older than their charges. In fact, where impoverished young men were entering colleges at advanced ages, as they were in New England, tutors were younger than some of their students. Colleges in the early Republic suffered from disciplinary problems, and the use of youthful tutors only exacerbated this trend. Tutors had trouble commanding the respect of students, so they often adopted a domineering stance that only created further conflict. As in southern families, tutors were instructing their students in a classical curriculum that seemed out of touch with the wider world. Until college education became more relevant and the teaching profession itself became more professionalized in the late nineteenth century, college students would continue to challenge the authority of tutors.

In general, the fate of tutors stood in inverse relation to the notions of equality in the early Republic. As Americans became more committed to this ideal, they turned increasingly toward publicly funded schools that offered the prospect of equal opportunity for all. Tutors seemed to hark back to an aristocratic society that aimed to prepare gentlemen to rule rather than allowing all to compete for political authority. Since the South bore a more tortured relationship to notions of equality, it is not surprising that tutors enjoyed a longer and more prosperous history in that region.

ELECTION OF 1796 Historians have often stressed the dramatic, transforming character of the election of 1800 as the first peaceful electoral transition from an administration of one party and set of principles to that of another in modern history. They have even, with some help from Thomas Jefferson, labeled the election the Revolution of 1800. But however transforming 1800 may have been, the election of 1796 was America's first national electoral competition for political power, both between individuals and political organizations.

Everything about the election of 1796 was unprecedented, except for its complex legal mechanism, carefully laid out in Article II of the Constitution: In sixteen state contests for sixteen sets of electors (selected in whatever fashion each state chose), each elector would submit two names for president, with no preference given to either name. The person gaining the most votes would be elected president, and the second-most popular person would be elected vice president. This system had been used twice before but had not been truly tested, because George Washington was the first choice of every presidential elector both in 1788 and 1792, and John Adams's selection as vice president in those years had generated neither much controversy nor much enthusiasm.

By 1796, however, much had changed. The fiscal policies of Alexander Hamilton and the foreign policy of all Federalists, including President Washington, had begun to polarize the nation. When Washington announced his determination to retire from public life in September 1796, a two-month campaign to elect men who would defend, or alter, the Federalist worldview began in earnest.

This was not, however, like any modern presidential campaign, nor indeed any campaign that followed it. It presented to the nation two strong, and recently labeled, national factions, but no real parties. There were two coordinated attempts to present two competing tickets—John Adams of Massachusetts and Thomas Pinckney of South Carolina for the Federalists, and Thomas Jefferson of Virginia and Aaron Burr of New York for the Republicans—but some states were far more receptive to these tickets than were others. Washington himself gave not the slightest hint of his personal preference for any candidate or either faction until every elector had cast his vote and Adams's election seemed assured in late December 1796. This left national political figures from every region to decide whether to push one of the supposed tickets or to advance other combinations, especially Jefferson and Pinckney, or to ponder whether they should, or even could, exert any influence at all.

In such a campaign, divisive national issues were often subordinated to considerations of local interest or of individual relations to a host of potential candidates. Nevertheless, the campaign was spirited, conducted by letters, newspaper essays, and public addresses. The correspondence between various public figures, and sometimes from a public figure to a known or probable presidential elector, was of two kinds: confidential (not meant to be shared widely, if at all), and quasi public (intended to be shown to others, and occasionally even to be published, usually anonymously). Most of the potential candidates for the presidency or vice presidency, however, refrained entirely from campaigning, and declined even to announce their willingness to serve. Adams and Jefferson stayed at home for the entire contest and said virtually nothing to any visitors that could be used to much effect. It was, however, clear that they were willing to serve, and only a public declaration that they would not serve would have discouraged most, but not all, of their supporters. To this there was one exception. Aaron Burr campaigned openly and energetically for Jefferson but was widely considered to be campaigning for himself.

The end result of the election fully reflected its pre-party (or at most, proto-party) character. Adams won narrowly in the electoral college (not in the House of Representatives, as he had believed he would in the late winter of 1796), gaining 71 electoral votes to Jefferson's 68, with the remaining 133 votes spread among Pinckney, Burr, and nine other candidates, including Samuel Adams and Patrick Henry. The efforts of both Federalists and Republicans to promote clear tickets had failed. John Adams won by doing well in most of the middle states, where Jefferson ran poorly, and by winning one elector each from Federalist-leaning districts in Virginia and North Carolina. Jefferson, unable to secure every Virginia and North Carolina vote, became vice president.

tion to the inauguration of Jefferson was anything but smooth. In the aftermath of the election Congress wrote and sent on to the states what became the Twelfth Amendment to the Constitution to create a new method of electing the president.

THE CAMPAIGN

The campaign was one of the nastiest in American history. Since 1797 Adams had been president while Jefferson, his political rival, had been vice president. In July 1798 Congress had passed the federal Sedition Act, which made it a crime to speak or write disparagingly of the president or the Congress, but not the vice president. Thus, as the nation moved toward the election, Federalist U.S. attorneys arranged for the arrest of twenty-five supporters of Jefferson. Fourteen of these men were indicted and ten were convicted. The Sedition Act harmed Adams, and the public hostility to the suppression of political dissent may have cost him the election. Even with the Sedition Act hanging over them, supporters of Jefferson denounced Adams as favoring a monarchy and claimed he had arranged a marriage with one of his sons and the daughter of the English king in order to bring back the British monarchy. The Jeffersonians further accused Adams of sending diplomats to England to procure "pretty girls as mistresses" for the president and his running mate. Adams's supporters, on the other hand, accused Jefferson of being an atheist (he was in fact a deist) and of planning to set up a guillotine in the new national capital to execute his opponents and bring to the United States a reign of terror similar to that of the French Revolution.

Beyond the nastiness, there were significant differences between the two candidates. Adams favored Britain in the ongoing wars in Europe, while Jefferson was much closer to France. Adams wanted to strengthen the army and navy in preparation for a possible war with France; Jefferson favored a smaller military and wanted to avoid a military encounter with any nation but favored war against Britain, rather than France, if forced into the European conflicts. Adams and members of his party supported the recently chartered Bank of the United States; Jefferson was opposed to the Bank. Jefferson wanted to see all Indians on the East Coast removed to the West; Adams believed that the Indians needed to be "civilized" but had never suggested their removal. Adams had never owned a slave and was on the verge of giving diplomatic recognition to Haiti, the republic created by former slaves who had overthrown their French masters; Jefferson owned about two hundred slaves at the time of the election, supported the insti-

ELECTION OF 1800 In 1800 Thomas Jefferson defeated John Adams, winning the presidency in the most important and complex election between the adoption of the Constitution in 1787 and the election of Abraham Lincoln in 1860. Jefferson's inauguration on 4 March 1801 signaled a new era in democratic self-government in the new nation, as the candidate of an opposition party peacefully took office while his defeated rival—the incumbent president—quietly left office. Never, perhaps, in the history of the world had regime change been accomplished so peacefully and smoothly. The campaign, however, was hardly harmonious and the route from the elec-

tution of slavery, and was hostile to both emancipation and Haitian independence.

In this context Jefferson won a slim electoral majority, gaining seventy-three electoral votes to Adams's sixty-five. There was no popular vote, so it is impossible to know if this outcome reflected the true will of the electorate. Jefferson's political strength came mostly from the South, where slaves were counted (under the three-fifths clause of the Constitution) for purposes of allocating representatives in Congress *and* for the allocation of presidential electors. Without those electors created because of slaves (who of course could not vote), Jefferson would not have had an electoral majority. Ironically, in this election a man who owned about two hundred slaves gained his office because of the political power of slavery that was built into the process of electing the president. Despite the fact that Jefferson gained a majority of the electoral votes, he did not immediately win the election due to the complexity of the electoral process and a political mistake by Jefferson's supporters.

THE HOUSE CONTEST

Under the original Constitution the presidential electors voted for two candidates. The candidate with the most votes became president, if that candidate had a majority of the number of electors. The candidate with the second highest total became vice president. The framers assumed that each elector would vote for the two "best" candidates, and thus they would become president and vice president. This worked out in the first three elections. Washington had the most electoral votes in the first two elections and Adams was the runner-up. In 1796 Adams ran for president and was challenged by Jefferson. Adams had the most votes and gained the presidency, while Jefferson was runner-up and became vice president. However, Adams and Jefferson were not only rivals, but also political opponents. This led to a strained administration. It also taught leaders of the Federalist Party and the Democratic Republican Party that they needed to have a coordinated vote in the next election.

Thus, in 1800 all sixty-five Federalist electors voted for Adams, and all but one voted for Charles Cotesworth Pinckney, who was slated to be the vice president. This party discipline is remarkable, especially because at the time Alexander Hamilton, who had little faith in Adams, was trying to manipulate the Federalist electors to support Pinckney as president. But, Hamilton failed, and had the Federalists been in the majority, they would have reelected John Adams and replaced Jefferson with their own candi-

date. But the Federalists did not have a majority. The Democratic Republicans had seventy-three electors. All of them cast their ballots for Jefferson and for Aaron Burr. The party leaders assumed that Jefferson would then become president and Burr vice president. But the Constitution provided that if there was a tie in the electoral college, the House of Representatives would choose the president, with each state delegation casting a single vote. While Jefferson's supporters had a majority in the House, they did not control a majority of the delegations. Jefferson expected Burr to step aside and become vice president. But instead, the New York politician asserted that he had an equal right to be president and appealed to Federalists in Congress for support. The Democratic Republicans controlled eight delegations, the Federalists controlled six, and two others were evenly divided between Federalists and Democratic Republicans. Thus, for thirty-five ballots Jefferson won eight delegations, Adams won six, and two were tied and unable to cast a ballot. On the thirty-sixth ballot, Federalists from Vermont, Delaware, and Maryland abstained, thus allowing their states to cast ballots for Jefferson, and he was elected president.

In the wake of this terribly divisive election, Jefferson took office peacefully. In his inaugural he extended an olive branch to the Federalists, characterizing the bitter campaign as merely a "contest of opinion" and asserting that all Americans accepted the "sacred principle" that "the will of the majority . . . to be rightful, must be reasonable; that the minority possesses their equal rights, which equal laws must protect, and to violate would be oppression." The shared belief in these principles led Jefferson to declare "we are all Republicans—we are all Federalists."

ELECTION OF 1824 The election of 1824 saw the breakup of the Democratic Republican Party, a party that had dominated American politics since 1800. Although Thomas Jefferson's party had previously always agreed to support either the incumbent president or the nominee of the party's congressional caucus, in 1824 four Democratic Republicans insisted on carrying their candidacy right through to the electoral college. When the Virginian supporters of William Harris Crawford of Georgia organized a congressional caucus for 14 February 1824, in the hope of pulling party loyalists behind him, only 66 Democratic-Republicans (out of 187) attended, and the supporters of other candidates denounced it as an attempt to dictate to the electorate. The popular appeal of these protests ensured that never again would a congressional caucus be used to nominate a presidential candidate.

Though most historians see the election of 1824 as a contest among ambitious personalities, each candidate represented a clear regional outlook and constituency. The main objection to Crawford was that he represented the so-called radicals of the South Atlantic states, who were eager both to protect slavery and to prevent the federal government from adopting tax-and-spend policies hostile to the interests of the exporting states. Their considerable political influence met opposition even in their own states: western counties in these states wanted federal assistance for "internal improvements" (improvements in transportation infrastructure) and initially regarded John C. Calhoun of South Carolina as their candidate, who looked strong in Pennsylvania as well. In the southwestern states, a similar demand for roads and canals produced early support for Henry Clay of Kentucky, the most public advocate of the American System of high tariffs and federal appropriations for internal improvements. Clay had criticized General Andrew Jackson of Tennessee for leading U.S. forces into Spanish Florida in pursuit of hostile Creeks in

John Quincy Adams Copper Cent. During the 1800s politicians used coins and currency already in circulation as a means of free advertising. This large copper coin is stamped with the name of John Quincy Adams, a candidate for the presidency in 1824. © DAVID J. & JANICE L. FRENT COLLECTION/CORBIS.

1818 and risking war with both Spain and Britain. But Jackson's actions, which hastened the acquisition of Florida in 1819, were widely popular in Tennessee, Alabama, and Mississippi, especially among those who wished to expel the surviving native tribes, and the general soon overwhelmed Clay's candidacy in the Old Southwest, outside sugar-growing Louisiana.

A series of events made Jackson more than merely a regional candidate. A grassroots movement on his behalf among the Scotch-Irish of western Pennsylvania made it politically difficult for the various Republican factions in the state to back anyone else. In March 1824 a Republican state convention overwhelmingly named him, rather than Calhoun, as the state's favorite. At that point Calhoun withdrew and became the sole candidate for vice president, and Jackson inherited Calhoun's strength in the Southeast and Middle states. Jackson won Pennsylvania, New Jersey, and South Carolina, and in North Carolina he directly benefited when a coalition of Jackson and Adams supporters calling themselves the People's Ticket carried the state against Crawford.

In New England, Southern candidates suffered from the almost universal revulsion (in the wake of the Missouri Compromise) against Southern dominance in national politics. John Quincy Adams was

the only viable candidate free of the stain of slave-holding, and he proved almost unstoppable not only in New England but also in the areas to the west that Yankees had settled during the previous quarter century. In New York, a coalition of groups calling themselves the People's Party rebelled against the attempt of old Republicans led by Martin Van Buren to give that state's votes to Crawford. Though this coalition failed to wrest the right to choose the electors from the state legislature, its success in the assembly elections ensured that Adams won the lion's share of the state's electoral votes.

In the Middle Atlantic and Border states, both Adams and Crawford were unpopular because they were commonly identified with areas in the old Atlantic economy that opposed protecting American industries. In Pennsylvania, New Jersey, and Maryland, Jackson benefited from being portrayed as a supporter of the American System. In the Ohio Valley, where there was strong demand for internal improvements, Clay was the front runner, but he was opposed by both New England settlers and those who resented his pursuit of debtors as attorney of the Bank of the United States following the Panic of 1819. Challenged by Jackson, who was portrayed as the people's champion, Clay lost Indiana and Illinois to him but carried Ohio and the slave states of Kentucky and Missouri. Through intrigue Clay lost important electoral votes in New York and Louisiana, where the choice of electors was made by the state legislature.

The consequence of this confusing election was that no candidate won a majority of electoral college votes and so, according to the Constitution, the election was thrown into the House of Representatives, with each of the twenty-four state delegations casting one vote. Only the top three candidates—Jackson with 99 electoral votes, Adams with 84, and Crawford with 41—could be considered, but as Speaker of the House, Clay (missing out with 37 votes) could act as kingmaker. The House that made the decision on 9 February 1825 had been elected in 1822–1823 and so did not reflect the recent popular election. This fact worked against the outsider Jackson, who had done surprisingly well in the electoral college, though it is a myth to say that he won more of the popular vote than any other candidate. At a critical moment in the session, New England representatives in Congress threw their support behind internal-improvement measures, which enabled Clay and his friends to claim that Adams was the most likely to back the American system as president. That gave Adams the three states Clay had won, plus Illinois

and Louisiana, to add to the six New England states. In addition, Adams's private assurance that he was not opposed to appointing Federalists to office gave him Maryland and swung the divided New York delegation his way, to give him the necessary thirteen states.

These bargains, though necessary, were denounced as corrupt by the disappointed candidates, especially when Adams appointed Clay as secretary of state. These opponents united to obstruct Adams's presidency and worked to replace him with Jackson in 1828. Thus the election of 1824 started the process from which the national Republican and Democratic Parties would emerge.

ELECTION OF 1828 The election of 1828 was one of the nastiest in American history. In some ways, the contest was an extension of the previous presidential election in 1824. On both occasions, John Quincy Adams and Andrew Jackson vied for the highest office in the land. In 1824 a total of four candidates ran, with the electoral votes scattered among them. Jackson won the most popular and electoral votes, but lacked a majority in both categories. Thus, the election went to the House of Representatives, where Adams was chosen primarily because of behind-the-scenes maneuvering by Henry Clay. Jackson cried foul when Clay was subsequently appointed secretary of state by Adams. The thunder of "corrupt bargain" rumbled throughout the nation, and as a result, campaigning for the election of 1828 began immediately.

The meanness of the campaign engendered charge and countercharge. Jackson's supporters declared that Adams, while acting as secretary to his father, then ambassador to Russia, had procured a young American girl for the tsar's pleasure. Adams's forces, in turn, announced that Jackson's mother was a prostitute and that he was the result of her liaison with a mulatto. Notwithstanding such tawdry accusations, the election actually involved important issues. Jackson's supporters argued that the will of the people had been cheated in the 1824 election because he had received the highest number of popular and electoral votes. On the election of 1828, insisted Jackson forces, teetered the very survival of constitutional, majoritarian democracy.

Such an argument was a rather new concept. The founding fathers had embraced democracy, but their emphasis was more on representative republicanism. They referred to the nation as a republic and believed firmly in deferential government. In other words the elite, educated men of the nation should lead, and the masses should defer to the elite's superior judgment. Jackson challenged and ultimately dismantled this system. He was not born into aristocracy. Rather, he was the first president reared in poverty. He struggled, fought, and worked his way to a position of respect and power. As a result, the people connected with him in a way they had never done with prior presidents. Even George Washington, revered as the nation's father, had not achieved such a status. Both the broadening right of suffrage throughout America and Jackson's victory at the Battle of New Orleans (1815) played significant roles in the election. Ultimately, Jackson became a symbol of burgeoning democracy and was venerated as representative of the common man. He promised reform in government and the people believed him.

John Quincy Adams appeared in stark contrast to Jackson's humble origins. Born into an elite Massachusetts family and educated at Harvard, Adams was the son of the nation's second president and had held a plethora of offices, including secretary of state under President James Monroe. After winning the questionable election of 1824, he announced in his First Annual Address that government was "invested with power" and made continual comparisons between the progress of Europe and the backwardness of America. He insisted that the nation should not "slumber in indolence," nor should the legislature be "palsied by the will of our constituents." This and other statements of Adams had the tone of haughtiness and aristocracy about which Jackson and his supporters warned. Adams's more-or-less-rejection

of the popular will as a guide for America's leaders paralleled that tone. Furthermore, the belief that the burgeoning United States was second to the decadence of centuries-old Europe angered Americans.

Jackson opposed that belief. His victory over the British at New Orleans, the crushing of an army that had defeated Napoleon's best by a ragtag group of yeoman militia, quickly became a symbol of America's greatness. As the commander of such a triumph, Jackson personified the nation's finest attributes. This, in fact, was the very reason that his popularity exploded following the battle and why the road to the executive office opened before him. Add the alleged corruption of 1824 and the inborn aristocracy of Adams, and Andrew Jackson's success in the election of 1828 was virtually assured.

Once presidential victory arrived, the nation witnessed an inauguration like no other. People flooded the streets in order to see "their" champion. Whereas in the past the ceremony to usher in a new leader had been an affair for Washington society only, this time the elite found itself surrounded by the members of the "rabble" who now felt they had license to partake in democratic government. America would never be the same.

EMANCIPATION AND MANUMISSION

Emancipation is the process of freeing slaves through government action. Manumission takes place when masters free their slaves voluntarily. When a government ends slavery completely, the process is known as abolition. Before the Revolution slavery was legal in all thirteen British mainland colonies. Some of the northern colonies allowed masters to manumit their slaves, and there was a significant free black population in all of them. On the eve of the Revolution, voluntary manumission was illegal in most of the South, and even where it was permitted, the practice was not common.

During the Revolution thousands of masters freed slaves who were willing to fight in the American army or local militias. Throughout New England male slaves became free black soldiers, and many were able to gain liberty for their wives and children as well at this time. Even in the South some masters freed slaves so that they could fight in the army. For example, in the legislative session of 1782–1783, Virginia passed a law declaring that all slaves who had served in the army and been honorably discharged were entitled to their freedom and condemning as “contrary to the principles of justice” those masters who tried to reenslave former soldiers.

Beyond wartime manumissions, a number of the newly independent states of the North began to take steps to end slavery. In its 1780 constitution Massachusetts declared that “All men are born free and equal, and have certain natural, essential and inalienable rights, among which may be reckoned the right of enjoying and defending their lives and liberties; that of acquiring, possessing and protecting property, and in fine of seeking and obtaining their safety and happiness.” In a series of cases, including *Commonwealth v. Jennison* (1783) the Massachusetts courts interpreted this clause to have ended slavery in the state. New Hampshire’s 1783 constitution contained a similar clause that was read the same way. Vermont, which became the fourteenth state in 1791, unambiguously abolished slavery. In 1780 Pennsylvania passed the nation’s first gradual emancipation act. The law provided that the children of all slaves born in the state would be free at birth, but subject to an indenture. The law was a compromise between those who wanted to end slavery immediately and those who opposed any emancipation on the grounds that it would take private property from people, in violation of the basic principles of the Revolution. Although the law did not require masters to emancipate their slaves, it seems to have led to that result. In 1790 the first U.S. Census, which was conducted ten years after the law went into effect, found 6,537 free blacks and 3,730 slaves. By 1800 the free black population had grown to over 14,000 while there were just 1,706 slaves in the state. At the end of the early national period the 1830 census found 37,930 free blacks and only 403 slaves in the states. Over time slavery had literally died out in Pennsylvania. In 1784 Connecticut and Rhode Island passed similar laws, and in 1799 and 1804 New York and New Jersey did the same. In 1790 the northeastern states had just over 40,000 slaves and about 27,000 free blacks. By 1830 the slave population was under 2,800 while there were over 122,000 free blacks in the region. Meanwhile, Ohio (1803), Indiana (1816),

Illinois (1818), and Maine (1820) had entered the Union as free states. The Constitutions of those states banned slavery, although some slaves were held into the 1830s in Indiana and into the 1840s in Illinois.

Before the Revolution manumission in the South was rare and in many places illegal. The free black population was small. During the Revolution some southern masters freed slaves who joined the army, but most masters did not. During the war, however, some southern masters concluded that slaveholding violated their political principles, their religious principles, or both. In 1782 Virginia allowed masters to voluntarily free adult (but not truly old) slaves. In 1780 Virginia had about 2,000 free blacks; by 1810 that number had increased to over 30,000, as thousands of individual masters—including George Washington—took advantage of this law to manumit their slaves. In this period the free black population in Virginia grew faster than either the white population or the slave population. However, these manumissions did not affect the overall importance of slavery to the state, as the slave population grew from about 288,000 in 1790 to 383,000 in 1810 and to over 453,000 by 1830. The free black population in the state in 1830 was about 47,000. In the rest of the South, there was a similar burst of manumissions during the Revolutionary period. South Carolina’s free black population went from 1,800 in 1790 to over 4,500 by 1810; but then the rate of growth slowed, reaching about 7,900 in 1830 and then hardly growing at all in the next three decades.

In Maryland and Delaware, however, manumission was more common in this period. Maryland had only about 8,000 free blacks in 1790, but by 1810 that number had grown to about 34,000; at the end of the early national period, the 1830 census found about 53,000 free blacks in the state. More important, in 1810 the slave population peaked at 111,000 and by 1830 had dropped to 102,000 as manumissions and sales reduced the percentage of slaves. This trend, started in the Revolutionary period, would continue until slavery came to an end. By the eve of the Civil War, Maryland would have about 83,000 free blacks and only about 87,000 slaves. The rate of manumission was even higher in nearby Delaware, which had over 15,000 free blacks by 1830 and about 3,300 slaves.

The Revolution in the North led to emancipation and abolition. John Jay and Alexander Hamilton were leaders of the New York Abolition Society while Benjamin Franklin was the president of Pennsylvania’s society. Collectively these opponents of slavery worked for a state-sponsored solution to slavery. As

governor of New York, John Jay signed the state's gradual emancipation law. But, despite the implementation of ideology that led to southern manumissions after the Revolution, individual opposition to slavery did not threaten the institution in the South. George Washington freed his slaves at his death, but he is remarkable as the only leading southern founder to do so. Washington contrasts sharply with Thomas Jefferson, who manumitted a handful of slaves (all members of the Hemings family); at his death his two hundred or so slaves were sold off at auction.

EMBARGO An embargo, or prohibition of trade with foreign nations, was integral to Jeffersonian Republican commercial policy and diplomacy from 1805 to 1814. The policy evoked heated debates among contemporaries and historians, the latter having variously described it as a form of pacifism, a preparation for war, an agrarian critique of commerce, and an extension of the Jeffersonian Republicans' deep commitment to the carrying trade. Rather than viewing individual measures as the embodiment of a particular worldview, however, the most famous embargoes—restrictions against Haiti in 1805 and 1806 and Jefferson's total Embargo Act of

1807—are best understood within the context of a diverse Jeffersonian Republican coalition acting within precarious geopolitical circumstances.

EMBARGO AGAINST HAITI

As Haitian revolutionaries fought for their independence from France, President Thomas Jefferson kept a watchful eye on the situation, adjusting economic policy to fit developments. At first, concerns about French designs in North America convinced him to allow the burgeoning American trade to the island to continue. The Louisiana Purchase of 1803 reduced these concerns, while the arming of private American vessels elevated the threat of open war against the French naval blockade of the island. News of bloody massacres at the hands of the Haitians heightened racist anxiety about an independent black republic so close to the United States's own slave populations. After first passing trade restrictions in March 1805, in February 1806, to the relief of concerned southerners and the chagrin of northern merchants involved in the Haitian trade, Jefferson and the Republican-controlled Congress refused to recognize the island's independence and prohibited trade to the revolutionaries. Legal trade resumed in the spring of 1810 but with restrictions against Haitian vessels entering the United States. Official recognition did not occur until 1862.

A COERCIVE MEASURE

The impact of the Haitian embargo paled in comparison to Jefferson's more controversial embargo passed by Congress on 22 December 1807. In this instance, Jefferson and Republican loyalists sought to close American markets completely until France or Britain agreed to respect America's neutral commerce. In 1803 the resumption of war between the two rivals had increased European demand for American crops and served as a boon to U.S. commerce. British naval supremacy, especially after the Battle of Trafalgar in October 1805, left France particularly reliant on American merchants to transport their colonial goods. America's good fortune, however, depended on the willingness of belligerents to allow its ships access to enemy ports.

Good will eroded in early 1806 as the British navy blockaded Continental ports, challenged U.S. involvement in the colonial trade, and increased impressments of American sailors who, Britain suspected, had deserted the Royal Navy. In April, a large congressional majority responded by passing a Non-Importation Act limiting the importation of certain British manufactured goods. The measure remained

in effect for only a short time, however, in hopes that James Monroe, minister to Britain, and special envoy William Pinkney could reach a diplomatic settlement. Negotiations led to a draft treaty in December 1806 that appeared to meet many of America's commercial demands but that proved unsatisfactory to the administration and its Republican merchant advisers. Further negotiations between the two nations fizzled in the spring of 1807. In June, tensions heightened when the British frigate *Leopard* fired on an American warship, the *Chesapeake*, and forcibly removed four British deserters. In September, reports from France warned of the seizure of American ships suspected of funneling British goods into the Continent in violation of the Emperor Napoleon's 1806 Berlin decree. His Milan Decree of November 1807 confirmed that was French policy. Britain, in turn, responded with Orders in Council requiring neutral nations to stop at British harbors and pay transit fees. When Congress convened in December 1807, the administration contemplated war but ultimately asked members for an embargo to "keep our seamen and property from capture, and to starve the offending nations." Wide majorities in both houses complied.

From the beginning, then, Jefferson's embargo had both defensive and offensive purposes. It kept American vessels and resources out of harm's way, saving them for possible war. At the same time, it withheld American raw materials—especially cotton, timber, and wheat—as leverage to encourage the belligerents to acknowledge America's neutral rights. Smuggling, especially across the Canadian border, undermined the embargo's impact and led to subsequent legislation and executive orders banning trade with Canada and Spanish Florida and giving government officials expansive powers to inspect and seize suspicious vessels. American exports dropped to one-fifth of their pre-embargo levels. The coastal trade between states remained legal but large bonds were required. New England Federalists decried the measure as "Francophile" and denounced its heavy-handed enforcement as an egregious abuse of executive power. Joining them were a small number of states'-rights "Old Republicans" like John Randolph who lamented the centralization of authority and the rejection of the Monroe-Pinkney Treaty.

Despite many complaints and some violations, the embargo gained broad public support from a loyal Republican majority—in part because it preserved peace while simultaneously laying the groundwork for possible war. Petitions from Republican strongholds throughout the nation praised the

measure, branded opponents as unpatriotic, and anticipated that this form of commercial warfare would win concessions from Europe. Supporters of the act argued that it offered "equal suffering from all"; the nation's diverse agricultural and commercial interests from all regions would share the hardships of protecting national honor and commercial rights.

RESULTS

Everyone did suffer, but to varying degrees. American artisans and nascent manufacturers, especially in mid-Atlantic localities, benefited from a lack of foreign competition. Southern planters and western farmers claimed they suffered the most, being deprived of markets for their crops or access to European finished goods. In all likelihood, however, New England commercial populations of fisherman, sailors, and merchants were hit hardest by the port closures. By late 1808 patience in this region ran out, sparking cries for secession that foreshadowed the Hartford Convention of 1814. In the meantime, initially optimistic reports from Europe about the embargo's impact gave way to more mixed notices, some even suggesting that French and British officials welcomed the policy. Federalist gains in state and national elections in the fall of 1808 suggested that neither the nation nor the Republican Party could bear the sacrifices much longer.

At the behest of northern Republicans, and more reluctantly the outgoing president, Congress backed away from a complete embargo, repealing it for good on 1 March 1809. In its place a Non-Intercourse Act opened trade with neutral nations while continuing the ban on trade with France and Britain. Some southern supporters of the embargo did not let the bill go quietly, however, arguing that Non-Intercourse ended the policy of equal suffering, allowing northern merchants to trade but preventing southern planters access to their chief markets except through expensive, circuitous, and potentially illegal routes. South Carolina representative David Williams and Georgia representative George Troup unsuccessfully lobbied to extend the embargo and, if necessary, declare war. Instead, Congress and the incoming president, James Madison, placed their faith in the assurances of British minister David Erskine, whose diplomatic negotiations had appeared to settle the dispute. In light of these discussions and as an act of further good will, Madison announced the renewal of trade with Great Britain in April 1809. When Westminster refused to accept Erskine's agreement, however, Non-Intercourse was reinstated while Congress began an extended debate on how to pro-

ceed. Unable to reach any consensus on a policy that would affect different groups equally, in May 1810 a Congress close to adjournment passed Macon's Bill No. 2, which lifted all trade restrictions against France and Britain while empowering the president to reimpose Non-Intercourse if one of the belligerents lifted its trade restrictions and the other did not do so within the following three months. The measure was so weak it was openly mocked at home and abroad, where it had no impact in changing European policies.

During its fifteen months of enforcement, Jefferson's embargo became paradoxically a symbol of national and party unity and a source of sectional frustration and national weakness. Its negative legacy and lack of success tainted Jefferson's legacy and Republican political economy. Attempts at other forms of economic coercion were equally controversial and unsuccessful. In 1812 the declaration of war against Britain was preceded by a ninety-day embargo. In the summer of 1813 Madison sought a new embargo law, but Congress refused to pass it. Madison succeeded in getting another embargo later in 1813, but it was repealed in the spring of 1814 after Britain and its allies had secured the abdication of Napoleon.

Brian Schoen

years 1754 to 1829 have found fairly ample evidence of how early Americans both described and prescribed emotional ideals—the cultural expectations of emotion. Yet evidence of the social expression of emotion—records of how people communicated and negotiated emotion—is harder to come by. Most problematic of all in the study of emotion during the early American period is finding surviving traces of the inner dimension of emotion, or subjective experience.

EMOTIONAL IDEALS OF THE ERA

In the wake of the Enlightenment, emotion achieved a newfound appreciation in the culture of the Old and New Worlds. A tremendous number of writers and thinkers devoted themselves both to describing and prescribing emotional ideals. According to their prescriptions, achieving civility required that people cultivate yet carefully control their emotions.

Scottish moral philosophers frequently read in America—Francis Hutcheson in *On the Nature and Conduct of the Passions and Affections* (1728); David Hume in *Treatise of Human Nature* (1739); and Adam Smith in *Theory of Moral Sentiments* (1759)—argued for the efficacy of emotion in fostering virtue. Benevolence, based on the ability to feel for others, was to be the glue that bound individuals together in society. Likewise, advice and conduct books, such as Lord Chesterfield's *Letters of Advice to His Son* (1775), urged the cultivation of finer feelings alongside the restraint of unruly personal passions. Popular literature—such as articles in the eighteenth-century periodical *The Spectator*, published in England by Joseph Addison and frequently reprinted on the other side of the Atlantic, and the first original novel ever published on American soil, William Hill Brown's *The Power of Sympathy* (1795)—also celebrated emotion. At the same time, American theologians preached the importance of emotion for Christian conversion. Jonathan Edwards helped provoke the First Great Awakening with his *Treatise Concerning Religious Affections* (1746); his grandson Timothy Dwight assumed the presidency of Yale College and helped begin the Second Great Awakening in 1795.

Notably, these emotional ideals, far from being associated exclusively with femininity, applied to men and women alike. And although there were certain associations between emotional sensibility and gentility, by the time of the Second Great Awakening the capacity for feeling was widely understood to cut across lines of race and rank as well as gender.

EMOTIONAL LIFE Although emotion is an elusive subject for research, it can provide insight into a society's workings. In early America, emotions colored every aspect of the new society from domestic to diplomatic relations. Historians examining the

EXPRESSION AND COMMUNICATION

American emphasis on emotion was sparked in part by the confrontations among cultures brought about during the Seven Years' War (1756–1763). During that war the British and British Americans, the French, and Native Americans alike contested the rules of savagery and civility, using emotion as a means of keeping score. Indeed, emotions played key roles in mediating colonial encounters: Europeans participated in Indian condolence ceremonies, and the French and English competed in the arena of civility and sensibility, as spelled out in both popular political pamphlets and official communiqués. Throughout the period 1754 to 1829, Americans preferred to cast themselves as inherently civilized and all Indians as savage. Yet they could not help admiring what they saw as the Indians' natural elegance of emotional expression. In 1785 Thomas Jefferson praised the eloquence of Shawnee Chief Logan in his *Notes on the State of Virginia*, and at the Treaty of Greenville in 1795, General Anthony Wayne paid tribute to his Indian opponents' civility and capacity for sympathy.

Emotional expression also contributed significantly to political language. Thomas Paine called on all Patriots to consult "the feelings and passions of mankind" in his 1776 pro-Revolution pamphlet *Common Sense*. In 1783 George Washington delivered an emotional speech on behalf of the new nation in response to the Newburgh conspiracy. Countless new senators and representatives sought to use their own finely honed senses of sympathy and resentment as a means of displaying their honor in the course of conducting the business of government. American political leaders relied on expressions of emotion to define and defend their positions.

In many areas of public life outside politics as well, expressions of emotion helped send important messages. Reform movements of the late eighteenth and early nineteenth centuries, especially abolitionism, used the language of humanitarian sensibility as a rallying cry. Like the evangelical minister John Wesley, who demanded (in a piece widely reprinted in the 1770s and after called *Thoughts on the Keeping of Negroes*) that slaveholders pay attention to "the flowing eyes, the heaving breasts" of those they held in bondage, activists urged their fellow citizens to show the strength of their feeling for others by having compassion for the enslaved.

SUBJECTIVE EXPERIENCE

To track changing ideas about emotion or shifting levels of expression is one thing, but it is quite another to attempt a history of emotion as experienced in-

ternally. Historians who investigate records with the potential to reveal personal emotions, such as speech recorded in court testimony, letters exchanged among friends and family members, and the emotions mentioned in diaries, agree that between 1754 and 1829 people devoted ever-increasing amounts of effort to the deliberate regulation of their emotions. Some emotions, such as social sympathy and romantic love, appear to have been granted greater importance; other emotions, such as anger, inspired ambivalence. Ultimately, however, beyond the general conclusion that Americans increasingly valued emotional control, determining the relative prevalence of any given emotion presents great difficulties.

Historians of emotion have turned to theories and methods drawn from many other disciplines, especially psychology, anthropology, and sociology, along with philosophy and literary theory. Historians influenced by psychological theory tend to argue against significant change over time, convinced that certain universal emotions largely transcend the particularities of time and place. Conversely, scholars influenced by anthropological theories tend to emphasize that emotion is contingent—that is, emotional experience is shaped through discourse. Between these two extremes lie approaches that try to account for both the commonalities of human emotion across culture and the very real variations in prescriptions for and expressions of emotion. If all human beings have the same potential to experience emotion, yet variations in the apparent occurrence of emotion are real, then attention to the patterns of which emotions are prized or pilloried, expressed or repressed can tell scholars a good deal. Such trends can reveal much about the structuring of society and may also ultimately offer clues to changing subjectivity.

Nicole Eustace

ENCYCLOPÉDIE There is little evidence to suggest that the twenty-eight volumes of the first folio edition of the *Encyclopédie, ou Dictionnaire raisonné des sciences, des arts et des métiers* (Explanatory Dictionary of the Sciences, Arts and Trades) (1751–1772), compiled by Denis Diderot and Jean d'Alembert, circulated widely in British North America. A London translation of Diderot and d'Alembert's preface, *The Plan of the French Encyclopaedia* (1752), could be ordered from colonial booksellers, however, and the single-volume *Select Essays from the Encyclopaedia* (1772) could be found in subscription libraries. British North American readers might also have encountered excerpts of articles from the *Encyclopédie* in such publications as Sir William Blackstone's four-volume *Commentaries on the Laws of England* (1765–1769) or in the numbers of *The Annual Register*. But far more common as reference works were the two volumes of Ephraim Chambers's *Cyclopaedia: or, a Universal Dictionary of Arts and Sciences* (1728), of which the original *Encyclopédie* project was to be a translation, and the three volumes of the *Encyclopaedia Britannica; or a Dictionary of the Arts and Sciences* (1771), for which the *Encyclopédie* served as a model.

The improved commercial and cultural relations between France and the new United States, which flowed from their alliance during the American Revolution, made the *Encyclopédie* more readily available to Americans during and after that conflict. Booksellers in Alexandria, Virginia, and Philadelphia advertised copies for sale, including the less-expensive thirty-nine volume quarto (1771–1781) and octavo (1778–1782) editions. The Société Typographique de

Neuchâtel, which was involved in publishing those editions, discussed the prospects of marketing them in America with Benjamin Franklin. In 1781 Thomas Jefferson, then governor of Virginia, convinced that state's council to purchase the *Encyclopédie* for the public's benefit. Jefferson subsequently obtained a copy for personal use, as did James Madison.

Greater interest was expressed in the United States for the successor to Diderot and d'Alembert's compendium, the *Encyclopédie méthodique, ou par ordre de matières, par une société de gens de lettres, de savans et des artistes*. Unlike the original *Encyclopédie*, which was arranged alphabetically, the *Encyclopédie méthodique* (Methodical Encyclopedia, arranged by subjects, by a Society of Men-of-Letters, Scientists and Artist) was a collection of dictionaries written on specific subjects. Ultimately it would consist of 102 parts, or *livraisons*, which appeared in 166½ volumes of text and 51 volumes of illustrations. Charles Joseph Panckoucke, the editor-in-chief, began publication in 1782, but the series was not completed until 1832. The *Encyclopédie méthodique* headed the list of books that James Madison, Thomas Mifflin, and Hugh Williamson recommended for purchase by the Continental Congress in 1783. Madison, Benjamin Franklin, Francis Hopkinson, and James Monroe were among those who subscribed to its volumes, as were the College of William and Mary and the American Philosophical Society. By far the most active American promoter and supporter of the *Encyclopédie méthodique* was Thomas Jefferson. In 1783 he suggested that Panckoucke appoint an agent in Philadelphia to solicit subscriptions and to supervise the distribution of the respective *livraisons* in the United States. While no such arrangements were made, Jefferson did take up these tasks informally during his residence in Paris from 1784 to 1789.

Jefferson was also a contributor to the *Encyclopédie méthodique*, which he described as a "valuable depository of science." Early in 1786 Jean Nicholas Démeunier, the editor of *Économie politique et diplomatique* (1784–1788), one of the dictionaries constituting the *Encyclopédie*, asked for his advice on drafts of articles on the United States and on a number of the states. Jefferson agreed. In a series of exchanges with Démeunier, he provided documentation for, corrections of, and comments on the Articles of Confederation, the debt of the United States, their population and their codes of law—including the Virginia Act for Establishing Religious Freedom, of which he was an author. But Jefferson's most extensive and substantive revisions to the "États-unis" (United States) entry concerned the remarks on

"*l'association des Cincinnati et des dangers de cette institution*" (the Society of the Cincinnati and the dangers posed by that organization). In preparing the materials for this section of the *États-unis* article, Dêmeunier had relied on the Comte de Mirabeau's *Considerations sur l'Ordre de Cincinnatus* (1784), a pamphlet that portrayed the Cincinnati as enemies to republican equality. Although Jefferson also opposed the order and hoped for its dissolution, he objected to Dêmeunier's "unjust and incorrect Philip-pic" against George Washington and his fellow officers. In its place he provided a more generous construal of the history of the Cincinnati based upon correspondence and conversations with Washington and Lafayette. Dêmeunier went on to incorporate most of the recommended changes in the final draft.

During the summer of 1786, the "États-unis" article appeared in volume two of *Économie politique et diplomatique*. His participation notwithstanding, Jefferson expressed strong reservations about some of the article. Yet when Panckoucke also printed copies of the article separately, Jefferson forwarded them to correspondents in Europe and the United States. He also arranged to have the Virginia Act for Establishing Religious Freedom excerpted from the *Encyclopédie méthodique* and distributed to embassies in Paris. Jefferson's collaboration with Dêmeunier could be seen as well in the article "Virginie," large sections of which were taken verbatim from the former's *Observations sur la Virginie* (1786), the French edition of his *Notes on the State of Virginia* (1785). The entry "Virginie," published in the fourth and final livraison of *Économie politique et diplomatique* (1788), also included the text of the new Constitution of the United States. Dêmeunier subsequently reprinted all the entries on America in pamphlet form as *L'Amérique Indépendante, ou Les différentes constitutions des treize provinces . . . sous le nom d'États-Unis de l'Amérique* (Independent America, or the Different Constitutions of the Thirteen Provinces . . . Called the United States of America) (1790). This pamphlet, and the original *Encyclopédie* articles, would prove to be important resources in the course of debates over constitutional reform in the National Assembly in the early years of the Revolution in France.

Although Jefferson predicted that the *Encyclopédie méthodique* would be "universally diffused" and would "go down to late ages," its impact in the United States was less than he anticipated. The factors of cost, delays in publication and distribution, and the barriers of language combined to limit its circulation and influence. The standard reference collection in the new American nation would be the *Encyclopaedia; or,*

A Dictionary of Arts, Sciences, and Miscellaneous Literature (1798), based on the third edition of the *Encyclopaedia Britannica*.

ENVIRONMENT, ENVIRONMENTAL HISTORY, AND NATURE By the eve of the American Revolution, travelers in the mainland colonies of British America were encountering a natural environment that had been transformed in significant and lasting ways during the prior century. Though inland communities remained home to the subsistence cultures of rural farming families and Native Americans, who transformed the environment in their own distinct and often destructive ways, the main sources of environmental change in the eighteenth century were the efforts of European settlers, Native Americans, and enslaved Africans to adapt to the development of a transatlantic market economy. While farmers in New England and the middle colo-

nies had begun to supply wheat, lumber, and other daily necessities to Europe and the British West Indies, the planters of Virginia and the Carolinas provided exotic items such as tobacco, rice, and indigo to consumers throughout the Atlantic world. Overseas markets extended their influence as far west as the vast Indian country between the Appalachian Mountains and the Mississippi River, where organized networks supplied a booming fur and skin trade.

The impact of the new Atlantic commerce on North American ecology was profound. Inhabitants of colonial North America learned to perceive of their physical surroundings in basically capitalist terms. Natural resources increasingly were viewed as commodities, articles of value capable of being exchanged for other goods or money. Though ecological consequences varied according to region, every colony touched by the Atlantic economy suffered deforestation, epidemics, soil exhaustion, and decreasing

numbers of game animals. Market forces would continue to transform the North American environment, east of the Mississippi River, during a period of national development and growth that extended from the American Revolution to the start of the Jacksonian era.

ENVIRONMENTAL CHANGE, 1776–1800

The environmental history of the post-Revolutionary period revolves around two key developments: the expansionist land policy of the new federal government and the commercial boom of the 1790s. When the North American colonies declared their independence in 1776, they complained that the Proclamation of 1763 had denied white colonists access to the fertile lands west of the Appalachians. The signing of the Treaty of Paris (1783) brought the era of British restrictions on colonial expansion to a decisive close. The Continental Congress worked quickly to promote settlement of western lands. The Land

Ordinance of 1785 advanced a sweeping vision in which federal authorities would transform the vast terrain between the Appalachian Mountains, north of the Ohio River, and the Mississippi River into rectangular lots to be granted as private property to enterprising citizens. Such a vision left little room for coexistence with the tribes that had dominated Indian country for centuries, initiating as it did a fatal struggle between red and white peoples for exclusive control of eastern North America. East of the Appalachians, many white Americans enjoyed the benefits of a surging economy. With western Europe recovering from a series of wars, the demand for North American products rose dramatically. The price of wheat, for instance, climbed high enough to tempt subsistence farmers in the mid-Atlantic states, whose primary aim had previously been to feed, clothe, and shelter an extended family, to begin to produce large surpluses (quantities of farm products beyond what was required for subsistence) for overseas trade.

New England. While the environmental effects of these developments would be felt throughout eastern North America, the environments of New England and the South Atlantic colonies (Maryland, Virginia, North Carolina, South Carolina, and Georgia) have received the most extensive study. New England has been one focus of an important debate among environmental historians over the timing of the transition to a market economy and its role in the transformation of the early American environment. According to William Cronon's *Changes in the Land* (1983), by the eve of the Revolution, prior Native American and European understandings of the New England environment had given way to a perception of the landscape as a source of commodities. Deforestation due to trade in white pine masts, turpentine, pitch, and tar had resulted in a drier landscape more vulnerable to erosion from high winds. Beaver, fox, and lynx had grown scarce as trappers and traders sought valuable pelts.

In *Ecological Revolutions* (1989), Carolyn Merchant argues that market attitudes prevailed only among the wealthy elite of New England's coastal towns. Inland communities with little access to markets practiced a traditional blend of Native American and medieval European agriculture that aimed to feed, clothe, and reproduce the family. This form of subsistence farming was far more ecologically sensitive than farming for the market would later be. After clearing forest trees by cutting or burning, farmers used small lots for crops for just a few years, rotating corn, beans, and squash between three

fields. Those fields then lay fallow (unused) or served as pastureland for up to eight years, then reverted to forest while a new lot was cleared for the growing of crops. Such methods worked effectively to preserve soil nutrients.

Environmental historians agree that ultimately, between the Revolution and 1800, broader developments would further integrate all of New England, including inland villages, into an expanding market economy. Federal land policy opened new terrain for settler farmers. The Iroquois lost title to two million acres in upstate New York in 1787. The peak in European demand for meat and grain in the 1790s, coupled with state-funded construction of turnpikes and canals, powered the growth of commercial agriculture.

At the same time, subsistence farming families also suffered the effects of another crisis. Though children were a necessary source of labor, sons needed to inherit farms when they came of age. As inland families grew due to sound farming methods, land in turn grew scarce. Within a few generations, many farms had been divided into small subunits in which less space for tillage, pasture, and woodlot could be spared.

Rural families responded to these tensions either by migrating to western lands, where they could preserve subsistence traditions, or by remaining in New England and raising cash crops for the market. For many families who did remain, the transition to commercial farming was disastrous. As more land was taken up by cash crops, the ecological balance of the entire farm was upset. Crop yields diminished as the soil was deprived of nutrients. The stage was set for the abandonment of New England farms in the nineteenth century.

The Chesapeake and the Carolinas. The ecological impact of the Atlantic economy was felt with even greater intensity in the region of warmer temperatures and more abundant rainfall that stretched from the Chesapeake Bay to the Carolina low country. Relying on the labor of enslaved Africans, southern plantation owners cleared Virginia forests and drained Carolina swamps to grow massive quantities of staple crops (including rice, tobacco, corn, and indigo) for overseas export. Merchants based in large towns, meanwhile, worked closely with southeastern Indians to organize a booming fur and deerskin trade as timber merchants cut oak, hickory, cedar, and pine to meet demands for lumber in the West Indies and Europe.

Europeans were not the only group to make an impact on the southern environment. Adapting to a transformed landscape, Native American tribes including the Creeks altered their subsistence ways to begin raising cattle for market. By the 1780s Backcountry cane fields suffered from heavy grazing. African contributions to environmental change went beyond expertise in rice cultivation. Raising African imports including yams, eggplant, and peanuts in small provision gardens, slaves maintained a more ecologically balanced form of agriculture on the edges of southern plantations.

Plantation agriculture, hunting, and logging altered the southern environment in interconnected ways. Beavers, bears, buffalo, elks, muskrats, wild turkeys, and passenger pigeons grew scarce in large portions of the southern colonies by the mid-1760s as deforestation destroyed habitats. The lack of beaver dams in turn contributed to severe floods in the Chesapeake colonies throughout the 1770s. Those floods were so destructive in part because row crops such as tobacco were planted along ridges arranged in long, straight lines. Field slaves then used hoes to carve ditches between the ridges. Plantations laid out in this manner were vulnerable to erosion when rainwater turned the ditches into raging streams. Those same single-crop fields were more vulnerable to pests including insects, squirrels, and crows. Deforestation even altered the southern climate. The absence of oaks and flowering trees led to colder springs, warmer summers, and earlier frosts. Planters, slaves, and small farmers all suffered from changes in the disease environment. As the aedes mosquito found breeding grounds in new ditches and reservoirs, populous towns such as Charleston endured epidemics of yellow fever and malaria.

The environmental strains of plantation agriculture ultimately contributed to its westward expansion. Commercial tobacco growing, for instance, was hard on the rich soil of Virginia, leaving it acidic and less fertile within a few years. Pine, sedge, and sorrel quickly took over fields abandoned by slaveholders, replacing the oaks that originally had enriched the soil. Though some planters rotated crops and allowed fields to lie fallow, the soils of the tobacco South were depleted by 1800.

Large planters began to cross the Appalachians in search of new land. Small farmers had preceded them, settling the eastern Mississippi Valley in the late eighteenth century as the great planters bought up the best lands in Virginia and Carolina. In 1793 planters received further encouragement to migrate when Eli Whitney invented the gin that made com-

mercial farming of cotton possible. Whitney's invention spelled the end of a South Atlantic region dominated by rice and tobacco and the beginnings of a new Cotton Kingdom that would extend south to Alabama and Mississippi and across the Mississippi River to the edges of the Great Plains.

A MARKET ENVIRONMENT, 1800–1829

During the early decades of the nineteenth century, government officials at the federal and state levels promoted a transportation and market revolution. Its beginnings were evident between 1796 and 1812 as the federal government moved to reduce the price of western land and ensure easy credit to speculators (investors gambling that the price of land would boom) and potential settlers. At the same time, eastern states saw a frenzy of turnpike, bridge, and plank road construction. The real revolution, however, began with the U.S. victory in the War of 1812 (1812–1815). With European demand for American foodstuffs again surging, national and state governments devoted public funds to the construction of roads and canals that would provide backcountry and western farmers easier access to markets.

The transportation and market revolutions altered the environment of eastern North America in two kinds of ways. Direct consequences included disruptions to the fragile ecosystems of rivers and lakes by canal and dam construction and the burning of vast quantities of firewood aboard new steamboats. Indirect consequences were perhaps more profound. New forms of transportation helped create new regions and economic zones. Vast stretches of southern North America, much of it formerly Indian country, became part of the Cotton Kingdom. The Great Lakes were integrated with the Erie Canal (1825) in western New York and the Ohio and Mississippi Rivers. Such developments created a sectionalized economy in which each region was dominated by a single form of enterprise. Southern plantations provided raw cotton to a New England focused on textile manufacturing. Pennsylvania and the Great Lakes region turned to coal, iron, and copper production, as the Midwest and the Northwest Territory north of the Ohio Valley took over as the primary growers of wheat. The environments of all these regions were transformed by their new economic roles.

The southern shift to cotton. Focusing on the cotton South and New England gives a more precise sense of the patterns of environmental change. Though corn remained the most common southern crop throughout the early nineteenth century, the shift to raising cotton for export marked a significant mile-

stone. The boom in cotton prices after the War of 1812 inspired settler farmers to migrate south and west from Virginia and Maryland. Large numbers of wealthy planters quickly followed. Clustered around the main branches of the Mississippi River, planters began to integrate the region into worldwide commerce, shipping their harvests south to New Orleans on the Gulf of Mexico.

The environmental consequences of these developments followed a familiar pattern. New pathogens caused yellow fever and malaria epidemics in New Orleans and elsewhere. Prairies and pine forests felt the impact of grazing cattle. Hunters pursued wild species to the brink of extinction as planters and lumber merchants felled trees. Environmental damage was limited, however, by the low level of industrialization throughout the Cotton Kingdom. Due in part to the lack of suitable rivers, the entire region supported fewer sawmills than the state of New York. The consequences of row-crop agriculture, though, continued to be devastating. Heavy rains poured through the ditches in cottonfields and cornfields as they carried off valuable topsoil. Like any monoculture (an agricultural system dominated by a single crop), the plantation South was ecologically unstable. Single-crop fields promoted the development of soil toxins and the rapid multiplication of parasites, including the cotton bollworm. Planters imposed a cost on the soil that southern farmers would continue to pay throughout the nineteenth century.

Industrialization in New England. New England farmers also faced hardships due to environmental degradation. With access to better transportation, farmers began to participate in the market economy in new ways, beyond raising cash crops, that the landscape could not long sustain. Potash making, home manufacture of shingles and barrel staves, selling of firewood, and production of livestock placed excessive demands on New England ecosystems. Already reeling, New England farms suffered a fatal blow from the construction of the Erie Canal, which opened the region to overwhelming competition from the farms of the Midwest and upstate New York.

The eventual ecological decline of New England farms helped set the stage for early industrialization, which in turn created new environmental challenges. As farms faltered, many landless sons and daughters turned to wage labor in new manufactories including textile mills and sawmills. This new source of cheap labor, combined with the introduction of the power loom in 1815, fueled an explosive textile industry along New England rivers ideal for generating

power. Sawmills also expanded, depleting forests as they worked further and further upstream. Construction of dams for the new industries altered the ecology of rivers in which fish, including salmon, were blocked from upstream spawning grounds. By the late 1820s, the signs of modern industrial pollution were already evident. As textile mills turned to steam power, burning coal transported from western mines through the new Erie Canal, smoke blackened the skies over fast-growing cities.

The real onset of industrialization would have to await the railroad and textile boom of the 1830s. Furthermore, the white settlement of western North America still lay in the future. Yet after little more than a half century of national development, residents of the United States found themselves faced with a set of environmental challenges that still confront them today.

EPIDEMICS Epidemic diseases, introduced from both tropical Africa and Western Europe were frequent visitors to the British North American colonies during the late colonial period and to the United States during the early years of the new nation. The two major epidemic diseases that broke out in the period from 1754 to 1829 were smallpox from the British Isles and yellow fever from West Africa via the West Indies. A number of other diseases, including diphtheria, scarlet fever, measles, whooping cough, and mumps also appeared in epidemic form and swept parts of eastern North America. This vulnerability to exotic disease continued through the nineteenth century. Cholera, spreading from an initial outbreak in South Asia, struck the United States of America for the first time in 1831 and 1832.

Epidemics typically broke out among urban populations that had little or no immunological experience with the pathogen. The outbreaks could be spectacularly frightful and impress themselves into cultural memory. Yellow fever and smallpox wreaked concentrated havoc in cities and spread terror and sickening fear both within and outside the immediate zones of infection.

Epidemics of yellow fever, a mosquito-borne viral disease, were spread by the arrival in port cities of ships from the West Indies, where the disease was endemic. The transmission of yellow fever depended upon an infected individual being bit by an *Aedes aegypti* mosquito that would in turn bite an uninfected individual. The first epidemics in the British North American colonies took place in the late seventeenth century. A succession of epidemics occurred in the mid-eighteenth century. Philadelphia was struck twice in the 1740s, once in 1762, and then three times in the 1790s. The most famous of these was the 1793 epidemic that killed nearly four thousand, sweeping away to death 10 percent of the urban population. In the early nineteenth century, yellow fever epidemics began to strike the southern ports of New Orleans, Mobile, Charleston, and Savannah. The only effective public health policy was the imposition of quarantine upon ships that were known or suspected to carry the disease.

The yellow fever outbreaks rent the fabric of family and community life. The means of transmission was unknown, and the disease was feared to be contagious. As ever, desperate circumstances brought out the worst and the best. Some families abandoned their sick. Others stayed to nurse their loved ones through the moment of death. The wealthy took flight from the cities; the poor were left

to the ravages of the disease. The high fevers and characteristic black vomit that signaled the approach of death inspired particular horror and unleashed racial fears and prejudices. In Philadelphia, African Americans volunteered to care for the sick and did so valiantly; after the epidemic had receded, fearful whites blamed them for the outbreak.

Smallpox was also a deadly viral disease, but unlike yellow fever, it was highly contagious and spread directly from human to human. Immigrants from the British Isles, where smallpox infection was endemic and the principal victims were children, introduced it into the British North American colonies. There, the disfiguring pox destroyed both old and young; survivors of smallpox carried their immunities into adulthood, but the disease never became fully endemic and thus new generations reached adulthood without immunity. In the colonies, smallpox leapt beyond the communities of whites and their slaves into the worlds of the Native Americans, where it wreaked disaster. The death rates among Native Americans are thought to have ranged from 25 to 50 percent. During the epidemic of 1775–1782, smallpox ravaged most of the North American continent, killing more than one hundred thousand and disfiguring many more.

Until the late eighteenth century, the only recourse against smallpox infection was a form of inoculation known as variolation that had been in occasional use since the 1720s. Variolation was dangerous; it involved the intentional subcutaneous introduction of smallpox pus and produced immunity in the 95 percent of the initiates who survived the procedure. The first enforced use of this technique took place during the American Revolution, when General George Washington made the decision to inoculate by variolation all of the troops of the Continental Army. At the end of the eighteenth century, a new type of inoculation, known as vaccination, used what is thought to have been either a cowpox or horsepox virus that proved safe and effective. The broad acceptance of vaccination in the United States reduced greatly the threat of smallpox and constituted a major advance in the efficacy of public health interventions.

James L.A. Webb Jr.

EQUALITY The idea of equality is not a single concept, and its complexity is evident throughout the revolutionary era and early Republic. For some, equality was the Christian idea of the individual's direct relationship to God and the Protestant's disdain for papal hierarchy. For others it was a political notion of equal representation, or of the individual's equal rights and liberty in law, both natural and civil. For still others, it meant a rough equality of condition thought to be efficacious to a republic. In general, Americans during the nation's early years held to combinations of some or all of these ideas with varying degrees of consistency. Assumptions about race and gender were persistent challenges. Even the most egalitarian thinkers found the implications of their principles discomfiting if not entirely unthinkable. To understand the meaning of equality at this time requires one to ask, of what kind and for whom?

COLONIAL BACKGROUND

During the years 1629 to 1641, New England Puritans, seeking refuge from persecution by mainstream Anglicans, sought to practice their beliefs in a "purified" worship. Yet they were loath to extend this freedom to non-Puritans. Although the Massachusetts *Body of Liberties* was to apply to all inhabitants residing within the colony, the General Court could determine who qualified for residence and expel or punish anyone who was deemed to have "exceeded the bounds of moderation." Equality was initially the equality of Puritan believers and those willing to conform to Puritan strictures.

Early Quakers (the Society of Friends) and German Pietists in the mid-Atlantic colonies in the years 1675 to 1725 were more tolerant of nonconforming neighbors in their midst. Pietists generally avoided politics, but Quakers who controlled the government of Pennsylvania for the first six decades of the colony accepted all denominations as expressions of the Holy Spirit. More individualistic in their understanding of differences, they affirmed William Penn's belief that the "Liberty of Conscience is every man's right, and he who is deprived of it is a slave in the midst of the greatest liberty." This led to a very liberal grant-

ing of equal legal rights to colonists, whether members of the Society of Friends or not.

A more peculiar development occurred in the southern colonies, settled largely from the south of England between 1642 and 1675. The region was known for its support of the Stuart monarchy during the Puritan Revolution; class position and personal status were accorded great importance in Virginia, the Carolinas, and Georgia. Many who arrived aspired to attain the position of gentlemen landowners, with all of the deference accorded such a position in England. As John Randolph of Roanoke announced, "I am an aristocrat. I love liberty; I hate equality." That said, there was a kind of formal equality that evolved with slavery.

The paucity of labor proved an early inducement to the African slave trade on a more intensive level than elsewhere in America. This fact set in motion a unique dynamic between the larger landowners and the more middling and lower-class white colonists. By 1776 what had been the "equality of aristocrats" was transformed into the equality of white males. Basic legal rights were recognized, such as the right to sue and testify in court, the right to enter contracts, and the right to vote if one met minimal property requirements—all rights denied, not only to slaves, but to the few black freedmen who resided in Virginia. Consequently, vertical ties of allegiance from lower to upper classes were reinforced by a concept of equality within the race. That fact influenced the republican ideology that galvanized Virginia's resistance to England in the Revolution.

Equality, or the lack thereof, manifested itself in specific legal frameworks or religious practices. More problematic was the expression of equality in social life. Europeans, regardless of how egalitarian in political, philosophical, or religious matters, were steeped in medieval customs of hierarchy and status. Deference to one's betters was ingrained and, with the possible exception of the Quakers, was characteristic of most of the American colonists as well. Persons of wealth were accorded respect. Those with less were simply expected to give way when superiors were present, and were certainly never to presume familiarity. The Virginia gentry were held in awe by the middling to lower freemen, while slaves were always to show obeisance. In this context, it is often wondered how a revolutionary spirit and republican ideas of equal and natural rights ever came to the forefront of the American consciousness.

FROM ENGLISHMEN TO ALL MEN

The religious ideas of the mid-Atlantic and New England states reinforced the belief that equality before God ought to be affirmed in law. Lockean ideas of the Enlightenment formed an important part of the theological understanding of man's original and natural rights in the state of nature. Elisha Williams preached in 1744 in Boston that "all are born . . . naturally equal, i.e. with an equal right to their persons; so also with an equal right to their preservation; and therefore to such things as nature affords for their subsistence." What followed was a Lockean account of how reason and differences in ability produced the natural right to property and the necessity for limited republican government. With prosperity and population growth, these ideas resonated with Americans who took umbrage at any claim that disparaged their status in the empire.

Ironically, in the southern colonies it was precisely the concern with domestic issues of status that prompted similar philosophical and political developments. If gentlemen planters were reluctant to submerge their status within their own society, they were especially reluctant to assume a position of inferiority with respect to their British counterparts in the empire. When British policy changed with the need for revenue, these status-conscious southern leaders asked why they did not have the same rights as all Englishmen to consent to the taxation of their properties. Richard Bland of the Virginia House of Burgesses articulated this point early in 1766: "These Acts which imposed severer Restrictions upon the Trade of the Colonies than were imposed upon the Trade of England, deprived the Colonies . . . of the Privileges of English Subjects, and constituted an unnatural Difference between Men under the same Allegiance, born equally free, and entitled to the same civil Rights."

Whether originally conceived of as equality before God, the equality of all believers, or the equality of freeborn aristocrats, the concept of equality came to mean equal legal and political status with the inhabitants of the mother country. By the end of the eighteenth century, the colonists would no longer tolerate being the "subjects of subjects."

As resistance to British colonial policy intensified, the assertion of equal status was replaced by a more universal claim to their equal *natural rights*, or rights given by God or nature to all humanity. With the decision to declare for independence, Thomas Jefferson penned perhaps the most famous statement on equality along these lines in the American Declaration of Independence: "We hold these Truths to be

self-evident, that all Men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty, and the Pursuit of Happiness."

EQUALITY OF CONDITION

Few sentences have been the source of so much debate. Is the statement simply about rights, or is it a basic assertion about the social conditions necessary for "happiness"? Does it describe, or does it also prescribe, the form equality ought to take in the new nation? Some writers have attempted to find a case for material equality, or equality of condition, during the Revolution and founding periods, and this has produced some interesting evidence.

For one, the culture of deference stemming from medieval views on status was irrevocably undermined. The urban artisan and working classes discarded much of their reserve with respect to their supposed social superiors. In cities like Boston and Philadelphia, often to the consternation of the higher sorts, artisans and day laborers were suffused with a spirit of republican equality that encouraged a more outspoken and participatory attitude. Yet the general sense was not so much in favor of material equality as a celebration of social freedom—the freedom to take pride in oneself regardless of occupation or wealth.

Others have detected a celebration of rough material equality considered to be especially conducive to a republic. Thus we find a statement by the minister Enos Hitchcock of Providence in 1793: "This soil is distributed in such portions amongst the inhabitants, and holden by such tenure, as afford the greatest security to the continuation of free government." In the absence of vast aristocratic fortunes, Americans need not fear domination by any particular group. Such fortunes, it was believed, gave means to bribe legislators and control government, but a rough equality of condition would avoid that unhappy prospect. Yet Hitchcock stopped short of prescribing anything other than equal laws. It was enough that in America

property is rendered secure, by the equality of law to all; and every man, being master of the fruits of his own labour, enjoys the right of property—no arbitrary imposition of taxes or of tythes, no lordly exactions of rents, chill the heart of industry, nor repress the cultivators exertions—no mercantile corporations, with exclusive rights, damp the ardent spirit of enterprise.

Jefferson's experience with the profound poverty evident in France caused him to question whether liberty and large disparities in property ownership

are compatible. In 1785 Jefferson noted the poverty of the French lower classes and monopolization of land by the aristocracy—lands left “undisturbed only for the sake of game.” He was “conscious that an equal division of property is impracticable, but the consequences of this enormous inequality” led him to conclude that legislators could not “invent too many devices for subdividing property, only taking care to let their subdivisions go hand in hand with the natural affections of the human mind.” By “natural affections,” he believed it would be sufficient in most cases to eliminate laws that required all land to go to the eldest son. But “whenever there are in any country uncultivated lands and unemployed poor, it is clear that the laws of property have been so far extended as to violate natural right.” That was not the case in America, but in France, as he noted in the *Autobiography*, he saw “the monstrous abuses of power under which this people were ground to powder.” Such circumstances might require redistribution. This was not advocating material equality per se. It merely meant lessening that inequality that left some near starvation. Thus in his Second Inaugural Address in 1805, Jefferson could still congratulate America for the “equality of rights maintained, and that state of property, equal or unequal, which results to every man from his own industry or that of his fathers.”

As with Jefferson and Hitchcock, most Americans of this period considered a rough material equality as desirable but not a main objective. The idea made sense only in relation to liberty. Individuals were to be free to pursue opportunities and reap the consequences. A rough equality of property was a happy accident of the equal application of law, but it was not to be a hindrance to the equal right to pursue opportunities and acquire the rewards of industry.

Freedom from artificial restrictions came to be the dominant conception of equality in economic matters after the Revolution, but profound social tensions were revealed as ideals conflicted with lived experience. Few embodied that tension more than Jefferson. The idea of equal freedom was rarely extended beyond white male adults. The most egregious inconsistency was the institution of slavery. Jefferson’s conceptual struggle was indicative of a wider societal ambivalence.

EQUALITY FOR WHOM?

Jefferson’s eloquence in defense of equal rights makes the fact of his ownership of slaves particularly jarring. The thinking of many of his contemporaries

tended toward a justification of the “peculiar institution” by various theories of racial inequality. Rather than ignore the obvious conflict between the claim of equal rights and the existence of slavery, Jefferson wrestled with both, and this struggle has highlighted the inconsistencies in his life and thought. He would move for emancipation, but only if followed by colonization or deportation back to Africa. He would assert that the “unfortunate difference of colour, and perhaps of faculty, is a powerful obstacle to the emancipation of these people,” but later contend that “no person living wishes more sincerely than I do, to see a complete refutation of the doubts I have myself entertained and expressed on the grade of understanding allotted to them by nature, and to find that in this respect they are on a par with ourselves.”

Equally problematic was the legal and political position of women. Accepted as equal intellectually, women were considered emotionally and physically unsuited to political life and public leadership. The Revolution was a political act, and even the most ardent of male liberal Patriots, or “Whigs” as they called themselves, could not conceive of women as having a political character or role. Yet during the Revolution women were depended on for providing food, shelter, and funds, and even for military intelligence. Equality was not so much the issue, but the role and status of women was steadily reconceived. The idea of republican motherhood was a first step in recognizing a political place for women in the family. Mothers were enjoined to impart republican values of independence, loyalty, thrift, and industry to their children.

Writing to John Adams on 31 March 1776, Abigail Adams famously asked him to “remember the ladies.” She hoped he and the other representatives in Congress would “be more generous and favourable to [women] than your ancestors. Do not put such unlimited power into the hands of the Husbands. Remember all men would be tyrants if they could.” Yet her call was only for an improvement in legal status or a lessening of inequality. “Regard us then,” she continued, “as Beings placed by providence under your protection and in imitation of the Supream [sic] Being make use of that power only for our happiness.” John Adams responded with the observation that the move to independence had “loosened the bands of Government every where.” Everywhere, people seemed to be agitating for their rights; Abigail’s was but “the first Intimation that another Tribe more numerous and powerful than all the rest were grown discontented.”

DEMOCRACY IN AMERICAN CIVIL SOCIETY

John Adams's reply was prophetic for society as a whole. With independence and the establishment of the U.S. Constitution, American civil society saw a whirlwind of political and social organizing for all sorts of causes.

The first political contests of the early Republic gave rise to the first two-party system, with the more democratically oriented Republicans under Thomas Jefferson and James Madison squaring off against the more conservative Federalist Party of Alexander Hamilton and John Adams. These were great social events at the local level and stirred the political consciousness of a whole generation of Americans. Combined with a dynamic economy, the years following the heated election of Jefferson to the presidency in 1800 saw tremendous movements of people both geographically and across social strata. Individuals became far more mobile socially, some moving up the socioeconomic ladder, while the relative status of established ranks was diminished. That dynamism contributed to the further erosion of earlier deferential social norms. How Americans thought of equality was given new expression in American religious, economic, and political life.

The Second Great Awakening, beginning in the 1790s and lasting until the Civil War, was a period of increased religious enthusiasm and organization. Like the first Awakening in the 1740s, the trend favored popular charismatic and "low" church forms of devotion, with emphasis on revivals and evangelism. These movements drew from the older wells of Presbyterian, Baptist, and Methodist faiths but were less hierarchical. The spirit of renewal unleashed a powerful desire to reform not only the individual, but society. From these sources sprang the temperance movement, the antislavery movement, education reform, and the movements for women's suffrage. The ideals of the Revolution were reexamined with an eye toward perfecting American equality in faith, in law, and in representation. Although the roots of the reform societies can be found in this period, their most important influence would not be realized until after 1830.

For many born after 1776, consistency with the Declaration became paramount as a means of demonstrating their worthiness of their Revolutionary and republican inheritance. The period saw a visceral reaction against unearned status that severely crippled the Federalist Party in all but a few New England states, ushering in the so-called Era of Good Feelings (1820s), a time when the predominant party was Jefferson's Democratic Republicans. Even in busi-

ness, entrepreneurs exulted in the equal rights of all individuals to pursue opportunities and for the common man to make good for himself and his family.

Equality in America was a complex blending of the equality of all believers, equality before God, equality in rights both natural and legal, and the lessening of the arbitrary distinctions of aristocracy. It was the working out of these ideals that eventually produced the great reform movements of the nineteenth century.

ERA OF GOOD FEELING The Era of Good Feeling generally refers to the period in American history between 1815 and 1825, particularly to the two administrations of President James Monroe (1817–1825). The term originated in an article in the *Boston Columbian Centinel* published on 12 July 1817. The newspaper used the term to refer to the general mood of the country immediately after the War of 1812 (1812–1815), which was nationalistic, harmonious, and prosperous. Historians' use of the term for American history between 1815 and 1825 is, however, somewhat misleading, because the entire period cannot be considered an era of "good feeling."

The period indeed started on positive notes. When the war ended in January 1815 with victory at the Battle of New Orleans, the American people became strongly nationalistic. Albert Gallatin, Secretary of the Treasury from 1801 to 1813, commented that "the war has renewed and reinstated the national feelings and character which the Revolution has given, and which were daily lessened." The heightened nationalism resulted in one-party rule at the national level by the Republican Party, which had led the war efforts. The political dominance of the Republicans culminated in the presidential election of 1820, when Republican candidate Monroe received all electoral college votes except one.

The political monopoly of the Republican Party also owed much to the postwar economic prosperity of the United States. European demand for American cotton and foodstuffs remained high between 1815 and 1818, and American farmers and planters expanded their acreages by purchasing more land. But the positive political and economic environments following the War of 1812 turned to ones of discontent and dissension after 1819.

One cause of this transition to discontent was the economic difficulties resulting from the Panic of 1819, which lasted until 1823. European demands for American cotton and other agricultural products declined from late 1818, leading to a severe depression in the American economy.

At almost the same time that the Panic of 1819 hurt the nation's economy, a political crisis shook the United States. In 1819, the House of Representa-

tives began debating a bill to admit the Missouri Territory to the United States as a state. The southern states supported the territory's application, while northern states opposed its admission as a slave state. Eventually, in March 1820, Speaker of the House Henry Clay engineered the Missouri Compromise: Congress admitted Missouri as a slave state while admitting Maine, theretofore a part of Massachusetts, as a free state. In addition, the agreement declared that the remainder of the Louisiana Territory above the 36°30' parallel—the southern boundary of Missouri—was to be free of slavery. Thus, it was the Missouri Crisis that started the sectionalization of national politics based on the slavery issue.

Although the domestic political situation became volatile, the United States achieved an important diplomatic success with President Monroe's issue in December 1823 of the Monroe Doctrine, which declared the Western Hemisphere would in the future be free of European interference. Britain supported the Doctrine for its own purposes, which ultimately made it succeed.

Close to the end of Monroe's administration, the Republican Party became fractured into personality-driven factions. In the presidential election of 1824, five Republican candidates—William H. Crawford of Georgia, John Quincy Adams of Massachusetts, John C. Calhoun of South Carolina, Henry Clay of Kentucky, and Andrew Jackson of Tennessee—vied for the presidency. The election ended with the victory of Adams.

Thus, the Era of Good Feeling started on positive notes of heightened national feelings, domestic political stability, and economic prosperity. In time, however, the Panic of 1819 ended the postwar prosperity, the Missouri Crisis sectionalized national politics, and domestic political stability based on one-party rule ended in 1824.

Waterloo Inn. In 1817 James Monroe, who served as president during the “Era of Good Feeling,” embarked on a tour of the northern United States. Early in the tour Monroe’s party stopped at the Waterloo Inn, a popular watering hole along the route between Baltimore and Washington, D.C., shown here in a 1827 lithograph by F. F. DeRoos and T. M. Baynes. PICTURE HISTORY.

ERIE CANAL The Erie Canal was the greatest American engineering project of the first half of the nineteenth century, though it was completed only a quarter of the way through it. It was the single most important factor in the emergence of New York as the “Empire State” and New York City as the economic center of the new nation. The canal sent settlers and manufactured goods through New York to the frontier and funneled grain, salt, lumber, and other raw materials to New York City for sale to the nation and the world. The canal cut the cost of freight transportation through its territory by up to 90 percent and reduced delivery times from uncertain weeks to scheduled days. By channeling overland through western New York, the canal bypassed traditional trade routes centered on Lake Ontario, limiting Canada’s share of economic growth. By reaching westward before the American southern states, especially Virginia, which had tried for decades to canalize the Potomac, New York’s canal delivered national economic dominance to the North. As the first human-made artery communicating with

the continental interior, the canal provided an early bond of national unity, soon strengthened by other canals, railroads, and eventually highways. The Erie Canal began the process of both tying the nation together and dividing it: the canal helped establish a national free-market industrial economy, but its locus in New York sowed division between the slave-based agrarian economy of the South and the rest of the country that eventually helped undermine the Union.

ARTIFICIAL RIVER

For all its impact, the original canal—begun in 1817 and completed in 1825—was a remarkably slender waterway. Stretching 363 miles from the Hudson River north of Albany to Lake Erie at the nascent village of Buffalo, the canal was just forty feet wide on its surface, narrowing to twenty-eight feet at a four-foot depth: it was a small prism of water dug across the breadth of New York. The path of the canal followed the lay of the land as much as possible to maintain levels and minimize expensive, traffic-slowing lockage. Long levels from Utica to what be-

DEWITT CLINTON

In popular imagination, DeWitt Clinton (1769–1828) created the Erie Canal. In fact, the plan for a canal linking the Hudson River with Lake Erie originated in 1807 with Jesse Hawley's newspaper essays. The following year, state-appointed surveyor and future Erie engineer James Geddes determined that the canal was feasible. Clinton had little if any interest in the project or canals generally until 1810, when fellow state senator Jonas Platt sought Clinton's influential support for a bill to conduct detailed surveys. To his credit, the once and future New York City mayor and future governor then seized on the canal as a means of ascendancy for the state and himself. Clinton served on the state canal commission from its creation in 1810 until his removal from its leadership in 1824, an unpopular maneuver by political opponents that prompted his reelection later that year as governor, holding the office until his death. During his first six years on the commission, Clinton emerged as the canal's most effective advocate, neutralizing the negative influence of commission head Gouverneur Morris, who until his death in 1816 clung to the imprac-

tical notion of a 360-mile inclined plane instead of the traditional locks and levels ultimately employed. After the War of 1812 suspended canal planning, Clinton's leading role at a public meeting in New York City in December 1815 and his authorship of a widely distributed memorandum to the legislature set the state on its course toward building the canal and placed Clinton in his role as its greatest champion. After construction began in 1817, Clinton—as commission head (and governor)—guided the project toward completion in a timely and economical manner unique to engineering projects in the new nation. Not standing for reelection as governor in 1823 and turned out of the canal commission the following year, Clinton presided as governor once again for spectacular celebrations of the canal's completion in 1825. Contemptuous of enemies and indifferent to allies, Clinton was rarely secure in his political life. As the greatest advocate of the Erie Canal, Clinton's name endures.

Gerard T. Koepfel

came Syracuse (seventy miles) and from the village of Rochester to what became Lockport (sixty-five miles) comprised over one-third of the canal's length and were the two longest canal levels in the world. Topography and water supply required the construction of eighty-three hand-operated locks, each 90 by 15 feet. Lake Erie is 572 feet above the Hudson but sag between Syracuse and Rochester required seven of the locks to lower the line, making a total of nearly 700 feet in elevation changes. Over four hundred feet of ascent occurred in the first one hundred miles of canal up the Mohawk River valley from the Hudson, requiring fifty-three locks; half of these were needed in the first thirty miles to Schenectady. The most challenging lockwork was located near the western end of the canal, where a double flight of five locks surmounted a forested, sixty-six-foot rock ridge at Lockport. Eighteen major aqueducts and several high embankments carried the canal trough over substantial rivers and valleys. To navigate the new waterway, boats sixty feet long and seven feet wide were designed to carry up to one hundred passengers or thirty tons of cargo. Animals were the motive force, initially horses but soon sturdier mules that towed the boats at four miles per hour.

HISTORICAL BACKGROUND

For nearly its entire length, the Atlantic coast is separated from the continental interior by the Appalachian Mountains and the Adirondack Mountains. The gap between these ranges lies in central New York State, where the Mohawk River runs in a westerly direction 125 miles from its mouth at the Hudson River above Albany to Rome. The traditional route of water travel into New York's interior—first by fur traders in native canoes and later by diversified merchants in increasingly larger paddled and poled shallow-draft boats—was up the length of the rapids-strewn and flood-prone Mohawk to a portage of several miles at what became Rome, then down shallow and meandering Wood Creek, across wind-swept Oneida Lake, and down the Oneida and treacherous Oswego Rivers to Lake Ontario at Oswego. Interior travel further west was up the Seneca River from the Oswego River to Seneca Lake, a hundred miles east of Lake Erie. There was no river route to Lake Erie; the only water route to Lake Erie and the other Great Lakes was from Lake Ontario via a steep portage around Niagara Falls, a route barely explored and rarely taken before the late 1700s. From Lake Ontario there were two major, competing

LABORERS

In popular imagination, gangs of immigrant Irish laborers built the Erie Canal. In fact, during the first half of the construction period (1817–1821), the overwhelming majority of laborers were the families and hands who worked the small farms through which the canal line passed. The entire middle section of relatively level, dry land was contracted for and built (1817–1820) largely by these homesteaders, who had emigrated from no further away than New England. The state canal commissioners overseeing the construction reported proudly in 1819 that three in four canal laborers were American born. Gradually, contracts for multiple of the canal's hundreds of short sections were taken up by local and regional merchants and associations of contractors, suppliers, and speculators who needed larger labor crews. In the remote western sections, where work began in 1819, the scattered resident population could not supply adequate labor. Nor were area farmers willing to muck out or risk sickness in the extensive Montezuma swamps. This work increasingly fell to Irish immigrants hired right off the boat in New York City who sang their

way into American folklore: "We are digging a ditch through the mire, Through the mud and the slime and the mire, dammit! And the mud is our principal hire; In our pants, down our boots, down our necks, dammit!" When the deadly work of blasting the canal trough through a long rock ridge in western New York was done, Irish laborers remained to become prominent settlers of the canal-made city of Lockport.

The Irish became the most notable and, for their considerable brawling, notorious immigrant group on the canal, but preceding them were substantial numbers of skilled and semiskilled Welsh, who often worked on the canal's masonry structures. Regardless of national origin, the tens of thousands of unskilled laborers who worked on the canal over nine construction seasons earned the same low wages: as little as fifty cents for day work, or from eight to ten dollars a month including room, board, laundry, and whiskey.

Gerard T. Koeppl

routes to market: on the tangle of New York waterways to the Hudson and, often preferably, down the St. Lawrence River to Montreal, and eventually the Atlantic.

CONCEPTUALIZATION

Jesse Hawley (1773–1842) was a pioneering western New York grain merchant who went bankrupt trying to get produce east along crude roads and unimproved waterways. While confined to debtor's prison in Canandaigua in 1807, Hawley wrote a series of newspaper essays under the pseudonym "Hercules" outlining how and why an Erie-Hudson canal should be built. Over the next several years, the Hercules essays circulated among the influential New Yorkers who would plan and build the Erie Canal. Hawley himself subsequently became a prominent citizen of Rochester and Lockport, two among the numerous cities created by the canal.

There were several other early proponents. Gouverneur Morris (1752–1816) may have informally suggested a cross-state canal as early as 1777; he subsequently led the first state canal commission (1810–1816) but induced ridicule for the project by insisting it be built on an inclined plane spilling Lake

Erie into the Hudson, instead of with locks and levels using local water sources. State assemblyman Joshua Forman (1777–1848) sponsored an 1808 resolution for the first survey that proved the canal possible; in 1819 he founded what became Syracuse, the canal-made city that shipped salt to the nation. State senator Jonas Platt (1769–1834) drafted the 1810 legislation that created the canal commission; Platt sought and won influential support for the bill from fellow senator DeWitt Clinton, who had given no prior thought to canals. Upon Morris's death in 1816, fellow commissioner and future governor Clinton emerged as the canal's greatest and most effective proponent, hitching his own destiny to that of the canal.

PLANNING

The seven-member commission established in 1810 oversaw several rounds of surveys. It was stifled, however, by popular, economic, and technological uncertainty and ultimately by the War of 1812, during which the British burned future canal terminus Buffalo.

Interest in the canal revived quickly after the war. A public meeting in New York City in late De-

Excavation of the Lockport Lock. During construction of the Erie Canal, the most challenging lockwork occurred near the western end of the canal, where a double flight of five locks surmounted a forested 66-foot rock ridge at Lockport, New York. This illustration from 1825 shows laborers operating manual pulley cranes during excavation at Lockport. ©CORBIS.

ember 1815 produced a persuasive memorandum by state Republican Party leader Clinton, which was circulated throughout the state and brought the question of construction before the legislature for the first time in 1816. Intense opposition came from Lake Ontario interests and regions distant from the canal line, especially New York City, whose merchants feared heavy taxes to support an expensive upstate project. Political interests, centered on Clinton's emerging Republican rival Martin Van Buren, feared that Clinton, narrowly defeated for the presidency in 1812 while running as a Federalist, was using the canal for personal political gain. Others questioned whether country surveyors with no engineering education or experience could build a canal more than ten times longer than the nation's only other significant canal. The twenty-seven-mile Middlesex Canal in Massachusetts was notorious for staggering construction costs and delays and financial strain on its prominent private investors.

Clinton settled for another round of surveys but claimed leadership of a new five-man canal commission stacked with supporters. They included Joseph Ellicott (1760–1826), influential agent for the Hol-

land Land Company, which owned 3.3 million mostly vacant acres of westernmost New York that the canal would profitably settle.

By 1817 popular imagination had overwhelmed political opposition sufficiently so that the legislature approved construction of the middle section of what the commissioners estimated to be a \$5 million project, by far the most expensive engineering project in the nation's history. Heeding its merchants' fears, none of the thirty New York City-area legislators voted in favor.

New York State moved ahead without any federal support. In 1809 President Thomas Jefferson called New York's project "madness," clinging to false hope that his own Virginia would be the first to reach the interior by canalizing the Potomac. On the final day of his presidency in 1817, Jefferson's successor and fellow Virginian, James Madison, vetoed a bill that would have provided federal money to canal projects like New York's. Madison's veto, on the grounds that Congress had no express constitutional authority to fund canals, came as New York's legislature was debating its canal bill; contrary to

what Madison might have wished, his veto helped unify opinion in New York behind the project.

A sophisticated canal fund, administered by a financial board separate from the canal commission that oversaw construction, featured state bonds, duties on auction and salt sales, taxes on steamboat passengers, and tolls. By 1833 total tolls surpassed the eventual construction cost of \$7 million; when tolls were abolished fifty years later, the canal had earned a profit of over \$40 million.

CONSTRUCTION

The canal was constructed in three sections for engineering, financial, and political reasons. The commissioners initially sought approval in 1817 only to build the ninety-six-mile middle section, from Utica on the Mohawk River to Montezuma on the Seneca River, calculating that the legislature would be more willing to approve a limited objective and that quick progress on one section would win popular support and legislative approval for completion of the entire project. The middle section featured the fewest elevation changes (only nine locks) and no significant engineering challenges, and ran through country that was settled enough to provide local labor. The ceremonial first shovelful of dirt was turned near Rome on Independence Day 1817, and the section was completed and open for travel by October 1820.

The middle section established the pattern for future construction. The work was bid out in segments of generally less than one mile. The winning bidder, especially in the early years, was often the farmer whose land would be bisected by the canal; the laborers were his sons and farmhands. In later years, especially in the unsettled western region of the state, bidders took up multiple contracts and hired immigrant labor gangs to do the hardest and most dangerous work: mucking out malarial swamps that disabled many hundreds of workers and blasting through rock that killed or maimed dozens.

Most of the work was basic manual labor with axes and shovels, digging a ditch along a line laid out by country surveyors and assistants training themselves as practical engineers. Benjamin Wright (1770–1842) was a county judge and surveyor in Rome when he conducted some of the early canal surveys; named Erie chief engineer in 1817, Wright subsequently was involved in canal and railroad projects from Canada to Cuba and is regarded at the turn of the twenty-first century as the “Father of American Civil Engineering.” Erie principal engineer James Geddes (1763–1838) was a pioneer salt manufacturer in the area that became Syracuse when he

conducted the initial Erie survey in 1808, using a leveling instrument for only his second time; he later engineered canals for Ohio, Pennsylvania, and the federal government. Nathan Roberts (1776–1852), an itinerant math teacher when Wright hired him, designed the Lockport locks and later served as Erie chief during the canal enlargement begun in the 1830s. Among the notable young graduates of the so-called Erie School of Engineering were John Jervis (1795–1885) and Canvass White (1790–1834). Rome farm boy Jervis rose from Erie axeman chopping down trees for a survey crew to become Wright’s successor as chief engineer and to be counted among the country’s most innovative canal and railroad engineers. A grandson of the first white settler on the Upper Mohawk, White started as a Wright assistant and later developed and patented the hydraulic cement that made the Erie and subsequent canals watertight; his engineering career rivaled Jervis’s but was cut short by ill health.

Innovations multiplied along the Erie line, often created by the contractors themselves to maximize efficiency and improve what were often slender profit margins. Large trees were toppled by a cable attached high on the trunk and winched by a hand-cranked endless screw. Stumps were pulled by a cable on a huge overhead wheel turned by a harnessed team of oxen. Rome contractor Jeremiah Brainard developed a rounded-basin wheelbarrow that was lighter, sturdier, and easier to unload than the centuries-old box-shaped barrow.

When the middle section appeared headed to successful completion in 1819, the legislature approved construction of the eastern and western sections. The 109-mile eastern section, with its dozens of locks, was completed in 1823, ending nearly two centuries of frustrating navigation on the Mohawk River, which was consigned to supplying water for the canal built along its banks. The 158-mile western section featured a spectacular embankment spanning the Irondequoit Valley east of Rochester, a landmark bridge across the Genesee River, and the Lockport locks. The western section was completed in 1825 after a bitter struggle between Buffalo and neighboring Black Rock to be the canal’s western terminus. Black Rock lost and within thirty years was annexed into Buffalo, which the canal rapidly made into the state’s second-largest city. Beginning in late October 1825 DeWitt Clinton, once again governor, presided over grandiose, canal-length celebrations, culminating in New York City, which already was gaining fortune and fame from the canal it had opposed.

LEGACY

The Erie Canal launched the nation's canal era, which peaked in 1860, when over 4,200 miles of mainline and lateral canals linked the nation's natural waterways as far west as Illinois. The Erie's success also induced a canal mania that spawned numerous ill-conceived canal projects; the Panic of 1837 and the subsequent national depression was caused in part by a bust in canal stock, the country's first technology bubble.

The original canal was enlarged to seventy feet wide and seven feet deep between 1836 and 1862, but by the late 1800s railroads had dramatically reduced mule-pulled boat traffic. The enlarged canal was replaced entirely by a twelve-foot-deep canal, built from 1905 to 1918 and designed for motorized barges; in the early twenty-first century, traffic was primarily recreational boaters.

Gerard T. Koeppl

poetry and fiction, and French libertine novels, could be found in the libraries of many eighteenth-century American gentlemen. During the French Revolution, readers in the new Republic became especially interested in the memoirs and other licentious writing of the French *philosophes*.

Certainly one of the most popular works of erotica in America during this period was John Cleland's fictional classic, *Memoirs of a Woman of Pleasure*, or *Fanny Hill*. First published in two volumes in London between 1748 and 1749, Cleland's work consisted of two long letters recounting the life of a country girl forced by the death of her parents to move to the city and become a prostitute. Fanny's epistolary confessions described a wide range of sexual activities in explicit detail, including lesbianism, cross-dressing, flagellation, orgies, and public sex.

American printers showed an early interest in the *Memoirs*. In 1786 Worcester printer Isaiah Thomas Sr. wrote to an English bookseller seeking to buy a copy, probably with the intention of publishing his own edition. By the second decade of the nineteenth century, substantial numbers of the book were sold in rural bookstores and by itinerant peddlers in New England. In 1817 the final inventory of New Hampshire bookseller Anson Whipple, an affiliate of the Thomas firm, revealed 293 copies of the book in stock. Evidence from prosecution records in 1824 establishes that the *Memoirs* were also sold in New York City, though in an expensive imported edition accessible only to the wealthy.

Other genres of European writing, including anti-masturbation literature, sex manuals, and transcripts of adultery trials relating the sexual scandals of the aristocracy, probably provided erotic content for American readers. The quasi-pornographic anti-masturbation tract, *Onania, or, The Heinous Sin of Self-Pollution, and All Its Frightful Consequences in Both Sexes, Considered*, first published in England in 1708, was frequently reprinted in the colonies. Imported copies of *Aristotle's Master-Piece*, a collection of folklore about sex that first appeared in English in 1684 and contained extensive descriptions of female anatomy and reproduction, also circulated widely. As early as 1744, Northampton minister Jonathan Edwards initiated a church inquiry into the "lascivious expressions" of certain young men who had read the *Master-Piece* and had taunted local women with their newly acquired "unclean" knowledge. Between 1766 and 1831, American printers also published thirty-two native editions of the *Master-Piece*.

American authorship of erotica was evidently scarce before the mid-nineteenth century, when a

EROTICA The vast majority of erotica that circulated in the United States between 1750 and 1830 was of European provenance. According to the scholar Peter Wagner, a large number of erotic books, including classics by Ovid and Boccaccio, English erotic

domestic pornography industry began to emerge. Before then, fans of bawdy literature like William Byrd II and Benjamin Franklin wrote occasional ribaldry, such as Franklin's "Letter of Advice to a Young Man on Choosing a Mistress" (1745). Quasi-medical works on sexual subjects may also have served as a form of homegrown erotica, such as a book published anonymously in Virginia in 1787, *A Treatise on Gonorrhoea. By a Surgeon of Norfolk, Virginia*.

In the early Republic the sale of erotic works only infrequently triggered criminal charges. The doctrinal basis for such prosecutions was the English common law of obscene libel, which the King's Bench adopted in 1727. In the first published American obscenity case, *Commonwealth v. Sharpless* (1815), Pennsylvania authorities indicted six men for charging a fee to see a lewd painting "representing a man in an obscene, impudent, and indecent posture with a woman." In upholding their convictions on appeal, the Supreme Court of Pennsylvania embraced the reception of English common-law prohibitions against obscene speech. In *Commonwealth v. Holmes* (1821), the Supreme Judicial Court of Massachusetts set a further precedent in support of sexual censorship by upholding the conviction of printer Peter Holmes for selling an illustrated copy of *Memoirs of a Woman of Pleasure*. The same year, Vermont enacted the first state statute banning the publication or sale of "obscene" pictures and books.

EUROPEAN INFLUENCES

This entry consists of four separate articles: *Enlightenment Thought*, *The French Revolution*, *Mary Wollstonecraft*, and *Napoleon and Napoleonic Rule*.

Enlightenment Thought

The Enlightenment was an intellectual movement in eighteenth-century Europe that influenced the American Revolution and helped shape American political institutions. Enlightenment authors addressed religion, politics, and economics and were diverse in their writings and nationalities. The Frenchman Voltaire wrote literature and advocated religious and political liberty in his *Philosophical Letters* (1734). The Scotsman David Hume wrote history and encouraged political and commercial liberty in his *Essays: Moral, Political, and Literary* (1753). The Englishman Richard Price wrote moral philosophy and the political essays *Two Tracts on Civil Liberty* (1778).

SCIENCE AND NATURAL LAWS

Although diverse, Enlightened writers shared a scientific outlook that influenced the development of American political institutions. Enlightened authors applied the scientific methods of observation and experimentation to study human beings and their social activities. Although not widely employed until after 1730, this scientific method of social thought developed from the scientific revolution of the 1600s. During the seventeenth century, scientists such as Isaac Newton (1642–1727) argued that the physical universe was orderly because it functioned according to natural laws. Newton maintained that through observation and experimentation, scientists could discover these natural laws that governed the physical world. In the 1700s, Enlightened thinkers applied these scientific ways of thinking to the study of human nature and human society. They used the scientific method of observation to study human nature and called this study the "science of man." They believed their scientific studies would reveal natural laws of human behavior that governed social activities such as religion, economics, and politics. They referred to the study of these natural laws as the "science of politics."

One such natural law was self-preservation. Enlightenment writers believed that the pursuit of self-preservation was ingrained in human nature. The Englishman John Locke (1632–1704) maintained that the law of self-preservation also included liberty and property. He argued that individuals possess natural liberty to pursue their own preservation, and he maintained that individuals use liberty to acquire property as the material means of preservation. Because these means of preservation—liberty and property—were grounded in human nature, Locke identified them as rights of human nature. He called them "natural rights." Locke defined the purpose of gov-

ernment as the protection of these rights of life, liberty, and the pursuit of property. Locke's influence was evident in the American Declaration of Independence, which defined the purpose of government as the protection of life, liberty, and the pursuit of happiness.

MONTESQUIEU

Locke's ideas were only part of the Enlightenment that influenced American politics. Two other important groups of Enlightenment thinkers were the French philosophes and the Scottish common-sense philosophers. The most influential French philosophe in America was Baron de Montesquieu. In 1748 Montesquieu published *The Spirit of the Laws*. Therein, he explicitly wrote about the "science of politics." By this he meant the study of how political laws affected the natural laws of human behavior. Commerce was one example. Montesquieu argued that politics could constructively channel the pursuit of self-preservation and property by encouraging commerce and promoting the virtues of labor and diligence that accompanied commerce.

Montesquieu also emphasized the separation of powers. He argued that the natural law of self-preservation required protection against, as well as encouragement of, government because the powers of government could be abused. Such powers could threaten personal security through policies of religious intolerance or arbitrary taxation. Thus, Montesquieu sought to create political institutions that governed effectively but were limited in power. He suggested separating the legislative, executive, and judicial powers of government. Each separate power, he hoped, would limit the power of the other two. American Revolutionary leaders followed Montesquieu's advice by writing the separation of powers into their state and national constitutions. John Adams particularly praised the achievement of separation in his *Defence of the Constitutions of the United States* (1787–1788).

SCOTTISH PHILOSOPHERS

Americans understood the separation of powers in tandem with the ideas of Scottish philosopher David Hume. Hume argued that the pursuit of self-preservation often kindled ambition as humans sought property and power beyond mere personal security. Similar to Montesquieu, Hume viewed ambition as constructive in commerce. Yet Hume feared ambition in politics. He maintained that ambitious people often formed factions or small groups that pursued private interests in politics, not public good.

Hume and his American readers sought to limit the effects of faction. They viewed the separation of powers as achieving this end by ensuring that each of the three powers counterbalanced the ambitions and factions in the other two. The American Revolutionary James Madison expressed this view in *Federalist* No. 51 (1788). He defended the separation of powers in the U.S. Constitution by explaining that "ambition must be made to counteract ambition."

In addition to Montesquieu and Hume, Americans also read Scottish common-sense philosophers such as Francis Hutcheson (1694–1746) and Thomas Reid (1710–1796). Hutcheson and Reid argued that all human beings possessed a common moral sense by which they distinguish virtue from vice. They proposed this common moral sense in opposition to eighteenth-century skeptics. Skeptics doubted whether the scientific study of human nature could establish fixed moral rules for human behavior. Hutcheson and Reid insisted that it could. They maintained that the human mind possessed a moral sense that naturally approved of virtues such as self-love and benevolence and disapproved of corresponding vices. Hutcheson explained this moral sense in his *System of Moral Philosophy* (1755) and Reid in his *Inquiry into the Human Mind, on the Principles of Common Sense* (1764).

Many Americans appealed to moral-sense theory to establish common moral ground within their religiously diverse and tolerant society. Such theory became a prominent part of American education and law after the Revolution. The president of the College of New Jersey (later Princeton University), Samuel Stanhope Smith (1751–1819), appealed to moral sense in his *Lectures on Moral and Political Philosophy* (1812). Supreme Court Justice Joseph Story (1779–1845) made similar appeals to moral sense in his *Commentaries on the Constitution* (1833). Thus, moral-sense theory helped Americans combine different elements of Enlightenment thought into a coherent social philosophy. With it, Americans balanced ambition in commerce and politics with agreed-upon social virtues in education, culture, and law.

The French Revolution

Between 1789 and 1792, the French Revolution seemed like the natural successor to the American Revolution. When news arrived that the French National Assembly had declared, on 26 August 1789, “Men are born and remain free and equal in rights,” Americans offered celebratory toasts, wrote sentimental poems, and congratulated themselves on having inspired a global movement for liberty. Polite praise for the French continued through the winter of 1791–1792, when Americans learned that the French had established a constitutional monarchy. A select number of Americans, like Vice President John Adams, denounced the French Revolution from the beginning. In Adams’s mind, the French Revolution was a dangerous utopian experiment. But in general Americans applauded the French and their attempts to secure revolutionary liberty and equality.

THE RADICALIZATION OF THE FRENCH REVOLUTION

The radicalization of the French Revolution in late 1792 and early 1793 changed everything, because it forced Americans to reconsider the meaning of transatlantic revolution. In particular, three events—the establishment of the French Republic on 22 September 1792, the execution of King Louis XVI on 21 January 1793, and the emergence of a British-led European military alliance united in opposition to France—dramatically transformed the environment in which Americans interpreted news of the French Revolution. Those events altered the terms of debate by shifting public attention away from a relatively moderate dispute over different versions of constitutional monarchy and toward a more brutal clash between monarchy and democracy. They also spawned a series of interconnected developments that directly impinged on the lives of common Americans. British raids on American maritime vessels disrupted commerce and infuriated ship captains and merchants. French minister Citizen Genet’s attempts to recruit Americans as military agents for French-commissioned privateers and French-sponsored expeditions against Spanish Louisiana and Spanish Florida incited civic unrest and diplomatic intrigue. Violent scuffles between French and British sailors

stationed in Charleston, Philadelphia, and New York became legal nightmares for municipal officials. All the while, political refugees from Britain, Ireland, France, and Haiti spilled into American ports, requesting material assistance and demanding a public voice.

By affecting so many areas of American life, the radicalization of the French Revolution confronted residents of the United States with a number of difficult questions. Should the United States support revolutionary France in its military clash against Great Britain and its counterrevolutionary allies? If so, how? If a policy of neutrality was the most appropriate course, what did neutrality mean in practical terms? Moreover, did the United States need to institute internal reforms to more closely approximate the example set by revolutionary France? If so, what role should the average citizen play in promoting and establishing those reforms? All of these questions revolved around basic concepts—liberty, equality, popular sovereignty, and the role of the United States in spreading revolution—that had first been raised during the American Revolution. But the French Revolution amplified them and recast them. Whereas the United States in 1776 stood alone as a beacon of revolutionary freedom, from 1793 onward it stood alongside a more noticeable and more powerful beacon, France. Determining exactly how the American Revolutionary tradition resembled or differed from its more influential French revolutionary counterpart became a concern of pressing immediacy.

THE POLARIZATION AND POPULARIZATION OF AMERICAN POLITICS

The need to define the Revolutionary American republic against France and its archenemy, Britain, divided the American populace and served as the catalyst for a decade of vicious political conflict. Democratic Republicans, led by Thomas Jefferson and James Madison, campaigned to reassert or extend the social and political reforms of the American Revolution. They also argued that the United States should do what it could—short of war—to assist Revolutionary France in its military clash with the British-led European military alliance. Federalists, led by Alexander Hamilton, derided the egalitarian excesses of the French Revolution and viewed the public fervor associated with it as a portent of social disorder. They simultaneously sought to curtail American involvement in French military affairs, even if it meant closer cooperation with Great Britain.

The political clash between Democratic Republicans and Federalists in the 1790s was the most heat-

ed internal dispute in the United States before the American Civil War. Friendships broke apart, fist-fights erupted in government halls, newspaper writers spewed forth invective, and talk of civil war and anarchy pervaded public arenas. Passions were so intense that zealots on both sides advocated partisan organization, even though many educated individuals at the time considered political parties illegitimate and dangerous. Advocacy of partisanship, in turn, sparked an amazingly high degree of popular participation in national politics; voter participation rates in many areas surged, and common citizens ran for political office with a surprising degree of boldness and success.

Popular political activity was generally more noticeable and aggressive among those who steadfastly supported the French Revolution. Thousands of individuals participated in large parades and elaborate “civic festivals” celebrating French military victories and revolutionary anniversaries. Members of Democratic Republican societies wrote resolutions, offered toasts, and agitated for political reform. A person could make a public political statement simply by donning a cockade (a ribbon worn on a hat or shirt) as a badge of party loyalty.

THE SIGNIFICANCE OF POPULAR POLITICAL ACTIVITY

Pro-French Revolution zealots took part in popular political activity for a variety of reasons. Some were inspired by the abstract ideological claims of the French Revolution and the chance to repay France for assistance during the American Revolution. Others, remembering British atrocities during the American Revolutionary War, viewed the current Anglo-French struggle as an opportunity to humble Great Britain. African Americans considered the French Revolution—and the slave rebellion on Haiti associated with it—as an opportunity to push for emancipation or revolutionary rebellion. Local activists and artisans, meanwhile, frequently used French revolutionary rhetoric to agitate for a number of goals: to destroy vestiges of social hierarchy and political privilege, to exact revenge against resented elites, and to stake their claim to a prominent role in the American political system.

No matter the individual reasons, what is striking in the hullabaloo over the French Revolution is the degree of persistence with which many Americans promoted the French cause. It is tempting to think that the horrors of the French revolution’s Reign of Terror—mass executions on the guillotine, arbitrary trials, and the centralization of power in

the Committee of Public Safety—uniformly alienated Americans, but that is not the case. Many residents of the United States expended a good deal of energy justifying the excesses of the French Revolution. The scale and rigidity of the Old Regime in France, they argued, necessitated a tumultuous and violent revolution. In addition, Great Britain—revolutionary France’s current enemy—had a long history of crimes against its own citizens and others’, so any criticism of political practices should begin with Americans’ former antagonist. Accounts of French revolutionary crimes, furthermore, could not always be trusted because Americans received much of their news through British sources, and many Americans believed—indeed, were certain—that British writers were generally untrustworthy, especially when it came to descriptions of the French. Some Americans not only justified French revolutionary horrors, they also appropriated the rhetoric of violence to intimidate opponents and rally supporters. Toasts to “the guillotine” were not uncommon, and a pamphlet circulating in Philadelphia reveled in the possibility of President George Washington’s execution by guillotine.

The fervor and stubbornness of American enthusiasm for the French Revolution indicates that much more than politics and ideology was at stake. Indeed, support for the French Revolution frequently took on religious overtones. Preachers related apocalyptic biblical passages to French revolutionary developments, while newspaper authors emphasized the overthrow of the Catholic Church. Just as common, ordinary citizens rejoiced because they believed the French Revolution represented a critical step in the coming of a secular millennium. The new age these enthusiasts hoped for revolved around the spread of universal rights, global peace, and republican government, rather than the second coming of Christ. The specific doctrines of secular millennialism mattered less, however, than the hopeful exuberance associated with the French Revolution. The cultural movement known as the Enlightenment rested on the assumption of progress, but the type of progress usually described before the American and French Revolutions was a slow, evolutionary change. In the 1790s, the pace of change seemed to accelerate and a utopian age appeared imminent.

SLAVERY

That the French Revolution, despite its lofty rhetoric, did not usher in a golden age is evident in white elites’ inconsistent approach toward the issue of slavery. For while disputes over issues like representation, lib-

erty, and equality clearly precipitated the onset of the slave revolt in Saint Domingue (the early name for Haiti), the vast majority of white Americans failed to see a connection between the French and Haitian Revolutions (1791). They saw the former as an indication of freedom's progress in the civilized world and the latter as an unwarranted descent into anarchy.

When genteel Americans did take notice of the connection between the French and Haitian Revolutions, they did so in a rather peculiar manner. In the spring and summer of 1793, elite and middling residents of seaport towns opened their homes to French slaveholders fleeing the devastation of the Haitian Revolution in the belief that hospitality directed toward these refugees equated to practical support for the French Revolution. In actuality, white Americans befriending slaveholders from Saint Domingue provided sustenance for a group of aristocratic elites determined to preserve European forms of hierarchy. In addition, by siding with those who opposed the efforts of Haitian revolutionaries, genteel Americans denied Caribbean slaves the opportunity to determine their own political destiny. Most important, white Americans aiding slaveholding refugees belied their own public professions about gradual emancipation in the United States; universal abolition might be a nice idea in the abstract, but it simply could not be endorsed at the present time.

Sensing an opportunity to undermine the credibility of their opponents, Federalists mocked Democratic Republicans in the South who espoused French revolutionary ideology even while holding African Americans in bondage. If Jefferson and his followers were really sincere in their protestations about tyranny, why did they not shed their own tyrannical practices and emancipate their slaves? As powerful as this argument was, Federalists did not employ it to full advantage for two basic reasons. First, Southern slaveholders represented an important segment of the Federalist Party and an undue emphasis on the tension between support for revolutionary liberty and toleration of chattel slavery might damage partisan unity across sectional lines. Second, Federalist propagandists in the North deployed the slavery issue in crosscutting ways. Even as they criticized Democratic Republican slaveholders' unwillingness to live up to the ideals of the French Revolution, they raised the specter of racial disorder in northern communities as a means of convincing people of the dangers of the French Revolution. In that sense, Federalist critics of Democratic Republicans' stance on slavery were by no means idealistic humanitarians determined to promote the interests of African Amer-

icans. Rather, they were political opportunists who twisted the issue of slavery to fit their particular goals. In some cases it suited their needs to provoke their opponents about emancipation, but in other cases they found it useful to warn of the upheavals racial equality might cause. Partisan politics at the national level thus trumped a more sustained ideological and sectional debate over slavery.

It was African Americans themselves who most fervently and consistently took up the task of exposing the possibilities and limitations embedded within the relationship between French revolutionary ideology and American slavery. In the mid-1790s, free blacks in the North signaled their approval of French revolutionary ideals by participating in street parades and civic feasts. Southern slaves enjoyed fewer opportunities for open expression of their beliefs, but they were no less aware of and exhilarated by the international revolutionary movement. Gleaning bits and pieces of knowledge from a variety of sources—including talkative masters, sympathetic white artisans, and Afro-Caribbean sailors temporarily stationed in port—American slaves developed a sophisticated, albeit unstable, network for relaying information. Indeed, the extent of shared intelligence among slaves in the revolutionary Atlantic world demonstrates how transnational upheaval captivated African Americans. Not satisfied simply to learn about French revolutionary affairs and the contest over its meaning in the United States, a number of slaves decided to take action. Some set fire to white Americans' buildings, sparking a wave of paranoia among slaveholders. Others mocked white rhetoric about revolution by proclaiming "Freedom to Africans." At least one slave, Prosser's Gabriel of Richmond, Virginia, used the opportunity created by partisan conflict over the French Revolution to initiate a slave rebellion. No ordinary uprising, Gabriel's Rebellion reached out to various Frenchmen in the United States and had as its goal the overthrow of Federalist merchants and their slaveholding allies. Unfortunately for Gabriel and his co-conspirators, the plot was discovered before it was launched, and the brutal repression that followed made it clear to any observer that Democratic Republican support for the French Revolution did not translate into sympathy for the plight of enslaved Americans.

THE DEVELOPMENT AND CONCLUSION OF THE FRENCH REVOLUTION

As the French Revolution proceeded from the Reign of Terror to the Thermidorean reaction, and from the Directory to Napoleon's coup d'état in November 1799, diplomatic events continued to affect the

American interpretation of transnational revolutionary struggle. In 1795 the Senate authorized and President Washington signed into law a pact, Jay's Treaty, establishing peaceful relations with the United Kingdom. The announcement of this Anglo-American accord sparked a series of massive popular protests, because pro-French individuals felt it catered to the British and betrayed American obligations to revolutionary France. Yet in the long run Jay's Treaty tempered American attitudes toward the French Revolution by resolving the Anglo-American war crisis of 1794–1795 and by facilitating commercial growth.

Three years later, the XYZ Affair again brought the United States to the brink of war, but this time the crisis was a Franco-American one. On 3 April 1798, President John Adams, who was elected in 1796, disclosed a packet of diplomatic materials—some of which referred to mysterious French officials "X," "Y," and "Z"—documenting a pattern of French belligerence and intrigue. Almost immediately, Democratic Republicans renounced their claims about the interconnectedness of the French Revolution and the progress of American freedom. They also declared their willingness to serve the United States in a war against France. Bombastic displays of popular support for President Adams persisted through the spring and summer, and Congress actually authorized the Quasi-War, an undeclared naval war against France.

The most important response to the XYZ Affair, however, occurred when a cohort of "high" Federalists succeeded in getting congressional approval for two controversial legislative measures, the Alien and Sedition Acts. These acts extended the length of time it took for immigrants to become naturalized citizens with full voting rights and gave the federal government power to punish individuals who spoke or printed anything thought to be slanderous against the Federalist administration. Accurately asserting that the Alien and Sedition Acts were implemented as partisan weapons designed to eviscerate Federalists' opponents, Jeffersonian politicians began reasserting themselves in public by portraying themselves as the defenders of American civil liberties. Democratic Republicans also took a more moderate position on the issue of transnational revolution. The principles of the French Revolution were still praiseworthy in the abstract, and the French Republic merited good wishes in its ongoing military struggle against Britain and its tyrant, King George III, but the cause of American freedom was carefully distanced from practical developments in Europe. Napoleon's rise to

power, as a result, did not undermine or retard Jefferson's rise to power because most citizens in the United States had already begun thinking of their nation as the only home for revolutionary republicanism. In a similar vein, Jefferson's victory in the election of 1800 assumed significance not simply as a seminal achievement for the Democratic Republican Party, but also as a great triumph for the American political system. Whereas the peoples of Europe continued to struggle against tyranny, social degradation, and material devastation, white Americans could revel in their freedom, equality before the law, and prosperity.

Although the French Revolution did not produce the same degree of violence and upheaval in the United States as it did in Europe, it had a tremendous impact on American life. Transatlantic turmoil spawned by the French Revolution prompted a wave of millennial yearning and an unprecedented amount of partisan organizing and conflict. It brought into relief the contradictions at the heart of the popular commitment to liberty and slavery. Indeed, though the American Republic was technically independent, events across the Atlantic constituted the frame within which Americans sketched the broad contours of their political and cultural identity. In that sense, the French Revolution decisively shaped the maturation of the United States.

Matthew Rainbow Hale

Mary Wollstonecraft

Born 27 April 1759 in Spitalfields, London, Mary Wollstonecraft was the second of seven children born

to Edward and Elizabeth Dixon Wollstonecraft. Wollstonecraft's father was a drunken bully who squandered the family's money and failed repeatedly at every occupation he tried. He not only terrorized his family and reduced them to genteel poverty, he also diminished his daughters' chances of making respectable marriages and denied them formal schooling beyond sketchy lessons in Yorkshire. The oldest son inherited money from a grandfather in preference to his siblings, had a full university education, and became a lawyer, an injustice that shaped Mary Wollstonecraft's views on the education of men and women for the rest of her life.

After failing at most of the acceptable occupations for ladies, including sewing, teaching, and working as a lady's maid and governess, Wollstonecraft began a girls' school in London but quickly ran into financial trouble. Turning to writing, she produced a pamphlet, *Thoughts on the Education of Daughters* (1786), which earned ten pounds and brought her to the attention of Unitarians Joseph Priestley and Richard Price, who in turn introduced her to her lifelong friend and patron, the publisher Joseph Johnson. Johnson's *Analytical Review* hired Wollstonecraft as a writer in 1787, for which she reviewed European works, teaching herself Dutch, French, Italian, and German in the process.

Although she cultivated a bohemian image, Wollstonecraft also turned out profitable books, including *Mary: A Fiction* (1788); *Original Stories from Real Life* (1788), an anthology for children; and an anthology for female readers in 1789. Already incensed by Jean-Jacques Rousseau's attitude toward women, Wollstonecraft then read Edmund Burke's *Reflections on the Revolution in France* (1790), which prompted her to write her groundbreaking work, *A Vindication of the Rights of Women* (1792), in less than three months. Johnson promoted the work as a companion piece and challenge to Thomas Paine's *1791 Rights of Man*, and the book enjoyed wide circulation in radical circles in Britain and France. Determined to live a genuine existence free of artificial restraints, Wollstonecraft pursued relationships with men, including the artist Henry Fuseli and the American naval captain Gilbert Imlay, that gave her great emotional anguish.

At a dinner for Thomas Paine in 1791, Wollstonecraft had met the author and reformer William Godwin. She met him again in 1796, and they became lovers. Wollstonecraft became pregnant, and in March 1797, at Godwin's insistence, they married. Wollstonecraft gave birth to a daughter (the writer Mary Wollstonecraft Shelley) but died of puerperal

fever on 10 September 1797 in London. Godwin oversaw the posthumous publication of *The Wrongs of Woman, or Maria* in 1798, and followed that year with his *Memoirs*, a frank recounting of Wollstonecraft's sexual history that scandalized her readers and alienated many former admirers.

American readers responded very positively to *A Vindication of the Rights of Women*, which appeared excerpted in literary magazines like the *Ladies Magazine* and the *Massachusetts Magazine* in 1792. The first complete American edition appeared in 1793 and went through three printings, surpassing in circulation Paine's *Rights of Man*. There was much for Americans to admire in Wollstonecraft's work. Far from a revolutionary overturning of gender roles, her plans for the reform of female education and the civic responsibilities of women struck a chord with Americans. As prominent women like Abigail Adams and Judith Sargent Murray argued, women needed a revolution in manners, to shed artificial cunning and flirtation in order to be better spouses, mothers, teachers and nurses—occupations that, over time, would confer status in the new nation. The notion of the importance of motherhood won the support of many conservatives. Americans also liked Wollstonecraft's emphasis on the ability of commerce to bring down social distinctions, as related in her 1796 work, *A Short Residence in Sweden, Norway and Denmark*, and her portrayal of women's friendship across class lines, in *Maria*.

However, the release of Godwin's *Memoirs* shocked American readers just as it had Europeans. As the French Revolution burned out, its supporters became disillusioned and Americans became disgusted with Napoleonic France. Some critics attacked Wollstonecraft as an immoral fanatic and derided her ideas about women's education. Nevertheless, Wollstonecraft had framed the case for women's rights in words that had special significance for Americans and echoed key philosophical texts revered by the new nation's intellectual elite. Even critics used her terms when defining the role of women, keeping these issues in circulation until the rediscovery of Wollstonecraft by women activists in the second half of the nineteenth century.

Napoleon and Napoleonic Rule

Americans first became aware of Napoleon Bonaparte in the mid-1790s, while he was a commander in the wars of the French Revolution. Newspaper accounts portrayed him as a gifted general along the lines of Julius Caesar. In particular, descriptions of Napoleon's youthful character, elevated reading taste, and magnanimous treatment of conquered enemies pushed many Americans to think of him as a liberal humanitarian. So inspiring were these printed testimonies that at least two individuals in the Philadelphia area, including an African American servant of soon-to-be Pennsylvania governor Thomas McKean, named their children "Bonaparte." The hunger for news about Napoleon contributed, in turn, to a profusion of misinformation. Rumors about Bonaparte's whereabouts and situation became a minor newspaper industry, and in 1799 it took approximately one month to discredit a rumor that the French general had died in Egypt during a military campaign in North Africa.

Though Napoleon did not assume political power until November 1799, Americans long before then grasped the depth of his political influence. When French and British officials initiated peace talks in June 1797, Americans attributed it to the daring accomplishments of Napoleon. In a similar way, observers of American domestic politics suggested that the European victories of Bonaparte had a moderating impact upon the political disputes between Federalists and Democratic Republicans. A few individuals, like U.S. representative Robert Goodloe Harper of South Carolina, identified a malicious element in Bonaparte, but most Americans in the mid-to-late 1790s viewed Napoleon with appreciation and awe.

THE GENERAL BECOMES A DICTATOR

News of the 9 November 1799 coup d'état bringing Napoleon to power reached most parts of the United

States by late January 1800, but it was not immediately clear how his emergence as a political leader should be understood. At times, Federalist politicians and newspaper editors denounced Bonaparte's rise as another example of the unstable political wrangling and illiberal ideology of the hated French Jacobins. In other situations, they praised Napoleon's regime for quashing democratic despotism and for establishing a foundation upon which international peace and French domestic tranquility might be developed. Democratic Republicans also gave mixed signals about the significance of Bonaparte's assumption of political power. He seemed to some the fulfillment of the French Revolution, a republican champion who persistently opposed monarchists. To others, however, Napoleon represented the betrayal of French revolutionary ideals and the dangers of a standing army.

The ambivalent and relatively nonpartisan approach toward Napoleon was undergirded by the Anglo-French peace treaty of 1802, which temporarily removed the immediate impetus for American discord regarding European politics. By the end of 1802, moreover, most Americans agreed that Napoleon operated as a dictator, not as a benevolent republican. Still, Democratic Republican and Federalist commentators found reason to praise Napoleon's regime. A writer for a Virginia newspaper noted that while Bonaparte continually disregarded constitutional procedures, he was "endowed with the most splendid talents." The author meant that Napoleon had charisma and panache and displayed the ability to shape events in his image. In an era when international conflict forced Americans to make difficult decisions about the character of the United States, and when Americans were developing the myth of the self-made man, the figure of Napoleon was appealing because he exemplified the way in which strong-minded individuals seemed to impose their ideas on external circumstances rather than yielding to the inscrutable forces of fate.

LOUISIANA AND THE NAPOLEONIC WARS

Reasons for bitter party conflict over the question of Napoleon reemerged rather quickly with the crisis over French occupation of the Louisiana territory. In 1800 France acquired the territory from Spain in a secret agreement. Napoleon hoped to reestablish a French presence in the New World and planned to use the Louisiana territory as the main source of timber and food for the sugar-producing island of St. Domingue. Once news of France's acquisition of Louisiana reached the United States, however, President

Thomas Jefferson moved quickly to protect American interests along the Mississippi River valley. While hinting at the possibility of an Anglo-American alliance if Napoleon did not moderate his imperial designs, Jefferson sent ministers to Paris in hopes of acquiring New Orleans and the right to navigate along the Mississippi River. Federalist politicians, in contrast, urged Jefferson to summon an army and take possession of Louisiana by force; only a sycophantic, Francophilic American would not stand up to the foreign threat looming on the western horizon. Unfortunately for the Federalists, the same St. Domingians who initiated a massive slave uprising in 1791 indirectly gave the Democratic Republican Party a public relations coup when they successfully thwarted Napoleon's attempts to reconquer their island in the first few years of the nineteenth century. For when Napoleon became frustrated with his inability to reassert French force in the New World, he decided to cut his losses and authorized the sale of the entire Louisiana territory—not just the city of New Orleans—to the United States for the bargain price of \$15 million. War with France had not only been averted, but a tremendous territorial boon to the United States had been acquired through peaceful negotiation.

Not coincidentally, the Louisiana Purchase (1803) occurred just before a new round of Anglo-French warfare (1803–1815) enveloped the Western world. As with the military strife of the French Revolution, the Napoleonic Wars provided a framework for vicious rhetoric and partisanship in the United States. Federalists attacked Napoleonic France for its aggrandizing, ambitious policies. Napoleon seemed to aim at nothing less than global domination, and comparisons to the Antichrist were not uncommon. Federalists also lauded the merits of Great Britain as it bore the burden of defending political liberty against the tyrannical assaults of France. Democratic Republicans, on the other hand, held up France as the defender of liberty even as they condemned the hypocritical rhetoric of Napoleon. By contending with monarchical, aristocratic Britain, France facilitated the survival of American republicanism. This did not mean that Democratic Republicans favored an alliance with Napoleonic France and a declaration of war against the British. Rather, Jefferson's administration pursued a policy of neutrality, one in which the United States would seek to establish favorable relations with both Britain and France.

Neutrality during the Napoleonic Wars was much easier to proclaim than to achieve. Caught in the middle of yet another round of Anglo-French

conflict, the United States struggled to defend its interests and national honor. Especially damaging to Americans' economic welfare were foreign restrictions on U.S. trade and naval attacks perpetrated by British and French ships. As a result, President Jefferson issued the Embargo of 1807, which prohibited American trade with all foreign countries. Unfortunately for Jefferson and his Democratic Republican colleagues, the embargo was a dismal failure: American exports declined from over \$100 million in value in 1807 to just over \$20 million in 1808; Federalists enjoyed a partial revival of popular support; and Britain and France refused to modify their policies. Jefferson's successor, James Madison, sought to curtail these negative consequences by repealing the embargo and by promulgating the Non-Intercourse Act of 1809, which prohibited trade with Britain and France only. Like its predecessor, however, the Non-Intercourse Act persuaded neither British nor French authorities to respect American maritime and commercial rights. Undeterred in their attempt to influence peaceably European policy toward the United States, Madison and Congress experimented with yet another piece of legislation. Macon's Bill No. 2 (1810) repealed the ban on trade with Britain and France, but simultaneously authorized the president to reimpose that ban on either nation if the other decided to rescind its restrictions on American trade.

At this point, Napoleon sensed a weakness in American policy and exploited it to the advantage of France. In particular, Napoleon had his foreign minister declare that France was lifting its ban on American shipping. Though the actions of Napoleon's minister represented a clear attempt to manipulate American policy, Madison followed through on the promise of Macon's Bill No. 2 and reimposed restrictions on trade with Britain. In other words, Napoleon forced Madison's hand and not so subtly pushed Americans to take a more aggressive stand against the British. And when officials from Britain refused to alter their stance on trade restrictions, Americans appeared to have no choice but war with that nation. Formal conflict came to pass when Congress declared war on Britain in June 1812. Though American ships achieved a number of dramatic triumphs over British vessels, the land confrontation in the struggle that became known as the War of 1812 (1812–1815) was a series of virtually uninterrupted disasters. The United States survived the war with its territorial integrity intact and self-confidence growing, but only because Napoleon's forces occupied the vast majority of Britain's resources, military manpower, and political energy.

THE LEGACIES

When Napoleon's enemies defeated his armies and forced him to abdicate in the spring of 1814, Americans responded, predictably, by dividing into partisan camps. Federalists rejoiced at the fall of Bonaparte and viewed the relative indifference among the French populace as a sign that his regime had never been very popular. Democratic Republicans argued that peace would be a blessing for Europe, but lamented the possibility of a return to French monarchical rule. After Napoleon returned from exile in 1815 for his 100 Days Campaign, Americans once again interpreted events along political lines. Federalists feared that the Napoleonic forces of disorder would threaten European stability, while Democratic Republicans claimed that Bonaparte fought for the right of self-determination. In the end, the duke of Wellington defeated Bonaparte's French army at the Battle of Waterloo (1815), and Napoleon's influence upon the United States underwent a drastic transformation. After that date—and more particularly after Napoleon's exile to a remote South Atlantic island, St. Helena—the French commander ceased to affect American life through direct political and military activity.

Yet Bonaparte's legacy in the United States persisted well beyond his political demise. Napoleonic military tactics became a staple for the education of cadets at West Point, while the Congress of Vienna (an assembly of European delegates gathered together in 1814 and 1815 for the express purpose of stabilizing international relationships in the wake of Napoleon's fall) indirectly assisted American economic and cultural growth by successfully establishing the framework for a century of relative transatlantic tranquility. No matter how Americans after 1815 viewed Napoleonic politics and warfare, they generally expressed amazement at the way in which the French general shaped the entire Western world in his image. Referred to as a "luminous star," a "great man," and the subject of "wonder, astonishment, and pity," Bonaparte seemed to comprehend and harness the vast potential of individual willpower in a way that few others in history ever had. Napoleon's name and image, therefore, became one of the most powerful symbols of Romantic belief in the nineteenth century. Transcendentalist thinker Ralph Waldo Emerson wrote about him in a collection of essays, *Representative Men* (1850). Andrew Jackson kept a bust of Napoleon on a bookshelf throughout his career. And dashing Civil War general George B. McClellan reveled in his nickname, Little Napoleon. As late as the 1920s, a poll found that Americans considered Bonaparte one of the three greatest figures

of history, along with Jesus Christ and Henry Ford. Napoleon died in exile on St. Helena in 1821, but the French general's image continued to evoke for Americans the power of individual exertion and visionary self-confidence.

EUROPEAN RESPONSES TO AMERICA

When news of the Battle of Yorktown, decided by the capitulation of General Charles Cornwallis on 19 October 1781, reached London, British ministers who had viewed King George III's military involvement in America as folly rose in prominence. Critics of the military conflict in America viewed it as an extension of the conflict between Britain and France and thought that Britain was foolish not to subordinate its American concerns to the contest with France. In a memorable speech at the outset of the American Revolution, the leading British statesman of that age, William Pitt the Elder, had foretold that the war with America would lay Britain prostrate before the power of France. After Yorktown, new British ministers tried to prevent military defeat from becoming a complete diplomatic defeat as well, and fighting in America virtually ceased. Britain recognized an independent United States by the Peace of Paris of 3 September 1783. The American Revolution had a major impact not only on British diplomacy but on European diplomacy as a whole. The Revolution also affected European economies by spurring the establishment of free trade policies. Finally, the Revolution left its mark on European monarchies and national identities.

DIPLOMACY

"Every nation in Europe," said Benjamin Franklin, "wishes to see Britain humbled, having all in their time been offended by her insolence." By the time of Yorktown, the truth of this was clear. France allied itself with the new American Republic and against Britain mainly because of the French leaders' desire to seize the diplomatic opportunity Britain had given them; but spite also played a part in the decision. The French defeat—largely at the hands of Pitt the Elder—in the Seven Years' War imbued the court at Versailles with bitter rancor toward King George III.

The American Rattle Snake. This etching by the British satirical artist James Gillray was published in London in April 1782 to mark the opening in Paris of peace negotiations between Great Britain and the United States. Gillray portrays America as a snake coiled around the British army encampments. LIBRARY OF CONGRESS.

Other European states, like the Netherlands and Russia, welcomed the opportunity to weaken Britain but opted for neutrality rather than outright war. Even neutrality implied hostility toward Britain. As the legitimate sovereign in America, George III expected European princes to support him against rebels. Instead, neutral European states aided America through trade. Dutch neutrality failed as a policy, and Britain forced war upon them.

In the era of the American Revolution, the European states can be divided into two groups. There was a European center comprising Britain itself, France, and to some extent the Netherlands. These three states vied among themselves for supremacy, although the Dutch were experiencing a long, slow defeat in the contest. France and Britain were locked in bitter contest. British defeat in the War of the American Revolution induced the same kind of spite in Britain as in France, contributing to the unyielding mind-set of Britain during the Napoleonic Wars, during which Britain truly, single-mindedly, and successfully fought France for supremacy in Europe.

Around the European center, there was a periphery comprising Spain, the German Empire with its principalities, and Russia, among other states. Some in this group welcomed the war because they hoped that a British loss in America would lead to a loosening of British power elsewhere. The Spanish, Germans, Russians, and other peripherals expected France to carry most of the costs, although some private individuals in these states were prepared to assist France themselves.

The most important peripheral state to join France was Spain. At one time a mighty power, Spain had declined to marginal status by the time of the American Revolution. This decline dated at least to the seventeenth century, but the Seven Years' War had hastened the process because Spain was humiliated, although it gained some North American possessions from France. Not content with the expulsion of France from North America and the humbling of Spain there, the Royal Navy dispatched Captain Cook to investigate whether Spain's South American colonies might also be opened to British trade. The Span-

Bostonians Paying the Excise-Man. This 1774 mezzotint by Philip Dawe illustrated for the English the lawless behavior of Americans in its depiction of a group of Boston men forcing tea down the throat of John Malcolm, a customs official who has been tarred and feathered. The Liberty Tree and the Boston Tea Party are visible in the background. ART RESOURCE, NY.

ish court felt therefore the same rancor toward Britain as did its counterparts at Versailles. Further, a family alliance bound the two courts, the French ruling house of Bourbon having placed one of its members on the throne of Spain. The two branches of the Bourbon family eagerly joined hands. They undertook joint naval action in 1779, threatening the English coast with invasion. In addition, the Spanish monarchy sent money, war materiel, officials, and military officers to America.

A small number of Europeans came to America to offer their personal assistance. The Marquis de Lafayette was perhaps the most famous. A major general in the Continental Army during the Revolution, he also played a prominent role in French politics during the French Revolution. Baron Friedrich von Steuben of Prussia was almost as famous, becoming inspector general of the Continental Army. Two other Europeans who made major contributions to the American cause were Count Casimir Pulaski and Thaddeus Kosciuszko, both from Poland.

However, these famous names belied the European reality. Whether at the center or on the periphery, most Europeans knew little of America and placed little value on its Revolution. America was a backwater. French scientists thought that even nature in America was feebler than in Europe, plants and animals smaller and weaker, and natural process more prone to decay. Although America had already produced a great philosopher, Jonathan Edwards, few Europeans read American books, and fewer valued American political ideas. Despite the contributions to the American Revolution of some German volunteer officers, reactions in Germany and Russia mostly reflected this combination of ignorance and disdain.

American notions of political liberty or representative government were attractive to very few Germans. Instead, Germans thought of America, when they did think of it, mostly as a place of fantasy or escape. "Here or nowhere is my America!" wrote the greatest German poet, Johann Wolfgang von Goethe, over the door of his house in Weimar. Under the nominal sovereignty of the German emperor, German princes were nevertheless effectively independent, and they could even go to war with one another. Some German princes opposed Britain in spirit. Silas Deane, an American diplomat in Europe, recommended Prince Ferdinand of Brunswick as a possible commander of American forces. Other German princes supported King George III, who after all was himself a German prince and who eventually married his eldest son to a daughter of the Brunswick house. American notions of republican liberty had

even less appeal in Russia than in Germany. Empress Catherine the Great and Tsar Alexander I both had some sympathy with republican notions, but Catherine stayed neutral. The British attempted to obtain her cooperation against America; she suspected British motives, yet she did not want to seem too hostile to Britain. Nor did Alexander assist the French Revolution. Hostility to all revolution then hardened in Russia in the early nineteenth century. When a French visitor, the Marquis de Custine, visited Russia in 1839, he discussed American notions of a representative republic with Tsar Nicholas I. Reminding Custine of the legacy of Tsar Alexander I, who had established a constitutional monarchy in Poland, Nicholas told Custine that the constitutional system was vile, complaining that a monarch should not have to stoop to petty deals with base politicians.

ECONOMY

After news of the Battle of Yorktown was reported to the Scottish economist Adam Smith, the carrier of the news said that the British nation was ruined. Smith replied coolly that there was much ruin in the British nation. He had predicted before the Revolution that a political separation of America from Britain would in fact make both parties more prosperous. Smith was not alone in this view. The eccentric but brilliant English economist Josiah Tucker had been even more outspoken than Smith on the subject, saying well before the Revolution that American colonies were a burden to Britain.

Smith described the principles that had long governed British thinking on matters of international trade and colonial administration. Calling these principles mercantilism, he said that states attempted to achieve a favorable balance in trade with one another, leading nations to regulate and limit trade. These were futile attempts because each nation viewed wealth as something to be gained at the expense of its neighbors. When states left trade free, wealth increased in absolute terms because merchants had larger markets and therefore incentives to invest more capital in larger and more efficient systems of production. So long as Britain controlled American commerce, Smith believed, regulation would tend to stifle trade. American independence would open American markets and rationalize British production.

The removal of British regulations in America stimulated transatlantic trade. The former colonies soon bought more British goods than they had before the war, with exports to North America from England and Wales rising from 2,460,000 in 1772–

1773 to 5,700,000 in 1797–1798. Then, during the French Revolution, Britain blockaded European ports, and it enjoyed the Atlantic trade without much rivalry or interference from other European powers. These opportunities more than repaired the loss of its thirteen American colonies, and Britain rose to unparalleled economic and political power in the nineteenth century. Britons learned from Smith. “We are all your students now,” the younger William Pitt told Smith during the wars of the French Revolution.

The movement toward free trade was a permanent European legacy of the American Revolution. However, this movement further exacerbated the contrast between the European center and the European periphery. Britain, France, the Netherlands (which included Belgium until 1830), and parts of Germany and Italy all made rapid economic progress, partly owing to the spread of free trade policies, while the peripheral region fell behind.

MONARCHY AND NATIONAL IDENTITY

In the late nineteenth century, the liberal English economist Walter Bagehot explained how the American Revolution had changed the role of the British monarchy. American colonists were wrong about the monarch, said Bagehot. They thought George III was a tyrant, but instead he was a fool and a madman. However, King George did nearly as much damage as if he had been a tyrant. His incapacity triggered the American Revolution, a misfortune that revealed to the British that their monarchy required an adjustment. In Bagehot’s view, Britain’s poor showing in the War of the American Revolution impugned George III’s active, daily oversight of government.

Bagehot’s opinions echoed those opposed to George III’s policies, and Bagehot implied that these ideas reflected public opinion at large in Britain. However, the most careful recent scholarship has failed to establish clearly how the various parts of the British public reacted to the American Revolution. No doubt, opinion was split, and changed over time. Exactly how it was split, and exactly how it changed, however, is not known. One result was clear: Britain established a foreign office, replacing the cumbersome system that previously mixed the management of foreign policy.

Such reforms, many of them consequences of the American Revolution but more of them of the French Revolution, allowed European monarchies to become powerful symbols of national identity. Some scholars have argued that the American Revolution

created national identity. Others have argued instead that Britain had a strong national identity before the American Revolution, which that event recast and strengthened. What is indisputable is that a spring of nationalism welled up in the American Revolution and the French Revolution, and in the nineteenth century that spring became a European torrent. For the most part in Europe, monarchs succeeded in making the monarchy a symbol of this torrent of identity. The rise of free trade and the emergence of powerful European national identities, symbolized by renewed and in some cases reformed monarchies, were the two most important European reactions to the American Revolution.

EXPANSION In a little over two hundred years, a few tiny, beleaguered English settlements evolved into a mighty nation that would soon extend its

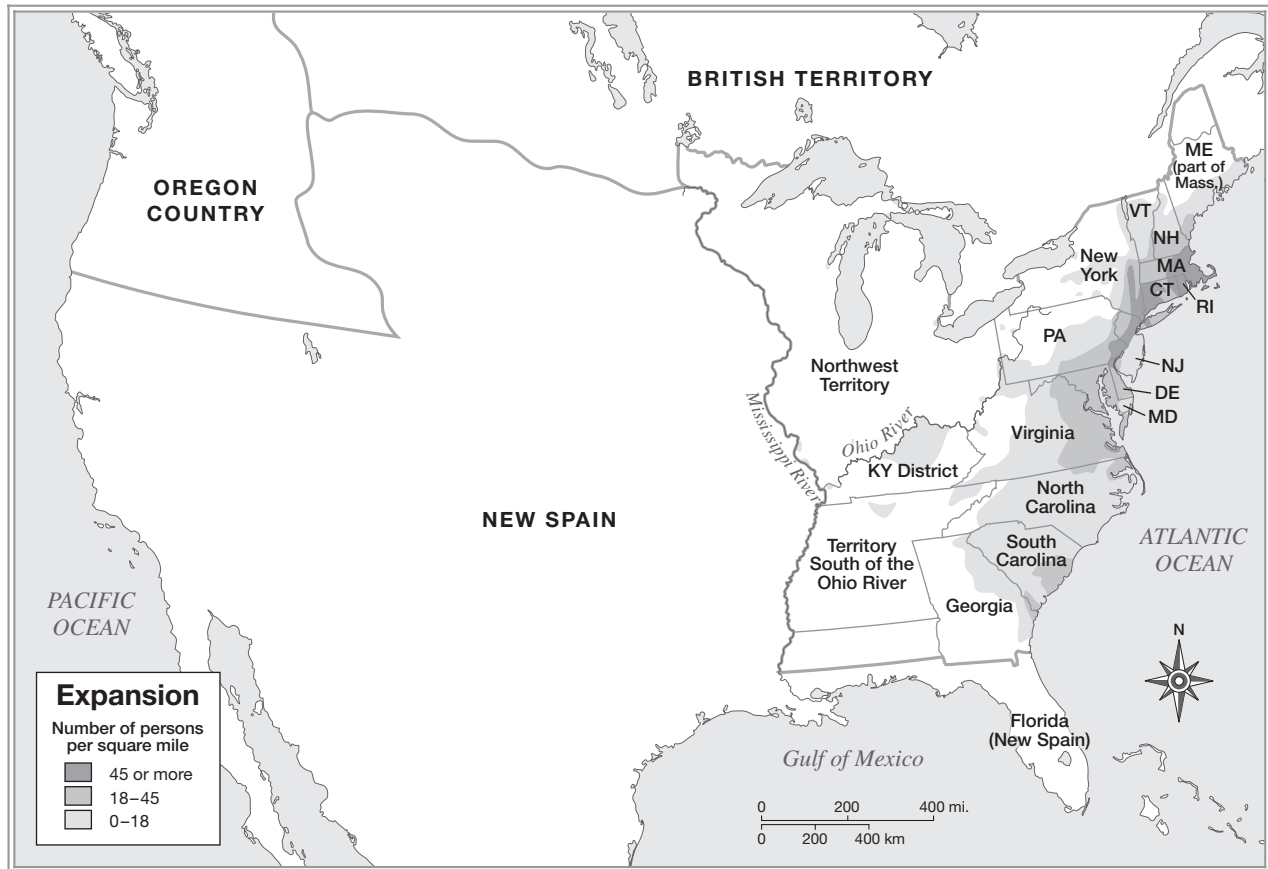

Towering Rock Formations. In August 1805 the Lewis and Clark expedition stopped near these rock formations along Tower Creek in Idaho. © DAVID MUENCH/CORBIS.

boundaries across the entire North American continent. Although “expansion” accurately describes the geographical transformation that would continue throughout the nineteenth century, the term connotes passivity and inexorability. The growth was so rapid, deliberate, energetic, and violent that it could just as well be described as an “explosion” that overwhelmed those colonists’ five rivals—the French, Spanish, Dutch, British, and Native Americans.

The English colonists had several competitive advantages over their opponents, the most important of which was their rapidly expanding population. The Spanish lusted after silver and gold, which they failed to use as the foundation of a system of public credit and private power. Generous agricultural subsidies failed to attract many Spanish colonists because there was a shortage of labor in Spain. Although the French engaged in some farming, they primarily sought such natural resources as beaver

skins in North America and sugar in the West Indies. For instance, French leaders thought they had acted wisely when they did not pursue England’s tentative queries about trading all of Canada for the sugar island Guadeloupe after the French and Indian War ended in 1763. This diplomatic blunder reminds historians how fortune (as well as particular decisions by particular leaders) plays a major role in history. If France had controlled Canada at the time of the American Revolution, the Revolutionaries might have won more easily and then successfully conquered Canada.

The Dutch simply did not have a large enough population at home to compete against the swarms of English who rushed over to the New World in four discrete waves during the seventeenth and eighteenth centuries. The English colonists quickly turned to agriculture and trade (even as some continued to look for gold), activities that transformed the landscape

and provided sustenance for a populace that grew from about one million settlers in 1740 to four million in 1790. They imported the dynamic, flexible common law system of rural capitalism: a free market in land, labor, and goods. Lightly taxed and well fed, the colonists were soon much taller than their European counterparts. Fully aware of their growing power and needs, the colonists chafed at the constraints the British put upon them after the French and Indian War: although the British had given them rights and access to all lands east of the Mississippi, they banned any further migration. Caught between these four competing European empires, the Native American tribes had neither the technology nor the cultural traditions to overcome numerous plagues, internal disputes, and the vast number of determined colonists.

THE IDEOLOGY OF COLONIZATION

From the beginning, the English colonists had continental aspirations, for which they had several ideological justifications beyond immediate self-interest and providing for one's family. Virginia governor Alexander Spotswood's expedition in 1716 to the

Blue Ridge Mountains was self-consciously nationalistic; he foresaw "a new English nation" sweeping across the frontier. Both Europeans and Americans preferred to wrap up their imperial ambitions in legal rhetoric. The king of England granted his colonists royal charters extending from the Atlantic to the Pacific, a grant covering not only Native Americans but also the French. The king authorized these grants on the legal theory that the English had "discovered" these lands even though Native Americans already lived there. Like his European rivals, the king based this circular, self-serving argument on the theory that non-Christian leaders had no capacity to establish their own title and that the Europeans were the first Christians to discover and thus legitimately own the lands.

When Chief Justice John Marshall faced the question of title in *Cherokee Nation v. Georgia*, he did not rely on euphemisms or noble principles. He invoked the doctrine of "conquest," bluntly stating that the Native Americans had lost a "contest for empire" because of their inferior military capacities. Sovereignty is a phenomenon described by the philosopher Thomas Hobbes: "In the exercise of sover-

eign right, the sovereign is the sole arbiter of his own justice. The penalty of wrong is war and subjugation." The philosopher John Locke provided a jurisprudential justification for English title: the Native Americans had no natural law property rights to the land because they had not cultivated the land (even though many tribes actually had extensive agriculture).

For most of the colonists, religious beliefs were not a pretext for a land grab. Many of the English left their native land to pursue their religious beliefs in the new country. The Puritans' desire to practice their religion (and suppress other religious views) enabled them to endure the harsh environment of New England. John Winthrop Jr.'s famous claim that the Puritans were establishing "a Citee on a Hill" combined religious and political aspirations. William Penn created Pennsylvania to protect the freedom of conscience. Many of the English sought to save the souls of the heathen natives, while others sought to eliminate them or at least move them out of the way. Thus, the early colonists believed in "Manifest Destiny" long before John O'Sullivan invented that phrase in 1845 to describe how Americans "overspread the continent allotted by Providence for the free development of our yearly multiplying millions." English racism also was a tool of empire. Unlike the French, who often went "native" in every sense of the word, the English remained more culturally and sexually isolated from their local rivals. They quickly embraced race slavery throughout the colonies, a system that achieved a high level of productivity at relatively little cost because the black slaves could not easily escape. The "rights of Englishmen" to representation, the common law, and the jury did not apply to anyone else.

THE STRUGGLE FOR DOMINION: WARS, SKIRMISHES, AND REVOLUTION

All the contestants paid a high price in terms of lives lost during these protracted struggles for control of the continent, which did not cease until the end of the nineteenth century. The list of atrocities, ranging from the slaughter of entire villages to isolated murders, is agonizingly long. During King Philip's War in 1675, Wampanoag Indians killed more than six hundred whites. The colonists retaliated by killing over four thousand Wampanoags—40 percent of the tribe. A century later, John Floyd described to Thomas Jefferson the hard life on the Kentucky frontier:

We are all obliged to live in forts in this country, and notwithstanding all the caution that we use, forty-seven of the inhabitants have been killed and taken by the savages, besides a number wounded,

since the first of January last. . . . Whole families are destroyed without regard to age or sex. Infants are torn from their mothers' arms, and their brains dashed out against trees.

Thus, for almost three hundred years, the colonists engaged in a "total war" that included civilians as well as combatants.

While the colonists continued their long war with the Native Americans, they faced a more dangerous threat from the French, who were wealthy, far better organized, and generally more effective in developing alliances with the Indians. The French sought to contain British expansion by building a ring of forts along the western frontier. When George Washington, a leading speculator in western lands, tried to negotiate with the French, they told him of "their absolute Design to take possession of the Ohio, and by G— they would do it." On his return trip in 1754, Washington helped trigger the French and Indian War by ambushing a French scouting party at Great Meadows (in what is now southwestern Pennsylvania).

England's eventual victory over France revealed that one of the perils of empire is ingratitude. The British had spent a great deal of money to defeat the French and maintained the Americans should help reduce the resulting national debt. The Americans, no longer threatened by the French and their Native American allies, saw no reason to pay any additional taxes without their own consent. After all, they had spilled their own blood to help Britain expand its empire. But the controversy extended beyond taxation without representation. In 1763 the British tried containment once again by proclaiming that colonists could not move into western lands already occupied by the Indian tribes, who now were also British subjects engaging in a lucrative fur trade, and by building forts to enforce the mandate. Even worse, in 1774, the Quebec Act extended Canadian jurisdiction to the Ohio River while also protecting loathed French Catholicism. In 1775 the Continental Congress responded to these constraints (as well as the escalation in the use of force by both sides) by invading Canada, knowing that such an act made reconciliation all but impossible. One year later, Thomas Jefferson turned those actions into the enduring words of the Declaration of Independence. The king's efforts to combat colonial expansion were listed among the Declaration's complaints justifying armed revolution: "[The king] has endeavored to prevent the population of these states; for that purpose obstructing the laws for naturalization of foreigners, refusing to pass others to encourage their migrations hither, &

raising the conditions of new appropriations of land.”

THE THEORY AND PRACTICE OF AMERICAN EXPANSIONISM

Benjamin Franklin and Jefferson were geopoliticians of the first rank. In 1748 Franklin described Captain Christopher Middleton’s arduous attempt to find the fabled North-West Passage to the South-Sea, a quest to facilitate the shipping of furs and other valuables to growing markets in Asia. Franklin would later fund another failed effort to find the nonexistent river route. As soon as Europeans began conquering the New World, they also started constructing a global market tying together Europe, Asia, and the Americas. Franklin understood sooner than most of his fellow colonists the need for coordination between the different colonies; his newspaper published the first political cartoon, a drawing of a snake cut into many pieces that were marked as various colonies, resting above the admonition “Join or Die.” Less noticed is the snake’s hissing recommendation to “Unite and Conquer.” That snake would later consolidate, warning “Don’t tread on me.” Franklin envisioned dramatically increased colonial coordination when he drafted the Albany Plan of Union, which described itself as a “Plan of a proposed Union of the Several Colonies . . . For their Mutual Defence and Security, and for extending the British Settlements in North America.” Even more important, Franklin developed the revolutionary premise that England’s constitution must apply equally throughout the empire. Jefferson would transform this notion into an “Empire of Liberty” offering unlimited opportunities and equal rights to any white males who would venture into the wilderness. In 1801, soon after Gabriel’s slave revolt reminded Southerners of their vulnerability, Jefferson described his hemispheric vision to James Monroe in terms intimating political, cultural, and even racial uniformity:

However our present interests may restrain us within our own limits, it is impossible not to look forward to distant times, when our rapid multiplication will expand itself beyond those limits, and cover the whole northern, if not the southern continent, with a people speaking the same language, governed in similar forms, and by similar laws; nor can we contemplate with satisfaction either blot or mixture on that surface.

Jefferson, the son of a surveyor, understood the necessity of exploration as precondition to establishing title and sovereignty. He organized the Lewis and Clark expedition to satisfy both his insatiable scientific curiosity and to begin the process of establishing sovereignty as far as the Pacific Ocean.

These examples of American leadership should not obscure the role that untold thousands of unknown, individual American settlers made throughout this era to change the face of the continent. Whatever the French, the British, the Native Americans, or American leaders said or did, the pioneers relentlessly risked their lives and fortunes to explore and develop new lands. Just before the Revolution, Lord Dunmore, governor of the Virginia colony, described this force to the Earl of Dartmouth, colonial minister and secretary of state for the colonies:

The Americans acquire no attachment to Place: But wandering about seems engrafted in their Nature. . . . In this colony Proclamations have been issued from time to time that restrain them. But . . . they do not conceive that Government has any right to forbid their taking possession of that Vast tract of Country, either uninhabited, or which serves only as a Shelter for a few scattered Tribes of Indians. Nor can they easily be brought to entertain any belief of the permanent obligation of Treaties made with those People, whom they consider but little removed from brute Creation.

Embracing rather than fighting the inevitable, Dunmore issued a proclamation granting title to new settlers who moved beyond the Allegheny Mountains and provided surveyors to facilitate development.

Heavily influenced by the economist Thomas Malthus and the French physiocrats, Madison and Jefferson believed the United States’ population surge was a short-term boon that would eventually undermine their ideal of agrarian republicanism. Explosive population growth would enable the Americans to spread the “empire of liberty” across the continent. As Madison argued in *The Federalist Number Ten*, this increase protected the Republic because a large republic is less prone to factionalization and tyranny than a small one. Thus the fortuitous Louisiana Purchase from Napoleon, which doubled the size of the new nation, not only augmented American power but also protected republicanism by providing an essential outlet for continued growth. Dissenting Federalists accurately observed that the purchase also provided new opportunities for the slave economy. The two Virginians understood that there was only a finite amount of arable land. Eventually, a surplus populace would move to the cities, which would turn that overflow into a dependent, corrupt faction, vulnerable to demagoguery. However, the steadily swelling populations of numerous urban centers indicated that many Americans did not perceive their cosmopolitanism to be incompatible with republicanism. In the meantime, Jefferson required that any growth be of the right kind of people. He refused to let the new citizens of Louisiana imme-

diately elect their own representatives because they were not of Anglo-American stock, preferring to wait until enough Anglo-Americans moved into the new territories before permitting elections. Jefferson also believed (or more accurately, blindly and self-servingly hoped) that expansion would resolve the slavery issue. Somehow slavery would disappear or at least become diluted as it spread westward. He never explained how his admired yeoman farmers could easily coexist with the new plantations, which would increase the demand for slaves.

While Jefferson preferred to enlarge the country and take residual title from Native Americans through negotiations and purchases, Madison preferred conquest. Twice Americans invaded Florida, only to retreat for diplomatic reasons. American leaders started the War of 1812 with the hopes of conquering Canada. Like most American military operations during that war, the invasion failed miserably. But a diplomatic return to the status quo obscured profound victories for expansionists. Andrew Jackson had effectively crushed any residual Native American resistance east of the Mississippi before he defeated the British at the Battle of New Orleans. Madison partially rejected the traditional Republican Party antipathy to the powerful federal government that Alexander Hamilton had argued was necessary to support and protect this union; Madison supported a second national bank but vetoed a bill to build federal roads to link the newly settled lands with the Atlantic Coast.

Aided by Secretary of State John Quincy Adams, President James Monroe paved the way for continued American expansion, both formal and informal. In 1819 the Monroe administration purchased Florida from Spain. In 1821 Russia attempted to forbid all foreign shipping as far south as Vancouver Island. Bluffing brilliantly, Adams convinced the British not to invade Alaska. When the British minister asked if the Americans were planning to invade Canada again, Adams replied, "Keep what is yours, but leave the rest of the continent to us." Relying on suggestions from the British, Adams next persuaded Monroe to declare in the Monroe Doctrine that no European nation could expand anywhere in either hemisphere, a dramatic step toward Jefferson's vision of hemispheric hegemony. Having secured the northern flank, Americans turned to the Southwest. Once again, individual settlers made foreign policy on the ground by moving in large numbers into Texas and pouring into the lands west of the Mississippi, thereby guaranteeing more conflicts with Native American tribes and the Spanish. The historian

Henry Adams best described the Americans' assessment of their next opponent:

In the end, more than half the territory of the United States was the spoil of the Spanish empire, rarely acquired with perfect propriety. To sum the story up in a single word, Spain had immense influence over the United States; but is the influence of a whale over its captors, —the charm of a huge, helpless, and profitable victim.

But the coming victories carried with them another peril facing successful empires: virulent internal dissension.

SLAVERY THREATENS THE CONSENSUS

Territorial expansion aggravated the sectional fault line of slavery, an issue swept off the table since the Constitutional Convention. When Southerners originally agreed to join the Union, they mistakenly thought their region would grow more quickly than the North. But thanks to immigration and the attractions of a free market culture, the North's population quickly outpaced the South's. The constitutional compromise giving Southerners three-fifths of a vote for every slave enabled Virginians to be president for twenty-four years; but events quickly revealed that the South could not control the House of Representatives. Consequently, the South desperately defended equality in the Senate, demanding that half of any new states, with their invaluable two senatorial seats, be admitted as slave states. In 1820 Representative James Tallmadge Jr. of New York broke the taboo by proposing that Missouri be admitted into the Union only if it banned the importation of new slaves and emancipated all slaves born there at the age of twenty-five. Tallmadge explained that slavery's "baleful consequences would surely conquer the West." Tallmadge's victory in the House demonstrated the loss of southern influence. Senator Henry Clay averted immediate conflict by pushing through the Missouri Compromise, which admitted Missouri as a slave state and Maine as a free state.

The historian Vernon Parrington offers one interpretation of the unstable situation of the United States. The nation was torn, he argues, between three rival forms of imperialism, each with its emerging utopian vision. The North was starting to create the world's second "industrial capital order." The South relied on cotton to create a "dream of expanding fields of white bolls and black slaves, reaching into Mexico and embracing the West Indies." The West preferred an individualistic society for whites only, seeking "county-seat towns where land holdings mounted in value with every new wave" (p. xiii) of immigrants. No longer seriously concerned about

external opposition, the growing country would turn on itself in a gruesome civil war to resolve this sectional competition.

EXPLORATION AND EXPLORERS Following the first tentative probings of the continent from the early sixteenth through the middle of the eighteenth centuries, a second critical period of exploration in the United States began. Whereas the earliest phase of exploration was almost exclusively commercial in nature, this second phase, although maintaining a commercial thrust, was also related to imperial ambitions for territory and to the period of scientific awakening in Europe and North America that is known as the Enlightenment. During this exploratory phase, from 1754 to 1829, the grand game of imperialism, with explorers as the chief players, was completed over most of what is now the United States, leaving the bulk of that territory under firm American control. In addition, most regions of the present-day United States were brought to the light of Euro-American science, which began to understand the continent in ways very different from those of earlier periods. The first phase of exploration of what became the United States dealt with discovery or “finding”; the second phase involved the process of exploration or “understanding,” as the traditions of Enlightenment science developed. By the end of the 1820s North America was no longer thought of as an Asian promontory; the Renaissance worldview had given way to an Enlightenment geographical conception based on detailed examination of both Atlantic and Pacific coastal regions and considerable penetrations of the continental interior.

Five groups of explorers were involved in scientific, geopolitical or imperial, and economic or commercial explorations in the United States. The Spanish operated primarily out of their settlements in northern Mexico and the Rio Grande valley. Russian explorers moved down the Pacific coast from their

Eskimo Lodges on the Sea. This engraving by George Francis Lyon appeared in *Journal of a Second Voyage for the Discovery of the North-West Passage*, published in London in 1824. THE LIBRARY OF CONGRESS.

fur-trading establishments in the Aleutians. French scientific explorers investigated the coastal areas of the Pacific Northwest, and other French explorers continued, as members of British or American fur trade ventures, to push south out of the St. Lawrence valley and west out of Louisiana (the western portion of the Mississippi drainage basin) even after the cession of Lower Canada to Great Britain and Louisiana to Spain in 1763. British naval explorers explored the Pacific Northwest and the colonial British probed westward from the Atlantic seaboard and south and west from trading posts in the western Great Lakes and Hudson Bay drainage basins. Finally, Americans at the time of the French and Indian War (1756–1763) and after the War for Independence began major explorations into the territories west of the Appalachians and, by 1804, west of the Mississippi.

SPANISH EXPLORATION, 1776–1821

The lands of northern New Spain, including the internal provinces of New Mexico and Texas, served as

points of departure for two principal types of Spanish explorers: the pathfinders who marked trails and geographical features across regions previously unexplored; and the explorer-colonizers who conducted explorations as part of the process of establishing temporary or permanent settlements. Between the cession of Louisiana Territory to Spain at the end of the French and Indian War in 1763 and the achievement of Mexican independence in 1821 (and thus the end of Spanish exploration in what is now the United States), both pathfinders, such as Franciscan friars Dominguez and Escalante and trader Pedro Vial, and explorer-colonizers, such as Franciscan missionary explorer Fray Francisco Garcés and Spanish army captain Juan Batista de Anza, were active in the territories that now make up the American Southwest.

The Dominguez–Escalante expedition of 1776–1777 took the friars north from the Rio Grande valley of New Mexico in search of a rumored city of bearded Indians and a northern route to California. They crossed the southern Rockies into the Great Basin (the first Europeans into that area) and proba-

bly fell just short of reaching Great Salt Lake before returning to the Rio Grande settlements. Pedro Vial was a trader employed by the government of New Spain to locate trading routes between Santa Fe and San Antonio, St. Louis, and New Orleans. Vial's several crossings of the southern Great Plains in the 1780s and 1790s provided the basis for the eventual opening of the Santa Fe Trail between that New Mexican city and St. Louis in 1821.

During the final phase of Spanish exploration, explorer-colonizers established the Old Spanish Trail linking the Rio Grande valley settlements of Santa Fe and Albuquerque with the Arizona mission settlements and the new mission-presidios along the California coast from San Diego north to San Francisco. The most prominent of the clerical explorers was Fray Francisco Garcés, who explored the Gila and Colorado River valleys in the mid-1770s and also joined Captain Juan Batista de Anza on Anza's pioneering explorations of the route from the junction of the Gila and Colorado Rivers across the Mojave Desert and Cajon Pass to the San Gabriel Mission near today's Los Angeles, a route now crossed by major interstate highways and the Union Pacific railroad. Other colonizing explorations in the Upper or Alta California coastal area aimed to establish the mission-fort settlements designed to protect Spanish territory from the possible encroachment of Russian fur traders moving down the Pacific coast from the north. Sergeant Jose Francisco de Ortega discovered San Francisco Bay in 1769, and Alferéz (Sublieutenant) Gabriel Moraga explored the entire Great Valley of California between 1806 and 1819, revealing much about the Sierra Nevada, the interior river valleys, and mountain passes across both the Sierras and the coastal ranges. After 1821 and Mexican independence, Spanish explorers were no longer active in the American Southwest. But they had laid the foundation for later explorations by the Americans and eventual United States control over the Southwest.

RUSSIAN EXPLORATION, 1770–1812

Russian explorations in the United States were entirely commercially driven by the Russian fur trade, first established in the Aleutians in the 1770s. The southward push of the merchant fur traders (*promyshlenniks*) along the coast of Alaska and, by 1812, to northern California was simply an extension of the rapid Russian advance eastward across Siberia in search of sable fur. By the time these fur traders had reached the Aleutians, the seal and sea-otter trade had begun to develop and the pelts of marine mammals supplanted sable as the primary goals of the fur

trade companies. Although their explorations of (mostly coastal) Alaska were significant, the Russian explorers were overextended, undersupplied, and undermanned by the time they had begun to penetrate as far south as Vancouver Island. And although Russian commercial explorers reached northern California and established Fort Ross in 1812, that venture was never economical. The Russians' chief contribution to North American exploration was in posing a potential imperial challenge that forced Spain to colonize California and Britain and France to pursue significant explorations of the Pacific Northwest in what is now the Washington and Oregon coastal region.

FRENCH EXPLORATION, 1754–1829

Like the Russian explorers, French explorers in this period were motivated almost entirely by the fur-trade and related concerns, such as the discovery of a water route between the Atlantic and the Pacific. Even though official French exploration of the continental interior ceased with the French and Indian War, French coastal exploration in the Pacific Northwest, initially stimulated by the promise of riches in the sea-otter trade with China, was significant. But exploration along the Pacific Coast also was a part of the traditional French exploratory objective of linking the Atlantic and Pacific via a sea-level route: the illusory Northwest Passage. Finally, French exploration in the Pacific Northwest was important for the advancement of Enlightenment science. In 1785–1786 the navigator Jean François de Galaup, Comte de La Pérouse, was commissioned to explore the Pacific Ocean and investigate whaling and fur prospects, search for a passage between Pacific and Atlantic, and establish French claims in the “northwestern parts” of North America. Accompanying La Pérouse were a number of civilian scientists, including a physicist and three naturalists. Although Captain James Cook's explorations in the Pacific Northwest a decade earlier were more important than those of La Pérouse, for scientific purposes his expedition's work provided the most solid investigations of the coastal regions of the Northwest before American explorers of the early nineteenth century.

BRITISH AND ANGLO-AMERICAN EXPLORATION, 1754–1792

British exploration of what is now the United States during this era was, like that of official French exploration, largely maritime and commercial but with overtones of imperial ambitions to match those of the Russians, Spanish, and French. This was particularly true along the Pacific Coast, where Captains

James Cook in the 1770s and George Vancouver in the 1790s led some of the century's most important exploratory endeavors. They produced excellent maps of the coastal region of Washington and Oregon. Vancouver depicted the course of the Columbia River approximately 100 miles inland and provided representations of the great volcanic peaks of the Cascade Range. Cook demonstrated the limited likelihood of a sea-level strait connecting the Atlantic and Pacific, slowing down the British naval maritime search for the fabled Northwest Passage. Civilian scientists on both missions collected considerable amounts of scientific data, particularly ethnographic data and information on "natural history."

Other British exploration in the present-day United States was largely confined to the hunting expeditions of settlers into the woods and valleys to the west of their farmsteads and villages along the Atlantic seaboard. This "Anglo-American" exploration (to distinguish it from "American exploration" of the postrevolutionary era) was often only a brief prelude to settlement; explorers such as Dr. Thomas Walker and James Robertson in the 1750s, among the first to view the great interior river systems west of the Appalachians, were followed closely by settlers like Daniel Boone who opened up the Ohio-Tennessee-Cumberland region for American settlement. In many instances the lands between the Appalachians and the Mississippi were actually settled by frontier farmers before they were officially "explored"; one of the primary geographical tasks of the new American government was to sort out conflicting land claims over land that was already being farmed but had never been mapped by an explorer, official or otherwise. The objectives of Anglo-American exploration, like those of other exploratory groups, were to find marketable land for settlement, to collect animal skins and pelts, and to locate a passage to the Pacific and the wealth of the Orient. The first major American explorations after Independence had the same general goals.

AMERICAN EXPLORATION, 1804–1829

At the beginning of the nineteenth century, the goals, priorities, and results of exploration in what was becoming the continental United States underwent a dramatic shift. The imperial clash between the British, Spanish, and Americans for possession of North America was still very much a part of the business of exploration in 1800. But by 1807, continuing through 1829, commercial exploration—primarily by representatives of the fur trade in western North America—became the primary exploratory incen-

tive. What could be termed "imperial exploration" at this time was carried out under the auspices of the government of the early Republic. America's epic exploratory endeavor, the expedition of Captains Meriwether Lewis and William Clark, had multiple goals: commercial, geopolitical, and scientific.

The primary objective of Lewis and Clark—as stated by Thomas Jefferson, the sponsor of their expedition—was to locate a water route to the Pacific via the Missouri and Columbia Rivers. In doing so, Jefferson hoped they would also open the newly acquired territory of Louisiana to American merchants and farmers, thereby consolidating the American hold on the western interior and eventually wresting the Columbia basin and Pacific Northwest away from the British. It was, after all, an American sea captain, Robert Gray in the ship *Columbia* out of Boston, who had first discovered the Columbia River in 1792, giving the young Republic at least some claim over the lands it drained. Although Lewis and Clark succeeded in negotiating the lengthy Missouri River to its source and thence down Pacific slope waters to the Columbia and the Pacific, they failed in their objective to locate a commercially feasible water route. But they did not fail in their goal of opening the trans-Mississippi region for American commerce. Within a year of their return to St. Louis, American fur trading posts were located in the remote western interior, as far as the junction of the Big Horn and Yellowstone Rivers in south-central Montana.

U.S. Army explorers, such as Zebulon Pike (in 1807–1808) and Stephen Long (in 1820), explored the central and southern Great Plains westward to the Colorado Rockies with the intent of defining the southern limits of the Louisiana Territory and the boundary between the United States and the interior provinces of New Spain. Civilian explorers Thomas Freeman and Peter Custis were commissioned by the government to ascend the Red River with much the same objective. All these explorers had some measure of success in collecting new geographical information on the southern portions of the Louisiana Territory (paralleling the contributions of Lewis and Clark in the territory's northern and western reaches). But it was the fur trade explorers between 1807 and 1829 who truly opened up the West for American exploitation.

If Lewis and Clark, Pike, and other government explorers were "diplomats in buckskin," then the members of the Rocky Mountain fur trade were "expectant capitalists." Profit-seeking rather than securing political claims to territory remained the chief goal of the fur-trade explorers. Fur-trade exploration

began with John Colter, George Drouillard, and Andrew Henry, employees of Manuel Lisa's Missouri Fur Company. From 1807 to 1810 they began to clarify the relationships between the source regions of the Missouri, Snake, and Colorado Rivers as the result of their search to establish trade relationships with tribes of the northern Plains and Rockies. Lisa's men were followed by John Jacob Astor's grand scheme to establish Astoria, an American fur-trading post at the mouth of the Columbia. A westbound party of Astor's men, led by Wilson Price Hunt in 1810, and an eastbound party led by Robert Stuart in 1812, laid down almost the entire route that would, a few decades later, become the Oregon Trail.

After these promising beginnings came a ten-year hiatus resulting from the War of 1812 and Indian resistance to American traders on the upper Missouri. Then the Rocky Mountain fur trade emerged again, this time under the auspices of William Henry Ashley and his Rocky Mountain Fur Company. Although the members of the fur trade were active in western exploration until the conclusion of the fur-trade era in the early 1840s, it was the decade of the 1820s that represented the high-water mark of fur-trade exploration. Chief among the fur trade explorers was Jedediah Strong Smith, who, in less than a decade in the West, saw more territory than any explorer before or after him. Smith's journeys took him from the Missouri and Platte to the Snake and Columbia, south to Great Salt Lake, across the Great Basin to California, throughout California and north into Oregon and Washington, and into the lower Colorado River country and across the Great Basin back to Great Salt Lake. Smith's manuscript map was lost, but the geographical knowledge it contained was not. American maps in the 1830s clearly demonstrated the significance of the fur trade in contributing to American knowledge of the western interior. With that knowledge came political control, and with the Louisiana Territory firmly in American

hands, the country was poised for the military expansion that followed.

FAIRS Agricultural fairs were a minor part of agriculture and rural life in the early Republic. But their rise and fall from 1811 to 1830 marked the beginning of farmers' commitment to improve agriculture through such techniques as selective livestock breeding, crop selection, fertilization, and crop rotation.

The first agricultural societies and fairs appealed to elites. In 1785 educated gentleman farmers and planters organized societies in Philadelphia and Charleston, South Carolina, to discuss the application of science to agriculture. Members included merchants and professionals as well as such prominent citizens as Benjamin Franklin and George Washington. These societies offered premiums for the best essays on fattening cattle and the best experiments in wheat growing and pumping water. The city of Washington established a series of market fairs in 1804 and 1805. Organizers awarded premiums to the best examples of each type of livestock sold. In 1809 Washington-area residents organized the Columbian Agricultural Society, which held regular fairs and awarded prizes for the best livestock exhibited rather than sold. The agricultural societies and fairs of the early 1800s, however, were not popular with the majority of people who actually raised most of America's crops and livestock.

In September 1811 Elkanah Watson organized and established the first true farmers' fair at Pittsfield, Massachusetts. Watson was a promoter and entrepreneur who had begun to raise merino sheep, an imported breed noted for fine wool. He understood that the existing organizations dedicated to improving agriculture appealed only to urban elites, gentlemen farmers, and amateur scientists. Watson believed that the message of improvement would be more palatable to working farmers if accompanied by entertainment and camaraderie. Fairs needed to feature enough pageantry to "seize upon the farmer's heart" as well as his mind. The 1811 event began with a parade of members of the society adorned with wheat cockades in their hats, livestock, and a band. Exhibits consisted of livestock along with field and orchard crops, and the Berkshire Agricultural Society presented certificates, ribbons, and engraved silver pieces as awards. Over the next few years, Watson broadened the appeal of the fair by adding competitions for domestic manufacturers, a church service, and an Agricultural Ball.

The blend of education and entertainment accounted for the popularity of agricultural fairs into the 1820s. Watson even wrote a book to promote his vision, *History of Agricultural Societies on the Modern Berkshire System* (1820). Visitors observed the difference between common livestock and improved

breeds. Exhibitors displayed sheep with heavier and finer fleeces, stronger oxen, more prodigious hogs, cows noted for producing rich milk in large quantity, and prolific bulls. They wanted to attract those who wished to purchase breeding stock. Exhibits of domestic manufactures were common by the mid-1810s, reflecting the importance of homemade textiles in the years before factory cloth dominated. This new style of fair, dedicated to experiencing improvement rather than merely discussing it, appealed to farm families, especially those with access to New York City and urban markets in New England. Organizers in Fredericksburg, Virginia, conducted that state's first fair in 1823.

The message of improvement was powerful enough to convince some state legislatures to appropriate funds to support county agricultural societies and their fairs. In 1819 the New York legislature authorized payments to Allegany and Genesee Counties to support agricultural societies. Two years later the legislature appropriated money for Livingston and Monroe Counties. Each county was responsible for providing matching funds to be used for fair premiums. In 1819 the Massachusetts assembly provided an annual payment of two hundred dollars to be used for premiums to every incorporated society in the state with capital stock of one thousand dollars that served a county of twenty-five thousand people.

In the late 1820s the popularity of agricultural societies and fairs waned. Increasing production through improved livestock breeding, crop selection, and cultivation practices was difficult for farmers to accept during a period of low commodity prices. Most agricultural societies in Pennsylvania and Connecticut disbanded after 1825 and only one society remained by 1830 in New York, the home of the most societies and fairs. State legislatures also withdrew financial support. While a few agricultural societies sponsored fairs in the 1830s, only the return of agricultural prosperity in the 1840s contributed to a new interest in forming agricultural societies and conducting fairs following Watson's Berkshire plan.

FALLEN TIMBERS, BATTLE OF By 1794, the northwestern Indian policy of the Washington administration was in crisis. Insisting upon the Ohio River as the southern boundary of their territory, Indians under the Miami chieftain Little Turtle routed expeditions led by Generals Josiah Harmer and Arthur St. Clair in 1790 and 1791, respectively. With the credibility of his administration at stake, Washington selected Anthony Wayne to command a third and final strike against the Indians.

Having spent the better part of two years raising and training his Legion of the United States, Wayne faced a delicate situation as he began his advance in July 1794. Not only were the Indians determined to resist, but they were armed and encouraged by British officials who operated out of Detroit and other posts that were supposed to have been abandoned to the United States under the terms of the Treaty of Paris (1783). Now, Wayne discovered that the British had recently rebuilt and garrisoned Fort Miami at the Maumee rapids, near present-day Toledo, a site that Wayne had targeted for his attack upon the Indians. To further complicate matters, John Jay was in London attempting to reach an agreement to avert the apparently inevitable war, resulting in Secretary of War Henry Knox's instructions to Wayne to avoid conflict with the British if at all possible.

On 20 August, Wayne's legion was attacked by the Miami Indians at a clearing called Fallen Timbers (because a tornado had uprooted many trees, leaving the wreckage scattered over the area), near Fort Miami. In a battle of only forty minutes, the legion

launched a bayonet charge that dispersed the Indians in disorder. Though both sides suffered about 150 casualties, the confidence of the Indians was broken. Even more dispiriting was the refusal of the British to allow refuge to the fleeing Indians inside Fort Miami or to offer any resistance at all as Wayne destroyed the Indian fields surrounding the fort.

The British had built Fort Miami at the Maumee rapids, a strategically important site. Fearing the imminence of war with the United States, the British had used the fort as a base from which to arm the Indians and encourage attacks upon the frontier. They gave every indication that they would fulfill their promises to support the Indians against attack by United States forces. Circumstances changed this situation, however, just at the time of Wayne's advance. With John Jay in London and the prospects strong for a peaceful resolution to the diplomatic crisis, British officials ordered the detachment at Fort Miami to avoid military conflict unless directly attacked (similar orders had been given to Wayne by Secretary of War Henry Knox). Thus, despite their promises to the Indians and provocative actions on Wayne's part, the British refused any assistance to the defeated Indians.

With British credibility shaken, the Indians had little choice but to come to terms with Wayne. In the Treaty of Greenville of 3 August 1795, the Shawnee, Delaware, and Miami tribes ceded three-fourths of modern Ohio and northeastern Indiana to the United States. This treaty, along with the final evacuation of British posts in the Northwest, as mandated by Jay's Treaty (1794), opened that region, particularly Ohio, to a flood of American settlement.

equivalents. While today fame connotes little more than notoriety, in the early national period it encompassed an entire ethic. Similarly, reputation meant more than one's public image; an almost tangible possession, it encompassed a person's entire identity and sense of self.

The concept of fame had particular power among the early national political elite, though its roots reached back to the beginnings of western civilization; *Lives of the Noble Greeks and Romans*, by Plutarch (c. 46–after 119 A.D.) was a literal guide to gathering fame, describing and ranking a spectrum of heroes who had achieved immortal fame—the highest of goals. In the early American Republic, young gentlemen schooled to find models of personal behavior in Plutarch and other classical texts imbibed this idea from a young age. As Alexander Hamilton put it in *The Federalist* No. 72 (1788), “the love of fame” was the “ruling passion of the noblest minds.”

As suggested by Plutarch's panoply of great men, a man earned fame by doing great deeds for the state—an assumption that evokes fame's aristocratic cast. Francis Bacon (1561–1626) mapped out a hierarchy of such acts in his widely read *Essays* (1625), assigning fame to “fathers of their country” who reigned justly; “champions of the empire” who defended or expanded territories; “saviors of empire” who surmounted national crises; lawgivers who governed posterity through their laws; and—highest of all—“founders of states and commonwealths.” For early national leaders engaged in the creation of a new nation, this sensibility infused their political efforts with a sense of lofty purpose as well as deep personal meaning. Seekers of fame wanted to make history and leave their mark on the world. America's founding generation assumed that they were doing just that. “We live in an important era and in a *new-country*,” Benjamin Rush observed in 1788. “Much good may be done by individuals and that too in a *short time*.”

Fame was considered a noble passion because it transformed ambition and self-interest into a desire to achieve great goals that served the public good. Even as fame fueled and inspired a man's ambitions, it reined them in; one could only achieve everlasting fame through public service. In essence, fame was a selfish virtue, enabling leaders to be simultaneously self-serving and public-minded; in a sense, it humanized the seemingly lofty and unreachable ideal of community-minded republican virtue.

Reputation was equally important, but to a broader range of people. Men and women of all ranks had a reputation, though its precise meaning differed

FAME AND REPUTATION Early national concepts of fame and reputation differ greatly from their late-twentieth and early-twenty-first-century

from group to group. For artisans, farmers, or merchants—people of business or productivity—it connoted reliability and honesty. For women, it was tied to concepts of personal virtue. For political leaders, it represented their political currency, gaining them office and influence; particularly before political parties were acceptable, it was reputation that won a man power and office.

There were many dimensions to the concept of reputation. Fame, rank, credit, character, name, and honor all played a role. Rank was a somewhat impersonal way of referring to a person's place within the social order. Credit was more personalized, encompassing a person's social and financial worth; people with good credit were trustworthy enough to merit financial risks. Character was personality with a moral dimension, referring to the mixture of traits, vices, and virtues that determined a person's social worth. Taken together, these qualities formed a name or reputation—an identity as determined by others. Reputation was not unlike honor, and indeed, early Americans often used those words interchangeably. Honor was reputation with a moral dimension. A person of good reputation was respected and esteemed; an honorable person was notably virtuous.

Although concepts of fame and reputation had a long-standing historical past, different cultures shaded and altered their meanings. In early national America, the gradual democratization of politics subtly altered their significance. Traditionally, European leaders worried about their honor and reputation among their peers. Increasingly concerned with gaining popular political approval, American leaders looked to a broader audience. A prime example of this was the American practice of advertising political duels in newspapers. By publishing detailed accounts of their encounters—signed by name, despite dueling's illegality—leaders attempted to prove their qualities of leadership to the public and gain political support. "Europeans must read such publications with astonishment," gasped a writer in an 1803 issue of *The Balance* (Hudson, N.Y.).

Eventually, the increasingly shifting and changeable nature of American society had its impact. Urbanization and the rise of manufacturing made cities and towns ever larger, more complex, and anonymous. It is no accident that the early nineteenth century marks the rise of the "confidence man" or "con man," a person who relied on his very lack of reputation for personal gain. Winning confidence through his genteel appearance and manners, he could cheat people in one town or city, then re-

make himself in another. In such a constantly changing world, even simple notoriety was a noteworthy accomplishment. Over time, this more democratic notion of fame grew to replace its more aristocratic forebear.

FAMILY LIFE See Domestic Life.

FARM MAKING In all regions, despite their differences, most colonists established farms from the beginning of settlement. Colonial settlers faced several obstacles as they acquired land for farms. Once land was obtained, either through a fee simple or quitrent process, farmers cleared it and determined how much would be in crops. Many farmers found the Indian method of slash-and-burn to be the easiest method to clear the land. Land was cleared of plants and small foliage and the undergrowth was then burned. This method made the land available for planting corn and other non-row crops in the Native American style. Farmers also removed trees by girdling their trunks. Using this method meant it took time for a tree to die, but over time, settlers would be able to clear their land for crops.

In the Northeast, colonists encountered rocky, acidic, clay soil that proved difficult to clear easily. Farmers spent years removing glacier rocks and other debris from the ground. These farmers established small-scale, general farms in which they raised a variety of crops and livestock. Wheat, rye, barley, corn, and other crops along with cattle, hogs, chick-

Sheep Shearing. This woodcut of a farm family shearing sheep illustrated the chapter covering the month of May in an American almanac published around 1810. © BETTMANN/CORBIS.

ens, and sheep were common across the region. By the end of the colonial period, however, farming had begun to decline in the upper Northeast. Lumber and naval stores as well as financial and manufacturing operations continued to be important in the nineteenth century. Farm size varied from state to state, but most farmers had fewer than two hundred acres. By the nineteenth century, agriculture in the Northeast had ceased to be the only occupation as farm families fell to roughly two-thirds of the population. In the nineteenth century, New England became a center for sheep production. At the same time that the South started to emerge as a center for cotton production, the New England states began exporting large quantities of wool each year to Britain and other manufacturing hubs.

In the mid-Atlantic states, agriculture developed around livestock raising and dairy and grain production. In the colonial period, Chesapeake Bay farmers raised tobacco for the British market, with production concentrated in Virginia rather than Maryland. Quickly dubbed the breadbasket of the colonies, Pennsylvania, New Jersey, and later Maryland produced wheat and raised livestock. During this time, farmers began to move from the dual purpose cow and started distinguishing between those that produced large quantities of milk and those that were best for providing beef. The production of butter and cheese allowed farm women to sell their surplus in the Philadelphia and international markets. In proprietary colonies, farmers acquired land subject to quitrents, with an average-size farm at 135 acres. In the nineteenth century, mid-Atlantic farmers continued to improve and clear their lands. Wheat re-

mained an important commercial commodity, although most farmers raised corn for family and local consumption. The raising of livestock in Maryland and other locales became an important industry in places where tobacco was no longer planted.

In the southern states, commercial agriculture drove the economy and society from the start. Colonial settlers planted tobacco, hemp, rice, indigo, and other crops for export. Tobacco farming expanded quickly across Virginia during the colonial period. The development of the Carolinas and Georgia saw the emergence of rice, sugar, hemp, and indigo production. Southern crops, however, depleted the soil, and planters and farmers found it necessary to use field rotation practices. Planters ran large operations, while family farms remained small, with farmers placing only a portion of their land into staple production while the remainder was used to sustain self-sufficiency. Planters gained large land grants from headrights and generous grants from colonial governments. Initially, labor was performed by indentured servants, but by the 1680s slavery had spread across the South. Originally used to farm tobacco, rice, hemp, and indigo and to raise livestock, slaves in the nineteenth century were concentrated on cotton plantations. The development of the cotton gin changed the structure of farms across the South.

When farmers migrated to the new western states, they found a different climate, topography, and soil. As New England and mid-Atlantic farmers moved to the Old Northwest, the land flattened out and the soil became more productive. Crops that could no longer be grown in the East, such as wheat, flourished in what would later be called the Middle

West. Settlers found that clearing land required breaking the prairie. While this was time-consuming and costly, once it was broken, farmers did not spend years clearing and rebreaking the soil. In the nineteenth century, the Middle West became a region not just for wheat and other crops, but also for livestock raising and feedlots. European immigrants from northern and central Europe joined settlers from New England, the mid-Atlantic, and the Upper South in the Midwest after 1820.

FASHION Both as a concept and a changing array of consumer goods and cultural practices, fashion served as an important means of social communication in eighteenth-century British America. Composed not only of objects and styles, but also of behaviors and the arenas in which such items and actions were displayed, fashion provided for connection as well as personal distinction. It possessed intensely local significance as a tool for distinguishing among and within social groups, yet also expressed participation in a cosmopolitan Atlantic world. While most inhabitants of the colonies recognized the symbols of power that fashion conveyed, they did not necessarily regard or respond to those markers in the same ways. Thus, fashion was a primary register of cultural and political contest.

For Anglo colonists, England was the locus and source of all things fashionable, although many modes actually originated in France. A burgeoning Atlantic trade made the adoption of European fashions, from fabrics and fans to teapots, possible, while waves of immigrants, many trained in the fashion trades, also spurred the transmission of modes. Newspaper advertisements for imports regularly deployed the adjective “fashionable” as a powerful selling point for the rising volume and selection of items that suffused even middling colonial households by the middle of the eighteenth century. Indeed, the British Empire’s smooth operation depended on consumption of fashionable goods in colonial outposts

Alice Lawrason Riggs. Cephas Thompson painted this portrait of a fashionable American woman around 1815. The sitter, the wife of a prominent Baltimore merchant, wears a high-waisted Empire-style gown. THE MARYLAND HISTORICAL SOCIETY, BALTIMORE, MARYLAND.

and the consumer appetites for novelty that changing fashions fed. As social critic Bernard Mandeville (1670–1733) observed, fashion was a “strange, ridic’lous vice” that nonetheless “turned the trade.” This trade reached across the Atlantic and into the heart of North America, as diplomatic and social relations on the frontier created amalgams of Indian, Anglo, and French fashions.

In contrast to more recent cycles, fashions in dress changed slowly during the eighteenth century, indicated by seasonal variety in fabrics and more glacial shifts in the widths of hoop-supported skirts or the cuts of sleeves—changes subtle enough to be acknowledged and adopted by the people “of fashion.” Likewise, the display of fashionable practices, from dancing the minuet to drinking tea, the imperial good par excellence, and the social spaces in which those occurred (and in which fashionable dress could be displayed to great advantage) signified high status and participation in the empire. While fashion’s appropriation and refashioning by slaves, servants, and other “lower sorts” due to theft and an underground trade in stolen and secondhand goods made it an un-

Benjamin Franklin (1794). Franklin donned the persona of a rustic American, along with the beaver hat and homespun suit that conveyed it, when appearing before the French court at Versailles to plead for French assistance. GETTY IMAGES.

stable marker of rank, other forms of social distinction, such as speech and carriage, countered fashion's democratizing potential. Thus was the very idea of fashion rife with contradiction: desirable as an expression of high rank, yet disdained as the province of mere pretenders to status; displaced onto consuming women, but avidly pursued by both sexes; connected to other celebrated concepts such as gentility, taste, and refinement, yet also suggesting luxury, appetite, and effeminacy; and fueling commerce through consumption, but creating a potentially uneasy dependence on markets.

FASHIONING A REVOLUTION

Due to its considerable influence, fashion served as a flashpoint for cultural and political contests during the revolutionary era. By the end of the Seven Years' War in 1763, some Anglo colonists and Indians alike, facing ailing postwar economies after more than a decade of increasing consumption, called for retrenchment and a lessening of dependence on foreign "luxuries," even as English bourgeois styles in dress

and furnishings grew more restrained. By 1764, when Britain's Parliament moved to diminish its war debt by collecting taxes on items such as sugar and French fabrics, the climate was ripe for calls to reject imports and the fashions they expressed. In response to the following year's Stamp Act, which levied a one-pence duty on all paper and paper transactions, merchants in the northern port cities of Boston, New York, and Philadelphia pledged not to import goods until the bill was repealed, and outraged colonists swore not to consume such articles. Supporters used the public prints to enforce the boycotts, promoting the virtuous behaviors of genteel "people of fashion" while attempting to create new "American" fashions, namely homespun cloth, domestic tea, and minimalist mourning garb. Yet after the Stamp Act's much-celebrated repeal, colonists jettisoned the new modes, never widely adopted but symbolically important nonetheless.

With Parliament's passage of the Townshend Act of 1767, designed to raise revenue through the assiduous collection of duties on certain items, including beloved tea, some colonists revisited boycotts. Resistance leaders called upon Anglo women in particular to discipline their appetites and thus prove themselves good female patriots, foregoing fashion's cultural power while gaining a new kind of visibility, yet also scrutiny. Extravagant display, from the form-fitting macaroni mode for men to high, ornamented hairstyles for women, characterized the period between the repeal of all Townshend duties except the tea tax in 1770 and 1773, demonstrating that many colonists had little use for asceticism and understatement. The Tea Act of 1773, which gave Britain's East India Company a monopoly on the sale of tea to the colonies, defined tea, once the hallmark of female-orchestrated gentility and participation in the empire, as a symbol of subjugation, and the colonists who consumed it complicit in a despotic, tyrannical regime. In 1774 the First Continental Congress's Association enacted colonywide nonimportation and nonconsumption resolutions, clamping down on appetites for all things fashionable in language that decried forms of "extravagance and dissipation," which undermined professed American values of virtue, simplicity, and sacrifice. Such regulation persisted through the onset of hostilities between Britain and the colonies in 1775, as hunting shirts and leather breeches joined traditional military uniforms. Benjamin Franklin himself donned the persona of rustic American, along with the beaver hat and homespun suit that conveyed it, when appearing before the French court at Versailles to plead for French assistance. Yet the American Revolution resolved little in

the battle over fashion, which shaped the contest not only between England and the newly created United States of America, but between Whigs (Patriots) and Tories (Loyalists), merchants and artisans, slaves and masters, men and women—all competing to see who would define fashion for the new nation.

THE NEW NATION

Revolutionary leaders had cast fashion as a threat to the Republic while promoting an American antifashion stance that was itself a fashion, one that they often failed to adopt. The new nation and its leaders needed to appear legitimate in the eyes of the world, and European modes retained their ability to communicate power and status, locally and internationally. Many Anglo Americans continued to regard Europe as the seat of the *mode* (the fashionable) as goods flooded an American confederation of states powerless to enact national commercial policy in the mid-1780s. Social critics pinned the Republic's potential demise on appetites for fashionable "gewgaws."

Fortunately for Americans faced with the dilemma of signifying both prestige and virtue, European fashions themselves grew more understated in the final decades of the eighteenth century, the so-called age of democratic revolutions. The Empire-style gown that became popular in the 1790s served the image of American, republican simplicity well, projecting it onto white women clad in simple white gowns, standard-bearers of virtue, if not rights. Meanwhile, the displacement of Indians beyond the literal and figurative borders of the nation made the interpretation of Indian-influenced frontier dress as an American folk form possible, and unthreatening.

With the emergence of partisan politics in the 1790s, Democratic Republicans used fashion to attack ostensibly foppish, elitist Federalists. Whereas George Washington had donned a suit of homespun for his 1789 inauguration, in 1793 he appeared in velvet. The cut and cloth of a man's breeches, and the color of one's cockade—ribbons worn during the French Revolution—signified political allegiance, in fact, created it. The influx of refugees from the slave revolt in Saint Domingue to cities such as Charleston and Philadelphia helped create a distinct African American style that recalled the French Revolution's contagion of social upheaval. With Thomas Jefferson's election to the presidency in 1800, the fashion of genteel understatement triumphed; Jefferson would famously greet guests donned in a banyan (a robe-like garment), the height of genteel fashion for the learned, leisurely set. Into the nineteenth century, Anglo American men traded knee breeches and bro-

cade for long trousers and somber cloth, while the high-waisted, corset-free Empire dress for women persisted into the 1810s. Indeed, men's and women's "fashionable" garb steadily diverged throughout the latter half of the eighteenth century, mirroring the rise of an ideology of separate "male" and "female" bourgeois spheres of influence as white men abandoned obvious ornamentation in favor of other representations of power available to them alone.

FEDERALISM As a form of government, "federalism" describes a system of divided powers, each sovereign within its limited realm but concerned with different spheres—one general, the other local. The federal system created by the United States Constitution is the first specimen of this type, though many other states have subsequently adopted federal forms.

Over time, federalism has come to convey a variety of meanings, some of them contradictory. At the beginning of the twenty-first century, the meaning of federalism—like its related terms, federative system, federal union, federal state—is difficult to disassociate from a strong central government within a

single nation-state. In its eighteenth-century signification, however, a federal relationship meant compact, alliance, or treaty among independent sovereignties seeking a cooperative relationship. The federative power, as the seventeenth-century philosopher John Locke defined it, concerned those powers of war and peace, of treaty and alliance that commonwealths had need of in their transactions with other states. The formal compacts among equal parties resulting from the exercise of this power—written constitutions, treaties, alliances—were things to which the adjective “federal” might apply. European publicists could speak of the “federal constitution” of Europe as actually existing, and meant by the term the web of treaties, laws, and restraints that was to govern the relations of civilized states.

THE FEDERAL PRINCIPLE

At the root of the federal principle was the idea of a covenant or *foedus* (its etymological root). This and “synonymous ideas of promise, commitment, undertaking, or obligating, vowing and plighting one’s word,” as S. Rufus Davis has suggested in *The Federal Principle* (1978), were joined together with two other things: “the idea of cooperation, reciprocity, mutuality,” and “the need for some measure of predictability, expectation, constancy, and reliability in human relations” (p. 3). As important as each of these three concepts—commitment, reciprocity, predictability—is to human relations generally, when states and peoples had need of such values they made use of the term “federal.”

European colonists perched on the eastern rim of North America were not in fact the first inhabitants of the continent to make use of ideas recognizably “federal.” A recognition that strength lay in union and danger in discord; a pledge of perpetual peace within, and of concerted action toward enemies without; an understanding of how individuality might be preserved by common action; the vital significance attached to sworn oaths and plighted faith—all these hallmarks of the federal principle were reflected in the institutions and norms of various Indian confederacies, especially the great league of the Iroquois or Six Nations.

Such a constellation of ideas was also central to the Articles of Confederation formed among the American states in the aftermath of their 1776 Declaration of Independence from Great Britain. The experience of the Revolutionary War, however, showed how difficult it was for states to cooperate in an enterprise they all regarded as vital. When the framers of the Constitution met in Philadelphia in 1787 to ad-

dress the deficiencies of the Articles of Confederation, they had to find a solution that somehow avoided the extremes of “anarchy” and “consolidation”—what the Virginian James Madison termed “a perfect separation and a perfect incorporation, of the 13 States.” Neither alternative found significant support within the convention. As James Wilson noted in his important explication of the new Constitution, “consolidation” would demand “a system of the most unqualified and unremitted despotism,” whereas separation into “a number of separate states, continuous in situation, unconnected and disunited in government” would make the states “at one time, the prey of foreign force, foreign influence, and foreign intrigue; at another, the victims of mutual rage, rancor, and revenge.”

CONSTITUTIONAL INNOVATION

As an experiment in federal government, the U.S. Constitution was unique in creating a general government that could carry its laws into execution through a regular executive and judicial establishment, one that did not depend on requisitions or edicts to the states to do its legitimate business. Conscious that the states would have to give up some of their sovereignty, and conscious, too, of the impossibility of legislating for communities as opposed to individuals, the framers brought forth a new political edifice devoted to federal objects yet fashioned on the norms and institutions of constitutional government existing within the American states. Unlike the state governments, which generally claimed a plenary authority over the lives and liberties of their citizens, the federal government was one of enumerated and limited powers. The powers so granted, as James Madison emphasized during the ratification debates, were “few and defined” and would be exercised “principally on external objects, as war, peace, negotiation, and foreign commerce.” Supremacy was accorded neither to the federal government nor the state governments but to the Constitution itself, though the more perfect union was justified by Federalists as being an indispensable means to the preservation of both states and nation.

What were the limits of the powers respectively given to the federal government and the states under the Constitution? And where was the authority lodged to decide this delicate question? Those questions arose immediately with the formation of the new government in 1789 and remained of key importance.

The controversy pit “nationalists” like Alexander Hamilton, the first secretary of the Treasury, against

“State rights” or “compact” theorists like Thomas Jefferson, a clash that achieved its first great expression in the contrary opinions of Hamilton and Jefferson over the constitutionality of a national bank in 1791. Hamilton took an expansive view of the implied powers vested in the national government by the Constitution, a view later unfolded eloquently and authoritatively in a Supreme Court opinion of 1819, *McCulloch v. Maryland*. Chief Justice John Marshall acknowledged that the powers of the national government were limited and enumerated but nevertheless found that Congress enjoyed “the right to legislate on that vast mass of incidental powers which must be involved in the constitution, if that instrument be not a splendid bauble.” Marshall continued, “Let the end be legitimate, let it be within the scope of the constitution, and all means which are appropriate, which are plainly adapted to that end, which are not prohibited, but consist with the letter and spirit of the constitution, are constitutional.”

The contrary position of the “compact school,” by contrast, held that the federal Constitution was a creature of the states, each of whom enjoyed the right to accede or not to the compact, and who, as the original parties, must ultimately retain the right to interpret the extent to which the compact was fulfilled. In cases not within the compact, wrote Thomas Jefferson in his draft of the Kentucky resolutions, the pretended legislation of Congress was “void, and of no force.” Some, like John C. Calhoun, insisted that each state enjoyed a right to nullify a federal law within its jurisdiction that, in its judgment, was unconstitutional; others who subscribed to the compact theory, like John Randolph, were content with affirming a constitutional right of secession. According to this view, the national judiciary did not enjoy the ultimate authority to decide the line of partition created by the Constitution. That power instead lay with the original contracting parties, the people of the states.

In between these rival understandings of the Constitution lay a third view, one which was probably more expressive of the general consensus from 1789 to 1829 than either of the two extreme alternatives. The moderates saw a “partly national, and partly federal” system, though they were not always in agreement among themselves. Some carved out an ample dominion for federal power while also believing that it would be utterly contrary to the spirit of the constitution to preserve the Union by force, a position adopted by constitutional commentator William Rawle in 1825. Other moderates, by contrast, chastised secessionists for counseling action that was

patently unconstitutional. But they also believed that the theory of implied powers was equally destructive of the constitutional order, a position taken by James Madison. Despite these differences, the moderates were united in the conviction that to push either national or state powers too far would destroy the constitutional order, which they saw as a vital barrier against powerful tendencies toward anarchy or despotism.

PRINCIPLE AND POLITICS

It is customary to associate the clash between national sovereignty and the compact school with North and South, but in the period from 1789 to 1829 the picture is more complicated. After Jefferson became president in 1801, his administration accepted a more expansive conception of federal power. By the same token, many northern Federalists brought against his administration the same charge of unconstitutionality that Republicans had made against the Federalists in the 1790s. The acquisition of Louisiana in 1803, they argued, went far beyond the implied powers claimed by the administrations of George Washington and John Adams from 1789 to 1801. They also claimed unconstitutional usurpation against Jefferson’s Embargo of 1807–1809 and later against “Mr. Madison’s War” of 1812, when several New England states refused to heed the president’s call to mobilize their militia for national service. From 1815 to 1830, similar flip-flops occurred over the issues of internal improvements, the national bank, and the protective tariff, with leading political figures sometimes reversing their previous judgments of what was constitutional. The most contentious issue, temporarily put to rest by the Missouri Compromise, concerned the extension of slavery.

The elapse of three decades from the establishment of the federal government did not bring a greater consensus on the fundamentals, but rather a drift toward constitutional doctrines mutually antagonistic and irreconcilable. This lack of consensus regarding the basics of American federalism—the sense, as the statesman Henry Clay put it, “that we are as much afloat at sea as the day when the Constitution went into operation”—was felt to be profoundly threatening to the sustenance of the constitutional order. Thirteen years after Marshall’s confident opinion in *McCulloch* he wrote despairingly to a close friend that his hopes for the Union were nearly at an end. “The union has been prolonged thus far by miracles; I fear they cannot continue.”

FEDERALIST PAPERS *The Federalist* (also known as the “Federalist Papers”) is a collection of eighty-five essays on the U.S. Constitution written under the pseudonym *Publius* by Alexander Hamilton, James Madison, and John Jay. Hamilton conceived of the project as a means of countering anti-Federalists, opponents of the Constitution who were busily writing their own essays warning of the dangerous powers given to the proposed national government. Madison and Hamilton eventually wrote all but five of the essays, which appeared serially in New York City newspapers between October 1787 and August 1788. They were also published in book form in 1788.

Although the procedure for ratification required only nine states to approve the proposed Constitution, New York’s support was crucial both because of the centrality of the state and because of its importance as a center of trade. If New York had voted against ratification, the Constitution would likely not have gone into effect, even with the necessary nine votes elsewhere. Ironically, *The Federalist* had little impact on ratification in New York. Although New York City elected representatives to the special

convention who favored ratification, rural New Yorkers were suspicious, and the final makeup of the state convention had a clear majority opposed to ratification. Hamilton and his supporters eventually wore down the opposition, though, and New York became the eleventh state to ratify the Constitution on 26 July 1788. Despite failing to influence many New York voters, *The Federalist* had a major impact beyond New York. The essays were reprinted throughout the states and served almost as a debater’s handbook for the forces in favor of ratification at other state conventions.

The Federalist examined a number of major issues, such as the flaws in the Articles of Confederation (which governed the United States of America until the Constitution was ratified), the nature of federalism with its division of power between a national and state governments, and the powers of the various branches of government as well as why those powers were necessary. Although *The Federalist* does contain some innovative political philosophy (most famously, Madison’s *Federalist No. 10*, with its novel argument that a republican government is safer in a large, not small, republic), it focuses mostly on practical considerations of how government should function. In this, the authors exhibit what would become a distinctly American, pragmatic attitude. Because nearly all agreed that America should have a republican government, the writers ignored many of the philosophical questions that had engaged Western political philosophy up to that time.

The Federalist also served an extremely important rhetorical function. The moment for such an ambitious series of political essays was brief. A few decades after 1787–1788, the essays would probably not have had a significant impact because of the explosion of newspapers. The essays themselves fostered a tone of civility in the debate and contributed to the larger discursive framework that the authors were attempting to establish. The well-wrought, carefully reasoned political essays became virtual enactments of the kind of deliberation the authors hoped the national government would foster.

The Federalist almost never mentioned specific anti-Federalist writers or essays, even though those attacks shaped the project. The invisibility of the anti-Federalists within the essays was part of *Publius*’s rhetorical strategy to establish himself as a neutral commentator offering an unbiased overview, rather than as a partisan responding to specific charges. These tactics reinforced the overall thrust of *The Federalist*. Instead of trying to score every possible debating point, the authors attempted to shift the

entire realm of the debate away from considerations of competing interests to considerations of the public good, as they defined it.

They also argued themselves into a more reasonable position. Both Hamilton and Madison had argued vigorously for an even more powerful national government during the Constitutional Convention. Now called upon to defend the Constitution to people suspicious even of the powers that were given, they offered a moderate view of what the national government would actually be empowered to do.

Hamilton and Madison had read widely in political philosophy and drew upon a large range of historical and political writings in articulating their understanding of the Constitution. Perhaps most important, David Hume, the Scottish enlightenment thinker, influenced both men on a number of important issues.

The Federalist continues to have a significant role in the American political tradition. Not only do political scientists still turn to it as the most authoritative guide to the U.S. Constitution, but legislators, presidents, and U.S. Supreme Court justices continue to study its pronouncements in their efforts to understand the Constitution.

FEDERALIST PARTY One of the first two U.S. political parties, the Federalists came into being, ironically, in the anti-party years of the early 1790s, when parties were thought to be dangerous factions undermining the Republic. Federalism had considerable early success, many significant achievements, and fleeting popular support. Federalists won the first three presidential elections, controlled Congress for most of the 1790s, established the new national government, and kept the nation at peace. Over time, however, the Federalists lost their popular support and with it, their grip on power. Out of power and

in opposition to their bitter rivals, the Jeffersonian Republicans, or Democratic Republicans, Federalists either tried to imitate and mirror their opponents or devolved into stinging and increasingly self-defeating attacks. But the Federalist Party had a significant if brief moment during the 1790s and helped to set the agenda for early American politics and government.

EMERGENCE OF PARTIES

The first federal elections of 1788–1789 were not conducted along party lines. Members of Congress were elected, much as representatives had long been chosen, based on reputation and renown. Since they were now the officers of the new federal government and since the great majority had supported the ratification of the new Constitution of 1787, these men appropriated the term *Federalist* to indicate their support for the Constitution and the new regime. But party identities and identification were weak in the early Republic. Not until 1792 was there a clear opposition group in place to challenge the policies of the administration and its allies in Congress. Furthermore, attitudes toward parties were still negative and neither side claimed to be one. Rather, Federalists considered themselves “the government” or “the nation” and branded their opponents as a “faction,” a term that had unhealthy, unrepugnant connotations. The Democratic Republicans also denied that they were a party and claimed instead to be protecting the Constitution from the depredations of the Federalist “party” faction that had improperly seized control of the government. Scholars have debated whether it is proper to speak of Federalists and Democratic Republicans as full-fledged parties or merely as loose alliances or proto-parties. No matter where one falls out on this question, it is clear that the competition between the two entities—whatever we may choose to call them—was as intense as any ever seen in American political history and reflected two radically different visions for the future of the nation.

LEADERS AND FOLLOWERS

The Federalists coalesced in the first several national Congresses and were comprised of a group of representatives and senators who supported the legislative initiatives of the administration of George Washington. Although President Washington and Vice President John Adams headed the administration, the party’s intellectual and political leader was Alexander Hamilton, who began his tenure as secretary of the Treasury in September 1789 and cultivated allies in Congress. Hamilton’s ambitious program—

creation of a national bank, assumption of state debts from the Revolution, imposition of an excise tax, the establishment of public credit, and encouragement of manufactures—sparked heated opposition and touched off the first party conflict.

Federalism appealed to merchants, many large landowners, those engaged in commerce, and the wealthy more generally. Federalists were concentrated in urban port towns (especially in the Northeast), in New England, and in parts of Virginia and the Carolinas (especially Charleston). In addition to Washington, Adams, and Hamilton, key party leaders included John Jay (New York), Fisher Ames (Massachusetts), John Marshall (Virginia), Rufus King (New York), Charles Cotesworth Pinckney (South Carolina), and Thomas Pinckney (South Carolina), along with newspaper editors such as Noah Webster, John Fenno, and Benjamin Russell.

PROGRAMS AND ISSUES

Federalists favored a strong central government and an activist state, stressing the energy and primacy of the executive branch. They favored a foreign policy of neutrality that would keep the United States out of the persistent conflict between Great Britain and France, though many Federalists sympathized with the British. Commercially, the Federalists sought to expand their trade networks with England and extend their shipping to other markets as well. Federalists also favored a loose construction of the Constitution, believing that whatever was not expressly forbidden could be fully legitimate and constitutional. Federalists seized on this interpretation to enact a powerful and sweeping vision of the United States, one that foresaw the country emerging under centralized authority as an industrial, financial, and military power to rival Britain.

These views were exemplified by Federalist actions on some of the major policy debates of the 1790s. In the Neutrality crisis of 1793, Federalists rejected Republican calls to aid France in favor of a strict impartiality so as not to antagonize Great Britain. In 1794, Federalists called out troops to suppress the Whiskey Rebellion among western Pennsylvania farmers angered over an excise tax. The next year the Federalist-controlled Senate approved the unpopular Jay's Treaty, a commercial agreement with England that—for all of its shortcomings—maintained the peace between the two nations.

IDEOLOGY AND CULTURE

Beyond programs and issues, the Federalist Party also was marked by an attitude or an ideology of un-

abashed elitism that defined the party at least as much as its policies and programs. That elitism did much to undermine the Federalists in their day and to stigmatize them in historical treatments since. Federalists generally subscribed to an older conception of politics that stressed deference by the people to their leaders. Federalists believed that once the tiny electorate had selected its duly chosen leaders (the “constituted authorities,” in a favorite Federalist phrase), the public's responsibility between elections was to defer to the judgment of those leaders, not to try to influence officials toward alternative positions. The party was unprepared to operate in any system not premised on deference, since it lacked a grassroots (or even top-down) political organization. These beliefs led Federalists—most prominently George Washington himself—to vehemently denounce the Democratic Societies (popular clubs which met to discuss topical political issues and sometimes produced addresses and resolutions) as dangerous, extraconstitutional bodies of great potential mischief and to mock them as “self-created societies.” This attitude did much to explain both the party's conception of governing and politics and its eventual downfall as these sentiments grew increasingly anachronistic in a democratizing society.

This attitude was also reflected in the political culture of the Federalists. The party centered its celebrations around Washington, especially his birthday of 22 February, which became the highest holy day of the Federalist calendar. The day was marked throughout the nation with parades, the firing of cannon, and dinners, toasts, and processions, all of which served to solidify in the public mind the link between Washington, the administration and its policies, and the Federalist Party. While Washington tried to remain above politics and party and govern as a disinterested national leader, he increasingly sided with Hamilton over Jefferson on political matters and behaved more like a partisan. By the end of his second term, Washington was acting as (and was seen by his opponents) as a strong Federalist despite his Farewell Address of 1796, which warned against domestic political divisions.

Federalist political culture mirrored its ideology by promoting deference. But despite their reservations and ambivalence, Federalists at times practiced popular politics and mobilized public opinion effectively on behalf of their measures. Federalists consistently and explicitly linked Washington's incomparable stature to support for party policy. By framing issues as a choice between supporting Washington and legitimate government or supporting some for-

eign or radical element (be it Citizen Genêt, the Whiskey rebels, the Democratic Societies, or opponents of Jay's Treaty), Federalists regularly rallied the public to their side. Federalists utilized newspapers, petition drives, sometimes even door-to-door campaigning to press their points and produce the desired results. Even though many Federalists were troubled by the use of such tactics, the party often wielded them to great effect, frustrating and defeating their opponents.

DECLINE

Difficulties under Adams. The Federalists began to lose their popular touch when Vice President John Adams succeeded Washington in 1797. Far less popular than Washington and much less adroit politically, Adams was also plagued by a disloyal cabinet and by a fierce division in Federalist ranks between those loyal to the president and those who took their marching orders from Hamilton, out of office but still highly influential. The party also lost its once-sharp political touch. In an ill-advised effort to stamp out the Democratic Republicans and their partisans in the press (all of whom Federalists considered illegitimate anyway), the Federalist Congress passed in 1798 the Alien and Sedition Acts, which were designed to curb the influence of recent immigrants and make criticism of government leaders or policies illegal. But these efforts backfired disastrously. Rather than destroying the opposition, the acts and the high-handed, arbitrary way they were carried out invigorated and revived the Republicans, especially the party newspapers. When he stood for reelection in 1800, Adams presided over a badly divided party and faced a furious and revived opposition. Matched against Jefferson and Aaron Burr, Adams lost the contest, winning sixty-five electoral votes to seventy-three each for his Republican rivals. After a protracted process, the House of Representatives ultimately selected Jefferson as president. When Adams returned to Massachusetts in a bitter fury, no one could know that the Federalists had had their last taste of the presidency.

Elections of 1804 and 1808. After Adams's narrow loss in 1800, younger Federalists in particular tried to regroup by appropriating the organizational tactics and campaign methods of the Republicans to build a national political party organization. Despite such efforts, Federalists never again came close to winning the presidency. Jefferson was reelected by a 162 to 14 margin in the electoral college in 1804, defeating Charles C. Pinckney, who carried only Connecticut and Delaware. In 1808 Federalists again ran

Pinckney, this time against James Madison. Federalist fortunes revived only briefly due to the unpopularity of Jefferson's embargo of 1807, which was designed to hurt Britain but which seemed to do the most damage to the American commercial economy. Even with this issue handed to them by the Jeffersonians, Federalists could do little better in 1808. Pinckney again ran strongly in New England, where opposition to the embargo was strongest and carried Connecticut, Massachusetts, Rhode Island, New Hampshire, and Delaware plus scattered electors from Maryland and North Carolina. Despite making a stronger showing than four years earlier, Pinckney nonetheless lost decisively, carrying just 47 electoral votes to Madison's 122.

Election of 1812. The closest the Federalists came to winning the presidency was in 1812 as a significant antiwar sentiment hindered Madison's reelection. Federalists tried to make common cause with antiwar Republicans and ran a fusion ticket that, while potentially adding new members to their base, also ran the risk of upsetting many Federalists who worried that an alliance with Republicans would undermine the party's independence and legitimacy. New York City mayor De Witt Clinton was nominated for the presidency with Pennsylvania's Jared Ingersoll as the vice presidential nominee. In the end, Madison prevailed by only 128 electoral votes to 89 for Clinton. Pennsylvania proved to be the key as Madison carried its 25 electoral votes. Had Clinton carried them, he would have won the election by a narrow margin.

Hartford Convention. Now thoroughly routed, losers of four consecutive presidential elections and increasingly becoming a regional party only, Federalists struggled with their future as the War of 1812 raged. In December 1814 and January 1815, delegates representing each of the New England states met at Hartford, Connecticut, to discuss their grievances. Some delegates urged secession of the New England states from the union. That proposal was defeated and the convention issued a moderate set of proposals (such as opposition to the three-fifths clause in the Constitution and to territorial expansion) designed to strengthen the power of the states and restoring the influence of New England Federalism. The Hartford Convention became, at best, irrelevant and, at worst, in the eyes of some, a near-traitorous gathering as news of the resounding victory of the Battle of New Orleans (8 January 1815) arrived and with it the prospect of peace. By merely discussing secession at Hartford, the Federalists finished themselves as a viable political party in many

minds. Rufus King was nominated for the presidency against James Monroe in 1816 but he lost badly, 183 electoral votes to just 34, as King carried only Connecticut, Delaware, and Massachusetts. The 1816 election marked the effective end of the Federalist Party at the national level. The party lingered for awhile in New England but never again nominated a presidential candidate. Some Federalists retreated into literary endeavors, hoping to redirect culture and society—a political project carried on by other means.

The Hartford Convention, the presidential election defeats, and the slow evaporation to extinction as a party stood in stark contrast to and marked a sad end to what had once been a visionary and vibrant party with many achievements to its credit. Federalists, it can be argued, served the nation well in their time but ultimately were too much at odds with the direction of the nation's political development to survive as a party.

FEDERALISTS The American Revolution, a struggle against encroaching British authority, left most Americans deeply distrustful of centralized power. Yet between 1787 and 1790 the Federalists achieved what had once seemed impossible: the fusion of thirteen disparate former colonies into a potentially powerful national union.

NATIONALISM IN 1787

During the 1780s, despite American mistrust of strong central government, many concluded that Congress's powers were inadequate under the Articles of Confederation. Faced with economic depression throughout the decade, many states were unable to deal with their Revolutionary War debts. The lack of a national commercial policy fueled a trade imbalance with Britain; consumer debt soared, leaving merchants vulnerable to creditors; debt and high state taxes threatened farmers with foreclosure. America's feeble diplomatic credibility, with diplomats such as John Adams and John Jay repeatedly humiliated by their vague and uncertain authority, made it nearly impossible to secure favorable treaties or trade concessions.

Americans were increasingly divided between what historians have labeled "cosmopolitans" and "localists." The former mostly included those with broad economic and social contacts—merchants, urban artisans, commercial farmers including southern planters—who wanted energetic state and continental governments to promote trade, stabilize the currency, and pay public debts. Localists, including farmers and rural artisans, wanted government kept small, seeking state debtor relief and paper money to depreciate individual debts and tax burdens.

Localists generally dominated state governments. Cosmopolitans looked to the central government, but the Confederation Congress was nearly impotent. With no taxation power, Congress failed to raise much revenue through requisitions upon the states; dangerous sectional divisions and separate state interests undermined foreign policy. Increasingly, cosmopolitans pondered a new national government to institute a single national trade policy and tariff and to block inflationary paper money.

George Washington's 1785 call for a conference between Virginia and Maryland, bypassing Congress to settle a dispute over the Potomac River, inspired former congressman James Madison of Virginia to call for a broader convention on trade at Annapolis. There, in September 1786, Alexander Hamilton of New York, once a distinguished officer on Washington's staff, urged that a general convention meet in Philadelphia the following May to revise the Articles and strengthen the union. Shays's Rebellion in Massachusetts and similar popular outbursts sparked by debt and taxes encouraged responses to Hamilton's call, especially when the Continental government proved unable to defend its Springfield arsenal from the Shaysite rebels. Perhaps most important, the disorders persuaded Washington himself to chair the convention. Congress endorsed the plan in February 1787, and every state but Rhode Island agreed to attend.

THE CONSTITUTIONAL CONVENTION AND THE EMERGENCE OF FEDERALISM

The Constitutional Convention was divided between those who wished merely to strengthen the Articles, and those who wished to replace them with a new national government. Leaders of the centralizing group included Madison, Hamilton, James Wilson, Gouverneur Morris of Pennsylvania, and Rufus King of Massachusetts, all delegates from large states with broad economic ties. Their main proposal was Madison's, calling for a bicameral legislature, with both houses proportional to population, that would choose a national executive and judiciary and have a veto over state laws. When the small states objected, the nationalists adjusted, accepting a compromise that preserved equal state representation in the Senate and dropping the veto on state laws. But federal laws were declared supreme, and the courts were expected to strike down incompatible state statutes. The centralizers achieved a genuine national government in federal balance with the states—the key, they believed, to preserving the republican legacy of the Revolution.

Despite some historians' long-standing arguments that the Convention was a virtual conspiracy to promote a particular economic interest, a remarkably heterogeneous group ultimately supported the new constitution. Of fifty-five delegates, four left in protest and three refused to sign the final document. At least forty-five, from large states and small, backed ratification. The ability of this compromise system to unite a wide range of viewpoints, backgrounds, and private interests was the key strength

of those who now began to call themselves "Federalists."

FEDERALIST CONSTITUENCIES AND THEIR PRIORITIES

The framers' decision to submit the Constitution to popularly elected state conventions transformed ratification into a broad public debate. The pro-Constitution stand of Washington and Benjamin Franklin, arguably the two most eminent men in America, helped sway opinion, but only to a point: Americans were wary of mere appeals to authority.

The pro- and anti-constitutional schism resembled the prior divide between cosmopolitans and localists. Federalists tended to be people with broader connections and interests: merchants, lawyers, and other educated professionals; clergy; and commercial farmers and planters. They found themselves faced mainly by yeoman farmers and rural leaders with mainly local connections, who feared broad new powers exercised by a distant elite. Those with entrenched interests in existing state powers were also frequently hostile. The Federalists branded their opponents "anti-Federalists," shrewdly tarring them with the stigma of a purely negative agenda.

In general, Federalists were concentrated in the east. Coastal areas, dependent on trade, linked economically, culturally, and intellectually to other states and other countries, favored a revitalized government that looked beyond their immediate localities. They viewed their generally inland, western opponents as ignorant backcountry rustics supported by self-interested state politicians.

Federalists enjoyed a key advantage in their overwhelming enlistment of printers, most of whom were eastern, commercially oriented, and cosmopolitan. A concerted Federalist campaign was mobilized in newspapers and pamphlets, where the "Federalist" label first emerged in print. Once a term for opponents of the nationalists, it was now used to invoke the layered system and emphasis on balanced powers that had emerged at Philadelphia. Federalist writers stressed the Constitution's preservation of popular sovereignty through the electoral delegation of authority and its steady equilibrium of powers. A pivotal argument, developed by Madison in the influential *Federalist Papers*, contradicted the traditional assumption that republics could function only on a small scale. Such republics, Madison observed, had invariably failed when factions achieved a majority and became tyrannical. In a large-scale government, the diversity of local interests would make control by a single majority interest impossible.

Anti-Federalists accused the Federalists of an elitist plot to remove power from ordinary citizens and create a moneyed aristocracy, a claim echoed by some modern historians. But the Federalists firmly defined themselves as the saviors of the Revolution and republicanism. The 1780s had, they believed, shown that myriad weak, local governments were undermining the achievements of 1776. Believing that a people as well as their government required checks and balances, the Federalists defended a careful delegation of authority to the best-known and ablest men, who would in turn be checked by their balanced constitutional powers. Yet the Constitution imposed no property qualifications for officeholding, and it was in fact the anti-Federalists who sought to restrict offices to professing Christians. And of course, anti-Federalists were often highly supportive of local elites.

The Federalists, however, were never monolithic. The Constitution's compromise nature attracted a wide range of supporters, giving the Federalists their strength and adaptability. But parties to a compromise are likely to interpret it according to their own desires: different Federalists inevitably understood the new system differently. Indeed, they did differ on the nature and role of elites. Some believed merit would rise; others assumed the socially prominent should govern; Hamilton stressed the interrelation of government with moneyed interests; others, such as Madison, were more concerned with the broad voice of the people, refined but preserved through constitutional delegation. The ratification struggle subsumed such differences. In time they would re-emerge.

FEDERALIST STRATEGIES FOR RATIFICATION

The Federalists enjoyed an initial wave of easy victories, with anti-Federalists stifled by the very localism, lesser education, and lack of broad connections that helped define them. Small states, mollified by equality in the Senate and eager to supplant the high-handed commercial policies of the large port states, rallied as Federalist strongholds. Delaware, New Jersey, Georgia (eager for federal aid in protecting its border), and Connecticut quickly and easily ratified. Later, Maryland and South Carolina would follow—though New Hampshire deadlocked, swayed by suspicion of the South and the fear of non-Christian officeholders, and Rhode Island refused even to call a convention.

Federalists realized the key battles would come in the large states. In Pennsylvania the Federalists, led by James Wilson, pushed ratification through before

the rural backcountry could mobilize. But ratification was increasingly faced with an articulate anti-Federalist opposition. The Federalist charge that the anti-Federalists lacked a positive agenda had some validity; the Constitution's foes knew what they opposed but were weak on specific alternatives—though most acknowledged the Articles were inadequate as they stood. But a key anti-Federalist objection to the Constitution, the absence of a bill of rights, resonated with many. Federalists denied the need, noting that the federal government would have only those powers specifically granted by the Constitution and warning that enumerating some rights could undermine others. But the issue persisted.

Rufus King and other Federalist leaders faced troubles in Massachusetts. Anti-Federalists had a clear majority, although their most experienced and articulate leaders were actually from coastal areas with Federalist majorities and thus were not elected to the ratifying convention. The anti-Federalists wanted the convention to ratify only on the condition that a bill of rights was added to the Constitution. Faced with defeat, the Federalists proposed that recommendatory rather than conditional amendments accompany ratification. The convention, they suggested, should ratify the Constitution and at the same time recommend amendments, on the understanding that the Federalists would then help to pass the amendments in the new Congress. Again, compromise succeeded in broadening Federalist support. John Hancock and Samuel Adams, influential local politicians who were uneasy about the Constitution, were reluctantly won over. Delegates from the coastal areas remained heavily Federalist, and the proposed amendments secured enough inland votes to narrowly win ratification.

Although the anti-Federalists, encouraged by their strength in the large states, were growing increasingly organized, this new Federalist strategy of recommendatory amendments began to undercut the opposition's main argument. In Virginia the heavily Federalist Tidewater region was faced with an overwhelmingly anti-Federalist majority in the rest of the state. Unlike in the North, where urban areas challenged the rural interior, here both sides were agrarian: in the virtual absence of cities, coastal planters with broad ties and interests faced inland farmers determined to preserve their independence. Madison skillfully led the Federalist minority in the state convention, urging recommendatory amendments and stressing the lack of concrete anti-Federalist proposals. Governor Edmund Randolph, who had refused to sign the Constitution in Philadel-

phia, wavered back to reluctant support. New Hampshire's second attempt at ratification had meanwhile succeeded: the nine states officially required to ratify the Constitution had adopted it. Federalists now warned that if Virginia rejected, the union itself might crumble. Enough inland votes were swayed to narrowly pass ratification.

Federalists were likewise a clear minority in New York, but again their opponents failed to offer clear alternatives. After Virginia ratified, Hamilton, backed by Madison, cautioned that the anti-Federalist plan to ratify on condition of future amendments might leave New York out of the union. Pragmatism, coupled with renewed Federalist assurances that a bill of rights would follow, again secured a slim majority for ratification.

THE LAST FEDERALIST CHALLENGE

It was by no means obvious that eleven ratifications signaled the end of the Federalists' struggle. All along, anti-Federalists had energetically sought a second constitutional convention, a scheme Federalists feared would unleash chaos. Yet important New York Federalists, courting anti-Federalist votes, had dismayed their own allies by endorsing a second convention to consider amendments. Some feared even a limited convention might go dangerously far, undermining federal authority and throwing power back to the states. Now North Carolina, one of the final two holdouts, adopted a scheme once proposed by Thomas Jefferson (who had meanwhile been persuaded by recommendatory amendments to back the Constitution): after most states had ratified, the remainder should hold out until a bill of rights was added. North Carolina's Tidewater Federalists were heavily outnumbered. The anti-Federalists kept control, refused to ratify, and demanded a second convention.

The call for a new convention proved abortive, but Federalists knew the climate could yet change. Madison and others also feared anti-Federalist attempts to elect a Congress that would annihilate itself and the Constitution. Such ideas certainly existed, and failed less decisively than is sometimes imagined. In the new Senate, twenty-four Federalists were in undisputed control, but the anti-Federalist legislature of powerful Virginia sent two firmly anti-Federalist senators. In the House, fifty-one Federalists outnumbered fourteen anti-Federalists. But two of eight representatives from Massachusetts, three of five from South Carolina, three of ten from Virginia, two of eight from Pennsylvania, and two of six from New York were anti-Federalist, and close elections in

the latter two states—extremely close in New York—narrowly prevented anti-Federalist majorities. Even Federalist representatives did not forget the misgivings of their constituents. As the first federal congress divided into blocs for and against the Washington administration, anti-Federalists unanimously went anti-administration—but many Federalist representatives from antiratification districts also joined the anti-administration party.

With the anti-Federalists in retreat but by no means gone, the need to pass a bill of rights was urgent. Madison, elected to the House from Virginia, led the fight; he had come to see genuine advantages in properly framed amendments and also knew they were a political necessity to complete the Federalist victory. He and his supporters acknowledged that a bill of rights could enhance the Constitution's safeguards against governmental abuses without returning important federal powers to the states, but they also knew how many influential men had backed ratification on the understanding that such amendments would follow. Even after Congress had passed the amendments, Virginia's anti-Federalist senators continued to press for a second convention. Most had been willing to wait and see what the new Congress would do, and after the Bill of Rights was added most anti-Federalists were willing to work within the new system. But had Congress repudiated the promises made in so many key conventions, a reinvigorated anti-Federalist movement might conceivably have yet toppled the new Constitution, destroying everything the Federalists had worked to achieve.

As it was, North Carolina conceded in late 1789 (though two of the five representatives it now elected were anti-Federalists), and Rhode Island, threatened with secession by its own coastal merchants, narrowly ratified in 1790. But as the Federalist majority turned to the actual business of setting up the new government and instituting policy, the compromise coalition inevitably began to come apart. The mercantile, monetary elitism of Hamilton and his backers drove them apart from Madison and many others, with their greater emphasis on popular participation and their suspicion of control by a moneyed interest. There was no neat transformation of Federalists into the Federalist Party of the 1790s, or anti-Federalists into Democratic Republicans. The diverging Federalists contributed constituencies and leadership to both parties.

FICTION There is an ongoing debate in the field of literary history about when a distinctly American literature emerged. Some scholars argue that American authors did not gain a voice separate from their British forebears until well into the nineteenth century. According to these critics, the form and voice of literature published in the early American nation was not distinctive enough to merit consideration as “American.” In some opinions, an added detriment to anything that might be considered American literature is that nothing produced had literary merit. Books were expensive to produce, and pirating of already produced English works was more profitable

for printers than producing new works of fiction by American authors. Only about ninety American works of fiction were printed between 1789 and 1820, and few of these made a profit. No American author was able to make a living from writing until the 1820s, although certainly Susanna Rowson (1762–1824) and Charles Brockden Brown (1771–1810) tried.

Despite these facts, other scholars make the case for an American literature that emerged in the period of the ratification of the Constitution. These scholars believe that the early American novel, while it may not live up to some hard-to-define literary standards, was very American, reflecting the anxieties of nation building. The American Revolution (1775–1783) led to social, political, and cultural upheaval. Because of this, they argue, the genre of American literature was far from stable because it was reflective of an unstable society. While the form was British, the messages, scattered as they may have been, were American. These early novels grappled with the question of what it meant to be a citizen of the newly formed nation and whether or not independence was worth the disruptions that followed.

These experiments in an American fictional voice took place exclusively in the North. The American South did not engage in the creation of fiction. While southerners certainly helped to shape political discourse, novels and other fictional forms were produced by the pens of northerners. As white southerners tightened their defense of slavery after the American Revolution, they took a lesser part in the creation of an American national identity than the northerners who engaged in the questions of identity in both fiction and nonfiction. In addition, the contribution to American fiction was limited by race. For African Americans in all parts of the new Republic, racism and the concomitant poverty and lack of education of blacks kept them from writing. Although poetry of African American Phillis Wheatley (1753?–1784) was widely read, only four novels by African Americans were published before the Civil War, and none of these were published until the mid-nineteenth century.

THE REVOLUTIONARY ERA

While American writers did not break away from the literary forms of the British, there were several attempts to create a distinctly American literature. The Connecticut (or Hartford) Wits were among the first group of writers who consciously tried to do that. These men had been born in Connecticut and had attended Yale College. They believed that they could

create an American voice and advocate a political cause. The Wits were concerned about the emergence of democratic movements after the war. They wrote poems to honor stability and oppose Jeffersonian democracy. The Wits included John Trumbull (1750–1831), author of two popular satiric poems, *M’Fingal* (1776–1782) and *The Progress of Dulness* (1772–1773), and Timothy Dwight (1752–1817), the author of *The Conquest of Canaan* (1785), an epic poem about the American Revolution. The Wits put themselves in opposition to Philip Freneau (1752–1832), known as the “poet of the American Revolution,” who embraced Jeffersonian democracy. Despite his ideological differences with the Wits, Freneau also believed in the importance of developing an exclusively American idiom. Although these early writers largely failed in their attempts to break from British forms, their attempts to create something truly American are noteworthy.

One of the first authors to explicitly attempt to define American character was J. Hector St. John de Crèvecoeur (1735–1813). A French immigrant who was married to a woman from a Loyalist family, Crèvecoeur was unable to choose a side during the American Revolution. After spending time in a British army prison in New York and then sailing to London, Crèvecoeur published the fictional *Letters from an American Farmer* in 1782. Taking the persona of James, a farmer without extensive schooling, Crèvecoeur asked, “What, then, is the American, this new man?” He answered his question by arguing that the American was indeed new, a mixture of ethnicities and beliefs, rising from a melting pot of European cultures. Crèvecoeur celebrated the American character, one that he believed had left behind the prejudices of Europe and defined itself by hard work and perseverance. However, Crèvecoeur did not leave the picture entirely rosy, but wrote of frontier dwellers who were less advanced than their eastern counterparts and of brutality in the slave system of the American South.

While other authors did not address the question as directly as Crèvecoeur had, the process of definition and differentiation from Britain was apparent in many of the early works of fiction. Much as Crèvecoeur had sought to define the American man as different from the European man, other early American writers sought to justify American independence or define American character. Francis Hopkinson (1737–1791), one of the signers of the Declaration of Independence, was well-known for his political allegories, which helped make the case against Britain during the war. In his best-known piece, *The Pretty*

Story (1774), the colonists appeared as a farmer’s sons fighting against mismanagement of their family farm. These political allegories helped set the stage for later American fiction. Early American playwright Royall Tyler (1757–1826) also worked to distinguish Europe and America. In *The Contrast* (1787), the first comedy play to be professionally produced on the American stage, Tyler pitted the republican American against the refined European, with the American triumphing in the end.

THE NEW NATION

The fiction of the early American nation reflected the rapid changes brought about by the Revolution and the nation making that followed. The first American novels were about seduction, telling the stories of young women who lost their virtue to conniving men. Novels centered on the seduction of young women highlighted the dangers and upheavals of the new nation. Focused on an English novel, *Clarissa* (1747–1748), and nervous about the changes in the nation he helped to create, John Adams famously compared democracy to Lovelace, the immoral character who leads to Clarissa’s ruin. He argued that democracy would lead to the ruin and death of the new United States, much as Lovelace had ruined Clarissa. While Adams called on an English example written before the creation of the United States, male and female American authors in the early American nation deliberately toyed with these same concerns.

By the end of the eighteenth century, Charles Brockden Brown had begun to publish his Gothic novels in which nothing was settled and the world seemed a very chaotic place. These early novels, like the poems, allegories, plays, and other forms of fiction in early America, were British in form. Yet they all spoke to the question of political unsettledness and the questions raised by the Revolution. Who had power? Who could speak? Had the republican experiment succeeded or failed? Who was an American citizen and what characteristics was that citizen to embrace? All of the early American novels advanced a theory of education, a topic that was much in the political and social discourse. Novelists like Charles Brockden Brown believed that their novels did nothing less than engage in the ongoing cultural dialogue about politics and society.

Despite Brown’s defense of the novel, the form had many critics. Politicians and ministers railed against novels. These critics believed, or said they believed, that novel reading would lead to the downfall of the Republic. Critics wrote about these fears in magazines and newspapers. In their prefaces or in-

troductions, novelists condemned the very form in which they engaged. Novels, in the opinion of the critics, took readers away from the serious matters of citizenship. Instead of reality, readers would be so tied up with fantasy they would be unable to function in the virtuous ways necessary for maintaining the Republic. After all, the United States was new and fragile. Psychologically, novel reading was dangerous for other reasons as well. In the growing field of medicine focused on mental illness, doctors believed that mental health was maintained by control. Men or women who spent too many hours immersed in the fantasy world of novels would more easily lose their control and would be ill-prepared to deal with disappointment or shock. Reading history or essays led to rationality; reading novels led to irrationality.

WRITERS AND WORKS

It is generally agreed that the first American novel is *The Power of Sympathy, or the Triumph of Nature Founded in Truth* (1789), by William Hill Brown (1765–1793). The main story in *The Power of Sympathy* is of a doomed, incestuous love. Embedded within the story of Harriot and Harrington, who discover too late that they are brother and sister, was the real-life eighteenth-century story of Fanny Aphthorp and her brother-in-law, Perez Morton. Morton had seduced Aphthorp, and she became pregnant. In August 1788, Aphthorp committed suicide, unwilling to make public accusations against Morton. In his book, Brown thinly disguised Aphthorp as Ophelia in a vignette that briefly distracts the reader from the main story line. With such tales, “founded in truth,” Brown argued that his novel was a cautionary tale and therefore fit for reading, unlike other, frivolous works of fiction.

Other novels quickly followed *The Power of Sympathy*. The two best-selling novels in the early American nation were written by women. In *Charlotte Temple* (1791), by Susanna Rowson, young Charlotte is seduced by Montraville, carried from her native England to America, and then left to her ruin and death. The novel was so popular that it was surpassed in sales only after the mid-nineteenth century, by *Uncle Tom’s Cabin* (1852). Second only to *Charlotte Temple* was *The Coquette; or, The History of Eliza Wharton* (1797), by Hannah Webster Foster (1758–1840). In this story Eliza Wharton chooses the path of coquetry, eschewing the life of virtue she felt would confine her too much. The consequence is death and dishonor, but the novel raised interesting questions about the nature of female roles in the new nation.

Other important writers emerged at the end of the eighteenth century. Hugh Henry Brackenridge (1748–1816), a Scottish immigrant and a friend of Philip Freneau, published several dramas based on events in the Revolutionary War. His most important work was a novel, *Modern Chivalry*, published in four volumes during the years from 1792 to 1815. In the republic of *Modern Chivalry*, men without qualifications are elected to office by ill-informed voters. In the text Brackenridge praised democracy but also worried about it. In a work written over more than a decade, a reader can see some of Brackenridge’s own shifting alliances.

The author who came closest to making a living as a writer in the period before 1820 was Charles Brockden Brown, although he was never able to fully support himself with his writing. With his Gothic novels, he emerged at the end of the eighteenth century as one of the most prolific writers of fiction. Brown’s first novel, *Wieland* (1798), is a story of madness. In his madness, Theodore Wieland eventually kills all four of his children, tries to kill his wife, and eventually commits suicide. Brown, engaging in the larger discourse about nationhood, believed this novel would be useful to his readers, particularly with regard to thoughts about “the moral constitution of man.” Without checks on liberty, anarchy would reign. He sent his novel to Vice President Thomas Jefferson, perhaps believing that he offered a solution to the problems of the new United States. Brown followed *Wieland* with *Ormond* (1799), *Edgar Huntly* (1799), and *Arthur Mervyn* (1799–1800).

While all of the published fiction in the early American nation was flawed, these works are reflective of a society born out of war, cut off from its colonial past, and experimenting with new forms of government. With this in mind, these publications can be seen as American publications. The writers adopted familiar forms and tropes but used these to comment on the new society, and in Charles Brockden Brown’s case, to push for change. For the new Republic to function and perhaps thrive, these authors believed, citizens needed to be educated. Female and male authors argued that this was true of women as well as men. And novelists, even those who—like Brackenridge—supported increased democracy, worried about what would happen if democracy was taken too far.

The new United States was far from united. Crime rose in the cities and disorder seemed to reign everywhere people looked. A myth about the American Revolution has developed over the centuries to the point where people now believe almost everyone

supported the cause and the consequences. The fiction of the time gives a more accurate picture of the debates, the upheavals, the disagreements, and the fears. While flawed as literature, it is utterly reflective of a time and place otherwise largely lost.

FIREARMS (NONMILITARY) Among the practices and prejudices English colonists carried with them to North America was the assumption that an armed population was normal and necessary. Few governments, then or since, have been prepared to trust the common people with weapons. Since “time out of mind,” however, the English had preferred a citizen militia to a professional military force and depended on armed citizens to protect themselves and their neighbors by shouldering a host of local peacekeeping duties. Until the Glorious Revolution of 1688–1689, being armed had been more a duty than a right. But the English Bill of Rights of 1689, passed in the wake of that bloodless revolution, guaranteed Protestants, then some 90 percent of the population, what it described as their “true, ancient and indubitable rights,” including the right to “have arms for their defence suitable to their conditions and as allowed by law.” The English prejudices that favored an armed citizenry translated easily to America, where the dangers of the wilderness made such community peacekeeping and self-reliance especially urgent.

FIREARMS TECHNOLOGY

By 1754 the civilian use of firearms had been common in England for some three hundred years and in its American colonies from the outset. Over the centuries, technology had led to the replacement of cumbersome, heavy, and inaccurate military weapons by more reliable and smaller flintlock muskets and, in the eighteenth century, by the famous Brown Bess musket. Lighter fowling pieces and pistols were also available and popular for personal protection and hunting. By the mid-seventeenth century, well-to-do women had taken to carrying little “pocket pistols” that could fit in a purse. By the eighteenth century the handgun had also become the weapon of choice for duels and highway robbery.

PEACEKEEPING AND HUNTING

The American colonists, faced with an often hostile native population and the usual array of crimes, immediately instituted the familiar means of keeping the peace. Every colony passed legislation to establish a militia and towns created systems in which householders took turns standing watch. All men between the ages of sixteen and sixty were liable for militia service, with some exceptions for clergy, religious objectors, and blacks. The dangers were so great that not only militia members but all householders were ordered to be armed. Many of these laws remained in place well into the eighteenth century. Connecticut’s 1741 militia act, for example, ordered all citizens, both those listed in the militia and every other householder, to “always be provided with and have in continual readiness, a well-fixed firelock . . . or other good fire-arms . . . a good sword, or cutlass” and a specific amount of gunpowder. In 1770 Georgia felt it necessary, “for the better security of the inhabitants,” to require every white male resident “to carry firearms to places of public worship.” In many colonies those who could not afford a firearm were set to work to earn one.

Firearms were valued for hunting as well as protection. Game was plentiful in the New World and, in contrast to common European practice that strictly limited those who could hunt, colonists were enticed to American shores with the promise of the “liberty of fishing and fowling.” American firearm needs differed from European needs, however, since hunting was less a sport than a key to survival in the wilderness and a reliable gun was critical for self-defense. For these purposes Americans wanted a rifle that was light, shot light bullets that needed only a modest amount of powder, was easy to load, and had a flat trajectory that would make it more accurate. By 1735 a rifle that met these specifications had

been developed in Pennsylvania, although for some reason it was generally known as the Kentucky rifle. It quickly became popular throughout the country and proved effective in bringing down the larger animals in the American forests. Firearms expert Robert Held claims that until the last quarter of the eighteenth century, "there were no guns anywhere in the world which could shoot so far, so accurately and so efficiently" as the Kentucky rifle. A better weapon was developed in Britain but neglected by the British War Office, and so the Kentucky rifle remained the most accurate, and actually the only, long-range shooter until about 1840.

Travelers to America were struck by how common guns were. Charles Augustus Murray, who toured America in 1834, noted that "nearly every man has a rifle, and spends part of his time in the chase," while Alexis de Tocqueville, who visited America in 1831, described a typical "peasant's cabin" in Kentucky or Tennessee as containing "a fairly clean bed, some chairs, a good gun."

INDIANS AND BLACKS

Sensible restrictions were put in place on the use of firearms in crowded areas or with intention to terrify. But the emphasis of colonial and early national governments was on ensuring the populace was well armed, not on restricting individual stocks of weapons. For the security of white colonists, efforts were made to prevent Indians, and in some colonies black slaves, from acquiring firearms. Nevertheless, Indians managed to obtain firearms and quickly became excellent shots. Access of slaves and free blacks to guns varied. The New England colonies and New Jersey permitted blacks, both slave and free, to keep private firearms but usually excluded them from the militia. A Virginia statute of 1640, "Preventing Negroes from Bearing Arms," was one of the first acts to legally define slave status. Free blacks in Virginia and South Carolina were permitted to keep firearms, as could blacks, whether slave or free, living on the frontier. Georgia, however, insisted upon a license for even temporary use of a gun by a slave. In the eyes of the law, neither the Indian nor the slave was a citizen; therefore, neither was entitled to the rights of citizenship. During the 1820s and 1830s therefore, a wave of anti-black legislation throughout the country was able to curtail the ability of blacks to be armed.

In sum, Americans were expected to provide themselves with firearms for the protection of themselves and their colony. There is ample evidence that they did.

FIRES AND FIREFIGHTING Fire was a serious and ongoing problem in colonial America and the new nation, especially in towns and cities. In an era before zoning regulations, flammable materials were regularly stored near the open fires necessary for heating homes and cooking food. As cities increased in size and density in the late eighteenth and early nineteenth centuries, catastrophic conflagrations became common occurrences. A candle in a New Orleans building set off a fire that destroyed over eight hundred buildings in 1788; three years later a Philadelphia fire spread easily through the wooden buildings on Dock Street, while an 1820 fire in Savannah, Georgia, became a conflagration after setting off a cache of gunpowder stored in one building.

Colonial fire codes required homeowners to be in possession of two buckets and prepared to transport water in them to the scene of any nearby fire. By the mid-eighteenth century municipal governments were taking a more active role in controlling fires. New Amsterdam taxed the citizenry to pay for chimney inspectors starting in 1646. In 1718 Boston citizens organized the first American volunteer fire company, complete with a small hand-operated pump fire engine, and uniforms for its members. In 1736 Benjamin Franklin organized, publicized, and participated in a Philadelphia volunteer fire company, set-

ting a standard for the participation of civic leaders in volunteer firefighting followed by George Washington, Aaron Burr, and Thomas Jefferson, among others. Fire companies were patriotic hotbeds in the 1770s, as firemen in cities including New York, Boston, and Philadelphia transformed their shared obligation to the preservation of public safety and order into active and outspoken support for the Revolution.

By the early nineteenth century, every American city was protected by volunteer fire companies, organized around small hand-operated fire engines, under the loose control of a municipal overseeing organization. Rural areas were also served by volunteer fire companies. All firefighting in the new nation was conducted by volunteers: paid fire departments were instituted only in the middle of the nineteenth century. Baltimore, for example, had three volunteer fire companies in 1790, six in 1800, and seventeen by 1843, and close to eight hundred active members in the 1830s. Philadelphia had seventeen volunteer companies by 1790. Early fire companies were selective in their membership and combined social activities with firefighting, including visits to firemen in other cities. One of the most notable characteristics of volunteer fire companies in the early nineteenth century was the occupational heterogeneity of their membership. Clerks, skilled laborers, and merchants fought fires side by side. Fire companies also provided early social services, including some of the first public lending libraries. Firehouses contained rooms for public use, and as early as 1792 fire departments set up widow and orphan funds to support dependents of injured or killed firemen. Volunteer firemen were not paid salaries but were absolved from jury and militia duty, and received an important public tribute and prestige for their actions. This prestige motivated firefighters to become active and outspoken in the Revolution, and sustained them in their belief that their public service revealed their civic virtue.

FIRST LADIES The institution of the "first lady," meaning the role of the wife of the president of the United States, did not take its modern form in the era of the new American nation. However, some of the salient features that have historically surrounded presidential wives—popular interest, leadership of Washington society, and ambivalence about the status of these women—emerged in these years. In the case of Dolley Madison, the first celebrity assumed the position of wife of the president. Elizabeth Monroe and Louisa Adams did not, however, build on what Madison had done. The wife of the president in 1829 remained a potential source of political and cultural influence but had not yet emerged as a figure in her own right.

The first presidential spouse, Martha Washington, lived in New York and then in Philadelphia for the eight years of her husband's administrations. She conducted receptions for the president's guests each week on Friday evenings and otherwise was a practiced hostess on numerous social occasions. Martha Washington had some direct correspondence with the wives of diplomats and officials of foreign countries, most of which others drafted for her to send. Although she was a semipublic figure, she did little to satisfy any appetite of her fellow citizens to know about her or to have her reveal her private thoughts.

Abigail Adams is one of the most famous women in the nation's history, but the four years from 1797 to 1801 when her husband was president did not represent a high point in her life. She spent some time in Philadelphia in its last years as the capital, but she also returned to her Massachusetts home for extended periods. Abigail received numerous letters from office seekers and sought to publicize the president's achievements in the press. In 1800, as the Adams administration wound down, the family moved to Washington and took up residence in the still uncompleted presidential mansion. Her husband's defeat in the election of 1800 made her stay in the executive mansion a short one, but she has the honor of being the initial first lady to live there.

DOLLEY MADISON

Thomas Jefferson was a widower when he became president in 1801, and for eight years the nation did not have a first lady in the usual sense. During the Jefferson presidency, however, an important woman stepped onto the national stage. Dolley Payne Todd Madison was the wife of James Madison, the secretary of state. She was thirty-three years old in 1801 and had been married to Madison for more

than six years. Jefferson did a minimum of entertaining on a large scale. As a result, the Madisons became surrogates for the president in a social sense. The couple lived two blocks from the White House. Dolley helped with official entertaining and became renowned for her skill as a hostess. In so doing, she helped to define a world of Washington society that lent a special style to the new American Republic. After Jefferson had served two terms as president, James Madison succeeded him in 1809. Now Dolley Madison had the task of putting her own stamp on the executive mansion.

Her work went forward in two areas. In the president's house itself, her husband gave Dolley Madison the authority to handle the task of decorating the new mansion. Working with Benjamin Latrobe, an architect for the government, she took the limited fund that Congress appropriated for that purpose and set to work. She emphasized the use of American-made furniture and avoided any taints of the aristocratic Federalist style that her husband's political party disliked. Madison succeeded in striking the right balance of simplicity and elegance that made the executive residence a testament to her good taste.

As far as formal entertaining was concerned, the Madisons held parties on a regular basis and sought to invite as wide a circle of guests from the Washington area as possible. The tradition of receptions that they established remained a distinctive feature of the presidency for one hundred and twenty years. These events enabled politicians and diplomats to meet on a neutral ground while allowing the president and his wife to create better relations with members of Congress. Some foreign diplomats chafed at the relatively simple style of these affairs, which lacked the rituals and formality of the European courts. Americans applauded Dolley Madison's ability to make all her guests feel at home. Under her direction, the practice of using the social aspects of the executive mansion for the political ends of the president began to emerge. The duties of her position were exacting and time-consuming, but she impressed the nation as the embodiment of what a president's wife should be.

The most famous moment of Dolley Madison's years as the first lady came during the summer of 1814. As the War of 1812 continued, British troops invaded and then moved toward Washington. As the military threat grew, Madison packed as much of the silver and as many of the other important possessions as she could and then dispatched the wagon to a nearby bank for protection. She also saw to it that the celebrated Gilbert Stuart portrait of George Washington was removed for safekeeping. Madison then left Washington while the British troops burned the mansion. In the wake of the British invasion, Dolley Madison played a large role in lobbying to retain the capital in Washington City. The presidential mansion was reconstructed during what remained of the Madison presidency and repainted white. James Monroe and his wife moved back into what was now the White House once the work was completed during 1817.

Dolley Madison's conduct during the war and her rescue of the Stuart painting became part of the personal legend that followed her until she died in 1849. She symbolized the era when the United States felt itself becoming a nation, and she embodied the distinctive republican style of the time. For the rest of the nineteenth century, she remained the most famous presidential wife.

ELIZABETH MONROE AND LOUISA ADAMS

The two women who followed Dolley Madison did not even approach having her impact on the institution of the first lady. Elizabeth Monroe was a far more reserved and less outgoing person than her pre-

decessor. Her experience as the wife of an American diplomat in European courts led her to adopt protocols for entertaining and receiving guests that relied more on formality and etiquette than had been Dolley Madison's practice. Uncertain health also disposed Elizabeth Monroe to limit her commitment to entertaining. These changes in style at the White House led to several social battles among women in Washington, including a boycott by Mrs. Monroe's critics in 1819 and 1820. The resulting tensions spilled over into the masculine world of politics. Eventually, the president's wife prevailed; her policy of limiting the number of visitors that she needed to receive proved enduring for future first ladies. Her worsening health reduced her public appearances still further during her husband's second term. During her eight years in the White House, the position of the presidential wife lost some of the luster that Dolley Madison had imparted to it.

Louisa Catherine Adams continued the downward trend of participation in social affairs during her husband's single term in office from 1825 to 1829. Her marriage to John Quincy Adams had had its rocky moments before he won the disputed presidential contest of 1824. Nevertheless, she had used her political skills effectively in his efforts to become president during the election and in the proceedings of Congress that resolved the election. Once in the White House, Louisa Adams did not do much entertaining, nor did she reach out to political Washington. Instead, she went into a shell, regarding the executive mansion more as a prison than as a place to make a reputation as a hostess. Her husband was preoccupied with the cares of office and devoted little time to his wife. The two became more distant from each other as the Adams presidency unfolded. They spent some months apart when they took separate vacations in 1826. Poor health, perhaps arising from menopause, dominated her existence.

In 1827 a newspaper friendly to Andrew Jackson, whom John Quincy Adams had defeated in 1824, attacked Louisa for her English origins and made her a target for political invective. In response, she authored an anonymous essay countering her critics and outlining her own virtues. That was a departure for a presidential spouse. Louisa hoped that her husband would be reelected in 1828, but the tide of support for Jackson sent the couple into private life. The four years of Louisa Adams left little impact on the issue of what a president's wife should do and how she should behave.

AFTER 1828

Over the next twelve years two widowers, Andrew Jackson and Martin Van Buren, occupied the White House. In the 1840s, interest in presidential wives revived with the presidencies of William Henry Harrison, John Tyler, and James K. Polk. However, with the new, more democratic politics of the mid-nineteenth century, the power of presidential wives receded. The first ladies of the new American nation from Martha Washington to Louisa Adams displayed some of the future roles of the institution—hostess; decorator of the White House; and in the case of Dolley Madison, political celebrity. They form part of the tradition of presidential wives that now stretches into the twenty-first century. If their contributions to the evolution of the position were modest, they worked hard in pursuit of the success of their husbands' administrations. They were all interesting women who helped to develop popular fascination with the relation of the president and his family to the rest of their fellow citizens. In that respect, their influence and example continues down to the present time.

FISHERIES AND THE FISHING INDUSTRY

The fishing industry was one of the more important components of the American economy of the late eighteenth and early nineteenth centuries. However, there was significant regional variation in the type and quantity of fish caught, the nature of the market for those fish, and the importance of the industry to the regional economy.

The Sacred Cod. The New England cod fishery was the largest and most important of the fisheries in what became the United States. The importance of the industry in Massachusetts is symbolized by the “Sacred Cod,” a carving that hangs in the Massachusetts House of Representatives in Boston. Jonathan Rowe, a Boston merchant, gave the carving to the state in 1784. © LAKE COUNTY MUSEUM/CORBIS.

NEW ENGLAND

The New England cod fishery was the first, the largest, and the economically most important of the fisheries in what became the United States. In the 1600s, fishing vessels from New England towns such as Gloucester and Marblehead joined ships from Portugal, Spain, France, and England in the cod-rich waters along the shores of Newfoundland, Nova Scotia, and Labrador. In the first half of the eighteenth century, ships from France, Britain, and New England also began to fish for cod on the Grand Banks, a forty-thousand-square-mile portion of the North Atlantic off the southeastern coast of Newfoundland. The fish taken by these fishermen were salted, dried, and shipped across the Atlantic and to the Caribbean in quantities known as quintals—112 pounds of dried, salted cod. These quintals of cod formed one leg of the so-called Golden Triangle, in which fish from the northwestern Atlantic were sent to Europe, loads of slaves were transported from Africa to the Caribbean, and commodities such as sugar, molasses (a key ingredient in rum), and indigo were shipped from the Caribbean to New England and Canada. All the nations involved in the cod fisheries viewed them

as not only a source of commerce, but also as “nurseries” for their navies, in which men would learn the craft of sailing. During wartime, harvests declined as men were taken from the fishing fleets to serve on men-of-war.

When the Treaty of Paris of 1763, which ended the Seven Years’ War, severely restricted French access to the Canadian fisheries, the New England fishermen and the British resident and cross-Atlantic fishermen, or “bankers,” became the primary competitors for the cod. For the next sixty years, the fishermen from New England struggled to maintain their rights to catch and export cod while Parliament sought to prevent them from doing so through parliamentary acts (the Restraining Act and Palliser’s Act, both of 1775) and treaty stipulations. The Treaty of Paris of 1783 maintained the access of American fishermen to the Grand Banks and to portions of the shore fishery in the Gulf of Saint Lawrence, while restricting their access to onshore areas on which to dry their catch. This resulted in shorter fishing trips, or “fares,” as the New Englanders had to return home to preserve their fish for export. A British act of that same year prohibited the sale of American fish

in the British West Indies, which forced the New Englanders to turn to the French West Indies as the primary market for their fish.

The War of Independence devastated the American fishery, as annual exports declined by nearly 30 percent, a reduction from the prewar level of 350,000 quintals per annum to 250,650 per annum after the war. The postwar recovery was slow, and exports did not return to their prewar average until 1790. In an effort to stimulate the industry, Congress in 1792 instituted a bounty system under which shipowners and operators would receive a certain amount according to the tonnage of their vessel, so long as they were engaged in cod fishing for at least four months in a given year. This system was altered several times to increase the bounty and include pickled cod. In 1807 the bounties were repealed, and this—in concert with the War of 1812 (1812–1815)—again decimated the fishery. The 1816 export of 220,000 quintals was the lowest since before the Revolution. In 1813 the bounties were reestablished, pending the end of the war.

When the War of 1812 came to a close, the rights of Americans to the British North American fisheries were again in dispute. The New Englanders maintained that the rights guaranteed in the 1783 treaty remained in operation, while the British asserted that the recent hostilities had annulled those privileges. The question was not settled until the Convention of 1818, which allowed New Englanders to catch and preserve fish on the southern and western shores of Newfoundland and the coast of Labrador. Elsewhere in British Canadian waters, American vessels could fish no closer than three marine miles from shore. Thereafter, the New Englanders' struggle for markets in which to sell their fish was part of a larger trade struggle with England in which each nation imposed tonnage and import duties and closed their ports to each other's ships.

THE CHESAPEAKE

The earliest explorers and settlers of the Chesapeake Bay area discovered abundant and diverse marine resources. Herring, shad, alewives, mullet, sturgeon, and many other species filled the rivers, estuaries, and bays. However, in spite of the rich fish resources, the fishing industry was relatively slow to develop in these waters. This delay was caused mainly by a lack of salt with which to preserve the fish caught in this warm climate. Locally produced salt was inferior and superior salt from the Mediterranean was unavailable in adequate quantities because of a prohibition by Parliament (in the seventeenth-century Naviga-

tion Acts) against the importation of salt directly to the Chesapeake colonies. This lack of salt and the resulting danger of fish spoilage resulted in a fishing industry that was primarily local. What fish was exported went primarily to the West Indies, where—like merchants from New England—those from the Chesapeake picked up molasses, coffee, sugar, and oranges.

THE GREAT LAKES

Commercial fishing in the Great Lakes developed somewhat later than in New England or the Chesapeake, due in large measure to the relative lateness of the region's settlement. Low population levels and lack of markets for fish impeded the industry's growth. It was not until the 1820s and 1830s that new markets opened up and the industry could expand.

Of the Great Lakes fisheries, the Atlantic salmon fishery of Lake Ontario was the first to be exploited commercially. By the 1790s, large numbers of these anadromous species (fish that grow to maturity in the lake's waters and swim upstream to reproduce) were being taken commercially in the Lake Ontario watershed. The fish's need to migrate to reproduce made them vulnerable to extensive harvesting as they made their annual spawning run upstream. Beginning in 1801, the New York legislature enacted a series of laws intended to extend some protection to the salmon, especially during the spawning season. By 1848 the state had enacted a total of twenty-four laws regulating salmon fishing in the state's waters.

The fishing industry on the other Great Lakes developed even later than that of Lake Ontario. In these waters, other species formed the base of the fishery: whitefish, sturgeon, lake trout, bass, pickerel, and herring, primary of these being the whitefish. Around 1812 these fish were being harvested commercially in the Saint Clair River and by 1815 in the Maumee River and Bay. In the early days of this commercial fishery, the catches were minuscule compared to those of New England's fishery. In 1817 approximately three thousand barrels of fish were taken from the lakes, only 2.7 percent of New England's prior year exports, which was a relatively small number for an industry still feeling the negative effects of the War of 1812.

By 1830, the Great Lakes fishery was about to experience its first period of substantial growth. The population around the lakes had grown, creating new markets close at hand, while the advent of lake steamers and the opening of the Erie Canal in 1825 created access to markets further afield.

FLAG OF THE UNITED STATES As a product of the political struggle with Great Britain during the 1760s and 1770s, the American flag reflects in its design and concept the nation's revolutionary origins. Flags had long been familiar to the American colonists, especially those used to identify imperial powers such as England and France. New Englanders even crafted their own standard sometime in the late seventeenth century. The flag adopted the red cross of St. George from England's state banner and added a pine tree, which represented one of the region's most important natural resources. It was an important precedent. Not only did the New England flag illustrate the tendency of Americans to adapt traditional English designs for their standards, but it also supplied a potential model for later American flags.

Three popular designs emerged during the American Revolution to provide possible prototypes for a national flag. In 1775 and 1776, several Massachusetts privateers and Continental naval vessels flew modified pine tree flags that often substituted St. George's Cross with the words "An Appeal to Heaven." So-called Liberty Trees, usually American elms, were becoming popular symbols of the Revolution throughout the colonies, but this Pine Tree Flag was perhaps too narrowly identified with New England to serve as a national flag. Another common motif of Revolutionary flags was the timber rattlesnake, a creature indigenous to America. Benjamin Franklin (1706–1790) had printed a segmented snake repre-

Early American Flags. Top to bottom: the flag proposed in 1777; the flag approved in 1794; and the altered flag of 1818. © BETTMANN/CORBIS.

sending the colonies to persuade Americans to "Join or Die" during the French and Indian War (1754–1763), and while his efforts failed, they did establish the snake as a symbol of union in Americans' minds. The image was revived in the 1770s, appearing in newspapers as well as on numerous flags. The most enduring example is the Gadsden Flag featuring a coiled rattlesnake atop the ominous warning "Don't Tread on Me," a phrase that subsequently became embedded in the American lexicon. It was not unknown for the rattlesnake image to be superimposed upon either a Pine Tree Flag or a striped union flag, the third major design popularized by the Revolution.

The use of alternating red and white stripes, though later closely identified with the American flag, was in fact characteristic of some earlier English

banners. The pattern assumed new meaning in the context of the American Revolution, when Sons of Liberty in Boston and elsewhere employed it to suggest unity among the thirteen colonies. To express continued loyalty to the crown, however, the British Union Jack often appeared in an upper corner, creating what became known as the Continental Colors. It was this flag that flew over George Washington's camp during the siege of Boston in early 1776, and it was also the first "American" flag to be recognized by some of Britain's European rivals later that year. Yet the Continental Colors—whose stripes variously appeared as red, white, blue, and even green—had no official status as a national standard.

After declaring independence in July 1776, the Continental Congress set to work fashioning the symbols of a new American nation. Its first priority was an official seal that would identify the United States as a sovereign entity. Less attention seems to have been paid to the issue of a flag until the following summer, when Congress passed a resolution on 14 June 1777 stating, "That the flag of the United States be thirteen stripes, alternate red and white; that the union be thirteen stars, white in a blue field, representing a new constellation." However, the function of the flag was as much utilitarian as it was nationalistic—to help distinguish Continental forces on land and, especially, at sea. The person generally credited with the design of the flag, which substituted a set of stars for the British Union Jack on the Continental Colors, is Francis Hopkinson (1737–1791), who served on the Continental Navy Board.

Standardization of the American flag was slow to develop. Not only did the use of rattlesnake designs and the Continental Colors continue for a time during the war, but also endless variations of the "stars and stripes" theme emerged on cloth and canvas in the following decades. The addition of new states in the 1790s touched off a debate in Congress about including them on the American flag. Although some argued that thirteen ought to be the permanent number of stars and stripes, federal legislation was passed in 1794 and in 1818 to allow for the alteration of the flag to include fifteen and then twenty stars respectively. The 1818 act also provided for the future addition of a single star for each state admitted to the Union, thus enabling the flag to keep up with the rapid growth of the nation.

FLAGS Nobody can be sure that Betsy Ross stitched the first version of the Stars and Stripes. She was accustomed to making flags, but her role regarding the initial U.S. flag was not proclaimed until 1870 and continues to be much debated. It is certain, however, that thirteen alternating white and red stripes below a blue rectangle set in the upper left-hand corner bespoke power in North America and the Malay Sea before either the United States or Malaysia was formed. Both have flags like that flown by the British East India Company's men-of-war well before the Continental Congress passed its resolution of 14 June 1777 "that the flag of the united states be 13 stripes alternate red and white, that the Union be 13 stars white in a blue field representing a new constellation." It is unclear whether they had Vermont in mind for the thirteenth state or Florida.

The first flag of the national army of the American Revolution was flown at the siege of Boston (1775–1776) but was replaced after it was mistaken for a flag of surrender. The second, bearing the impression of a serpent, had unpleasant implications for the biblically literal and was replaced in 1779. The green flag of John Houstoun McIntosh's East Florida Republic of 1811 was equally easy to misunderstand, for it depicted a bayonet-carrying Patriot wearing a tricolor hat with his pigtail flying behind his head. When the wind reversed, so did the pigtail, and the Patriot appeared to be retreating in haste.

Read from any direction, the Stars and Stripes meant Union and freedom as well. As such, it has been emulated by Uruguay, Venezuela, Chile, Taiwan, Thailand, Burma, Tonga, Western Samoa, Liberia, Togo, Greece, and the Netherlands Antilles. Single-starred emblems, on the other hand, have fissionary associations. The Lone Star Flag of Fulwar Skipwith's Republic of West Florida of 1810 flew for a month or two as a symbol of defiance of the federal government. It was resurrected by the secession convention of Mississippi on 9 January 1861 to become the Confederacy's famous Bonnie Blue flag. The very similar Lone Star Flag of the Texas Republic of 1836

The Gadsden Flag. The timber rattlesnake, a creature indigenous to America, was a common motif on Revolutionary flags. The best-known example is the Gadsden Flag, featuring a coiled rattlesnake atop the warning “Don’t Tread on Me.” Christopher Gadsden was a Revolutionary leader from South Carolina and a delegate to the Continental Congress. PICTURE HISTORY.

drew the United States into the Mexican War (1846–1848), which produced the deepest divisions since President Thomas Jefferson’s Embargo (1807–1809) and the War of 1812 (1812–1815). Albert Gallatin, Revolutionary War soldier and secretary of the Treasury for Presidents Jefferson and James Madison, later referred to the U.S. banner raised over Chapultepec in the war with Mexico as “slavery’s flag.” That was Gallatin’s way, less inflammatory than that of the flag burners of a later era, of joining future president Abraham Lincoln and former president John Quincy Adams in calling upon the conscience of their fellow countrymen. Gallatin, Lincoln, and Adams regarded the Mexican War as being directed by President James K. Polk for the purpose of expanding the cotton-growing empire of his fellow planters, and they disapproved. The national flag has, therefore, been at most times the rallying point it provided George Washington’s army after 1779, but at other times a symbol of sharp divisions in the American community.

FLETCHER V. PECK Chief Justice John Marshall’s 1810 decision in *Fletcher v. Peck* arose from the Yazoo Land Fraud, in which the Georgia legislature voted in 1795 to sell 35 million acres of land (in what is now Alabama and Mississippi) to four private companies. The Yazoo land, named after a major river running through it, was sold at bargain rates (less than two cents per acre). Many Georgia legislators had been bribed to offer such good terms: many of them received stock in one of the companies; others received cash payments.

U.S. Senator James Jackson of Georgia returned from the capital in Philadelphia to run for the state legislature and lead the fight against the Yazoo fraud. Angry Georgia voters turned the legislators who voted to sell the land out of office and the new legislature, at the instigation of Jackson, repealed the grant in 1796. In the interim, however, much of the land had been sold one or two times, and the new property owners—many of whom had paid as much as sixteen cents per acre—now claimed they were innocent victims of the Georgia legislature’s repeal. But proponents of the repeal claimed that the subsequent purchasers had known about the circumstances of the fraud (the story was reported throughout the nation) and thus could not claim to be innocent purchasers.

The Yazoo fraud took on national dimensions when the purchasers asked Congress to compensate them from their losses. Federalists, who generally supported property rights more vigorously than Jeffersonian Republicans, opposed the repeal. Meanwhile, the four land companies that had purchased the land sought to challenge the repeal by concocting a lawsuit. John Peck, an investor in the New England Mississippi Company (one of the grantees in 1795), sold land to Robert Fletcher (another investor in the same company). In his lawsuit Fletcher presented

himself to the court as innocent of the wrongdoing and claimed that he was being deprived of his property rights. The repeal by the Georgia Legislature thus pitted subsequent purchasers against initial grantees.

Marshall's opinion invalidated Georgia's repeal, using two arguments: "Georgia was restrained, either by general principles . . . common to our free institutions" or by article I, section 10 (the Contracts Clause), of the U.S. Constitution (*Fletcher v. Peck*, 10 U.S. 87, 139 [1810]). The "general principles" included the idea that innocent subsequent purchasers should not be deprived of their property. As Marshall said, "He has paid his money for a title good at law, he is innocent, whatever may be the guilt of others, and equity will not subject him to the penalties attached to that guilt" (*Fletcher*, 10 U.S. at 133).

Marshall also broadly construed the Contracts Clause, which prohibits states from passing a "law impairing the obligation of contracts." The initial understanding of that clause appears to have been that states could not interfere with contracts among private parties; it seemed to have no bearing on contracts between the government and individuals. Thus when *Fletcher* proclaimed the power of federal courts to protect legislated contracts from interference, it marked an expansion of the Contracts Clause. In praise of the Contracts Clause, Marshall wrote, "The people of the United States, in adopting the instrument, have manifested a determination to shield themselves and their property from the effects of those sudden and strong passions to which men are exposed" (*Fletcher*, 10 U.S. at 138).

For Marshall and other Federalists, the Constitution was a support against the passions of legislatures. Subsequent cases, like *Dartmouth College v. Woodward* (1819) and *Ogden v. Saunders* (1827) applied the Contracts Clause to prohibit legislative interference in state charters and bankruptcy. The Contracts Clause thus became an important vehicle for judges (particularly those of the Federalist and later Whig Parties) to protect property rights.

FLOGGING Flogging, defined as punishment by whipping according to forms prescribed by law, was a common practice at the time of the founding of the United States. It was one of a number of corporal punishments, including branding, the pillory, and the stocks that were in general use at a time when prisons were employed more as a means to hold people already in the process of judgment than to punish or to rehabilitate and when many offenders were too poor to make fining them worthwhile. Flogging was also the most common method of punishing slaves, though no slave was entitled to the protections and limitations of the practice to the extent that these were prescribed in law for civilians.

With the creation of national armed forces during the Revolutionary and early republican eras—in the form of, first, the Continental Army, and subsequently the U.S. Army and the U.S. Navy—flogging was the punishment of first resort to enforce subordination and the unquestioning obedience that were deemed essential for military operations. In drawing up articles of war in the Continental Congress in 1776, John Adams borrowed from the customs and practices of the British army and navy, though he also sought to prevent the excesses of the British codes, such as the naval ritual of flogging men round the fleet—a form of punishment administered to a man tied to a grate in a boat in which he received a dozen lashes alongside every vessel in the harbor—from entering into American law. Punishment for lesser offenses, such as drunkenness, were usually limited to a dozen lashes with a cat-o'-nine tails, to be ordered after only minimal or sometimes no judicial proceedings. More serious offenses, such as a first attempt to desert the service, could be punished with up to one hundred lashes after sentencing by a general court martial.

After the Revolution, flogging came under increasing criticism. In part, this was because it subjected the citizens of a new Republic that placed a high premium on the autonomy and dignity of the individual to a cruel form of punishment that was one of the defining characteristics of slavery. But it was also in part because of wider transatlantic changes, associated with the Enlightenment, in thinking about human nature and the causes of

crime and deviance. Philosophers, religious leaders, and administrators believed that offenders could be reformed through changes to their environment and by encouraging them to repent of their erring ways, provided they were not brutalized by degrading and disfiguring punishments. For rehabilitation to occur, a range of carceral institutions, including asylums, penitentiaries, orphanages, and workhouses were established to create the circumstances under which offenders could develop the character and self-discipline necessary to function as useful and virtuous citizens.

Consequently, from the 1780s to the Civil War the states of the Union, with the exception of South Carolina, restricted and ultimately abolished the practice of flogging offenders in public and replaced it with various forms of incarceration, accompanied by regular work regimes. This did not mean, however, that flogging actually ended as a means of either discipline or punishment. It merely moved indoors and out of public view as almost all carceral institutions in the early Republic continued to use whipping and other forms of corporal punishment to enforce discipline within the reforming institution itself. And in South Carolina, not only did the state not abandon corporal punishments in favor of the penitentiary, it also allowed masters to send offending slaves to the workhouse, where they could be flogged for the payment of a fee.

Flogging in the armed forces was only minimally and far more slowly affected by these changes. From time to time, Congress would revise the Articles of War, but flogging remained the first recourse for punishment, in the case of the navy up until 1850. In the army flogging was abolished on the eve of the War of 1812. The change was made not so much for humanitarian reasons as from a more pragmatic awareness that potential recruits under a voluntary system of military enlistment might be reluctant to leave their local militias, where flogging was not practiced, to subject themselves to harsher forms of discipline. This reform had only limited success, and after 1815, as the number of immigrants in the ranks increased along with the number of desertions, the army became convinced that only the restoration of flogging would improve discipline. Accordingly, in 1833 flogging for desertion was reintroduced and remained in force until the outbreak of the Civil War.

J. C. A. Stagg

FLORIDA Congress admitted Florida to the Union in 1845 as a slave state together with Iowa, a free territory, maintaining the balance between slave and free states. The United States acquired Florida in 1821 following Spain's concession, under the Adams-Onís Treaty (1819), of its colonies East and West Florida in lieu of a five-million-dollar debt to American citizens. Spain had controlled Florida from the settlement of St. Augustine in 1565 until the end of the Seven Years' War in 1763, when Britain took possession. The British occupation ended with the American Revolution and the signing of the Treaty of Paris in 1783, which returned Florida to the Spanish. The War of 1812, the Florida campaigns of General Andrew Jackson, and the First Seminole War (1817–1818) convinced Spain that it could no longer protect its Florida possessions.

WEST FLORIDA

The initial boundary of West Florida extended from the Apalachicola River in the east to the Mississippi River in the west, north approximately to present-day Vicksburg (Mississippi), and east to the Chattahoochee River. It included the cities of Mobile, Natchez, and, serving as its capital, Pensacola. Americans claimed that the territory above the northern border of present-day Florida at the thirty-first parallel belonged to the United States. Under the 1795 treaty negotiated by Thomas Pinckney, U.S. envoy to Spain, a militarily weak Spain ceded this territory, which included the lower parts of present-day Mississippi and Alabama, to the United States.

Spanish records indicate that the nonwhite population in 1795 was 8,390, among which were Spanish, English, French, and Americans. The colony recognized the Roman Catholic faith as the official religion, but perhaps 15 percent of the population was Protestant. The mainstays of the economy were timber, indigo, and tobacco, although competition from Mexico significantly reduced tobacco's economic potential. Probably the most lucrative endeavor was trading British-manufactured products with Indians in return for land.

Historians argue that the conflict in West Florida was an early expression of Manifest Destiny, the belief, which became widespread in the 1840s, that the United States was destined to expand across the continent. Spain maintained a generous land-grant policy that brought large numbers of Americans into the colony, mostly to the Baton Rouge area; eventually this policy led to Spain's loss of territory that came to be known as the Florida Parishes of Louisiana. In 1810 American insurgents captured Baton Rouge, declared it independent, and created the Republic of West Florida; under a flag bearing a single star, it became—before Texas—the first lone-star republic. At the insurgents' urging and despite Spanish opposition, the United States annexed the territory (now part of Alabama, Louisiana, and Mississippi) along the Gulf Coast between the Mississippi and Perdido Rivers (the present-day western boundary of Florida) into the Territory of Orleans.

EAST FLORIDA

East Florida included most of present-day Florida, with St. Augustine as its capital and only significant city. Following Spanish acquisition, the non-Indian population of East Florida dropped to below two thousand from a peak of approximately twelve thousand during British occupation. Yet with Minorcans, Greeks, Italians (all of whom the English had imported as laborers), British, Americans, Spanish, and Africans, the population remained diverse. A continually unstable economy revolved around timber, cattle, rice, and increasingly cotton. Seeking to end its financial dependence on Spain, East Florida instituted a liberal land-grant policy like that in West Florida, only to suffer similar consequences.

Encouraged by West Florida insurgents, self-professed East Florida patriots—Americans living in the colony and others who came down from Georgia—staged their own insurgency. They managed to seize Amelia Island, but when the United States declared war on Britain in 1812, it withdrew its support of the patriots. Seminoles, including many fugi-

tive slaves, then allied with the Spanish and helped defeat the patriots.

INDIANS, BLACKS, AND CESSION

Americans found Florida Indians an especial irritant because among them lived so-called black Seminoles, fugitive slaves from the British colonies and later the southern U.S. states. Beginning in 1693 Spanish Florida offered freedom to runaway slaves from the British colonies who pledged their loyalty to Spain and converted to Catholicism. That policy continued into the second Spanish period over the protests of American slaveholders, eventually strengthening congressional support for the acquisition of the two Floridas.

The climax in the struggle over Florida came during and after the War of 1812. During the war Jackson conducted forays against the British (allies of Spain) in Florida, capturing fortifications in Mobile, Pensacola, and St. Marks. When British forces withdrew after the war, they left Seminoles and blacks with provisions at a fort on the Apalachicola River just south of the Georgia border. Jackson ordered the destruction of the so-called Negro Fort for security reasons. Its demolition was soon followed by the Seminole War and the Spanish cession of its Florida provinces.

U.S. TERRITORY

The first territorial census in 1825, which is incomplete, counted less than 15,000 slave and free people living in Florida, almost all in the northern section and representing to a large degree the remnants, though culturally diverse, of the Spanish period. During the four decades following U.S. acquisition, Florida became increasingly Anglo and African as settlers and slaves, mainly from Georgia and South Carolina, flooded into the region. The census recorded 34,730 people living in Florida in 1830, 54,477 in 1840, 87,445 in 1850, and 140,424 in 1860. The slave population continually hovered around 40 percent, which in 1860 belonged to 5,152 slaveholders. Free blacks were legally prohibited from relocating to Florida, which kept their population below 1,000. Representing approximately one-half the total population and the majority of the slave population, middle Florida, between the Apalachicola and Suwanee Rivers, grew into the wealthiest and most politically powerful region.

The territorial capital was built in 1824 on the Indian fields of Tallahassee in middle Florida, which dominated Florida's agrarian economy. Although farmers grew rice, corn, and later sugarcane, the sta-

ples of a robust economy were cotton and timber. Middle Florida yeomen farmers (known as Crackers) and planters with their slaves produced 80 percent of the territory's cotton. By the 1850s, Florida's annual cotton crop represented the highest per-capita yield in the South with the highest dollar value. Timber—pine and oak—was extracted mainly from northeast Florida and shipped out of Jacksonville, the territory's largest city and busiest port. With more than twenty sawmills in operation along the St. Johns River in the 1850s, Jacksonville claimed to be the largest timber market in the South. Cattle raising by that time had emerged as a third major industry, with the export trade passing mainly through the port of Tampa.

SEMINOLE WARS

An estimated five thousand Indians occupied the territory at the time of U.S. acquisition. By the middle of the eighteenth century, disease and warfare had wiped out the original native population. In the eighteenth and early nineteenth centuries, continuing conflicts between whites and Yamasee, Cherokee, and Creek peoples in South Carolina, Georgia, and Alabama forced a fresh influx of Indians into Florida, where the Spanish generally welcomed them as allies and trading partners. Beginning with the British, they became collectively known as Seminoles. In contrast to the expanding general population, wars with the United States would nearly eliminate their numbers.

White Americans generally regarded Indians as a threat to their safety and property. To that end, the First Seminole War followed after Secretary of War John C. Calhoun dispatched General Jackson to Florida to prevent Seminoles from conducting raids on homesteads in southern Georgia and providing sanctuary to runaway slaves. Lasting from 1835 to 1842, the Second Seminole War was the longest sustained conflict between the United States and a single Indian group. The war broke out after a treaty forced Indians out of middle Florida and other areas of white settlement and onto a reservation north of Tampa. Approximately three hundred Seminoles survived the war and evaded relocation to the Oklahoma territory, where nearly four thousand Seminoles had been sent. Minor conflicts continued between the remaining Seminoles and Florida whites, who demanded the Indians' execution or removal. War erupted again in 1855, lasting two years. About two hundred Seminoles escaped to the Everglades and the Big Cypress Swamp, where their descendants remain today.

FOLK ARTS An analytical category of cultural expression, "folk art" draws attention to traditional handiwork produced with aesthetic intent, typically crafted by and for ordinary people. Twentieth-century scholars began using the term to refer to a body of material produced outside of the worlds of academic art, and in the United States there has been a special interest in the relation of folk art as grassroots expression to the rise of distinctive American identities. Examination of folk art, found in great variety among the diverse communities in the new nation, expands the evidence of art in American everyday life and raises questions about the influence on cultural production of the country's broad social and physical landscape.

There are disputes among scholars about what should properly be included in the category of folk art for the purposes of cultural and historical analysis. Many collections emphasize painting and sculpture that appear to be naive, primitive, or plain by academic standards and that therefore are assumed to be crafted by ordinary citizens. There is a tendency to overstate the middle class as "common folk" and feature novel nationalistic expressions in such collections. Many of the images presented of common folk, for example, emphasize merchants and artisans who produced or consumed portraits and wares, sometimes in imitation of status symbols marking the elite who could commission professional artists. Scholars have noted that to establish a class identity that was merely derivative of European high style, but distinctive, merchants and artisans often underscored the home-grown source of their products

contributing to the rising national identity of “ordinary” Americans.

The use of “folk” as defined by folklorists, however, implies the significance of tradition in the transmission of skills and themes in diverse community contexts. The material included in folkloristic collections that is meant to illuminate continuities with native and Old World traditions typically comprises decorated craftwork such as ethnic-regional pottery, needlework, ironwork, basketry, calligraphy, and carving. Occupational traditions, especially in maritime trades along the expanse of America’s abundant shores, with sailors producing decorated scrimshaw and shipcarvings flourished. Further inland, the growth of lumber and textile industries included cottage operations producing decorative coverlets and rugs using hand-made wooden looms, wheels, and winders. Artisanry in traditional arts was encour-

aged by the absence of a protective European guild system in the new nation and a mobile population rapidly establishing new communities with craft needs. In addition, a can-do, self-sufficient (some say democratizing) spirit of vernacular free expression, represented by guides such as Benjamin Franklin’s *Poor Richard’s Almanack* (1732–1757), led Americans to believe that they could try their hand at various skills once reserved for elites.

The extent of connection to, and separation from, the Old World is not simply a matter of analyzing whether transplantation took root in the New World. Some distinctive conditions during the period of the emerging Republic affected the adaptation, hybridization, and emergence of many traditions on the American landscape. First was the presence of an indigenous population with skills and images that entered into the symbolic repertoire of many non-

The Peaceable Kingdom (1826) by Edward Hicks. Many folk renderings of William Penn's treaty with the Indians, including fireboards by Pennsylvania Quaker Edward Hicks, emphasize the mythological foundations of Penn's "holy experiment." © PHILADELPHIA MUSEUM OF ART/CORBIS.

native artists. Second was the diversity of languages, religions, and backgrounds in the nation, particularly in places like Pennsylvania, where—according to the 1790 census—one-third of the population spoke German and lived in homogeneous farming communities. This diversity included the significant presence of enslaved Africans, particularly in the South, many of whom incorporated African aesthetics when forced to take up British American crafts. There is also substantial evidence for the persistence of Africanisms in, among other things, ironwork, grave decoration, and basketry that informed hybrid American forms. In Louisiana, creole foodways and arts emerged from the racial mixing of blacks and whites and the ethnic fusion of Spanish, African, and French traditions. Regional cultures of New England, the mid-Atlantic, and the South, with their distinctive ethnic and religious mixtures, became en-

trenched as a result of diffusion emanating from several prominent ports of entry on the eastern seaboard and the Gulf Coast. Communities within these regions, often isolated by physical or social boundaries, maintained folk art traditions that symbolized their difference. In the Adirondacks, the pack basket became one such marker; in the South Carolina Sea Islands, it was the sweetgrass basket; in central Pennsylvania, the rye straw basket.

The wide availability of land and the movable nature of the frontier in America contributed to the perception that a rooted peasant class associated with the folk art of European villages did not exist in the United States. But the openness of America's borders, the need for labor, and the promise of religious and political tolerance provided opportunities for separatist communities (e.g., Amish, Shakers, Harmonists) that produced distinctive artistic expressions.

With settlement moving toward the varied interior, some highland communities in the Appalachians, Ozarks, and Adirondacks evolved in relative isolation and developed localized folk cultures. Some maritime locations, such as the Eastern Shore of Maryland and northern “Arcadian” Maine, were also comparatively isolated and thus preserved colonial era folk arts well into the industrial era. In not-so-isolated urban areas, folk arts also took hold, especially for immigrant and religious communities that provided for ritual needs with specialized artisans. In New York, Philadelphia, and Boston, Jewish calligraphers, stonecarvers, and metalsmiths produced ritual objects needed by the community.

Using folk art to construct a cultural history during the late eighteenth and early nineteenth centuries, one finds evidence of several themes emerging as the colonies gave way to a new nation. They were cultural expressions of nationalism and regional identity; ethnic-religious distinctions and continuities; and occupational, class, and craft consciousness.

NATIONALISM AND REGIONAL IDENTITY

As a revolutionary Republic, the United States needed icons that could be artistically expressed and ingrained in cultural traditions. In folk art, the construction of patriotic and heroic symbols for private domestic uses or public celebrations became an important aspect of nation building and regional identification. While eighteenth-century printmakers created a symbol of the thirteen colonies in the form of a fierce Amazonian Indian queen-huntress, colonists also fashioned a more Anglicized figure in the form of the more civilized, but nonetheless indigenous, Indian princess to pottery, trade signs, weather vanes, and statuary. The young, industrious maiden was usually adorned with a feathered headdress and skirt and thus represented a stylized image rather than an ethnographic portrayal of North American Indians. At the time of the protests against the Stamp Act of 1765, the figure became significant politically as the rebel daughter of the British “Britannia” and sometimes accompanied the Sons of Liberty on folk banners.

After the Revolution, the female symbol of America received a neoclassical makeover in folk expressions. She appeared as a Greek goddess in flowing robes, at least in part because of the linkage made between classical republics and the modern American nation. In folk art, the American classical icon may be accompanied by a flagpole, often with a tasseled liberty cap on top. In imitations of Edward Savage’s popular engraving, *Liberty, in the Form of the Goddess*

of Youth; Giving Support to the Bald Eagle (1796), her tender, youthful image—festooned with a flower garland—is feeding the aggressive eagle from a cup. While the name Liberty is frequently applied to this Greek revival image, she also goes by Columbia (after Christopher Columbus) and was a favorite design for post-Revolutionary ship figureheads, tobacco-store trade figures, and weather vanes. The eagle often appears alone in carvings, scissors cuttings, illuminated manuscripts, and coverlets of the period. Sometimes a shield with the colors of the new nation covers the bird’s breast. In many renderings of Liberty, she is holding a cornucopia for the abundance of the new land or a torch for providing a light to the world, well before Frédéric-Auguste Bartholdi erected the Statue of Liberty, unveiled in 1886.

The liberty cap, often portrayed being hoisted on a pole, is especially prevalent in the period of the early Republic. A soft, conical hat, its symbolism of freedom and independence for Americans derives from the Roman custom of awarding it to freed slaves to wear on their shorn heads. In addition to being painted on banners and signboards as a patriotic symbol, carved and woven caps were paraded on top of poles in public processions and festivals during the early years of the nation. Among the most enthusiastic paraders were volunteer firefighters who showed their civic pride by fashioning elaborate hats, engine panels, and buckets with patriotic symbols for parades on Independence Day and other occasions.

The flag and its colors figured prominently in traditional forms marking the Americanness of their users. Among Pennsylvania Germans, for instance, patriotic eagles transformed ethnic crafts of *scherenschnitte*, or scissors cuttings, and *fraktur*, or illuminated manuscripts for baptism and weddings, into American forms. Painted furniture in “Dutchland,” traditionally decorated with hearts, tulips, and rosettes, often had eagles and flags added to their design after the turn of the eighteenth century. Elsewhere, expressions of nationalism appeared to be especially evident in woven bed coverlets and table covers, hooked rugs, and quilts.

Although the United States did not claim a pantheon of gods comparable to European mythologies, the figure of George Washington arguably became mythologized as “father of his country” in folk art after his death in 1799. Schoolgirls stitched and painted memorial pictures in his memory, sign painters adopted his visage for trade shingles, and craftsmen forged weather vanes and carved cake boards and statuary with his likeness. Often shown with his horse, in uniform with period hat and

sword, Washington assumed a majestic pose and typically suggested a nation inspired to action.

Often less visible than the nationalistic symbols but nonetheless significant to the American heritage of simultaneous local-national loyalties, regional expressions also emerged as signs of American distinctiveness. Frequently, these expressions were in the form of landscapes recognized as "homeland." Perhaps prepared as an overmantel, fireboard, or wall mural, the landscapes tended to emphasize the prosperity of the settlement they depicted. Connecticut-born Winthrop Chandler (1747–1790), for instance, painted for his extended family members several overmantels featuring the shorescapes of booming New England. In the South, a number of anonymous paintings of plantations, probably commissioned by the plantation owners, show the extent of their holdings. In Pennsylvania, many folk renderings of William Penn's treaty with the Indians, including fireboards completed by Pennsylvania Quaker Edward Hicks (1780–1849), establish a mythological foundation for William Penn's Holy Experiment. Sometimes called "The Peaceable Kingdom" by the artist, the scene includes animals and cherubic figures looking at the scene of the treaty in the background. Hicks frequently surrounded the painting with text such as "The leopard with the harmless kid laid down, And not one savage beast was seen to frown, when the great PENN his famous treaty made, With Indian chiefs beneath the elm tree's shade."

ETHNIC-RELIGIOUS DISTINCTIONS AND CONTINUITIES

The practice of folk art was a visible way of expressing, reinforcing, and sometimes reformulating the identities of new settlers in new settings. In South Carolina, where African Americans were forced to cultivate rice, they created coiled baskets for fanning rice similar to those made in West Africa for that purpose. Often outnumbering whites in rice-producing regions, Africans were able to maintain craft traditions. Commonly made with hard rush plants by men during the early years of slavery, coiled baskets forming designs unlike those of Anglo-American baskets were later made with soft, pliant sweetgrass and tied with palmetto strips as reminders of African heritage. If the use of Africanisms by slaves was discouraged outside the home by masters, inside the home women retained African aesthetics in the strip quilt. Although the techniques of quilting are associated with British American tradition, the strip quilt for which long, narrow bands of cloth are assembled into quilt-top patterns harks back to West African textile techniques. The tradition of the strip

quilt persists as a distinctive African American form into the twenty-first century.

The German-speaking settlers who came in large numbers to Pennsylvania beginning in 1683 were hardly united, since they came from several source areas stretching from Holland down to Switzerland. But as they mixed together, a distinctive Pennsylvania German dialect and culture formed during the eighteenth century that stretched into the Shenandoah Valley of Virginia and western Maryland. The colorful designs of hearts, tulips, rosettes, and birds used on baptismal paper certificates, redware pottery, painted softwood furniture, fancy linens or "show towels," gravestones, and tinware stood in contrast with the subdued products of the politically dominant English Quakers. The Pennsylvania Germans resisted control of their German-speaking schools and institutions by English-speaking authorities, and were able to do so because of their entrenchment in often inaccessible valleys. As canals and roads reached into the Dutchlands, more traffic from Philadelphia westward brought more interchange with English-speaking citizens. Laws were passed to make the Germans conform to an English standard. In central Pennsylvania, many German schoolmasters and ministers ushered in a revival of traditional designs and skills in the early nineteenth century to proclaim Pennsylvania German ethnic identity within the new American nation. Gravestones were more highly elaborated than in earlier generations, before becoming less ethnically distinctive around the Civil War. Illuminated family registers, tracing generations in the American experience, announced the maintenance of an ethnic legacy within a growing nation-state.

While the Germans covered a large regional expanse in Pennsylvania and beyond, some groups formed small enclaves of believers who wanted to live separately from "the world" or to organize utopian experiments. William Penn's Holy Experiment of religious tolerance attracted many of these groups, including the Ephrata community, which created a renowned set of illuminated hymnbooks; Moravian villages known for their slip-decorated pottery; and Harmony, which produced illustrated plans of the built and natural environment. Outside of Pennsylvania, the most notable separatist community that spanned the Revolutionary and national periods was the Shakers, known formally as the United Society of Believers in Christ's Second Appearing. Persecuted in England, the Shakers formed seventeen communities in the United States between 1776 and 1810. But relations between the Shakers

and non-believers in America were often tense as they had been overseas, and arrests of its pacifist membership occurred during the Revolutionary War. They proclaimed their difference visually with inspirational drawings meant as “gifts of love” to one another. Among the designs were illustrated “rewards” shaped into hearts and fans; “sacred sheets” filled with motifs such as mystical circles, doves, angels, eyes, and hands; and colorful trees of life accompanied by commentaries about being led to the spirit world or messages from spirits often inspired by biblical passages.

OCCUPATIONAL, CLASS, AND CRAFT CONSCIOUSNESS

The expansion of communities inland along a movable frontier and their separation from European markets created localized or regionalized markets within America for many traditional artisans. In addition, the availability of land, especially in newer, more remote settlements, fostered the taking up by farm families of a variety of crafts, including smithing, pottery, and basketry, that might have been done on a more specialized basis in a more feudal-like system. Especially notable on the American landscape was an abundance of wood, which often surprised Europeans, whose forests had been depleted. A number of American arts made use of this resource in the making of such things as cigar-store figures, signs for shops and inns, ship figureheads and sternboards, weather vanes, bird decoys, toys and gameboards, gates, butter molds, dough trays, and cake boards.

By the time of the Revolution, furniture making was one of America’s leading trades, and many examples of decorated chests, benches, tables, beds, and chairs enlivened domestic environments. In Pennsylvania German communities, it was common to bestow a decorated dower chest and bride’s box, frequently painted with ethnic symbols, to newlyweds. Elsewhere, storage boxes made of wood for candles, knives, trinkets, and spices were constructed in households. Among the decorated furniture that announced rising economic status was the tall clock. Sometimes reaching as high as ninety-five inches, fancy clockworks were typically made by a special artisan, while the impressive case was made by someone else. The tall clock usually contained decorations on both the case and dial and would usually be kept in a prominent place in the hallway near the house’s entrance. Indeed, one of the architectural developments in the late eighteenth century that fostered domestic arts was the idea of a “front-stage” hallway furnished with—in addition to the clock—

decorative items such as framed mirrors, benches, wall hangings, and floor coverings meant to convey status before visitors were taken “back-stage.”

The enlargement of the whaling trade in the early nineteenth century gave rise to a distinctive American sailor’s art in scrimshaw, namely, engravings and carvings on whale’s teeth and bones. Many of the scenes illustrate occupational pride in the experiences of the voyage or expressions of love for those left home. Home ports in New England as well as scenes of exotic locations and adventures are depicted, showing pride in American sailing expertise. Sailors also created implements out of whale ivory, including pie crimpers and dippers that often had carved animal figures for handles.

Although the period of the young Republic has often been romanticized as being a golden pre-industrial age when American folk art flowered, traditions continued to evolve and emerge even as industrialization and urbanization spread. While folk art is not restricted to one period, the symbols and forms of grassroots production that took shape during the early national period bring into relief the ways that people expressed their separateness and unity within a broad American landscape.

FOOD The story of American food in the mid- to late eighteenth and early nineteenth centuries involves changes in production, trade, cuisine, and consumption. During these years, American settlers witnessed not only the birth of a nation but also the emergence of a national economy based on the circulation of such foodstuffs as wheat, corn, livestock, and rice. Overall, the period was a time of increased prosperity for settlers able to take part in the most lucrative forms of agriculture and trade. This prosperity was reflected in the diet of the wealthy, who chose from an abundant and diverse selection of foodstuffs.

Growth throughout the original colonies and new territories was not uniform, however, and settlers did not profit equally from the changes. In particular, many Amerindians and African slaves, whose knowledge, labor, and land proved essential to the success of the new nation, were excluded from the benefits of economic progress. Poorer white Americans also did not necessarily see a significant change in their standard of living. Indeed, economies and ways of life, including culinary customs, varied widely by racial and socioeconomic status, as well as by region. White ethnic groups also practiced unique traditions that contributed to regional habits.

A few commonalities did exist among groups, however; for instance, corn (often called Indian corn or maize) and pork remained staples well into the nineteenth century for virtually all. Additionally, women largely were responsible for food preparation, and scholars at the turn of the twenty-first century are particularly interested in examining American-authored cookbooks, first published in the late eighteenth century and often written by women, for information about women's lives and beliefs. In spite of these similarities, regional variations in the ways people produced, obtained, prepared, and consumed food in the early years of the nation are significant enough to merit separate treatment here.

THE NORTH

Much of the wealth in New England during the colonial era derived from the shipping trade, which carried goods to Britain, Continental Europe, and the Caribbean, a major market for American foodstuffs. In particular, New England settlers produced and sent large quantities of dried fish to southern Europe and the Caribbean, which also received livestock, salt beef and pork, butter, and cheese. Some cheese and foodstuffs went to the American South as well.

In the earlier part of the eighteenth century, New England farmers supplied the Caribbean and southern Europe with wheat, corn, and flour, too, but by the latter half of the century, Maryland, Virginia, and the middle colonies, which included New York, Pennsylvania, New Jersey, and Delaware, had surpassed New England in the production of breadstuffs. Indeed, New England settlers as a whole came to depend on the middle colonies and the South for their own wheat as well. Inhabitants of the middle colonies also produced salted beef and pork for the Caribbean and southern Europe, which in the late eighteenth century experienced unusually bad harvests that drove up the price and demand for American wheat.

New England dietary habits have been studied in more detail than those of other regions, and research suggests that the seasonal diet of the early colonial period had given way by the late eighteenth century to a more diversified fare throughout the year. In colonial times, settlers subsisted mainly on breads made with corn, which Amerindians taught them how to grow and cook, as well as other corn-based dishes, such as hasty pudding and other cornmeal mushes or porridges. Colonists also made breads from a corn and rye mix. By the early nineteenth century, however, wealthier inhabitants were using wheat grain and flour.

Salt pork and beef were the most popular meats in New England, and New England settlers in general adhered to the English dietary preference for meat by consuming it in increasing quantities. Early colonists depended on wild game, but later inhabitants used it only as a supplement. The consumption of butter and cheese also increased, and by the nineteenth century, families of moderate means could eat it year-round.

The production of garden vegetables, such as pumpkins, squashes, beans, and peas—many of which also had Amerindian origins—had increased by the nineteenth century, too, and could be eaten year-round by the more wealthy. Peas and beans often were boiled with salt pork to form a kind of

porridge or stew; baked beans also were a popular dish. These one-pot meals were mainstays for poorer families, who also consumed turnips and, by the late eighteenth century, potatoes. On the other hand, well-to-do residents could partake of such imported luxuries as oranges, limes, coffee, and chocolate.

Archaeological research into the trash sites of homes shows further disparity between the foods consumed by wealthy and poor families. Although chickens were prevalent in New England, they were eaten more frequently by the wealthy. The wealthy also seem to have eaten more expensive cuts of meat, while poorer families depended more on fish and shellfish, which, however, were consumed by all classes. Settlers also grew apples across New England and used them in pies and cider, which along with beer was a ubiquitous beverage.

Some New England settlers thus experienced a significant increase in their daily standards of consumption in the late eighteenth century. The middle colonies, endowed with richer soils, may have been the site of less noticeable changes. In large port cities, such as New York and Philadelphia, the wealthy continued to eat better foods. However, the French Revolution, which began in 1789, had a profound impact on upper-class cuisine, which incorporated the ragoûts, soups, and ice cream introduced by exiled cooks. These cooks also founded the first restaurants, a French invention, up and down the eastern seaboard and in New Orleans.

Among farmers, a simple if ample diet still reigned. The Dutch in New York and the Germans in Pennsylvania were especially known for eating a wide variety of dairy products, fruits, and vegetables, including cottage cheese, coleslaw, and sauerkraut. Among German immigrants, pork was popular and was turned into sausages, filled pig's stomachs, and scrapple, a boiled pudding of pork and buckwheat.

Less fortunate than the white settlers were the region's Amerindian inhabitants, who were gradually forced west, especially after the Louisiana Purchase (1803), in which the United States bought the Louisiana Territory from France. Although many Amerindians by the mid- to late eighteenth century were raising livestock and crops for consumption and trade, the United States government preferred strategies of removal to those of assimilation. Amerindians also faced food shortages by the late eighteenth century because of the depletion of game and other forest resources. Some Amerindians experienced shortages because of their increased focus on producing goods for trade. Although much Ameri-

can culinary culture can trace its roots to Amerindian practice, Amerindians themselves were not incorporated wholeheartedly into the United States.

THE SOUTH

Colonial-era planters depended on tobacco for their livelihood, but those in Maryland and Virginia increasingly began to grow corn, and more so wheat, by the late eighteenth century to supply the Caribbean and southern Europe, as well as New England. In the Carolinas, Georgia, and other parts of the South, rice became a major export crop during the eighteenth century and continued to be produced into the nineteenth. Some slaves, familiar with rice cultivation in Africa, contributed greatly to the rise of rice as a staple commodity by providing both technical knowledge and labor. Slaves also worked on sugar plantations established in the Lower Mississippi Valley during the late eighteenth century. By the early nineteenth century, other American markets were importing sugar from the lower Mississippi in significant quantities.

Slaves also transformed Southern cuisine by preparing most of the food on the plantations, as well as by using ingredients unfamiliar to white settlers. Barbecuing became a favorite method of food preparation adopted from Caribbean Indians by slaves. Okra, too, was a popular ingredient after arriving either directly from Africa or from Africa via the Caribbean. The wealthiest planters lived lavishly on elaborate breakfasts, dinners, and suppers of eggs, ham, fish, fowl, seafood, cheese, apples, cakes, pickles, marmalades, creams, sweetmeats, jellies, rum, and Madeira. The less moneyed planters may not have lived as luxuriously, but the wealthy did set a standard for lavish eating that others emulated.

Slaves and poorer whites lived on less exalted fare, depending on the staples of pork and corn. Corn was used to make breads, cakes, mush, hominy, and grits, all of which wealthier settlers ate, too. Sweet potatoes also occupied a paramount place in a less affluent diet, and for many, turkeys, rabbits, partridges, squirrels, opossums, and other wild animals provided an important supplement to pork. Some slaves were allowed to cultivate gardens, raise livestock, and hunt, but others did not receive adequate provisions or have the opportunity to produce their own food. Standard slave rations included corn and, in some areas, salted herring or, occasionally, meat. Those who had gardens produced cabbages, collard greens, turnips, and other vegetables. Some slaves also raised hogs and chickens, while others sold surplus goods to their masters and in markets.

Slaves around New Orleans, too, had opportunities to grow produce for the market, and Amerindians also grew and sold crops in what was perhaps the most cosmopolitan region of the time. There, French, Spanish, African, Amerindian, and, later, English influences mixed to produce a unique culture and cuisine that became known as Creole. Indeed, for most of the eighteenth century, European settlers in the area depended heavily on trade with Amerindians for basic foodstuffs, including cornmeal, bear oil, poultry, vegetables, fish, and game. Colonists also emulated Amerindians in using a mix of agriculture, hunting, gathering, fishing, livestock raising, and trading to supply their daily needs.

Lower Mississippi cookery had a similarly multiethnic provenance, and many settlers adopted Amerindian foods and methods of food preparation. *Sagamité*, or corn boiled in water with butter or bacon fat, was a popular dish among many settlers. African slaves also had an impact on the diet and incorporated rice into many of the region's dishes, including rice with red beans. Various types of fish and shellfish also formed the basis of bisques, gumbos, and jambalayas. The latter two dishes have names that could be of African, Choctaw, and French origin and represent the diversity that characterized the region overall.

THE WESTERN TERRITORIES

The western territories, which included western Pennsylvania, western Maryland, the land around the Appalachians, and much of the Ohio and Mississippi Valleys, were for most of the eighteenth century and beyond largely isolated from major centers of commerce. Significant routes of trade had opened up, however, by the early nineteenth century, so that corn, flour, and salted pork from the Upper Mississippi Valley, for example, were being sent downriver to New Orleans and thence to the Caribbean. Settlers in the Ohio Valley, Kentucky, and Tennessee had also begun transporting cattle and hogs to the east by the late 1820s. The opening of the Erie Canal in 1825 facilitated the shipment of grain and other provisions out of the Ohio Valley and presaged the important role the region would assume later in the production of wheat.

Although those participating in these profitable trades enjoyed a high standard of living, less wealthy, Backcountry settlers maintained a more subsistence-oriented diet and depended heavily on game, including bear, venison, rabbit, squirrel, opossum, woodchuck, and turkey. Settlers also consumed nuts, wild fruits, and wild honey. Bear's

grease comprised one of the principal flavorings and was often added to various dishes as shortening. Cornmeal made into bread or pone, mush, and porridge was a staple, as were pork and bacon. Whiskey, too, was a popular drink that allowed settlers to trade grain in portable form. A large number of Scots-Irish settlers populated the Backcountry as well and brought the use of potatoes with them. They also made a dish called clabber, which contained sour milk, curds, and whey, and partook of the basic fare that characterized much of the region as a whole.

Food in early America thus was a varied and complex affair. Although some feasted on elaborate preparations, many adhered to a simpler cuisine. A widespread plenty may have been emerging, but the terms also were set for distinctions in wealth and consumption that have continued into the twenty-first century.

FOREIGN INVESTMENT AND TRADE The European settlement of British North America began as a series of business ventures. Though the Virginia and Plymouth joint-stock companies failed to reap large profits, they did provide the capital and organization through which permanent settlement began in the early seventeenth century. Even after these companies disappeared, the overseas trade they inaugurated grew in importance as British North America emerged as a primary supplier of raw materials and a major consumer of British finished goods. After independence, Britain remained a primary investor and partner in international trade, though the United States found new markets throughout Europe and the Western Hemisphere.

LATE COLONIAL PERIOD

The economic effects and even the meaning of mercantilism remain contested, but if nothing else the system tied colonists commercially to English, Scottish, Irish, and British West Indian markets. Nor was that relationship necessarily disadvantageous, as Americans profited mightily from the Atlantic trade. Inadequate evidence prevents definitive conclusions, but work on the period from 1768 to 1772 provides a glimpse into the nature of trade at the end of the colonial period. As Table 1 demonstrates, the British Isles were the primary source of trade for the thirteen mainland colonies. As a result of mercantilist legislation like the Navigation Acts, manufactured and luxury goods from the British Isles composed an estimated 79 percent of colonial imports. In exchange, the colonists exported 58 percent of their commodities—most notably tobacco, flour, rice, fish, wheat, and naval stores—to Great Britain. French and British planters in the West Indies consumed 27 percent of the mainland’s exports, exchanging sugar and molasses for foodstuffs and lumber. In the 1760s demand for food in the Iberian Peninsula and the Mediterranean region broadened the market for American rice and wheat, making southern Europe a destination for 14 percent of total exports.

Statistical evidence regarding finance in early America, especially in the colonial period, remains scattered and imprecise. Nevertheless, economic historians have estimated that on the eve of the Revolution, Americans owed British investors around £2.9 million in commercial debt. In addition to this Mira Wilkins, in *The History of Foreign Investment in the United States to 1914* (1989), has estimated that there was an additional £1.1 million of long-term foreign investment in land, ironworks, and other ventures.

TABLE 1

Estimated Average Amount of Annual Trade from Thirteen Continental Colonies, 1768–1772		
(thousands of pounds sterling)		
Destination/Origin	Value of Exports	Value of Imports
Great Britain and Ireland	£1,615	£3,082
West Indies (British and Foreign Islands)	£759	£770
Southern Europe and Wine Islands	£426	£68
Other	£21	N/A
Total	£2,800	£3,920

At the end of the colonial period, Britain very much remained the center of American trade and finance.

REVOLUTIONARY ERA, 1765–1789

Conditions of war notably altered and restricted trade while also raising the need for more foreign investment from new sources. The nonimportation agreements from late 1774 to April 1776 and Britain’s wartime embargo curtailed foreign commerce considerably. The signing of a Treaty of Amity and Commerce with the French on 6 February 1778, and similar treaties with the Netherlands (8 October 1782) and Sweden (3 April 1783), did, however, facilitate the importation of goods from non-British nations. In addition, American privateering against British traders caused an estimated £18 million worth of damage and illegally brought confiscated goods into the United States.

The war shifted the sources of foreign trade somewhat. Though Britain reemerged in the early 1790s as the single most important trading partner of the nation (consuming 31 percent of American exports from 1790 to 1792), American merchants also dealt directly with northern European trading houses, especially in the Netherlands, Germany, and France, nations that consumed 14 percent of U.S. exports. (See Table 2.)

Generally speaking, the war and its immediate aftermath adversely affected exports more than imports, in part because of the need to purchase supplies for armies. To make up for the resulting trade deficit and to fund the war effort, Americans were forced to borrow large sums of money. In December 1776 the Continental Congress authorized the first of several loans from France, which by war’s end totaled \$4.4 million. Dutch and Spanish allies contributed additional sums of \$1.8 million and \$200,000, respectively. Overseas investment and finance

TABLE 2

changed during the Revolutionary period as Britain's rivals became the chief lenders to the new nation. Particularly important were the Dutch, who in 1782 floated the United States additional loans of around \$2 million. By the time Alexander Hamilton prepared his *Report on the Public Credit* (1790), the country's total federal debt at the end of 1789 had reached \$54 million, of which 21.6 percent (\$11.7 million) was held overseas. A portion of Virginia and South Carolina's state debts were also foreign-held, meaning that at least 29 percent of the public debt was held overseas, predominantly in the Netherlands and France.

EARLY REPUBLIC, 1790–1830

The implementation of Secretary of the Treasury Alexander Hamilton's financial system helped to stabilize the nation's public credit and attract increased European (especially British) investment in the federal debt and the stocks of the First and Second National Banks. By 1803, about 62 percent (or \$6.2 million) of the stocks in the First Bank of the United States were foreign-owned, including \$4 million by British firms like the prestigious House of Baring. In that same year, largely as a result of the loans necessary to pay for the Louisiana Purchase (1803), the percent of foreign investment in the federal debt reached its all-time high of 56 percent.

TABLE 3

Note: These statistics include gold and silver transfers and are taken from the *Historical Statistics of the United States, from Colonial Times to 1970, U187–200*, p. 886.

Better credit along with international circumstances made the period from 1793 to 1806 a time of considerable growth in foreign commerce. Direct trade with Europe remained an important part of American overseas trade, especially after Jay's Treaty (1794) secured peaceful relations between the United States and Britain. But with the outbreak of war in Europe in 1793, America's position as a neutral nation allowed it to profit from the reexport trade. American merchants and shippers indirectly transported sugar, coffee, cocoa, and pepper from French and British West Indian colonies to Europe, a carrying trade that contributed considerable wealth to northeastern port cities. By 1805 the reexport carrying trade of foreign goods was valued at slightly over \$53 million, while that of domestic products was only \$42 million. This trade's profitability, however, further embroiled the United States in European conflicts, leading to commercial retaliation under the administrations of Thomas Jefferson (1801–1809) and James Madison (1809–1817). (See Table 3.)

In December 1807 Congress passed, at Jefferson's request, a complete embargo or ban on American exports. Despite some smuggling, Jefferson's embargo and accompanying enforcement legislation dramatically reduced foreign trade. Total exports of U.S. merchandise dropped from an estimated \$49

TABLE 4

Source: *Historical Statistics of the United States*, U317–334, p. 904.

million in 1807 to \$9 million in 1808, while imports fell from record highs (\$139 million) to decade lows (\$57 million). The end of the embargo early in 1809 would briefly allow for a recovery of the export and to a lesser extent the import trade. However, the buildup to war against England in 1812 further restricted international commerce. The extended period of commercial and actual warfare from 1805 to 1815 would increase the nation's nascent manufacturing capabilities and provide some viable domestic sources for finished cloth and metal goods that previously had to be imported from Europe.

The return of peace in 1815 meant a decline in the significance of the reexport trade, but America's direct trade to Europe, and especially Britain, quickly rebounded. The industrial revolution in Britain and the emergence of cotton as a cash crop in the lower southern United States brought Anglo-American trade to new heights. By the 1820s cotton had risen to approximately one-third of total U.S. exports, most of which went to Britain and some of which was exchanged for finished cloth. Wheat and tobacco destined for Europe remained important segments of international trade. An important, if often neglected, part of American foreign commerce involved the growing trade within the Western Hemisphere, which included the sale of foodstuffs, naval stores,

and even some manufactured goods to the West Indian islands, Brazil, and Canada. (See Table 4.)

As the early national period progressed, foreign investment in the federal debt grew less significant, though British and Dutch interests would continue to invest in U.S. stocks, even after the War of 1812. In 1818, 26 percent of the \$99 million federal debt was held overseas, with the British holding \$12.6 million and the Dutch \$11.1 million. British investors would play an important role in funding the second national bank (1816). Andrew Jackson, in his 1832 veto message blocking renewal of the bank's charter, claimed that 30 percent of the bank's private shares were held abroad, principally in Britain. Foreign investment grew in the 1820s as individuals and states turned increasingly to Britain to fund banking and internal improvement projects. By the 1820s American states such as Pennsylvania, Virginia, Louisiana, and Ohio had followed the lead of New York, which in 1817 sold state bonds for canal projects in London securities markets. In addition, during the 1820s European and particularly British investors were increasing their investments in various facets of the cotton trade. These post-1815 investments were a prelude to the rapid expansion of foreign investment and speculation in U.S. markets in the mid-1830s, a development believed by many to have contributed to the Panic of 1837.

FORTS AND FORTIFICATIONS In the 1770s, on the eve of the American War of Independence, the colonists already had an established “heritage of war.” This heritage began in 1607 with the building of protective forts by the Jamestown settlers and continued in 1634 with the fortification of Boston by the Massachusetts Bay Company. The intervening skirmishes and campaigns aimed at maintaining European domination of its colonies around the world were part of the larger Euro-American heritage of war, which reached its conclusion in the War of 1812, the end of the Napoleonic Wars.

THE COLONIAL AND PRE-REVOLUTIONARY PERIOD

Native Americans and seventeenth-century settlers and colonists frequently surrounded their villages with palisades or stockades, interchangeable terms for protective rows of felled trees dug vertically into the ground. Musketeers and bowmen shot from ports or loopholes in the stockade or, occasionally, from a blockhouse or a bastion located on one or more corners (salients) of the square or rectangular fort. Some blockhouses and bastions were two stories in height for greater visibility and firepower. Buildings for cooking, eating, and sanitation and for storage of weapons, munitions, and food, as well as barracks, were protected within the palisade when space permitted.

During the French and Indian War (1756–1763), the colonists’ opposition was a Western European nation with the capability for cannon and artillery and two centuries of experience and knowledge in the military arts. Thus the colonists’ level of military technology took a necessary leap. Colonial fortifications became more complex than the simple palisaded outpost, incorporating earthworks based on European military models. Fortifications, such as those at Fort Stanwix in New York colony, were frequently strengthened several times. Dirt was added, or “thrown up,” behind the palisade or stockade, resulting in an earthen rampart that provided a heavier shield of protection against a besieging force. Colo-

nists employed a “balanced job” construction technique, with the thrown-up dirt forming a ditch (or fosse) encircling the entire palisade; occasionally this ditch was filled with water to form a moat. Palisades with loopholes for firing *en embrasure* (from openings in the parapet) or with castellated parapets for firing *en barbette* (from a protected platform) were sometimes dug into the top of the rampart, adding height and visibility to the fort’s firepower. In these cases, a banquette (an elevated way along the inside of a parapet) or terreplein (a level space behind a parapet) was formed for placement of defenders and cannons at a raised level. In some cases the wooden palisade was laid back at an angle on the earthen rampart, forming a revetment on the front slope of the rampart and above the scarp of the ditch. When cannonballs exploded on timber revetments, secondary projectiles of large wooden splinters were sometimes launched at both the attackers and the defenders. Trees were felled and bushes were cleared from the slopes surrounding a fort to provide better visibility; the products of this clearing activity were used to build additional elements of defensive works, including fascines (bound bundles of sticks), *chandeliers* (pairs of x-shaped sawhorses connected by a bar that supported fascines), fraises (long, pointed stakes projecting from the rampart at an angle) and abatis (obstacles formed by felled trees with sharpened branches).

THE REVOLUTIONARY PERIOD THROUGH 1794

The term “fort” had a broad meaning in the North American colonies. It referred to stockades, palisades, blockhouses, redoubts, *redans* (v-shaped projections from a fortified line), detached works, rifle and artillery batteries, *flèches* (detached v-shaped defensive works in an open field), garrisons, outposts or camps, and even castles and fortresses. A fortified place, whether a log cabin with loopholes for rifles or a huge stone castle with a hundred or more guns in casemates (protected enclosures), went by the name “fort.”

Generally, American Revolutionary War forts were temporary, hasty, and pragmatic earthworks set up to respond to a perceived military threat. These early earthworks contrasted sharply with the planned and permanent castles, forts, and walled cities of Europe based on British and French siege craft theory. European fortified places were considered Enlightenment works of art, like landscaped gardens; they served as physical symbols of man’s rationality and his dominance over natural forces. European manuals described the fort-building process in great

Fort Edgecomb. This centerpiece of this fort is an octagonal blockhouse that was built about 1809 to protect the town of Wiscasset, Maine, then an important shipping center. © LEE SNIDER/PHOTO IMAGES/CORBIS.

detail, relying on geometry to provide lines of fire along all angles of the fort's curtain walls so as to prevent an enemy from climbing and breaching the defensive works.

Depending on the topographic and strategic situations, forts could be triangular (*fleches*, outer works, and detached batteries), square, rectangular, pentagonal, hexagonal, or star-shaped. There were almost as many shapes as there were practicing military engineers and architects. But the French and the British schools clearly dominated the stately art of siege craft. The dominance of French terms in naming parts of forts (many English words derive from these imported French terms) reflects the importance of the French militarists, especially Sébastien de Vauban (1633–1707).

In the North American colonies and the early republic through the War of 1812, the star fort was preferred for political and military reasons. Because the French preferred the star and the revolutionaries were politically allied with France, it quickly became the American favorite. Strategically, the star allowed

360-degree visibility across the open glacis and beyond. Each projection of the star fort was called a salient, and the point where two salients joined, near the central body of the star, was called a re-entrant angle. The star shape enabled enfilading fire, meaning that both faces of each salient could be covered by cannons and muskets from the face of the adjacent salient. The star's salient had faces looking toward the enemy as did a bastion, but no inward-facing flanks, the absence of which meant one less surface to protect with enfilading fire. The traces of star forts were probably easier to mark on the ground during construction than other polygons that included bastions. The six-pointed "Washington Star" forts were symmetrical and stylistically compatible with Georgian and Enlightenment ideals of balance and symmetry. In addition, the American Revolutionary forces preferred to place their earthworks on hilltops, a topographic situation favoring the panoptic, 360-degree views afforded by the star. By contrast, the British preferred to locate their fortifications to enable the control of roads; thus British forts required views of only 90 degrees to either side. Given that

Fort McHenry. Built in the 1790s on the harbor in Baltimore, Maryland, Fort McHenry was attacked by British warships in September 1814. Francis Scott Key was inspired to write the “Star-Spangled Banner” after witnessing the American defense of the fort. © PAUL A. SOUDERS/CORBIS.

preference, the British had little use for the star form and little understanding of the American preference.

During the Revolution and later, Americans also commonly used linear, temporary, semitransportable breastwork constructions. These constructions, arranged linearly along a position, included gabions (baskets or cages filled with rocks used to build supports) and *chandeliers* that supported fascines. Such constructions snaked across the landscape at Valley Forge and Bunker Hill. They had right-angled projections, prototypical bastions, along their length, allowing the defenders enfilading fire along the face of the breastwork. These fieldworks derive historically from Vauban’s system of parallels and approaches used by the besieging forces.

Just as the plan of a single fort was geometric, so was the arrangement of forts on the landscape. At Yorktown the British entrenchments consisted of two parallel arcs, with the first-built outer works set

up to impede Allied forces (the combined American colonials and French) and the subsequently built inner works to protect the town itself. The outer works incorporated the naturally swampy ravines adjacent to the York River into the entrenchment plan as a means of further impeding the Allied investments. The arc of the outer work was also continued in the shallow waters of the York River when the British scuttled twenty-nine ships.

The inner, main works was planned to consist of eight redoubts interspersed by eight land batteries and four water batteries, with several picket *redans*, traverses, and a hornwork. These works, together with an earth-backed, stockaded line without a ditch, were arranged concentrically around Yorktown. The powder magazine at Redoubt No. 4 had a fascine-type floor and a roof covered with fascines, dirt, and rawhide that were typical of the period.

Southern coastal fortifications displayed some variability in construction materials. As a rare half-bastioned redoubt, Fort Dorchester in South Carolina was simpler to construct than full bastions but was weaker because of its fewer flanks; moreover, the faces of the half-bastions could only be protected by enfilading fire from one side. Among the earliest southern campaign fortifications (c. 1775), it had tabby ramparts walls that were an amazing thirty-four feet thick and only the customary seven to eight feet high. Tabby was a building material composed of ground oyster shells, lime, and sand mixed with salt water. Other revolutionary forts in the southeastern United States, such as Fort Frederica in coastal Georgia, were constructed of tabby.

Fort Moultrie, part of a complex defensive works that Americans collectively called Charleston, was instrumental in the early colonial victory, preceding the Declaration of Independence, of 28 June 1776. The fort’s ramparts were revetted with soft palmetto log cribwork filled with artillery-absorbing sand. Enclosed bunkers located beneath the cannon on the rampart were used as magazines, officers’ quarters, or a casemated lower tier of cannon. Later versions of these bomb proofs were complete with chimneys for ventilation. Fort Moultrie was an unusual Revolutionary citadel because it was the colonial counterpart of a European walled city, serving to surround a town and its civilian inhabitants.

In the southern backcountry, troubled relations between the Cherokees and Creeks, the colonial settlers, and the British resulted in the building of many fortifications between the 1750s and 1800. For example, Fort Ninety-Six was originally built by the British in 1759 as a stockade against the Cherokees,

whose resistance was broken in 1761. The British used sandbags to raise the parapets by three feet and to shape the musket loopholes in the palisade. To occupy a fortification was to be on the defensive and to engage in passive practices; the British defenders waited, played games, drilled, and maintained fortifications, provisions, and equipment.

At Fort Ninety-Six in June 1781, the colonials, commanded by Lt. Col. Thaddeus Kosciuszko, a skilled military engineer, unsuccessfully besieged the improved, British-held star and circular redoubts. The colonials attacked with sandbags, hooks, and ladders through almost a half-mile of excavated, underground features such as systems of parallels, approaches, saps, and mines. Aboveground, gabions served to protect the besieging colonials. The act of besieging required invaders to dig parallels and approaches in the dirt and build fascines and gabions, dissipating the strength of their offensive. A colonial innovation, the thirty-foot-high Mahan Tower topped with parapets for attacking colonial musket fire, offered a panoptic elevation to the planar landscape. The tower was built of green logs so the British hot shot would not ignite it. The British abandoned their fortifications in July 1781 because of their poor, isolated backcountry position; the War of Independence began to focus on the coasts and river near Yorktown. The Americans occupied the fortifications and used them as backcountry defenses against the British-allied Creeks and Cherokees for the rest of the eighteenth century and through their removal in the 1830s.

In the western backcountry of Appalachia, the Great Lakes region, and beyond to the Mississippi River, the colonial campaigns of 1778 and 1779 sought to break the British-Indian alliances. A string of earthen outposts and wooden stockades were built along the Ohio River system to protect the waterways that brought supplies and militia to the far western theater of operations. Fort Duquesne (renamed Pitt when under English control) is the most famous of these riverine forts, which also included Forts MacIntosh, Fincastle (Henry), and Randolph. The colonial populace frequently fled to these forts for refuge from, and retaliation against, British-inspired Indian attacks. Between 1784 and 1790 Indians killed or captured some fifteen hundred settlers in Kentucky alone. Many forts were captured by the British-Indian alliance. These forts, according to the terms of the Jay Treaty of 1794, were to be evacuated by the British by 1796.

THE FIRST SYSTEM, 1794–1801

After the Treaty of Paris ended the War of Independence in 1783, Americans were concerned that France and Britain would exploit the loyalty of Native American groups to block American westerly expansion. Also, the young American nation saw Britain's nautical mercantilism and France's Anglophobia as a threat to American rights of shipping and commerce on the high seas.

In response to these threats, the fledgling federal government instituted the First American System for the defense of its seacoast from British attack. As part of this system, in 1794 the government authorized \$76,000 in federal funds for the construction of coastal fortifications designed to protect fourteen geographically isolated seaports along the Atlantic Ocean from Maine to Georgia. The original authorization included another \$96,000 for armaments of the forts. The design of these defenses was not American but rather largely the product of French engineer-consultants. The small funding allocations of the First System generally allowed only for impermanent, earthen fortifications that could be easily thrown up without central planning. Some First System forts were revetted with stone.

Revolutionary battles frequently had two parallel command structures: a militarist held the overall command while an engineer was in charge of building the earthen defensive forts and excavating the offensive siege works (saps and mines, for example) for the attackers. An engineer, when present, or the military leaders commanded the sappers and miners. On 16 March 1802, Congress authorized the organization of an engineer corps, known as the Army Corps of Engineers, and the institution of a military academy at West Point, New York.

THE SECOND SYSTEM, 1807–1814

A renewed need for seacoast protection against the French, British, and Native Americans resulted in the Second American System of fortification of the seacoast, one of the first projects undertaken by the Army Corps of Engineers. Most Second System seacoast forts were essentially completed by 1812. Multitiered architecture, with casemates at the levels of both the parade and the terreplein, first appeared in what Americans called the castles, such as Castle Clinton in New York City, of this Second American System. The Second System fortifications were generally intended to be masonry, although local exigencies and funding may have kept some of them as backcountry earthworks. The Second System was centralized and coordinated at the federal level, with

much less variability in form and method of construction than in the first. Local funding and volunteer assistance by state and other institutions, as at Dorchester Heights in South Boston, augmented the generous \$3 million federal allocation. A total of thirty-one new or rebuilt forts were part of this Second System and included defenses on the Gulf of Mexico. The works of many First System forts were improved during the Second System. When the War of 1812 broke out, every town of any magnitude on the coast was protected by at least one battery. Built in 1814, Fort Gratiot, located on Lake Huron on the American–Canadian border, is an example of American palisaded earthworks that were commonly found throughout the backcountry of the western frontier.

THE FLORIDA FRONTIER, 1817–1842

Diverse groups of Native Americans including Yamasees, Muscogulees, Seminoles, Cherokees, and Creeks settled in Florida throughout the eighteenth and early nineteenth centuries. The First Seminole War (1817–1818) involved raids, with the quasi approval of the president, by General Andrew Jackson’s army against the forts and crops of Seminoles, “Seminole Negroes” (Africans enslaved by the Seminoles), and escaped slaves near and on the Florida panhandle. The U.S. government followed a civilization program in this period to contain the excessive land requirements of the Native mixed economies. Conflicts with white and Spanish settlers led to a reservation north of Tampa in inland areas established by the 1823 Treaty of Moultrie Creek (near St. Augustine) with the U.S. Government. Slave raiders attacked Creek and Seminole towns to recover escaped slaves and Seminole Negroes. Florida thus became caught up in the sectional contentions over slavery. Because of these land conflicts and slave raids, Americans felt that settlers needed protection; Cantonment Brooke (built in 1824 in modern Tampa) and Fort King (established in 1827 near Ocala) were established immediately after the treaty.

After the Native American groups learned of the new governmental policy of Indian removal of 1830, the Second Seminole War (1835–1842) erupted. Seminoles led by Osceola ambushed U.S. Army troops, led by General Wiley Thompson, outside the Fort King gate. Major Francis Dade’s troops were attacked en route to Fort King from the U.S. Army headquarters at Cantonment Brooke. Fort King was a palisaded outpost with two full, square, two-story bastions on opposing corners. The palisade enclosed a magazine, a two-story blockhouse, and quarters

for officers and enlisted men. Other settlers’ buildings located close to the palisade enjoyed the protection that the fortified garrison afforded. Fort King was abandoned in 1843 after the Second Seminole War ended.

James W. Mueller

FOUNDING FATHERS The term “founding fathers” denotes the politicians, soldiers, jurists, and legislators who held leadership positions during the era of the American Revolution, the Confederation period, and the early Republic. Sometimes the term covers only the delegates to the Second Continental Congress (more usually known as “signers”), who in

July 1776 in Philadelphia's State House (now known as Independence Hall) declared American independence and adopted Thomas Jefferson's amended Declaration of Independence. More often it means the delegates to the Federal Convention, who met in the same building from May through September of 1787 and framed the proposed Constitution of the United States (more usually known as "framers"), and those who supported or opposed the Constitution during the ratification controversy of 1787–1788. At a minimum, the roster would include the seven key founding fathers named by Richard B. Morris, the eminent historian of the Revolution, in 1973: Benjamin Franklin (1706–1790), George Washington (1732–1799), John Adams (1735–1826), Thomas Jefferson (1743–1826), John Jay (1745–1829), James Madison (1751–1836), and Alexander Hamilton (1755–1804).

But "founding fathers" is a protean phrase whose meaning has varied depending on who has used it and when. Some have used it to identify not only the usual cadre of elite white males but also the middling and common sorts who served in the American Revolution, voted for or against the Constitution, and helped to bring the new government into existence. Some historians have used the phrase "revolutionary generation"—although, depending on whom one includes, the founding fathers spanned three or even four generations, from Benjamin Franklin to Albert Gallatin (1761–1849). Some political writers have sought to remind Americans of the role of women in the nation's history, applying the term "founding mothers" to such women as Abigail Adams, Mercy Otis Warren, and Deborah Sampson. Significantly, however, with few exceptions the phrase has not included those who were not white, whether African American or Native American.

The core meaning of "founding fathers" remains constant, whatever the group's membership. It designates those who, by word or deed, helped to found the United States as a nation and a political experiment. Thus, the term includes those who sat in the Congress that declared American independence—even a delegate like John Dickinson of Pennsylvania, who opposed independence and refused to sign the Declaration but fought for the American cause in the Revolutionary War. It also encompasses others who fought for the American side in the war, or played important roles, as framers or ratifiers or opponents or subsequent effectuators, in the origins of the Constitution of the United States and the system of government it outlines.

ORIGINS OF THE TERM

For a term so central to most Americans' understandings of their past, and so productive of legal, political, and historiographical controversy, "founding fathers" has a surprisingly short history—and an unexpected coiner. On 22 February 1918 Warren G. Harding, then a Republican senator from Ohio, was the featured speaker at the Washington's birthday commemoration hosted by the Sons and Daughters of the American Revolution. Harding intoned, "It is good to meet and drink at the fountain of wisdom inherited from the founding fathers of the Republic." Pleased with how his words were received, Harding revived "founding fathers" in a speech accepting the 1920 Republican presidential nomination. Finally, on 4 March 1921, President Harding told the nation, in his Inaugural Address:

Standing in this presence, mindful of the solemnity of this occasion, feeling the emotions which no one may know until he senses the great weight of responsibility for himself, I must utter my belief in the divine inspiration of the founding fathers. Surely there must have been God's intent in the making of this new-world Republic.

Harding's coinage passed into general usage so swiftly and easily that its origins were soon forgotten. Not until the 1960s, when the speechwriter, journalist, and lexicographer William Safire posed the question to the Library of Congress's Congressional Research Service, was Harding identified as the inventor of "founding fathers." Given Harding's weak historical reputation, this two-word coinage may be his most enduring political and intellectual legacy.

VENERATION OF THE FOUNDERS OVER TIME

Even before there was such a term, Americans expressed their reverence for the heterogeneous group of signers, framers, politicians, generals, polemicists, and jurists now known as the founding fathers. The tendency to see the elite national politicians of the 1770s, 1780s, and 1790s as a distinct group worthy of veneration began in the early decades of the nineteenth century. As the leaders of the Revolution and the early Republic retired and began, one by one, to die, their passing sparked growing anxiety among later generations of citizens and politicians. Those who had created the nation's constitutional and political order no longer would be present to guide its development and improvement.

Few captured this unease better than Abraham Lincoln, who in January 1838 delivered his first major political address, "The Perpetuation of Our Political Institutions," before the Young Men's Lyceum of Springfield, Illinois. Lincoln spoke less than two

years after the death of the last surviving framer of the Constitution, James Madison, and less than six years after the death of the last surviving signer of the Declaration of Independence, Maryland's Charles Carroll. In his lecture Lincoln challenged Americans to preserve the form of free government created by those whom he hailed as "a once hardy, brave, and patriotic, but now lamented and departed race of ancestors," whom he dubbed "our fathers."

Lincoln's concerns resonated in many ways for decades thereafter, the most critical having to do with the vexed question of how to interpret the Constitution of the United States. As the nation expanded westward, issues of federal constitutional power entwined with various other questions of public policy confronting the United States: governance of the western territories; designing "internal improvements" (such as roads, bridges, and canals) to knit the nation together as a single economic and political unit; and the place of slavery in American life. All these matters raised issues of constitutional power and constitutional limitations, and in turn those issues raised the question of how properly to interpret the Constitution.

ORIGINAL INTENT

Increasingly, those embroiled in disputes over the scope and extent of powers conferred by the Constitution invoked the words and deeds of those who framed and adopted it as guideposts of authoritative constitutional interpretation. (Even while he was alive, the aged James Madison found his correspondence in the 1830s dominated by appeals for advice and guidance as to what he and his colleagues intended the Constitution to authorize or to prohibit.) Once all the "founders" were gone, polemicists and litigants on both sides of these contests ransacked newly published editions of the writings of such key figures as Washington, Franklin, Jefferson, Madison, and Hamilton; James Madison's *Notes of Debates in the Federal Convention of 1787* (sold by Madison's widow to the federal government following his death and the mandate of his will, and first published in 1840); and Jonathan Elliot's five-volume *Debates in the Several State Conventions on the Adoption of the Constitution* (originally published between 1827 and 1830, then revised and enlarged between 1836 and 1859). This hunt for authoritative guidance soon became known as the quest for the Constitution's "original intent" or "original meaning."

In 1857, when Chief Justice Roger B. Taney sought in *Dred Scott v. Sandford* to hand down an irrefutable, authoritative interpretation of the Consti-

tution on issues of slavery in the western territories, he cast his opinion as a carefully considered, neutral sifting of the intentions of those who created the nation and its constitutional system. And in 1860, when Abraham Lincoln challenged the position staked out by Taney in *Dred Scott*, he too undertook his own massive research project into the "original intentions" of "our fathers, who framed the Government under which we live" and presented the results in a formidable speech delivered at New York's Cooper Union. The forensic duel between Taney and Lincoln fixed the quest for "original intent" at the core of all subsequent disputes about interpreting the Constitution.

THE FOUNDERS IN HISTORICAL MEMORY

Another reason why Americans' veneration of the founding fathers intensified was the need to create a "usable past" (a phrase coined by the literary historian Van Wyck Brooks in his 1915 book *America's Coming of Age*) for a young nation. Commemorations of the nation's origins in the Revolutionary War, including such anniversaries as the Declaration of Independence and the anniversaries of the births or deaths of such figures as Washington, Franklin, and Jefferson, helped to fix these revered figures in the nation's historical memory. In particular, the deaths on 4 July 1826 of John Adams and Thomas Jefferson appeared to Americans as some sort of divine sign of favor on the American experiment. One of the most powerful reasons for the continuing influence of the founding fathers is that they take on roles in the nation's cultural life played by ancestors in such cultures as Confucian China or Republican or Imperial Rome. Unlike so many nations, whose origins are lost somewhere in the misty past, the United States began as a political entity in a specific time and place, as the handiwork of specific individuals. In other words, the United States is a nation because it chooses to be, and it confers on those who created the nation the cultural roles, functions, and reverence associated with biblical patriarchs or patron saints.

To be sure, within the group known as the founding fathers the historical reputations of individual figures rose and fell with the changing fortunes of American politics and the ideas and principles with which they were identified. Thus, for example, from his death in 1826 until the outbreak of the Civil War in 1861, Thomas Jefferson continued to be as controversial as he had been in life. Some extolled his commitment to liberty, equality, and the rights of man, whereas others denounced him as the intellectual godfather of nullification, secession, and

disunion. From the end of the Civil War in 1865 until the era of the Great Depression (1929–1941), Jefferson fell to his lowest historical ebb, due in part to the conclusion of many historians and politicians that he bore a great measure of responsibility for the Civil War and in part to the discovery by biographers and historians of the many inconsistencies between his public and private writings, which some saw as amounting to dishonesty. From the 1930s through the late 1960s, by contrast, Jefferson achieved apotheosis as a symbol of human rights, religious freedom, separation of church and state, and democratic revolution. Beginning in the late 1960s, however, his historical stock started to fall again, with new historical and public attention to issues of race, slavery, and civil rights, and Jefferson's conflicted and sometimes appalling views on the nature of race in general and African Americans in particular.

As Jefferson rose, Alexander Hamilton fell, and as Jefferson fell, Hamilton rose, their reputations rising and falling as functions of partisan and sectional conflict. All but forgotten, save as the leading author of *The Federalist*, in the years preceding the Civil War, Hamilton rose spectacularly in the late nineteenth century, as many politicians and scholars hailed him as the father of modern industrial, urban America. Again, as Jefferson rebounded in the era of the New Deal, Hamilton fell, dismissed as an apologist for wealth, power, and privilege—despite the arguments of such polemicists as Herbert Croly in *The Promise of American Life* (1909) and such politicians as President Franklin Delano Roosevelt that the best goal of American public life was to use Hamiltonian means to achieve Jeffersonian ends. Yet again, as Jefferson fell in the 1990s, Hamilton rose anew, as historians and journalists rediscovered him as a consistent and coherent advocate of vigorous national constitutional power and a tough-minded realist at home and abroad.

At the same time, however, historians in the middle and late twentieth century began to reconsider the centrality of the group known as the founding fathers to the era in which they lived and worked. The rise of social history, with its attention to the social, economic, and private lives of ordinary men and women, helped to shunt aside the profession's former preoccupation with "great dead white men." So, too, the growing attention to the histories of Native American nations and peoples and the history of both free and enslaved African Americans raised key questions about the founding fathers' lives and achievements. Some historians have taken this matter to extremes, rejecting attempts to study the lives,

thoughts, and deeds of the founding fathers as reactionary. Other historians, while continuing to study such men as Adams, Jefferson, Washington, Hamilton, and Aaron Burr, have restored them to their historical and political contexts. Key political figures, these historians argue, did not act in splendid isolation, but rather within a shifting field of expectations by and reactions from the people. They operated in the political realm in large part by reference to what they hoped or feared popular reaction to their policies and conduct might be.

Meanwhile, controversies over the jurisprudence of "original intent" ebbed and flowed throughout the twentieth century and into the twenty-first. At first, conservative jurists used original-intent arguments to block such measures as federal regulations of interstate commerce or a federal income tax. In response, such historians as J. Allen Smith and Charles A. Beard criticized the antidemocratic cast of thought of the framers of the Constitution, pointing out that they might have framed the document to enshrine their own economic interests rather than as a high-minded exercise in constitutional statesmanship. Later, from the 1940s through the 1970s, liberal jurists and scholars sought to ground arguments for strict separation of church and state in the intent of the framers. In the mid-1980s the pendulum swung back, as Attorney General Edwin Meese III called for a "jurisprudence of original intent" that would anchor freewheeling judges to the text of the Constitution interpreted solely in the light of its origins. In response, constitutional scholars and historians such as Martin S. Flaherty, Jack N. Rakove, and James H. Hutson argued that original-intent jurisprudence fails on two grounds. First, it does not take account of the inadequacies of the historical evidence of original intent. Second, it fails to consider the historical and intellectual contexts of the origins of the Constitution and the ways in which those contexts differ significantly, often radically, from those of the present. Nevertheless, Rakove has argued, the advice of those who framed the Constitution, argued over its adoption, and put it into effect is valuable to us for two reasons: First, the framers were "present at the creation," and their discussion therefore sheds light on the origins of the constitutional system. Second, the framers were among the most learned and profound political and constitutional thinkers that this nation has produced; thus, even if we reject the binding force of original-intent jurisprudence, their wisdom often has persuasive value.

CONCLUSION

The founding fathers draw renewed attention not only from scholars but from Americans from all walks of life. Major constitutional crises, triggering acerbic dispute over whether and how “original intent” can resolve such crises, intersect with a sense of public uncertainty as to the lessons that the usable past ought to teach. In 1941, with the United States on the brink of entering World War II, the novelist and critic John Dos Passos observed in *The Ground We Stand On*: “In times of change and danger, when there is a quicksand of fear under men’s reasoning, a sense of continuity with generations gone before can stretch like a lifeline across the scary present.” Dos Passos’s words apply equally as well to the state of mind of the American people in the wake of *Bush v. Gore* (2000) and the terrorist attacks on New York City and Washington, D.C., on 11 September 2001. In this era, many Americans questioned the constitutional system’s ability to respond to grave national problems. Looking back into the nation’s history, many Americans saw in John Adams a figure of reassuring toughness and in Alexander Hamilton a forthright, realistic champion of national interests in a hostile world. Despite sharp differences between scholarly and popular understandings of the era of the Revolution and the making of the Constitution, the appeal of a mythologized cadre of founding fathers became, once again, irresistible.

FOURTH OF JULY The Fourth of July, the first American holiday, began as a way of celebrating Congress’s vote for independence. The vote occurred on 2 July 1776, but the announcement of the action was spread on 4 July 1776. Americans mistakenly believed that the date on the newspapers and broadsides was the date of independence.

Fourth of July festivities followed an age-old pattern of celebratory rites. Since bells were rung and cannons fired to acknowledge a royal birth, the same signals were used to mark the nation’s birthday at dawn. A military muster was often the first event of the day, providing much pomp and pageantry. The soldiers would then retire to drink and eat the traditional Fourth of July dishes of turtle soup and ice cream. Most Americans gathered late in the day, especially at night. Men and women attended plays, concerts, hot-air balloon demonstrations, horse

Declaring Independence. This illustration from *The New, Complete, and Authentic History of England* (London, c. 1783) by Edward Barnard depicts the manner in which the American colonists declared themselves independent of England: a man on horseback rides through town reading the Declaration of Independence to cheering crowds, while a notice reading "America Independent 1776" is posted on a wall. LIBRARY OF CONGRESS.

aces, and fireworks exhibitions. Huge paintings depicted General George Washington and American military victories. Rowdies would occasionally set bonfires, but most activities were subdued. Rural areas did not participate.

The Fourth of July was not a benign celebration. During the Revolution, Independence Day observances inspired patriotic Americans to keep fighting and served to force out opponents of independence. British sympathizers were easily identified by their refusal to participate in toasts, parades, and other activities and were stigmatized as a result. Loyalists would typically keep their houses free of lights, and rock-throwing patriots often broke the darkened windows. In these years, when the war proceeded badly for the patriots, celebrations were muted or abandoned entirely, as was the case in 1780 and 1781.

When the Revolutionary War ended in 1783, the Fourth of July became a commemorative event. Communication and entertainment were viewed as more important than any practical result. Community after community made the day into an official holiday with barbecues, parades, and readings of the Declaration of Independence.

In the late 1780s control of Independence Day became hotly contested between political groups that attempted to direct the activities in a way which allowed them to promote their agendas. During the Adams presidency in the late 1790s, Republicans used the day to indicate their support for France and their distaste for the president. On festive occasions, American men in this era would commonly place a black rosette cockade in their hats. In response to Adams's unpopular French-aimed Alien and Sedition Acts of 1798, Republicans along the Eastern seaboard replaced the American cockade with a blue one symbolic of France. A few Federalists then physically removed the blue cockades. In the 1790s the Fourth of July became notorious for riotous behavior, and many Americans dreaded the coming of the day.

By about 1814, the Fourth of July had become a generally accepted day off from work because of politics. Prior to this time, Americans had a relatively uninterrupted work schedule with only the Sunday Sabbath as a rest day. Deprived workers were eager for a day of celebration. With both Federalists and Republicans seeing political advantages in promoting a vacation, the day became a holiday.

After the War of 1812 it was a holiday only for whites, however. African Americans were pushed out of Fourth of July celebrations by a mixture of intimidation and physical violence. Slaves typically did

not possess the right to congregate freely, to be unescorted at night, or to throw fireworks. Whites saw Independence Day as a holiday for Americans only and blacks did not qualify for citizenship.

During the War of 1812, Independence Day celebrations in southern cities served to boost enthusiasm for the war effort. In Boston, a city controlled by the Federalist opponents of the war, celebrations stopped. By halting the festivities, the Federalists hoped to awaken people to the dangers of losing to foreign invaders and to Republican mismanagement of the country. As the Federalist Party collapsed in the wake of the British defeat, partisanship in Fourth of July celebrations rapidly disappeared. Parades, speeches, and fireworks continued, but the focus was now entirely on nationalism.

The end of the war brought the end of celebrating Revolutionary goals. Images of prosperity replaced images of liberty. Lengthy orations focused on love of the land as well as America's beauty, abundance, and potential for material progress. In the 1820s women joined the festivities for the first time as active participants. Dressed in calico, they marched in front of flag-draped wagons filled with the goods of local merchants. The only discordant note came when female temperance advocates began staging Independence Day rallies against the heavy drinking that had become a part of the occasion in urban areas. By 1830, the Fourth of July had emerged as a nonpartisan national holiday to celebrate America.

FRANCE, WAR WITH See **Quasi-War with France**.

FRANKLIN, BENJAMIN Benjamin Franklin is arguably the most beloved and the most disparaged of America's founding fathers. He is perhaps the least understood as well. A jack-of-all-trades and the master of many, he is a nearly impossible man to pigeonhole. He was a scientist and inventor, printer and publicist, brother and son, father and husband, diplomat and staunch—if somewhat belated—supporter of America's War for Independence. He was the most cosmopolitan founder, and yet people think of him as the most quintessentially American.

Franklin's career spanned nearly an entire century. Born in Boston on 17 January 1706 and dying in Philadelphia on 17 April 1790, Franklin never called one place home. He fled his native Boston when he was only seventeen. In Philadelphia, he suffered a series of failures. He tried unsuccessfully to begin his own printing business, relying on the false promises of Governor William Keith for capital that never materialized. He briefly worked as a clerk in a friend's general store, but returned to printing when his benefactor died. He even briefly considered becoming a swimming instructor. He seemed to flounder, drifting aimlessly from one project to another until he married Deborah Read in 1730. Soon thereafter he began his successful printing career, setting up a thriving shop on Market Street. He had three children. William, his illegitimate son, was born in 1731 to a woman whose identity remains unknown. He and Deborah had two children of their own. Francis Folger died of smallpox in 1736 at the age of four. Sarah, his only daughter, was born in 1743.

Franklin retired at the age of forty-two and entered the public arena with ill-disguised enthusiasm. With William, he conducted his famous kite experiment in 1752. His ability to prove that lightning was a form of electricity instantly garnered him international acclaim. He also embarked upon his political career, organizing Pennsylvania's militia during King George's War (1740–1748), winning a seat in

Benjamin Franklin. Franklin examines an electrical device in this eighteenth-century mezzotint by Edward Fisher after a painting by Mason Chamberlin. A lightning bolt can be seen through the window at the right. LIBRARY OF CONGRESS.

the colonial legislature in 1751, and presenting his Plan of Union to the Albany Conference in 1754. At the same time, he was a pivotal player in his colony's effort to become a royal colony.

Franklin's involvement in Pennsylvania's effort to escape proprietary rule led him to spend some of his most important years on the other side of the Atlantic. He sailed to England in 1757 and again in 1764, remaining in London until 1775. No radical, he spent the decade looking for an accommodation between England and America, only gradually and reluctantly coming to the conclusion that accommodation was impossible to achieve. Thus, at the age of seventy, at a time when he had much to lose and little to gain, this once-proud member of the British Empire returned to Philadelphia determined to represent Pennsylvania in the Second Continental Congress and to persuade his compatriots to sever their ties with England. Thereafter, he was unrelenting in his efforts to secure colonial independence. He was a member of the committee that drafted what became known as the Declaration of Independence. Although Thomas Jefferson was the scribe on that committee, Franklin used his skills as an editor to tweak—gently and diplomatically—the Virginian's prose. With in-

dependence declared, he was soon in Paris, working indefatigably—and successfully—to secure French military and financial aid for the American war effort. At war's end he played a major role in negotiating his country's peace treaty with England. With the signing of the Treaty of Paris in 1783, Franklin returned to Philadelphia. There, at the age of eighty-one, he was the oldest member of the Constitutional Convention of 1787. While his substantive contributions to the body were few, he constantly drew the delegates' attention to the republican principles of 1776. Although his colleagues usually rejected his suggestions, few could simply ignore the words of a man who had helped launch America's existence as an independent nation.

THE INDISPENSABLE MAN

The American story and Franklin's story seem to be one and the same. Beginning with his efforts to represent the colonies' interests during the Stamp Act crisis in 1765, Franklin was never far from the scene of action. His most important service to the new nation is the least celebrated. The stuff of diplomacy is not as dramatic or compelling a subject as the triumphs and sacrifices of soldiers on the field of battle. Yet America's military exploits, however valiant, would have been for naught had it not been for Franklin's endeavors. If it is true that America could not have defeated England without French military and financial aid, it is possible that such assistance would not have materialized without Franklin. He was not America's only representative in France. But no one else, not Silas Deane nor John Adams nor Arthur Lee, could do what Franklin did. Using his fame as the man who brought the lightning from the skies, taking advantage of the adulation in which the French intelligentsia already held him, he quickly became a court favorite. Judiciously balancing idealistic appeals with hard-headed arguments, cajoling, flattering, and even threatening, Franklin held his own and then some in a royal court riddled with international suspicion and intrigue. The French alliance he achieved made American independence possible, if not inevitable.

AMERICAN ICON

Benjamin Franklin was never the representative American that both his admirers and detractors have made him out to be. He was more at home in England and Europe than any other American—including Thomas Jefferson. Throughout the prewar years, he was more comfortable with his identity as a British American than any Patriot—and probably most

Loyalists. And yet it is as a "representative American" that most people think of him. We know him best through his *Autobiography*, first published four years after his death, and the pithy aphorisms of *Poor Richard's Almanack* (1732–1757). These two works—published, republished, analyzed, criticized, and admired—have made Franklin the creator not simply of a nation, but of a national identity. His life became synonymous with the "rags to riches" story that Americans like to claim as peculiarly their own. In part because of his humble origins, he is viewed as more democratic than any of the other founders, and thus as a man who would have been happy to tear down the class, racial, and gender barriers that Americans had erected in his own lifetime. Finally, Americans see him as the ultimate pragmatist, a man who eschewed ideological arguments that troubled fuzzy-headed intellectuals and instead practiced the art of the possible with grace and good humor.

Franklin used his own life as an object lesson, implying that his life was an especially American life, that his identity was America's identity, writ small. In his hands, that life and that identity were something of which all his countrymen could be proud. His experience proved, above all else, that America was the land of opportunity. He had entered the world as the son of a humble Boston candle maker and had ended it by dining with kings. Taking advantage of opportunities that existed for anyone with the intelligence and character to recognize them for what they were, he triumphed over adversity with seeming ease. Only in America, he implied, could such a success story be told.

In part because he was a "self-made man," a persona that is at the core of American mythology, he has also been designated as his century's spokesman for the egalitarian ideals upon which the new nation's independence was based. He seemed to revel in his ability to communicate with ordinary people and enjoyed even more the opportunity to cut an aristocratic pretender down to size. He valued life's simple pleasures and was even uncomfortable with the few luxuries—a china cup, a silver spoon—that his wife insisted upon purchasing for him. In his very old age, he became a champion of the nascent antislavery cause.

Franklin's admirers also see him as pragmatic and nonideological, willing to accept half a loaf as better than none, determined to achieve the possible rather than tilt at windmills. He was unfailingly optimistic, suffused by that "can-do" spirit which Americans like to claim as an intrinsic component of their character. He put his scientific bent to practical

ends, inventing a stove, a lightning rod, and bifocals, all designed to improve the everyday lives of ordinary men and women. Even at those rare moments when he failed to achieve his ends, he shrugged, made a joke—often at his own expense—and proclaimed that occasional “errata” were not such bad things. Errata could be corrected. People could learn from their mistakes.

THE “SNUFF-COLORED MAN”

Ironically, the attributes that have turned Franklin into the beloved founder are the very qualities that invite the most disdain from some quarters. While his detractors agree with those who see Franklin as a representative American, they see little in that characterization to admire. Intellectuals, in particular, view Franklin as the very essence of bourgeois Babbitry. In the classic lines of D. H. Lawrence, this “middle-sized, sturdy, snuff-colored Doctor Franklin” was a “dry, moral, utilitarian little democrat.” If he was the “first downright American,” that was no compliment—either to him or to his country (*Studies in Classic American Literature*, p. 21).

Smug, materialistic, and hypocritical, Franklin was, say some critics, above all the progenitor of American capitalism. His sunny disposition, his eternal optimism simply proved that he did not have the capacity to sympathize with those who failed to rise to his own level. His own determination to climb the social ladder turned him into a money-grubbing parvenu whose eye was always on the bottom line. His famous plan for self-improvement was little more than a reflection of his ledger book mentality.

Franklin was, moreover, no democrat. His own career was built on the backs of others. He drove more than one Philadelphia printer out of business and delighted in doing so. He was disdainful of the “unworthy poor” who refused to work and did not take advantage of the opportunities that at least in America beckoned at every turn. His treatment of women, especially his wife and surviving daughter, was far from admirable. No charming rogue, he was an unreconstructed womanizer who used women for his own purposes and discarded them once those purposes had been served. Far from being the one founder who recognized the evils of slavery, he was, for most of his life, peculiarly untroubled by the institution of bondage. He owned, bought, and sold slaves. He came to the antislavery cause very late in his life, and only then did so when it was politically safe.

Moreover, say some naysayers, Franklin’s much vaunted pragmatism is proof that he lacked depth.

He was multifaceted. He was a chameleon. He was an actor, a shape-shifter, and a confidence man. He was all things to all people, but ultimately he had no principles, no true essence. He was all means and no end. If historians have failed to penetrate his inner core, if they find him maddeningly elusive, perhaps there is a reason for their failures. This was a man who valued appearances above reality, who skimmed the surface of things, who was reluctant—perhaps unable—to plumb the depths.

Nor was this supposedly bright and practical man an especially astute politician. Even those historians who find much to admire in Franklin are puzzled by the many missteps he made throughout his long and varied career. His personal vendetta against the Pennsylvania proprietors made him blind to the dangers that his colony would have faced had it become a royal province. He was completely blindsided by the depth of the colonists’ anger at the beginning of the Stamp Act Crisis in 1765. When he first heard about the Boston Tea Party of 1774, he suggested that Massachusetts should pay for the tea that some Patriots had so unceremoniously dumped into Boston Harbor. While Franklin always seemed to land on his feet in the end, he was not an invariably prescient observer of his times.

EIGHTEENTH-CENTURY MAN

The “real” Franklin is more complex and in some ways more admirable than the image he helped to create. He may have been the self-proclaimed exemplar of the rags to riches story, but he was not the avaricious materialist that modern observers would understand or recognize. He valued money as a means to an end, and he was bewildered by those who sought profit for its own sake. Like most Americans of his day, he craved the independence that money could bring rather than money itself. Without independence he could not serve his “public” effectively, nor could he enjoy the political career that became the central focus of his life after he retired.

Interestingly, Franklin’s meteoric career did not even achieve its ultimate goal. A man of his times, he sought royal patronage with unabashed fervor and longed to be a part of the upper reaches of British society. He eventually acquired money and position, but he could never completely escape his humble past, even though he spent nearly a decade in London trying to do just that. He moved easily in aristocratic circles in France and England. He failed to understand the disgust with which John and Abigail Adams viewed the “decadent” aristocracy they encountered at the court of Louis XVI. But despite his efforts, he

never managed to secure the royal favor he craved and thought he deserved.

Most important, Franklin was by no means invariably pragmatic or optimistic. He did not always walk the middle line, avoiding rigid intellectual systems and the extremists who devised those systems. He did not shrink from disputation, and many times he failed to see compromise as a worthy goal or even an acceptable option. Franklin was a passionate man who knew how to hate as well as how to smile and laugh. Not everyone in his own day found him amusing or likeable. He acquired any number of personal and political enemies throughout his life. He was a man who cared, and cared deeply, about the empire and about America's role in that empire. When he finally came to the conclusion that the colonies would be better off if they escaped English rule, he was single-minded and unrelenting in his efforts to secure independence. He could carry a grudge as well as anyone and never forgave his personal or political enemies. Franklin never even forgave his own son for remaining loyal to the king.

Partly because he lived so long, partly because he kept so much of himself to himself, historians have failed, despite their many valiant attempts, to capture Franklin's "true" identity. In an odd way, he was a tabula rasa who left it to future generations of Americans to project themselves—their darkest fears and their most cherished hopes about themselves and their nation—onto Franklin's persona. In the end, the mythical Benjamin Franklin tells us more about ourselves than he does about this quintessential eighteenth-century man.

FREEDOM OF THE PRESS By the late colonial period, the theory and practice of freedom of the press allowed for considerable political and moral debate. Laws against seditious libel (printed matter tending to threaten or undermine the authority of government) still existed, but the last trial for seditious libel, the case of John Peter Zenger, ended in acquittal in 1735. Some self-censorship, however, no doubt continued. Civil suits for private libel (publications defaming a private person or private characteristics) were not uncommon. Laws against blasphemy (words offending religious orthodoxy) were rarely enforced.

BEFORE AND DURING THE REVOLUTION

The most common threat to freedom of the press was the ability of colonial legislatures to jail an offender for a breach of legislative privilege (words offending a sitting legislature). Many colonists held the notion common among critics of the government that the people's liberty is always under threat from royal or ministerial power. Accordingly, the popularly elected lower houses of the various colonial legislatures came to be seen as defenders of the people's liberty against the royal governor and his allies. Criticizing a state assembly might be seen as simply freedom of the press, the right of individuals to voice their sentiments. But it might also be seen as an abuse of that freedom. Any criticism that undermined the people's faith in the assembly could be regarded as abusing one safeguard of the people's liberty (a free press) to undermine another (the popular branch of the legislature). Following this latter perspective, legislatures throughout the colonies reprimanded, fined, and even occasionally imprisoned their critics, though this became less common as the 1750s and 1760s wore on and virtually disappeared after the Revolution.

The Stamp Act (1765) taxed paper goods of all sorts and amounted to a type of censorship aimed particularly at opposition newspapers, which were less able to pay since they were less likely to profit from government printing contracts. These and other new laws seemed to reveal an unfolding conspiracy by the British ministry and its Tory allies in the colonies to promote arbitrary power. The people, led by outraged editors, actively and successfully opposed the Stamp Act.

As the wider crisis deepened in the late 1760s and early 1770s, the press flooded the colonies with provocative newspaper articles and political pamphlets on both sides. Limits on the press were still debated, but neither the royalist Tories nor the opposition Patriots could gain enough power to control it. Tories insisted that they defended an individual's right to print his political views. Patriots insisted that freedom of the press was properly used to protect the people's liberty from an overreaching government, as it always had been. The truth will prevail, the Patriots conceded, but only if there is a fair fight. With Tories propagandizing their way to complete tyrannical power, all of the people's liberties—including freedom of the press—seemed endangered. Rather than risk this, Patriots took to intimidating and even terrorizing Tory printers and authors.

With the commencement of open hostilities at Lexington and Concord, Massachusetts, on 19 April 1775, the very real threat to the people's liberties from ministerial forces became unmistakable. Both sides took to allowing only their partisans to print on their side of the war front. But during the war, within a given side, press freedom largely existed. For example, Patriots threatened other Patriots who suggested, even sarcastically, the wisdom of surrender, yet they allowed a vigorous debate over independence.

AFTER THE REVOLUTION

After the Revolution new, more radical leaders took power and the common people entered into public life as never before. The voters, who now usually included white men of all social ranks, expected to have a greater say in the government. The first press provisions in Revolutionary America illustrated this expectation. George Mason's Declaration of Rights for Virginia (1776) employed the traditional theory that a free press is meant as the protector of the people's liberty from tyrannical power: "The freedom of the Press is one of the greatest bulwarks of liberty, and can never be restrained but by despotick Governments." But the early constitutions also voiced the

long-standing view that freedom of the press was simply a basic individual right to print what one pleased. Pennsylvania's constitution (1776) declared that "the people have a right to freedom of speech, and of writing, and publishing their sentiments; therefore the freedom of the press ought not to be restrained."

Having just started a war to rid themselves of what they took to be a tyrannical power, the former colonists were careful to emphasize that now the people, not a king or even the legislatures, were sovereign. Public officials were now "servants" and the people their "masters." These expansions of the theory of popular sovereignty occasioned new understandings of the role of the press and the nature of freedom of the press. Radical thought had long considered the press as a last resort should the more moderate safeguard provided by the representative legislature fail. With the advent of broad-based, annual elections for larger, more representative, and more powerful legislatures, the people's duty and the press's role increasingly centered on maintaining and shaping rather than simply defending the republics the former colonists had established.

As always, a crucial question was how far the press's liberty should go. The press clauses in the state constitutions did not specify any particular limit. The Massachusetts constitution (1780), for example, declared that "the liberty of the press is essential to the security of freedom in a State; it ought not, therefore, to be restrained in this commonwealth." But town meetings debating the clause read it to provide complete impunity, even for private libel.

First Amendment. Originally, the federal Constitution (1787), like the earlier Articles of Confederation (1781), included no protection for freedom of the press. Anti-Federalists criticized this absence repeatedly in the ratification debates, but the Federalists insisted that such protection was not needed because the new national government would only have those powers expressly given to it. Press liberty was thus beyond federal authority. Many anti-Federalists maintained the traditional view that governmental power continuously and inexorably struggles to expand; without a clear declaration protecting press freedom, they argued, the national government would soon seek to limit freedom of the press. Such a limitation, they feared, would undermine the more engaged oversight of the government that they expected of republican citizens.

Critics of the Constitution were more likely than its supporters to stress the advantages of an active press. The anti-Federalists admitted that publications

might contain abusive language and false claims, but said the advantages to the people outweighed the disadvantages. Moreover, they argued, the disadvantages of an unbounded political press simply had to be borne, since they were interwoven with the advantages. Federalists were more likely than their critics to stress the disadvantages of an unrestricted political press, in particular an ill-informed but empowered citizenry.

Though he was the “father of the Constitution,” James Madison came to see the importance of a bill of rights to protect basic liberties. After ratification, Madison proposed a number of amendments in Congress. He saw more clearly than anyone that while there still remained a threat that the government might tyrannize the people, the bigger threat was that a majority of the people would tyrannize over a minority of controversial printers and authors. Madison drafted, and the House of Representatives passed, two clauses protecting press liberty from the state and federal governments. The Senate, however, revised them into what became the First Amendment, which states in part: “Congress shall make no law . . . abridging the freedom of speech, or of the press.”

Federalists versus Democratic Republicans. Differences over the proper interpretation of the vaguely worded press clause became heated as competing parties emerged. The Federalist Party spent the 1790s debating policy and exchanging newspaper attacks with the emerging opposition party, the Democratic Republicans (led by Madison and Thomas Jefferson). Newspaper impartiality—never pure or perfect—became a victim of increasing partisanship, and editors began ridiculing, for the first time, the very idea of impartiality. In 1798 the Federalists used the pretext of the Quasi-War (1798–1800) with France to pass a number of draconian measures, including the Sedition Act, which was intended to silence Republican printers and other critics of government.

The Sedition Act criminalized “any false, scandalous and malicious . . . writings against the government of the United States . . . or Congress . . . or the President . . . , with intent to defame . . . or to bring them . . . into contempt or disrepute.” The Federalists followed the standard established in the Zenger case (1735) by allowing evidence of the truth of the alleged libel to be presented and allowing the jury to issue a general verdict, not merely a “special verdict” on the fact of publication only.

Despite this break with the British common law tradition (in which truth was immaterial), the Sedition Act seemed tyrannical to many people. Federalist

Party leaders did not see themselves as despotic or even partisan, but rather as loyal to the elected government. Still, the political nature of the sedition legislation was evident from both its expiration date and its execution. The law was to expire not at the end of the international crisis with France, but at the end of Federalist president John Adams’s term on 3 March 1801. Moreover, only Republicans were indicted, and most of the major opposition papers and several minor ones were targeted before the election of 1800.

Republicans repeatedly insisted that the Sedition Act was unconstitutional. Federalists countered by claiming that the freedom of the press had historically allowed for laws against abuse of the press. Their theory of press liberty adapted traditional concerns about press abuse to their view of the new republican theory of government. To them, the Republican critics of government were not defending the people, but attacking them through their elected officials. Moreover, the Federalists maintained that America’s republican form of government made regulating the press even more important than in any other form of government, since elective government ultimately rested on a truthfully informed electorate. The general public’s limited information and education was good reason, Federalists maintained, to mandate constrained and decorous press discourse, lest the people be confused or deceived. For the Republicans, to the contrary, the people’s limited information meant more wide-open political debate was needed. A republican form of government did not rely merely on elections every few years, they contended, but on continuing debate of public men and measures.

That debate, Federalists observed, had led to a world of deceptive half-truths and outright lies. The political discourse of the 1790s was among the most vitriolic and partisan of any era in America. Republicans—like the anti-Federalists before them—conceded that the truth did not always immediately prevail, but they maintained that opinion, not truth, was what was really at issue in political debates. Factual truths that could be proven in a court of law were rarely if ever central to a seditious libel case; therefore, interpretations of freedom of the press that included protections for provable truth—such as the Sedition Act—were really despotic limitations on press liberty. Moreover, Republicans insisted that the liberty of the press and its licentiousness—its use and abuse—were inseparable: one simply could not separate and punish what was false and abusive without undermining the necessary and salutary critiques of a spirited, democratic press.

Republicans like James Madison, then, were formulating and defending a broad notion of press liberty that allowed for civil suits for private defamation but dispensed with the notion of public libel. Only actual, overt acts of violence or rebellion would be punishable crimes. This theory, however, was developed by the opposition party at its most extreme and embattled. Once in power, President Jefferson pardoned the victims of the expired Sedition Act but soon also encouraged the use of state seditious libel laws against critics of his administration. In one of these cases, *People v. Croswell* (1804), the Federalist Alexander Hamilton defended Jefferson's critic by espousing principles that were actually more restrictive than those in the disputed Sedition Act (though they were less restrictive than those of the Jeffersonian prosecutor). Hamilton's theory of seditious libel gave the jury uncontested authority to find a general verdict and made truth a justification only if published "with good motives and for justifiable ends." Hamilton lost the case, but this standard soon became law in New York and many other states. At the national level, *U.S. v. Hudson and Goodwin* (1812) rejected federal jurisdiction over the common law crime of seditious libel.

Struggles over the press continued. During the War of 1812, riots that centered on a Baltimore newspaper office left the office destroyed and many people dead. Yet, in the face of successful British attacks on American soil and arguably treasonous discussions of New England secession, the Madison administration made no attempt to enact federal restrictions on the press. Nevertheless, it was Hamilton's theory of freedom of the press, not Madison's, that was predominant and generally followed throughout the nineteenth century.

Reflecting on the late colonial and early National period, some scholars (e.g., Levy 1985) have placed all emphasis on official restrictions such as the Sedition Act. Others (e.g., Smith 1988) stress the opposition to seditious libel laws and the practical reality of an open and at times licentious political press. The American approach to press liberty during this period included both of these extremes and is perhaps best understood as an ambivalent tradition (Martin 2001).

FREE LIBRARY MOVEMENT Although tax-supported free libraries first appeared in the United States in the 1840s, various other institutions existed during the colonial and early national periods that were often dubbed "public libraries," the term designating any book collection not owned by a private individual. Wealthy colonial patrons sometimes established libraries through donations. Thus, in 1638 John Harvard left four hundred volumes in his will to establish the library at the college that would soon bear his name, and in 1656 Robert Keayne left his books and a large sum of money to establish a town library for Boston.

In 1690s Reverend Thomas Bray proposed a library for every Anglican parish in the American colonies. His Society for the Propagation of the Gospel in Foreign Parts (1701) helped establish more than thirty parish libraries, primarily in the southern colonies, ranging from as few as two to as many as eleven hundred volumes each. These "Bray Libraries," which focused upon theology but also included some history, science, and Latin classics, proved to be forerunners of the ubiquitous church libraries of the early Republic, when ministers or lay leaders often managed small collections of books that

could be borrowed by those who attended religious meetings. Similarly, nineteenth-century Sunday schools invariably included libraries of pious didactic reading material. The American Sunday School Union (1824) furnished books to thousands of auxiliary Sunday schools, mostly sets of short religious tracts but also such evangelical favorites as John Bunyan's *Pilgrim's Progress* (1678) and Jonathan Edwards's *Life of Brainerd* (1749).

The social library, essentially a joint stock company, constituted the dominant form of library in America from the 1730s through the 1840s. Social libraries could be proprietary collections, established by learned societies or private associations for the use of members, or subscription libraries, which were available to anyone able to pay the modest required subscription fee. Commonplace in England in the 1720s, social libraries appeared in the American colonies in the 1730s. The most famous, although not the first, colonial subscription library was the Library Company of Philadelphia, founded by Benjamin Franklin in 1731. Between 1730 and 1780 New England alone boasted at least fifty-one social libraries. Other important collections included the Charleston Library Society (1748) and the New York Society Library (1754). Unlike parish libraries, social libraries offered a broad range of nonsectarian titles, reflecting the diverse personal tastes and needs of the subscribers. Collections typically emphasized history and biography; political commentaries; and literary works by Shakespeare, Defoe, and Pope, as well as eighteenth-century novels such as Laurence Sterne's *Tristram Shandy* (1760) and Tobias Smollett's *The Expedition of Humphry Clinker* (1771).

During the early national era, social libraries proliferated at a phenomenal rate, reflecting the democratization of American society and the greater affordability of books. Between 1790 and 1815 New Englanders established over five hundred subscription libraries, with another five hundred appearing before 1850. Social libraries flourished in every region of the young Republic. Many communities had subscription libraries open to all interested residents. In addition, countless private organizations established libraries or reading rooms for members. There were mercantile libraries, lyceum libraries, factory libraries, mechanics' libraries, apprentices' libraries, libraries for young men or women, and libraries associated with reform organizations. As a result, the majority of Americans in the new nation had access to the resources of one or more social library.

Prior to 1850 only a handful of publicly funded and controlled libraries existed for free general use.

Most of these were originally subscription collections later acquired by town meetings. In 1827, for example, the social library of Castine, Maine (1801), gave its collection to the town, which thereafter operated it as a free public library. The first town known to establish a publicly funded library was Peterborough, New Hampshire, where in 1833 the town meeting voted to use a part of the state literary fund for the support of schools instead to purchase books for a free town library. Several other New England towns took similar action in the following decade, but the practice seems to have been confined to the Northeast.

The free public library movement really began in 1849, when the New Hampshire legislature authorized towns to levy taxes for the establishment and support of public libraries. Massachusetts enacted similar legislation in 1851, and Maine followed suit in 1854. These early state initiatives did not spread to the rest of the nation until after the Civil War, however, when public libraries would rapidly displace social libraries as the dominant institution for the dissemination of books in the United States.

FREEMASONS Freemasonry, America's oldest and most important voluntary society, experienced

enormous change during the generation after the Revolution. The fraternity entered a period of unprecedented growth in prestige and popularity, but a powerful new movement opposing it in the 1820s led to a dramatic decline in membership.

ORIGINS AND THE REVOLUTION

An international fraternity of men using secret rituals and meetings open only to members to promote morality, charity, and fellowship, the modern order of Free and Accepted Masons developed out of British craft organizations. Details of this transition remain obscure, but the years surrounding the 1717 formation of a grand lodge in London were crucial. By the end of the 1720s, Masonry had assumed much of its distinctive form: a series of local lodges supervised by grand lodges; a secret ritual system made up of three levels known as degrees, augmented by a less well-defined series of further, "higher," degrees; metaphorical use of building tools to represent moral truths; and an ideal of brotherhood encompassing men of differing political, religious, national, and ethnic affiliations. This new "speculative" Masonry (so-called to distinguish it from "operative" builders) spread rapidly to the European continent and America. Lodges met in Philadelphia by 1730 and Boston by 1733. But the colonial fraternity remained small. Before the 1760s, it included only a couple of dozen lodges in coastal cities, made up primarily of well-to-do elites seeking to assert status as enlightened gentlemen.

The Revolutionary years brought major challenges. The break with England, the source of Masonic legitimacy, forced a reorganization that placed final Masonic authority in the hands of state grand lodges rather than in Britain or the national grand lodge some brothers favored. Issues of loyalty also caused problems. Barred by rule from discussing politics and religion, the fraternity took no official stand on the conflict itself, but individual brothers had to make choices. Many remained loyal to the king. Many others, however, became leaders in the Revolutionary cause, including Masonic officers Benjamin Franklin, Paul Revere, and George Washington. The proportion of Masons at the Continental Congress that approved the Declaration of Independence and at the Constitutional Convention was far higher than their proportion in the general public. Of the fifty-six signers of the Declaration, nine (perhaps twelve) were Masons (at least 16.1 percent); twelve (perhaps fifteen) of the fifty-five members of the Constitutional Convention were Freemasons (at least 21.8 percent). The fraternity proved even more popular in the

Continental Army. Ten military lodges, generally limited to officers, met in its camps. About 42 percent of the army's generals were or later became Masons.

POST-REVOLUTIONARY MASONRY

These connections with the Revolution helped spur a generation of Masonic expansion. By 1806 New York alone had more than a hundred lodges; twenty years later, it had five times that many. A Masonic meeting in 1822 estimated national membership (conservatively) at eighty thousand. By then, lodges met in nearly every village, town, and city in the country. Post-Revolutionary brothers celebrated this growth as evidence of the fraternity's identification with the ideals of the Revolution and the new nation. Like the Republic, they proclaimed, the fraternity supported learning, education, morality, and non-sectarian Christianity. Its rituals and fraternal oversight provided a particularly effective means of teaching these values. As a Massachusetts minister, Preserved Smith, argued in 1798, Masonry was "the great instrument of civilization."

Such bold claims partly responded to anxieties about the problem of preserving the Republic. But they also spoke to continuing criticism of the fraternity, questions that focused primarily on Masonic secrecy and religious diversity (the exclusion of women also was a common issue). These doubts, however, remained secondary except in a few rural areas and some conservative religious groups. Even the attacks on the Illuminati first raised by the clergyman Jedidiah Morse and others in 1798, claiming that this subversive order had caused the French Revolution partly through infiltration of continental Masonic lodges, generally explicitly exempted the American fraternity. Ministers and church members often joined and led lodges. Churches even called on the fraternity to dedicate their buildings. Such cornerstone-laying ceremonies became popular for all sorts of public structures, including the United States Capitol (1793), the University of Virginia (1817), and the Bunker Hill Monument (1825).

More than public ideals made Masonry attractive. Membership also conferred private advantages. Lodges and grand lodges provided substantial charitable aid to needy brothers and their families. More important, Masonic affiliation also helped build contacts that could prove extremely valuable in business and politics. Members typically joined the fraternity in their twenties as they were moving into manhood, a pattern followed by such prominent leaders as New York governor DeWitt Clinton, Kentucky senator and U.S. secretary of state Henry Clay, and President

Andrew Jackson. Fraternal membership helped establish an honorable reputation and develop relationships with local and national leaders. According to the idea of “preference” that became widespread in these years, Masons were obligated to help and support brothers over similarly qualified non-Masons.

As Masonry grew both in size and significance, the fraternity itself changed as well. What had been a series of scattered lodges now became a well-organized institution with complex rules and organizations. Reform-minded brothers carefully revised rituals to make them more powerful and more uniform—and pressed for exact memorization of these new ceremonies. Higher degrees also became popular. Established in organizations outside the lodge, these new ceremonies included what would later become the Scottish Rite (founded in 1802, but relatively small until the twentieth century) as well as the York Rite (a system that included the degrees of the Royal Arch and the Knights Templar).

THE RISE OF ANTI-MASONRY

Success, however, also brought problems. Expansion sharpened tensions inherent in Masonry itself, between public and private goals, between inclusiveness and exclusivity, between adherence to religious ideals and acceptance of diversity. These fault lines were exposed when, in September 1826, a number of Masons, acting unofficially, kidnapped and possibly murdered William Morgan, a Freemason who had announced plans to publish a volume containing the rituals of both the original three degrees and some higher degrees. Morgan’s disappearance, and an attempted cover-up by the fraternity, sparked a huge reaction. The anti-Masonic movement that emerged from this anger attacked the fraternity as a threat to both Christianity and republicanism. American Masonry was weakened in the South and nearly destroyed in the North. Membership began to revive only after 1840 with the weakening of anti-Masonic anger. This revival marked the start of another, even more substantial expansion lasting into the middle of the twentieth century.

FRENCH The establishment of the first permanent English settlement in North America at Jamestown in 1607 was immediately followed by the planting of the first permanent French colony in North America at Quebec in 1608. As colonists from both nations arrived in the New World, they brought with them the rivalries of the old, where their respective mother countries were emerging great powers in Europe whose interests more often collided with one another than coincided. Beginning with the War of the League of Augsburg (King William’s War) from 1689 to 1697 and continuing through the Seven Years’ War (French and Indian War) from 1756 to 1763, a series of massive conflicts between France and Britain raged, dominating the affairs of Europe. They also directly impacted the lives of their colonists in North America, who found themselves swept up into these wars. The Spanish were a major factor in North America as well, but their power declined steadily throughout this period and, after the War of the Spanish Succession (1701–1714) placed a Bourbon prince on the Spanish throne, the French and Spanish were allied in their conflicts against Britain, with the French serving as the dominant player in the coalition.

AMERICAN PERCEPTIONS OF FRANCE

In this Age of Reason, religious differences were becoming less of a factor in European politics, yet religion still exercised a heavy influence in defining cultural and political identity. Nowhere was this more true than in the North American colonies. The rivalry between Catholic and Protestant remained alive and well in North America, and much of the anti-French rhetoric that came from the British colonies was laced with anti-Catholicism. The colonists tended to equate Catholicism with despotism and viewed the French, with their powerful monarchical system of rule, as the very epitome of autocracy and the complete antithesis of the British with regard to individual rights and liberty and parliamentary government.

The feelings of animosity of most British colonists toward the French during this long period of warfare went far beyond traditional patriotism or religious belief, but rather were born from the

Allegory of France Liberating America. In addition to geopolitical and nationalistic reasons for supporting the United States, many French saw in the infant Republic the first real attempt to place the ideas of Voltaire and Rousseau into practice. This painting (c. 1784) by Jean Suau expresses this ideal symbolically as France takes the hand of liberty and presents him to the Americans. RÉUNION DES MUSÉES NATIONAUX/ART RESOURCE, NY.

unique situation and circumstances confronting the colonists in the New World. The French were the commercial rivals of the British colonists in the booming economic trade of the North American continent, and in particular in the lucrative fur trade over which the French exercised a powerful hold. French explorers were among the first to penetrate into the interior of North America, and while their settlements were small and scattered, they nevertheless established a claim to the land west of the Alleghenies, which effectively hemmed the British colonists into the Eastern seaboard and prevented their westward expansion. In the agrarian economy of the frontier, land represented money, power, and status to the colonists, and the French hold on the continent's vast interior was deeply resented.

Another major factor in colonial animosity toward France was the close relationship that the French established with Native Americans. Indeed, of

all the European powers to establish colonies in the Americas, none was more able to win the affection and loyalty of the indigenous peoples as the French was. The French worked to introduce Catholicism to the Indians, but their priests did so through peaceful persuasion rather than with the sword, in contrast to their Spanish coreligionists. Unlike their British rivals, the French were respectful of native culture, treated the tribes as sovereign nations, and established meaningful alliances with them. Frenchmen routinely married Indian women at a time when the Church of England heavily frowned upon interracial marriage. Whereas British colonists generally practiced a policy of exclusion toward the Indians, the French established ethnically diverse settlements in the midst of the various tribes they called their friends, and virtually every French town in North America included a sizable population of Native Americans living peaceably in and around the area.

Benjamin Franklin at the French Court in Versailles.

Benjamin Franklin, shown here in a 1784 engraving by Daniel Berger after the German artist Daniel Chodowiecki, became an instant celebrity after his arrival in France, where he traveled to solicit French support for the American cause. LIBRARY OF CONGRESS.

The British colonists viewed such behavior as not only morally abhorrent but threatening. Besides France, the great enemy the colonists faced in North America was the Indians, and throughout the long struggle for possession of North America, most of the major Indian tribes were allied with France. Indian war parties—armed, organized, and sometimes led by the French—terrorized the frontier during the colonial wars.

The Treaty of Paris in 1763, which ended the final Anglo-French colonial war in North America, resulted in the eviction of France from the continent and a sudden removal of the French as a menace to the American colonists. Ironically, the British government quickly replaced the French as a target of American ire, as it was now Parliament that restricted the colonists' westward expansion and even courted favor with the Indian tribes, who were still viewed with hostility and suspicion by Americans on the frontier. As relations between Britain and its American colonies deteriorated sharply during the

decade from 1765 to 1775, the image of France as an enemy sharply receded in the minds of many colonists, who now viewed the enemy as residing in London rather than Paris.

A FRANCO-AMERICAN ALLIANCE

The outbreak of the American Revolution in 1775 found the Continental Congress facing a full-scale war against Great Britain but lacking the most basic essentials for waging such a conflict. The Americans had no means of producing cannon or gunpowder and only a limited ability to manufacture small arms. The colonial militias had relied upon the mother country for these necessities, and with that source gone, a new means of procuring the implements of war had to be found quickly. In addition, the Continental Congress faced a chronic shortage of funds with which to procure weapons, uniforms, shoes, food, and other essential supplies for George Washington's Continental Army. Thus, the Americans were forced to look overseas for military and economic support from Britain's European enemies and France, with its vast treasury and massive armaments industry, was the natural choice. In 1776 the Continental Congress dispatched a diplomatic mission to Paris headed by Silas Deane (later to be joined by Benjamin Franklin and John Adams) to solicit French support for the American cause.

The French viewed the outbreak of the American Revolution with a certain pleasure as they saw the mastery of North America by their archenemy, Britain, threatened by its very own subjects. The news of American victories at Lexington and Concord in April 1775, as well as the heavy casualties suffered by the British at Bunker (Breed's) Hill in June 1775 had been greeted with wild jubilation in the streets of Paris. Thus, Deane was warmly received the following year at the court of the young King Louis XVI, and in particular by the king's influential foreign minister Charles Gravier, comte de Vergennes. The cunningly ambitious Vergennes believed that the American Revolution offered France many possibilities to avenge its humiliating defeat in the Seven Years' War, acquire valuable colonies in the West Indies and severely harm the power and prestige of its main rival, Britain.

In short order, Vergennes and Deane concluded an agreement by which the United States could purchase arms and munitions from France; in addition, Vergennes threw open French ports to American privateers. The materiel thus acquired from the French in 1776 and 1777 was indispensable to the American war effort and enabled the Continental Army to con-

tinue to remain an active force despite the best efforts of the British to destroy it. Even more importantly, the French government granted the Americans the diplomatic status of a belligerent nation, as opposed to viewing them as British rebels, which was an important first step toward establishing a formal relationship and, eventually, a military alliance between the two nations.

France initially avoided a direct confrontation with Great Britain while taking all steps short of war to provide aid to the Americans. The actions of the French government won wide approval throughout the kingdom, receiving the support of the nobility as well as the common people. The reasons for such widespread French backing for the American cause were deeply rooted in traditional Anglo-French hostility. While few believed in the opening stages of the conflict that the United States could actually win, many French hoped that a long and debilitating war would significantly weaken Britain, regardless of its final outcome. In addition to geopolitical and nationalistic reasons for supporting the United States, many French saw in the infant Republic the first real attempt to place the ideas of Voltaire and Rousseau into actual practice and thus believed for ideological reasons that the Americans should be supported in their rebellion.

French army officers were soon clamoring to serve in the American cause, an action encouraged by Vergennes to provide the Continental Army with badly needed professional officers as well as to increase French influence and control over the American war effort. Among the numerous French officers seeking a commission in the Continental Army was an idealistically romantic nineteen-year-old nobleman, the Marquis de Lafayette. Though he spoke little English and had virtually no military experience, the young man was politically well-connected at the court of Louis XVI, and the American representatives in Paris were impressed by this as well as his idealism and zeal for the American cause.

Lafayette arrived in America in June 1777 and soon attached himself to the staff of General George Washington. The dour and irascible Washington was besieged by foreign officers of all stripes seeking commands in his army, and consequently he was initially dismissive of the young marquis. But Lafayette's boyish enthusiasm for the cause and eagerness for battle against the British impressed Washington, and soon a close bond developed between the two men. Indeed, as time went by, Lafayette became like a son to Washington, and the former eagerly returned this paternal affection with a deep devotion

and fierce loyalty to the American leader. Lafayette served with distinction at the Battles of Brandywine (11 September 1777) and Germantown (4 October 1777) and endured the privations of Valley Forge in the winter of 1777–1778. His services were rewarded with command of a division, making him one of the principal field commanders of the Continental Army and one of the very few foreign officers with whom Washington entrusted American troops.

Shortly after his arrival in America, Lafayette had begun to bombard the French government with letters praising the Americans and their cause and appealing for King Louis XVI to enter the war at their side. Lafayette's reports added traction to the American diplomatic mission in Paris, which was now headed by the charismatic Benjamin Franklin. Already famous in France for his scientific discoveries and writings, Franklin had become an instant celebrity after his arrival at the French court, and his dalliances with the ladies of Paris soon became legendary. Yet he was also a forceful speaker and relentless diplomat who sought to turn French covert assistance for the American cause into an actual military alliance between the two nations.

Vergennes was eager for Franklin's proposals, but King Louis XVI still waited for some tangible sign that the American cause was worth supporting. That sign came in the autumn of 1777, when word arrived in Paris that the British army under General John Burgoyne had been defeated and forced to surrender in the field at Saratoga, New York, on 17 October 1777. The American victory sent shock waves throughout Europe. It was the worst defeat suffered by the British army in decades, and it had come at the hands of the "backward" and "ill-trained" Americans. King Louis XVI reasoned that if the Americans could pull off such a feat on their own, they could do far more with a real ally in the field alongside of them. With visions of restoring the lost prestige of France and wreaking a terrible vengeance on France's ancient enemy, Louis XVI informed Franklin that the French government would enter into a formal economic, political, and military alliance with the United States with the express aim of securing American independence from Great Britain. These agreements being signed, on 17 June 1778 France formally went to war against Britain and entered the American Revolution as a full ally of the infant United States.

French military support. The French immediately extended badly needed financial and military aid to their embattled ally and also dispatched an expeditionary force and powerful naval squadron under the command of Admiral Jean Baptiste d'Estaing to

North America. The French entry into the conflict forced Britain to reconsider its grand strategy, withdraw its forces from Philadelphia and other exposed outposts, and essentially go on the defensive for the rest of the war—except in the southern colonies, which they still believed could be retained under British rule.

Joint military operations between the Continental Army and French expeditionary forces were at first problematic. A Franco-American attack on Newport, Rhode Island, in August 1778 was initially successful but ultimately failed due to bad weather and poor cooperation between the Americans and French. In September 1779 d'Estaing's forces linked up with American troops under General Benjamin Lincoln for a joint attack on Savannah, Georgia. After a month-long siege failed to bring about results, d'Estaing ordered a full-scale assault; it was bloodily repulsed, with the French and Americans compelled to withdraw in defeat. Although the formal military forces sent by France failed to achieve initial successes, other French were proving their worth to the American cause. In 1779 Colonel George Rogers Clark began a desperate campaign to win control of the future Northwest Territory. Clark was ably assisted in this endeavor by the support of the French population of the region. The French were by far the most numerous nonnative population in the area, and their support for Clark and the American cause proved vital to the eventual American victory in this critical theater of the war.

By 1781 the French expeditionary forces in America had been reinforced and reorganized. A French army numbering approximately seventy-five-hundred men was under the command of the Comte de Rochambeau, while a powerful fleet under the Comte de Grasse, including twenty-eight ships of the line, was deployed to the West Indies. In the summer and autumn of 1781 Washington, Rochambeau, and de Grasse masterfully coordinated their allied forces in a campaign designed to isolate and destroy the British forces under Lord Cornwallis in Virginia. Admiral de Grasse defeated the British at the Battle of the Virginia Capes in September. Then Washington, with ninety-five-hundred Americans, and Rochambeau (who had placed himself under Washington's orders), with seventy-eight-hundred elite French troops, rapidly marched south from New York, trapping Cornwallis's army at Yorktown, Virginia. After a brief siege, Cornwallis surrendered his entire force on 19 October 1781. The British cause in America had been dealt a death blow. Negotiations began shortly afterward, and the Treaty of Paris was

ratified by Congress in 1783, bringing peace and independence to the United States.

THE FRENCH REVOLUTION

Just six years after the conclusion of the American Revolution, the French Revolution erupted with the storming of the Bastille on 14 July 1789. Initial American reactions to the Revolution were almost universally positive, with many Americans embracing it as a natural outgrowth of their own revolt. Lafayette became a significant leader in the new French government and sent his mentor, President Washington, the key to the Bastille as a symbol of unity between the two revolutions. That unity was severely challenged, however, when the French Revolution entered upon a more radical phase under the leadership of the Girondins, replaced in June 1793 by the still more radical Jacobins. Attacks upon the nobility and clergy increased dramatically, and King Louis XVI was tried for treason and executed in January 1793. This action set off a wave of imprisonments and executions by the new French republic during the time known as the Terror, which would last into 1794. Lafayette himself, who was a member of the nobility, was accused by the Jacobin rulers of France of being an enemy of the republic and was forced to flee for his life.

As France became convulsed by internal turmoil, it was also invaded by the other great powers of Europe, who were intent on destroying the revolution in its cradle while simultaneously taking advantage of perceived French weakness to seize territory and enhance their own power and position. Faced with war against virtually all of Europe, the French republic invoked the terms of the Franco-American alliance and called upon the United States to wage war at its side as a sister republic. While no one in France believed the infinitesimal American military could wage war in Europe, it was hoped that the Americans could attack British and Spanish possessions in North America and thus pin down and distract the military forces of those nations. While substantial numbers of Americans, including Secretary of State Thomas Jefferson, favored supporting France in its war on ideological grounds, cooler heads prevailed. President Washington refused to honor the alliance, claiming that it was no longer valid as it had been concluded with the government of King Louis XVI, not the French republic. Washington's decision was certainly in the best interest of the United States, which had little to gain and much to lose by launching into a major war so soon after independence, but the failure of the United States to honor the alliance

was seen by the French as a betrayal of their friendship.

Deteriorating relations. In an effort to secure American cooperation, the French Girondin government in 1793 dispatched a diplomatic mission headed by Edmond Genet to press Washington into some form of support for France in its hour of need, but Washington remained intransigent on the matter. Sensing quite correctly that, in spite of Washington's avowed policy, large numbers of Americans supported France, Genet took his cause directly to the American people. He helped stir up pro-French feelings as Democratic Republican clubs throughout the United States held demonstrations supporting and celebrating the triumphs of the French Revolution. Genet also issued letters of marque to American privateers, urging them to attack British merchant shipping while simultaneously attempting to organize a mercenary army of Americans to attack Spanish Louisiana, an idea that originated with American Revolutionary War hero George Rogers Clark. Genet's activities brought a formal protest from Washington and a demand that the French government recall him immediately. Before this could happen, however, the Jacobins overthrew the Girondins. Fearing for his life, Genet sought political asylum in the United States, which Washington granted.

Support for or opposition to the French Revolution increasingly became a major issue in the emerging rival political ideologies of the early Republic. Democratic Republicans favored the French while the Federalists were adamantly anti-French and desirous of better relations with Great Britain. Jay's Treaty of 1794 brought about a rapprochement between the United States and Great Britain, and this was followed by the ascension of the staunchly anti-French John Adams to the American presidency in 1797. The Directory, which had come to power in France during 1795, viewed the warming relations between its erstwhile ally America and its current enemy Britain with deep hostility and suspicion, and French privateers were given license to attack American ships. President Adams sent a delegation to negotiate an end to these attacks and a formal renunciation of the Franco-American alliance. The American diplomats were treated disrespectfully by the French foreign minister Charles Maurice de Talleyrand, who demanded a personal bribe under the table and a large loan for the French government before he would even begin negotiations. These demands were presented to the Americans by a group of agents known as X, Y, and Z. The American mission refused to pay the bribes and returned home without an agreement,

as American newspapers roared with indignation over the XYZ Affair and Franco-American relations reached their nadir.

Unable to reach a diplomatic agreement, President Adams authorized the U.S. Navy to protect American shipping from French depredations, and so the Quasi-War with France commenced in 1798. The conflict resulted in a few dramatic victories for the infant American navy and the seizure of a number of French merchant vessels, but French privateers continued to prey on American shipping and relations between the two republics remained hostile. A full-scale war, however, never broke out.

NAPOLEON AND AMERICA

In November 1799 General Napoleon Bonaparte seized power in France, proclaiming himself first consul, supreme head of the republic. Unlike the government he toppled, Napoleon had warm feelings for the United States and believed the Americans were a natural ally against his enemy, Great Britain. He was also an ardent admirer of George Washington, keeping a bust of the American general in his office and presiding over a special memorial service when he received news of Washington's death in 1799. Napoleon was also an ardent expansionist, and among his dreams for empire was the notion of resurrecting a French presence in North America which, after a halt in hostilities with Britain in 1801, seemed a real possibility. Toward this end he bullied his new ally, Spain, into ceding the Louisiana Territory to him in 1800. Spain acquiesced to Napoleon's demand, but only on the condition that he never allow the territory to fall into the hands of the United States. Napoleon's ardor for a new French empire in North America quickly cooled in the wake of a failed campaign by French troops to control the island of Hispaniola and the threat of a new war with Britain. With Britain's mastery of the seas, it would be impossible to maintain control of any overseas possessions, and Britain would be able to swoop down from Canada and grab the Louisiana Territory with ease.

Louisiana Purchase. As Napoleon contemplated these issues in 1803 a delegation arrived from the United States seeking to purchase the port of New Orleans and West Florida for \$10 million. He offered instead to sell the entire Louisiana Territory for \$15 million, a deal eagerly accepted by the Jefferson administration and formally concluded on 30 April 1803. The Louisiana Purchase was a mutually beneficial bargain, for not only did it almost double the size of the United States and open up the Mississippi River to American commerce, but it also prevented the terri-

tory from falling into the hands of the British who, like the Spanish, sought to prevent America's westward expansion. Napoleon received badly needed funds for his wars of conquest from the sale of territory he would have probably lost anyway, while simultaneously enhancing the power and prestige of the nation that he believed would frustrate Britain's colonial ambitions more than any other in the Western Hemisphere. In later years Napoleon would take great pride in the part he played in the growth of the United States.

FRENCH AND INDIAN WAR, BATTLES AND DIPLOMACY The French and Indian War (1754–1763) climaxed the 150-year Anglo-French contest for dominance of North America in trade, culture, and religion. The war was also part of two other persisting contests: the seven-century-old Anglo-French dynastic rivalry that had become global and the two centuries of American Indian resistance to European invasion.

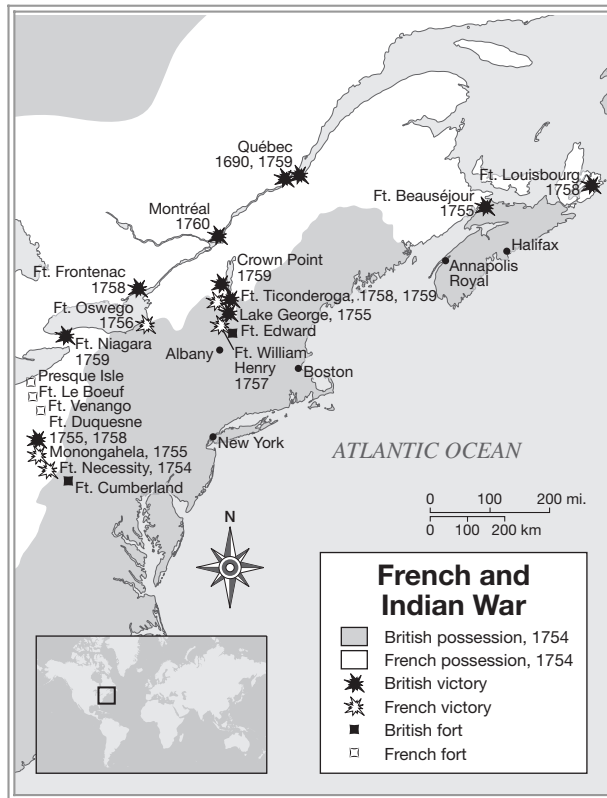

ORIGINS OF THE CONFLICT

The improbable flashpoint for this war was the Upper Ohio valley, an underpopulated borderland between Iroquois and Algonquian peoples that had been resettled from the 1720s onward by Shawnee, Delaware, and Iroquois hunter-farmers who traded furs and deerskins with both French-speaking Canadians and English-speaking Pennsylvanians. Although the main Canadian trade routes to Illinois country and to Louisiana passed north and west of this region, Canadians feared disruption and had evidence of Indian defection to the Pennsylvanians, who were expanding trade with the French-allied Hurons and Miamis in the 1740s. The Canadians responded with an armed diplomatic tour in 1749 that threatened English traders and planted plaques proclaiming French sovereignty. Canadians then began imprisoning what they regarded as illegal Pennsylvania traders and supported the Ottawa-Ojibwa destruction of the westernmost English trading base at Pickawillany in 1752. The following year the French governor of Canada sent an army of fifteen hundred to build and man forts between Lake Erie and the Allegheny River, forts that asserted French occupation, channeled trade, and effectively excluded their English rivals.

Initial resistance to this French escalation was lame. Three protests by Mingo chief Tanaghrisson, the Iroquoian “Half King” in the region, were dismissed by the Canadian commanders; most Indians of the region cautiously waited to see whether increased competition between the European rivals

might provide trade and diplomatic advantages. The Pennsylvania government increased gifts to its new Ohio Indian allies and urged unity among them, but the pacifist Quakers who dominated that colony’s assembly had no intention of sending armed support. Like the French government, the British authorities were neither ready nor anxious for war but responded to Iroquois alarm by sanctioning a British intercolonial conference that finally met in Albany, New York, in June and July 1754. The Albany Conference placated the Iroquois with gifts and pioneered famous discussions about colonial unity, but it failed to achieve the intended diplomatic or military cooperation between colonies.

The Virginia elite, whose desire for western lands had been incorporated in the Ohio Company of Virginia (chartered in 1749), was willing to fight, but soon discovered its limitations. Virginia’s initial protest, conveyed by a young Virginia militia officer and Ohio Company stockholder named George Washington, was dismissed by the Canadian commander of the new Fort Le Boeuf just as firmly, if more politely, as Tanaghrisson had been. The Ohio Company hurriedly built, and attempted to fortify, a storehouse at the forks of the Ohio River. In April 1754 more than five hundred Canadians, equipped with cannon, needed to fire not a single shot to prompt the surren-

der of forty-one Virginia workmen and soldiers. The victors promptly built Fort Duquesne on the site. Lieutenant Governor Robert Dinwiddie of Virginia, having secured British permission to use force against the Canadians, raised a motley 159-man Virginia regiment led by Washington. Guided by a dozen of Tanaghrisson’s comrades, they ambushed a Canadian reconnaissance party, capturing twenty-one and killing ten, including ensign Joseph Coulon de Villiers de Jumonville. This peacetime assassination of Jumonville, as it was called by the French, eventually became a diplomatic weapon of France in Europe; more immediately, it prompted retaliation by some seven hundred French, Canadians, and Indians led by Jumonville’s brother. Reinforced to number four hundred, Washington’s force attempted to defend another hastily fortified Virginian storehouse, aptly named Fort Necessity, but Washington surrendered on 3 July 1754. This formal surrender, complete with hostages given to ensure adherence to the terms, escalated tensions but did not necessarily mean war between Britain and France.

BRITISH DEFEATS

The British government responded in 1755 with its own show of force to remove what it considered to be French encroachment on British-claimed frontiers. General Edward Braddock led two undermanned regiments of British regulars to Virginia, where they recruited colonials and attempted to accomplish part of an elaborate strategy in which four nearly simultaneous British and colonial expeditions were to capture French forts Duquesne, Niagara, St. Frédéric, and Beauséjour. Braddock’s expedition against Fort Duquesne initially progressed well, building a road and hauling cannon through mountainous terrain, but the campaign ended disastrously just nine miles from its destination. On 9 July Braddock’s advance column of 1,450 was halted by more than half as many Indians and Canadians. Under cover of the surrounding woods, Ottawa, Ojibwa, Wyandot, and Potawatomi warriors flanked the redcoats and fired on the exposed and confused column for more than three hours. Fully two-thirds of the English were killed or wounded in this humiliating defeat, a higher casualty rate than suffered by the defeated side in any major European battle of the era.

The other three English armies fared somewhat better, though only one of them accomplished its objective. Governor William Shirley of Massachusetts led an English army that stalled 150 miles from its target, Fort Niagara, and instead merely strengthened dilapidated Fort Oswego on Lake Ontario. Colo-

nel William Johnson led the third English army's fifteen hundred colonials and three hundred Iroquois, who failed to reach Fort St. Frédéric on Lake Champlain but won a hard-fought, defensive Battle of Lake George in August 1755. As this army cut a sixteen-mile woodland road and hauled siege guns north from Fort Edward, it was challenged by a fast-moving vanguard of 700 Indians, 600 Canadians, and 220 French grenadiers led by the newly arrived Major General Jean-Armand, baron de Dieskau, who had led irregular troops in Europe. Dieskau intended to cut Johnson's line of supply by capturing Fort Edward, only to find his Indians would not attack that fort. Dieskau then trapped part of Johnson's army, sent back to support Fort Edward, in a major ambush known as the Bloody Morning Scout, on 8 September 1755. Chasing the survivors back into Johnson's camp at Lake George, Dieskau was again stalled by Indian reluctance to face cannons, even though these were still being set up behind overturned boats and wagons. This artillery, ably managed by Captain William Eyre of the British army, was unsuccessfully attacked by Dieskau's grenadiers, although their discipline unto death so unnerved their opponents that they did not counterattack. Although Dieskau had displayed tactical brilliance and adaptability, he was defeated by differences between guerrilla war in Europe and in America. Wounded in the day's final battle, he became Johnson's prisoner-guest. Johnson became a baronet and a hero in a year when the English had few of them. His force had not reached its objective; it had built a road that exposed northern New York and was content to build a substantial fort to defend it, Fort William Henry.

The only English army to reach its objective in 1755 was a force of 2,000 New Englanders and 250 British regulars commanded by British colonel Robert Monckton. He quickly secured the surrender of Forts Beauséjour and Gaspereau on the Acadian isthmus; then his army was used to expel some six thousand Acadian neutrals who had been less-than-enthusiastic British subjects for more than forty years. New Englanders confiscated Acadia's farmlands and coal mines as well as consolidating what was already part of their trading empire. The British declared war on France the following year and, ignoring obvious lessons from 1755, sent nearly five thousand additional regulars to America, commanded by the able but impolitic John Campbell, earl of Loudoun, who could gain neither adequate colonial cooperation nor the military initiative.

Although outnumbered in population by twenty to one, Canada under native-born governor

Pierre-François de Rigaud, marquis de Vaudreuil, was able to take the military offensive between 1755 and 1757. Braddock's defeat had reinforced a widespread Indian preference for Canadian traders over American frontier farmers, and even the strong Iroquois hostility to the French abated after losses in the Bloody Morning Scout caused the Iroquois League to reassert its formal neutrality in the Anglo-French war. The war afforded the Indian allies of New France opportunities to avenge innumerable injustices and to roll back white encroachment by as much as two hundred miles in borderlands from Maine to the Carolinas. In independent raids, and in those where they were accompanied by Canadians, the Shawnee, Delaware, and Mingo Indians conducted a parallel war in which they captured nearly two thousand whites who were adopted to strengthen Indian communities, to blunt retaliation, or to be redeemed profitably. However, these raiders also killed at least twice as many as they captured and drove refugees from a swath of destroyed farms. British colonial militias, regiments, and governments became wholly preoccupied with the unsuccessful defense of vast woodland frontiers against surprise attack.

New France, as Canada was called by the French, gained more from its Indian allies than the distraction of its colonial enemies. Indians integrated well into Canadian offensive operations of 1756 and 1757. Fort Oswego had been a thriving English trading post on the southern shores of Lake Ontario, with vulnerable supply lines that reached 150 miles to Albany. Throughout the winter of 1755–1756, Indian and Canadian scouting parties took prisoners and burned boats, effectively isolating Oswego. In March 1756, Indians from mission settlements in Canada joined Canadian and French regulars in a surprise attack on a major supply depot at Fort Bull, New York, where they destroyed gunpowder, ammunition, and provisions intended for Fort Oswego, as well as burning wagons, boats, and Fort Bull itself. Dieskau's replacement as commander of the French regulars in Canada was a more conventional, maneuver-conscious General Louis-Joseph de Montcalm. He was apprehensive about Vaudreuil's planned siege of Fort Oswego, a diversion that left the Lake Champlain–Richelieu River corridor poorly protected in the summer of 1756, when British regulars were massing at Albany for a predictable push north. In August the siege of Fort Oswego was over as soon as Montcalm's first battery chanced to kill the garrison commander. The siege was so short that it failed to draw any British reinforcements from Albany, leading Montcalm to apologize to the French court

for a victory that had violated prevailing military conventions. Montcalm was clearly unwise in taking the captured garrison of 1,640 soldiers back to Canada, where another crop failure made it almost impossible to feed civilians, soldiers, and prisoners of war and also made it difficult to gather supplies for the next campaign.

The centerpiece of the Canadian offensive of 1757 was the siege of Fort William Henry at the south end of Lake George. A garrison commanded by the fort's architect, Major Eyre, had successfully withstood an attack in March, though boats and outbuildings were destroyed. Some eighteen hundred Indians from as far away as Acadia and the Mississippi valley were recruited to join more than six thousand Canadian and French regulars in Montcalm's second annual summer siege. Hundreds of Indian scouts led preliminary raids; cut the fort's communications; and killed, captured, or forced back all English scouting parties seeking information on French strength or movements. Even an English reconnaissance down Lake George by 350 men in a fleet of twenty-two whaleboats was trapped and destroyed by an armada of Ottawa, Ojibwa, and Menominee canoemen who killed or captured 250. Indians and Canadians again formed the French army's van, isolating the fort and the adjoining entrenched camp and sustaining a small-arms battle while the first battery of French cannon was being prepared. The attackers had brought four mortars and thirty-six cannon, and siege preparations were shortened by ferrying each of these guns the length of Lake George on two lashed-together bateaux. The log-faced and sand-filled walls of the fort were as much as thirty feet thick, but the sleep-deprived defenders ran out of ammunition and usable cannon. Without reinforcement from Fort Edward, Lieutenant Colonel George Monro was compelled to surrender on 9 August.

THE TIDE TURNS

The capture of Fort William Henry marked the apex of Canadian fortunes in the war. Immediately afterward, however, there was evidence of a turning tide. To honor the bravery of his opponents and to avoid further aggravation of Canadian food shortages, Montcalm granted the defeated a military parole, the freedom to return to nearby Fort Edward in exchange for a promise not to fight in the subsequent eighteen months. Montcalm's Indian allies, who had joined the expedition on promises of scalps, prisoners, and captured goods, disrupted the retreat of the defeated; but of the 2,308 parolees, all but 308 were saved by the French and Canadians. Their suc-

cess in protecting or recovering so many of the parolees infuriated the victorious Indians. For this reason, and because they had carried a deadly smallpox epidemic back to their communities, these allies would not return in their previous numbers to support Canada again.

French strategy was shifting because of the French government's enthusiasm for Montcalm's successes, which increased his influence and led to the choice of conventional defensive preferences in place of Vaudreuil's more aggressive and more irregular strategy. This change may well have been inevitable, as British military efforts and fortunes improved. Loudoun's failed attempt in 1757 to besiege Louisbourg, on Cape Breton Island, had used much of the increased manpower Britain had sent to America. France, however, could not match these troop commitments because of the emergence of a major land war in Europe and the increasingly effective British naval blockade of French ports.

The British opened the 1758 campaign with a new government leader, the eloquent and efficient William Pitt, who was committed to providing more troops, more money, and new military commanders for the North American theater of war. In a strategy roughly parallel to the failed operations of 1755, though now focused on the conquest of Canada, the British again attacked four targets simultaneously: Louisbourg, Fort Carillon (Ticonderoga), Fort Frontenac, and Fort Duquesne. In July some thirteen thousand British regulars under Major General Jeffrey Amherst, supported by a fleet of thirty-nine ships and fourteen thousand sailors successfully besieged Louisbourg. Meanwhile, Major General James Abercromby hurriedly ordered a conventional frontal assault on Fort Carillon, located on Lake Champlain, in July; fifteen thousand attackers were unable to overcome a massive *abattis* of freshly cut trees with sharpened branches, ably reinforced by thirty-five hundred defenders under Montcalm. In the wake of this failure, Abercromby approved a successful surprise attack in August on Fort Frontenac, on Lake Ontario, by a force of three thousand colonial volunteers under Lieutenant Colonel John Bradstreet. Farther west that summer, seven thousand men under Brigadier General John Forbes built a fortified road, similar to those created in subduing Scotland a decade earlier, through Pennsylvania to Fort Duquesne. Indian allies from various tribes joined the Canadians repeatedly in challenging the road builders, but local Shawnees, Delawares, and Mingos eventually abandoned their French allies in the face of Forbes's army, and the French evacuated and demolished Fort Du-

Fort William Henry. Built during the mid-1750s at the south end of Lake George in New York, Fort William Henry became the focus of the Canadian offensive of 1757. Now a museum, the fort is shown here with modern flags in a photograph taken after 1970. © ROMAN SOUMAR/CORBIS.

quesne before the end of November. More than fifty-two thousand men had succeeded in three of four British offensives in 1758, whereas fewer than ten thousand had been defeated in three of four major engagements in 1755.

The British invasion of Canada in 1759 was cautious and methodical. Nearly one thousand Iroquois, lured from their uneasy neutrality, joined the British army that successfully besieged Fort Niagara in July 1759. During the same month, the French evacuated Forts Carillon and St. Frédéric ahead of British invaders, drawing their forces together for a final defense of Canada. While increasing numbers of Indians abandoned the French on sensing British victory, former Cherokee allies of the English were provoked into war with South Carolina in 1759. The Cherokees raided borderland settlements, harassed invading armies, and successfully besieged remote Fort Loudoun in August 1760. It would take three summers of punitive expeditions, which systematically burned evacuated Cherokee towns and vital crops, to provoke a negotiated peace.

QUEBEC AND MONTREAL

The celebrated British conquest of Quebec, the capital of New France, in 1759 was a fortunate conclusion to a three-month siege that was failing. Montcalm had refused to be drawn out of the town's natural and man-made defenses, and Brigadier General James Wolfe had been unable to deploy his larger amphibious forces successfully. A well-executed final gamble brought four thousand British troops up a steep, narrow passage to the Plains of Abraham early on the morning of 13 September, challenging the town's weaker landward defenses and cutting communication with Trois-Rivières and Montreal. Like Abercromby at Fort Carillon the previous year, Montcalm moved too hastily against an enemy he thought was not yet effectively deployed. The British won the brief but deadly battle that would kill both commanders and gained control of the city four days later. Control of New France's capital was not decisive; British defenders lost a remarkably similar second battle for the town the following April and were besieged within the town when a British fleet arrived to reverse fortunes in mid-May. That same navy had

sufficiently crippled its French counterpart the previous November, across the Atlantic at Quiberon Bay in Brittany, to ensure that a British rather than a French flag was flying from the first ships up the St. Lawrence River in the spring of 1760.

The British campaign of 1760 was a carefully planned accomplishment of the obvious. Early in September three British armies, totaling seventeen thousand men, approached Montreal from three directions, arriving within two days of each other. Governor Vaudreuil sensibly surrendered New France on 8 September, and that news was conveyed to the western trading posts without prompting any immediate resistance. The French and Indian War was over. At expense so great as to bring severe fiscal and political problems, British regulars had learned to fight in North America and Europeans had imposed enough of their martial culture so that the war ended in formal siege and surrender. The veteran British regulars were redeployed against the French and Spanish in the West Indies, taking Guadeloupe in 1759 and Martinique and Havana in 1762, all of which would be returned in the peace. Young George III had succeeded his grandfather as king of England in 1760 and strongly urged peace. In the Treaty of Paris, signed 10 February 1763, the diplomatically adept French court recovered the economic core of their Atlantic empire: sugar plantations, slaving stations, and access to the Newfoundland fishery. To regain these assets, the French accepted the British conquest of New France and ceded to the British all French rights to lands east of the Mississippi.

FRENCH AND INDIAN WAR, CONSEQUENCES OF The capitulation of Montreal to British troops in September 1760 ended the French and Indian War in North America but ushered in a host of new problems for the British Empire. Previously, when European powers ended wars they exchanged conquered colonial possessions with an eye to keeping a balance of power between their American empires. This war, however, was different. It had begun in North America in an Anglo-French dispute over control of the Ohio Valley. British colonists, who had expended far more blood and treasure in this war than any prior one, were anxious for Britain to seize control of French Canada so that they might expand westward without threat of foreign reprisals. In Britain some policymakers argued for restoring Canada to the French but keeping the Caribbean sugar colony Guadeloupe, which British forces had also taken during the war. Others argued that Canada was far more valuable than a sugar colony because of its fur trade and the access it would provide to the continent's interior.

When the Peace of Paris was finally signed in 1763, the advocates for the retention of Canada won out. By the terms of the treaty, Britain acquired all of France's North American possessions east of the Mississippi River. In addition, Britain acquired Florida from Spain. The balance of power in North America had shifted decisively in Britain's favor, but so too had the costs of governing and defending imperial possessions there. Before the French and Indian War, British policymakers had looked upon the North American colonies chiefly as self-sustaining commercial enterprises, to be governed as cheaply as possible through the regulation of their trade. After the Treaty of Paris, British North America became a vast imperial dominion containing British subjects, conquered foreigners, and Native Americans all in need of government and protection from each other and external enemies.

The chief consequence of the French and Indian War, therefore, was a reorientation in Britain's perception and administration of its American colonies. This reorientation unfolded over the next dozen years, as British policymakers grappled with the expanded responsibilities and costs of their American

empire. Their efforts fell into three broad categories shaped by the Peace of Paris: the maintenance of a North American army, the management of Indian affairs, and the government of new territories and peoples.

The acquisition of Canada and Florida made the maintenance of British troops in North America after the war a *fait accompli*. Colonial militias and provincial troops had proven themselves notoriously unreliable in garrison duty during the war, so British regulars were needed to police newly conquered subjects and to staff forts and posts abandoned by the French and Spanish. The British ministry planned to maintain about 7,500 British troops in North America, at an estimated annual cost of £350,000. This policy would add a substantial burden to a royal treasury already heavily indebted by the war effort. In 1764 Prime Minister George Grenville introduced the Sugar Act to Parliament, the first of a series of taxation measures pursued by the British ministry over the following decade designed to shift a portion of this financial burden onto the shoulders of the colonists, who, according to Grenville and his successors, could well afford to pay for it. The colonists, of course, saw it another way, and launched a series of protests, beginning with the Stamp Act riots in 1765, that condemned such measures as “taxation without representation.”

Quartering of troops was another issue that arose out of the decision to maintain regular troops in America after the war. When the effort to raise tax revenues in America stalled, Parliament passed Quartering Acts in 1765, 1766, and 1774 that required the American colonists to provide barracks and supplies for the troops. Quartering had arisen as a point of contention during the French and Indian War in Massachusetts and New York, but local compromises and generous subsidies from the government ministry of William Pitt had helped paper over these differences. With the passage of the Quartering Act of 1765, the issue arose again, this time in the context of parliamentary efforts to tax the colonists without their consent. The colonial opposition to quartering intensified in 1768, when the ministry, in an attempt to cut expenses, ordered troops to vacate most western posts and relocate in eastern cities.

The administration of the army in North America after the French and Indian War was intertwined with British efforts to place Indian affairs under the centralized management of imperial officials. The French had maintained an extensive network of commercial and military alliances with Indian nations in the Great Lakes, Ohio, and Mississippi regions, play-

ing the role of a diplomatic “father” who supplied his “children” with presents of trade goods and helped mediate their relations with traders, missionaries, and other Indians. The British inherited this role but played it very poorly. General Jeffrey Amherst, commander in chief of the British forces in North America, regarded the Indians as conquered peoples rather than allies and ordered that the flow of diplomatic presents to them be stopped. In May 1763 Anglo-Indian tensions created by Amherst’s high-handedness erupted into a widespread and devastating frontier war known, after the American Ottawa chief, as Pontiac’s War.

The violence and cost of this war spurred the British Board of Trade to expand the powers and responsibilities of the two superintendents for Indian affairs the crown had appointed during the French and Indian War. According to a plan formulated in 1764, the Indian superintendents—William Johnson in the northern colonies and John Stuart in the southern colonies—would oversee all Indian land purchases, regulate the fur trade, and negotiate a boundary line between Indian and colonial territory. The implementation of this new policy was stymied by the colonists’ reluctance to follow the dictates of the crown’s Indian superintendents. In 1768 the ministry restored management of the fur trade to the individual colonial governments, which lowered the crown’s expenses but also increased the exploitation and abuses that fueled Indian discontent along the frontier in the years preceding the American Revolution.

The British ministry’s efforts to fund the army and pacify Indians in North America were directly related to the third major focus of policymaking initiated by the French and Indian War. The territorial acquisitions of the war opened a vast new frontier to American land speculators and squatters anxious to exploit territory west of the Appalachian Mountains. Even before the ink was dry on the Peace of Paris, settlers were pushing into the Ohio Country, over the objections of Indians who claimed that region as their own. In the Proclamation of 1763, the British ministry tried to stem this tide by temporarily prohibiting settlement west of the Allegheny Mountains. Over time, this injunction became more permanent as the Indian superintendents negotiated treaties to create a fixed boundary line between colonial and Indian populations. Squatters ignored such restrictions, and well-connected land speculators lobbied the crown for land grants to establish new colonies in the continent’s interior.

The British effort to impose control over its new western territories in North America came to a head in 1774 with Parliament's passage of the Quebec Act. While the chief purpose of this legislation was to establish a plan of civil government in Canada, it extended the authority of the new Quebec government over the western territories ceded by the French in 1763. Various provisions in the Quebec Act curtailed liberties Anglo-American colonists considered their birthright, including trial by jury and local government by elected assemblies. Anglo-Americans interpreted these measures as an effort to impose French-style despotism over any new colonies established west of the Appalachians.

Historians have long argued over the significance of these policies in the coming of the American Revolution. Some assert that the origins of the American Revolution lay in the western policy pursued by the British ministry after 1760, because this policy generated the need for the taxes that proved so obnoxious to the colonists. Others discount the impact of such measures as the Proclamation of 1763 and Quebec Act, especially when compared to the widespread protests ignited by the Stamp Act, Townshend Duties, and Tea Act. Regardless, the French and Indian War fundamentally changed Britain's approach to governing its North American colonies. The efforts to maintain a North American army, centralize Indian affairs, and manage a vast and unruly frontier no doubt contributed to the souring of Anglo-American relations after 1763 and helped define the issues upon which the empire split apart in 1776.

FRENCH REVOLUTION See **European Influences: The French Revolution.**

FRIES'S REBELLION Following Shays's Rebellion (1786–1787) and the Whiskey Rebellion (1794), Fries's Rebellion was the last in a trilogy of popular uprisings against taxing authorities after the American Revolution. The federal government had imposed its first Direct Tax in 1798 to fund a military program for defense against France during the Quasi-War. The French launched naval attacks upon America's Atlantic shipping after the United States in 1794 negotiated Jay's Treaty with Britain, with whom France was at war. The Direct Tax was a levy on lands, dwelling houses, and slaves, and the Federalist Adams administration appointed placemen to take the rates.

In eastern Pennsylvania, Federalist patronage fell to Quakers and Moravians, local minorities who had abstained from participation in the Revolution while their more numerous German Lutheran and Reformed neighbors had supported the Patriot cause. With the tax, the local ethno-religious political battle assumed national significance as resisters connected it with what they believed was a broader, Federalist Party assault upon the people's liberty that included the Alien and Sedition Acts (1798) and the creation of a peacetime standing army. John Fries and his neighbors believed they had learned valuable lessons from the mistakes of the Shays and Whiskey rebels. Fries and other leaders had marched westward under George Washington and Alexander Hamilton to suppress the Whiskey Rebellion in 1794. In 1798 they aimed to prevent what they perceived to be an unconstitutional tax through a combination of traditional and constitutional means. They drew upon the rituals of crowd action—affirmed during the imperial crisis and the Revolution—and nonviolently stopped the assessments while pleading with their representatives and petitioning Congress to repeal the tax law as well as the Alien and Sedition Acts. During the earliest days of the Republic, while James Madison and Thomas Jefferson were testing the the-

ory of state nullification, the Fries rebels were asserting that the people themselves retained that right.

The rebellion occurred when some resisters liberated their neighbors from a federal marshal in Bethlehem, Pennsylvania, on 7 March 1799. The Adams administration quickly quashed the revolt with military force, but the story did not end there. Federalist mishandling of the affair accentuated existing intra-party divisions. While Adams had advocated the use of militia, the commanding general of the professional Provisional Army, Alexander Hamilton, and Secretary of War James McHenry had employed regular forces instead. When Adams pardoned John Fries just hours before his scheduled execution in May 1800, he alienated himself from most of his cabinet during a tight reelection campaign. The resisters went on to capture control of local government, help the Democratic Republicans win Pennsylvania, and throw the Keystone State to Jefferson in the Revolution of 1800.

FRONTIER "Frontier," one of many English words that took on new meanings in North America, has assumed as well a role in explaining the continent's history during the past five hundred years. In time the word has acquired other connotations, both positive and negative, and with that a power to kindle high emotions about the course and consequences of North American history.

In England and Europe, "frontier" has meant a border or boundary, usually between nations, and thus by nature is static. Across the Atlantic it became dynamic, referring to the outer edge of European settlement and influence intruding into the continent.

Among historians, the term "frontier" is most closely associated with Frederick Jackson Turner, whose essay "The Significance of the Frontier in

American History" profoundly influenced American historiography for forty years after its publication in 1893. Here and in subsequent essays Turner drew heavily for inspiration and examples from the early years of the American Republic and the frontier's advance from the Appalachian Mountains to just beyond the Mississippi River.

Reacting against historians such as his mentor, Herbert Baxter Adams, who considered American history essentially an outgrowth of British and European institutions, Turner argued that Old World customs and attitudes broke down and reformed in America's radically different physical and social environment. The prime site of that transformation was along the cutting edge of advancing settlement, "the line between civilization and savagery." First in England's Atlantic colonies and later in the United States, the opportunity of "free land" drew pioneers westward into settings that required them to modify or scrap entirely many of the institutions and values of their previous lives. The result was a "composite nationality," a distinctive culture and people. The frontier, as both a process and a condition, thus "explain[s] American development," Turner wrote.

The "frontier thesis" remained hugely influential until the 1930s. It jibed with several intellectual trends, including the evolutionary theories of Charles Darwin and Herbert Spencer and, by stressing how a people's material foundations shaped their values, the ideas of Karl Marx. Turner also reflected his generation's conflicted feelings about its nation. On the one hand his descriptions of evolving frontier societies after the Revolution thrummed with highly positive traits he considered essentially American—among others, a democratic individualism, inventiveness, toleration, and a restless striving. Thus in Turner's day the early Republic's frontier spoke both to a desire for unity, as the United States grew beyond the Civil War and its contentious aftermath, and to a growing pride as it emerged as a leading world power.

Turner also noted, however, that the frontier was coming to a close. As defined in the federal census, the frontier was a north-and-south line separating an area with two or more persons per square mile from one with fewer than two. The census of 1890 showed for the first time no unbroken frontier line across the nation. As the frontier came to an end, the process that had produced the American character presumably would no longer do its work. By implication the nation would enter a new era, perhaps one of decline. Turner's thesis expressed a nation's anxiety about its future as well as a pride in its past.

Swedish Log Cabin. The first American log cabins were modeled after the simple log homes of Scandinavian peasants. This engraving from 1824 shows a cabin built by Swedish immigrants to the New World. The wooden rack in the foreground was used to dry corn. THE GRANGER COLLECTION, NEW YORK.

THE PROGRESS OF THE MOVING FRONTIER

As Turner conceived and described it—a westward advance of settlement—the frontier began on the Atlantic coast with the first English settlements of the seventeenth century. By the time of the Revolution and the birth of the Republic it had moved across the Appalachians into Kentucky, Tennessee, and western Pennsylvania. By the 1820s it had rolled through the Ohio Valley and Gulf coastal region and across the Mississippi River into Missouri, Arkansas, Louisiana, and his own native Wisconsin. There it paused before jumping to the Pacific coast in the 1840s, then advancing from both east and west into the interior of the American West after the Civil War.

The frontier of the early Republic was predominantly agrarian. Most who moved west were families establishing small farms, although cotton plantations and slavery were a large part of the advance through the Gulf Coast region. By 1829 the quest for farmland had driven the frontier as well into eastern Texas and the first tier of states beyond the Mississippi River. Over the next two generations the same hunger would draw frontier farmers to western Oregon and central California, to Mormon settlements

near Utah's Great Salt Lake, and finally to the Great Plains.

In the earliest stage of frontier farming, settlers hacked out a clearing, built a rude dwelling, planted corn around tree stumps, and began the long process of clearing enough land for a working farm. They were subsistence farmers, producing only for themselves and neighbors. They borrowed heavily from Indian peoples, from clothing to such techniques as girdling to kill trees before felling them. In fact, early white frontier families lived as much by a hunting-gathering economy as did their Indian neighbors. As settlement thickened, more land was cleared and farms improved; settlers gradually turned to crops meant for distant markets. An exception to this pattern was on the Gulf Coastal frontier, a region beautifully suited for growing short-staple cotton to meet the voracious demand in English textile mills. Planters consequently established cotton plantations almost from the start as the southern frontier was opened to settlement after 1815.

Popular images of solitary frontiersmen to the contrary, the family was ubiquitous. Success, even survival, depended on all its members contributing

and cooperating. Wives performed not only household and nursing duties but also heavier labor, and children of both sexes worked at all but the most physically taxing tasks. As a result widows and widowers rarely remained single for long, and the birth rate was by most calculations far higher than in more settled parts of the nation.

Frontier farming should not be defined too narrowly. Cattle raising, linked in the popular imagination mostly with later frontiers in the far West, was crucial to the eastern agricultural frontiers before 1830, for instance. The term “cowboy” appeared first in the Carolinas, already with a tone of wild independence. Scots-Irish settlers of the Gulf Coastal frontier were especially accomplished at herding cattle; on plantations in many parts of the southern frontier, including the rich farming region of the Mississippi delta, slaves sometimes spent as much time tending cattle as cultivating cotton. Many of the techniques of cattle raising applied later on far-

western ranches evolved first on the southeastern frontier. Other animals were raised to be sold and slaughtered. Pigs, which prospered in the woodlands with little supervision, were especially popular. There are even accounts from the southern frontier of turkey drives, with hundreds of the large fowls herded to market.

The need for markets made towns and urban centers also a vital part of the moving frontier. Coming to life as trading and transportation centers, they further facilitated the westward flow of people and goods, supported farms and other settlements nearby and provided the ground where political, educational, religious, and cultural institutions could take root and grow. In these frontier towns appeared a region's earliest light industry, not only slaughterhouses—Cincinnati earned the nickname “Porkopolis” for all the swine processed there—but the manufacture of goods impractical to

import, such as glassware, barrels, rope, and flatboats.

Towns most often sprang up along trade routes, and on frontiers of the early Republic that usually meant rivers. Pittsburgh first drew settlers because of the protection of Fort Pitt, then for its prime location at the headwaters of the Ohio River. Farther downstream Cincinnati and Louisville served as collecting and distribution points for trade north and south of the river. Several important urban centers were founded along water routes by England's imperial rivals, in particular France, which established St. Louis, Detroit, Natchez, New Orleans, Biloxi, Mobile, and many somewhat lesser towns to service its far-flung fur trading empire. In 1763 these passed to Spain and England, and by the 1820s all had been pulled within the expanding United States. Overland trade routes, typically following trails taken by Native American traders and warriors, produced some towns. The Wilderness Road connected the first frontier towns in the Kentucky interior to North Carolina. The Natchez Trace ran from Natchez, Mississippi, to Nashville, Tennessee, which in turn was connected by trails to the Ohio River at Maysville and via Zane's Trace across Ohio to Wheeling, West Virginia.

The importance of these arteries to commerce and life is a key to understanding the frontier's role in early American diplomacy. Concerns about interference with settlers' use of the Mississippi led to confrontations with Spain in 1795 and with France in 1803. The young Republic turned these crises to its advantage, particularly the conflict with France, which resulted in doubling the nation's size and propelling the frontier toward the Pacific.

RESHAPING SOCIETY

Without question frontier conditions did reshape society. People of many ethnicities and from a variety of places were tossed together. At first, institutions imported from mother cultures were poorly rooted or wholly absent. The tentative nature of settlements combined with a high rate of mobility to make for a social fluidity and a fuzziness of hierarchical order. With the notable exception of areas where the plantation system appeared early, there was considerable economic leveling. Turner argued that these and other conditions produced the admirable traits he cited as essentially American. The need to cope with unfamiliar challenges, plus a relative lack of tradition, bred an inventiveness and pragmatism. Greater individualism was a natural outgrowth of strangers thrown together, measuring one another by person-

al capacity rather than lineage or social position. With fewer economic and social distinctions, politics tended to be more democratic and innovative.

Although he emphasized the positive, Turner observed that the same conditions had less desirable effects. An unsettled society short on institutional controls promoted violence as well as individualism and democracy. The pressing demand to meet immediate physical needs brought a cultural atrophy and anti-intellectualism. Some critics stressed a theme that ran against Turner's argument—a strong conservative impulse on the frontier. Settlers often felt a powerful urge, even an obsession, to transplant what they considered cultural essentials. Because they had to create political forms almost on the fly, early governments were less likely to innovate than to copy what they knew from the past. In particular, constitutional forms often mimicked those of the East. The tension between change and tradition was played out in gender relations. Frontier conditions often required women to take on roles usually reserved for men, but the crushing load of work and the need for children made women's lives difficult and dangerous and left little room for individual fulfillment outside their labors.

DEBATING THE ROLE OF THE FRONTIER

By Turner's death in 1932, more fundamental critiques of his ideas were being heard. Some stressed that many other factors—among them patterns of immigration, American society's middle-class nature, and the ferment of ideas in eastern cities—influenced the national character at least as much as the frontier. Others argued that class divisions and social and economic hierarchies have been much more a part of American life than implied in the celebration of frontier-inspired egalitarianism. Still others found Turner unclear on the mechanisms of the frontier's influence and specifically questioned how an area by definition thinly populated could transform an entire society. In the 1980s and 1990s practitioners of the "new" Western history argued that, as the frontier's influence had been described thus far, it presented a doubly deficient narrative. It downplayed or ignored the terrible costs of expansion—dispossession and cultural destruction of native peoples, environmental calamity, dashed hopes, and an obsessive acquisitiveness. And as a story dominated by Anglo-Saxon males, it neglected the vital parts played by women and the many ethnic groups active in westward expansion.

The effect of these various critiques has been paradoxical. No longer considered the primary forma-

tive force on continental history, and thus narrower in influence, the frontier has been more broadly defined and its explanatory power has grown. An especially revealing line of research has explored the interactions among Europeans, Euro-Americans, and Indian peoples. Along the various frontiers there developed what the historian Richard White has called a “middle ground,” syncretic cultures of overlapping customs and mutual borrowing in which all sides created new terms of understanding and exchange and new means of accommodation. One native response to frontiers was ethnogenesis—the creation of new collective identities. Many tribes assumed to have existed on the frontiers at the time of European contact, such as the Catawbas of the Carolinas, were in fact smaller related groups that merged and consolidated to meet the threats and opportunities posed by the newcomers.

A frontier in this sense was not a line dividing one condition from another, and certainly not a division between “civilization and savagery,” but rather a place where peoples, ideas, cultures, and institutions came together and interacted on many levels, sometimes mixing and sometimes conflicting but always in mutual influence. The interaction included the environment. Clearing the land and introducing domestic animals and new farming methods, settlers set loose chains of environmental changes and undermined native economies. Drawn to opportunities of trade, Indians depleted populations of deer, beavers, and other animals. Perhaps the most profound environmental interaction came with the introduction of Old World pathogens and waves of epidemics that devastated native populations.

The frontier has proved most persistent as a term in popular culture summoning up images of opportunity, adventure, challenge, courage, danger, and innovation. The first such images emerged from the early Republic. By 1829 Daniel Boone stood as the nation’s first paragon of frontier virtues. James Fenimore Cooper had created a wildly popular frontier character in his Leatherstocking tales. Upon his election to the presidency, Andrew Jackson’s unprecedented political appeal was inextricably tangled with his image as backwoods hero. The frontier’s mythic power has continued in forms as varied as Western novels and films, subgenres of science fiction, political rhetoric and slogans, and advertising, where its references are used to sell everything from computers and toothpaste to automobiles and tattooing. This allure is a reminder of the frontier’s enduring hold on the imagination among scholars and the public at large.

FRONTIER RELIGION The frontier of the new nation—extending from the Appalachian Mountains to the Mississippi River—was a region of intense religious activity by both Euro-Americans and Native Americans. Among Euro-American settlers of the region, the most important aspect of religious activity was the democratization of religion. Among Native Americans, on the other hand, it was resistance to Christianity and to its associated cultural elements.

The democratization of American religion had begun during the first Great Awakening (c. 1740–1760) and the American Revolution (1775–1783), but it accelerated dramatically during the Second Great Awakening (c. 1790–1830). The process was marked by the absence of established churches, an emphasis on the vernacular in the forms and language of worship, and a refusal to see clergy as a divinely ordained class apart from the laity.

The first Great Awakening had seen established churches from New England to the Carolinas lose much of their authority. Congregational and Anglican churches were divested of much of their power to coerce attendance or financial support, and many dissenting Protestants gained at least *de facto* toleration. The Revolution continued this trend, especially in Anglican colonies, where the Church of England was associated with discredited royal officials and where independence brought rising demands for its disestablishment. After the Revolution, the Northwest Ordinance (or Land Ordinance of 1787) set the tone for frontier religion. First among the “unalterable” characteristics that it mandated for the region was that no peaceable person ever be molested on account of religion, and none of the new territories and states that emerged west of the original thirteen ever had established faiths.

Frontier religion also perpetuated the first Great Awakening’s emphasis on “heart” religion. The Awakened had to feel God in their hearts, and the characteristic form of worship on the early national frontier was the revival, or camp meeting. The meeting held at Cane Ridge, Kentucky, in 1801 was the most celebrated example of this phenomenon. Thousands of men, women, and children spent a week at Cane Ridge, and during that time many demonstrated profound physical manifestations of their religious enthusiasm, such as jerking, dancing, barking, and falling down. Cane Ridge was unusual only in its size, though. Throughout the early national period, the two largest denominations on the trans-Appalachian frontier—Baptists and Methodists—held thousands of smaller such events. Baptist services, which had long been known for their enthusiasm, tended to be in established churches; Methodists, on the other hand, employed a cadre of itinerant ministers—circuit riders—to spread the word to any who would hear it.

Finally, frontier religion shattered the notion of the clergy as a separate, elite class. Baptists had always opposed any sort of church hierarchy, and their ministers were known more for the enthusiasm of their preaching than for their education or their

ability to split theological hairs. Methodists of the era were somewhat less democratic in that they had a church hierarchy, symbolized on the frontier by Bishop Francis Asbury (1745–1816), although they also relied on a host of lay preachers to serve the faithful. The most democratic of all may have been the Disciples of Christ, or the Christians. The Christian movement emerged in the late eighteenth century, when adherents of several faiths began to emphasize the ability of every man or woman to effect his or her own salvation through reading the New Testament. On the frontier, the most prominent leaders of the movement were Barton Stone (1772–1844) and Alexander Campbell (1788–1866), but neither claimed any special religious status. To the followers of Stone and Campbell, anyone who read the Bible had an equal claim to understanding the will of God.

While Euro-Americans on the frontier developed a more democratic version of Christianity in the region, Native Americans often resisted Christianity with increasing determination. Even those tribes that began to adopt the agricultural capitalism of white Americans often declined to adopt their religion. The Cherokee, for example, were perfectly willing to permit Moravian missionaries to establish schools and provide practical training but showed little interest in their faith. Indeed, by 1830 fewer than 10 percent of the Cherokee people had converted to Christianity, despite years of activity among them by Moravians, Baptists, Presbyterians, and Methodists. In other tribes, most notably the Shawnee and Muskogee (Creek), resistance to Christianity was even stronger. The cultural and demographic devastation that followed European expansion led Tenskwatawa (1775–1836), a Shawnee, to advocate a return to traditional ways in order to appease the Great Spirit and bring an end to white incursions. His message not only contributed to Tecumseh’s war against the United States (1811–1813), but also inspired traditionalists among the Muskogees, known as the Red Sticks, to attack as well (1813–1814). Both wars ended in defeat, but Native Americans continued their effort to preserve traditional beliefs in the face of Christianity.

FRONTIERSMEN Adventurous. Rugged. Individualistic. Free of the oppression of institutions and the restraints of civil society. Living on the edge of danger, unsure of whether or not the day would be their last. These are all classic characteristics of the American frontiersman of western lore.

To be sure, men like Daniel Boone possessed a fanciful, adventurous side. Born in a log cabin in Pennsylvania, Boone spent much of his life on the western frontier of America, taking part in military campaigns, acting as a backwoods guide, embarking on extended hunting expeditions, fighting Indians, and establishing settlements deeper into the American interior. Yet men like Boone also exhibited a more “civilized” side. Both Boone and his frontier counterpart Davy Crockett served their fellow frontier settlers as state legislators, Boone in the Virginia Assembly and Crockett in Tennessee. Intermingling politics with business, Boone spent a good part of his time engaged in activities not characteristically associated with frontiersmen, such as contracting with the assembly to provide supplies to western militias, dabbling in business as the operator of a general store, speculating in land, and petitioning the Federal Land Commission and Congress to secure land grants in the West. Crockett found his way into national affairs as well, serving three terms in Congress as a U.S. representative.

Just as frontiersmen like Boone and Crockett were not quite as rugged as they were often portrayed, individualism did not characterize all of the activities taking place on America’s western frontiers. Even the famed frontier historian Fredrick Jackson Turner, noted for his interpretation of the frontier as a definitive factor in the development of the American character, had to acknowledge that the transplanting of whole communities by opportunity-seeking easterners meant that many Americans living on the frontier skipped the primitive frontier phase of settlement almost entirely. Some enterprising businessmen even offered up for sale ready-made homesteads, cleared of timber, fenced in, and ready for seed, therefore eliminating much of the back-

breaking work and uncertainty often associated with frontier life.

Those living in the West built on a long tradition of communal activity and support, and the very nature of the frontier and the dangers present on it necessitated such cooperative behavior. The practice of traveling in wagon trains across the Great Plains, for example, grew in part out of the need to provide protection against hostile Indians, which these larger groups afforded, and which the mythical, Indian-fighting frontiersmen of lore would not have required.

Thus it was the rare individual who fit the frontier mold, and perhaps this rarity helped stimulate the attraction on the part of many Americans to the fiction of the rugged, individualistic frontier lifestyle. But if the life of the frontiersman in Boone’s Kentucky and Crockett’s Tennessee was not wholly the life of adventure and complete abandon, then when and where did this myth originate?

Many credit Daniel Boone’s contemporary and fellow land speculator, John Filson, for introducing Americans to the archetypal “frontiersman” personified by Boone himself. In part attempting to attract interest in the west of the early Republic so as to bolster the value of his own Kentucky landholdings, Filson published *The Adventures of Col. Daniel Boon* in 1784 to much acclaim. In the book Filson presented Boone in an Enlightenment-inspired image, that of a “natural man,” born of a simpler time and free of the apparent constraints and restrictions of civilized society.

Perhaps it is no coincidence that the myth of the American frontiersman, first invoked shortly after the ratification of the Constitution and the birth of the new American nation, accelerated during the first half of the nineteenth century. James Fenimore Cooper’s “Leatherstocking Tales” (beginning with *The Pioneers* in 1823), Davy Crockett’s autobiographical work, *A Narrative of the Life of David Crockett of the State of Tennessee* (1834), and Timothy Flint’s *The First White Man of the West, or the Life and Exploits of Col. Dan’l. Boone, The First Settler of Kentucky* (1854), expanded on the concept of the American frontiersman as a unique element of the unexplored American West. This booming interest in the American frontiersman coincided almost seamlessly with the growing American belief in “Manifest Destiny,” the idea that Americans were fated to spread their civilization across the entire North American continent. In this sense then, the myth of the American frontiersman was one of empire and civilization as much as a symbol of its rejection, and would remain so

throughout the twentieth century as Americans set their sights across the Pacific and toward Asia.

Born of speculation and profit and nurtured by the quest for a landed empire, the American frontiersman personified, and continues to personify, the American belief in the individualism of the American people and the exceptionalism of the American experience. Although perhaps more myth than reality, the memory of the American frontiersman remains a powerful force in the shaping of American identity.

FUGITIVE SLAVE LAW OF 1793 By the time of the Constitutional Convention in 1787, a division between slave and free states had begun to emerge. Massachusetts, New Hampshire, and Vermont (which would become the fourteenth state) had abolished slavery, while Pennsylvania, Connecticut, and Rhode Island were in the process of doing so. Southerners at the convention feared that in the new nation, their slaves would escape to these free states and be forever lost. Thus, late in the convention, Pierce Butler of South Carolina proposed that the fugitives from justice clause, designed to facilitate the return of accused criminals, also provide for the return of fugitive slaves. The convention rejected this idea but a few days later adopted, without debate or vote, a separate provision for the return of fugitive slaves. The clause provided that “No Person held to Service or Labour in one State, under the Laws thereof, escaping into another, shall, in Consequence of any Law or Regulation therein, be discharged from such Service or Labour, but shall be delivered up on Claim of the Party to whom such Service or Labour may be due.”

FUGITIVE SLAVE CLAUSE

During the ratification debates, southern supporters of the Constitution used the clause to bolster their support for the document. At the South Carolina ratifying convention, for example, Charles Cotesworth

Pinckney, who had been a delegate at the Philadelphia convention, declared, “We have obtained a right to recover our slaves in whatever part of America they may take refuge, which is a right we had not before.” Similarly, in Virginia, Governor Edmund Randolph and James Madison, who had also been delegates in Philadelphia, used the fugitive slave clause to show that the Constitution protected slavery.

The fugitive slave clause was placed in Article IV of the Constitution, immediately after the clause providing for the return of fugitives from justice. But the two clauses, although juxtaposed, differed significantly. The fugitives from justice clause was predicated on legal due process. It provided for the return of a fugitive who was “charged in any State with Treason, Felony, or other Crime.” The term “charged” implied some sort of legal proceeding—such as a grand jury indictment—that established prima facie guilt. The fugitives from justice clause also provided a mechanism for returning alleged criminals. The clause said that “on Demand of the executive Authority of the State from which he fled,” the fugitive from justice was to be “delivered up, to be removed to the State having Jurisdiction of the Crime.” In other words, after an indictment the governor of the state would contact the authorities where the fugitive was hiding and request that the fugitive be arrested. The governor would then send someone to receive the prisoner and bring him back for trial.

The fugitive slave clause, on the other hand, provided no clear mechanism for the return of a fugitive slave. The clause declared the fugitive would be returned “on Claim of the Party to whom such Service or Labour may be due.” Such language implied that the fugitive slave would normally be in the custody of someone, or even be working for someone as a slave. The fugitive was to be “delivered up on Claim” of the owner. But the clause did not indicate how that delivery was to take place, who was to pay for it, or what would be needed to prove that the “Claim” was legitimate.

Perhaps the most significant difference between the two clauses was their lack of symmetry. Each state had two strong interests in cooperating in the seizure and arrest of fugitives from justice. No state would want a criminal hiding within its boundaries. That alone was incentive enough to help return fugitives. In addition, however, all states would eventually seek the return of a fugitive from justice, and thus there was a strong incentive for mutual cooperation. This did not exist with fugitive slaves. The northern states had no strong need to prevent blacks

from escaping into their jurisdiction. Indeed, such fugitive slaves were likely to be highly motivated people who were determined to be successful in a free society. Nor could the free states expect any symmetry in this process. They would never seek to recover fugitive slaves because they did not have slavery.

FUGITIVE SLAVE LAW

In 1791 Pennsylvania sought the return from Virginia of three fugitives from justice who were accused of kidnapping a free black named John Davis and taking him to Virginia, where he was enslaved. The governor of Virginia refused to cooperate in the extradition of the three men, arguing that in fact Davis was a fugitive slave from Virginia, and that even if he was not, kidnapping a free black was not considered a felony in Virginia. The governor of Pennsylvania went directly to President George Washington for help. Congress responded in 1793 with a law that regulated both the extradition of criminals and fugitive slaves.

Although it covered both issues, the act was known as the Fugitive Slave Law of 1793. The law required that persons seeking runaway slaves obtain a certificate of removal from any federal judge or any state judge, magistrate, justice of the peace, or other judicial official. In order to receive the certificate, the claimant had to provide an affidavit, sworn before a judge in his home state, describing the alleged slave. The law provided a five-hundred-dollar penalty for anyone interfering with the return of a fugitive slave and also allowed a master to sue anyone who successfully helped his slave escape for the value of that slave. The law did not provide a criminal penalty for helping a slave escape. While many northerners did help fugitive slaves, before 1830 there were no known suits against them.

This procedure created a great danger for the growing free black population of the North. Because of abolition in upper New England and private manumission and gradual emancipation statutes in the rest of the North, by 1790, 40 percent of the blacks in the region were free. By 1800, 56 percent were free, rising to 83 percent by 1820. In 1830 there were over 125,000 free blacks in the Northeast but fewer than 3,000 slaves. Throughout the North, blacks and whites alike worried that southerners might fraudulently claim free blacks as their fugitive slaves, or that they might simply try to kidnap free blacks and take them to the South, where they could be sold. By 1829 a number of northern states, including New York, New Jersey, and Pennsylvania, had passed personal liberty laws, which supplemented

the 1793 law by demanding greater proof before a black could be removed from a state as a fugitive slave. These laws typically required that claimants bring an alleged fugitive slave before a state magistrate or judge, who could consider the evidence before allowing a person to be removed as a slave. No known cases under the 1793 law reached the federal courts before 1830. There are few reported cases in which courts in the free states supported the claims of masters seeking to recapture their runaways, but by and large before 1830 the act of 1793 produced few cases and did little to help slave owners recover their runaway slaves. However, in the period from 1793 to 1829 there were scattered instances of free blacks, especially children, being kidnapped and taken south. While few in numbers, these kidnappings worried northern blacks, especially those who lived along the Ohio River, in port cities like New York and Philadelphia, or in southern Pennsylvania. Kidnappings were illegal and were not sanctioned by the Fugitive Slave Law, but free blacks saw little difference between the agent of the master armed with a certificate of removal and the kidnapper. Both intended to reduce African Americans to bondage.

FUGITIVE SLAVES See **Slavery: Runaway Slaves and Maroon Communities.**

FUR AND PELT TRADE The fur trade—the very phrase continues to conjure up the drama of the frontier, and for good reason. The pursuit of furs—referred to by some as “soft gold”—had an enormous impact on the exploration and colonization of North America. Reenactors dress up as *voyageurs* (the teamsters of the trade) and follow the paths of the fur trade in canoes along rivers and lakes, rediscovering

old portages (the carrying places in between water highways). Others dress up in buckskin outfits like the mountain men who trapped beaver in the central Rockies and gathered at a summer rendezvous to trade for supplies and goods. The image of the self-reliant, wilderness-savvy individual may appeal to some in the urbanized world of modern America, but the heyday of the mountain man lasted for only fifteen years, from 1825 to 1840. This particular strategy for gathering furs never seriously challenged the dominant mode of the trade, which revolved around trading posts, Euro-American merchants, and Native American producers and consumers.

SIGNIFICANCE AND PRACTICES

The real significance of the fur trade lay in the fact that, in contrast to the creation of small farms and cash crop plantations, it was an economic activity that required some measure of cooperation between indigenous peoples and Europeans. The real drama of this activity lay not in the tedium of paddling thousands of miles, but in the integration of North American products and economies with global markets, requiring merchants to keep track of currencies and goods from a bewildering diversity of places. A successful fur trader had to maintain a careful and continuous correspondence with wintering partners in Indian country and agents in Europe to calculate the prices of supplies and current values and demand for various furs. In truth, the "fur trade" is a convenient shorthand for a complex business that constituted a major economic force from the beginning of European involvement in North America, through the colonial period, and into the middle of the nineteenth century.

The fur trade began in the early sixteenth century as an adjunct to the cod fishing and whaling voyages off the coasts of Newfoundland and New England. A series of events occurred later in the century that cut off supplies of pelts from Siberia and stimulated the demand for North American furs. At the same time, Parisian hatters reintroduced beaver felt hats, which were superior to wool-felt hats and fetched a much higher price. (The European beaver stocks had become exhausted in the fifteenth century.) The short barbed undercoat of the beaver was perfect for the felting process. Ironically, beaver robes that had been worn by Native Americans for a year (greasy beaver, or *castor gras*, as opposed to *castor sec*, or dry beaver) were more valuable than fresh pelts. Since the long, outer guard hairs had worn off, the used robes required less processing by European hatters. The beaver remained the most im-

portant object of the trade until the 1830s, but other animals were sought after as well. Peltries (*pelletterie*), skins worn as furs or used for linings, constituted a smaller percentage of the trade. Marten, raccoon, and otter skins were preferred. Moose hides were used for leather, as were deerskins—the staple of the trade in the Southeast. Buffalo robes replaced beaver pelts as the most valuable component of the American fur trade in the second quarter of the nineteenth century.

Indian men obtained the majority of furs through various hunting practices. Native women processed the furs—scraping, stretching, rubbing, curing, and sewing the products of the hunt. They also provided food for all involved in the trade and manufactured snowshoes, canoes, and various articles of clothing worn by both Indians and Europeans. Native people were equally important as consumers, since merchants often obtained more profits as importers, outfitters, and retailers of European goods than they did through the sales of furs in Europe, which were often handled by agents and companies located there. Finished fabrics were the principal category of imports, and the most important of these were duffels and strouds—woolen blankets that were as warm as furs but had the advantages of being lighter and of drying faster. Reds and blues were the preferred colors.

Other items of clothing exchanged included calico and linen shirts, leggings, and sleeves (*manches sauvages*). (Native consumers did not desire fitted clothes—especially breeches—which hampered their movements.) Metal tools were an equally important category of goods, though they constituted a much smaller percentage of imports. These labor-saving objects included copper kettles, axes, chisels, knives, fishhooks, and guns. The demand for such hard goods tended to be inelastic, as native communities often had limited carrying capacity. Brandy and rum made up a relatively small percentage of imports for the trade and were rarely a source of much profit; yet alcohol, then as now, facilitated commerce. Other imports included fashionable items such as tin rings, silver earrings, and gorgets manufactured in Germany specifically for the Indian trade, glass beads produced in Murano (a suburb of Venice), Chinese vermilion sold in small paper packets, Brazilian tobacco, mirrors or "looking-glasses," and even spectacles. In short, the fur trade was a global business, and historian James Axtell has suggested that the remarkable increase in native disposable income and consumption stimulated European production and might be described as the "first consumer revolution."

Other scholars have insisted that Indian societies had fixed needs and a nonmaterial conception of wealth that emphasized public redistribution of goods and an ethic of sharing. Economic activities, in short, were not viewed as separate from social activities and obligations. Exchange was conceived as mutual gift giving and used to reaffirm social ties, kinship (real and metaphorical), and political and military alliances. (Such practices and notions were not uncommon in Europe, of course, and economic activities continue to be shaped and conditioned by extra-economic factors.) Still, historians agree that Indian groups did act as intermediaries and were often shrewd bargainers, insisting on “good measure” in their transactions and aware of the impact of competition on exchange rates. We may fairly say that through the fur trade, preexisting Indian patterns of village-to-village exchange were linked to a more extensive Atlantic economy and developing capitalist world system.

The fur trade also changed over time. One rather consistent element of change was game depletion. This caused a search for new supplies and, at times, suppliers. Another factor that determined change was the tension between competition and monopoly. Because the trade involved a limited resource and required credit transactions due to the long delay between ordering goods and receiving payment in furs, there was a predictable tendency for merchants to try to limit their risk. This was done in various ways: buying out the competition; partnerships; restricting supplies; and being the first “in the field” to receive the products of the hunt. When profit margins increased through monopolistic practices, the temptation for independent traders to enter the field increased and the cycle began anew. A third factor that affected the trade was political rivalry. Access to hunting grounds often caused conflict between competing native groups. Trade alliances between Europeans and Indians often led to competing claims of sovereignty between empires or jurisdiction between colonies within the same empire. The interaction of these factors—ecological, economic, and political—helped to shape the course of fur trade history.

THE COLONIAL TRADE

When Samuel Champlain established a post at Quebec in 1608, he gave permanence to the French enterprise in North America and with it, a trading network centered on the St. Lawrence River and the waterways that connected it to the rich fur-producing areas of the Great Lakes. Over the next decade, the Hurons emerged as important intermedi-

aries in the trade. They would gather as many as thirty thousand beaver pelts in peak years.

Serious competition for the French emerged shortly thereafter along the Hudson and Mohawk Rivers, where the Dutch established Fort Orange (Albany) in 1614 and acquired aggressive trading partners in the Mohawks and the rest of the Iroquois Confederacy. This trading network also had access to wampum-producing native communities living along the coasts of Long Island, and wampum was used to obtain furs from inland tribes. When they faced a shortage of fur-bearing animals in their own hunting grounds, the Iroquois began a series of attacks on northern and western tribes to expand their territory and acquire new sources of furs. These Beaver Wars began in 1647 and resulted in the decline and dispersal of the Hurons and their allies, the Eries, Neutrals, and Petuns. Refugees migrated to the Ohio country and Great Lakes area (the *pays d'en haut*). With the English conquest of New Netherland in 1664, the French-Iroquois rivalry took on a new imperial dimension.

Although Canada seemed more than once to be poised on the brink of extinction, the French Crown assumed control of the colony in 1663 and sent an entire regiment to bolster its military strength. New native groups from the Great Lakes area joined the French side, and several of those, especially the Ottawas and the Ojibwas (Anishnaabe) replaced the Hurons as intermediaries in the trade. Montreal (1642), located at the junction of the two critical water routes (the St. Lawrence to Lake Ontario and the Ottawa River to Georgian Bay and Lake Huron) became the site of annual trading fairs.

A decade of calm between 1667 and 1677 allowed hundreds of unemployed French soldiers and veteran fur trade employees (*engagés*) to venture west. By 1680, encouraged by a new policy of guaranteed prices for beaver, over eight hundred illegal *coureurs de bois* (woodsmen) were operating in the *pays d'en haut* (upper country). A new phase in the fur trade had begun, with Europeans transporting goods to and from Indian country itself rather than relying on natives to make the trip to fixed posts in the East. Living in or near Indian villages, many French traders cemented their ties to their customers by marrying native women. By the end of the century, a growing Métis (children of mixed ancestry) population, constituting a distinctive fur trade society, had emerged. The fur trade had always encouraged an exchange of information between natives and Europeans. In addition to having a familiarity with each other's languages and customs, the French

and Indian inhabitants of this growing “middle ground” now added a network of personal relations that would provide some balance to British military and economic strength during the various imperial wars of the late colonial period. New fur trade centers—Michilimackinac and Detroit—also emerged in the western country, and the French opened a new trading zone in the Illinois country in the first two decades of the eighteenth century.

The English also developed several new fur-trading regions in this period. In 1670 the Hudson’s Bay Company (HBC) was granted a royal charter by King Charles II. Operating from fixed posts on Hudson Bay and James Bay, the company had access to a region rich in furs, and the Cree and Assiniboine people played a critical role as suppliers. The company faced little competition until French traders began moving into their territory from the Great Lakes in the 1740s. The company evolved away from the French pattern of geographical expansion and competition, opting instead for a tightly controlled structure run by salaried managers. The company also lowered risks by employing futures contracts with suppliers and a fixed unit of exchange (the Made Beaver) that standardized all transactions—though items had a range of markups—and simplified book-keeping. The company’s isolated position made it vulnerable to French attacks until the Treaty of Utrecht (1713) confirmed British possession of the bay.

In the Southeast, traders from Virginia pioneered the commerce in deerskins in the 1640s. Carolina-based traders later bypassed their colonial neighbors and became embroiled in several wars with coastal Indian communities. The Carolinians formed alliances with the Creeks, Catawbas, and Cherokees that produced an extensive commerce in both deerskins and Indian slaves. At the end of the century the French established their own deerskin trade network further west, centered around the Choctaws and several smaller tribes. By the 1750s, New Orleans (1718) and Charleston (1670) were exporting more than 100,000 pounds of skins annually.

The expansion of these various trading networks led to a series of confrontations during the eighteenth century in the Southeast and along the border between Canada and New York. The competition between French and British traders in the Ohio country led directly to the first battles of what would become the Seven Years’ War (1756–1763).

THE AMERICAN TRADE

The fur trade after the Seven Years’ War was shaped by local, national, and international events. With the disintegration of French hegemony in 1763, the old Montreal–St. Lawrence trading system was increasingly dominated by a new group of traders (referred to by the HBC contemptuously as “peddlars”). Many were from Scotland—among them the McGills and the McTavish and McGillivray families. Various competing partnerships merged in 1784 to form the North West Company. By the end of the century, this combination of field partners and wholesale merchants had pushed westward to the Canadian Rockies, established itself in the Athabasca region, and even reached the Mackenzie River headwaters.

At the same time, the North West Company and other Montreal partnerships continued to operate in the Great Lakes region, south of the international border established by the Treaty of Paris in 1783 and finally made effective in 1796 following Jay’s Treaty of 1794. The United States, in an attempt to redirect the flow of American furs into Canada, set up government factories to conduct trade, starting in 1796. These government operations had limited success, hampered by restrictions that disallowed credit, liquor, and imported goods. Sensing an opportunity, a German immigrant, John Jacob Astor, began purchasing furs in his home base of New York City and in Montreal. When the Napoleonic Wars (1803–1815) disrupted traditional fur markets, Astor took advantage of American neutrality and shipped his stock directly to France and Germany. In 1808 he received a corporate charter for his new American Fur Company from New York State. After forming a brief combination with merchants from Montreal, Astor used the conditions created by the War of 1812 to drive out his competitors. British-Indian relations had turned sour, and Astor lobbied Congress to pass an act in 1816 that excluded British citizens from trading in American territory. Astor was less successful in the Pacific Northwest. After setting up a post, Astoria, at the mouth of the Columbia River that he hoped would anchor a tripartite trade between that region, China, and the East Coast, he was forced to abandon his plans, and the post was sold to the North West Company. Nevertheless, Astor and his son William created a powerful organization built on controlling the supply of furs in Indian country from their western headquarters in Michilimackinac and on careful anticipation of world markets from their offices in New York and Europe.

In Canada, the Hudson’s Bay Company had responded to the incursions of the North West Compa-

ny by establishing new inland posts. Several periods of intense and even bloody competition, spurred by game depletion, finally resulted in a merger of the two companies in 1821, and goods and furs gathered in the north flowed only through the bay. Montreal's long-standing connection to the trade was now lost.

Ironically, even as Scottish "peddlars" had taken over the top levels of the business from the French in the Montreal fur trade network after the Seven Years' War, a new group of French fur traders had emerged in what would become American territory after the Louisiana Purchase of 1803. St. Louis, founded in the winter of 1763–1764, stood on the international border between Spanish Missouri (Upper Louisiana) and the British-held Illinois country. Traders there shipped furs through both New Orleans and Montreal until the War of 1812 forced them to consider New York as an increasingly attractive alternative. The founding family of the city, the Chouteaus, monopolized the lucrative trade with the Osages, and a family partnership signed a marketing agreement with Astor in 1827. The Chouteaus and Astor had cooperated earlier in a lobbying effort that persuaded Congress to abandon the government factory system in 1822. Astor retired from the business in 1834 to devote his energies to managing his real estate interests. He sold his Western Department to the Chouteau family firm. By 1842, Pierre Chouteau Jr. and Company had become the American Fur Company, establishing its own marketing office in New York but maintaining its principal headquarters in St. Louis.

The Chouteau company, taking a clue from Astor, built a fur-trading empire on a grand scale. It built or acquired trading posts throughout the area drained by the Missouri River system, some of the most famous being Fort Union at the mouth of the Yellowstone, Fort Clark in Mandan country, Fort Pierre in the heart of Dakota territory, and Fort Laramie on the northern fork of the Platte River. Company steamboats reached Fort Union in 1832, and thereafter the company controlled the flow of information and goods in the American West. Through their affiliation with Bent, St. Vrain and Company, which dominated the southwestern trade from its post, Bent's Fort, on the Arkansas River in Colorado, the Chouteaus also gathered a share of the trade in New Mexico and the southern Rockies.

By the late 1830s, raccoon pelts and buffalo robes had replaced the beaver as the dominant furs in the American trade. And the fur trade had truly become a corporate enterprise dominated by several

large firms in the United States and Canada. Of more significance, in its final phase, the classic fur trade became more of an "Indian business." The Chouteau company and smaller firms profited from the federal government's desire to obtain Indian lands and remove tribal communities after 1830. Traders often enjoyed a position of political and economic influence within Indian communities and were more than willing to exploit that influence during the treaty-making process. Profits accrued to fur traders primarily by providing "annuity goods" promised by the government to various tribes in treaties and land cessions and by receiving money directly from the government in payment of Indian debts. In 1842 alone, traders' claims amounted to over \$2 million. Fur companies reinvested their profits, diversifying into areas such as land speculation, mining, and railroads. What had begun as a colonial enterprise that required cooperation between natives and Europeans and provided a conduit for material and cultural exchange became, in the end, a tool for dispossession. The fur trade had other dire consequences, providing a pathway into Indian villages for deadly diseases and alcohol and a commercial incentive for the decimation of fur-bearing animals across the continent.

FURNITURE Furniture made in the American colonies in the two decades prior to the American Revolution (1775–1783) was modeled after the prevailing style of furniture in Europe, namely the French or English rococo. The importation of European furniture and the immigration of European-trained craftsmen fostered the spread of this style to the colonies. Pattern books also had a profound influence on American furniture, particularly on the costliest furniture commissions in major urban centers. Among the pattern books available in the colonies were Thomas Chippendale's *The Gentleman's and Cabinetmaker's Director* (1754), William Ince and John Mayhew's *The Universal System of Household Furniture* (1762), and Robert Manwaring's *The Cabinet and Chair-Maker's Real Friend and Companion* (1765), all published in London. Although only a few surviving examples of American furniture are known to have been copied directly from engraved plates in these pattern books, much American furniture owes a debt to the stylistic features depicted in them, such as curvaceous forms, ornate foliate carving, and exotic motifs, which are hallmarks of the rococo style in furniture. Furniture made for average consumers also bears similar stylistic origins, although it typically appeared slightly later and generally used less costly materials than the most expensive furniture made in the colonies. Certain forms, such as Windsor chairs, were popular among all levels of consumers throughout the eighteenth and early nineteenth centuries.

The major colonial population centers—Boston, Newport, New York, Philadelphia, Annapolis, and Charleston—developed distinctive regional furniture styles. Furniture makers in Philadelphia, the largest city in the American colonies in the second half of the eighteenth century, produced some of the most elaborately carved furniture in colonial America. One well-known set of examples is a matching suite of mahogany furniture made around 1770 for the Philadelphia townhouse of John Cadwalader, who later served as a general of the Continental Army, and his wife Elizabeth Lloyd Cadwalader, a wealthy Maryland heiress. Made under the direction of the Scottish-born cabinetmaker Thomas Affleck, who con-

tracted London-trained carvers James Reynolds, Nicholas Bernard, and Martin Jugiez, all recently immigrated to Philadelphia, the suite included among other forms sofas, card tables, chairs, and fire screens in the high-style London taste. Some of the wealthiest American colonists had the means to acquire fine furniture and other luxury goods directly from the merchant houses of Europe; however, most patronized local craftsmen for at least some of their furniture. The nonimportation movement prior to the Revolution encouraged colonists to support local craftsmen.

Not all furniture made in North America adhered to the cultural norms of the dominant Anglo society. Significant pockets of settlement by the Germans in Pennsylvania, North Carolina, and the Shenandoah Valley of Virginia, the French in Canada and Louisiana, the Dutch in New York and New Jersey, and the Spanish in Florida and far to the west in New Spain contributed to the diversity of furniture-making traditions in North America.

Following the Revolution, the economic disruption caused by the war soon gave way to increased prosperity as populations in cities grew and settlement into the hinterlands of North America created new customers for furniture. The lifting of the colonial-era trade restrictions imposed by the British allowed American craftsmen to seek international markets for their products. Woodworking craftsmen used valuable raw materials, including native woods such as maple, walnut, cherry, and pine, as well as fine imported mahogany and rosewood from the Caribbean, to produce marketable finished products for both local consumption and export. Some of the most successful American furniture makers became merchants or retailers of furniture.

In general, furniture made in America beginning in the last decade of the eighteenth century reproduced the new international style of neoclassicism in architecture and interior furnishings that was already popular in Europe. In furniture, this “antique” or “classical” style found expression in a wide variety of classically inspired forms and ornamentation. Derived in part from examples of classical architecture and decorative arts uncovered during recent archaeological excavations in Italy and Greece, the details of this style of furniture were thought to be more correct than earlier Renaissance interpretations of classical designs. This style of furniture often employed gilded and painted surfaces and inlays of wood and metal, which required specialized skills. The English-trained architect Benjamin Henry Latrobe designed a painted, Grecian-style klismos chair with incurvate

Queen Anne Side Chairs. Furniture made in the colonies in the decades prior to the American Revolution was modeled after the prevailing styles of furniture in Europe. These American Queen Anne style chairs, with their characteristic cabriole legs, were produced around the 1760s and would have been popular with wealthy Americans. © PETER HARHOLDT/CORBIS.

front and rear legs in 1809 for Dolley Madison to be used in the oval drawing room of the President's House. English pattern books continued to influence American craftsmen even after the Revolution. *The Cabinet-Maker and Upholsterer's Guide* (1788), by George Hepplewhite, and *The Cabinet-Maker and Upholsterer's Drawing-Book* (1792), by Thomas Sheraton, promoted designs of classically inspired furniture. So did Thomas Hope in his book *Household Furniture and Interior Decoration* (1807), which introduced a mix of Roman and Egyptian motifs, and Thomas King in *Modern Style of Cabinetwork Exemplified* (1829). Despite international political tensions and a thriving market for locally produced furniture,

Americans continued to turn to European sources for this style of furniture, which was popular well into the 1830s.

GABRIEL'S REBELLION The slave known only as Gabriel was born in 1776 near Richmond, Virginia, at Brookfield, the Henrico County plantation of Thomas Prosser. By Virginia standards, Brookfield was a large plantation, with a population of approximately fifty laborers. The identity of Gabriel's parents is lost to history, but he had two older brothers, Martin and Solomon. Most likely, Gabriel's father was a blacksmith, the occupation chosen for Gabriel and Solomon. Status as a craft artisan provided the young blacksmith with considerable standing in the slave community, as did his ability to read and write. By the mid-1790s, as he approached the age of twenty, Gabriel stood "six feet two or three inches high." A long and "bony face, well made," was marred by the loss of two front teeth and by "two or three scars on his head." In later years, a legend arose which held that Gabriel wore his hair long in naive imitation of Samson, in hopes that his locks would give him extraordinary strength. Contemporary descriptions say only that his hair was cut short and was as dark as his complexion. According to the journalist James T. Callender, blacks and whites alike regarded him as "a fellow of courage and intellect above his rank in life."

In the fall of 1798 Gabriel's old master died, and ownership of Brookfield passed to twenty-two-year-

old Thomas Henry Prosser, who maximized his profits by hiring out his surplus slaves. Despite all of the work to be done at Brookfield, Gabriel spent a considerable part of each month smithing in Richmond for white artisans. Although still a slave under Virginia law, Gabriel enjoyed a rough form of freedom. Indeed, his ties to the plantation became so tenuous that several historians have identified him as a free man.

Emboldened by this quasi-liberty, in September 1799 Gabriel moved toward overt rebellion. Caught stealing a pig by a white neighbor, Gabriel wrestled him down to the ground and bit off the better "part of his left Ear." Under Virginia law, slaves were not tried as whites. They were prosecuted by special tribunals composed of five justices of the peace. Gabriel was formally charged with attacking a white man, a capital crime. Although found guilty, Gabriel escaped the gallows by pleading "benefit of clergy," which allowed him to avoid hanging in exchange for being branded on the thumb with a small cross, as he was able to recite a verse from the Bible.

Gabriel's branding and incarceration served as a brutal reminder that despite his literacy and privileged status, he remained a slave. By the early spring of 1800, his fury began to turn into a carefully considered plan to bring about his freedom, as well as the end of slavery in Virginia. Slaves and free blacks

from Henrico County would gather at Brookfield on the evening of 30 August to march on Richmond. If Governor James Monroe and the town leaders agreed to Gabriel's demands for black liberty and an equitable distribution of the property, the slave general intended to "hoist a white flag" and drink a toast "with the merchants of the city."

The conspiracy matured in the context of developments in the Caribbean and political affairs of the late 1790s. Since 1793, large number of refugees from the slave rebellion in French Saint Domingue had arrived in Virginia, many of them bringing their bondservants with them. Monroe worried, as he later expressed it in a letter to Brigadier General Matthews, that the "scenes which are acted in Saint Domingue, must produce an effect on all the people of colour" in the Chesapeake. But if the uprising in the Caribbean helped to inspire mainland rebels, it was the divisive election of 1800 that provided Gabriel with his opportunity. Rumors circulating around Richmond held that if Jefferson was victorious, the Federalists would not relinquish power, and one Federalist newspaper predicted an "ultimate appeal to arms by the two great parties." Most likely, Gabriel hoped not only to exploit this split among white elites, but also to throw his lot in with the side that would do the slaves the most favor in the coming civil conflict.

The planned uprising collapsed just before sunset on the appointed day when a severe thunderstorm hit the Richmond area. The chaos of the storm convinced two Henrico slaves that the revolt could not succeed. They informed their owner of the conspiracy, and he hurried word to Monroe. After hiding along the James River for nearly two weeks, Gabriel risked boarding the schooner *Mary*. Captain Richardson Taylor, a recent convert to Methodism, spirited Gabriel downriver to Norfolk. There, Gabriel was betrayed by an enslaved crewman, who had heard of Monroe's three-hundred-dollar reward for Gabriel's capture. Returned to Richmond under heavy guard, Gabriel was quickly tried and found guilty of "conspiracy and insurrection." On 10 October 1800, the young revolutionary died on the town gallows near Fifteenth and Broad Streets. He was twenty-four. In all, twenty-six slaves, including Gabriel and his two brothers, were hanged for their part in the conspiracy. Eight more rebels were transported to Spanish New Orleans; at least thirty-two others were found not guilty. Reliable sources placed the number of slaves who knew of the plot to be between five and six hundred.

In the aftermath, as was the case in the wake of most slave conspiracies, white authorities, as one newspaper put it, moved to "re-enact all those rigorous laws" that had been allowed to lapse after the Revolution. In late 1802, Monroe established the Public Guard of Richmond, a nighttime police force designed to protect the public buildings and militia arsenals. The state assembly passed a law ending the right of masters to hire out their surplus slaves, and in 1806 the legislature amended the state's Manumission Act of 1782 by requiring liberated bondpeople to leave Virginia or face reenslavement.

GAMBLING The early settlers of colonial America undoubtedly viewed their decision to migrate from Europe to be a major gamble. Crossing the Atlantic in a small sailing ship and establishing a foothold in the wilderness was fraught with danger. A strong adventurous spirit was required to tackle this first of many American frontiers, and so a willingness to take a chance, to risk everything, naturally emerged as a prominent American trait. By the mid-eighteenth century, a willingness to take risks in business and trade had become a defining American characteristic. It was only natural that gambling of many types would become an integral part of the American lifestyle, just as it had been in England. However, as gambling developed in the colonies it exhibited traits that deviated from the mother country, reflecting the open, democratic, aggressively capitalistic, equalitarian values of colonial life.

VIRGINIA

Gambling came to the colonies with the first settlers at Jamestown—a motley collection of misfits to be certain—who came unprepared for the hazards they faced and were disinclined to undertake the arduous

labor necessary to build shelters and grow food. One inspector from London in 1609 identified “idleness and other vices,” specifically rampant gambling, as a major problem. Consequently, the expectations of investors in the Virginia Company were not met, and in near desperation they turned in 1612 to gambling as a means of saving the enterprise. They decided to raise much-needed capital by holding a lottery—a relatively novel idea at the time—and over the next decade several lotteries were conducted by the Virginia Company. These unique fund-raisers enabled the colony at Jamestown to survive, but ironically, at the same time that this form of gambling sustained the lifeline of supplies across the Atlantic, the officers clamped down on the Jamestown residents with strict prohibitions on gambling within the Jamestown settlement in an effort to get them to take their labors seriously.

By the mid-seventeenth century, the Tidewater region of Virginia had become transformed by tobacco—an unexpected but welcomed revenue producer—and the importation of slaves to do the arduous work that its cultivation required. The slave-owning planters dominated Virginia’s economy and its political and social life. High-stakes gambling with the money earned from the labor of their slaves became an integral part of their lives. Men of substance found gambling an apt metaphor for their own lives as planters, where high economic risk was a constant. Their fortunes, however, were often established on fragile margins and were always in play, subject to the vagaries of weather, fluctuating commodity markets, work slowdowns by slaves, and violent weather at sea that could sink a year’s money crop. One planter wrote a friend in England whose son was contemplating taking up the life of a Virginia tobacco grower with the warning that “even if the best husbandry and the greatest forecast and skill were used, yet ill luck at sea, a fall of a Market, or twenty other accidents may ruin and overthrow the best industry.” In this turbulent economic environment, it was not unusual for a planter to wager an entire year’s crop on a turn of the cards, a toss of the dice. A visiting Frenchman observed early in the eighteenth century that many members of the House of Burgesses began to gamble at cards immediately after dinner. One of the gamblers told him that he might wish to retire, “for it is quite possible that we will be here all night.” Indeed, the next morning he arose to find the game still in session.

Virginia’s slave-owning elite gambled heavily, risking large sums upon quarter horse races, cock-fights, dog fights, and table games. The historian El-

liott J. Gorn summarizes the gambling mania of the southern slave-owning gentry as a product of a “fiercely competitive style of living,” wherein

individual status was never permanently fixed, [where] men frantically sought to assert their prowess—by grand boasts over tavern gaming tables laden with money, by whipping and tripping each other’s horses in violent quarter races, by wagering one-half year’s earnings on the flash of a fighting cock’s gaff. Great planters and small shared an ethos that extolled courage bordering on foolhardiness and cherished magnificent, if irrational, displays of largess. (pp. 21-22)

Gambling was also a popular pastime of those southerners who did not own slaves. At the many small taverns that stood along the main traveled dirt roads, male members of the lesser classes convened regularly to drink, socialize, argue, and gamble. One frustrated Anglican clergyman complained in 1751 that the taverns had become a place of “rendezvous of the very dregs of the people. . . . Where not only time and money are vainly and unprofitably squandered away, but (as is yet worse) where prohibited and unlawful games, sports, and pastime are used . . . namely cards, dice, horse-racing, and cock-fighting, together with vices and enormities of every other kind.”

THE NORTH

Such behavior would have produced severe retribution in New England. Unlike the southerners who sought to emulate the landed aristocracy of rural England, along the North Atlantic the dominant religious and social force was the new wave of Puritanism that had surfaced in urban England. To strict Calvinists, gambling served to undercut the established order, diminishing the work ethic by providing successful gamblers with monetary rewards that did not result from honest effort, stripping losers of their hard-earned income, and generally creating a social atmosphere not conducive to the earnest pursuit of an honest wage. Further, gambling tended to encourage other social misbehavior—excessive drinking and profaning the Sabbath among them. As the preeminent scholar of the Puritan ideology, Perry Miller, has explained, gambling tended to encourage idleness, but it also brought into play divine providence on trivial matters, because the toss of the dice or the turn of a card invited God to become involved in matters of little significance. Any game of chance “prostituted divine providence to unworthy ends.” A leading Puritan theologian, Increase Mather (1639–1723), once commented, “God determines the cast of the dice or the shuffle of the cards, and we are not to

implicate His providence in frivolity." The all-powerful Puritan God, it was clear to Mather, had more important things to occupy his time.

Nonetheless, as the decades rolled by, gambling increased in New England as the forces of "declension" undercut authoritarian theocratic rule. At times gambling even constituted a positive social and religious force, as many a Puritan schoolhouse, public building, and church was paid for by seemingly omnipresent lotteries. Well into the nineteenth century, lotteries were a popular method of raising funds for public works and worthy projects; in the 1740s, for example, Benjamin Franklin (1706–1790) organized a lottery to raise monies for military defense of the city of Philadelphia, and the Continental Congress launched a national lottery in 1777 as a means of financing the War for Independence. Those who purchased tickets were told that they could take patriotic pride in having "contributed . . . to the great and glorious American cause."

Lotteries naturally invited corruption by their organizers, however, and a series of sensational revelations led legislatures to abolish them in every state between 1820 and 1850. (They would inevitably make a comeback, however, beginning in 1963 when the New Hampshire legislature created a lottery as a means of raising revenue without raising taxes, and by 1990 thirty-six other states had followed suit.)

By the eve of the American Revolution, New England and the middle colonies tolerated gambling because it did not constitute a serious social problem. The relatively low number of laws and decrees regarding gambling and its influences in Massachusetts and Connecticut, for example, indicates that gambling was neither widespread nor widely popular in the region. Nonetheless, Puritan leaders kept a close eye on the practice because it could lead to unnecessary idleness and the profaning of God and the Sabbath. The Quakers in Pennsylvania held a similar view of gambling because it produced no social good and contributed to unsavory behavior. Nonetheless, card playing grew steadily throughout the middle and northern colonies as the decades passed. In Massachusetts, card games became a constant form of recreation, with games being played both in taverns and private residences. The historian Foster Rhea Dulles reports in *A History of Recreation* (1965) that during the years preceding the American Revolution, the popular card game of whist became a social passion for New Englanders of all classes. He reports that customhouse records revealed large quantities of cards being imported and that the game was often mentioned in diaries and correspondence. In New En-

gland, gambling at cards was widespread, but stakes were usually modest—one convenient way to keep score, in fact—and because this recreation was conducted in moderation, it was not considered a threat to society. The region's increasingly lenient leaders even permitted occasional organized horse racing because the crowds were well behaved, the wagering modest, and threats to the social order nonexistent.

The ambivalence of the Puritans is instructive. Although gambling posed a potential threat to their theocratic instincts, it also seemed to be a natural human endeavor given the dangers and risks that existed in colonial America—from the vagaries of unpredictable weather and disastrous epidemics to even an occasional marauding Indian tribe. Consequently, throughout the colonial period, and in fact extending to the twenty-first century, gambling in America has always been enshrouded in what the historian Ann Fabian, in *Card Sharks and Bucket Shops* (1999), calls "moral confusion." While investors speculated on wild land schemes, dubious issues of stocks and bonds, agricultural commodity futures, untested new business ventures, and other risky get-rich schemes, they were merely responding to the temptations of high returns in the liberated capitalist society that America had become by the time of the Andrew Jackson's presidency. But when individuals pursued these same risk-taking instincts at the gaming tables or while watching a cockfight, a bare-knuckled prizefight, or a quarter horse race, they were skating on thin moral ice. Thus, while the spirit of unfettered American capitalism emphasized serious risk taking and speculation, and those who practiced them successfully were rewarded with high social status and public admiration, many moralists were quick to condemn successful gamblers as slick shysters because they made a mockery of the traditional Calvinist virtues of thrift, the work ethic, and prudence.

THE WEST

The opening of the trans-Appalachian West in the 1790s introduced a new era in American gambling, especially in the southern slave states. No one American better exemplified this spirit than Andrew Jackson of Tennessee, who owned a stable of race horses and bet heavily (as much as \$6,500) on the outcome of a single race. He was also an avid card player. As a young man in his native North Carolina, he was known as "the most roaring, rollicking, game-cocking, horse-racing, card-playing, mischievous fellow that ever lived." In 1806 he killed young attorney Charles Dickinson and almost died himself from

wounds inflicted in a duel that stemmed from a disagreement over the settlement of a wager on a race involving Jackson's prize horse, Truxton. Jackson would become the first president known for his propensity for high-stakes gambling.

Of major importance in the evolution of gambling in America was the emergence of organized casino-style gambling in the Lower Mississippi Valley between 1800 and 1830. Men who became known as riverboat gamblers had often honed their skills as con men operating flim-flam land promotions. This wide-open frontier area was rampant with a myriad of suspicious investment schemes, and gambling naturally flourished in the fluid frontier social order. Gambling mimicked the staunch frenetic speculative economic climate of the era, as it did the frenzied entrepreneurial outlook of those who migrated into the area in hopes of making a fast fortune. By the time Jackson entered the White House in 1829, a commercialized gambling culture had become firmly entrenched along the Mississippi Valley from St. Louis to New Orleans. Professional gamblers adapted card and table games from Europe, modifying them to be attractive to their American clientele. The games of French origin were especially popular: faro, roulette, three-card monte, and *vingt-et-un* (twenty-one). Professional gamblers preferred them because of the decided odds favoring the house and because they could easily be manipulated by myriad forms of cheating; this was especially true of the scam of three-card monte.

However, by the early 1830s there had emerged the especially popular card game that best exemplified the raucous entrepreneurial atmosphere of the frontier: poker. Although its origins are murky, the wildly popular American card game of poker most likely evolved from the eighteenth-century French game of *poque* and entered the United States at the time of the French occupation of New Orleans. Others claim it is of Germanic origin. Whatever the case, its incremental betting system, the art of bluffing, and the optimism that it takes to attempt to fill an inside straight were apt reflections of the economic climate of the times. The game also afforded con men and cheats ample opportunities to ply their trade. Usually operating in pairs, professional gamblers were adept at skinning their victims with a wide range of scams. In fact, Jonathan H. Green, a one-time successful professional riverboat gambler who reformed in 1842 and launched a national antigambling lecture crusade, routinely referred to poker as "the cheating game."

As gambling grew in popularity in the early nineteenth century, philanthropic reformers sought to have the practice banned on the grounds that it undermined the economic order, that professional gamblers were nothing more than thieves and crooks, and that gambling threatened society by holding out false hopes and robbing naive individuals of their hard-earned wages. By 1830 many states, both North and South, had passed legislation making it illegal to gamble in public; these laws were designed in part as an attempt to control the lives of the working-class poor and to protect innocent travelers from professional cheats. At no time did any state attempt to ban private gambling. The laws seemed aimed not so much at gambling per se, but at the attendant vice, drinking, and public disorder. Never widely enforced, these laws might have revealed a moral intent but had little impact, unlike the actions of a group of "respectable" Vicksburg citizens in 1835 who, angered by the nefarious cheating of five itinerant professional gamblers, took the law into their own hands and lynched the gamblers.

The historian John Findlay has identified four centuries of Americans as a "people of chance" in a 1986 volume of that title. In writing about the period from 1750 to 1830, he concludes, "The culture of gambling . . . thrived in the relative fluid society on the frontier, amid footloose and acquisitive men. . . ." That forty-eight of fifty states in the year 2004 were home to many forms of legalized, and often state government-operated, gambling is no accident. Games of chance have been an integral part of the American heritage ever since Jamestown, and in the late-eighteenth and early-nineteenth centuries they gained wide and popular acceptance, despite opposition from outnumbered and outflanked moral reformers.

GAMES AND TOYS, CHILDREN'S Play as a positive good was a novel idea in the early Republic. In the late-eighteenth-century era of revolution, childhood was redefined as a natural state, and the child became a symbol of freedom for Americans wishing to cast off the patriarchal power of monarchy. After the Revolution, for example, boys, particularly in New England, would instantiate the political principles of that event by seizing control of a schoolhouse and "barring out" the schoolmaster until he acquiesced to their demands for more rights and freedoms in the forms of less homework, more recess, and a withholding of the switch. Generally speaking, though, toys, the artifacts of play, and games, the activities that were bound by rules and limited by time and space, reflected cultural, if gendered, emphases on virtue, skill, work, and luck.

CHILDREN'S PLAYTHINGS

The same philosophers who influenced Anglo-Americans' Revolutionary political thought also underwrote Americans' shifting definition of childhood as a distinct life stage throughout the eighteenth and early nineteenth centuries. John Locke's *Essay on Human Understanding* (1690) and *Some Thoughts Concerning Education* (1693) influenced Americans' concepts of childhood and child rearing, as did Jean-Jacques Rousseau's popular novel *Émile or, On Education* (1762). Although the two philosophers differed on several principles, both agreed, as did their followers and imitators in North America, that the child was malleable. Education and "playing as learning" were thus keys to creating responsible and compassionate adults in a republic; toys and games were lessons in this (extra) curriculum.

Perhaps all children everywhere throughout history consider all of the world's things as toys, all social interactions as games, without consideration of gender, race, and class. Parents, on the other hand,

adapt social prescriptions of gender and class in their child-rearing habits. Portraits, as social conventions, provide abundant evidence of this thinking and reflect well the prescriptions of advice writers for child rearing. Before 1750, the rare portrait of a child or children even more rarely showed playthings, evidence of the assumption that the life stage now termed "childhood" was neither distinct from nor defined against adulthood. Increasingly after 1750, and especially after 1770, children were portrayed with toys. Girls with parents of means held adult female fashion dolls made of wax or carved of wood. Girls dressed dolls, fussed over miniature furniture and tea sets, and even furnished dollhouses, all efforts to achieve the skills of womanhood. In 1759 and 1760 George Washington ordered from the London toy maker Unwin and Wigglesworth dolls and doll furniture for his stepdaughter, Patsy Custis. Girls with parents of lesser means enjoyed dolls made of rags or corn husks. In *Children in the House* (1992), the historian Karin Calvert notes that even "girls' imaginary games centered on imitating the activities of adult women" and included imitative spinning and knitting yarn and the other chores of keeping house.

Portraits depict boys with balls and whips, rolling hoops, miniature wagons and sleds, toy horses, and tin soldiers. Boys sledded and steered and rode in wheelbarrows, collected and shot taw (clay marbles), spun wooden tops, and fashioned bows and arrows. They perched and skedaddled on stilts, elevating themselves as they balanced and disciplined their bodies. Mastery over the elements was evinced by successful kite flying. Other toys that tested and improved skills included whirligigs and bilbo-catchers (cups and balls attached by a string), hobbyhorses, and toy drums. Boys' skills were also tested against luck in several games of chance, including chuck-farthing (penny pitching) and taw (marbles), which were means of socializing boys for their adult roles in the marketplace.

Slave children, particularly in the South, experienced many more limits to their play. Like their white counterparts, slave boys hunted, fished, swam, climbed trees, and shot marbles and played ball, while slave girls played with rag dolls and imitated domestic chores. Although several historians have pointed to such games as hide the switch and rap jacked—in which players are beaten—as indicative of slavery's brutality, the historians Lawrence W. Levine and Bernard Mergen point out that these games have earlier English origins. What seems clear, however, is that white children did not play these games.

CHILDREN'S GAMES

Boys more than girls played games of physical exertion, though some games engaged both sexes. Ball games seem to have been, through much of the era, the province of boys; stool-ball, cricket, fives (handball), and several early forms of what would become the national pastime were played. Public forms of team play such as bowling and field hockey also were played. Other games, such as battledore and shuttlecock (badminton), thread the needle, tag, leapfrog, and hopscotch could be, and often were, played with members of both sexes. Given that the median age of the Revolutionary generation was sixteen, games provided a means through which sexual mores could be tested and learned. Charades, hide-and-seek, and blindman's bluff were popular heterosocial activities, but they were given moral intent by popular advice writers. John Newbery's *A Little Pretty Pocket-Book: Intended for the Instruction and Amusement of Little Master Tommy and Pretty Miss Polly*, first published in London in 1744, explained thirty-two games. Newbery appended a moral lesson to each game, and the book was reprinted numerous times through the rest of the century. By the first decades of the nineteenth century, physical activity for girls was condoned, and activities traditionally accorded to boys, such as jumping rope, became girls' fun.

FAMILY GAMES

Board games were enjoyed by child and adult, male and female alike. Chess, draughts (checkers), and pachisi (later Parcheesi) were centuries old when North America was being settled. Other board games, such as the English game Goose, were found in Virginia taverns. Dated to 1597, Goose featured a board painted with a circular track of sixty-three numbered small circles. Within the circles were pictures of a boat, tavern, church, maze, skeleton, horse, and chair. Geese were featured in every ninth circle. A similar game was created in France and appeared in English in 1790. Called The New Game of Human Life, it made its way into American family homes. The game offered a pathway through the seven periods of life. Players "traveled" the path in the hope of reaching a safe and happy old age, negotiating along the way penalties and rewards. (This board game anticipated the 1843 game, The Mansion of Happiness, and the 1860 game, The Checkered Game of Life, by Milton Bradley.)

The increasing popularity of children's cabinets of curiosities in the early decades of the nineteenth century spoke to a fascination with natural history. Yet this trend also pointed to American parents' reactions to increasing industrialization, a process that

would, after 1830—and with an increased emphasis on Christmas—bring into American middle-class homes a seemingly endless variety of manufactured toys and games. New England, that erstwhile bastion of Puritanism, would prove to be the center of toy making in the United States.

GENDER

This entry consists of two separate articles: *Overview* and *Ideas of Womanhood*.

Overview

Historians use the concept of gender to analyze the socially constructed systems that order human experience based on perceived sexual difference. Gender structures relationships of power, not only between men and women, but also across other social divides. Scholarship on gender during the early Republic has long emphasized changing ideas about women. It now seeks a more complex understanding of the re-

relationships between masculinity and femininity and also between prescribed gender ideals and actual patterns of behavior. Gender norms help to define and demarcate other aspects of identity and social order, especially along the lines of race and class. Many gender norms remained consistent during the colonial, Revolutionary, and post-Revolutionary eras, whereas others changed as Americans adapted the intellectual currents of the late eighteenth-century Atlantic world to the needs of the new nation.

CONTINUITY: HOUSEHOLDS AND MASCULINE AUTHORITY

In the early Republic the household was the basic social, economic, and political unit. Society celebrated masculine and feminine traits that fostered and reproduced well-ordered households. The paradigmatic American household during this period was that of the independent yeoman farmer, an ideal derived from England. Revolutionary literature—particularly the writings of John Dickinson, Thomas Jefferson, and J. Hector St. John de Crèvecoeur—helped transform this English ideal into an American icon. The changes in this ideal between 1750 to 1830 illustrate the subtle shifts in dominant gender norms during this period.

For eighteenth-century households, independence was obtained through interdependence. The prototypical yeoman was a benevolent patriarch, whose status and power derived from his ability to govern his dependent wife, children, and perhaps also servants and slaves. His feminine counterpart was the “good wife,” who contributed to household prosperity through production, reproductive labor, and rational consumption, and who also modeled deference and submission for other dependents. The collective aim of a yeoman household was a comfortable “competence,” meaning enough wealth—and especially enough land—to keep the immediate family employed at home. Prosperity enabled a yeoman to become a patron to his poorer neighbors, giving them work and sustenance they could not provide for themselves; in return, he earned respect, rank, and authority in his community.

In its broad outlines, this pattern of patronage-based social hierarchy also applied to artisans and gentlemen. (In America even those who aspired to gentility usually had to acknowledge that their wealth and leisure had originated in the labor and values of ancestors of the middle sort.) Even the wealthiest independent households were not self-sufficient. Rather, they occupied a position of strength within the interdependent hierarchies and

patronage networks that made up the colonial social fabric. In all instances, the vaunted independence of the household head was predicated on the dependence of many others.

Contrary to the ideal of yeoman independence, in reality the majority of families were not fully self-supporting. Most white households found it necessary to send family members out into the service of others. Native Americans and African Americans faced formal legal barriers to their attempts to marry and form independent households, even when they were technically free. The denial of legal protection to the marriages and family ties of slaves rendered slaves permanent dependents in the households of others. White Americans seized on differing gender and kinship conventions—and invented differences when necessary—to justify their exploitation of people of color. African American men, they argued, were physically strong but morally weak, subject to childish passions that made them unfit for independence. Native American men might be valiant warriors, but they were too lazy to make good household governors. Moreover, the labor they expected of their women indicated their savagery. Women of color could perform physical labor that would exhaust European women, but they supposedly lacked the natural modesty and piety that made the latter virtuous wives and mothers.

CHANGING IDEAS OF GENDER

Basic assumptions about organization of household government, and its foundational place in the polity, did not change with the American Revolution. However, the late eighteenth and early nineteenth centuries did see subtle shifts in beliefs about the appropriate way to exercise masculine authority, in the meaning of masculine independence, and social tolerance for individual ambition.

Male household heads retained formidable legal powers over their dependents well into the nineteenth century, but during the era of the American Revolution they began to express reservations about how this authority should be used. Historians argue that a gentler, paternalistic ethos called into question the authoritarian prerogatives of household patriarchy. The sources of this shift included the Scottish Enlightenment’s celebration of “men of feeling,” political disavowal of monarchical despotism, and—perhaps—self-consciousness inspired by Americans’ own critique of “savagery” in the households of subject people of color. Most significantly, the 1780s saw an explosion in popular literature that idealized marriages based on affection and shared “sensibili-

ty." Sentimental writers turned the loving submission of a wife to the gentle guidance of her chosen husband into a metaphor for the virtuous citizen's consent to just government. Conversely, this literature condemned "rakes" and the "coquettes" as masculine and feminine manifestations of the arbitrary passions that fostered tyranny in households and in society at large. The impact of paternalistic rhetoric is difficult to measure concretely, but over time it opened new opportunities for social dependents to question masculine power.

The Revolutionary era also saw a reformulation of the concept of independence. It became a natural characteristic of individual white men, rather than a status attained through control of property. The masculine right to control dependent wives and children—not the economic resources needed to maintain that control—became a marker of sufficient independence for political privilege. In 1785, for example, an advocate of universal white male suffrage argued that "every man . . . has what is supposed by the constitution to be property: his life, personal liberty, perhaps wife and children, in whom they have a right, the earnings of his own or their industry." By emphasizing the enduring authority of male household heads, the writer recast poor white men as independent property holders and defended their claim to the vote. Such reasoning enlarged the electorate, but it also cemented women's political exclusion. New Jersey's 1808 revision of its voting requirements illustrates this point: the state reduced the property qualification for suffrage and at the same time denied propertied women and free blacks voting rights they had exercised since the Revolution.

The final noteworthy shift was in attitudes toward individual ambition. The patriarchal yeoman household was supposed to be self-replicating, with children following in the footsteps of, and adhering to the gendered ideals of, their fathers and mothers. Economic circumstance made this ideal unattainable for most families. In the early Republic, children could seek alternative means of support by pursuing education in newly available schools and academies, by moving to growing cities and towns, and by relocating to lands opening in the West. In particular, new educational opportunities for boys and girls encouraged them to aspire to wealth and gentility rather than mere competency, and to question the values of their parents. Loss of control over children ultimately led to a rebellion against the male's traditional authority in household government during the Civil War era.

Ideas of Womanhood

The early Republic gave rise to a feminine ideal that transformed women's duties in the home into the wellspring of public virtue. This new concept of womanhood changed the colonial ideal of the "good wife" in ways that at first seemed subtle, but which ultimately reshaped women's relationship to the state. The new feminine ideal also helped the white middle class define citizenship according to its own image and interests. Women of color were some of the first to challenge the notion of virtuous republican womanhood as a source of social inequality.

WOMEN IN COLONIAL AMERICA

In early modern England and in colonial America, "good wife" described the female counterpart to the yeoman farmer. The term was also a polite form of address for a mature woman of middling status, regardless of whether or not she was married. A woman called Goodwife Smith might be the wife of John Smith, Yeoman, or she might be his unmarried sister. These usages indicate the strength of the expectation that women would become wives, and the degree to which gender norms were built around household roles.

“A FRIEND TO THE RIGHTS AND DUTIES OF MEN AND WOMEN”

As I am a real friend to the fair sex, as well as to good, strong, energetic family government, it has given me some concern to see the papers so generally silent about the RIGHTS OF WOMEN. Permit me, Mr. Printer, through the Museum, to state some few of the many essential rights and duties which belong to Women.

1. Women by entering upon the marriage state, renounce some of their natural rights, (as men do, when they enter into the civil society) to secure the remainder. In the one instance, men obey the laws of their own making, so should women, cheerfully submit to the government of their own chusing.
2. While women are under the care of their parents it is their duty, and so should it be their wishes, to shew all filial respect to them—a desire for dress should not exceed their share of that income of the family which can be spared from the necessary domestic wants.
3. When a woman arrives to an age suitable to make a choice of a companion for life, she has an undoubted right to choose a husband: But this election should be cautiously made, and not without consulting those under whose care she may be at the time.
4. A single woman, who is the entire mistress of her own time, has a right of acquiring and possessing property—she also has an unquestionable right to invest the fruits of her earnings in gauzes, flounces, ribbons, and other baubles; But she would do wise to lay up savings, that she may exercise the right of bestowing them towards family support, when she alters her condition.
5. A married woman has a right, in common with her husband, to instruct her children in piety religion and morality, and to instill in them the duties they owe to society, as well as what is due to the parent.
6. As it is a right, so it is a duty of every woman to be neat and decent in her person and family.
7. She has a right to promote frugality, industry and economy; but there is nothing in matrimonial contract to warrant her in the waste of time and property.
8. In family broils, the wife has a right to expostulate with temper: But when entreaty is unavailing, it is her duty to submit to the controul of that government which she has voluntarily chosen.
9. The wife has a right to manage the female department of the family, as long as her prudence and good sense are adequate to the task; and when her talents are superior (*which is frequently the case*) to those of the husband, she has a right to make use of female persuasion to engross the sole government of the home department into her hands.
10. As the men, living under a free constitution of their own framing, are entitled to the protection of the laws—so likewise has a woman a right to be protected by the man of her own choice.
11. If rebellion, insurrection, or any other opposition to a just, mild, and free political government is odious, it is not less so to oppose good family administration.
12. Good government in families creates domestic happiness, and tends to promote the prosperity of the state.

*(From The Weekly Museum [New York],
16 March 1793.)*

As a cultural icon, the good wife encompassed contradictory ideas. She exemplified female industriousness and ability, while at the same time she dutifully submitted to masculine authority and acknowledged female inferiority. The ideal good wife was, above all, assiduously engaged in her household's effort to remain competent. She actively managed her domestic affairs and engaged with her community of neighbors. She participated in the production and exchange of household goods and labor, and she monitored the behavior—especially the moral and sexual behavior—of people in her cir-

cle. She was the pious backbone of her local church, using faith as the basis for her good works and for her “humble and modest” character. Her piety affirmed her spiritual equality with men, yet prescriptive literature also stressed that faith should make her “submissive from Choice, and obedient by Inclination.”

Under ordinary circumstances, her activities followed a division of labor in which women's work was centered within the household. She produced food and goods for home use and local exchange. The

ability to work primarily in the service of her own household, rather than for others, was a sign of privilege and prosperity. At least in theory, the good wife left the public world of trade, travel, law, and politics to her household head. In that public realm, her identity was legally subsumed by that of her husband. She did not have the right to make independent contracts, to own property, or to serve in government.

Under extraordinary circumstances, however, many of these constraints might not apply. Colonial ideals emphasized role-specific duties rather than (supposedly) essential natural differences between women and men. This ideology not only acknowledged women's ability to perform masculine duties when the situation required, it made doing so the responsibility of a good wife. In the absence of masculine authority—through distance or death—it fell to women to act as “deputy husbands,” carrying out duties a more rigid gender system would deem them incapable of performing. In this regard, colonial ideas of womanhood were more flexible than the reality of most women's lives.

WOMEN IN THE NEW REPUBLIC

During the American Revolution, Americans came to reject the power of monarchs in the government of nations, but they remained reluctant to do away with the analogous powers of fathers in the government of households. The Revolution did not substantially change the economic and legal structures that shaped most women's lives. It did, however, generate new ways of explaining women's relationship to the state and of justifying their subordinate political and social status.

In 1976, historian Linda Kerber coined the term “republican motherhood” to describe the feminine ideal that emerged in the early Republic. Her discussion of the topic has been extremely influential, although scholars now dispute the accuracy and usefulness of her key term. The new ideal elevated traditionally feminine duties into a form of public service, while at the same time providing a rationale for women's continued political exclusion. Popular periodical literature depicted women, in their role as nurturing mothers and chaste and loving wives, as the guardians of civic virtue. By promoting morals and manners in the private, domestic sphere, women curbed the corrupting influences that the public realms of government and business had on male citizens, protecting the integrity of the nation.

Many historians have come to see “republican motherhood” as an imprecise description of this ideology. They note that women's civic importance was

grounded in their loving influence on their husbands as well as on the young; motherhood was not the most significant element of the new rhetoric. And although scholars agree that this new attitude toward women's roles served political ends in the new Republic, they now emphasize that it was neither primarily republican nor even American in its origin. Rather, this new idea of womanhood was a transatlantic offshoot of the moral philosophy and political economy of the Scottish Enlightenment.

The dominant feminine ideal that emerged in the new American nation served conservative ends in the short term, but it also marked the beginning of several profound, long-term changes in American (and arguably international) concepts of womanhood. The celebration of feminine domestic virtue in the early Republic reordered older conceptions of the spheres of human action, shrinking the “private” into a narrowly defined domestic world. It also inverted classical understandings of the locus of virtue, which had seen household interests (and women in particular) as the primary source of vice in public life. The new feminine ideal emphasized claims about essential, natural female difference; this change eroded the more flexible ideology in which women could assume men's roles, enabling some colonial good wives to exert public power. At the same time, the revised idea of womanhood provided a potent new argument in favor of female education, for mothers could not inculcate civic virtue in their children if they themselves did not understand it. Finally, by recasting traditional female duties in the language of rights, it opened the door for later, more direct claims to the expansion of women's political and economic rights. The new Republic simultaneously created a rigidly defined, separate female sphere and provided new grounds on which women could mount challenges to the limits of that sphere.

WOMEN OF COLOR

For poor women and women of color, the dominant ideas about virtuous femininity were double-edged. The colonial good wife and early Republic's concept of feminine virtue were ideals shaped by and for the middle ranks of society, but which claimed universal applicability. The middle class offered these ideals as prescriptions for those of the lower sort who sought to better themselves. Yet they also served as a powerful justification for subordination based on class and race.

The logic here was circular (and not unique to this time and place). Poor women could be criticized for failing to be appropriately feminine, implying

that the shortcoming was something they could remedy. Simultaneously, their supposed lack of feminine propriety could be used to justify exploiting them for labor and for sex, thereby rendering it impossible for them to conform to the dominant ideals.

This tautology took on an added racial dimension in America. The creation of an ideal for white women that posited their natural virtue and modesty was accompanied by rhetoric about women of color that proclaimed their natural propensity for sexual vice. What in the early modern era had been seen as a universal characteristic of female weakness and inferiority became a specific racial trait. This can be sharply illustrated by the changing usage of the words "wench" and "nasty wench." Originally these terms could designate any woman of low status, especially if she was sexually promiscuous. By the late eighteenth century, however, they were used almost exclusively in reference to black women.

In daily life, Native American women often found themselves in the same exploitative bind that was the lot of African American women. The frequent Revolutionary-era use of the image of the Indian woman as an icon for the American nation is particularly ironic. As a woman and a member of a supposedly disappearing people, her image was deliberately not representative of any faction with a chance at political power. As white Americans confronted strong Indian resistance to their efforts at national expansion, they came to prefer the symbolism of Columbia, a white woman of perfect virtue.

Women of color argued and took action against the injustices and inconsistencies inherent in the early Republic's conceptions of women. Native American basket makers, for example, confounded their New England neighbors by conforming to Anglo-American ideas about respectable femininity for part of each year, only to take up the dress and habits of their forebears every autumn. As these women traveled about the countryside marketing their wares, they defied not only the women's roles assigned to them, but also the very notion of the vanishing Indian. Black women founded the nation's first female benevolent societies in the 1790s, using religious arguments to support a public female presence that was a force for virtue rather than vice. A new era in American gender ideology began with the arguments of a black woman, the antislavery activist Maria Stewart, who by 1831 clearly saw that racial and gender hierarchies reinforced each other and subverted America's professed allegiance to liberty and equality.

GEOGRAPHY The United States in 1829 was a little more than seventeen hundred miles long from north to south and about the same distance (counting the Louisiana Purchase) from east to west. Beginning with Cape Cod and widening farther south was the Atlantic Coastal Plain, a low to gently undulating surface that, at the time, offered easy penetration of the interior. From Cape Cod north and immediately to the interior of the coastal plain farther south was the Appalachian System. The line of contact between the coastal plain and the Appalachian System is termed the Fall Line. It is here, at the head of deep water navigation, where many cities developed. On the other hand, New England's rocky coast was very irregular and encouraged the development of many ports. Two general regional terms used from Maryland south were Tidewater, for the easily penetrated coastal plain, and Piedmont, for the gently rolling approach to the mountainous Appalachians west of

The British Colonies in North America. An engraving, dated 1777, by the English cartographer William Faden. SNARK/ART RESOURCE, NY.

the Fall Line. West of the easily penetrated Appalachians lay a great Central Lowland, drained by the navigable Mississippi River system.

Western Europeans, in encountering the new environment, found many parallels with what they had known at home. Much of the animal life was similar. For what was not similar they adopted Native American names (raccoon, opossum, for example). The same followed for vegetation. Other than for Native American clearance, forest prevailed, until the grasslands of the Central Lowland were penetrated. In general the climate was more humid than in Europe, with many large rivers providing abundant waterpower sites, especially in New England. Atlantic America had a continental, rather than a mari-

time, climate, meaning that there were greater temperature differences between winter and summer than in Western Europe. Winters were more severe in New England and the northern interior and summers longer and much hotter in the South than was the case in Western Europe.

Soil fertility varied greatly. Much of the coastal plain and New England had relatively poor soils. There were, of course, exceptions. For example, the Black Belt of Alabama had fertile soils, as did river bottomlands in Mississippi and Louisiana. Large areas of excellent soils could be found in the Piedmont and Central Lowland, notably in Illinois, Ohio, Indiana, and Iowa.

PEOPLE: 1754

By 1754 people of African and European origin occupied a broad area in eastern North America. In the area controlled by the British in what would later become the United States, continuous coastal settlement could be found from present-day Maine through North Carolina. A short gap intervened between coastal North Carolina and South Carolina and Georgia. Navigable rivers, such as the Hudson in the North and Savannah in the South, had encouraged settlement toward the interior, and movement down the great interior valley of the Shenandoah was just beginning. Outliers of settlement to the interior included, in the North, French settlement at Detroit and, in the Illinois Country, along the upper Mississippi in the vicinity of St. Louis. In the Southeast, Spain had settled Saint Augustine and in the Florida panhandle. Spanish and French settlers also occupied a coastal strip around Mobile Bay in what later became Alabama. French and some Spanish settlement could be found at and near New Orleans on the lower Mississippi. To the interior were located various Native American tribal entities, among the most notable being the League of the Iroquois centered on New York's Mohawk Valley and the Creek Confederacy of the Southeast. There were considerable cultural differences between the European and African settled areas. Many of these continued well beyond 1829. New Englanders came disproportionately from the area of East Anglia in Great Britain, north and east of London. Congregationalism was the major religious following. Few held slaves. In New York and New Jersey people who were either Dutch in ethnicity or who had become Dutch in culture comprised an important segment of the population. Many held slaves, and the Dutch Reformed Church was regionally important. In southeastern Pennsylvania and nearby areas, English Quakers were dominant. Slavery was rare. Germans of various Protestant faiths had also settled in Pennsylvania as well as people from the north of Ireland, who generally arrived as Presbyterians but often, in the move to the frontier, became Baptists or Methodists. African slaves could be found in the Tidewater, in many cases making up more than half the population. Slave owners were from many parts of Great Britain and northern Ireland and often were communicants of the Anglican Church. French and Spanish settlement favored Roman Catholicism and, in the South, slavery.

New England was the most heavily populated region, with about 400,000 people, overwhelmingly white. Virginia and the Tidewater country through North Carolina had almost as many people, but here

initially culturally diverse Africans from several areas in West Africa often dominated in numbers. The Hudson Valley and areas adjacent had about 100,000 people, southeastern Pennsylvania had about 230,000, and coastal South Carolina and Georgia had about 90,000, again with Africans in many places often outnumbering the whites. In addition to the contrasts in numbers and religion and ethnicity were differences in age and sex ratios. The frontier tended to have more white males than white females, whereas longer-settled areas tended to have the sexes in equal proportions or be slightly dominated by females because of the outmigration of some males to the frontiers. Where slavery dominated there were often severe differences in sex ratios as the focus of owners early on was for (preferably male) field laborers.

To the interior, the Native American population was also quite varied culturally, in language, subsistence, forms of dwellings, and many other things. Although there is no real agreement on their numbers, there is no question that by 1754 many had died of introduced European and African diseases. In the North, smaller villages prevailed, whereas in the Southeast some settlements reached several thousand inhabitants. In subsistence Native Americans varied from the largely hunting and gathering of northern New England, fishing along the coast of southern New England and Long Island and southern Florida and the Gulf Coast, to farming in much of the interior where a long growing season allowed cultivation of corn, beans, and squash. Dwellings were regionally quite varied, with examples such as the Quonset longhouse of the North, the domal wigwam of the mid-Atlantic and the hipped-roof, rectangular wattle-and-daub house of the Southeast.

PEOPLE: 1829

Decennial national censuses beginning in 1790 give a much better picture of population trends, at least in numbers. By the census of 1830, for example, the population had grown to almost 13 million. Over 18 percent of this population was African American, over 86 percent of whom were slaves. By 1830 natural increase had evened the ratio between the sexes among African Americans to about 102 males per 100 females. In newly settled slave states, the ratios of African Americans to whites was greatly different. In Mississippi, for example, almost half the population was African American, and of this half over 90 percent were slaves. Using New Jersey as an example, in 1830 only a little more than 6 percent of the population was African American, and of these only a little over 10 percent were slaves.

North America. A map of the North American continent, published in 1829 by D. F. Robinson and Company of Connecticut.
© BETTMANN/CORBIS.

Nationally, among whites, the gender ratio was about 104 males to 100 females. These ratios among whites varied greatly with the length of settlement. In New Jersey, for example, an older seaboard state, there were 103 white males to 100 white females. In Michigan Territory, a newly developing area, the ratio was 138 to 100.

The growth in numbers by 1830 had come about largely by natural increase. Exceptions to this included the continuous flow, before the Revolution, of Scots-Irish from northern Ireland, through the port of Philadelphia, westward into Pennsylvania, and then southward to the interior. The other major exception was the displacement of thousands of French settlers after the Seven Years' War from Acadia (present-day Nova Scotia). Many of these people found their way to southwestern Louisiana and became the ancestors of the present Cajun population.

By 1829 Europeans and Africans settled portions of the United States had expanded into what are now the states of Michigan, Wisconsin, Illinois, Indiana, most of Ohio, Missouri, Mississippi, Alabama, and Arkansas. Several events had allowed this to occur. The French threat had been removed by their defeat in the Seven Years' War. Thomas Jefferson's purchase of the Louisiana Territory from Napoleon in 1803 opened the vast interior to American settlement. There had also been several Indian wars. For example, the League of the Iroquois had sided with England during the American Revolution and had been defeated by the Americans. They were no longer a barrier, allowing New Englanders in particular to pour westward through New York's Mohawk Valley. A little later this was the route of the Erie Canal, begun in 1817 and completed in 1825, adding to the flow of settlement west and of produce east.

Possession of Florida began with accessing a portion of the present state of Louisiana (the Florida parishes) in 1819. This was completed in 1822. Further, Native Americans displaced westward, and improvements in transportation (for example, the National Road, the Wilderness Road through Cumberland Gap, and the great expansion of steam navigation in the 1820s) made westward migration much easier.

AGRICULTURE

In an economic sense, whether in 1754 or in 1829, agriculture, with several regional variations, ruled. New Englanders had originally come seeking religious freedom and planned agricultural villages like those in their homeland. Much of New England, however, proved to be hostile to agricultural endeavors, and many people increasingly turned to produc-

ing naval stores (turpentine, pitch, and resin) and timber for shipbuilding and to fishing the rich coastal waters for cod, which was salted and sent in large measure to the Caribbean and Mediterranean. The middle colonies of New York, New Jersey, and Pennsylvania were known as the bread colonies, famed for production of wheat, which was milled into flour and exported in barrels to Europe and the Caribbean. Some areas had regional specialties. Southwestern New Jersey, for example, specialized in growing corn to feed hogs, the source of the hams that were exported through Philadelphia. Also in New Jersey were the small farms established by New Englanders that specialized in apples, which were transformed into the area's famed apple brandy.

The Tidewater country of Maryland, Virginia, and North Carolina early turned to cultivating tobacco with the use of slave labor. North Carolina was especially known for producing naval stores. Indigo, which produces a blue dye, was grown on the coastal plain in North Carolina, especially in South Carolina, Georgia, Spanish Florida, and French Louisiana. Long-staple cotton was produced on the Sea Islands off the Georgia coast. Corn was raised everywhere. Cattle and swine were ubiquitous, roaming free.

Sheep characterized New England more than any other area. By the 1820s the agricultural regions had changed greatly. Farms were being abandoned in New England. Many farmers had left for the West (western New York to Michigan) or to sites where waterpower could be harnessed for manufacturing. The midwestern Corn Belt was in formation, with rapidly growing Cincinnati termed "Porkopolis."

In the middle states, farming remained viable, although there was a shift to livestock to provide protein for the growing cities. Indeed many farmers in this region as well left for the West. In the plantation South, with the introduction of Eli Whitney's cotton gin, upland, short-staple cotton became a major crop in the Piedmont. Cotton production had also moved to central Tennessee, the so-called Black Belt of Alabama, and the bottomlands along the Mississippi in Louisiana and Mississippi. Land worn out by tobacco farming had been abandoned, but wide areas in Virginia's Piedmont were still devoted to producing the crop. Tobacco was now also to be found in the Bluegrass region of Kentucky. Rice replaced indigo in coastal South Carolina and Georgia. In southern Louisiana's Red River and Mississippi bottomlands, sugar had become king.

INDUSTRY AND MINING

Overall, when compared to agriculture, industry was a very minor activity in 1754. Industry was mainly to be found from Maryland north and consisted of grist and saw milling, ironworks, shipbuilding, and distilling. Ironworks were especially to be found in Pennsylvania and New Jersey and the milling of grain especially in the middle colonies. Even by 1820 the use of waterpower for manufacturing outnumbered the use of steam engines by a factor of at least one hundred to one. Factory jobs were to be found in few locations, mainly southeastern Pennsylvania, coastal Connecticut, and eastern Massachusetts. The first major planned manufacturing center, based on textiles, was Paterson, New Jersey, planned in 1791, utilizing the waterpower of the Great Falls of the Passaic River. But it was places in New England, especially in Massachusetts (Lowell being the most commonly cited example), that were able to capitalize on the combination of humid climate, relatively great fall in water from place to place, people abandoning farms and moving to town, interested investors, ease of transport, and availability of cotton from the expanding plantations of the South.

In 1754 mining was quite limited, with iron ore being the major material sought. By 1829 iron mining and production were quite widespread and especially followed in Pennsylvania and New Jersey. Shaft mining for copper began at North Arlington, New Jersey, in about 1712, interrupted by the Revolution, then continued well into the nineteenth century. The mining of glass sands began in southern New Jersey in 1739, and production there was still under way in 1829. Gold was found as early as 1799 in North Carolina, and mining activity was ongoing there and in Georgia in the 1820s. More important economically was the production of salt in the vicinity of Syracuse, New York. Clay was widely mined for pottery and bricks.

TRANSPORTATION

In both 1754 and 1829, the key to settlement and productivity, whether agricultural or industrial, was transportation. The seaboard settlements obviously had an early advantage, with immediate access to marine navigation. In 1754 Philadelphia was the major port, with, from north to south, Boston, Newport, New York, Charleston, Savannah, and New Orleans being of importance. By 1829 New York had eclipsed Philadelphia to become the leading port, partially owing to the opening of the Erie Canal.

New Orleans had become much more important owing to the settlement of the trans-Appalachian West and the development of steam navigation on the Mississippi. In 1754 overland transportation, initially along paths opened by Native Americans, was very poorly developed. Even in 1800, for example, overland travel from New York to Illinois took approximately six weeks. The Capital Turnpike, completed in 1795 between Philadelphia (which was then the capital) and Lancaster, set the stage for private investment in toll roads. Largely because of this, by 1828 the trip from New York to Illinois had shrunk to about three weeks. Where they existed, canals both speeded travel and made the movement of cargoes less expensive. Before the opening of the full length of the Erie Canal, for example, a wagon load took twenty days to reach Buffalo from Albany at a cost of a hundred dollars. After the canal opened, in 1825, the time was reduced to eight days and the cost to twenty dollars. After 1829, of course, the rapid expansion of canals, steam navigation, and the coming of the railroad further revolutionized transportation.

Peter O. Wacker

GEORGIA Initially settled in 1733, for its first twenty years Georgia was a frontier colony. By 1760 the population was six thousand whites and thirty-six hundred blacks, outnumbered by neighboring Creek Indians with a population of thirteen thousand. With only two major towns, Savannah and Augusta, Georgia consisted of little more than a strip of land along the coast between the Altamaha and Savannah Rivers and some additional land inland along the southern bank of the Savannah. By the 1760s Georgia's economy, population, and territory had all begun to grow rapidly. Slavery was legalized in 1750, leading to the expansion of rice-growing coastal slave plantations. White immigrants were drawn by the promise of land. By 1775 the population had mushroomed to eighteen thousand whites and fifteen thousand blacks, but growth of this magnitude could only be maintained with cessions of land from the neighboring Creeks and Cherokees. Indian resistance to land cessions was overcome by misrepresentation, fraud, and the Indians' increasing dependence on trade. Between 1763 and 1773, six official conferences were held with the Creeks alone, five of which led to land cessions that quintupled the area of Georgia.

Initial responses to unpopular British imperial policies of the 1760s were muted. Active support for rebellion developed only after fighting broke out in Massachusetts in April 1775. In January 1776, the Council of Public Safety arrested royal governor James Wright, and in May 1776 the new state of Georgia sent a delegation to the Continental Congress in Philadelphia with instructions to support indepen-

dence. Aside from three unsuccessful invasions of British East Florida beginning in 1776, large-scale military operations in Georgia began with the surprise British capture of Savannah in December 1778. The war would drag on thereafter, with neither side able to win a decisive victory. The continuing warfare divided a countryside deeply between Loyalists and Patriots, the British withdrawing from Savannah only in July 1782.

With the end of the war, Georgia continued to seek additional Indian lands, and in 1785 and 1786 large cessions were obtained from the Creeks with fraudulent treaties. Fighting erupted as settlers flooding into the contested lands were met by Creek soldiers, but neither Georgia nor the Creeks proved strong enough to win uncontested control. The situation helped convince many Georgians of the need for a stronger central government, and delegates from Georgia played an active role in the Constitutional Convention in Philadelphia in 1787. Georgia quickly ratified the new constitution by unanimous vote on 31 December 1787. Land hunger was the thread binding together Georgia's participation in the War of 1812 (1812–1815) as well. Georgians were behind an attempted invasion of Spanish Florida in 1812, and the state benefited from the Treaty of Fort Jackson (1814) that Andrew Jackson imposed on both Creek allies and enemies. The treaty forced the Creeks to part with over twenty million acres in Alabama and southern Georgia.

Georgia's population and economy continued to expand rapidly into the nineteenth century. The non-white population in particular grew in an economy increasingly based on large slave plantations growing cotton. According to the federal decennial census, there were 82,548 Georgians in 1790, and this number doubled by 1800 to 162,686. In 1810 it reached 251,407; by 1820 it was 340,989, and it reached 516,823 in 1830. In 1790, 36 percent of the population was black; in 1800 it was 37 percent, and from 1810 onward it remained at or slightly above 43 percent of the total population. Blacks were overwhelmingly slaves, as the free black population was always much less than 1 percent of the total state population and during this era around 1 percent of the black population (except for 1800 and 1810, when it approached 2 percent).

Concerns over territorial expansion also dominated Georgia politics. James Jackson established one of the most enduring political alliances of the era based on the popularity he gained by opposing Governor George Mathews during the Yazoo land fraud crisis of 1794–1795. The Yazoo crisis was sparked by

the taint of bribery and corruption that surrounded the government authorization of the sale of around thirty-five million acres of western lands for \$500,000, which was signed by Governor Mathews. Although the sale was overturned by Jackson's supporters, it remained a potent political issue in Georgia for decades to come.

Indian removal was the central theme of Governor Michael Troup's successful campaign to win the first popular election for governor in 1825. He influenced the fraudulent Treaty of Indian Springs of 1825, which extinguished the Creeks' title to all of their remaining lands. Creek resistance led President John Quincy Adams to an unprecedented step, the tearing up of a ratified treaty. Renegotiation resulted in the Treaty of Washington (1826), accepted by a people that recognized it had little choice. By 1827 the Creeks had been forced to cede their remaining land in Georgia, leaving only the Cherokees with sizable territory within Georgia's boundaries. The election of President Andrew Jackson in 1828 and the passage of his Indian Removal Act in the spring of 1830 signaled to Georgians that they would not have to wait long, and in 1838 the last of the Cherokees were rounded up by the army and sent west on their infamous Trail of Tears.

David A. Sicko

GERMAN-LANGUAGE PUBLISHING By the 1730s, the American colonies were home to a rising population of German speakers, with nearly 20,000 in Pennsylvania, a number that would increase to one-third of the population of 125,000 by 1776. These readers generated a high demand for newspapers, almanacs, and Bibles printed in their native tongue. The first newspaper in America printed in German was the *Philadelphische Zeitung*, started in 1732 by Benjamin Franklin. Unfortunately, Franklin, who was known for his anti-German political remarks, chose material for the paper carelessly; in addition, it was badly translated. As a result, the paper generated few subscribers and collapsed in 1733. More responsive presses directed by Christopher Sauer, located at the Cloister of Ephrata, the seat of communitarian religious leader Conrad Beisel, printed Bibles, a newspaper, and religious tracts for a German audience beginning in 1739. Sauer's press had the advantage, in 1744, of adding its own paper mill to supply printing material. The Sauer press expanded further in 1770, adding the first German type foundry in the colonies to its enterprise. Before this, type in German Gothic lettering had to be imported from Europe, adding cost and inconvenience to the printing process.

Meanwhile, enterprising German emigrants started newspapers in Philadelphia, like *Der Hoch-Deutsche pennsylvanische* in 1745, closely followed by the *Pennsylvanische Berichte germantauner Zeitung* in 1746. Editors with connections in the German states often received news unavailable elsewhere and printed it first in German for their readers, including updates on the Seven Years' War (1756–1763) and religious disputes. By 1751, five German-language Pennsylvania papers had circulations of nearly four thousand subscribers each, charging an average of three shillings a year and using both the mails and store sales for circulation. For new emigrants, these papers contained crucial information on land acquisition, sending money back to the German states, and avoiding local scams and pitfalls. After 1750, most papers included woodcut illustrations and substantial advertising sections. The British Society for the Propagation of the Gospel (1701) even started a newspaper to Anglicize Germans but found little response.

The American Revolution split the German population, a political trend reflected in the German-language press. The Sauer family, whose politics were pro-proprietor, pacifist, and anti-Revolutionary, published the *Pennsylvanische staats-*

Courier during the British occupation of Philadelphia in 1777–1778. The family was, however, bankrupted by the British evacuation and, because of the enormous hostility it faced, had to relocate after the Revolution to German neighborhoods of Baltimore. There, Samuel Sauer resurfaced in 1791 as the editor of *Der neue hoch deutsche amerikanische Calendar*. At the other end of the political spectrum, Heinrich Miller, a Moravian from Waldeck, set up a print shop in Philadelphia in 1762, where he published *Der wöchentliche pennsylvanische Staatsbote*. A pro-colonial paper, on 5 July 1776 it was the first to publish notice of the adoption of the Declaration of Independence. Ironically, in 1768 the papers of both Miller and the Sauer family had printed German translations of John Dickinson's *Letters from a Pennsylvania Farmer*, a protest against British taxation of the colonies.

In the generation after the American Revolution, German presses began to decline because there were no large waves of German-speaking immigrants. German was gradually replaced by English as a working language in German-dominated areas, and many second-generation German Americans were deeply self-conscious about the slangy language of the existing German newspapers, which they considered ignorant and derisive. The pacifist tradition informed *Der Friedensbote* (1812), a German newspaper in Allentown, Pennsylvania, edited by Joseph Ehrenfried and Heinrich Ebner, that opposed the War of 1812. Partisan political campaigning in the early Republic kept alive some other German papers through high-priced advertising aimed at German-speaking voters. German Americans generally voted against Federalists and nativists, as reflected in *Der Wahre amerikaner* (1804) of Lancaster, Pennsylvania, which was a pro-Jefferson campaign organ. In later campaigns, Democratic candidates such as Andrew Jackson appealed to German American voters, especially on anti-Masonic issues, through specially founded papers, including the Reading, Pennsylvania, *Readinger demokrat und anti-freimaurer Herold* (1826). These papers, however, were only successful when they were written in proper High German, employed German correspondents, and avoided exposing readers to ridicule through vulgar advertising or provincial content.

The religious and political turmoil of the 1830s in Europe spurred intellectual refugees to seek safety and careers in America, and they often gravitated toward existing German publishing. Johan Georg Wesselhöft of Frankfurt emigrated to Philadelphia, founding the high-toned *Alte und neue Welt* in 1834.

Frequently quoting Goethe and Hegel, the paper championed German-speaking small shopkeepers and skilled craftsmen while offering a taste of European cultural material. As Germans migrated westward, German papers followed them, appearing in Cincinnati in 1826, Louisville in 1841, and eventually in Galveston, New Orleans, Indiana and Wisconsin by the 1840s. When the Revolution of 1848 was suppressed in Europe, a new wave of German-speaking emigrants came to the United States, many finding work at German-language papers and carrying over their liberal political traditions into their editorial policies. In Wisconsin, for example, the German press fought a fierce battle against residency restrictions on voting and attacked the Whig Party for its anti-German slurs. Buoyed by new readers, these papers survived into the 1880s, especially in German-dominated regions of Pennsylvania and the Midwest.

GHENT, TREATY OF Signed on 24 December 1814 and also known as the Peace of Christmas Eve, the Treaty of Ghent brought the War of 1812 to an end. This war was a by-product of the Napoleonic Wars (1803–1815). The United States had declared war on 18 June 1812 to force the British to give up certain maritime practices that grew out of the European war, particularly restrictions on American trade with the Continent, imposed by Orders-in-Council, and impressment, which was the forcible removal of seamen from American merchant ships. Although the British suspended the Orders-in-Council on 23 June 1812, they refused to give up impressment, and American attempts to force them to do so by conquering Canada failed. Hence, on 8 Au-

gust 1814 representatives of the two powers met in Ghent, in modern-day Belgium, to discuss terms for peace.

The American delegation, which was headed by John Quincy Adams and included Henry Clay and Albert Gallatin, was exceptionally strong, while the British relied on men of more modest accomplishments, most notably Henry Goulburn, an undersecretary in the colonial office. On more than one occasion, the American envoys outmaneuvered their British counterparts.

By the time the negotiations got under way, the United States had dropped its demand for an end to impressment, but the war in Europe now appeared to be over, which enabled the British to concentrate on the American war and thus put them in the driver's seat at Ghent. As a price for peace, the British insisted on significant American concessions: the creation of an Indian barrier state in the Old Northwest; the surrender of territory in northern Maine and Minnesota; the American demilitarization of the Great Lakes; and an end to American fishing privileges in Canadian waters.

Stunned by the scope of these demands, the American delegation refused to make any concessions and contemplated departing for home. The British, however, retreated to a proposal for making peace on the basis of *uti possidetis*, which meant that each side would keep any conquered territory. If this proposal were acceded to, each power would retain several forts on the other side of the frontier and the British would acquire eastern Maine. When the American envoys rejected this proposal, the British reluctantly agreed to return all conquered territory and establish peace on the basis of the status quo ante bellum (the state that existed before the war).

The treaty did not actually end hostilities. Fearing that the United States might demand changes before approving the agreement, the British insisted that the fighting should end only after both nations had ratified it. The crown ratified almost immediately, on 27 December 1814, but it took six weeks for the treaty to reach the United States. In the meantime, Britain suffered a major defeat—the worst of the war—at the Battle of New Orleans. It was not until 16 February 1815 that President James Madison, with the unanimous consent of the Senate, ratified it on behalf of the United States. Both sides immediately ordered an end to hostilities, although fighting continued for several months in remote parts of North America and in distant seas.

GIBBONS V. OGDEN More than three decades after the ratification of the Constitution, *Gibbons v. Ogden* (22 U.S. 1 [1824]) raised, for the first time, questions concerning the nature and scope of congressional authority in regulating interstate commerce. Chief Justice John Marshall, writing for a unanimous Supreme Court, held that Congress's power to regulate commerce extended to every species of commercial trade, including navigation, between the United States and foreign nations and between the states.

In 1798 New York granted to Robert R. Livingston and Robert Fulton the exclusive right of navigating the state's waters with steamboats. Livingston and Fulton subsequently granted Aaron Ogden the exclusive right to operate a ferry between New York City and several ports in New Jersey. The holders of this monopoly so dominated and energetically enforced it that other states threatened to pass laws in retaliation that would refuse to let steam-powered vessels from New York into their waters.

Thomas Gibbons, who possessed a federal permit under the 1793 Coastal Licensing Act, began to operate a service carrying passengers between New York and New Jersey. Boats belonging to Gibbons and his partner, Cornelius Vanderbilt, entered New York waters, attempting to gain as much business as possible. Ogden was successful in convincing the New Jersey courts to deny Gibbons the right to enter New York waters. Gibbons retained William Wirt, the U.S. attorney general, and Daniel Webster, the lawyer and congressman, to represent his interests at the Supreme Court.

In arguments before the Court that lasted four and a half days, Ogden's attorney, Thomas J. Oakley, held that navigation was not commerce under the meaning of the Constitution; thus intrastate commerce was left to the states to regulate. Wirt put forth the argument that the federal license issued to Gibbons took precedence over a state-granted monopoly. Webster went further, arguing that the

commerce clause of the Constitution gave Congress sole power over commerce and that the state-granted monopoly was in conflict with this clause.

The Court ruled in favor of Gibbons but did not go as far as Webster would have liked. The ruling that Gibbons's federal license nullified the New York grant of monopoly had both immediate and long-term consequences. The opinion held that commerce involves more than the buying and selling of goods. The decision was popular because it broke up the monopoly, prevented further conflict between the states, and left the power to regulate intrastate commerce to the states; this last provision kept states' rights advocates happy. Furthermore, the public welcomed the ruling because, in stating that Congress had the power to regulate interstate commerce, the Court allowed for the nation's economy to operate under one set of laws. The decision was broad enough to apply to new technologies in transportation and communications and to support federal regulation over banking, industry, and labor throughout the nation.

GOVERNMENT

This entry consists of four separate articles: *Overview*, *Local*, *State*, and *Territories*.

Overview

Government is a set of institutions with the legitimate right to use coercion within a given territory, and Americans understood the need for effective government from the beginning. Americans relied on government to keep the peace, defend the land, nurture prosperity, regulate the careless, and administer justice. The British Crown gave its American colonists considerable latitude to govern themselves. Colonial legislatures laid down a diverse mixture of taxes, imposed an assortment of rules on behavior, and defended their citizens against a wide array of foes. Massachusetts began to steer its economic de-

velopment in ways that mimicked mercantilism in Britain itself.

REPUBLICANISM AND STATE GOVERNMENTS

When America's separatists totally dissolved their political connection with the British government in 1776, they were forced to remake their governments. Whig ideas dominated their political thought. Whigs in Britain and America believed that the British government had departed from its true principles and become dominated by a corrupt court in London. Americans based their Revolution on the principle of John Locke (1632–1704) that legitimate government results from a social contract among people seeking authoritative protection of the right to life and liberty. In the Declaration of Independence and elsewhere, rebel leaders listed the British government's violations of this principle to justify political independence. They set out to reconstitute their governments according to republican ideals. Republican principles stipulated, first, that public policymakers should be the agents of the people. Second, republicanism demanded the separation of government powers to prevent the possibility of a single leader, such as a king, making laws, enforcing them, interpreting them, and punishing those who disagreed.

Fueled by passionate republicanism and resentment against the crown, each colony reinvented itself as an independent, self-governing republic. Each of these self-proclaimed states drew on written charters for their authority. Most of them crafted new constitutions for the purpose. Each state assumed the power to legislate tariffs, currency systems, property regulations, and rules concerning debts. State governments took control of millions of acres of lands formerly in British hands. The new American states grew adept at taxation, the foundation power of European nation-states. While individual states found it challenging to exercise control over the territory they governed, and many had to deal with British invasion and occupation during the Revolution, each was steadily consolidating power in the 1780s.

Born of Revolutionary fervor and facing the practical necessity of establishing their legitimacy, these new governments enthusiastically implemented republican ideals. They extended the voting franchise so that from 60 to 70 percent of adult white males in the United States had the right to vote by 1790. The states placed the preponderance of power in the hands of the popularly elected legislators. Each of the new governments also leashed its legislators to the voters with short terms of office, often adding term limits. Pennsylvania's constitution of 1776 em-

bodied Revolutionary republicanism in its purest form, vesting “supreme legislative power” in a unicameral house of representatives whose members faced annual elections and a term limit of four years. The new state governments experimented with a variety of schemes to separate powers, particularly to limit executive power. Ten states created bicameral legislatures, where an upper chamber (typically called a “senate” or “council”) exercised some degree of influence over legislation from the lower house. To shield the courts and the legislature from executive manipulation, the state constitutions limited the power of the state executive (termed either a “governor” or “president”). Only four states allowed the governor substantial power to appoint public officials, and only three provided for an executive veto.

THE U.S. CONSTITUTION

By the mid-1780s, problems arising from state governance were building an increasingly broad constituency for fundamental reform of the national government. Without the unifying fact of British governance or the unifying spirit of Revolutionary idealism, the states’ diverse cultures, religious traditions, political dynamics, and economic interests began to send them on conflicting paths of political development. The United States faced a dilemma of cooperation: the popularly elected state legislatures had strong incentives to resist imposing any sacrifice on their constituents, and each could gain more in the short term by acting independently than by cooperating to advance the long-term interests of the nation as a whole. Economic depression in the 1780s only intensified pressures on state legislatures to use their authority to protect the mass of their voting constituents, even at the expense of Americans elsewhere. Some state governments revived the paper money emissions used by their colonial predecessors, while others suspended debtors’ payments. Massachusetts pursued a more conservative policy toward debts and money, but that course sparked the intense resentment that contributed to Shays’s Rebellion (1786–1787). Meanwhile, states became bolder in using their power to slap fees on imports and exports from other countries or states. The thirteen states were pursuing different economic policies customized to their diverse economic and political interests, threatening economic elites and imperiling national commercial, currency, and other policies that some political elites desired.

The Confederation government. These circumstances prompted republican nationalists like James Madison to seek additional powers for the national

government to make it more capable of pursuing the nation’s interests. The Continental Congress assumed some of the key functions of national sovereignty in the 1770s, particularly overseeing the conduct of the Revolutionary War. This jerry-built national government, however, had no constitutional authority until the states completed ratification of written Articles of Confederation in 1781. The Articles provided little more than a whisper of sovereign power to the central government. In the Confederation Congress each state, whether large or small, cast a single vote. Congress could not exercise any exclusive power over the nation’s interior, any state’s economic assets, or any state commercial powers. Congress had no taxing powers, but instead depended on the states to contribute national revenues according to a schedule of requisitions; not surprisingly, the states balked at filling these requisitions, causing overwhelming fiscal problems for the Confederation government. Even when the cumbersome national policy process produced a decision, the Articles made the policy hard to implement because there existed few national administrators and no national judges. By 1786, growing anxiety had created an opportunity for pathbreaking government reform.

Madison and national powers. Madison, Alexander Hamilton, and other nationalists had tried but failed to increase specific national powers incrementally in the 1780s. In 1786 they seized on the climate of opinion to engineer, first, a commercial convention at Annapolis, Maryland, and in turn the Constitutional Convention in 1787 to deliberate reforms more comprehensively. Drawing on an extensive study of past and present governments, Madison proposed a national government with broad powers, including the authority to tax, to regulate both interstate and intrastate commerce, and to veto state laws at will. Madison thought that the national government should “have powers far beyond those exercised by the British Parliament when the States were part of the British Empire.” This expanded national authority would be lodged in a bicameral legislature, with a lower house elected directly by the people, an upper chamber selected by the lower house, and seats in both chambers apportioned on the basis of population. The two legislative houses would select the executive and the courts. Madison believed this process of “successive filtrations” would ensure that a national government rooted in popular sovereignty also would have the capacity to govern in the nation’s interests.

Large versus small states. Because broad republican principles did not specify precisely how powers

should be separated, checked, and balanced, the Constitutional Convention became a protracted battle between the smaller states' demands for rules protecting their advantages and the larger states' desire for a government effective enough to promote their interests. Madison's scheme, presented as the Virginia Plan at the start of the Convention, posed a serious threat to the interests of smaller states. Delegates from these states had supported a few specific additions to national power, such as the regulation of interstate commerce. But these delegates viewed the equality of state representation in the Continental Congress as a compensation for their economic disadvantages relative to better-endowed, more populous neighbors. Large states would gain power if legislative representation were apportioned by size of population. The small states' alternative plan, the New Jersey Plan, proposed a limited set of added national powers, vested authority in the existing Continental Congress (thus protecting their equal weight in policymaking), and added a national executive and judiciary.

The battles between these interests shaped the Convention's decisions from start to finish. A balance of power was struck between the House of Representatives, based on representation proportioned to population, and the Senate, based on equal state representation. The executive was chosen by an electoral college invented to separate presidential selection from Congress and to give the smaller states some additional weight in choosing the executive. Slavery complicated both debates. The southern states successfully demanded that their slaves be counted for both representation and the election of the president. Indeed, during one crucial debate James Madison argued that the real difference between the states was not their size, but between the states where slavery was the basis of the economy and those where it was not. Judges and administrators would be chosen by the president with the Senate's consent.

Division of powers. In defiance of the conventional wisdom among legal authorities such as Sir William Blackstone, sovereignty was divided and parceled out to both the national and state governments. The Constitution enumerated national powers, left substantial policy authority to the states, and placed the burden of proof on advocates of future extensions of national authority. The national government would exercise the powers of a sovereign nation, such as war, diplomacy, coinage, and regulation of international trade. The states would continue to do most of the governing of everyday life in America, such as the regulation of capital, land, and labor, including

slave labor. The Constitution left ambiguous the boundaries between state and national power and between the powers of the national policymaking institutions.

THE CONSTITUTION'S CONSEQUENCES

No other country had deliberately put its governmental contract in writing, and no other had sought to establish the legitimacy of its fundamental law through special, temporary ratifying conventions. Disarmingly styling themselves "Federalists," Madison, Hamilton and other proponents of the Constitution endeavored to persuade citizens that the proposed government was logical and coherent. "Anti-Federalist" opponents asked whether government in such a vast area as the United States could remain republican and also questioned the proposed powers of the national government, as well as specific institutional arrangements. Immediately after a sufficient number of states approved the plan in 1788, the unifying power of the Constitution and popular ratification became apparent. In spite of intense conflicts over its ratification, nearly all the Constitution's opponents quickly acquiesced when the new national government started up in the spring of 1789. The Constitution became the most fundamental source of public authority in the United States. It also structured the most important battlefields of American politics.

Much of the subsequent history of the government of the early American Republic involved struggles to bring the Constitution to life and to define its ambiguous boundaries. True to his word, Madison, as floor leader in the first House of Representatives, successfully led the fight for a set of constitutional amendments establishing a bill of rights. President George Washington's steady leadership and Treasury Secretary Hamilton's ambitions for an active national economic policy established the independent vigor of the executive branch. Hamilton's program, in turn, animated alliances of officeholders across the nation. One aligned with Hamilton and became the Federalist Party, and another, led by Madison and Thomas Jefferson in opposition to Hamilton, became the Democratic Republican Party. The peaceful transition of power to Jefferson after the bitter presidential election of 1800 proved the new government's durability.

From 1801 until Andrew Jackson's presidential inaugural in 1829, these Democratic Republicans dominated the development of American government. Rather than alter the Constitution fundamentally, political leaders experimented with institution-

al powers and boundaries. President Jefferson actively directed Congress, but it grew more independent under Presidents Madison, James Monroe, and John Quincy Adams. Under the strong leadership of Speaker Henry Clay from 1811 to 1825, the House of Representatives developed twenty permanent committees and more actively investigated executive branch activities. Jefferson's electoral triumph in 1800 helped push the Federalist chief justice of the Supreme Court, John Marshall, to assert its power of judicial review, strengthening its ability to check and channel other parts of government. In this period, national expenditures grew, the national military was reorganized, the U.S. Army Corps of Engineers became important in civil and military construction, and post offices grew exponentially. But presidents refused to commit the national government to a broad national program of internal improvements. This task, like most other tasks of internal governance, fell to state and local governments. Many of them extended suffrage. State and local taxation, regulation, and economic development continued to expand. State projects like New York's Erie Canal (1825) set the pace for the development of public infrastructure.

The American revolution in government set new precedents for the construction of governments and of politics. It established the model of a written constitution ratified indirectly by popular approval. As implemented, it established formally separated national powers, judicial review, and a form of federalism in which states and the national government shared sovereignty. It profoundly shaped American politics by creating new arenas for political combat and making the Constitution the foundation for legitimizing political positions. Its ambiguities displaced many substantive conflicts into battles over the definition of institutional powers. In the case of slavery, the struggle to resolve ambiguities about government put America on the path to civil war.

Local

In a period of tumultuous political developments, the institutions of American local government exhibit surprising continuities across time: first, in the unit of jurisdiction (town or county) dominant in each state; second, in the nature of relations between local governments and the central government of their respective states; and third, in the ongoing role of English law. During the eighteenth century, as a result of the Great Awakening, the French and Indian War, and national independence, local government also experienced considerable change.

TOWNS AND COUNTIES

In states that began existence as chartered corporations—Massachusetts, Rhode Island, and Connecticut—the unit of jurisdiction was the town; in those that began as proprietary colonies—New York, Pennsylvania, Maryland, Delaware—or were first organized as royal provinces—Virginia, North Carolina, South Carolina, New Jersey, New Hampshire, Georgia—it was the county. New states followed a regional pattern: Vermont and Maine, the town; Kentucky, Tennessee, Louisiana, Mississippi, Alabama, the county; Ohio, Indiana, and Illinois, a township-county arrangement that divided offices and services. Likewise early cities: Boston's represen-

tation in the Massachusetts assembly, for instance, was based on its identity as a town, not on its being the county seat of Suffolk County. New York, Baltimore, Philadelphia, and Charleston were counties and represented as such.

In many respects counties performed functions parallel to towns and were everywhere the location of state courts. Still, the distinction was significant. Towns usually chose their own administrative officers, whereas most county officers during this period were appointed by governors and, later, by state legislatures. The town meetings of New England were attended by free male inhabitants of legal age, charged with duties of establishing schools, levying taxes providing for ministers, allotting lands, laying out roads, legislating by-laws setting the height of fences and the price of beer, and electing or appointing an exhaustive list of local officers—selectmen, clerks, overseers, inspectors, keepers, and measurers of every description. Suffrage and officeholder requirements were generally lowest at the local level. In Pennsylvania, Virginia, and Indiana, counties of-

ferred opportunities for participation and employment similar to those of towns.

Although counties, being larger, may have engendered a less parochial citizenry, they were on the whole the more problematic form. Because counties typically characterized less populous regions, county seats were often miles away from already isolated residents. Land policy in the Northwest and Southwest Territories strengthened this difference. In the Northwest, Congress set aside lots for schools that were attached to townships, and schools became a focal point of local public activity. In the Southwest, Congress allotted lands in large tracts, with adjacent counties sharing in them proportionally, with the consequences of slowing both civic and school growth. County lines, laid down centrally and in advance, were slow to keep pace with population, causing disproportionate representation in state legislatures. Indeed, reapportionment was a major issue of contention in all areas of frontier settlement, before and after independence. Without adequate representation, settlers were poorly situated to redress the

corruption that plagued the backcountry or to expand needed services.

RELATIONS BETWEEN LOCAL AND CENTRAL GOVERNMENTS

In South Carolina, where homesteads were far apart, the connection between local government and the central government of the state barely existed. Most court proceedings took place in Charleston; local justices of the peace were appointed by the governor and enjoyed little authority; tax assessors and collectors were appointed by the assembly. As the need arose, the assembly would appoint temporary commissioners to perform local tasks. After independence, the city of Charleston elected officers to measure wood, monitor fuel sales, and inspect goods for export, but these answered to the assembly, which paid their salary. In North Carolina, Kentucky, and Tennessee, governors appointed county courts of justices of the peace, nominated by the assembly, who in turn appointed most other county officers. In Virginia the balance leaned in favor of local government: although appointed by the governor, local justices enjoyed broad discretion, and court days, with their slave markets and horse races, were a high point of commerce and sociability. In Vermont the storied autonomy of towns was strengthened by short terms for governor and assembly and, until 1808, by moving assembly meetings from town to town. In New York and Pennsylvania, state legislatures themselves mirrored local factions, with members drawn from rival oligarchies and machines. In Massachusetts relations between the towns, jealous of their independence, and central institutions located in Boston were continually strained.

Central authorities, first royal governors and later usually assemblies, appointed most judicial officers—justices of the peace, judges, sheriffs, coroners, constables, as well as heads of the militia and special commissions—sometimes from lists drawn up locally. Because justices of the peace and sheriffs were frequently assigned administrative duties like supervising elections and collecting taxes, central control was also exerted by that route. As the period progressed, election of judicial officers other than judges became more common: sheriffs, for example, were elected in Maryland and New Jersey following independence and in Alabama, Indiana, and Illinois from statehood. Judicial appointment was more significant than it is today. At a time of little bureaucracy, when common law regulated the use of fields, keeping of animals, working hours, fences, fire prevention, family relations, and poor relief, judges were the primary instrument of public administra-

tion as well as ordinary law enforcement. Judicial officers staffed special commissions, conducting inquiries and arriving at policy in the style of petition-and-answer familiar today mainly in litigation.

THE ROLE OF ENGLISH LAW

The preeminent role of judicial officers invokes the third constant in local government during this period, which is the ongoing role of English law. The organization and responsibilities of towns and counties paralleled their English counterparts. The New England town meeting resembled the meeting of ratepayers in the English parish. The restrictions on sales and gifts of land, the registration of outsiders staying in colonial towns and their indemnification against damages, the regulation of lights-on and the night watch: all reproduced life in English localities. With minor adaptations, English laws or their redaction in colonial and state statutes governed the rights and duties of local officers. For instance, one can read court cases on the reimbursement of expenses to American sheriffs decided according to English precedents of a century earlier. Likewise, all local property transactions were scrutinized for their adherence to common law. The traditional regulations of English militia structured slave patrols in southern states. Another English import was holding more than one office at the same time; prompting charges of corruption, appointing officers often reserved coveted local positions for themselves.

Matters of religion constituted an important departure from English government. A primary reason for founding New England towns was the independent operation of individual churches within the framework of state establishment. In places where Anglicanism was established, county parishes governed by vestrymen and church wardens continued to perform many of the same secular functions as did English parishes, including caring for the sick and indigent, processioning land, and presenting moral offenders to court. The choosing of ministers and vestrymen, however, marked a major difference. In the absence of a North American bishop or other ecclesiastical authority, vestrymen elected by Anglican freeholders chose ministers in South Carolina, and vestrymen appointed by their own predecessors appointed ministers in Virginia. In Maryland, where the majority of offices were originally held by Catholics and other Catholics, vestrymen were chosen by all freeholders and confined to church functions. By 1820, all states but Massachusetts had disestablished churches, and counties took over parishes' public responsibilities—frequently to the detriment of schools, poor relief, and local finance.

ERAS OF CHANGE

A critical era of change for local government occurred midway through the eighteenth century, at the time of the Great Awakening, a series of religious revivals that spread through the colonies beginning in the 1730s, and the French and Indian War (1754–1763). These events exerted pressure on existing forms of government at all levels. The Great Awakening spawned religious factionalism wherever it took hold. The war increased insecurity as it heightened British anxieties about its cost. Together they spurred movements of resentment and revolt. Among the most sensational was the Paxton Boys' rebellion in Western Pennsylvania in 1763, starting with an attack on a nearby Indian encampment, proceeding to local resistance against colonial troops, and culminating in an armed march to Philadelphia to demand better representation of outlying settlements. Another was the Regulator movement in western North Carolina, where settlers, largely German Reformed and Presbyterian, organized against taxes and other predations administered by officeholders appointed from the eastern and Anglican parts of the colony. The Regulator movement continued in fits and starts until its defeat by an army of militiamen and the hanging of six of its leaders in 1771, but not before it had joined its grievances with those of other colonials seeking independence.

A second era of change was independence. As state after state wrote new constitutions replacing royal executive power with greatly weakened governors, the importance of localities increased alongside that of their representatives in the assembly. In Georgia, for example, in addition to naming most other state officers, including local sheriffs and constables, the assembly elected the governor. In Connecticut, the governor was given authority to appoint petty notaries and interim turnpike commissioners and little else. With even the upper house (Council) chosen by the assembly from a list of nominees drawn up by town meetings, a measure of central control was imposed by requiring that the meetings be conducted by justices of the peace or constables or persons designated by them. The new states of Ohio, Louisiana, Illinois, and Indiana all established weak governors. Only Mississippi deviated: its first constitution in 1817 limited assembly terms to one year and restricted local choice by requiring that members own three hundred acres of land or one thousand dollars in other real estate.

With independence, state governments were free to modify existing city charters and create new ones. States with counties as their basic political unit were more accommodating to the promotion of cities than

were states with towns. Pennsylvania, New Jersey, Virginia, and South Carolina had granted eleven new charters before New England granted any; of twenty-five charters granted by former colonies in the first dozen years after the Revolution, New England granted only six. Residents of towns, coming to decisions as a body, were well situated to defend the status quo. The Boston meeting defeated some five charter plans before the state constitution was amended to shift authority to the legislature. New York, a tightly regulated corporation since the seventeenth century, faced a different obstacle: a new constitution in 1777 provided a city council of popularly elected aldermen but left the appointment of thousands of city officers—including the mayor, who presided over the aldermen and the principal civil and criminal courts—to a Council of Appointment chosen by the assembly and controlled by the governor. Nevertheless, while Boston lagged, New York City saw a rapid loosening of old restrictions on commerce and other steps toward modernization.

State

The states of the United States of America are among the basic political units of the federal system as defined in the Constitution. They perform all of the domestic tasks usually assigned traditional nation-states in other parts of the world. Basic rights are given force of law in state constitutions and legislative form by state assemblies. State governments are

responsible for defining criminal and civil procedures for administering justice and settling disputes among citizens.

As the principal authority of a specific region, state governments fill a primary role in the provisioning and administering of internal improvements, such as roads, waterworks, and schools, either directly or indirectly (through counties and cities), as may be directed by the specific provisions of their respective constitutions. They may also grant articles of incorporation to both public and private enterprises. Their central role in local internal matters developed out of their existence as distinct political entities that predated the ratification of the Constitution in 1789. Their origins extend back to the colonial charters of the original thirteen colonies. Indeed, to properly understand the constitutional relationship of the states to the national government and the reasons for their dominance of local affairs, it is imperative to understand their earlier origins as colonies of the British Empire.

COLONIAL ORIGINS OF THE STATES

Each colony of British North America had its own distinctive history and motive for settlement. In each case the king recognized a legal existence through the granting of special articles of incorporation to either a company of men or a single proprietor. These articles of incorporation were called charters.

The earliest American colonial projects developed for many reasons, but from the perspective of the crown they were principally of a business nature. Even the Massachusetts Bay Company was to develop land and seek out commercially viable products for trade, though the merchants who formed the company were seeking religious freedom for their Puritan coreligionists. The Virginia Company was entirely commercial, focusing on the prospects for gold and mercantile development. In both cases, what began as an essentially private concern was transformed by the mid-eighteenth century into a public, political entity whose primary purpose was to administer a specific territory. This was typically accomplished through a mixture of representative assemblies, a council of advisors, and a governor appointed either by a proprietor in whose name the colony operated, or directly by the king. In each case the crown retained control of the appointment of governors, requiring proprietors to submit their nominations for approval before commissioning. That said, the legislatures of all the colonies were well developed by the early 1700s and possessed the major portion of influence in local affairs, even setting the salaries

of royal governors and magistrates. By 1750 friction between America and England would erupt along these very lines, setting royal governors against colonial assemblies.

FROM COLONIES TO STATES

Until the end of the Seven Years' War (or what was called in America the French and Indian War [1756–1763]), the colonies had been left largely to themselves. It was in this period that the colonies developed the habit of self-government, conducting most matters of a domestic nature on the basis of their own taxing powers, their own rules of local representation, and their own systems of adjudication. With the defeat of the French in North America in 1760, however, England turned its attention to its American possessions and, needing resources to extend its imperial objectives, looked to the colonies for those resources.

Opposition to various British measures designed to tax Americans formed in each colony and eventually galvanized into a unified opposition, setting the stage for the formation of what became the United States of America. Americans based their opposition on a very particular understanding of their constitutional relationship to the English king and Parliament. Like England, each colony had its own distinct representative institutions. These assemblies, according to the American Whig understanding, were in the same relation to the king as was Parliament. Their governors were still appointed or approved by him, and there was precedent for the king making direct requests to colonial legislatures for funds. Thus Richard Bland, a prominent member of the Virginia House of Burgesses, pointed out that when Charles II had sought to establish a permanent revenue "for the support of the Government in Virginia, the King did not apply to the English Parliament, but to the General Assembly [of that colony]." From this perspective, the executive of the empire was responsible to each legislature within the imperial domain, but no particular legislature could legislate for the others. Indeed, if one were to try, Thomas Jefferson contended, the king would be obliged to use his veto to oppose such a measure: "Let no act be passed by any one legislature which may infringe on the rights and liberties of another."

According to Americans, the rights of Englishmen included the right to be represented in a legislature capable of representing their interests. For Englishmen, however, the king had to remain under the strict control of Parliament; by this time even the monarchy would not broach the idea of an indepen-

dent royal jurisdiction in the colonies. By 1774 the conflict with America had become violent, and by 1776, reconciliation was unworkable. Having been commissioned the previous month to prepare a statement declaring the reasons for independence, Jefferson's Declaration of Independence was accepted with moderate revisions by Congress on 4 July 1776.

Prior to the congressional vote for independence, each state had issued its own formal instructions to delegates, which amounted to separate and distinct declarations of each colony. Congress's Declaration recognized something of the grievances of each and was thus a recognition of the united character of their opposition, but also the separate and distinct corporate existences of what were now explicitly called "states."

FROM CONFEDERATION TO FEDERATION

In their opposition, the colonies put into practice the theory they had used to describe the constitution of the empire. Internal affairs were governed by each colony separately, but external defense was to be coordinated from the Confederation Congress in command of the Continental Army. The relationship was formalized in the Articles of Confederation ratified on 1 March 1781.

The Articles empowered Congress to deal with foreign nations, make war and peace, negotiate disputes arising among the states, maintain an army and a navy, and regulate post offices and mail delivery across the United States. These were not inconsiderable powers, but they were made difficult to implement properly because of Congress's inability to raise an independent source of revenue.

Just as the colonies had distrusted the distant authority of Parliament to raise taxes from them, so they remained leery of even Congress's authority to collect excises and tariffs. Consequently the Articles required the unanimous support of all the states to pass legislation for levying a tax, and this proved ultimately unworkable. It was also clear that something had to be done about the power of the states to impede trade across their borders.

In a few instances states were engaging in their own foreign relations, imposing tariffs on the productions of other states, and interfering with the powers that supposedly had been delegated to Congress. Issues of paper money finance were also a major concern. Each colony had issued its own currency that competed with the continental issues, and although these did fare better because of the states' taxing powers, it was clear that some states were less

responsible in the discharge of their debts than others. As paper money depreciated in value over the course of the Revolution, contracts of all sorts, public and private, were imperiled. To address these concerns, a special Constitutional Convention was called by certain congressional leaders to meet in Philadelphia to propose revisions of the Articles that would provide the national government with effective powers to enforce its constitutionally delegated powers. The convention was composed of representatives appointed by the states and began business in May 1787. It did not complete its task until September. The result was far more than a revision—it was in fact an entirely new government.

During the Constitutional Convention, issues of how the state governments would be represented in Congress quickly came to the fore of political debate. Two plans were presented: The Virginia Plan called for a more centralized power, with the ability to override state laws and a legislature based on proportional popular representation. The New Jersey Plan gave Congress certain powers of taxation, but representation was to be equal among the states. In the end a compromise was reached whereby the larger and smaller states agreed to equal representation in the upper house, or Senate, and popular proportional representation in the lower house, or House of Representatives.

Other provisions were passed to define the powers of the legislative branch (Senate and House), the executive branch (the presidency), and the judicial branch (the Supreme Court). The end result was a government of limited delegated authority, with powers assigned to the national government for matters of foreign relations and relations among the states, and other powers being retained by the states or the people of the states. Those powers were considerable.

STATE POWERS RETAINED

Religion. Before the adoption of the Fourteenth Amendment, in 1868, the First Amendment to the Constitution, only prohibited Congress from passing laws respecting the establishment of religious institutions and practices. Although most states recognized the freedom of worship and belief, many still retained some official relations with particular faiths. In Massachusetts, for example, the state imposed a tax on all residents for the support of the Congregational Church until 1811, unless one could show membership in some other incorporated religious body. New Hampshire would require public support of some religious institutions until after the Civil

War. Other states, such as Pennsylvania and Tennessee, required a belief in one God and a future state of rewards and punishments to qualify for office. Tennessee, and a few other states also prohibited members of the clergy from holding public office. Maryland pronounced atheists ineligible to serve on juries. Virginia, on the other hand, in a law written by Jefferson and guided through the legislature by Madison, secured a more thorough separation of church and state government through the passage of the Bill for Religious Freedom in 1786, well before the creation of the federal constitution. New York's first constitution created a complete separation of church and state, and full religious freedom for its citizens. However, the document also required that all aliens renounce allegiance to any foreign "potentates," a provision that seemed to discriminate against Catholics. There is no indication, however, that this provision was ever enforced.

Suffrage and office holding. States were also possessed of wide powers to regulate the right to vote and office holding. About half of the original states, as well as Vermont and Tennessee, allowed free blacks to vote on the same basis as whites. After 1800, however, no new state except Maine granted blacks suffrage until the Civil War era. After 1821 blacks in New York had to meet property requirement to vote that was no longer applied to whites. By 1830 blacks had completely lost the right to vote in New Jersey and Maryland. In the next decade, Jacksonian democracy would lead to black disfranchisement in Pennsylvania, Tennessee, and North Carolina. New Jersey allowed women to vote in its first constitution, but eliminated this right before 1812. Most of the states initially has some property requirements for voting, but by 1830 almost none did.

The states also had different requirements for office holding. Many of the states required officeholders to possess a set amount of property, and some, like New York, had a sliding scale, with members of lower house of the state legislature required to own less property than state senators or the governor. Eleven of the first thirteen states had some form of religious test for office holding. The New England states limited the privilege to Protestants, while the middle and southern states limited it to Christians. Delaware, in a unique provision, allowed only Trinitarians to hold public office. Most states abandoned these restrictions in the early part of the nineteenth century, although North Carolina and Maryland retained them into the 1820s.

The states experimented with different rules for office holding and different terms of office. Some preferred annual elections to the state legislature, while others had two year terms for the lower house and much longer terms for the state senates. Some governors had a veto power, others did not. While the founding generation tended to believe in rotation in office, most state constitutions did not have term limits.

Education. State governments also retained the power to legislate for the provision of basic public goods. Education was often assigned to localities—to cities and counties. A public school system was especially well developed in the New England states. New York City experienced considerable controversy during the 1840s over the integration of Catholic and Protestant students, and in 1842 the New York State Legislature took control away from the private Protestant Public Schools Society and established a Board of Education to govern the city's common schools.

Internal improvements. Roads and canals for the improvement of farming and commerce were a major focus of state governments. Although many were in fact built by private businesses, state funding was not uncommon; between 1817 and 1844 some four thousand miles of canals were constructed. Among the most notable was that undertaken by New York, the Erie Canal project under the direction of DeWitt Clinton in the 1820s.

Direct taxation. To go along with such internal projects, and for the funding of basic government expenditures, states possessed (and still retain) broad powers of direct taxation (e.g., property and income taxes). These could vary in form from state to state, but the chief tax was a property tax. Those who assessed the tax were appointed by local communities under general laws of the state.

Incorporation. Somewhat more controversial was the power to incorporate businesses. Articles of incorporation usually provided specific protection or limited liability to the owners of corporate shares in a particular enterprise. This was to encourage the development or performance of a specific area of business. Among the most controversial were banks. From 1791 to 1816 the total number of such institutions grew from 6 to 246. Each state regulated its banking system in its own way. Some prohibited branch banking, believing that capital should remain for local uses. Often banks were required to invest a certain portion in state or municipal bonds, and still others established various forms of insured deposits. By the 1840s a number of states had accepted the

idea of a “general law of incorporation,” allowing fairly easy entry into the business of banking. Although the charge of wildcat banking was overblown, some institutions were run on very shaky foundations, especially in remote areas where branches were prohibited and banknotes were difficult to redeem.

TENSIONS OF A PARTLY NATIONAL AND PARTLY FEDERAL SYSTEM

Such sizable powers were in fact merely a continuation of the basic idea that differing communities ought to be allowed to govern themselves according to their own lights. Representation of the people was a principle of the Revolution, but the people were not the same from state to state. Rather than surrendering all authority to a single unified government, Americans chose to retain the most immediate powers of private and public regulation closer to home.

So where was the balance of power between the states and the national government? Was the United States primarily of a national or a federal character?

A national government derives its powers directly from the sovereignty of the whole people. A federal government takes its authority from the corporate powers of the states. As Madison famously observed in essay number 39 of the *Federalist Papers*, a series published in New York collaboratively with John Jay and Alexander Hamilton between 1787 and 1788, the new government was “a composite of both.” This ambiguity was partly intentional and partly not. To some degree the authors of the Constitution wanted the state governments and the national government to check each other to ensure that neither would overstep their “constitutional” bounds. What was perhaps unintentional was the ambiguity that would become apparent when trying to interpret the document. Was the Constitution a compact among the peoples of the states, or was it fundamentally based on the people as a whole? Could the states secede if they believed the compact had been violated, or would the supremacy clause of the Constitution uphold all federal laws in all circumstances? And who would decide such questions? The federal judiciary? Each separate branch of the federal government? The states themselves?

The issue of slavery was mostly left to the states in the early national period. Some states, including Massachusetts, Vermont, and Ohio, prohibited slavery in their first Constitutions. Other Northern states tried to balance claims of liberty against claims of property, by the adoption of gradual emancipation laws and by encouraging private manumission. By

1830 slavery had all but disappeared in the North, where fewer than 3,000 slaves, mostly in New Jersey, could be found. Southern states did not take any steps to end slavery in the revolutionary period, but most allowed private manumission in the years immediately following the War. Support for such laws waned after 1800 and by 1830 Southern states were far more concerned with suppressing slave rebellions and controlling their free black population, than with ending human bondage in their midst.

Slavery also raised political issues at the national level, which impacted on state governments. The Northwest Ordinance (1787) prohibited slavery in the territories north of the Ohio river, but implied slavery would be permitted south of the river. Congress under the new constitution subsequently allowed slavery in those territories and after the purchase of Louisiana in 1803, did nothing to discourage slavery in the West. As the morality of slavery came into question in the North, Southern leaders began to aggressively defend the institution. This came to a head in 1819 when Missouri sought to enter the Union as a slave state. Northerners had never opposed the admission of a slave state before, but Missouri was north of the Ohio River, and northerners argued it should be free under the Northwest Ordinance. Southerners insisted that the people of Missouri should decide the issue for themselves. Two years of stalemate finally led to the Missouri Compromise in 1820, which brought Missouri in as a slave state and broke Maine off from Massachusetts to create a new free state. Under the Compromise Congress banned slavery in the territories north and west of Missouri. This Compromise delayed a cataclysmic crisis over slavery in the territories, but did not solve the problem.

For states the Missouri debates raised the issue of whether Congress could set preconditions for admission to the Union and enforce those conditions after statehood. Some northerners had wanted Missouri to guarantee the rights of free blacks in the state or adopted a gradual emancipation program before entering the Union. Most political leaders agreed, however, that once a state entered the Union it could not be bound by any preconditions set by Congress. This issue emerged in Illinois between 1822 and 1823 when proslavery forces tried to amend the state constitution to allow slavery. The proposal for a state convention failed, and thus there was no opportunity to consider whether the Northwest Ordinance, or any other federal law for the governance of a territory could limit the actions of a state after it entered the Union. But, the issue remained hovering over the de-

bates over new states in the next three decades. The issues over slavery would eventually be resolved by the Civil War, the Emancipation Proclamation (1863), and the Thirteenth Amendment (1865).

The controversies over secession and slavery would compel yet another examination into the tremendous local powers of states to define the rights of citizens. How much difference could be tolerated between states on basic questions of right and wrong within the same federal union? By the time of the conclusion of the Civil War, it would become obvious to some national leaders that a further revision of what states could do with respect to the deprivation of civil rights was in order. It was that sentiment that formed the basis for the Thirteenth, Fourteenth, and Fifteenth Amendments to the Constitution.

That said, the states continue as the primary corporate entity for the resolution of domestic matters in law, both civil and criminal. They are also the primary distributor of funds, whether raised within their own jurisdictions or from Congress, and are the primary arena in which individual rights to life, liberty, and property are given legal form. Each state, having its own written constitution of specified and separate powers, was thought to afford Americans a double security for the rule of law both nationally and domestically—both at the federal and state levels.

Territories

Contention surrounding the ownership, organization, and administration of the territories west of the Appalachian Mountains plagued the United States from its very inception. Relying upon ill-defined colonial charters granting title to lands extending to the “western sea,” many of the Atlantic seaboard states lay claim to vast tracts of western land; claims (many of which overlapped) that they sought to preserve in the nation’s first instrument of government—the Articles of Confederation—drafted in 1777. A handful of eastern states, lacking western claims, argued that trans-Appalachian lands should be pooled into a national domain and placed under the direct control of the Congress. This disagreement, among others, delayed ratification of the Articles until 1781, at which time the states with western land claims, Virginia foremost among them, proposed to cede their claims to the Confederation Congress. The Treaty of Paris (1783), which brought the Revolutionary War to a close, firmly established the American claim to the western territory when Britain ceded all of the land between the Appalachian Mountains and the Mississippi River, north from Spanish Florida and Louisiana to the Great Lakes.

In order to pave the way for the sale of the land and its distribution to Revolutionary War veterans, the United States entered into negotiations with the six Iroquois nations regarding their claims in the West. The resulting Treaty of Fort Stanwix (1784) surrendered lands in western Pennsylvania and Ohio. Similar negotiations with western tribes led to more cessions in the region through the Treaty of Fort McIntosh (1785). Many Ohio country tribes, however, rejected the treaties and resisted the tide of settlers that soon flooded the region. The military suppression of the northwestern tribes would drag on until the end of the War of 1812.

NORTHWEST TERRITORY

In 1784 Virginia formally ceded its lands to the north and west of the Ohio River to the national government, retaining its claim to lands south of the river. The Confederation Congress quickly moved to bring order to the region, passing a series of ordinances in 1784, 1785, and 1787. The Ordinance of 1785 established an orderly and systematic pattern of land survey (based on rectilinear units) and sale that served as the foundation for American public land policy until the Homestead Act of 1862. Of equal consequence was the Ordinance of 1787, which created the nation's first organized territory, the Northwest Territory, encompassing more than 260,000 square miles of land west of Pennsylvania (which was given control over the headwaters of the Ohio River) and north and northwest of the Ohio River.

Among the ordinance's most important features were its guarantees of civil rights and basic freedoms for the region's settlers, its prohibition against slavery and involuntary servitude, and its encouragement of public education. The ordinance further provided that no fewer than three, or more than five, states would be carved out of the territory and that the states would be admitted "to a share in the federal councils on an equal footing with the original states." Additionally, it created a framework for territorial governance and outlined the necessary steps for statehood. In their initial stage, the territories were to be administered by a governor (assisted by a number of other officials) and judges (who concomitantly served as a legislative body) appointed by Congress. Once a population of five thousand inhabitants was reached, the settlers would elect a territorial legislature and be entitled to one nonvoting representative in Congress. After the population grew to sixty thousand inhabitants, the legislature was empowered to submit a constitution to Congress for its approval.

The Northwest Territory elected its first territorial legislature in 1798. Two years later, the territory was divided and the Indiana Territory was created, thereby shrinking the Northwest Territory to the present-day state of Ohio. In 1803 the territory ceased to exist when Ohio was admitted to the union. The remainder of the Old Northwest followed a similar path to statehood. Congress truncated the Indiana Territory in 1805, creating the Michigan Territory, which included the Lower Peninsula of Michigan and the eastern end of the Upper Peninsula. In 1809 the Indiana Territory was again divided and the Illinois Territory was created, encompassing present-day Illinois, Wisconsin, parts of Minnesota, and the western Upper Peninsula of Michigan. Indiana became a state in 1816 and Illinois in 1818. The remainder of the Illinois Territory then transferred to Michigan. Michigan would not achieve statehood until 1837, followed by Wisconsin in 1848 and Minnesota in 1858.

THE OLD SOUTHWEST

This blueprint for territorial organization and governance also served, with some notable modifications—most notably, the absence of a ban on slavery—as the basis for administering and admitting new states in the Old Southwest. In 1790 Congress, operating under the new federal Constitution, created the Territory South of the River Ohio (the Southwest Territory) out of lands ceded by North Carolina. The territory encompassed what became the state of Tennessee but did not include Kentucky, which remained a part of Virginia until 1792, when it entered the union as a state. Tennessee did not linger in the territorial stage for long, gaining statehood in 1796. Two years later, Congress established the Mississippi Territory out of lands previously claimed by South Carolina. The territory was expanded in 1804 to include lands surrendered by Georgia, and again in 1812, extending its boundaries from the Gulf of Mexico to Tennessee and from the western boundary of Georgia to the Mississippi River. In 1817, as the western portion of the territory prepared for statehood, the eastern section, only recently cleared of Indian title through the Treaty of Fort Jackson (1814), was established as the Alabama Territory. As cotton planters flooded onto Alabama's fertile lands, the territory quickly met the requirements for statehood as it entered the Union in 1819.

The acquisition of additional lands by the United States (Louisiana in 1803 and Florida in 1821) added vast new regions to the national domain. Relying upon the precedent for territorial organization al-

ready in place, the federal government moved quickly to establish administrative control over its new possessions. Louisiana was organized into two territories, the Territory of Orleans south of the thirty-third parallel and the Territory of Louisiana to the north. When the southern portion achieved statehood in 1812, assuming the name Louisiana, the northern territory was renamed Missouri. In 1819, in anticipation of Missouri's entrance into the Union two years later, the territory was again divided and the Arkansas Territory established. Florida's territorial stage lasted from 1822 until 1845.

Martin J. Hershock

GOVERNMENT AND THE ECONOMY During the early Republic, both the federal and state governments played a large role in structuring the American economy. Following independence, the United States struggled to replace the British mercantilist system of closed markets, bounties, and limited development with a framework that emphasized economic growth and yet insured stability as well. Paramount to this goal was a preservation of individual liberty and property. Policymakers in the early Republic thus struggled to devise government institutions that would allow entrepreneurial activity to flourish while insuring that republican virtue still held sway in the Republic.

The period from 1789 to 1815 saw the establishment of many permanent institutions that would

continue to structure the nation's political and economic framework for most of the nineteenth century. There were two competing philosophies as to the proper role of government in economic growth. On the one hand, the Federalists, led by Alexander Hamilton (1755–1804), championed a strong central state and attempted to enact policies that would use the power of the federal government to encourage the development of agriculture, commerce, and manufacturing. An oppositional ideology, espoused by Thomas Jefferson (1743–1826) and the Democratic Republicans, emphasized the role of government in the economy no less than the Federalists but stressed the participation of state, not federal, officials in growth. Republicans also tended to look westward into the interior of North America for the nation's future economic growth, whereas Federalists highlighted the commercial potential of the Atlantic world. Despite these contradictory tendencies, both parties influenced the shape and character of the federal government's role in the economy for years to come.

CREATING A NATIONAL ECONOMY

The Federalist-Republican debates had their origins in the earliest years of the United States. One of the biggest drawbacks of the Articles of Confederation was its creation of a decentralized economy in the United States. From 1781 to 1789 states had the power to set duties against the imports of other states, coin their own currency, set their own bankruptcy laws, and levy taxes all by themselves. The Constitution of 1787 remedied this problem by shifting the authority to regulate interstate commerce, protect patents and copyrights, set tariff rates, establish bankruptcy policy, coin currency and set monetary policy, and establish postal services to the new federal Congress. The Constitution was intentionally vague on the issue of slavery, but a compromise struck during the Constitutional Convention insured that the flow of slaves from Africa and the West Indies would remain unimpeded until 1808. The first few sessions of Congress, therefore, established many of the hallmarks of American political economy, for better and for worse. The Tariff Act of 1789, for example, passed easily and immediately established federal duties on certain goods, which would serve as the main revenue-raising device for the federal government for much of the nineteenth century. An excise tax on whiskey, on the other hand, provoked farmers in western Pennsylvania to rebellion in 1794. Regardless of the reception, the Constitution put federal authorities in charge of the basic foundations of the

American economy and established the parameters of a national market.

As the first treasurer of the United States, Alexander Hamilton made a significant imprint upon the political economy of the early Republic, and particularly in establishing an activist role for the new federal government in promoting growth. In his *Report on the Public Credit* (1790), Hamilton recommended that the new government establish financial stability by assuming all of the outstanding national and state debts from the American Revolution. Rather than discount the value of bonds, paper money, and other government issues, Hamilton recommended that the federal government pay face value for the \$80 million, in debt, which was about 40 percent of the nation's gross national product in 1790. Doing so, he argued, would legitimize the United States not only in the eyes of its internal creditors, but also in international markets. Hamilton and his Federalist followers believed in the power of a centralized federal state to encourage economic growth and promote international trade. The Federalists openly admired Great Britain's emergent industrial economy and hoped that the United States would one day develop a strong manufacturing sector of its own.

With this goal in mind, Secretary Hamilton recommended the creation of a national bank in order to establish a reliable national currency and to mobilize large amounts of capital for development loans. The bank would be chartered by Congress for a specified number of years; would collect, hold, and pay out government receipts; would hold the new federal bonds and oversee their payment; would be empowered by Congress to issue currency; and would be backed by the government bonds. The proponents of the Bank argued that it should be capitalized at \$10 million and that one-fifth of the capital would be provided by the federal government, which would also appoint one-fifth of its directors. Notes of the Bank of the United States would be used for all debts to the United States. The idea was to have the Bank serve the capital needs of both the new federal government and private investors. When the bank opened up for business in July 1791, Americans subscribed about \$8 million in the first hour, thus filling the private requirement. The following year, branches opened up in New York, Boston, Baltimore, and Charleston, and in 1805 there were branches in Norfolk, Washington, Savannah, and New Orleans. The first Bank of the United States thus became a centerpiece institution for the Federalist strategy of using the power of government to promote capital formation in the young nation.

The next phase of Hamilton's vision of American political economy was not, however, realized so successfully by the federal government. In December 1792 Hamilton released his *Report on Manufactures*, in which he advocated federal subsidies for manufactures wherever possible, directly through bounties and indirectly through taxes. Although the Federalists achieved many of their plans for a strong federal government, they were unable to involve it directly in the process of encouraging manufactures. Instead, states assumed the leadership role in encouraging growth in the manufacturing and transportation sectors, mainly through the creation of corporations.

THE REPUBLICANS LOOK WEST

A change in federal economic policymaking came with the ascendance of the Republicans, led by Thomas Jefferson of Virginia, to the presidency in 1801. Jefferson and his followers are often misrepresented as promoting a nation of farmers only, but their vision of America's future included a commercial and manufacturing community as well. In order to provide this threefold opportunity, especially as it related to land usage, Republicans favored westward expansion and the development of domestic industries rather than an emphasis upon the Atlantic trade. This vision led to the Louisiana Purchase (1803), in which the United States acquired about 800,000 square miles for \$15 million—roughly 3.5¢ per acre—from France. Jeffersonians also liberalized the sale of federal lands, which had already been established on rather easy terms by the Land Act of 1796. In 1804 they reduced the minimum tract for purchase by individuals to 160 acres, kept the price at about two dollars an acre, and offered a discount for cash purchases.

The Republican tendency to focus on domestic production rather than international trade pushed the federal government into new avenues of economic promotion. For example, Albert Gallatin (1761–1849), Jefferson's secretary of the Treasury, recommended that the federal government oversee the improvement of rivers that would create an inland water navigation from Massachusetts to North Carolina, building roads to cross the Appalachian Mountains and constructing canals that would link the seaboard with inland cities such as Detroit, St. Louis, and New Orleans. He estimated that this network would cost approximately \$16.6 million to build and recommended an additional \$3.4 million for smaller local improvements across the United States. Gallatin's plan never came to fruition, and the federal gov-

ernment played a limited role in transportation policy. Nonetheless, the expansionist land policy continued as the federal government sent a host of surveyors to explore the western territories of the United States and continued to sell public lands on easy terms. In 1820 the minimum price fell to \$1.25 an acre, and in 1832 the minimum tract size was sliced again to forty acres.

A LIMITED FEDERAL ROLE

The political tussle between Federalists and Republicans came to a close in 1815, but not before their debate over the proper role of the government in the economy became well engrained within the nation's political culture. The federal government remained active in economic affairs, but its role was always controversial and contested. The financial difficulties during the War of 1812 (1812–1815), for instance, led Congress to charter the Second Bank of the United States in 1816. The Second Bank succeeded in stabilizing the nation's financial system, but longstanding reservations about the concentration of power and wealth resulted in Andrew Jackson's famous campaign to "slay" the "monster Bank" in the 1830s. When New York State officials opened the 250-mile-long Erie Canal in 1825, they demonstrated the important role of government involvement in transportation projects. But throughout the antebellum period it was state governments, not federal officials, who aggressively pursued these types of projects.

GUNPOWDER, MUNITIONS, AND WEAPONS (MILITARY)

Firearms have played a significant role in America's history. The story of their evolution chronicles the development of industry and technology. Moreover, firearms were linked to early concepts of national defense. Hence, understanding the importance of firearms is critical to understanding America's civic and industrial beginnings.

FIREARMS

Two categories of firearms existed: civilian and military. Civilians kept shotguns, rifles, and pistols at home for hunting, sport, and self-defense. Most of these firearms were made by and purchased from local gunsmiths. Military firearms for national or state defense included muskets, rifles, carbines, and pistols. Unlike privately owned guns, military firearms were often manufactured at government-owned arsenals. In times of demand, however, contracts were given to private businessmen as a way to augment the government's output.

Firearm technology remained the same throughout much of the eighteenth and early nineteenth centuries. The standard ignition system was the flintlock. This mechanism, which was fitted to the side of the weapon, contained the hammer and steel (also called a frizzen). The hammer's jaws held a piece of flint; the steel was an L-shaped piece of metal that covered a depression called the pan. A small amount of gunpowder was placed in the pan and then covered by the steel, hinged to allow it to move back and forth. A pull of the trigger released the hammer, causing the flint to strike the upright arm of the steel and push it forward. The contact between the flint and steel produced a spark that ignited the powder in the now-exposed pan. Flame passed through a small hole in the gun's barrel, igniting the main charge that had been forced down the barrel by the ramrod. The system had drawbacks, as flintlock firearms were prone to misfire. In addition, wind, rain, and heavy dew often rendered flintlocks inoperable.

Firearms fell into two categories based on their design and use. Smoothbore weapons had a barrel that was smooth on the inside. These firearms, which were easy to load but lacked range, included muskets, shotguns, and most pistols. Rifles had spi-

General Pickens's Sword. This sword, presented to General Andrew Pickens, commander of the South Carolina militia during the American Revolution, carries the inscription ". . . to General Pickens, March 9th, 1781." © WILLIAM A. BAKE/CORBIS.

ral grooves (rifling) cut into the inside of their barrels, a feature that caused the bullet to spin as it left the barrel, imparting greater accuracy and range to the projectile. Although the military adopted a small number of rifled arms for use by soldiers, rifles were mainly used by civilians for hunting prior to 1850. The military preferred the higher rate of fire for the musket (three times a minute for a musket opposed to one time a minute for a rifle) and accepted the shorter range (one hundred yards for a musket opposed to three hundred yards for a rifle). Although

the frontiersmen with their rifles were credited with winning the Battle of New Orleans, in reality the muskets and artillery in the hands of the army saved the day for Andrew Jackson.

A national militia. On 8 May 1792, the U.S. Congress created a national militia that mandated gun ownership. The law declared that "each and every free-bodied white male citizens of the respective states, resident therein, who is or shall be of the age of eighteen, and under the age of forty-five years, (except as hereinafter exempted) shall severally, and respectfully, be enrolled in the militia." The law required each member of the militia to arm himself with either "a good musket" or "a good rifle" with the appropriate accouterment and ammunition. The prevailing notion was that the citizens of the Republic should form the nation's true military force. Moreover, a national militia, regulated by the states, would serve as a counterweight to the professional corps, which Congress deliberately kept small for fear of a standing army.

Firearms manufacture. The militia law directly stimulated the development of the firearms industry in the early Republic. Congress decreed that within five years of its passage, all muskets should be uniform in design. In 1794 Congress passed an act to facilitate the mandated standardization by establishing government arsenals to manufacture and repair weapons. That year Springfield, Massachusetts, was selected as the site of the nation's first arsenal, primarily because the Connecticut River town was already the location of workshops that had provided weapons during the American Revolution. In 1796 a second arsenal was established at the confluence of two rivers, the Shenandoah and Potomac, at Harpers Ferry, Virginia (later West Virginia). Production was slow at first with only 245 muskets manufactured at Springfield in 1795, but that number steadily rose. By 1810, the arsenal at Harpers Ferry was producing ten thousand muskets a year.

One inventor significantly contributed to the higher arsenal output. Eli Whitney, who is most remembered for his cotton gin, introduced the concepts of interchangeable parts and division of labor into arms manufacturing. Whitney, who received a contract in 1798 to privately manufacture ten thousand muskets, revolutionized the industry by separating production into a series of steps that could be performed by semiskilled labor. The change sped production because workers operated water-powered machines that made identical copies of each part. Interchangeable parts did not need to be hand fitted, saving time as well as eliminating the need for skilled

craftsmen. Although still in its primitive stage, Whitney's system used at his factory near New Haven, Connecticut, soon spread to other arsenals. Moreover, other industries adopted the system, further propelling the industrial revolution.

Government procurement. Although Congress created the national militia and decreed the appropriate type of weapons to be used, not until 1808 did it agree to supply states with those arms. Militiamen were expected to provide their own firearms, which Congress exempted from seizure for payment of debt. In the meantime, some states established their own arsenals or purchased firearms from contractors. Congress finally acted in the wake of the *Chesapeake-Leopard* naval encounter of 1807, when it appeared that the United States and Great Britain were headed toward war. The national government agreed to an annual allotment of \$200,000 to purchase arms for the national militia. In reality, the procurement system failed to work as intended for two reasons: (1) the federal government initially lacked adequate resources to meet the need, and (2) individual states routinely failed to send in their annual militia returns indicating how many weapons were required. By 1861, however, hundred of thousands of weapons had been distributed to the states, unintentionally arming the South in its attempt to break up the Union.

GUNPOWDER AND AMMUNITION

Firearms were of little use without gunpowder, ball, or shot. Civilians usually separated their bullets and gunpowder, keeping the projectiles in a leather pouch and the powder in a hollowed-out bull's horn or copper flask. Military ammunition, though, required the bullet and gunpowder to be rolled together in a paper wrapper, making it easier for the soldier to handle when loading. For years, hunters and soldiers had painstakingly poured molten lead into hand molds, plierlike devices that contained spherical cavities which formed the liquefied metal into bullets. New technology made hand casting obsolete when water-powered machines were developed that could press the soft metal into hundreds of balls at a time. By mid-century, one man operating a water-driven press could produce thirty thousand bullets in a ten-hour shift. It was also discovered that molten lead formed perfect spheres when poured from a height. Vertical shot towers soon became an efficient way to mass-produce bullets. The lead, which formed different size balls depending on the size of the droplet, landed on a cushion of sawdust. Once collected, the bullets passed through gauges that separated them

by caliber. Arsenal workers rolled and packaged cartridges on an assembly line, meaning that soldiers no longer had to prepare their own ammunition in the field.

Gunpowder production benefited from advances in technology. The basic composition of gunpowder (seventy-five parts saltpeter, fifteen parts charcoal, ten parts sulfur) had not changed since its discovery, but industrialization allowed the propellant to be mass-produced. Production created several side industries: mining for guano (nitrogen-rich bat dung) and sulfur and charcoal manufacturing. Once the ingredients were combined, the mixture formed hard slabs. Broken into pieces by tumbling or rolling, the fragments were passed through screens and sorted by grain size suitable for cannon, musket, rifle, or pistol. Although the national government operated its own powder mills, private mills sprang up to provide for the needs of the nation, both military and civilian. DuPont, the most successful of these private firms, was started in 1802 by the French émigré E. I. du Pont on the Brandywine River at Wilmington, Delaware. Du Pont's success with gunpowder placed his company in position to become a leader in the chemical industry.

The arms industry would see even greater changes by the middle of the nineteenth century. The invention of percussion caps, small brass cups filled with an explosive compound, made the flintlock obsolete. Moreover, inventor Samuel Colt (1814–1862) developed revolving pistols and rifles that allowed the shooter to fire multiple times without reloading. By the 1850s, inventors had found a way to combine the primer, gunpowder, and bullet into a self-contained metal cartridge. Thus, a century that began with single-shot, muzzle-loading firearms saw the rise of repeating rifles and pistols that “won the West.”

HAITIAN REVOLUTION Throughout the eighteenth century, the French island of Saint Domingue (the early name of Haiti) and the British North American colonies were tied together by trade. Although illegal until the Seven Years' War (1756–1763), and limited to only a few ports after that, exchanges between North American merchants and the planters of the thriving French colony were constant and lucrative: the by-products of sugar, particularly molasses, were traded for provisions desperately needed in the colony. There were other connections as well. During the American Revolution, a unit of soldiers of African descent recruited in Saint Domingue participated in the French mission to assist the rebels at Savannah. The victory against Britain in North America inspired some planters in Saint Domingue who dreamed of increased autonomy and who used the political opening of the French Revolution to clamor for it.

Between 1789 and 1791, planters and free people of color seeking an end to racist legislation and access to political rights pushed for reform from Paris and increasingly battled one another in the colony. Then, in August of 1791 a massive slave insurrection began in the northern plain of the colony. It became the largest and most successful slave revolt in history, leading to the abolition of slavery in the colony

in 1793, a decision ratified and extended to the entire French empire in 1794. The uprising sent waves of fear through the communities of slave owners of the United States, as well as inspiring some among the enslaved. North Americans could read regularly in newspapers of events in the Caribbean colony, and many came face to face with the impact of slave revolution as waves of refugees—the largest of them in late 1791 and in mid-1793—came into North American port towns such as Philadelphia and Charleston. Among these refugees were not only white planters and slaves but also free people of color. Many members of this latter group settled in Louisiana in the early nineteenth century, after being expelled from Cuba. They had a major impact on the demography and political culture of the region for generations.

Saint Domingue's slave revolution posed delicate problems for the leadership of the United States. After 1794 France pursued a policy of revolutionary emancipationism, using abolition as a weapon of war against the British, recruiting armies of former slaves, and encouraging uprisings in enemy colonies. France also outfitted and rewarded privateers in the Caribbean. Their crews were often populated with former slaves, and they regularly captured North American ships. French privateering led to a break in U.S.-French relations in the late 1790s. At the same time, however, the chaotic situation in the French

Caribbean provided an attractive opening for North American traders, who built on and expanded their long-standing links with the colony during the revolutionary years, profiting handsomely.

By the late 1790s Saint Domingue was under the control of General Toussaint-Louverture (c.1743–1803). Wary of the conservative direction of metropolitan French politics, which he rightly believed represented a threat to the policy of emancipation, Louverture adroitly cultivated alliances with both the British and North American governments. For the United States under the administration of John Adams, the link with Louverture represented an ongoing economic opportunity and a way to strike at the French. The consul Edward Stevens was sent to work with Louverture, and in 1799 the U.S. Navy supported him in his war against André Rigaud, who controlled the southern portion of the colony. Concerns about the possible “contagion” of the revolution in Saint Domingue to slaves in North America were superseded by the political and economic advantages of working with Louverture.

North American policies toward the revolution in Saint Domingue shifted dramatically with the election of Thomas Jefferson in 1800. Although trading continued—the French blamed the United States for supplying Louverture with his guns and ammunition—there was growing hostility to the regime in Saint Domingue, and the easing of relations with the French reduced the political value of an alliance with Louverture’s regime. Jefferson approved of the French attempt, in 1802, to wrest control of the colony from Louverture and his followers. He was right that the French mission would be to the advantage of the United States, though not for the reasons he expected. The decimation and ultimate defeat of the French mission at the hands of the former slave Jean-Jacques Dessalines in late 1802 and 1803 was the cause of Napoleon Bonaparte’s decision to sell Louisiana to the United States. The reconstruction of Saint Domingue had been the centerpiece of Bonaparte’s plans for the Americas, and once he lost the island colony, Louisiana became irrelevant to him.

Even as the purchase of Louisiana allowed for the expansion of slavery in the United States, the example of the Haitian Revolution resonated through the uprisings of Gabriel and, later, Denmark Vesey. But Haiti’s independence, declared 1 January 1804, went unacknowledged by the United States until the intervention of Senator Charles Sumner in 1862.

HAMILTON, ALEXANDER Alexander Hamilton (1755?/57?–1804) was born on the West Indian island of Nevis and moved to St. Croix with his mother and older brother, James, in 1765. Poverty-stricken and illegitimate, he was sent to North America for an education through charitable contributions from a small group of supporters. After hasty preparatory work at an academy, Hamilton enrolled at King’s College (later Columbia University) in New York City and rapidly became involved in America’s burgeoning war with Britain, first as a pamphleteer and then as captain of an artillery company.

Leaving college without a degree in 1776, he led his company into action in New York and New Jersey, coming to the attention of General George Washington, who appointed him an aide-de-camp in 1777. Although desperate to earn glory on the battlefield, he served most of the war by Washington’s side, drafting letters, assisting in administrative duties, and acting as an emissary; his frustration with the powerlessness and inefficiency of the wartime Continental Congress spurred the centralizing focus of his later policies. Marrying Elizabeth Schuyler, the daughter of the wealthy New York landowner Philip Schuyler, in December 1780, he left Washington’s service a few months later, the result of a spat born of Hamilton’s impatience with his desk job and Washington’s frayed nerves. Washington finally granted him a field command storming a redoubt at Yorktown in 1781. Retiring from active service after the British surrender, he dedicated himself to developing a law practice in New York City.

Throughout this time, Hamilton gave much thought to the failures and flaws of the Articles of Confederation, devising detailed plans for reforming American government and finance. He was soon at the forefront of efforts to revise the Articles, and his

ardent nationalism was a driving force behind the calling of the Federal Convention of 1787. Outvoted by the other two New York delegates to the Convention—both opposed to the emerging Constitution—Hamilton forged ahead afterward, investing his full energies in New York's ratification debates. As part of this effort, he planned a series of newspaper essays in defense of the proposed Constitution, inviting James Madison and John Jay to join him. The resulting *Federalist* essays appeared in various New York newspapers from October 1787 to August 1788. Hamilton authored approximately fifty-one of the eighty-five essays.

With the launching of the new government in 1789, President Washington invited Hamilton to be the nation's first secretary of the Treasury; he was confirmed in the position on 11 September 1789. Here, Hamilton's dedication to fostering an energetic national government came to fruition. Given the enormous task of bringing order to the nation's disordered finances, he forged a national financial infrastructure through a combination of administrative organization and bold policies. His three-pronged financial program proposed the national assumption of state war debts, the creation of a National Bank, and national support of manufacturing; he also encouraged close economic ties with British manufacturers and trade. Amidst a population fearful of slipping back into despotism, Hamilton's policies provoked enormous controversy, ultimately contributing to the rise of national political factions.

Hamilton resigned as secretary of the Treasury in 1795 and returned to his law practice, but he remained at the center of the Federalist cause for several years, privately advising members of President John Adams's cabinet; during the 1798 Quasi-War with France, he ardently advocated building America's armed forces in preparation for war. Adams's peace efforts with France enraged Hamilton for reasons of both policy and personality, driving him to write an injudicious pamphlet attacking Adams's Federalist candidacy for president in 1800 and promoting Federalist Charles Cotesworth Pinckney in his stead. By dividing the Federalists, the pamphlet helped to raise Hamilton's two foremost political enemies—Thomas Jefferson and Aaron Burr—to executive power and destroyed his political influence.

Hamilton's final years were melancholy. In 1801, shortly before the completion of Hamilton's Upper Manhattan country home, the Grange—the first house that he owned—his family life was ripped apart when the oldest of his eight children, nineteen-year-old Philip, was killed in a duel defending his fa-

ther's name. Three years later, Hamilton opposed Burr's candidacy for governor of New York; after fifteen years of political opposition, Burr responded by challenging Hamilton to a duel. The two men met on the heights of Weehawken, New Jersey, on the morning of 11 July 1804. Mortally wounded, Hamilton died the next day. The nation mourned the passing of an ever-controversial but essential political leader whose policies and vision shaped the character and future of the American nation.

HAMILTON'S ECONOMIC PLAN In 1790 and 1791, Secretary of the Treasury Alexander Hamilton presented four major reports that dealt with the financial, social, and constitutional future of the United States. Three were public documents, presented to Congress as proposals for policies that Congress might enact. One of the reports was private, written for President George Washington, who was in a quandary about whether to veto one of those proposals. Taken together, the reports sketched out a coherent vision for the new Republic. Hamilton saw them all as continuing the work of establishing a coherent national economy that had begun with the adoption of the Constitution.

PAYING THE DEBT

One of his proposals received unqualified assent. This was to pay off at full value the principal and interest of the enormous foreign debt that the United States had built up during its struggle for independence. Hamilton, Washington, the president's other advisers, Congress, and the interested public all understood that any other course would destroy America's financial credibility. His other proposals, however,

provoked great controversy, both at the level of public policy and at the level of what the Constitution permits the government to do. The result was to open a gap among the very men who were responsible for the Constitution, beginning with Hamilton and his former close ally, James Madison. The friendship of those two highly talented thinkers came to an end; Hamilton and Secretary of State Thomas Jefferson, never close, became bitter enemies, and political parties started to emerge.

Nobody doubted in 1790 that both the instruments of American finance and the structure of the American economy faced very severe problems. One aspect was the war debt. The old Confederation Congress had possessed absolutely no means to pay off what it owed, either abroad or at home. Federal taxing power under the new Constitution offered a means to solve that problem, but once the issue shifted from debts owed overseas to debts owed at home, grounds for dispute emerged. Some of the domestic debt was owed to the soldiers who had fought the War of Independence. Some was owed to farmers and artisans who had accepted paper in return for their wartime goods and services. Some of the debt was owed not by Congress but by the states. Virtually all of the debt was in the form of badly depreciated paper currency and certificates. Those certificates could be transferred, and many were in the hands of secondary purchasers, who had paid far less than face value to the original owners. Controversy centered on who should gain from the new government's apparent power to raise taxes and pay off what American institutions owed.

Hamilton's view was that the public debt could be a means for the new government to acquire the strength that he believed it should have. Overseas it would gain that strength by paying its debts off in full. Within the United States, he wanted the federal government to assume what remained of the wartime debts that the states had contracted. He wanted the domestic debt to be paid off as close to full value as possible, to whomever held the appropriate paper. Because of Confederation-era agreements about the level of interest, this would be at par rather than in full, so domestic creditors would receive less than their foreign counterparts. Nonetheless, the program of duties on imported goods and excise taxes on domestic products that Hamilton proposed would generate revenue that might well end up very far from the person who had suffered and sacrificed during the war. Hamilton dealt with foreign debt, domestic debt, and assumption of the state debts in his first *Report on Public Credit* of 9 January 1790.

CREATING A NATIONAL BANKING SYSTEM

Hamilton wanted more, having in mind an American future that would resemble the reality of Britain in his own time. He had been instrumental in establishing America's first two banks, in Philadelphia in 1782 and New York in 1784. Though he never visited England, he carefully studied its system of privately held banks under the direction of a private-public Bank of England and proposed that there be a national bank in the United States on the same model, to serve the same goals. He wanted central direction for the financial sector, and he believed that the federal government had the power under the "necessary and proper" clause of the Constitution to create an institution that would bring that direction about. This was the subject of his second *Report on Public Credit*, which actually pre-dated the first report by a month.

Hamilton believed that a system of interconnected banks was necessary. Others, including Madison and Jefferson, regarded the idea with horror, particularly should the federal government become involved. They saw a banking system as a harbinger of the very corruption they thought their America had escaped thanks to the Revolution. Madison led ineffectual opposition in Congress. Jefferson, asked by President Washington for his opinion on signing the bill, objected on constitutional grounds. To his mind, no such power for establishing a bank existed. Hamilton replied with the third of his reports, arguing the case that the "elastic clause" should be broadly rather than narrowly interpreted. He won the battle for Washington's mind. But the dispute over strict and loose construction of the Constitution that he and Jefferson began continues into the twenty-first century.

PROMOTING MANUFACTURES

Hamilton's final proposal did not become law, but it too set the terms of a continuing debate. He wanted to set the United States on a course of industrial development emulating Britain's. He did not submit his *Report on Manufactures* until December 1791. Within it he proposed a comprehensive program of protective taxes, government bounties, and federal public works, all with a view to nourishing the sprouts of industrialism that he could see emerging among the primarily northeastern, commercial-minded, well-off Americans with whom he felt most comfortable. As a program, it looked forward to the state-sponsored attempts at economic development of many late-twentieth-century countries. Historian John Nelson has suggested that Hamilton's ultimate goal was a neocolonial economy, subordinate to

Britain, rather than independent development. However that may be, Congress rejected the report entirely. American industrial creativity and energy, however, were not to be denied. By 1860 the United States was second only to Britain among industrializing economies. But not until the administration of President Abraham Lincoln would the federal government begin to assume the active, fostering economic role that Hamilton proposed in 1791.

Edward Countryman

HAPPINESS In the Declaration of Independence, published on 4 July 1776, Thomas Jefferson declared: “we hold these truths to be self evident: that all men are created equal; that they are endowed by their creator with certain inalienable rights; that among these are life, liberty and the pursuit of happiness.” He thereby designated happiness the quintessential American emotion. Yet what did it mean to insert a seemingly private feeling into a public document? What were the personal and political meanings of happiness in the years from 1754 to 1829?

Jefferson’s invocation of happiness reflected ideas and traditions well established by 1776. The English had long believed that promoting general happiness, in the sense of material well-being and prosperity, was one of the key functions of government. Many colonial charters made mention of this concept, from the Virginia charter of 1611, which promised to “tender” the “good and happy Success” of the colony “in Regard of the General Weal of human Society,” to the Massachusetts Bay charter of

1691, which declared an intention to “incorporate” the king’s subjects in the way “thought most conduc[ive]” to their “Welfare and happy State.” In seventeenth-century usage, public happiness and the common good were more or less synonymous. Far from being a matter of personal fulfillment, happiness most often referred to the communal prosperity of country or kingdom.

By the eighteenth century, moral philosophers of the Scottish common-sense school began to focus on the problem of how to assure maximum happiness for the most people. In *An Inquiry into the Original of Our Ideas of Beauty and Virtue*, published in 1725, Francis Hutcheson proclaimed, “that Action is best which accomplishes the greatest Happiness for the greatest Numbers.” Following in Hutcheson’s footsteps, philosophers like Adam Ferguson emphasized that happiness could have complementary private and public components. In *An Essay on the History of Civil Society* (1767), Ferguson explained, “if the public good be the principle object with individuals, it is likewise true that the happiness of individuals is the great end of civil society.” By the time Jefferson wrote the Declaration, the idea that happiness involved individual satisfaction as well as common good had become entrenched in British America.

Practically speaking, the emerging eighteenth-century emphasis on happiness as an individual matter as well as a common concern meant that people began to focus as much on private sources of happiness as on public ones. Historians argue that the desire for happiness helped foster the eighteenth-century consumer revolution. In Britain only one-quarter of the population participated in this revolution, whereas in America as many as two-thirds of the people entered the market for such luxury staples as tea and sugar, as well as for fashionable items like tea sets, engraved prints, and fine imported fabrics. This process may have occurred more quickly in Virginia, where individualism sooner took hold, than in Massachusetts, where people clung longer to Puritan communalism. People in search of happiness also began to turn inward to family life as a source of personal satisfaction, focusing on nurturing deeper emotional ties with spouses and with smaller numbers of children.

By the early nineteenth century, the idea that happiness should relate to the common good had become almost entirely eclipsed by the quest for private gain. In one mark of the ever-increasing role of consumerism in the definition of happiness, Independence Hall, the statehouse in which Jefferson had first written the Declaration, found new use in the

1830s as a clothing store. To attract customers, the owner of the store published an advertisement announcing, “we hold these truths to be self-evident, that all men are created equal—that [here] they can obtain Clothing as rich, as cheap, and as durable as at any other establishment in the nation.” Happiness, understood as a public concept in the seventeenth century, had been almost entirely privatized by the nineteenth.

When Jefferson promised people the right to the pursuit of happiness, he offered them no guarantee of social equality. But he did pledge them the opportunity to strive for a social condition that would bring them contentment. He tried, in other words, to balance the public and private meanings of happiness. In the years after the Declaration, the understanding of happiness was rapidly further reduced from its origins as a social ideal for the common weal to an individual search for material riches. In the process, the concept of happiness became impoverished to the point that in the early twenty-first century it seems surprising to include such an emotion in a political text.

Nicole Eustace

Hartford, Connecticut, it featured twenty-six attendees from Massachusetts, Connecticut, Rhode Island, New Hampshire, and Vermont. Its members included many of New England Federalism's leading lights.

BACKGROUND AND MOTIVES

This assemblage was many years in the making. It went back to the election of 1800, which swept Federalists out of power and installed Thomas Jefferson, the chief of the rival Democratic Republican Party, as president. After the Louisiana Purchase in 1803, Federalist strategists feared that this territory would add new states to the Democratic Republicans' power base in the South and West. Moreover, these states would enjoy added representation in the U.S. House of Representatives and, consequently, the electoral college, under the Constitution's clause counting three-fifths of the slave population. Despairing of ever regaining national power, leading Federalists adopted a sectionalist strategy, hoping to retain their strength in New England and make it the last bastion of Federalism. They appealed to a northern audience, seeking repeal of the three-fifths clause. Some talked of seceding from the Union to form a “Northern Confederacy.” Yet in 1803 and 1804, only Connecticut and Massachusetts called for the abolition of slave representation, and the “Northern Confederacy” plot went nowhere.

Federalist popularity rose in 1808 after passage of Jefferson's embargo of trade with Britain, which proved devastating to the New England economy, but it was the War of 1812 that produced a formidable, organized opposition to the federal government in New England. For Yankee Federalists, the war was the latest and worst Republican measure meant to destroy their region's commerce and political power. They also believed that it was immoral, partly because the United States took the offensive by invading Canada. Furthermore, the British invaded New England early in 1814 and seemed poised to strike again even harder later in that year.

Faced with a defense crisis and burning with sectional and partisan antagonism, citizens organized town meetings throughout Massachusetts in 1814. These gatherings petitioned the state legislature to protect their towns in the federal government's place and to remedy the political ills that had produced the war in the first place. The petitioners called for an assembly of New England states to consider how to wrest the Constitution back from its usurpers, the slaveholders of the South and the upstarts of the

HARTFORD CONVENTION The Hartford Convention was a gathering of leading New England Federalists during the War of 1812 (1812–1815). Held between 15 December 1814 and 5 January 1815 in

West. These remonstrances typified the charged atmosphere that produced the Hartford Convention.

Massachusetts state legislators heard this call. Acknowledging that they were responding to the town memorials, the lawmakers voted by large margins on 18 October 1814 to invite other states to a convention. Other state legislatures followed Massachusetts's lead, but they all appointed delegates who were calculated to cool the passions that produced the convention. The men they appointed were moderate Federalists unlikely to take rash measures despite the harsh rhetoric swirling around wartime New England.

THE REPORT

The Hartford Convention's main product was a report encapsulating New England's grievances and calling for constitutional amendments to redress them. Its introduction dwelt at length on matters of defense and introduced the proposed amendments as meant "to strengthen, and if possible to perpetuate, the union of the states, by removing the grounds of exciting jealousies, and providing for a fair and equal representation, and a limitation of powers, which have been misused" (Dwight, *History of the Hartford Convention*, p. 370). It rejected disunion, much to the dismay of some Federalist hotheads and the surprise of Democratic Republicans who had painted the secretive conference as traitorous.

The report proposed seven constitutional amendments. The first two sought to remove perceived structural supports for Republican power. The first abolished slave representation. This was in part a response to the Massachusetts towns, whose memorials consistently listed the abolition of the three-fifths clause first among their demands. The second required a two-thirds vote in Congress, rather than a simple majority, for the admission of new states. This proposal resonated with a long-standing Federalist complaint and was only aggravated by the admission of Louisiana as a state on the eve of the war.

The next few were aimed at specific Republican policies. The third and fourth limited embargoes to sixty days and required a two-thirds vote for their passage. The fifth made a two-thirds vote a condition for waging offensive war. The sixth barred those of foreign birth, even if naturalized, from holding any national office, including a seat in either chamber of Congress. This was a jab at the likes of foreign-born Albert Gallatin, longtime secretary of the Treasury under Republican presidents. The final amendment sought to prevent a repetition of the successive two-term presidencies of Virginians Jefferson and James

Madison, limiting presidents to one term and declaring that no two presidents in a row could hail from the same state. The report was sent out to all states as a means of starting the amendment process.

LEGACY

Both the end of the war and the stigma attached to the Hartford Convention weakened its political force. It adjourned just as word reached America of the Treaty of Ghent (December 1814), which ended hostilities. From beginning to end, the convention was so tied up with questions of defense and wartime grievances that word of peace halted its impetus. The legislatures of Connecticut and Massachusetts directed their states' congressional delegations to present the report to Congress. But they complied only perfunctorily, and Congress took no action.

Although the convention thus ended with a whimper, in the long term it became more like a hiss and a byword. Despite the relatively moderate nature of its report, the Hartford Convention became the symbol for sectionalism and disunionism. That disrepute sealed the national demise of the Federalist Party and lasted for decades. Well into the 1840s, northerners and southerners of all parties occasionally branded their antagonists with the Federalist label or compared their actions to that of the infamous Hartford Convention. The Hartford Convention, symbol and apex of New England Federalism, failed to enact any of its proposed amendments, at least until slavery was abolished and with it slave representation. But that hardly meant it had no impact, for Federalists and their convention stalked American politics long after their fall from the national stage.

HEALTH AND DISEASE Until the beginning of the twentieth century, infectious diseases were by far the most important causes of mortality; they took their greatest toll among infants and children. Indeed, if individuals managed to survive to the age of twenty, they could for the most part look forward to an additional forty years or more of life. High rates of infant and child mortality (as well as fertility) meant that the number of aged persons in the population would be correspondingly small. Hence, chronic and long-term diseases—many related to advancing age—were less important causes of mortality. To emphasize the significance of infectious diseases, however, is not to imply that their impact on populations was constant. Infectious diseases appeared and disappeared and were often dependent on the interaction of social, economic, behavioral, and environmental factors. Nowhere is this better illustrated than in the history of health and disease in late-eighteenth and early-nineteenth-century America.

COLONIAL BACKGROUND

The first settlers who came to the North American continent in the seventeenth century faced a strange and unfamiliar environment. In the initial stages of settlement, there were extraordinarily high death rates from dysentery, typhoid fever, a variety of en-

teric diseases, and respiratory infections. Nutritional diseases, inadequate housing, contaminated water supplies, and deficient disposal of organic wastes further compounded health risks. New England and the mid-Atlantic or middle colonies adjusted to their new environment relatively quickly, and mortality rates declined rapidly. The rural character of these colonies also minimized the spread of epidemic and endemic infectious diseases. The environment of the Chesapeake and southern colonies, by contrast, was far more threatening to human life. In addition to gastrointestinal disorders, the presence of infected individuals and insect vectors made malaria one of the gravest health problems in these areas. High mortality rates made it difficult for the white population to sustain itself through natural growth. The overwhelming majority of individuals who lived through the vicissitudes of infancy and childhood and reached the age of twenty rarely survived to the age of fifty. Unlike their neighbors to the north, the residents of the Chesapeake and southern settlements continued to face an environment that posed severe health risks.

The native Indian population was hardest hit by the movement of Europeans to the Americas. During the seventeenth and eighteenth centuries, their numbers declined rapidly because of the impact of imported diseases. Having never been exposed to many of the diseases common in England and Europe, they constituted a highly vulnerable population. High mortality from infectious diseases (notably smallpox), periodic famines, and the social dislocations that accompanied these crises also reduced fertility to such low levels that population recovery became impossible. From a high of three thousand in the late seventeenth century, the Indian population on Nantucket had fallen to twenty by 1792. Much the same was true for many other East Coast tribes.

EIGHTEENTH-CENTURY HEALTH PATTERNS

After the dangers posed by a new environment were surmounted, population began to grow rapidly. Between 1700 and 1770 there was a ninefold increase from 250,000 to an estimated 2.15 million. Health indicators in the Northeast and middle colonies improved dramatically during these decades. Nevertheless, increasing population density, the expansion of internal and external trade and commerce, the development of new forms of agriculture, and the transformation of the landscape began to alter health patterns. Toward the end of the eighteenth century, there was an increase in mortality from a variety of infectious diseases, particularly among infants and

children and residents of larger towns and urban port areas. In the seventeenth century the rural character of colonial society inhibited the spread of infectious epidemic diseases that had such a dramatic impact on societies in Europe, Asia, and the Middle East. In the eighteenth century, by contrast, colonial port communities began to experience the ravages of infectious epidemic diseases. Although small if not infinitesimal by modern standards, they contained larger numbers of people living in close quarters. The maritime character of Boston, New York, Philadelphia, and Charleston—the most important colonial ports—brought their residents into contact with each other and, more important, with Europe, the Caribbean, and Africa. These ports were also the entry points for both sailors and immigrants. Such population movements became the means of transporting a variety of pathogens capable of causing epidemic outbreaks. Moreover, the physical environment of port villages—crowded living conditions, crude sewage disposal, and stagnant or contaminated water—facilitated periodic epidemics. Many residents were susceptible to the invading pathogens and hence lacked antibodies that prior exposure would have produced. The large number of susceptible individuals facilitated the rapid spread of infectious diseases.

During the eighteenth century periodic smallpox epidemics became common in New England and the middle colonies. Despite efforts at containment, it was difficult to prevent the spread of the disease. The movement of people in trade and commerce provided a convenient means of transporting the virus. The war with the French in the 1760s merely exacerbated the problem. In Philadelphia, smallpox was the single largest cause of mortality during the third quarter of the eighteenth century. The disease was less significant in the Chesapeake and South because a more dispersed population and an agricultural economy inhibited the spread of the virus (which can only survive in human tissue). South Carolina was an exception, since Charleston was an important seaport and commercial center with links to the interior. It therefore served as a port of entry for infectious diseases. In 1760, 6,000 of 8,000 residents were infected with smallpox, and estimates of mortality ranged from a low of 730 to a high of 940.

Smallpox was by no means the only imported disease. Yellow fever (a viral disease) was another. Transmitted by an insect vector biting an infected individual, it flourished in moist tropical areas. During the first two-thirds of the eighteenth century, there were at least twenty-five outbreaks. The interrup-

tion of trade during the Revolutionary crisis caused the disease to disappear. But with the return of peace, yellow fever returned. In 1793 Philadelphia experienced an epidemic that threatened its very existence. A slave rebellion in French Saint Domingue (later Santo Domingo) brought two thousand refugees to the city, some of whom were infected. A hot and humid summer provided ideal conditions for the proliferation of the mosquito population. Perhaps half of the fifty-one thousand residents fled the city during the outbreak. Of those that remained, a large number became ill and between 9 and 12 percent perished. Nor was Philadelphia the only city to experience an epidemic. Between 1793 and 1822 yellow fever was also present in Baltimore, Boston, and New York. After the latter year it disappeared from New England and the mid-Atlantic states, where the climate was not conducive to the insect vector, while appearing periodically in the South, notably New Orleans, which had five epidemics between 1804 and 1819.

Spectacular periodic smallpox and yellow fever epidemics tended to overshadow other diseases that played a more important role in shaping population development. Indeed, the health advantages enjoyed by seventeenth- and early-eighteenth-century settlements, once the period of adjustment passed, slowly began to diminish. In the eighteenth century infectious diseases traditionally associated with infancy and childhood became common. Many of these diseases were not indigenous to the Americas. When imported they affected the entire population, since adults as well as children were susceptible. Measles, for example, struck New England and the mid-Atlantic colonies; the Chesapeake and South were less affected. Mortality from measles was extraordinarily high, equaling modern death rates from cancer and cardiovascular diseases. Other infectious diseases, including diphtheria, scarlet fever, pertussis (whooping cough), and chickenpox, also resulted in high mortality.

Despite high mortality rates associated with periodic epidemics, certain endemic diseases—notably dysentery and malaria—took a far higher toll. In general, sporadic and spectacular outbreaks of epidemic diseases produced much greater fear than did endemic diseases that had a much greater demographic impact. Dysentery was undoubtedly the most significant disease in eighteenth-century America. Outbreaks were especially common in such towns as Boston, New York, Philadelphia, and Charleston. These ports were the entry points for ships bringing thousands of immigrants to the colo-

nies. Conditions aboard vessels were conducive to outbreaks of dysentery, and infected immigrants disseminated the causative pathogens upon their arrival. Infants and children were especially vulnerable, since there was no understanding that dehydration could lead to rapid death. Local data revealed that during an epidemic, perhaps half of a community's population would become infected and that one of every six or seven would perish.

Malaria had the same endemic characteristics as dysentery. Although important south of the Mason Dixon line, it had its greatest impact in South Carolina, where the cultivation of rice and indigo created ideal conditions for the breeding of the anopheles mosquito. The colony acquired a deserved reputation as a graveyard. High mortality among whites provided a rationale for the introduction and spread of slavery, since they believed that Africans were better equipped physiologically to labor in a sunny, hot, and humid climate.

Most eighteenth-century respiratory disorders were endemic and seasonal in character. But the growth of population and expansion of trade rendered the colonies somewhat more vulnerable to influenza pandemics and epidemics. By the time of the American Revolution, the newly independent colonies had become part of a larger disease pool. In 1781–1782 and 1788–1789, influenza appeared in pandemic form, affecting millions of people in both Europe and America. Nevertheless, case fatality rates remained low, although it did pose a mortal threat to elderly and chronically ill persons.

During these decades, tuberculosis and other pulmonary disorders also emerged as important causes of mortality. They were most prevalent in more densely populated areas, although rural areas were affected as well. The critical element was not total population, but household size. Many households contained from seven to ten inhabitants, thus permitting the dissemination of the tubercle bacillus and other pathogens. Moreover, relatively inefficient heating led inhabitants to seal windows and doors. Behavioral patterns thus facilitated the spread of the infection within households.

Nowhere was the complex relationship between pathogens, humans, and the environment better illustrated than during war. In the American Revolution a large number of recruits came from rural areas and had never been exposed to many common communicable diseases. Crowded camp quarters and contaminated water supplies from both human and animal wastes, inadequate diets, and the absence of personal hygiene provided ideal conditions for the

spread of infectious diseases. Perhaps 200,000 served in the military (comprising the total of all American armed forces, including militia). About 7,100 were killed in military engagements, 10,000 died in camps, and 8,500 perished as prisoners of war. Deaths in camps and among prisoners resulted from a variety of diseases, notably dysentery and respiratory disorders. A similar situation prevailed during the War of 1812. About two and half times as many soldiers perished from disease or accident as were killed in battle.

THE EARLY NATION

Toward the end of the eighteenth century, mortality from infectious diseases began to increase. In New England and the mid-Atlantic regions, this increase did not appreciably affect population growth. Mortality, however, was not equally distributed. After 1760 health indicators improved among the white middle and upper classes. Among the poor—both white and black—mortality rose. Philadelphia—a center of commerce and immigration—proved to be a dangerous place. Its mortality rates, particularly among recent immigrants, exceeded many European cities. Despite high fertility, Philadelphia's growth was made possible only because of migration from rural areas and immigration of younger people.

Mortality rates in the South remained excessive even by the standards of that age. South Carolina presented the greatest risks to life; the Chesapeake region and North Carolina followed. Without a constant supply of immigrants to replenish a population devastated by extraordinary mortality rates, these areas would not have developed economically and their very survival as societies would have become dubious. Neither wealth nor status conferred a distinct advantage insofar as survival was concerned. Mortality rates, admittedly unequally distributed, remained high among all groups, both white and black.

By the beginning of the nineteenth century, the health advantages that Americans had enjoyed after the initial period of adjustment had begun to diminish. Rapid population and economic growth created conditions conducive to the spread of infectious diseases. In succeeding decades, health indicators would begin to fall. Ironically, the increase in mortality and decline in life expectancy occurred at a time when the standard of living was rising.

Although the United States was still a predominantly rural nation, cities were growing in number, size, and importance. Their growth, together with the simultaneous acceleration in economic activity,

magnified the risks from infectious diseases. Municipal governments moved relatively slowly in protecting health. There was little provision for safe and accessible water supplies or removal of wastes. Because horses were used for transportation, streets were covered with manure. Housing standards were virtually unknown; there were no provisions for drainage or ventilation in most structures. The accumulation of organic wastes and rising odors caused inhabitants to keep their windows shut, thus preventing the circulation of fresh air and facilitating the dissemination of infectious organisms. The movement of large masses of immigrants and susceptible individuals from rural areas only served to magnify the impact of infectious diseases.

In these urban areas, tuberculosis and pulmonary diseases took a high toll. Nearly a quarter of all deaths in Boston between 1812 and 1821 were due to "consumption" (a generic category that included tuberculosis and other pulmonary diseases). Native-born whites had the lowest mortality rate, African Americans the highest, and foreign-born individuals fell between the two. The circumstances of urban life—crowding and the absence of facilities to bathe and wash clothes, among other things—led to the emergence of such infectious diseases as typhus, which at times could result in a mortality rate of 50 percent in adult populations. Other infections—diarrheal and respiratory diseases, diphtheria and croup, measles, whooping cough, and scarlet fever—added to the burden of disease. Mortality was largely a function of age: infants and children were at highest risk. In 1830, 1,974 deaths were recorded in Baltimore. Of these, 406 were under the age of 1 and 932 under 10. Suicide, homicide, accidents, and occupational diseases also contributed to total urban mortality. To emphasize that infectious diseases were the major element in urban morbidity and mortality patterns is not to suggest that such chronic and long-duration diseases as cancers, cardiovascular and renal diseases, and diseases of the central nervous system were absent. Their incidence and prevalence, however, were low, because high mortality rates among the young meant that the older cohort constituted a relatively small percentage of the total population.

Rural areas had lower mortality rates than their urban counterparts. For the nation as a whole in 1830, about 54 percent of those alive at age 5 survived to 60. In rural areas the figure was 57.5 percent, as compared with 43.6 in such small towns as Salem, Massachusetts, and New Haven, Connecticut, and 16.4 in the large cities of Boston, New York, and

Philadelphia. Nevertheless, the increase in mortality that set in toward the end of the eighteenth century was not confined to cities; the same occurred in rural areas.

Aggregate data reveal the magnitude of the decline. In the period from 1800 to 1809, a white male and female age 20 could expect to live an additional 46.4 and 47.9 years, respectively; by 1850 to 1859 the comparable figures were 40.8 and 39.5. Declining life expectancy was also accompanied by a decline in height as well. By the American Revolution, Americans had achieved heights not fundamentally different from their twentieth-century successors; during and after the 1820s heights declined, reflecting a comparable decline in health. In these decades the standard of living rose, calling into question the familiar generalization that health indicators rise with increasing affluence.

What accounts for the declining health of Americans, a decline that lasted beyond the Civil War and was not reversed until the end of the nineteenth century? The answer to this question remains somewhat murky. Whatever the reasons, it is clear that economic development negatively affected health. The beginnings of a national transportation network increased both internal migration rates and interregional trade and thus contributed to the movement of pathogens from urban to rural and semirural regions where more susceptible populations resided. The movement across the Appalachian Mountains after the War of 1812 enhanced the significance of such debilitating and fatal diseases as malaria and various forms of dysentery, to say nothing about the health risks in a new and undeveloped environment. The rise of artisan workshops and factories concentrated employees in surroundings conducive to the spread of infectious diseases. The advent of large-scale migration of poor immigrants exacerbated the prevailing disease environment, particularly in urban areas. Fundamental changes would be required to alter an environment in which infectious diseases flourished.

HEATING AND LIGHTING In early modern Anglo-American housing culture, people with the means to have ostensibly comfortable houses did not necessarily build them. When Governor William Bradford referred to the early houses of Plymouth Colony as "small cottages," he was employing a historical association of "cottage" with standard housing. After all, these structures lacked foundations and had wooden chimneys, thatched roofs, earthen floors, unglazed or small-paned casement windows, and wattle-and-daub walls. In England inhabiting a cottage marked people as lacking sufficient landholdings to support a household, but in early America there were many more cottages than cottagers. Most American households held sufficient land to provide livelihoods for their members, so they were not cottagers in the sense of living in a dwelling owned by someone else. The term "cottage" nearly passed out of usage in colonial America, although most Americans lived in houses that looked like cottages. Through the seventeenth and eighteenth centuries housing in America lacked the close architec-

tural association with social standing that it had in Britain. Spending on fashionable architectural designs for heating, illumination, privacy, and hygiene—in other words, physical comfort—had a relatively low priority in colonial Anglo-America.

The analysis of physical comfort—self-conscious satisfaction with the relationship between one's body and its immediate physical environment—was an innovation of eighteenth-century Anglo-American culture. It indicated a disposition to criticize traditional material culture and to improve upon it. In the first chapter of *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776), the Scottish economist Adam Smith identified candles as one of the "necessaries" of life, by which he meant "not only those things which nature, but those things which the established rules of decency have rendered necessary to the lowest rank of people." Considering candles as a necessity was part of the Enlightenment's developing attention to physical comfort.

As the value of physical comfort became more explicit and desirable, the technology of its improvement gained intellectual prestige. Here Benjamin Franklin was the paragon among eighteenth-century *philosophes*, with his interest in the history, anthropology, and science of basic household comforts. He identified himself with members of a scientifically enlightened subculture who criticized the priority of fashion over comfort in the domestic environment. He promoted candles made of spermaceti (a waxy substance derived from sperm whale oil) for their steady, clean illumination; he suggested that people experiment with the ventilation of their sleeping quarters to improve their sleep; and his name became synonymous with smoke-free and draft-free heating. He appreciated that the obstacles to improving comfort were more cultural than technical, and to remove these obstacles he urged his readers to question expert authority on material culture and to transcend their adherence to the customs of their ethnic group regarding the domestic environment.

In Pennsylvania Franklin could consider a range of ethnic alternatives in domestic comfort. He was particularly attentive to the Dutch and German use of stoves that entirely enclosed the fire and used it only for heating purposes. Franklin contrasted the clean warmth of these stoves with that provided by the two fireplace types popular among English colonists: a large traditional fireplace in which people could sit warmly within the hearth space itself, and fashionable smaller fireplaces whose classicized designs were the focus of interior decoration. From

Franklin's perspective both of these chimney fireplaces required an invidious trade-off between comfortable heat and smoky discomfort: the more heat, the more smoke.

Rather than leave such technical problems aside once he had established a transatlantic scientific reputation, Franklin became the Enlightenment's authority on smoky chimneys. He drew on his scientific work in physics to dissociate the fire's elements of smoke, heat, and light. To reduce drafts, Franklin designed a stove that cut off the air for ventilation from that for combustion by piping the latter directly to the fireplace from outside the house. Because such stoves provided draft-free warmth throughout a room, members of a household would be freer to spend time together out of choice rather than from physical necessity for the fire's heat and light. At the same time they would be able to pursue their individual activities in a uniformly heated space. Or so he hoped. In fact, his original design was difficult to retrofit and too complicated to be frequently installed in new construction. What came to be known as the Franklin fireplace was basically a cast iron version of the genteel open fireplace, with its trade-off of smoke and heat.

Franklin was also attentive to the relationship, developing throughout the Anglo-American world, between genteel domestic culture and improved artificial illumination. People wanted more light. Interest in the improvement of domestic lighting was especially keen in America. Americans had a near monopoly on the new spermaceti industry, extracting from sperm whales an oil that flowed well in temperate climates and also provided a new candle material, spermaceti wax, which burned cleanly and gave a reliably bright light. Franklin promoted the spermaceti candle for these qualities, and experimented with multiple-wick oil lamps in order to determine the most efficient arrangement for a bright light.

Thomas Jefferson's design and furnishing of his home at Monticello epitomized the new attention to comfort, as he sought to improve the heating, ventilation, illumination, privacy, and hygiene of conventional architecture. For insulation the north-facing tea room had triple-glazed windows and double sliding glass doors, and he installed a Rumford stove for heating. Jefferson also promoted Aimé Argand's (1750–1803) design of an oil lamp whose cylindrical wick produced a bright light, and sent examples from France to James Madison and others. Jefferson never elaborated on what he meant by "the pursuit of happiness," but given his lifelong obsession with the improvement of convenience and comfort, it

seems reasonable to infer that he believed their successful pursuit would result in happiness.

But the efforts of Franklin, Jefferson, and other *philosophes* to improve comfort had little effect on most Americans' priorities for their domestic environments. At any one time in the late eighteenth century, a large proportion of the American population (outside New England) still lived in houses of quickly worked local materials, usually logs. According to the 1798 Direct Tax Assessments, windows, and even more so windowpanes, were the chief architectural improvements, adding more value than material of construction, floor area, or number of stories. In the countryside, glazed windows were a luxury, but living in a house built of logs did not preclude such refinement, nor was sheer affordability the main constraint. The plans, amenities, and finish of the houses in which most Americans lived at the end of the eighteenth century—room-and-loft house plans, wood and clay chimneys, few and small windows, and construction from local raw materials—would still have earned them the derogatory designation "cottages" in England.

HESSIANS The Hessians were a group of German auxiliary soldiers hired by the British Crown in 1776 to assist them in putting down the American colonial rebellion. In all, approximately 30,000 "Hessians" would eventually serve in North America during the course of the American Revolution. Although the term "Hessian" was commonly used by contemporary Americans of the day and later historians, the title actually identifies only those from the German principalities of Hesse-Hanau and Hesse-Cassel. In fact, these soldiers were recruited from a wide variety

of locales across Germany during the course of the war. However, of the 30,000 troops sent, the Landgraf of Hesse-Cassel provided well over half (18,970) of all German troops who would fight in the war. The next-highest contingent came from Brunswick (about 5,723), followed by Hesse-Hanau at 2,422, Hannover at 2,373, Anspach-Bayreuth at 2,353, and Waldeck at 1,225. Owing to its tiny home army, the smallest amount was provided by Anhalt-Zerbst at 1,152 (Fischer, *Washington's Crossing*, pp. 53–54).

The first contingent of Hessians (about 8,000 officers and men) arrived off New York City in mid-August 1776. Crossing over to Long Island on 22 August 1776, the Hessians played an instrumental part in the rout of General George Washington's Continental Army during a series of engagements in and around New York City, White Plains, and Fort Mifflin, where they captured over 2,800 Continental soldiers.

Having driven Washington and his army across New Jersey in the late fall and early winter of 1776, a large Hessian contingent of about 1,000 men, located at Trenton, New Jersey, under the command of Colonel Johann Gottlieb Rall, was subsequently attacked in a surprise Christmas Day raid by Washington, and the first large contingent of Hessians become prisoners of war.

During this time, Hessians assisted British troops in the bloodless capture of the city of Newport, Rhode Island, and later, in August 1778, helped repel an American attempt to retake the city by force. Accompanying William Howe to the Philadelphia area in the summer of 1777, Hessian forces participated in the British victories at Brandywine and Germantown only to become victims of a stinging defeat at the Battle of Red Bank, New Jersey. Another Hessian contingent, commanded by Major General Friedrich Adolph von Riedesel, formed part of the army led by General John Burgoyne that was defeated at Saratoga in October 1777. Another sizeable contingent of nearly 6,000 Hessians (mainly from the Brunswick and Hesse-Hanau regiments) were taken prisoner.

During the latter years of the war, Hessian soldiers formed part of the British force that seized the southern cities of Savannah and Charleston from the Americans and Pensacola from the Spanish. A large Hessian contingent was also captured along with the rest of Lord Cornwallis's British army at the decisive battle of Yorktown, Virginia, and became the third large Hessian force to have surrendered during the war. In all, it is estimated that nearly half of the total Hessian contingent did not return to their native Germany. Some became either American or Canadian

citizens by discharge or desertion, and others were killed or died of disease during their long years of service during the Revolution.

HISTORICAL MEMORY OF THE REVOLUTION

Even before the American Revolution officially ended with the signing of the Treaty of Paris in 1783, the battle over the memory and meaning of the Revolution had begun. Particularly in the early years of the Republic, every group attempted to establish its legitimacy and gain popular support by laying claim to the Revolution. Thus memories of it became hotly contested terrain and played a central role in shaping the political life of the nation. Virtually every important political battle in the early Republic was also a battle over the memory and the meaning of the American Revolution.

The complicated relationship of memory, myth, tradition, and history became even more tangled in this highly charged atmosphere. By 1811 John Adams, the first vice president and second president of the United States, was so disgusted by how political conflict had distorted the history of the Revolution that he begged a friend to write a treatise on "the

Bunker Hill Monument. The Battle of Bunker Hill is commemorated with a 221-foot granite obelisk that stands on Breed's Hill, the actual site of the battle. The obelisk was completed in 1842, replacing a smaller monument placed in 1794. © KEVIN FLEMING/CORBIS.

corruption of history," arguing that "both tradition and history are already corrupted in America as much as they ever were in the four or five first centuries of Christianity, and as much as they ever were in any age or country in the whole history of mankind."

REMEMBERING THE DECLARATION

Perhaps nothing better illustrates both the centrality and the contentiousness of memories of the Revolution than the history of the Declaration of Independence. Today, the Declaration stands as one of the country's foundational documents, and no American would question its importance to the nation's political tradition. But it did not always have such a secure place in the hearts and minds of citizens. At first, the Declaration was almost entirely forgotten by Americans, and Jefferson's authorship was not common knowledge. Then, as Democratic Republi-

cans and Federalists waged an increasingly fierce political contest in the 1790s, the Republicans attempted to elevate the historical significance of the Declaration as a means of burnishing Jefferson's reputation and, consequently, bolstering the party's popularity. In the nineteenth century memories of the Declaration continued to prove changeable, as other Americans attempted to reshape the memory of the American Revolution. In the Gettysburg Address in 1863, President Abraham Lincoln did not mention the Constitution but chose to concentrate instead on the Declaration's promise of equality so as to change the meaning of the Civil War from a political struggle to a much more profound battle to create equality. Lincoln gave the document a fresh historical twist and, in the process, reshaped the memory and meaning of the Revolution once again. Of course, even though the founders had never imagined that the declaration's principles applied to anyone but white males, women and African Americans were quick to seize on its revolutionary implications for themselves almost from the moment it was first published.

POLITICS AND MEMORY

The Declaration of Independence is only one example of the ongoing struggle among different groups over the memory of the Revolution. Every important debate in early American history was also a battle over the memory of the Revolution. For example, the intense fight over ratification of the Constitution pitted two opposite understandings of the Revolution against one another. Anti-Federalists and Federalists both used memories of the American Revolution to justify their arguments. The capaciousness of Revolutionary experience allowed the two sides nearly equal validity. Anti-Federalists recalled the origins of the Revolution as an assertion of local self-government over the imposition of imperial, centralized control and argued that the proposed Constitution would erase those hard-won freedoms. Federalists pointed to the increasing unity of the colonies, including greater centralized control, as essential not just to winning the war but to surviving as a nation and saw the Constitution as the only means of preserving the gains of the Revolution.

Ratification failed to end the contest. The debate grew even more ferocious as Federalists and Republicans opposed one another in the 1790s. Was Treasury Secretary Alexander Hamilton's financial scheme a brilliant rescuing of national finance or a usurpation of state power? Once again, disagreements about the memory of the Revolution were

The Sesquicentennial International Exposition. This poster by Dan Smith promoted an exposition held in 1926 in Philadelphia to mark the 150th anniversary of the signing of Declaration of Independence. © SWIM INK/CORBIS.

central to this debate. Other questions—whether the United States should lean toward England or France in foreign policy, how democratic politics should be—also revolved around memories of the Revolution.

POPULAR MEMORIES OF THE REVOLUTION

The battle over how to remember the Revolution was not simply fought among elites—there was a popular front as well. A variety of quasi-political events, such as Fourth of July celebrations, served as arenas in which groups who were frequently excluded from political life, such as women and men with little property, could offer their own symbolic understanding of the Revolution and contest elitist conceptions of political life. The Revolution itself always remained open to reinterpretations that challenged the status quo. For example, even African Americans found resources within memories of the Revolution to challenge slavery, despite the founders' refusal to include them as part of a new political order ostensibly based on liberty and equality. At an event commemorating the signing of the Declaration of Independence in 1852, the abolitionist Frederick Douglass recalled the American Revolution not to praise it but to challenge it, openly contesting the contented celebration of the Revolution by white citizens. "What, to the American slave, is your 4th of July?," he asked, reminding his audience that the truly revolutionary aspects of the war for independence remained unfulfilled for some. "This Fourth July is yours, not mine. You may rejoice, I must mourn," he said. In coming years Douglass's challenge would be taken up by others to expand the promises of the Revolution to groups never imagined by the founders. Even today, memories of the Revolution continue to prove elastic and capacious and are used by groups who want to expand the boundaries of American politics.

THE REVOLUTION AS REMEMBERED BY TODAY'S SOCIETY

With the victory of the Republicans in 1800 and their increasing dominance of national politics during the subsequent years, the passionate debates about how to remember the Revolution began to cool, allowing the memory of the Revolution to serve as a force for national unity rather than division. Of course, politicians still recognized the importance of associating themselves with the Revolution. Thomas Jefferson referred to his election as the "revolution of 1800" so as to present himself as the embodiment of the "true" meaning of the American Revolution. Increasingly, however, Americans began to remember the Revolution

as a source of national, rather than partisan, pride.

The best example of this transformation is George Washington, the preeminent man of the Revolution. As the first president of the United States, Washington had become a deeply politicized figure, serving as the Federalists' most important weapon and as the Republicans biggest obstacle. In the early 1800s, Mason Locke Weems wrote an astoundingly popular—and not altogether factual—biography of Washington that restored his national popularity by draining him of his political specificity and repositioning him as an American hero. It proved to be a winning formula; indeed the nation's current celebrations of the Revolution revolve largely around entertainment, not politics, which represents perhaps both a loss and a gain. The political apathy that afflicts a significant percentage of the electorate is nothing to celebrate, yet that apathy is a sign that the nation no longer has to fear dissolution.

Some contemporary commentators complain that today's Americans hardly bother to remember the Revolution at all, that the country suffers from a kind of collective historical amnesia. Even this problem can be traced to the Revolution. The break with Great Britain also promoted a break with tradition. As many writers at the time exhorted their fellow citizens to look to the future, rather than the past, the entire historical project of remembering the Revolution could seem suspect. There remains a powerful strand of American thought that continues to question the relevance of the past. Perhaps this explains why the country has frequently been slow to commemorate its own Revolutionary past. For example, the construction of the Washington monument was not begun until 1848 and not completed until 1885.

Memories of the Revolution remain at the center of American national identity, although not perhaps in the way that they once did. Today, most Americans have an uncritical and even worshipful attitude toward the founders. When towns and cities across the country hold their annual Fourth of July parades, it is difficult to remember that these memories once served to divide, rather than to unite, the nation.

HISTORY AND BIOGRAPHY Over the period 1750 to 1830, the writing of history in America emerged as a discipline intended to illustrate truths about human behavior and the natural world that would enable people to comprehend the present. Although historians and biographers scrupulously pursued an ideal of objectivity, their accounts of the past possessed an unmistakably didactic quality. Historians sought to persuade readers to embrace certain behaviors and ways of living; they also hoped to persuade government leaders to adopt specific policies. Histories written in this period, consequently, illustrate both the evolving practice of a scholarly discipline and the larger political, cultural, and social disputes of the era.

As a result of the growing influence of the Enlightenment, with its emphasis on exploring causation through documentation and observation, American historians began to investigate primary sources (such as governmental records, court cases, and individual recollections) to provide readers with an accurate account of the past. Such accounts, they believed, would reveal the larger principles that governed human behavior, for both better or worse. Following independence, these efforts culminated in the

establishment of libraries and historical societies to preserve the raw material on which contemporary and future authors could draw to write regional and national histories. Massachusetts, Pennsylvania, and New York were the first states to establish such societies in the 1780s and 1790s, and by 1830 they could be found in Maine, New Hampshire, Vermont, Rhode Island, Connecticut, Tennessee, Ohio, Illinois, Indiana, and Michigan.

COLONIAL HISTORIES

As the colonies grew both in material prosperity and intellectual sophistication, colonial authors sought to validate their cultural, social, and political institutions to interested, and often skeptical, European observers. At the same time, their own anxiety about the viability of colonial communities prompted them to instruct their fellow Americans in manners and sensibilities. Thus history writing and biography joined rational observation and objective analysis with a political and cultural agenda.

Several colonial authors used the official records of their colonies to illustrate the failings of imperial policies and chart various paths for reform. These include William Smith, Jr., *History of the Province of New York* (1757); Samuel Smith, *History of the Colony of Nova Caesaria, or New Jersey* (1765); and William Stith, *History of the First Discovery and Settlement of Virginia* (1747). Robert Beverley, in *History and Present State of Virginia* (1705), combined his less thoroughly researched but equally passionate criticisms of imperial policy with an ethnographic discussion of Native American culture intended to refute charges that societies degenerated in North America. In *Chronological History of New England* (1736), Thomas Prince used the diaries and recollections of the founders of Massachusetts and Plymouth colonies to remind readers, and particularly the royal governor, of the debt the present generation continued to owe to the ideals of these first Puritan settlers. Thomas Hutchinson, in *History of the Colony and Province of Massachusetts Bay* (1764, 1767), used official records and the recollections of a wide array of observers of Massachusetts Bay Colony to persuade his readers that its development into a cosmopolitan community was an improvement over its Puritan origins.

POST-REVOLUTIONARY HISTORIES

The same didactic and partisan tone reappeared after the American Revolution. Concerned over the fragility of republics in general and eager to answer European skepticism about the effects of the New World

on human development, historians began a concerted effort to mold the character of their fellow citizens. In every region of the new nation, histories appeared that presented the development of particular states or the experiences of the nation as a whole—particularly during the American Revolution—and prescribed republican values. The exclusive purpose of biographies of the era was to provide young Americans with models of republican virtue to emulate.

Despite the historians' universal ambition to present accurate accounts of the past free of party politics, few histories lived up to that ideal. The Federalist sympathies of David Ramsay, in *History of the American Revolution* (1787), and Jeremy Belknap, in *History of New Hampshire* (1785–1791), were thinly veiled, as were the Democratic Republican sentiments of James Sullivan, in *History of the District of Maine* (1794), and Samuel Williams, in *Natural and Civil History of Vermont* (1794). The most partisan accounts, reflecting the time in which they were written, were Mercy Otis Warren's *History of the Rise, Progress and Termination of the American Revolution* (1805) and John Marshall's *Life of George Washington* (1804–1808). Warren freely criticized what she saw as the corruption of the body politic through the spread of commercial interests at the expense of patriotic sentiment. She also warned of the monarchical aspirations of several leading figures in the Washington and Adams administrations. Marshall wrote from the opposite perspective. He used his life of Washington to illustrate the naivete of those who feared a strong central government and vigorous commercial economy. His account of the political turmoil of the 1790s offered tempered but unmistakable criticism of the Democratic Republican opposition and praise for the individuals in the Washington and Adams administrations, as well as the policies they pursued.

Some authors tried to avoid the political controversies of the age. The most famous and successful in this regard was Mason Locke Weems, whose *Life and Memorable Actions of Washington* (1800) celebrated his character as an exemplar of republican virtue but paid scant attention to partisan politics. It is from Parson Weems's enormously successful biography that we have received many of the myths surrounding Washington, notably the story of young George chopping down the cherry tree.

CULTURAL POLITICS

The first historians of the United States were also embroiled in the cultural politics of their time. Sullivan,

weighing in on the debate over the role of religion in a republic, praised the privileged place that the founders of Massachusetts Bay had given religion in their communities. On the other hand, William Gordon, in *History of the Rise, Progress, and Establishment of the Independence of the United States* (1788), reminded readers that people with no identifiable religious affiliation had not only served in Pennsylvania's government but had done so with distinction. John Lendrum, in *Concise and Impartial History of the American Revolution* (1795), offered scathing criticism of both the institution of slavery and those who defended it; Marshall carefully pointed out the institution's centrality to the economic viability of the South. Hannah Adams, in *Summary History of New England* (1799), and Warren used their accounts to call for a greater role for women in the public life of the nation. Most authors, notably Williams, sought to find a place for Native Americans in the new Republic, usually arguing for their transformation into members of Euro-American society.

The historians and biographers of the colonial and post-Revolutionary eras were important players on the political and cultural stage of the new nation. These authors reflected the anxieties of the young Republic and sought to strengthen it by promoting particular values among its citizens. In the process of recording the emergence and development of the United States, they laid the groundwork for the modern discipline of history.

HOLIDAYS AND PUBLIC CELEBRATIONS

Guy Fawkes Day, King George III's crowning, the British evacuation of New York, the Battle of Yorktown: these were some of the most popular events commemorated in the colonies and the new nation. Celebrations of these events often involved whole communities and were marked by public sermons, toasts, and parades. Public commemorations of holidays served as a way to both express and inculcate a shared identity, first as British subjects and then as citizens of a new nation.

Prior to the Revolution, colonists celebrated a series of British events centered on the Crown. When word of George III's accession reached the colonies, colonists paraded in the streets and expressed with gusto their fealty to the monarch. These celebrations occurred throughout the colonies, binding colonists together as British subjects. They celebrated other traditional secular holidays that reaffirmed the colonists' British heritage, such as the monarch's birthday, the Restoration, and Guy Fawkes Day (called Pope's Day in Boston).

Although virtually all colonists shared in commemorating these events, celebrations were local. Philadelphians, for example, had little if any knowledge of what Bostonians were doing. Instead, they celebrated their heritage as members of a separate colony that was part of a broader Atlantic world directed toward London. The mustering of militias, followed by tavern-going and toasting, marked many of these secular celebrations. Guy Fawkes Day (5 November), the holiday commemorating the failed plot by a group of Catholic radicals to blow up Parliament and assassinate James I, became a holiday with both regional and class distinctiveness. The holiday was a particularly raucous event among mechanics and artisans in Boston and New York, whereas royal festivals in other regions were orchestrated by the elites and thus more subdued and standardized.

Celebrations of religious holidays were less formal and less public. The traditional Christian liturgical calendar was seldom observed outside the pages of almanacs; Christmas, in particular, was little celebrated except in German- and Dutch-speaking communities. Although colonists shared many secular holidays, local exigencies shaped religious celebrations. Churchgoing itself in the Northeast was a communal affair, with tightly knit towns congregating in a central parish to worship. In colonies with less centralization, particularly in the South, churchgoing was less frequent, serving as a special occasion for the community to gather and socialize. Congregational New England and Anglican Virginia practiced state-mandated fasts more often than the more pluralistic and expansive colonies like New York and Pennsylvania. Colonists fasted as a form of penance intended to influence God's will. In Pennsylvania during the Seven Years' War, for instance, casualties were attributed to the colonists' profligate ways, and the governor declared fasts to appease God. The fasts usually lasted for a day and restricted people from performing "servile labor"; instead, they were to devote a day to public prayers and sermons.

AFTER THE REVOLUTION

In the immediate aftermath of the Revolution, citizens needed to create new holidays that would help cement a national bond. The Fourth of July was one of the most popular holidays, but citizens also celebrated other dates, now forgotten, with almost as much fanfare. Battles fought in distant colonies became the subject of parades and toasts. Newspapers throughout the country reported on these celebrations, helping to create a shared memory among widely scattered and previously unconnected people. As a new shared identity as American citizens took shape, the celebration of holidays reinforced the sense of collective nationhood and citizenship. Celebrating the battles also recast the Revolution, not as a bitter, divisive, bloody, and closely fought battle, but as a moment of national ascendancy and union.

As the nation became more partisan, especially following the debates about the Constitution's ratification in the late 1780s, celebrations of secular, civil holidays became politicized. Political parties realized that owning the commemoration of popular national events was a potent strategy for gaining power. Rather than the raucous, rebellious celebrations during Revolutionary days, the national culture began adopting more formal, prosaic, and sentimental displays of memory, which were nonetheless highly contested by the dueling parties. For a brief time, Fed-

ederalists successfully used public celebrations to reaffirm their ascendancy. They promoted Washington's birthday as a holiday according to the tradition of celebrating the king's birthday. Anti-Federalists recognized the Federalists' success late and slowly, and then unsuccessfully tried to co-opt these same events for their cause.

Party politics inspired new kinds of commemorations. Republicans, the opposition party, began commemorating the French Revolution in the 1790s as a way to critique what they viewed as the growing elitism and aristocracy of the Federalist Party. Federalists, on the other hand, bitterly fought over the right to own the commemoration of George Washington's death.

Formal, public celebrations of religious fasts and thanksgivings were eclipsed by the increasingly contested but popular secular holidays. After Independence, the Continental Congress often endorsed fasts, in some respects linking God's will to the outcome of the Revolution. However, with the ratification of the Constitution, Federalist attempts—and then those of President Washington—to decree a day of thanksgiving met with widespread opposition. This day of thanksgiving was not a formal remembrance of a specific event like the modern Thanksgiving, but rather a day to give thanks to God for the success of the Revolution and creation of the federal government. Washington's successor, John Adams, decreed two national fast days during the Quasi-War with France and couched these declarations in explicitly Christian terms. Although individual states often celebrated a day of thanksgiving in the early Republic, it was not until Sarah Josepha Hale, a prominent writer, successfully lobbied Abraham Lincoln in 1863 to create a national holiday that commemorated the Pilgrims' original feast.

Although fasts and public religious celebrations were few, sermons at secular events were common, especially during the Federalist period (1789–1800). Newspapers, broadsides, and pamphlets disseminated many of these sermons throughout the country, which allowed celebrants in different states to share a common bond as citizens. In this respect, even civil events had an air of sanctity. The strength of the Democratic Republicans and the Jeffersonian victory in 1800 brought another partisan change to celebrations. Sermons receded as secular orations about political, local, and patriotic heroes assumed a more prominent role. Although holidays were still hotly contested, both parties used orations to link their cause to the Revolution.

Partisanship may have marked the public performance of holidays, but the very nature of the celebrations—public events that often involved all members of a community as either spectators or participants—helped create a sense of national unity and identity in the new nation. Both Democratic Republicans and Federalists saw themselves as the proper inheritors of the Revolution's mantle, but the centrality of the Revolution in both camps' public celebrations helped create and reinforce a shared national identity.

HOME As much a mental as a physical construct, "home" is a place we dwell on as well as dwell in. The emergence of home as we understand it in the early twenty-first century began in the late eighteenth and early nineteenth centuries. The modern notion of home ultimately replaced the older idea of household, a slow, almost imperceptible process but one of huge significance for the future of American society, for the shift from household to home was paralleled by the rise of the idea of "homeland," a key concept in the founding of the new American nation.

At the mid-eighteenth century, the subjects of European monarchies living on the North American continent, both free and enslaved, dwelled in places

universally described as households. The household was not only the basic residential unit, but also the fundamental political, economic, and social organization. In many of the New England colonies, everyone was obligated to live in a household. These were organized in a hierarchical manner, with the royal household at the pinnacle. The household of each royal subject was ruled by a patriarchal master, who exercised authority over all the inhabitants: family members, kin, servants, slaves, even guests. No distinction was made between family and household. Indeed, the term “family” applied equally to all living under the one roof. In the big houses of slave plantations, masters talked of their families as including both black and white members.

The household was a functional unit to which few of the sentiments that we now associate with home were attached. Membership of the household changed frequently, and people felt at home in a particular region rather than in a particular house. There was little interest in roots or the history of particular residences, and no sense of sacredness attached to domestic space as such. When people talked of going home, they were referring to a place of destination rather than of return. In the journey, the prevailing metaphor of Christian life, the ultimate home was in heaven rather than on earth. Households were mere way stations, and too great a fondness for worldly places was considered an obstacle to salvation among both Protestants and Catholics. Neither faith spiritualized the household in the ways that later generations would do.

The time and space of the household was not significantly different from the times and spaces of the world at large. Its rhythms were dictated by the work and leisure patterns of its inhabitants. It was more communal than private and was heterogeneous with respect to age, race, and gender. As long as each resident adhered to her or his assigned place in the household hierarchy, they mingled quite freely, sharing rooms, even beds. There was little concern for personal privacy; and the household was as much men’s space as it was women’s. Indeed, in this patriarchal society it was more his than hers.

INVENTION OF THE HOME

There is no precise date by which to mark the transition from the eighteenth-century notion of household to the nineteenth-century idea of home. The shift was the product of changes in social and economic conditions, of religious transformations, but also of the American Revolution, which replaced the ancient notion of royal sovereignty with the idea of

the sovereign nation defined as a people sharing a certain bounded territory. The Revolution displaced not only the figure of the royal father but the royal house, replacing them with republican fathers and republican homes. The old hierarchy of households was replaced with an imagined landscape of single-family homes, congruent with the Jeffersonian vision of a nation of small farmers, artisans, and shopkeepers, each with a wife and children. The result was a radically new sense of both domestic space and domestic time that gradually established itself as the middle-class norm by the mid-nineteenth century.

By the early nineteenth century, the household had begun to lose its place at the core of American life. It shed its economic functions when paid work was relocated to the shop or the factory. Apprenticeship was replaced by wage work, and it became less common for employees to live in the houses of their masters. Servants remained, but they were now quartered apart from family members. In time, the household would also lose its educational role to the school, and in the new republican nation-state, powers once vested in the head of the household were relocated to the courts and governmental agencies. By the middle of the century, there was a clear separation of the private and public spheres. To the former belonged women and children; to the latter belonged the free, property-owning males who were now employed in offices and factories and who, as citizens, exercised power in the new nation. This process proceeded fastest in the industrializing Northeast, in cities rather than on farms. A clear distinction between family and household emerged first among the urban middle classes there. In the plantation South, older forms of household persisted, and among the working classes, heterogeneous households were still common.

Among the middle classes of the Northeast, a new kind of feminized domesticity was emerging, reflected in the gendered concept of the “homemaker.” It came to be assumed that only a woman, preferably a mother, could create a proper home. Previously honored for their domestic skills, fathers were now defined by their prowess as breadwinners. The patriarchal house gave way to the matri-centered home. Thus, while the residence remained for women a place of work, it became something very different for middle-class men. For them, it became a retreat, a place of rest and relaxation. It was said that “with fond longings does he turn toward that bright paradise, his home. . . . With what refreshing gladness does he retire from the noise, and strife . . .

into this *sanctum sanctorum* of the world's vast temple" (Boydston, *Home and Work*, p. 146).

NO PLACE LIKE HOME

Home had begun to take on a meaning once associated only with heaven. This transition was slow and uneven, but in the course of the early nineteenth century a shift in religious sensibilities initiated by the evangelical Protestant middle classes spiritualized domesticity, giving it a sacramental quality that it had not had earlier. Catholics were slower to sacralize the home, but they too would eventually sanctify it. The first step in this process was to erect new boundaries between home and world. The house, previously a semipublic space, was gradually becoming an entirely private sphere. Entry into the *sanctum sanctorum* took on a ritualized formality it had not previously had. But because most middle-class households had servants, internal space was differentiated in such a way as to segregate those rooms (the parlor, dining room, and bedrooms) that belonged to the family and those (kitchen, stables, and "below stairs") reserved for strangers. The single-family house, located at the edges of eastern cities, was becoming the norm of middle-class family life. This private way of life was mirrored in a private way of death, with new cemeteries laid out in family plots with tombs that looked like suburban houses. Heaven itself came to be imagined as a pleasant suburb filled with nuclear families.

Time was also used to set home apart from house. A series of daily, weekly, and annual family-centered rituals came into existence, separating the newly invented notion of "family time" from work and public time more generally. Christmas, previously a public event, came to be the archetypal family occasion, a moment of homecoming that had no precedent in earlier centuries. The idea of home, usually the maternal home, as a place of return reinforced its temporal as well as spatial mystique. Home came to be associated with personal or familial past, an object of intense nostalgia. In an era of rapid change and frequent movement, when Americans—both native and immigrant—were beginning to move westward in massive numbers and would never go back to their place of birth again, the symbol of home took on enormous meaning. Home became for many, and especially for middle-class men, both a dream of future success and a memory of lost paradise. Home was to become an ideal, often at odds with the places people actually lived in.

MYTH OF THE AMERICAN HOME

The ideal of the American home emerging in the early nineteenth century should not be confused with the residential life even of the Protestant middle classes who invented it. It is wrong to think of housewives as ladies of leisure. Their toil, vastly increased by the elevated standards of Victorian homemaking, was portrayed as a labor of love. Yet married women were in many ways worse off than single women, who at least had access to their own earnings. Motherhood, also idealized, was no paradise either. High infant and maternal death rates made it a cause of intense anxiety and real distress. No wonder many women put off marriage and considered alternative living arrangements. Children were perhaps the chief beneficiaries of the newly established home life. Among the middle classes they were coming to be regarded as innocent creatures, in need of protection from the world. Withdrawn from work and increasingly confined to school, they were, however, still subject to whims of adults and were much less independent than their age-mates among the working classes.

For the vast majority of Americans, home was nothing more than a dream. A freestanding house was beyond the reach of most wage workers. Slaves, who were a part of their masters' household property, were not allowed to own their own houses. Immigrants might aspire to homeownership, but most were too poor to attain their goal. And even among the rising middle classes, the ever-increasing standards of a middle-class home—fashionable furniture, fine art, good food and drink—always seemed just beyond reach, a spur to constant striving, a source of anxiety, and in the case of those who failed to earn enough, a cause of shame. Home had become a generator of gender and generational differences. It was also to become a marker of class division.

The Protestant middle-class concept of home did not go unchallenged, however. Most Americans lived the best they could, ignoring and even defying its standards. In the early nineteenth century, inner-city slum dwellers as well as people on the expanding frontiers put together their own heterogeneous residential arrangements. The various utopian communities that proliferated in this same period offered a variety of alternative living arrangements which were explicitly aimed at coping with the well-known shortcomings of the private home and nuclear family. Experiments ranging from polygamy to celibacy attracted many adherents; at places like Oneida community in New York State, communal dining rooms and shared child care proved very popular. In the South, slaves, forbidden to marry, performed their

own nuptials, which allowed them to have some measure of family and domestic life.

Henry David Thoreau (1817–1862) was particularly uneasy about the new homes and private cemeteries he saw being built all around Walden Pond. He worried that the sanctification of domestic life reflected in their architecture produced a poorer rather than richer spiritual life. Invoking an earlier tradition in which the house was a mere way station on a grander journey, he wrote: “We no longer camp as if for a night, but have settled down on earth and forgotten heaven. . . . We have built for this world a family mansion, and for the next a family tomb” (Chandler, *Dwelling in the Text*, p. 40). In this respect, Thoreau was a prophet, anticipating developments that continue to shape the American landscape into the twenty-first century.

HOMOSEXUALITY In the late colonial and early national eras, same-sex sexual behavior was at times still seen as a discrete sinful act unrelated to a person’s identity. Only over time did the notion develop that homosexual acts unquestionably indicated an overall sexual identity.

In the new nation the penalty for sodomy was death, but prosecutions for same-sex behavior were

rare. (Some, like Thomas Jefferson, proposed changing the penalty from death to castration.) The numbers of sodomy cases heard by the courts had declined through the colonial period. The overall lack of court cases, although notable when compared with much of Europe in the same period, does not mean that homosexuality was virtually unknown in early America. Society was generally intolerant of explicit same-sex sexual behavior and especially condemned such behavior when linked to gender non-conformity.

Newspapers and imported literature poked fun at men interested in sex with other men and, with ribald humor, derided their character. A variety of eighteenth-century print genres viewed same-sex sexual behavior as indicative of moral corruption, and some publications endorsed executing men convicted of committing sodomy. Only very rarely did print sources even broach the subject of lesbianism.

The term “Boston Marriage” did not come into public use until after the publication of Henry James’s 1886 novel *The Bostonians*, in which an early feminist develops a strong attachment to a young woman from a prominent Boston family. But the relationship the term describes—a romantic friendship between two women, usually expressed through correspondence—had been known since the mid-eighteenth century. In the 1750s, for example, Sarah Prince and Esther Burr wrote letters to each other expressing mutual support and their intense passionate interest in each other. When Burr died Prince compared her love for her friend to that she felt for her husband. In the mid-nineteenth century, the literary critic and reformer Margaret Fuller expressed similar emotions in her description of falling in love at the age of thirteen with an Englishwoman. Such intense female friendships became socially acceptable and allowed some women to live together in partnerships.

Men’s diaries and correspondence from the late eighteenth century also reveal passionate and romantic male friendships. The Bostonians Joseph Dennie and Roger Vose wrote to each other about building a “permanent friendship.” Their letters reveal an intensity of emotion that may or may not have included physical intimacy when the two men were together in private. The essayist and poet Ralph Waldo Emerson (1803–1882) wrote in his journal a poem expressing the despair caused by his deep feelings for a classmate named Martin Gay.

NATIVE AMERICANS

European travelers had long noted sodomy in Native American communities. Missionaries of the Moravi-

an Church, for example, traveling in Pennsylvania, New York, and North Carolina, wrote of “unnatural sins”—a broad term that usually suggested same-sex sexual behavior. Travelers and missionaries noted the presence of the *berdache*, individuals who appeared to be men dressed as women and performing women’s social roles. Many of these individuals were believed to occupy a special spiritual realm. The *berdache* made an impression on European travelers and missionaries not only because of their gender ambiguity, but also because they were understood to engage in sodomy. Jesuit priests noted homosexual behavior among *berdache* while on journeys throughout California. Father Pedro Font, who recorded observing such individuals while traveling in 1775–1776, said he was told that such men were “not men like the rest”; he concluded that they were hermaphrodites and called them “sodomites.” The *berdache*, according to European accounts, was known among many indigenous communities in North America well into the modern era.

In the new American nation same-sex sexual behavior and desire had not yet been psychologized and medicalized. Although sodomy was a capital crime, interest in same-sex sexual behavior and romance was not yet considered distinct from other sensual tendencies. Homosexual behavior was not seen as indicating exclusive homosexuality, and homosexuality itself was not yet conceived of as a determining factor in an individual’s identity. Thus intense romantic relationships between members of the same sex could flourish without necessarily being reproached as a form of moral degeneration.

HORSESHOE BEND, BATTLE OF On 27 March 1814, a force of twenty-seven hundred U.S. soldiers, Tennessee militiamen, Cherokee cavalry, and one hundred “friendly” Creek Indians, all led by General Andrew Jackson, defeated the Red Stick faction of the Creek Nation in the Battle of Horseshoe Bend. Jackson’s victory ended the Creek War (1813–1814) and thrust him into national prominence. It also marked the last serious armed resistance of southeastern Indians against the United States.

The battle’s name came from a loop in the Tallapoosa River in Alabama. The Red Sticks, a segment of Creeks who wished to return to traditional social and religious practices, built a fort across the base of the bend in the stream. During 1813, the Red Sticks suffered a series of setbacks at the hands of the American militia and regular troops. The defenses on the Tallapoosa initially proved successful, allowing the Creeks to repel Jackson’s first attack on 21 January 1814. However, harsh winter weather, food shortages, and a dearth of firearms made the Indians situation precarious by early spring. Over 1,000 Creek warriors, along with 350 women and children, were inside, hoping to hold off the American and Indian force of over 2,700.

At the start of the fight, General Jackson’s Tennessee militia and regular army troops built a barricade across the base of the peninsula. Then Jackson opened fire on the fort with two cannons. However, the general hesitated to order a frontal assault on such a strong position. The Cherokees and Euro-American militia troops took up positions on the opposite bank of the river, across from the undefended side of the Red Sticks’ camp. During the artillery bombardment, some Cherokee warriors swam the river and stole the Red Sticks’ canoes. They then used the craft to bring more Cherokees and militiamen over to the Creeks’ camp to engage the Red Sticks. When Jackson heard the sound of gunfire from inside the fort, he ordered his men to charge the Creeks’ defensive works. The assault worked; the Euro-Americans and the Cherokees completely defeated the Red Sticks, killing nearly 600 Creek warriors. In addition, approximately 250 Red Sticks drowned in the Tallapoosa trying to escape. The losses suffered by the Creeks at Horseshoe Bend made it the single bloodiest day in the history of Native American warfare.

The remnants of the Red Sticks, under the leadership of Red Eagle, surrendered soon afterward. Andrew Jackson negotiated the Treaty of Fort Jackson on 9 August 1814 without federal authorization. Its

terms required the Creeks to give up half of their territory. Ironically, most of the land came from the Upper Creek Towns, the same people who fought alongside the Euro-Americans at Horseshoe Bend.

HOSPITALS In eighteenth- and early-nineteenth-century America, birth, sickness, and death took place in the home. Furthermore, medical care was not dominated by physicians. Indeed, the small number of physicians found in such communities as Boston, New York, Philadelphia, and Charleston were not the sole or even the major providers of health care. Ministers, midwives, wives, and a variety of other laypersons played important roles in caring for the sick and dying.

Many of the “hospitals” that existed prior to 1830 bore little or no resemblance to their modern counterparts. The majority, particularly those in urban areas, originally were associated with welfare and penal institutions. Philadelphia, for example, established a pesthouse to confine sick immigrants and thereby prevent epidemics. Indigent residents who were ill or insane were cared for at the municipal almshouse, which later evolved into the Philadelphia Hospital. A similar situation prevailed in other urban areas. In New York City, the House of Correction, Workhouse, and Poorhouse that opened in 1736 became Bellevue Hospital in 1816. Combining the functions of almshouse, workhouse, and penitentiary, these institutions provided some semblance of care for sick and disabled inmates, most of whom were indigent and dependent. The existence of such institutions also provided physicians with opportunities to learn their craft and to train younger men.

As late as 1800, only two institutions in the entire nation provided inpatient care for the sick, name-

ly Philadelphia’s Pennsylvania Hospital and New York City’s New York Hospital. The idea for the former originated with Dr. Thomas Bond, who subsequently enlisted the aid of Benjamin Franklin. The need to provide suitable accommodations to care for poor and sick individuals (as compared with those with resources to pay for private care), as Franklin noted, seemed pressing. Moreover, he was concerned with the fate of inhabitants “who unhappily became disorder’d in their Senses, wander’d about, to the Terror of their Neighbours, there being no Place (except the House of Correction) in which they might be confined.” After receiving a charter and a modest subsidy from the provincial assembly, the Pennsylvania Hospital received its first patient in 1752. The idea of creating a hospital in New York City originated with Dr. Samuel Bard, who believed that such an institution would facilitate medical education and elevate standards of medical practice. Receiving a royal charter in 1771, the New York Hospital had no sooner opened in 1775 when a fire destroyed the building. The ensuing war prevented its reopening until 1791.

During the American Revolution, military hospitals proliferated to provide care for wounded and sick soldiers, but they were short-lived. In 1798 Congress passed legislation that provided for the establishment of marine hospitals in seaports; they furnished temporary relief for sick and disabled seamen. After 1800 the pace of hospital founding began to accelerate. In 1811 the Massachusetts legislature, following the lead of elite Bostonians, passed an act of incorporation that created the Massachusetts General Hospital, which opened in 1821. A decade and a half later, a comparable institution was created in New Haven, Connecticut, to serve the needs of the Yale Medical School.

The few hospitals that existed before 1830 differed in fundamental ways from their modern counterparts. Individuals with resources would never be found in a hospital unless insane, taken sick during an epidemic, or involved in an accident while in a city away from home. Nor did hospital therapeutics differ from what could be done in a home. Indeed, the hospital was an institution created by elites to serve the needs of the less fortunate. Power within these institutions did not reside in medical hands; prominent laypersons played a dominant role in both admissions and the shaping of policy. The overwhelming majority of patients paid no fees; the costs were borne by philanthropic contributions. A small number of patients paid for their board and were provided with more comfortable quarters. In general, given

the lower-class makeup of the patient population, these institutions possessed a paternalistic character.

When the Pennsylvania and New York Hospitals were founded, the care of the insane was one of their primary responsibilities. By the early nineteenth century, however, separate institutions for the insane had become more common. Claims by such figures as Samuel Tuke in England and Philippe Pinel in France that environmental changes (that is, moral or psychological therapy) could reverse the course of the debilitating condition of insanity provided a rationale for institutionalization. Quakers played important roles in establishing the Friends Asylum in Pennsylvania in 1813 and the Bloomingdale Asylum as a separate part of New York Hospital in 1821. The McLean Asylum for the Insane (a division of Massachusetts General Hospital) opened in 1818, followed by the Hartford Retreat for the Insane in 1824.

Yet the structure, financial base, and goals of these private institutions were such that they could not become the foundation of a comprehensive system of hospitals serving the entire community. Consequently, during the 1820s and 1830s a movement to create public mental hospitals gained momentum. The first such institution, at Williamsburg, Virginia, had opened in 1773. By the 1820s South Carolina, Kentucky, and Maryland had created their own institutions. But the most important event was the establishment of the Worcester State Lunatic Asylum in Massachusetts. Opened in 1833, it set the stage for a phenomenal expansion of public mental hospitals throughout the United States. Indeed, the population of these institutions was considerably larger than those found in private and voluntary hospitals for much of the nineteenth century.

If anything symbolizes the contemporary American health care system, it is the modern hospital and its commitment to technology. Two centuries ago, however, the hospital was a fundamentally different institution, providing care for destitute, disabled, and dependent persons whose very survival was at risk. The emergence of the hospital in its modern form would have to await the scientific and technological changes that transformed America in the late nineteenth and twentieth centuries.

HOUSING Out of all the building types that combined to form the built environment during the second half of the eighteenth and the first decades of the nineteenth century, houses provide the most considerable insights into the lives of the nation's citizens and illuminate the diverse complexion and provincial nature of the Republic. Numerous variables, among them ethnicity and geographic location, helped shape the native house and created the broad range of types and traditions that are encountered and studied in the early twenty-first century.

A DIVERSITY OF INFLUENCES

In the decades immediately following the Revolution, the new Republic remained largely what it had been before, a collection of disparate regions with diverse cultural traditions. Within these regions distinctive building customs had been fostered and cultivated, shaped by economic and social variables, the strength of tradition, technology, climate, and geographic location. Dwelling forms, floor plans and room functions, heating and cooking arrangements, and construction materials and techniques were as varied as the nation's ethnic and socioeconomic composition. In certain instances dwellings reveal clear architectural precedents, that is, transplanted characteristics of foreign forms; in other cases the derivation of particular types is less pronounced if not altogether muddled. While high-style examples proclaimed, among other things, the prominence of their owners, vernacular manifestations often reflected more mundane and practical considerations. Some areas of the nation with distinctive ethnic traditions were, during the identified period, experiencing an influx of new influences that permeated established customs and created hybrid forms. House design and construction remained predominantly the domain of the master builder and mason; they drew foremost upon established building practices and tradition, tempered by local conditions.

House plans. Dwellings constructed from 1754 to 1829 can be broadly classified within two sub-

Carroll Mansion. This staircase spirals up three stories in Baltimore's elegant Carroll Mansion, a late-Federal-style house built circa 1811. The house served as the winter home of the family of Charles Carroll, a signer of the Declaration of Independence. © LEE SNIDER/PHOTO IMAGES/CORBIS.

groups, freestanding or attached. Freestanding houses encompass a broad range of types, both rural and urban; attached dwellings, those built with shared walls, were more common in denser population centers. Among those plans to be found during this study period were modest one-room types, single cell and half house; two-room examples, like the hall-and-parlor house—the hall offering a mixed-use cooking and dining area and the parlor or “best room” denoting a formal capacity—and various three- and four-room types, often a story-and-a-half or two stories in size. Bedchambers might be found in finished areas on the primary or upper story, or accommodation found in unfinished garret space or a bed niche. Larger dwellings included the center chimney house, with the hall, parlor, and a rear kitchen occupying the primary floor with bedchambers above, and center-passage houses with end-wall fireplaces. Center-passage layouts became increasingly common as the eighteenth century progressed. More sophisticated dwellings, such as the eighteenth-century Georgian-style houses of

Virginia and the Federal-style houses of the early-nineteenth-century Atlantic seacoast, boasted fully developed multistory plans, often of the center-hall type. Earlier houses were sometimes subsumed or augmented as part of subsequent expansion phases.

Heating and cooking. Among the foremost concerns in the conception of a dwelling in colder climates was heating, which was achieved through the fireplace and the stove. Wood-burning fireplaces were by far the predominant heating feature of houses in this period, and they included both jambed fireplaces such as those built by the English and jambless open hearths that were losing favor as the eighteenth century progressed. Stoves were likewise finding increased application in American dwellings in the eighteenth century, including five-plate cast iron examples and ceramic types. Among the more ingenious arrangements for heating was that utilized by people of Germanic descent: from the large kitchen hearth, a small opening allowed hot coals to be pushed to a five-plate iron or ceramic stove situated behind in the adjacent parlor or “stove room.” By the

end of the third decade of the nineteenth century, earlier advances such as the six-plate Franklin stove had begun to undermine the practicality of wood-burning fireplaces and coal, too, was gaining increased popularity as a fuel. As with heating, cooking was often conducted in large wood-burning fireplaces, yet by the end of the period cast-iron cooking stoves were beginning to replace the open fire. Beehive ovens facilitated bread baking. Food storage was accommodated in cellars and root cellars, pantries, and garrets. Indoor plumbing had yet to make any impact on domestic architecture, and people remained largely bound to privies, chamber pots, and hand pumps.

REGIONS, TYPES, AND TRADITIONS

In the rural, English-settled regions of Massachusetts Bay and the Connecticut River valley, a tradition of heavy frame construction evolved during the late seventeenth and eighteenth centuries that had its roots in southeastern Britain. These houses were

sturdy and largely conceived in practical terms, though not without attention to aesthetic interests. By 1750 an important change governing the house plan was taking place in these dwellings, which were typically associated with Massachusetts and Connecticut but were also found in the larger environs of New England: the abandonment of the center chimney, hall-and-parlor arrangement for a center-hall layout with end-wall fireplaces. In rural Maine and parts of New Hampshire, where winters were fierce, houses of this type were built as components of attached farm complexes—the “big house, little house, back house, barn” interconnected arrangement—to shield human activity from the harsh climate. Other distinctive New England regional forms included the Cape Cod cottage common to coastal areas, which utilized a three-room plan like the above center-chimney type.

The Hudson Valley and Pennsylvania. New York State’s Hudson Valley region witnessed a convergence of building traditions and cultures within the

time frame in question. Settled in part by Dutch, French Huguenot, and Palatine immigrants, this area gave rise to a tradition of native stone construction that helped define the vernacular spirit of the region for well over a century. These houses, particularly the earlier ones, were often built as single-room units with jambless fireplaces and unfinished garrets, expanded in linear fashion over the generations to accommodate growing family units. By 1750 the influence of English building practices was becoming increasingly prevalent in the Hudson Valley region; by the last quarter of the century, the largely insular Dutch had begun to incorporate distinctly English features such as the center-hall floor plan, the jambed fireplace, and the symmetrical arrangement of fenestration into their dwellings. By the conclusion of the 1820s, many of the distinctive hallmarks of the Dutch craft tradition had been eroded. Further to the south, in present-day Staten Island and Brooklyn, Dutch and Flemish settlers developed a tradition of frame dwellings peculiar to that region.

Similarly, Pennsylvania witnessed the convergence of multiple ethnic groups, among them Germans from the Rhine Valley, English Quakers who settled Philadelphia, and the Swiss. In parts of eighteenth-century Pennsylvania, which like the Hudson Valley fostered a tradition of stone construction, three-room plans were common with both Germanic peoples and the English. Here, too, the influence of the Georgian tradition with its formal overtones was initiated near the midpoint of the eighteenth century and from that point forward began to transform the established subtypes.

The South. The American slave population's diminished place in society was reflected in its housing. In the South particularly, slave housing provided a stark contrast to the grand houses of large-plantation owners. Slave houses were utilitarian in concept, predominantly of log or crude frame construction, often with dirt floors, and expressing little or no pretense to architectural fashion. Multiple units were often housed within a single freestanding building. In the North it was not unusual for slaves to reside in their owner's dwellings, in quarters segregated from family areas such as a garret, not unlike farmhands.

Conversely, in the English-settled areas of Virginia and Maryland, the social and economic elite had constructed for them houses of great sophistication and pretense, echoing the prevailing Georgian manner of the mother country. Nowhere was the transplantation of high-style architectural trends from England more pronounced than in the mid-

eighteenth-century Georgian houses of this region. The hall-and-parlor and center passage frame houses of the Tidewater region accommodated those more modestly disposed. In the South kitchens were often relegated to a separate freestanding building. Elsewhere, other distinctly vernacular adaptations, such as the French-inspired Creole dwellings of the Mississippi River valley and the log houses of the mid-Atlantic Swedes, suggest the diversity to be found in the Republic's domestic architecture. The tradition of log construction introduced by the Swedes and Pennsylvania Germans, incidentally, was subsequently picked up by Scots-Irish settlers and transplanted in North Carolina and upland Virginia. Here the distinctive "dog trot" and "saddlebag" forms developed.

Urban centers. In densely populated areas like Philadelphia, Boston, and New York, the row house—an attached dwelling built as an integral part of a larger group—was emerging as the predominant housing form. Built to maximize efficiency in construction and to meet increasing demands for housing, row houses had—by the end of the period in places such as New York—assumed a generally standardized layout to conform to the dimensions of subdivided urban parcels. Often constructed on speculation by enterprising builders, row housing accommodated both the wealthy and the middling classes, finding expression in examples of varying quality and scale. The row house form emerged in the late seventeenth century in Philadelphia, first in the traditional half-timbered manner and later in masonry, and was derived from contemporary English examples. By the end of the period it represented the predominant urban housing type, in its most common manifestation laid out with a basement kitchen, a side-hall plan with double parlors on the primary story, and bedchambers on the story or stories above. The earliest identified examples in Philadelphia were quite modest in concept and scale and employed one-room plans.

HUMANITARIANISM “Humanitarianism” is the term retrospectively applied by historians to the benevolent reform movement that swept through western Europe, England, and North America after 1750. The term itself did not come into use until the middle of the nineteenth century, although by the late medieval period, “humanity” had become a synonym for compassion, the inclination to treat other human beings and even animals with kindness and to relieve their distress.

PRINCIPLES

Both the philosophical bases of humanitarianism and its first applications can be traced to the late seventeenth century. Latitudinarians rejected Calvinist notions of innate depravity and Hobbesian ones of self-interest, instead arguing for an inherent impulse toward benevolence. The third earl of Shaftesbury (1671–1713) developed the notion of “natural affection.” He also developed its negative corollary, writing that “to delight in the torture and pain of other creatures,” whether “native or foreigners, of our own or another species, kindred or no kindred,” was unnatural. Hence, to feel for the suffering of others defined one as human. The Scottish philosophers Francis Hutcheson (1694–1746), David Hume (1711–1776), and Adam Smith (1723–1790) developed these ideas further. By the middle of the eighteenth century, the idea of irresistible compassion was so widely accepted that Smith could begin his *Theory of Moral Sentiments* (1759) with the proposition that “how selfish soever man may be supposed, there are evidently some principles in his nature, which interest him in the fortune of others, and ren-

der their happiness necessary to him, though he derives nothing from it except the pleasure of seeing it. Of this kind is pity or compassion, the emotion which we feel for the misery of others.” Humanitarianism presumed that, as the Philadelphia physician Benjamin Rush (1745–1813) put it, “Human nature is the same in all ages and countries.” Hence, “all the differences we perceive . . . may be accounted for from climate, country, degrees of civilization, forms of government, or accidental causes” rather than fundamental depravity or innate differences. Sharing in the Enlightenment’s optimism, humanitarians believed that both the environment and human beings were malleable. Indeed, the alleviation of suffering could serve as both cause and effect: a person who was treated kindly would in turn act with kindness. On the other hand, cruelty only begot more cruelty, while torture produced not truth but lies. As Thomas Jefferson (1743–1826) argued in 1778 when proposing a new penal code for Virginia, “The experience of all ages and countries hath shewn that cruel and sanguinary laws defeat their own purpose.” In the words of Pennsylvania’s James Wilson (1742–1798), “A nation broke to cruel punishments becomes dastardly and contemptible.”

PRACTICES

Such principles easily entered the wider culture through magazines such as the *Spectator*, in England, and the *New-England Courant*, where Benjamin Franklin (1702–1790), using the pen name Silence Dogood, observed in 1722 that “from a natural Compassion to my Fellow-Creatures, I have sometimes been betray’d into Tears at the Sight of an Object of Charity.” The effect of the new humanitarian sensibility can be seen as early as 1689 in the English Bill of Rights’ prohibition on “cruel and unusual punishments,” although it took several decades more before humanitarian reform movements emerged. After the Revolution, Americans joined together in countless benevolent societies, many of which sought to alleviate suffering. The Philadelphia Society for Alleviating the Miseries of Public Prisons (1787) worked for penal reform, while the same city’s Magdalen Society (1800) attempted to reintegrate prostitutes into society. The New York Manumission Society, founded in 1785, opened a school for free black children two years later.

Humanitarian reform focused on those institutions or practices where the infliction of pain was particularly obvious: torture, flogging, and other physical punishments and modes of interrogation; capital punishment; and slavery. The humanitarian

impulse can also be seen in the efforts to alleviate the suffering of the mentally and physically ill.

Punishment. In response to the new humanitarian ethos, both the Bill of Rights and many state constitutions banned “cruel and unusual punishment.” Applying the arguments of Cesare Beccaria (1738–1794) and the Baron de Montesquieu (1689–1755), penal reformers argued that punishment must be proportionate to the crime. Post-Revolutionary revisions of state penal codes eliminated numerous physical punishments and reduced the number of capital crimes. Pennsylvania’s Act Amending the Penal Laws (1786), for example, eliminated capital and corporal punishments for a host of crimes ranging from robbery to sodomy and horse theft, while reducing the maximum sentences for many noncapital offenses. Eight years later the state divided murder into two degrees, while other states defined as many as eight different degrees of homicide, effectively restricting capital punishment for those murderers who seemed wholly depraved. While some humanitarians, such as Thomas Jefferson, supported the death penalty for murder, others, such as Benjamin Rush, were beginning to advocate its elimination. The move to abolish capital punishment met with some success in the antebellum period. Pennsylvania eliminated public executions in 1834, and Michigan abolished the death penalty entirely in 1847, with Rhode Island following in 1852 and Wisconsin in 1853. Despite concerted efforts in other states, particularly New York, Massachusetts, and Ohio, the reform movement was turned back everywhere else.

Slavery. Reformers also turned their attention to slavery. As early as 1754, the Quaker John Woolman worried about the effects of slavery on both slaves and their masters, “For while the Life of one is made grievous by the Rigour of another, it entails Misery on both.” He argued both for the abolition of slavery and its amelioration where it existed, and these were the two approaches taken by humanitarians in the following decades. Their efforts were instrumental in achieving the abolition of slavery in states such as New York and eliminating some of the most horrific punishments for slave crimes, such as breaking on the wheel, burning at the stake, and displaying the dismembered body parts of executed slaves. Historians debate whether slavery itself became milder after the Revolution; southerners liked to think that it did.

RESULTS OF REFORM

Historians debate too the efficacy of humanitarian reform. Some argue that it merely hid forms of cru-

elty that once had been public, replacing public executions, for example, with private hangings and lengthy incarcerations. Others point to unintended and ironic consequences. An intense preoccupation with pain could produce its own kind of pornographic pleasure; it is no accident that the age of benevolence was also the age of the Marquis de Sade (1740–1814). And ameliorating slavery may have made it more tolerable, at least to slaveholders, whose consciences were eased. Finally, as the age of Enlightenment gave way to that of romanticism, some humanitarians may have derived more pleasure from feeling another’s pain than actually alleviating it. When one considers, however, the abuses that the humanitarians struggled to correct, it is hard not to appreciate their achievements, imperfect though they may have been.

HUMOR The humor of the colonial and early national periods featured indigenous American character types, some of whom were progenitors of what Louis D. Rubin Jr., in his introduction to *The Comic Imagination in American Literature* (1973), has defined as the “great American joke”—the difference between what people are and what they should be. In colonial America and in the early days of the Republic, this disparity was often treated satirically, satire being an import appropriated from Great Britain. Many of the practitioners of eighteenth- and early-nineteenth-century American humor cast their mocking barbs at various character types, manners, and social concerns endemic to the American experience. Their

comedy also often displayed a strong democratic tendency, which would become a key recurring ingredient in what Walter Blair has called, in his book of the same title, native American humor.

COLONIAL WORKS

Acknowledged as the father of American humor, Benjamin Franklin (1706–1790) introduced several comic types who have enjoyed long and prominent currency in American culture. In several of his most memorable comic works, Franklin adopted democratic voices who spoke in a direct, amusing, and sometimes even self-deprecating manner and who expressed essential values for living. Through Silence Dogood, a loquacious New England countrywoman, Franklin spoke forthrightly and practically, deriding Boston manners, education, religion, government, and male idleness in the *Dogood Papers*, fourteen essays written in a manner imitative of the *Spectator* papers of Joseph Addison (1672–1719) and Richard Steele (1672–1729) and published anonymously in his brother James's newspaper, the *New England Courant*, between 2 April and 8 October 1722. Richard Saunders, the wise fool of Franklin's perennially best-selling *Poor Richard's Almanack* (1733–1758), was both entertaining and moralistic, conveying gems of wisdom in jokes, light verse, comic predictions, and satiric pronouncements—all of which were intelligible to practical-minded common people. A conservative voice, a purveyor of witty advice or, as Walter Blair has classified it, "horse sense," Richard is remembered for his comically didactic and plainspoken aphorisms, such as "He's a fool that makes his doctor his heir," "Men and melons are hard to know," and "Tongue double, brings trouble."

Throughout the eighteenth century, in the competitive almanac market that *Poor Richard's Almanack* helped to spawn, humor became a major staple. And as Robert K. Dodge observes in *Early American Almanac Humor* (1987), almanac humor served as a barometer of "what early citizens of the United States considered funny" (p. 4), which included attitudes toward women, relations between the sexes, and attitudes toward immigrant minorities and Native Americans. One of Franklin's most famous comic pieces, "The Speech of Miss Polly Baker" (1747), uses as a female persona a woman of easy virtue who naively and reasonably defends her promiscuity by criticizing the double standard of sexual morality and justifies her sexual behavior by innocently claiming that she was merely following nature and "nature's God," the God who said "increase and multiply."

Another dimension of Franklin's humor, a dark and sinister side, is manifested in his pre-Revolutionary and Revolutionary War political satires—"Rules by Which a Great Empire May Be Reduced to a Small One" (1773), "An Edict by the King of Prussia" (1773), "A Method of Humbling Rebellious American Vassals" (1774), and "The Sale of the Hessians" (1777)—each caustically ridiculing oppressive British policies. In them Franklin creates personae, fashions them in the blatantly ironic manner of Daniel Defoe (1660–1731) and Jonathan Swift (1667–1745), and employs them as his mouthpieces, adopting the point of view that he is attacking, pretending to support it while actually carrying this view to an absurd extreme, thereby making a mockery of his subject.

Franklin continued this practice in "On the Slave Trade" (1790), an expression of his opposition to American slavery. Adopting the form of a fictitious letter from Moslem Sidi Mehemet Ibrahim that he enclosed with his own letter to the editor of the *Federal Gazette* under the signature of Historicus, Franklin, who belonged to a society dedicated to improving the conditions of African Americans, employed Ibrahim's letter as an ironic response to Georgia Congressman James Jackson's defense of slavery. In assuming the guise of Ibrahim, Franklin pretended to defend the continuation of slavery, drawing on some of the same political and economic arguments of Jackson. Although, his actual intent in exposing Moslem pirates' capturing of Christian white people along the African coast, a situation closely analogous to the slavery system in America, was to ridicule the irrationality of Jackson's proslavery stance.

The versatile Franklin also created one of the first American political cartoons, "Join or Die," published in the *Pennsylvania Gazette* in 1754, depicting a snake severed into eight parts, representing all of the American colonies except Georgia and Delaware. Franklin likewise used this cartoon as part of his "Plan of Union" presentation to the Albany Congress in New York to persuade the leaders of the colonies to unite in order to survive. Another famous political cartoon, Elkanah Tisdale's "The Gerry-Mander" published in the *Boston Weekly Messenger* in 1812, depicts a political district as a salamander in protest of Massachusetts Governor Elbridge Gerry's effort to restructure the state's voting districts to prevent the election of members of the opposing political party.

Humor as a vehicle for political protest can also be found in Thomas Paine's (1737–1809) widely influential pamphlet *Common Sense* (1776), his spirited and rational plea for ending all attempts at reconcili-

ation and for immediate independence from Great Britain. Sarcasm was among the strategies that Paine effectively employed in *Common Sense* to persuade his readers to embrace his political agenda, particularly in the section, "Of Monarchy and Hereditary Succession," where he debunked the monarchy, particularly the British crown. In attacking the practice of hereditary succession, which he states is "a degradation and lessening of ourselves" and as "an imposition on posterity," Paine sardonically writes that "one of the strongest natural proofs of the folly of hereditary right in kings, is, that nature disapproves it, otherwise she would not so frequently turn it into ridicule by giving mankind an ass for a lion." He further caustically observes that persons "so weak" to believe in "the folly of hereditary right . . . let them promiscuously worship the ass and lion, and welcome. I shall neither copy their humility, nor disturb their devotion." Paine also turns his invective to the notion of the "honorable origin" of monarchy, cynically denying the possibilities of any noble origins of kingship. Instead, what one would discover, he points out, is "the first of them [is] nothing better than the principal ruffian of some restless gang, whose savage manners or preeminence in subtlety obtained him the title of chief among plunderers."

Another national leader, the future U.S. president, John Adams (1735–1826), also turned to humor, beginning in 1763, in a series of six epistolary satires, written in the vernacular dialect of Humphrey Ploughjogger, a New England farmer. He was an early exemplar of the rustic Yankee who commented critically on political and social issues, including the Stamp Act (1765), and who would reappear in numerous reincarnations in American humor of the late eighteenth and first half of the nineteenth centuries.

THE REVOLUTIONARY ERA

The three most prominent humorists of the American Revolution were John Trumbull (1750–1831), Mercy Otis Warren (1728–1814), and Royall Tyler (1757–1826). One of the Hartford Wits, Trumbull was the author of a two-part mock-heroic poem, *M'Fingal* (1776, 1782), which satirized both British Loyalists and American Patriots. Warren was a Patriot who anonymously authored five satiric closet dramas between 1773 and 1779, the best-known of which is *The Group* (1775). In *The Contrast* (1787), Tyler introduced to the American stage the character of Jonathan, the comic Yankee, creating in him a discernible American identity. In *The Group*, which employs comedy as a tool for propagandistic ridicule,

Warren uses derogatory and ridiculous names such as Meagre, Hateall, Crusty Crowbar, and Dupe to expose and accentuate the greed, self-serving motives, and hypocrisy of Tory sympathizers. For his part Tyler, also a Patriot, employed the strategies of British Restoration comedy in *The Contrast* to juxtapose the simplicity, virtue, and innocence of Jonathan, a country bumpkin, and the artificial and pretentious manners and speech of urban sophisticates like Dimple, a Europeanized American. Tyler's play, which clearly privileged the virtuous and naïve Jonathan and which offered a corrective to a potentially false, supercilious, standard of America's national manners, afforded the audience the opportunity to examine itself honestly and to determine what manners, fashions, and values to adopt.

The antithesis of Tyler's promotion of a democratic ideal of the innocent and virtuous farmer in *The Contrast* is found in New England Federalist mock pastorals of the 1790s. In courtship poems like Thomas Green Fessenden's (1771–1837) "Peter Periwinkle to Tabitha Towzer" (1798), they express antagonism toward democratization, mocking the common man by comically denigrating the rural Yankee.

FURTHER DEMOCRATIZATION OF HUMOR

Modern Chivalry: Containing the Adventures of Captain John Farrago and Teague O'Regan, His Servant (1792–1815), by Hugh Henry Brackenridge (1778–1816), is a comic picaresque novel and double-edged satire directed against both the common people, depicted as fools, and the educated, presented as impractical. In this work Brackenridge exposes the excesses and dangerous tendencies inherent in a democratic system of government such as existed on the Pennsylvania frontier in the eighteenth century. He focuses on the misadventures of the ignorant and unrefined Teague O'Regan, an Irish servant and the main object of the novel's humor, who repeatedly exposes his ineptitude when trying to pursue responsible vocations for which he is unqualified.

Despite Brackenridge's negative attitude toward democracy, the frontiersman began to emerge as a significant comic figure in America in the early nineteenth century. Mason Locke Weems (1759–1825), book peddler, preacher, and author of a biography of George Washington, also wrote *The Drunkard's Looking Glass* (1812). It comprises his humorous observations of and anecdotes about his travels on the southern frontier, graphically capturing in print the vernacular voice of the southern frontiersman and some of his rollicking activities, such as boasting,

drinking, and fighting. Weems's contemporary, James Kirke Paulding (1770–1860), composed *Letters from the South* (1817), based on the author's travels in Virginia. It features epistles recounting some of the humorous manners and customs he observed among Virginia backwoodsmen. He subsequently incorporated this subject matter into *The Lion of the West* (1830), his popular play that features the bravado of Nimrod Wildfire, a tall-talking backwoodsman from Kentucky.

While both Weems and Paulding were important trailblazers in opening up the southern frontier as a rich source of humor, Washington Irving (1783–1859) was the pivotal force in popularizing and expanding the comic possibilities of the character of the backwoodsman. His *History of New York, from the Beginning of the World to the End of the Dutch Dynasty* (1809) was notable for its foolish pedant, Diedrich Knickerbocker; its pseudocomic history; and its robust and earthy humor. More important, however, in the story called "The Legend of Sleepy Hollow" (1820), Irving created a paradigm for merging the two American comic types—the Yankee and the frontiersman. Ichabod Crane, a genteel, ambitious Yankee schoolmaster, intrudes on the quiet, settled, rural hamlet of Sleepy Hollow, where he cultivates a design to marry a rich farmer's daughter and then, with her father's money, to migrate to the frontier. But Ichabod's rival suitor, Brom Bones—a rural ruffian known for his marksmanship and roguish, humorous pranks—foils and vanquishes Ichabod through trickery and deception. The eponymous hero of "Rip Van Winkle" (1820) is Irving's other major character creation. A likeable frontiersman, he avoids work by spending his time playing games with the village children or going on long hunts in the Catskill Mountains. In the mountains he escapes both civilization and his termagant wife, an advocate of a staunch work ethic. In "Rip Van Winkle" Irving also fabricated a comic plot formula, the tale beginning on a factual basis, then proceeding into the realm of the fanciful or incredible, and concluding

with a return to a realistic semblance. Though derived from German folk sources, Irving's two classic tales are noteworthy for privileging the common man and his way of life and for popularizing several scripts featuring clashes of urban and rural values, lifestyles, and manners and a readily adaptable plot structure. These features would, beginning in the 1830s, be appropriated and reconfigured by the South's amateur frontier humorists and subsequent generations of professional American humorists, including Mark Twain.

ICONOGRAPHY The creation and promotion of symbols to represent the United States of America was a process that started with the Continental Congress in 1776, which issued a Declaration of Independence from Great Britain and charged a committee with designing an official seal for the nation. A complex effort ensued to create usable symbols that would communicate unity of purpose, core principles, and sovereignty. Participants in committees and competitions for designs—for everything from buildings in the federal city to flags, holidays, and currency—drew from familiar European forms to fashion symbols that would serve as reminders of ancient republics and recall revolutionary unity and sacrifice. But the creation of symbols to represent the nation and the people of the United States was not solely a governmental process. Artists, writers, and ordinary citizens also participated in creating symbols and rituals that expressed their vision of the new nation and its future.

REVOLUTIONARY UNITY

Many symbols that were to become national had their origins in local efforts to instill revolutionary unity. The “liberty tree” or “liberty pole” became both a symbol of resistance and a physical location for planning that resistance during the war. Follow-

ing the Revolution, partisan politics surrounded these symbols as they became a rallying site for dissent. In the 1790s inflamed Federalists described them as “sedition poles” to cast the actions associated with them (especially those of Democratic Republicans) not as dissent but as dangerous or even treasonable activities. Likewise, the “liberty cap,” derived from the Phrygian cap worn by freed Roman slaves, had a limited life after the Revolution in part because of contemporary politics. Revived in the early 1790s during the initial excitement over the French Revolution, the classically inspired figure of Liberty on the half-cent coin took on a martial appearance complete with liberty cap. As the violence of the French Revolution became distasteful to the wary American government, overt symbols of revolution fell from favor.

IMAGES AND HOMAGES

The figure of “Columbia,” sometimes called “America” or “Liberty,” was created deliberately to represent the nation. Traditionally Europeans, and particularly the British, had used the figure of an Indian to represent alternately the former North American British colonies or the entire New World. Like the new national figures, the Indian was usually female, with feathered skirt, bare breast, and bow and arrow. The inclusion of a crownlike headdress hinted at the idea

of a native aristocracy as personified in the Indian princess. As an American symbol, the Indian figure quickly became relegated to marginal official items such as the Indian Peace Medal, first struck in 1800. Such an item was meant only to be presented to Indians themselves as a mark of formal treaties with the United States; its supposedly Indian features were depicted in a hand clasped in “peace and friendship” below a crossed hatchet and peace pipe. The central image on the medal was that of the current president. After the Revolution, as the nation looked for representative figures, the Indian became undesirable. The founding generation of race-conscious Anglo-Americans looked to symbols they could more readily identify with and that could stand against similar European symbols. In such images Americans sought to reinforce their European origins and keep any lingering provincial insecurities at bay.

The choice of Columbia as the central figure honored Christopher Columbus. Variations on the name “Columbus” appeared everywhere in the 1780s and 1790s. Colleges and towns were named in his honor, and Columbus was a popular subject in poems and

songs. The names of scores of newspapers and periodicals such as the *Columbian Magazine and Monthly Miscellany* and *The Columbian Centinel* also paid homage. The new federal city would be housed in the Territory of Columbia, and schoolbooks signaled American authorship and content by choosing names like *The Columbian Reader*.

The search for symbols that might easily communicate the principles and character of the nation went far beyond formal allegorical figures. To counterbalance the feminine figures, the masculine eagle was borrowed from the iconography of the Roman empire to remind all of the link to ancient republics. The committee charged by Congress in 1776 to create a symbol for the nation initiated a six-year process resulting in a Great Seal that held the motto “E Pluribus Unum” (out of many, one) and a central figure of an eagle. The eagle’s vigilant stance suggested power and, in the inclusion of a red and white striped shield for a breastplate, an aggressive and even individualistic posture. To mark the number of original colonies, the image included thirteen leaves on the olive branch clutched in one claw and thirteen

arrows in the other. The centrality of the motif of thirteen carried over to the national flag. In the version adopted on 14 June 1777 by the Continental Congress, thirteen red and white stripes beside thirteen white stars on a field of deep blue signified the colonies in revolt and, more important, their presumed relationship to one another as equals.

DECLARATION OF INDEPENDENCE

Read or “proclaimed” in cities and towns in the summer of 1776, the Declaration of Independence achieved its own iconic status. Bonfires, gun salutes (observing the ritual number of thirteen shots), parades, and toasts (again, thirteen) celebrated the document. In the 1790s Democratic Republicans used the Declaration in their own Fourth of July rallies and based their claims to authority on issues of government not only on the document itself but on the party membership of Thomas Jefferson, its author. Under the party system that emerged in the 1820s, both Jacksonian Democrats and Whigs claimed descent from the party of Jefferson and so too a particular guardianship of the Declaration’s principles. In 1818 John Trumbull’s paintings for the Capitol included the popular and widely reproduced *Declaration of Independence*, depicting the fateful proceedings at the Continental Congress as imagined by the artist. As the generation who fought the Revolution was dying off, a wave of nostalgia and filial piety swept the nation. Lafayette’s visit in 1824, the dedication of the Bunker Hill Monument in 1825, and the twin deaths of John Adams and Thomas Jefferson on 4 July 1826, the fiftieth anniversary of the Declaration, inspired commemorative fervor. Jefferson himself asked to be remembered for only three things on his gravestone. The first was his authorship of the Declaration of Independence.

THE CAPITAL

Many Americans fervently desired a capital city to rival those of Europe. That the capital was to be located in the new, independent Columbia Territory (later the District of Columbia) was itself symbolic, because the city would neither depend on nor favor any single state. By 1790 the long, complicated process of designing the city, which would be fraught with competing visions through several administrations, was under way. Pierre Charles L’Enfant, a veteran of the Continental Army and a member of the Society of the Cincinnati, developed a city plan that emphasized large lots and wide boulevards to frame imposing buildings, whose design borrowed freely from ancient Roman and Greek architecture.

L’Enfant’s vision called for numerous allegorical figures to adorn the facades of buildings, but President John Adams found these figures too “pagan” for his simple republican and Christian tastes.

The architect Benjamin Latrobe, whom Thomas Jefferson appointed in 1803 as surveyor of public buildings, modified L’Enfant’s designs. Latrobe emphasized classical architectural forms, reduced the allegorical figures that so distressed Adams, and increased the number of eagles, stars, and representations of the Constitution. A primary element of building design in the federal city was symbols of the individual states of the union. The visiting citizen was to be reminded directly of the power of the nation and its component states rather than only abstract ideals. Where Latrobe did retain classical figures, such as the one of Justice and a winged youth, he added eagles in a watchful position and a copy of the Constitution in the youth’s hand.

HOLIDAYS

Ritual observance of holidays injected the symbols of the nation into public activities. First celebrated in Philadelphia on 4 July 1777, the Fourth of July became the preeminent national holiday. In 1778 George Washington ordered a double ration of rum for troops to mark the day; by 1783 Boston had enacted legislation officially declaring the day a holiday. The memory of the Revolution was the critical factor in shaping nationalism and political culture. Speeches, sermons, songs, poetry, and newspapers all focused on the ideas of shared sacrifice, heroism, and dedication to the principle of liberty. Grounding Independence Day festivities in tributes to those qualities of national character and founding principles created emotional bonds among citizens as well as to the nation itself. By 1800 public figures across the nation were taking advantage of local Fourth of July celebrations to lend authority to their political positions.

GEORGE WASHINGTON AND POPULAR SYMBOLS OF THE NATION

Building new traditions on old foundations was often precarious. Washington’s position as architect of the military victory in the Revolution and then as its first elected president went beyond simple celebrity and approached the divine. The popularity of and affection for Washington created a climate that was dangerously reminiscent of monarchical cults of personality. In Europe celebrations of the king’s birthday were important public holidays; Washington’s birthday was celebrated in Virginia in the years after

the Revolution and by the 1790s was widely and popularly celebrated across the nation. Upon his death in 1799, following two terms as president and his principled rejection of a third, extravagant public displays of grief included simulated funerals, memorials, needlepoint tributes, and reams of obituaries, songs, and poems. A move was made to bury him within an elaborate tomb in the Capitol itself, but dissenters to this plan included Washington's own family. Another idea floated was to put Washington's face on the penny, but, like the burial plan, this too smacked of monarchical practices.

Ultimately, the penny featured the eagle, and Washington was buried, according to his own wish, at his Mount Vernon home. But the impulse to raise George Washington to the pantheon of the gods found its expression in numerous illustrations, in Horatio Greenough's statue of the president in a Roman toga at the Capitol, in the federal holiday marking his birthday, and in the countless reproductions in schoolrooms across the nation of Gilbert Stuart's famous portrait. Although George Washington was among the elite, the force that propelled his fame and the celebration of his birthday was a product of popular will.

PERSONIFICATION OF THE AMERICAN PEOPLE

Although powerful figures—politicians, presidents, newspaper editors—attempted to shape the symbolic elements of nationhood, popular symbols emerged and endured. The personification of the American people and, later, the American government was the natural outgrowth of a society born out of the words "We the People" and whose unfettered press drove political culture.

A prime example of personification is Yankee Doodle. For British soldiers stationed in the American colonies, "Yankee Doodle" was a term of derision that mocked the bumpkin colonists. But during the war the Patriots transformed Yankee Doodle into a symbol of American pride. The high point in this process was the victory over the British at Yorktown, where the troops played the "Yankee Doodle" song at the surrender ceremony to ask, in musical fashion, Who should be ridiculed now?

Following the Revolution, Brother Jonathan arose to fill the need for a figure illustrative of the new citizen of the new United States of America. This character appeared in stage plays and humorous newspaper pieces from the mid-1770s until the mid-nineteenth century. A figure of both energy and common sense, Brother Jonathan looked toward the future and always got the better of the confidence

man or elitist who tried to trick or shame him. Northeastern, middle-class, and relentlessly entrepreneurial, Brother Jonathan eventually became less useful as a national figure. As sectional divisions deepened in the 1830s, Jonathan became a victim of politics. Southern periodicals began to use him as a symbol not of an American type but of a despised Yankee type. The figure of Jonathan gradually melded with that of Uncle Sam, who is first found in soldiers' jests during the War of 1812. With a wiry build, large hat, and striped trousers, Uncle Sam shared physical traits and costume with Brother Jonathan. A common element of political cartoons, Uncle Sam was American but less representative of the American people than of the American government itself.

CONCLUSION

The United States of America, in its unique position as the first popularly created nation, promoted nationalism and sovereignty by means of the images that symbolized its principles. So that individual citizens would identify their interests with both the nation and their fellow citizens, the government needed to forge the affective ties of patriotic devotion. For the uneasy new states, fearing by the late 1780s that they had traded a royal master for a federal master, the constant reassurance that the foundation for the federal government was the individual state was key to binding the states to a common purpose. To the world beyond its borders, the new nation communicated unity of purpose, strength, stability, and, above all, sovereignty by means of its symbols. Thus American iconography contributed not only to its developing culture but to its standing in the eyes of the world.

ILLINOIS The southernmost of all midwestern states, Illinois also borders on Lake Michigan. Laced with navigable rivers and relatively short portages, Illinois provided relatively easy passage from the Great Lakes to the Mississippi River basin. Bounded by the Mississippi River to the west and the Wabash and Ohio Rivers to the east and south and situated opposite the mouth of the Missouri River, Illinois benefits from navigable rivers that link it directly to Pennsylvania, other midwestern states, states west of the Mississippi River, and the Gulf of Mexico. The Erie Canal, completed in 1825, the Illinois and Michi-

gan Canal, completed in 1848, and other canals and river improvements greatly augmented water transportation to and from and within Illinois.

Illinois is located in the prevailing westerlies belt and in warm months the Gulf of Mexico pumps huge amounts of moisture-laden winds into the Lower Midwest, generally guaranteeing adequate precipitation at critical times of the year and enabling Illinois to grow a wide variety of fruit and vegetables. Freezing winter blasts from Canada help retard soil leaching and ensure rich, black soil throughout much of the northern two-thirds of the state. In addition, the state enjoys rich alluvial soil, especially along the American Bottom, a region that stretches along the Mississippi River's eastern bank for one hundred miles south of Alton. Growing seasons lasting over half the year in the south and about half a year in the north sustain agricultural variety.

FRENCH, BRITISH, AND INDIANS

Before French voyageurs and missionaries arrived in 1673, Iroquois Indians and others attacked and disrupted Indian societies, especially in northern Illinois, and drove some Indians over the Mississippi. French explorers found Cahokia, a former residence of mound-building Indians, virtually abandoned and relatively few Indians remaining in the region altogether. Establishing their first permanent settlement at Cahokia in 1699, the French generally established mutually beneficial ties with most Indians, intermarrying, providing via trade such goods as iron objects and other desired material culture, and exchanging ideas and understandings that fostered a "middle ground" culture, one that incorporated both French and Indian ways. By 1720 the French also had introduced slavery to Illinois.

After a series of wars with Britain in which local Indians generally sided with France or stayed neutral, France lost control of all of North America in 1763. The vast region west of the Mississippi was transferred to Spain. British occupation of Illinois was slow, difficult, and light, with only a handful of British and British colonists moving to the region before the American Revolution erupted in 1775. Britain tried to placate or even win over both the French and Indian populations of Illinois and surrounding regions, but were largely successful only with Indians in northern Illinois.

AMERICAN CONQUEST AND SETTLEMENT

Small units fighting in Illinois and north of the Ohio River brought spectacular results. In 1778 George Rogers Clark commanded about 150 Virginians;

they conquered French settlements in Illinois and then subdued the British fort at Vincennes on the Wabash. Although the American grip on lands north of the Ohio was frail, it gave Americans a claim to these lands. The entry of Spain into the war complicated the conflict for the British, and Spanish attacks against British posts from St. Louis reached northeast as far as Michigan. Peace in 1783 gave the United States not just the lands immediately north of the Ohio, but lands all the way to Lake Superior, a stunning accomplishment for the young nation.

The war introduced into Illinois a stream of settlers from Virginia and other southern states, many of whom had either served in Illinois or had relatives or friends who had served there. This migration gave Illinois powerful cultural, political, and economic links to the South and encouraged some efforts to make Illinois a slave state. In most instances, the French and the southerners coexisted reasonably well among or near each other.

The Ordinance of 1785 required that public lands be surveyed before sale, producing the familiar checkerboard land pattern common throughout the Midwest and elsewhere. This orderly method of sale avoided the tangled, bitter land disputes that flared in Kentucky and other states, inhibiting sales and cloaking social and economic developments in uncertainty. The Northwest Ordinance of 1787 was even more significant. It broke historical patterns of creating colonies from conquered lands and, instead, created a steady but radical system of allowing Illinois and the other states of the Old Northwest a measure of self-government as territories and then the right to enter the Union as full states. It also banned slavery in the region, although this had little impact on the hundreds of slaveowners and their slaves living in the region.

By 1810, the year after the Territory of Illinois was formed, trickles of migration boosted Illinois's non-Indian population to about 12,300. Its Indian population probably exceeded 14,000, many of whom kept in touch with British officers in Canada and British traders and agents around the Great Lakes. The War of 1812 triggered destruction and uncertainty, causing some settlers to flee the territory, but after peace in 1815, settlement surged. Many Indians had sided with the British during the war, leaving their cultures in tatters, and a great number of native groups left the state. The federal government continued via treaties to purchase lands from Indians who had claims to possession. A large stretch of land between the Illinois and Mississippi Rivers was designated the Military Tract and was offered as

reward to military veterans. Although many veterans throughout the country never settled in this tract, they sold their rights to the land and others came to settle.

STATEHOOD, TRANSPORTATION, AND NEW SETTLERS

In December 1818, Illinois achieved statehood. This was done with a wink and a nod, for the population of the new state was only perhaps thirty-five thousand, far below the required level. Moreover, just before statehood, astute Illinois politicians and friends pushed the northern boundary upward from the southern tip of Lake Michigan, giving Illinois the town of Chicago, the route for the Illinois and Michigan Canal, valuable lead mines at Galena, and a region that now includes fourteen of the state's 102 counties, a region in which the vast majority of Illinois's early-twenty-first-century population lives. Kaskaskia had served as territorial capital, but the capital moved to Vandalia with statehood.

Despite sluggish national economic conditions during the 1820s, the Erie Canal opened in 1825, which did much to transform Illinois. Before the Erie Canal and the advent of predictable and inexpensive Great Lakes shipping, most flour, beef, honey, hides, and other goods shipped from Illinois were shipped downstream as far as the Gulf of Mexico, upstream transportation being prohibitively expensive and time-consuming for all but the most valuable commodities. With the Erie Canal, however, farmers and others in the northern quarter of the state and along the Illinois River could transport goods a relatively short distance to Lake Michigan, across the Great Lakes and the Erie Canal, and down the Hudson River to New York and other burgeoning cities on the East Coast. This did much to reorient Illinois economic ties from a north-south axis along the Mississippi River to an east-west axis via water and later via rail. The arrival of steamboats at St. Louis in 1817 and at Chicago in 1832 accelerated this reorientation. Land sales boomed into the mid-1830s, ten federal land offices by 1834 selling and recording orderly transactions. As the last sales from Indians occurred in the 1830s and as settlement pushed northward, the need for the state's capital to be more centrally located became apparent, and in 1839 Springfield became the capital.

Chicago became the state's largest city by the late 1830s, but the need for a canal to connect the Illinois River to Lake Michigan at Chicago became increasingly apparent, and construction on the Illinois and Michigan Canal started in 1836. The great national

depression that began in 1837, however, slowed work, delaying its completion until 1848, just several years before railroads would lace Illinois.

NEW IMMIGRANTS, EDUCATION, AND REFORM

Increased immigration to the United States and improved transportation to Illinois changed the state's population. Settlers from the Middle Atlantic states and from Ohio and New England dotted the landscape in increasing numbers. Cultural differences between them and the earlier southern settlers ignited clashes and disputes, including some friction over slavery and antislavery activities. In 1823 and 1824 Governor Edward Coles helped defeat an attempt to legalize slavery in the state. Settlers from the Northeast became involved in education and reform movements, and graduates of Yale College were responsible for the founding of the state's first institution of higher education, Illinois College, in 1829. Reform movements, including antislavery efforts, brought progress, but they also sparked political strife in the 1830s and beyond.

By 1860 the Illinois population stood at 1,711,951, perhaps about forty-five times the population at the time of statehood in 1818 and ranking it the fourth-largest state in the country. Its railroad track totaled nearly 2,800 miles, second in the country.

IMMIGRATION AND IMMIGRANTS

This entry consists of twelve separate articles: *Overview, Canada, England and Wales, France, Germans, Ireland, Scots and Scots-Irish, Anti-Immigrant Senti-*

ment/Nativism, Immigrant Experience, Immigrant Policy and Law, Political Refugees, and Race and Ethnicity.

Overview

“Whence came all these people?” wrote Frenchman Michel-Guillaume-Jean de Crèvecoeur about the American population in his *Letters from an American Farmer* (1782). Crèvecoeur, who immigrated to New York in 1759 and in 1783 became French consul in New York, noted: “They are a mixture of English, Scotch, Irish, French, Dutch, Germans and Swedes. From this promiscuous breed, that race, now called Americans, have arisen.” As the British American colonies expanded and the new American Republic emerged, individuals and families left the European Continent, coerced by circumstances at home and drawn by opportunities abroad. They sought new homes that offered economic security and nurturing environments for their respective cultures and religions. At the same time, European slave traders forcibly brought thousands of enslaved Africans to serve as the labor force that sustained the colonial economy and contributed to the livelihood of the new American nation. Through these multiple streams of migration, the American Republic took shape.

SOURCES AND EXTENT OF IMMIGRATION

Records of immigration to the British colonies and the early American nation are extremely spotty, thus making it difficult to describe accurately the extent of the period's migration. Compared to the mass migrations of the mid- to late nineteenth century, however, relatively few people came to America during the 1700s. From five thousand to ten thousand individuals, including slaves, arrived annually in the colonies and the American nation from the mid-1700s through the early 1800s.

The successes of the colonies and the attractiveness of the new Republic led to increased promotion of immigration. Newspaper advertisements and articles encouraged individuals with enterprising dispositions to settle America's fertile lands and those seeking work to pursue the numerous available labor opportunities. Immigrants responded to new inducements following the founding of the United States, including letters from family and friends, appeals by land companies, and recruiting efforts by manufacturers and state governments. Businesses involved in the emerging “immigrant trade” also played a significant role in stimulating and facilitating the migration of Europeans.

Immigrants of the period originated in northwestern Europe—the British Isles, Germany, the Netherlands, Sweden, and France—and were predominantly Protestant. British immigrants settled throughout the colonies, solidifying the crown's hold on its territorial claims in North America, expanding the transatlantic trade, and laying the social and cultural foundations of a future republic. Families constituted a growing portion of the overall immigration stream, while African slaves gradually replaced the indentured servants that had been a critical component of the earlier colonial labor force.

More people (Celtic Irish, English Irish, and Scots-Irish) emigrated from Ireland than from Britain itself during the period. They came in two main waves, around 1754–1755 and 1770–1775, totaling some forty thousand, in response to high population density, subdivision of lands, and growing specialization within the Ulster linen industry. Mostly Presbyterian in religion, they settled in Pennsylvania, the Piedmont of North and South Carolina, and the Shenandoah Valley of Virginia.

Germans journeyed to America in reaction to harsh economic, political, and religious conditions. They established themselves as farmers, farmworkers, and artisans in the mid-Atlantic region. Most Germans were members of the Lutheran or Reformed Church, though dissenting groups like Mennonites and Dunkards were also present. The Scots, Dutch, French, and Swedes—groups that had arrived early in the colonial period—maintained distinct settlements in America, though migration streams were small.

The first census of the United States, taken in 1790, illustrated the migration streams that shaped the nation. More than three-quarters of the white population were of English stock.

An estimated 250,000 people arrived in America between 1783 and 1815. The origins of European migrants, however, are more easily defined after 1820 as the sending nations and the receiving nation began to gather more specific information on those making the transatlantic trek. Between 1820 and 1830, over 151,000 people came to the United States, more than two-thirds of whom originated in the British Isles. Of that number, the Irish contributed 54,338 immigrants, or approximately one-third; the English constituted about one-fifth of the migration.

Throughout the late colonial and early national periods, events in both the Old and New Worlds affected the waves of immigration, influencing individuals and families who sought to pursue dreams of freedom and economic opportunity and to follow the

encouragements of those who had preceded them to the New World. The Seven Years' War halted immigration from 1756 to 1763. The years surrounding the American Revolution (1775–1783) brought immigration to a literal standstill. The turmoil accompanying the French Revolution and Napoleonic Wars, lasting from 1789 to 1815, kept yet another generation from migrating. Finally, the political uncertainty surrounding the new American Republic, the War of 1812 (1812–1815), and the Panic of 1819 discouraged immigration to America, thus limiting much of the nation's growth in its formative years to natural increases among the resident population. For nearly half a century, therefore, immigration to the new nation was but a trickle compared to later nineteenth-century migration waves.

ATTITUDE TOWARD IMMIGRATION

The British considered immigration to be the principal means of securing labor for the colonies, which in turn strengthened their territorial claims and control of Atlantic commerce. Americans also possessed a favorable attitude toward immigration, viewing the colonies (and eventually their new nation) as an asylum for the oppressed of the world, open to all those who sought economic opportunities, freedom from persecution at home, or adventure in the American wilderness. There were, however, those who voiced concerns over the increasing diversity of the colonial population, considering regional clustering and resistance to Americanization by the minority non-English-speaking populations as a threat to the British colonies. Benjamin Franklin, writing in his *Observations Concerning the Increase of Mankind* (1751), criticized what he perceived as the growing influence of German immigrants in Pennsylvania:

Why should the Palatinate Boors be suffered to swarm into our Settlements, and by herding together establish their Language and Manners to the Exclusion of ours? Why should Pennsylvania, founded by the English, become a Colony of *Aliens*, who will shortly be so numerous as to Germanize us instead of our Anglifying them? (Daniels, *Coming to America*, pp. 109–110)

Starting in the 1760s, Britain rejected colonial demands for more open immigration policies. Thomas Jefferson, writing in the Declaration of Independence, expressed the Americans' pro-immigration stance by criticizing the king for preventing "the population of these States" by refusing to recognize naturalization acts passed by colonial assemblies. In *Common Sense* (1776), Thomas Paine acknowledged the importance of immigration on the grounds that America was "the asylum for the persecuted lovers

of civil and religious liberty from every Part of Europe. . . . Europe, and not England, is the parent country of America."

With the Revolution behind them and the challenge of forming a new nation ahead, Americans had to confront issues of immigration policy themselves. Members of the Constitutional Convention of 1787 debated the issue. New York's Alexander Hamilton claimed immigrants would contribute to the well-being of the new nation. George Mason of Virginia favored an "open door" policy, but was hesitant about allowing "foreigners . . . to make laws for us and govern us." Others expressed fears that immigrants would retain the principles of despotic countries, which could undermine the American Republic.

From the founding of the United States, Americans saw their nation as a noble experiment in freedom, a place that would share its benefits, blessings, and opportunities with all who sought freedom. George Washington described the importance of immigrants to the new nation, noting that

the bosom of America is open to receive not only the opulent and respectable stranger, but the oppressed and persecuted of all Nations and Religions; whom we shall welcome to a participation of all our rights and privileges, if by decency and propriety of conduct they appear to merit the enjoyment. (LeMay, *From Open Door to Dutch Door*, pp. 7, 9)

While Americans proclaimed their new Republic to be a symbol of freedom and an asylum for the world's oppressed, there was a growing nativist attitude among certain groups. The belief in the supremacy of Anglo-Saxon institutions and principles and a need to restrict the influence of non-English immigrants led the Federalists and President John Adams to adopt various Alien Acts in 1798. These acts, which targeted recent Irish and French immigrants who supported the Jeffersonian Republicans, extended the time of naturalization and imposed restrictions to monitor and govern the behavior of aliens. Opposition to immigration at this time was based primarily on ideological grounds rather than on the ethnic or religious grounds of later years. Congress repealed or amended the Alien Acts after Jefferson became president.

In the early decades of the American Republic, the federal government did little to supervise, control, or regulate immigration, leaving immigration policy to state authorities. Not until 1820 did the U.S. government begin to record the number of immigrant entrants annually by requiring a complete list of all ships' passengers.

The early immigrants were, on the whole, successful. That fact, and the emergence of shipping and recruiting agencies, laid the foundation for the mass immigrations to the United States that began in the 1830s.

Canada

Before the Louisiana Purchase in 1803, New France—subsequently Canada—was the neighbor of the United States not only to the north but also to the west. The colonial settlers in the vast and once contiguous area known as New France were overwhelmingly French as opposed to the inhabitants of the thirteen original states who were mainly of British extraction.

It is important to realize, however, that French colonization in North America, which was sparse except along the St. Lawrence River and in a few other areas—chiefly along the Mississippi River, notably New Orleans—came to an end with the British conquest in 1760. (Quebec assumed its modern boundaries by royal proclamation in 1763.) In Quebec, areas surrounding it, and a few enclaves in the rest of Canada, the early French settlers and their descendants have managed to preserve their ethnic identity into the twenty-first century, while those everywhere else in North America have largely been assimilated. Cajuns—descendants of Acadian colonists who were deported beginning in 1755 from what later became known as the Maritime Provinces and began arriving

in Louisiana in 1760—constitute an exception, although two and a half centuries later the group's cohesion and numbers are disputed. (Cajuns are sometimes lumped with the offspring of the original French settlers, the French planters who later emigrated from Haiti, and the latter's French-speaking slaves.). Meanwhile, in 1765, Acadian deportees were allowed to return to their homeland. Many did although they did not always settle in the same areas of Canada.

Migration between Canada and the United States has been a continuous phenomenon since the earliest times. Until the 1830s, however, Canadian immigration to the United States was slack and stood in sharp contrast to movement in the opposite direction. Afterward, however, the pendulum swung the other way.

During the American Revolution and especially in 1783 and 1784, some one hundred thousand Loyalists, American colonists who supported the British cause, left the United States. About half of them relocated to Canada, their preferred destinations being Montreal; Quebec City; Sorel; and above all, the Eastern Townships of Lower Canada and Nova Scotia. The Maritime Provinces admitted more than thirty thousand Loyalists, notably in the St. John River valley, and, in 1784, largely due to this influx, Nova Scotia was divided and its northern and western section became a separate province called New Brunswick. In the next two decades, perhaps as many as fifteen thousand other Americans, discouraged by poor economic conditions in the United States and seeking work and cheap land to homestead, followed in their footsteps, settling in the same areas and also in Ontario.

However, in the late 1830s, Canada was beset by political turmoil and business stagnated while prosperity returned to the eastern states. At the same time, vast new lands became readily available in the Mississippi Valley. As a consequence, American immigration to Canada dropped off sharply and the tide of immigration turned southward.

England and Wales

The English and Welsh immigrants who crossed the Atlantic did so for a variety of optimistic reasons. Yorkshire farmers, London merchants, Monmouth tradesmen, and Brecon miners who embarked from ports in London, Liverpool, and Bristol were vital to the shaping of American identity.

English and Welsh emigration reached its peak during the last half of the eighteenth century, when it appeared as though all able-bodied young men were headed for port cities, intent on departure. Overcrowding and a weakened economy, particularly in the northern agrarian sections, caused many to look for relief in the American colonies. The population of the typical English village was already mobile, as a majority of young men had left home by the age of nineteen; this itinerant attitude made the prospect of an Atlantic move less daunting than for other European emigrants.

Middlemen on both sides of the Atlantic helped the process along, with promises of overseas fortune hung in notices in pubs and on shop windows. In some cases unscrupulous "crimps" encouraged seamen and laborers to run up large debts of ale, food, and clothes, and then called in the debt by presenting the choice of debtors' prison or indentured service across the Atlantic.

London was by far the most popular departure point, as almost a quarter of pre-Revolution emigrants claimed the city as residence. Seventy percent of English and Welsh emigrants left from its port, some coming from four hundred miles away. The remainder sailed from the ports of Liverpool, Hull, Bristol, and smaller harbors such as the Isle of Man. Yorkshire was a significant source of emigrants to Nova Scotia and the upcountry of New York, driven by an increasing scarcity of land and increase in rents. Yorkshireman John Wetherhead, who left Leeds in the 1760s, became one of the new breed of land speculators, scouting territory in northern New York and vigorously promoting purchases for new immigrants by promises of fertile land, easy access to river trade routes, and family safety.

Young men such as Wetherhead were by far the majority of emigrants. Over half of all English emigrants were men under the age of thirty, with many of those under twenty-five. Although they spanned all classes, the typical emigrant was a metropolitan skilled tradesman or artisan who had completed an apprenticeship in a skilled trade and felt his value would be realized in America. Clergymen and agrarian families, mostly from the North, hoped to settle

in a more fruitful situation as well. Less than 20 percent were described as being “the enterprising sort,” namely merchants and entrepreneurs. Those who were settled in comfortable professions in England did not feel the pull to leave, and only a very small percentage of immigrants claimed to be upper-class.

The number of immigrants varied widely from decade to decade, increasing through the eighteenth century until the Revolution. It peaked at some 125,000 between 1764 and 1776, prompting Parliament to consider a bill banning North American emigration entirely. The glut of new arrivals soon spread farther to the American interior, greatly extending the possibilities on the continent away from the port cities.

Emigrants were drawn to certain regions based on available opportunities. Young urban men settled in Pennsylvania, Maryland, and Virginia, colonies with labor markets in need of experienced tradesmen. Rural families were drawn to Nova Scotia, New York, and North Carolina, farming regions where settlement, not fortune, was the goal. Familiarity played a role as well. Many preferred districts that resembled the areas they had left behind; thus, for instance, Welshmen populated the mining towns of Pennsylvania and English merchants the port cities of New England and the mid-Atlantic.

The ten- to thirteen-week Atlantic crossing was made by merchant ships, which picked up a few emigrants for the free labor they provided on the trip, and larger vessels dedicated to ferrying as many emigrants in as little space as possible. One ship in the mid-eighteenth century spent twenty-two weeks at sea and cast seventy-five bodies overboard during the crossing; the *Essex*, bound for the northern provinces in 1720, was taken by pirates, who terrorized the passengers and diverted the ship to Newfoundland. The sad fate of the *Nancy*, a Sunderland brig overloaded with settlers which embarked from Britain in 1773, meant for the northern wilderness of New York, was not unusual: after a brutal crossing, during which disease and storms claimed the lives of one-third of the passengers, the weak and emaciated remainder were submitted to a strict quarantine by unsympathetic customs officials in New York harbor.

Some made the crossing almost by accident. John Harrower left the Shetland Islands in 1773, seeking any employment in Britain, and his travels took him southward through Scotland, Newcastle, and Liverpool. Down to his last shilling, he walked eighty miles to London and accepted the first employment he found—passage to America as a servant

on the steamship *Planter*. In the end, he was luckily enlisted as a tutor to a Virginia merchant, avoiding the toils of fieldwork.

As the Revolution approached, new arrivals pushed westward with remarkable speed. By 1770 the Great Wagon Road stretched from Philadelphia some eight hundred miles through rocky and swampy terrain to Augusta, Georgia; via this route, migrants spread through the south and west by the thousand. Absentee land speculators in England, who had never even set foot in the province of “West Florida,” enticed settlers with fantastic descriptions of plentiful game and fertile ground—which settlers quickly discovered was just so much swampland.

As many as half the male emigrants from England came across as indentured servants. They met the costs of emigration by reaching agreement with a ship captain or broker, who paid their transit in exchange for a period of service of anywhere from one to four years. Such indentures could be sold or bartered, and the servant was legally bound for the period of his contract. Though most served out their terms, there were many cases of escape. Londoner John Watts fled from his brass-making master in 1775 and was sought with the offered reward of five pounds and “reasonable charges” of capture; the former convict William Chase was hunted with the warning that he was a villain.

For those who came for the promise of open land, the West held limitless potential. Taking advantage of existing networks of trade and agriculture, wealthy British squires imagined potential estates that would dwarf the size of their lands at home. The earl of Dartmouth’s tracts totaled 100,000 acres near present-day Miami. Absentee landlords like Dartmouth needed immigrants to cultivate and protect their lands, and found no shortage of Britons ready to cross.

While few families emigrated together in America, and those who did were frequently only a husband and wife with no children, emigration had a profound effect on family life in America. The greatest concentration of families settled in New York, and Nova Scotia, and quickly tried to re-create the family and gender roles they had in England. Colonial life forced changes in those roles, however, as both men and women assumed previously unfamiliar duties—particularly for women, in fieldwork and paid labor. While the traditional family structure survived, it was forced to adapt and become less rigidly defined than before. The large numbers of young, able men caused the structure of courtship and marriage to change as well; men and women married a few years

later, on average, in the colonies than in England, and also had fewer children.

Welsh emigration to America was quite small compared to that from England, but uniquely Welsh settlements were formed in many parts of colonial America. Welsh Quakers were by far the largest group of immigrants to Pennsylvania, and by 1700 they accounted for approximately one-third of the colony's estimated population of twenty thousand, reflected today in a legacy of Welsh place names like Bryn Mawr and Cardiff. Welsh miners, the most skilled in Europe, came to Pennsylvania because of the opportunities in the mines; they found better working conditions and a better chance of owning property. In the ironworks of Maryland, in scattered but close-knit communities in New York and Connecticut, in later migrations of Baptists to South Carolina, and in small settlements like the community of Calvinist Welshmen who settled in Jackson County, Ohio, in the mid-eighteenth century, Welshmen brought their cultural identity and guarded it in North America.

Perhaps because of their own conflicted colonial relationship with England, Welshmen were also more likely to ally themselves with American Revolutionary ideals. Fourteen generals of the Revolutionary army were Welsh, as were eighteen of the men who signed the Declaration of Independence. Men like James Davies, originally from Carnarvon, earned distinction as a militia captain during the time of the Whiskey Rebellion.

The polyglot mixture of emigrants in America was nothing like the ordered social world, with its defined strata, in England from which the immigrants came. Although many struggled to cope with the challenges of the colonial world, as a whole the English and Welsh showed a remarkable resilience. They established homogenous and integrative networks and practices with remarkable speed. Immigrants from England and Wales managed to retain their national identity even as they forged a new, American presence.

France

Migration of French men and women to the new American nation followed two distinct, successive patterns between the 1780s and the 1820s. Setting aside the few individuals who fought alongside the Americans during the Revolutionary War and remained in the United States afterward, a first group included sizable contingents of migrants who reached the United States during the 1790s and 1800s, usually as a consequence of the French and Haitian Revolutions. Beginning in 1790–1791 and accelerating in 1792–1794, some ten thousand émigrés arrived in the United States from metropolitan France. Most were royalists. Others were moderate republicans who fled the increasing Jacobin radicalization of the revolutionary process. At the same time, the slave revolt in Saint Domingue led to a significant emigration of white and mulatto colonists—along with some of their slaves. Many of the white colonists had only arrived in the prized sugar island during the 1770s and 1780s. They now reinforced the French communities in the United States. One of the largest, albeit belated, population movements took place in 1809, when former Saint Domingue colonists who had resettled in Cuba were expelled from the island by the Spanish authorities as a consequence of Napoleon's invasion of Spain. Some eight thousand of these refugees fled to New Orleans, whose French-speaking population they doubled within a few months. Last and quantitatively least significant during these decades were the migrants, often of republican and later Napoleonic persuasion,

Éleuthère Irénée du Pont. A French immigrant to the United States, Éleuthère Irénée du Pont (1771–1834), shown here in a portrait by Rembrandt Peale (c. 1790), established a gunpowder company in 1802 in Wilmington, Delaware. This firm was the forerunner of the DuPont chemical company.

who fled Napoleon's imperial and Louis XVIII's Restoration France during the 1800s and 1810s.

Quite different from these diasporic movements linked to the French and Haitian Revolutions were the migrations that developed when peace returned to Europe after 1815. Like other Europeans at the time, some French women and men were attracted to the United States by economic motives. Fewer individuals left France than other areas of Europe in the late 1810s and 1820s because the country's lesser demographic growth alleviated population pressure and helped maintain France's pattern of small farms and small industry in the countryside, where many small farmers were also part-time laborers in the local mill or mine.

But France did not escape the migratory temptations that were common in the British islands and western continental Europe at the time. During the

1820s several thousand left France every year and many others dreamt of following their examples. The Río de la Plata, Mexico, and the United States were on the mental map of many Frenchmen hoping for a different future. Aside from Paris, most of those who chose the United States came from the peripheral regions of France: Alsace and Lorraine in the northeast, the southwest from Bordeaux to Toulouse to the Pyrenees, or the mountain regions of central France.

The different groups of immigrants and exiles who went to the United States between the 1780s and the 1820s created lively communities in the new American Republic, particularly in the capital at Philadelphia and in New York, Baltimore, Charleston, Norfolk, and New Orleans after the Louisiana Purchase (1803). During the 1790s Philadelphia was host to thousands of French men and women of contrasting political persuasions, ranging from Jacobin supporters of the French Revolution to royalist exiles.

In general, and although individual situations could be very different, continental émigrés and Saint Domingue refugees were mobile populations in uncertain circumstances. They crowded the seaports' boardinghouses and attempted to make do by using whatever social networks of the past might be available or by founding new ones. They created French ethnic societies and more than ten newspapers, which—while often short-lived—brought them news from home and provided space for political debates. More often than not, they disagreed in their assessments of the political situation in France and the events in Saint Domingue. Some émigrés left the seaports and relocated in rural America, becoming farmers in Pennsylvania or planters in Alabama or Virginia. Once the political situation quieted down in France in the late 1790s, many continental exiles returned to France. But others stayed. The arrival of the Saint Domingue refugees from Cuba in 1809 reinforced New Orleans's post-Louisiana Purchase preeminence as the most important concentration of French—indeed, the only one where French speakers were a majority.

Therefore, French economic migrants of the late 1810s and 1820s did not arrive in a vacuum. They built on migratory traditions within the French Atlantic that went back to the eighteenth century. Entering the United States through the ports of New Orleans or New York City, some decided to stay and reinforce what had become the two largest French communities in the United States. New Orleans's city directories of the 1820s testify to the number of

French natives who became merchants, clerks, artisans, or teachers and attempted to take advantage of the port's extraordinary growth. Like their predecessors in the 1790s, French migrants of the 1820s developed ethnic institutions in New Orleans and New York, including the *Courrier des États-Unis*, which was created in New York in 1828 and soon became the longest-lasting and most influential French newspaper in the United States. Perhaps the greatest moment of visibility for French migrants took place when Lafayette traveled to the United States a last time in 1824 and 1825 as "the guest of the nation" and met with his countrymen and women, some of whom had left the seaports and attempted to better their lots in rural America—in the Ohio and later the Mississippi Valley or in rural Louisiana.

With the exception of the later migration to California, the migratory patterns of French people to the United States between the 1780s and the 1820s remained in place for much of the nineteenth century. The relative weight of French migrants within the total European migration, however, became less significant.

Germans

At the start of the American Revolution people of German background represented roughly 10 percent of the 2.5 million inhabitants of the British colonies. Nearly half of them lived in Pennsylvania and most of the others in New York, New Jersey, Delaware, Maryland, and Virginia. Significant numbers of Germans lived also in the Carolinas and Georgia, and a smaller number in New England.

German migration to North America began early in the seventeenth century when Germans accompa-

nied English, Dutch, and Swedish colonizers in ventures along the Atlantic coast, but the settlement of Germantown, near Philadelphia, in 1683 is commonly regarded as the beginning of major German migration to what became the United States. From that year to the start of the Revolution, perhaps more than 110,000 German speakers left their homes in Europe to settle in America.

Most of the immigrants entered America through the port of Philadelphia, although other ports, such as New York, Baltimore, Annapolis, and Charleston, provided points of entry as well. Some of the immigrants settled in or near the port cities where they landed; many others migrated inland to more distant locations. Thus major German settlements developed along the Hudson and Mohawk Rivers in New York, along the Delaware River in New Jersey and Pennsylvania, along an arc stretching from southeastern Pennsylvania through the Shenandoah region of western Maryland, Virginia, and North Carolina, and in Savannah, Charleston, and the Carolina Piedmont.

For four decades starting in 1776, the stream of German immigration to the United States narrowed but never stopped. On average, less than one thousand German immigrants arrived in each of those forty years. The reduced immigration, however, combined with natural increase to maintain a significant percentage of people of German background within the American population. In 1790, the year of the first federal census, when the total population of the United States was approaching four million, estimates of the number of Germans and German descendants living in the country still represent roughly 10 percent of the total.

Areas of concentrated German settlement established in the colonial era continued as such in the early national period. Pennsylvania remained home to nearly half of all Germans living in the United States. In 1790 Germans represented 38 percent of Pennsylvania's white population. Some Pennsylvania counties had populations that were more than 50 percent German; in Pennsylvania's Lancaster County the figure was perhaps 70 percent.

Yet Germans also participated in the westward migration of American people that led to the development of new states and the geographic expansion of the nation. From established areas of earlier settlement in the original thirteen states, Germans pressed over mountains, along rivers, and through valleys to help settle new areas such as Ohio, Indiana, Kentucky, Tennessee, and Missouri.

CULTURE AND RELIGION

The most reliable indicator of German background among inhabitants of the early Republic was the use of German language. German-speaking immigrants to America included people from Switzerland, Alsace, and the Netherlands, as well as territories inside Germany itself. The German language provided a mark of common identification for a diverse population of immigrants who otherwise differed from one another in many respects.

Germans who remained in the urban areas surrounding their port of initial entry, or migrated to other urban centers, tended to assimilate into the larger culture around them. Germans who settled in the countryside beyond the cities tended to form ethnic communities with other Germans. In both cases the German language served as social currency. In the cities a German-language print industry developed, providing German speakers a medium for the exchange of ideas and information in their native language. The urban centers of southeastern Pennsylvania radiating from Philadelphia hosted numerous print shops established by Germans, as did the Maryland cities of Baltimore, Frederick, and Hagerstown, and other locations such as New Market, Virginia, and Salisbury, North Carolina. Some of the production of German print shops served outlying rural areas, but in the countryside the German language also helped to maintain a degree of separation from the larger culture. A common motive for much of the German migration to and within America in the eighteenth and early nineteenth centuries was economic opportunity, and many Germans found such opportunity in the purchase and cultivation of farmland; the use of the German language helped to assure that the farming communities established by German settlers provided not only economic opportunity but also an integrated culture embracing all aspects of life and mitigating the pressures of assimilation.

Religion was a central aspect of an integrated culture for many Germans in America. Some German communities were founded on experimental religious blueprints. Examples include the Ebenezer settlement established by Salzburger refugees near Savannah, Georgia; the Moravian communities of Salem, North Carolina, and Bethlehem, Pennsylvania; and the Ephrata cloister near Lancaster, Pennsylvania. Most religious Germans in the early Republic were Protestant, although there were also some Jews and enough Catholics to organize a German parish in Philadelphia in 1787. Among Protestants, the majority of Germans in early America were either Lutheran or Reformed. Missionary ministers of both

denominations helped to organize local congregations among Germans in the cities and the countryside, although religious freedom in America meant that such efforts depended on the voluntary support—and often the initiative—of lay people. In many places Lutheran and Reformed congregations shared the same church building while maintaining separate denominational identities. Both denominations also worked to organize local congregations into larger cooperative networks known as synods, which later established colleges and seminaries. Renowned among the leaders of the German churches in the early Republic were the Lutheran missionary pastor Henry Melchior Muhlenberg (1711–1787) and the Reformed minister Michael Schlatter (1718–1790). Besides the Lutheran and Reformed majority, German Protestants in the early Republic also represented a number of traditions associated with the so-called Radical Reformation and Pietism. Groups of Mennonites, Moravians, Amish, Dunkers, Schwenkfelders, and Waldensians had migrated to America before the War of Independence, seeking freedom from the persecution they often experienced as outlaw religions in Europe.

The episodes of religious revival that occurred in America in the mid-eighteenth and early nineteenth centuries appealed to many Germans. The dramatic expansion of Baptist and Methodist churches during the early national period occurred in part because of Germans who exchanged their previous religious affiliation, or indifference, for the pioneer spirituality of the fast-growing evangelical denominations. Germans who wanted an evangelical alternative to their traditional Lutheran and Reformed churches also formed new denominations such as the United Brethren (founded by Philip William Otterbein), the Evangelical Association (founded by Jacob Albright) and the Church of God (founded by John Winebrenner). In spite of such developments, however, traditional German churches continued to thrive as the German population increased and expanded. Wherever they went, German settlers usually established churches, which served as the predominant institutions of German culture.

In association with churches Germans also established schools for the religious instruction and elementary education of young people. The prevalence of schools in German communities contributed to a high degree of literacy among the German population and further promoted the integrity of German culture.

POLITICS AND LEADERSHIP

Despite their cultural distinctions in the early American Republic, Germans embraced the ideals and opportunities of the new nation and contributed to its vitality. On 5 July 1776 the Philadelphia printer Henrich Miller published a notice concerning the Declaration of Independence in his semiweekly newspaper, the *Pennsylvanische Staatsbote*. The next issue of the paper included a German version of the entire Declaration. Miller's eagerness to publicize in German the actions of the Continental Congress indicates the degree of interest Germans felt in the affairs of the Revolution and the new nation being established.

Though some Germans in America remained loyal to the British crown, the majority—including many religious pacifists who would not bear arms—supported the Revolution. Thousands served as ordinary soldiers; a few became distinguished officers. Notable among the latter was John Peter Gabriel Muhlenberg (1746–1807), the eldest son of Henry Melchior Muhlenberg. At the start of the Revolution, Peter Muhlenberg, then serving as a minister in Virginia, was named to a local committee helping to organize that state's involvement in the war. He rose quickly through the ranks of command, becoming a brigadier general in 1777 and a major general in 1783.

The war itself brought many Germans to America. The British crown purchased the military service of nearly thirty thousand German troops from the princes of several German states; because the majority of the troops came from Hesse-Cassel, they have usually been referred to simply as "Hessians." The crown's money was ill spent: more than one-third of the contracted troops abandoned the British army either by simple desertion or enlistment with the American forces, later settling within German communities in Pennsylvania and other states. Congress actively enticed such desertions with offers of American citizenship and free land. Some Germans came to America enticed by the Revolution itself and eager to aid the patriots in their struggle. Perhaps the most famous was Friedrich von Steuben (1730–1794), a Prussian aristocrat in search of adventure who met Benjamin Franklin in Paris in 1777 and offered his services. Baron von Steuben aided Washington in the training and organization of the American forces. After the war he received American citizenship and retired to New York. Another notable German who fought for the Americans was Johann Kalb (1721–1780), a native Bavarian known as Baron de Kalb (although he was not in fact a baron). Kalb came to America in 1777 with Lafayette and was wounded

and captured by the British in South Carolina, where he died.

Some Germans served the new nation in high political office. Frederick Augustus Conrad Muhlenberg (1750–1801), younger brother to Peter Muhlenberg, was elected in 1779 to serve as a Pennsylvania delegate to the Continental Congress. He later supported Federalist efforts to ratify the Constitution and was named Speaker of the House during the First (1789–1791) and Third (1793–1795) Congress, during which terms his brother Peter also served as a member of the House. David Rittenhouse (1732–1796), a native of Germantown, became the first director of the United States Mint in 1792. In 1808 Simon Snyder (1759–1819) became the first German American to serve as governor of Pennsylvania, serving three terms in that office.

Outside Pennsylvania, where they represented a large percentage of the state's population, Germans were not often elected to high office at the state or federal level in the early national period. More frequently, they held positions of local leadership within ethnic communities at the county or township level. The German conception of American law and liberty emphasized individual rights and local autonomy over against centralized authority. For this reason, although Germans never constituted a homogeneous political bloc, most of them preferred the Republican Party of Thomas Jefferson to the Federalist Party of John Adams. In the 1790s Frederick Muhlenberg shifted his own affiliation from the Federalists to the Republicans, and German support for Jefferson in 1800 helped to decide the election.

Preference for local autonomy shaped the attitudes and responses of Germans to a variety of issues in the early Republic. For example, Germans largely opposed various plans to establish public schools in Pennsylvania, preferring their own traditional parochial schools. When John Fries, a German in eastern Pennsylvania, led an armed opposition to federal tax assessors who were commissioned by the Adams administration in the late 1790s, many Germans sympathized with the rebellion as a necessary resistance to centralized encroachment over local autonomy. On the other hand, during the 1820s, when some evangelicals agitated to prohibit the government from delivering mail on Sunday, many Germans objected that the reformers were trying to establish unwarranted hegemony over the affairs of the nation, thereby usurping the authority of Congress. Ironically, one of the most enduring legacies of German emphasis on local preference is the national observance of a Christmas holiday in the contemporary

United States, which is due in part to German resistance to government workdays scheduled on 25 December and 26 December.

Paul A. Baglyos

Ireland

Immigrants from Ireland played a critical role in the development of the new American nation. As indentured servants, they formed the backbone of the labor force that allowed the colonies to thrive. As artisans, tradesmen, merchants, and patriots, they made the foundation of the United States possible. The first census of the United States in 1790 found 3.17 million Americans of European descent, of which 400,000 to 517,000, or 14 to 17 percent, were of Irish origin. In 1820, the year when the Department of State began collecting statistics about immigrants and their country of origin, the Irish accounted for almost half of the total number of immigrants.

For the years 1820–1830, the Irish were the largest group of immigrants entering the country, consistently outnumbering the second-place British by a factor of at least two to one. As these figures indicate, the Irish formed a significant portion of the American population well before the great immigration waves of the mid-nineteenth century. However, unlike the later influx of Irish Catholics during the Famine, the Irish immigrants of the mid-eighteenth to early nineteenth centuries were predominantly Protestant. Their American contemporaries grouped all immigrants from Ireland under the label “Irish,” but among themselves the Irish had more subtle distinctions based largely on religious affiliation.

Although it is a trap to view the conflict among the peoples of Ireland as solely based on religious differences, religious labels were often used as shorthand to indicate deeper cultural and political identities. Catholicism was the religion of the oldest groups in the country: the native Irish and the descendants of the twelfth-century English conquerors who had adopted the customs of Gaelic culture. Descendants of English colonists of the Elizabethan era, the self-named Protestant Ascendancy, were members of the Church of Ireland. The last significant religious grouping was that of Dissenters, Protestants not affiliated with the Church of Ireland. This group included Quakers, Methodists, and, most significant to Irish immigration, the Ulster Scots—Presbyterians of Scottish descent who colonized Ulster during the Elizabethan and Jacobean eras. In the past, the historiography of Irish immigration was heavily influenced by Irish nationalism of the nineteenth and twentieth centuries, a process that envisioned Irish immigrants as a homogenous, predominantly Irish Catholic whole. However, scholarship of the late twentieth and early twenty-first centuries favors a more nuanced treatment of the different immigration patterns of the Protestant and Catholic Irish.

IMMIGRATION BEFORE THE AMERICAN REVOLUTION

Eighteenth-century Irish immigration, especially before the American Revolution, was dominated by Protestants, particularly the Ulster Scots. It is estimated that between 250,000 and 400,000 Irish Protestants arrived in America during the eighteenth century, 75 percent of whom were Presbyterians from Ulster. In the pre-Revolutionary period, there were two significant waves of Ulster Scots immigration, in 1754–1755 and 1771–1775, with large numbers originating in the northern counties of Antrim, Derry, and Down. Faced with pressures in Ireland created by landholding practices, economic decline,

and a degree of religious intolerance, Ulster Scots saw emigration to America as an increasingly attractive opportunity for bettering the fortunes of their families and communities.

Most Ulster Scots were tenant farmers who survived by a mix of cultivation, livestock breeding, and either linen or wool production. Changes in landholding practices had the deepest-felt and most immediate impact on this lifestyle. In the early part of the eighteenth century, the original leases granted to Scottish Presbyterians for the colonization of Ulster began to come due. The implementation of the Ulster Plantation was rather successful, and the Anglo-Irish landlords no longer felt the need to keep a population of Scottish settlers as a buffer between themselves and the native Irish. Leases were renewed with shorter terms and higher rates (a process known as rack-renting), some leases were auctioned to the highest bidder (canting), and large renewal fees were tacked onto the transaction. As a result of these practices, access to land grew more restricted and competitive. The Ulster Scots found themselves up against native, Catholic Irish families who were willing to pay the high rents in order to live on their ancestral lands. As their access to land diminished, the Ulster Scots farmers discovered they had a way to obtain ready passage money; by a practice known as the "Ulster Custom," tenants were reimbursed by their landlords at the end of their lease for any improvements they made to the land during their tenancy.

Many may not have chosen to immigrate because of higher rents. However, several economic factors increased the pressure on the northern tenant farmers' incomes. As their rents increased, the Ulster Scots also faced higher food prices, at the same time finding they could no longer make as much money producing textiles. The linen industry declined in the second half of the eighteenth century, going into full recession during the 1770s. A currency and capital shortage placed stress on other crafts, creating a lull in trade overall. Agrarian violence rose as it became more and more difficult to make a living off the land, with such notable outbreaks as the Oakboys in 1764 and the Steelboys in 1770–1771. As Dissenters, Ulster Scots also bore a measure of religious intolerance—being required to tithe to the Church of Ireland in addition to supporting their own presbyteries—that may have increased their desire to leave the Anglican-run establishment of Ireland. Given all these factors, and the exacerbation of an ever-growing population, many tenant-farmers opted to accept their reimbursement and take their chances overseas.

The majority of Ulster Scots emigrated in groups, either with their families or with their local church community. The majority also relied on the Ulster Custom to pay their passage in advance; however, during the recession of the 1770s, the majority traveled as indentured servants or "redemptioners" who had to repay their ship's captain within a certain period of disembarking. A symbiotic shipping relationship between Ireland and America in the eighteenth century encouraged the flow of raw materials to Ireland and passengers to America. Departing from the ports of Belfast, Newry, Derry, and Larne, with occasional departures from the southern Irish ports of Dublin, Waterford, and Cork, Ulster Scots immigrants landed principally in Newcastle, Delaware, and Philadelphia. A portion of Ulster Scots, those with artisanal skills or a surplus of capital, remained on the American seaboard and made their living as trades- or craftsmen. In general, though, Ulster Scots immigrants continued to make their living by farming, becoming pioneer settlers in the backcountry of early America; in the South they also raised cattle and helped create the cattle economy. From Newcastle and Philadelphia they moved to where land was available, first in the Delaware Valley, then to the Cumberland Valley and beyond. By the 1760s the Ulster Scots fanned out into the South Carolina piedmont, into western Pennsylvania, and across the Cumberland Gap into Tennessee and Kentucky. Initially, their lives were full of hardship. They endured around-the-clock labor on isolated frontier farms, housed in rough log cabins; the women bore tremendous workloads on the frontier. The Ulster Scots focus on acquiring more land often placed them in contact and conflict with surrounding Native American tribes. In America the transplanted Ulster Scots found themselves acting as a buffer between British and Native Americans, much as their ancestors had served as a boundary between the Anglo-Irish and native Irish. With time and good fortune, the Ulster Irish were able to increase their standing in America. The seaboard merchants and professionals made their mark in American politics, medicine, law, and finance, speculating on the further development of the west. The backcountry pioneers eventually were able to move up from log cabins to respectable farmhouses.

Nearly 100,000 Irish Catholics immigrated to America in the eighteenth century. It is especially difficult to get a clear picture of those who made the journey in the pre-Revolutionary period. Unlike the Ulster Scots, they tended to travel singly, and it is assumed they were wanderers—underclass servants, migrant workers, and transported criminals—with

few ties to their ancestral lands in Ireland. In addition to the increased competition for resources created by Ireland's rapidly growing population, economic factors forced these immigrants from their homeland. Southern Ireland experienced a famine in 1740–1741, a potato failure in 1765, and a grain failure in 1766–1767. Cottage textile production was hurt by a handloom weaving collapse in Cork in 1769 and the linen depression of the 1770s. Living at the very margins in Ireland, this free-floating group of Irish Catholics felt that it was preferable to live as indentured servants in America, hoping for better opportunities once their terms of indenture were up. These immigrants followed the same shipping patterns as the Ulster Scots, landing predominantly in Newcastle and Philadelphia.

Around 20 percent of Irish Catholic servants worked for merchants, artisans, or tradesmen in cities like Philadelphia and Baltimore. The majority of Irish Catholic indentured servants became agricultural laborers. Those working in the middle colonies of Pennsylvania, New York, and New Jersey worked as farmhands. Although they had to endure harsh adjustments to America's more variable climate and a corn-based diet, their masters tended to treat them relatively humanely. Servants in the South encountered a more exploitative environment, driven by the aristocratic tastes and heavy debts of the planter class. Indentured servants on plantations found their masters treated them as property, whereas northern masters only laid claim to their time. In both the North and South conditions were far from easy as shown by a disproportionately high percentage of advertisements for Irish-born runaway indentured servants. Those Irish who did successfully serve out their contracts were given "freedom dues" of clothing, tools, seed, and provisions, but rarely land. With this new stock, they often went on to become farmers or pioneers farther inland from their place of indenture, or wandering farm laborers. A minority became workers in towns and cities.

IRISH AMERICANS AND THE AMERICAN REVOLUTION

The period of the American Revolution saw a marked decline in immigration from Ireland. The war, with its closure of sea lanes, disrupted shipping and the passenger trade along the Atlantic. In addition, any potential passengers were hesitant to risk the danger of being taken up from their journey abroad and impressed into the British military. However, even as the tide of incoming Irish stemmed to almost nothing, the Irish who had immigrated in the earlier years

of the 1770s took on a significant role in the violent birth of the new American nation.

By the middle of the 1770s, many Ulster Scots immigrants had established themselves firmly enough in their new land to have moved beyond the constant labor and hand-to-mouth existence of frontier life. Ulster Scots found themselves intensely interested in the Revolutionary crisis precisely because they were more established; their financial and physical security was tied up in their American colleagues and contacts and depended heavily on the outcome of the war. They were also quick to adopt the republicanism espoused by the proponents of the Revolution, exposed as they were in their Presbyterianism to the radical republican ideals of the Scottish Enlightenment. In general, the Ulster Scots immigrants were pro-Revolutionary. As a result, the American armies of New Jersey, Delaware, and Pennsylvania had a disproportionately high number of Ulster Scots soldiers. Ulster Scots were especially prominent in the Revolutionary Pennsylvania government, with such men as Thomas McKean as chief justice, Joseph Reed as president of the executive council, and George Bryan as vice president.

Although evidence is sketchy, it is believed that Catholic Irish immigrants were more conservative and slower to choose sides between the British and American causes. Some may have felt the Revolution was a chance to prove their loyalty to the crown by serving in royalist forces against the rebels. However, dissatisfaction with the British handling of Irish affairs along with the lure of advancement within American society may have won over many. Indentured servants among Catholic Irish immigrants may have been most attracted to military service, which could very well reward them with an early termination of the indentures, business connections, and the possibility of land grants out west.

In the long run the service of Irish immigrants in the American Revolution earned the Irish in America better living conditions than those Irish living under British rule. As members of the early Republic, the Irish gained access to civil and military offices, voting, and membership in the professions of law and medicine. Even Irish Catholics benefited. Although there were still legal barriers to Catholic office-holding in some states, they did win other rights not held before. There was even an increased toleration for Catholic religion, which contributed to the solid establishment of the Catholic Church in America by 1790. The Irish Catholic immigrant John Carroll was consecrated the first bishop of Baltimore in this period.

IMMIGRATION FROM 1783 TO 1829

Patterns of immigration changed markedly in the postrevolutionary period. America was now a competitive market, no longer providing the benefits of common British membership, and Irish shippers were forced to diversify their goods and broaden their geographic range. Immigrants now had greater opportunities to sail into ports in New York and New England, as well as Delaware and Philadelphia. There was also a sharp decline in the practice of indentured servitude in the 1780s. The American Revolution questioned the morality of both indenture and slavery, and captains were suspicious of the willingness of American courts to uphold articles of indenture. As the new American nation found its feet, other types of work were advertised that did not require indentures. By 1800 Irish indentured servants were no longer a factor in immigration from Ireland. Shipping agents preferred the security of paying passengers, such as farmers, artisans, small businessmen, schoolmasters, and physicians.

The end of the eighteenth century also saw a rise in the number of Catholic Irish entering America, although they were still outnumbered by Irish Protestants. The failed 1798 Rebellion of the United Irishmen forced many surviving Protestants and Catholics to flee prosecution or subsequent sectarian violence in Ireland. The United Irishmen themselves, with their classical republican tradition, turned to America as a natural sanctuary. Their skills in political organization and newspaper publishing along with the timing of their arrival had a significant impact on the debate between Federalists and Jeffersonian Republicans. Irish Protestants and Catholics united behind the Republican banner in opposition to the Federalists' implementation of the Alien and Sedition Acts and their attempts to keep United Irishmen out of America. The United Irishmen immigrants, such as the successful newspaperman Matthew Carey, pushed for a wider political franchise and a more egalitarian and accessible legal system. Their ideas became the hallmarks of what Americans proudly called democracy by the end of the War of 1812. The post-Revolutionary period saw increasing numbers of Irish and those of Irish descent successfully involved in American politics. Some became influential in local and regional party politics, especially in Philadelphia and New York, while others like the Scots-Irish Andrew Jackson and John C. Calhoun were elected to the highest national offices.

After 1800 the competition for Irish land coupled with the increased commercialization of agriculture pushed more and more Catholics out of Ireland. The era of Irish Catholic immigration had begun, with

the numbers of Catholic immigrants doubling every twenty years—a full forty years before the Great Famine. By the 1810s Irish Societies were appearing in major American cities to help new immigrants find housing, jobs, and community. Ulster Scots adopted the label “Scotch-Irish” in this period to distinguish themselves from the growing enclaves of Catholic Irish immigrants. However, this was the most overt sign of sectarian differences. It seemed for the brief period of the 1820s, up through the inauguration of President Andrew Jackson, that the Irish in America would be able to put aside the religious and cultural differences that had marked them so profoundly in Ireland. This time of relative peace was broken by a mass southern Irish migration in the 1830s that sparked Irish sectarian differences and further fueled the rise of the anti-immigrant, anti-Irish Catholic hatred known as nativism.

Scots and Scots-Irish

The relationship of Scots and Scots-Irish immigrants to North America—the latter principally Presbyterians from Ulster in the north of Ireland, predominantly of Scottish background and connections—is among the most complex of migration stories. At one time it was common to treat migrants from those two places as a single people deriving from a common ethnic “stock.” But in recent years, as historians came to shun the use of racialist characterizations, they began to emphasize instead the distinctions between migrants from Scotland and from Ulster, who had been separated by many miles of water and a century of divergent development before the transatlantic migrations of either group began in earnest in the early part of the eighteenth century.

That approach has proved no more satisfactory than the first. The more that is learned about the extensive movements of peoples within the Atlantic world during the early modern era, the more difficult it is to establish such clear separations. In the case of the inhabitants of Scotland and Ulster, there was simply too much movement back and forth between the locales, and too many persistent connections, to permit the rapid establishment of distinct identities among their populations. While Scots began moving to Ulster at the beginning of the seventeenth century, for most of that century the north of Ireland and the west of Scotland were less separate societies than alternate locations to which populations flocked at different times in the face of religious and political conflicts and economic woes. Thus, while twenty thousand or more Scots settled in Ulster during the early plantation years, a large portion of them fled to Scotland during the civil war years in Ireland at mid-century. Some then returned to Ireland with the Restoration of Charles II in 1660 and the return of Ireland to Protestant control. The greatest period of Scots migration to Ulster was undoubtedly during the famine years of the 1690s, a mere two decades before the start of substantial transatlantic migration from that province. Thus, Ulster’s first migrants to America were hardly the products of a wholly separate society.

Several kinds of links continued to connect the inhabitants of Ulster and the west of Scotland thereafter. Ulster Presbyterians continued to travel to Scotland for their educations; in many respects, Glasgow served as their cultural capital. Moreover, they were linked by the process of migration itself; emigration vessels departing Scotland, for example, sometimes called at northern Irish ports along the way, and Scots traveling to America sometimes sailed from Ulster ports. It is often difficult to determine whether a particular group of immigrants had departed from Scotland or Ulster, or where they had lived before arriving at the point of departure.

EARLY MIGRATION PATTERNS

One feature common to the experiences of those settlers was a strong migratory tradition. For centuries, Scots—coming from an impoverished land on the outskirts of Europe with few natural resources—had been among the most mobile people on that continent. Long before they began moving to America, Scots had traveled extensively within Europe, to the Baltic and Scandinavia and the Low Countries in search of opportunity in the army or in trade; the seventeenth-century movement to Ulster was one manifestation of that tradition. Moreover, the necessity of finding opportunities abroad had meant that migration among the Scots affected an unusually broad spectrum of the population, extending well beyond the desperately poor to include merchants, scholars, and clergymen in substantial numbers.

Early Scots and Scots-Irish migration to America was influenced by those traditions. In the seventeenth and eighteenth centuries, relatively few Scots traveled across the Atlantic, even though they continued to move abroad in large numbers. That was largely because they were too well connected in Europe to be interested in transatlantic migration. The frequency of out-migration, including the massive movement to Ireland during the famine years of the 1690s, left Scotland rather underpopulated at the outset of the eighteenth century, with numbers at a level not much different from the century before. Thus, the overall rate of out-migration from Scotland declined in the eighteenth century. By contrast, the north of Ireland, which had attracted so many migrants, became a fertile source of emigrants, and from the 1710s men and women from Ulster began crossing the Atlantic in ever-larger numbers.

The immigration of Scots and Scots-Irish falls into three distinct phases. The first, lasting until the outbreak of the Seven Years’ War (1756–1763), saw modest Scots migration coupled with the beginning

of substantial movement from Ulster. The second phase took place between the Seven Years' War and the American Revolution (1775–1783), during which time emigration from both Scotland and Ulster became increasingly prominent phenomena and closely connected movements. The final phase followed American independence and led once again to the development of distinct patterns in Scots and Scots-Irish migration.

While there had been occasional migrants from both Scotland and Ulster to North America from the beginning of English colonization, the movement began in earnest in the second decade of the eighteenth century, heading first to New England but then, increasingly, to Philadelphia. In the peak year of 1729, close to six thousand persons may have left Ulster for the Delaware Valley. That movement was a response to several forces: the relatively high population levels carried over from the Scots migrations of the late seventeenth century; fluctuations in the linen trade, a staple for Ulster Scots; and the disadvantaged position of Presbyterians as dissenters from the established Church of Ireland. Over four decades, as many as thirty thousand persons departed Ulster ports for North America, the great majority heading for the Delaware Valley towns of Philadelphia and Newcastle. As many as one-third of Ulster migrants during this period may have traveled as indentured servants. Migration from Scottish ports during this period was much less, owing in part to stagnant population levels resulting from the considerable migrations to Ireland and Europe the century before. The principal exception was a growing movement to the colonies of persons from the commercial and professional classes that included merchants, doctors, clergymen, and public officials of all sorts.

THE REVOLUTIONARY ERA

Scots-Irish migration continued and even accelerated in the second phase, as the end of the Seven Years' War opened up new lands to settlement and attracted new immigrants. At least thirty thousand and perhaps as many as fifty thousand emigrants headed to North America over the next fifteen years, still concentrating in the Delaware Valley, although increasing numbers moved west and south from there into the opening backcountry regions of Pennsylvania, Maryland, Virginia, and the Carolinas, and into the New York backcountry as well. What was new in the second phase was a dramatic increase in migration directly from Scotland, also amounting to upwards of thirty thousand persons. During this phase, migrations from the two places often over-

lapped, as ships from Ulster carried migrants from Scotland, while emigration promoters in Scotland advertised and enlisted agents in the north of Ireland as well.

The second phase of migration included a significantly broader spectrum of the population than had traveled before, especially from Scotland. Where earlier immigrants had come disproportionately from the educated classes, almost all from the Scottish Lowlands, they were joined after 1763 by increasing numbers of farmers and artisans. Where earlier movements had originated predominantly in the Scottish Lowlands, in the second phase nearly half of the migrants were Highlanders, and the proportion increased until the outbreak of hostilities between Britain and the colonies in 1775. Rather than concentrating in the eastern cities, as earlier migrants had done, they fanned out into the backcountry and into the underdeveloped but rapidly growing colonies of North Carolina and New York. Especially among the Highlanders, the great majority came in families and traveled as free passengers, with only a few single migrants or indentured servants among them.

Another new feature of the second phase of Scots and Scots-Irish emigration was the place it attained in public discussion. During this period Samuel Johnson (1709–1784) and James Boswell (1740–1795), touring the western islands of Scotland, saw the rising “emigration mania” wherever they went. During that time also, panicked Highland landlords asked the British government to place controls on emigration, fearing the depopulation of their estates. On the other side, political and religious dissenters cited a rising level of emigration as evidence of the need for the reform of Britain's economic and political systems, and they played leading roles in the creation of Scotland's first organized emigration companies. All of that encouraged writers and newspapers to publicize and quite probably exaggerate the movements to the point that it is difficult to separate fact from fiction in their accounts or to gauge the numbers involved.

In addition to those newcomers, the American colonies continued to attract more than their share of Scots with professional educations during this period. Among those were two who would be members of the Continental Congress and signers of the Declaration of Independence: John Witherspoon (1723–1794), minister of the Church of Scotland, who became president of the Presbyterian College of New Jersey at Princeton and de facto head of the Presbyterian Church in America, and James Wilson (1742–1798), Pennsylvania lawyer and leading political

thinker, an influential member of the Constitutional Convention, and a justice of the U.S. Supreme Court.

AFTER INDEPENDENCE

The outbreak of war between America and Britain in 1775 halted the migration flow; when it resumed the following decade, there was a new United States. One result was to divert many migrants to the remaining British colonies in Upper Canada and the Maritime provinces, which in succeeding years became the principal destination for Scottish emigrants, especially from the Highlands, in numbers that sometimes exceeded the peak years of 1774–1775. Montreal and Quebec and Halifax now succeeded New York, Philadelphia, and Charleston as trading points for Scots merchants.

Migration from Ulster was less affected by American independence. By the third phase of emigration, the migration histories of Scotland and Ulster were less intertwined than they had been before, possibly because by this time the Ulster community had established a more stable identity than previously. As was the case with Scots migrants, movement from Ulster to North America resumed and even accelerated during the 1780s, in their case much of it to the new United States—as many as 5,000 arrivals per year. Migration declined during the Napoleonic Wars (1803–1815), but accelerated afterward. Overall, perhaps 200,000 people moved from the north of Ireland to North America between 1783 and 1835, some to the Canadian provinces, some directly to the United States, and some to the new nation by way of the northern provinces.

Among Scots, the one kind of migration that continued in earnest after American independence was that of merchants and professionals. Clergymen continued to migrate, as would physicians and educators. One group of Scots who were increasingly noticeable in particular were those with industrial and technical skills in mining and textiles who would play a considerable role in transferring the technology of industrialization to the United States. They would include Robert Dale Owen (1771–1858), son of the pioneer of the model industrial community of New Lanark in Scotland and founder of the utopian community of New Harmony in Indiana; in his utopianism, Owen would be matched by his partner, Frances Wright (1795–1852). Technicians and inventors and engineers would be followed by entrepreneurs investing in all facets of American development, of whom the most renowned would be Andrew Carnegie (1835–1919).

Another kind of immigrant who arrived in the new nation from both Scotland and Ulster was the political refugee. The 1790s was a decade of political reaction in Britain and Ireland, and those who supported political reform in Britain or the campaign of the United Irishmen—led first by Ulster Presbyterians—found themselves confronting prison and exile. Among those who fled to America were political journalists, such as the Scotsman James Thomson Callender (1758–?), and the future ornithologist Alexander Wilson (1766–1813). Most would support the Jeffersonian party or later democratic movements.

One thing that particularly distinguished Scots and Scots-Irish immigration from that of most ethnic groups was their relatively easy adjustment into American society as white, English-speaking Protestants from the United Kingdom—despite occasional outbursts against the allegedly uncivilized Scots-Irish of the backcountry or “Scotch mercenaries” at the time of the American Revolution. Thus, they never faced the discrimination encountered by Catholic migrants from southern Ireland. They have been called invisible immigrants for their ability to fit in. Moreover, the Presbyterianism of the largest number of these migrants was often more in keeping with the American religious mainstream even than the predominant Anglicanism of the majority of newcomers from England.

Their relatively easy adaptation was facilitated also by their migratory traditions. From early on, both Ulster Scots and Scots Highlanders were regarded as a valuable resource for settling backcountry lands, where they could serve as a buffer for eastern settlers against Indian attacks. Their history of venturing abroad in search of commercial opportunities also made them well suited to promoting the commercial development of the backcountry, where Scots traders established a powerful and disproportionate presence. And, having established some of the Western world’s leading programs in the sciences and technology during the eighteenth century, and as a result of the long-standing willingness of trained and educated Scots to travel, Scots, along with the Ulster natives who flocked to their universities, played critical roles in bringing technical expertise and inventiveness to the new nation.

Ned C. Landsman

Anti-Immigrant Sentiment/Nativism

Nativism during the first half century of American nationhood played nothing like the part it did in the second. No movement to define nationality in a restrictive way coalesced sufficiently to produce local political movements like New York City's Native American Democratic Association of the mid-1830s, much less putatively national organizations such as the American Party of the 1850s. At the end of the third decade of the nineteenth century, there were still no colorful nativist fraternities like the Order of United Americans or the Sons of the Sires of '76. There were no convent burnings, lurid public exposés of the "licentiousness" of the Roman Catholic confessional, street battles between immigrant and "native" fire companies, or employers' windows posted with "No Irish Need Apply" notices. There was only a hint of the mass immigration from Europe that later offered nativists their foils, the wars of the French Revolution and Napoleon (1793–1815)

and the United States's own economic doldrums providing little encouragement to transatlantic migrants.

THE QUESTION OF NATIONALITY

Yet the roots of the robust nativist movement that spawned a major third party political insurgency at mid-century, played a role in the remaking of the American political landscape, and had a prominent and enduring cultural impact lasting into the twentieth century were nurtured in the decades before 1830. It should not be at all surprising that a movement about defining nationality had its origins in a period of nation building.

The opportunity for a nativist movement was provided by the unprecedented character of the American nation itself. The preexisting European definitions of "nation" did not seem to fit this new creation. The United States neither drew identity from association with a historic "people," with cohesion in common traditions, values, culture, or "blood," nor from time-tested institutions nor even long-established territorial boundaries in the ways to which Europeans were accustomed. To be sure, the United States had established political and legal structures, but the notion that they operated by the voluntary subscription of the citizenry rather than as the inheritance of monarchical authority or feudal obligation was untested.

European doubters regularly reminded Americans that they might not be a nation at all, certainly not one calculated to endure. Americans were disposed to have their own doubts. Political rhetoric inherited from eighteenth-century Britain posited that republics faced endemic internal threats. The rich and powerful might come to dominate as oligarchs or the poor and ignorant might fall to the sway of demagogues and tend to anarchy. Consequently, the central requisite for a republican citizen seemed to be what was then called "independence" or what later might be called "autonomy." The only reliable citizen was one with the freedom of mind to resist manipulation and the material possessions or prospects to avoid domination. This outlook encouraged scrutiny of others, and a conventional ethnocentrism directed attention to those who looked, talked, or lived differently. But, as important, it encouraged judgment of self. For if citizens fell into dependency of almost any sort, not only was the nation in peril, but their very identity as Americans was threatened. Nativists, or in the period from 1789 to 1829, protonativists, were those for whom anxieties about both self and nation became particularly intense.

ALIEN AND SEDITION ACTS

Authentic nativism and the beginnings of organized nativist activism should not be confused with the nascent party politics behind the four pieces of legislation passed by the Federalist leadership in Congress in the summer of 1798, which collectively came to be known as the Alien and Sedition Acts. Particularly vexing to hard-line Federalists was the enthusiastic participation in press and politics of small numbers of Irish expatriates whose experiences with nationalist organizations like the United Irishmen had inclined them to take their ideological cues from revolutionary France rather than conservative Britain. Finding outlets in the Philadelphia *Aurora* and the publications of the Carey brothers, Mathew and James, the group included such outspoken anti-Federalists as James Callender, William Duane, and John Daly Burk. While three of the four measures were directed at the foreign-born, the legislation was much less about nationality than about the uncertainties of political party formation, doubts over legitimate political opposition, and a neocolonial outlook which suspected that the Republic remained a pawn of the European Great Powers. Suspicious of revolutionary France, eager for commercial alliance with Britain, and observing that neither the French in the United States nor many recent arrivals from the British Isles were likely friends of Federalism and the administration, Federalist votes in Congress supported a "Naturalization Act," an "Act Concerning Aliens," an "Act Respecting Alien Enemies," and an "Act for the Punishment of Certain Crimes" (the Sedition Act). The first extended the probationary period for naturalization from five to fourteen years; the second and third—never enforced—created conditions for the punishment or deportation of politically troublesome aliens in either peace or war; and the final act, of which a congressman and several prominent Republican newspaper editors were the chief victims, outlawed publicly shared "false, scandalous, or malicious" words about the government or officers of the government. While political enemies did not hesitate to castigate the Irish origins of Republican Congressman Matthew Lyon of Vermont, the most visible public figure convicted under the Sedition Act for "libeling" President Adams, the issue was not nativity or nationality but ideology. The chief consequence of the acts was not an enduring nativism but the solidification of the Republicans as an opposition party.

PROTONATIVISM

Actual protonativism originated with groups that established themselves to promote citizens' partici-

pation in republican government and the autonomy that permitted them to be reliable repositories of self-rule. Mechanics societies that sprung up in New York and Baltimore during the 1780s and 1790s lobbied for a just wage and economic competency for the laborer or craftsman, while promoting oratorical and debating skills considered essential to participation in public affairs. New York City's Tammany Society, founded in the late 1780s, sought to encourage effective participation in republican government for those without the wealth or connections of aristocracy. It endorsed free public education and the cessation of imprisonment for debt. Although a later version of Tammany would be closely associated with Irish American politics, its earliest incarnation actually had free-thought and anti-Catholic tendencies. Democratic Republican societies, which emerged in 1793–1795 in the tradition of the Revolution's Committees of Correspondence, not only supported public schools as training grounds for republicans but scanned the political horizon for evidence of republican degeneration and instituted mutual benefit insurance for members as a way of promoting autonomy and, accordingly, political reliability. This was a tradition sustained in New York City by the Washington Benevolent Society, founded in 1808, with a more Federalist temper.

These bodies organized to guarantee the ability of members to function as citizens but also to watch carefully for those who might imperil republican self-government by undermining citizens' autonomy. There was a pattern to whom they watched most closely. The conventional Anglo-American view of Roman Catholics as priest-drilled and ill-educated raised the specter of an organized bloc of dependent voters. The poorest among foreign-born arrivals attracted attention as prospectively devaluing labor and throwing American workers into dependency. Ethnocentrism suggested that these might have a capacity for living at a low living standard, a capacity that the self-respecting American republican lacked. In fact, any collection of persons that could be regarded as clannish or under some form of uniform direction could be regarded by protonativist groups with suspicion.

THE 1820S: A TRANSITIONAL DECADE

Conditions in the mid-1820s set the stage for the eruption of a real nativist movement. The death of the last of the Republic's founders underscored latent anxieties about the future. Franchise reform, such as that which increased the size of the New York City electorate by 30 percent, reawakened fears of depen-

dent voters. The recession that had begun in 1819 ended and was succeeded by an agricultural boom, an emergent factory system of production, and a canal craze. All encouraged European immigration, and the foreign-born became more widely dispersed around the nation. Disfranchisement of small freeholders in Ireland in the mid-1820s, followed by landlord consolidations and dispossession of homes and livelihoods put Irish Catholics on the move to both England and America. These were the kind of people bound to impress anxious republicans as habitual dependents. Immigration figures, which had been running from 6,000 to 10,000 annually during the first half of the decade, increased to nearly 150,000—almost 51,000 of them Irish—by the end of the 1820s. Roman Catholics, who numbered only 35,000 nationwide in 1790, by 1830 made up nearly 75,000 residents of the New England states alone. (There would be 660,000 nationwide ten years later.) In 1829 a Provincial Council of American Catholic bishops specifically called for parochial education, which suggested to those of suspicious mind clerical thought control on the one hand and an affront to culturally unifying (and culturally hegemonic) public schooling on the other.

Nativism, appropriately associated with the decades of mass immigration following 1829, with the tensions of a growing and sectionally diverse nation, as well as with the stresses of urbanization and early industrialization, was, however, fundamentally about defining nationality. Its luxuriant growth in the antebellum period would have been impossible without the public debates and private anxieties about national character that were so prominent in the early American nation.

Dale T. Knobel

Immigrant Experience

Immigration was a consistent theme and formative force in the creation of the British colonies and the new American Republic. Streams of people from different nations left their homelands at different times and for various reasons, carrying their distinct cultures, beliefs, and institutions to the shores of a new land. They first came in small numbers, populating the colonies and helping to build the transatlantic trade. As the reputation of America spread, the flow of immigrants swelled, though economic and political conditions affected the actual periods and rates of migration. British officials and colonial leaders, ship and land companies, merchants, and others had to address the means of transporting, receiving, and accommodating this new population. Following the creation of the United States, American leaders addressed immigration policy, usually to ensure the ongoing flow of people that had helped to create the Republic and to guarantee the rights of those who sought asylum and freedom. During the Quasi-War with France (1798–1800), however, Congress in 1798 passed three Alien Acts that limited naturalization and provided for the deportation of immigrants.

REASONS FOR COMING TO AMERICA

Immigration was a complex process that required an individual, family, or group to assess conditions in their homelands, decide whether relocating would be advantageous for them, and ultimately take the risk of packing up and moving to an unfamiliar location. In the late nineteenth century, British social scientist E. G. Ravenstein sought to explain this process through his "laws of migration." He posited that migration was a selective process whereby "push factors" impelled individuals to migrate and "pull factors" attracted immigrants to specific locations. Ravenstein concluded that each nation, region, and time period ultimately had its own distinct "push-pull factors" which shaped the streams and rates of migration.

Throughout the colonial and early national periods, there were numerous push factors that led to emigration from Europe. Between 1750 and 1850 the European population doubled in size, which contributed to significant economic and social changes across the continent. Skilled handworkers in the English textile industry were replaced by power looms. Farmers faced the enclosure of lands and the reorganization of the rural economy. High taxes and land rents along with increased poverty inspired individuals to migrate. Political circumstances, wars, and even the desire to escape military service led others to

leave their homes, while persecution of religious minorities caused others to depart.

There were also many pull factors that fostered emigration to America. Most common was the belief that America was “the promised land,” a “land of liberty,” and an asylum for the persecuted or the less fortunate. The colonies and eventually the new states attracted people by touting their flourishing settlements through pamphlets and newspapers. Ship companies, land companies, and labor brokers announced the many employment opportunities abroad. Clearly, the pursuit of economic opportunity was key for many as German and Scots-Irish farmers sought land and displaced English and Irish textile workers pursued employment in the developing textile industry in Philadelphia and New England. The American states, as they embarked upon internal improvements programs, recruited immigrant laborers to assist in the construction of roads and canals that would bind the new nation together. Likewise, the presence of distinct ethnic communities established by earlier immigrants encouraged individuals and families, often from the same region, hometown, or parish, to emigrate. There were even occasional instances of Americanized immigrants who returned home (known as Newlanders among the Germans) to promote the benefits of emigration.

One of the strongest motivating forces were written accounts, often called “America letters,” sent back home by immigrants. These accounts brought families separated by the Atlantic together with news about economic conditions, cultural life, descriptions of daily life, and comparisons with previous conditions in the homeland. The letters often encouraged the recipients to relocate to America; some even included prepaid passage. Several foreigners also wrote travel accounts about their experiences in America, which were published in their homelands. Book-length works such as Englishman Morris Birkbeck’s *Letters from Illinois* (1818) and German Gottfried Duden’s *Bericht über eine Reise nach den westlichen Staaten Nord Amerika’s* (1829, *Report on the Journey to the Western States of North America*) not only provided detailed information about life in the new nation but offered additional reasons and inspiration for migration. These letters and narratives provided potential immigrants with the rationales for leaving their homes and created images of expectations that shaped their visions of America well before they had departed home.

Observing the growing popularity of independent America, England imposed restrictions on emigration. In 1788, fearing the loss of workers to the

growing American employment market, England banned the emigration of skilled artisans. The British Passenger Act of 1803 reduced the number of passengers that ships could carry, thus making it unprofitable for ship companies to seek immigrants as westbound cargo and hampering the flow of immigrants.

FINANCING AND TRANSPORTATION

Immigrants generally financed their own trips to America from savings or sale of property. Some, however, received prepaid passages from family members or were recruited by American businesses. Another way of covering passage was becoming a redemptioner. Unlike thousands of early immigrants who were forced into indentured servitude, whose service contracts were at the disposal of the ships’ captains or the owners’ agents, a redemptioner voluntarily entered into a labor agreement, probably as a means of escaping undesirable conditions at home. Individuals actually executed two agreements, either before departure or after arriving—one with the ship captain, guaranteeing payment for passage upon arrival, and the other with the purchaser in America, specifying the terms of service.

Those departing Europe traveled from their hometowns by road or river to reach the principal ports of London, Belfast, and Londonderry, where they secured passage for America. As immigration increased and attracted a diversity of groups, the ports of Le Havre, Bremen, Hamburg, Rotterdam, Amsterdam, and Liverpool became more important in handling the Continent’s immigrant flow. Sailing ships transported the immigrants to the principal American ports of New York, Boston, Philadelphia, Charleston, and later New Orleans.

Ships participating in the regular transatlantic trade were critical to the emerging immigration trade. Departing the colonies, the ships carried assorted goods to England and the European Continent; on the return trip, unoccupied space was made available to immigrants, thus allowing merchants and shipowners to gain from the return trip. Following the War of 1812 (1812–1815), ship companies introduced packet ships with regular sailings between New York and Liverpool, Le Havre, and other European ports. Steerage rates dropped from ten to twelve pounds in 1816 to five pounds in 1832, making travel more affordable for the common person.

Upon arriving in the port cities, the immigrants faced the challenges of getting situated in America. They might have been greeted by family members or encountered recruiters seeking laborers for local businesses. If the immigrants were redemptioners,

they faced the scrutiny of individuals, often Americanized immigrants, who would buy their services. For some groups there were benevolent associations, such as the German Society of Maryland, that addressed the needs of distressed Germans arriving in the country.

SETTLEMENT

Immigrants responded to their new environments generally by settling in distinct ethnic enclaves, which allowed them to maintain their sense of community and cultural identity. Most transplanted the familiar institutions and cultural surroundings of the homeland—building houses and farms like the ones at home; adopting similar agricultural techniques; and establishing churches, schools, and social organizations. While British immigrants easily blended into the English-based society, other groups like Germans and Scots-Irish carved out distinct areas of settlement in Pennsylvania, the North and South Carolina Piedmont, and the Shenandoah Valley of Virginia, for example, where their cultural influences were clearly evident. Though many immigrants found a new life in America's growing cities, most acquired some of the abundant agricultural lands and established farms, thereby distinguishing themselves from the next major migration of immigrants, which would be heavily urban in residential concentration.

ASSIMILATION AND RESISTANCE TO ASSIMILATION

All immigrants, regardless of origin and period of migration, had to come to terms with life in America as well as with their separation and isolation from home. Their ability and willingness to adapt or assimilate varied, depending much upon their socioeconomic status, the extent to which their group's traditional cultural had been transplanted in the regions where they settled, and the number of people within their communities.

The transition of immigrants from the British Isles was generally easier, given the predominance of English culture and institutions within the American colonies (though the Scots-Irish continued to maintain hostility toward all things English and sought to maintain a separate existence). There were, however, reservations among many English people about the increasing diversity of the American population, which, they believed, could undermine the colonies. Some feared the threat of Catholicism to the American experiment. Others, like Benjamin Franklin (1706–1790), expressed a concern that Pennsylvania

would become “a Colony of Aliens” and that the growing German population would eventually “Germanize us.” Germans tended to cluster and were consequently more visible than other non-English immigrant groups as an “unassimilable bloc.” As a result, according to the historian John Higham, fear of Germans represented the first ethnic crisis in American history. With the slowing of immigration due to world events in the late eighteenth and early nineteenth centuries, many of the earlier non-English immigrant groups—Dutch, Germans, Swedes—were not reinforced by regular arrivals of new immigrants to maintain the strength of their cultures. The first generation traditionally retained much of its ethnic identity; intermarriage, education, and contact with American society, however, led the second generation to become increasingly assimilated, which often strained the ethnic community. Frenchman Michel-Guillaume-Jean de Crèvecoeur, writing in the 1780s, argued for assimilation and called upon immigrants to “cast off the European skin, never to resume it. They must look forward to their posterity rather than backward to their ancestors.”

Following the American Revolution and the creation of the American nation, immigrants, in their letters and books about life in the United States, affirmed America as a land of opportunity and a sanctuary for the oppressed. Not only did these attitudes intensify the desire to emigrate, but they also elicited a growing sentiment among the resident immigrant population to associate more strongly with the American nation.

NATURALIZATION

The British Parliament enacted a naturalization law in 1740 that permitted foreigners in America to acquire “subjectship” in their colonies of residence, provided they proved residence in any colony continuously for seven years, professed Christianity, had taken the sacrament in a Protestant congregation, and swore allegiance to the king. In 1761 Parliament permitted the British army to naturalize those foreign Protestants who had served in the military for two years in the colonies. Americans, however, believing that the colonies should exercise their own control, passed their own naturalization laws until the king nullified them in 1773 and prohibited colonial governors from approving such laws. Writing in the Declaration of Independence, Thomas Jefferson charged the king with obstructing immigration and the naturalization process of foreigners.

With independence won, the new American states took control of naturalization policies, which essentially required a public oath of allegiance to the state government, a period of residency, and a disavowal of allegiance to foreign sovereigns. The first Congress of the United States adopted a naturalization statute in 1790 that allowed any “free white person” who had resided in the country for two years to be naturalized. Fearing the growing political power of the Jeffersonian Republicans and the strength of ethnic voters as well as responding to the Napoleonic Wars in Europe and a military crisis with France, the Federalists raised the residency requirement to five years in 1795 and to fourteen years in 1798 as part of the Alien and Sedition Acts. After Jefferson’s election as president in 1800, the Republican-controlled Congress, opposing his proposal to grant immediate citizenship to all newcomers, returned the residency requirement in 1802 to five years.

As immigration resumed following the War of 1812, the Naturalization Law of 1802 governed the process of becoming a citizen. It required individuals to submit their applications at local courts, declare their intention three years prior to naturalization, reside for five years in the United States, and renounce allegiance to foreign rulers. All naturalization laws in this period restricted citizenship to white aliens. Despite these guidelines, there were some native-born Americans and Americanized immigrants who called upon Congress to simplify the citizenship process, seeking to encourage greater immigration to the United States.

Immigrant Policy and Law

The Naturalization and Alien Acts of 1798 were part of the Federalist program to insulate the United States from the radical principles of the French Revolution, which seemed to have infected both newly arriving immigrants and the political opposition, headed by Thomas Jefferson. The Naturalization Act’s fourteen-year residence requirement would, given eighteenth-century life expectancies, completely disenfranchise most adult immigrants. The Alien Act gave the president the power to deport any foreigner he deemed dangerous. Both of these acts violated America’s Revolutionary principles and previous practice.

In 1776 the American colonies declared themselves independent states—free of a British government that had been corrupted by its abuse of power. By renouncing allegiance to the British crown, the American rebels created a new form of volitional citizenship: Americans were no longer perpetual subjects, by birth, of hereditary monarchs but rather citizens, free to choose and change their allegiance. The American Republic also broke new ground by creating a single class of citizens. In the Old World, naturalization (or denization) never conferred the full rights of natural-born subjects; foreigners could become only second-class citizens, forever subject to economic, political, and religious disabilities. Eight years of war finally forced British recognition of American independence. However, the British government continued to deny its subjects the right of peaceful expatriation and volitional citizenship well into the nineteenth century.

After declaring independence, the American states invited the oppressed subjects of Old World tyranny to join in the battle to preserve liberty and to enjoy the fruits of free republican government. Initially, full citizenship was readily bestowed on

Congressional Brawl. The Naturalization and Alien Acts of 1798 fueled opposition to the Federalist Party, and issues related to immigration led to political conflict. This 1798 cartoon depicts a fight that broke out on the floor of the United States House of Representatives between Matthew Lyon (center), an Irish immigrant and Republican congressman from Vermont, and Roger Griswold (right), an American-born Federalist from Connecticut. © BETTMANN/CORBIS.

foreigners who supported the American cause. The Continental Congress and individual states rewarded foreign soldiers with lands and citizenship and offered similar grants to those who deserted from the British army. The path to citizenship was even easier for noncombatants. Several states required only evidence of commitment to the American cause, by oath (or affirmation) of allegiance and renunciation of all other governments or potentates. For states with residency requirements, one or two years were the norm; all states provided access to full civil and political rights.

As the war progressed, some states, especially those that had endured years of occupation by the British army, enacted more stringent naturalization requirements and increased the economic and political disabilities imposed on aliens. In the mid-1780s New York, Virginia, South Carolina, and Georgia all passed laws to bar American Loyalists from political office and to prevent British traders from regaining their economic stranglehold on American markets.

Yet at the same time states such as Connecticut, New Jersey, and Delaware publicized their eagerness to welcome and enfranchise the Loyalists and foreigners shunned by other states.

By the end of the Revolution, the American naturalization process was a confusing amalgam of disparate practices that varied over time and place. In Pennsylvania the oath administered by justices of the peace in the 1770s to ferret out British sympathizers was used in the 1780s to naturalize foreign-born immigrants. From Massachusetts to Georgia state legislatures conferred citizenship on immigrants seeking asylum, foreigners hoping to perfect land titles or escape customs duties, and repentant Tories. In 1783 Benjamin Franklin, then in France to negotiate a peace treaty with Great Britain, drew up and administered an oath that naturalized the Scottish-born father-in-law of Franklin's grand-nephew.

In the summer of 1787, delegates to the Constitutional Convention recognized the need to rationalize the motley assortment of state procedures into a

single national avenue to U.S. citizenship. However, the daunting magnitude of that task was soon revealed. Rather than grapple with yet another divisive issue, convention delegates handed Congress the mandate to create a uniform code of naturalization. In 1790 the First Congress elected under the new Constitution did create a unique, national mode of naturalization—requiring a two-year residence, an oath of allegiance, and proof of good character. However, this national procedure did not supercede state law but was merely added to the mix. In 1795 Congress finally overcame states' rights arguments and enacted a new national, and exclusive, naturalization code. All free, white foreigners arriving after June 1795 would be required to meet the same naturalization requirements, including a five-year residence and a declaration of intent to seek citizenship at least three years prior to naturalization.

Although the Naturalization Act of 1795 barely had time to take effect before being replaced in 1798, its provisions became the foundation of American policy. The laws of 1798 fueled, rather than squelched, opposition to the Federalist Party and helped to secure the presidency for Thomas Jefferson in 1800. The so-called Revolution of 1800 returned the nation to its more liberal stance on alien rights and American citizenship. After the expiration of the Alien Act in 1800, Congress made no attempt to resurrect the extraordinary presidential power over America's immigrants. In 1802 Congress repealed the Naturalization Act of 1798 and reinstated, in essence, the citizenship requirements enacted in 1795.

Political Refugees

"Freedom hath been hunted round the globe," Thomas Paine wrote in *Common Sense* (1776). "[Asia and

Africa] have long expelled her, [Europe] regards her like a stranger, and England hath given her warning to depart." The American people must "receive the fugitive, and prepare in time an asylum for mankind." Paine (1737–1809) had been in the United States for less than two years, but his call resonated with his American audience, many of whom were recent arrivals.

Immigrants seeking economic opportunity had come to the new world in great numbers after 1750. In the Revolutionary years, aristocratic idealists like the Marquis de Lafayette or the Polish officers Casimir Pulaski and Thaddeus Kosciuszko had come to offer their services. After the war, politically active Europeans fled to America to escape political oppression at home. Drawn by the promise of creating a haven for liberty, political immigrants helped to create the American political system.

Among them were Albert Gallatin (1761–1849) and Matthew Carey (1760–1839). Gallatin, born in Geneva, arrived in America in 1780. After briefly teaching French at Harvard and accompanying Massachusetts troops to the coast of Maine, he settled in western Pennsylvania where he quickly became involved in politics, serving in the state convention in 1789, and the legislature in 1790 and 1791.

Carey had been driven from his native Dublin for his political views. An apprentice printer and bookseller, Carey at age nineteen (1779) found himself in deep trouble for his pamphlet "To the Roman Catholics of Ireland." In it he urged Irish Catholics to throw off the "tyrannical bigots" who ruled them: "At a time when America, by a desperate effort, has nearly emancipated herself from slavery," Irish Catholics should seize their natural rights. Protestants and even Catholic leaders who accepted British rule denounced him (Dublin's archbishop wanted the pamphlet burned). Fearing for his safety, Carey escaped to France, where a Catholic priest introduced him to Benjamin Franklin. Franklin set him up printing American tracts and introduced him to Lafayette. A year later Carey returned to Ireland, but he continued to provoke the authorities. When the Irish House of Commons called for his arrest in 1784, Carey fled to Philadelphia. After Lafayette, then in America, learned that the "Dublin printer" was also there, he gave Carey four hundred dollars to start a newspaper. Two years later Carey published a "Philosophical Dream," a vision of the United States in the year 1850, when the thirty states of the union stretched to the Mississippi. Canals connected the prosperous land, and Americans had even built a canal through central America linking the Atlantic and Pacific. Slav-

ery had been eliminated, and the freed slaves repatriated to a thriving free Africa. The most serious crime to be found was that of a man who failed to send his son to school.

When the French Revolution came, Carey and Gallatin welcomed it. So did other political refugees and some native-born Americans. In Paris, Lafayette and the American minister Thomas Jefferson drafted proposed constitutions for the French Republic, and Thomas Paine served in the French Assembly. But the revolution drove a wedge between moderates and radicals. As the revolution became increasingly radical and moderates (like Lafayette and Paine) were imprisoned or executed, some Americans, who saw the French Revolution as an extension of their own, now worried that France's anarchy would spread to the United States.

Edmond Genet (1763–1834) came to America not as a refugee or immigrant. The French Republic sent him to reaffirm the Franco-American treaty of 1778. When, in April 1793, he arrived in Charleston, South Carolina, Citizen Genet, as he called himself, was greeted as a hero. When President Washington declared America neutral between France and England, Genet turned to the American people to support the French cause against the English and their own president. He encouraged citizens and French exiles to form Democratic Republican Societies, modeled on the Jacobin Clubs that toppled France's monarchy. Jamaican immigrant Alexander J. Dallas launched the first society in Philadelphia on 4 July 1793. Genet's meddling in American politics so infuriated Washington that the president demanded Genet's recall. By this time a more radical faction had overthrown Genet's government in France, and, realizing that the guillotine awaited him, he chose to remain in America. He married the daughter of New York Governor George Clinton and settled down on a farm in Rensselaer County. Genet avoided politics for the rest of his life, but he had helped to create a political movement.

The Democratic Republican Societies spread—opposing the pro-British drift of the Washington administration and championing the French Revolution. The number of French and British political refugees in these societies alarmed some political leaders. Connecticut Congressman Oliver Wolcott warned in 1794 of “great numbers of violent men who emigrate to this country from every part of Europe.” Abigail Adams's son-in-law wrote her, “Let us no longer pray that America may become an asylum to all nations.”

France reacted to the U.S. peace with England in 1795 by attacking American ships on the high seas. In 1798 Congress created a navy and a provisional army, and it passed a series of laws to prepare for a looming conflict with France. The Naturalization Act extended the time an alien must reside in the United States before becoming a citizen from five years to fourteen. The Alien Enemies Act permitted the president to deport any alien from a nation at war with the United States. If the alien hailed from a country at peace with the United States but was a threat to American security, the Alien Friends Act permitted his deportation. And finally, the Sedition Act punished any editor, writer, or speaker who brought “contempt, hatred, or ridicule” upon the president or Congress.

Secretary of State Timothy Pickering became the chief enforcer of the Sedition Act, and he understood how the Republican press operated. Ideas and opinions percolated out of the Democratic Republican Societies through a national network of papers. It was said that a jibe at the Federalists would make “its way into the beer houses in the evening, to the *Aurora* in the morning, and to a large portion of the Democratic papers throughout the Union in due course.” To cut off the flow of such ideas, Pickering could shut off the source of sedition—immigrants. Five of the fourteen or fifteen individuals charged under the Sedition Act were foreigners: Congressman Matthew Lyon of Vermont was born in Ireland, and a Federalist paper said he spoke “a gibberish between Wild Irish and vulgar American.” Philadelphia *Aurora* editor William Duane, though born in 1760 near Lake Champlain, New York, had spent his childhood in Ireland (he had also spent some years editing a newspaper in Calcutta, and his attacks on the British East India Company led to his imprisonment there). John Daly Burk had been expelled from Ireland in 1796 for his political activities. Journalist and scandalmonger James T. Callender was a Scot, and Thomas Cooper was an English radical. Callender had been jailed for sedition in England, and on his arrival in America in the early 1790s had worked as a reporter for the *Federal Gazette*. But his verbatim coverage of Congress, showing the incomprehensible ramblings of its members, led to his being fired. Callender attacked not only Congress, but venerated figures like Washington, accusing him of the “foulest designs against the liberties of the people.” The pro-administration *Gazette of the United States* warned that the country should not become “a receptacle for malevolence and turbulence, for the outcasts of the universe,” and Francis Hopkinson (author of the anthem “Hail Columbia”) noted with alarm that “this foreign heaven”

had “fermented the whole mass of the community” and “divided the country into contending political parties.”

Though no enemy aliens were deported, French philosophe Abbe Constantin François Volney left voluntarily, and French General Victor Collott dodged prosecution until the Alien Enemies Act expired. The Philadelphia *Aurora* speculated that “Cremona fiddles are to be ordered out of the kingdom under the *Alien Bill*,” as their tones were “calculated to bring the *constitutional* music of *organs* and *kettledrums* into contempt.”

William Duane (1760–1835), editor of the *Aurora*, joined with Dr. James Reynolds to solicit signatures against the Alien Acts outside St. Mary’s Church in Philadelphia in February 1799. As some parishioners gathered in the churchyard after mass to sign the petitions, Federalist parishioners objected to having “Jacobins” outside the church and tried to push Reynolds from the churchyard. When Reynolds drew a pistol, parishioners panicked, and he, Duane, and two others were arrested for provoking a “united Irish riot,” bringing “terror and torment to America.” Federalists hoped to silence Duane, but Alexander J. Dallas so ably defended him that the jury only deliberated half an hour before acquitting.

During the election of 1800, Duane helped to expose the Ross Election Bill, which many said was a Federalist plot to prevent Jefferson’s election. Duane reported that Federalist senators were preparing a plan to create a Grand Council to judge the validity of electoral votes, and thus prevent Thomas Jefferson’s election as president. Duane’s publication of the plan outraged Republicans, and Federalists charged Duane with breaching Senate privilege. Cooper and Dallas handled Duane’s legal defense, delaying an indictment until October 1800 and delaying the trial for another year. By then the Grand Council had been squelched, and Jefferson had become President.

Jefferson pardoned the men sentenced under the Sedition Act and restored the immigrant to a place of trust in American society. French immigrant Stephen Girard, a Philadelphia ship-owner, donated gunpowder to celebrate Jefferson’s inauguration. Albert Gallatin, a Swiss émigré who by now led the Republicans in Congress and who was regarded by the Federalists as a French agent, became Secretary of the Treasury and one of the most powerful men in the administration. Duane moved with the *Aurora* to Washington, and his son later became secretary of the Treasury. Carey’s publishing empire grew, and his son became one of the first American economists. Jefferson even brought Thomas Paine back from his

European exile, to live out his days in the new land Paine and other political refugees had helped to create.

Race and Ethnicity

British North American society was defined by race and racial divisions in the eighteenth century. The colonists understood each other as being white and part of a superior race of Europeans. Close contact and intermixing notwithstanding, Africans (called Negroes) and American Indians were consigned to separate racial categories. Racial attributes were considered biological and racial differences placed the members of nonwhite races at a greater or lesser distance to civilization as whites understood it. While the societies of Spanish and French North America were based on the mutual assimilation of Indian and white cultures, the English colonies of North America experienced such mixing only at the edges, on the Upper Midwest frontier and parts of the frontier South.

By the time of the American Revolution (1775–1783), the general Enlightenment view of Indians, which regarded them as people of the earth whose less acquisitive and more primitive way of life was destined to fade or even merge with that of whites, bore little relation to Indians’ struggles in the North American colonies for land and resources. The erosion of power of even the larger Indian tribes and federations toward the late eighteenth century further contributed to the whites’ belief that Indians lacked

civilizing force and were doomed. The expulsion of Indians from their lands beginning in the 1820s only seemed to confirm the view that even “civilized tribes” could not resist the power of the European race.

Africans in the colonies were a diverse group in terms of their cultural and geographic origins. Blacks born in North America, slaves born in the West Indies and sold to North American colonists, and African-born men and women all intermingled, especially in the southeastern part of North America, and formed communities of slaves for whom their different cultural origins diminished in importance. Regardless of their specific origins, blacks were deprived of rights as a result of their racial designation. Over 80 percent were unfree, and their enslavement was associated with their race—though not yet justified by it. Resistance, including some open slave revolts, as well as flight and intermingling with native Indians also characterized the relationship of African-origin immigrants to whites.

Whites in the English colonies were not a very diverse group in terms of their origins. Over 80 percent of colonial settlers were of English origin, an even higher percentage was English speaking (English people, Scots, and Protestant Irish). Germans and remnants of Dutch and Swedish colonists on the Atlantic seaboard were among the more visible non-English-speaking whites, but with the exception of the Germans, their number declined in the pre-Revolutionary era. Though in 1751 Benjamin Franklin expressed misgivings about the “Palatine Boors” among his fellow Pennsylvanians, such hostile comments on distinct immigrant subcultures remained rare in pre-Revolutionary times.

Race was one of the ideas that structured the Revolution and the new Constitution (1787). The Declaration of Independence (1776) offered an inclusive vision of the new nation, declaring that “all men are created equal,” but this Enlightenment vision of the innate right to freedom for people of all races remained a theoretical premise not met by the political and constitutional realities that followed. In 1775 the Continental Congress prohibited blacks from joining the Revolutionary forces. Indians were suspected as collaborators with the enemy by both Loyalists and Revolutionary forces.

Indians were largely situated outside the Constitution. Unless they were taxed members of a white community, they were not considered to be citizens of the United States. The Constitution was silent on the issue of black citizenship except in Article I, which counted free blacks as full citizens but slaves as just

three-fifths of a person for purposes of congressional apportionment. While African immigrants and their descendants were not explicitly denied American citizenship, the Naturalization Act of 1795 specified that U.S. citizenship could only be acquired by whites. This racialization of American citizenship would become one of the cornerstones of ideologies of race and ethnicity in the nineteenth century and the first half of the twentieth century.

Increasing immigration from Europe in the early nineteenth century, especially after 1815, heightened the awareness of cultural differences among European immigrants. While older groups (Dutch, Swedes, Huguenots) became subsumed in the English-speaking majority cultures, newer immigrants (Irish, Scots, and Germans) arrived in sufficient numbers to increase ethnic diversity among white Americans in the early nineteenth century. Ethnic awareness in the modern sense, however would not emerge until the large-scale immigration of Irish Catholics throughout the Eastern seaboard that began in the 1830s.

Dorothee Schneider

IMPERIAL RIVALRY IN THE AMERICAS The struggle of the United States for independence and post-Revolutionary development occurred in the context of a contest between the European imperial powers to achieve geopolitical, commercial, and cultural dominance in the Western Hemisphere. Once independent, the United States became an actor in this larger drama of imperial rivalry.

EUROPEAN EMPIRES IN THE AMERICAS IN THE MID-EIGHTEENTH CENTURY

By the middle of the eighteenth century, the contest for the Americas primarily occupied three of the great European powers—the kingdoms of Spain, France, and Great Britain. Spain claimed the largest empire—all of South America except Brazil and the

Guyanas, all of Central America, all of modern-day Mexico, most of what is today the western United States, Florida and the Gulf coast, and the largest Caribbean islands (Cuba, Santo Domingo, and Puerto Rico). France laid claim to most of the eastern half of modern-day Canada, the Great Lakes basin, the Ohio-Mississippi-Missouri drainage, and a few islands in the Caribbean, including modern-day Haiti, then called Saint Domingue. Great Britain held the thirteen American colonies, Nova Scotia, the area around Hudson Bay, the islands of Jamaica, Barbados, and the bulk of the Lesser Antilles in the Caribbean, in addition to the Mosquito Coast of Nicaragua and modern-day Belize.

In addition, the Netherlands, Portugal, and Russia all claimed territories in the Americas: the Dutch in Guyana and the Caribbean, the Portuguese in Brazil, and the Russians in Alaska and the Pacific Northwest. These powers were minor players in the contest between European empires in the late eighteenth and early nineteenth centuries.

In all of the European empires, the amount of territory claimed exceeded the amount of territory actually controlled. In North America especially, the indigenous population retained control of much of the land and its resources. Much of the rivalry between empires played out in a contest of Europeans trying to win political and commercial alliances with the various communities of American natives.

The American Indians of North America were a numerous and diverse lot, and it is difficult to generalize about them. Language, political organization, and culture varied among different tribes and nations. Modes of subsistence tended to vary by region, with temperate-region nations being more sedentary and arid-region nations being more mobile, although there are important exceptions even to this rule. By the middle of the eighteenth century, nearly all American Indian communities had been transformed by contact with the Europeans.

The American Indian communities that survived the onset of Old World diseases and had not been displaced by settler colonies gradually worked out a set of customs and practices with their European neighbors that facilitated cross-cultural interaction. These relationships were centered around commerce—one historian has characterized the European empires of the early and middle eighteenth century as “empires of trade.” American Indian hunters provided furs and hides—generally of deer, beaver, or buffalo, depending on the region—in exchange for European-made metal goods, firearms, and alcohol. The contest among the Europeans through the middle of the

eighteenth century was over who would dominate access to these trading arrangements.

THE SEVEN YEARS' WAR

The Seven Years' War (1754–1763), or the French and Indian War as it was known in America, was a continuation of the conflict Britain and France had fought in America during the War of Austrian Succession (1740–1748). British colonial subjects desired to bring the Indians of the trans-Appalachian region into their commercial orbit and expand the frontiers of their settlement. The French hoped to pull British-allied Indian nations into their orbit and check British settler expansion. British traders had crossed the Allegheny Mountains in the mid-1740s, attempting to open trading relationships with the Algonquian-speaking communities of the Ohio Valley and Great Lakes basin. In 1749 a French expedition under the command of Céloron de Bienville officially claimed the Ohio Valley for France, and a subsequent French expedition destroyed British trading posts. In 1754 an expedition from the British colony of Virginia under the command of Colonel George Washington attempted to counter the renewed French military presence in the Ohio Valley and touched off the war in America.

From Virginia northward, the war pitted the French and their predominantly Algonquian allies against the British (both colonials and the regular army) and their predominantly Iroquois allies. Initial French success, under the command of Louis-Joseph de Montcalm, was soon checked. The emergence of William Pitt the Elder as head of the British government in 1757 transformed the British war effort. Pitt saw the North American theater as crucial. Pitt directly paid the American colonies for the goods and troops he requisitioned, spent the British government into debt, and appointed new and more competent field commanders. Under James Wolfe, the British consistently won on American battlefields, his campaign culminating in a daring and successful attack on the city of Quebec in 1759. Success continued the next year when Jeffrey Amherst took Montreal and drove France from North America.

King Charles III of Spain formed an alliance with Louis XV of France in 1762. Yet Spain fared no better than France. The British Royal Navy took Spanish ports in Havana and the Philippines, as well as nearly all of France's island possessions in the Caribbean.

The Seven Years' War ended in 1763 with the Treaty of Paris. The peace settlement transformed the geopolitical dynamic of North America. Britain ceded Havana back to Spain and Guadeloupe back to

France. Britain retained all of Canada and the Ohio Valley and was awarded the two Floridas by Spain. Spain acquired the Louisiana Territory, the western drainage of the Mississippi. Of course, these claims were still more notional than real, as Europeans still had to negotiate with Indians for the land they claimed. In the immediate aftermath of their victory, the British commanders in North America, notably Amherst, forgot this and downplayed the need to conciliate the Indians. As a result, warfare between the Algonquians of the Great Lakes basin and the British regulars (Pontiac's Rebellion) erupted and ensued for nearly two years. The late 1760s found North America contested by only two major European empires—Great Britain and Spain.

THE ERA OF THE AMERICAN REVOLUTION

The new geopolitical situation proved unstable. The French government resented the loss of its empire. The Comte de Vergennes, foreign minister to the new French king Louis XVI, was committed to returning France to the preeminent position it had once held in Europe and the Americas. Vergennes began preparing for a new war with Britain, which he viewed as inevitable. In 1775 the prospect of a rebellion by Britain's American colonies offered Vergennes and the French government the opportunity to strike a blow at their mortal enemy.

The American Revolution would not have been successful had the American movement for independence not enmeshed itself in the larger European rivalries. When the thirteen North American colonies declared their independence from Great Britain and called themselves "the United States," their leaders knew that they needed recognition and assistance from other European powers. Under Vergennes, France provided the United States with clandestine assistance (materiel and financing) during the first two years of the war. Following the American victory at Saratoga in 1777, France openly allied itself with the United States in early 1778. A French expeditionary army under the Comte de Rochambeau aided George Washington's Continental Army upon its arrival in America in 1780, and the French navy under the Comte de Grasse defeated the British navy off Hampton Roads to ensure the American-French victory at Yorktown.

It was Vergennes and the French, not the Americans, who turned the other European empires to the American side. Vergennes signed a treaty of alliance with the Conde de Floridablanca, the Spanish foreign minister, at Aranjuez in April 1779. The French-Spanish alliance did not explicitly include the Ameri-

cans, and Spain did not recognize the United States until after the war. But Spain was fighting Britain, thus weakening the overall British position. The Netherlands too entered the war as a French ally, but unlike Spain, the Dutch government recognized American independence and offered the Americans financial assistance. The peace settlements of 1783 ended the American war, granted the United States independence, and returned the Florida territories to Spain.

Even before the 1783 Treaty of Paris formally ended the American Revolutionary War and secured American independence, the United States became an actor in the ongoing imperial rivalry for the Americas. The United States contested the right to navigate the Mississippi River with Spain, and Great Britain retained alliances with American Indian communities that were technically inside the borders of the United States. In 1778–1779, Virginian George Rogers Clark had led a militia expedition down the Ohio River that captured British posts at Kaskaskia, Cahokia, and Vincennes. While some Indian communities, such as the Kaskaskia and the Delaware, allied themselves with the United States, others, notably the Shawnee, did not. Britain continued to trade with Indian communities in the Northwest, and Spain continued its trade with the Indians in the South. This unstable border situation was a key impetus behind the American states' coming together to strengthen the Union by ratifying the Constitution of 1787. Although the United States was still a weak power, it had the military and diplomatic muscle to rival Spain, France, and Britain for access to trade and alliances with the American Indians.

THE FRENCH REVOLUTION AND THE NAPOLEONIC WARS

The outbreak of the French Revolution in 1789 transformed the political balances in Europe, affecting the Americas as well. The greatest changes occurred following the arrest of King Louis XVI by the Paris Commune in August 1792. Soon the radical National Convention replaced the National Assembly as the head of the French government. With the new regime's public execution of the king in January 1793, the vast majority of European monarchies declared war on revolutionary France. The War of the French Revolution quickly became a world war. France required materiel from the Americas to support its war effort, and it hoped at the same time to disrupt the flows of materiel to its British enemy. The National Convention's minister to the United States, Edmond Charles Genêt, actively (and controversially) sought out American citizens to embark on priva-

teering raids against British merchantmen. The administration of George Washington did not want European politics brought into the Americas in this manner and publicly declared the United States neutral in the conflict.

As the War of the French Revolution escalated, the politics of the Americas were drawn deeper into the conflict. Great Britain sought to interdict all commerce bound for France, and even seized the ships of neutral nations, notably the United States, that were trading with belligerents in the war. The preponderant power of the Royal Navy led to two important outcomes. First, it induced the United States to negotiate a commercial accord with Britain that tended to favor British interests. This commercial treaty, known in America as the Jay Treaty, was ratified in 1795. Perceived closeness between Britain and the United States alienated France, and the Directory, which replaced the radical National Convention after a 1794 coup, began seizing American ships. A low-scale, undeclared naval war (the Quasi-War) between France and the United States ensued between 1797 and 1800.

At the same time, the French Revolution and resultant war wreaked havoc in the Caribbean. In August 1791 the African slaves of the French colony of Saint Domingue, hearing of the Revolution, rose in rebellion, and aided by Spanish forces on the island, demanded their liberty. The National Assembly responded by granting full citizenship to Saint Domingue's free blacks and mixed-race population. The National Convention abolished slavery in 1794. Saint Domingue remained a French province, with prominent people of color, notably Toussaint Louverture and Jean-Jacques Dessalines, in charge of its civil and military affairs. The image of former slaves wielding political and military power shocked many Anglo-Americans and Europeans.

In November 1799, with the coup of 18 Brumaire, Napoleon Bonaparte became First Consul of France. At the head of the French state, Napoleon transformed French foreign policy. He ended the Quasi-War with America in September 1800 and, with the Peace of Amiens (1802), the long war with Great Britain. Even before peace in Europe, Napoleon sought to expand France's empire in the Americas. By the secret Treaty of San Ildefonso (1800), France reacquired the vast Louisiana Territory. In November 1801, Napoleon ordered General Victor Leclerc and a large army to Saint Domingue. Leclerc carried orders that provided for the re-enslavement of large portions of the black population on Saint Domingue. Plans also existed for the colonization of the Louisi-

ana Territory: settler farms in Louisiana would feed the slave plantations of the French Caribbean. These plans came to nothing when disease and defeat decimated Leclerc's army. In April 1803 Napoleon sold the Louisiana Territory to the United States and abandoned the colonial project in Saint Domingue. That colony declared its full independence as the Republic of Haiti in 1804. France's role in the imperial rivalry for the Americas ended.

In Europe, the war between France and the rest of the European powers began again in 1803, and it too spread to the Americas. After Napoleon defeated Prussia, Austria, and Russia and knocked each power out of the war, only Britain remained in the fight. After the Battle of Trafalgar (1805), the Royal Navy had complete control of the Atlantic, and the British government sought to restrict the flow of New World goods to France and its allies. The British government resumed seizing neutral ships bound for the European mainland, with most of these seizures being of American ships. Similarly, the British impressed sailors of suspected British origin into service in the Royal Navy. This affront to American sovereignty was deeply humiliating. The combination of these policies led to war between the United States and Great Britain in June 1812. The War of 1812, or Anglo-American War, lasted until the early weeks of 1815. Though essentially a draw, the War of 1812 did confirm the dominant position of the United States vis-à-vis the American Indian communities within its borders.

AFTER THE CONGRESS OF VIENNA

With the Restoration of the European monarchies at the Congress of Vienna (1814–1815) and the conclusion of the War of 1812, the United States became the preeminent player in the imperial rivalry for the Americas. The United States forcibly annexed West Florida from Spain in 1810 and acquired East Florida from Spain in 1819. At the same time, Spain and the United States concluded the Transcontinental Treaty, which fixed the boundary between New Spain and the United States, from the Sabine River to the Pacific Ocean. Between 1815 and 1820 the United States and Great Britain concluded a series of treaties. The Rush-Bagot Agreement (1817) essentially demilitarized the Great Lakes, while two Commercial Conventions (1815, 1818) resolved the commercial issues that had caused the War of 1812 (except impressment) and fixed the U.S.-Canada border (except for the Maine boundary).

The final point of contention was how the United States and the European powers would respond to

the disintegration of the Spanish Empire. Gran Colombia, Mexico, Argentina, Chile, Peru, and the United Provinces of Central America all declared independence between 1815 and 1825, and the United States recognized these states between 1822 and 1826. When it appeared that Spain and its European allies might attempt to reconquer these new states, British foreign minister George Canning offered to make a joint statement with the United States standing against European intervention in the Americas. American Secretary of State John Quincy Adams and President James Monroe decided that it would be better for the United States to make such a statement by itself. Their statement, the Monroe Doctrine, told the world that the United States would resist European attempts to interfere in the political life of the Americas. Though born from the European imperial rivalry for the Americas, the United States presumptuously declared the rivalry to be at an end.

IMPRESSMENT Impressment, the unsystematic seizure of men by a state to fill the ranks of its military machine, had provided warriors long before the opening volleys of the War of 1812. From the peasant spearmen of ancient Egypt to the superbly trained soldiers of Frederick the Great (1712–1786), monarchs had forced men from fields and city streets to battle the foe. In England, heads of state since Alfred the Great (849–899) had pressed men for army and navy alike, and impressment would provide 75 percent of the Royal Navy's crews during the Anglo-French wars of 1793–1815.

Conflict with France meant a global struggle for far-flung colonies and trade routes. As the Royal Navy added new vessels to its list, manning requirements climbed from a prewar low of 10,000 to 85,000 in 1794 and 140,000 by 1812. Attrition by disease, accident, desertion, and combat reduced crews and required constant replacements. At the same time, the ranks of the army had to be filled. But whereas a soldier could be trained in a matter of weeks, a sailor needed years of experience to become proficient in nautical skills—and at least one-third of a ship's crew needed to be able seamen to avoid shipwreck or destruction at the enemy's hands. Britain's Quota Act of 1793 ordered each county to provide a percentage of the navy's manpower, but few of those men possessed any seafaring skills. Skilled seamen could be acquired in a number of ways, such as by taking them from passing merchantmen, though laws exempted many sailors and fishermen from service lest the economy collapse. Quite often, captains coerced foreign nationals into serving by threatening the latter with becoming prisoners of war. Also, coercion was frequently applied when the foreigners were regarded as actually being British citizens. For the Royal Navy, the definition of citizenship was quite clear. Any man born on English soil was and would always be a subject of the crown and thus subject to impressment. This included most American citizens born before 1783.

The impressment of American citizens, whether naturalized or not, began with the outbreak of war in Europe during 1793. The United States attempted to protect its seamen by issuing warrants or “protections” attesting to citizenship, but the ease of forgery and the British definition of citizenship made them ineffective. Even American warships proved unable to resist the Royal Navy: the USS *Baltimore* lost fifty-five of its crew to impressment in 1798, and the USS *Chesapeake* was fired upon and then stripped of four crewmen in 1807. Merchant vessels suffered more cruelly, the Department of State reporting in January 1812 that 9,991 American seamen had been impressed since 1796. The exact number of Americans pressed to crew the Royal Navy may well have exceeded twenty thousand. Despite continuous efforts of American presidents from George Washington through James Madison to end this threat to Americans and to American sovereignty, Britain—its very survival threatened by France—ignored them. Thus Madison, in his war message of 1 June 1812, listed impressment as the first justification of conflict. As the War of 1812 continued, abandonment of the practice of impressment would be the last American condition dropped for a negotiated peace.

INDENTURED SERVANTS See **Work: Indentured Servants.**

INDEPENDENCE Independence was a central keyword of politics in the eighteenth century. For in-

dividuals as well as the United States in 1776, independence—the ability to dictate one’s own course without outside reference—was a goal that in theory was worth striving for, but in reality was difficult to attain.

THE CONCEPT OF INDEPENDENCE

Personal independence was an important concept for many eighteenth-century Americans. Independence was the notion that a person was entirely free from all entangling obligations, the ability to be self-sufficient in all political, economic, and social relationships. A person free from any dependence on another, most Americans agreed, epitomized an ideal citizen, the perfect guarantor of liberty. Independence was synonymous with happiness, comfort, ease, a trouble-free life. Eventually—although not easily—the concept of individual or personal independence would become a national ideal as well; independence, in other words, became the model for Independence.

True independence, though, was built on contradiction. Although self-sufficiency was the goal, this end was highly compromised. Gendered male, the “independent” patriarch was in fact actually reliant on the labor of those in his household who were by definition dependents, including women, children, and slaves. Also, the social standing of elites depended on the consumption of an increasing variety of consumer goods, and as a result many so-called independent Americans were rarely free of debts owed to British merchants. As members of an empire ruled by a monarchy, Americans were politically dependent on the king. Although they did not view this as complete dependence—colonists insisted the relationship was reciprocal and that their allegiance was contingent on the king’s ability to provide for their protection—they were still subjects of the crown.

Personal independence, then, was largely evanescent. Although the concept was consensually agreed upon as the goal for happy individuals and a healthy community, it was seldom realized. Still, aspiring Americans believed the freedom to pursue independence, as Jefferson intimated, to be a closely guarded right, one that sat at the epicenter of the imperial crisis of the 1760s and 1770s. Throughout their controversy with Great Britain, colonists protested that their ability to achieve independence was under increasing assault by an insidious and grasping imperial administration. Their reaction reflected the desire to eliminate all forms of dependence. Economic boycotts, political maneuvering to control imperial

agents, and the promotion of virtue all addressed the issue of American independence.

One of the primary tactics Americans employed to protest British policies was to boycott imported goods. Seeing their purchasing power as a lever with which to pressure Parliament, American leaders administered nonimportation boycotts to varying degrees of success in response to the Stamp Act (1765), Townshend Duties (1767), and Coercive Acts (1774). Americans' concept of personal independence lay at the heart of the boycott movement. Because nonimportation naturally reduced consumption, the measure also had a side benefit of limiting debt. With the nonimportation boycott, personal independence from consumer debt suddenly became a patriotic act; personal virtue and the public display of political principles were now one and the same. Americans who protested British policies further drove home the connection between economic independence and political resistance by labeling virtuous the consumption of domestic manufactures, such as homespun clothing. Wearing a suit of clothes stitched by a person in one's own household played on many different levels of independence: it reduced the influence of British merchants; it rejected the notion that Britain could take away individual liberties; and it served as a totem that this individual was his own person not beholden to anyone.

Ideas about the dangers of dependence also fed into American concerns about the arrangement of political power in the British Empire. While they nominally declared their dependence on the crown (albeit with reserved rights), colonists worried about the independent status of the king's agents in America. Throughout the eighteenth century, imperial officials had depended on American assemblies to pay their salaries and expense accounts. This leverage, colonial leaders argued, was a vital check that safeguarded American rights. When Parliament attempted to consolidate its authority in the years after the Stamp Act, one of its most pressing concerns was the wrestling away of the ability to control the livelihood of British colonial officials. Parliament, in other words, wanted to ensure that its representatives in the colonies would be dependent on its authority only. Colonists, especially in Massachusetts, reacted in horror; they protested that if the interests of imperial agents were independent of the colonies they administered, tyranny would directly ensue, followed, inevitably, by slavery.

Concepts of personal independence—whether political, economic, or social—mobilized increasing numbers of Americans to resist British policies. But

the incorporation of ideas about personal or individual independence did not naturally or easily lead to calls to cut all ties with Britain. The road from independence to Independence was indeed long and tortured.

THE ROAD TO INDEPENDENCE

With the Treaty of Paris in 1763, American feelings of patriotism and attachment to the British Empire overflowed. Believing they were fully vested partners in the defeat of France, Americans saw themselves as belonging to a "Greater" Britain. Independence from Britain and the king was far from their minds at the beginning of the imperial crisis. Throughout the 1760s and 1770s, even as they protested British policies as an abridgment of their rights, American petitions continually pledged allegiance to the king. The major statements that underscored the American position, from the Stamp Act Congress in 1765 through Thomas Jefferson's *Summary View of the Rights of British Colonies* in 1774 to the Olive Branch Petition of 1775, each denied that the colonies desired their own independence. They begged the king to take up his role as protector and act on their behalf by reining in a runaway Parliament and ministry. While they insisted that colonial legislatures should have sovereignty over provincial laws, most revolutionaries adamantly denied that they should cut ties with the British monarchy as well.

Common Sense (1776) in large part changed this. Thomas Paine's pamphlet spoke directly to the possibilities of Independence. Paine argued that continued attachment to Britain would drag America into war, destruction, and tyranny. The first to "kill" the king, *Common Sense* became a literary phenomenon throughout the colonies in the early months of 1776; the forty-six page pamphlet convinced thousands of Americans that hereditary monarchy was corrupt and that an immediate declaration of national independence was in their best interest. But as powerful as the argument was, even Paine's sensational rhetoric did not spur Congress to action. Even after news reached America in early 1776 that the king had withdrawn his protection from the colonies, the question of Independence remained controversial. By the first anniversary of the Battle of Lexington of April 1775, only a few colonial assemblies had authorized their representatives to concur if Congress were to hold a vote on Independence. As of May 1776, no delegate had permission to initiate debate on the issue.

The deepening exigencies of war, however, would ultimately trump the colonists' attachment to

the monarch. In the spring of 1776, war continued throughout the colonies from Canada to the Carolinas. Rumors of British efforts to supplement their invasion force with foreign mercenaries, from either Russia or the German principalities, had been rampant throughout America since the previous fall. Throughout the first two weeks of May 1776, American newspapers were filled with reports from ship captains that testified to seeing a transport fleet filled with British and German soldiers en route to New York. The simultaneous arrival of official transcripts of the king's treaties with the German states for mercenaries confirmed the reports. Congress reacted immediately. On 15 May 1776, it ordered a de facto independence by instructing every colony that had not yet done so to draft its own republican constitution. At the same time, proponents of Independence dispatched Richard Henry Lee to Virginia to secure instructions from that critical province to bring up the issue on the floor of Congress. Lee returned on 7 June with a resolution from Virginia that instructed Congress to vote on whether "these United Colonies are, and of right ought to be, free and independent States, that they are absolved from all allegiance to the British Crown, and that all political connection between them and the State of Great Britain is, and ought to be, totally dissolved." Congress agreed to consider Lee's resolution and, on 11 June, appointed a committee of five delegates—John Adams, Benjamin Franklin, Thomas Jefferson, Robert R. Livingston, and Roger Sherman—to draft a declaration of independence.

After taking a three-week recess for the remainder of June, Congress debated Independence on 1 and 2 July, a huge step made only more difficult by word that the vanguard of the impending British invasion fleet had indeed arrived off New York City a few days previously, on 29 June. With twelve colonies supporting the measure (New York lacked instruction and therefore abstained), the vote for Independence passed on 2 July. Congress spent the next two days editing the language of the draft declaration of independence written by Jefferson and the other members of the "Committee of Five." On 4 July 1776, Congress approved the final version of the Declaration of Independence and sent the copy to Philadelphia printer John Dunlap for its publication. The concept of independence—the republican ideal of complete self-sufficiency—had finally come full circle. Ideas about personal independence into which the revolutionaries had tapped in order to mobilize support for resistance to British policies had become national Independence.

INDEPENDENCE DAY See **Fourth of July**.

INDIANA The territory and state of Indiana emerged from conflict between Native American and European peoples and the eventual victory of American colonists over British domination.

Native Americans (including Miamis, Weas, Piankesaws, Kickapoos, and Potawatomis) were the first to occupy the Indiana country. The Frenchman René Robert Cavelier, Sieur de La Salle, arrived in 1679, opening the way for the French to establish the fur trade and erect fortified trading posts at Fort Miami (renamed Fort Wayne, 1715), Fort Ouiatenon (renamed Lafayette, c.1718), and Fort Vincennes (1732). As British colonies in the East expanded, Great Britain and France contested the American interior and sought to protect their respective interests in trade and land. By winning the French and Indian War (1756–1763), Britain, through the Treaty of Paris (1763), gained control of lands east of the Mis-

Mississippi. The Proclamation of 1763 prevented white settlement west of the Appalachians until Britain acquired Indian lands and established an orderly system for settlement. Native Americans challenged British authority, resulting in Ottawa chief Pontiac's failed effort in 1763–1764 to expel the British.

During the American Revolution Native Americans, recognizing that American colonists posed a greater threat to their lands, sided with the British against the Americans. In 1777 Lieutenant Colonel George Rogers Clark, sponsored by the Virginia General Assembly, launched a campaign to gain control of the Ohio River Valley. He captured several posts in the Illinois country and, after a long wintry trek, recaptured Fort Sackville at Vincennes to force a British surrender (1779). The British continued to resist, however, until their eventual defeat in October 1781. The Treaty of Paris in 1783 led to British recognition of American independence and cession of all lands up to the Mississippi River, including the Indiana country, to the United States.

Unsettled Indiana benefited when Congress, under the Articles of Confederation, adopted two ordinances for the economic and political organization of the newly acquired western lands. The Land Ordinance (1785) prescribed a survey and public auction of lands. The Northwest Ordinance (13 July 1787) organized lands north of the Ohio River as the Northwest Territory, established a three-stage process for achieving statehood, and adopted a standard of civil rights, including the prohibition of slavery. In a further effort to weaken Indian control of the interior, President George Washington sent General Anthony Wayne against the tribes. Wayne's victory at the Battle of Fallen Timbers in 1794 led to the Treaty of Greenville (1795).

On 7 May 1800, the U.S. Congress approved the division of the Northwest Territory into two separate governments, which led to the formation of the Indiana Territory. The white population of Indiana at this time was 5,641. President John Adams appointed William Henry Harrison as territorial governor, and Vincennes became the territorial capital. The population grew steadily, and in 1805 the Indiana territorial legislature convened to adopt territorial laws, including laws allowing indentured servitude. The Indiana Territory was decreased in size when the Michigan Territory split off in 1805 and the Illinois Territory in 1809. By 1810 the Indiana population, including 237 slaves, numbered 24,520.

As territorial governor, Harrison pursued an aggressive policy of land acquisition. He negotiated land cession treaties with tribes, sometimes using

military intimidation, to chip away at Indian possessions and effect the demise of native culture. Seeking to regain their dwindling land, Shawnee leader Tecumseh and his brother "The Prophet" Tenskwatawa established a confederacy of tribes to attack Indiana settlements. Continued tensions led to the Battle of Tippecanoe (7 November 1811) near Tecumseh's village of Prophetstown, where the confederacy was damaged. The subsequent death of Tecumseh at the Battle of the Thames (1813) in Canada marked the demise of Indian resistance in Indiana.

After enduring the War of 1812, the territorial legislature convened in December 1815 at Corydon, which had succeeded Vincennes as capital in 1813, to draft a petition for statehood. With the approval of Congress, the representatives wrote a constitution, and on 11 December 1816 Indiana became the nineteenth state of the Union. Although the Northwest Ordinance prohibited slavery, there were unsuccessful efforts during both the territorial and early statehood stages to reintroduce slavery to Indiana. Jonathan Jennings, an opponent of slavery who was instrumental in drafting the constitution, became the first governor.

With Native Americans still occupying most of the central and northern parts of Indiana, the first decade of statehood witnessed numerous treaties that gradually removed the Indians, making way for settlers migrating primarily from the upland South. The Treaty of St. Mary's (1818), or the "New Purchase," opened the central third of the state to white settlement, and by 1820 the population had increased to 147,178. In that year the General Assembly chose a centrally located capital on the White River, and in January 1825 the legislature convened at the new capital of Indianapolis.

The new state quickly pursued policies of economic development by chartering a state bank (1817), encouraging agriculture and manufacturing, and promoting a system of internal improvements. As the state prospered the population grew, totaling 343,031 in 1830. Towns such as Madison, located on the Ohio River, profited as improved transportation spawned increased migration and continued economic growth for the Hoosier state.

INDIANS See **American Indians**.

INDIVIDUALISM A powerful ideal that signifies the preeminence of the self as an autonomous, rights-bearing entity, individualism first emerged as a national ethic during the half-century after the American Revolution. Elements of individualistic thought reach back to ancient Greece and Renaissance Europe. Over the centuries, various writers have used individualistic themes to express and proclaim all sorts of agendas and convictions. All of these efforts, however, strive to locate the singular person within—or atop of—the social institutions that standardize life. Individualism is, at root, a relational idea, one that responds to and rejects its foils: anonymity, passivity, conformity. As such it has often borne a defensive or embattled posture. This was certainly true in early national America. For some, individualism helped to define the Republic against its ancien régime enemies; for others, individualism menaced both public order and personal morality.

ROOTS OF AMERICAN INDIVIDUALISM

The concept of individualism grew from religious, political, and economic roots in early America. Protestant Christianity, practiced in some vein by most Euro-Americans, rejected the symbolic and institutional props of Catholicism in favor of a more intimate link between the seeker and God. The personalized thrust of Protestantism inhered in Puritan diaries, through which the writer catalogued his or her search for salvation, and in Quaker meetings,

during which men and women silently accessed their “inner light” of faith. The conversion experiences of eighteenth-century Evangelicals also underlined this personal connection to God. American individualism also derived from liberal political theory, especially from John Locke’s precept that an individual’s rights preceded the formation of governments. According to Locke, all men—women were subsumed by their fathers or husbands—bore inherent entitlements to life and property that the state had to respect. Finally, the concept of individualism issued from the market economy that developed throughout the North Atlantic world during the seventeenth and eighteenth centuries. In light of this new economic setting, some philosophers celebrated the “natural” workings of trade and commerce. When each person pursued his own interests, they argued, every person benefited. Mercantilist or paternalistic controls on self-interest (and, by extension, self-awareness) thereby lost some of their cultural legitimacy.

THE INDIVIDUAL VS. DUTY, OBLIGATION, AND THE PUBLIC INTEREST

As powerful as these experiences and belief systems were in colonial America, they cut against the grain of early modern thought and culture. In both Europe and North America, most of those in power as well as most philosophers understood society as an organic whole, a “body politic” of unequal but interdependent parts. No one but Robinson Crusoe lived alone or unattached; all people bore duties and obligations to those above and below them on the “great chain of being.” In Revolutionary America, political radicals who called themselves “republicans” found these old ideas increasingly hollow. Haughty aristocrats who curried favor with the crown did not appear to uphold their responsibilities to the commonweal. Yet such radicals did not seek an alternative to monarchical “corruption” in the ascension of the individual. On the contrary, republicans exhorted would-be citizens to sacrifice their private interests for the sake of the political community. “Every man in a republic,” declared the physician and Revolutionary Benjamin Rush, “is public property. His time and his talents—his youth—his manhood—his old age—nay more, life, all belong to his country” (Wood, *The Creation of the American Republic*, p. 61). Thus, neither the monarchical precepts that Americans rejected nor the republican philosophies they embraced during the Revolution celebrated (or even tolerated) the free-floating, autonomous individual.

Nonetheless, the American Revolution propelled individualistic thought toward its eventual enshrinement as a (not *the*) national ethic. Historians often

argue that the Revolution bequeathed a dual legacy of republican and “liberal” tendencies to American culture, and that the latter eventually won out. Individualism is often taken as the end product of liberal capitalism and liberal democracy. Early national Americans, however, would have puzzled over the term “liberalism.” Many, perhaps most, explicitly invoked or implicitly embraced Christian and republican virtues of self-sacrifice and public service. Yet others discerned a fresh potential for self-fulfillment within the cultural topography of the new Republic. They celebrated “emulation”—creative tension between an individual and a certain goal or another person—as the key to such fulfillment. Teachers, ministers, and other local notables argued that emulation pushed people, especially youth, to “excel” their peers in learning or virtue, tapping reservoirs of personal energy that monarchy had kept frozen. Some even lauded the long-feared passion of “ambition”—the personal desire for honor and preeminence—as a potential virtue, an emotional “fire” to be harnessed rather than stamped out. Such beliefs intersected with hero-worship of Revolutionary figures (“which one of you will be the next Washington?” asked one academy preceptor) and manifested in everything from school spelling-bees to debate societies. For the first time, the cultivation of the self for a distinct role in “the grand theater of the world” gained widespread legitimacy.

Again, though, such ideas ran counter to vital currents of thought and experience. Even as Americans moved toward a popular and competitive rather than an elitist and consensual political culture, and even as they participated in an ever-expanding commercial economy, they remained enmeshed in household and neighborhood obligations. The family economy, in which women and children worked for household heads, survived the Revolution. In fact, it adapted to and helped to propel a burgeoning of commerce in the early nineteenth century. Farmers and artisans enhanced labor demands on their wives and children and used republican citizenship to affirm their authority within the household. Many an “ambitious” farm lad found his aspirations thwarted by his father’s wishes. Ironically, proponents of emulation often assailed such fathers as litigious, greedy, and selfish—in other words, as individualistic. Protestant views of the self as depraved and worthless also retained their power over the new nation’s religious culture.

A CELEBRATION OF SELF-DEFINITION

The term “individualism” finally emerged in national discourse during the 1820s, as those who inherited

the Revolution and its new grammar of personal potential gained civic, cultural, and economic power. The word, and the social types associated with it, celebrated personal discovery and self-definition, not (or not just) personal gain and self-interest. The appearance of the term coincided with the rise of the autobiography as a popular genre. The first of the so-called “self-made men” in America were those who had left the farm, admired and imitated some hero or ideal type, and then invented a special vocation or niche—a “career”—in society. They included itinerant ministers, factory founders, Western explorers, and college professors; they also included many who went bankrupt and a few who struck it rich. Women faced even greater obstacles to self-definition. Effectively marginalized from the world of commerce, ambitious women sought distinction and personal fulfillment in reform movements like temperance, antislavery, and, of course, women’s rights. All of the early autobiographers conveyed a sense of struggle—with physical disabilities, with financial hardships, and with the provincial mores and local commitments that fettered the self.

By the 1830s, the language of individualism helped to portray the United States as a hurried and “bustling” place, one where the demands of money-making and self-making intersected and collided. Yet no sooner had individualism established itself in the American vocabulary than it provoked new criticisms and alternatives. The French traveler Alexis de Tocqueville (1805–1859), for example, believed that the America he toured in 1831 was degenerating into individualism, which he called “a calm and considered feeling which disposes each citizen to isolate himself from the mass of his fellows.” Many middle-class commentators, who now worked in offices or shops rather than at home, praised that very tendency. The middle-class home, by design, provided a gentle retreat from the callous world of work. But many worried that this withdrawal hindered the civic engagement and public spirit that made republics better than monarchies. Tocqueville also noted that the prevailing sense of self-interested busy-ness actually suffocated personal creativity and self-expression. Individualism was, in a sense, its own worst enemy.

Even as it became the nominal core of the democratic, capitalistic world of nineteenth-century America, individualism remained a controversial and complex notion. As home and work divided in the industrial age, more and more Americans took for granted the need to exercise one’s ambition, to find one’s unique place in the wide world. Competition

and the disciplined pursuit of wealth and status became organizing principles of American society—at least, of its bourgeois elements. But the formation of a full-blown market economy and democratic polity only sparked a new quest for authentic freedom and self-determination. Transcendentalists like Ralph Waldo Emerson and Henry David Thoreau sought a more satisfying form of autonomous experience than industrial society, or conventional ideas of individualism, would allow. Thoreau found his in the solitude of Walden Pond outside Concord, Massachusetts; Emerson, in the introspective faith he called “self-reliance.” Religious perfectionists, moral reformers, and factory workers all invented new kinds of associations to combat the anonymity and inequity of nineteenth-century America. And the vexed career of individualism stretches to the present day, underscoring the multiple and conflicting legacies of the American Revolution.

J. M. Opal

Nevertheless, it remains a useful concept for understanding the great changes of the late eighteenth and nineteenth centuries.

ORIGINS

The concept is probably most applicable to late-eighteenth-century England, where the rapidity of the onset of industrialization, particularly in the textile and metal industries, was very much remarked upon by contemporaries. The crux of this revolution was in the transformation from handicraft work performed at home or in an artisan’s shop to factory work, performed by wage laborers and characterized by a highly developed division of labor and reliance upon automated machinery, such as the spinning jenny of James Hargreaves (d. 1778), the water frame (an automated spinning machine) of Richard Arkwright (1732–1792), and the power loom of Edmund Cartwright (1743–1823). Initially, this machinery was most frequently powered by hand or water, but as the century progressed, the steam engine of James Watt (1736–1819) became increasingly important. While undoubtedly innovative, these developments built upon a long history of textile manufacture in England reaching back at least to the Norman Conquest of the eleventh century. The seventeenth century saw a marked rise in interest in manufacturing by so-called projectors, who began all sorts of new initiatives. By the first half of the eighteenth century, England had entered a transitional phase variously described by historians as an age of manufactures or as protoindustrialization, during which manufacturing began to be performed much more widely and on a broader scale in large, factorylike settings that, nonetheless, had not yet attained the extent of mechanization and division of labor that characterized the industrial revolution.

The United States lacked this long engagement with manufacturing. Before the American Revolution, most colonists remained content to make money through agriculture and commerce while importing manufactures from Britain. Furthermore, mercantilist legislation such as the Wool Act (1699), Hat Act (1732), and Iron Act (1750) made many forms of large-scale manufacturing illegal. After the Revolution, however, Americans became very interested in ending their dependence on British manufactures for political and economic reasons. Without a rich manufacturing heritage they found themselves at a disadvantage. Often the solution was to rely on skilled immigrants and to steal British technology. Immigrants such as the German glassmaker John F. Amelung (1741–1798), the British cloth dyer John

INDUSTRIAL REVOLUTION The “industrial revolution” is a term coined in the nineteenth century to describe the rapid rise of the modern factory system and the related economic, social, and cultural effects. It is a phrase that to some extent began to fall out of favor in the latter part of the twentieth century as the factory no longer seemed quite so central to western society and as historical research began to question whether the rise of the factory system was quite as revolutionary and rapid as it once seemed.

Hewson (1744–1821), and most famously Samuel Slater (1768–1835), who smuggled plans for Arkwright’s machinery out of England, brought established European technologies to the new nation.

Americans also developed some innovations of their own. They were particularly adept at creating automated machinery, a necessity in a country where labor costs remained relatively high. Oliver Evans of Delaware invented an automated gristmill (1784) that allowed Americans to grind wheat into flour with very little human labor. Jacob Perkins’s nail-making machine (1795) automated that process and rapidly drove the price of nails down by more than 60 percent. David Wilkinson cleverly automated the machine shop at Slater’s Rhode Island mill, creating instruments such as a power-driven lathe (1794). By the early nineteenth century, precision machine tools allowed Eli Whitney (1765–1825) to develop his system of interchangeable parts, which came to be known as the American System of Manufactures and which opened the door to mass production.

While industrialization was relatively late and derivative in the United States, demand for manufactures was quite high from the colonial period onward. From the first seventeenth-century settlements, Anglo-Americans were highly disposed to purchase fine manufactured goods on the world market, and by the eighteenth century many were avid participants in a consumer revolution that was connected to the increasingly widespread availability of manufactured goods from industrializing England. Additionally, well before the onset of industrialization, Americans were participating in what has been described as an “industrious revolution” characterized by increased household production of agricultural and manufactured goods by families hoping to improve their income in order to purchase new manufactures such as inexpensive, factory-made china. Thus, developments that once were described as effects of the industrial revolution—increased consumption and increased productivity—are now seen to have preceded industrialization in the United States and Europe.

THE PROCESS OF INDUSTRIALIZATION

The textile industry followed the industrial revolution model more closely than any other early national American economic sector. Before the American Revolution, virtually all domestic-made textiles were manufactured in the home. With the onset of the Revolutionary crisis and the demonization of British manufactures during the American boycotts, Patri-

ots attempted to construct textile factories in Philadelphia, Boston, and New York City. The Philadelphia project, commonly known as the American Manufactory (1775), was the most successful. It employed several hundred workers, many of them women, to produce wool, linen, and cotton cloth before disbanding due to the British occupation of Philadelphia in 1777. Many new textile factories emerged in the decade following the war in the mid-Atlantic and New England states, including the famous Almy, Brown, and Slater mill (1790) in Pawtucket, Rhode Island. While these early operations all anticipated the modern factory in employing some automated machinery, usually powered by water, they also continued earlier traditions of hiring large numbers of outworkers, usually (although not exclusively) women who spun thread or sewed fabric in their own homes.

Between 1808 and 1830 the textile sector began to industrialize in earnest, prompted in large part by difficulties in importing products during President Thomas Jefferson’s embargo (1807–1809) and the War of 1812 (1812–1815). One of the first and largest projects was the heavily mechanized Union Manufacturing Company established in Baltimore in 1808 and initially fitted with between six and eight thousand spindles. It was followed by a number of other sizable textile mills clustered in Baltimore, New England, and western New York. The largest and most famous were the Waltham-Lowell factories in Massachusetts, founded in 1812 by the so-called Boston Associates using technology pirated from England by the merchant Francis Cabot Lowell (1775–1817) and modified by Paul Moody (1779–1831), a skilled mechanic.

The Boston Associates’ establishments were the first fully automated, vertically integrated factories in the United States. Their factories at Lowell performed all the functions of textile manufacturing—spinning, weaving, finishing, printing, and packaging—under a single roof housing impressive amounts of water-powered machinery. By 1836 the Boston Associates had invested more than \$6.2 million in these establishments.

Although immensely important in the development of American industry, the Lowell pattern was not the only one followed by early national industrialists. In Philadelphia, manufacturers created a different model that came to be known as “proprietary capitalism.” Unlike their corporate counterparts in Massachusetts, these individual proprietors invested in numerous smaller, specialized textile firms that lacked the efficiencies of scale of the vertically inte-

grated Massachusetts firms but had the advantage of flexibility, which allowed them to retool rapidly and produce only those products currently in high demand.

Other manufacturing sectors followed still different paths. Iron making was one of the few large-scale colonial industries. By 1775, America's iron foundries produced one-seventh of the world's iron, frequently relying upon the labor of enslaved African Americans. The technology and scale of this industry changed very little during the early Republic, although after 1830 a switch to anthracite coal would have important ramifications. Shoe manufacturing grew very rapidly during the same period in places such as Lynn, Massachusetts, where output rose from 100,000 pairs in 1788 to nearly 1.7 million by 1830. This increase was made possible through increased division of labor and centralization of production under the control of market-oriented merchants. Unlike the textile industry, the shoe industry underwent virtually no mechanization before 1830. Similarly, New York City became increasingly industrial despite a relative absence of mechanized factories. This pattern, sometimes called "metropolitan industrialization," was marked by relatively small manufactories composed of twenty or more workers performing traditional craft processes as wage workers, who generally had less expectation of becoming a master than in earlier generations. But metropolitan industrialization, like early industrialization generally, was difficult to define because it was characterized by diversity rather than typicality.

IMPACT OF INDUSTRIALIZATION

Although the heaviest industrialization would come later in the nineteenth century, the labor force of the United States was already showing signs of transformation in the early Republic. As late as 1810, nearly thirty times as many Americans worked in agriculture as in manufacturing. By 1840 that ratio had dropped to seven to one. Even more important, as a result of industrialization the nature of those jobs shifted. Earlier, most manufacturing workers labored in small shops within a craft system of masters, journeymen, and apprentices, with some expectation of attaining a "competency," a comfortable living as a master, by the latter stages of their careers. By 1830, laborers more frequently worked for wages within a factory or a larger shop in which the artisanal system was breaking down and in which hopes for advancement were less realistic. In short, a more clearly defined working class was now emerging.

Workers increasingly expressed dissatisfaction with the emerging labor system. In the early 1790s a number of journeymen actions—at least six in New York City alone between 1791 and 1793—protested the declining wages and loss of workplace control already developing as the craft system began to weaken. In the well-known Philadelphia cordwainers' strike of 1805, journeymen who struck against lower wages were imprisoned, charged, and convicted of conspiracy to restrain trade, thereby setting a precedent allowing courts to break up subsequent strikes as illegal conspiracies. Despite this setback, in the 1820s workers began a new phase of intense organization during which they formed workingmen's societies that called for ten-hour days and more educational opportunities for laborers. The unions of the 1820s published twenty newspapers and attracted up to 300,000 members.

Early industrialization also led to important shifts in gender roles. The Boston Associates initially employed women, many of them New England farm girls, as operatives in their mills. Although many of these young women planned to work only a short time before leaving to get married and have a family, they nonetheless came to resent their low wages, typically below those of the lowest-paid male workers, and by the 1830s they, like their male counterparts, began to strike for better pay. Even the women who remained at home saw their roles altered by early industrialization. The home had been the most important workshop for American manufacturing throughout the eighteenth century, but by 1830 home manufacturing was in precipitous decline as the factory began its ascendancy. As a result, the role of middle-class women could now be increasingly directed away from producing goods and toward raising children in the more intensive fashion of the Victorian era.

Although the greatest period of immigration would not begin until the 1840s, in the years before 1830 industrialization was already attracting a steady stream of immigrants to the United States. Many early entrepreneurs such as Samuel Slater emigrated to the new nation expressly because they saw an opportunity to profit from the emerging manufacturing sector. Of the fifty-three thousand Irish immigrants arriving in Philadelphia between 1789 and 1806, an estimated 30 to 40 percent were skilled artisans and their families.

Finally, early industrialization also led to an acceleration of urbanization and the growth of the market economy. Some new mill towns quickly became urban centers. The population of Lowell, for

example, ballooned from twenty-five hundred in 1826 to more than twelve thousand by 1833. Established population centers such as Philadelphia and Baltimore also grew rapidly. Because early factories were generally powered by streams and rivers, many rural areas were also affected. For example, largely agricultural Oneida County in western New York contained fourteen textile factories by 1832. Rural people there became more closely tied to markets as they purchased factory goods and sold farm goods to factory workers. More generally, the widespread availability of inexpensive manufactured items coupled with better and cheaper transportation of goods in the canal age were important factors in the great market revolution of the early nineteenth century.

INHERITANCE Despite some changes, at Independence the law of inheritance, which the English jurist Sir William Blackstone described as “the double preference given by our law, first to the male issue, and next to the firstborn among the males,” retained the imprint of its feudal origins. In every society the rules governing inheritance—the principles by which property descends to an heir—embodied economic structures, social norms, and cultural preferences. As Blackstone correctly pointed out, English law had developed its rules of succession at a time when a monarch had to identify and sustain those on whom he counted for military aid: “the ability for personal service was the reason for preferring males at first in the direct lineal succession.”

Among these rules was that of primogeniture, according to which land held by a person who died without a will went in its entirety to the eldest son. Consistent with their reformist impulses, every New England colony abolished it and replaced it with a biblically inspired rule dividing lands among all children—sons as well as daughters—equally, except that a double portion went to the eldest son. This rule of “partible inheritance,” established in the Puritan colonies, followed religious impulses; but it also reflected a distributive ideal of spreading property broadly to produce a society of numerous independent households. A significant number of New Englanders drafted wills providing for all their children with some legacy of property. Outside New England, by contrast, all but the Quaker colonies of Pennsylvania and West New Jersey retained primogeniture, with its traditional English dynastic ideal of keeping property consolidated within a male bloodline. Widows were not heirs of their husbands: a widow was entitled only to her “dower” rights of one-third of her husband’s personal property and the use of one-third of his real property during her lifetime, after which the property went to the husband’s legal heirs. Such rules, which Blackstone described as “intended for [a married woman’s] protection and benefit,” also barred her from bequeathing any of her own land to her husband. In practice, many men left real property to their widows or made them executors in charge of their estates. Mortality left many a widow but also many an orphan, and Maryland created courts to assure the proper use of assets left to minors.

The limited abolition of primogeniture marked the limits of colonial inheritance reform. All the colonies continued English rules that gave priority to male heirs and allowed them to preserve their lands

INFRASTRUCTURE See **Internal Improvements.**

undivided by converting them into “fee tail” estates passing to “the heirs of my body.” Because title to the land could pass to no one else, these heirs could not sell or mortgage it. As in England, ending an entail was costly and time-consuming, and Virginia, where many estates were entailed, made it even more so in 1705. Tradition held out, therefore, supported by social ideology and enforced by English authority when challenged, as the Privy Council made clear in 1728 when it invalidated Connecticut’s law on partible inheritance.

Independence provided the opportunity to reshape inheritance law consistent with the goals of the Revolution. As a type of property law, the rules governing succession were left to the states; but the shared impulses of creating republican societies produced some general patterns of change in state statutes of distribution. Because Virginia’s laws governing succession were particularly retrogressive, the reform efforts of Thomas Jefferson and others stand as noteworthy attacks on an ancien régime of law that protected huge landed properties. “The transmission of this property from generation to generation in the same name,” he wrote, “raised up a distinct set of families who, being privileged by law in the perpetuation of their wealth were thus formed into a Patrician order, distinguished by the splendor and luxury of their establishments.” His proposals to abolish primogeniture and entail provoked fierce opposition among conservatives, one of whom said that only a “mid-day drunkard” would think of doing so. Nevertheless, reformers persisted in using law instrumentally to create what Jefferson called “a system by which every fibre would be eradicated of antient or future aristocracy; and a foundation laid for a government truly republican.” Their goals went beyond the political and envisioned a reform of social behavior as well. The entailment of estates, Jefferson argued, was “contrary to good policy” because it deceived lenders, discouraged improvement, and emboldened children to disobey their parents.

Despite its defenders, entailment aroused powerful opposition as a bulwark of privilege and obstacle to economic growth. Jefferson believed that each generation held its property as “usufruct”—a term describing land possessed for use only—and that entailment denied a people’s right to determine its own policies. Virginia abolished entail in 1776, and in the process crippled the dynastic tool of the “strict settlement” that had also been used to tie up property for generations. Massachusetts, acting in 1791, was among other states following suit in abolishing entailment.

In 1777 Georgia became the first southern state to end primogeniture, followed by North Carolina in 1784. Virginia, to Jefferson’s embarrassment, did so only in 1785. Massachusetts, which had replaced primogeniture with its double-portion rule in the seventeenth century, finally ended even that discrimination by making all shares equal in 1789. In any event, as more and more people made wills in the post-Revolutionary era, such a rule governing intestacy was of diminishing practical importance.

As a Connecticut judge commented, inheritance was “not a natural, but municipal right,” and the powerful force of Revolutionary positivism overcame resistance and propelled legislatures across the new nation to reform the law of succession. Statutes weakened the paternalistic and aristocratic English system and in its place made inheritance law an instrument of creating responsible property-holding citizens. Where English law had served to preserve an aristocratic family bloodline by excluding half-brothers and half-sisters from inheriting, for example, Virginia abolished the discrimination and allowed them legacies. Although statutory change stopped short of expanding the inheritance rights of women, they benefited from the expanded use of practical methods that allowed families to create legal settlements in the form of trusts or chains of future interests.

INSURANCE Despite receiving scant scholarly attention, the creation of a domestic insurance sector was an important factor in the commercial and eco-

conomic development of the early United States. The first and most consequential form of insurance in the period between 1750 and 1830 was marine insurance, developed after 1720 in colonial port towns by American merchants who sought to lower the risk of their growing overseas commerce and benefit from a financial intermediary that could mobilize capital and spur greater economic development. The first fire and life insurance enterprises appeared in the 1750s and 1790s respectively, but they remained less important (and profitable) than marine insurance until after 1815, when the centrality of overseas commerce to the U.S. economy declined and American cities began growing more rapidly. Along with commercial banks, insurance companies represented a significant source of capital accumulation and credit for early American entrepreneurs and also, because of generally low share prices and strong returns, an accessible and reliable investment opportunity for both small and large investors.

MARINE INSURANCE

In the early eighteenth century, American merchants purchased marine insurance largely from British sources, most frequently from agents of Lloyd's of London, who set up shop in American ports. However, the difficulties of obtaining insurance from foreign sources—the high commissions paid to agents and the problems of providing proof of loss and collecting claims—convinced colonial merchants that they needed their own sources of insurance. All the early American firms operated along the same principles as Lloyd's. A broker drew up policies for shippers and a variety of local underwriters were invited to subscribe for whatever portion of the policy they wished. Insurance firms employing this model appeared in Boston (1724), Charleston (1739), Philadelphia (1748), and New York (1759). Prior to the American Revolution this type of private, informal, and unregulated insurance expanded the supply and lowered the cost of insurance for small shippers and provided more established merchants an important investment opportunity—though British sources of insurance remained important for American shippers into the early nineteenth century.

The Revolutionary War, however, deeply disrupted American shipping, raised insurance rates exorbitantly, and made British insurance nearly impossible to obtain. The war experience convinced American merchants that they needed to develop additional domestic sources. Moreover, the problems associated with private insurance—the ease of fraud, the low capital reserves of individual underwriters,

and the need to launch multiple lawsuits when underwriters refused to fill claims—led merchants to develop the corporate form of insurance. The first such U.S. company was Philadelphia's Insurance Company of North America, established in 1792 and incorporated by the Pennsylvania legislature in 1794. The key figure in the creation of this company was Samuel Blodget Jr., an inveterate entrepreneur and early statistician. He began the enterprise as a tontine association—that is, a scheme in which all subscribers received an annuity during their lives, with the last survivor enjoying the whole income—but when it failed to attract enough investors, the cash raised provided the capital for the new insurance company.

Despite these inauspicious beginnings, incorporated marine insurance companies began appearing in every major U.S. port. In 1800 there were eleven such firms in the United States, and in 1809 the chairman of Lloyd's of London estimated that there were forty-four marine insurance companies in America. Their creation was largely in response to the Napoleonic Wars (1799–1815), which provided lucrative opportunities for neutral American merchants who shipped goods to Europe and the West Indies. The era's conflicts, however, also posed great hazards to American shippers as both British and French vessels attacked U.S. merchantmen with impunity. Indeed, so great were the risks that during the War of 1812 a number of American insurance companies ceased issuing policies. Nonetheless, marine insurance played an important role in the economic development of the early Republic. It helped stabilize the commercial environment and permitted direct access to overseas markets for American commodities, thereby sparking increased domestic production. Equally significant, it supplied a regular source of credit to merchants because premiums did not have to be paid until after the voyage was complete, and most companies possessed the power to lend—though this aspect of their business has remained murky. Finally, marine insurance companies invested their assets heavily in the stocks of other financial intermediaries such as commercial banks, providing capital that fueled economic growth.

FIRE AND LIFE INSURANCE

The Napoleonic Wars had a second important impact on the insurance business: they convinced many firms to concentrate more heavily in the field of fire insurance. The nineteenth-century growth of U.S. towns and cities had a similar effect. Though early attempts were made to establish fire insurance asso-

ciations in Boston (1728 and 1748) and Charleston (1736), the first enduring firm, the Philadelphia Contributionship for the Insurance of Houses from Loss by Fire, appeared in 1752, with the support of Benjamin Franklin.

Like early marine insurance efforts, the Contributionship was based on English models, and Philadelphia merchants Joseph Saunders and John Smith, who were heavily involved in marine insurance, played key roles. In 1768 the Contributionship was incorporated by the Pennsylvania legislature, but heavy losses in the early years resulted in slow growth, and the expansion in the fire insurance business did not occur until after the Revolution. Between 1786 and 1800 some twenty firms were incorporated by the states, and in 1804 Samuel Blodget Jr. estimated that there were forty insurance firms of all types in the new nation, with capital in excess of \$10 million. In subsequent years the number and size of insurance companies continued to rise rapidly; by

1830, for example, New York City alone had twenty-eight insurance firms with capital in excess of \$10.8 million, \$7.8 million of which was in fire insurance.

In contrast, life insurance floundered in the early Republic. Noah Webster noted that some financial intermediaries were authorized to insure lives, but the "business . . . is novel in this country and of small value to the insurers." For instance, when chartered in 1794 the Insurance Company of North America was empowered to insure lives and the company appointed a committee to establish a business plan. However, the firm seems to have drawn up only a few short-term policies, usually for the life of an individual during the duration of a voyage. Slow growth continued throughout the period. By 1814 there were only four active life insurance companies in the United States, a number that had risen to only seventeen (with a total capital of \$2.8 million) in 1836. Not until the 1840s would life insurance be-

come an important part of the insurance business in the nation.

INTERNAL IMPROVEMENTS The term “internal improvements” came into popular usage in the United States during the 1780s and originally referred to most economic, educational, and engineering programs undertaken by federal and state governments. Over the next few decades, the idea of internal improvements narrowed to include state-sponsored transportation projects such as improvements in navigation of existing rivers, turnpike roads, canals, and railroads. Although all could agree that innovations in the nation’s transportation network were a positive goal, the extent of public funding and administration quickly served as a focal point of a political debate that lasted throughout the antebellum period. The federal government had several opportunities to take the lead in promoting a national system of internal improvements, and in each instance it failed to overcome political opposition grounded in a states’ rights approach to the Constitution. Individual states briefly seized the initiative during the canal boom of the 1830s, but they eventually withdrew from massive public works programs. In the end, private firms assumed the major responsibility for American transportation networks, although often with financial backing from public institutions.

EARLY EFFORTS

Early attempts at internal improvement often blended public and private initiative. George Wash-

ington, for example, promoted a survey of the Potomac and James Rivers to explore the possibility of connecting them with the Ohio River and the Great Lakes. In 1785 Virginia’s legislature responded to Washington’s idea by passing charters for the Potomac Company and the James River Company. The Potomac Company later declared bankruptcy, but the James River Company thrived during the post-Revolutionary decades. It had no problem finding subscribers for the initial capitalization of \$100,000, of which the Commonwealth was entitled to purchase \$20,000. In 1790 the company completed a short section of the canal and improved navigation linking Westham to Richmond; in that year it also successfully petitioned the legislature for permission to raise an additional \$20,000 in private subscriptions plus another \$20,000 in state-held stock. Although it never lived up to the ambitious designs of its founders, the James River Company is an excellent example of the mixed enterprises typical of early internal improvements.

Canals figured prominently in the nineteenth century, but at its beginning, turnpikes were the most common type of internal improvement. These toll roads were sometimes built on existing paths but in other cases blazed entirely new trails through the countryside. Most turnpikes were privately owned companies with routes of from fifteen to forty miles, although many received subsidies from local or state governments. The National Road, a federally funded turnpike, was the most ambitious road project of the early Republic. Federal engineers planned for this gravel-topped road to link Baltimore on the Chesapeake Bay to the Ohio River and ultimately to the Mississippi River. Although some hoped that the National Road could serve as a shining example for federally funded turnpikes, the vast majority of toll road construction occurred under the authority of private firms with only limited public investment. From 1800 to 1810, states chartered 398 turnpike companies—more than five times the amount during the previous decade. Meanwhile, construction on the National Road languished until the first major section, which connected Baltimore and Wheeling, Virginia (later West Virginia), was finally opened in 1818. Although the federal government spent \$1.6 million dollars on the National Road over the next six years, it suffered from rockslides and erosion that made it almost impassable. When it finally reached Columbus, Ohio, in 1833, the grandiose plans for the federal turnpike had all but disappeared.

Internal-improvement boosters nonetheless continued to agitate for a larger role for government in

transportation projects in the United States. In 1807 the Senate instructed Albert Gallatin, Thomas Jefferson's secretary of the treasury, to make a report on the need for further public improvements in the United States. Gallatin's *Report on Roads, Canals, Harbours, and Rivers*, issued in 1808, set out a plan for a nationwide series of federal projects aimed at improving the transportation and communications network of the young nation. Gallatin recommended that the federal government oversee the construction of canals and improvements to rivers that would create an inland water navigation from Massachusetts to North Carolina and build roads to cross the Appalachian Mountains and link the seaboard with inland cities such as Detroit, St. Louis, and New Orleans. He estimated that this network would cost approximately \$16.6 million to build, and in addition, he also recommended \$3.4 million for smaller local improvements across the United States. The revenue from tariffs would pay for this very ambitious scheme. Gallatin argued that the project was aimed at the development of both the seaboard and interior and that therefore it was the duty of the federal government to embark upon such a program. Despite the extensive nature of this plan, opponents denounced the use of public funds for projects that would benefit only those in the projects' immediate area.

The War of 1812 (1812–1815) put an immediate stop to Gallatin's plan, but it was revived in 1817 when John C. Calhoun of South Carolina suggested that a \$1.5 million chartering bonus along with any future stock earnings from the newly created second Bank of the United States be used to create a permanent fund to "bind the Republic together with a perfect system of roads and canals." The debate in the House over Calhoun's so-called Bonus Bill revolved around an all-too-familiar question: Should the federal government pay for projects that did not benefit all of the states? Nationalists argued that the federal government should allocate funds to roads and canals that would have the greatest impact upon the economy; states' rights advocates countered that such a plan would funnel massive amounts of money for pet projects that would reflect political, not economic, agendas. In the end, opponents of Calhoun's plan stated, the federal system would be corrupted beyond repair. The Bonus Bill narrowly passed Congress, but President James Madison sided with the states' rights approach to the matter and vetoed the legislation in 1817.

STATE GOVERNMENTS TAKE CHARGE

With the federal government temporarily out of the picture, state governments picked up the internal improvements torch. New York was the first state to undertake a massive internal improvement project with its own public funds. In 1817 the legislature authorized the construction of the Erie Canal, to run from the Hudson River to Buffalo on Lake Erie, under the watchful eye of the state's governor, DeWitt Clinton. Critics of the plan thought that it would never succeed and referred to the project as "Clinton's Big Ditch." But in 1825, only eight years after work on the project had begun, the Erie Canal was finished. The fruits of the endeavor were both impressive and immediate. In the first year of its operation, toll revenues on the Erie Canal surpassed the annual interest on the state's construction debt as traffic on the improvement ranged from heavy freight including lumber and wheat to small manufactured valuables to passengers utilizing the canal for both speedy transportation and leisure. By 1837 the revenues from the Erie Canal had erased New York's construction debt completely—only twelve years after beginning operation. The waterway shortened the time and expense required for the transportation of both bulk and high value commodities considerably and also effectively opened up New York's western counties to development; the growing cities of Buffalo, Syracuse, and Rochester all prospered from bordering the Erie Canal. Moreover, as a public works project constructed by New York's state government, the Erie Canal demonstrated the potential benefit that a state-funded internal improvement networks could provide.

Many states rushed to copy New York's success with the Erie Canal. During the 1820s the state of Virginia took over the James River and Kanawha Canal project, which was designed to cross the mountains and enrich the inland counties along the way. In 1826 Pennsylvania decided to build a statewide system of trunk and branch canals, commonly known as the State Works. Even states west of the Appalachian Mountains such as Ohio, Indiana, and Illinois rushed to build systems of their own, and during the 1830s a full-blown canal boom gripped the United States. But as quickly as many of these projects were begun, they began to see diminishing returns. Because many canal projects were inspired more by political expediency than by an actual prospect of improved economic efficiency, they lost money.

In addition to building these roads themselves, states also chartered transportation companies that provided funding for other ventures. Probably the

most famous example of this is the Baltimore and Ohio Railroad. In 1827 a group of Baltimore merchants met to discuss ideas about a central line of improvements for Maryland. They looked at the case of New York and Pennsylvania to the north and Virginia to the south and saw that these states were all planning massive canal systems to aid the development of their interior counties. Since Maryland had no sizable river system to expand upon like the Hudson River in New York or the James River in Virginia, they decided to experiment with a new form of transportation known as the railroad. These merchants petitioned the legislature for a charter, and in February 1827 the Baltimore and Ohio Railroad was created with a capital stock of \$3 million. But more important, of the company's thirty thousand shares of \$100, the state subscribed to ten thousand, for \$1 million. In exchange for the rights of eminent domain and exemption from taxation, the Maryland legislature received the right to set passenger and freight rates. Railroads, like turnpikes, would be built by private firms, but often with limited public financial backing.

THE RISE OF LAISSEZ-FAIRE

A final attempt to involve the federal government in supporting internal improvements occurred in 1830 during the administration of President Andrew Jackson. Although a proposed national road linking Buffalo to New Orleans failed to pass Congress, several bills authorizing the federal government to subscribe to the stock of private canals and turnpikes passed. One such project, the Maysville Road, was a planned route from the Ohio River to Lexington, Kentucky. Jackson vetoed federal funding for the Maysville Road and seized the opportunity of his veto message to make a statement about the appropriateness of the federal government's role in internal improvements. In his message Jackson argued that the Maysville Road was of "purely local character" and that he wanted to "keep the movements of the Federal Government within the sphere intended." Thus, like James Madison before him, Andrew Jackson constricted the federal government's role in regard to internal improvement programs.

Following the heady canal boom of the 1830s, individual states showed signs of withdrawing their support for massive public works. As construction and operational expenses rose and revenues dwindled, state officials reconsidered their support for canal construction. The Pennsylvania State Works, for example, was completed in 1835 and cost an estimated \$12 million. But toll revenues never lived up

to expectations and the State Works dragged Pennsylvania into a deep financial crisis. In 1844 the legislature authorized the sale of the Philadelphia to Pittsburgh route for \$20 million, a price that no private concern was willing to pay for a line of navigation that had proved both unpopular and unprofitable. In the end, the State Works were sold to the Pennsylvania Railroad over the course of the 1850s, but in the process, the idea that state-built internal improvement projects were not just expensive, but were by their nature an unwise move, became popular. The idea of laissez-faire began to take hold in many states. Railroads—the next great innovation in transportation in the United States—would depend mainly upon private firms for their construction and operation.

Internal improvements thus went through several distinct stages. At first, it seemed as if the federal government would replicate its sponsorship of the National Road and branch into other endeavors. After it failed to do so, state governments responded with ambitious but unwieldy canal programs to provide needed links between market centers. The failure of these programs caused a withdrawal of administrative, if not financial, support for internal improvements by state governments.

INTERRACIAL SEX Judging by the laws and rhetoric of early Americans, the notion of sex across the color line struck them as repulsive, unnatural, and intolerable. White concern over the act of interracial sex can be traced to seventeenth-century colonial America. Criminalization of interracial sexual relations stood as a monument to white society's commitment to maintaining the "purity" of the white race.

The ideal of racial purity proved elusive, however, as conditions in the very early years of colonial settlement simply did not permit the absolute sexual separation of the three races: indigenous Indians, African slaves, and Europeans. The dire scarcity of European women in some regions, especially in the southern colonies, left many European American men partnering with non-European women, some merely for sex, but others in marriage. Also, during this time racial categories had not yet fully formed, so there was greater fluidity across racial lines. Some colonial historians have even claimed that full-blown racism, long associated with the American South, was inchoate in colonial America, permitting a certain degree of tolerance of interracial sexual relations that continued through the Civil War.

In 1662, however, the first clear statutory legal proscription against interracial sexual relations was adopted. The Virginia law reflected a new, harsher racism that had taken hold in the Chesapeake as African slaves began significantly to supplant European indentured servants as the chief labor source. This law, which punished only whites for broaching the color line to have sex, seems to have emerged primarily in response to a social conundrum in the New World: What to do with mixed-race children in a society that was increasingly associated with racial slavery? Prohibitions against interracial marriage soon followed. Antimiscegenation laws, as they were known, continued throughout much of the United States well into the twentieth century.

By the eighteenth century, lawmakers' aversion to racial mixing was shored up by an emerging ideology that cast sexual intimacy across the color line as abominable. Clearly the notion of interracial sex offended the sensibilities of many whites, signifying underlying fears of racial difference and worries that a mixed-race population could undermine slavery and confuse the social and racial order. Famously, Thomas Jefferson decried "amalgamation" or the "mixture of colour," which he equated with the degradation of whites. Less famously, countless Americans voiced their disgust with the possibility of racial

mixing. James Wilson, a Pennsylvania delegate at the Constitutional Convention, announced to the gathering that he, like his constituents, responded to stories of racial miscegenation with "disgust."

Based on pronouncements like Jefferson's and Wilson's, as well as the statutes denouncing and punishing interracial mixing, historians long believed that actual cases of miscegenation were infrequent. Because of the public antipathy toward interracial sex, of course, few whites would risk social opprobrium by publicly acknowledging they had traversed sexual and racial boundaries. Hence, traditional sources of evidence failed to reveal a pattern of extensive racial mixing. However, at the beginning of the twenty-first century, social historians relying on different kinds of historical sources (for example, local court transcripts rather than statutes) have asserted that miscegenation was common, even ubiquitous, at some times and in some places.

Few Americans at the beginning of the twenty-first century are unaware that the founding father and third U.S. president, Thomas Jefferson, likely had a long-term intimate relationship with his slave, Sally Hemings, that produced several children. Journalist James Callender, Jefferson's chief political enemy, first publicized allegations of the affair to a mass audience in 1802, but neighbors near Jefferson's Monticello home had long been aware of such rumors. While the nature of the relationship continues to be debated by historians, scientists, and laypersons, the larger truth is that Jefferson's purported relationship with Hemings was hardly an isolated or even an unusual episode in the early American slave South. Sexual relations between master and slave, which took many forms including rape and other forms of nonconsensual sex, as well as long-lasting, loving concubinage, were relatively common.

Not only was interracial sex rather common in early America, but much of society tacitly if begrudgingly tolerated such relations in their communities. If the offending interracial couple acted discreetly, not flaunting the taboo relationship, it was not uncommon for southerners to look the other way, in much the same way as turn-of-the-century Virginians seemed nonplussed at Jefferson's rumored relationship with one of his slaves. This pattern is documented throughout early America.

While sexual relations between black men and white women were less common, they nonetheless occurred with regularity. White women's sexual relations with slaves were especially policed in nineteenth-century America, in large measure because of

A *Philosophic Cock* (c. 1804). In this satirical cartoon by James Akin, President Thomas Jefferson appears as a rooster courting a hen with the face of Sally Hemings, one of Jefferson’s slaves. Jefferson’s political opponents sought to weaken his presidency with charges of promiscuity and interracial sex. COURTESY, AMERICAN ANTIQUARIAN SOCIETY.

worries about the economic welfare of the offspring whose fathers might be enslaved, but also to enforce the fiction of racial purity that permeated much of early America, including the area outside the South. While sporadic attempts were made to outlaw interracial sex in the North, the policing was never as strict as in the slave South. Slave fathers obviously could not provide for their mixed-race children. Still,

white women—especially of poor and middling rank—had frequent contact with men of color, free and slave. They sometimes worked as servants alongside slaves. Or sometimes they traveled on errands with little or no protection, making them susceptible to sexual assault. White women without husbands or fathers to support them and their families may have engaged in sexual bartering or ex-

change with blacks occasionally or regularly. As with master-slave sexual relations, suspecting neighbors typically ignored such activities unless a pregnancy or an accusation of rape forced the community to deal openly with the relationship.

in Massachusetts. By doing so, Parliament inspired widespread resistance in North America to its policies, including the meeting of the first Continental Congress later in 1774 and the actions at Lexington and Concord the following year.

The Boston Port Act closed and blockaded the city’s harbor beginning 1 June 1774. Boston could neither ship outward nor import any goods (with the exception of supplies for the British armed forces and fuel or food via the coastal trade). The blockade would not be lifted until the townspeople had repaid the East India Company for the tea that had been destroyed. The Massachusetts Government Act altered the colony’s cherished charter by directing that the king could appoint members of the council and that the royally appointed governor could appoint judges and county sheriffs, who in turn selected jurors; Parliament sought effective law enforcement by ridding these offices of men with Whig sympathies. In addition to stripping the House of Representatives of these powers, the act also curtailed the incidence of town meetings. The Administration of Justice Act allowed the Massachusetts governor to transfer the trials of certain persons (magistrates, those suppressing riots, and customs officials) to another colony or to Great Britain, particularly in the case of capital offenses. The law was intended to protect British officials and supporters of the crown, who believed they could not get a fair trial in front of a Boston jury. The law’s detractors believed (erroneously) that soldiers might now kill Massachusetts people with impunity. The Quartering Act, which applied to all the colonies, allowed British officers, in conjunction with governors, to demand suitable billeting in uninhabited buildings.

The colonists also associated the Quebec Act of 1774 with the Intolerable Acts, though it was not intended as a response to the Boston Tea Party. The bill expanded the boundaries of Quebec to include the land north of the Ohio and Illinois Rivers, allowed French Catholics the free exercise of their religion, recognized French civil law (which did not include trial by jury) in Canada, and established a council appointed by the king in lieu of an elected legislature. To the Protestant colonists south of the St. Lawrence River, many of whom feared ecclesiastical control, the Quebec Act was a provocation: the establishment of an arbitrary, tyrannical government filled with Catholic subjects menacing their borders and blocking westward expansion. To the north, however, the Act effectively helped Parliament retain Canadian loyalty to the British Crown.

INTOLERABLE ACTS The Parliament of Great Britain passed the Intolerable Acts, also known as the Coercive Acts, in 1774 in response to the Boston Tea Party of December 1773. Angry with the “dangerous commotions and insurrections” that had roiled Boston, the British ministry passed these acts in Parliament for the “reestablishment of lawful authority”

Though most of the Intolerable Acts were aimed solely at Massachusetts, people throughout the colonies recognized them as setting a dangerous precedent for the subversion of constitutional rights and liberties. Parliament was testing its supremacy against the autonomy of colonial legislatures, and it was clear which side most Americans favored. Arguments against the Intolerable Acts spread through newspapers and committees of correspondence across North America. Though the colonies had often bickered over boundaries and other issues, the acts motivated them to unite. Boston became a martyr, suffering for the cause of all America. Americans sent aid to the blockaded city, and twelve colonies sent delegates to the first Continental Congress at Philadelphia in September 1774. These delegates soon endorsed the Suffolk Resolves, passed by Boston and its surrounding towns, which proclaimed the Intolerable Acts unconstitutional and called for a boycott of British goods. The Continental Congress enumerated the Intolerable Acts as grievances and asserted the Americans' rights as citizens under the British constitution. The Intolerable Acts provoked a striking unanimity and assertiveness among the delegates.

Meanwhile, the king had appointed General Thomas Gage, commander of His Majesty's forces in America, to serve as governor of Massachusetts. When Gage attempted to enforce the Intolerable Acts by appointing sympathetic judges and suspending town meetings, he met with anger and resistance. General Gage, therefore, believed it prudent to seize the colony's stores of arms, powder, and ammunition. In each instance, New Englanders rose to stop his movements. Gage sent one such expedition of seizure to Concord on 18 April 1775, and the next day British troops exchanged fire with Americans for the first time. Boston became a city under siege. Thus, the Intolerable Acts mobilized military and political action in ways that united the colonies in their resistance to Great Britain. The execution of the acts had failed, just as these laws had misfired as tools of persuasion and authority.

INVENTORS AND INVENTIONS Rapid and extensive technological change was not one of the hallmarks of the colonial era, but the pace increased noticeably during the early national period. Except for the evolution of the American felling axe and Benjamin Franklin's promotion of an efficient heating stove (1742) and lightning rod (1752), notable contributions by Americans had to wait until the era of the Revolution. Then, energized by the example of British inventions in manufacturing and fired by the ideals of American independence, entrepreneurs, inventors, and legislators aggressively promoted innovation.

True, most innovations came from the workbenches of now-anonymous workmen and nearly all were the product of incremental change rather than the inventor's mythical "eureka!" moment of inspiration. Still, in the early decades of the nineteenth century, individual innovators multiplied in numbers, expanded their range of work, transformed the material conditions of society, and earned an international reputation for their storied "Yankee ingenuity."

PROMOTION OF LEARNING

In his *Proposal for Promoting Useful Knowledge among the British Plantations* (1743), Benjamin Franklin wrote of encouraging studies that would increase the power of men over matter and multiply the conveniences and pleasures of life. Most of the earliest learned societies, such as the American Philosophical Society in Philadelphia, promoted practical knowledge as much as literary, philosophical, or scholarly pursuits. Recognizing that their members commonly pursued multiple enterprises, occupations, and intellectual interests, these societies supported the Enlightenment ideal of useful learning.

A proliferation of local societies for the promotion of agriculture, natural history, and arts and sciences culminated with the establishment at Philadelphia in 1824 of the Franklin Institute and its journal specifically for the increase and spread of practical knowledge. The Institute became a de facto public-private research laboratory, bureau of standards, and educational institution.

Fulton's Steamboat and Submarine. Although Robert Fulton did not invent the steamboat, he was the first to dramatically illustrate its financial potential. He designed his first experimental steamboat (top) in 1803 to travel the Seine River in France. Fulton also designed submarines (bottom). © BETTMANN/CORBIS.

ENCOURAGEMENT OF INVENTIONS

The colonists found themselves in an ambiguous situation, subject to British mercantile restrictions on manufacturing but anxious to improve the colonial

economy. A handful of colonies passed legislation offering incentives such as bounties and subsidies for profitable inventions. Some colonies, prominently Connecticut and South Carolina, offered monopolies

"A New Machine to Go without Horses." A 1774 version of a horseless carriage. © CORBIS.

or land grants for the establishment of new industries such as ironworks. The situation was difficult for inventors since they had to obtain a patent in each colony in order fully to protect their rights.

After the Revolution several state governments, following the theories of Alexander Hamilton and Tench Coxe, actively promoted innovations by granting patents or monopolies. Most often these monopolies were offered as much to promote economic development for the state as a whole as to reward individual achievement, a distinction worth noting. In the 1790s Georgia established a commission to promote the invention of a device to remove the seeds from cotton. Still, the lack of a uniform patent system frustrated inventors and created difficulties for economic promoters.

The framers of the Constitution debated a number of incentives for authors and inventors, but ultimately included in Article I, section 8, congressional

power to grant them "the exclusive Right to their respective Writings and Discoveries" for a limited period of time. While disliking monopolies, the framers felt the need for a uniform system covering all the states. Enacted in 1790, the first patent law proved cumbersome, since each application had to be examined for originality and utility by a commission headed by Secretary of State Thomas Jefferson. Substantially revised in 1793, the new system required no examination or proof, only the inventor's assertion that the idea was original and useful, leaving the courts to decide which claims were justified. Further, this law required that patents be granted only to native-born citizens, a significant limitation given the number of talented immigrants arriving from more technologically sophisticated England and Europe. Not until 1836 was the patent system revised again, this time putting it upon the solid basis of professional patent examiners. By this time, just 9,957 patents had been granted, only a small fraction of which actually proved useful.

SIGNIFICANT INVENTIONS AND NOTABLE FAILURES

The impact of the continent's vast forests on American inventiveness cannot be overstated. As early as the late seventeenth century, Americans excelled in constructing water-powered sawmills since nearly every community near a suitable waterway had one. The American felling axe is a classic case of anonymous technical evolution. No one invented it, but over time its handle was given a curve and length to fit the individual user rather than the standard European straight shaft. The iron cutting-edge was made shorter than the European versions while the poll or flat edge was longer. This balanced the axe and made it three times as efficient as its European cousins, a fact of no small consequence.

Jacob Perkins's water-powered nail-making machine, patented in 1795, was said to be capable of producing 200,000 nails a day and helped lower the cost of nails by 85 percent over the next thirty years. The introduction in 1819 of Thomas Blanchard's copying lathe for the production of rifle stocks was a landmark of American armory practice that contributed to the manufacture of interchangeable parts. By 1829 America was a leading producer of woodworking machinery—saws, planers, lathes.

Intrigued by the complaints of Georgia plantation owners, Yale-educated Eli Whitney in 1793 devised a simple mechanical device to remove seeds from short-staple cotton. His problem-solving approach was practical, not theoretical; his machine

was easy to build and to operate by hand. Exports of cotton increased by a multiple of fifty to nearly twenty-one million tons in less than a decade.

In the mid-1780s Oliver Evans developed an automatic flour mill in which grain was ground into flour without any human intervention. The mill was the most dramatic early illustration of automation, replacing human labor with machinery, and it encouraged flour production around the nation.

While Robert Fulton did not invent the steamboat, in 1807 he was the first to dramatically illustrate its financial potential and social impact. Earlier, between 1787 and 1790, John Fitch had designed from scratch, constructed, and operated a steamboat on the Delaware River. Fulton's demonstration on the more heavily traveled Hudson River proved more financially successful and more inspiring to others seeking to improve inland transportation, the *sine qua non* for westward trade and expansion.

There were any number of unsuccessful inventions, some developed by the unknown and some by the famous. David Bushnell, a renowned mechanic, attempted to construct a submarine during the Revolutionary War. Thomas Paine, the Revolutionary pamphleteer and author of *Common Sense* (1776), proposed using incendiary arrows to attack warships and patented a prefabricated iron bridge. Charles Willson Peale (1741–1827), the painter, experimented unsuccessfully with a telescopic sight for rifles. Oliver Evans developed an ineffective machine for inserting wire spikes into a leather pad used to unspool wool or cotton fibers. In 1813, Philadelphian George E. Clymer produced the first hand printing press made of iron, the patriotically ornamented and named Columbian Press. Weighty, awkward to move, and elaborately decorated, it never found favor in the United States but was popular in England and Europe for more than fifty years, a testament to the peculiar requirements for success in the new nation.

INFLUENTIAL INVENTORS

In 1744 Benjamin Franklin, a printer by trade, published *An Account of the New Invented Pennsylvanian Fire-Places*, beginning an extraordinary career as a promoter of technical innovation. Franklin's original cast-iron stove was based on scientific principles but was technologically unsound and filled many a room with smoke. Later, he and others modified the original design and the misnamed "Franklin stove" became a common household device. Franklin began his experiments with electricity at about the same time and in 1753 published directions for construct-

ing lightning rods to protect houses, a practical application of his scientific experiments. He later developed bifocal eyeglasses and promoted technical improvements in papermaking and printing.

Thomas Jefferson was less an inventor than an enthusiastic polymath interested in all sorts of intricate devices and technical improvements. His one public invention, a moldboard plow he devised in 1788 and introduced at his Monticello plantation in 1793, found little favor among the yeomen farmers he championed. Though wary of the social impact of manufacturing and cities, Jefferson was a significant promoter of technological innovation in the new nation.

Benjamin Banneker (1731–1806), an African American, was not technically an inventor. But his mathematical skills, his construction of a self-designed clock, and his publication of an almanac rank him among the most celebrated innovators of his time. Banneker's abilities directly challenged Thomas Jefferson's assumptions about racial inferiority and induced him to a grudging recognition of the intellectual potential of some blacks. Thomas Jennings, a free black resident of New York City, may have been the first black to receive a patent, granted him in 1821 for a dry cleaning process.

Oliver Evans, the prototypical ingenious mechanic, repeatedly demonstrated the economic benefits of mechanization, the substitution of mechanical for human labor. His automatic gristmill, his improvements in machine shop practice, his application of steam engines to manufacturing and transportation, and his well-read publications on these nascent industrial practices make him one of the most significant technologists in American history.

Robert Fulton may be best known for his successful demonstration of the steamboat on American rivers. But he also developed a rope-making machine, underwater bombs (torpedoes), and an inclined plane for moving barges from one level of a canal to another. Indeed, his description in 1796 of the inventor as a poet combining old mechanisms into new ideas stands as an early, signal description of inventive creativity.

Though historians question his claims for originality and success with both the cotton gin and interchangeable parts, Eli Whitney remains one of the most important technologists in American history. Whitney's optimism, practical approach to innovation, and very public promotion of interchangeability mark him as an early advocate of technological progress.

Samuel Slater (1768–1835) invented little of note but represented a significant source of technological innovation, the transfer of technology from England and Europe to the United States. Slater's success at bringing new technical ideas into use in the textile industry marked the beginnings of the industrial revolution in the United States.

IRON MINING AND METALLURGY Iron mining, refining, and manufacturing were at the core of early American industrial development. The iron industry was both the most capital-intensive to develop and the most potentially lucrative business venture in the British colonies of North America. Interest in locating deposits of iron, extracting the ore, smelting it, and refining it was evident in the earliest permanent settlements. Small amounts of ore were found in Virginia in 1608 and sent back to England for refinement. A bloomery (a small, enclosed kiln used for roughly smelting iron) was established in the colony at Falling Creek by 1622, although it was destroyed in the Powhatan rising in the same year. In 1641 John Winthrop, Jr., proposed the construction of a complete ironworks in Massachusetts, including a blast furnace (where iron ore was initially smelted into liquid and turned into large bars, called

pigs), fineries (a large hearth where pig iron was reheated into a softened mass called a “half-bloom,” from which larger impurities were hammered and chipped out manually or by means of a trip-hammer), and chaferies (a smaller hearth where the iron was again heated and drawn into thinner bars, which were continually rubbed and redrawn until all visible impurities were eliminated). By 1643 a company was formed in London to finance the Massachusetts works. In 1644 construction of the works on the Saugus River began, and more than one hundred experienced ironworkers were imported to carry on the operations.

In the 1650s and 1660s ironworks were established in Massachusetts, Connecticut, and Delaware. But these iron companies were expensive to build and maintain. Because the cost of transatlantic transportation in the period was high, with few local markets available, all of these early operations fell into severe financial difficulties and eventually failed. The first profitable iron company in the English colonies was founded by Lewis Morris at Tinton Falls, New Jersey, around 1680, followed by others in Maryland and Pennsylvania. By the turn of the eighteenth century, establishing a viable and profitable iron industry in the colonies became easier for several reasons. First, the settlement and stabilization of more than fifteen colonies from New England to the West Indies after 1630 created a much larger market network in the Americas that could support iron manufacture. Second, after 1660 more ships were built for transatlantic shipping and regulation increased, greatly reducing shipping costs and making exportation of pig iron from the colonies to England at least minimally profitable. Third, the expansion of trade under the English mercantile system beginning in the mid-seventeenth century aided in enriching a significant number of colonial merchants and their families. These merchants, seeking to diversify their interests, had the capital to finance the building and expansion of dozens of new ironworks. Fourth, and perhaps of the greatest importance, local populations grew rapidly in the colonies, continually expanding local markets for iron and iron goods. These local and regional markets along the Atlantic coast were keys to the profitability of the iron industry, as nearly 80 percent of the iron produced in the British colonies of mainland North America was sold on the mainland.

Not all iron manufacturing operations were successful. At a cost of between £10,000 and £50,000 in the eighteenth century, depending on the size and complexity of the ironworks, problems with resources, labor, transportation, weather, competi-

tion, or any combination of these factors could spell disaster. Nearly half of the ironworks established in the six decades prior to the American Revolution failed less than twenty years after they were founded. Others, however, would last nearly a century.

LAND AND RESOURCES

Iron ores, including red and brown hematite, magnetite, and carbonate can be found throughout southern Virginia through western and northern Maryland, Pennsylvania, and New Jersey, and in the colonial period could be found widely across the land's surface. The visible abundance of iron deposits, as well as limestone deposits (used as flux in charcoal iron manufacture), were the first indicators that profitable extraction and refining were possible. But iron ore and limestone deposits were not enough. Fueling even a small ironworks required a large area of forest, as charcoal production was a necessary step preliminary to the smelting process. A colonial blast furnace produced approximately 400 tons of pig iron per year (2 tons of ore could be smelted into 1 ton of pig iron), with each ton requiring between 100 and 120 cords of wood as fuel. Hardwoods burned hottest and were most efficient, softwoods less so. An acre of forested land yielded an average of 20 usable cords of wood, and would take a minimum of twenty years to replenish, if conservation was followed. An iron plantation needed 4,000 to 5,000 acres of forested land in order for production to continue for more than twenty years. The average iron company operated on 5,400 acres.

MINING

The availability of much surface ore in the early eighteenth century kept mining operations fairly basic before mid-century. Miners dug shallow trenches, following the visible lines of ore and extracting the most accessible iron. Under these conditions four to six miners could dig a sufficient amount of ore per day (three to four tons) to keep a furnace in operation. The deeper the trenches were cut, the more labor was necessary, as impacted ore was harder to extract and required additional workers to hoist the ore out of deeper trenches and keep the pits clear of water.

Although technologies did not change, by 1750 most iron companies that had been in operation for two decades or more were operating what could be more accurately called mines. Mine holes forty to fifty feet deep required eight miners to produce the same daily tonnage as six had done from a surface

trench, and at least one winch operator was needed to hoist water from the hole. By the 1770s and 1780s, long-established operations were beginning to move toward shaft mining to access deeper veins of ore. This was more costly and dangerous, as it required more labor as well as blasting. Shaft mines had to be shored up by wooden palisades in order to prevent regular collapses. Accidents were still fairly regular and the narrow shafts, typically less than a hundred feet deep, did not allow for rescues of men trapped by flooding waters or cave-ins.

Miners in the last quarter of the eighteenth century were typically skilled both in locating profitable veins deeper in the earth and the art of gunpowder blasting. Men whose higher wages were based on skill were called masters, and laborers who actually did the digging were often called helpers. Higher wages for skilled workers and the need for more labor increased the cost of production after the mid-eighteenth century. Britain still needed American iron, but its value decreased as its production costs increased. Parliament, through regulation, tried to keep colonial iron competitive with Russian and Swedish iron sources, but this became more difficult over time.

BRITISH REGULATION

Many Americans viewed the British mercantile system as restricting, and at times it was, but it was always intended to benefit both the home country and the colonies. In the field of iron production, parliamentary allowances were historically generous. Parliament routinely voted down bills that would have raised the import duties for pig and bar iron and outlawed the manufacture of ironware in the colonies. This policy allowed for colonial iron to enter England competitively compared to foreign exporters' iron. Also, owing to the prohibitive cost of establishing and running a blast furnace in the colonies, to prevent ironmasters from refinement beyond initial smelting or a prohibition on ironware manufacturing would have eliminated any profit incentive for colonial entrepreneurs.

In 1750, however, a new iron act was passed in reaction to the great expansion of ironware manufacture in the colonies, which was drastically reducing imports from England. Pot ware (kettles, pots, pans), wrought iron, and stove plates of colonial manufacture covered almost all of the American market; of even greater concern, the proliferation of steel furnaces, plate mills (producing sheet iron), rolling and slitting mills (producing rods), naileries, and wire mills were eliminating local need from Brit-

ish manufacturers. In exchange for elimination of all duties on American iron brought into England, the Iron Act of 1750 banned the new construction of any of these operations in the colonies.

No one on either side of the Atlantic was satisfied with the 1750 act. British manufacturers wanted existing colonial mills shut down, and colonial entrepreneurs saw the regulation that barred them from tapping into an expanding market for goods as unfair. In the end, the inability of the British government to enforce the act made it essentially moot. American iron manufacturing had come too far in the half-century prior to 1750 to stop cold. Colonial ironmasters took the stance that, rather than fighting for the repeal of the act, they would ignore it. Not only were preexisting iron mills underreported by at least 75 percent, between 1752 and 1775 five new steel furnaces, five naileries, four slitting mills, three plate mills, and three wire mills were built in Pennsylvania alone. In the mainland colonies as a whole, more than sixty operations made illegal by the Iron Act of 1750 were constructed in defiance of parliamentary regulation.

Independence requires both a belief and a practical demonstration that one can stand on one's own. In the business of iron manufacturing in British America, that belief and demonstration began to appear soon after 1750.

In many ways, both independence and available resources hampered technological expansion in the U.S. iron industry in the half-century after the Revolution. By the early 1790s, Congress regularly passed tariff legislation to protect the iron industry from foreign competition. This kept the price of iron and iron products high enough in the domestic market for U.S. companies to maintain profitable businesses, but most were unwilling to invest capital in newer technologies before the 1840s. The application of steam power technology, expanding in other U.S. industries, was universally ignored in the iron industry for decades. U.S. iron manufacturers held to charcoal blasts long after coke was employed as a cheaper fuel source internationally. The rationale for this was based on the availability of seemingly endless forests on the western frontier. Iron manufacturers generally abandoned older works situated one hundred miles or less from the Atlantic coast and set up newer works to the west—in upstate New York, the Alleghenies of Pennsylvania, eastern Ohio, the northwestern counties of Virginia, and eastern Tennessee—still applying seventeenth- and eighteenth-century techniques.

This attitude damaged the ability of U.S. iron manufacturers to compete effectively in the international iron and steel markets. It was only the rapidly expanding domestic market that allowed iron makers to profit. One of the highest rates of natural increase in the world and high immigration figures swelled the population in the early nineteenth century. Urbanization, particularly after 1815, expanded markets for iron goods for construction as well as potware and utensils.

U.S. iron manufacturers might have continued for decades longer without change had it not been for the advent of railroads. Between 1835 and 1850, it became clear in the first flurries of railroad building that the quantity and quality of U.S. iron was insufficient to meet the needs of expansion. The needs of railroads to tie the growing United States together, along with the realization that forests were a finite resource, forced iron makers to modernize.

IROQUOIS CONFEDERACY In the 1750s the Iroquois Confederacy (or League) comprised 8,500 individuals spread across some forty-five villages and hamlets west of Albany in New York and in northern Pennsylvania. Despite their modest numbers, the Iroquois were powerful players in the struggles for control of the Great Lakes region and enjoyed more success in preserving their cultural viability and territory than most aboriginal societies did south and east of the lower Great Lakes before the War of Independence. Yet, in its wake, Americans forced them

onto reservations in an effort to assimilate the tribes—people and open their lands for Euro-American settlement.

SIX NATIONS SOCIETY

The confederacy began to form around 1450, primarily to end intertribal strife among five member nations, and secondarily to engage in common foreign policies. However, achieving league-wide agreements in external affairs was difficult. Decisions arose out of a consensual political process that incorporated the opinions of most adults, with the result that agreements regularly could not be achieved above the village level, where regional relationships with the outside world dominated people's views.

In the mid-1700s the league embraced the five original confederates—Mohawks, Oneidas, Onondagas, Cayugas, and Senecas—plus the Tuscaroras, an Iroquoian people who fled settler persecution in North Carolina in the 1710s to settle among the Five Nations and become the confederacy's sixth nation in 1722 or 1723. Other aboriginal refugees, such as the non-Iroquoian Tutelos and Delawares, settled among or near the Iroquois and fell under league suzerainty. Beyond tribal divisions, confederacy communities were multicultural: as a result of intermarriage, in-migration, and the adoption of prisoners, various red, white, and black people entered Six Nations society, typically as full members, although some were treated as inferiors. In addition to immigration into Iroquois territory, people emigrated to New France, beginning in the mid-1600s, to live in mission communities along the Saint Lawrence and Ottawa Rivers. Along with other natives, they formed the Seven Nations of Canada, of whom fifteen hundred were Iroquois in the 1750s. Beginning in the 1720s other Iroquois moved west to the Ohio country to form the Mingo nation, which had five hundred to six hundred people by 1750.

Iroquois people primarily were horticulturists who also fished, hunted, gathered, and traded. Through contact with Euro-Americans, they grew foreign crops in addition to such indigenous plants as corn, beans, and squash. Some individuals in the 1700s adopted animal husbandry or worked for wages in the fur trade and in other realms of white-native interaction. The importance of these new activities increased after the American Revolution, and people in the late eighteenth century also turned to lumbering and milling.

By 1750 most Iroquois no longer lived in the stockaded villages of earlier times. Instead they occupied less dense settlements, typically spread out

along waterways. Many individuals, especially toward the east, had begun a process, which would encompass almost all Iroquois by 1800, of abandoning longhouses for smaller, often single-family dwellings that outwardly (and sometimes inwardly) resembled the homes of white settlers. Although the externals of material culture changed dramatically during the colonial and early national periods, core interior beliefs and customs remained strong, with the majority of Iroquois embracing traditional faith and social practices. Nevertheless, Christianity made inroads, particularly among Mohawks, Oneidas, and the Seven Nations of Canada.

COLONIAL STRUGGLES, 1754–1774

In their relations with other natives and with Euro-Americans, the Iroquois wanted to preserve their land, independence, and culture, prevent outsiders from monopolizing their trade (and acquire large quantities of gifts from colonial powers), and exercise some control over other indigenous peoples to prevent them from becoming threatening rivals. They pursued these goals during the first half of the eighteenth century mainly through diplomacy rather than war. For instance, while serving as intermediaries between the crown and the natives of the Ohio country, they gained privileges from the British and inhibited the power of other tribes to compete against the league.

In the Seven Years' War (1754–1763 in America; 1756–1763 in Europe), the Iroquois adopted a military approach to defending their security, especially the Mohawks and Senecas who sided early in the conflict with the British and French respectively because of trade and other associations that they had built up with them over previous decades. However, the British succeeded in improving their standing with the Iroquois during the conflict, largely through the efforts of the crown's superintendent to the Six Nations, Sir William Johnson (c.1715–1774), who worked from his Mohawk Valley estate to cultivate Anglo-aboriginal alliances. Then in 1758 the confederacy as a whole allied with Great Britain, primarily to harness ascending British power to exercise suzerainty over native people in the Ohio country who resented Six Nations interference in their lives and whose emerging regional alliance posed a challenge to Iroquois ambitions. Thus Six Nations forces, including Senecas, participated in the British capture of Fort Niagara in 1759 and in the subsequent move against Montreal that led to the capitulation of Canada in 1760. (As New France foundered, the formerly French-allied Iroquois of the Seven Nations negotiat-

ed treaties with the British to defend their rights and independence.)

In Pontiac's War (1763–1764) many Senecas, and closely allied Delawares, participated in the wider rising against the growing British colonial menace to aboriginal aspirations in the wake of France's expulsion from North America. In contrast, the Mohawks helped white forces suppress the native alliance while the other confederates generally stayed neutral. For their hostility, the Senecas lost land along the Niagara River to enable the crown to secure communications between Lakes Ontario and Erie. Then in the 1768 Treaty of Fort Stanwix, the confederacy united with the British to sell the territory of tribes south of the Ohio River, especially the Shawnee, which had risen in the late war and which had resisted Iroquois efforts to manage its foreign affairs. To make this transaction possible, the Six Nations claimed the region through a tenuous ancient conquest, which white officials agreed to acknowledge. Aside from giving the Iroquois the proceeds of the sale, the treaty opened the region south of the confederacy's heartland for white settlement and thereby reduced the pressure to alienate league homelands, although some losses did occur at the eastern end of the Six Nations territory in New York.

AMERICAN REVOLUTION, 1775–1783

At the outbreak of the Revolution, many Mohawks sided with the crown because of their connections to loyalists through such individuals as the Mohawk matron, Molly Brant (c.1736–1796) and her half-brother, the war and diplomatic chief, Joseph (1743–1807). However, the rest of the confederacy adopted a neutralist stance. Then, in January 1777, an epidemic killed three important league chiefs, which brought confederacy business to a halt until new leaders could be “raised up” to replace them. This problem, combined with the degenerating wartime situation and pressure from the white combatants to join their respective causes, led the confederacy to “cover” its great league council fire and free the member nations to choose their own course of action. The Onondagas opted for neutrality, the majority of Tuscaroras and Oneidas sided with the revolutionaries, and the Cayugas and Senecas joined the Mohawks in a Loyalist alliance. Logic suggested that, as most of the threats to Iroquois liberties came from people associated with the rebellion, the crown offered a better future. London promised to protect aboriginal property and freedom in return for help in suppressing the revolt. Nevertheless, the Tuscaroras and Oneidas, influenced by their pro-rebel missionary, Samuel

Kirkland (1741–1808), chose to support the revolutionaries.

Divisions among the Iroquois had a brutal impact when pro- and anti-Loyalist warriors fought each other at the battle of Oriskany in August 1777. In subsequent campaigning—raiding rebel districts in New York, Pennsylvania, and the Ohio country alongside Loyalist forces to destroy crops and settlements—the crown-allied Six Nations had the greater influence on the course of events. In response, revolutionary armies invaded Iroquois territory in 1779 to knock the confederacy out of the war by burning most of its villages (including those of the neutral Onondagas). Yet even as the rebels forced people to flee from their homes, warriors continued to fight effectively until 1782, when hostilities wound down. During the latter part of the conflict, most Iroquois ended up in squalid refugee camps, with the pro-revolutionaries concentrated at the eastern end of their traditional homelands, and the pro-Loyalists sheltered around Fort Niagara in the west. (Most Seven Nations Iroquois had negotiated peace with the rebels when they controlled Montreal in 1775; but when crown forces reasserted their dominance along the Saint Lawrence River in 1776, most then entered the war on the Loyalist side. The Mingos helped the Loyalists, although they had fought against the British during Pontiac's War.)

The Treaty of Paris of 1783, which ended the Revolutionary War and created the current Canadian-American border, put Six Nations land inside the United States. One-third of the Iroquois in New York chose not to live in the new Republic but moved to Canada, beginning in 1784, to settle at Tyendinaga on Lake Ontario and along the Grand River north of Lake Erie. Modest numbers of others moved to Ohio, either to join the Mingos or to form a separate “Sandusky Seneca” community. (The Iroquois in Ohio later participated in the frontier war of 1790–1795 against the Americans; the rest of the Iroquois fundamentally stayed aloof, believing they would only suffer if they fought the United States.)

THE NEW RESERVATION SOCIETY, 1784–1829

Within a year of the Treaty of Paris, Americans began to force the Iroquois in the United States to give up land and move onto reservations. Tragically, it was the pro-Revolutionary Tuscaroras and Oneidas who first were dragooned into signing away substantial territories. By 1797 all of the Iroquois in New York and Pennsylvania had been restricted to reservations that encompassed only a tiny fraction of their former homelands.

Aside from acquiring territory for settlement, Americans hoped that confining the Iroquois to reservations would lead to assimilation: surrounded by newcomers, the natives would be forced to adopt Euro-American ways of life in a rapidly changing environment. The result was the opposite: reservations, with their small but concentrated populations, became heartlands of aboriginal identity and resistance. Yet they also became economically desolate places where intense levels of alcohol abuse and family violence erupted, symptoms of the oppression and poverty their residents suffered in the 1780s and 1790s.

Toward the end of the eighteenth century, reformers within Six Nations society—and missionaries from without—offered ways for the Iroquois to overcome their problems and make their way in the shifting environment. The most famous reformer was the Seneca prophet Handsome Lake (1735–1815). Beginning in 1799 he demanded that people renounce alcohol, witchcraft, and other vices and exercise moral restraint within a rekindled but reformed indigenous faith. He also promoted Euro-American farming and craft production, not so his people could assimilate (as the missionaries wanted), but so they could achieve economic independence and thereby reject unwanted white influences on their lives. He also preached that Six Nations interests lay in standing aloof from any future hostilities that might occur between Britain and America. Through his and other people's work, the Iroquois rebuilt their society after 1800 to regain some of the prosperity and self-esteem that they had lost since 1775.

In the War of 1812, the Six Nations again pursued actions that they thought best protected their interests. Except for the Mingos, who joined the British, most Iroquois in the United States allied cautiously with the Americans, although many of Handsome Lake's followers remained neutral. In Canada both Six and Seven Nations warriors fought, mainly on the British side, and made an important contribution to defending Canada from U.S. annexation.

After 1815 the Iroquois in both the United States and Canada continued to be pressured to give up land and assimilate. The problem was worse in the United States, where powerful land interests, a flood of newcomers, and the construction of New York's Erie Canal (opened 1825) combined to force the loss of more territory as well as the removal of many Iroquois to British territory or to the West between the 1820s and the 1850s. Yet others hung on, physically and culturally. As a result, Iroquois communities survive not only in Quebec, Ontario, Wisconsin, and Oklahoma, but also in New York, thus making the Iroquois one of the few aboriginal peoples to occupy land in their traditional territory in what is now the eastern United States.

JACKSON, ANDREW Born 15 March 1767 on the rural frontier region called the Waxhaws, located on the borders of North and South Carolina, Andrew Jackson did not represent what many expected in a president. His Scots-Irish immigrant origins, lack of education, and virtual poverty all destined him for the affairs of average men. He was, however, anything but average. With a fiery temper and vaulting ambition, the young Jackson stood out among his peers. Orphaned at the age of fifteen, he could easily have become lost. Instead, Jackson looked to the upper class and strove to join society's elite. He ultimately succeeded and as a result symbolized the possibilities for self-made men.

By the age of thirteen, Jackson had learned the meaning of struggle, duty, sacrifice, and Union because of the American Revolution's impact on his family. Both of his brothers and his mother (his father had died before Jackson's birth) were killed during the conflict. In the war's aftermath Jackson wandered for a time but ultimately settled on the study of law, realizing that it was an entrance to the upper class. While studying, Jackson made important connections that resulted in an offer to serve as public prosecutor for the western district of North Carolina. In 1788 he accepted and traversed the Appalachian Mountains into a new territory that came to be the

state of Tennessee. It was here that Jackson achieved his initial goal of wealth and society. In 1791 he joined the Donelson clan by marrying Rachel Donelson Robards and in doing so aligned himself with a well-respected, landowning family.

In 1795 Jackson served as a delegate to the Tennessee constitutional convention and the next year was elected as the state's first representative to Congress. He served as a U.S. senator in 1797–1798 and then, in 1798, was elected to the judgeship of Tennessee's superior court. In 1802 Jackson achieved election as major general to the Tennessee militia, a position that signified social standing and prestige. It was as military leader that he gained his greatest fame and ultimately opened the door to the presidency.

When the United States declared war on England in 1812, Jackson eagerly awaited his opportunity to repay the injuries he had received during the Revolution. Yet his first actions as commander were not against the British, but the Creek Indians who had utilized the timing of the war to stop American expansion into the Old Southwest. In a series of battles in 1813–1814, Jackson revealed his skill and courage. Subsequently promoted to the rank of major general in the U.S. Army, he proved victorious against the British at the Battle of New Orleans (1815) and in doing so raised himself to the heights

of everlasting fame. The battle itself was won against overwhelming odds. The disciplined, veteran English forces were some of the same troops that defeated Napoleon, and many in both Britain and America expected a swift defeat for the rather meager defenses at New Orleans. Jackson, however, won the day and in doing so achieved the greatest military victory in the young nation's history up to that time. The people sang Jackson's praises and recognized him as a symbol of American greatness.

Just a few years later, in 1818, Jackson was once again ordered to defend the nation's borders, this time against Seminole Indians who engaged in raids on American citizens in Georgia. Jackson's subsequent invasion of Spanish Florida caused controversy because the action violated Spanish sovereignty. Nevertheless many Americans once again heralded Jackson's defense of the nation. His popularity greater than ever, Jackson entered the presidential race of 1824. He was narrowly defeated by John Quincy Adams during a runoff election in the House of Representatives but charged corruption when Henry Clay, who had orchestrated the House voting, was appointed secretary of state. Jackson and his supporters immediately began preparations for the election of 1828, campaigning on a platform of reform and arguing that Jackson was robbed of the presidency. As a man from humble origins who had struggled to gain fame and fortune, Jackson's victory was a symbol of what common men could achieve.

During Jackson's two terms as president, from 1829 to 1837, he oversaw the dismantling of the aristocratic, deferential governmental system created by the founding fathers. He believed that any man of intelligence could serve in governmental office. Such ideas, along with expanding voting rights throughout the nation, ushered in the era of the common man. Jackson continually argued that he was the elected representative of the people and that his job was to protect their interests. Jackson championed his famous veto of a bill to recharter the second Bank of the United States (1832) in such terms, and he beat down South Carolina's attempts at nullification by stressing the importance of Union and the Constitution for the people.

Not everyone loved Jackson, however. Some viewed him as a dangerous military chieftain who threatened the very liberties that he himself heralded. His invasion of Florida violated international law and exceeded orders. His veto of the bank and subsequent removal of federal deposits was viewed as tyrannical. The fact that he vetoed more bills than all of the pre-

vious presidents combined revealed tremendous and, some argued, aggressive power. Even his defense of Union during the Nullification Crisis bordered on mania, charged opponents. The Whig Party called Jackson "King Andrew" and fought what they viewed as dangerous, monarchical power.

Even after his retirement from the presidency, Jackson wielded significant political influence. The masses continued to love him as the nation's hero and at the time of his death on 8 June 1845, cities throughout the nation mourned his loss with the largest outpouring of veneration and respect America had ever witnessed.

JAY, JOHN Born on 12 December 1745, John Jay was an active leader of the Revolution and a key figure in the founding of the nation. During the period of the early Republic he served in Congress, as a diplomat, as chief justice of the United States, and as governor of New York. He was also a co-author of the *Federalist Papers* and president of the New York Society for the Manumission of Slaves.

Jay's grandfather was a Huguenot who had been imprisoned in France before escaping to America. His father, Peter Jay, was a successful merchant; his mother, Mary Van Cortlandt, came from a Dutch patroon family in the Hudson Valley, one of the most aristocratic families in the American colonies. Jay graduated from King's College (now Columbia University) in 1764 and was admitted to the bar four years later. By the eve of the Revolution, he was a prosperous and effective lawyer, who, unlike most New York attorneys, and most members of the wealthy landed gentry, was a committed Whig. In

1774 he increased his status and access to power by marrying Sarah Livingston, daughter of one of the leading families in New Jersey, whose father, William, would be a signer of the Constitution and a governor of his state. The couple would have seven children, including William Jay, a future judge and abolitionist.

In 1774 Jay was elected to New York City's Committee of Correspondence and later as one of the colony's five delegates to the First Continental Congress. Jay was relatively conservative within the Congress, but went along with, and supported, the more radical members who denounced acts of Parliament as "unconstitutional" and urged local militias to arm themselves. Jay drafted the *Address to the People of Great Britain*, which Congress used to justify its radical moves. Here he rejected the idea that Parliament could tax the colonists or subordinate them within the imperial economy. Americans, he asserted, would never become the "hewers of wood or drawers of water" for their English cousins.

Jay had returned to New York by early 1776 and was a member of the colonial legislature. In that position he opposed declaring independence but after July 1776 was fully committed to the Revolution and independence. He helped obtain munitions for the troops, investigate traitors, and organize spies. More important, in 1777 he helped write New York's first constitution. Like many others in the founding generation, Jay had experience with constitution-making well before the United States wrote its constitution in 1787. The New York document of 1777 was the only constitution of the period to have no religious tests for officeholding, reflecting his French Huguenot background and his respect for religious freedom. On the other hand, the constitution also required that foreigners seeking naturalization as citizens of New York renounce allegiance to any foreign "prince or potentate," an anti-Catholic measure that reflected his Huguenot ancestry and his family's memory of Catholic persecution.

With the adoption of the New York Constitution, Jay became chief justice of the state's Supreme Court while at the same time serving as a delegate to the Continental Congress. He was elected president of the Congress in 1778 and helped negotiate the treaty that led to the French alliance. In 1779 Congress made him minister plenipotentiary to Spain, where he arrived with his wife in 1780. This first diplomatic mission for Jay was mostly a failure. Spain refused to give him diplomatic status, recognize the new American nation, or acknowledge Americans' navigation rights on the Mississippi. The government in

Madrid feared—correctly, as it would turn out—that American independence would be the first step leading to the destruction of Spain's New World empire.

In the spring of 1782 Benjamin Franklin asked Jay to come to Paris to help negotiate the treaty of peace with England. Jay declined to formally meet with the English envoys, however, because their credentials directed them to meet with representatives of the American "colonies" and not with the United States. Franklin ultimately joined Jay in taking this position, and the British acquiesced, getting new instructions from London. This position put him at odds with America's French allies, who urged a more speedy negotiation. Jay soon came to suspect that France was attempting to negotiate a separate peace with England, and on his own, without consulting Franklin, contacted an official in Britain to derail this possibility. Ultimately, Jay, Franklin, and John Adams, who had just arrived from the United States, negotiated a separate peace with England that recognized American nationhood and secured rights to all British possessions on the continent south of Canada, including all territory bordering the Mississippi River. The skillful negotiations of Jay, Adams, and Franklin led in 1783 to the comprehensive Treaty of Paris signed by Britain, France, Spain, and the world's newest nation, the United States of America.

Jay triumphantly returned to his homeland and was immediately appointed secretary for foreign affairs in the government under the Articles of Confederation, which had been ratified in his absence. This made the American ministers to France (Thomas Jefferson) and England (John Adams) his subordinates. Despite the weakness of the Confederation government, in 1786 Jay negotiated a trade agreement with Spain, known as the Jay-Gardoqui Treaty, in which the United States agreed to give up any navigational rights on the Mississippi for thirty years. This was perhaps Jay's greatest mistake in this period, because it infuriated Southerners, who believed the New Yorker had sacrificed their vital interest in access to the Mississippi in return for trading rights that helped only the Northeast. Congress did not ratify the treaty, but Southerners continued to mistrust Jay for the rest of his career.

Throughout the convention period Jay remained frustrated by the weakness of the national government. Thus he enthusiastically supported the Constitutional Convention of 1787, although he was not a delegate. After the convention he joined James Madison and Alexander Hamilton in writing essays to gain support for the new Constitution in New York. These became *The Federalist Papers*. Jay became

ill shortly after the project began and wrote only five of the essays. When the Constitution was ratified, the new president, George Washington, nominated Jay to be the first chief justice of the United States. He held that post until 1795, but his legacy was minimal. His most important decision, in *Chisholm v. Georgia* (1793), in which he interpreted the Constitution to allow a citizen of one state to sue another state, outraged almost all the states and led to the Eleventh Amendment (1798), which reversed this ruling.

More significant than his jurisprudence was Jay's diplomacy. In 1793 he drafted Washington's Proclamation of Neutrality as war broke out in Europe. In 1794 he went to England at Washington's request and successfully negotiated what became known as Jay's Treaty. Under this treaty England finally vacated forts on the American side of the Great Lakes; the treaty also helped the United States obtain British support for access to the Mississippi. However, the settlement signaled a tilt toward Britain in its emerging conflict with France, and supporters of Jefferson attacked it as pro-British and pro-North. Ultimately, however, the Senate ratified most of the treaty.

While in England Jay had been elected governor of New York, and when he returned to the United States he resigned from the Supreme Court to become chief executive of his home state. He held this position for two terms, retiring in 1801. While governor he signed into law a gradual abolition act (1799) that led to the end of slavery in the state. In 1800 he refused to follow Hamilton's suggestion that he alter the way the state chose its presidential electors, in order to secure the electors for Adams. The end result was that New York, and the election, went to Jefferson. The lame duck Adams offered the chief justiceship to Jay, but he declined. Adams then gave the position to John Marshall. Jay then retired to his home in Westchester County, after more than twenty-five years of public service at home and abroad. He died 17 May 1829.

JAY'S TREATY Negotiated and signed in 1794, Jay's Treaty attempted to resolve several diplomatic and commercial issues between the United States and Great Britain. As Britain and France warred with each other beginning in 1793, the United States found itself being drawn into the fray although it tried to remain neutral, maintaining trade with both belligerents. Britain secretly disrupted and seized over three hundred U.S. ships and a furious America demanded a diplomatic mission to that nation. In April 1794 Chief Justice John Jay was appointed envoy with instructions to seek indemnification for British seizures of American ships, fulfillment of all the unfulfilled elements—especially the evacuation of western posts—of the 1783 Peace of Paris treaty, and a more liberal interpretation of neutral rights. Some southerners wanted Jay to request compensation for slaves that had been carried off by the British during the Revolutionary War. Jay and the administration of President George Washington believed they were negotiating from a position of weakness and so could not press too hard on any of these points. Negotiations continued sporadically throughout the spring and summer of 1794 until a treaty was signed on 19 November 1794.

The treaty's twenty-eight articles addressed most of the issues the mission was designed to accomplish. The second article secured British troop withdrawal from the western posts on or before 1 June 1796 as had been promised in the 1783 treaty. The treaty also established four commissions to investigate and resolve disputed issues, such as the debts owed to British merchants by American citizens and compensation for losses for U.S. ships seized by the British. Most problematic was article 12, which granted the United States access to the West Indian trade but only in vessels of seventy tons or less, an almost insulting condition that would severely restrict and limit trade.

Jay believed that he had obtained the best terms possible at the time and subsequent historians, while noting the weaknesses, have largely agreed. The United States was unable to force compliance from the British and unwilling to risk a serious rupture between the two nations. The treaty failed to gain recognition of America's neutral rights in shipping or compensation for slaves carried off during the Revolution, and it did not address the matter of impressment or compensation for slaves. Still, comparing Jay's instructions to the final product, he did reasonably well.

The treaty was sent to the Senate, which debated it in secret, rejected the controversial twelfth article, and on 24 June 1795 ratified the document by a 20 to 10 vote, exactly meeting the required two-thirds majority. Before the administration could publish the treaty, Republican anti-treaty newspapers had printed an extract of the leaked document and then the full text. Publication provoked furious, sometimes violent, protests by opponents who charged that the treaty was a sellout to Britain, willingly placed the United States in a subservient position to that nation, and further solidified American ties to a country many believed to be corrupt and dangerous. Despite the public protests, President Washington signed the treaty in late August 1795 and many of the protests died down. They were revived in the spring of 1796 when the House of Representatives took up the matter of funding the commissions created by the treaty. After several weeks of intense debate and against a backdrop of petitions cascading into the House—most of them now favoring approval of the treaty—the House acted in a series of close votes on 30 April 1796 to fund the treaty.

As its negotiators had hoped, the treaty strengthened commercial relations between the United States and Britain and preserved peace between the two nations even as it intensified partisan politics in the former. However, it infuriated the French, who felt betrayed by the U.S. decision to side with Britain against its Revolutionary War ally. Consequently, it was the French who stepped up attacks on U.S. ships and violations of American neutrality in the late 1790s, heightening tensions between the erstwhile allies and culminating in the Quasi-War with France in 1798.

JEFFERSON, THOMAS Thomas Jefferson (13 April 1743–4 July 1826) was the most gifted writer among the founding fathers. He was, among other things, the principal author of the Declaration of Independence, governor of Virginia, minister to France, secretary of state, vice president, president, founder of the University of Virginia, president of the American Philosophical Society, naturalist, architect, and philosopher of democracy. A sentence from his prologue to the Declaration has become a sacred text for Americans and many others: "We hold these Truths to be self-evident, that all Men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty, and the Pursuit of Happiness."

Jefferson's father, Peter, was a pioneer of Albemarle County, Virginia, a successful planter, surveyor, lieutenant of militia, and member of the General Assembly. He died when Thomas was fourteen, leaving a fine estate, a small library, and an example of personal distinction. Less is known about the talents of his wife, Jane Randolph, who belonged to one of the most prominent families in Virginia. Young Thomas was blessed with advantages and opportunities available to very few of his contemporaries. What set him apart even among those few was the remarkable use he made of them. Well prepared through his own appetite for study and the guidance of the Reverend James Maury, Jefferson in 1760 entered the College of William and Mary in Williamsburg, Virginia. His wide learning, musical abilities, polished manners, and active mind won him the friendship of the lieutenant governor and de facto governor, Francis Fauquier and two outstanding teachers, William Small (mathematics) and George Wythe (law).

After college, Jefferson returned often to Williamsburg, studying and then practicing law. Beginning in 1769 he sat in the House of Burgesses. In 1772 Jefferson married a young widow, Martha Wayles Skelton, who brought land and slaves in abundance, but also debts that would plague Jeffer-

Thomas Jefferson. The third president of the United States, in an engraving by Charles Balthazar Julien Févret de Saint-Mémin. Jefferson sat for this portrait by Saint-Mémin in 1804. LIBRARY OF CONGRESS.

son for the rest of his life. The newlyweds settled in a cottage on the little mountain near Charlottesville that would eventually be world famous as Jefferson's Monticello. Martha Jefferson died after ten years of marriage and six children. Three daughters survived her: Martha (Patsy) and Mary (Polly, Maria), who would live to marry and have children, and Lucy, who lived less than three years.

JEFFERSON AND THE AMERICAN REVOLUTION

Jefferson's political fame spread beyond Virginia in 1774 with the publication of his pamphlet, *A Summary View of the Rights of British North America*. He argued, powerfully if not quite accurately, that England's colonists had settled, developed, and defended their American homes with their own lives and treasure and were under no obligation to accept taxation from an imperial government already enjoying great profits from commerce with the colonies. Jefferson's literary powers earned him membership in Virginia's delegation to the Second Continental Congress meeting in Philadelphia in 1775. Before departing he helped draft a plan for organizing the militia of Virginia and wrote a firm reply to Lord North's proposal for peace, based on submission to parliamentary taxation. In Philadelphia he collaborated with John Dickinson on *A Declaration of the Causes and Necessity of Taking Up Arms* (1775). In June 1776 he became the principal draftsman of the Declaration of Inde-

pendence. Benjamin Franklin and John Adams modified it slightly; the full Congress eliminated an entire section that denounced the slave trade and blamed the King of England for continuing it. Historically the charge was doubtful, and many members of Congress owned and traded slaves.

For the next several years Jefferson labored in Virginia. Resuming membership in the House of Burgesses, he served with George Wythe and Edmund Pendleton in undertaking a thorough revision of the laws of Virginia. Jefferson succeeded immediately in abolishing the entailing of landed estates, a practice tending toward hereditary aristocracy. He also moved to abolish primogeniture, but that reform had to wait several years before Madison and other allies accomplished it. That was also true of Jefferson's Statute for Religious Freedom (1786), which completed the disestablishment of the Church of England in Virginia and guaranteed that all religious organizations would be voluntary and separate from government. The assembly rejected Jefferson's proposals for universal public education, for reducing suffrage requirements, and for representation on the basis of population. He succeeded, however, in liberalizing the criminal code. Though Virginia's slave code remained much as it had been in colonial times, the state did outlaw the further importation of slaves in 1778. Jefferson also reported, in his book *Notes on the State of Virginia*, completed and first published in France in 1785, that he drew up a proposal for the gradual emancipation and deportation of Virginia's slaves. But this proposal never came before the assembly.

In June 1779 Jefferson followed Patrick Henry as governor. Virginia's constitution gave very little independent authority to its governor, whom the General Assembly elected for one-year terms, with three consecutive terms the maximum allowed. During his two terms, Jefferson was able to support George Rogers Clark's military successes in the West and managed to send some Virginia forces to the defense of the Carolinas. Unfortunately, a series of British invasions overtaxed the resources of the state. Jefferson spent much of his time searching for arms, supplies, and manpower while moving state papers and military supplies from one place to another, trying to evade British troops. Considering that his fellow Americans had been unable to hold New York City, Philadelphia, Charleston, or several other key positions, Jefferson's military failures were fairly typical of the Revolutionary War, but some legislators demanded an inquiry into his actions. Vindicat-

ed but still offended, Jefferson refused the third year offered to him.

Jefferson's retirement in June 1781 proved relatively brief and was marred by the death of his wife in September 1782. Though immobilized with grief for several weeks, Jefferson soon agreed to serve again in the Continental Congress. In only five months his legislative achievements were remarkable. He worked out the plan for U.S. currency that has been the basis of American money ever since: a decimal system based on the Spanish dollar. He developed plans for the survey and future government of the western territories ceded by various states. His two ordinances of 1784—Congress adopted one, concerning local self-government and the means toward statehood, but rejected the second, dealing with land surveys and sales—were changed in many details by the Land Ordinance of 1785 and the Northwest Ordinance of 1787, both written when Jefferson was in France. But most of the essential principles originated with Jefferson, including the rights of people to form states that, once admitted to the Union, would be equal to the original thirteen. Jefferson, following a suggestion from Timothy Pickering, wished to prohibit slavery in all western territories after 1800; the Northwest Ordinance prohibited slavery immediately, but only north of the Ohio River.

MINISTER TO FRANCE

In July 1784 Jefferson left for France to assist in the drafting of commercial treaties with European powers. In 1785 Congress made him U.S. minister to France; Benjamin Franklin, seventy-nine and in declining health, was eager to return home. In Paris, Jefferson enjoyed a commodious dwelling, a French cook, a growing circle of political and philosophical friends, and sufficient leisure to travel. He completed his only book, *Notes on the State of Virginia*, intended for European philosophers and printed privately in an edition of two hundred copies. A pirated edition appeared in Philadelphia in 1788, somewhat embarrassing the author for its severe strictures on slavery and slaveholders. Jefferson also enjoyed a long flirtation with an English painter, educated and steeped in Italian culture, Mrs. Maria Cosway. As a diplomat Jefferson tried vigorously to advance the interests of the United States, but was frustrated by the fact that neither he nor the Congress could bind individual states to commercial agreements with foreign nations. He was also furious that Congress, lacking a navy, had to pay protection money to Morocco and other Muslim states in North Africa to permit Amer-

ican merchant ships to sail in the Mediterranean Sea. Corresponding with friends in the United States, Jefferson criticized certain aspects of the Constitution of 1787. However, his experience in France caused him to advocate a far stronger government for the United States, with powers to pass and enforce commercial regulations and a power of taxation sufficient to build and maintain a navy as well as guarantee the security of western territories. Before leaving France in October 1789, Jefferson enjoyed witnessing and playing an advisory role in the early stages of the French Revolution. His close friendship with the Marquis de Lafayette enabled Jefferson to contribute advice on the Declaration of the Rights of Man (1789) and other matters.

SECRETARY OF STATE AND VICE PRESIDENT

Expecting to return to his diplomatic post in the spring of 1790, Jefferson was surprised when President George Washington nominated him secretary of state in September 1789. Jefferson accepted and, assuming the post the following March, became an actor in most of the great political events and controversies of the next eighteen years. The new government began its career in New York City, where Jefferson joined his friend Madison in brokering a political deal in mid-1790: a few less Virginia votes against the assumption scheme of Secretary of the Treasury Alexander Hamilton (the federal government would assume responsibility for all state debts incurred during the Revolution) in exchange for a few Pennsylvania votes supporting the permanent location of the U.S. capital on the Potomac River. Before moving to the Potomac, however, the government would settle in Philadelphia for ten years.

Jefferson and Madison came by degrees to oppose the policies of Hamilton, who they believed exerted an improper influence on Washington. In fact, Hamilton's view of things had long been more in harmony with Washington's than with theirs. When Hamilton late in 1790 asked Congress to charter a National Bank, Jefferson argued that the Constitution gave no such authority to Congress. Hamilton advocated conciliatory diplomacy with Britain; Jefferson preferred strengthening the alliance with France while taking a tough line against Britain and Spain. In 1791 Jefferson hired Philip Freneau as a translator in the State Department, but his real job was editing an anti-Hamilton—and eventually an anti-Washington—newspaper, the *National Gazette*. Jefferson shared confidential papers with Freneau and ghostwrote some of his material. This was part of a larger policy of organizing an opposition party,

the Democratic Republicans, from whom Jacksonian Democrats later claimed direct descent.

Following the creation of a French republic, Jefferson advocated immediate recognition and meeting scheduled debt payments, while Hamilton urged delay and caution. President Washington took Jefferson's position, maintaining diplomatic relations with France. However, when France declared war on England, Washington issued a Proclamation of Neutrality (1793). In Jefferson's view, this gave protection to Britain without requiring any reciprocal concessions. The energetic new French diplomat, Edmond Charles Genet spent much of 1793 using the United States as a base for attacks on Spanish territory and British shipping. This was too much even for Jefferson; he had to spend much of his last year as secretary of state restraining Genet and trying to repair the damage done to Franco-American relations. He hoped that his final *Report on Commerce* would move Congress to take a firmer line against British trade restrictions, and encourage increased trade with France.

Jefferson resigned at the end of December 1793, weary of partisan politics and eager to look after his family and estates. Since 1784 he had spent but a few months of vacation at his beloved Monticello. He maintained an extensive political correspondence, however, and in 1796 became his party's candidate for president against Federalist John Adams, Washington's vice president. Under the terms of the Constitution in its original form, the odd result was Jefferson's serving a full term as vice president under his increasingly bitter rival, Adams, having received the second-highest number of electoral votes. Jefferson was discreet about his opposition. Many years passed before the world learned that he had written the Kentucky Resolutions of 1798, claiming the right of a state to nullify acts of Congress that were unconstitutional—in this case the Alien and Sedition Acts (1798). In public, he was a model vice president, systematizing the Senate's procedures with rules that are still in use.

PRESIDENT

The election of 1800 produced an unexpected result when Jefferson and Aaron Burr received the same number of votes in the electoral college. This threw the election into the lame-duck, Federalist-controlled House of Representatives. Burr, whose probably treasonable acts were still in the future, appeared a preferable candidate to many Federalists, so a deadlock persisted from 11 February to 17 February 1801. Finally, on the latter date, two Federalists—

possibly influenced by Hamilton—stopped voting for Burr, permitting Jefferson's victory. Hamilton had the satisfaction of seeing Jay's Treaty (1794) honored until its term (and Hamilton himself) had expired. Jefferson also retained the Bank of the United States, which established additional branches under the new secretary of the Treasury, Albert Gallatin of Pennsylvania.

Jefferson's first term was extremely successful. Trade expanded, Ohio entered the Union as a state in 1803, the Indiana Territory grew, revenues improved, and expenditures were reduced. A serious crisis in relations with France ended spectacularly when Napoleon sold the vast Louisiana Territory to the United States (1803). Instead of continuing the practice of paying bribes, Jefferson sent a small fleet to the Mediterranean in 1801, eventually forcing the pasha of Tripoli, by a treaty in 1805, to leave American commerce alone. The Lewis and Clark Expedition (1803–1806), originally conceived as military reconnaissance, turned into a valuable exploration of new U.S. territory. Congress repealed the tax on distilled liquors and the Federalists' lame-duck Judiciary Act of 1801, which created judgeships for many otherwise unemployed politicians. The Twelfth Amendment, ratified in 1804, provided that the president and vice president should be elected separately. During the same year, Congress removed an incompetent federal judge, John Pickering of New Hampshire, by impeachment in the House and conviction in the Senate. An attempt to remove a justice of the Supreme Court, Samuel Chase of Maryland, failed. Chase had proved anything but impartial when presiding over a trial under the Sedition Act. But while he was impeached late in 1804, early the next year his opponents failed to muster two-thirds of the Senate to convict. Meanwhile, Jefferson was not amused by Chief Justice John Marshall's assertion of the Supreme Court's right to nullify federal laws (euphemistically known as judicial review) in *Marbury v. Madison* (1803).

Jefferson won the election of 1804 in a landslide victory, with fair hopes for a second term as successful as his first. It was not to be. At war once more, France and Britain each tried to prevent the United States from trading with the other. Because thousands of British sailors sought safer and higher-paid employment with the commercial ships of the United States, the British navy increasingly stopped American ships on the high seas and impressed sailors they identified, correctly or not, as British subjects. Failing to secure recognition of neutral rights from the belligerents and following the attack of a

British warship on the new, not fully fitted United States frigate *Chesapeake* (22 June 1807), Jefferson resorted to an embargo, lasting from 22 December 1807 to 15 March 1809. Unfortunately the United States suffered more from this measure than either France or Britain. Another distraction was Aaron Burr's western conspiracy, his arrest in 1807, and his trial for treason later that year, at which he was acquitted. Historians still dispute Burr's intentions, if indeed he ever had a distinct plan. However, it is known that he proposed to a gullible British minister a plan for separating the western states from the United States and sought money from Spain to engineer a coup d'état in Washington, D.C. John Randolph of Virginia, a pillar of strength in the House of Representatives during Jefferson's first term, became a caustic and persistent critic of the administration during the second. Nevertheless, James Madison easily won the election of 1808.

THE SAGE OF MONTICELLO

Jefferson enjoyed an active retirement. He continued to maintain an extensive correspondence, notably with a reconciled John Adams. Perfecting Monticello occupied him, as did designing an elegant, new, octagonal house for his Poplar Forest plantation. Jefferson wished his grandson Francis Eppes, the only child of Polly, who had died young, to inherit Poplar Forest; he designated Monticello for the most accomplished of Patsy's children, Thomas Jefferson Randolph. The University of Virginia was Thomas Jefferson's last major achievement. He cajoled funds from the General Assembly, chose the location in Charlottesville, designed the buildings, and recruited faculty. The nation noticed with awe that Jefferson and John Adams died on 4 July 1826, the fiftieth anniversary of the Declaration of Independence.

Jefferson opposed any sort of hereditary privilege or established religion; he also advocated the free exchange of ideas, natural science, universal education, and political democracy. In other respects he was not so progressive: he thought freedom would last only so long as Americans owned and worked their own farms; he thought himself a friend of Native Americans, but ran them off their land as fast as any president before or since; he wrote eloquently about the evils of African American slavery, but did nothing effectual to limit its growth after 1800, let alone to begin its unwinding. There was one notable exception: he secured from Congress and promptly signed a law as soon as the Constitution permitted outlawing the importation of foreign slaves (1808).

Recent DNA evidence has given added credence to the story that Jefferson was the father of the children of his slave Sally Hemings. Although Jefferson brushed the charge off when it was first made in 1802 by the journalist James Thomson Callender, it long circulated in abolitionist circles and in the black community, as well as among those who claimed descent from Jefferson and Hemings, including one of Hemings's sons, Madison, who told his family's story in his 1873 memoirs. Sally Hemings was the half-sister of Jefferson's deceased wife and both the daughter and granddaughter of white men. Her children with Jefferson were seven-eighths white, making them legally white at the time, but still legally Jefferson's slaves. Presumably in accordance with the pledge he made their mother, Jefferson freed Hemings's four surviving children when they reached the age of twenty-one, and after his death, Jefferson's daughter Martha quietly freed Sally Hemings as well.

LEGACY AND ICONOGRAPHY

Thomas Jefferson's incomparable phrases have been repeated for over two centuries: by Whigs and Democrats, by the new Republicans of 1854 and by the founders of the Confederate States of America, by capitalists and communists, and by segregationists and integrationists. His benign pronouncements can be claimed by virtually anyone. On other points his messages remain clear. He favored reason over revelation, feared religious establishments, promoted natural science, advocated education at all levels, and favored the fine arts. His actual practices regarding freedom of the press were no better than those of his contemporaries, but his pronouncements in favor of intellectual freedom ring through the ages.

The spirit of Jefferson illuminates his restored mansion and plantation at Monticello and the buildings he designed for the University of Virginia, two miles away in Charlottesville. Poplar Forest has also been restored and is now open for visitors; it is located near Lynchburg. Jefferson sat for many portraits, which have been reproduced in countless books and prints. Among the finest are those of Mather Brown (1786; National Portrait Gallery, Smithsonian Institution); Charles Willson Peale (1791; Independence National Historical Park, Philadelphia); Rembrandt Peale (1800; White House); Gilbert Stuart (1805; Colonial Williamsburg); and Thomas Sully (1821; American Philosophical Society, Philadelphia). Jean-Antoine Houdon executed a fine marble bust in 1789 (Museum of Fine Arts, Boston). On the bicentennial of Jefferson's birthday, 13 April 1943, the United

States dedicated the Jefferson Memorial on the banks of the Potomac River in Washington, D.C. John Russell Pope captured Jefferson's own style in the architecture, and Rudolph Evans executed an imposing bronze statue, nineteen feet tall. Jefferson's likeness is rarely seen on paper money: someone assigned him to two-dollar bills. This neglect is redeemed by the five-cent coin, with its fine profile of Jefferson on one side and his home at Monticello on the other.

population had risen only slightly, numbering between four and six thousand. Many Jews converted to Christianity since they could not marry outside the faith and retain it. An astonishing 40 percent never wed. Other Jews were isolated merchants in smaller towns or were frontier traders.

By the 1790s Jews could vote in all states and hold public office in most states. Maryland explicitly granted them that right in 1826. They ensured this through service in the Revolution and their subsequent endorsement by George Washington. When the synagogues congratulated him on his election as president, he responded that "it is now no more that toleration is spoken of as if it was by the indulgence of one class of people that another enjoyed the exercise of their inherent natural rights. . . . The Government of the United States gives to bigotry no sanction, to persecution no assistance." Prominent Revolutionary Jews were Mordecai Sheftall (1735–1795), who headed Savannah's Revolutionary committee; Major Francis Salvador (1747–1776) of South Carolina, killed early in the war, who served in the Provincial Congress; and Haym Salomon (1740–1785) of New York and later Philadelphia, who gave large sums of money to the new Republic and negotiated much of its foreign exchange. A brigade from Charleston, South Carolina, that included twenty-six Jews ("Lushington's" or "the Jews' brigade") acquitted themselves nobly when the British besieged Savannah in 1779. David Salisbury Franks was an aide to General Washington and later negotiated the United States' first treaty with Morocco.

Anti-Semitism far out of proportion to the presence of Jews was a feature of American political life before 1800. Foreign-born clergy and newspaper publishers whose loyalty to the nation was suspect were leaders in projecting their own marginality onto Jews. During the 1790s, anti-Semitism shifted from anti-Federalist to Federalist hands, as the Jews almost unanimously supported the French Revolution, which granted them full equality, and hence Jefferson's party, which supported that revolution. Jews joined and were leading members of the Democratic Societies and later the Republican Party in several cities. Even practicing Christians, such as Israel Israel and his son John, two prominent Pennsylvania leaders, were objects of anti-Semitism, since it was thought that they could abandon Judaism as a faith but not their Jewish ethnicity. With Jefferson's election to the presidency in 1800, anti-Semitism died out in public debate. Jefferson appointed Jews to office, although he despised Jews who clung to the formalities of a religion he considered superstitious.

JEWS There were few Jews in the early Republic. They numbered between thirteen hundred and three thousand in 1790, and only seven communities—Newport, Rhode Island; New York City; Philadelphia and Lancaster, Pennsylvania; Richmond, Virginia; Savannah, Georgia; and Charleston, South Carolina—had the requisite minyan, or ten men, to hold services. By 1830 the Newport and Lancaster congregations had gone out of existence, and the Jewish

Although they were few in number, by the early 1800s German and Central European Jews (Ashkenazim) had established separate synagogues in several cities. Largely poorer immigrants who came to America after 1760, they chafed under the power of the earlier, wealthy Jewish communities that followed the Sephardic ritual and perpetuated their leadership through self-selection of ruling elders. The newcomers differed in appearance, wearing beards and robes, from the assimilated elite whose numerous portraits are indistinguishable from those of gentiles.

Both groups, however, strictly observed rituals and holidays, performed lengthy services in Hebrew that few could understand, and restricted burials to members in good standing. Young, secularized men in the new Republic sought the religious self-government and comprehensible ritual of their Protestant neighbors: the first Reformed Jewish congregation was founded in 1824 by Isaac Harby (1788–1828), although few followed before the Civil War. Like Americans in general, Jews—wherever they were sufficiently numerous—also established charitable and fraternal orders. The most visible Jew of the early Republic was Manuel Mordecai Noah (1785–1851). A controversial figure who served as consul to Tunis and high sheriff of New York City, he fought a duel in Charleston, tried to combat anti-Semitic stereotypes with his plays on the New York stage, was an early Zionist, and planned a rural colony for Jews on Grand Island, south of Niagara Falls, that never attracted his urban coreligionists. Naval captain Uriah Levy (1792–1862) also fought a duel and was a focus of attention for his ultimately successful campaign to abolish flogging. Merchant Judah Touro (1775–1854) of New Orleans was one of the nation's leading philanthropists; he donated ten thousand dollars to help finish the Bunker Hill Monument and gave hundreds of thousands to numerous Christian as well as Jewish charities throughout the nation. Philadelphia's Rebecca Gratz (1781–1869) and her Christian beloved, Samuel Ewing, refused to marry outside their respective faiths; she became the model for Rebecca in Sir Walter Scott's *Ivanhoe* (1819) and was known throughout Europe and America for her beauty as well as her philanthropy. In the early Republic, Jews were so few in number compared to other groups like the Irish and Germans that following the Federalists' defeat, they attracted little attention until large numbers began to arrive in the 1840s.

JUDAISM A minute percentage of the population of early America, Jews settled primarily in seaport towns, New York, Philadelphia, Newport, Charleston, and Savannah during and after the colonial era and Richmond and Baltimore during the late 1700s and early 1800s. A handful resided in rural sections of New York, New Jersey, and Pennsylvania. In each of the towns in which they settled, their first communal religious action was the acquisition of land for a cemetery. Traditional Jewish religious law requires burial in ground surrounded by a wall or a fence, thereby creating an enclosure in which only Jews are interred. In New Amsterdam, mainland North America's earliest Jewish colonists acquired land for a cemetery in 1656 and twenty-six years later, in 1682, the reappearance of a small Jewish presence in New York necessitated purchase of cemetery land a second time. Subsequently, wherever a new Jewish community took root, consecration of a cemetery connoted the permanent appearance of the Jewish religion in that new location.

SYNAGOGUES AND RITES

By contrast, synagogues were constructed long after a Jewish presence developed. Because traditional Jewish law permits communal worship in virtually any location, congregations gathered at first in private homes or in homes rented for services, waiting many years, or until the community deemed itself sufficiently well established, to build houses of worship. In New York, for example, services were held in a private home as early as the 1690s, and they continued to be held privately for a generation. It was not until 1728 that the congregation embarked upon construction of a synagogue, dedicating it for use in 1730 and subsequently adding a ritual bath, a school, quarters for a hired caretaker, and a booth for the autumnal festival of Sukkoth (Festival of Booths). Similarly in Philadelphia, a Jewish commu-

nity began to form during the late 1730s, but its members did not construct a synagogue until 1782, while in Charleston and Savannah synagogues were not erected until 1794 and 1820, respectively. In Newport, however, action was swifter. A new Jewish community emerged there during the 1740s and early 1750s, and it had formulated plans for a synagogue by 1754; it broke ground for the synagogue in 1759 and began to worship in it in 1763, although the congregants were unable to complete the structure until 1768.

Whether within the private home or later in the synagogue, the Sephardic rather than the Ashkenazic rite was the one that the congregations followed. Most of the Jews who settled in the colonies during the seventeenth century were Sephardim, that is, the descendants of Jews who originated in Spain and Portugal. While Ashkenazim, or Jews who originated in central and eastern Europe, also appeared in America during the seventeenth century, the small population was preponderantly Sephardic. Consequently, the Sephardic rite became the American rite, and it continued to prevail until the 1820s, despite the fact that, as early as 1720, Jews of Ashkenazic descent were in the majority. Notwithstanding their larger numbers, the Ashkenazim accepted the Sephardic system of worship in keeping with another fundamental principle of religious law, namely, that established custom has the status of law as long as the custom in question conforms to the norms of Jewish *halacha* (traditional religious law). The Ashkenazim may well have maintained their own customs and traditions within the privacy of their homes, but at communal worship they adhered to the Sephardic rite. Signs of conflict among early American Ashkenazim and Sephardim surfaced in Charleston and Philadelphia late in the eighteenth century and again in New York around 1820, leading in 1825 to the creation of the first congregation in North America to follow the Ashkenazic rite. The Ashkenazic ritual became the norm thereafter throughout the United States, owing to a large influx of Jews from central and eastern Europe after 1820, although the congregations that dated to the colonial period continued to adhere to the Sephardic tradition.

TRADITION: ENFORCEMENT AND DEVIATION

In their spiritual lives and in questions pertaining to the legal and customary requirements of normative, traditional Judaism, early American Jews did not have the guidance of trained rabbis. Unlike their counterparts in the Caribbean colonies belonging to

Britain (Jamaica and Barbados) and the Netherlands (Curaçao), Jews in mainland North America did not secure the employment of ordained rabbis, and there is no indication in surviving records that they even attempted to obtain such expertise. Save for several brief visits by rabbis from abroad, and with the additional exception of requests for rulings that were directed to rabbinic authorities in London and Amsterdam, the Jews of North America were largely on their own. Judaism in early America was therefore almost entirely defined and maintained by laypersons.

That they endeavored to enforce compliance with traditional Jewish beliefs and practices is evident from the disciplinary methods the leaders of the Jewish community employed. These ranged from a simple admonition to withholding honors in the synagogue, expulsion from membership, and denial of the right to burial in the community's cemetery. In theory, the leadership could also have imposed the *herem*, or excommunication, a severe penalty that required members of the community to shun the punished individual not only in the synagogue but outside as well, commercially and socially. In practice, however, the sanction of excommunication appears to have been rarely invoked.

The fact that such disciplinary methods were believed to have been necessary reflected the extent to which some American Jews as early as the mid-eighteenth century deviated from tradition in their private lives. There were no organized attempts to reform Jewish law and practice prior to 1824, when a group within the community in Charleston proposed to revise the synagogue service and then, between 1825 and 1833, congregated separately and formulated a prayer book that introduced a number of theological reforms. Moreover, there is little to suggest that Enlightenment skepticism and rationalism provoked dissent from Orthodoxy (a term that was not employed until the late nineteenth century). Nevertheless, tendencies to abandon strict Sabbath, festival, and dietary laws did exist, although many early American Jews were scrupulous in their fidelity to tradition. Deviations that occurred among the traditionalists are attributable not to intent but, rather, to the absence of rabbinic authorities in America who could resolve questions of Jewish law and who could provide adequate instruction to a Jewishly undereducated laity.

JUDICIAL REVIEW In the years preceding the U.S. Supreme Court's ruling in *Marbury v. Madison* (1803), Americans gradually came to accept the notion that courts could in certain instances strike down laws as contrary to a constitution. They formulated a rationale for *judicial review* (a term coined in the twentieth century) that drew upon several interrelated ideas, including fundamental law, written constitutions, popular sovereignty, and the separation of powers. Eighteenth-century Americans firmly believed that the acts adopted by their legislatures should conform to some unwritten "higher" or "fundamental law," variously referred to as divine or natural law; the immutable standards of reason, morality, and justice; or the principles embodied in the British constitution. Unwritten fundamental law was not the kind of law that judges were particularly qualified to enforce, however, because it was too general and amorphous to accommodate itself to judicial interpretation. After 1776, however, Americans began to identify fundamental law with the written constitutions that accompanied the establishment of their new state governments. These constitutions provided the concreteness and specificity of written documents that were the staple of judicial exposition. In time, written American constitutions, including the U.S. Constitution, came to be framed and adopted by conventions elected for the purpose. A constitution so formed was perceived to be more than a plan of government but a "law" enacted by the supreme legislative power, the sovereign people. It was a law of superior obligation, imposing limits upon government that were to be obeyed in the same way citizens obeyed ordinary laws.

The concept of supreme law as the original and deliberate act of the people was the indispensable basis for a theory of judicial review compatible with popular government. In the emerging American doc-

trine of separation of powers, legislature, executive, and judiciary were joined together in an equality of subordination to the people. The judiciary, in consequence, could plausibly claim that to uphold a constitution was to preserve and enforce the people's permanent will. To void an act as contrary to a constitution was not an encroachment upon legislative power but a legitimate exercise of the judiciary's province to declare the law.

Before 1803 state and federal courts explicitly or implicitly endorsed the doctrine of judicial review; for example, *Bayard v. Singleton* (1787), a North Carolina case, and *Hylton v. U.S.* (1796), in the U.S. Supreme Court. The most articulate defense, however, was undertaken by Alexander Hamilton. Writing as Publius in *The Federalist* No. 78 (1788), Hamilton set forth the essential elements of the doctrine: the Constitution was a written fundamental law enacted by the people; courts were the peculiar guardians of the Constitution, trustees acting on behalf of the people; the refusal to uphold a law contrary to the Constitution did not imply judicial superiority over the legislative power but "only supposes that the power of the people is superior to both"; and choosing between Constitution and statute was an act of discretion wholly within the scope of judicial power, no different in kind from that exercised in ordinary cases of determining between two contradictory laws. This argument was effective in persuading Americans that judicial review was both a sound theory and a practical means of insuring that popular government would also be orderly and constitutional government.

JUDICIARY ACT OF 1789 The Judiciary Act of 1789 established a three-tiered hierarchy of federal courts. Article III of the U.S. Constitution provides that the judicial power "shall be vested in one su-

preme Court and such inferior [federal] Courts as the Congress may from time to time ordain and establish," but the number and nature of those courts is not specified. At the top of the structure established by the 1789 Act was the Supreme Court, with five associate justices and one chief justice. Down one level were the circuit courts, composed of two itinerant U.S. Supreme Court justices for each of the three geographical "Circuits," who would sit with local district court judges. At the base were the one-judge district courts, one each for eleven of the original thirteen states and two in Massachusetts and Virginia. The act gave the district courts jurisdiction in matters of admiralty and revenue collection, while it gave the circuit courts jurisdiction over other commercial cases and jurisdiction over "all crimes and offenses cognizable under the authority of the United States." Article III gave the Supreme Court original jurisdiction in cases "affecting Ambassadors, other public Ministers and Consuls, and those in which a State shall be a party" and appellate jurisdiction in all other federal cases.

Some opponents of the proposed Constitution of 1787 had argued that federal courts were unnecessary and might usurp the jurisdiction of the state courts. Because of this fear, complete jurisdiction over cases "arising under the laws and Constitution" of the United States was not given to the lower federal courts. Further, section 29 of the act required that the federal District Courts follow the trial procedures in use in their particular states, and section 34 provided "that the laws of the several states, except where the constitution, treaties or statutes of the United States shall otherwise require or provide, shall be regarded as rules of decision in trials at common law in the courts of the United States in cases where they apply."

Nevertheless, one purpose of the federal courts was to ensure that cases that arose between citizens of different states would be decided without prejudice, and since it was assumed that state courts might tend to favor citizens of their own states, the 1789 act gave circuit courts jurisdiction over disputes between citizens of different states or between a citizen of the United States and an alien, as long as the amount in controversy was more than five hundred dollars. The system of having Supreme Court justices "ride circuit" to sit with the district court judges was designed to keep those justices in touch with the needs of the American people, but circuit riding proved to be a difficult hardship for the justices. It was abolished by the Judiciary Act of 1801, but reinstated by the Judiciary Act of 1802 and not

permanently ended until after the Civil War, when full jurisdiction over matters of interpretation of federal law was also extended to the inferior federal courts.

Stephen B. Presser

JUDICIARY ACTS OF 1801 AND 1802 The Judiciary Act of 1801, commonly referred to as the "Midnight Judges' Act," was passed at a time following the Republicans' election victories in 1800 but before the Jeffersonians actually took office. It has been traditionally viewed by historians as an attempt by the outgoing Federalists to secure the judiciary, since they had lost their control of the executive and legislative branches of government. The act created sixteen new federal judgeships, each of which was filled with a Federalist appointee. These judges were to be members of newly constituted circuit courts, which were to be given an expanded jurisdiction to handle cases arising under "the Constitution and laws of the United States." The circuit courts had existed prior to the passage of the 1801 act, although with narrower jurisdiction and without specially appointed judges. The Federalists argued that their act was nonpartisan, as there was an objective need for expanded federal jurisdiction and for specially constituted circuit courts, with their own judges. There was some merit to their argument, as the circuit courts' dockets were crowded and since, more often than not, it was difficult, if not impossible, to have more than one justice sit with a district court judge.

The practice under the Judiciary Act of 1789 had been for two justices from the U.S. Supreme Court to sit on the circuit courts with a local district court judge. However, riding circuit, as it was called, proved to be onerous, given the frailty of the Supreme Court justices and the precarious state of overland transportation in the country. From the beginning, the justices had argued in vain for an end to the

practice. At least one justice, James Iredell of North Carolina, is supposed to have gone to an early grave, dying at the age of forty-eight, exhausted by the practice. Two years after Iredell's death, the 1801 Act abolished circuit riding for the justices. Nevertheless, since the incoming Jeffersonians regarded the appointment of Federalist judges as anathema, because they believed that there was merit in the system of circuit riding since it kept the Supreme Court justices in closer contact with the people, and since they favored state over federal court jurisdiction, as their first legislative act the Jeffersonians in 1802 used their new congressional majority to repeal the 1801 act. They thus reinstated circuit riding, restricted federal jurisdiction, and abolished the freestanding circuit courts created by the 1801 act.

The Constitution provided no means for removal of federal judges other than by impeachment for treason, bribery, or other high crimes and misdemeanors. Article III vested the judicial power "in one supreme Court, and in such inferior Courts as the Congress may from time to time ordain and establish," and the Jeffersonians read this provision as giving them authority to abolish as well as to create federal courts. They argued, in other words, that they were not removing judges, only courts, but the sixteen new Federalist circuit judges were still out of their jobs. Many Federalists and at least one Supreme Court justice, Samuel Chase, viewed the repeal of the 1801 act as unconstitutionally removing judges without benefit of impeachment; he wrote Chief Justice John Marshall that the Supreme Court should make that declaration. The constitutional terms were certainly ambiguous, but since only a simple majority was required in both houses of Congress to abolish courts, and an express two-thirds majority of the Senate to remove judges by impeachment, it would seem that Chase and the Federalists had the better argument.

In order to avoid an adverse Supreme Court decision immediately regarding the Judiciary Act of 1802, the Republicans postponed the Court's next term until February 1803. That term saw John Marshall make a powerful statement supporting the power of judicial review of congressional and executive acts in *Marbury v. Madison* (1803). In that case, he declared that the Jeffersonians had wrongly failed to deliver a commission to a Federalist appointee pursuant to a statute, passed contemporaneously with the 1801 Act, creating several new Federalist justices of the peace. But since Marshall declared unconstitutional a provision of the 1789 judiciary act that gave the Supreme Court jurisdiction to issue a mandamus

compelling that the commission be granted, he held that he was without power to act, thus avoiding a battle with the Jeffersonians and signaling that the Court was not likely to overrule the repeal of the 1801 Act. When the Court had the opportunity directly to rule on the issue, in *Stuart v. Laird* (1803), the Court, as expected, upheld the repeal act. The restrictions on federal jurisdiction remained in effect until well after the Civil War, and thus the lower federal courts were not particularly important to the development of the nation for many years.

KENTUCKY A forty-thousand-square-mile region of grassland and forest bounded by the Appalachian Mountains and the Ohio and Mississippi Rivers, Kentucky derives its name from Iroquois and Shawnee words for "grassland" and "dark and bloody ground." While the area had few permanent Native American settlements during the era of European colonization, it was a favorite Shawnee and Cherokee hunting preserve and the junction of several major Indian paths.

In 1750 Virginia explorers led by Thomas Walker discovered the Cumberland Gap, which allowed regular overland travel from Virginia to central Kentucky. Surveyors and hunters from Pennsylvania and Virginia, including Daniel Boone (c. 1734–1820), followed Walker's party in the 1760s and 1770s, despite a royal proclamation of 1763 forbidding white settlement west of the Appalachians. These adventurers' reports encouraged Virginia speculators to claim and sell Kentucky lands and white farmers to establish permanent settlements there, beginning with Harrodsburg in 1774.

The Ohio Valley Indians resisted the intruders, and skirmishes between warriors and settlers led to Dunmore's War (1774), whereby Virginia laid claim to the Kentucky region. During the Revolutionary

War the Shawnees and other British-allied Woodland Indian warriors ambushed white travelers, plundered flatboats, and besieged frontier outposts in Kentucky. The Indian confederates renewed their guerrilla war in the 1780s and maintained it until 1794 in an effort to bar white farmers from the Ohio Valley. White Kentuckians built blockhouses, organized punitive raids, and in 1779 captured the British post of Vincennes, but ultimately they could not secure their settlements without outside assistance. They finally received it in the 1790s, when the U.S. Army broke the Northwest Indians' confederacy at the Battle of Fallen Timbers on 20 August 1794.

Migration from the eastern states to Kentucky continued in spite of the war, encouraged by a liberal Virginia land law of 1779 that opened Kentucky lands to white settlement and allowed old settlers to buy land at a discount. Kentucky's non-Indian population increased over 900 percent in the 1780s, and with the end of Indian warfare and Spain's opening of the Mississippi River to American shipping in the 1790s, immigration surged. In 1790 the total population of Kentucky was 73,677 and its slave population was 12,430. These figures grew to 220,955 and 40,343 in 1800; 406,511 and 80,561 in 1810; 564,317 and 126,732 in 1820; and 687,917 and 165,213 in 1830.

Kentucky's economy concurrently changed from a subsistence culture to a commercial one. Farmers in the Bluegrass raised wheat, tobacco, hemp, cattle, and horses for export to the Lower South and New Orleans. The villages of Lexington and Louisville had grown into booming cities by 1830. Businessmen financed ropewalks, sawmills, and gristmills and opened dozens of private banks. In fact, Kentucky chartered one-third of the approximately four hundred American banks that opened between 1815 and 1820.

Economic growth had some adverse social costs. Many planters increased their profits by employing African American slaves, particularly on the state's hemp and tobacco plantations. Hard work, harsh punishments, and unstable family life were norms for Kentucky slaves, though opportunities for escape were greater than in other southern states because of the North's proximity. The spread of the institution of slavery, the growth of a cash and credit economy, and frequent litigation stemming from inaccurate land surveys concentrated wealth in the hands of planters, merchants, and lawyers. Thousands of less successful families, like that of Thomas and Nancy Lincoln, the parents of the future president, left Kentucky after 1800 in search of better opportunities.

Educational opportunities were limited in early national-era Kentucky, and private academies remained the sole source of schooling until the 1830s. Religious institutions, however, experienced explosive growth during a series of Protestant revivals that produced tens of thousands of converts. The Cane Ridge Revival of 1801 drew over twenty thousand attendees, and membership in Baptist and Methodist churches tripled within a few years. The Presbyterians and Disciples of Christ also used revivals to increase their membership. Kentucky Evangelicals later took the lead in establishing the state's first temperance society in 1830 and transforming Transylvania University into an eminent institution of higher learning.

Kentuckians' political outlook remained localist and populist throughout the period. Kentucky settlers denounced the never-consummated Jay-Gardoqui Treaty of 1785–1786, opposed the federal Constitution of 1787, and refused to pay the Federalists' whiskey excise of 1791. Kentucky's admission to the Union as the fifteenth state in 1792 did not improve its relationship with the federal government, and in 1798 the legislature threatened to nullify the Alien and Sedition Acts as unconstitutional. In national elections Kentuckians voted for the Democratic Republican Party, then in the 1820s, when that party splintered into factions, supported the presidential candidacy of Henry Clay (1777–1852). Clay, a native Virginian and lawyer, moved to Lexington in 1797 and successively served in the Kentucky General Assembly, the U.S. Senate, and the U.S. House of Representatives. He became Speaker of the House in 1811, and later served on the commission which negotiated the Treaty of Ghent and crafted the legislation that resolved the Missouri Controversy. Clay's reputation suffered, however, after he helped engineer the election of President John Quincy Adams in 1824 and became Adams's Secretary of State. Meanwhile, a state controversy over banking, debtor relief, and judicial reform from 1823 to 1825 led many Kentuckians to transfer their political allegiance to Andrew Jackson in 1828.

LABOR MOVEMENT: LABOR ORGANIZATIONS AND STRIKES

Labor organizations appeared in the half century after the Revolution, responding primarily to the stratification of the artisan trades in eastern seaboard commercial and manufacturing cities. Before then, the trades had been predominantly communities of independent petty producers. On completing their training, apprentices would simply set up as sole traders rather than become journeymen wageworkers. After the mid-eighteenth century, the incidence of wage labor began to increase. In Philadelphia, from 30 percent to 50 percent of the city's shoemakers and tailors can be found hiring themselves out to master craftsmen, the actual numbers fluctuating by decade. In Boston and New York, the preponderance of independent tradesmen was greater. In Boston during the 1790s, there were still eight master carpenters for every journeyman. By 1815, however, the journeymen were in a majority. By then, journeymen also outnumbered masters across all trades in Philadelphia, and decisively in New York.

TERMS OF EMPLOYMENT

The turn to wage labor meant friction over terms. How the price and hours of labor should be set and enforced became the object of intense debate from the

1780s onward, accompanied by resort to association on both sides and competing declarations of standards for a trade throughout a given locality. Journeymen enforced their declarations by "turn outs"—refusals to work except on the terms they prescribed or with any person not part of their fraternity. These tactics earned them indictment, and usually conviction, for conspiracy. Between 1806 and 1815 at least half a dozen conspiracy trials took place in Philadelphia, Baltimore, and New York. The depression of 1819 put a halt to journeymen's organizing activities, but another cluster of prosecutions came between 1823 and 1829 as the economy revived. Shoemakers and tailors were the most frequent defendants, but urban textile workers—spinners and weavers—were also indicted. Though concentrated in the artisan trades of the seaboard cities, trials spread to inland centers, such as Pittsburgh (1814) and Buffalo (1824), and as far south as New Orleans (1826). More trials came in the mid-1830s, at the peak of the Jacksonian labor movement, and in the early 1840s, when for the first time indictments were returned against rural factory workers.

Journeymen's associations recapitulated traditions of craft organization with roots deep in the English past and with scattered precursors in the colonies. They were, however, certainly not the nation's only expression of concerted labor action.

Riots and strikes over working and living conditions also occurred among unskilled workers: canal diggers, mostly working in rural areas (particularly as the economy began to improve after 1825); waterfront workers on several occasions in the second half of the 1820s; and New York's building laborers (1816). Strikes also occurred among urban female tailors (New York, 1825) and among rural textile factory workers—the first in Pawtucket, Rhode Island (1824), another at the Slater Mills in Dudley, Massachusetts (1827).

DEVELOPMENT OF A LABOR MOVEMENT

More significant than who was organizing and striking was when. It is the coincidence of action among different groups that signifies the beginnings of a full-fledged labor movement.

Before the late 1820s, a labor movement as such did not exist. The journeymen's associations of the previous forty years were not a movement. They were trade-specific combinations organized within a particular locality, asserting quasi-corporate or quasi-municipal rights of regulation, not a nascent collective bargaining mentality. There was little communication among them, far less any explicit attempts at translocal organization. Combinations among unskilled workers, meanwhile, tended to be spontaneous and short-lived.

This situation began to change in the mid-1820s. Economic recovery brought renewed organization across a broad front of trades in all the eastern cities, accompanied by wage conflicts and agitation for the ten-hour day, notably the Boston house carpenters' strike of 1825. Simultaneous stirrings among the new classes of factory workers and strikes among canal workers suggest generalized grievance. Different segments of working people appeared to share a common understanding of the extent of economic transformation that had occurred since the end of the War of 1812: decomposition of the artisan mode of production in the cities, growing concentration of wealth, and the spread of entrepreneurialism and "free market" rhetoric, all accompanied by growing stratification in the employment relationship. The result was the first attempt to create more general forms of organization. Beginning in Philadelphia, journeymen joined with factory hands not only to organize unions but also confederations of unions as well as workingmen's political parties that quickly assumed an active role in local and state politics. Establishment in 1827 of the Mechanics' Union of Trade Associations, the first citywide federation of journeymen trade societies in the country, led to in-

dependent organized participation of workingmen in the 1828 city and state elections. In 1829 and 1830 Working Men's parties developed in New York and Massachusetts.

Notwithstanding that this was a movement founded in the first instance on journeymen's associations, the Working Men's parties showed little programmatic commitment to trade unionism. Particularly in Massachusetts, the Working Men's parties transcended a specifically urban base, attracting support from rural artisans and farmers. Eclectically radical, they are best considered representative of a "catchall" popular anxiety about the course of the polity. All articulated broad programs of republican reform, and all were shaped by a diversity of influences—middle-class intellectuals and Jeffersonian agrarians, not just plebeian radicals. Frontiers between the Working Men's parties and factions in the mainstream parties were highly permeable.

In the fifty years after the Revolution, "labor" had emerged amid the expansion and reorganization of the new nation's economy as an increasingly separate and identifiable interest. But its organizational manifestations were eclectic and brief, its politics undefined. Strikes had become commonplace, but periods of agitation were easily snuffed out by economic downturns. The 1830s saw more of the same, but with the crucial addition of a growing emphasis on permanent trade unions as the only basis upon which working people could expect to have any impact upon the polity. Federations of urban craft unions were established in all the eastern seaboard centers during 1833 and 1834 and remained active for several years. Ultimately, they too would prove vulnerable to economic downturn and depression after the Panic of 1837. But their appearance lent real definition to labor activity in the 1830s, proving what had still been uncertain as late as 1829: that the new nation now had a labor movement.

LAFAYETTE, MARIE-JOSEPH, MARQUIS DE (1757–1834) The Marquis de Lafayette (born Marie Joseph Paul Yves Roch Gilbert du Motier) became the most influential non-American commander in the Continental Army during the Revolutionary War and an important foreign contributor to the emergence of American nationalism. He was born into a prominent noble family in the rugged, remote south-central French province of Auvergne. His father was killed in battle (in 1759) during the Seven Years' War, and his mother died (in 1770) while he was still at the Collège du Plesis in Paris, where Lafayette received most of his formal education. Like most other noble boys in eighteenth-century France, he studied ancient history, prepared for a military career, and collected income from his family's landed estates. His wealth and noble status attracted the attention of the powerful Noailles family, and they arranged for Lafayette to marry the youthful Adrienne de Noailles (1759–1807) in 1774. This marriage gave Lafayette a position in the prestigious Noailles Dragoons and set him on course for a successful military career.

Soon, however, he developed a political interest in the American colonists' declaration of independence from Britain. In December 1776 Lafayette received the promise of a military commission from the American representative in Paris, Silas Deane. Lacking official permission to leave his French regiment, Lafayette secretly bought a ship and sailed to the New World with several other military officers in April 1777. This flight from the privileges of European nobility later became a popular American story, in part because it displayed Lafayette's commitment to America's Revolutionary cause and in part because it exemplified a familiar American desire to break with the constraints of the Old World.

LAFAYETTE'S ROLE IN THE AMERICAN REVOLUTION

Although some Americans opposed the appointment of French officers in the Continental Army, George Washington accepted Lafayette as an unpaid major general whose family connections at the French court might be useful for the development of a military alliance. Lafayette quickly gained Washington's

personal respect and trust when he demonstrated both courage and military skill in battles at Brandywine and Barren Hill, both in Pennsylvania. The friendship between Washington and Lafayette grew into a kind of father-son attachment in which Lafayette deferred to the older man's judgment and Washington expressed his appreciation of a young European noble "who acts upon very different principles than those which govern the rest." These principles included Lafayette's willingness to listen to Americans (rather than just to give them instructions) and his support of the political objectives of the Revolutionary War.

Lafayette's military role in the American Revolution developed in several different spheres. He provided valuable military leadership as he helped to train, organize, and supply the American brigades that he commanded. Equally important, he constantly urged the French government to send more supplies and military support after France entered into a formal alliance with the American Continental Congress, and he became an energetic cross-cultural mediator when French naval forces and a French army

arrived in Rhode Island. Finally, Lafayette commanded American forces with exceptional skill in Virginia during the decisive campaign there in the spring and summer of 1781. This campaign required careful political negotiations as he gathered supplies for his small, ragtag army and imaginative military strategies as he closed the trap around the British army at Yorktown. Although Lafayette could not gain a decisive victory until the Comte de Rochambeau and Washington arrived with the main French and American forces, his strategic maneuvers prepared the way for the final French–American siege.

LAFAYETTE'S AFFIRMATION OF AMERICAN NATIONAL IDENTITY

His leadership of the complex Virginia campaign and his close friendship with Washington were important enough to give Lafayette an enduring reputation in American history, yet his political affirmations of the emerging national identity may well have contributed even more to the American cause than his notable military achievements. Lafayette was the first famous foreigner to affirm the new national narrative of America's exceptional achievements, political ideals, and historical destiny. He described Americans as they liked to describe themselves. Lafayette always assured his American friends that their struggle for national independence had the broadest possible historical significance. When he was elected to the American Philosophical Society in 1781, for example, he noted in his acceptance letter that America promoted the rights of mankind on a more liberal basis than any other country in the world. Such public praise for the Revolution reinforced what American leaders already believed about the moral superiority of their national cause, but the statements of a disinterested European nobleman added welcome international credibility to the American claims.

Lafayette's useful and symbolic role as America's best European friend later paved the way for an equally significant role as a leading symbol of American national ideas in France. When the French launched their own revolutionary movement in 1789 to promote the "rights of man" and establish a new constitutional government, most Americans interpreted Lafayette's leadership of the new French National Guard as evidence that France wanted to adopt enlightened American principles of freedom and legal equality. When the French rejected Lafayette in 1792 (he fled for his life and spent five years in Austrian and Prussian prisons), Americans had new reasons to believe that they had a unique national mission: only the United States truly under-

stood and defended the commitment to freedom and order that Lafayette had carried home from the New World.

Lafayette eventually returned to France after Napoleon seized power in 1799, but he rejected Napoleon's authoritarian policies and viewed Jeffersonian America as the main refuge of liberty in the modern world. He continued to praise the American political system as the Napoleonic Empire gave way to a restored French monarchy and to the political conservatism that spread across Europe after 1815. Challenging the ascendancy of conservative regimes wherever he could, Lafayette supported liberal national movements in Spain, Greece, and Poland—all of which he compared to the earlier American struggle for national independence and political freedom. Yet, the powerful conservative tide blocked the progress of liberal nationalisms and his own political career, so he welcomed an invitation from Congress and President James Monroe to return to the United States for a triumphal national tour.

This thirteen-month tour of every American state in 1824–1825 became Lafayette's final important contribution to early American nationalism. He was welcomed everywhere as a living connection to George Washington and the heroic Continental Army. Traveling through a nation engaged in a bitter conflict between the supporters of Andrew Jackson and John Quincy Adams, Lafayette became a unifying messenger from the generation of the founders. He assured uncertain Americans that they were carrying forward the vision of their Revolutionary ancestors, and he reaffirmed, as always, the nationalist belief in America's world-historical significance. He also praised the unique success of the American Revolution, celebrated the superior achievements of America's constitutional government, and interpreted America's rapid economic development as a remarkable consequence of the nation's freedom and republican institutions.

In response, Americans hailed Lafayette as the greatest and wisest man in Europe. Newspapers reprinted his speeches, musicians composed songs to describe his accomplishments, and artists portrayed his image on souvenir dishes, handkerchiefs, and in published illustrations. The celebration of Lafayette became also a celebration of America's national history, political accomplishments, and economic progress. Towns, streets, and schools were named in his honor, and even his occasional references to the dangers of sectionalism or the injustices of slavery could not diminish the nationalist rituals that his tour evoked.

Lafayette later returned to political prominence in the French Revolution of 1830, and he continued to support national independence movements in Poland, Italy, and Greece until his death. Yet these later campaigns for French political reforms and liberal nationalisms never led to the kind of decisive victories he had witnessed at the conclusion of the American Revolution. In the end, therefore, it was the Americans who offered the highest praise for the European who first embraced their cause in 1776 and reaffirmed the central beliefs of American nationalism throughout his long life. At a joint session of Congress in 1834 John Quincy Adams gave a eulogy for Lafayette in which he asserted that no one “among the race of merely mortal men” could rival Lafayette “as the benefactor” of mankind. Though modern historians have questioned such nineteenth-century claims for Lafayette’s achievements, the rhetoric points to his exalted status in a new nation that yearned for foreign affirmation of its emerging national identity and historical significance.

LAKE ERIE, BATTLE OF The Battle of Lake Erie, which took place on 10 September 1813, was a critical naval engagement in the War of 1812. It allowed the American reconquest of much of the Michigan Territory lost earlier in the war, relieved Ohio and Indiana Territory from Native American raids, contributed to the destruction of the Tecumseh Indian confederacy, elevated the martial reputation of the U.S. Navy, and made Oliver Hazard Perry a national hero.

Combined with the U.S. Army victory at the Battle of the Thames or Moraviantown on 5 October 1813, it insured the retention of the modern states of Michigan and Wisconsin within the American national boundary.

After the surrender of Detroit on 16 August 1812, President James Madison began a major effort to reclaim lost territory. Many recognized that the key to such an endeavor was the attainment of naval superiority on Lake Erie, a crucial line of communications. After a winter ground offensive against Detroit failed, Major General William Henry Harrison began construction of Fort Meigs at the Maumee River rapids (now Perrysburg, Ohio) and awaited naval superiority on the lake before moving northward.

The Navy Department appointed Captain Isaac Chauncey commodore of the Great Lakes, and he secured Master Commandant (modern commander) Oliver Hazard Perry for the almost nonexistent Lake Erie squadron. Aply assisted by shipwright Noah Brown, Perry supervised the construction of two brigs—*Lawrence* and *Niagara*—and four schooners at Erie, Pennsylvania. After some delay in securing sailors, Perry led his squadron onto the lake on 12 August 1813 and, after conferring with General Harrison, established his base at Put-in-Bay on South Bass Island.

Suffering from a decided logistical disadvantage at their naval base at Amherstburg, Ontario, near the Detroit River’s mouth, in 1813 the British construct-

ed only the ship *Detroit*. The ship augmented a small squadron that had previously given the Royal Navy dominance on the lake. Commander Robert H. Barclay led a British squadron carrying 64 guns throwing 905 pounds total weight of metal and 496 pounds in broadside. The U.S. flotilla mounted 54 guns with a total weight of metal of 1,536 pounds and broadside of 936. Barclay brought six vessels into his line of battle, Perry nine.

Once a wind shift allowed Perry to close with the HMS *Detroit*, the battle's outcome seemed obvious. But Jesse Duncan Elliott, captaining the *Niagara*, failed to engage his designated foe, and the British concentrated their fire on Perry's flagship, the *Lawrence*. For over two hours the ship fought gallantly until completely disabled. About this time Elliott brought the *Niagara* forward, and Perry transferred his flag to that undamaged vessel. He sent Elliott to bring up the trailing gunboats while he commanded the *Niagara*, which broke the British line and forced the entire Royal Navy squadron to surrender.

Perry's report to General Harrison—"We have met the enemy and they are ours"—was an immediate sensation and his battle flag's inscription—"Don't Give Up the Ship"—became an unofficial navy motto. The controversy over Elliott's behavior remained a cause célèbre in the U.S. Navy until his death in 1845.

LAND POLICIES During the early history of the United States, land and the policies governing its distribution, disposition, and transferal from public to private ownership were of great national interest. Land policies were crucial to a range of nation-defining issues including federal Indian policy, westward expansion and settlements, the spread of democracy, and the development of a strong national agricultural economy. Geographically, they imposed a rational order upon the land, most notably in the form of a grid-pattern, geometric landscape that was devised by politicians, marked and drawn by surveyors, and domesticated by the western farm people.

STATE CLAIMS TO WESTERN LANDS

The 1783 Treaty of Paris that ended America's Revolutionary War left unresolved the matter of state claims to western lands north and south of the Ohio River that stemmed from old royal charters. Considering the political advantages afforded to larger states, smaller states without western land claims, such as Maryland, held out and refused to ratify the Articles of Confederation until states gave up their western lands. When Virginia, the largest state, gave up its claims in 1784, others followed. By 1786 all state claims to Old Northwest lands had been ceded to the federal government in return for the creation of a vast public domain that encompassed more than 230 million acres. This public domain represented both a veritable windfall of untapped land revenues for a cash-strapped fledgling government and a seemingly boundless western space for a land- and agriculturally minded nation to grow. Additional land cessions followed: North Carolina in 1790 and Georgia in 1802.

Although states ceded their rights to western lands, other claims and contingencies on the public domain existed for the government to handle. Numerous states retained a considerable amount of lands for their own disposal, whereas Virginia and Connecticut held on to "reserves" so as to meet their obligations to holders of military bounty land warrants issued to Revolutionary War soldiers. Far more complicated and vexing to the government was the process of confirming private claims to land granted to settlers by prior French, Spanish, and English authorities. More important with respect to land policy, however, was the government's active and aggressive securing of land cessions and the extinguishing of tribal claims from Native Americans, whether through warfare, deception, or trea-

ties. From the beginning land policy was predicated on the dispossession of the native peoples.

THE EMERGENCE OF LAND POLICIES

Given the unique American circumstances, early government land policies reflected the tentative, innovative, and idealistic nature of the new Republic, and some practices persisted and became distinctive features of U.S. land policy. A national land disposal policy emerged in 1784–1785 only after lively congressional debates had taken place over such fundamental issues as whether Virginia's system of indiscriminate location with surveys following was more expedient than New England's orderly course of surveying and sectioning townships prior to land sales, along with reserving lots for churches and schools. The latter won out (minus the church lots) and formed the basis of the Land Ordinance of 1785. It bore a significant measure of Thomas Jefferson's influence and his interest in surveying. Among the stipulations was that Indian titles must be extinguished before surveys were done; herein also were the beginning stages of an administrative process of record-keeping to legitimate and safeguard land transactions.

The survey was important for a number of reasons. Besides the appearance of security, familiarity, and a simple grid pattern, the rectangular survey was an exercise in rationality. The land ordinance specified that a presidentially appointed geographer, in this instance Thomas Hutchins, would oversee a corps of surveyors and chain carriers whose job was to mark off the land, by way of recorded descriptions and actual markings on trees, into townships that were six miles square and then into sections of 640 acres each. These were numbered from south to north beginning in the southeastern corner. After seven ranges of townships had been surveyed, the geographer would convey a scaled diagram of this tract, called a plat, to the Board of the Treasury in advance of a public sale minus reserves for public schools (sixteen in each township) and military bounty lands.

The Seven Ranges represented the first of these organized surveys and was inaugurated where the Ohio River crosses into Ohio from Pennsylvania. This method, however, proved slow and costly, especially in the opinion of Congress, which noted that by February 1787 only four ranges had been completed. That fall, Congress acted at variance with the Land Ordinance and auctioned off the four completed ranges at one dollar per acre with disappointingly low sales. Although the land parcels and price failed

to attract the average yeoman farmer, speculators and land companies, including the Ohio Company, the Scioto Company, and John Cleves Symmes, received Congress's blessing for one-million-acre purchases in the hopes that they would generate federal revenue and encourage settlement. With organized settlement Congress sought to diminish the chronic appearance of squatters on the public domain who it believed were robbing the federal Treasury of land revenue and whose illegal settlement also precipitated Indian hostilities. Nevertheless, as land historian Paul Gates observed, squatters' persistence on the landscape influenced land policy by constantly bringing the matter of preemption (a squatter's "right" to first consideration in gaining title to land he and his family have worked by being allowed to circumvent competitive bidding for it at the public auction) to Congress's attention such that it was finally sanctioned by law in 1841. Altogether, as fellow land historian Malcolm Rohrbough contends, the Land Ordinance fostered a break from the Old World's feudalistic landholding patterns by instituting a large-scale, democratic system of land ownership in the new American Republic.

THE NORTHWEST ORDINANCE

The question of how the public domain would yield politically functioning territories and ultimately add new states to the Union was answered by the Northwest Ordinance of 1787. Integral to U.S. land policy, this ordinance of governance was considered vital to the success of speculative land company enterprises such as the Ohio Company. Moreover, it provided for the creation of three to five territories northwest of the Ohio River, from which the present-day states Ohio, Indiana, Illinois, Michigan, and Wisconsin would emerge. Concurrent with national expansionist objectives, the land area comprising the public domain expanded with the federal acquisition of additional territories, including the Louisiana Purchase (1803), Florida (1819), Texas (1845), Oregon (1846), and the Mexican cession (1848).

Land disposal policies underwent constant revision in the quest to generate more federal revenue to apply against the national debt. Added incentive came through a series of Indian land cession treaties that followed hostilities and afforded the opening up of more land for sale and settlement, including the 1795 Treaty of Greenville. At this point, Pennsylvania Democratic congressman Albert Gallatin took a leading role in reformulating what would become the Land Act of 1796. Policymakers debated whether it was more profitable to tailor prospective land sales

to settlers or to speculative groups, who would then presumably sell to those settlers; the terms of sale reflected the most substantive policy reform. The minimum purchase size remained at 640-acre tracts, although the minimum price was raised from one to two dollars per acre. Modest credit was now extended so that a purchaser could put down one-twentieth of the price, one-half within thirty days, and the rest within one year. However, this translated to \$1,280, a considerable amount for the average settler. Cash purchases were discounted by 10 percent, but this was still out of reach for many. Additionally, the act called for more detailed surveys, and it made the receipt of land sales monies the responsibility of the new secretary of the treasury, Oliver Wolcott. Although western settlers benefited from the designation of two convenient points of sale (Pittsburgh and Cincinnati), overall sales were low and the act failed to achieve anything close to revenue objectives.

EVOLUTION OF LAND POLICIES

Almost immediately Congress recognized the need to liberalize its land policies in order to compete for sales against the major land companies in Ohio, New York, and Pennsylvania as well as with large investors. Many of the private landholders had acquired military bounty lands so cheaply that they offered settlers many more advantages than the government could: the best prices, smaller lots, longer credit, payment in produce and livestock, local agents, as well as developing tracts that encompassed towns, roads, and improvements. Ohio Territorial delegate William Henry Harrison was keenly aware of these circumstances and figured prominently in the drafting of what became the Harrison Land Act of 1800. This act finally facilitated increased revenues, largely because it met the needs of western settlers by reducing the minimum purchase tract to 320 acres, creating four western land office districts (Marietta, Cincinnati, Chillicothe, and Jeffersonville), and by extending favorable credit terms to meet the retained minimum two-dollar-per-acre price. The terms allowed the purchaser to pay in fourths: one-fourth of the price within forty days, another within two years, another within three years, and the final fourth within four years. The unpaid balance incurred 6 percent interest. If the tract was not fully paid within five years, it was subject to forfeiture. However, pleas from delinquent purchasers led Congress to suspend this clause and pass numerous relief measures that granted additional time during the next two decades.

By 1820 the West was taking shape in the form of spreading land offices north and south of the Ohio

River as well as in the admission of new states to the Union—from Ohio (1803) to Illinois (1818) on the one hand, and Mississippi (1817) to Alabama (1819) on the other. The General Land Office was established in 1811. Yet the experiment with credit sales had a ruinous effect on the economy as evidenced by the Panic of 1819, a time when western land buyers owed the government more than \$24 million. Through the Land Act of 1820, Congress abolished credit sales, mandating that land must now be paid in full with cash on the day of purchase, although the minimum price was reduced to \$1.25 per acre and the tract size to eighty acres. Predictably, land sales plummeted to nothing; the government, on the other hand, succeeded in reducing the land sales debt to just over \$6 million by 1825. This act seriously hurt western pioneers—as much by denying them much-needed credit as by not incorporating preemption, which at least would have given them some means of acquiring a farmstead without credit. One consequence was a greater visibility of squatters' claims clubs in places such as Iowa during the 1830s. These clubs operated as self-protection associations to prevent competitive bidding by speculators against farmers' interests at public auctions.

Despite the hardship to settlers caused by ending credit land purchases and insisting on cash, Congress recognized that it had a revenue interest in reforming land policies to further the transfer of as much of the public land into private ownership as possible. The graduation of land prices represented one of these reforms. Between 1820 and 1854 the issue consistently appeared before Congress, usually at the urging of its chief proponent, Missouri Democratic senator Thomas Hart Benton. The Graduation Act, passed in 1854, addressed the problem of undesirable lands that stayed unsold because the government minimum prices were too high, leaving potentially workable land unimproved and untaxed. As a result of the act, the price of public land that had been on the market for ten years, with some exceptions, would be reduced to graduated levels. For example, the price for land that had been unsold for ten to fifteen years would now be valued at one dollar per acre, and valued even lower, at seventy-five cents per acre, if unsold for fifteen to twenty years. Policymakers hoped that by imposing a 320-acre limitation on the purchase size, broad speculation of these lands would be difficult. According to Gates, however, the act prompted substantial abuses and runs on land. Less than a decade after the Graduation Act, Congress passed its most liberal, ambitious, and optimistic land reform in the Homestead Act of 1862, a pivotal policy that would define America to many and en-

courage land-hungry immigrants to flock to the United States. Prospective farmers could enter 80- or 160-acre tracts at the nearest land office, pay nothing more than the ten-dollar filing fee and the four-dollar commissions, and take five years to “prove up,” after which the land belonged to them.

LAND AS NATIONAL SYMBOL

From the beginning, Americans invested complex national meanings in the public domain. Although flawed and constantly revised, early American land policies simultaneously generated revenue and provided a means to gain access to the soil for the predominant agricultural populace as well as for the land entrepreneurs. They were also inherently bound up with national expansionist goals and Native American dispossession. Equally important were the seeds of republican ideals, which were transplanted and widely spread as the public domain was progressively marked, surveyed, sectioned off, and sold. As townships were laid out, the lot reserved for education aimed to ensure—with poor results in this period—that the new American Republic would contain an educated populace, while the Northwest Ordinance stipulated that the West would be fashioned after republican principles of governance. Americans’ beliefs in “progress” and in the benefits of a market economy were evident in land policy as well, particularly in the area of land grants to states for internal improvements in roads and canals—which also served to raise land values. Indeed, railroads were given grants totaling 127 million acres. Land policies, then, embodied the broad aspirations of an ambitious early American Republic.

LAND SPECULATION British North America appeared to its colonizers as a land of boundlessly rich natural resources, unworked and thereby unclaimed by its Native American inhabitants. Thus, even before the end of the Revolutionary War (1775–1783), to an extent unknown in Europe, land became a commodity to be granted, traded, bought, and sold, and land speculation became an outlet for Americans’ drive for self- and community improvement. While land speculation was at first the province of highly placed elites, the Revolution marked a major disjuncture, with social uncertainty providing an opportunity for new men to make—and lose—quick fortunes through land trading. Later, during the period of the market revolution, land sales were inextricably tied up with Americans’ general excitement over the development of canals, roads, cities, and later, railroads, but the tensions between eastern land speculators and western settlers were always acute.

THE EIGHTEENTH CENTURY

It is ironic that the enthusiasm about America’s natural resources contributed greatly to the loss of Britain’s American empire. A group of noteworthy Virginia planters, including George Washington, had created the Ohio Company in 1747 in hopes of speculating in land west of the Appalachian Mountains. Having secured a large tract, they began to survey it in 1750. In the course of exploring a disputed area of the tract in 1753, they collided with the French, who were also hoping to exploit the tract for settlement and fur trading. Attempts at diplomacy failed, and the resulting Battle of Great Meadows in 1754 touched off the eighteenth-century equivalent of a world war and ultimately resulted in a permanent estrangement between Britain and its North American colonies.

Eighteenth-century land speculation was undertaken by companies arranged on the joint-stock model as well as by individuals. In the immediate aftermath of the Seven Years’ War (1756–1763), for example, veterans of the conflict who had been granted lands as military bounties formed into the Military Company of Adventurers to find and map out their claims. Those who speculated in land this early were in every sense adventurers, having to

trudge through trackless wilderness and, like George Croghan (1720–1781), parlay with Indians in order to find and mark out the limits of settlement. The rewards could be totally disproportionate, however. Croghan was able to pay for tens of thousands of acres of land with bonds secured by mortgages on the same land—a circuitous method of payment that ensured that the Indians he bought it from would receive nothing in return.

Whether companies or individuals like these were seeking to buy and populate military bounty lands or other lands held in reserve by the existing states, their success depended on their political connections. The modern idea of “conflict of interest” was more or less absent in this period of patronage. This enabled men like William Duer (1747–1799), secretary to the Board of Treasury, to enrich themselves through land speculation. Duer negotiated on behalf of the Ohio Associates for Congress to sell to military veterans of the Revolutionary War five million acres of land at a good price in return for U.S. debt certificates. At the same time he negotiated this contract, Duer and two of his friends formed a private company, the Scioto Associates, to benefit from the contract and receive the majority of the land. After an abortive attempt to settle French emigrants on the Scioto company’s land, Duer’s company failed, dragging the military veterans’ company down with it. Duer’s land speculations numbered among his many dodgy enterprises before an attempt to corner the New York stock market in the 1790s landed him in debtor’s prison.

Eighteenth-century land speculators also depended on the ability to exploit multiple jurisdictions and conflicting surveys. Only after the Land Ordinance of 1785 initiated a the rectangular survey system for the Northwest Territory was the process of land survey and auction regularized, and even then there were still opportunities to bend the rules. The case of the acquisition of the Otsego patent in 1786 in upstate New York by William Cooper (1754–1789) illustrates various actions that might today be considered fraud, including ignoring existing boundaries, the deliberate failure to publicize a land auction, and the holding of an auction in disregard of a legal injunction against it. Cooper’s career as a land speculator also shows, however, that after the Revolutionary War the land business provided great opportunities for self-fashioning, enabling a poor and unlettered son of an artisan to climb into the ranks of gentlemen. Cooper was able to buy land with no fortune of his own by selling his land off in large tracts as soon as he bought it. Although many of the

tract holders themselves failed, the land defaulted back to Cooper, and he was able to sell it to new farmer-speculators.

THE EARLY REPUBLIC

Most people who purchased land in the early Republic intended to reap a return on their investments, although many would not have thought of themselves as speculators. Some purchasers were farmers hoping to buy more land than they needed to finance the development of their own farms by selling off part of their newly acquired tracts at a higher price. Bankers, judges, legislators, and other professionals speculated in land as a sideline. Land was a great investment, providing about a 40 percent return; but it also contained hidden dangers. Many eastern speculators proved unappreciative of the hardships of western settlers, including Indian attacks, lack of transportation, and lack of access to markets, and were often more concerned with reaping paper profits than with actual settlement. Thus, while the Connecticut Land Company, formed in 1795 to sell lands in the Western Reserve, foundered, the Holland Land Company, a group of Dutch developers who speculated in New York lands, succeeded because the company refused to allow land sales until it had developed sufficient infrastructure, including a modicum of government and educational opportunities, for prospective settlers.

The actual process of land purchase depended on both time and geography, because throughout the early Republic, lands for sale included state and federal lands and land that was priced as part of improvement districts (a way of making public improvements by assessing through taxes those private properties standing to benefit), all of it for sale under different rules. Vast tracts of land were sometimes purchased at auctions that lasted only half an hour, and other tracts lay open for twenty years at a time. This was possible because the price of land sold at land offices—unlike lands resold by speculators—often did not vary with supply and demand. Prices could be set by state land offices without anyone having actually assessed the quality of the land, which resulted in artificially high prices and, therefore, few sales. On the other hand, states might offer deep discounts on the official price of lands; Ohio offered a 75 percent discount per acre to actual settlers willing to swear out an affidavit that they planned to live on and cultivate the land. Under these circumstances, land prices could fall to as low as 12.5 cents per acre.

Federal and state governments actively promoted the transfer of public lands to private citizens in several ways. Veterans of the Revolutionary War and the War of 1812 (1812–1815) were given warranty claims to western lands as payment. The granting of these bounty lands fueled speculation, since to the extent that these lands were far from the line of existing settlement, grantees sold their plots to speculators, sometimes for less than they were worth. In the wake of the Panic of 1819, the government reduced the minimum price of its public lands from \$2 to \$1.25 per acre, with a minimum farm size of 80 acres rather than 160. Auctions were advertised three months before the opening of sales and were opened for two weeks; then, any unsold lands were kept on sale at the minimum price, making farms widely available for around \$100. Missouri U.S. senator Thomas Hart Benton (1782–1858) campaigned in favor of graduation laws that would gradually drop the price of unsold lands to as low as 25 cents an acre. By the late 1820s states then in the far West, like Arkansas and Indiana, were giving tracts of land to settlers who agreed to live there, develop towns, and serve as a buffer zone against Indian encroachments.

SPECULATION: BENEFICIAL OR HARMFUL?

One of the main concerns of historians, when discussing land speculation, is the degree to which rampant speculation held back or promoted national development. It seems fairly clear that land speculation promoted the settlement of the West by making more land available more cheaply than did the state or federal governments and by offering potential buyers a choice of land tract sizes and easier credit terms than did government. The picture is mixed in relation to the impact of speculation on taxation. In contrast to war veterans, who were not immediately responsible for taxes on their land grants, land speculators were responsible for taxes. This was beneficial in that speculators who did not live on the western frontier helped to subsidize infrastructure for the settlers who did live there. But it also had a downside. Larger speculators depended on the success of smaller ones or on tenants who failed to pay, defaulted, or renegotiated contracts. Speculators who found themselves overextended often lost their lands to confiscation for nonpayment of taxes, which created a good deal of churn in the land market.

Even once the process of land purchase in the early Republic had become fairly regularized, it was rife with corruption, which explains in part the bad reputation that land speculators had. Land receivers

were known to have engaged in a number of corrupt practices, among them arranging for land surveys that included notes describing the land's quality, maintaining their own maps of sold land, and allowing their silent partners to purchase land before and in greater quantities than other buyers. Even the wholesale bribery of legislators was possible, as in the Yazoo land fraud of 1795, which resulted in the sale of tens of thousands of acres owned by Georgia to four land companies. Despite the scandalous behavior of the Georgia legislators, the U.S. Supreme Court upheld the Yazoo contracts in *Fletcher v. Peck* (1810), which seemed to illustrate that it was better to apologize later than to ask permission at the start. Elites were also able to establish banks in order to finance their land purchases, a fact that led to widespread popular distrust of banking.

Land speculation has often been implicated in the boom-and-bust cycle of the nineteenth-century economy; and while it was not the cause of economic depression, it certainly contributed to the general air of instability. The Panic of 1819 began with falling prices for American grain, meat, and cotton in foreign markets. This fall in prices was exacerbated by the high level of land-related indebtedness at every level of society. Land speculation also contributed to a feeling of being exploited among western settlers, who languished in frontier settlements without infrastructure and under the threat of Indian attacks while promoters made money at a distance. Given the importance of widespread landholding to a Jeffersonian republic, the checkered history of land speculation would lead to calls later in the nineteenth century for a more equitable and transparent distribution of lands through homesteading.

LANGUAGE What is meant by “language” in the context of the early Republic? Do we mean simply the English language, the dominant spoken and written language in the early United States? If so, does it make sense to speak of one “language”? After all, there were (and are) many “Englishes.” For instance, there is the language spoken by New Englanders and then there is the one spoken in the Smoky Mountains. We may choose to define these as separate dialects, implying that English speakers in these regions can easily understand each other. But for linguists, levels of mutual intelligibility are not necessarily meaningful. After all, the English spoken in northern Maine differs significantly from that spoken in the Smoky Mountains. And the reason for this is partly the very real difference in the character of these varieties of English: they had (and have) distinct vocabularies, distinct syntax, and widely differing pronunciation.

VARIETIES OF AMERICAN ENGLISH

The various types of English in the new United States had their origins in patterns of immigration during the colonial era. Settlers from different regions of England and Britain carried with them distinct patterns of speech. Settlers in Virginia came primarily from the East Midlands of England. Those who traveled to New England came from London as well as the East Midlands. The British migrants to Pennsylvania and the Delaware Valley were primarily from the North and North Midlands. And through the eighteenth century Irish and Scottish migrants settled regions adjoining the Blue Ridge and Appalachian Mountains. As these initial foci of settlement expanded to the West, North, and South, they carried with them their regional English.

Although the varieties of American English had their origins in British English, by the early nineteenth century they had acquired distinctive American qualities. Americans, for example, came to prefer “fall” to “autumn,” and they came to use the term “creek” to mean small stream or brook, whereas in Britain the term refers more specifically to a small

seacoast inlet. American spelling also came to be very different from English spelling. Because printers in the Northeast were prepared to adopt Noah Webster’s more economical spellings, Americans now write “color” and “labor” instead of the English “colour” and “labour.” Aside from being simpler, these spellings saved printers money by reducing the amount of costly metal type required for printing.

NON-ENGLISH LANGUAGES

Beyond simply the varieties of English spoken in the new nation was the variety of other languages that were heard. German was a virtual official language in parts of eastern and central Pennsylvania; French, Spanish, Dutch, Swedish, Greek, Portuguese, and Ladin were among those also present in the early national years. As long as African slaves continued to be imported into the country—and for at least a generation after—native speakers of dozens of distinct African languages lived in the early United States. Similarly, Native Americans continued to speak several hundred distinct, mutually unintelligible languages and dialects in North America. To this mix of languages we might add the dozens, perhaps hundreds (given their evanescent nature, the exact number is unknown), of Creoles, pidgins, and trade jargons that combined elements of different languages.

It is also important to note that spoken languages—contrary to the wishes of lexicographers and authors such as Samuel Johnson (1709–1784) and Noah Webster (1758–1843)—are constantly mutating and evolving. Like culture itself, language cannot be fixed. Hence, the prevalence of Native American loan words such as *caribou*, *moose*, *pow-wow*, *bayou*, and *tepee* or African words such as *banana*, *yam*, *cola*, and *gober* (peanut) in American English. And in much the way that the computer revolution has transformed modern English, so the industrial revolution transformed nineteenth-century English. Words such as *factory*, *mill*, and *engine* acquired meanings that would have been almost totally unfamiliar to English speakers in eighteenth-century America. Much like vocabulary, whole languages themselves come and go. From the colonial era to the early nineteenth century, European languages—usually some variety of English or French—and various pidgins and Creoles supplanted an untold number of non-European languages and dialects. In the South Carolina low country, for example, Gullah, a New World Creole combining elements of English and a variety of African tongues, became the dominant language among some African slaves.

Any complete assessment of language in the early United States must also account for the fact that language is not necessarily a spoken medium. Hence, although elite young American men learned Latin and Greek and possibly Hebrew, few actually knew them as spoken languages. Similarly, a variety of symbol systems and sign systems that themselves might be characterized as languages were used during the period. Native peoples of the Great Plains had developed an elaborate sign language to serve as a sort of lingua franca in that vast, diverse part of North America. In the late 1820s, Thomas Hopkins Gallaudet, the principal of the American Asylum for the Deaf and Dumb in Hartford, Connecticut, announced the creation of a new sign language designed to allow the deaf to communicate. Several years later Samuel F. B. Morse devised the system of coded dots and dashes subsequently called Morse Code.

LANGUAGE AND CULTURE

Finally, “language” does not necessarily mean specific systems of speech. It can also refer to that collection of thoughts, sentiments, values, or assumptions that allow certain behavior (sometimes involving speech or writing; sometimes not) to have a specific meaning in a specific time and place. To modern Americans, for instance, the “tweaking” or twisting of a nose has little real meaning. But to politicians in the early United States, such an act carried with it very specific and widely recognized implications: it was one man’s way of accusing another of being a liar and a coward. In other words, those distant figures—Aaron Burr or Alexander Hamilton or Andrew Jackson—understood a very different language of politics from the one that would be familiar to us. Instead of discipline and party loyalty, the governing values—some might even say the “grammar”—of their political language was personal honor and reputation. Indeed, every profession or social grouping uses a distinct language—a language sometimes involving speech, sometimes centering on gesture or comportment, sometimes having to do with clothing or insignia.

Insofar as we can generalize about language in the early United States, we can thus say that language was many, many things to many, many people. Much like the values or customs or cultural habits of the early United States, so the languages of the nation reflected a vast array of social, ethnic, and economic imperatives.

A NATIONAL LANGUAGE

For some members of the founding generation, much as for some Americans in the early twenty-first century, this was a disturbing reality. A nation of many and diverse languages would—in their minds—be a weak, incoherent nation and as such a nation prone to the sorts of corruption and conflict that appeared to plague the bodies politic of the Old World. Indeed, the entire philosophical project of the American Enlightenment (and, really, everything we call the Enlightenment) was founded on faith in the idea that human speech, and its accrued conventions, obscured truth and, in doing so, produced human conflict. Whether Patrick Henry’s oratory or the social facts and statistics in Thomas Jefferson’s *Notes on the State of Virginia* (1785) or Noah Webster’s lexicon—all sought more transparent, less historically inflected modes of communication. Human beings, they believed, needed to find ways to communicate and discover truths unhindered by the cumulative effects of politics and self-interest that left language a cloudy, imprecise, and deeply flawed medium.

Although everyone who gave the issue any thought at all assumed all language to be flawed and opaque, they also believed that some languages were simply better than others (a notion that has no currency among turn-of-the-twenty-first century linguists). The thinking went something like this: as human creations, languages bore the imprints of the minds that fashioned them. Crude minds would thus fashion crude tongues. Hence, among Americans inclined to think about such things, there was no doubt that some form of English, the product of the most historically advanced society on earth, would be the language of the United States. Because the language had been fashioned by people achieving the highest known levels of literacy and social development, it would be well suited to the needs of a modern republic. As such, it would inevitably displace minority languages, whether those of native peoples, African slaves, or non-English-speaking Europeans.

Contrary to what is occasionally asserted, no one ever seriously proposed German or any other European tongue as an alternative language for the new nation. Noah Webster and others may have believed that English would have to be improved to adequately serve the new Republic, but no one ever seriously proposed that America be anything other than an English-speaking country.

It is one thing to envision an English-speaking nation, and another to create one. Noah Webster may have envisioned a simplified, standardized idiom bringing the republican people of the United States

together, and he may have believed his lexicon and his spelling texts could produce such a result. But he was profoundly mistaken. Languages become national not because of the interventions of pedants and grammarians. Of far greater importance has been the growth of mass media such as cheap newspapers and magazines. Still, even with the regularizing influence of print, one has to feel for those purists among us making usually futile efforts to protect American English from neologisms, regionalisms, and other developments that they might call "corruptions." For most linguists, language change represents neither corruption nor improvement. It simply is. It is an inevitable facet of that ever-fluid and endlessly adaptive thing called language.

Edward G. Gray

America, most notably with the Spanish Caribbean, grew to considerable proportions. Sugar, molasses, cocoa, and coffee were imported through New York, Boston, and Philadelphia. In exchange, North American merchants supplied the Spanish colonies with foodstuffs, lumber, and manufactured goods despite Spanish officials' efforts to enforce decrees to restrict this commerce. Trading was accompanied by the keen interest of a small group of scientific men—many from the American Philosophical Society—in Latin American civilization. Philadelphia became the capital of Hispanic studies in the United States. Prominent Philadelphia publishers helped publicize the writings of Spanish American exiles living in the city. These publications, mostly of a revolutionary nature, provided a utopian picture of American democracy and highlighted Spanish Americans' capability for establishing reliable, democratic governments. Yet the general public in the United States remained skeptical, for it considered its neighbors politically inept and culturally backward.

From 1810, the revolutions in the Spanish American colonies generated broad sympathy and interest among American political leaders and pro-revolutionary enthusiasts for the cause of liberty on the continent. Their interest was mainly focused on Spanish America, as in Brazil the revolution began later and ended with the establishment of a monarchy under strong British influence. The *Philadelphia Aurora* and the *Richmond Enquirer* promoted the independence of the colonies and the *Weekly Register* regularly published news from Spanish America.

In Washington there was much discussion about the economic benefits the United States would reap from the disruption of the Spanish commercial monopoly. Until then, most North American merchandise got to Spanish America either as contraband, or was allowed in by the occasional trade treaty with Spain. Consuls were sent to the main South American seaports to collect information on the new trading possibilities. Yet reports that Spanish America could offer more markets for U.S. agricultural produce and more supply of specie (Spanish American gold and silver) and facilities (the use of Spanish American ports on the Pacific coast by American vessels trading with the East Indies) for trade with the East Indies did not convince all Americans. Eastern merchants were more concerned about protecting their well-established trade with Cuba, which was firmly under Spanish control. Southern planters were worried that their crops would face strong competition from Spanish American produce. On the other hand, western farmers were enthusiastic about

LATIN AMERICAN INFLUENCES During the eighteenth century, North American trade with Latin

trading with the southern continent via the Mississippi River and New Orleans.

From 1817 to 1825, the revolutions in Spanish America had a considerable effect on the debate over foreign policy. First, the U.S. policy of strict neutrality regarding all foreign conflicts was challenged. From Congress, Henry Clay—a fervent supporter of the revolutionists—claimed that neutrality was consistent with immediate recognition of the independence of the Spanish colonies. Secretary of State John Quincy Adams opposed recognition on the grounds that it would be dangerous to back up unstable governments. Second, the role of the United States in the Western Hemisphere was discussed extensively. The United States was either to take up a leading position in the continent, as Clay hoped, or remain aloof from hemispherical affairs, as Adams favored. The section of President James Monroe's message to Congress in 1823 known as the Monroe Doctrine cast the United States as defender of the Western Hemisphere against European intervention. Yet the debates on U.S. participation in the Panama Congress of 1826, organized by the Latin American countries, clearly show that Americans were unenthusiastic about involvement in the hemisphere.

LATIN AMERICAN REVOLUTIONS, AMERICAN RESPONSE TO The centuries-old Spanish and Portuguese Empires in the New World had experienced upheaval long before the French emperor Napoleon I tried to extend his sway over the Iberian Peninsula in 1807. But it was his decision to replace the Spanish king with his brother, Joseph Bonaparte, that sparked the events that resulted, fifteen years later, in the independence of Portuguese Brazil and all of Spain's mainland colonies in the Western Hemisphere.

In late 1807, with French troops poised to enter Spain, the Portuguese royal family decamped to its largest American colony, Brazil. The following June, Napoleon installed his brother on the Spanish throne. Very quickly, a revolution broke out in Spain in support of the king (Ferdinand VII) and the Junta Central (later, the Cortes) that ruled on his behalf. In most of Spain's colonies, the local authorities initially declared their loyalty to the Junta. But by 1810 true independence movements had begun to emerge across the Spanish colonial mainland. Neither Joseph nor the Cortes were in a position to address the colonial crisis. Some of these revolutions were suppressed by local authorities; others managed to establish independent governments.

With the defeat of Napoleon and the restoration of Ferdinand VII in 1814, most of the early independence movements collapsed. But the seeds of instability remained. The Portuguese king (João VI) stayed in Brazil, which he elevated to the status of a kingdom within his empire (the equivalent of Portugal itself) in 1815. And a new group of revolutionaries, including Simon Bolívar and José de San Martín, organized forces and made plans for renewed action. In July 1816 Buenos Aires declared its independence. In 1817, Bolívar in the south and San Martín in the north won major victories. Over the next few years, they proceeded to establish military and political control over most of Spanish South America.

During the early 1820s Latin America was transformed. In April 1821 the Portuguese king returned to Lisbon, leaving a prince regent (Pedro I) to rule in Rio de Janeiro. Eighteen months later he declared Brazil independent. In the summer of 1821, major revolutionary victories in Peru and Mexico finally broke Spain's hold over its mainland colonies. By early 1822 six independent nations—Mexico, Central America, Colombia, Peru, Chile, and Buenos Aires (the United Provinces of the Río de la Plata)—had replaced the old Spanish colonies.

EARLY RESPONSE TO REVOLUTION

From the beginning, American public opinion tended toward enthusiastic support for the revolutionary movements to the south. While there were always skeptics, the signs of support were everywhere. Letters and essays in newspapers and journals championed revolutionaries who often claimed the Americans' own anticolonial and republican revolution as their model. Private citizens showed their views, illegally, by joining filibustering incursions into neighboring Spanish colonies or outfitting privateering expeditions against Spanish shipping. Following the War of 1812, this popular interest fueled frequent efforts on behalf of the revolutions in Congress, led by Speaker of the House Henry Clay.

Until early 1822, however, administration opinion generally lagged behind that of the public and Congress. Thomas Jefferson and James Madison had initially viewed the turmoil in Spain and the Spanish Empire with a combination of hope and fear. If it resulted in republican governments that were independent of all of Europe (not just Spain), it would certainly advance American economic and strategic interests. But if it instead ended with a powerful France or, even worse, Great Britain replacing a weak Spain throughout the hemisphere, American interests would clearly suffer. Between 1808 and 1812, Jefferson and Madison had offered some encouragement to the revolutionaries, particularly in Mexico and South America. At the same time, they had tried to guard against the spread of British influence in the region, especially in the neighboring colonies of East and West Florida, Mexico, and Cuba. With the start of the Anglo-American War of 1812, American policymakers received little information from, and devoted little attention to, the Spanish Empire beyond their immediate borders.

With the end of the war in early 1815, President Madison and Secretary of State James Monroe labored to shape policies toward the region that balanced threats and opportunities. They crafted a neutrality policy that they hoped would prevent a conflict with Spain and, thus, with Spain's Native American and British allies, while still opening American markets to the revolutionaries. Their definition of neutrality fully satisfied no one—not Spain, which complained about lax enforcement of the existing laws, and not the patriots or the American public, which expected more encouragement for revolutions that seemed so like the American Revolution. The War of 1812, however, had convinced the administration not to risk another war until its wide-ranging preparedness efforts had been completed.

DECIDING ON RECOGNITION

After the spring of 1817, the principal issue confronting the new Monroe administration was whether to extend formal diplomatic recognition to Buenos Aires, which had declared its independence the previous year. Both supporters and opponents of recognition squared their position with American neutrality. Supporters argued that the United States was not neutral if it failed to recognize states that had secured their independence because recognition would confer rights Spain already enjoyed. Opponents insisted that the government would abandon neutrality if it recognized any of the rebellious states, since that would effectively announce that the revolutionaries had won. Speaker Clay led the congressional pressure for recognition. Secretary of State John Quincy Adams made the strongest counterargument. President Monroe sought ways to recognize the new states without risking war. Between late 1817 and early 1821, Clay tried at every session of Congress to introduce a resolution or bill in support of recognition. Adams worked quietly to defeat them or, at least, to water them down.

Then, in early 1822, the administration quickly reversed its position. Monroe and Adams continued to worry about the Spanish and European response. They continued to doubt that the United States was ready for war. And they continued to wonder whether the Spanish Americans could establish independent, republican governments. But the military successes of the preceding summer had left no doubt that the revolutions had succeeded throughout the Spanish mainland colonies. Any further delays, they worried, would only poison their relations with the new governments. By recognizing the governments and exchanging ministers with them, moreover, Monroe and Adams hoped to encourage the emergence of truly republican governments, the adoption of nondiscriminatory trade policies, and the rejection of close political or diplomatic ties to Europe. In early 1822 the New World seemed to have reached a decisive moment. It would either replicate—or extend—the European political, economic, and diplomatic system or reproduce the very different U.S. system. The former would seriously threaten American economic and strategic interests; the latter would probably promote them. Recognition might help decide in favor of the latter.

MONROE DOCTRINE

Having recognized five Spanish American nations in March 1822, Monroe and Adams found themselves in a difficult position eighteen months later, when European developments threatened a new effort by

Spain, aided by the anti-republican Holy Alliance, to reconquer the rebellious colonies. The British foreign minister proposed a joint Anglo-American statement to discourage such a multipower enterprise and to disavow any interest in acquiring Spanish colonies for themselves. The cabinet discussed the new European threat and the surprising British proposal at length in the fall of 1823 (while the British dispelled the danger through quiet negotiations with the French). The result of these deliberations was a public statement of American concern in the president's annual message to Congress in December 1823 and new instructions for the American ministers in Great Britain, France, and Chile. In time, three crucial paragraphs in Monroe's message would be known as the Monroe Doctrine. Taken together, they asserted that the New World was closed to new colonization, that the European powers should not intervene in New World affairs, and that the United States would not interfere in European affairs. This bold stance was undercut by the reserve expressed in the instructions and other contemporary documents. Largely ignored in Europe, the message was well received within the United States and by the new Spanish American governments, some of whom hoped that it embodied the commitment to the success of their revolutions that they had expected from the United States years earlier. Monroe and Adams were quick to dispel this misconception.

RELATIONS WITH THE NEW NATIONS

In 1825 President Adams and Secretary of State Clay seized a new opportunity to shape Latin America in the United States' image by accepting an invitation to the Panama Congress. First proposed by Bolívar, the Panama Congress would bring together all of the independent American governments in the summer of 1826. Adams and Clay hoped to secure multilateral agreements at Panama that would solidify republican government, liberal commerce, and diplomatic isolation throughout the hemisphere. Fierce domestic opposition to attendance at Panama foiled these hopes. Delayed by congressional attacks, the U.S. delegates missed the Congress, which accomplished very little in any case.

By the end of the 1820s, developments in Latin America—the emergence of military governments and the descent into recurrent warfare, in particular—had left American policymakers untroubled by and uninterested in the new states. Only the United States' immediate neighbors, Mexico and Cuba (which remained a Spanish colony), still captured its attention.

LAW

This entry consists of four separate articles: *Federal Law*, *Slavery Law*, *State Law and Common Law*, and *Women and the Law*.

Federal Law

Federal law in the early national period was limited by both the U.S. Constitution and the perceptions of what politicians in the founding era thought should be federal law. At the time of the ratification of the Constitution, most Americans understood that the Constitution created a government of limited powers. Anti-Federalists feared the powers were not limited enough, while Federalists argued the government was properly limited. Shortly after the new government went into effect, James Madison proposed a series of constitutional amendments that became the Bill of Rights. These amendments further limited the power of the national government. Thus, in the early national period most congressional legislation was limited to the business of running the government. Rarely did Congress pass legislation that would today be seen as of a social nature. No one at the time envisioned an activist federal government

that could regulate vast aspects of American life. Economic policy was mostly limited to tariffs and expenditures, although some economic matters, such as protective tariffs, internal improvements, and the Bank of the United States, went beyond the simple business of government.

THE BUSINESS OF GOVERNMENT

With the Constitution ratified, the new government needed laws under which to operate. Most of the laws passed by Congress from 1789 until 1800 were about the business of government.

The first law Congress passed regulated “the time and manner of administering certain oaths.” If the national government was to have officers and officials, they had to be properly sworn into their office. Three of the next four acts Congress passed involved collecting duties on imported goods and other forms of revenue collection. The government could not be run without money—and at last, for the first time since the Revolution began, the national government had the power to tax. Congress then set about creating a government, passing laws to establish the State Department, the War Department, the Treasury Department, and the courts. All together, during its first session in 1789, Congress passed twenty-five laws. All were housekeeping measures, tax laws, or acts to create government institutions. The most creative was the Judiciary Act of 1789, which set up an elaborate court system. The least innovative was the law that reenacted the Northwest Ordinance of 1787, making it applicable under the new Constitution and the new government.

Statutes passed in 1790 were similarly mundane, but also vital to the new nation. Congress passed a law to take the national census, “create a uniform rule of naturalization,” establish a patent office, institute copyright regulation, regulate the army, and buy land to establish a fort at West Point. That year Congress also passed various laws to pay salaries of government officials. In addition, it adopted a rudimentary criminal code for those few areas where Congress could punish crimes. Most criminal law remained with the states at this time, but piracy, other crimes on the high seas, treason, counterfeiting, and forgery, as well as more mundane crimes committed on federal land, could be punished by the national government.

In 1791 Congress, at the request of the Washington administration, passed legislation to charter the first Bank of the United States. Representative James Madison believed the law was unconstitutional because Congress did not have authority, under the

enumerated powers listed in Article I, section 8 of the Constitution, to charter a bank or any other company. A majority of Congress, however, accepted the rationale, set out by Secretary of the Treasury Alexander Hamilton, that Congress had implied powers to pass laws under the necessary and proper clause of Article I, section 8. This was the first important statute that did not deal with the mechanics and business of government, foreign policy, or trade. It represented an activist and creative use of the law by the federal government. It was also the most controversial act passed by the early Congress. Also controversial were laws to fund the debt and pay off all remaining state debts from the Revolution. In 1793 Congress passed a law to regulate fugitives from justice” and “fugitives from labour.” Although not controversial at the time, the second part of this law, dealing with fugitive slaves, would ultimately become quite controversial. More controversial would be the Alien and Sedition Acts, passed in 1798, which attempted to suppress criticism of President John Adams. While clearly unconstitutional by modern standards, their unconstitutionality was less clear at the time. Politically, however, the Sedition Act was a mistake. When it expired in 1801, no one suggested renewing it.

Throughout the first decade under the Constitution, Congress was generally circumspect and cautious in its legislation. Most of the controversial legislation, such as the bill to create the Bank of the United States, was initiated by the executive branch. Federal law thus developed in response to political initiatives by the president.

FEDERAL COMMON LAW

Beyond statutory law, however, was the question of common law. The United States had inherited its legal structures from Britain. While the Constitution limited the kinds of laws Congress could pass, it did not say anything about common law. Did the United States inherit the common law of England? If so, then federal law would include a huge body of private and public law that was not codified. Most of the state constitutions of this period declared that English common law, as it existed on 4 July 1776, was part of their law, except as modified by the state constitutions and statutes. The U.S. Constitution did not have such a provision. Did that mean that English common law was not part of federal law? There was no clear answer to this question at the founding.

Some Federalists, including Chief Justice Oliver Ellsworth and Associate Justices Bushrod Washington, James Iredell, and James Wilson, believed that

English common law was part of federal law. In the 1790s there were a number of federal prosecutions under common law. These included the prosecution of Gideon Henfield in 1793 for helping a French ship to capture a British vessel on the high seas, a prosecution of a diplomat from Genoa for extortion, a prosecution for an attempt to bribe a public official, prosecutions for counterfeiting currency issued by the Bank of the United States, and charges of sedition against publishers who criticized the U.S. government. Congress had not passed any statutes criminalizing these acts when they were committed, and thus the U.S. government brought these prosecutions under common law.

Jeffersonians opposed the idea of a common law of crimes. They believed that the Constitution did not merely limit the power to Congress to legislate, but also limited the power of the federal government to those laws that Congress could, and did, pass. As St. George Tucker noted in his American edition of *Blackstone's Commentaries* (5 vols., 1803), if the common law applied to the federal government, then the power of the national government would be "unlimited."

Despite this position, when Jefferson became president he had a new appreciation for using the common law as a political and legal tool. In 1798 Congress had passed the Sedition Act, which eliminated the need for common law prosecutions for the crime of criticizing the government. The law had been very unpopular, as the Adams administration used it to persecute the president's critics, who were Jefferson's supporters. The law expired by its own terms on 3 March 1801, the day before the new president took office. Shortly after his inauguration Jefferson pardoned all those convicted under the law, and Congress ultimately passed a law to remit their fines. Jefferson, however, soon discovered that he too did not like criticism. In 1806 the U.S. attorney in Connecticut instituted a common law sedition prosecution against various critics of the president, including two editors of the Connecticut *Courant*. The cases were delayed for a variety of reasons and did not reach the Supreme Court for six years. In *United States v. Hudson and Goodwin* (1812), the Court ruled that there was no federal common law and that all criminal prosecutions by the national government had to be under an existing statute.

THE ECONOMY

The charter for the first Bank of the United States expired in 1811, and neither Congress nor the executive branch had any interest in extending it. James Madison

had opposed the bank in Congress in 1791, and as president he had no interest in continuing it. But the War of 1812 (1812–1815) changed Madison's mind, because during that conflict the government lacked a sound financial institution to help pay for it. In 1816 Congress, at Madison's urging, passed legislation to charter the Second Bank of the United States. Congress also passed a law, known as the Bonus Bill, to use excess federal revenues, including money that the United States received from profits of the Bank of the United States, to build roads and canals and to support other internal improvements. Madison vetoed this bill in 1817 on the grounds that it violated the Constitution. He urged that Congress propose a constitutional amendment allowing it to pass laws to fund internal improvements that were not directly related to lighthouses, post roads, and military fortifications.

Congress regulated foreign trade with tariffs and embargoes, but these had a direct effect only on coastal towns and shippers. An act of 1801 banned the African slave trade as of 1 January 1808, and laws of 1818 and 1819 further enforced the ban. This was both an economic act and a rare example of social legislation. So too was the Missouri Compromise (1820), which banned slavery in the territories north and west of the new slave state of Missouri. But social legislation was rare. Most legislation dealt with more mundane aspects of the government or the economy. In 1828 Congress passed a new tariff, which was soon called the Tariff of Abominations because it greatly increased import duties. This, along with the bank charters, was the most conspicuous example of federal activism in the early national period. The tariff led to the nullification crisis a few years later and was ultimately replaced with a less extreme tariff.

DAILY LIFE

For most Americans in the early national period, the federal government was a distant entity and federal law had little impact on their lives. It was possible to spend an entire lifetime never encountering any federal official except the local postmaster. Federal law regulated some aspects of trade and commerce. Ship captains obtained coasting licenses, cleared ports, and entered them under the watchful eyes of federal customs officials, and they depended on federally funded lighthouses and other coastal installations and landmarks when they traveled. Merchants paid tariffs on imported goods and passed those costs on to consumers. Western settlers depended on federal law to organize the territories, create the first rudimentary

governments, and supervise the sale of federal land. Indeed, it was possible that western settlers would go years without encountering any representative of the federal government except the federal land agent. These settlers also expected the army to protect them from Indians, the British, and the Spanish. But these settlers rarely had to think much about the content of the laws that created the army, established forts, or paid the salaries of Indian agents. Rather, they were the beneficiaries of laws appropriating money to create and pay the army, but the settlers were not usually directly involved in the implementation of these laws. Even in wartime, as during the War of 1812, most soldiers served in their state militias, not the national army. War veterans and their widows depended on federal laws to fund their pensions, and special acts to grant pensions where records were uncertain or missing can be seen as one of the few forms of social legislation of the period. Federal law was so unimportant to the lives of most Americans that even residents of federal jurisdictions might be only marginally governed by federal law. The governments of the federal territories adopted laws from the existing states to regulate their young societies. The federal territories were not governed, on a day-to-day basis, by federal law. Similarly, the District of Columbia, created by Congress as the national capital, was not directly governed by acts of Congress. For the most part, Washington, D.C., merely adopted the laws of Maryland and Virginia.

A majority of Americans of the time probably agreed that it was best to leave most law making to local governments, which reflected the goals, desires, fears, prejudices, and even hatreds of themselves and their neighbors. A generation later a civil war and three constitutional amendments began to change the nature of federal law.

Slavery Law

Slavery was not recognized in English common law, but by the mid-eighteenth century, systems of slave law had been established through legislation and adjudication in each of Britain's North American colonies. Slave laws varied in each colony, but everywhere they supported slaveholders' property interests and the racial basis of slave society by denying the legal personality of the slave in civil cases and providing minimal protection for the humanity and due process rights not only of slaves but also free blacks.

In response to the great political, cultural, social, and ideological upheavals of the time, the law of slavery evolved throughout the late eighteenth and early nineteenth centuries. The most important changes were in criminal law, manumission, the regulation of free blacks, and the determination of racial identity. Despite the Revolutionary rhetoric of liberty and equality, changes to the law did nothing to undermine slavery in the southern states, and even in the North, where gradual abolition commenced in the 1780s, the law continued to deprive free blacks of basic civil rights.

CRIMINAL LAW

When slaves charged with felonies against person and property appeared before legal authorities, they were treated very differently from whites by a justice system that was swift, severe, and paid scant regard to legal due process. In Virginia, slaves were not entitled to trial by jury like whites, but instead were examined, judged, and sentenced by a panel of justices of the peace in what were termed courts of oyer and terminer. There were few checks on the magistrates' discretionary decision-making power and no provision for verdicts to be appealed to a higher court. Yet during the colonial period, similar trial systems in which slaves were tried by magistrates and freeholders were established in other colonies, including South Carolina, North Carolina, Georgia, Louisiana, and Pennsylvania.

Virginia retained its oyer and terminer system until 1865, and South Carolina and Louisiana did not abolish their slave courts until the late antebellum era. However, in other states, particularly in the

North and the Border South, there was a trend toward greater formalism in slave trials after the Revolution. Pennsylvania abolished special courts for slaves in 1780, and in the following decades Delaware, North Carolina, Tennessee, and Kentucky also provided for slaves charged with felonies to be tried by a jury and in the same courts as whites. Other states did not go so far in providing equal trial procedures for black and white felony defendants. Trial by jury was extended to slaves in Georgia in 1811; however, in contrast to white defendants who were tried in superior courts, slave trials took place in inferior courts until the 1850s. Meanwhile, a variation of the oyer and terminer system was established in Mississippi in the 1820s. In practice, the absence of common law due process in slave trials resulted in higher conviction rates for slaves than whites, although when slaves were tried in regular courts the proceedings were marked by a surprising degree of fairness, and appellate courts in particular often protected slaves' procedural rights.

The movement toward greater due process in slave trials was accompanied by changes in slave punishments. Although whipping and hanging remained commonplace, more extreme forms of physical punishment such as branding, maiming, castration, and burning at the stake gradually disappeared from the statute books in the early national period.

When slaves committed minor criminal offenses, they were usually punished informally and summarily by their owners, overseers, or slave patrols that policed slave conduct off the plantation. The functions of the patrols included searching for runaways and tracking stolen goods, and often they were empowered to enter both black and white properties without a warrant and to inflict summary punishment on slaves and free blacks. In southern cities, where many slaves lived and worked with a substantial degree of autonomy, the patrols were gradually replaced by municipal police forces in the nineteenth century. The specific content of municipal slave codes varied, but commonly urban slaves were prohibited from hiring themselves out, gathering together in groups, and moving about the city at night without a permit from their owner or employer. By the 1820s many cities held daily court sessions to ensure the rapid examination and punishment of slaves who flouted the municipal codes, but enforcement remained sporadic and did little to restrict slave autonomy. The public regulation of slaves also placed restrictions on whites who were required to serve on patrols and prohibited from selling liquor to slaves, aiding slave runaways, and marrying and engaging

in sexual relationships with blacks, although this last prohibition was rarely enforced.

CRIMINALIZING THE MURDER OF A SLAVE

In the colonial period, slaves had little legal protection from white violence, particularly when perpetrated by their owners. In Virginia and South Carolina, statutes protected slaveholders from prosecution for killing a slave through excessive punishment, and in the latter colony slave murder was not a capital offense when perpetrated by any free person. In other southern colonies the law regulating slave murder was uncertain or unclear. In practice, few slaveholders were ever prosecuted for slave homicide, although on rare occasions in mid-eighteenth-century Virginia, whites were executed for murdering another person's slave. In addition, slaveholders could sue for damages for nonfatal assaults perpetrated against their slaves.

From the late 1780s there was a gradual shift toward greater protection of slaves from white violence. In 1788 Virginia upgraded the killing of a slave during punishment from manslaughter to murder and most other southern states followed suit through legislation, constitutional provisions, or judge-made law by the early 1820s. However, in most states slaveholders remained exempt from prosecution if they killed a slave who had committed an act of resistance or insurrection, and it was rather nonslaveholding whites who were the primary target of the new legislation. Not only were nonslaveholders more often convicted for murdering slaves by the 1820s than they had been in the colonial era, they were also subject to criminal prosecution for nonfatal attacks on slaves. Rather than concern for slaves' humanity, therefore, these legal developments reflected the rising value of slave property and the growing threat to their slaves' life and labor that slaveholders perceived from nonslaveholding whites. Laws protecting slaves from murder or other harms, however, were limited by the fact that no slave or free black could ever testify against a white in the South.

MANUMISSION

The law placed few restrictions on the master-slave relationship, but the right of private manumission was limited by legislation. In early-eighteenth-century Virginia and North Carolina, manumission could only occur as a reward for public service and had to be approved by the governor and council. Similarly, South Carolina only permitted manumission as a reward for slaves who killed or captured an

enemy “in time of alarms,” and from 1722 slaveholders were required to provide means for freed slaves to leave the colony within twelve months of receiving their freedom. In 1735 the time allowed for departure from the colony was reduced to six months, and any former slave who returned within seven years could be reenslaved. Restrictions were also placed on manumission in some northern colonies. In Pennsylvania, for example, as in Virginia and Delaware, slaveholders had to post a bond for the good conduct of former slaves and to ensure that those who were unable or unwilling to work would not become a burden on the public purse. In Massachusetts, however, all blacks had the right to sue for their freedom.

After the Revolution, manumission laws were relaxed across the South. In Virginia, slaves under age forty-five could be granted their freedom by will or deed from 1782, and a similar policy was enacted in Delaware in 1787 and Maryland in 1790. However, as humanitarian and ideological concern with issues relating to African American liberty waned in the early nineteenth century, and as fear of the free black population increased at the same time, there was a renewed clampdown on manumission. In Virginia, for example, slaves freed after 1806 had to leave the state within twelve months on pain of reenslavement.

EMANCIPATION IN THE NORTH

Laws were never passed specifically to establish slavery in the American colonies, but in the early national era the northern states used legal and constitutional means to bring about slavery’s abolition. Vermont ended slavery by constitutional amendment in 1777, while in Massachusetts and New Hampshire, abolition proceeded gradually through judicial rulings and individual acts of manumission. In the mid-Atlantic states, legislation provided for the gradual abolition of slavery. In 1780 Pennsylvania passed an act for its gradual abolition, according to which all slaves born after 1 November 1780 would be freed on reaching the age of twenty-eight. Gradual emancipation laws were also introduced in Connecticut and Rhode Island in 1784, but in New York, where slavery was a more integral part of the economy, a similar law was not passed until 1799. The New York law stated that children born to slave parents had to serve their mother’s owner until age twenty-five if female and twenty-eight if male. Children born under these conditions had to complete their period of service even after New York finally abolished slavery in 1827. The final northern state to legislate for gradual emancipation was New Jersey in 1804.

LAWS REGULATING FREE BLACKS

In the colonial period, free blacks held an ambiguous legal status. In many cases they were treated as slaves, but at times they were entitled to the rights of white citizens, including in some colonies trial by jury and the right to vote. In the southern states, where slavery was most entrenched, the growth of the free black population after the Revolution led to even greater restrictions on free blacks’ legal rights, civil liberties, and freedom of movement. By the 1790s, only in North Carolina and Tennessee were free blacks permitted to vote and hold public office, while free black felony convicts were subject to similar corporal punishments as slaves in all states except Virginia and Maryland, where they were imprisoned alongside whites in the penitentiary. Throughout the South, free blacks were required to register at the local courthouse and carry papers attesting to their liberty. Legislation also prohibited free blacks from entering the states of Virginia and South Carolina, and in many states free blacks could be sold into servitude for offenses including defaulting on their taxes, vagrancy, and harboring a runaway slave.

Another threat to free blacks’ liberty was South Carolina’s Negro Seaman’s Act. Passed in 1822 in response to Denmark Vesey’s rebellion, the act required free black seamen on board ships entering South Carolina’s ports to be imprisoned until their vessel departed. If the ship’s captain refused to pay the costs of imprisonment or to remove a seaman from the state, the seaman could be sold into slavery. Under pressure from Britain and the northern states, the provision for enslavement was replaced within a year with a requirement that black sailors leave the state, but this policy was reversed in 1835 and similar legislation regarding black seamen was enacted in other Deep South states in the 1830s and 1840s.

In the northern colonies, too, the legal rights of free blacks were less than those of whites. In Pennsylvania, free blacks were tried in the same special courts as slaves, could be sold into slavery for marrying a white person, and were subject to corporal punishment for a wider range of criminal offenses than whites. In addition, free black children born after 1726 could be bound out for service until age twenty-one for women and twenty-four for men. With the introduction of emancipation legislation in Pennsylvania in 1780, free African American defendants were accorded the same trial rights as whites, but they continued to be denied other legal privileges, including the right to vote. Free blacks’ rights were more extensive in New England, where the black population was smaller and abolition was enacted more swiftly after the Revolution than in other

northern states. In Massachusetts, for example, the Declaration of Rights (1780) made all men eligible to vote and hold elective office irrespective of race.

RACIAL IDENTITY

Although race was central to the law of slavery in all of the American colonies, there was little agreement on how race as a legal concept should be determined. In Virginia the law was vague and changed over time. In the colonial era, a person with one-eighth African ancestry was defined as a mulatto, a category legally indistinct from black. Subsequently, the degree of “black blood” that signified mulatto status was raised to one-quarter, implicitly expanding the definition of whiteness. Statutes defining race in terms of fractions of black blood were enacted in all southern states except Delaware, Georgia, and South Carolina, but nowhere was it made clear what evidence was required to prove an individual’s racial identity. In practice, therefore, determining who was black and who was white was never a simple task, and although courts never failed to assign an individual to a particular racial category, the process by which they did so was often inconclusive and revealed the fallacy of a simple division between black and white on which the law of slavery was based. Since the laws on slavery and race overlapped imperfectly, and with slave status determined by the mother, a person could—at certain times and places—be both slave and white. As with all aspects of the law of slavery as they functioned in practice, therefore, the determination of race at the local level articulated tensions between slaveholders’ interests and the law of slavery that were not evident in the law as it stood on the statute books.

State Law and Common Law

Americans of the Revolutionary generation approached the common law with the ambivalence inherent in the dual nature of the common law itself. In resisting British encroachments on their liberty, the colonists had claimed the common law as a source of liberties guaranteed to them as their birthright. The First Continental Congress had asserted Americans’ entitlement to “the common law of England”; but when delegates met in Philadelphia thirteen years later to draft a federal constitution, they carefully avoided including the term in their final product. Those in 1774 had embraced the common law as a body of fundamental rights that existed above statute and royal prerogative, such as the right to a speedy trial and a trial by jury, to habeas corpus, or to be subject to no ex post facto laws. So understood, the common law allowed legal writers to import many “higher law” doctrines into practice and to oppose acts of the legislature or executive. Chancellor George Wythe of Virginia thus could declare void a state law discharging a private debt because the act was contrary to “unwritten or common law, that is, of the law of nature, called common law, because it is common to all mankind. . . . They are laws which men, who did not ordain them, have not power to abrogate.” Indeed, states under the Articles of Confederation had set the common law against acts of the Confederation government, which they said were merely acts of an ordinary legislature.

At the same time, however, the common law was a body of unwritten law based on the steady accretion of procedures and definitions used by common law courts, and based on the ancient system of writs, commissions, and trial process. Such practices had developed over time in England, shaped by a discretionary judicial methodology that applied old principles to new cases and maintained the spirit of the common law by retaining its reasoning and rules. In this way, each colony’s courts had developed and followed their own usages and their own ways of interpreting and applying age-old principles and procedures. Each colony thus had developed its own variant forms, creating its own common law alongside its particular statutory law.

The common law was a reliable source of law for new state courts at the crucial moment of rejection of British sovereignty. State legislatures knew that it would “take a considerable time to compile a body of laws suited to the circumstances of the country,” declared the Virginia assembly in 1776 when it adopted the common law, “and it is necessary to provide some method of preserving peace and security in the mean time.” To James Madison, the common law provided continuity and stood as a barrier against the idea “that the separation from G[reat] Britain threw us into a State of nature, and abolished all civil rights and obligations.” Even so, as the newly independent states set about revising their legal systems, they recognized that the common law had to be purged of “what was inapplicable or unsuitable to us,” as Thomas Jefferson described the process undertaken in Virginia in 1776. It was for this reason that the Constitutional Convention would not include the term “common law” in the new federal Constitution. As James Madison explained to George Washington, “if they had in general terms declared the Common law to be in force, they would have broken in upon the legal Code of every State in the most material points: they would have done more, they would have brought over from G[reat] B[ritain] a thousand heterogeneous and antirepublican doctrines, and even the *ecclesiastical Hierarchy itself*, for that is part of the common law.” The states acted with the same caution.

Wary of the antirepublican influences in England’s common law, therefore, only nine states expressly adopted the common law, either by statute or constitutional provision. The new states chose selectively from among the fundamental guarantees of the common law (such as criminal trial by jury) and from the writs, commissions, and procedures of its courts. The Massachusetts constitution of 1780, for example, avoided the term “common law” when it retained those “laws which have heretofore been adopted, used and approved in the province, Colony or State of Massachusetts Bay, and usually practiced on in the Courts of law.” Others, such as New York and Pennsylvania, limited their reception of the common law to what had been adopted already. Virginia in 1776 included the common law among those laws declared to “be the rule of decision, and . . . in full force, until the same shall be altered by the legislative power,” but all were to “consist with” rules, decisions, and resolutions already made by the Revolutionary convention.

As state law reformers undertook to revise their legal systems, they found in the common law many

of the basic principles and procedures needed to make Americans a “people free, contented and united” under law and a terminology with settled meanings that would ensure consistency. How to separate these useful elements from their antirepublican features, and to make them “consist with” Revolutionary goals, was the reformers’ challenge. Jefferson, who distrusted common law methods of adjudication that gave great authority to unelected judges in interpreting the law, was a member of a committee that considered a plan in 1776 to “reduce the common law, our own, and so much of the English statutes as we have adopted, to a text,” or code. The group decided against the idea, recognizing that new terminology would only lead to more uncertainty and possibly the very ills they were trying to eradicate. A comprehensive new code, he wrote, would “have retained the same chaos of law lore from which we wished to be emancipated, added to the evils of the uncertainty which a new text and new phrases would have generated.” Instead, the committee worked three years to produce a preliminary list of suggested bills, only a portion of which were enacted. Not until 1785, nine years after beginning its work, did it make a complete report, but only a third of its proposed laws were accepted. In doing so the legislature made some major revisions of particular common law rules (such as abolishing primogeniture and entail), but the force of tradition, the needs of continuity, and the association of the common law with fundamental rights had conferred on the common law a staying power there as in other states.

Despite the torrent of post-Revolutionary legislation and the absence of any uniformly explicit reception of the common law by the states, the common law remained a powerful force in state law. The system of common law adjudication, so distrusted by many, actually allowed judges to adapt the common law to the new needs of the new states. When Jesse Root of Connecticut wrote the introduction to his state’s law reports in 1798, he pointed to judicial decision making as a way of “forming a system of jurisprudence congenial to the spirit of our own government.” Root was referring to Connecticut’s own government, just as the Virginia assembly in 1776 was referring to itself when it spoke of “the circumstances of the country” as the guide for lawmaking. Through case law made in state courts, the common law was reformed and given new meaning and legitimacy. The publication of such case law in law reports, moreover, made these decisions accessible to a wider public and diminished the sense of mystery once attached to the work of judges. Although state

judges were hesitant about citing English common law in their decisions, its presence was evident. Congress, in fact, recognized the legitimacy and utility of state common law in the Judiciary Act of 1789, which made the “laws of the several states”—including the common law—the rules for decision in civil cases.

State common law thus weathered its first challenges in the new nation, but new challenges appeared in the 1800s. The common law was criticized for its alleged obscurity, foreignness, technicality, and slowness, all protected by an elitist judicial establishment said to stand against popular change. Many legal reformers in the first decades of the nineteenth century thus revived the demand for a comprehensive system of codification. Despite—or because of—these calls, defenders of the common law absorbed these criticisms and adjusted to many of them through statutory revision, pleading reform, and decisional rule making, and made the common law accessible through treatises and law reports. As their predecessors had done in the past, common law judges were able to respond to opponents by recasting doctrines while maintaining that they were only finding and extracting principles from the past. The abolition of common law writs in pleading by many states before the Civil War did not change the substance of state common law, which survived to offer the states not only a guide for conducting their legal systems, but for protecting them against incursion by the federal government.

Women and the Law

In the Revolutionary era, Americans prided themselves on their superiority to “barbaric” nations in which women were little better than slaves. “Matrimony, among savages,” Americans told themselves, had “no object but propagation and slavery” and hence “is a very humbling state for the female sex” (“The Influence of the Female,” pp. 153–154). Indeed, the enviable position of women in the new nation was one of the markers of the Revolution’s triumphs, they believed, an indication of American moral and political superiority.

This admiration for women brought into question women’s historic legal disabilities. Under English common law, when a man and woman married they became legally one person—the husband. Americans learned this formulation from the *Commentaries* of English jurist William Blackstone (1723–1780), the first American edition of which in 1771 sold out quickly and remained influential well into the nineteenth century. As Blackstone put it, “The very being of legal existence of the woman is suspended during the marriage, or at least is incorporated and consolidated into that of the husband; under whose wing, protection, and cover, she performs everything; and is therefore called . . . a *feme covert*.” The principle of coverture, as it was called, shaped not only the law of marriage and domestic relations, but also that of property, business, and even criminal law. With few exceptions, a married woman had no legal existence apart from her husband’s.

Such restrictions on female agency fit badly with Revolutionary notions of equality, not to mention sentimental ones of women’s moral worth. Yet changes in the law came slowly, and the federal nature of the new government, which left all domestic law, as well as most property and criminal law, to the states, meant that change was piecemeal as well. Changes in one state were not binding on other states, nor did state laws fall into conformity. With a few exceptions, dramatic changes in women’s legal status did not come until the middle of the nineteenth century, although their way was paved by more modest achievements—and retarded by other contradictions in both precept and practice—earlier in the century.

WOMEN AND THE CONSTITUTION

Although the Constitution nowhere mentions women explicitly, records of the debates in the Constitutional Convention make it clear that women were to be included when congressional representatives were apportioned and hence that women, even though they could not vote or hold office, were to be represented by the new government. Likewise, the First Amendment rights, such as freedom of religion, assembly, speech, and trial by jury, all applied to (free) women. At the same time, as the scholar Linda K. Kerber has shown, women were not allowed to perform the duties of citizenship, not only (with the exception of New Jersey) voting and holding office, but also serving in the militia or on juries. Moreover, judicial pronouncements on female citizenship in this period, particularly for married women, were anything but consistent.

COVERTURE AND CITIZENSHIP

The principle of coverture, which subsumed a married woman's legal identity in that of her husband, came into direct conflict with Revolutionary ideals of individual accountability in several cases in which questions of property were caught up in discussions about women's competing obligations to their husbands and the state. In the 1805 case of *Martin v. Massachusetts*, James Martin, the son of Loyalist parents who had fled the country after the Revolution, sued to recover the confiscated property of his deceased mother. The case turned on whether Anna Martin had had any choice but to follow her Loyalist husband. The states generally recognized that both women and men could commit both treason and misprision of treason (concealing an enemy plot), and Massachusetts law expressly mentioned males and females both. Applying the contract theory of government, the state argued that its confiscation statute implicitly included women, for "surely a *feme-covert* can be an inhabitant in every sense of the word. Who are the members of the body-politic? Are not all the *citizens*, members; infants, idiots, insane, or whatever may be their *relative* situations in society?" James Martin's lawyer countered that "a *feme covert* is not a member; has no *political* relation to the *state* any more than an alien." The court agreed, refusing to penalize Anna Martin (or her son) "because she did not, in violation of her marriage vows, rebel against the will of her husband." The principle of coverture remained intact, although it is perhaps as important that it faced a serious, if unsuccessful, challenge from a more liberal vision of women's relationship to the state.

Twenty-five years later, in *Shanks v. Dupont*, the Supreme Court backed off so confining a notion of coverture. Once again the issue was one of property, in this case, who was to inherit the property of Ann Scott Shanks, an American woman who had married a British officer during the Revolution and returned with him to England at the war's end. The logic of *Martin* would have suggested that as a married woman she could not choose her own national allegiance, but here the Supreme Court, on relatively narrow grounds, disagreed. It distinguished between the "incapacities" of married women that "apply to their civil rights, and are for their protection and interest" and married "political rights, [which] . . . stand upon the general principles of the laws of nations." This was a limited concession to women's citizenship, and one with little practical implication, but it was a concession nonetheless.

MARRIAGE

It was in the area of marriage and divorce that liberal ideas about contract and sentimental ones about the family had the greatest impact on the law. Marriage became much easier to enter and somewhat easier to exit. Early modern law had placed a number of hurdles in front of couples who wanted to marry in order to prevent fraudulent marriages, for fraudulent marriages interfered with the orderly transmission of property within families—at the time, one of the chief purposes of marriage. The law increasingly defined marriage as a private contract between two consenting individuals and diminished the state's role in regulating who could marry and how. In order to make a marriage valid, "the consent of the parties is all that is required," wrote the influential legal commentator James Kent in 1826. States even recognized common law marriage; the key case was *Fenton v. Reed* in New York (1809). The sentiment was in favor of marriages, even those entered into irregularly or informally. As the historian Michael Grossberg has noted, the law increasingly set aside the family as a separate legal sphere, one outside the state and, ideally, free from the state's intervention. As a consequence, the law was reluctant to intrude into families.

Still, changing attitudes ran ahead of legal practices, and both the prescriptive literature and legal treatises began to criticize domestic violence. Blackstone had said that a man could legally chastise his wife (as well as other members of his household), although he criticized domestic violence as a practice only of "the lower rank of people." By the early nineteenth century, legal commentator Tapping Reeve

had doubts about the applicability of this doctrine in the United States; he thought that “the right of chastising a wife is not claimed by any man; neither is any such right recognized by law.” Nonetheless, courts routinely ruled in favor of wife-beaters, and it was not until at least the middle of the century that the practice met with significant opposition.

One arguable exception to the law’s *laissez-faire* approach to marriage concerns breach of promise, although, to be sure, it regulated only the entrance into the institution. In line with the contractual view of marriage, courts proved increasingly willing in the post-Revolutionary era to let jilted lovers sue for breach of promise. Almost without exception, however, this was a woman’s action, for “a deserted female” would find “her prospects in life . . . materially altered by the treachery of the man to whom she had plighted her vows” (Grossberg, p. 36). Not until mid-century, however, were courts generally willing to award additional damages for seduction. Until then the law tended to treat men and women as relative equals when contracting to marry, the era’s pervasive gender inequality notwithstanding.

DIVORCE

Before the Revolution only the New England colonies granted divorce, with Connecticut granting one thousand divorce petitions before 1789, primarily for desertion or adultery. In the other colonies separations could be obtained through colonial courts but divorce only by petitioning Parliament. However, in 1773 the Privy Council determined that subsequently “Acts of Divorce in the Plantations” would be “either Improper or Unconstitutional.” In the face of so restrictive a legal regime, countless men and women engaged in self-divorce and pseudo-remarriage, and when no property was at stake, the law looked the other way.

After the Revolution most states hurried to bring order to this messy situation. By 1800 divorce was legal in twelve states and the Northwest Territory. This rapid transformation in the law is all the more remarkable when compared to the slow pace of change in Britain, where between 1670 and 1857 only 325 divorces were granted, just four of which went to women. In the United States, federalism meant that each state established its own grounds, ranging from New York, which permitted it only for adultery, to Indiana, whose grounds were so expansive that it became the divorce mill of the day. Only South Carolina denied divorce altogether. With so much variety, there was a certain amount of migratory divorce—moving to another state temporarily

for more lenient grounds—and tailoring the “facts” to meet the grounds. Scholars debate the extent to which post-Revolutionary divorce was a woman’s remedy. In the most common scenario, a woman went to court to bring closure to a marriage already effectively terminated by her husband’s decampment. Rarely did she receive alimony. Yet divorce proceedings allowed women to enter court to assert their identity and to bring order to their lives.

PROPERTY AND ESTATES

In the realm of property and estates, significant change would not occur until the middle decades of the nineteenth century. Following the principle of coverture and common-law practices adopted in the colonies, when a woman married she lost all control of her property. The principle of coverture dictated as well that a married woman could not enter into contracts or conduct any business except as her husband’s agent. She could not sue or be sued, nor could she dispose of her realty without her husband’s consent. Although there were some variations from colony to colony, in general there were only two major limitations on the husband’s right to control his wife’s property. The first, a reciprocal obligation on the husband insured that if he died first, his widow would inherit a life-interest in, typically, one-third of his estate (which, after her death, would pass to his heirs). This was the widow’s “dower” right, and even during the marriage, her husband could not dispose of this property without her consent.

The other big exception was the wife’s “separate estate.” From the late sixteenth century on, English law had provisions for setting up a trust for a woman before, or even during, her marriage, which preserved the property for the woman and kept it out of the hands of her husband or his creditors. Such separate estates were typically created for wealthy women by their fathers, and they preserved a woman’s connection to her family of origin. Perhaps only 1 or 2 percent of married couples made use of them, although there was some increase during the first half of the nineteenth century.

Legal change after the Revolution brought some limited gains for women. The abolition of primogeniture and the double-share of the inheritance for the eldest son worked to women’s advantage. In some states married women gained expanded rights to enter into business, and in 1808 married women in Connecticut secured the right to bequeath real estate. But there were setbacks as well, making for a complex and contradictory picture. In 1804, in *Dibble v. Hutton*, a Connecticut court refused to recognize a

contract between a man and his wife. If husband and wife were "considered as one person in law . . . the . . . husband and wife cannot contract with each other." Although some scholars see an erosion of women's dower rights and hence their economic power in post-Revolutionary decades, others note that women's share of the national wealth remained essentially unchanged. In this period social and legal opinions about women's property rights were unsettled. Equity could seem either an aristocratic relic or a means to protect women and hence the family from dissolute husbands. Women's property rights might appear to set wife and husband against each other, by giving them separate interests, or they might seem a way to preserve part of the family's wealth in a tumultuous economy. Not until the middle of the century would law and society begin to sort these contradictory views out and craft out of them married women's property acts that were consistent with emerging patterns in the economy and family.

LEATHER AND TANNING INDUSTRY The leather and tanning industry began in the American colonies as a local industry for personal and local consumption. The tanners used local hides, local tanning bark, and hand techniques essentially the same as those used for centuries. Pioneer settlers tanned hides as just one of many tasks needed on the farms. As communities grew, a tanner who focused solely on tanning began to take farm goods in exchange for tanning or took half of the tanned leather from hides that a farmer brought to him.

Virtually every town in the colonies had a tannery. American settlements needed leather for shoes, boots, aprons, clothes, and more. Eventually, the demand for leather expanded beyond immediate local needs to include transportation (horse saddles and bridles, ships' rigging), communication (book bindings), and industry (cards for carding machines in the textile industry and belts for machinery). The leather and tanning industry developed rapidly in the middle and northern colonies, particularly Massachusetts, New York, New Jersey, and Pennsylvania.

The colonial legislatures promoted the industry through legislation. In the seventeenth and eighteenth centuries, many colonies passed laws forbidding the export of hides to promote local tanning and the production of finished products. Some colonies followed these prohibitions with export duties on raw hides.

The development of the U.S. industry benefited from the availability of large quantities of tanning bark and cattle hides. However, the abundant use of cattle hides may have also impeded further development. Cattle hides could take over a year to properly tan (unlike sheepskins and goatskins). This long time hindered development toward larger tanning establishments and mechanization.

As the industrial revolution and mechanization came to the United States in the early nineteenth century, the leather and tanning industry did not experience much change. Tanners, it turned out, were slower to use power-driven machinery than other artisans. However, the machines used in those other

industries often used leather as belting in the machines.

No radical change in tanning methods occurred in the early nineteenth century. Inventors patented machines and improvements in cleaning and treating hides, and a few large tanneries used machinery. However, the majority of tanners continued to use the age-old methods. Most of the proposed methods and machines were neither labor saving nor time saving for the average tanner. Part of the problem remained the lack of a scientific understanding of tanning on the part of local tanners.

In two areas, however, some of the industry adopted minimal mechanical improvements. Machines to "split" a hide divided a skin into two layers, grain and flesh. The grain is the outside skin with the hair follicles. The flesh is the inner layer with no grain marking. This process produced leather of a practically uniform thickness and of high quality. However, local tanneries could not afford these machines, and some began to sell their rough product to the few larger tanneries for finishing. Larger firms also began to use bark mills for grinding the tanning bark, although many of them remained horse-powered rather than steam-powered well into the nineteenth century. The number of small tanneries continued to grow and to far outnumber the large ones.

The few large tanneries appeared in the middle states, particularly New Jersey and New York, and this region became a center of the industry. New York City merchants devised new business strategies, such as contract tanning. The merchant provided financing to the tanner as well as negotiating services for the purchase of raw materials and the marketing of finished goods. The tanner paid fees, commissions, interest, and profits to the merchant. With this arrangement the merchants began to dominate the tanners, many of whom eventually became little more than skilled craftsmen or technicians in the employ of the merchants. The industry began a slow shift from sole proprietorships to partnerships and eventually corporations. The merchant provided financing to the tanner as well as negotiating services for the purchase of raw materials and the marketing of finished goods. The tanner paid fees, commissions, interest, and profits to the merchant. With this arrangement the merchants began to dominate the tanners, many of whom eventually became little more than skilled craftsmen or technicians in the employ of the merchants.

The involvement of the merchants also brought an international dimension to what had been a local

and domestic industry. Around 1825 the larger tanneries shifted away from using domestic hides as the merchants contracted for shipments of hides from South America. The first half of the nineteenth century also brought efforts to improve the quality of U.S. leather, which became more competitive on international markets.

In 1830 the leather and tanning industry was one of the four leading industries in the United States. Cattle hides remained the major source of leather. Most towns continued to have a tannery, but larger establishments grew in number. Developments after the Civil War, including the discovery of ways to address the long time required for tanning, resulted in a permanent shift from many local tanneries to large centralized tanning companies by the 1890s. In 1860 the nation had about 7,500 leather and tanning firms. By 1914 the number had been reduced to 750.

LEGAL CULTURE The transition from colonial to national status had, at least initially, little effect on American legal culture. The American bar at the time of the Revolution was relatively small and much dependent on its English brethren both for legal precedent and for legal texts. Although the Revolution brought about significant changes to the status of English precedent, it did little to change the intellectual life of the bar.

During the late eighteenth and early nineteenth centuries, American lawyers did not occupy a place in the intellectual hierarchy equal to that of the clergy. There were no domestic law schools until the second decade of the nineteenth century, and there were few lawyers in the United States who could claim to be "learned" in the same manner as their ecclesiastical

friends. American law publishing was very much in its infancy, and for the most part books that were published in the United States were published by local printers and tended to be practice manuals and the occasional text on local law. Even well into the first half of the nineteenth century, the American law book market was dominated by reprints of English legal texts as well as by imported English legal treatises. Most American states began early programs to publish state statutes, but few analytic treatises on these statutes were published to accompany them. Indeed, until the reformation of the U.S. postal system in the 1830s, lawyers outside major eastern or southern cities were hard pressed to obtain law books at reasonable prices.

Although native legal culture, narrowly defined, was not highly sophisticated in the new nation, it would be unfair to say that all lawyers themselves during this period were uncultured. Indeed, many lawyers, particularly in cities such as Boston, Philadelphia, and New York, were highly cultivated men who took part in the intellectual life of the day. Diaries of these lawyers show frequent entries for purchase of subscriptions to lecture series and concerts. Lawyers were among the most stalwart of public speakers on holidays and at civic events. A number of lawyers maintained substantial libraries of nonlegal materials. Indeed, by the early nineteenth century lawyers had made strides toward achieving their goal of being considered a learned class.

A few examples are helpful. Daniel Webster, of course, was one of the most noted—and erudite—public orators of his day. The printed versions of his lectures, speeches, and courtroom arguments are filled with references to classical literature. His library was large and its holdings of literary works substantial. Rufus Choate amassed one of the greatest classical libraries of his day, superior even to those owned by most American colleges. Theophilus Parsons, Sr., who became chief justice of the Massachusetts Supreme Judicial Court, was noted not only as a lawyer and judge but as a scientist. He contributed a section on the calculation of astronomical orbits to a standard work on celestial navigation and designed an improvement for cooking stoves.

In the literary realm many antebellum lawyers were renowned for their achievements. Justice Joseph Story wrote poetry throughout his life, as did a number of other prominent lawyers of his time. Indeed, a significant number of the poets whose works are excerpted in Rufus Griswold's *The Poets and Poetry of America* (1845), one of the first anthologies of American poetry, were lawyers by training or trade.

Indeed, legal prose was considered by many critics to be a literary genre, as witnessed by the inclusion of the legal writing of men such as Story in Griswold's *The Prose Writers of America* (1847).

Although a native American legal literature was slow to develop in the period immediately after the Revolution, by the beginning of the nineteenth century this had changed. A number of jurists of this generation began to emerge as legal treatise authors of a level equal to or exceeding that of the English. Chancellor James Kent of New York revolutionized American legal writing with the publication of his *Commentaries on American Law* (1826–1830). With its publication Kent earned the sobriquet “the American Blackstone.” St. George Tucker, a Virginia jurist, became known as the “Virginia Blackstone” for his annotated edition of Blackstone's *Commentaries*. Justice Story not only served as a justice of the United States Supreme Court and, from 1829, as the Dane Professor of Law at Harvard, but also edited and authored a series of treatises on subjects such as constitutional law, equity, bailments, agency, and conflicts of law. These were admired not only in the United States but in Britain and throughout Europe both for their scholarship and their wide-ranging knowledge of common and civil law. Other less prominent authors also made major contributions to American legal literature. Nathan Dane's *General Abridgement and Digest of American Law* (1823) helped to rationalize American case law and produced enough profit to endow Story's chair.

Along with the growth of a native legal literature, American legal culture also benefited from the founding of several law schools. Although several eighteenth-century universities such as the College of William and Mary and the University of Pennsylvania had law departments or law professors, it was only in the early nineteenth century that fully developed, university-affiliated law schools were founded, beginning with the Dane Law College at Harvard in 1817. The establishment of these law schools meant that future lawyers could have a period of time in which to learn law systematically as a “science.” They also provided an environment in which men like Story and Simon Greenleaf at Harvard and George Robertson and Daniel Mayes at Transylvania would have the time and resources to devote to treatise writing. The University of Virginia also had a strong law program at an early date. The Litchfield Law School, a judge-run law school in Connecticut also trained a number of prominent lawyers of the antebellum period.

As a result of these various early developments, American legal culture obtained a high degree of sophistication by the time of the Civil War. In effect, American law went from being a colonial backwater to an internationally recognized leader in legal thought within only three generations. By the early 1840s, when the British Parliament held an inquiry into the state of legal education and legal learning in Britain, American legal culture had come so far that Story and James Kent were asked to testify about American law schools so that they could serve as a model for British reform efforts.

LEWIS AND CLARK EXPEDITION On 18 January 1803, President Thomas Jefferson delivered a secret message to both houses of Congress. "As the continuance of the act for establishing trading houses with the Indian tribes will be under the consideration of the Legislature," he advised, "I think it my duty to communicate the views which have guided me in the execution of that act." Jefferson complained that Indian tribes increasingly grew "uneasy at the constant diminution of the territory they occupy" and that they refused "all further sale, on any conditions." To peaceably "counteract this policy of theirs," Jefferson wrote, "and to provide an extension of territory which the rapid increase of our numbers will call for, two measures are deemed expedient." First, he advised Congress to "encourage them [the Indians] to abandon hunting" and to take up the plow "and thereby prove to themselves that less land and labor will maintain them." Second, toward this end he urged Congress "to multiply trading houses among them, and place within their reach those things which will contribute more to their domestic comfort, than the possession of extensive, but

uncultivated wilds." The government should operate these trading posts to "undersell private traders, foreign and domestic."

Later that year Jefferson revealed his full intentions when he instructed William Henry Harrison, territorial governor of Indiana, to "push our trading uses" upon the Indians, "because we observe that when these debts get beyond what the individuals [Indians] can pay, they become willing to lop them off by a cession of lands." In the secret message of January, Jefferson revealed even larger aims when he suggested this policy for "the river Missouri, and the Indians inhabiting it" since it afforded "a moderate climate, offering, according to the best accounts, a continued navigation from its source, and possibly with a single portage from the Western Ocean . . . to the Atlantic." He requested that twenty-five hundred dollars be appropriated "for the purpose of extending the external commerce of the United States" by sending a military expedition to "explore the whole line, even to the Western Ocean, have conferences with the natives on the subject of commercial intercourse, get admission among them for our traders . . . agree on convenient deposits for the interchange of articles, and return with the information acquired, in the course of two summers." This was all part of Jefferson's plan to make the United States into an "Empire of Liberty." Indians would be acculturated to white ways and together with whites would secure the property necessary for republican citizenship. He planned imperialism through absorption rather than colonization, ending in citizenship instead of subjection.

Three months after the January message, Jefferson shocked Congress with the Louisiana Purchase from France, doubling the size of the nation with the acquisition of the entire Missouri River watershed for pennies an acre. Indians could now "lop off their debts" by selling land in the territories between the Appalachian Mountains and the Mississippi River; then they would move to Louisiana, where government traders and missionaries would have the time to inure the natives to white ways and ideas while facilitating America's international commerce via a transcontinental water route.

Meanwhile, Jefferson's plan for an exploration party called the Corps of Discovery was already well under way. He had chosen his personal secretary, a fellow Virginian and veteran soldier Meriwether Lewis, to lead the expedition. Captain Lewis chose William Clark as his "co-Captain," and together they led more than thirty soldiers, a French interpreter and his teenage Shoshone wife, Sacagawea (a guide),

The Missouri River. Before embarking on their expedition, Lewis and Clark collected the best cartographical information available at the time. This map of the midsection of the Missouri River in North Dakota was transcribed by Lewis from a map drawn by Canadian cartographer and explorer David Thompson in 1798. LIBRARY OF CONGRESS, GEOGRAPHY AND MAP DIVISION.

and Clark's black slave, York, in an expedition along the Missouri and Columbia Rivers to the Pacific and back between 1803 and 1806. They pursued Jefferson's instructions of 20 June 1803 to "explore the Missouri . . . for the purposes of commerce" while taking "observations of latitude & longitude, at all remarkable points on the river." They were to gather knowledge of all the Indian tribes along the way, as "the commerce which may be carried on with the people inhabiting the line you will pursue, renders a knowledge of those people important." Jefferson also instructed them to collect knowledge of the flora and fauna, to explore the Missouri's tributaries and the land they drained, to treat the natives "in the most friendly and conciliatory manner" to convince them to sign peace treaties with their enemies and with the

United States, and finally to report on the feasibility of the fur trade at the Pacific. The president charged Lewis with recording all of this information in a journal to be published at the mission's conclusion.

The Corps of Discovery failed to find an all-water route to the Pacific. The explorers also failed at conciliatory diplomacy among the Indians. The Lakota never made peace with their Mandan or Arikara neighbors, and the U.S. Army would war with them for the rest of the century, eventually subjugating and herding them onto reservations. The Corps did succeed in coming home alive, with only one exception. It also brought back valuable maps; discovered new species of animals and plants, such as prairie dogs, the white-rumped shrike, and "prickly-pears";

and obtained valuable information about the richness of the land and Indian ethnography. But here too it actually failed. Lewis never published his journals. He committed suicide a few years after returning, and the journals remained unpublished and in unusable form for almost a century. This failed expedition cost the nation's taxpayers \$38,722.25, more than fifteen times the original congressional allocation. The Corps of Discovery did succeed in capturing the imagination of the American people, who eagerly read reports in newspapers and awaited the explorers' return. They feted Lewis and Clark with balls and toasts in 1806 as trappers, traders, and settlers rushed up the Missouri River, settling the territory, clashing with Indians, and gradually dispossessing them of their hunting grounds and homes. Instead of using absorption methods, the U.S. Army and state militias conquered and colonized the West. For the Indians, the Lewis and Clark Expedition foreshadowed old-fashioned imperialism, not an "Empire of Liberty."

LEXINGTON Since its founding in 1779, Lexington has been one of Kentucky's major urban areas. Surveyors working along South Elkhorn Creek identified the site for a town in the spring of 1775. Tradition states that upon learning of the American victory in April of that year over the British at Lexington, Massachusetts, they vowed to return and establish a town named in honor of that historic battle of the American Revolution. Four years later Robert Patterson, who had been one of the surveyors, led a party of settlers from nearby Harrodsburg to the site and

founded Lexington. Once the Revolutionary War and significant Indian hostilities came to an end, town leaders set about improving the town. Located in the heart of Kentucky's Bluegrass region and being its population center, Lexington thrived as a major intersection for roads through the state and was its fastest-growing town. When Fayette County was formed in 1780, Lexington was named its seat. Although Lexington was not selected as Kentucky's capital, the first state legislature assembled in the town during June 1792. By 1800 Lexington had become Kentucky's major urban center, boasting fine homes and estates, manufacturing and mercantile businesses, a university, a newspaper, and cultural attractions.

The combination of population, economic growth, and cultural and educational attainment resulted in town leaders proclaiming Lexington the "Athens of the West." In 1789 Transylvania Seminary (chartered in 1780 and originally opened in Danville, Kentucky) held its first classes in Lexington. In 1798 its name was changed to Transylvania University. It is the oldest university west of the Appalachians. The school struggled in its early years, but from 1818 to 1825 it thrived under the leadership of the Reverend Horace Holley. Its law and medical schools were among the best in the nation. Among its students during this period were future U.S. senator Henry Clay, future vice president John Breckinridge, and future associate justice of the U.S. Supreme Court Thomas Todd. Lexington also had the first mental hospital west of the Appalachians. Incorporated in 1816 as Fayette Hospital, eight years later it became the state-funded Eastern Lunatic Asylum (later Eastern State Hospital), the second state-funded mental institution in America.

This climate of learning and public works was supported by an active publishing business. On 11 August 1787, the first issue of the *Kentucky Gazette*, Kentucky's first newspaper, appeared. From the *Gazette* office a variety of books, pamphlets, and broadsides were published in addition to the newspaper, including the *Kentucky Almanac* and early editions of the *Acts* and the *Journals* of the state legislature.

Business also thrived in Lexington. Its central location made it a major marketing and supply source for both agricultural, livestock, and manufactured products. In 1802 it boasted printing houses, powder mills, ropewalks, factories, stores with fine goods from the East, skilled artisans, and bustling inns and taverns. Some of Kentucky's earliest livestock, agricultural, and mechanical fairs were held in Lexington. The wealth and education centered in the town,

together with its prosperity, fostered the establishment of a library, theater, dancing school, churches, and other institutions.

Lexington's importance was reflected in its rapid population growth. The ethnic composition of Lexington's population was primarily English, Scots-Irish, German, and Irish. African Americans also constituted a significant proportion of the population. The U.S. census for 1790 listed Lexington's population as 834. Ten years later it had increased to 1,795 (including 462 African Americans [439 of whom were enslaved], or 24 percent of the population), and in 1810 it was 4,326 (including 1,594 African Americans [of whom 1,509 were slaves], or 35 percent of the population). Growth continued, but albeit at a slower pace, over the next two decades to a reported 6,026 in 1830. This total included 2,286 African Americans (2,065 of whom were enslaved), or 34 percent of Lexington's population. The town's central Bluegrass location, in the heart of Kentucky's highest slave concentration, resulted in its becoming a major slave-trading center. The decades following 1830 witnessed Lexington's continued success and importance, although it lost its standing as Kentucky's preeminent town.

LEXINGTON AND CONCORD, BATTLE OF

During the late evening hours of 18 April 1775, General Thomas Gage, commander in chief of all British forces in North America, ordered a raid to capture military stores then known to have been gathered by colonial forces in the town of Concord, Massachusetts. Gage selected a group of soldiers led by Lieutenant Colonel Francis Smith and had them quietly rowed across the Charles River to begin their nearly twenty-mile march from Boston to Concord. However, the Patriot leader Paul Revere, spying a lantern warning hung in the steeple of Boston's Old North Church, rowed across the river ahead of the British landing force and quickly traveled by horseback,

along with other alarm riders, to warn the Middlesex countryside that the British regulars were out in force. Revere was ultimately captured and later released by British patrols but other alarm riders were able to warn the entire countryside within a few hours of the British beginning their march on the town of Concord.

Arriving at the village of Lexington near dawn, the van of Smith's force spotted the militia company of Captain John Parker in loose formation on Lexington Green. A British officer ordered Parker and his men to lay down their arms when a shot rang out. No one knows for sure which side fired the "shot heard round the world." The British responded by firing a volley into the ranks of Parker's militia, ultimately killing eight townsmen.

Continuing toward the village of Concord, Smith placed a company to guard the North Bridge while other components searched for military stores. About four hundred colonial militia then marched on the bridge and, in a sharp action in which several British soldiers were killed, routed the British company guarding the bridge. Sensing that the countryside was now in a full state of alarm, Smith quickly reformed his force and began a rapid retreat toward Boston. Ambushed at frequent locations on the long road back, Smith's command would have been nearly destroyed had it not been for the timely arrival of Lord Hugh Percy's relief column, which met Smith and his men near Lexington. Even so, the now united British force found itself in heavy combat with Massachusetts militia units for the rest of the day. Casualties were considered heavy on both sides, but the Patriot side claimed the day as a great victory for their cause. In all, 49 militiamen had been killed along with 39 wounded. British losses for the day were 73 redcoats killed and 174 wounded. With this battle, American resistance to British policies shifted from political protest to armed belligerence, and the Revolutionary War commenced.

LIBERIA The establishment of the American colony of Liberia in 1822 marked the culmination of five decades of argument about whether whites and blacks could live together in a free society. Debate had begun in 1773, when the Reverend Samuel Hopkins of Newport, Rhode Island, a vigorous opponent of slavery, proposed an ambitious plan to send freed slaves as missionaries to Africa. While he won the support of some New England African Americans keen to emigrate, Hopkins trained only two would-be Evangelicals before the Revolutionary War intervened and the plan had to be abandoned.

It was not until the 1810s, when the number of freed blacks topped 200,000, that many Americans, both black and white, again paused to consider the future of this problematic population in a slaveholding society. This time, many groups saw advantages in the emigration of these blacks to Africa. White missionaries and antislavery activists such as Samuel Mills and the Presbyterian minister Robert Finley, as well as free black New Englanders such as Paul Cuffee, saw black emigration as an opportunity to elevate an oppressed segment of the American population while also bringing Christianity and enlightenment to the “Dark Continent.” Some southern slaveholders supported emigration schemes to remove the divisive influence of free black communities and thereby prevent slave rebellions.

Drawing on bipartisan support for the plan from political leaders including Thomas Jefferson, James Madison, Henry Clay, and John Randolph, leaders from all three communities came together in 1816 to form the American Colonization Society (ACS). In 1819, after lobbying from the ACS, President James Monroe backed a law facilitating the resettlement of free blacks in West Africa. The following January the ship *Elizabeth* sailed from New York with eighty-six

African American men, women, and children and several government agents on board. This first expedition ended in failure, with the colonists unable to find fresh water and soon being forced to evacuate to the nearest British settlement. A second and third group departed America for Africa in 1821 and 1822 to settle a permanent colony on land purchased from the local inhabitants of Cape Mesurado, west of Grand Bassa. The colonists named their first mainland settlement Monrovia in honor of their presidential patron.

Those early years were marked by incredible hardship and internal dissension as the colony struggled to organize and provide for itself. A ragged coast and dense inland vegetation made communication with sponsors and trade with neighbors difficult, and to make things even harder, malaria ravaged the population. Only half of the 4,571 black Americans who arrived in Liberia during the first twenty-three years of settlement were still alive by an 1843 census.

Open revolts over how to run the settlement, as well as frequent disputes between settlers and the native population, continued to hinder the colony's economic independence. Yet little support was forthcoming from the ACS at home. By the 1840s the society had been crippled by financial mismanagement and accusations of racism from radical abolitionists such as William Lloyd Garrison. With the society rendered impotent, the Liberian colonists were effectively stranded.

Direct control of the colony's administration thus passed from the floundering ACS to the settlers in 1847, marking the official birth of Liberia, Africa's oldest republic. Joseph Jenkins Roberts, a freedman from Virginia, was elected as the first president. Yet despite political independence, Liberia was battered by further financial insecurities and continued to rely on foreign aid until the 1950s.

LIBERTY In the eighteenth-century English and American political vernacular, no word or concept was as important as “liberty.” Celebrated by political theorists, pamphleteers, politicians, and the clergy, English people and Americans often boasted that they possessed greater liberty than anyone else. For all the Anglo-American celebration of liberty, however, the concept was often ill defined.

POLITICAL LITERATURE

Liberty was a common theme in many of the important English and American political treatises of the seventeenth and eighteenth centuries. By far the most common form of literature to discuss liberty was the pamphlet. As historian Bernard Bailyn has pointed out, pamphlets were cheap to produce, easy for publishers to turn out, and—since they normally ran from only five thousand to twenty-five thousand words—easy to finish quickly, which meant that the ideas contained within them could be rapidly disseminated throughout society. Some of the most important and influential political writings of the Revolutionary period were pamphlets, including John Dickinson’s *Letters from a Pennsylvania Farmer* (1767–1768), John Adams’s *Novanglus* (1775), and the most famous of all, Thomas Paine’s *Common Sense* (1776).

Beyond pamphlets of the Revolutionary era, British and American political actors and thinkers could rely on a host of book-length works that discussed liberty. Works from diverse authors such as Plato (c. 428–348 B.C.) and Cicero (106–43 B.C.) in the ancient world to Algernon Sidney (1622–1683), James Harrington (1611–1677), James Gordon (d. 1750), and John Trenchard (1622–1723) in the early modern era—to name only a few—lined the shelves of personal libraries. For colonial readers, at least, these works were a *sine qua non* of proper political thought, and it would be difficult for a well-educated American Revolutionary to be considered a true republican without familiarity with some, if not all, of these works.

POLITICAL THEORY BEFORE THE REVOLUTION

Despite the apparent vagueness of the concept of liberty, historians have established what it meant in the

eighteenth century. Considering the various writings of political philosophers such as Harrington, Sidney, Gordon, Trenchard, John Locke (1632–1704), Robert Molesworth (1656–1725), Baron de Montesquieu (1689–1755), and James Burgh (1714–1755) as well as political pamphlets, personal letters, state documents, and sermons, liberty by eighteenth-century standards can be said to have had two distinct definitions. According to the first, which has been largely forgotten, liberty, or public liberty, was the right of the people to establish and maintain some form of self-government. Many English and American political theorists believed that if the people created and served in government, liberty could not be usurped. As a result, public liberty was the most important form of liberty during the eighteenth century. The second definition of liberty concerned the rights of individual citizens, with the most common being property rights and religious freedom. It is this second definition of liberty, the one concerned with individual freedom, or personal liberty, which is more familiar.

Because the two definitions of liberty were distinct, a natural tension existed between them. Unfortunately, historians have compounded this natural tension by separating the two concepts into divergent and exclusive intellectual traditions. The creation of self-government is defined as the “republican,” or “civic-humanist,” concept of liberty. This republican concept required not only citizen participation in government, but also a citizenry possessed of virtue and disinterestedness. On the other hand, historians have often labeled the concern for individual freedom as the “liberal,” or “Lockean liberal,” concept of liberty.

However, eighteenth-century Americans were able to easily reconcile the duality and tension of liberty. Neither English people nor Americans defined personal liberty as it later became known, namely personal autonomy or the restraint of government upon civil liberties such as freedom of speech or the press, or freedom from illegal search and seizure. Personal liberty in the eighteenth century had to conform to the norms of society and, more important, to the rule of law. Thus, to most eighteenth-century English people, liberty was the law. This negative form of liberty was often characterized not as the freedom to act, but as freedom from arbitrary government actions. Furthermore, private liberty had to work in tandem with public liberty; one could not be paramount over the other. As long as a proper balance remained between governmental authority and private rights, English and Americans argued, liberty

Liberty Displaying the Arts and Sciences (1792). In this painting by Samuel Jennings, liberty is personified as a white woman surrounded by symbols of knowledge. She presents books to African Americans, while a group of freed slaves dances in the background. THE GRANGER COLLECTION, NEW YORK.

could exist. Making the natural tension of both concepts of liberty easier to accommodate was the belief that both types of liberty derived from the same source, nature itself. Because humans were endowed with free will, they were afforded certain freedoms naturally. It is important to note, however, that most theorists did not fully explain which liberties were taken from nature. This theory held that once people entered into a contract to create a government, only those liberties surrendered for the creation of the society were lost; all other freedoms remained.

Often, in the works on the political philosophy or other political writings, liberty was juxtaposed to two other concepts, tyranny and licentiousness. Since tyranny or arbitrary power was defined as the unlimited power of the executive and licentiousness

as the absence of order, liberty was seen not as the average of the extremes but as the perfect, if somewhat fragile, balance between the two. For the English to possess liberty, freedom and order had to peacefully coincide. English and colonial writers warned that when either tyranny or licentiousness became too dominant in politics and society, liberty ended and political slavery began. This need for constitutional balance was also found in ideas about English and colonial society. Theorists argued that society was divided into monarchy, aristocracy, and commons—or the one, the few, and the many—and that so should be government. With the monarch stationed in the executive, the aristocracy in the House of Lords, and the commoners in the House of Commons, they would balance each other and ensure that one branch did not obtain too much au-

thority. Theorists further maintained that each branch was responsible for certain functions of government. The monarch was responsible for the energy and dispatch of government, the House of Lords was responsible for deliberating on important issues and applying wisdom to its decisions, and the House of Commons was responsible for maintaining through legislation the protection of liberty and the public good.

Closely related to the need for a balance in the creation of liberty was the need to defend liberty from its antagonist, power. When discussing the dichotomy of liberty and power, liberty was portrayed as a hapless victim, vulnerable to the assaults of an aggressive, self-aggrandizing foe: arbitrary power. Whenever governmental power increased, usually in the form of a power-lusting executive, theorists held that the natural outcome was a decline of the people's liberty. This outcome could be staved off, theorists argued, only if the people remained ever-vigilant against and jealous towards encroachments upon their liberty.

Another term closely linked to liberty in the pre-Revolutionary era was property. As with so many terms in English and American political theory of the eighteenth century, property held several meanings. The most common definition was material goods, but in connection with the concept of liberty, property moved beyond mere materialism. In the eighteenth century, property in the form of land brought personal independence.

POLITICAL THEORY IN THE EARLY REPUBLIC

Although, broadly speaking, English concepts of liberty continued to carry tremendous significance in the early American Republic, during the era of the American Revolution, and especially during the adoption and early implementation of the Constitution (ratified 1788) and the Bill of Rights (ratified 1791), subtle changes in the concept of liberty began to develop in America. The first of these shifts in the concept of liberty was in connection with the need for representation in government. Beginning with the famous phrase "no taxation without representation," American theorists argued that only when the people were represented in Parliament, and later in state and national governments, could liberty flourish. The people's representatives, this argument ran, would insure the protection and security of liberty through their power to accept or reject proposed laws and taxes. To be sure, the English House of Commons, the body of the English government most accountable to its subjects, did possess the ability to

consent to or reject legislation. American theorists argued, however, that having direct representation instead of the English system of virtual representation (the belief that Parliament represented all the English people whether or not they actually elected a member) meant that liberty would be more secure because the government would be more accountable to the citizenry.

Another subtle change in the concept of liberty occurred with the creation of the state and federal constitutions and the various federal and state bills of rights. Since these documents were the fundamental law of the states and the nation, governmental authority was formally defined and, in most cases, curbed. Thus, for the first time governments would have clear, distinct outlines of their responsibilities. Furthermore, most of these constitutions, including the federal Constitution along with its Bill of Rights, protected many of the rights associated with traditional definitions of liberty: the right to trial by jury; the right to be free of standing armies; the right of habeas corpus; the right to be protected against arbitrary search and seizure. With this constitutional protection of rights and limitation of power, what began to take shape was a more modern definition of liberty wherein government is forbidden to violate particular, specified liberties. Just as important as the establishment of governmental authority was the creation of the constitutions themselves. In creating these documents, the people were exercising public liberty.

Closely linked with the development of constitutions was another shift in the American concept of liberty. With experimentation in public liberty and the crises of the 1780s came the realization that virtue and disinterestedness, which English and European theorists had argued were needed to sustain republican governments, could be achieved only with difficulty, if at all. From this awareness came the redefining of tyranny, which, in turn, meant the redefining of liberty. Tyranny now, unlike before, could come from any branch of government, including the populace itself. Efforts were made to curb this new tyranny, as well as the excesses of liberty that, as a result of events such as Shays's Rebellion, many thought were occurring in the 1780s. These efforts took the form of the federal Constitution of 1787, ratified the following year, and the Bill of Rights, ratified as constitutional amendments in 1791. Through this redefining and tempering of tyranny, the emphasis upon public liberty began to wane. Evidence of this changing understanding of the sources of tyranny, and along with it the changing concept

of liberty, can be found in the Constitution's sanctioning of the separation of powers. Before, European and English political theorists had surmised that the people could not threaten liberty and therefore could be trusted with governmental authority. However, the events of the 1780s caused many American political thinkers to reexamine that belief and conclude that only by constitutionally separating governmental power into distinct branches could liberty be safeguarded.

The crises of the 1780s also demonstrated that the traditional arguments regarding the clash of power and liberty needed recasting. No longer did American theorists view power as the automatic antithesis of liberty. Instead, they developed a new theory which argued that governmental power does not necessarily translate into a loss of liberty. As long as laws were enacted by a government of the people, the people themselves remained ever vigilant towards their liberty, and the people sanctioned a constitution that officially limited government responsibilities and authority, power could be entrusted to the government. This new political theory received its greatest confirmation in the federal Constitution of 1787.

Even more important than the addition of representation, constitutionalism, and the separation of powers to the concept of liberty was the intertwining of liberty and equality. Before the American Revolution, equality and liberty were seldom, if ever, linked, but by the time the American Republic was established, the two concepts were becoming inseparable. The enslavement of hundreds of thousands of blacks during this period makes this linkage appear hypocritical, but when the revolutionaries referred to equality as liberty, they did not mean that the law should force the equality of people. Instead, they desired the equal application of the law. Although modern Americans have become accustomed to a government that legally enforces the equality of people, to eighteenth-century American political theorists, who harbored a deep distrust of governmental power, government could not be trusted to create or enforce such equality. To be sure, associating liberty with the equality of people was becoming part of the American concept of liberty, but this change did not fully emerge until well into the nineteenth and then the twentieth century.

POLITICS, 1765–1820

The concept of liberty played an important role in the politics of the Revolutionary period. Beginning with the Stamp Act of 1765 and ending with the Declaration of Independence of 1776, the colonies justified

their resistance to parliamentary measures by claiming to defend their liberty. Although the colonies made continual attempts to reconcile with Britain, each rejection only reinforced the colonists' belief that their liberty was threatened. Seeing no alternative method of securing their liberty, they formally declared independence.

After the Revolution, liberty continued to play an important role in the politics of the new nation. The decade after the Revolution was filled with a series of crises that threatened to overtake the fragile country. In each crisis, whether concerning the financial situation of the states and the nation or the growing power of the states, the concept of liberty played some role. That was particularly so in regard to Shays's Rebellion of 1786–1787 and the Constitutional Convention along with the ratification debates. When disgruntled debtor farmers from western Massachusetts revolted against heavy taxation, among other things, they claimed they were defending their liberty from tyrannical actions of the state legislature. Most political figures disagreed, however, and the rebellion was quickly suppressed. At the Constitutional Convention and the ratification debates, securing liberty was a great concern of every participant. Although concepts of liberty were undergoing change at that very time, the older conceptions remained and were an important element in both the defense of and attacks on the Constitution.

During the Federalist period from 1789 to 1801, and then the Jeffersonian revolution of 1800, liberty was the dominant feature of the political landscape. Nearly every controversial measure during this period, including Alexander Hamilton's financial program, the Jay Treaty (1794), the Alien and Sedition Acts (1798), the Louisiana Purchase (1803), the Embargo Act (1807), the War of 1812, and even the Missouri Compromise (1820), were all judged by whether or not they threatened liberty. Even the rise of political parties in the 1790s is due in large measure to the fact that both Federalists and Republicans believed that the other side threatened liberty and that only their side could defend and protect it.

CULTURE AND SOCIETY

American society remained deferential during the eighteenth century in the sense that those with better social and economic standing were expected to lead government and society. However, there were increasing strains upon this traditional order of things. Because of the ideas of liberty promulgated during the imperial crisis and the termination of monarchical and aristocratic government with victory in the

American Revolution, the idea of equality under the law began to take root. Taking the place of hierarchical arrangements was a culture that began to celebrate the natural equality of people with the argument that liberty should create a level playing field for all individuals and allow those with natural talent to rise to the top levels of their fields of endeavor. This new meaning of liberty was in its embryonic form in the early Republic and excluded both slaves and women, but later events greatly furthered the cause of equality.

LIVESTOCK PRODUCTION Most colonial American livestock was raised for home consumption. After 1754, cattle remained the most important farm animal, providing meat and hides, tractive power in the form of a yoke of oxen (the preferred team for plowing in New England), and dairy products. With the elimination of predators, hogs freely grubbed roots and browsed on acorns and beechnuts in woodlands in the North and South. Most colonial farmers also kept a small flock of sheep for mutton and wool. Various poultry, including chicken, geese, ducks, and turkeys, were also found on eighteenth-century farms and plantations, providing fresh meat, eggs, feathers, and entertainment in the form of cockfighting, especially in the South.

Colonists in Rhode Island and Connecticut had raised horses and mules for the West Indies trade long before 1754. Horses were key to colonial land transportation. Three northern breeds are particularly noteworthy: the Narragansett pacers of Rhode Island; the Conestoga horses of Pennsylvania; and the Morgan horses, which originated in Vermont in the 1790s. Mules became important draft animals in the South only in the nineteenth century, despite George Washington's early efforts to popularize them. Henry Clay imported a jenny and jackass into Kentucky from Spain in 1827 and 1832. The South led the nation in horse raising before the mid-nineteenth century, and Kentucky became the center of horse breeding and mule raising.

Market-oriented cattle raising had also existed in America before 1754. Backcountry farmers in Pennsylvania and the uplands of Virginia and North Carolina drove range cattle to the Philadelphia market. Shenandoah Valley farmers sold their cattle in Fredericksburg and Petersburg, Virginia. Charleston, South Carolina, served as a market for the significant West Indies meatpacking trade. Eastern New Jersey

farmers raised cattle on bog meadows and marshes for sale in New York City, a market that was also served by stock driven from the northern New England hill country. Farmers in the Connecticut River valley of Massachusetts, the first region to specialize in cattle raising, early perfected stall-feeding animals for the Boston market. Windham and Litchfield Counties in Connecticut produced cheese in large quantities for export to the South and to the West Indies. The Narragansett country in Rhode Island developed as a specialized grazing region.

Military provisioning and wartime shortages during the American Revolution (1775–1783) created high prices for meat that spurred livestock production, and the postwar period saw the beginning of an age of improvement. Earlier, communal pasturing of animals on New England commons, with private ownership identified by a system of brands and earmarks, had prevented selective breeding and other progressive practices. Poor whites in the piney woods and the southern backcountry made a living from grazing livestock on poorer lands unclaimed by rich planters, who also practiced a system of woods ranching. Their slaves built cow pens near savannas or other good grazing and forage land and managed the herds far from their home plantation, driving the stock into the forest and rounding it up at selling time. Free-range stock raising was inefficient and unsustainable, however. By the mid-1700s, some farmers in New England and Pennsylvania were creating artificial meadows by seeding tilled uplands with English grasses, but the practice, which provided rich pasturage and dependable winter fodder, did not spread until after the Revolutionary War, when improved European animals were increasingly imported by gentlemen farmers. English Shorthorns became the most popular breed of beef cattle in the first two-thirds of the nineteenth century.

An important development in American animal husbandry in the early 1800s was the rise of the sheep industry. Wolves, hard winters, the poor quality of native stock, mercantilist bans on wool exports, and lack of domestic markets all prevented colonial sheep husbandry from expanding beyond household production. But patriotic promoters like Chancellor Robert R. Livingston of New York, David Humphreys of Connecticut, and Elkanah Watson of Massachusetts began building woolen manufactories and importing and promoting fine-fleeced Spanish merino sheep in 1802. American factories created a market for wool that survived the failure of the merino speculation in the late 1810s. The crossbreeding of merinos with common sheep greatly im-

proved the quality of fleeces, as did the importation in the 1820s and 1830s of Saxonies, New Leicesters, Cheviots, and Cotswolds. The center of American sheep husbandry would later move westward, but in the late 1820s it was still located in western Massachusetts and Vermont. Protective tariffs on woolens, passed in 1812, 1824, 1828, and 1832, made possible the expansion of the sheep industry.

The growing population of eastern cities created a greater demand for beef and pork than could profitably be supplied by regional farmers with increasing production costs. Many converted their operations to dairy production, providing milk, cheese, and butter to the growing urban centers. Increasingly unable to compete against western wheat production, the Mohawk Valley of New York shifted from a wheat-growing region after the opening of the Erie Canal in 1825, and New York became America's first dairy state. As early as the 1810s, cattle and swine were being driven to Philadelphia, Baltimore, and New York from the Ohio Valley. The Bluegrass country of Kentucky and the Scioto Valley of Ohio were two of the earliest important feeder areas (to be superseded in the 1850s by the prairies of Illinois and Indiana). The advent of railroads only facilitated western dominance of American cattle raising by the mid-nineteenth century; it did not create that ascendancy. For example, the stock business in New York State peaked about 1825, a quarter of a century before the New York and Erie Railroad and then the New York Central Railroad first brought livestock to eastern stockyards and later flooded the market with cheaper western meat packed in Cincinnati and Chicago.

LONDON The colonial period was the only time in American history when America looked to Europe for its principal city. But London was America's capital city in a far broader sense than as the seat of imperial government. Georgian London was the center of the English-speaking world for trade, finance, and banking; the empire's biggest port; the fountain of art and literature; the center of scientific endeavor; the chief nursery of music and theatre; the leader in journalism and print culture; the model of fashion and good taste. It was also the biggest shopping center in the British Atlantic Empire, with shops whose numbers and goods outrivaled even those of Paris. The sheer size of London added weight to its influence. In the eighteenth century, it was one of the largest cities (with a population of approximately 700,000) in the world. London towered above the provincial cities of Britain and America. It was more than twenty times the size of America's largest, Philadelphia. It was the model for provincial cities throughout the British Empire as they aspired to acquire the new leisured urban culture of Georgian England.

What all the American colonies had most in common was their British heritage, but by the late colonial period it was really London, as opposed to England or Britain, that most colonists knew something about. Americans in the colonial period knew from afar London's best-known features and its most famous citizens. Colonial newspapers fed a continuous American appetite for London news, including not only politics and trade, but also court functions, stage gossip, London crime, and other everyday events in the Great City. Essays from *The Spectator*, with their colorful descriptions of the life of London town, were frequently reprinted in the colonial papers of the day. Material evidence of London's cultural preeminence could be encountered everywhere in the colonies. The works of the galaxy of authors who formed Dr. Samuel Johnson's famous Literary Club (1764) were widely read. The trinity of George Handel, Sir Joshua Reynolds, and David Garrick were held up as the standards in music, painting, and theatre, respectively. The productions of the London stage were easily the most popular shows in the infant theatres of the colonies. London fashions were eagerly copied, even in the American countryside. The vast majority of colonists who traveled to Britain were either destined for London or passed through it.

CENTER FOR THE PROFESSIONS

With its unrivalled concentration of talent and ability, London was the center of creative excellence within the English-speaking world. Therefore, it drew ambitious colonists from all walks of life: newspapermen, artists, scientists, botanists, poets, novelists, anyone who aspired to reach the top of their profession. Exposure to London standards could have more value than any provincial training. Benjamin Franklin's first trip to London (1724–1726) was as a printer's apprentice. Colonial artists came to London to study under Pennsylvanian Benjamin West (1738–1820). West helped to found Britain's Royal Academy of Arts in 1768 and became historical painter to the king in 1772.

Throughout his career, West offered support to aspiring American artists in London. For this he came to be seen as the father of American art. Britain's foremost scientific institution, the Royal Society of London (1660), was the most important clearinghouse for the collection and dissemination of scientific knowledge in the English-speaking world, facilitating the exchange of knowledge throughout the British Empire and between British, American, and European scientists. It was the inspiration for the American Philosophical Society (1744). Its news and publications were followed in the colonies. In the two decades preceding American independence, American memberships in the society increased under the patronage of Benjamin Franklin (resident in London in 1757–1762, 1764–1775) and Dr. John Fothergill. Although Edinburgh was the foremost university for medical studies in eighteenth-century Britain, London's hospitals were still considered as an integral part of a thorough medical training. The first medical school in America, at the University of Pennsylvania, was established in 1765 with the assistance of Dr. Fothergill, a London philanthropist.

Throughout the colonial period, the bishop of London was the Head of the Church of England for America. There were no American bishops until after the War of Independence. All Anglican clergymen from the colonies had therefore to go to London for ordination.

CENTER FOR EDUCATION

Even with the approach of the American Revolution, an English education was considered to be the best apprenticeship for genteel colonial society. An indeterminate number of children of wealthy colonists—mostly boys—were sent to English schools. Many of these schools were in or near London. Colonial youths who attended Oxford or Cambridge came to

London to visit, tour, and get into trouble. Wealthy colonists sent their sons to study law at London's Inns of Court. Between 1755 and 1775, over one hundred mainland Americans registered to study at the Inns, a substantial increase over the earlier colonial period. Most of these were from Pennsylvania, Virginia, Maryland, and South Carolina. An equal number of West Indian youths (still counted as Americans prior to American independence) also attended. Absentee planters and their families from the southern mainland colonies and the West Indies were a conspicuous presence in London by the late colonial period. At any one time from 1763 to 1775, at least one thousand resided there. This made London the foremost meeting place in the empire for the rich and powerful from Britain's many American colonies.

THE SORDID SIDE

But London also represented the worst of the Old World to American visitors. Its slums (almost nonexistent in the largely rural colonies), its conspicuous extremes of rich and poor, empty consumerism, and appalling death rates suggested to some that Britain's greatness was on the verge of decline. This was hardly an exclusively American insight, but particularly with the approach of the Revolution, Americans contrasted London's sordid side with their own supposedly purer provincial lifestyles. The political career of John Wilkes in the city during the 1760s also brought into focus American fears of corruption in metropolitan politics. When Wilkes was denied his seat in Parliament after his election by Middlesex County in 1769, the disaffected in the colonies drew parallels between Parliament's infringement of voters' rights in England and its attempt to deny the colonies the right to be taxed by their own representatives.

In the thirty years following American independence, London in many respects remained America's financial and cultural capital. The United States was never to have a single dominant metropolis like London or Paris, but by the latter half of the nineteenth century, New York, Boston, and Washington had overtaken London's place as America's financial, cultural, and political centers.

LOUISIANA During the period 1754 to 1829, ownership of Louisiana was transferred from the French to the Spanish in the Treaty of Paris (1763), ceded back to the French in the Treaty of San Ildefonso (1800), and then sold to the United States in 1803. Not only did Louisiana's ownership change but also its boundaries. They ranged from the vast area of the Louisiana Purchase (stretching from the Gulf of Mexico to the Canadian border and the Mississippi River to the Rocky Mountains) to the smaller area of the Territory of Orleans (1804 to 1811), which did not include the Florida Parishes (the section of Louisiana between the Mississippi and the Pearl River) and which had an unresolved border with Spanish Texas. The addition of the Florida Parishes, after the 1810 West Florida rebellion severed this region from Spain, and the passage of the 1819 Transcontinental Treaty, which established the Sabine River as the state's western boundary, determined Louisiana's modern-day borders.

POPULATION

Although the region's borders fluctuated, its population steadily increased from an estimated 11,000 people in 1771 to 76,556 in 1810, 152,923 in 1820, and 215,739 in 1830. During the period of Spanish control, between 2,600 and 3,000 Acadian refugees, who had earlier been expelled from Maine and eastern Canada by the British, arrived in the region; their descendants are often called Cajuns. Additionally, approximately 10,000 people (including 3,000 slaves) emigrated from Saint Domingue (Haiti) after a successful slave revolt there. Most of these refugees came to Louisiana in 1809 and 1810, following their expulsion from Cuba. Finally, after the Louisiana Purchase and especially after 1820, settlers from elsewhere in the United States helped further increase the population. Much of this growth occurred in New Orleans, the capital of Louisiana and the South's foremost commercial center. With a population of 46,082 in 1830, it ranked as the nation's fifth-largest city.

LOUISIANA PURCHASE

Aware of the economic importance of having access to the mouth of the Mississippi River, President Thomas Jefferson offered to purchase New Orleans and its surrounding area from France. Initially, the French leader Napoleon Bonaparte ignored Jefferson's negotiators. In 1803, however, Napoleon, fearing that he could not protect Louisiana, needing money for his European military campaigns, and having already suffered defeat in Saint Domingue, suddenly changed his mind and sold all of Louisiana (approximately 830,000 square miles, comprising territory which became all or part of thirteen states) for \$15 million (\$11.5 million payment plus the assumption of \$3.5 million in French debts). In 1804 Congress established the Territory of Orleans and appointed William C. C. Claiborne as governor. The region remained a territory under Claiborne's jurisdiction until 30 April 1812, when Louisiana became the eighteenth state.

In 1806 former Vice President Aaron Burr, apparently hoping to capitalize on Louisianans' discontent with the United States government, traveled to the region with clandestine designs. His goals remain unclear, but some speculate that he was organizing a separatist movement. Whatever its aims, the Burr conspiracy quickly collapsed, in part because Louisianans refused to participate in it.

CONFLICT AND COOPERATION

The development of Louisiana during this period is often portrayed as a conflict between people of different cultures, languages, religions, and legal traditions. In this view, Americans saw the people of Spanish and French origin as incapable of participating in a democracy because of their monarchical and Catholic heritage. (Some historians describe these Louisiana-born Europeans as Creoles, but *Creole* can also be used to describe people of mixed race, anyone born in Louisiana, or to distinguish between European and Louisiana-born French or Spanish citizens. Thus, the term often confuses more than illuminates an understanding of Louisiana history.) According to this conflict argument, Spanish and French residents considered the Americans to be money-grubbing, uncultured invaders. Law provided one of the most important arenas of disagreement. The Americans promoted common law, with its emphasis on jury trials and precedent, whereas the Spanish and French advocated civil law, with its emphasis on educated judges rendering decisions based on a strict reading of the law. Generally, common law triumphed in the criminal code, while civil law remained the standard in the civil code. Other historians see cooperation

among Louisianans rather than conflict. In their view, all residents, in the wake of the Louisiana Purchase, sought to ensure their incorporation into the United States as equal citizens as well as the prosperity of the region. Toward those ends, they downplayed ethnic tension and took part in a growing network of cross-cultural kinship, while maintaining a shared commitment to white supremacy.

SLAVERY AND PEOPLE OF COLOR

Because of its French and Spanish heritage, Louisiana was less rigidly divided along racial lines than other sections of the United States. Under Spanish law slaves could purchase their freedom with or without their owner's consent, interracial liaisons were greeted with greater tolerance, and the offspring of these relationships were often freed. Additionally, among the refugees from Saint Domingue were more than three thousand free people of color. After the Louisiana Purchase this population struggled to maintain its unique position in society. Although never able to achieve equality, these men and women had greater rights than free African Americans elsewhere. Concentrated primarily in New Orleans, they numbered 16,710 in 1830.

In addition to its free people of color, Louisiana had a significant slave population, which increased from 34,660 in 1810, to 69,064 in 1820, to 109,588 in 1830. Because of improvements in agriculture, including the invention of the cotton gin and an improved process for refining sugar, Louisiana had an almost insatiable desire for slaves. The alluvial lands along the Mississippi River were among the best cotton lands in the nation, and south-central Louisiana had the only land in the United States where sugarcane could be grown profitably (with the help of a tariff on imported sugar). The growth of the slave population outpaced the growth of white Louisiana. In 1830 slaves comprised 50.8 percent of the population, whites 41.5 percent, and free blacks 7.7 percent. This slave majority, particularly when combined with the belief that slaves from Saint Domingue had brought rebellious ideas with them, fueled fears of slave revolts. A major conspiracy was uncovered at Pointe Coupee in 1795. Although historians disagree on its extent and on the involvement of free blacks and poor whites, they concur that the government acted swiftly and forcefully, executing twenty-three slaves and sentencing thirty-four more to jail terms. In 1811 a revolt led by a slave on the Deslondes plantation began near Laplace, in St. John the Baptist Parish. In what is considered the largest slave revolt in United States history, between two hundred and five

hundred slaves marched downriver toward New Orleans; despite their numbers, they were quickly defeated, with as many as sixty-six slaves slain in battle and twenty-one later executed.

THE BATTLE OF NEW ORLEANS

Only a few months after Louisiana achieved statehood, the United States declared war on Great Britain in the War of 1812. Landing on the state's coast in 1814, the British army expected to meet a fractured society eager to throw off the yoke of American rule. Instead, they faced General Andrew Jackson and an army comprised of regular troops, militia from several states including Louisiana, Native Americans, free people of color, and Baratarian pirates. Jackson and his men, with a strong defensive position and superior artillery, inflicted a tremendous defeat on the British at the Battle of New Orleans on 8 January 1815. This victory made Jackson a national hero and helped solidify Louisiana's place in the Union. Although the state remained unique in terms of its demographic composition, its legal code, and its cultural traditions, by 1830 Louisiana had much in common with its fellow states, particularly those in the slaveholding South.

LOUISIANA PURCHASE On 30 April 1803, French and American negotiators completed work on the Louisiana Purchase. For a pricetag of close to \$15 million, the United States acquired territory totaling 828,000 square miles. Eventually, fifteen states—Arkansas, Colorado, Idaho, Iowa, Kansas, Louisiana, Minnesota, Missouri, Montana, Oklahoma, Nebraska, New Mexico, North Dakota, South Dakota, Texas, Wyoming—joined the United States, either in whole or in part, through the Louisiana Purchase. It was, ironically, exactly the sort of deal that the United States had *not* sought in 1803, but which became an event that Americans eventually described as a godsend for reasons very different from the motivations that initially drove federal policymakers to pursue the Purchase.

DIPLOMACY OF THE PURCHASE

The French had established a vaguely defined colony called Louisiana before ceding that territory to Spain following the Seven Years' War (1756–1763). By the time the United States secured its own independence, however, the extent of European control remained limited to the Mississippi Valley itself, with Spanish officials governing a predominantly Francophone population. Meanwhile, Indians continued to wield power further west.

Foreign control of the Mississippi made policymakers in the United States worry about their own ability to secure trade down the river. This concern transcended region or party. Americans were therefore uniformly dismayed to learn that a secret agreement in 1800 had transferred Louisiana from Spain to France, followed soon after by news that the Spanish intendant in New Orleans had imposed restrictions on American trade and that Napoleon had dispatched a vast army to the Americas. In response to a situation that Americans began discussing as the Mississippi Crisis, the Jefferson administration and its allies in Congress sought to acquire New Orleans and the Gulf Coast. Their goal remained simple: to consolidate federal sovereignty east of the Mississippi River, not to expand further west.

The Americans proved unsuccessful in negotiating a resolution of the crisis in Paris because the French regime had other concerns. When Napoleon was not attempting to secure dominance in Europe, he was focusing on efforts to reestablish white power in the Caribbean colony of Saint Domingue, the site of an increasingly successful revolt of slaves and free people of color. The army that American observers worried would go to Louisiana was in fact

bound for Saint Domingue. When the French military expedition collapsed through disease and military defeat, Napoleon abandoned his hopes for Saint Domingue (in 1804 leaders of the revolt declared independence for the Republic of Haiti). Louisiana, which Napoleon had acquired to provide supplies and security for Saint Domingue, immediately lost its value to France. Well aware of the Americans' eagerness for a resolution to the Mississippi Crisis, Napoleon ordered his own diplomats to negotiate the sale of Louisiana in its entirety. Although much of the wording of the subsequent treaty followed a template developed by President Thomas Jefferson and Secretary of State James Madison, the scope and timing of the treaty reflected Napoleon's decisions. The agreement itself required the United States to pay \$11.5 million and to forgive \$3.5 million in French debts.

RESULTS OF THE PURCHASE

The reaction in the United States was one of relief, not because the new nation had acquired additional territory, but rather because the Purchase had achieved a peaceful settlement of the Mississippi Cri-

sis. Nonetheless, Americans worried about what they should make of the treaty and its ramifications. The absence of clearly defined boundaries immediately created intense disputes between the United States and Spain. Some members of Congress expressed ongoing doubts that the president had the constitutional power to negotiate a treaty that redefined national boundaries. Although the treaty itself was quickly ratified by the Senate, debates over how best to govern the territory continued for months. Many in Congress questioned whether the United States possessed the resources to govern such a vast terrain, and those concerns crossed party lines.

Establishing federal sovereignty west of the Mississippi would be among the greatest challenges in both foreign and domestic policy during the decades that followed. The United States and Spain repeatedly came close to war over the boundaries of Louisiana. It was not until 1821 that the United States and Spain ratified the Transcontinental Treaty, which finally established boundaries acceptable to both nations. Meanwhile, the federal government devoted unprecedented resources to securing the loyalty of

white residents and preserving racial supremacy over Indians, slaves, and free people of color.

Settling these foreign and domestic affairs was a prerequisite for creating states from the Louisiana Purchase. The first of those states, Louisiana, entered the Union in 1812 after a brief congressional debate. But less than a decade later the second state, Missouri, unleashed disagreements that brought the expansion of slavery to the center of national politics. And the Purchase guaranteed the issue would not go away, for as Purchase territories petitioned for statehood in the decades that followed, Americans were repeatedly forced to reargue the issue. Nonetheless, the successful integration of new states and territories also led Americans to conclude that territorial expansion was possible, and by the antebellum era those successes were contributing to the spirit of Manifest Destiny, which argued that expansion was not only viable but essential.

The new territories carved from the Purchase were uniformly Jeffersonian in their national politics, but each one became home to unique local political systems. With the collapse of the Jeffersonian coalition, the states and territories of the Louisiana Purchase became the site of bitter disputes between Whigs and Democrats. But the primary political division was sectional. Northern states and territories became both antislavery and, in 1861, strongly pro-Union. The southern states of Louisiana and Arkansas became strongly proslavery before joining the Confederacy. States and territories in the middle—most notably Missouri and Kansas—became the sites of their own internal civil wars.

Although creating states from the Louisiana Purchase fueled the disputes causing secession, the Civil War ironically helped complete the Purchase. Only the creation of a large modern army in the Civil War provided the means for the United States to complete its conquest of the Northern Plains. It was over a half a century after negotiators signed the Louisiana Purchase before the United States could claim that it truly controlled the territory.

LOUISVILLE Louisville was founded in 1778 at the Falls of the Ohio River. The falls (actually a series of usually navigable rapids extending for about two and one-half miles) are the only serious obstacle to navigation on the almost one-thousand-mile length of the Ohio. Virginia surveyors working in Kentucky had identified the site as an ideal location for a town as early as 1773. On 27 May 1778, Lieutenant Colonel George Rogers Clark landed on an island at the falls with a force of approximately 175 Virginia militiamen and 50 settlers. Crude cabins and a fortification were constructed, a corn crop planted, and the militia trained on what was named Corn Island. In late June, Clark launched his Illinois Campaign, the successful completion of which helped secure the Old Northwest Territory for the United States at the conclusion of the American Revolution. The settlers remained behind, moving to the south bank that autumn, where they built cabins and a fort. In 1779 the settlement was named Louisville in honor of King Louis XVI of France and the Franco-American alliance against Britain. It received its town charter in 1780.

Louisville's early growth was slow. As the most westerly American settlement, it was exposed to Indian attack and the threat did not end until the conclusion of the area's Indian wars in the mid-1790s. Because of its strategic location at the falls, Louisville's future success depended on the burgeoning river traffic and trade. It became a major jumping-off place for those going farther west (and often north and south). Explorers Meriwether Lewis and William Clark met in Louisville in October 1803 to form their historic partnership, and the first permanent members of their Corps of Discovery were enlisted at the falls, thus forming the all-important foundation of the historic trek to the Pacific. The acquisition of New Orleans and the securing of free navigation of the Mississippi River in 1803 provided a significant boost to Louisville's fortunes. By the early 1800s thousands of flatboats and other river craft were landing at Louisville loaded with immigrants and goods. In 1811 the *New Orleans*, the first steamboat to ply the western waters, landed at Louisville. In 1815 the *En-*

terprize, moving upstream, arrived from New Orleans. With significant upriver steamboat traffic now added to the well-established downriver trade, Louisville boomed. In 1830 the Louisville and Portland Canal opened, thus bypassing the obstacle of the falls and assuring an easier and more reliable transit time for river craft.

This economic activity reflected the growth of Louisville's population. From recorded totals of 200 in 1790 and 359 in 1800, Louisville's population almost quadrupled in the next decade to 1,357. By 1820 its population had almost tripled to 4,012, and in 1830 it was 10,341, making Louisville the largest city in Kentucky and the fourteenth largest in the nation. The ethnic composition of Louisville in its early years was primarily English, Scots-Irish, and German, with a small but prominent French community. By 1830 an increasing number of native-born Germans and Irish began arriving. Also among Louisville's earliest settlers were African Americans, the vast majority of them enslaved. Their numbers increased as Louisville's population grew. In 1800 there were 77 African Americans, only one of whom was reported as being free. In 1810 there were a reported 495 African Americans (36 percent of the population) living in Louisville, only 11 of whom were free. The 1820 federal census reported 1,124 African Americans (28 percent of the population, of whom only 93 were free) living in Louisville. By 1830 there were 2,638 African Americans (232 of whom were free) living in Louisville, 25 percent of the population. Although never the major slave market that Lexington was, Louisville was an active slave-trading center. It also was increasingly a magnet throughout the antebellum period for runaway slaves hoping to lose themselves in the city and eventually make their way across the Ohio River to freedom.

Louisville's bustling river trade was supplemented by surrounding farms that raised livestock and a variety of crops. Stores, taverns, inns, warehouses, factories, mills, shipyards, distilleries, and other businesses all proliferated. The growth of population and of business activity encouraged the establishment of newspapers, churches, schools, a library, and a theater. The numerous ponds in and around Louisville that were a breeding ground for mosquitoes and disease were largely filled in during the 1820s, thus improving the health of the area and removing a factor prohibitive to future growth. In 1828 Louisville was granted city status, the first community to be granted that designation, with its greater level of independence, by the Kentucky legis-

lature. As the fourth decade of the nineteenth century began, Louisville was a major western city poised for even greater growth.

LOYALISTS The old cliché that winners write the history is applicable when discussing the domestic losers of the American Revolution, the Loyalists. Found in every colony, Loyalists were those American colonists who sided with the British throughout the entire imperial crisis, including the Revolutionary War. Too often, Loyalists are classified as those Americans who supported Britain during the Revolutionary War; actually, however, Loyalists were those who supported Britain from the Stamp Act of 1765 through the Revolution. Historians are unsure of the actual percentage of colonists who considered themselves Loyalists, but the fact that approximately eighty thousand people fled the country after the American victory in 1783 suggests that a large number of people remained loyal to the crown during the entire conflict.

LOCATION AND STRENGTH OF LOYALISTS

John Adams once remarked that the American people could be broken into thirds regarding their feelings on the Revolution, with one-third in support, one-third against, and the other third neutral. An educated guess at best, historians view Adams's remarks with some skepticism. In all likelihood, but with no certainty, there were greater numbers who either opposed the Revolution or remained neutral. What is known is that the Loyalists were most numerous and politically powerful in New York and South Carolina. This concentration of Loyalists in New York is attributed to the diverse ethnicities of its inhabitants, many of whom believed that Britain and its empire offered a greater degree of liberty and religious toleration than an American republic likely

would, while those in South Carolina embraced and supported the empire for the commercial success that it made possible. Loyalism also persisted in the frontier regions of the colonies, especially the frontiers of the southern colonies from Georgia to North Carolina. In part, loyalism there, as in New York, can be attributed to the ethnic and religious diversity of the frontier and the protection from a dominant Anglo-American culture they thought the empire could provide. Finally, the Iroquois nation can be labeled as Loyalist, for it too supported the British cause.

REASONS FOR SUPPORTING BRITAIN

Loyalists could be found among all socioeconomic classes, but the best-known and most vocal opponents of the Revolution came from the elites of the respective colonies. Indeed, if the American colonies can be said to have had any form of aristocracy, it consisted primarily of persons who became Loyalists. Most of the elites owed their political position to royal appointments to office, although many of the elite Loyalists were also lawyers or merchants. For example, perhaps the most famous Loyalist, Thomas Hutchinson (1711–1780) of Massachusetts, was not only a wealthy merchant, but was also the crown-appointed governor of his colony. Hutchinson's attorney general, Samuel Sewall, owed his position to not just his ability but also to connections within the British government. Even William Franklin (1731–1813), governor of New Jersey, owed his appointment to his famous father, Benjamin, who used his political connections to secure the post for his son. Thus, many of the Loyalists in the colonial political elite owed their social standing to the British monarchy. The many colonial leaders who received support from the British government were reluctant to address colonial grievances, which only further angered the colonists. Ironically, however, the Loyalists never formed an organized, cohesive body of opposition to the revolutionaries. One of the consequences of the Revolution was the crumbling of the Loyalists' political power, which created a power vacuum that the revolutionaries filled.

Along with the political connections that tied the Loyalists to Britain, those Loyalists outside of politics, namely merchants, remained loyal because, in their estimation, the empire provided the best protection of their livelihoods. The mercantile system of the empire, as well as the strength of the British navy, afforded merchants opportunity for wealth and protection of their wares. Even those Loyalists who were neither politicians nor merchants remained loyal to England, in part because of the protection the British

army provided on the frontier. In other cases, Loyalists did not embrace the republicanism of the revolutionaries or simply wished to remain British subjects.

Support for the British came from places and people beyond the cities and the elites. In the frontier regions of the colonies, support for Britain ran high. It is important to note that frontiersmen did not necessarily disagree with the arguments of the Patriots. Rather, they supported the British for two simple and self-interested reasons. First, they feared the further encroachment of settlers into the frontier regions. Only the British, they believed, would be able to halt westward expansion past the Appalachian Mountains. Second, they believed that only British troops could protect them from the various Indian tribes on the frontier.

A final reason for supporting Britain lies in ethnicity. Too often, the natural assumption of both historians and laity is that Loyalists were either English born or of English heritage. Such an assumption, however, is incorrect, as a very large number—the exact percentage is unknown—of Loyalists belonged to non-English ethnic groups. Among the more prominent groups that for the most part supported Britain in the Revolution were the Dutch, Germans, and Scots. To find precise motives for their loyalty is difficult, yet it is not unreasonable to assume that they sought British protection from what would be an Anglo-American cultural majority in an American nation. They may have also understood that minorities were more likely to be protected in a larger empire than in a smaller nation controlled by local majorities.

LOYALIST IDEOLOGY

Along with the socioeconomic and political reasons, ideological reasons guided loyalism. Generally, and in part because they never formed an organized resistance, Loyalists did not have the same overarching ideology that guided the revolutionaries. There were, however, common threads of thought. The most common characteristic of Loyalist thought was its conservatism. Nearly all Loyalists of any consequence believed in the political status quo. Undoubtedly, this conservatism stemmed in part from a desire to preserve political power, but Loyalists also believed that any disruption of the traditional political arrangement was hazardous to the body politic. Furthermore, Loyalists tied their commitment to the status quo to their belief in aristocracy and deference. Many Loyalists believed that society could function only with an established and ruling aristocracy—not

one that was necessarily hereditary or titled but elite nonetheless—with each level of society deferential to those above it.

Further evidence of Loyalists' conservative ideology was their use of history in arguments over politics, society, and human nature. Whereas many revolutionaries relied on the theories of philosophers such as David Hume (1711–1776) or John Locke (1632–1704) to justify not only rebellion but also human nature, Loyalists ignored theorists, relying instead on historical precedents or incidents to argue against revolution and to demonstrate an innately corrupt human nature. From their use of history and beliefs about human nature, the Loyalists argued that the revolutionaries were a self-seeking political faction bent on disrupting the status quo by attempting to establish a democratic or mob government based on a majoritarian tyranny.

Much like their Revolutionary counterparts, the Loyalists embraced the traditional view of liberty as being freedom from arbitrary power. Where the two camps separated was on the degree of order needed to maintain liberty. Many revolutionaries believed that order, while necessary for liberty to flourish, must be kept to a minimum; otherwise, it would result in tyranny. Loyalists, again exhibiting their conservative ideology, argued that order was the fundamental ingredient needed for liberty to thrive. Loyalists did not embrace absolutism; far from it, they insisted that political society must first acknowledge and then follow a clearly defined rule of order before liberty could exist. This belief in order explains why so many Loyalists were shocked and terrified at the numerous instances of mob action during the imperial crisis leading up to the Revolution, labeling such action as lawlessness or licentiousness. Ironically, many Loyalists believed that the colonists had genuine grievances, especially regarding the Stamp Act and other revenue-garnishing measures. Yet because Loyalists also believed in the enforcement of law and order, they risked their social and political standing by supporting the enforcement of such measures. Thomas Hutchinson is perhaps the best example of the risk many Loyalists placed themselves under. Although Hutchinson, the lieutenant governor of Massachusetts at the time, opposed the Stamp Act, he nonetheless believed in the enforcement of the act. Although he was not a tax collector and played no enforcement role, protesters stormed his family home and then ransacked and set fire to it.

AMERICAN TREATMENT OF LOYALISTS

The destruction of Hutchinson's house is perhaps the most extreme example of what some Loyalists underwent during the imperial crisis. Yet during the Revolutionary War, many of them suffered persecution at the hands of the revolutionaries. Each state government passed a Test Act requiring persons to take an oath forswearing allegiance to King George III. Anyone who refused the oath could face several penalties, including imprisonment, disenfranchisement, additional taxes, land confiscation, and banishment. In November 1777, the Continental Congress recommended that the states confiscate Loyalists' property. The recommendation came somewhat late, as most of the states had already confiscated large amounts of Loyalists' land. Also, by 1777 most states had passed legislation that declared loyalism a treasonous act. Pennsylvania, for example, drew up a list, known as the "black list," containing the names of 490 Loyalists who were convicted of treason for supporting the British. Although the Pennsylvanian governor pardoned a number of these Loyalists, some executions occurred. Not surprisingly, those states where Loyalists were the strongest, such as New York and South Carolina, had the most stringent anti-Loyalist legislation, as well as the heaviest level of enforcement.

The confiscation of land and other legislative measures were not the only methods by which the Patriots made the Loyalists suffer. More often than facing formal, legal punishments, Loyalists had to bear informal consequences such as becoming social outcasts in their own neighborhoods or being forced to leave their communities by extralegal committees. Other such consequences were losing servants, being denied services, or losing customers. Violent extralegal punishments included tarring and feathering, often followed by forced "rides" on a rail—a painful punishment in which the victim, always male, had a ragged and often splintered rail scooted between his legs.

Perhaps the harshest punishment many Loyalists (along with revolutionaries) underwent was the splitting of their families over the war. As in every conflict with a civil war dimension, families were sometimes torn asunder, with family members taking opposite sides. The American Revolution was no different. The most notable example is Benjamin Franklin and his son William. A fervent revolutionary, Benjamin suffered humiliation over the fact that his son, the last royal governor of New Jersey, remained a strong Loyalist. So angry was Benjamin at his son's refusal to become a revolutionary that Franklin disowned William. Despite several attempts

by William after the war to reunite with his father, the two never reconciled.

Because of all their ill treatment at the hands of the Americans during the war as well as their fidelity to the crown, approximately eighty thousand Loyalists fled America. While a number of states forced the exile of some Loyalists, the overwhelming majority fled on their own accord. Some traveled to London and other parts of England in hopes of either settling down or influencing the government in its conduct of the war. Others traveled to Jamaica or elsewhere in the British Caribbean seeking a new life under British rule. A large number of Loyalists sojourned to Upper Canada, where they settled in areas such as southern Ontario. The overwhelming majority of exiled Loyalists, however, traveled to Nova Scotia, where they lived the rest of their lives in settled communities. During the 1780s, some exiled Loyalists returned to America, where they were reintegrated into society.

The Treaty of Paris of 1783 concerned itself with American treatment of Loyalists in three of its ten sections. Article 4 allowed the Loyalists' American creditors to attempt recovery of any contracted debt owed to them. Article 5, among the longest sections of the document, required the Continental Congress to recommend to the states that all confiscated land and other property of Loyalists be returned to them and that any law that targeted Loyalists be reconsidered and revised. The article also ensured the physical protection of Loyalists who returned to the country to retrieve any confiscated property. Article 6 of the treaty was the last to deal with the Loyalists. It prohibited any further confiscation of Loyalist property and called for the release of any Loyalists imprisoned because of their loyalism.

During the 1780s, a large number of Loyalists, including those who returned to their homeland as well as a smaller number who remained abroad, attempted to regain their confiscated property as provided for by the treaty. Not surprisingly, these attempts led to a great deal of litigation in the states. Much of it went on well into the nineteenth century, with the Loyalists most often meeting with some success. Perhaps the most well-known court cases concerning the recovering of property were the those of *Fairfax's Devisee v. Hunter's Lessee* (1812) and *Martin v. Hunter's Lessee* (1816). These related cases, decided during the tenure of Chief Justice John Marshall, originated in Virginia within five years of the treaty and were decided in favor of the Loyalist, Lord Fairfax.

BRITISH TREATMENT OF THE LOYALISTS

In those areas controlled by the British army, the Loyalists obviously did not suffer the violence that beset those in Patriot-held territory. But while the British army afforded protection, the Loyalists often complained that it ignored them, either by not listening to their advice or by not trusting them enough to allow them to join the army. Although there is some indication that the British intended to organize Loyalists, such plans were never more than plans, as the British made no serious attempt to form them into a fighting force. Loyalists were also quick to criticize the inept campaigning of some British generals and the failure of the British to restore civil government in areas under their control. In sum, while the British in North America did not treat the Loyalists with violence, as the Patriot side often did, their conduct was, nevertheless, inept.

Those Loyalists who fled to London were at first welcome guests of the British government. Many of the more prominent Loyalists received audiences with high-ranking members of the British government. Thomas Hutchinson, for example, met with King George III. Soon, however, as the number of exiles increased, their novelty wore off. Many American Loyalists, even those of high standing in the colonies, were treated with disdain and were often cheated out of money and other possessions. A good number of Loyalists who fled to England were disgusted with what they believed to be the decadence and luxury of London. This shock at London's size and perceived decadence, coupled with homesickness, caused many English exiles to attempt to return to their homes in America.

LUMBER AND TIMBER INDUSTRY America's vast forests were the most distinctive and impressive feature confronting settlers in the New World. The ubiquity of timbered lands greatly influenced the cultural and economic development of the American landscape. Whether providing fuel for frontier homes or masts for navy ships, the Eastern Woodlands of North America shaped the course of settlement and were central to the creation of a uniquely American identity. The numbers of products dependent on lumber production were many and varied, and the seemingly inexhaustible supply of timber quickly inspired the erection of mills, kilns, and other facilities to process cut timber into various products for domestic use and export to Europe and the Caribbean. In this latter respect, British attempts to maintain control over the "king's forests" in America through taxes and harvest restrictions played a crucial role in fomenting Revolutionary discontent in the 1760s and 1770s.

The ever-present forest was generally considered a bane more than a boon to most Americans, who viewed it with disdain as an impediment to progress and with fear as a haven for evil spirits. Prior to 1830, these attitudes in many ways kept the timber industry driven by a patchwork of full-time farmers and part-time loggers. For Americans in this period, clearing away the forests was requisite for the establishment of "civilization" in the New World—a sentiment that remained salient over commercial designs until the mid-nineteenth century. The arduous process of clearing the land, however, did provide settlers the materials to build their homes in addition to preparing agricultural lands. Dwellings and fencing, particularly the uniquely American zigzag fences, used tremendous amounts of lumber and could be easily constructed with roughly hewn unprocessed timber. Trees used for these purposes were either chopped down or girdled, a common method of killing trees by gouging out a band around their base that inhibits the flow of sap. Girdling was far less labor intensive, but rotting trees proved hazardous as they fell and produced far less timber for construction and fencing.

POTASH AND CORDWOOD

The clearing of land for agriculture created the two most prevalent commercial timber by-products in early America: potash and fuelwood. The number of trees cut in the process of clearing the land far surpassed local needs and excess timber was usually burned off. For the frontier settler, the resulting ashes provided an important source of cash that helped to defray the costs of clearing the land. Potash and the more refined pearl ash were valuable components in many industrial processes. Also, lye—the liquid form of potash—was widely used in the production of soap, glass, and gunpowder and in various cleaning and tanning processes. Because the soft and resinous forests of the South produced inferior ashes, potash and lye production was primarily limited to the hardwood forests of the Northeast. There, ashes of oak, maple, and other hardwood trees were processed at local asheries, which were frequently the first commercial establishments built on the frontier north of the Chesapeake.

Fuelwood, meanwhile, was another essential by-product, particularly in the colder climes of New England. A household in early America required from twenty to thirty cords (1 cord equaling a 4-by-4-by-8 foot pile, or 128 cubic feet) of wood per winter, an amount easily harvested by rural homeowners. For the growing cities along the eastern seaboard, however, supplies had to be hauled in from the hinterlands, creating another source of income for frontier settlers. Brought in by boats or sleds, the consumption of cordwood was impressive. Between 1770 and 1810, American households warmed themselves with approximately 650 million cords of wood.

In the realm of industry, the advent of the steam engine along with the commercialization of iron and textile production led to increasing demands on cordwood supplies. Charcoal furnaces dominated the industrial landscape of early America, surviving there long after European factories had turned to coal. It required four tons of wood to produce one ton of charcoal, but Americans preferred the stronger iron produced from charcoal-fired blast furnaces, while the sheer magnitude of available timber rendered a turn to coke and anthracite impractical. It was not until the eve of the Civil War, when local resources had been exhausted and transport costs had become a significant consideration, that coal began to supplant charcoal as the predominant industrial fuel.

SAWMILLS

An early accompaniment to most settlements, sawmills produced a variety of products for domestic use

and export. Nearly all mills were located on rivers, which provided both a source of power and avenues of transportation for logs. These enterprises existed primarily to provide materials for local use, though some surpluses were exported to larger settlements downriver. Unfinished timber for furniture, construction, farming implements, and any number of other products comprised the greatest output of the lumber industry. In the South, many mills concentrated on the production of shingles and staves out of the cypress and cedar forests that predominated there. Staves were an important export commodity, often returning from the Caribbean via barrels filled with molasses, sugar, and rum. They also served the maritime industries by providing containers for fish and brine production.

The difficulty of overland transport meant that mills rarely extended their harvests more than five miles from the mill site. By the late eighteenth century, however, the practice of rafting huge numbers of logs tied together down major waterways was commonplace. Larger mills along these watercourses, particularly the Delaware and Susquehanna Rivers above Philadelphia and Baltimore, processed the raw timber of the interior for burgeoning metropolitan markets. By the 1830s these operations began to supplant the more locally focused farmer-logger as the dominant producer of commercial timber products.

NAVAL STORES

The British very early placed a premium on the production of masts, planking, turpentine, pitch, and tar sealants used in shipbuilding, which were known collectively as naval stores. The forests of the Baltic region had long been the source of these materials (and indeed, of most other timber products as well), in large part because they were much closer than those of America and therefore cheaper to transport.

By the mid-eighteenth century, however, frequent warfare and periodic scarcity made the Baltic supplies an untenable commodity, rendering American production a necessity for the British navy. In the Caribbean, the economics of transportation were far more balanced than with the precarious Baltic sources, and a robust exchange between American ports, Cuba, and the West Indies continued well into the nineteenth century. In economic terms, the production of naval stores constituted a mere fraction of commercial forest exploitation compared to fuelwood and general lumbering operations. Nevertheless, the strategic and political importance of shipbuilding materials was paramount in the timber industry. The center of pitch, tar, and turpentine production was located amongst the longleaf pines of the Carolinas, while the larger trees and more developed network of mills in New England provided the majority of American masts and planking. Production and export of naval stores under the control of the crown peaked on the eve of the American Revolution (1775–1783). Following a nadir during that conflict, American production was quickly reestablished and rose steadily throughout the late eighteenth and nineteenth centuries.

Bradley J. Gills

MADISON, JAMES James Madison was born 16 March 1751 in Port Conway, Virginia, the first child of James and Nelly Conway Madison. His father owned a large plantation in Orange County, Virginia, and it was there at Montpelier that Madison grew up. At the age of eleven he went to boarding school and at sixteen returned home to continue his studies with a tutor. Madison entered the College of New Jersey at Princeton in 1769. He completed the four-year course in two years, graduating in 1771, and spent the following year in graduate studies in the classics, reading Greek and Latin writers, and in natural and moral philosophy, in which modern thinkers like Michel de Montaigne, John Locke, and David Hume figured prominently.

Back home at Montpelier, Madison passed through a period of career indecision that coincided with the political turmoil leading up to the American Revolution. He played a prominent role in local politics as a member of the Orange County Committee of Safety (1774) and as colonel of the county militia (1775) and was elected a member of the Virginia Convention of 1776. At the convention Madison made a significant contribution by inserting language in the state constitution that upheld the free exercise of religion as a right and not a privilege. Defeated for election to the newly created General As-

sembly in 1777, Madison was selected as a member of the Council of State, an executive body that advised the governor. Madison served through 1779 under the governorships of Patrick Henry and Thomas Jefferson.

In December 1779 Madison was elected to represent Virginia in the Continental Congress, where he served until 1783. Madison took his duties seriously, participating vigorously in debates, immersing himself in committee work, and taking copious notes of the proceedings. These notes, published in the modern edition of the *Papers of James Madison*, are a valuable source for the proceedings of Congress. Madison, while upholding the interests of Virginia, was among those members who fought for expanded powers for the Confederation Congress to support the Continental Army, including a federal government tax on imports. Although this measure failed, Madison left Congress with a reputation for intelligence, hard work, and integrity.

From 1784 to 1786 Madison served in the Virginia House of Delegates, where he was instrumental in gaining passage of a portion of Jefferson's law reform measures, including the Virginia Statute for Religious Freedom. He also helped defeat an attempt by Henry to provide for state support of religious teachers, in the process formulating a Memorial and Remonstrance (1785) that remains a ringing state-

James Madison. The fourth president of the United States, in a miniature watercolor by Charles Willson Peale. Peale painted this portrait in Philadelphia in 1783 when Madison was in his early thirties. LIBRARY OF CONGRESS.

ment of the essential value of the separation of church and state.

In 1786 Madison attended a convention at Annapolis, Maryland, to discuss interstate trade issues. The convention called for a general convention of delegates from all the states to discuss measures to enhance the powers of the federal government. At home in Virginia Madison lobbied heavily for such a meeting and to compose a slate of distinguished Virginians to attend. He was instrumental in convincing George Washington that his presence was essential for the success of such a convention.

In the meantime, Madison undertook two research projects. The first involved reading widely in the history of ancient republics and confederacies and studying the reasons for their collapse. The second was an examination of the “Vices of the Political System of the U.S.” Both projects yielded notes and memoranda that formed the basis for Madison’s contributions to the Constitutional Convention.

In February 1787 Madison took his seat as a delegate in the Confederation Congress at New York. During the spring session Madison drafted the plan

of a system of government that was adopted by the Virginia delegation to the Constitutional Convention as the Virginia Plan. The plan scrapped the Articles of Confederation and proposed a national government that operated directly on its citizens.

In May 1787 the Philadelphia Convention quickly adopted the Virginia Plan as the framework for discussion. Madison took a central role in the debates that followed and took detailed notes of the proceedings. Despite the defeat of two important parts of his plan—proportional representation in both houses of Congress and a federal veto over state laws—Madison’s contribution to the U.S. Constitution was such as to earn him the title “Father of the Constitution.”

Once more in Congress, Madison made sure the drafted constitution was sent to the states for ratification. He joined forces with Alexander Hamilton and John Jay to write a series of essays for a New York newspaper explaining and defending the new constitution. These eighty-five essays, of which Madison wrote twenty-nine, were subsequently published as *The Federalist* and have ever since been read as a guide to the constitutional thought of the founding generation.

In 1788 Madison returned home to attend the Virginia Ratifying Convention, where he successfully defended the draft constitution against the anti-Federalists led by Patrick Henry. Virginia became the tenth state to ratify. Blocked by Governor Henry from a seat in the U.S. Senate, Madison ran against James Monroe and won a seat in the House of Representatives.

In the First Federal Congress, Madison took a leading part as legislators created a revenue system, executive departments, and a federal court system. Madison also advised President Washington on matters of protocol and procedure and drafted a number of the president’s speeches. Madison’s most important contribution in this period was the drafting of a series of nineteen amendments to the Constitution, culled from more than two hundred suggested by the states, answering the most vociferous criticisms of the document. Madison insisted that Congress take up this issue, ensuring the debate that sent twelve amendments to the states for ratification. Ten were finally adopted to become the Bill of Rights.

Madison lost influence with the president as Washington turned to his newly appointed cabinet for advice. Perhaps the most powerful voice in the new administration belonged to Hamilton, the secretary of the Treasury, whose financial plans for the new Republic were distinctly at odds with those of

Madison. The Virginian opposed Hamilton's policies on assumption of the states' Revolutionary War debt, on his plans to fully fund U.S. securities despite rampant speculation, and on Hamilton's pro-British trade slant. The divide between the two men only grew larger in subsequent Congresses as the full extent of Hamilton's financial system became apparent. Madison, along with Secretary of State Jefferson, considered the system, modeled on that of Great Britain, a betrayal of the original principles of the American Revolution and an attempt to subvert the intent of the framers of the Constitution. Their opposition laid the foundation for the first party system and divided the country into Jeffersonian-Republicans and Federalists.

The divide was further embittered by the European conflict that arose in the wake of the French Revolution. Madison and the Republicans expressed sympathy for France, which they felt was the legitimate heir of their own revolution, whereas Federalists recoiled at the violence and excesses there. Despite treaty ties with France, Washington issued a neutrality proclamation in 1793, which Madison considered unconstitutional. He attacked the proclamation in a series of essays signed "Helvidius," but to no avail. The tilt toward Great Britain continued with the negotiation and ratification of Jay's Treaty in 1794–1795, which brought an end to a number of conflicts at the price of significant concessions. Madison considered these concessions to be so humiliating that he tried to block House appropriations to implement the treaty. Once again his efforts failed. With the election of Federalist John Adams in 1796, Madison took his leave of the House of Representatives in March 1797.

In his Montpelier retirement, Madison responded to the Quasi-War with France and Adams's domestic policies. In 1798 the Virginia legislature accepted a number of his resolutions, with his authorship concealed, in response to the passage of the Alien and Sedition Acts. The Virginia Resolutions called for the states to protest federal infringements on personal liberties. In 1799 he wrote two essays, also anonymous, for the newspapers: "Foreign Influence" examined British influence on the United States, and "Political Reflections" discussed France and the nature of republican government. In that same year he sought and won a seat in the state legislature, determined to defend the Virginia Resolutions from attacks by other states. His *Report of 1800*, adopted by the Virginia assembly, set forth the case for the unconstitutionality of the Alien and Sedition Acts and eloquently defended the right of free speech.

With Jefferson's election to the presidency in 1800, Madison became secretary of state, serving from 1801 to 1809. Madison's tenure was distinguished by the purchase of the Louisiana Territory from France, which effectively doubled the size of the United States. Madison's greatest trial was maintaining U.S. neutrality in the face of British and French depredations on American commerce. His meticulously researched book, *An Examination of the British Doctrine, which Subjects to Capture a Neutral Trade, Not Open in Time of Peace* (1806), demonstrating how Great Britain's maritime practice contravened international law, proved to no avail. The embargo enacted in 1807, employing Madison's favorite weapon, economic coercion, was an equal failure.

Elected president in 1808, Madison tried other economic measures to stop European depredations on U.S. commerce and seamen. None proved successful, and Madison undertook measures to prepare the country for war. In June 1812 he laid out the rationale for hostilities with Great Britain, and a declaration of war by Congress followed.

Madison was the first president to serve as commander in chief under the U.S. Constitution. The war effort was hampered by poor leadership at every level—national, state, and in the armed forces—and political opposition from the New England states. The administration's Canada strategy was a fiasco, and the British campaign in the Chesapeake, including the burning of Washington, D.C., was a humiliation. Only the single ship combats on the high seas and the naval victory at Lake Erie provided a modicum of success. The skill of the U.S. negotiators at Ghent and the victory at New Orleans provided a happy ending to what might have been a political disaster.

Upon leaving office, Madison returned to his Montpelier plantation, where he edited his public papers for posthumous publication and assisted Jefferson in the creation of the University of Virginia. He served as the university's second rector from 1826 to 1833. His last public appearance was at the 1829 Virginia Constitutional Convention.

MAGAZINES Magazines in the colonial era faced significant challenges. Paper and printing presses were in short supply and expensive, and the existing transportation and postal systems did not facilitate widespread distribution of periodicals. Also in short supply were readers with enough leisure time and surplus money to support magazine ventures. Nor were there enough authors available to craft the stories, essays, sketches, and poems required by periodical publishers. By 1829 none of these obstacles had been completely overcome, but the industry was poised on the brink of an era in which the number, variety, and readership of magazines grew exponentially and authors could make a living by their pens. Thus the periodical made only intermittent contributions to the political, economic, and cultural fabric of

the colonial and early national periods; the story is rather one of gradual growth and laying the groundwork for a periodical boom in the antebellum years.

The birth of the American magazine can accurately be traced to February 1741, when rival Philadelphia printers Andrew Bradford and Benjamin Franklin introduced the *American Magazine* and the *General Magazine*, respectively. Both were monthlies that took as their models the English *Gentleman's Magazine* and *London Magazine*. They attempted to fill a publishing niche between two already popular formats, the newspaper and the almanac. Though neither lasted more than six months, Bradford and Franklin provided the organizational model for the colonial magazine: print shop proprietors founded the majority of the approximately seventeen magazines attempted between 1741 and 1776. Articles in early magazines tended toward sober essays on subjects such as government legislation, economics, and European military campaigns. Often, little distinguished magazines from early newspapers other than their greater length (the *General Magazine* averaged seventy-five pages) and less frequent issue. However, newspaper, pamphlet, and broadside publishing thrived during the era, whereas no American magazine lasted more than three years and most folded within a year. Conditions were not yet right for longer, more expensive periodical experiments.

The magazine also played only a small role in the Revolutionary era, when material constraints were, if anything, more pronounced than in colonial years. The Boston-based *Royal American Magazine* (1774–1775) was founded by the most successful printer in early America, Isaiah Thomas, and featured copper engravings by Paul Revere. It combined Patriot politics with a miscellany of original and reprinted fiction, advice columns, and essays on history, agriculture, literature, and religion. In Philadelphia, Thomas Paine served as editor and primary contributor to printer-bookseller Robert Aitken's *Pennsylvania Magazine* (1775–1776). Though Paine's Revolutionary ardor was prominently featured, so too were articles on love, marriage, and the rights of women. That the *Pennsylvania Magazine* attained some fifteen hundred subscribers—large for its time—suggests that its domestic leanings were a sign of things to come.

Two important early American magazines were the *Columbian Magazine* and the *American Museum*, both published in Philadelphia. Mathew Carey, the prominent printer, helped found the *Columbian Magazine* with three others in 1786. In 1787, Carey, upset by the frustrations of co-ownership, began the *American Museum*. Both magazines lasted until 1792

LIBRARY OF CONGRESS.

and thus constitute the first successful American periodicals. They featured topical and historical essays, short narratives, poetry, and one or two engravings per issue. Much of the material was reprinted from other newspapers and magazines, from America and abroad, but they also included original texts when possible. Charles Brockden Brown and William Byrd contributed articles to the *Columbian Magazine*, while Benjamin Franklin and the poets known as “the Connecticut Wits” appeared in the *American Museum*.

Two other influential periodicals prior to 1800 were Noah Webster’s *American Magazine* (1787–1788) and the *New York Magazine* (1790–1797). Both contributed to a characteristic magazine ethos—that of a cultivated forum in which an educated aristocracy adjudicated republican virtue and taste. The elite tone persisted through the first quarter of the nineteenth century in magazines such as Joseph Dennie’s *Port Folio* (1801–1827), the longest-lived periodical of the era. The *Port Folio* began as a staunch advocate of conservative Federalist politics, but by 1809 eschewed politics for a literary agenda of short fiction, poetry, book reviews, and author biographies to assert its claim to cultural stewardship.

The *Port Folio* was never financially prosperous, a fate it shared with most of its peers. However, several developments during the early national period boded well for the growth of the industry. The practice of unsigned or pseudonymous publishing began to wane, which allowed authors to establish their names as recognizable commodities. Authors began to be paid for their efforts, and Washington Irving (1783–1859) built on his periodical experience to become the first American to earn a living as a writer. Magazines devoted to single subjects—such as medicine, agriculture, or humor—appeared as the industry took tentative steps to market specific products to segmented reading audiences.

Women played only a small role during this era as owners, editors, or writers, but they began to make their presence felt as readers. Much of the material provided for their consumption consisted of fashion, domestic advice, and sentimental fiction, but some articles did cover larger issues such as suffrage, the need for equitable education, and the right to enhanced legal stature.

MAINE For most of the eighteenth century, Maine was a sparsely settled frontier appendage of Massachusetts. The French and Indian War removed threats to settlers and helped to spur migration to Maine. From a total of roughly 10,000 white inhabitants in 1750, Maine’s population grew to 42,241 by 1777, numbered 96,540 in the first census of 1790, and 151,719 in 1800. The American Revolution marked a turning point in Maine’s early history. The burning of Falmouth (Portland) early in the war and the 1779 occupation of Castine at the mouth of the Penobscot River convinced many that Maine should seek independence from Massachusetts. The supporters of separation were often yeomen farmers in the district’s interior, many of whom lacked title to their land. Coastal merchants and creditors generally opposed statehood. Conflict over these issues dominated the political landscape until after the War of 1812.

The British conquest of eastern Maine in 1814 during the War of 1812 was the catalyst for Maine statehood. Mainers overwhelmingly voted in favor of separation in the spring of 1819. The ensuing Maine Constitution would be one of the most democratic in the nation, embracing freedom of religion, extending both the franchise and the right to hold state offices to all adult males regardless of race or property ownership, and instituting annual elections of state representatives. Maine’s entry into the Union was delayed by the Missouri controversy. When Northern legislators sought to prevent Missouri from entering the Union as a slave state, Southerners held Maine’s application for admission hostage to prevent an imbalance between free and slave states. Many Mainers were willing to forgo statehood to prevent the expansion of slavery, but ultimately the pro-statehood arguments overwhelmed antislavery principles, and Maine was admitted as the twenty-third state on 15 March 1820.

Maine had 298,335 inhabitants in 1820, an increase from the 1810 figure of 228,705. Most of the newcomers to this overwhelmingly rural state were farmers who had come from other parts of New England. The great majority of Maine residents were white: only 929 Mainers were nonwhites (Native Americans were not included in the census), and only 1,680 were unnaturalized immigrants. Over 90 percent of the population was either Congregationalist or Baptist. Lumber, shipbuilding, and commerce were important in Maine's few towns, the largest of which was Portland, with just 8,581 inhabitants. During the 1820s the population grew by roughly 10,000 a year, increasing from 298,335 in 1820 to 399,455 in 1830. Much of the growth resulted from migration into the interior. Although Maine's economy did not dramatically change during this period, lumber and land sales became increasingly prominent facets of the local economy.

After Maine achieved statehood, several details of the separation remained unresolved. The most pressing issue was the status of Maine's northern border. The Treaty of Paris following the American Revolution offered an imprecise description of the U.S.-Canada border. Initial efforts to resolve this issue failed, and the resulting boundary dispute would dominate state politics for a generation.

MALARIA Both European and African immigrants introduced malaria, a mosquito-borne parasitical illness that produces alternating cycles of fevers and chills, to North America. From the British Isles, the early colonists brought vivax malaria, the great debilitator, that was known as “the ague.” It became established in the British North American colonies, although outbreaks were only sporadic in the more northern territories, where human populations were low and adult mosquitoes died during the winter. The African captives brought falciparum malaria, the great killer. Falciparum became established in regions of the southern and middle colonies, alongside vivax malaria.

Both forms of malaria were prevalent in tidewater, marshy, riverine, and low-lying regions of the British North American colonies and are best considered as endemic. In the middle colonies, most malarial infections seem to have been vivax, with its low (characteristically, 1 to 2 percent) rate of mortality. In the southern colonies, both falciparum and vivax infections were common, particularly during the summer months.

The patterns of infection varied greatly, however, between Africans and Europeans. Almost all Africans were unable to contract vivax malaria, owing to a genetic mutation of a hemoglobin antigen known as red blood cell Duffy negativity. Europeans, on the other hand, were fully susceptible to vivax malaria, and because the vivax parasite could lie dormant in the liver, Europeans were subject to malarial relapses even without additional infection. Africans and Europeans also had differential responses to falciparum infections. Many Africans carried a genetic hemoglobin mutation known as hemoglobin S or sickle-cell that afforded considerable protection against the great killer. Europeans had no such genetic defense, and mortality during the first year of falciparum infections could run as high as 50 percent. The differential response to both vivax and falciparum underwrote European American convictions that the European and African “races” were biologically different and thus helped to rationalize the institution of racial slavery.

Malaria was, however, not only a disease of the eastern seaboard. As European American migrants opened up new territories beyond the Appalachian Mountains and began the great deforestations of the Ohio and Mississippi Valleys, malaria insinuated itself into the newly converted biomes. On soils broken by the plow, hoof, and wheel, rainfall puddled and produced ideal conditions for mosquito breeding. A

frontier of malaria moved with the migrants, pushing westward a zone of endemic malarial infection.

The only effective cure during the eighteenth century was to ingest powdered bark from the cinchona tree, which grew high in the Andes. In 1820 pharmacists in France succeeded in isolating the anti-malarial alkaloids from cinchona bark, and within a few years their techniques became known in the United States. In the early 1820s a new quinine industry took root in Philadelphia, and a national market developed. Quinine relieved suffering, but until the late nineteenth century the alkaloid remained expensive and its use was never sufficiently universal to break the chains of infection. Malaria continued to plague the nation into the late nineteenth century and, in some southern regions, the first half of the twentieth century.

James L. A. Webb Jr.

MALE FRIENDSHIP Male friendships during the early Republic played an important role in its politics. The bonds between the Lees of Virginia and the Adamses of Massachusetts, between George Washington and James Madison, between James Madison and Thomas Jefferson, and between Thomas Jefferson and John Adams are often noted even in brief biographical sketches. On the other hand, intimate male friendship—enshrined in Western myth and honored in Western history as ennobling and virtuous since classical times—has generally been ignored in studies of the politics and culture of the period. Until its last decade, twentieth-century historians confronted by the devotion and anguish of the love letters that such friends wrote each other have veiled their meaning with a dismissive remark about the flowery language of the times. In fact, intimate male friendship seems to have flowered in the early Republic, fueled in part by the cultural role of the Continental Army and the male bonding inherent in war, but also perhaps by the need to define republican citizen-

ship differently than colonial citizenship. Consequently, it was not shocking in 1826 that George Washington Parke Custis published newspaper articles identifying Robert Morris as the man whom George Washington really loved and who “had the privilege of his heart,” or comparing the relationship between his step-grandfather and General Nathaniel Greene to that of Alexander the Great and Hephaestion.

These intimate male friendships did not generally occur in the absence of women; indeed many of the men married or had sexual relations with women. Nevertheless, the question of whether there was a genital sexual component to any of these relationships is raised by the passionate and—to modern ears—homoerotic language of the letters and diaries, as well as by the argument that intimate male friendship was one of the roots that gave rise to homosexual culture in the twentieth century. We may never know the answer because in the early Republic sexuality was seldom the subject of the written discourses on which historians rely, the exception being political attacks such as those suffered by Jefferson and Hamilton.

NOTABLE EARLY AMERICAN INTIMATE MALE FRIENDSHIPS

While early American historians have only begun to discover and study these friendships in and of themselves or within the social context in which they existed, the source materials are rich.

Peter Charles L’Enfant and Swedish Consul Richard Soderstrom began living together in Philadelphia in 1794 when the planner of Washington, D.C., moved to the city to build a mansion for Robert Morris. Ten years later the relationship ended in federal district court. The emotionally charged self-defense that the French-born American put on paper, and kept all of his life, indicates that the lawsuit is better described as palimony rather than settlement of accounts.

Two hours before being blown up in Tripoli harbor, United States Navy Captain Richard Somers gave fellow naval hero and soon-to-be-inconsolable Captain Stephen Decatur a gold ring engraved “Tripoli 1804” on the outside and “R.S. to S.D. 1804” on the inside. A better documented though unexplored military friendship was that between William Clark and Meriwether Lewis. Built on mutual respect and trust, the relationship was strong enough to support a voluntarily shared command over a United States Army unit that explored the North American conti-

ment from the mouth of the Missouri River to the mouth of the Columbia River from 1804 to 1806.

Another well documented intimate friendship was that among former Continental Army General Frederick Steuben and his two aides, Colonels William North and Benjamin Walker. Steuben had come to manhood in a Germanic culture that, as Stephen Jaeger notes, was experiencing the revival of passionate male friendships rooted in admiration of the male physique. North, who believed that the three veterans should live together and that his and Walker's wife should submit to the situation, stood at the center of the triad, comfortably expressing love to both men while at the same time struggling to understand the meaning of the friendship.

Other examples of intimate male friendships include Alexander Hamilton and John Laurens, George Washington and the Marquis de Lafayette, Robert Fulton and Joel Barlow, William Wirt and Dabney Carr, Rep. George Thatcher and Thomas B. Wait of Maine, the abolitionists Theodore Dwight Weld and Charles Stuart, the South Carolinians Jeffrey Withers and James Hammond, the Brown University students Virgil Maxy and William Blanding, and, in fiction, Natty Bumppo and Chingachook.

INTERPRETATION

E. Anthony Rotundo, who finds little evidence of male friendship in the late eighteenth century outside of the Continental Army, sees the phenomenon throughout the nineteenth century as a rather commonplace bonding between young adult males during the transition between their childhood and marriage. He discusses several such intimate relationships, concluding that most resembled a marriage in which genital sexual activity was not allowed but caressing, kissing and other forms of physical affection in and out of bed was.

Donald Yacovone argues that American fraternal love was modeled on classical tradition and particularly on *agape*, the love of the early Christian Church inspired by Christ's love for humanity and the twelve disciples' love for Christ. Thus, a man's character was measured by his ability to be gentle and affectionate as well as strong. Fraternal love was, according to Yacovone, a remarkably constant and pervasive cultural ideal from the Puritan settlement until the second decade of the twentieth century.

In the most sophisticated study of the subject to date, Caleb Crain mentions or explores several intimate friendships, including those of Daniel Webster and James Bingham and Charles Brockden Brown and various men. John Mifflin and James Gibson re-

corded their relationship in shared diaries in 1786 and 1787, the sources from which Crain so ably, and in such detail, reconstructs their intimacy. That Mifflin's mother and her neighbor Mary Norris both welcomed the older Gibson into their sons' beds is shown to be quite ordinary. Crain suggests the thesis that male romantic friendship was better suited as a metaphor and model for republican citizenship than the filial parent-child metaphor that had defined the relationship between the American colonies and England, or even a marital metaphor because women were not full citizens in the early Republic.

While some attempt has been made to categorize these friendships as egalitarian or dependent, all such categories—other than older/younger—seem to fall apart. Was the Hamilton-Laurens relationship egalitarian given the class distinctions? Was the French aristocrat Lafayette, whose support Washington desperately needed, really the dependent partner? How long, if ever, was the L'Enfant-Soderstrom relationship egalitarian?

Crain argues that democracy's assault on the culture of sympathy and sensibility at the close of the early Republic wounded intimate male friendship, citing Tocqueville's observation that the direct expression of love between men was becoming stigmatized in the United States by 1831. That the wound was not mortal can be seen in the relationship between Abraham Lincoln and Joshua Speed, and, most strikingly, in the many surviving photographs of male friends. The gradual adoption of the concept of homosexuality in the United States after World War I (the word entered the English Language in 1892), and the resulting concern of males that they not be so targeted finally struck the death blow.

MANLINESS AND MASCULINITY Concepts of manliness in the dominant culture of eighteenth-century British North America came largely from England. Independence and honor were vital components of manliness in all the colonies of British North America. Independence was probably the more important of the two in the northern colonies, while honor was generally more significant in the southern colonies. "Manly independence" referred to the economic autonomy that came with the ownership of property, generally land. Independence also referred to candor ("manly frankness"); in this era of hierarchy and deference, speaking honestly to one's superiors was a brave act worthy of a man. "Honor" referred to reputation in a face-to-face society, a reputation that had to be maintained in the view of one's (usually male) peers. A man's good name had to be preserved at all costs ("saving face").

A third component of manliness, reason, was considered a defining difference between men and women. "Manly reason," it was thought, enabled men to control their feelings in a way that women could not. This fundamental difference had roots both in the Bible (Adam and Eve) and science (the theory of the humors). From both of those perspectives, men and women were seen as having the same fundamental nature, with men being a superior version of that nature. The idea of superiority provided justification for men's power over women in the eighteenth century.

Age also played a crucial role in the understanding of manliness. A man could control his passions, the thinking went, whereas a boy could not. A boy—and a man lacking self-control—were considered effeminate. Both within the colonial apprenticeship system and in the farming society of early New England, it was important for a teenage boy to live with a man (his father, or his master within the apprenticeship system) from whom he could learn the self-restraint of a man. At the same time, the youth would learn occupational skills from the adult male that in the future would enable him to achieve "a

competence"—a reference both to a set of skills and to an ability to support a family competently.

In the mid- to late 1700s, republican ideals became a part of the period's essential understanding of manliness. In many ways, the ideology of the Revolution gave preexisting ideas about manhood a new language and a vital political framework. When republican theory defined "virtue" as a readiness to put the general interest above self-interest, it echoed the concern with "social usefulness" that was already a manly ideal in the face-to-face communities of British North America. The republican concept of "effeminacy" as luxury and self-indulgence was a short step away from the existing idea of effeminacy as a boyish lack of self-control.

A transformation took place in concepts of manliness in the decades surrounding 1800. One fundamental change was in the understanding of how maleness and femaleness differed. No longer seen as better and worse versions of the same substance, men and women were now viewed as fundamentally different in nature. To be manly was to be active, ambitious, rational, and independent. To be womanly was to have keen moral, spiritual, and emotional sensibilities and a strong sense of interdependence. The traditional understanding that men should have power over women remained; however, that power was justified on new grounds. Common wisdom now held that women were naturally domestic and submissive, whereas men—strong, rational, energetic—were naturally dominant.

At the same time, regional differences that already existed in concepts of manliness sharpened. The North during the late eighteenth and early nineteenth centuries was emerging as a commercial region in which farmers and artisans produced increasingly for broader markets. The South remained wedded to a semifeudal, single-crop economy based on plantation slavery. In the new commercial milieu of the North, (white) manliness was understood in the context of open competition for wealth, status, and power—indeed, popular belief held that men were "self-made." The ideal man was someone who possessed the aggressive, self-advancing qualities to succeed in the competition for power and reward. This competition meant that the regard for the social good built into colonial concepts of manhood declined. In its place came a new gender-based model for maintaining the social good. According to this doctrine of "separate spheres," men sought their personal good in the harsh, amoral public arena ("the world"), while women maintained the domestic arena ("the home") as a nurturing place where

women revived the moral and spiritual sensibilities of their husbands and instilled them in their children. Aiding women in their role as moral exemplars and teachers were the values of the Second Great Awakening, which impressed many northern men with demanding notions of piety and restraint (notions that would become secularized later in the century as “character”).

The solidification of the southern planter class and of race-based slavery led to notions of manhood that reflected imaginings of chivalry and feudal social structure. Where northern men imputed sexual purity to women and saw it as a force that could save men from “natural” lust, southern men imagined women’s sexual purity not as something that would protect them but as something that they as men should protect. While early modern notions of honor faded in the North, they flourished in the South. A man’s reputation and those of his family and his wife were central to manly notions of honor that were invigorated in this period among all classes of white men. But there were significant class differences. For the planter class, the ultimate proof of honor lay in the duel, which wrapped anger and violence in elaborate, formal ritual. Yeomen farmers and poor backwoodsmen proved their honor in a different fashion, ritualized but far less formal and restrained. They engaged in eye-gouging and no-holds-barred wrestling as customary practices that proved manly honor.

White southern men were held together across class lines by a common sense of superiority and fear in relation to African American men. White men cast them as ignorant, uncivilized, and sexually dangerous, and these qualities provided a convenient rationale for the system of bondage. Because African Americans were scarce in the rural North, they played little role in notions of ideal manhood there. Nevertheless, many white workingmen in the burgeoning cities of the North imagined African American men as libidinous and uncivilized. These notions arose in the context of economic friction stemming from competition for work between white and African American artisans and laborers in the early nineteenth century.

Although our knowledge of African American manliness as a category of “otherness” is extensive, we know little about African Americans’ own concepts of manliness in this era. To the extent that African Americans absorbed or adapted to white concepts of manliness (such as independence and “competence” as economic providers), they were dealing with a standard that they were denied resources to

attain. During the early nineteenth century, freedom (and the act of standing up for it) became known as “the manhood of the race,” a term that applied to the behavior of both men and women in pursuit of freedom. But in general we know less about concepts of manliness in this era than we do about many other aspects of African American culture.

MANNERS The story of manners in the new nation is one of increasing opportunities for social equality for some, but not all, Americans. Manners, like many revolutions that mark the era, underwent an unfinished or partial revolution. Trends in behavior codes were transatlantic, and American independence did not greatly influence the pace or substance of change. Yet changing expectations for face-to-face behavior do suggest how the larger political and economic revolutions reverberating through Western civilization were enacted in daily encounters.

Diaries and letters provide glimpses of early American manners, but we discover a broader picture of contemporary expectations in the advice literature written by elites to teach certain behaviors to the middling and lower classes. Conduct literature in colonial America consisted mostly of imported English translations and imitations of Renaissance courtesy works and, especially in New England, local sermons. The courtesy works were nearly all intended for elite men, whereas the sermons were elite efforts to teach the lower sort how to defer.

The mix of advice books, sermons, treatises on family government and other published discussions of proper behavior began to change in the Revolutionary era. New works, generally of British authorship, were written by and for the rising middling sort. In addition, whereas most of the earlier literature had been intended for gentlemen, after 1750, and especially at the end of the century, there was a great deal of discussion of proper behavior for women. Notions of proper behavior in youth also underwent change. In all three cases—the middling, women, and youth—these groups whose status was rising in Anglo-America were given advice similar to that previously reserved for elite adult men. This advice generally consisted of how and when to exercise bodily self-control. To a greater extent than ever before, the concern was with proper behavior in encounters with equals. The lower sort and children were still asked to defer to their superiors.

The era's most popular and influential book of manners was Lord Chesterfield's *Letters to His Son*. Widely castigated for the worldliness of some of his advice—he told his son that the best shortcut to polished behavior was to take up with Parisian ladies of fashion—his work was nevertheless a runaway best seller after its posthumous publication in 1776. Although he was an aristocrat, Lord Chesterfield wrote advice that reflected the rapidly changing social scene of mid-eighteenth-century Britain. He told his son not to make the mistake of looking down on the rising middling sort. More important, his advice revived for an English audience the continental tradition of exacting particulars for deportment—"Remember the Graces!" was his constant plea. The specifics of how to stand, sit, and enter a room provided a ticket of entry into the newly empowered but self-conscious bourgeoisie. His work and that of many imitators formed the core of Anglo-American etiquette for nearly a century.

Chesterfield began to compose advice to his son when the latter was in his mid-teens and entering society while making a tour of the Continent. He was entering the world of adults and was expected to behave like one. Chesterfield and other authors whose work circulated in Anglo-America between 1750 and 1820 adopted a new stance toward standards of behavior for youth. Previously, youth had been taught an only slightly watered-down version of the deference repertoires children were taught to perform in the presence of their elders (or an even stricter repertoire should they happen to be positioned as servants). After 1750 youths were treated more as young adults than as older children. Expectations for

children's behavior remained the same except for the recommendations of the philosopher John Locke, who urged parents to rule a bit more gently than in the past. But even Locke made clear distinctions between the handling of youth and the handling of young children.

Much of the advice to women in the era was a simple extension of the bodily self-control taught to youth and the middling sort. As the culture began to grapple with the meaning of equality in the case of relations between men and women, arbiters of behavior were no longer comfortable lumping women with other inferiors. But nor were they comfortable with sameness in expectations for male and female behavior. Thus began their first tentative steps toward the "ladies first" system of etiquette that would flourish in the nineteenth century. Rather than continue to call women men's inferiors, the new system would turn the world upside down and call them men's superiors—in the social realm. Chesterfield's disparaging of women while urging his son to cater to their needs hints at the reality behind this new kind of deference. It was not the old deference to the strong, but a new compensatory form accorded women who were increasingly deprived of power in the political and economic realms. After 1820, however, these realities were increasingly disguised in such a way as to make "ladies first" an axiom of modern manners until the late twentieth century.

Because manners are first and foremost the stuff of urban culture, these new expectations appeared first in the cities of the eastern seaboard. The books that codified these expectations gradually made their way to the countryside and went west with the ambitious. Many dissenters from the new behavior codes sprang up. Southern planters, for example, clung to the older exclusive aristocratic code longer than did their Yankee and British counterparts; it bolstered their claims to all forms of leadership through the early national period. But the power and utility of the bourgeois code for creating and maintaining a fictional theater of equals served the American Republic at least until the late nineteenth century, when great fortunes and great inequality could no longer be denied.

MANUFACTURING The turn toward manufacturing was one of the most notable economic developments of the early national period. From a series of agricultural and mercantile colonies in the 1750s, the United States had begun to evolve into an important manufacturing power by the 1820s.

BEFORE THE TRANSFORMATION

The growth of manufacturing would have been very difficult to predict in the years before the Revolution. Although Benjamin Franklin half-jokingly wrote an English correspondent in 1764, “As to our being always supplied by you, ‘tis a folly to expect it,” the reality was that during the colonial era the colonists’ manufactured goods were supplied primarily from overseas. British mercantilist legislation such as the Wool Act (1699), Hat Act (1732), and Iron Act (1750) was intended to prevent large-scale colonial manufacturing. Colonists for the most part were satisfied with this situation, provided that British merchants continued to pay good prices for American raw materials such as rice, tobacco, wheat, naval stores, and fish. Although some types of commercial manufacturing—such as iron forges—flourished, and some regions, particularly New England, developed a number of manufacturing establishments, the vast majority of Americans were content to stick to agricultural or mercantile pursuits throughout the colonial period. The dearth of manufacturing did not by any means signify a lack of goods; in fact, Americans participated in a consumer revolution during the eighteenth century as the number, types, and quality of imported manufactures grew exponentially.

The American Revolution brought an end to this colonial economic configuration. Most obviously, it destroyed the legal basis of British mercantilism. But several other related developments proved to be at least as significant. During the years of conflict in the 1760s and 1770s, the colonists turned toward eco-

nomie protest as a means to coerce the British government into repealing obnoxious legislation such as the Stamp Act (1765) and Townshend Duties (1767). The most important weapon in their arsenal was the boycott used against British manufactures. Consequently, nonconsumption of British manufactures and production of domestically made articles became patriotic and profitable, spurring many Americans to begin manufacturing projects of their own. Some of these manufactories were built by individual entrepreneurs, while others, such as Philadelphia’s so-called American Manufactory, were the products of patriotic civic committees. The boycotts also politicized for the first time America’s artisans, who became very active in urban committees, such as the Sons of Liberty, that took it upon themselves to enforce the boycotts. Finally, the war itself impelled a certain level of economic independence as the British army and navy impeded Americans from importing goods as readily as they had during times of peace.

POST-REVOLUTIONARY DEVELOPMENTS

Enthusiasm for domestic manufactures and economic independence continued to grow after the war, and many sorts of people lobbied the national and state governments to encourage manufacturing. The newly politicized artisans initially led the movement. In most of the major cities they formed umbrella organizations that pushed the states to implement protective legislation. They were most successful in Massachusetts, New York, and Pennsylvania, all of which enacted significant tariffs on foreign manufactures in the years before the ratification of the Constitution. Some merchants also saw the potential profits from manufacturing. In many cities they formed manufacturing societies that sponsored fairly large-scale textile factories to raise interest in the potential possibilities for domestic manufactures. Some, such as the Pennsylvania Society for the Encouragement of Manufactures and the Useful Arts, were briefly profitable. Merchant members of these societies also joined with mechanics to lobby for government encouragement of manufacturing. Finally, a number of agricultural societies also publicized home manufacturing and larger-scale textile manufacturing as a means of stimulating new markets for agricultural products.

The most famous attempt to promote manufacturing during these years, Treasury Secretary Alexander Hamilton’s *Report on Manufactures* (1791), owed much to these efforts. Co-written with Tench Coxe, assistant treasurer of the United States and founder of the Pennsylvania Society for the Encour-

agement of Manufactures and the Useful Arts, the report urged greater investment in factory production and more government encouragement to manufactures, especially in the form of bounties. Although the report died in Congress, it did spawn the Society for Establishing Useful Manufactures, a multifactory corporation in Paterson, New Jersey, that resembled a larger version of the earlier manufacturing societies, attracted many of the same wealthy investors, and which benefited from a valuable package of incentives from the state of New Jersey.

Technological change and new legal developments were two other factors stimulating manufactures in the early Republic. The industrial revolution was already well under way in England, where factory technologies were zealously guarded. However, new technologies seeped into the United States along with heavy immigration of skilled Europeans—both free men and servants. Samuel Slater, alerted to America's need for industrial technology by the propaganda of one of the manufacturing societies, is perhaps the most famous example of an immigrant who smuggled detailed information into the United States. Slater, credited with establishing modern textile-producing technology in American mills, was not an isolated example; in fact, it was often government policy during the early Republic to encourage such technology piracy. The most important indigenous technological development was Eli Whitney's system of interchangeable parts, which came to be known as the "American System" of manufacturing and which made possible the widespread development of mass production. Additionally, the early national legal system increasingly encouraged manufacturing. Many states offered various forms of pecuniary inducements to manufacturers. Although their exact role is now debated, corporate charters issued by state legislatures encouraged manufacturing companies by providing them a solid legal foundation and, in some cases, state subsidies. Finally, the emerging doctrine of "creative destruction," most famously elaborated in the U.S. Supreme Court's ruling in *Charles River Bridge v. Warren Bridge* (1837), made it easier for industrial projects to proceed, despite claims from local landowners (often farmers whose lands were flooded by mill dams) that such development impinged on their right to enjoy their own property.

By 1808 a new set of concerns further encouraged manufacturing. The immediate catalyst was the challenge to American shipping by the Napoleonic Wars (1799–1815). President Jefferson's Embargo

of 1808 was intended to coerce Britain and France to respect American neutrality at sea. It ultimately failed, but by cutting off all foreign imports it had the largely unintended effect of further encouraging American manufacturing. The War of 1812, which ensued when economic coercion failed, also acted as a continuing incentive for domestic manufacturing by further isolating America from European imports. With the end of the war, many American manufacturers and their political allies forcefully argued for the need to pass new legislation to protect America's emerging factories, resulting in the tariffs of 1816, 1824, and 1828. The last of these acts, sometimes derided as the Tariff of Abominations, proposed to raise many tariffs well above the 25 percent mark and nearly precipitated civil war during the Nullification Crisis of 1832.

THE TRANSFORMATION

All of these factors led to a significant rise in manufacturing by 1830. The most notable sector was textiles. Cotton production capacity, for example, increased from 8,000 spindles in 1808, to 80,000 by 1811, an estimated 350,000 by 1820, and 1.2 million by 1830. The most famous of all the textile projects was the large, vertically integrated factories created in Waltham and Lowell, Massachusetts, by corporations founded by wealthy merchants retrospectively known as the Boston Associates. The Waltham-Lowell factories were typical insofar as they relied on pirated technology and were begun when the War of 1812 offered protection from competing imports. They initially employed large numbers of young farm women from the surrounding rural areas, many of whom lived in company boarding-houses. By 1836 Lowell alone could boast of twenty textile mills employing nearly 7,000 workers, for an average of 350 workers per mill.

Further to the south, Philadelphia also was a major manufacturing center by 1830, but without large, vertically integrated factories. Instead, manufacturing there was characterized by proprietary capitalism, a flexible mixture of small, highly specialized, generally privately owned firms. Well over one thousand workers labored in the thirty-nine Philadelphia textile firms that responded to the census of 1820, for an average of fewer than thirty workers per manufactory. Factories also flourished in the countryside, usually near likely sources of waterpower. For example, Oneida County, New York, lightly settled and almost entirely agricultural in the 1790s, supported twenty-one textile factories producing a total of half a million dollars worth of goods by 1832.

But textile factories, while having a high profile, were only one aspect of the rise of manufactures. The years just after the Revolution witnessed the growth of many sorts of nonmechanized manufacturing establishments such as sugar refineries, ropewalks, and small shoe manufactories. New York City was moving toward “metropolitan industrialization,” characterized by growing numbers of nonmechanized manufactories using traditional technologies but often employing wage laborers rather than the traditional configuration of master, journeyman, and apprentice. Home manufacturing grew, too. One contemporary estimated that New England farm families manufactured twice as much in 1790 as they had twenty years earlier. However, by 1820 factory production was beginning to be accepted as the new standard. While the 1810 census of manufactures had included all sorts of manufacturers—nonmechanized, factory, and household—the 1820 census generally assumed that manufacturing would be performed outside the home by wage workers rather than by apprentices or family members.

By the time of the Civil War, the United States would be on the verge of becoming one of the world’s largest manufacturing economies. It was not quite there by 1830, but it had advanced a very long way from the dependent, agricultural, colonial economy of sixty years earlier.

MANUFACTURING, IN THE HOME Historians once viewed home manufactures as part of a golden age of rural economic isolation and self-sufficiency. More recently, they have viewed home manufacturing as a vital link in the economy of early America. It connected the rural economy to the urban economy at the same time that it tied the private world of the household to the public world of the marketplace.

Home manufacturing became increasingly important during the late colonial era and much of the early national period because of political and economic factors. Politically, home manufacturing played a central role in the protests leading up to the Revolution. Most famously, the Daughters of Liberty held highly publicized “spinning bees” at which they demonstrated their support for a nonimportation movement that, in calling for a boycott of British textiles, temporarily bolstered the symbolic and economic importance of homespun products. Others, such as volunteer firefighters, the graduating classes of both Harvard and Yale, and elite politicians such as Benjamin Franklin and George Washington also patriotically supported homespun.

As the colonies moved to separate themselves from the British Empire, economic circumstances again thrust home manufacturing into the limelight. Throughout the colonial period, home manufacturing processes such as cabinetmaking, leather tanning, and potash making held important places in regional economies. But after the colonies declared independence and the British navy blockaded their harbors, colonists increasingly were also forced to manufacture war materiel, ranging from gunpowder to textiles, within their households.

After the war, home manufacturing continued to prosper. By one estimate, New England farm families doubled their manufacturing output between 1770 and 1790, and as late as 1810, census figures showed “blended and unnamed cloths and stuffs,” primarily home manufactures, as America’s leading manufactured goods. Some entrepreneurs attempted

to promote new home manufactures on a broader scale; for example, William Cooper and Henry Drinker tried to convince upstate New York farm families to produce maple sugar as a substitute for imported West Indian sugar in the early 1790s. To the south, enslaved African Americans continued to manufacture many necessities for their owners' plantations and surrounding farms. For a time in the 1790s, for example, Thomas Jefferson turned a tidy profit from a slave-run nailery at Monticello. Other farm families continued to make finished items, such as candles, and processed foodstuffs, such as cider and cheese. But textiles, ranging from simple thread to high-quality woven products, remained the most important home manufactures. Agricultural societies promoted them by offering prize medals and publicizing them at country fairs. New York's state legislature even offered fifteen thousand dollars in prizes for homespun cloth made from domestic wool between 1809 and 1814.

Home textile manufacturing followed different patterns in different regions. In seventeenth-century New England and Maryland, male artisans had performed many cloth-making functions, but by the late colonial period all aspects of the process—from spinning to weaving—were generally performed by women in the New England household. By contrast, in early national Pennsylvania, women usually were responsible for spinning, but male weavers, some trained in Europe, still generally performed the final stages of manufacture on their looms. Far from destroying home manufacturing, early industrialization initially stimulated it in both Pennsylvania and Massachusetts, beginning in the 1790s. Because this early factory production of textiles was only partly mechanized, women outworkers became a crucial aspect of the new factory system. As a result, women's work was increasingly brought into the marketplace.

This situation did not last long, however. Just as women's work became more profitable, home manufacturing began to decline. One can see the beginnings of this shift as early as the War of 1812, when patriotic literature was more inclined to laud new factories than to praise the female spinners who followed in the footsteps of the Daughters of Liberty. The industrial revolution played an important role in this decline. As more fully automated factories such as those in Lowell, Massachusetts, became more common by the 1820s, there was less demand for women to do outwork at home. Additionally, the concomitant market revolution led to a greater supply of all sorts of inexpensive goods to replace many

of the products previously made at home. Thus, by 1830 or so, home manufacturing had begun a precipitous decline from which it never recovered. This decline altered family structures in important ways. In some rural families, women who might once have spun thread or woven cloth on the farm were now employed outside the home in new mechanized factories rising up along rural and urban waterways. Other rural women found new opportunities to sell processed agricultural goods such as butter to workers in nearby factories. Many middle-class women increasingly shifted their labor away from production and toward consumption and the more intensive child rearing characteristic of the Victorian era, reversing the earlier trend toward female market participation through home manufacturing.

MARBURY V. MADISON On Friday, 27 February 1801, John Adams signed the bill for the governance of the District of Columbia. He had but five days left in his administration to appoint a series of judicial officers, including justices of the peace for five-year terms for the District's two counties. Over the weekend, the nominations for justices of the peace were completed and on Monday, 2 March, the president dispatched to the U.S. Senate nominations for twenty-three justices of the peace for Washington County and nineteen for Alexandria County. The Senate approved the nominations the following day, the last in Adams's administration. That night, after the president had signed the commissions and returned them to the Department of State, the chief justice of the Supreme Court, John Marshall, affixed the seal of the United States to the commissions and left it to his chief clerk to deliver and have them recorded in the department's record book of appointments.

The next day, while Thomas Jefferson was being inaugurated as the country's third president, James Marshall, brother of John and circuit court judge of the District of Columbia, delivered some of the commissions to justices of the peace in Alexandria County. But William Marbury's commission for Washington County was not among them. Other appointees, too, did not receive their commissions. The following day, Thomas Jefferson visited the State Department, almost certainly having inside information of what had happened, and "discovered" the undelivered commissions. He ordered them to be withheld and later issued his own appointments.

Later in the year, Marbury and some others appointees brought suit, asking the Supreme Court to issue a writ of mandamus to Secretary of State James Madison to compel the delivery of the commissions. Marbury brought his suit directly to the Supreme Court under section 13 of the Judiciary Act of 1789, which gave the Supreme Court "original" jurisdiction in cases where a writ of mandamus (an order to perform a function) was requested against an executive official. The suit was part of a Federalist Party counterattack against the Jefferson administration. When the case finally came to trial before the Court in early 1803, John Marshall as chief justice, refused to be drawn into the political contest on the side of his Federalist Party compatriots. Instead, in a unanimous opinion, Marshall established the moral basis for the judicial review of unconstitutional legislation and removed the Court from partisan politics.

Marshall held that, as a matter of law, Marbury was entitled to his commission because his appointment as justice of the peace had been completed when President Adams signed the commission; delivery of the commission was not necessary for Marbury's assumption of office. The commission was merely evidence that Marbury had been appointed, as would a record of his appointment in the record book of the Secretary of State. But because he was validly appointed, Marbury was entitled to the evidence of his appointment. It followed logically from Marshall's opinion that President Jefferson could appoint new justices of the peace (there was no limit to the number under the law) but could not deny the position to those already appointed.

Marshall took pains to point out that he was acting solely as a judge in a court of law, and that the Supreme Court had no business interfering in the president's political or discretionary powers. But since the appointment had been completed, the secretary of state was legally bound to deliver the evidence of that appointment. Even at the trial, Marshall went

out of his way not to embarrass Jefferson. He allowed Attorney General Levi Lincoln to refuse to answer the question, "What had been done with the Commission?" The answer, as everyone knew, would have been, "The president ordered me to destroy it," an act that would have been illegal. Marshall in effect was telling the president that the Supreme Court would no longer be involved in partisan politics (as it had been), and by implication was telling the president not to interfere with the judiciary. For his part, Jefferson did not accept the offer and continued, through intermediaries, to attack the Federalist judiciary for years to come.

Yet Marshall did not issue the writ of mandamus to Madison. The chief justice found that the Constitution had already defined the extent of the Supreme Court's original jurisdiction and that Congress could not expand it. The Court could only hear such cases on appeal. Marbury had brought his suit to the wrong court and Marshall dismissed it.

In this first instance of declaring part of an act of Congress unconstitutional, Chief Justice Marshall was careful to avoid saying that the Court could overrule Congress. Rather, Marshall pointed to his moral obligation under his oath of office as justice to enforce only that which was truly law. The Constitution was the superior law to this particular act of Congress, and Marshall, in order to fulfill his office under the Constitution, could not enforce what was not, in fact, valid law. He thus grounded the separation of powers in the different functions each branch performs and the moral obligation of members of each branch to perform their assigned functions and no others.

MARINES, U.S. Created by Congress in 1798, the United States Marine Corps is one of the two services of the Department of the Navy and one of the four American military services. Its legislative legitimacy as a separate service was made clear in the Marine Corps Act of 1834.

The Marine Corps measures its unofficial historic existence from the American Revolution (1775–1783). The marines copied from their British Royal Marine counterparts, serving aboard U.S. Navy vessels for several reasons: intimidate the sailors into obedience; serve as bodyguards for U.S. naval officers; become naval gun crews in desperate gunnery engagements; serve as on-board snipers and grenadiers; and spearhead boarding and landing parties. Ashore, marines lived in barracks in navy yards in east coast port cities. “Marine Corps towns” were Boston, New York, Baltimore, Washington, Norfolk, Charleston, and New Orleans. The marine enlisted force came from uneducated rural and urban British Americans and Irish and German immigrants. Non-whites were banned from the Marine Corps by law to avoid fraternization with multiracial sailors the marines policed. Marine officers tended to be West Point and Annapolis dropouts, ambitious Celtic and German immigrants with some education, displaced southern gentry, and educated and unemployed youths influenced by bright uniforms and tales of exotic foreign adventures.

The U.S. Marine Corps had two predecessor organizations, four regiments of three thousand colonials recruited for a Royal Navy expedition to Cartagena (in contemporary Colombia) in 1741 and the Continental marines of the Revolution. The first unit, known as “Gooch’s Marines” since it was raised by William Gooch, royal governor of Virginia, became too sick to play any role in Admiral Edward Vernon’s failed campaign. Only three hundred of these marines returned to the colonies; the rest deserted or died of tropical fevers. The Continental marines, raised directly by Congress for shipboard service, may have numbered two thousand officers and men over the course of the Revolution. Other groups of seagoing soldiers served as state troops; these marines served on coastal and inland waters as widely separated as the Ohio River, Lake Champlain, Chesapeake Bay, and along the Atlantic seaboard.

The Continental marines, like the Continental navy, never grew large enough to challenge the British forces but performed well enough in isolated sea battles and limited raids ashore. The most memorable successful Continental marine operations were a

raid on New Providence in the Bahamas in 1776 and two single-ship victories in 1776 and 1778. Marines also fought well in several ship-to-ship defeats and participated in the failed Penobscot Bay expedition in Maine during 1779. By war’s end only five Continental navy ships had marine detachments, and the corps dissolved in 1783.

Reborn to man the six frigates authorized by the Naval Act of 1794, the U.S. Marine Corps served principally in sea battles as marksmen in the rigging and tops and as boarding parties. The ships’ guards, no more than one or two officers and fifty enlisted men, also participated in raids from the sea. The marines of the 1798–1812 era fought French privateers and warships in the Caribbean, pirates in the same area, and the Barbary corsairs of the Mediterranean and in 1805 spearheaded a mercenary force led by the American William H. Eaton that captured Derna (in contemporary Libya) and displaced the bashaw of Tripoli, a corsair sponsor. This action is commemorated in the Marine’s hymn with the words “to the shores of Tripoli.”

The War of 1812 provided the marines with more opportunities for distinguished service that, however, had little effect on the war with Great Britain or even on the engagements in which they participated. In a war marked by repeated American strategic and tactical errors and lack of ardor, the marines made a commendable impression as steadfast fighters. Marines fought aboard the frigates *Constitution*, *United States*, *Essex*, *Chesapeake*, and *Lawrence* and other warships in sixteen sea battles. In battle ashore, marine companies from the naval stations at Washington, Baltimore, and New Orleans joined extemporized American armies that failed to save the capital but repulsed major British expeditions sent to seize two of the most valuable ports of the United States.

The postwar Marine Corps of thirty-five officers and 1,200 enlisted men (compared to 2,700 authorized men during wartime) continued to serve primarily as “soldiers at sea.” In 1820 President James Monroe appointed Archibald Henderson, a thirty-seven-year-old Virginian, as the corps’s colonel commandant; he went on to serve for thirty-eight years. A combat veteran and driving commander, Henderson used his long tenure as commandant to set much stricter standards of dress, training, and discipline than were common in the army and navy of that era. He advocated a larger and better navy and created firm bonds between the Marine Corps and Congress. Essentially, Henderson created the foundation of the modern Marine Corps.

MARITIME TECHNOLOGY From the earliest period of settlement, colonial Americans took advantage of cheap, available timber resources to build ships for fishing, commerce, and trade. Shipbuilding was particularly strong in New England, where, by the time of the Revolution, one new vessel was being launched every day. For most of the eighteenth century, ships were built according to traditional English construction practices, with few innovations. Shipping was dominated by smaller, slow-sailing carriers differentiated only by the number of masts, rigging plan, and size of hull. During the Revolution, construction of privateers provided shipbuilders with experience in designing faster, sleeker vessels. The post-Revolutionary economic recovery and explosive growth in trade created a need for fast, reliable means of shipping goods. In the 1790s a “mania for speed” seized shipbuilders and triggered a wave of experimentation with sail plans and hull design.

Answering the need for speed, many builders modeled their ships after the “Baltimore clipper,” a late-eighteenth-century Chesapeake design that maximized the amount of sail and cut through the waters with sharp ends and a deep keel. The deep keel proved problematic, as many ports had only shallow harbors. The solution was the centerboard, or “drop-keel,” which could be moved up and down in a watertight case to give the vessel a deep keel for fast sailing or a shallow draft for navigating in port. The centerboard had been invented in the 1770s, but problems with the watertight case kept it from general usage until it was perfected in 1814. The War of 1812 again provided shipbuilders with opportunities to design fast ships for privateers. After the war,

high-risk ventures such as slaving, opium smuggling, and coffee and fruit trading kept shipbuilders competing to build faster ships with greater cargo capacities. This competition kept the fast-ship building tradition alive and proved crucial in establishing the basic designs for the great clipper ships of the 1840s.

AIDS TO NAVIGATION

Beyond the ships themselves, several innovations helped support maritime enterprise in the early national period. The first lighthouse had been built in Boston Harbor in 1716, but by the time of the Revolution only fifteen lights had been built on the entire coast. In the following four decades, lighthouse construction efforts intensified, extending inland to the Great Lakes in 1819 and southward to the Gulf Coast in the 1820s. Experiments with wicks and lenses increasingly magnified the whale-oil lights, and eventually resulted in the 1840 invention of the powerful and effective fresnel lens.

In the 1750s Englishman John Harrison solved the problem of determining longitude by developing a marine chronometer capable of keeping precise time. The clocks, however, remained too expensive for most mariners, and a ship’s position was most often determined by a complex set of calculations based on astronomical observations and published tables. The sextant, invented in 1757, was in popular use by 1800 and provided mariners with much more precise astronomical measurements than had been previously available. The tables used in computing longitude were published in British marine almanacs starting in the mid-eighteenth century but were filled with errors. In 1800 Nathaniel Bowditch, a Salem shipmaster, corrected the eight thousand errors in the British tables and published the results in 1802 as *The New American Practical Navigator*. Just six years earlier, another Massachusetts ship captain, Edmund Blunt, published *The American Coast Pilot*, which contained instructions for entering ports along the eastern seaboard. Both texts quickly became the essential technical works for American navigation; their publication, with annual updates, has continued to the present day.

STEAM POWER

The first commercially viable steamboat, the *Clermont*, was built by Robert Fulton in 1807 for use on the Hudson River. By 1815 Fulton had fifteen steamboats in operation, Nicholas Roosevelt had run his steamboat *New Orleans* from Pittsburgh to New Orleans, and twenty steamboats were making regular

trips on the Ohio River. Steamboats burned an enormous amount of timber, which had to be stored on-board, thus adding to the boat's weight and using up valuable space. In 1817 the *Chancellor Livingston* was fitted to burn coal as fuel, and by the mid-1820s most steamboats were equipped to burn both wood and coal. Using the much more compact coal meant a savings in space and weight that allowed steamboat designers to add not only more passengers and cargo, but amenities like dining saloons and private cabins.

Steamboats were great commercial successes on the inland waters, but it was only after the move to coal that ocean steamers could provide services to compete successfully with sailing packets. In 1819 the sailing ship *Savannah* was retrofitted with a steam engine and paddle wheels and was the first ship to cross the Atlantic partly under steam. Later the same year the *Robert Fulton* became the first steam vessel built specifically for ocean travel. Steam was still unreliable, though, and most of the seaborne steamships retained masts and sails. The steamship *President*, built in 1829, was the first to abandon sails entirely, but most steamships combined sail and steam power through the 1880s.

NAVAL VESSELS

The navy also experimented with steam, hiring Robert Fulton to build the *Demologos* in 1814. Prior to that time developments in naval technology had largely been limited to design improvements that balanced the weight of guns, structural integrity, and speed. One advance had been the invention of the carronade, a small cannon that could throw a full-size shot, but with limited range. The carronade was invented in the 1770s and quickly adopted by naval shipbuilders, as it allowed the clustering of firepower at the vulnerable bow and stern of the ship. Fulton's *Demologos* was a paddle-wheeler equipped with five-foot wooden sides for defense and twenty guns for offense, but was so heavy that it could only make five knots under full steam. Overweight, underpowered, and propelled by vulnerable above-water paddlewheels, the steamboat remained unviable as a naval craft until improvements in boiler technology and the replacement of paddle wheels with screw propellers in the 1840s cleared the way for the development of a steam-powered navy.

MARKET REVOLUTION In the decades following the American Revolution, the American economy underwent many changes. As the agricultural frontier expanded westward, farmers were more eager to participate in the market than ever before. They lobbied for greater availability of money both to facilitate trade and to invest in production. Legislatures controlled by Democratic Republicans chartered companies to build roads and dig canals to connect the seaport towns with the countryside. Manufactures, once an item solely of household production, began to move into mills where producers could divide labor among wageworkers and utilize machines to produce goods in greater quantity and at lower cost than before. These changes comprise what historians have called the market revolution.

The market revolution did not occur uniformly across the United States, nor did it equally engage all its people. It was acutely felt in the North and the trans-Appalachian West, and it specifically excluded Native Americans, many of whom had participated in localized exchange economies on the frontier. In the South, plantation owners increasingly invested capital and ideological energy in a slave labor force rather than in the transportation and credit networks developed in the North and the West, leaving penurious farmers at a comparative disadvantage to their counterparts in the North.

Still, there was a genuine change in the behavior and goals of a large number of Americans by 1829. The first and second generation of Americans born after the Revolution largely accepted the idea that agriculture should be produced for profit rather than

solely to guarantee the subsistence of their families. They were more likely to use their savings (or obtain loans) to buy land or improve their tools to increase their yield. They were more willing than their ancestors to buy goods manufactured outside the home. This transformation in their economic mindset, realized in the extensive economic changes in banking, transportation, and manufacturing in the early Republic, produced a market revolution.

DEMOCRACY AND ECONOMY

Although the American Revolution was not fought principally on economic grounds, independence unleashed tremendous commercial-capitalist energy. Farmers and speculators had long wanted to settle the trans-Appalachian West, which the British Proclamation of 1763 had prohibited, at least by law. The Ohio Indians also resisted this settlement, but their defeat at the Battle of Fallen Timbers (1794) cleared the path for concerted migration. Between 1800 and 1820 nearly two million European Americans crossed the Appalachians to settle in the Old Northwest.

Demographic expansion and migration cannot by themselves explain why agricultural output in the North and trans-Appalachian West increased in the early Republic. To achieve more output per capita, farmers had to undertake to change their economic practice from subsistence to market production. Several factors aided this change. There was a large demand in the West Indies for a variety of foodstuffs that American farms could easily produce. The consistently rising price of grain on the Atlantic market between 1772 and 1819 provided further incentive for farmers to adopt crop rotation to improve yield, and in some cases partially specialize in a cash crop to maximize profits.

Although marketing agricultural surpluses became more attractive, the lack of an adequate money supply made investment and marketing difficult, and the poor quality of the transportation network isolated much of the hinterland. Both these issues would become intertwined with democratic politics in the early Republic. In the 1790s Alexander Hamilton and Thomas Jefferson articulated two very different economic visions for the future. Hamilton sought to develop manufacture in the seaport towns and prevent capital from dispersing across the western frontier. His plan for the first Bank of the United States fulfilled these goals by creating an attractive and secure investment opportunity that would make capital available only to large industrial projects.

Jefferson and the Democratic Republican Party opposed Hamilton's program of centralization and worked to dismantle it after Jefferson assumed the presidency in 1801. Jefferson appointed Albert Gallatin secretary of the Treasury, a post he would hold under both Jefferson and Madison until 1814. Gallatin sold the government interest in the Bank of the United States, repealed direct taxes, and relied on import duties to reduce the national debt.

The effect of Gallatin's program was to decentralize capital. In 1798 there were only twenty-one banks in addition to the first Bank of the United States, most serving the mercantile elite of the seaports. Eager to obtain capital for agricultural and small-scale manufacturing enterprises on the frontier, Democratic Republican legislatures in Vermont and Kentucky chartered banks in 1806 expressly to provide money and loans to its citizens. Other states quickly followed suit, and many citizens formed insurance companies and other depositories that extended credit. By 1810 there were over one hundred banks across the United States. By 1820 there were over three hundred, and by 1830 over two thousand.

TRANSPORTATION IMPROVEMENTS

One use to which Americans put this new capital was improvements in transportation systems, often demanded by farmers who wanted better access to the seaports so as to sell their surplus agricultural products. In the 1790s and 1800s, mid-Atlantic and New England legislatures appropriated money to build turnpikes that would connect seaport towns to each other and to the hinterland. They built roads of plank wood and stone overlaid with gravel, complete with drainage ditches to protect roads during inclement weather.

Turnpikes improved communication between seaport towns, but hauling grain and other goods overland to market was expensive. The preferred method was by water. Small canals connected some farming communities with major waterways and seaport towns, and several small projects were carried out in the 1790s and 1800s. The longest canal in this period, the 27.25-mile Middlesex Canal, was built between 1795 and 1803 to connect New Hampshire with Boston Harbor via the Merrimack River.

Infrastructure improvements became a matter of national politics after the War of 1812. Henry Clay (1777–1852), Speaker of the House of Representatives, advanced a plan for building a national economy that included a tariff on manufactured goods to encourage native industry, a national bank to stabilize currency for a national money market, and in-

frastructure improvements. Some Jeffersonian Republicans balked at this ambitious national program, including Presidents James Madison and James Monroe. Although Madison approved the second Bank of the United States in 1816, he vetoed a bill to devote federal funds to transportation improvements in 1817. Madison could accept that the second U.S. bank served the public good by creating a kind of national currency, but he drew the line at funding transportation improvements, which he believed should be left to the states. Monroe vetoed a similar bill in 1822. Andrew Jackson would veto a bill to devote federal funds to help finance the Maysville Road in 1830. It would be up to the states to build the nation's infrastructure.

The most ambitious project began in 1817, when Governor DeWitt Clinton of New York signed a bill appropriating seven million dollars in bonds for construction of a canal that would connect Albany with Lake Erie. Portions of the Erie Canal were open for use as early as 1819; the entire canal, 363 miles long, 40 feet wide and 4 feet deep, was opened on 26 October 1825. Tolls collected on the canal quickly paid off the debt New York had contracted to build it. The Erie Canal, connecting with the Hudson River in Albany, opened up the Great Lakes and their tributaries to New York City and cut the cost of transportation by over 90 percent. Encouraged by the success of the Erie Canal, other states jumped to build their own, resulting in a boom. By 1840 there were over 3,300 miles of canals in the United States.

The South lagged in building canals and turnpikes. Large plantation owners held a major share of the South's wealth and invested in slave labor to maximize production of the cotton and rice cash crops, leaving little in the way of available capital to develop a transportation network. With 40 percent of the South's population enslaved, there was a conspicuous absence of a local consumption market for agricultural or manufactured products. Small farmers in the South maintained a traditional subsistence economy, marketing small surpluses to large, cotton-exporting plantations.

MANUFACTURING

Improved transportation did more than just bring the raw materials of the hinterland to the port cities; it took manufactured goods from the Northeast into the hinterland. Most manufactures during this period were small-scale family operations that served local markets, although after the Revolution manufacturers responded to increased internal demand for high-quality finished products by expanding opera-

tions. In New England, mills became profitable investments because cheap manufactured goods could pay for inexpensive grain from the mid-Atlantic and the West. In 1791 Samuel Slater assisted a mercantile partnership in Providence, Rhode Island, in establishing a yarn mill at Pawtucket. His small mills were replicated and established in numerous New England towns by 1815.

Industry expanded across the Northwest at a time when labor was still a scarce commodity in most of the United States. New England's intensifying person-to-land ratio, however, left part of its workforce idle. To supplement family income, family farms sent women and children—their reserve labor—to earn wages in the mills. Industry also grew up in Philadelphia, where immigrants arriving from Europe looked to wages in order to survive. Although family agriculture would continue to dominate the economy, wage labor became important to cost-conscious industry.

In 1813 Francis Cabot Lowell and his Boston Manufacturing Company started a textile mill in Waltham, Massachusetts, that introduced the power loom to North America and the mass production of cotton cloth. Lowell's mills integrated the economic processes of spinning, weaving, bleaching, and dyeing (and in some cases printing) and mechanized the labor process. Lowell also built dormitories to house young female laborers.

Large factories were rare in the early Republic, as most industry was small-scale, relied on labor expertise rather than mechanization, and could not afford to integrate different aspects of the production process under one roof. But owners of small manufactories consciously worked to increase profits by investing capital and streamlining the productive process, particularly through more efficient divisions of labor. By dividing up tasks, manufacturers could increase output and reduce costs.

All of these changes were indicative of and fueled by a new entrepreneurial spirit in the early Republic. Although elements of the traditional, subsistence-based economy survived into the early Republic, noticeably in the South, the country as a whole was remarkably different by 1829. Farmers, tradesmen, merchants, and manufacturers increasingly devoted more resources to investment in their productive processes. They clamored for easy credit to expand operations and built roads and canals to integrate seaports and the hinterland. All this signaled a widespread acceptance of the aggressive pursuit of profit, making the market revolution a reality for the people of the early Republic.

MARRIAGE In the period from 1754 to 1830, marriage was defined in a relatively constrained and uniform way. Among Euro-Americans, who almost universally married, it meant a monogamous, consensual legal union between a man and a woman. Men were obligated by law to provide for and govern their wives, while women were to obey and aid their husbands. Love and affection were encouraged and often expected in the relationship; law, religion, and

community standards dictated that sexual relations be kept within its bounds. Marriage was thus both a public institution shaped by the larger society through law and societal expectations and a private relationship influenced by the interaction and negotiation of the couples themselves.

MARRIAGE LAW

Marriage law was set by the individual colonies (and later the states). These laws regulated who could marry and when, what obligations spouses lived under, who could officiate in ceremonies, and when and how marriages could be terminated. During the period from 1750 to 1830, the beginnings of a social and legal shift gradually increased individual choice and diversity in marriage. In the pre-Revolution Chesapeake region, for example, many people entered into common-law marriages largely because of the scarcity of Anglican priests; new laws eventually allowed magistrates also to conduct ceremonies, giving Tidewater residents more opportunity to marry legally if they so chose. Divorce also became slightly more available in many states by 1830. An exception

to this loosening of legal control was the maintenance of statutes restricting sex outside of marriage (despite growing nonconformance to this standard) and interracial marriage.

THE REVOLUTION AND RIGHTS IN MARRIAGE

The Revolutionary War's impact on the demographics of marriage was limited—there were more widows and a slightly higher number of divorces and desertions. However, the war did contribute to a dialogue about the nature of marriage and marriage law. Commentators influenced by Enlightenment ideas of contractualism began writing less about hierarchy and more about union and consent. This trend later contributed to the passage of mid- to late-nineteenth-century laws liberalizing divorce and guaranteeing married women's property. Colonial marriage entailed the serious inequity of coverture: upon marriage, a woman's legal identity was subsumed or "covered" by her husband's, and she ceased to exist as a legal being. She could not own property, make contracts, testify against her husband, file suit, and so on. These restrictions show that during this time marriage law allowed men to exercise considerable power over wives. Still, the rhetoric of the Revolution contributed to a language and dialogue that eventually was used to challenge coverture.

COMPANIONATE MARRIAGE

A corollary development to the changes in law and legal thinking about marriage was the rise of the middle-class companionate marriage. In the flux of complex social and economic changes shaping the new nation, families lost many of their economic and social functions on the path to becoming middle class. Marriage became less about the transfer of property and more about emotional fulfillment. By 1830 middle-class parents were allowing their children to make their own choices in marriage. Parents might steer children away from undesirable suitors of the wrong social group, but couples made their own choices based on mutual attraction and esteem. Companionate marriages also often included family limitation. In the early decades of the nineteenth century, births per white woman began a gradual decline that continued through the century, from 7 in 1800 to 3.5 in 1900. This revolution had immense implications for marriages, ranging from improved health for women to changes in child rearing and the role of the provider.

Ceremonies surrounding marriage reflected the companionate ideal. The practice of publishing banns (public announcements of marriage) died out, and

church weddings with more elaborate rituals, including the exchange of rings, became more common. In the South elaborate marriage celebrations became signs of rank to separate the elite from the lower classes.

AFRICAN AMERICAN AND NATIVE AMERICAN MARRIAGES

For most African Americans during this period the constraints of the institution of slavery dominated marriage. Slaves lacked the freedom to express consent, and thus owners theorized that slaves could not legally enter into the contract of marriage. More important, the cold economics of slavery required the absence of any legal marriage contract that would hinder the owner's ability to sell a slave. Therefore, the laws of most colonies, and later states, did not recognize slave marriage. Most slaves, however, wedded unofficially, using ceremonies conducted by preachers or by their own word, often ritually "jumping the broom." That these marriages had weight with both blacks and whites is evidenced by the fact that many slaves remained with the same spouse till death. Still, slavery prevented African Americans from fulfilling the male and female roles traditionally held in either African or white American society. Slave men, for example, could rarely provide for their wives or protect them from abuse by owners. Many slave women had no choice but to neglect children and home to cook and clean in the big house or labor in the fields. Neither could ultimately protect a child or spouse from sale and separation. Ironically, because of these disruptions to traditional roles, slave marriages were probably more egalitarian than white marriages during these years.

Among Native Americans there was a greater diversity of marriage practices than among whites or blacks. Although most men and women lived in monogamous relationships, most groups allowed men to marry more than one wife. Among Plains groups and West Coast tribes, for example, polygamy was fairly common. Some tribes placed no restrictions on premarital sex, and a few allowed married men sexual relations outside of marriage while their wives were pregnant or nursing. Widows often married a brother of their deceased husbands, and some widowers were expected to marry an unmarried sister of their deceased wives. Native Americans also tended to marry earlier than whites—women as early as twelve to fifteen years old and men generally in their late teens and early twenties. Perhaps the most striking difference was the number of matrilineal societies. Hunting-oriented groups, like the Sioux and Cheyenne, tended to be patrilineal, passing property

and authority through male lines, but among tribes where women did much of the essential work of farming, matrilineality was common. Among the Iroquois and the Pueblos, for example, marriage for a man meant moving into his wife's extended family. Divorce was generally available among most groups, often requiring nothing more than the decision of one spouse to terminate the marriage. By 1830, however, many native marriage practices were lost to the pressures of Euro-American encroachment.

MARSHALL, JOHN John Marshall, the greatest chief justice of the U.S. Supreme Court, was born on 24 September 1755 in Fauquier County, Virginia, and was the oldest of fifteen children. He married Mary Ambler in 1783 and they had ten children.

Prior to his appointment to the Supreme Court by President John Adams early in 1801, he had distinguished himself in numerous areas of public service. Marshall was a successful lawyer, practicing in the area of Richmond, Virginia, and specializing in debt cases. He argued, unsuccessfully, one case before the Supreme Court—*Ware v. Hylton* (1796). He was a soldier in the American Revolution, served several terms in the Virginia legislature, and was a diplomat to France. He refused several offers to serve in government, most notably as U.S. attorney general and as an assistant Supreme Court justice. He served

in Congress from 1799 to 1800 and then briefly as President John Adams's secretary of state.

When Adams sent Marshall's nomination to the U.S. Senate in January 1801, the Federalists were still in control, but most were not enthusiastic about the nomination; this caused some delay in confirmation. Nevertheless, Marshall assumed his duties on 5 March 1801, becoming the highest-ranking Federalist in the new Democratic Republican era that began after 1800. For the first time in the nation's history, the Democratic Republicans controlled the House, the Senate, and the presidency. Federalists thought the country would never survive Republican governance. The Republicans, on the other hand looked unfavorably upon the federal judiciary as the last stronghold of Federalist influence. The feelings of the Republicans were only strengthened by the last-minute passage of the Judiciary Act of 1801, which was an attempt by Federalists to put their party in firm control of the judiciary after having lost control of the other two branches of the government. This put Marshall, just as he arrived on the Court, right at the center of President Thomas Jefferson's assault on the federal judiciary.

Marshall worked quite hard and, for the most part, was successful in persuading the Court to produce single "opinions of the court"—except for dissents—so the Court's decision would be clear, strengthening the Court. To further this goal he convinced the rest of the Court to cease the practice of seriatim opinions by which each justice had written his own opinion for each case. To have one Court opinion and usually to have unanimity in support of that opinion was one of the many things Marshall did to help the Court achieve equal footing with the other two branches of government. In most of the unanimous opinions, at least in the significant cases, it was Marshall who wrote the opinion of the Court.

Most, if not all, of Marshall's noteworthy opinions increased the power of the federal government at the expense of the states. One case that does not fit this description but the one for which, perhaps, Marshall is best known, is *Marbury v. Madison* (1803). His opinion gave the first clear articulation of the principle of judicial review by the Supreme Court. This opinion was carefully crafted, keeping in mind Jefferson's battle with the courts and attempting not to give him more ammunition in his effort to check the influence of the judiciary.

Marshall used a case-by-case approach in attempting to strengthen the federal government. In *Fletcher v. Peck* (1810) his opinion furthered the goal

of judicial nationalization, using the contract clause of the Constitution as the instrument.

His opinion in *McCulloch v. Maryland* (1819) used federal supremacy as its dominant theme. This opinion restrained the actions of state legislatures, but it also freed Congress by giving judicial approval to the loose construction of the Constitution, particularly Article I, section 8, clause 18, the necessary and proper or elastic clause.

Marshall and the Court issued a strong justification and defense for judicial review in upholding the right of the Supreme Court to review decisions of state courts in *Cohens v. Virginia* (1821). In *Gibbons v. Ogden* (1824) Marshall's opinion held that Congress had the power to regulate interstate commerce. His opinion was written broadly so that his opinion and its findings would not become antiquated.

Marshall's greatest period of influence was the first ten years of his tenure. From 1811 to 1823 his importance declined, in part due to the personnel on the Court with him—Justices Joseph Story and William Johnson, for instance—being great justices in their own right. After *Gibbons*, Marshall's influence on the Court, particularly in conference (meetings of the justices alone), began declining further, reaching a low point in the early 1830s. Marshall died 6 July 1835.

MARTIN V. HUNTER'S LESSEE The case of *Martin v. Hunter's Lessee* (1816) helped shape the jurisprudence of the early Republic by confirming the power of the U.S. Supreme Court to review decisions of state courts. In this case the U.S. Supreme Court reversed a decision by Virginia's highest court. The issues in the case involved the Constitution and the Judiciary Act of 1789, which was one of the first acts

passed by Congress. Article VI of the U.S. Constitution provided that the Constitution itself and all laws and treaties made under it "shall be the supreme Law of the Land" and that "the Judges in every State" were obligated to enforce the Constitution, laws, and treaties. Section 25 of the Judiciary Act empowered the U.S. Supreme Court to review cases from the highest courts of the states if those cases involved a federal law or treaty. In *Martin v. Hunter's Lessee*, the Supreme Court upheld and implemented this provision of the Constitution over the objections of the state of Virginia.

The case involved tens of thousands of acres of land in Virginia that belonged to Thomas, Lord Fairfax, before the Revolution. Fairfax fled to England during the conflict and died there in 1781. His estate went to his nephew, Denny Martin, who was a British citizen. Lord Fairfax required that to claim this land, Martin must change his name to Fairfax, which he readily did. In 1782, with the Revolution still raging, Virginia passed legislation to take the Fairfax lands from the family on the grounds that aliens could not inherit land in the state. David Hunter subsequently bought some of these lands from the state and began a suit to force Fairfax's heirs to vacate the lands. By this time the land had passed to Denny Fairfax's brother, General Philip Martin, who argued that under the Treaty of Paris (1783), which ended the Revolution, and Jay's Treaty (1794), Virginia was obligated to return the lands to their rightful owners. By the time the case reached the Supreme Court, Martin had sold some of his interest in the land to a group of investors that included Chief Justice John Marshall. Thus, the chief justice did not participate in the case.

In *Fairfax's Devisee v. Hunter's Lessee* (1813), the Supreme Court upheld Martin's claim. However, the Virginia Court of Appeals refused to accept this result and issued an opinion declaring the U.S. Supreme Court had no jurisdiction to review the decision of a state court and that the judges of Virginia were not obligated to obey the Supreme Court. In 1816 the case was back before the Supreme Court as *Martin v. Hunter's Lessee*. At this point the case was deeply tied to both Virginia politics and the politics of the early nation. Judge Spencer Roane of Virginia, who was the most important figure on his court, despised John Marshall and was a close ally of Thomas Jefferson. His challenge in refusing to accept the Supreme Court's decision was not just legal, but personal and political as well.

With Marshall not participating, Justice Joseph Story of Massachusetts wrote the opinion of the

Court. Unlike Marshall, Story was not a Federalist but, rather, had been a Republican congressman appointed to the bench by Jefferson's close friend and ally, James Madison. The Court also included William Johnson, who had been appointed by Jefferson and three other justices appointed by Jefferson or Madison. The political leanings of the justices had no effect on the outcome of the case. All agreed that the Constitution was the "supreme Law of the Land" and that Virginia had to obey the Constitution and the treaties made under it. In a lengthy opinion Story bitterly denounced the states' rights position of the Virginia court. He accused it of resorting to the same antinationalist doctrines that extreme Federalists had invoked just a few years before in resisting the War of 1812. He also exposed the absurdity of the Virginia court's claim that state courts were free to interpret the U.S. Constitution and federal laws as they wished. This would have led to legal anarchy and, as Story put it, "the public mischiefs that would attend such a state of things would be truly deplorable." America's constitutional system required that "the absolute right of decision, in the last resort, must rest somewhere" and that "somewhere" was the U.S. Supreme Court.

Story's opinion in this case is generally considered one of the most important in Supreme Court history. He rejected the states' rights "compact theory" of the Constitution and emphatically endorsed the idea that the U.S. Supreme Court was indeed the final arbiter of the Constitution and the laws and treaties made under it.

Paul Finkelman

MARYLAND Founded as a refuge for Catholics in 1632, Maryland was one of the oldest English colonies in America. By the 1750s, however, many Marylanders had grown tired of British rule. The British practice, instituted in 1717, of transporting convicts deeply angered the colonists by establishing one convict for every ten adult males in Maryland by 1757. Partly as a result, Maryland strongly supported the Revolution and played an integral role in

the hostilities. During the war, Maryland privateers severely crippled British commerce. The captured supplies of powder, arms, and clothing greatly helped the American forces. Congress moved to Baltimore for the winter of 1776–1777 when the British threatened Philadelphia. On 28 April 1788 Maryland became the seventh state to ratify the new Constitution, and the colony seemed poised for prosperity. Over the next four decades, the state's white population grew and its slave population declined steadily. Suffrage was expanded, and the state became increasingly involved in the market economy.

In the federal census of 1790, Maryland had a population of 319,728. In 1800 the population rose to 341,548 despite Maryland's 1791 gift of territory to form the federal District of Columbia. The state's population continued to increase, with 380,546 people in 1810; 407,350 in 1820; and 447,040 in 1830. The state's major city, Baltimore, was the fourth-largest urban area in the nation in 1790, with 13,500 people. Baltimore's population, consisting of German Americans, French Acadian refugees, Anglo-Americans, and African Americans, continued to grow over the succeeding decades. Western and northern portions of Maryland grew modestly.

Maryland's growth is deceptive. Although much of the state expanded, in the national era the counties with the highest number of slaves steadily lost population. When land no longer supported a planter's family and slaves, many Marylanders left the state rather than lose their status as slave owners. Other planters facing economic ruin sought out-of-state buyers for their slaves. Such sales were common enough that bills were introduced in the state assembly to prevent the breakup of black families, but none of the legislation ever became law. Giving freedom to slaves also proved a popular way for slave owners to escape financial burdens. In 1796 Maryland permitted voluntary slave emancipation while also forbidding the import of slaves for sale. The legislation dramatically affected the black population. In 1790 Maryland had almost thirteen times as many slaves as free blacks. By 1810 the ratio was about three to one as the number of free blacks swelled to thirty thousand. In 1830 Maryland had nearly fifty thousand free blacks.

As the numbers of free blacks rose, fearful whites attempted to maintain control by reducing the rights accorded to blacks. After 1796 free African Americans could not testify in court cases involving the question of blacks being free or slave. A later law permitted slaves to testify against free blacks. In 1806 the Maryland Assembly revealed white fears of slave

uprisings by restricting the rights of free blacks to assemble and by requiring African Americans to obtain a permit to own a firearm or a dog.

As blacks lost rights, poor white men and Jews gained privileges. In 1802 the Assembly approved a state constitutional amendment removing property qualifications for adult white males voting in local and state elections. In 1810 the state extended the ballot to federal elections and abolished property qualifications for would-be state officeholders. Jews were permitted to hold public office with legislation passed in 1826.

Maryland also experienced economic changes. By 1815 most farmers had abandoned tobacco as a cash crop because its repeated cultivation had depleted necessary nutrients from the soil. Additionally, European conflicts had made the market unpredictable. Many of the tobacco farmers switched to wheat, but attacks by the Hessian fly consumed thousands of baskets of grain and prompted major importers of Maryland wheat to close their docks to Maryland products.

The poor state of the agricultural economy prompted Maryland to focus more on trade and industry. In 1790 the Bank of Maryland formed to issue paper money and make capital available for investment. Some of these investments went into transportation. After five years of construction, the Chesapeake and Delaware Canal opened in 1829. Eager to profit from western trade, Maryland chartered the Baltimore and Ohio Railroad in 1827. State leaders thought that railroads would overtake canals as the preferred routes to the western markets. By 1830 Maryland was shifting its focus away from agriculture to commerce.

MASSACHUSETTS Mid-eighteenth century Massachusetts was an overwhelmingly white, English, Congregationalist colony, with a population of about 175,000, second only to Virginia. In the years since the landing of the Pilgrims, the colonists had created two rather distinct worlds—a culture of small farms and small towns in the interior, and a maritime culture along the Atlantic coast.

Typical inland farmers produced largely for their households rather than for markets and relied on family, neighbors, and town for their protection and nurture. Devoted to the republican ideal of a virtuous moral community, they placed the common good ahead of individualism and were suspicious of commercial society. Yet markets and a cash economy existed in the countryside, and a different, liberal ideal, stressing the rights of individuals and capital, was gaining ground.

The liberal ideal was more advanced in the seaports, where merchants were making profits in the British trading system. Their ships arrived regularly with tea, fish, molasses, whale oil, and manufactured goods and left with rum, dried fish, lumber, and other products. Massachusetts led all colonies in distilling, sugar refining, ship building, and tonnage of incoming and outgoing ships. In 1750 Boston was the largest port on the Atlantic coast.

The steady hum of commerce fostered a cosmopolitan culture that was less homogeneous and more individualistic and refined than in the backcountry. In 1775 the seaports had almost as many dissenting churches as Congregational. A large nonfarming population, including some African Americans, both slave and free, created a widening gap between poor laborers and rich merchants like John Hancock, who in 1771 had savings of 16,000 pounds earning interest. Boston boasted four newspapers, four marine insurance offices, and a major royal post office. It was also known for its handsome Georgian-style buildings, the portraits of John Singleton Copley, and, across the Charles River, Harvard College (founded 1636).

The provincial government of Massachusetts dated back to the royal charter of 1691. A powerful governor, appointed by the king, had absolute authority to appoint judges, veto bills from the legislature, and dissolve the House of Representatives. There was no religious test for voting and only a moderate property qualification. Congregationalism was the established religion, supported by town taxes. The system worked well, but most colonists

considered town government more important than provincial government.

Despite its established position, Congregationalism was under attack. In 1740 the eloquent English revivalist George Whitefield warned large crowds in Boston that no one could be saved without having undergone a deep, personal religious experience. His sermons buttressed a similar message from Jonathan Edwards and other American revivalists. The Great Awakening, as the movement was called, drew many Congregationalists away from the orthodox church.

After the French and Indian War (1754–1763), the British Parliament began to levy heavy taxes on the colonies. The new policy triggered a sharp reaction in Boston, where friction already existed between a royal party led by Lieutenant Governor Thomas Hutchinson and an opposition championed by men such as John Hancock, Samuel Adams, and James Otis, who had influence over the Boston workingmen. When Parliament passed the Stamp

Act in 1765, mobs of workers destroyed Hutchinson's home.

From then on Massachusetts was on the leading edge of the American Revolution. The Massachusetts legislature sent out the first circular letter, the Boston Massacre inflamed public opinion, and the Boston Tea Party brought on the war. Parliament made it almost inevitable that the war would start in Massachusetts when it closed the port of Boston, sent in troops, and restricted the holding of town meetings. Ironically, the fighting began, not in the seaport where the controversy had flourished, but in Lexington and Concord, two country towns. In the months that followed, a Massachusetts leader, John Adams (cousin of Samuel) played a dominant role in the Continental Congress, chairing many committees and persuading the Congress to issue the Declaration of Independence.

TRANSITION, 1775–1789

Adams also drew up the new Massachusetts state constitution (ratified 1780), the first ever adopted by

Year	Total Population	Black Population	Native American Population
1750	c. 175,000	c. 4,500 (of which, slaves c. 2,000)	c. 1,500
1770	235,000	—	—
1790	379,000	5,463	—
1800	423,000	—	—
1810	472,000	—	—
1820	523,000	—	—
1830	610,000	7,049	—

Note: Figures given here do not include Maine, which was governed by Massachusetts until 1820 but is not covered by this article.

a specially elected convention and ratified by the people. The constitution was a conservative document. The governor, who was given limited power to veto and appoint, was stronger than governors in other states. The property qualification for voting was retained and was not removed until 1821. African Americans, however, were allowed to vote, and slavery was abolished. The constitution failed to end the establishment of religion, but it protected the rights of all denominations. The document was a setback for the interior because it established a powerful central government that would overshadow the towns and gave the large coastal towns proportionately more representation in the lower house than the small interior towns.

Another setback for the interior came in 1786–1787 when the governor used the power of the state to suppress Shays’s Rebellion, a farm movement in central Massachusetts demanding relief from foreclosures and high taxes. The rebellion was a fruitless attempt to maintain the republican ideal of a moral economy regulated by the towns. The failure of the rebels reflected the steady gains of liberal ideas.

A year later, when a Massachusetts convention met to consider the United States Constitution, a majority of the delegates were opposed to ratification, especially many from the interior who resisted the idea of a strong national government. But again the seacoast had its way, and, despite a better than two-to-one vote against it by the delegates from the inland counties, the Constitution was ratified by a tiny majority.

IN THE UNITED STATES, 1789–1829

For the next twenty-five years, the Federalists, who had supported the Constitution, dominated Massa-

chusetts politics. They controlled the major seacoast counties of Essex and Suffolk as well as Hampshire County in the Connecticut River Valley and represented the powerful Congregational, maritime, and financial interests of the state. Their opponents, the Republicans, won the support of religious dissenters and the counties west and south of Boston. After 1800 some of the Massachusetts Federalists became so frustrated with national Republican policies that they started a sectional resistance. In 1803–1804 Essex County Federalists tried unsuccessfully to form a Northern Confederacy to secede from the Union. Later the Federalists opposed the War of 1812 and called the Hartford Convention (1814–1815), which, again unsuccessfully, proposed states’ rights amendments to the Constitution.

In the 1820s the Federalists merged with centrist Republicans to form a state party, led by John Adams’s son, John Quincy Adams. Partisan Republicans reorganized under the banner of Andrew Jackson. In the presidential election of 1828, in which the Adams party carried Massachusetts but Jackson won the presidency, Massachusetts was again out of step in national politics.

But not in the economy. The movement of people into western Massachusetts and the spread of a market economy brought changes that blurred the distinction between seacoast and interior. Labor and investment capital were now available in the west as well as the east. New turnpikes had been built connecting Boston with Albany and New York City. Canals were dug between the Merrimack River and Boston and between the inland town of Worcester and Narragansett Bay.

The changing face of the interior was one of the elements in the rise of cotton manufacturing. Between 1790 and 1812 entrepreneurs built scores of tiny cotton mills between Worcester and Rhode Island. But large-scale manufacturing did not begin until trade restrictions prompted seacoast merchants to look for new forms of investment. In 1813 Francis Cabot Lowell and Patrick Tracy Jackson of Boston raised the enormous sum of \$400,000 and organized the Boston Manufacturing Company. Within a year they had set up a factory in Waltham, near Boston, where for the first time in America the entire process of manufacturing cotton textiles took place under one roof.

Eight years later Jackson and others founded a new town on the Merrimack River, named Lowell, which would devote itself solely to textile manufacturing, with young farm women running most of the machines. By 1834 six companies were operating

nineteen cotton mills at Lowell, and Massachusetts had become the leading cotton manufacturing state in the Union.

Meanwhile the spread of Methodist and Baptist churches and the rise of Unitarianism had accelerated the decline of the Congregational Church. The struggle with Unitarianism came to a head in 1805–1806 when Harvard College, where Congregational ministers were traditionally educated, selected Unitarians as Hollis Professor of Divinity and president of the college. In Boston church after church went over to Unitarianism, and the orthodox Congregationalists were forced to found a seminary at Andover in Essex County. The official end of Congregational dominance came in 1833, when a constitutional amendment did away with an established religion.

The overturning of the Congregational churches took place during the rise of a new Boston under the leadership of the architect Charles Bulfinch, who served as chairman of the selectmen between 1799 and 1817. Bulfinch left an indelible mark with his Massachusetts State House (1800), his graceful street patterns, and his plans for filling in coves to increase the available land mass. Boston grew from a town of eighteen thousand in 1790 to a city of sixty thousand in 1830.

In less than a century Massachusetts had made the transition from an agrarian, maritime British colony culturally divided between seacoast and interior to an American state in which all sections were becoming increasingly involved in manufacturing.

MATERIAL CULTURE Material culture refers to the pattern of tangible, human-made forms as an indicator of cultural ideas and traditions. While architecture, art, craft, food, and dress are genres represented in material culture, the emphasis in material culture analysis is upon discerning patterns, landscapes, symbols, and behaviors that cross these genres and characterize the built environment. Material culture often refers to social relations among people mediated by objects and, therefore, involves connections to intellectual and social systems in communities and regions.

The period of the new American nation, sometimes referred in historical material culture typologies as the Federal period, is particularly significant for material culture analysis because of the development of a national design alongside the ongoing regional and ethnic folk cultures, often formed out of the hybridization of transplanted traditions and responses to the new environment. The Eastern seaboard that Europeans and Africans encountered was filled with natural wonders, but there were few of the ancient ruins and remains that characterized the Old World. As settlement pushed the frontier westward and crossed natural as well as social borders, residents formed cultural landscapes for a new land and nation. Into the nineteenth century, migrant set-

tlers shaped the New World's environments; they were cognizant of their traditions but willing to reshape them for the new land and a sense of community. As citizens of the new American nation, many settlers indeed asked whether a national architecture, art, and food could possibly unite the wide expanse of the American cultural landscape from the commons, maple syrup, and connected farmsteads of New England to the plantations and sorghum of the Deep South.

NATIVE AND AFRICAN INFLUENCES

Drawing on early American historical experience, an assessment of material culture can draw contrasts between American Indian, northern European, and African influences on the landscape. In colonial New England and Virginia, according to this perspective, different material culture systems came into conflict when English settlers confronted Native Americans. Observers noted that the English system was built on the formation of lines and rectangles, while many Indian tribes relied on a base concept of the circle. English architecture was organized on a rectangular foundation and therefore emphasized human control

over the landscape. The English conception of time and age was linear, and English settlements were permanent and arranged on a grid with privately owned properties. Indian settlements were mobile and often arranged in circular patterns, their conception of time and age was cyclical, and tribal architecture was based less on human dominance than on a relationship with nature.

Both groups practiced agriculture, and much of the cultural borrowing that occurred between them seems to have been in various forms of food, including tobacco, corn, and maple syrup. The dugout canoe used by European Americans was indebted to Indian technology, but the Europeans did not adopt the crooked knife of the Indians, held in one hand and used by cutting away from the body; Europeans preferred the shaving knife, held in two hands and used by cutting toward the body. Some architectural exchange apparently took place in lumbering areas, where building in bark was borrowed from Indian sources.

Enslaved Africans in the American South were forcibly acculturated to European American material systems, but strong signs of ethnic maintenance are evident in privatized areas of house interiors, crafts, dress, and foodways. An example is the African American head wrap, a cloth tied around the head that emphasized the upward vertical extension of the head, in contrast to the European American scarf and bonnet that was fastened to extend down the back of the neck. Africans adapted the British American quilt form of symmetrical blocks to show the African aesthetics of textile strips across the blanket, often with irregular designs. Evidence of cultural exchange also includes the spread of the Deep South's front porch and long shotgun house, American developments of African origin. African influences are particularly evident in American instrument making. The African *banjar*, with a skin stretched over a deep gourd, and the instrument's distinctive feature of a plucked short drone string on the neck entered into general American culture during the 1830s.

REGIONS OF MATERIAL CULTURE

The persistence of westward movement through the nineteenth century has informed the idea that the distinctive characteristics of American material culture which developed in that century were based on the clearing of the forested wilderness and a reliance on wood as the primary component of construction. This movement westward helped shape a new national identity, assimilate immigrant groups into the aesthetics of a pioneer American society, and encour-

age the removal of indigenous peoples. Particularly for groups that did not plan to return to Europe but, rather, were making a fresh start with a commitment to making a home or establishing a religious or political haven in the New World, settlement was more than just a matter of transplanting the Old World to the New. As can be seen by the migration of log construction from a core area in the mid-Atlantic to the South and West or the wide adaptation of Native American foodways, there was an openness to technologies that fit the environment while conforming to familiar aesthetics and traditions. Nonetheless, the first permanent European settlements in the American experience effectively determined the future course of material culture development and the formation of regions in the new American nation.

Material culture regions emerged from settlements on the Eastern seaboard around four main ports of entry and subsequent migrations. Scholars frequently use the metaphor of a “hearth” to describe the central sustaining influence of settlement pat-

terns through these ports of entry on cultural formation. The New England hearth, with its strong English stamp, was based in the Cape Cod area and from there material culture patterns established by English settlers spread north to New Hampshire and Maine and westward across New York and Michigan. The Chesapeake-Tidewater hearth influenced the movement of material culture across Maryland and Virginia into the upland South. The lowland South hearth, featuring a strong African influence, worked its way through South Carolina and Georgia into the Deep South. The last hearth to form was in Pennsylvania, where Palatine Germans, Swiss Anabaptists, English Quakers, French Huguenots, and Scots-Irish influenced the formation of a plural society and a strong inland Pennsylvania-German culture subregion that spread into the Midwest. While the Pennsylvania cultural hearth is considered to show the most hybridization out of the multiple ethnic influences in the settlement, each of the hearths reveals some cultural hybridization, giving rise to a distinctive American material culture.

New England. In New England, a noticeable settlement pattern brought from England was the town common, or green. It was not prevalent in other regions, and was influenced in New England by the Puritan idea of mutual aid and meeting undergirding a community, stated in documents such as the Mayflower Compact (1620). In some New England towns the common was called the “meetinghouse lot” because it lay near the chief public structure. Originally intended as a common space for grazing the livestock owned by townspeople, it came to signify the corporate spirit that shaped space and structure. Around the green emerged separated, individualized houses, often single-bay, story-and-a-half structures meant for nuclear families; but the green and meetinghouse gathered people together and centered the town. Houses and fields took shape according to community will; land committees assigned acreage and town meetings arranged the placement of mills and blacksmith shops as well as controlling the activities of millers and blacksmiths. Graveyards were often established as common space where the elite as well as ordinary townspeople were buried. The pattern of community spirit and town meetings continued into the founding of the new nation as communally built roads, bridges, and jails multiplied and the tradition of common land became a sign of the new democratic Republic.

The ordinary New England house and barn took advantage of the abundance of forested land to build in wood with an abandon unknown in England. One sign of the new landscape was the replacement of thatch as a roofing material by wooden shingles. The Cape Cod house, consisting of a central chimney and central doorway with a kitchen on one side of the hearth and front and back rooms on the other, was an adaptation of the English hall house. With a lean-to on the back to allow an extension, the house took the shape of a saltbox and became known as a standard regional type. Not far from the house, the English barn reflected the symmetry of the house and was used as a threshing floor and a location for social dances. It had a central entrance on the nongable end and was built flat on the ground. Toward northern New England, one could find connected farmsteads that brought house and barn together in a linear pattern. Not simply a reaction to the cold and snow of harsh New England winters, the line of connected buildings sheltered a south- or east-facing work yard, called the dooryard, from north or west winter winds. It developed even more as a response to multipurpose agricultural production, including a mixed husbandry system of working with a variety of crops and animal products and involvement in home

industry for non-agricultural sources of income (e.g., lumbering, clothing, and basketry).

As New Englanders moved west across New York State, the connected farmstead gave way to a dispersed farm-building layout, but the tradition of the workyard remained. A distinctive material landscape emerged particularly in towns along the Erie Canal. There, cobblestones were used as building materials in public and private buildings. In the Hudson Valley, Dutch building skills from the seventeenth century continued in many families and could be discerned in the rise of New World Dutch barns, noticeable in their open interior space and steep-pitched roofs. The farmstead might also have another distinctive form marking a New World Dutch identity: a hay barrack, usually smaller than its Old World counterpart. Consisting of a movable roof resting on four posts, it provided flexible hay storage and reminded English neighbors of ethnic differences in agricultural building design.

Pennsylvania. In Pennsylvania and the Delaware Valley, a varied combination of English Quakers and Anglicans, Scots-Irish Presbyterians, German Mennonites and Reformed, and Lutherans, among others, participated in William Penn’s Holy Experiment, which promised religious tolerance and entrepreneurial opportunity in wooded and mountainous areas thought to be a barrier to settlement. Germans and Scots-Irish enthusiastically sought farmland and put distance between themselves and Quaker control. Visitors remarked on the isolated, self-contained, German-speaking “Dutchland” forming inland and the migration of Scots-Irish and Germans into Virginia’s Shenandoah Valley to help form the hardscrabble Appalachian region. The region’s mountain dulcimer, for example, was derived from the German zither and was used to accompany old British ballads. The “pot pie” (actually appearing to be more of a stew with dumplings and chicken) associated with Pennsylvania-German cuisine maintained the heavy dough and gravy diet of Central Europe while borrowing the terminology of the British “pie.” Farmlands were at first devoted to wheat, but later a corn-pig complex was developed by which corn supplied a grain for baking as well as food for livestock. Many Pennsylvania foods that spread beyond the German population, including sausage, scrapple, and corn mush, relied on this complex. Probably best-known of the German American traditions that spread widely into American material culture were the holiday customs of the indoor Christmas tree, the Easter bunny, and decorated egg tree.

Most notable on the Dutchland landscape was the large, two- or three-level Pennsylvania barn, which featured a German-looking forebay hanging over a sublevel on one side and an inclined bank leading to an entrance on the nongable side. It departed, however, from the forms of many lower Rhineland barns in its nongable entrance, perhaps adapted from English barns. The German house also went through an Anglicization and later an Americanization process. Known for its asymmetrical *flurkuchenhaus*, or continental German type of dwelling, the house of Rhineland settlers in Pennsylvania usually had an entrance that led on one side directly into the kitchen hearth, which extended to the back of the house. On the other side were a wide front room, or *Stube* (literally the “stove room”), and the sleeping chamber, or *Kammer*. The chimney was therefore off center in the house, and befitting the dough cuisine, it often contained an exterior bread-baking oven. In some areas, the oven was in a separate structure. With the spread of English political influence in urbanizing areas, many houses took on more of the symmetry of the Georgian high-style exterior while often retaining the long kitchen and two side rooms. A folk type that developed out of this hybridization throughout the mid-Atlantic region used two front doors and the German-type interior in contrast to the central hallway and four evenly spaced rooms of the Georgian plan. Although the German type persisted into the nineteenth century in many rural areas of the state and in several communal societies such as Ephrata, Bethlehem, and Harmony, the central passage and decorative architectural features of eagles and classical pediments were increasingly in evidence on the two-story, two-room-wide, two-room-deep mid-Atlantic house. The eagles and classical features even appeared on furnishings (e.g., painted dower chests) and illuminated manuscripts (e.g., *Taufscheine*, or baptismal certificates) alongside the traditional German symbols of the heart, tulip, and *distelfink* (an ornamental bird design deriving from the German for “goldfinch;” it is often used to represent good luck and happiness and is sometimes shown as two attached birds facing away from each other).

The Chesapeake Tidewater. In the source area of the Chesapeake Tidewater, running from Baltimore down to the coast of North Carolina and inland to the Blue Ridge Mountains, settlers developed a material culture based largely upon the cultivation of tobacco. By the end of the eighteenth century, householders had developed specialized barns for curing their tobacco with loosely jointed sideboards to allow air to flow among the hanging leaves. Barns, dwellings,

and fences reflected the transiency of their builders. The tobacco barns and small stables of the Tidewater region appeared astonishingly flimsy to visiting Europeans and northern farmers. If not cultivating tobacco, many southern planters erected log double-crib barns based on a type found in Central Europe; these barns were found especially further inland into the Tennessee Valley at the beginning of the nineteenth century. As storage needs grew, they expanded into a New World form of the four-crib barn with a central passageway (one of its two passageways was blocked off to provide additional stabling), thus forming a transverse-crib barn.

The settlers in the Tidewater understood themselves as southerners by the contrast of their built landscapes to the corn-pig complexes and multipurpose agricultural systems further north. With wood being plentiful, they created a building style adaptable to an agricultural crop that exhausted the soil and forced them frequently to move on to new arable land. Their “worm” fences, made from split rails heaped loosely upon one another in self-supporting zigzag patterns enclosing their fields, could easily be dismantled as well as erected. These fences appeared to waste vast amounts of wood, but they had the advantage of needing no posts or post-holes, thus allowing for quick mobility and expansion.

The most distinctive folk house-type to emerge in the Tidewater and spread outward through the South was the one-room-deep hall and parlor house, which developed into the two-story, one-room-deep “I house.” Frequently built of wood rather than brick, the hall and parlor were fashioned largely after the English original but were frequently adapted to the hot, humid climate of the South. It had a raised foundation to avoid water damage to the first floor; external chimneys to maximize heat loss; a deep, shady front porch; and frequently a breezeway or central passageway that allowed air to flow through. A peculiarly southern terminology emerged for variations of its two-room-wide, one-room-deep structures that developed in the early nineteenth century, including “dogtrot,” “saddlebag,” and “double-pen” houses. Some observers have noted that unlike the sturdy bay or room of the North, the southern pen connoted impermanence as well as an adaptation to the expansiveness of the southern landscape. This pattern fostered an American material culture of mobility, which included the development of large-wheeled vehicles, use of wood for road coverings, and clothing such as lightweight fabrics and protective bonnets for women and durable broadcloth pants

Gardner-Pingree House, Entry. Fanlights and sidelights surround the front door of the Gardner-Pingree House. Such embellishments are characteristic of Federal architecture. © TODD GIPSTEIN/CORBIS.

and riding boots for men. Scholars have speculated whether this mobility also fueled an increased taste for consumer goods, since people on the move demanded ready-made domestic products.

Deep South and Louisiana Purchase. The development of plantations for cotton and rice in the Deep South, meanwhile, included the common layout of the big house and slave cabins behind the big house. In South Carolina the line of slave cabins was known on the rice plantations as “the street” with a white overseer’s house at its end. The slave houses exemplified British house-types, typically single-story or hall and parlor cabins with symmetrical fenestration. Some observers have noted that African American carpenters built broad front porches unlike those in Europe and thereby taught their masters about adapting to a hot climate. Slave women learned quilting from European American tradition but applied quilt patterns, especially the ubiquitous strip or string quilt characteristic of West African textiles. Outside the cabin, slaves continued the African tradition of having dry gardens by sweeping dirt to form aesthetic patterns in front yards. In death, African

American cemeteries featured mounded dirt graves with shells and broken crockery in keeping with African funerary practices.

Hybridization in New World material culture was particularly noticeable to Americans in the southern portion of the Louisiana Purchase (1803), previously colonized by France and Spain. Along the Mississippi River into New Orleans and the Louisiana bayou, Afro-Caribbean influences could be discerned in the early nineteenth century; along with French and Spanish colonial cultural exchanges, they created a distinctive Creole society. Especially conspicuous on the built landscape was the “shotgun” house, reminiscent of Haitian and West African building styles of one room behind another and a front porch, in contradistinction to the two-room-wide, one-room-deep pattern of British folk house-types. On the American landscape, a third and even fourth room was added. (The kitchen was typically in the rear, the front or common space in the front, and sleeping areas in between.) Characterized by a narrow facade and extreme length, the shotgun might be constructed with wood or brick or with infilling

between vertical posts, following French tradition. In keeping with African tradition, the front-to-rear arrangement of the house lacked privacy and encouraged socialization. One American response was the development of the double shotgun house to provide a two-room-wide structure with two front doors reminiscent of the double pen. A room on one side might be removed to create a deep corner porch and main entrance through the social space of the porch, as was common in northern Louisiana. Metal grave-markers commonly seen in cemeteries also derived from French tradition, but some black Creoles shaped the crosses into heads and animals following Afro-Caribbean tradition.

THE FEDERAL STYLE

While strong ethnic cultural sources and migration patterns influenced the development of America's regional differences into the nineteenth century and beyond, the creation of the new nation also inspired high-style architecture and furnishings, primarily urban, befitting the Federal vision of a new Republic. Often the Federal period in material culture is known for a classical revival, particularly between 1780 and 1830, leading to the Greek Revival in town naming and architecture between 1820 and 1860. Federal architecture derived from the high-style emphasis on symmetry and order from 1700 to 1780 in the British Georgian style that was commonly used in large civic buildings in the English colonies. Georgian architecture had a rectangular plan, often with symmetrical wings flanking each side. Many American architects who had been abroad celebrated its geometric rationality. Over time the facade and interior decorations became more elaborate and often signified imperial excess. The architecture often had a pedimented gable, frequently with a projecting central pavilion or a portico with two-story columns emphasizing authority and power. Brick walls were commonly laid in a fancy Flemish bond pattern. Also influencing the Federal style were the royal architects Robert Adam (1728–1792) and James Adam (1730–1794), who refined the Georgian style with elegant lines and design motifs including fan ornaments, festoons, urns, wreaths, leaves, and petals.

Although echoes of the Adam style are clearly discernible in the Federal style, the American version is often distinguished by emphasis on classical features, extensive use of glass (glass manufactured in the United States was less expensive than that imported from England), and elegantly elaborate doorways. The Federal style also extended from civic and commercial buildings to brick and brownstone

urban row houses in both South and North. Federal taste, promoted by celebrated American figures such as Thomas Jefferson (1743–1826), Charles Bulfinch (1763–1844), and Robert Mills (1781–1855) favored giant entrance porticos, sometimes domed; a fan-shaped light; a central pediment; and a cupola with arched openings. Exemplary Federal buildings, such as the U.S. Custom House and Public Stores in Salem, Massachusetts, built in 1819, reflected a trend of locating a large, nationalistic eagle on or over the central pediment. The U.S. Capitol, completed in 1827, exemplified the symbolic qualities of the style for the nation. It announced in its classical designs the revival of the Republic; while it owed its inspiration to Europe, it contained distinctive American features such as the neoclassical Statue of Freedom with a Native American crest of an eagle's head, feathers, and talons and a shield with thirteen stripes.

Decorative moldings, friezes, pilasters, and quoins used in the large civic buildings were also adopted in ordinary houses, especially in highlighting the pediment, fanlight, and pilasters around the door. In fancier houses, Federal buildings have side-gabled, center-gabled, or hipped roofs, often enclosed or partially enclosed with a balustrade at the line of the cornice. Furniture also exhibited Federal taste, especially in the stylistic treatment of chairs, chests of drawers, and bookcases in inlaid mahogany with shield designs and central wheat sheaves or urns and plain, tapering legs. Although Windsor chairs are known in England as well as America, American craftsmen during the Federal period developed the fanback style among others and had a fondness for the rocking chair that spread in vernacular forms. Other decorative arts taking on a Federal look included mirrors topped with eagles; brass eagle door knockers; classically inlaid tall and banjo clocks; weathervanes with Columbia and other patriotic symbols; neoclassical dresses featuring a high-waisted bodice; carved pilastered mantelpieces; and silver boxes, pots, and bowls festooned with classical wreaths and plumes. In public places and private interiors, particularly in eastern cities for a rising middle class, the Federal style was expressed materially through classical design and American iconography. It influenced the spread southward and northward from America's midland of the design of America's courthouse on the square and the outlying classical "temple" form of the vernacular upright and wing house. As the Federal building marked America's national aspirations in capital cities, the courthouse square and upright and wing house became hallmarks of the American small town in the new nation.

MCCULLOCH V. MARYLAND U.S. Supreme Court chief justice John Marshall's opinion in *McCulloch v. Maryland* (1819) ranks, along with his opinion in *Marbury v. Madison* (1803), as one of his two most important opinions. It is the most important and persuasive assertion of the supremacy of the Constitution and Congress in the period before the Civil War. The case involved the constitutionality of the federal legislation creating the Second Bank of the United States. Marshall wrote an opinion that resembles a state paper or an essay on constitutional and political theory. It is a magisterial essay on the powers of the national government and the meaning of the Constitution. In it he upheld the constitutionality of the bank.

In 1791 Congress had given the Bank of the United States a twenty-year charter over the objections of Secretary of State Thomas Jefferson and U.S. Representative James Madison. The charter expired in 1811, when Madison was president and his allies firmly in control of Congress and just as firmly opposed to the bank. Thus, the first Bank of the United States ceased to exist. However, the War of 1812 (1812–1815) forced Madison and his party to rethink their position. Without a central bank it was difficult for the government to function, especially in a time of crisis. Thus, in 1816 Congress chartered a new bank and Madison happily signed the legislation creating the Second Bank of the United States. The bank was initially popular, but public support diminished as a growing financial crisis led to the Panic of 1819. In 1818 Maryland passed a law to tax notes of all banks "not chartered by the legislature." The only bank that fit this description was the Baltimore branch of the Bank of the United States. James W. McCulloch, the head of the Baltimore branch, refused to pay the tax and was subsequently sued by the state. He appealed his conviction to the U.S. Supreme Court.

Arguments in the case lasted nine days as Daniel Webster, Attorney General William Wirt, and Wil-

liam Pinkney, one of the most prominent lawyers in the nation, defended the bank's interests. Maryland's legal team was led by Luther Martin, who had been a delegate to the Constitutional Convention in 1787.

Marshall, speaking for a unanimous Court, based his opinion on the "necessary and proper" clause of the U.S. Constitution. He established that the bank was necessary for the smooth operation of the national government. He showed that it was proper for the government to control its finances and have a place to deposit tax revenues. He demonstrated that nothing in the Constitution prohibited Congress from establishing a bank. Thus, he concluded: "Let the end be legitimate, let it be within the scope of the constitution, and all means which are appropriate, which are plainly adapted to that end, which are not prohibited, but consist with the letter and spirit of the constitution, are constitutional." He noted that the Tenth Amendment declared that the "powers not delegated to the United States by the Constitution" were reserved to the states or the people. But he pointed out that the amendment, unlike the language in the Articles of Confederation, did not use the term "expressly delegated." He rejected the idea that the Constitution was like a legal code, spelling out all the powers of Congress. Such a document "could scarcely be embraced by the human mind." He reminded readers they must "never forget that it is a *constitution* we are expounding," and that it was "a constitution intended to endure for ages to come." Thus, it had to be "adapted to the various crises of human affairs." This flexible approach to the Constitution allowed Congress to pass all laws and create all institutions that were necessary and proper for implementing the functions of government, as long as the Constitution did not specifically prohibit such actions.

He then turned to Maryland's attempt to tax the bank. He noted that the "power to tax involves the power to destroy," and that if Maryland could tax the bank created by Congress, it could destroy that bank. But no state could destroy what Congress legally and constitutionally created, because "the great principle" of the American nation was "that the constitution and the laws made in pursuance thereof are supreme." If Maryland could tax the bank, it could tax the customhouse, the mails, military installations, and in effect destroy the national government. "This," Marshall was certain, "was not intended by the American people."

Marshall's opinion deeply angered states' rights advocates, especially those in Virginia who feared a strong national government. Judge Spencer Roane,

Judge William Brockenbrough, and former U.S. senator John Taylor (known as John Taylor of Caroline) attacked the decision in Virginia's newspapers. Marshall replied to these attacks on his opinion, first under the *nom de plume* "A Friend of the Union," but the Philadelphia paper that published these essays gnarled them and left out complete paragraphs. Thus, he republished corrected versions in an Alexandria, Virginia, paper under the name "A Friend of the Constitution." The newspaper debate did not settle the issue, and in 1832 Andrew Jackson would dismantle the bank. But Marshall's opinion endured as the Supreme Court's most powerful and authoritative analysis of the inherent flexibility in the Constitution and the supremacy of both the Constitution and Congress.

MEDICINE Between 1754 and 1829, medicine in what would become the United States passed through three stages. All of the stages originated in Europe, and American medicine remained in a colonial relationship with that continent, regardless of what was going on in politics and economics.

STAGES OF DEVELOPMENT

At first, physicians and educated people who knew medical texts tended to think in very traditional terms and formulations that had been honored since the time of Galen in the second century A.D. People fell ill because of an imbalance in the humors—black bile, yellow bile, phlegm, and blood. To this basic scheme were added alchemical ideas, folk wisdom, and sometimes ideas about the body as a chemical or physical organism.

The second stage came in the late eighteenth century, when a number of physicians took up Enlightenment teachings. The most conspicuous and important was Benjamin Rush, a physician and teacher in

Tranquilizing Chair. Designed by Benjamin Rush around 1800, the tranquilizing chair was used in the treatment of mental illness. The chair restrained the body with straps and a box-like apparatus that fit over the head. Engraved by Benjamin Tanner after John James Barralet. © CORBIS.

Philadelphia. Rush based his ideas on those of William Cullen of Edinburgh, who in turn inspired John Brown, also of Edinburgh, where a significant number of American physicians studied. All three of them taught highly rational systems of medicine, as was appropriate to the Age of Reason. Disease in their eyes represented either too much or too little irritability or excitability. Rush in particular held that pathology grew out of a morbid tension in the walls of the arteries.

After the War of 1812, leading American physicians began to study in France. By 1830 the French clinical school was deeply influencing the way physicians viewed and treated ill health. By correlating symptoms with local lesions found during autopsy, and by introducing a measure of skepticism concerning traditional therapies, French clinicians gave a small but growing number of American physicians a sense that empirical investigation could lead to much better understanding of disease.

IDEAS ABOUT DISEASE

Except for the theories of Rush and others, and then the slow incursion of notions of localized pathology, ideas of what a disease was did not change greatly in the two-thirds of a century after 1763. Epidemics were sent by God, but individuals had some control over their own health. Something, it was held, went awry with “the system,” a more or less mechanical entity that nevertheless had a vital spirit infusing it and was sensitive to the ordinary inputs of eating and sleeping and the more ominous influences from the environment (often airborne “miasmas”). Because the ideas of both the human system and inputs and environments were vague and contested, medicine remained at best an inexact science and one that was difficult to explain in that time or this. Certain features did stand out, however.

While a few diseases were distinctive, such as syphilis, cancers, stroke, and smallpox, most acute diseases were just varieties of general categories, chiefly fluxes (that is, diarrheas) and fevers. And that was what practitioners ordinarily saw the most of. But fever could come in many varieties, such as long fever (typhoid), malarial fever, putrid sore throat, and the like. In general, diseases were classified by symptoms. One of the most common diseases, for example, tuberculosis of the lungs, was described in a term suggesting the way patients wasted away: consumption.

What people at the time especially noted was how illnesses varied with season and geography. The measles of one year would be different from that of the next. Even epidemics came at different seasons—everyone knew that malaria was a disease of hot weather, that respiratory and arthritic ailments were worse in the winter. Moreover, there was serious doubt that the disease of one place was the same as that of another. It was a surprise in 1800–1801, for example, that the smallpox of New England would respond to vaccination just as would the smallpox of Old England.

As sectional identities began to develop, sectional differences appeared among physicians. Southerners encountered diseases such as malaria and yellow fever that were seldom found in the North. Northern physicians had to deal with diseases of cold weather, not only frostbite but arthritic disorders, which appeared in young as well as older adults. The trans-Appalachian West even acquired a significant disease, first described in 1809–1811. Called the milk sick, it later was found to be poisoning that came when cattle ate a common weed, white snakeroot, so that the illness was both geographical and seasonal. As set-

tlers filtered into the West, the milk sick was a serious and sometimes epidemic disease. (The mother of Abraham Lincoln died of the milk sick in 1818.) On the basis of these different types of illnesses, physicians began to describe special regional medicines, especially southern medicine.

TREATING ILLNESSES

To a remarkable extent, the therapies available then were general, designed to set the system back onto a natural course so that it had humors in balance or the amount of irritability or tenseness balanced. There could not be a specific cure until there was a specific disease to be cured. From an earlier period, there was a specific cure for the disease of syphilis: mercury. And in the 1730s, Europeans started using cinchona bark, which contained quinine, a specific for malaria. But since the bark affected one fever, many physicians used it for all fevers, since "fever" was the working category. Then, beginning in 1785, foxglove (containing digitalis) was imported from England, where it was discovered to counter dropsy (congestive heart failure). Thus, the list of specifics was a very short one, without significant additions until after 1830.

Physicians often prescribed very powerful drugs—usually herbs, including opium. Each practitioner had his or her favorites. Diet and other, more homely, devices were also used. Sweating was common. The gastrointestinal system was kept as active as possible, and stimulating medications were administered from both ends of the GI system, causing diarrheas and vomiting. "Trust in God, and keep the bowels open," was common wisdom.

Treatments were described in general terms according to the effects that they had on the system. There were stimulants (people most importantly and incorrectly imagined that alcohol was a stimulant). There were depletives, of which the most commonly employed was bleeding. And there were alteratives, such as violent purges that wracked the system and left it in a new rhythm or state after the effects had run their course.

Physicians and people practicing on themselves utilized other techniques as well. In addition to bleeding, a variety of instrumentalities existed to produce running sores and pus by means of which the body would throw off "moribific matter" or undesirable elements in the blood. The skin could be blistered with irritants such as cantharides (Spanish fly) or cupping (burning paper in a cup applied to the skin and creating a vacuum). "Issues" could be created by inserting a pea or bean under the skin to obtain a dis-

charge. Or a seton could be made: a thread was run under the skin and then coated with an irritant and pulled back and forth, which usually produced a satisfactory discharge (done in the neck for headache, for example).

Since treatment modalities tended to persist from the late eighteenth into the nineteenth century, the style of treatment rather more than the specific details defined changes in medicine. Beginning in the 1790s, and especially under the leadership of Benjamin Rush, who thought his extreme measures had some effect against the yellow fever epidemic in Philadelphia in 1793, so-called heroic medicine flourished in the United States. The more serious the symptoms, the more powerful were the treatments. "It is but trifling with the life of a man to give him less of a remedy than his disease calls for," wrote a southern physician in 1828.

Heroic treatment consisted of the usual therapies carried out with more than usual vigor and dosage. "Copious bleedings" took place—to an extent that scandalized later generations. Although extremely violent purgatives were used, "the Samson of the material medica" was mercurous chloride, or calomel. Calomel was used as a stimulant, and it did stimulate the gastrointestinal system. Calomel also caused classic symptoms of mercury poisoning. The mouth could turn ash gray, ulcers of the oral area appeared, and teeth could become loosened. Patients often took calomel until they "salivated"—another sign of mercury poisoning.

Heroic treatment spread most famously to the West and South. The practice of many New Englanders and other physicians was often relatively restrained and mild—and empirical. But already by the 1820s, a popular reaction had set in, and many lay people as well as medical practitioners were criticizing heroic styles of practice. At the same time, an active stance regarding an individual patient's disease was part of a professional identity.

SURGERY

In colonial medicine, physicians, even those trained in England as surgeons, did only limited kinds of surgery. Since there was no anesthesia, and since infection almost invariably followed cutting into the body, only in urgent cases would anyone resort to surgery. A competent practitioner would set a simple fracture or correct a dislocation. He would lance abscesses and extirpate growths on the skin. He might couch a cataract. In a case of a compound fracture, or in warfare when a bullet broke the skin, amputation of the limb was called for. Infection otherwise

would almost certainly kill the patient. The only generally accepted procedure that involved cutting below the skin on the body or head came when a patient was dying with bladder stones that prevented urination. Then a physician could “cut for stone”—often with considerable success.

Occasionally some foolhardy or desperate practitioner would attempt to intrude into the thorax to cut a dangerous growth or condition, though such incidents became more common in the nineteenth century. The most famous instance was that of Ephraim McDowell, a practitioner of Danville, Kentucky, who in 1809 operated on a woman with a large ovarian tumor. He subsequently repeated the operation successfully, reporting his cases in 1817. And all through the late eighteenth and early nineteenth centuries, many practitioners ingeniously invented or copied new and better surgical instruments, many of which have survived in museum collections.

MEDICAL PRACTICE AND SELF-TREATMENT

Almost all practice was carried out in patients’ homes or, to a lesser extent, the physician’s home office. Charitable hospitals appeared only slowly. The Pennsylvania Hospital had been founded in 1751 (and the New Orleans Charity Hospital in 1736), and others came and went. But no one would willingly choose a hospital over home care. Nursing, either institutional or domestic, was carried out by servants or relatives.

Because of the isolated life of many settlers, and because a large and growing proportion of the population was literate, many Americans avoided the expense of seeking medical advice and used their own means to treat their illnesses. Sometimes family recipes or folk healing sufficed. A growing number of advice books was available, either imported from Europe or printed in America in pirated editions. Throughout the period, almanacs like those compiled by Benjamin Franklin contained medical advice. Most notably, proprietary or “patent” medicines, offered commercially, attracted many customers. Newspaper ads for English preparations first appeared in significant numbers during the 1750s, and by the 1820s Thomas Dyott of Philadelphia, a former bootblack, was becoming one of the richest men in the country by marketing nostrums.

In 1830 American medicine was poised for great changes. For the first time, Americans would be contributing significantly to world medicine. (The physiology of digestion, surgical anesthesia, and landmark therapeutic skepticism all came in the 1830s.)

Cholera, which terrorized the population and stimulated changes in medical practice; health reform movements; and the railroad, which enabled professionals to organize, all lay in the future. Meantime, in the 1820s, many signs of the future were already in place. Sulfate of quinine—in place of “bark”—came in. A national pharmacopeia appeared in 1820, with a promise of revision every ten years. The Philadelphia College of Pharmacy was established in 1821. The first state mental hospital to signal a wave of reform that swept the country, the Eastern Lunatic Asylum (later Eastern State Hospital), was established in 1824 in Lexington, Kentucky. And by 1829, 105 American physicians had returned from studying in Paris. Of course, they still had to practice right alongside a very large number of practitioners of various degrees of education, apprentice training, self-education, and simple commercial cupidity.

MENTAL ILLNESS The understanding and treatment of mental illness changed radically between

1754 and 1829. Two major, related trends can be discerned: a move towards a more benevolent, non-theological approach to persons considered insane and the establishment of the first institutions in British North America designed to treat mental illness.

1754–1790s

By the 1750s, colonists in British North America who were influenced by the European Enlightenment increasingly questioned Calvinist concepts of the innate evil of mankind and pessimism about human life, as well as age-old Christian beliefs that demonic possession and sinful natures caused insanity, for which the insane deserved punishment. On the European continent, optimistic Enlightenment views that human nature was malleable and that nature could be controlled by knowledge-based action fostered a secular approach to mental disorders. Although not new, the idea that mental afflictions were diseases, natural phenomena, and thus subject to medical treatment, became more common in British North America and began to be expressed institutionally. The colonists wanted to emulate Europe in establishing enlightened institutions in North America. Furthermore, population growth and urban development, especially in the northern colonies, produced fears of deranged persons wandering freely in the community.

The Pennsylvania Hospital, the first hospital in the colonies, established by Quakers in Philadelphia in 1754, accepted mental patients. In support of that policy, Benjamin Franklin—preeminent civic activist, creator of institutions, and promoter of the hospital—pointed to London’s venerable Bethlem Royal Hospital (“Bedlam”) for the mentally ill, where two-thirds of patients reportedly recovered (an exaggerated claim). At the Pennsylvania Hospital more than a generation later, Dr. Benjamin Rush—scientist, reformer, and “father of American psychiatry”—advocated humanizing the care of mental patients. However, his heroic therapeutic techniques, most notably extensive bloodletting and dosing with chemicals, did not work. Rush and his contemporaries could accurately describe symptoms of mental illness, but they had limited scientific understanding of it, and their physical remedies were minimally effective.

Another early institutional model was the first publicly supported hospital exclusively for mental patients in the colonial capital of Williamsburg, Virginia. Opened in 1773 as a secular, humane institution, it demonstrated to the governor and other elite

founders the advanced state of their civil society (slavery notwithstanding).

Throughout the colonies, though, most “insane” persons—often chained in basements or attics at home, languishing in almshouses and jails, or roaming about neighborhoods—remained untreated, and physicians, however enlightened, lacked verifiable knowledge of the etiology of mental disorders, the physiology of the brain, and the nature of the “mind” and its relationship to a soul assumed to be immortal.

1790s–1829

By the end of the eighteenth century new approaches to the nature and treatment of mental disorder emerged in Europe and found their way to the United States. In revolutionary France Dr. Philippe Pinel, famous for removing chains from insane patients, initially considered insanity to be a self-limiting disorder that could be ameliorated by physically shocking the patient. When this technique failed, he adopted a “moral” treatment, whereby patients were managed primarily with compassion and moral suasion.

In England the Quaker leader Samuel Tuke independently devised and introduced a somewhat similar system in 1792 in a small new sectarian asylum. Tuke’s example influenced fellow Quakers in the United States to open the Friends Asylum outside Philadelphia in 1817. Subsequently, Friends elsewhere were involved in founding several well known nonsectarian hospitals following the same therapeutic philosophy. They stressed humane care and occupational therapy, in a comfortable, friendly setting in bucolic surroundings, with patients away from their families, the cares of ordinary life, and fire and brimstone religious sermons—all believed to contribute to, if not cause, mental illness. While physicians visiting the facilities continued dosing and bleeding patients, the emphasis at the new institutions was on trying to affect the psyche through a benevolent, communal environment and training in self-control. Exactly how these techniques affected the mind was not made clear: these early British and American lay reformers were motivated by pragmatic and humanitarian concerns rather than medical science.

American physicians—like Pinel, whose psychiatric writings became available in English translation in 1806—considered insanity to be an essentially somatic (physical) disease. They viewed moral treatment, however humane, as nonmedical in nature and therefore incapable of curing insanity, although they had little else to offer and were stymied by the traditional mind-body dichotomy.

By 1829 the high recovery rates reported in moral-treatment hospitals seemed to justify therapeutic claims for the system. But only a relatively few mentally ill persons could benefit from such hospitals, as these institutions tended to cater to (white) families able to pay the fees. Physicians and laypeople both assumed that the sensitive upper classes were most likely to succumb to insanity, while lower-class white people were much less susceptible and blacks and Indians least so. In fact, there was no evidence for most contemporary notions about the prevalence or incidence of insanity. By the mid nineteenth century, when state mental hospitals for the public proliferated, views about susceptibility reversed: now poor people, immigrants, and non-whites were considered more apt to become insane and harder to treat. As before, social and class prejudice, combined with unsophisticated and erroneous statistics, influenced “scientific” attitudes.

Still, some of the early hospitals, by gathering patients together in an optimistic hospital environment, gave local communities experience with the insane to counterpose against traditional pessimistic, superstitious, and theological lore about mental illness. This change, together with an American belief in progress and overoptimism about curability (spawned by the presumed effectiveness of moral treatment), would help to inspire the later full-scale movement (beginning in the mid-nineteenth century) to build state mental hospitals, many with moral treatment as a goal. To be sure, an additional major consideration was always the perceived need to protect society, and at lowest cost. The difficulty of sustaining moral treatment, an expensive therapy, plus the intractability of much of mental illness and the failure of physicians to discover a somatic basis for it, dimmed the early high hopes and eventually alienated most advocates of moral treatment from the medical establishment. Cycling between psychological and somatic theories—the old mind-body split—continued through the years and is still used today, in practice if not in theory. The moral-treatment movement faded from history until the mid-twentieth century, to be rediscovered in a new era of reform, serious historical study of psychiatry, and radical critiques of medical concepts of mental illness and its treatment. By the beginning of the twenty-first century, contrary to revisionist writers like Michel Foucault (1926–1984), who viewed all societal efforts to improve the lot of the mentally ill as inherently exploitive, most historians would agree that moral treatment, its limitations notwithstanding, was a social advance.

MERCANTILISM See **Economic Theory.**

MERCHANTS In eighteenth-century parlance, a “merchant” was a wholesaler who traded in foreign markets. Residing in seaport cities, with their businesses and even their homes usually located conveniently close to the wharves, merchants played key roles in the early American economy. Merchants arranged for farm products to move from the countryside to seaports, imported manufactured necessities and luxuries for colonists’ consumption, and shipped cargoes of raw materials and produce to Europe, the West Indies, and Africa.

In a precarious business world, merchants had to be flexible and versatile. Besides buying and selling goods, they served as bankers by extending credit and transferring funds, and acted as insurance underwriters. Because communications were slow and unreliable, merchants used agents in foreign ports to purchase and ship their orders of merchandise and to find buyers for their shipments from America. Alternatively, merchants might consign goods to a ship’s captain or associate known as a supercargo, who traveled with the shipment and handled its sales. Merchants often hedged their investments by putting funds in business or real estate. Among New

York merchants, land was the preferred investment; others owned shares of companies such as iron furnaces. A trader could specialize in dry goods (textiles, notions, and certain items of clothing), meaning that his main contacts were in Great Britain, or in wet goods (rum, molasses, coffee, and other imported groceries), in which case he did business in many ports. Generally, dry goods dealers were the more prosperous of the two groups.

It is customary to refer to a “merchant class,” implying a coherent, wealthy group that wielded political and economic clout. But in fact merchants varied widely in their ethnicity, politics, religion, and income. In all the major seaports—Boston, New York, Philadelphia, and Charleston—some merchants were among the elite, upper ranks, but by no means were all merchants in that class. Philadelphia traders, for example, included wealthy merchants as well as middling ones whose income was equal to that of a shopkeeper or artisan. (Even struggling merchants enjoyed a higher social status than that of artisans or mechanics, however, because they did not work with their hands.) Most merchants who did reach the upper strata worked their way up rather than relying on inherited wealth; they did not have time for politics while they were active in business. Thomas Hancock, for example, the son of a Puritan minister, began as a bookseller in Boston and made his fortune by supplying British troops during the Seven Years’ War. He left a substantial business to his nephew, John Hancock, who succeeded him in the House of Hancock; John, however, found he had more aptitude, interest, and success in politics than he enjoyed as a merchant, and his business suffered as a consequence.

In the Lower South the status of upper-tier merchants was comparable to that of wealthy planters; merchants sometimes owned plantations as well as city businesses, and they intermarried frequently with planter families. Charleston, the fourth-largest (and wealthiest) city in the colonies, had the largest concentration of merchants in the South. By the late colonial period, Charleston merchants conducted 75 percent of the region’s overseas trade; they did most of their business with British firms, with whom they formed close business and social ties.

The two principal ports of the middle colonies, New York and Philadelphia, had sizable merchant communities. In Philadelphia before the Revolution, about fifty men (or 10 percent of the total number of merchants) handled half of all the city’s shipping. These top Philadelphia merchants were among the wealthiest men in America, and, though not rich by

European standards, they lived in aristocratic fashion. Merchants such as Robert Morris and Joshua Fisher resided in three-story, elegantly furnished brick townhouses and frequently built countryseats outside the city.

In New England, Boston was the main port, but it competed for trade with lesser places, including Newburyport, Marblehead, Salem, Newport, Providence, and Portsmouth. Here too, certain families—the Faneuils, Hancocks, and Boylston of Boston, and the Browns of Providence—rose to prominence, rising above the lesser merchants to form a wealthy, near aristocratic, class. Although he came to relish hobnobbing with the common man, John Hancock lived extravagantly, including riding in a coach with liveried servants.

Some merchants were actively engaged in the cause of liberty, whereas others were lukewarm. Hancock was popular among the working classes in Boston because of his Patriot stance and his association with Samuel Adams. When Hancock was placed under arrest for smuggling (evading duties was everyday practice for Boston shippers), a mob dragged a British custom boat through the streets, then burned it in protest. South Carolina merchant Christopher Gadsden was so ardent for the rebellion that he was known as a Southern Samuel Adams. Prominent Rhode Island merchant John Brown was among the locals who wounded the captain of the British customs boat *Gaspée*, then set it on fire in 1772. In Newburyport, Massachusetts, merchants supported the radical movement wholeheartedly, perhaps because they had fewer ties to Britain than merchants in other cities. In some cases merchants may have supported the periodic boycotts of British imports for economic reasons; it is possible that boycotts gave merchants a chance to unload the accumulation of dry goods that the British merchants had dumped on the American market, or that some merchants saw nonimportation as a way to drive competitors out of business.

In other instances merchants were cautious and conservative when it came to rebellion. Like their more zealous counterparts, they, too, worried about British infringement on American rights, and some were even willing to sacrifice for the cause. However, there was no sustained support among all merchants for nonimportation. In Philadelphia and New York, traders were reluctant to jeopardize business by cutting ties with British firms. Sometimes merchants supported boycotts under duress; in 1773 Philadelphia merchants James Abel and Henry Drinker anticipated a healthy profit when they agreed to sell tea

for the British West India Company. They had to give up the commission when visited by a “tar and feather committee” enforcing the boycott against the Tea Act. Even in Boston, where there were major protests, including the Boston Tea Party, merchants were not united. The historian John Tyler found that, of 392 Boston merchants whose sentiments can be determined, 42 percent were Patriots and 39 percent were Loyalists. Loyalists tended to be Anglican dry goods traders with ties to British exporters, while most Patriots were Congregationalists who dealt in a variety of goods.

Sectional interests also played a role. When the Continental Congress decided to ban exports to Great Britain in response to the Coercive Acts, South Carolina insisted and Congress acquiesced that it continue exporting rice, a clear indication that neither all colonies nor all merchants were united in a course of action. The rice trade aside, Congress warned merchants that violators of the sanctions would be considered “enemies of American liberty.” Because colonists were increasingly directing their resentment not only toward what they saw as British oppressors, but also at merchants and others in positions of power and wealth at home, mob rule continued to keep reluctant merchants in compliance.

Merchants may have had good reason to question rebellion, considering that after the war the nation plunged into a depression that lasted until the 1790s. Although they sought new markets in distant places, merchants were hampered by Britain’s punitive trade restrictions and by lack of imperial protection. British merchants also dumped goods on the American market and then demanded payment in scarce specie (money in coin) rather than paper money, so that American merchants, in turn, pressed customers for payment and caused resentment among citizens already affected by the depression and inspired by the rhetoric of liberty. Moreover, wealthy creditors, including some merchants, pressed Congress to repay war loans and bonds, with interest and in specie, while ordinary citizens agitated for paper money and tax relief. When tensions between upper-class creditors and working- and middle-class debtors erupted in Shays’s Rebellion in Massachusetts, merchants helped finance the militia that quelled it. Wealthier merchants and businessmen merchants were thus clearly aligned with the educated elites who believed that too much government in the hands of ordinary people was dangerous. They were also among the nationalists who backed the movement to craft a new Constitution that would

strengthen the federal government and allow it to regulate trade, impose taxes, and raise a standing army, as well as rein in state and individual powers.

Throughout the nineteenth century northern merchants attempted to reduce the nation’s reliance on imports by investing in factories. Indeed, by the antebellum era New England had become the nation’s most industrialized region. New York and Baltimore continued to grow, while Philadelphia declined in relation to the other ports. By 1800 Baltimore merchants were siphoning off trade from the Eastern Shore and western Pennsylvania and leading the nation in flour exports. New York trade surpassed that of Philadelphia in the early nineteenth century, and Philadelphia merchants made the transition from being leaders of American commerce to holding important positions in banking, manufacturing, mining, and coastal trade. Southern planters and businessmen, rather than expand into manufacturing, continued to put their emphasis on agriculture.

MESMERISM When he arrived in Paris in February 1778, the Austrian physician Franz Anton Mesmer (1734–1815) introduced a new healing art that rapidly became a transatlantic sensation. Theorizing that all natural bodies were permeated by a rarified fluid akin to electricity or magnetism, Mesmer argued that illness was the product of obstructions in the flow of this fluid. The task of the physician, then, was to manipulate these fluids by massaging and manipulating the bodily “poles” to overcome blockages and restore the natural electromagnetic flow. Sometimes en masse, patients responded dramatically to mesmeric treatment, falling into convulsive fits (the “crisis”) that signaled the cure.

Mesmerism’s authority stemmed from its mingling of the science of electrical theory with familiar notions of bodily balance. Although it developed a strong following among the French elite and among social reformers, it remained controversial. Worried by its reputed connection with political radicals, a skeptical Louis XVI appointed a commission of eminent scientists in 1784 to investigate its claims. Headed by Benjamin Franklin, the commission ultimately concluded that although some patients had indeed improved, the phenomena were merely a product of the “force of imagination.” When asked by his grandson whether this report would be the end of mesmerism, however, Franklin was doubtful. “Deceptions as absurd,” he wrote, “have supported themselves for ages.”

As Franklin predicted, mesmerism flourished despite the verdict, diversifying in theory, practice, and

application. Even as many practitioners clung to some version of a universal fluid that was analogous (or equivalent) to electricity and magnetism, others charted new theoretical terrain. By the 1820s almost the only feature uniting mesmerists and their peers, animal magnetists and electrical physicians, was the contention that the mind was capable of sympathetically exerting influence on other bodies and minds. In the United States, mesmerism found particularly fertile ground. From the time that the Marquis de Lafayette delivered a paper on the subject before the American Philosophical Society in 1781, it swelled in popularity, reaching its apex during the 1830s and 1840s.

Instead of crises, however, American somnambules (the subjects of animal magnetism) exhibited a range of remarkable phenomena that seemed to confirm the reality of the universal fluid predicted by Mesmer. Some were brought into a cataleptic state so profound as to permit them to undergo surgery without experiencing pain. Others entered a state of mutual sensation with their mesmerists, and still others exhibited the capacity to read thoughts, to experience religious ecstasy, to see and diagnose illnesses within others, or to make clairvoyant voyages to other cities or planets. Most famously, the “Poughkeepsie seer,” Andrew Jackson Davis (1826–1910), experienced visions of the afterlife and other worlds while mesmerized that echoed the visions of the Swedish scientist and philosopher Emanuel Swedenborg (1688–1772). Davis would become an important figure in the Spiritualist movement of the 1850s. In short, mesmerism promised a world of unseen sympathetic connections between individuals and became a powerful means of conceptualizing nature and society and the relations of individuals within society.

The antebellum years, however, also marked a significant juncture in the history of animal magnetism. Although it remained enormously popular, it was increasingly marginalized by the medical community, its practices coopted and incorporated into the new field of hypnotism.

METHODISTS In 1776 the Methodist movement and the new American Republic existed in uneasy tension. By 1829 the two seemed to share a common destiny, so closely did Methodists identify with the new Republic. By the opening salvos of the Civil War, Methodist churches of varying identities would claim the largest proportion of American churchgoers, the largest numbers of ministers, and the largest numbers of church structures of any American denomination. Regarding the religious culture of the new Republic, it may be said, as went Methodism so went the nation.

This great American church's origins could not have been more improbable. Methodism emerged from the reforming impulses of early Anglicanism, seized upon by the brothers John and Charles Wesley in their experience as Anglican missionaries to American Indians in Georgia. Methodism's emphases on missionary outreach, moral reform, and later episcopal structure all owed their ancestry to the Church of England. John Wesley, the movement's chief theologian, organizer, and advocate, conjoined a powerful focus on religious conversion with a "connection" (loose hierarchy) of unordained itinerant preachers to produce what he considered a return to the values of early or "primitive" Christianity. But Wesley's free will theology, emphasizing the experience of sanctification (also called spiritual perfection), was distinctly at odds with the largely Calvinist revivals in the American colonies, led by the Wesleys' former fellow Oxford comrade and competitor, George Whitefield.

Conditions for the introduction of Methodism improved in the 1760s, when Methodist adherents migrated to the middle colonies. Wesley was inspired to appoint two itinerants to a new "American circuit" in 1769, just before Whitefield's death. The Patriot movement was well under way, but the rising numbers of American-based itinerants remained nonpartisan or Loyalist in keeping with Wesleyan instructions. In Britain, contrary to his reformist tendencies, Wesley published strongly worded condemnations of the Patriot movement. Conversely, the Methodists' liberal strain appeared early in their path-breaking recruitment of African slaves and free people, also encouraged by Wesley's antislavery publications. Because few of the Patriots espoused emancipation of slaves, this ambition further removed many Methodists from the greater cause of the Revolution.

With American independence and intensification of the Revolutionary War, Wesley's itinerants scat-

tered, some back to Britain, some into British-occupied territory, others dangerously into Whig neighborhoods. The future leader of the American movement, British-born Francis Asbury, took sanctuary in Delaware. Methodism's fate was left in the hands of novice preachers, mostly American recruits. Among their main concerns was appealing to followers without attracting the attention of Patriot authorities and state legislatures.

THE METHODIST EPISCOPAL CHURCH AND ITS FIRST MEMBERS

The Methodists' change in fortunes came with the end of the war and Wesley's decision to permit the American preachers to form their own connection. At the Christmas Conference (24 December 1784–2 January 1785), Asbury and Wesley's emissary, Thomas Coke, went one step farther, persuading the American itinerants to create the Methodist Episcopal Church (MEC), in part to keep pace with the Anglicans and the formation of the Protestant Episcopal Church. The Methodist order of the ministry was established, and Coke, already ordained as "superintendent" by Wesley, officiated over Asbury's ordination as his co-bishop, the apostolic title preferred by the Americans. (By contrast, the connection in Britain remained a part of the Church of England until Wesley's death in 1791.) In 1785 the first Methodist discipline condemned slaveholding as "contrary to the Golden Law of God . . . and the unalienable Rights of Mankind."

Initially centered in Philadelphia and New York City, the new church's informal headquarters swiftly moved to Baltimore at the northern tip of a rapidly rising Methodist population in Delaware, Maryland, and northern Virginia. The itinerants now recruited a wide array of Americans into their movement. A large percentage of Methodist followers before 1800 were women—as much as two-thirds of the early city congregations. Many of these women were young and unmarried, part of a new post-Revolutionary generation bound less by family ties than voluntary association. Many were slaves and former slaves. Others, especially in the Baltimore and urban areas, were wealthy patrons and confidantes of the traveling ministers. The movement provided unprecedented opportunities for women to lead public prayer groups and to support the itinerants. The correspondence between the preachers and their female adherents is replete with expressions of mutual admiration. Women's presence in the church continued strong after 1800. As she notes in *Strangers and Pilgrims* (1998), the scholar Catherine A. Brekus discovered as many as twenty-nine self-appointed fe-

male Methodist preachers, black and white, in the years before the Mexican-American War (1846–1848). Among them was African Methodist Jarena Lee, who published her spiritual memoir in 1836.

Methodist outreach to black members was the movement's most distinctive social characteristic. By 1800, 21 percent of America's 64,000 Methodists were black, slave and free. A small Methodist congregation in Wilmington (Delaware), the pioneering African Methodist Episcopal congregation under Richard Allen in Philadelphia, and the African Methodist Zion congregation in New York City asserted their independence as separate denominations in 1813, 1816, and 1821 respectively. All these groups placed special emphasis on the "African"—African American—identity of their members and sought full ordination of their ministers, refused to them by the MEC. By contrast, Baltimore's black Methodist presence, forming up to 35 percent of the city congregation in and around 1800, remained within the larger church. Although most of Baltimore's black worshippers likely met in their own chapel building, the Baltimore Methodist churches may be described as the first significant multiracial organizations in the United States.

The white men who came to the church in its first years were also socially diverse—laborers, artisans, professionals, middling merchants, and assorted industrial capitalists in the cities; slaves, farmers, and varying orders of gentry in the countryside. After the MEC was organized in 1784, urban and rural local elites alike began to form boards of trustees to sustain the building of hundreds of Methodist chapels across the states and into the territories.

Young, single men especially discovered the vocation of the traveling preacher in the church's formative years. Between 1769 and 1806, Jesse Lee, the first Methodist historian, calculated that 990 men comprised the first generation of licensed Methodist preachers. They were a sacrificial lot: committed to traveling a different, and often enormous, circuit every six months, as mandated by church discipline and dictated by the bishops. The early Methodist clergy's feats of itinerancy were legendary. Bishop Asbury traveled sixty times across the Appalachians and twenty-nine times to the Lower South, covering over a quarter of a million miles on the American continent before he died in 1816. He probably met more Americans face-to-face than any single figure in the early Republic. The itinerants' lives were often cut short by their labors, and their obligations ran the gamut from delivering sermons to delivering health care. In some areas, the preachers were seen

as shamanlike figures, capable of magical acts of redemption and personal healing. But the older denominations often typecast the itinerants as uneducated upstarts, who, in the words of one Anglican minister, "set themselves up as teachers of those above them."

Other churches had reason to fear Methodist growth. By the 1790s Methodist circuits were being surveyed in especially large numbers in New York, New England, and the Upper South, and Methodist itinerants were moving quickly into new territories and states west of the Appalachians. In New England the MEC challenged the standing order of the Calvinist Congregational Church. In the South they eventually overtook the Anglicans and posed the first significant competition for the Baptists.

THE METHODIST AGE

The later years of the Second Great Awakening (1800 through the 1830s) have also been called the Methodist Age by religious scholars, and with good reason. Although conservative Evangelicals were convinced that freethinker Thomas Jefferson's election as president marked a low point in American religious influence, many Methodists were encouraged by the Democratic Republicans' support of the separation of church and state. The Methodists' success in Jeffersonian America corroborated the liberal (Wesleyan) evangelical belief that religious freedom would serve newcomer churches well.

Membership in the MEC skyrocketed in the decades after 1800: from 64,000 in 1800 to 175,000 in 1810, 257,000 in 1820, and nearly 500,000 in 1830. The church's message was assisted by an eastern innovation, the camp meeting. These initially interdenominational revivals further popularized the Methodist style: preacher, hymnbook in hand, exhorting expectant listeners to receive the Holy Ghost and convert to primitive Christianity. The huge meeting in Cane Ridge, Kentucky, in 1801 marked the starting point of evangelical dominance in the West, but also the beginning of Methodism's massive influence on the style of worship of other American churches.

Less easily determined is Methodism's political character after 1800. In Great Britain, in response to the French Revolution, the royal government's crackdown on radicals—traveling preachers among them—compelled the Methodist leadership to steer a conservative course. The long association between the Methodist establishment and Victorian values began early in the century, although working-class Methodists also developed strong ties with the trade

unionist movement in Britain's emerging industrial centers.

In the United States, historians disagree on the fundamental nature of Methodist political culture. The historian Christine Leigh Heyrman argues in *Southern Cross* (1997) that evangelical preachers across the South, hundreds of Methodists among them, succeeded in controlling the region's religious future only after they abandoned their early allegiance with women and African Americans and adopted the gender and racial norms of southern white men. Southern Methodism and Baptism consequently, and rapidly, veered away from early emphases on emotionality and the equality of all Christians to a masculine mastery that has come to define American evangelicalism. Heyrman's thesis is supported by the rapid movement of southern Methodists away from the church's original antislavery teachings. In 1804, the church no longer urged its southern members to abandon slaveholding. By the 1820s, black Methodists in the south were strongly discouraged from forming their own congregations.

Similarly, in the North other studies show that the book agent Nathan Bangs eagerly encouraged Methodists to pursue gentility, while he transformed the Methodist publishing house into a thriving capitalist enterprise with publications like the *Methodist Magazine and Quarterly Review*. Methodist women, the *Magazine's* avid readers, were urged to devote their missionary energies to their families, and Methodist women increasingly complied. Pew rents became customary in many Methodist churches. In 1820, New York Methodists objected to replacing the downtown meetinghouse with a neoclassical edifice as a departure from "the primitive simplicity of Methodism." Gothic-style Methodist structures would help define the American Victorian landscape.

Taking the opposing view, in *The Democratization of American Christianity* (1989) the scholar Nathan O. Hatch portrays Methodism as one of the great democratic mass movements in United States history, notable for its unorthodox preaching, indifference to established ecclesiastical authorities, and all-embracing religious populism. Evangelical preachers were passionate insurgents, Hatch argues, determined to reinstate primitive Christianity in America and strikingly unconcerned with respectability. Black Methodist preachers were likewise proud of their lack of sophistication. Typically American, the Methodist clergy also made the most of a burgeoning capitalist economy to advertise their spiritual wares and whereabouts.

Certainly, the scale of Methodist expansion—federal in structure, multiracial in composition, propelled by troops of charismatic and energetic itinerants into every region of the country—prompts irresistible comparisons to the democratic Republic: experimental, expansive, young, and vibrant. As the historian Richard Carwardine has shown, in *Transatlantic Revivalism* (1978), the competitive political culture of the Republic also drew many Methodist men away from their espousals of nonpartisanship into enthusiastic participation in electoral politics. Methodists were pro-Federalist in Delaware and pro-Jeffersonian in Ohio. Methodists soon appeared in the ranks of state legislators, judges, and even governors. By the 1820s the Methodist ministerial calling attracted westerners like Peter Cartwright who identified with the American revolutionaries, American political virility, and American expansion. The historian Mark A. Noll, in *America's God* (2002), describes Methodism's spiritual practice, evangelical mobilization, and sheer size as providing the bonds for national cohesion, linking together religion and republicanism in fundamentally new ways.

Whether interpreted as conservative or democratic, political or more strictly spiritual, John Wesley's missionary movement was a thoroughly Americanized institution by the beginning of President Andrew Jackson's first administration in 1829. As such, Methodists were divided by the same issues, particularly the conflict over slavery, that divided the country. In 1844 the MEC split into two halves, northern and southern, a breach that would not heal for more than a hundred years.

Methodism's unorthodox influence remained strong nonetheless. While Frederick Douglass condemned the hypocrisy of southern Methodist slaveholders, he was a Baltimore Methodist when he made his escape to the North in the late 1830s. Women remained strong advocates of Wesley's teachings and took leading roles in the formation of Methodist offshoot denominations, among them the Primitive Methodist and Methodist Protestant churches. The Methodist preachers' rejection of Calvinist predetermination and embracing of free will theology and sanctification fundamentally altered the aim and tone of American Christianity. For the Republic, the legacy of the Methodist age was deep-seated, multilayered, and long-lived.

MEXICO Mexico had undergone nearly three hundred years of Spanish rule by the eighteenth century's end. Although the occupation failed to erase Mexico's indigenous culture and customs, it indelibly marked the region with Spain's stamp. In the end, Spanish insistence on strict control over its overseas holdings drove Mexico to seek independence.

UNDER SPANISH RULE

The arrival of Spanish conquistadors in 1519 began Mexico's domination by Europeans. However, indigenous groups that had assisted Spain in defeating the Aztecs found special favor. The Spanish Crown rewarded men like Hernando Cortés (1485–1547) and

their native allies with grants and titles. Within a short time, Mexico's new ruling class had begun the process of re-creating in New Spain life as they had known it on the Iberian Peninsula.

A caste system developed in Mexico that persisted well after independence. *Peninsulares*, Spaniards born in Spain, occupied the top rung of the social ladder and received the most important government and ecclesiastical positions. *Peninsulares* also controlled the trading houses and industrial endeavors such as mining. Second in importance were the *criollos*, or Mexican-born Spaniards. *Criollos* occupied an inferior station to *peninsulares* solely because of the location of their births. Below Mexican-born Spaniards were *mestizos*, people of mixed Spanish and Indian ancestry. Other classes, such as *zambos* (children of African and Indian parents) and *mulattos* (children of Spanish and African parents), were looked down upon by the pure-blood Spanish. Although the families of some indigenous people who had assisted in the Spanish conquest of New Spain had been given the title and prerogatives of nobility, the majority of Mexico's indigenous population made up the lowest class of colonial society.

Spain tightly regulated colonial Mexico's economy. Nations with colonies expected their overseas holdings to provide resources and serve as markets for their industrial output. Thus, Mexican silver and other minerals traveled eastward to Spain and Spanish goods sailed westward to Mexico. Fortunes could be made in trade, and the *peninsulares*, with ties to friends and relatives in Spanish ports, made the most of their connections. To ensure Spanish dominance of industry and agriculture, the Spanish government published an extensive list of products that could not be manufactured or grown in Mexico. Strict restrictions spawned smuggling, an activity that became endemic within New Spain's economy.

Spanish and indigenous cultures coexisted in colonial Mexico. Important cities—Jalapa, Puebla, Mexico City, Guadalajara—dotted the road across central Mexico that connected Vera Cruz and Acapulco. Other important towns grew in the north due to the mining wealth that came from the ground near Zacatecas, Guanajuato, and Durango. These communities were home to Mexico's ruling and working classes. The countryside, however, was still home to the vast majority of Mexicans, an indigenous population that continued to farm the land of their ancestors. The major change to the life of these men and women was the tax and labor burden levied on them over the years by the Spanish.

A change in Spain's royal dynasties from the Habsburgs to the Bourbons occurred in 1700 when the childless Charles II selected his French nephew, Philip V, to take his place on the Spanish throne. The move resulted in the War of the Spanish Succession (1702–1713), which upheld the Bourbons' right to rule Spain. The consequence for Mexico was that the Bourbon desire for administrative reform was applied to New Spain. Bourbon reformers believed that a rational approach to government administration would make Spanish bureaucrats more efficient, meaning that more revenue could be raised for the crown. Officials analyzed Mexico's political divisions and economic practices and recommended improvements. Although these changes increased Mexico's contribution to its own upkeep as well as Spain's, it did little to alleviate the growing rift developing between the *peninsulares* and the rest of Mexico's population, which increasingly felt overburdened and slighted.

FIGHTING FOR INDEPENDENCE

Events in Europe ultimately led to Mexico's independence. The eighteenth-century Enlightenment (the movement that had produced the Bourbon reforms) had weakened absolutism by proposing alternatives to the traditional relation between rulers and their subjects. Monarchs and their supporters viewed with alarm the formation of the United States and its adoption of a federal, republican form of government. They had reason to fear, because in 1793 the French populace revolted and ultimately executed many of the ruling class, including its own king and queen. A brief flirtation with republicanism gave way to the rise of Napoleon Bonaparte and a new French empire. In 1808 Napoleon deposed the Spanish king and gave the throne to his own brother. This action severed the ties between the Spanish Crown and its overseas possessions, giving these colonies their first opportunity to experience self-government.

Mexico responded to these events as did other Spanish colonies, establishing *juntas* that claimed to rule in the name of the king. The turmoil brought the underlying tension between the *peninsulares* and other Mexicans into sharp focus. *Criollos* contemplated not just freedom from Spain but freedom from the grasp of the *peninsulares*. The latter held the upper hand through their control of the army, church, and commercial enterprises, but they feared that without continued support from Spain, they would lose their dominant position in society.

The first step in Mexico's road toward independence came on the evening of 16 September 1810. Many parish priests, themselves *criollos*, sympathized with Mexico's mixed-blooded population. Although their plight was not as severe, their own Mexican birth prevented advancement within the church hierarchy. One village priest, Father Miguel Hidalgo y Costilla, plotted a revolt with other *criollos*. The plot discovered, Hidalgo went to his church at the village of Dolores and rang the bell to assemble his parishioners. There he issued the Grito de Dolores, a call for protection of the church and an end to "bad government." News of the revolt spread quickly, and within days thousands of *mestizos* and Indians had flocked to Hidalgo's banner.

Many *criollos* desired a reordering of Mexican society but were shocked by the turn of events initiated by Hidalgo's pronouncement. The revolt took on the tone of a race and class war when his mixed-race army attacked both *peninsulares* and *criollos*. Hidalgo's followers seized Guanajuato and plundered the city, killing more than three hundred royalists who had sought refuge from the mob in a public granary. Forced by circumstances to ally with the *peninsulares*, *criollos* joined with royalists to put down the insurgency that threatened to destroy Mexico's social order. Hidalgo and his army were defeated in 1811, and the priest along with his lieutenants were captured as they made their way to Texas; their severed heads adorned posts outside the granary at Guanajuato as a warning to would-be rebels.

The Spanish, however, were not able to stamp out the revolt. Allies of Hidalgo and his supporters took to the forests and hills and waged a guerilla campaign against the royalists. Leaders included another parish priest, José María Morales. In 1815 the Spanish captured Morales and executed him, depriving the insurgency of a popular and effective leader, but others continued the insurgency.

Rebellion was not confined just to the heart of Mexico. In 1811 the garrison at San Antonio de Béxar in the province of Texas revolted against the Spanish and seized the governor and other officials. The revolt crumbled but discontent remained. In 1812 Mexican republicans, supported by American filibusters, crossed into Texas from Louisiana and confronted the Spanish. By April 1813 the expedition had defeated local forces and occupied San Antonio. That summer, however, a royalist army arrived in Texas to reclaim the province and to punish the insurgents. The republicans were routed at the Battle of the Medina outside San Antonio. The brutal suppression of the revolt, which included hundreds of

executions of rebels and mistreatment of the Tejanos, further depopulated an already sparsely settled region. The need for a stable population led Spain to invite colonists like Moses Austin from the United States to settle in Texas.

Events in Europe once again rocked Mexico and resulted in its independence. In 1820, liberal army officers forced the Spanish king to reinstate popular governmental reforms. The news was received with alarm because Mexico's upper classes feared a renewal of class warfare. The royalists finally lost control because *criollos* worked out a power-sharing agreement with *mestizo* insurgents by adopting three principles that all Mexicans could support: independence from Spain, equality for all Mexicans, and protection of the church.

INDEPENDENT MEXICO

The year 1821 brought political independence but failed to mark an end to Mexico's problems. The new nation inherited an economy and infrastructure that had been wrecked by ten years of civil war. European leaders looked to establish a strong presence in the former Spanish colony and gladly extended credit to Mexico, trapping it in a web of foreign debt. An aggressive neighbor, the United States, eyed Mexico's northern territory from Texas to California. Internal political factions struggled for control of Mexico's new government and the chance to shape the country's future. Civil war, invasion, and dismemberment awaited Mexico as the nineteenth century progressed.

MICHIGAN Remote from eastern settlement, Michigan was initially set off as part of the Indiana Territory in 1796. In 1805 Congress established the Michigan Territory, which included all of present-day Wisconsin and part of what became Minnesota in addition to the two peninsulas that constitute what became the state of Michigan. The territory remained a sparsely populated hinterland into the 1820s, with a diverse collection of British and French-Canadian fur traders, Métis, and various Indian peoples, but few American settlers. Popular perceptions of the territory as an impenetrable swamp in the south and a sterile, rocky wilderness in the north offered little incentive to potential settlers compared to the favorable soils, greater accessibility, and milder climates of Ohio, Indiana, and Illinois. Not until the introduction of steamships into the Great Lakes in 1818 and the opening of the Erie Canal in 1825 did any substantial American migration penetrate the isolated peninsulas.

In 1810 Michigan's Anglo population of 4,762 was concentrated in and around Detroit and outposts in Michilimackinac and Sault Sainte Marie in the Upper Peninsula. Founded by the French in the early eighteenth century, these military and trading posts passed to the British following the Seven Years' War (1756–1763). The British ceded their Old Northwest claims in 1783, although French Canadian and British traders continued to operate in the Territory. Detroit and Michilimackinac played significant strategic roles in the Seven Years' War, the American Revolution, and the War of 1812. At the onset of the War of 1812, the British seized Michilimackinac and Detroit, but these victories proved temporary. Following its recapture in 1813, Detroit served as an important base for the American invasion of Canada. The Treaty of Ghent in 1815 firmly established the boundaries of Michigan, and the trickle of settlement into the territory slowly expanded. Yet growth remained gradual, and in 1820 census takers still counted only 8,896 non-Indians in the entire territory. By 1830 that number had grown to a mere 31,639—a population that paled in comparison to the nearly one million inhabitants of Ohio to the south and east.

Unlike Ohio, however, Odawa (Ottawa), Ojibwa (Chippewa), and Potawatomi villages populated both peninsulas, with approximately fourteen thousand Indians living in the Lower Peninsula and two to three thousand in the Upper Peninsula in 1830. Their presence posed a significant barrier to the spread of white settlement outside of Detroit, making land-

cession treaties with the various bands a preeminent concern of Michigan's early leaders. One of Michigan's most vigorous boosters was Lewis Cass, territorial governor for thirteen of the sixteen years between 1813 and 1829. Cass directed the acquisition of approximately two-thirds of the Lower Peninsula via treaties with the Odawa and Ojibwa in 1819 and 1821 and engineered the funding and building of a government road that finally connected Michigan with Ohio in 1827. Cass's tireless efforts to erase the negative image of Michigan encouraged the spread of settlements across the southern Lower Peninsula, but it was not until 1836 and 1842 that the remainder of the new state was transferred from Indian control, following which American settlers began to populate the northern wilderness.

MID-ATLANTIC STATES The British middle colonies were constructed, between 1664 and 1720, from the remnants of Dutch New Netherland in the Hudson River Valley and Scandinavian New Sweden on the Lower Delaware River. The defining element of their character was population diversity, beginning with these non-English seventeenth-century foundations and continuing with major German and Scots-Irish migrations to the region during the mid-eighteenth century. By 1750, the mid-Atlantic region included members of a dozen or more religious denominations, including Anglicans, Lutherans, German and Dutch Reformed Calvinists, Presbyterians, and sectarian Pietists, as well as Jews and Catholics.

The region's architects included royal agents and proprietary stakeholders working from the top down and diverse colonists operating at ground level.

English officials by 1682 had carved the territory into New York; New Jersey; and Pennsylvania, including its Lower Counties below Philadelphia (later Delaware). New Jersey split into two proprietary entities, called East and West New Jersey. Settlers and Indians across the Hudson and Delaware watersheds acted as if these imperial and political designations were irrelevant. They traveled, traded, farmed, and built families across the vague borders of the region. Royal officials after 1685 tried to reassemble a greater New York, resembling the original footprint of New Netherland, but proprietary interests, led by William Penn, resisted this project. Between 1720 and 1760, imperial and proprietary activism receded, and the bonds of region were private trade, extended family dynamics, and complex interprovincial political networks. The durable geopolitics of Indian diplomacy—anchored in an entity in western New York known to ethnohistorians as Iroquoia—reinforced regional cohesion. None of these processes generated any broad consciousness of collective identity among the area's people. Unlike in New England or the southern colonies, "region" here was more a behavioral than a subjective phenomenon.

The American Revolution destroyed the main structural pillars of the region—the hub of royal government at New York, the proprietary hearth in Philadelphia, and the linchpin of European-Indian relations in Iroquoia. Defeated redcoats sailed from New York Harbor in 1783, leaving a toothless socket of British imperial power. The Penn family was the biggest Loyalist claimant on royal largesse. The Six Nations, or Iroquois Confederacy, having benefited from both imperial military power in New York and war aversion in Pennsylvania, were driven by American treaty expansionism into Canada and the Great Lakes country. The adhesive strength of private behaviors is suggested by the fact that—as the institutional scaffolding of the region collapsed—the mid-Atlantic complex retained so much of its shape and its functional utility.

Economic processes in the late colonial era contributed to both the survival and the modest warping of the mid-Atlantic's outer boundaries. The bulwark of great landlord power in the Hudson Valley kept New York underpopulated, and—with help from British troops in the 1760s—pushed Yankee settlers north along the Connecticut River and into coastal Maine. Mason's and Dixon's Line was barely surveyed in the 1760s, defining a political border between Pennsylvania and Maryland, when the loss of planter confidence in tobacco culture eroded the economic edges of the region. Farmers on the Delmarva

Peninsula and in northern Maryland shifted to grain cultivation and much of the area joined Philadelphia's economic hinterland. With this shift, the families of talented lawyers like John Dickinson and Joseph Galloway came into that city's political orbit. By 1776 they embodied the at-best ambivalent response of elite middle colonists to the risks and opportunities of independence.

RESISTANCE AND REVOLUTION

Geographical convenience made New York and Philadelphia the respective meeting places of the Stamp Act Congress in 1765 and the first Continental Congress in 1774. From 1765 until 1783, members of the Continental Congress from New England were described as being from the "Eastern" colonies or states, while the rest lacked focused regional identities. The overlapping hinterlands of New York and Philadelphia were harder to herd into effective cooperation against British imperial change, or to mobilize into resistance, than the more united societies of Massachusetts, Virginia, and South Carolina. This caution initially assured a local stability that was fruitful of deliberative creativity. As the crisis of empire intensified in the 1770s, however, it meant that opposition to British measures was forced on many communities and enforced in others. It was not accidental that a Pennsylvania moderate like Dickinson presided over political deliberations at the Stamp Act Congress in New York in 1765 and remained influential in Philadelphia a decade later. When he and the conservative Whigs who supported him retreated in 1776—opposing separation until after adoption of the Declaration of Independence—radical Patriot forces had to steer the Revolution from places that had been wracked by intense internal upheaval and divisive change for more than a decade.

The mid-Atlantic's cautious approach toward rebellion and then its explosive embrace of it grew from factors that had made the region vibrant, prosperous, and turbulent for a century. Cultural and religious pluralism bred a pragmatic toleration that was not conducive to boycotts or active resistance. The royal hub in New York and the proprietary hearth at Philadelphia established rooted patronage circles in the hinterlands of both towns that grew together in New Jersey. The mundane commodities that the region made—grains, meats, timber, glass, and even bar iron—escaped the regulatory embrace of mercantilist imperial managers and found Atlantic markets that enriched their makers within the strictures of the English Navigation Acts. This fostered what Thomas Doerflinger has called a "logic of moderation" that persistently muffled radicalization.

When war intruded into the region between 1776 and 1779, it galvanized these circumstances. Washington fought unsuccessfully in late 1776 to defend the islands at the mouth of the Hudson River. Repeated defeats sent his army retreating across New Jersey, while that colony's pragmatic civilians seemed to embrace the ascendant British side. When this momentum unexpectedly reversed after Christmas 1776, their mercurial loyalties did too. The British withdrew into New York City, which they kept as a headquarters garrison until late 1783. The Continentals tried to police the Hudson and Delaware watersheds. The territory between the two forces became a no-man's-land where corrupt and violent freelance conflict between civilians often followed patterns of prewar ethnic and religious enmity and amity. When General William Howe invaded Pennsylvania in late 1777 and occupied Philadelphia, similar dynamics emerged there, complicated by that polity's Quaker culture. The British abandonment of Pennsylvania in 1778 froze this crazy-quilt pattern of strengths and weaknesses into place there.

The war was neither won nor lost in the mid-Atlantic, but the Revolution showed its kaleidoscopic character there as vividly as anywhere in America. Native American–European hostilities, although arriving belatedly after 1750 in the one English place that had been buffered from them by Iroquoian diplomacy and Quaker restraint, continued into the Revolutionary era. Washington's effort to end this problem decisively with a destructive invasion of Iroquoia under General John Sullivan in 1779 loosened the hold of Indians on the region and hastened their removal from it during the 1780s and 1790s. The multiethnic European populations of the Mohawk, Raritan, Schuylkill, and Brandywine Valleys—almost as prolific demographically as New Englanders—were freed to expand into the western parts of the older colonies.

THE EARLY REPUBLIC

The mid-Atlantic was both an exporter and importer of population in the early Republic. The manorial wall along the Hudson River broke after 1790 and restless Yankees "hived" west into the spaces evacuated by retreating native nations. Across the Finger Lakes region, and especially in the Genesee country, they hoped to create a newer New England, but smaller transecting streams of settlers moving north from Pennsylvania and New Jersey subverted that design. The British seizure of Fort Duquesne in 1758 made Pennsylvania a cultural filter for postwar American settlement of the Ohio Valley and the Old

Northwest. The mid-eighteenth-century flow of German and Scots-Irish Presbyterian migrants into the Valley of Virginia likewise fashioned a Greater Pennsylvania portal to the upper parts of the trans-Appalachian South. Although Frederick Jackson Turner's 1893 claim probably overstated the case, a new and distinctly "American" society seemed to be emerging between a temporarily exhausted and in some ways a culturally fragmenting New England hearth and a still-incipient South that had yet to achieve any real integration or coherence.

During the generation after 1787, the mid-Atlantic traded its fortuitous Revolutionary-era position of national political centrality for one of continental economic and then industrial hegemony. This advantage was not built on internal unity, or even internal coherence, as the polar tendencies latent in the region since the 1630s reasserted themselves. New York political leaders mobilized British capital and new immigration between 1817 and 1825 to drive a canal west from the Hudson Valley to Lake Erie during those years. The success of the Erie Canal in the 1820s positioned New York to become a dominant force in the nation's economy for the next century. By "improving" the natural sea-level path of the Mohawk River, they welded the Great Lakes and Ohio Valley agricultural hearth and eventual industrial belt to their Atlantic metropolis. Pennsylvania's efforts to match this achievement with an awkward combination of turnpikes, canals, railroads, and inclined planes over the Appalachian Mountains seemed more inspired than ingenious. By mid-century, however, the Pennsylvania Railroad pierced that barrier. Then the subterranean accident of anthracite and bituminous coal deposits could redress the advantage. Pittsburgh became the heavy manufacturing citadel of an industrializing America while Philadelphia built a diversified and resilient light industry and skilled-craft economy. That city's port, although farther from the Atlantic than New York City's and prone to winter disruption, held its share of the Northeast's import and export traffic. New York City became the financial engine of a capitalist national economy and displaced Philadelphia as the port of entry for the torrential streams of Europeans who transformed the nation in the nineteenth century.

In the generation before the Revolution, the mid-Atlantic colonies built prototypes for a modern political system that stabilized a dynamic plural society, ameliorating its conflicts and harnessing its energies into productive channels. While those state-based machines failed under the pressures of imperial crisis,

and while governments in the region were maintained by the sword rather than by consensus during the Revolution, the underlying culture of political pragmatism survived the trauma. By 1787, Philadelphia again seemed a safe enough place for national constitutional delegates to gather. The document that they produced received some of its most challenging ratification tests in the region. While planning began almost immediately for the national capital to move south along the balance beam of free and slave systems, and while Virginia and Massachusetts would dominate the American presidency for a generation after the Revolution, New York and Pennsylvania remained laboratories of state and metropolitan political experimentation. Indeed, New Jersey—by allowing women to vote until 1807, however inadvertently—even more fully anticipated the ultimately democratic political future.

MIGRATION AND POPULATION MOVEMENT By 1754, most of the choice lands between the Atlantic Coast and the Appalachian Mountains had been settled by European colonists who, looking westward, pressed colonial governments to acquire and provide new lands. As early as 1747, Virginia planters interested in land speculation and the fur trade organized the Ohio Company to explore and open the Ohio River valley to settlement and economic exploitation. The French viewed the company's activities as a challenge to their imperial claims, which in part led to the Seven Years' War (1756–1763). When the war ended, however, rather than open the Ohio River valley to colonists, the British—hoping to avoid further conflict with the Indians—barred settlement in trans-Appalachia in the Proclamation of 1763.

Throughout the 1760s and early 1770s, pressures for new lands escalated. Over 125,000 emigrants arrived in the colonies from the British Isles. Many found jobs in urban areas along the coast, but most sought land and, unable to acquire large farms along the seaboard, began looking to the backcoun-

tries. By the outbreak of the Revolutionary War (1775–1783), settlers (large numbers of whom were German, Scots, and Scots-Irish) streamed into New York's Mohawk River valley and the Pennsylvania mountains and along the Great Wagon Road into the Virginia and North Carolina backcountries.

Yet Europeans were only the most conspicuous populations on the move. The migrations of slave-owning colonists created a forced migration of African Americans, particularly in the southern colonies. As whites and blacks moved into new areas, they displaced Native Americans who consequently relocated into other regions and uprooted other peoples. This pattern of peoples bumping into each other characterized American migrations throughout the eighteenth and nineteenth centuries. The pattern pertained as well to Europeans, who—as Bernard Bailyn in *The Peopling of British North America* (1986), David Hackett Fischer and James C. Kelly in *Bound Away: Virginia and the Westward Movement* (2000), and others had demonstrated—were of such vast cultural, if not ethnic, diversity that their migrations often challenged the cultural ways of previous settlers.

The Revolutionary War accelerated these patterns by eliminating imperial impediments to migration and by giving rise to a sense of providential destiny. Migration had been among the causes of revolution; British western land and Indian policies were among the grievances listed in the Declaration of Independence. Under the Treaty of Paris (1783), the Confederation of American states gained all the territory east of the Mississippi River between Canada and Florida. And among the most significant acts of the Confederation Congress of the 1780s was a series of ordinances organizing the Old Northwest that opened territories north of the Ohio River to settlement.

THE TRANS-APPALACHIAN WEST

Dr. Thomas Walker was the first American to discover the Cumberland Gap in 1750, but it was not until the impediments to migration disintegrated with the Revolutionary War that the gap became a primary gateway to the West. Throughout the late 1770s and 1780s, increasing numbers of backcountry peoples from the Carolinas and Virginia flowed through it, moving southward into the Holston settlements of Tennessee or following the Wilderness Road into central Kentucky. The other major route into the West was along the Ohio River, which remained under the watch of Native Americans well into the 1790s. Migrants from Pennsylvania, Maryland, and the Northeast arrived in Pittsburgh and chartered flatboats down the Ohio to landings at Maysville, Fort Washington (Cincinnati), and Louisville.

The majority of white migrants, whether German or Scots-Irish or traveling along the Wilderness Road or the Ohio River, journeyed either alone or in small family groups. The cost and burden of travel made the transport of households difficult for the wealthiest of travelers, so many migrants left extended kin networks behind, along with most of their belongings. Still, the draw of the West was for many more powerful than attachments to family and possessions. By 1790 Kentucky had some seventy-three thousand occupants, and Tennessee's population grew tenfold between 1790 and 1796, when it had sixty thousand residents.

In comparison to furniture and elderly parents, slaves were less of a problem to transport, and the postwar migrations evidenced large-scale displacement of black Americans. First, the Shenandoah Valley, western North Carolina, and the South Carolina and Georgia up-countries became new slave societies. Then, slaves were forced into Tennessee and Ken-

tucky. The uprooting of slaves disrupted the fragile kin networks that provided stability to black life on the plantations, and the Appalachian Mountains created a barrier that made escape and reconciliation nearly impossible.

THE OLD NORTHWEST AND OLD SOUTHWEST

The opening of Tennessee and Kentucky encouraged leaders of the new nation to expand westward, evidenced in two of the Confederation Congress's most impressive accomplishments: the Ordinances of 1785 and 1787. The earlier law provided for the survey and sale of lands in the Old Northwest (later the states of Ohio, Indiana, Illinois, Michigan, Wisconsin, and part of Minnesota). The Northwest Ordinance of 1787 forbade slavery and outlined the process for statehood.

Yet the Old Northwest was occupied by numerous Indian nations, all assured by the government that their rights and interests would be protected. White and black migrants into Kentucky and Tennessee, however, had already bumped into these Native Americans, inciting an Indian war north and south of the Ohio River. Despite several military victories, the Indians' defeat at the Battle of Fallen Timbers in 1794 forced them to concede much of what later became Ohio in the Treaty of Greenville (1795) and to migrate collectively farther northwestward. The trickle of American settlers that characterized migration into the Old Northwest in the 1780s and early 1790s became a flood as migrants from Virginia, Pennsylvania, and New England flowed into Ohio. By 1800, over forty-five thousand Americans had migrated into the territory.

Between the 1770s and 1790s, therefore, the patterns of white migration, forced black migration, and Native American displacement and migration that had formed in the colonial era became more evident and ingrained in American western development. As the Old Southwest opened in the late 1790s, these patterns and their consequences became even more dramatic.

Most whites who migrated into the Old Southwest (later western Georgia, Alabama, Mississippi, and the Florida panhandle) came from Virginia, the Carolinas, and Georgia in search of rich soils and agricultural opportunity. They were small, nonslaveholding farmers, just as in the Old Northwest. But a planter elite also migrated westward, expanding the institution of slavery as well. Determined to open up the territory for cotton agriculture, they pushed for federal intervention with the Native Americans and with the Spanish who still controlled Florida. In

1818 Andrew Jackson occupied West Florida and virtually conquered East Florida, forcing the Spanish to cede the territory to the United States through the Adams-Onís Treaty (1819). By 1840, Florida's population had reached fifty-four thousand, half of whom were slaves.

More than one million African American slaves went from the slave states to the Old Southwest, which soon became the largest cotton-producing region in the world. Especially after the War of 1812 (1812–1815), when commercial ties were reestablished with Great Britain, the cotton boom lured settlers rapidly toward the Mississippi River and beyond.

While rapid expansion into both the Old Southwest and the Old Northwest strained relations with Native Americans, the War of 1812 ended Native American military resistance to white settlement in both regions. The Shawnees under Tecumseh, who had formed an alliance with Britain against the United States, were defeated at the Battle of the Thames in 1813. Meanwhile, in 1814 Andrew Jackson conquered Red Stick Creeks at the Battle of Horseshoe Bend in Alabama and forced all the Creeks to cede lands to the United States. Again, Native Americans were on the move, migrating westward and joining with other Indian groups for survival. This set the stage for the final removal of Native Americans from the Old Southwest in the 1830s, when the Cherokees, Creeks, Choctaws, Chickasaws, and Seminoles would be taken, most by force, into the Indian Territory of what subsequently became Oklahoma.

The War of 1812 also opened up the northwesternmost reaches of the Old Northwest to American settlement. Migration into Michigan boomed following the war, as did the movement of miners into the lead deposit regions of Wisconsin.

ACROSS THE MISSISSIPPI RIVER

By the turn of the nineteenth century, American migrants were moving into most of the lands east of the Mississippi River, and both the federal government and the citizenry began to look even farther westward. Interest in expansion into the trans-Mississippi West had begun simultaneously with the first migrations into the Old Northwest. In 1792, for example, Robert Gray explored the mouth of the Columbia River by sea, mapping much of the Pacific Coast and strengthening the claim of the United States to the far Northwest. Eleven years later, Meriwether Lewis and William Clark embarked on their expedition into the northern reaches of the newly acquired Louisiana Purchase and then on to the Pacific

Ocean, gathering a vast amount of geographic and scientific information, establishing diplomatic and trade relations with Native American tribes, and further establishing an American claim to the West. They were followed by other government-sponsored expeditions: Zebulon M. Pike in 1805 and Stephen H. Long in 1820 explored the central Great Plains and eastern hills of the Rocky Mountains.

On the heels of these explorers came American migrants. The cotton boom of the Old Southwest spread into Louisiana and swelled its population to seventy-eight thousand by 1810. The confluence of the Mississippi River, the Oregon Trail, and the Santa Fe Trail at St. Louis drew migrants into Missouri, the population of which reached over sixty thousand by 1820. Missourian Moses Austin organized and his son Stephen F. Austin led three hundred families to eastern Texas, opening the way for further migration into the region in the 1830s. As American migrants traversed the Mississippi River, they took with them the patterns that had characterized American migration for over one hundred years: the bumping-in-to-each-other process, forced black migration, and Native American displacement.

MILITARY TECHNOLOGY Revolutionary Americans fought the War of Independence (1775–1783) with a munitions industry that they pieced together as they went. They achieved no notable innovations in production techniques or products made. With readily available supplies of wood and iron, experience in colonial warfare, and gunsmiths scattered throughout the colonies, they had the foundation for a munitions industry but only learned through bitter experience how difficult and expensive it was to equip large numbers of men in the field. Powder mills built for the French and Indian War (1754–1763) rotted in disrepair. Gunsmiths were more accustomed to repairing old than making new weapons. Many of those guns and most if not all of their flintlock firing mechanisms came from Europe—and primarily from England, ironically enough.

SUPPLY SHORTAGES DURING THE REVOLUTION

Americans were short of firearms and gunpowder throughout the Revolution. If not for large quantities of both imported from Europe, their difficult circumstances would have been dire. A deal struck between the Continental Congress and a French firm to make small arms and artillery somewhere in the middle states fell through, an opportunity lost not only for short-term supply, but for long-term development of an American munitions industry with closer ties to continental production methods. The American procurement system was fundamentally the same as that of the British—by contract through small shops, but the revolutionaries had to create that system at the same moment they were forming a nation that divided political authority under a federal arrangement and divided military organization into militia and Continental units, all of which institutionalized confusion and internal competition for scarce munitions. Almost all American artillery came from abroad, except for a few scattered pieces from private forges and foundries and congressionally funded magazines at Carlisle, Pennsylvania, and Springfield, Massachusetts. Munitions production in any form underwritten by individual states rarely lasted long, so private provisioners dominated the industry.

Developing new weapons and weapons tactics for an impoverished army that grew and shrank with the campaign season was next to impossible. Initially, George Washington had thought that he could use rifles to advantage, given their superior range over muskets, and he was an enthusiastic supporter of rifleman units raised in frontier areas dur-

ing the early stages of the Revolution. Before too long he saw that riflemen were better adapted to light infantry duty than linear tactics, and by war's end the Continentals were trained and equipped very much like British regulars, insofar as supplies and finances allowed.

Muzzle-loading, smoothbore muskets, ideally issued with socket-style bayonets, were therefore the most common weapons for all troops in the war. Skilled laborers, the most likely source of innovation, sometimes received exemptions from military service, not to experiment with new weapons but to keep production from falling short. The Board of War had been authorized by the Continental Congress to set up “laboratories” for munitions production, but Congress did not have the resources for much more than simple purchase and repair. Systematic research and development did not yet exist in either the private or public sectors. There was no enforceable, standardized weapons design and little chance of interchangeability. Even so, because firearms were sophisticated tools, emphasis on improved design and more specialized labor—precursors to modern factory techniques—was intrinsic to the trade. Some muskets were patterned after the British Brown Bess, others followed French specifications, and all were manufactured (in the pre-industrial sense of being made mostly by hand) in small lots, with repair ad hoc, on-site, weapon-by-weapon. Wilder schemes, such as the proposal by Thomas Paine, the Revolutionary pamphleteer, for steel crossbows to shoot fire arrows the breadth of the Delaware River or Joseph Belton’s rapid-fire musket, understandably garnered little interest. While in large part this was a function of scarce resources, it was also a reflection of the military’s preference for the inexpensive, simple, and reliable, which explains why the British did not suddenly embrace a bayonet-fitted, breech-loading rifle designed by Major Patrick Ferguson and Americans did little to encourage the submarine experiments of David Bushnell.

SLOW PROGRESS AFTER THE REVOLUTION

Independence did not in and of itself bring much change. The Hamiltonian program of the early 1790s included plans to make the new nation more self-sufficient in the weapons of war. National arsenals at Springfield, Massachusetts, and Harpers Ferry, Virginia, supplemented by contracts with individual gunmakers, were supposed to supply both the regular army and the state militias. Failure by either to do so adequately as an undeclared war (1798–

1800) loomed with France explains the contract offered to Eli Whitney in 1798, who had made cotton gins but not firearms. Despite promises to deliver improved, standardized muskets (following the popular French Charleville 1763 pattern) by using newly designed machine tools, Whitney's guns did not have interchangeable parts and were late in coming; more expensive than projected; and, overall, of rather poor quality. Among private contractors, pistol maker Simeon North produced perhaps the best weapons at the turn of the century.

Ultimately, the United States went to war in 1812 against Britain with a woefully inadequate munitions industry. In the years leading up to the war and during the war itself, various inventors approached the national government with plans for improved weapons, but nothing came of these schemes, and most were reminiscent of failed proposals put forward during the Revolution (including Robert Fulton's "torpedoes," which were essentially naval mines). Americans were fortunate that the fighting was intermittent and small scale and that

they had managed to reduce their dependence on imports. Although it is not clear if American gunmakers drew from the practices of French gunsmith Honoré Blanc that so impressed Thomas Jefferson in the 1780s, it is clear that the gunpowder industry benefited immensely from operations begun by French émigré Éleuthère Irénée du Pont along the banks of Delaware's Brandywine River in 1802. In 1813 Simeon North had ambitiously contracted to deliver twenty thousand pistols in five years, all of them with truly interchangeable parts. He failed but came much closer than had Whitney. By war's end the Springfield Armory led the way in quality musket production, making use of better tools and more specialized labor than other arms producers.

Postwar developments were more notable still, marked by Thomas Blanchard's stockmaking machinery at the Springfield Armory and John Hall's model 1819 breech-loading rifle at Harpers Ferry. Hall, who began as an independent contractor, personified the blending of entrepreneurial inventiveness with the War Department's quest for standardized

weapons. At the same time, the War Department's reluctance to put aside muzzle-loading muskets because of its desire to have one inexpensive, easily produced weapon that could be used by militiamen as well as regulars demonstrates that inventions can succeed or fail as technological innovations for non-technical reasons. Moreover, change came incrementally and gradually. There was no sudden transformation from shop techniques to factory-based machine production, even in the so-called armory practice pioneered by Hall and Blanchard.
