# Preface

THE brave, large aim of this book has been to bring philosophy together between two covers better than ever before. That is not a job for one man, or one woman, or a few, or a team, although it is tried often enough. So 249 of us joined forces ten years ago for the first edition. We have now been reinforced by forty-two more contributors for this second edition. To the 1,932 entries in the first edition, about 300 more have been added. Also, many of the entries in the first edition have been considerably lengthened and revised. Many others have been updated. The list of contemporary philosophers in the first edition has been adjusted in order to reflect what McTaggart denied, that time is real.

The philosophy brought together includes, first of all, the work of the great philosophers. As that term is commonly used, there are perhaps twenty of them. By anyone's reckoning, this pantheon of philosophy includes Plato, Aristotle, Aquinas, Hobbes, Descartes, Spinoza, Leibniz, Locke, Berkeley, the blessed Hume, Kant, Hegel, and Nietzsche. These, together with others who stand a bit less solidly in the pantheon, are the subjects of long essays in this book.

Philosophy as this book conceives it, secondly, includes all of its history in the English language, a history mainly of British and American thinkers. In this history there are many figures not so monumental as Locke, Berkeley, and Hume. Among them, if they are not admitted to the pantheon, are John Stuart Mill, Charles Sanders Peirce, Bertrand Russell, and, if an Austrian can be counted in this particular history, and should be, Ludwig Wittgenstein. They also include Jonathan Edwards, Thomas Reid, William James, and F. H. Bradley.

Thirdly, if the book cannot include all of the histories of philosophy in languages other than English, it does attend to them. It attends to more than the great leaders of the philosophies in these languages. Thus Descartes is joined by such of his countrymen and countrywomen as Simone de Beauvoir, Henri Bergson, and Auguste Comte. Kant and Hegel are joined by J. G. Fichte, Jürgen Habermas, Karl Jaspers, and others. There are also general entries on each of the national philosophies, from Australian to Croatian to Japanese to Russian.

A fourth part of the book, not an insignificant one, consists in about 150 entries on contemporary philosophers, the largest groups being American and British. It would have been an omission to leave out contemporaries, and faint-hearted. Philosophy thrives. Its past must not be allowed to exclude its present. It is true, too, that one of these contemporaries may one day stand in the pantheon.

What has now been said of four subject-matters within philosophy as the book conceives it can be said differently. These subject-matters can be regarded less in terms of individual thinkers and more in terms of ideas, arguments, theories, doctrines, world-views, schools, movements, and traditions. This contributes to another characterization of the book, more complete and at least as enlightening, perhaps more enlightening. In particular, it brings out more of the great extent to which the book is about contemporary philosophy rather than the subject's history.

There are perhaps a dozen established parts of philosophy: epistemology, metaphysics, moral philosophy, political philosophy, philosophical logic, logic, the philosophy of mind, aesthetics, and so on. In the case of each of these, the book contains a long essay on its history and another on its problems as they now are, by contributors not at all new to them.

In the case of each of these established parts of philosophy, more light is shed by very many additional entries—for a start, by the aforementioned entries on the great philosophers, on their lesser companions in English-language history and other-language histories, and on contemporaries now carrying on the struggle.

In the case of each of the established parts of philosophy, there are also very many subordinate entries not about individual philosophers. They are quite as important and perhaps take up more of the book. They range from shorter essays down to definitions. To glance at subordinate entries just in the philosophy of mind, the two long essays go with such shorter entries as *actions*, *animalism in personal identity*, *anomalous monism*, *body*, *Brentano*, *bundle theory of the self*, *cognitive architecture*, *cognitive science*, and *determinism*, *double-mindedness*, *dualism*, and *duck-rabbit*. That is but a very small start on the philosophy of mind.

I have now said something of the philosophy which it is the aim of the 2,230 entries of this book to bring into clear view. But whose clear view? The book is for all those who want authoritative enlightenment, judgement by good judges. Thus it is directed partly to general readers for whom philosophy has a fascination greater than, or at least as great as, any other part of our intellectual and cultural existence, and who want accounts of it that they can trust. The book is also directed to those who study and practise the subject, and are scrupulous about their guides. If it did not also have the second aim, it could not have the first. No accounts of a subject can be authoritative for the general reader if they do not also attract and aim to survive the scrutiny of its experts.

If that is one description of the two classes of intended readers of this book, there is another quite as important. There are different ways of reading. The general readers and the experts can be taken together and then divided into two other classes of readers. The first class has in it readers who are on the job, the second those who are not. Not even your most conscientious postgraduate, or your academic of truly careerist inclination, or your zealous autodidact, is always attending to duty. Reading is not always work. Fortunately, it is more often not work. It is not done to get answers to pre-existing questions, to pass exams or write essays, to get promoted to full Professor. It is not done out of a stern determination to become informed, to pursue truth. To read is often to browse, dally, and meander. It is to satisfy curiosity, or a curiosity owed just to a page that falls open. It is to be intrigued by the sight of *affirming the consequent*,

*agglomeration, American philosophy today, arthritis in the thigh, Baudrillard, beatitude's kiss, closure, feminist philosophy of science, quantum logic, slime, slingshot arguments, tarot, tarwater, Thrasymachus, vague objects, or the new Wittgenstein.*

A Companion, then, in what there is excuse to call the correct sense of that sometimes abused word, is not only a book for diligent readers, to be studied and perhaps laboured over. It is not only a complete reference book. It is more amiable than that. It diverts. It suits a Sunday morning. Hence, not all that is in it was chosen by the high principle of nose to the grindstone. There are entries in it, as already noticed, that are owed to their intrinsic interest rather than their proven place in a sterner editor's list of headwords.

Only three things remain to be said in this Preface, the first of them about the nature of philosophy and hence of the book. Isaiah Berlin, one of the contributors, once characterized philosophy not only as lacking answers to many questions but also as lacking an agreed method for the finding of answers. (He may have had in mind a contrast with science, perhaps a contrast not dear, albeit for different reasons, to a fellow contributor or two, say Paul Feyerabend or W. V. Quine.) Certainly it is true that philosophy, no doubt because of the peculiar difficulty of its questions, is at least as much given to disagreement and dispute as any other kind of inquiry. In fact it may be more given to disagreement and dispute than any other inquiry. It has the hardest questions.

As a result, this book cannot be wholly consistent. Even with fewer than 291 contributors, if they were as committed to their views as philosophers usually are, and no doubt should be, there would be disagreement. There would be disagreement if the book was limited to the thirty-four Oxford philosophers in it, or, say, the various Californians. As it is, there are entries, occasionally cheek by jowl, that fight among themselves, or at any rate jostle. As an editor, I have not tried too hard to subdue or get between my colleagues, but only succumbed to a thought or two about *unlikely philosophical propositions*. (Nor have I bullied my colleagues about what sort of thing to put into the bibliographies at the ends of their entries, or ruthlessly excluded an entry whose subject is also treated, somewhat differently, somewhere else.) To do so would have produced more decorum but less truth about philosophy. It would also have touched what I hope is another recommendation of the book: it has not only different views but different voices in it.

That brings to mind a second matter, that of the 150 contemporary philosophers on whom there are entries in the book. The aim was to give to the reader, mainly the general reader, a sense of the philosophical enterprise as it is now being carried forward. (Philosophy, as already remarked, is not a dead or dying subject, but one whose vigour—I am tempted to say its youth—is as great as ever it has been. It is only the sciences and the superstitions that come and go.) Another editor, quite as sane, would have looked around at his cohorts, contemplated a reputation or two, no doubt mused on the fact of philosophical fashion, and chosen somewhat differently.

For the first edition, a list of contemporaries was initially drawn up mainly by me. The list was subsequently the subject of a kindly suggestion or two from possible contributors to the book who laid eye on it, and perhaps a letter or two of hurt pride or disbelief. Notice was taken of these pleas, in a certain way. The initial list of contemporaries was submitted to a jury of a dozen distinguished

philosophers from all parts and inclinations of the subject. They agreed about the large and indisputable core of the list, but not much more. They did not much agree about their proposed additions to the rest of the list, or their proposed deletions from it. No proposed inclusion or deletion got more than two votes from the twelve good philosophers and true. Any contemporary who did get two votes was added in. No deletions were made.

For this second edition, opinions were taken from thirty philosophers, of all or anyway various persuasions, as to how to make the contemporaries in the book representative of the new millennium well under way. The results of this poll contained some biffs to my loyalties and sensibilities. But, being a true as against merely a hierarchic democrat, I acted on the advice. Should you be certain, reader, that this little anointing is a very serious matter, remember David Hume, Saint David, the greatest of British philosophers. He did not get elected to professorships at Edinburgh and Glasgow, which accolades went instead to Mr Cleghorn and Mr Clow.

Finally, my gratitude, of which there is a lot. I am grateful to many people, first the 291 contributors. They did not do too much satisficing. Contributors to the first edition put up with a change of mind about entry lengths. Many of them put up with a lot more, including a lot of letters about revising their work or making new starts. Some were stalwarts who did a goodly number of entries very well. They rush to mind, and produce glows of gratitude there. Some were philosophical about the sad fact that their prize entry, say the Frankfurt School or the indeterminacy of translation, did not get into the book because the editor had blundered and earlier assigned it to someone else. Some contributors and others were decent or anyway silent when their proposed entries, say *marital act* and *Ayn Rand*, did not penetrate my fortress of philosophical principle.

My special thanks to Peter Momtchiloff, doyen of the world's philosophy editors, the Philosophy Editor of Oxford University Press. This book is almost as much his doing as mine, despite my sole responsibility for errors, infelicities, and one or two judgements with which he is not in absolute agreement. I am also grateful to the following fourteen philosophers who read all or parts of the first manuscript and issued proposals for its improvement: Christopher Kirwan, David Hamlyn, and Jonathan Lowe, above all, and also Simon Blackburn, Alexander Broadie, Jonathan Cohen, Ross Harrison, Ronald Hepburn, Michael Inwood, Nicola Lacey, David Miller, Richard Norman, Anthony O'Hear, and Richard Swinburne.

My thanks as well to the jury of distinguished philosophers who cast an eye over the initial list of their contemporaries, and then to the thirty advisers in this matter for the second edition.

Thanks too to all of these: Ingrid Coggin Honderich; Jane O'Grady; Alan Lacey, who did the Chronological Table of Philosophy and the Maps of Philosophy; John Allen of the library at University College London; Helen Betteridge, Vivien Crew, and Ann Wooldridge for some secretarial assistance; Tim Barton, Laurien Berkeley, Angela Blackburn, and Frances Morphy of Oxford University Press, all of whom were fortitudinous, and almost always right.

# On Using the Book

In one way there is little need for an entry in this book to contain cross-references to other entries. This is so since the reader can safely assume that almost every philosophical term which is used for an idea or doctrine or whatever also has an entry to itself. The same is true of almost every philosopher who is mentioned. That is not all. Entries can be counted on for very many subjects which fall under such common terms as 'beauty', 'causation', 'democracy', 'guilt', 'knowledge', 'mind', and 'time'—all such subjects which get philosophical attention.

Still, it seems a good idea to provide occasional reminders of the general possibility of having more lights shed on something by turning elsewhere. And there is often a good reason for prompting or directing a reader to look elsewhere, a reason of which a reader may be unaware.

So occasionally a term in an entry is preceded by an asterisk, indicating that it is the heading or the first word of the heading of another entry. For the same reason an asterisked term or terms may appear on a line at the end of an entry. In some cases the latter references are to related or opposed ideas or the like. In order not to have the book littered with asterisks, they have very rarely been put on the names of philosophers. But it is always a good idea to turn to the entries on the mentioned philosophers.

The cross-references are more intended for the browsing reader than the reader at work. For the reader at work, there is an Index and List of Entries at the back of the book. The Index and List of Entries usually gives references to more related entries than are given by cross-references in and at the end of an entry. It is also possible to look up all the entries on, say, aesthetics or American philosophy or applied ethics.

The book is alphabetized by the whole headings of entries, as distinct from the first word of a heading. Hence, for example, *abandonment* comes before *a priori* and *a posteriori*. It is wise to look elsewhere if something seems to be missing.

At the end of the book there is also a useful appendix on *Logical Symbols* as well as the appendices *A Chronological Table of Philosophy* and *Maps of Philosophy*.

# A

**abandonment.** A rhetorical term used by existentialist philosophers such as Heidegger and Sartre to describe the absence of any sources of ethical authority external to oneself. It suggests that one might have expected to find such an authority, either in religion or from an understanding of the natural world, and that the discovery that there is none leads one to feel 'abandoned'. For existentialists such as Sartre, however, this sense of abandonment is only a prelude to the recognition that ethical values can be grounded from within a reflective understanding of the conditions under which individuals can attain \*authenticity in their lives. Thus the conception of abandonment is essentially an existentialist dramatization of Kant's rejection of heteronomous conceptions of value in favour of the \*autonomy of the good will.

T.R.B.

\*existentialism; despair.

J.-P. Sartre, *Existentialism and Humanism*, tr. P. Mairet (London, 1948).

**abduction.** Abductive reasoning accepts a conclusion on the grounds that it explains the available evidence. The term was introduced by Charles Peirce to describe an inference pattern sometimes called 'hypothesis' or '\*inference to the best explanation'. He used the example of arriving at a Turkish seaport and observing a man on horseback surrounded by horsemen holding a canopy over his head. He inferred that this was the governor of the province since he could think of no other figure who would be so greatly honoured. In his later work, Peirce used the word more widely: the logic of abduction examines all of the norms which guide us in formulating new hypotheses and deciding which of them to take seriously. It addresses a wide range of issues concerning the 'logic of discovery' and the economics of research.

C.J.H.

\*induction.

C. S. Peirce, *Collected Papers*, vii (Cambridge, Mass., 1958), 89–164.

**Abelard, Peter** (1079–1142). Most widely known for his love affair with Héloïse, about which we learn a good deal from his letters to her as well as from his *Historia Calamitatum*. He was also one of the great controversialists of his era. After studying under Roscelin (c.1095) and William of Champeaux (c.1100), he established himself as a master in

his own right, and one to whom students flocked throughout his career. In the dispute about the nature of \*universals he was in the nominalist camp, holding that universals are utterances (*voces*) or mental terms, not things in the real world. The universality of a universal derives from the fact that it is predicable of many things. Nevertheless, unless a number of things are in the same state, the one universal term cannot be predicated of them. Hence although universals are not themselves real things, it is a common feature of real things that justifies the predication of a universal of them.

In his *Dialectica* Abelard takes up, among numerous other topics, the question, widely discussed in the Middle Ages, of the relation between human freedom and divine providence. If God, who is omniscient, knows that we are going to perform a given act, is it not necessary that we perform it, and in that case how can the act be free? Abelard's answer is that we do indeed act freely and that it is not merely our acts but our *free* acts that come under divine providence. God's foreknowing them carries no implication that we are not free to avoid performing them.

A.BRO.

\*Heloïse complex; properties; qualities.

Abelard, *Dialectica*, ed. L. M. de Rijk (Assen, 1970).

J. Marenbon, *The Philosophy of Peter Abelard* (Cambridge, 2002).

**ableism.** Prejudice against people with disabilities, which can take many forms. It can take the form of a prejudice against using sign language with those who are deaf even when only a small percentage of them can master the alternatives of lipreading and speaking. It also shows itself as a prejudice against the use of Braille with the blind or visually impaired even when this makes them less efficient readers than they might be. In general, it is a prejudice against performing activities in ways that are better for disabled people.

J.P.S.

\*disability and morality.

Anita Silvers, 'People with Disabilities', in Hugh LaFollette (ed.), *The Oxford Handbook of Practical Ethics* (Oxford, 2003).

**abortion.** Human beings develop gradually inside women's bodies. The death of a newly fertilized human egg does not seem the same as the death of a person. Yet

## 2 abortion

there is no obvious line that divides the gradually developing foetus from the adult. Hence abortion poses a difficult ethical issue.

Those who defend women's rights to abortion often refer to themselves as 'pro-choice' rather than as 'pro-abortion'. In this way they seek to bypass the issue of the moral status of the foetus, and instead make the right to abortion a question of individual liberty. But it cannot simply be *assumed* that a woman's right to have an abortion is a question of individual liberty, for it must first be established that the aborted foetus is not a being worthy of protection. If the foetus is worthy of protection, then laws against abortion do not create 'victimless crimes' as laws against homosexual relations between consenting adults do. So the question of the moral status of the foetus cannot be avoided.

The central argument against abortion may be put like this:

It is wrong to kill an innocent human being.  
A human foetus is an innocent human being.  
Therefore it is wrong to kill a human foetus.

Defenders of abortion usually deny the second premiss of this argument. The dispute about abortion then becomes a dispute about whether a foetus is a human being, or, in other words, when a human life begins. Opponents of abortion challenge others to point to any stage in the gradual process of human development that marks a morally significant dividing-line. Unless there is such a line, they say, we must either upgrade the status of the earliest embryo to that of the child, or downgrade the status of the child to that of the foetus; and no one advocates the latter course.

The most commonly suggested dividing-lines between the fertilized egg and the child are birth and viability. Both are open to objection. A prematurely born infant may well be *less* developed in these respects than a foetus nearing the end of its normal term, and it seems peculiar to hold that we may not kill the premature infant, but may kill the more developed foetus. The point of viability varies according to the state of medical technology, and, again, it is odd to hold that a foetus has a right to life if the pregnant woman lives in London, but not if she lives in New Guinea.

Those who wish to deny the foetus a right to life may be on stronger ground if they challenge the first, rather than the second, premiss of the argument set out above. To describe a being as 'human' is to use a term that straddles two distinct notions: membership of the species *Homo sapiens*, and being a person, in the sense of a rational or self-conscious being. If 'human' is taken as equivalent to 'person', the second premiss of the argument, which asserts that the foetus is a human being, is clearly false; for one cannot plausibly argue that a foetus is either rational or self-conscious. If, on the other hand, 'human' is taken to mean no more than 'member of the species *Homo sapiens*', then it needs to be shown why mere membership of a given biological species should be a sufficient basis for a

right to life. Rather, the defender of abortion may wish to argue, we should look at the foetus for what it is—the actual characteristics it possesses—and value its life accordingly. P.S.

\*applied ethics; double effect.

D. Boonin, *A Defense of Abortion* (Cambridge, 2002).

Judith Jarvis Thomson, 'A Defense of Abortion', in Peter Singer (ed.), *Applied Ethics* (Oxford, 1986).

Michael Tooley, *Abortion and Infanticide* (Oxford, 1983).

**Absolute, the.** That which has an unconditioned existence, not conditioned by, relative to, or dependent upon anything else. Usually deemed to be the whole of things, conceived as unitary, as spiritual, as self-knowing (at least in part via the human mind), and as rationally intelligible, as finite things, considered individually, are not. The expression was introduced into philosophy by Schelling and Hegel. In the English speaking world it became the key concept of such absolute idealists as Josiah Royce and F. H. Bradley. T.L.S.S.

\*idealism, philosophical.

J. N. Findlay, *Ascent to the Absolute* (London, 1970).

T. L. S. Sprigge, *The Vindication of Absolute Idealism* (Edinburgh, 1983).

**absolutism, moral.** The view that certain kinds of actions are *always* wrong or are *always* obligatory, whatever the consequences. Typical candidates for such absolute principles would be that it is always wrong deliberately to kill an innocent human being, or that one ought always to tell the truth or to keep one's promises. Absolutism is to be contrasted with \*consequentialism, the view that the rightness or wrongness of actions is determined solely by the extent to which they lead to good or bad consequences. A consequentialist could maintain, for example, that \*killing is normally wrong because it creates a great deal of grief and suffering and deprives the person who is killed of the future happiness which he/she would have experienced, but that since, in some cases, a refusal to kill may lead to even more suffering and loss of happiness, it may sometimes be right even to kill the innocent.

Moral absolutism is linked to, but not synonymous with, a \*deontological position in ethics. The latter is the view that certain kinds of actions are *intrinsically* right or wrong—right or wrong simply because they are that kind of action—independently of the consequences to which they may lead. Killing the innocent, for instance, may be thought to be wrong *just because it is the killing of the innocent*, quite apart from the suffering and loss of happiness to which it will normally lead. A deontological position obviously contrasts with a consequentialist one, and may appear to be the same as absolutism, but in fact the two are distinct. One may hold that killing the innocent is intrinsically wrong, but also accept that in certain extreme circumstances the intrinsic wrongness of killing the innocent may itself be overridden by the appalling consequences

which will occur if one refuses to kill. Absolutism builds on a deontological position but adds a stronger claim—not only is the action intrinsically wrong, but its wrongness can never be overridden by any consideration of consequences.

The absolutist position corresponds to common traditional views of morality, particularly of a religious kind—what might be called the ‘Ten Commandments’ idea of morality. Nevertheless, when detached from appeals to religious authority absolutism may appear to be vulnerable to rational criticism. Is it not perverse to maintain that a certain kind of action is simply ruled out, even when the refusal to perform it will lead to even worse consequences? Why insist on *never* killing the innocent, for instance, if in certain circumstances a refusal to do so will mean that more innocent people will die? To be plausible, absolutism needs to be supplemented with some further distinction between different ways in which consequences may come about, such as the distinction between \*acts and omissions, or the doctrine of \*double effect. The absolutist who refuses to condone the killing of the innocent, even though more innocent people will die as a result of not doing so, can then say that though the loss of innocent lives is a terrible thing; nevertheless, letting innocent people die, or bringing about innocent deaths as an unintended side-effect, is not ruled out by an absolute prohibition in the same way as is the intentional killing of the innocent. Whether this is a sufficient defence of absolutism remains a matter for debate.

R.J.N.

\*ideals, moral; lying.

**abstract entities.** The dichotomy between the abstract and the concrete is supposed to effect a mutually exclusive and jointly exhaustive ontological classification. The dichotomy is, however, too naïve to be of theoretical use. There are many different ways, themselves vague, to mark the distinction: abstract entities are not perceptible, cannot be pointed to, have no causes or effects, have no spatio-temporal location, are necessarily existent. Nor is there agreement about whether there are any abstract entities, and, if so, which sorts of entity are abstract. Abstract entities, conceived as having no causal powers, are thought problematic for epistemological reasons: how can we refer to or know anything about entities with which we have no causal commerce? Hence the existence of nominalists, who try to do without abstract entities.

A.D.O.

\*universals; nominalism; proposition.

B. Hale, *Abstract Objects* (Oxford, 1987).

**abstract ideas:** *see* ideas.

**abstraction.** A putative psychological process for the acquisition of a \*concept *x* either by attending to the features common to all and only *x*s or by disregarding just the spatio-temporal locations of *x*s. The existence of abstraction is endorsed by Locke in the *Essay Concerning Human Understanding* (esp. II. xi. 9 and 10 and III. iii. 6ff.) but rejected by Berkeley in *The Principles of Human Knowledge* (esp. paras. 6ff. and paras. 98, 119, and 125). For Locke the capacity to abstract distinguishes human beings from animals. It enables them to think in abstract ideas and hence use language. Berkeley argues that the concept of an abstract \*idea is incoherent because it entails both the inclusion and the exclusion of one and the same property. This in turn is because any such putative idea would have to be general enough to subsume all *x*s yet precise enough to subsume only *x*s. For example, the abstract idea of triangle ‘is neither oblique nor rectangular, equilateral nor scalenon, but all and none of these at once’ (*The Principles of Human Knowledge*, Introduction, para. 13).

**abstract particulars:** *see* properties, individual.

**absurd, the.** A term used by existentialists to describe that which one might have thought to be amenable to reason but which turns out to be beyond the limits of rationality. For example, in Sartre’s philosophy the ‘original choice’ of one’s fundamental project is said to be ‘absurd’, since, although choices are normally made for reasons, this choice lies beyond reason because all reasons for choice are supposed to be grounded in one’s fundamental project. Arguably, this case in fact shows that Sartre is mistaken in supposing that reasons for choice are themselves grounded in a choice; and one can argue that other cases which are supposed to involve experience of the ‘absurd’ are in fact a \**reductio ad absurdum* of the assumptions which produce this conclusion. The ‘absurd’ does not in fact play an essential role within existentialist philosophy; but it is an important aspect of the broader cultural context of existentialism, for example in the ‘theatre of the absurd’, as exemplified by the plays of Samuel Beckett.

**academic freedom.** An integral aspect of open societies, academic freedom is the right of teachers in universities and other sectors of education to teach and research as their subject and conscience demands. This right, though, may not be unproblematically applicable, even in free societies. Should academic freedom be extended to those perceived by others as using it to interfere with the rights

#### 4 academic freedom

of others, or to pursue morally objectionable research? Like other \*freedoms, in practice academic freedom is constrained by often tacit conventions regarding its limits. One should never underestimate the ingenuity of academics themselves in justifying denials of academic freedom to their colleagues.

A.O'H.

\*persecution of philosophers; teaching and indoctrinating.

C. Russell, *Academic Freedom* (London, 1993).

**Academy, the.** The educational institution founded by Plato, probably around 387 BC, so-called because of its location at a site sacred to the hero Academus. It is fanciful to call the Academy a 'university' or 'college'. The best idea we have of the subjects studied there comes from Plato's dialogues themselves and Aristotle's testimony. When Plato died, the leadership of the Academy passed to his nephew Speusippus. About 275 the so-called Middle Academy came to be dominated by \*Sceptics under the leadership of Arcesilaus. This dominance continued through the middle of the second century when Carneades founded the New Academy. In 87/6 Antiochus of Ascalon broke away from the sceptical tradition of Platonic interpretation to try to recover what he regarded as a more authentic form of Platonism. Since the physical structures of the original Academy had been destroyed with the fall of Athens in 88, Antiochus' Academic leadership was more notional than real. Though the Academy was revived in the later fourth century AD, it was destroyed finally by Justinian in 529.

**access, privileged:** see privileged access.

**accident.** The term 'accident' in philosophy has two main uses, both stemming from Aristotle. In the first an accident is a quality which is not essential to the kind of thing (or in later philosophers, to the individual) in question. 'Being musical' is accidental to Socrates, 'being rational' and 'being an animal' are not. Which \*qualities, if any, are essential or non-accidental is a controversial matter in contemporary philosophy. In the second main use, the term 'accident' is a way of allowing chance and causality to coexist: digging for truffles I turn up some treasure. The digging was not an accident, and since the treasure was there all along, my finding it if I dug there was determined; none the less, my finding of it was accidental, since my digging was a digging for truffles, not for treasure. Typically, events which are accidental under one description are determined under another. In non-philosophical contexts the term often connotes *harmful* accidents.

**Achilles paradox.** A paradox of motion, due to Zeno of Elea. In a race, Achilles can never catch the tortoise, if the tortoise is given a head start. For while Achilles closes the initial gap between them, the tortoise will have created a new gap, and while Achilles is closing that one, the tortoise will have created another. However fast Achilles runs, all that the tortoise has to do, in order not to be beaten, is make some progress in the time it takes Achilles to close the previous gap. Standard responses include claiming that the argument misconceives the implicit ideas of infinite series and their limits; alternatively, that space is not adequately described in purely mathematical terms. Zeno's own response is not documented. One hypothesis is that he took the conclusion at face value, as part of a general scepticism concerning matter, space, and motion.

Mark Sainsbury, *Paradoxes* (New York, 1988), ch. 1.

**acquaintance and description.** A distinction between two kinds of knowledge, crucial to Russell's philosophy, and analogous to that between *connaître* and *savoir*. We are not acquainted with Sir Walter Scott, so we know him only by description, for example as *the author of Waverley*. By contrast, we can know one of our experiences 'by acquaintance', that is, without the intermediary of any definite description. More generally, to know a thing by description is to know that there is something uniquely thus and so; to know a thing by acquaintance is for it to come before the mind without the intermediary of any description. Knowledge by description involves knowledge of truths, whereas knowledge by acquaintance does not: it is knowledge of things.

For Russell, acquaintance is basic on two counts: all understanding rests upon acquaintance (with what the word or concept stands for); and all knowledge of truths depends upon acquaintance with those things which the truths concern.

**action.** An action is sometimes defined as someone's doing something intentionally. The phenomenon of human action owes its importance both to questions about \*agents' metaphysical status, and to ethical and legal questions about human \*freedom and \*responsibility. Recently many philosophers have thought that an account of action (the phenomenon) should proceed via an account of actions (events). When an action is defined as someone's doing something intentionally, actions are

taken to be a species of event, and events are taken to be particulars which can be described in different ways. On this account, Jane's moving of her fingers against the keyboard, where it results in sounds of piano playing, is Jane's playing of the piano. Thus Jane does two things—move her fingers and play the piano—although there is only one action here. Typically someone who does something does several 'linked' things, each one being done *by* or *in* doing some other. (\*Basic action.) According to the definition, for there to be an action a person only has to have done intentionally one (at least) of the things she did. So Jane's waking up the neighbours could be an action, even though she didn't intentionally wake them: it would be, if it were also her playing of the piano, and she did play the piano intentionally.

When this definition is combined with the thought that it is *by* moving her body that a person does anything, the claim that actions are bodily movements is made: every action is an event of a person's moving (the whole or a part of) her body.

The definition is not uncontroversial. Some philosophers (such as Goldman) deny that a person's doing one thing can be the same as her doing another; they believe that events should be 'finely individuated', not 'coarsely', so that only some actions, not all of them, are bodily movements. Other philosophers deny that actions are events at all: either they think that there are no such things as particular events, or they allow that there are events but say that actions are not among them.

Even a proponent of the definition will acknowledge that it does not cover all of the ground where attributions of responsible agency can be made. (1) A person may be said to have done something when she keeps perfectly still—when, apparently, no event occurs. In such cases, it seems intuitively right that to say there is an instance of action only if the person *intentionally* kept still. Thus it may still be thought that 'doing something intentionally' marks out action: the original definition can be seen to be basically right, but it has to be conceded that there is not always an event when there is an instance of action, and that no fully general link can be made between action and bodily movement. (2) A person may be answerable for doing something that she didn't intentionally do: for instance, when she starts a fire by idly throwing away her lighted cigarette. To cover cases like this, more resources than the word 'intentionally' are needed. But further elucidation of 'intentionally' may uncover a range of concepts which can in turn illuminate a broad conception of responsible agency.

A person's doing of something intentionally, it may be argued, always results from that person's believing something and her desiring something, which jointly constitute her having a reason to do the thing. The definition of actions, then, may be part of a view according to which a certain sort of causal history distinguishes actions from other events. Such a view fell from philosophical favour in the 1950s and 1960s, but has by now been largely restored to credibility. The view has many variants. In a traditional

empiricist version, each action is caused by a \*volition. In some quarters, the traditional version has been supplanted by the thesis that each action is itself an event of someone's \*trying to do something: the suggestion is that a person's having a reason to do something leads her to attempt to do it, and then, when her attempt actually has the effects she wants, as usually it does, it is her doing the thing intentionally.

Giving someone's reasons is a matter of saying *why* she did what she did, so that the idea of a distinctive kind of explanation—action explanation—enters the picture when an action is seen to result from someone's having a reason. (\*Reasons and causes.) Also introduced is the idea of a distinctive kind of thinking from which action issues—\*practical reason, or deliberation, an account of which requires understanding of (at least) \*belief, desire, valuing, \*intention, and choice. **action, basic:** *see* basic action.

**action at a distance.** That one event could have direct causal influence on another spatially separated from it without causation being propagated continuously from point to point has often been met with scepticism. In the nineteenth century field theories 'filled in' the causation between particles with spatially continuous fields. But field theories have their own problems, especially with the interaction of the source particle of the field with its own generated field. These have led to contemporary action at a distance theories of interaction. In order to conform to the observed facts and to relativity, these must posit a time delay between cause and spatially distant effect. In order to account for the behaviour of the source, both retarded and advanced effects must be posited. While the denial of action at a distance is built into quantum field theory and into many accounts of causation (Hume, Reichenbach, Salmon), the famous space-like correlations of \*quantum mechanics are a difficulty for those who deny action at a distance. **active and passive intellects.** Two powers relating to conceptual thought associated with Aristotelian philosophy. In *De anima* Aristotle distinguishes between the \*mind as a capacity for conceptual thinking (the passive intellect), and another power (the active intellect) which forms concepts and activates the latent capacity for thought. The interpretation of these notions has been a

## 6 active and passive intellects

matter of controversy since antiquity and remains unresolved today. Some medieval Arabic commentators regarded the active intellect as a single immaterial principle to which all thinkers are related; other medievals held this to be so in respect of *both* intellects. Aquinas argued instead that the two intellects are simply powers of the mind of each thinker. Conceived in this way the distinction corresponds to that recurrent in cognitive psychology between concept-forming and concept-employing capacities. It also bears upon the debate between nativism and abstractionism in relation to the source of \*ideas. J.HAL.

\*acts, mental.

Z. Kuksewicz, 'The Potential and the Agent Intellect', in N. Kretzmann, A. Kenny, and J. Pinborg (eds.), *The Cambridge History of Later Medieval Philosophy* (Cambridge, 1982).

**acts and omissions.** The moral distinction between acts and omissions amounts to the claim that there is a morally significant difference between a particular action and a corresponding failure to act, even though they have the same outcomes. Thus, it is said that there is a moral difference between, for example, lying and not telling the truth, hindering and failing to help, and between \*killing and letting die, even though, in each case, the consequences of the action and the omission may be the same.

There is undoubtedly some obscurity about the distinction. Understanding it is complicated by the somewhat untidy concept of an omission. Roughly speaking, an omission of mine may be said to occur when I fail to do something which I might reasonably have been expected to do. Such an omission may or may not be a matter of moral censure, depending on what duties I have and what expectations they give rise to.

However, since the fact that something is an omission settles no moral questions, it is mistaken to interpret the acts–omissions distinction as straightforwardly differentiating between what we are obliged not to do and what we are allowed to do. Hence it is not the claim that killing, for instance, is morally forbidden while letting die is morally permissible. Nor does it seem helpful to see the distinction as hanging on a difference in intention, for, clearly, *both* a case of killing *and* a case of letting die would have to be intentional, as opposed to accidental, to raise serious moral questions. The point of the distinction seems rather to be to assert that there are prima-facie differences in gravity in the moral logic of the two areas, i.e. that cases of positive commission require reasons that are morally weightier than, and perhaps different in kind from, those that would justify an omission. Thus not killing and not lying, for example, are held to be morally more basic than saving lives and telling the truth, even though the latter are also a matter of moral duty.

As a cornerstone of \*deontological ethics, the acts–omissions distinction is vulnerable to the usual criticisms by \*consequentialism and its proponents. But some of these criticisms are misguided: utilitarian dismissals of the distinction are often based on the idea that it amounts to,

for instance, a denial of the duty to save life. Yet one does not have to refute the distinction to establish the moral duty to save lives. If we can be held just as responsible for the things we fail to do as for the things we do, we need not deny what the distinction asserts—that there is a difference between the moral ground we should be able to take for granted and the moral ground we have to struggle continuously to gain. P.W.

\*absolutism, moral.

E. D'Arcy, *Human Acts* (Oxford, 1963).

**acts, linguistic:** see linguistic acts.

**acts, mental.** (1) Mental actions; or, less commonly, (2) \*mental events in general. Mental events that are not mental actions include suddenly remembering where one left one's keys and noticing that it is raining. Paradigmatic mental actions include adding numbers in one's head, deliberating, and (one some views) choosing and trying. The precise difference between mental events that are actions and those that are not is a vexed question (sometimes examined under the rubric 'activity versus passivity'). Whether there is a single concept of action that includes both mental actions and actions essentially involving peripheral bodily movement is controversial. The promising idea that actions are analysable as events with 'the right sort' of psychological–causal history may provide the key to both questions, provided that the right sort of history does not itself essentially include actions. **Adorno, Theodor Wiesengrund** (1903–69). German philosopher, sociologist, and musicologist, who was the most brilliant and versatile member of the \*Frankfurt School. He studied philosophy, music, and sociology at Frankfurt and music in Vienna under Alban Berg. In 1934 he was forced to emigrate, first to Oxford, then in 1938 to New York.

His thought was permanently marked by the rise of fascism, and by the failure of \*Marxism both in the West and in the Soviet Union. Political defeat accounts for the survival of philosophy, against Marx's expectations: 'Philosophy, which once seemed obsolete, lives on because the moment to realize it was missed.' He and Horkheimer diagnose the ills of modernity in *Dialectic of the Enlightenment* (1947; tr. New York, 1972).

Another factor shaping Adorno's thought is \*existentialism, which was in part a 'movement of rebellion against the dehumanization of man in industrial society' (Tillich) and a response to the failure of Marx's and Hegel's solutions to it. Despite his criticisms of the existentialists, Adorno shared many of their concerns: Kierkegaard's reinstatement of subjectivity against Hegel's supposedly

panlogistic and historicist system, Heidegger's antipathy to technology, and so on. (Adorno's 1933 habilitation thesis on Kierkegaard appeared as *Kierkegaard: Construction of the Aesthetic* in 1965.) He criticizes them from a (considerably modified) Hegelian–Marxist viewpoint, arguing that they, like more traditional philosophies, misrepresent social and political relations and thereby provide an ideological justification for domination. Even to ignore socio-political relations is to justify them, by suggesting, for example, that the individual is more autonomous than he is: 'If thought is not measured by the extremity that eludes the concept, it is from the outset of the nature of the musical accompaniment with which the SS liked to drown the screams of its victims.' But he also subjects them to 'immanent' philosophical criticism, applying 'Hegel's dictum that in dialectics an opponent's strength is absorbed and turned against him.'

In *Against Epistemology: A Metacritique* (1956; but written in Oxford, 1934–7; tr. Oxford, 1982) he applied these methods to Husserl's half-hearted idealism, arguing that 'one cannot both derive advantage from this solipsistic approach and transcend its limit' and that 'phenomenologically speaking, [the fact that it is done] "with the eyes" belongs to the sense of seeing and is not only [the result of] causal reflection and theoretical explanation'. Adorno invokes Hegel's belief that everything is mediated against Husserl's attempt to find an indubitable beginning or foundation for philosophy: 'The insistence on the mediatedness of everything immediate is the model of dialectical thinking as such, and also of materialistic thinking, insofar as it ascertains the social preformation of contingent, individual experience.'

In *The Jargon of Authenticity* (1965; tr. London, 1973), besides censuring what he saw as Heidegger's obfuscating and ideological jargon, Adorno criticized him both on a philosophical level ('In view of our potential, and growing control over organic processes, we cannot dismiss *a fortiori* the thought of the elimination of death. This may be very unlikely; but we can entertain a thought, which, according to existential ontology, should be unthinkable') and on a political level: 'Heidegger's dignity is again the shadow of such a borrowed ideology; the subject who based his dignity on the (albeit questionable) Pythagorean claim that he is a good citizen of a good state, gives way to the respect due to him merely because he, like everyone else, must die. In this respect Heidegger is a reluctant democrat.'

*Negative Dialectics* (1966; tr. New York, 1973) gives a general account of Adorno's thought. Like Socrates and the early Plato, he wields a negative dialectic and does not, like Hegel and the later Plato, derive a positive result, let alone an all-encompassing system or a philosophy of 'identity', from his critique of other philosophers and of social institutions. His aim is to dissolve conceptual forms before they harden into lenses which distort our vision of, and impair our practical engagements with, reality. Reality is not transparent to us; there is a 'totally other', a 'non-identical', that eludes our concepts.

When concepts fail us, \*art comes to our aid. Aesthetic illusion sustains the hope for an ideology-free utopia that neither theory nor political activity can secure: 'In illusion there is a promise of freedom from illusion.' Art, especially music, is relatively autonomous of repressive social structures and thus represents a demand for freedom and a critique of society. This is to be discerned in the formal properties of particular works. Art is 'concentrated social substance'. Even music commercially mass-produced by the 'culture industry' has a social meaning: the repressive irrationality of capitalism. M.J.I.

**aesthetic attitude.** The aesthetic attitude is supposedly a particular way of experiencing or attending to objects. It is said to be an attitude independent of any motivations to do with utility, economic value, moral judgement, or peculiarly personal emotion, and concerned with experiencing the object 'for its own sake'. At the limit, the observer's state would be one of pure detachment, marked by an absence of all desires directed to the object. It could be conceived of as an episode of exceptional elevation wholly beyond our ordinary understanding of empirical reality (as in Schopenhauer), or simply as a state of heightened receptiveness in which our perception of the object is more disengaged than usual from other desires and motivations which we have. The term 'disinterested' is often applied to such an attitude.

Commonly, proponents of the aesthetic attitude think that it can be directed as much to nature as to works of art, and, for some thinkers, it is important that we may adopt an aesthetic attitude towards any object without restriction. However, it is questionable whether we can always abandon our instrumental, moral, or emotional attitudes. For a range of different cases to test this question, think of buildings which we live in, war atrocities which we see on film, and the naked human body. The two questions are whether we can, and whether we ever should, adopt a purely aesthetic attitude to these things. In the case of art, an aesthetic attitude theory can support the idea that certain kinds of response are privileged, others discountable on the grounds of failing to take the 'correct' attitude towards the object concerned. This assumes that the point of \*art is wholly aesthetic. The notion of an aesthetic attitude deserves to be treated with some scepticism, as it has been in recent philosophy. C.J.

\*aesthetic concepts; aesthetic judgement.

**aesthetic concepts.** Term introduced into aesthetic theory in Frank Sibley's landmark 1959 essay of that name.

According to Sibley, aesthetic concepts, such as *balanced*, *delicate*, *anguished*, differ from non-aesthetic ones, such as *orange*, *rough*, *square*, in being strongly non-condition-governed, that is, not applicable according to a rule going from non-aesthetic concepts to aesthetic concepts. Aesthetic concepts, Sibley insisted, were strongly perceptual ones—their presence must be experienced, not inferred—but unlike non-aesthetic perceptual concepts, they require taste, not merely functioning senses, for their discernment, and they are of a higher order than and dependent on non-aesthetic perceptual concepts. Sibley's claim is plainly related to the Kantian notion that the judgement of beauty is not subject to rule.

It is important to see that Sibley's claim is, in terms suggested by Monroe Beardsley, a denial of application conditions for aesthetic concepts, not a denial of occurrence conditions for them. And one piece of evidence for the correctness of Sibley's claim concerning the non-condition-governedness of the aesthetic is how finely dependent on the non-aesthetic complexion of an object the application of an aesthetic term appears to be, very small differences in non-aesthetic complexion being able to induce large differences in the aesthetic terms that apply. Nevertheless, Sibley's thesis came under attack early on from philosophers such as Ted Cohen, who maintained that the aesthetic/non-aesthetic distinction was untenable, and Peter Kivy, who held that aesthetic terms were in fact condition-governed after all.

In more recent discussion, talk of aesthetic concepts has usually been replaced by talk of aesthetic properties, and Sibley's claim of dependence has been transmuted into talk of the supervenience of aesthetic properties on non-aesthetic properties, including those relating to an object's appreciative context. Current debate about aesthetic concepts turns on the issue of how to delineate clearly the class of such concepts, the issue of whether such concepts essentially involve a normative or evaluative component, and the issue of the defensibility of realism with respect to such concepts. **aesthetic distance.** In one version of \*'aesthetic attitude' theory, aesthetic responses are alleged to occur when people 'distance' themselves from an object they perceive, suspending their desires and other feelings, and leaving the mere experience of contemplating it. 'Distancing' is also thought of as a feature in understanding artistic representations. Someone whose own emotions became engaged in an experience of full-blown pity or contempt for a fictional character would be 'under-distanced.' C.J.

E. Bullough, 'Psychical Distance as a Factor in Art and an Aesthetic Principle', in *Aesthetics: Lectures and Essays* (London, 1957).

**aesthetic imagination:** *see* imagination, aesthetic.

**aestheticism.** A term sometimes used pejoratively for a view about the value of \*art. More often presupposed than argued for, it is the idea that works of art have value to the extent that they can be appreciated for their aesthetic merits, and that such appreciation requires no justification by reference to anything outside itself. Aestheticism presupposes both that there is distinctively aesthetic value, and that such value is not derivative from any other kind. An alternative to aestheticism would be instrumentalism, the view that art is valuable, if at all, because it is a means to some end, such as moral improvement, knowledge (say, of human psychology or history), or a more cohesive society. For aestheticism, by contrast, art belongs securely in the realm of the aesthetic, and that realm has a wholly autonomous value. C.J.

L. Tolstoy, *What is Art?*, tr. A. Maude (Indianapolis, 1960).

**aesthetic judgement.** An aesthetic judgement attributes a form of aesthetic value to a thing, of whatever kind. (For most philosophers, not all aesthetic judgements are about art, and not all judgements about art are aesthetic judgements.) Kant's influential theory provides a starting point for analysing such judgements. For Kant, aesthetic judgements are distinguished both from the expression of subjective likes and dislikes, and from judgements that ascribe an objective property to the thing that is judged. Like subjective preferences, they must be made on the basis of an experience of \*pleasure; but like property-ascribing judgements, they make a claim with which other subjects are expected to agree. Other views would assimilate aesthetic judgements more closely to truth claims about a thing's properties, or place more emphasis on subjective response, and less on the notion of agreement or correctness. C.J.

\*aesthetic attitude.

I. Kant, *Critique of Judgement*, tr. J. C. Meredith (Oxford, 1969).

**aesthetics, history of.** Aesthetics, conceived as a distinct discipline or sub-discipline dealing with philosophical questions concerning \*art and aesthetic value, is a modern invention, originating in the eighteenth century. Ancient and medieval writers gave consideration to \*beauty, artistic representation, the \*sublime, and the value of the arts, and among these discussions those of Plato (especially in the *Republic*) and Aristotle (in the *Poetics*) have been vastly influential and are still studied by aestheticians today. Later writings by, for example, Plotinus, Augustine, and Aquinas are of historical importance for the philosophy of art. However, this sketch will concentrate on major lines of thought concerning art and the aesthetic on the part of philosophers in the modern period, from roughly 1700 onwards.

Philosophical aesthetics owes much to German philosophy of the eighteenth and nineteenth centuries,

including its name (Alexander Baumgarten coined the term in 1735, taking it from the Greek *aisthesis*, meaning sensation or perception), but also, thanks to Kant, Hegel, and their contemporaries, its first definitive book, its arrival as a systematic discipline, and its period of greatest intellectual fervour. However, the earliest recognizable practitioners of aesthetics were philosophers in the British empiricist tradition. The most important work here is that of David Hume; other figures are Joseph Addison, Francis Hutcheson, Edmund Burke, Alexander Gerard, Lord Kames, and Archibald Alison. These thinkers were broadly in the wake of Locke's empiricism, but worked on problems of \*taste, beauty, and critical judgement in a way that Locke had not. Locke's contemporary Shaftesbury addressed such issues prominently, and has sometimes been considered the founder of aesthetics, though he never achieves the separation from ethical questions which allows the aesthetic to emerge as an area of investigation in its own right. The work often credited with developing the first independent notion of aesthetic response is Hutcheson's *Inquiry into the Original of Our Ideas of Beauty and Virtue* (1725). Hutcheson attempts to explain the source of our pleasure in beauty, and assigns it to an 'internal sense' in addition to the five familiar senses. We are caused by some objects to have ideas of beauty, but their occurring in us is neither determined by knowledge we have of the object, nor attended by any desire or interest towards it. This effectively sets the stage for many later theories of aesthetic response.

A concise early discussion of the problem of \*aesthetic judgements is Hume's essay 'Of the Standard of Taste' (1757), regarded today as the most important contribution to aesthetics before Kant. Hume starts from an apparent contradiction. Judgements of taste, which in this context are critical judgements about the arts, are founded upon sentiments of beauty, but sentiments make no reference to states of affairs in the world and are merely subjective, so judgements of taste, which are frequently found to be in conflict with one another, might all seem equally 'right'. Yet there are some judgements which we would regard as clearly wrong, absurd or ridiculous (such as the assertion of 'an equality of genius between Ogilby and Milton'). How to explain the rightness or greater authoritativeness of some critical judgements, while acknowledging them to be based upon subjective responses? Hume proposes that there must be some standard of taste to settle aesthetic disputes. He mentions the idea of general principles of taste, though what they are and how they are applied is less clear. He adduces the fact that certain works of classical literature are universally regarded as paradigms. Finally he suggests that some human beings can be found who are 'true judges' and whose responses are more authoritative than those of others. These true judges would be characterized by 'strong sense, united to delicate sentiment, improved by practice, perfected by comparison, and cleared of all prejudice'. Though it remains difficult to see how such judges are to be identified and why we should assume that their judgements will

agree with one another, Hume's essay is a clear exposition of the issues surrounding aesthetic judgement.

The now familiar concept of art also has its roots in the eighteenth century. In the work of such French authors as Dubos and especially Batteux there formed the concept of the *beaux arts*: \*music, \*poetry, painting, sculpture, and dance. New at this time was the separation of the arts as such from other human accomplishments, notably the sciences, and the idea that there were systematic resemblances that united all the arts. In Germany, where rationalist philosophy predominated, Baumgarten's innovation was to claim that the sense experience provided by a poetic work could be analysed as having its own kind of perfection, a perfection that must be distinguished from that of intellectual thinking. He thus showed the way to theorize the arts as human attainments distinct from science and rational thought. The \*Enlightenment figures Moses Mendelssohn and Lessing were much influenced by this. The grouping of the arts under a single heading allowed also for work on the differences between them, of which a striking example is Lessing's analysis of representation in poetry and the visual arts in his essay *Laokoön*.

Immanuel Kant's *Critique of Judgement* (1790) begins by pursuing essentially the same question as Hume, though in different terminology. Kant's central notion is that of judgements of taste, or judgements of some particular object's beauty, which he is concerned to demarcate from judgements of the good or judgements of the merely agreeable. Judgements of taste, though similar to these other judgements in being associated with pleasure, have distinct characteristics: the pleasure they are founded upon is disinterested, they claim universal assent but without basing that claim upon concepts, they arise out of a consciousness of purposiveness in the object without its being assigned any determinate purpose, and they regard pleasure in the object as necessary for all judging subjects. The central question is: How can such judgements be justified in claiming universal assent, when their basis is a subjective pleasure? Kant's answer relies on his theory that ordinary perception involves a joint operation of the imagination and the understanding. The pleasure in something's beauty engages these cognitive capacities in 'free play', where we are conscious of a 'formal' harmoniousness in our experience, or a unity of the same kind as when we judge something under a concept, but without the determinate content a concept provides. Kant argues that since we can assume the same cognitive faculties in all, we can rightfully expect them all to experience the same pleasure.

Kant has often been interpreted as putting forward a theory of art which is formalist and centred around the notion of a pure aesthetic encounter with the art object. But this is to some degree an anachronistic reading, answering to later views of the nature of art. Kant's own theory of art requires a distinction between 'pure' aesthetic judgements and other judgements of beauty in which we take into account the object's purpose and its perfection in answering to that purpose. Even more

importantly, Kant characterizes art from the productive viewpoint as the work of genius, a natural capacity for forming original images rich in suggestions of thought that cannot be conveyed directly in language or concepts. He has a lively sense of the connections between the aesthetic and the ethical, saying that beauty symbolizes morality, that an interest in natural beauty is the mark of a moral character, and that the cultivation of taste and that of moral feeling go hand in hand. A connection with his ethics is also evident in Kant's treatment of feelings of the \*sublime, which occur when some object is either too vast for us to comprehend or so powerful that it can destroy us. Our capacity to tolerate these limitations gives pleasure because it acquaints us with our existence as free moral agents who are not wholly exhausted by our empirical natures.

The period immediately after Kant was fertile for aesthetics. For Friedrich Schiller (1759–1805) art has an exalted role in human life because of its \*freedom from constraints of moral duty and physical need. Human beings have two essential drives, the material and the formal, and these are united in a 'play drive', manifest in art which in its freedom succeeds in uniting form and matter. An emphasis on freedom, \*autonomy, spontaneity, runs through the main movements of the day: early romanticism and German idealism. Art was seen as the prime arena for human self-expression and as important in the quest for a problematic union with nature and with society. In the early philosophical work of F. W. J. von Schelling (1775–1854) art is seen as uniquely unifying the conscious productivity of mind and the unconscious productivity of nature. But the most substantial and enduring contribution to aesthetics from this period of German idealism was the work of G. W. F. Hegel, principally in his *Lectures on Aesthetics* delivered in the 1820s. Art has a cognitive value for Hegel: it does what religion and ultimately philosophy do more perfectly, that is allow humans to attain self-understanding as freely self-determining conscious beings. Art's distinctive manner of achieving this is via the making of sensuous material objects. Hegel is much concerned with beauty, though unlike Kant he excludes from consideration the beauty of nature, because for him philosophy studies the development of the human mind or reason through history. Hegel's pronouncement that his topic is 'the beauty of art' fixes in place the confluence of interests that defined but also bedevilled philosophical aesthetics long afterwards.

For Hegel beauty in art is conceived neither in terms of mere form nor principally in terms of its giving pleasure: rather it is 'sensuous appearance of the idea', a manifestation of truth through some experienceable medium. Hegel not only gives a thorough systematic account of architecture, sculpture, painting, music and poetry, but provides a unified history of the development of the arts, embracing a wide range of epochs and cultures (including non-Western ones). This historical approach has been vastly influential on the practice of art history and criticism, and indeed on the practice of the arts to this day.

Hegel divided the history of art into a pre-classical 'symbolic' phase, then the classical phase of the ancient Greeks, which he regarded as superior because of its attainment of unity between content and sensory medium, and a third phase of romanticism which embraced medieval Christian art and the art of modernity. Art had already declined in the modern period, and must end, according to Hegel, superseded by religion and philosophy.

Two further German philosophers of the nineteenth century produced original aesthetic theories of lasting interest: Schopenhauer and Nietzsche. In *The World as Will and Representation* (1818) Schopenhauer developed one of the earliest 'aesthetic attitude' theories. Aesthetic experience is for him a suspension of the will, allowing the subject to enter a higher state of consciousness, freed from desire or interest towards the object of contemplation, and free of the suffering that attends willing. This state of peaceful elevation is of peculiar value to Schopenhauer because of his philosophical pessimism, the view that human individuals must strive and suffer without attaining any lasting or redeeming goals. Aesthetic experience is a temporary relief from the misery of an existence we would prefer not to have if we understood it properly. But Schopenhauer also attaches to the aesthetic state a supreme cognitive value, in that by freeing ourselves of will we free ourselves of subjective forms and achieve a purer knowledge, which he says is of 'Ideas, conceived in a Platonic manner. Art—treated here in a resolutely ahistorical manner—is of special value because through the work of a genius, who can suspend individual willing and merely perceive, we are enabled to experience reality more objectively. Schopenhauer gives accounts of the distinctive value of the different art forms. Of special note is his theory of music, which he says dispenses with representation of Platonic Ideas and copies directly the movements of the will, of which, according to his metaphysics, the whole of reality consists.

In his early period Nietzsche was influenced by Schopenhauer, but he took seriously the more Hegelian emphasis on the historical development of the arts, imbued his theory with scholarship of the ancient world, and sought to promote the recent oeuvre of Richard Wagner as a model art form. The result of this mixture was Nietzsche's first book *The Birth of Tragedy* (1872). Nietzsche's central opposition here is between two Greek deities, Apollo and Dionysus, who have complex symbolic significance. Apollo is associated with sun, light, appearance, and clarity, Dionysus with trance, abandon, and ritual dance. Nietzsche takes them to symbolize natural forces or drives whose key-words are *dream* and *intoxication*. We have drives to immerse ourselves in an alternative world of appearance and beauty, and to lose our sense of self in a drunken transport or trance in which we become conscious of an identity with nature as a whole. The plastic arts and music respectively answer to these drives in their purest forms. But Nietzsche's central claim is that in tragic drama of the classical age in Athens these two creative drives became fused so as to create the

perfect art form. \*Tragedy represents the individual in image, but uses the music and dance of the chorus to provide an identification with a greater unity, a viewpoint from which the suffering and destruction of the individual can be witnessed with fulfilment and joy. Nietzsche pronounces that 'it is only as an aesthetic phenomenon that existence and the world are eternally justified', in part because of a pessimism similar to Schopenhauer's: life itself is brief, painful and ultimately without point, so that only when transfigured by art is it something we can celebrate.

Nietzsche's narrative concludes with the claim that philosophy brought about the death of tragedy through the figure of Socrates, who held an optimistic view of human happiness and devalued anything for which there was not a rational explanation. Nietzsche's unorthodox book, which he himself more or less disowned in later years, was influential in revealing the expressive and irrational in Greek culture. More recently it has attained great resonance in postmodernist critiques of traditional philosophy and its treatment of the arts. The later Nietzsche was preoccupied with a critique of post-Christian culture, including its morality, metaphysics, and conception of truth. He produced no other systematic work in aesthetics, but regarded artistic creativity, with its licence to form fictions that disregard truth but affirm life, as paradigmatic of autonomous agency and value formation, so that in a sense his moral psychology and theory of value are at the same time contributions to the philosophy of art.

German philosophy continued its tradition of aesthetic theorizing into the twentieth century, where it emerged variously in the form of \*phenomenology, \*hermeneutics and Marxism. A unique body of work arising out of phenomenology is that of Martin Heidegger, whose 1936 essay 'The Origin of the Work of Art' is his most studied work in the philosophy of art. Heidegger was influenced by Hegel and Nietzsche, and by his reading of the poet Hölderlin. A preoccupation with art as revelatory of truth and frequent reference to Greek paradigms show continuity with Hegel, but Heidegger invents a quite new way of describing the work of art and what it does. It is for him a fundamental mistake characteristic of modernity to regard the work of art as a thing present in the world; rather, for Heidegger a work of art 'opens up a world' and is a 'happening of truth'. The being of things in our experience is 'unconcealed' by an art work: for example, a Van Gogh painting of peasant shoes allegedly 'lets us know what shoes are in truth'. Heidegger makes rich, quasi-poetic use of the concepts 'world' and 'earth', to convey that which opens itself to us in our experience of using 'equipment', and the firm but unconcealed basis on which human lives are lived. Art is a uniquely revelatory form of *poiesis* or 'bringing forth', for Heidegger, and fundamentally challenges traditional \*ontology and the technological conception of things that he criticizes in modernity. Hans-Georg Gadamer, a pupil of Heidegger, is the principal exponent of the tradition of hermeneutics, or theory of interpretation, in the German tradition. His *Truth and*

*Method* (1960) seeks a conception of 'experience of truth' which is absent from traditional Kantian conceptions of aesthetic experience, and which sees the experience of art works as transformatory of our own self-understanding.

The most discussed writers in Marxist theoretical aesthetics are Walter Benjamin, whose essay 'The work of art in the age of mechanical reproduction' (1936) is especially widely read, and Theodor Adorno, whose later work is woven from many influences apart from Marxism, including Kant, Hegel, Nietzsche, twentieth-century music—in which he was expert and on which he wrote sophisticated criticism—and aesthetic modernism more generally. Adorno analysed art works as commodities within Western capitalism, but also saw art as having the potential for an autonomy which enabled 'truth content' and a critical standpoint towards society. In his *Aesthetic Theory* (published posthumously in 1970) he adopts a complex dialectical approach, multiplying pairs of opposed concepts to describe art works from many perspectives.

In the English-speaking world the late nineteenth and early twentieth century saw the prevalence of \*aestheticism and \*formalism. Aestheticism arose out of specific artistic preoccupations in Victorian Britain, and is sloganized as the 'art for art's sake' movement, with Oscar Wilde one of its notable proponents. Formalism was championed by Clive Bell, who in his book *Art* (1914) wrote that art was characterized by 'significant form', or 'a combination of lines and colours that moves me aesthetically'. These theories mirrored modernist developments in the various art forms, and reflected a tendency to secure autonomy for art by linking it with a conception of pure aesthetic experience. Such theories had their opponents, most notably perhaps Leo Tolstoy in *What is Art?* (1898) and the American pragmatist John Dewey in *Art as Experience* (1934). Tolstoy rejected much of the celebrated art of his day because it did not fulfil his preferred criterion of communicating moral feeling between human beings. Dewey also accentuated the role of communication and opposed the notion of the single detached subject of aesthetic experience. In a highly developed though recently rather neglected theory, he sought a more comprehensive conception of art, opposing the separation of art from the rest of human experience, and viewing art—conceived more broadly than the traditional fine arts—as an activity productive of consummatory experience.

In *The Principles of Art* (1938) R. G. Collingwood, influenced by the Italian aesthetician Benedetto Croce with whom he is often linked, presents the view that 'art proper' is the expression of emotion. Some activities that are called art Collingwood relegates to the categories of amusement and 'magic', the latter being the arousal of emotions with social usefulness such as solidarity and religious allegiance, while amusement is the arousal of emotions for the sake simply of enjoying them. Collingwood opposes the conception of art as a craft or technique of arousing emotions by making representations, and regards representation as inessential to art. Expressing an emotion is quite distinct from arousing it; expression

involves the authentic realization, through an artistic medium, of the emotion that one is feeling, and independently of this there can be no adequate characterization of what the expressed emotion is.

After the Second World War there began what could be called the first phase of analytical aesthetics in the English-speaking world, influenced by the ordinary language philosophy of the day and by Wittgenstein. The latter's work issued in scepticism about the possibility of defining art. 'Art' was perhaps a family-resemblance concept, whose use did not depend on necessary and sufficient conditions. In the 1960s this dovetailed with an awareness of the rapid change occurring especially in the visual arts, and gave rise to an anti-essentialist view that art was not by essence representation, or pure form, or expression, but an open-ended and liberating set of activities with no clear boundaries. Much debate ensued about what is to be included under the heading of art. In a period when a well known article was entitled 'The Dreariness of Aesthetics', work that stands out as of enduring value is that of Frank Sibley on the relation of aesthetic and non-aesthetic concepts, and Nelson Goodman's proposal to view art as a set of symbol-systems analogous to but importantly distinct from language.

Other influential trends in aesthetics in the second half of the twentieth century could be grouped under the heading of \*post-modernism, stemming from work by a number of French philosophers, of whom Nietzsche is often, with some justification, invoked as a precursor. Some of the approaches now labelled as post-modernism are foreshadowed in the work of Michel Foucault. Others occur in, for example, Roland Barthes and Jacques Derrida. Characteristic ideas of post-modernism are the plurality and arbitrariness of interpretations of art works, the unavailability of stable truth or meaning, the inability of language to refer to a reality beyond itself, the historical constructedness of the interpreter's own standpoint, and the 'death of the author', which supposedly leaves texts interpretable in an unregulated 'play' of multiple readings. Such work challenges many presuppositions about the traditional subject-matter of aesthetics, throwing into question the notions of the autonomy of art, of art as a single coherent category, of the subject of aesthetic experience, of privileged or correct interpretation of art works, and of there being any truth for art to reveal.

These ideas have been highly influential on literary and art theory, and where they have influenced philosophers they have tended to break down the distinction between philosophy and other disciplines. Similar characteristics are found in feminist aesthetics, which has recently emerged as a recognizable strand of thought. Taking a lead from feminist cultural criticism, philosophers have questioned the extent to which art and the concepts in which it is described are gendered. Kant is often a focus for feminist critique, as indeed he is in much twentieth-century aesthetics. In this case, the notion of the disinterested spectator of an object of beauty is argued to reflect a privileged 'male gaze' (a term first used in film theory by

Laura Mulvey) for which women are the prime object. Christine Battersby has argued that the concept of genius too has been constructed in the modern period so as to embody a peculiarly male set of characteristics.

A later phase of aesthetics in the analytic tradition has seen an increased diversity of enquiry, somewhat less isolation of aesthetics from other areas of philosophy, and some degree of interest in questions raised by the so-called continental strains of philosophy. One aspect of recent analytical work has been a decisive, though not uncontested, move away from the assumption that the aesthetic is definitive of art. The work of George Dickie attacked the aesthetic attitude, and he and Arthur Danto argued, in different ways, that art must be defined and interpreted in the context of the history and institutions of art and of its specific history of production. Monroe Beardsley championed a more traditional definition of art as designed to arouse aesthetic response, a view which would exclude many of the broadly 'conceptual' works that impressed other theorists. More recently analytical aesthetics has been alive to a widening range of questions, including the ontology of art, art's relation to mental states such as emotions and beliefs, the nature of pictorial representation (where Richard Wollheim's work has been prominently discussed), musical expressiveness, the value of tragedy, narrative, film, popular art, the relation between aesthetics and ethics, and the distinctiveness of the appreciation of nature. If towards the end of its three-hundred-year history aesthetics is expanding in sophistication and varying its repertoire of questions, that has been accompanied in all of its traditions by increasing uncertainty as to whether aesthetic experience has any role in accounting for art, or indeed whether art is anything of which a unitary account can be given.

**aesthetics, problems of.** Aesthetics is that branch of philosophy which deals with the arts, and with other situations that involve aesthetic experience and aesthetic value. Thus only part of aesthetics is the philosophy of art. The rest, which might be termed the philosophy of the aesthetic, centres on the nature of aesthetic responses and judgements. The philosophy of art and the philosophy of the aesthetic overlap, without either being clearly subordinate to the other. Contemporary aesthetics is a rich and challenging part of philosophy, marked by a high level of disagreement even about what its basic problems are. Faced with a field of diverse subject matter, aesthetics

often looks to stable reference points in its own history, as well as calling on knowledge of the various arts and a sensibility to wider philosophical issues.

*Philosophy of the Aesthetic.* Many different kinds of thing are regarded as having aesthetic value. If we think of pieces of music, poems, paintings, cinematography, bird song, stretches of countryside, cathedrals, flowers, clothes, cars, and the presentation of food, the aesthetic seems to be one pervasive dimension of our lives. A central task will be to examine what 'having aesthetic value' amounts to.

Are we talking about \*beauty? Truth, beauty, and the good may be the traditional staples of philosophy, but contemporary aestheticians would not necessarily accept that the second item in the trinity is the predominant concern of their subject. To many, beauty does not even appear to be a single quality, let alone the summation of everything aesthetic. When we think in particular of the arts, it is debatable whether beauty is *the* quality which gives them value. There has been some interest recently in the notion of the \*sublime as an alternative. All in all, it may be safer to talk about 'aesthetic value' in a more general way, while noting that some philosophers regard 'beauty' as the best name for aesthetic value.

The big, obvious question about \*aesthetic value is whether it is ever 'really in' the objects it is attributed to. This issue parallels \*realism–anti-realism debates elsewhere in philosophy—though there is little reason to assume that aesthetic value will behave in just the same way as, for example, moral value. An extreme realist would say that aesthetic values reside in an object as properties independent of any observer's responses, and that if we make the judgement 'That is a beautiful flower', or 'This painting is aesthetically good', what we say is true or false—true if the flower or painting has the property, false if it does not. We will tend to like the object if we recognize the aesthetic value in it, but, for the realist, whether we recognize it and whether it is there are two separate questions.

Departing from this realist starting point one may suggest various ways in which aesthetic value is less than fully objective. Most people would agree that to have aesthetic value is to be prone to bring about certain responses in observers. Aesthetic value is closely linked with a kind of satisfaction which we may feel when we perceive the thing in question. So whether a cathedral is beautiful depends on whether people who look at it in the right way are liable to enjoy what they see. This does not in itself mean that aesthetic judgements are not true or false. But if they are true or false, what they say about an object is that perception of it is likely to bring about a kind of satisfaction in an observer.

Consequently, much work in aesthetics has gone into trying to specify the nature of aesthetic experience or aesthetic response. One factor is pleasure, satisfaction, or liking. The second is experience: the response we are looking for must be a way of attending to the object itself. In the case of music, it must be a response to perceived patterns

of sound, in the case of cinematography, a response to the experience of seeing something on the screen. If you merely describe a piece of music or a sequence of images to me, I am not yet in a position to respond in the kind of way which is peculiarly relevant to aesthetic value. The third factor in aesthetic response is often thought to be 'disinterestedness'. The idea is that the pleasurable experience of attending to something in perception should not consist in liking a thing only because it fulfils some definite function, satisfies a desire, or lives up to a prior standard or principle.

One paradigmatic view of aesthetic response in recent philosophical aesthetics runs as follows. There are subjective responses which we are justified in demanding from others: these are not idiosyncratic likes and dislikes, but deeply rooted in our common nature as experiencing subjects, and founded on a pleasurable response to the form of the object as it is presented in perception. This means, among other things, that aesthetic value cannot be enshrined in learnable principles—there are no genuine aesthetic principles because to find aesthetic value we must (as Kant put it) 'get a look at the object with our own eyes'. Aesthetic judgements are founded upon the slender basis of one's own feeling of pleasure, but can justifiably claim universal agreement if the subjective response in question is one which *any* properly equipped observer would have.

Proponents of this line contend that agreement in aesthetic judgement is agreement in one's subjective responses. We thus seem to move further away from the idea that aesthetic value is a property residing in objects. If an aesthetic judgement can be made only by someone who undergoes the right sort of aesthetic experience, then we have to accept the following as a consequence: if someone tells me that an object which I have not seen is ten feet tall, black, and made of steel (non-aesthetic properties), I am usually in a position to form the belief that it has these properties; but if someone merely tells me that the same thing is beautiful or has high aesthetic value, I am not yet in a position to make my own aesthetic judgement on it. This is a puzzling result, which should incline us to examine the notion of aesthetic judgement in more depth.

Another line is taken by \*aesthetic attitude theories, which hold that we may approach whatever comes before us in a contemplative frame of mind, submerging or disengaging our desires and extraneous motivations. Historically the clearest and most extreme instance is Schopenhauer's theory of the suspension of the will, in which the mind supposedly becomes temporarily empty of everything except the contemplated object. Aesthetic attitude theories are sometimes conducive to the idea that the value in aesthetic situations resides not in the object perceived but in our entering a particularly liberating and receptive state of mind. Recent critics of the aesthetic attitude have, however, doubted whether any such state of mind exists, or whether, if it does, it is anything more important than simply concentrating fully on what one is looking at or listening to.

The aesthetic attitude approach suggests that any kind of thing may be the occasion of an aesthetically valuable experience, which provokes a query with wider resonance: in trying to explain aesthetic value and aesthetic experience, should we treat *art* with any special privilege? Some philosophers contend that the true home of aesthetic judgements is the artistic sphere, and that we would scarcely think of judging nature aesthetically if we did not inhabit a culture which produced art. If we believe them, then the main focus for a theory of the aesthetic should be judgements of, and responses to, art. But aesthetic responses to art usually depend to some extent upon knowledge of such matters as the style and genre which a piece is in, the identity and intentions of the artist, or at least the historical period and the cultural possibilities available. There is such a thing as understanding a work of art: how does such understanding relate to aesthetic judgements of art? On the one hand, the uninformed observer seems entitled to aesthetic judgements based on his or her responses; on the other, there must be room in principle for right and wrong aesthetic judgements, whose possibility tends to be assumed by ordinary aesthetic discourse.

The aesthetic as a phenomenon, and theories about aesthetic value, can also be studied from a sociological or historical point of view. It is quite fashionable to claim that the practices of aesthetic judgement carried out by particular classes in society, and the very idea of the aesthetic as a realm of self-contained value, have a political or ideological function. But we should avoid the dubious assumption that such claims, if true, would show the whole notion of aesthetic value to be somehow spurious. To use an analogy, the practice of attending football matches may, from a sociological point of view, serve some function of preserving class identities; but this does not alter the fact that people judge matches and players as better or worse. Similarly, it is a fact that aesthetic judgements occur, and that they purport to be about aesthetic value. Whatever their social roles (and these may be quite diverse), we can still ask what aesthetic judgement and aesthetic value are.

*Philosophy of Art.* Sometimes it is assumed that the prime interest in art is aesthetic. But that assumption bears some examination. Unless 'aesthetic' stretches to cover everything conceivable that is of value in art (making it a very impoverished term), art may have values which are not aesthetic. For example, it might have therapeutic value, or give us moral insights, or help us to understand epochs in history or points of view radically unlike our own. We might admire a work for its moral integrity, or despise it for its depravity or political untruthfulness. Are all these a matter of aesthetic value? If not, then \*aestheticism gives too narrow a view of the value of art. Without succumbing to the instrumentalist view that art's point is always as a means to some end outside itself, we should concede that works of art have a great variety of values. Plato's well known hostility to certain artistic practices was largely

based on the idea that one should demand from the artist a concern for truth and appropriate moral paradigms of behaviour. It is too simple to say that he missed the point of art altogether.

Much contemporary philosophy of art does not address what might be called Art with a capital A, which to many writers seems an outdated an unmanageable notion. It is debatable whether there is any reason beyond historical circumstance why music, painting, architecture, drama, novels, dance, films, and other things should all have come to be called \*art. Although the attempt to define art is certainly within the brief of aesthetics, it is not always the most fruitful initial approach. Many, including the present writer, have felt that the more exciting definitions of art ('art as expression of emotion', 'art as significant form') tend to be too narrow, while recent alternatives which are wide enough to include everything fail to tell us why art is important. Prominent among these is the much-discussed institutional definition, which links something's status as art to the role it plays within the practices of the 'artworld'.

Philosophically productive work on art in today's aesthetics is often more narrowly focused, looking at a specific art form and posing of it a specific question. For example, How does music express emotion? What makes a painting a picture of something? What happens when we imagine characters in novels, plays, or films? What characterizes metaphorical uses of language? How is one literary work distinguished from another? (\*Expression; \*fiction; \*forgery; \*imagination; \*metaphor; \*music; \*tragedy; \*representation in art.) In addressing these questions, the philosopher of art will often call on philosophical conceptions of identity, meaning, intention, and other mental states such as belief, emotion, and imagination. Parts of aesthetics are also parts of the philosophy of mind and metaphysics.

When dealing with the arts, we are by and large concerned with intentionally produced artefacts. Having said this, there are differences in kind between them. A symphony is not a physical object, nor are other things which may have multiple instantiations (such as a short story or a film). A painting seems more likely to be physical object, although thinking about the means by which the image in a painting can be reproduced gives one a taste for the problems of identity which works of art can throw up. Is the work of art the thing on the wall of a certain gallery, or is it the image which you also find in art books and on the postcard you take home with you? Performing arts raise more complexities: all performances of a particular play or opera could be failures, while yet the play is one of the greatest ever written. This suggests that the play is not identical with its performances—but what is it then? Only a plunge into metaphysics will take this much further—a plunge which today's aestheticians are often willing to take.

Artworks are, nevertheless, usually intentionally produced things. They are also things with characteristic modes of reception or consumption. Paintings are placed where we can see them in a certain way, music is enjoyed

or analysed mostly by being heard. This pattern of production and reception gives rise to two recurring general questions in the philosophy of art: What relation does the work bear to the mind that produced it? And what relation does it bear to the mind that perceives and appreciates it? As an example, we may take emotion and \*music. We say that music has, or expresses, some emotional character. Since emotions are mental states, we may think that the emotion gets into the sounds by first being present in the mind of the composer or performer. Or we may think that the listener's emotional reactions are somehow projected back on to the sounds. Neither of these approaches has great plausibility, however, so that a fresh question emerges: The music all by itself somehow seems to point to, or stand for, emotions—how? Aesthetics has yet to come to terms with this tantalizing problem. There is a similar pattern in the case of artistic representation. In the question of what a picture depicts, what role is played by the artist's intentions, and what by the interpretations which an observer may conjure up? Or does the painting itself have a meaning by standing in symbolic relations to items in the world? If the latter, how similar, and how dissimilar, are depiction and linguistic representation?

There have been widely differing views about the role played by the mind of the artist in determining the identity of an artwork. At one extreme stands the theory of Croce and Collingwood, according to which the artwork is an expression of emotion by the artist, and exists primarily in the artist's mind. At the other end have been a number of views in literary theory, including the notion of the \*intentional fallacy and the \*death-of-the author thesis. For different reasons, these views hold that the work of art, or text, can and should be interpreted without any reference to the supposed mind of the author that lies behind it. The philosophical issues here are complex. It may, for example, be an illusion that interpreting the text and interpreting the author's mind are entirely separable. We have to engage with the philosophy of mind, to decide how people generally become aware of mental states such as intentions, and whether interpreting a text can be assimilated to interpreting a person's action as informed by their intentions. But we also have to be careful not to depart too much from the practice of ordinary readers. For many people, their interpretation of a novel will be crucially affected by their beliefs about the author; it will matter, for example, whether the author is male or female, European or African. Who shall prescribe that such readers are wrong?

Critical discourse about the arts (that is, literary criticism, music criticism, or criticism of the visual arts) provides another important topic for the philosophy of art. Until very recently the philosophical conception of \*art criticism has seen it either as a form of expert evaluative judgement which enables others to find aesthetic value in a work, or as an interpretative exercise in search of a meaning which the work may bear. Criticism in the various fields has its own traditions, and its own ways of theorizing about itself, and the philosophy of criticism should

be informed by knowledge of these. However, the question of what criticism stands to gain from philosophy is not an easy one to answer. Those who retain faith in the philosophical enterprise will be confident that the clearer the account given of the nature of aesthetic value, perception, meaning, intention, identity, and so forth, the better the description of discourse about the arts.

Ranged against such a view, however, are those closer to recent developments in criticism itself, who claim to deconstruct any notions of stable meaning or value, do not accept the terms in which philosophers tend to ask about the identity of work or author, and are at best ambivalent towards the notion of the aesthetic. The philosophy of criticism therefore faces a dilemma: either to engage in debate with theories that arise from criticism itself, and become involved in a protracted attempt to justify its own methodology, or to carry on its own task of clarification, at the risk of producing an idealized account of art criticism which may be only tenuously related to actual critical practices.

Plato spoke of an 'ancient quarrel between philosophy and poetry'. His conception of philosophy as rational inquiry into truth and the good was built on the claim that it was distinct from and superior to the arts. \*Poetry was no guide to truth, and could not be relied upon to set its own standards. Some recent philosophers have alleged that the philosophy of art has tacitly operated on much the same assumption ever since, and that when the value of the arts is at issue, philosophy's own right to call the tune should also be questioned. Once it starts to address problems at this level, the philosophy of art starts to concern the nature of philosophy as a whole.

**aesthetic value:** see value, aesthetic.

**aeterni patris:** see neo-Thomism.

**affirmative action.** This term refers to positive steps taken to rank, admit, hire, or promote persons who are members of groups previously and/or currently discriminated against. The term has been understood both narrowly and broadly. The original meaning was minimalist: it referred to plans to safeguard equal opportunity, to protect against \*discrimination, to advertise positions openly, to create scholarship programmes to ensure recruitment from specific groups, and the like. Controversy today centres on expanded meanings associated with quotas and preferential policies that target specific groups, especially underrepresented minority groups and women.

Policies of affirmative action are often said to have their foundations in the principle of compensatory \*justice, which requires that if an injustice has been committed, just compensation or reparation is owed to the injured person(s). Everyone agrees that if *individuals* have been injured by past discrimination, they should be compensated, but controversy has arisen over whether past discrimination against *groups* such as women and minorities justifies compensation for current members of the group.

R. K. Fullinwider, *The Reverse Discrimination Controversy* (Totowa, NJ, 1980).

**affirmative and negative propositions.** Given any proposition *p*, it is possible to form its negation, not-*p*. Since not-*p* is itself a proposition, it in turn has its negation, not-not-*p*, which in classical logic is just equivalent to *p*. On some theories of propositions, indeed, *p* and not-not-*p*, being logically equivalent, are not distinct propositions. This casts some doubt on the idea that some propositions are intrinsically negative and others affirmative.

A \*sentence used to express a proposition may be negative, in that it contains a negative particle—for example, 'This is *not* red' or 'He is *unhappy*'. But it is easy enough to express the same proposition using a sentence which does not contain a negative particle—for example, 'This lacks redness' or 'He is *sad*'. The latter sentences are, grammatically speaking, affirmative. So it does not appear that one can satisfactorily define a negative proposition to be a proposition expressible by means of, or only by means of, a negative sentence, where a negative sentence is understood as one containing a negative particle. Nor is it particularly plausible to maintain that certain \*concepts, such as the concept of sadness, are intrinsically 'negative', being definable as the negations of supposedly more fundamental 'positive' concepts—in this case, the concept of happiness.

Rather than try to set up such fruitless divisions, it is better simply to see (classical) negation as a logical \*operation which, applied to any proposition, transforms a truth into a falsehood and vice versa. At the same time, it is important to distinguish between the \*speech-acts of affirmation and denial on the one hand and the propositional content of an assertion on the other, for we can concede the legitimacy of such a distinction between speech-acts while rejecting the idea that propositions themselves are intrinsically affirmative or negative.

**affirming the antecedent.** In a hypothetical proposition 'If *p*, then *q*', *p* is the antecedent, *q* the consequent.

Asserting  $p$ , so that  $q$  may be inferred, is called affirming the antecedent; the inference is said to be in the *\*modus ponens*. Knowing that if it lacks a watermark, the note is counterfeit, I affirm the antecedent when I discover that it lacks a watermark, concluding that it is counterfeit. The corresponding fallacy is *\*affirming the consequent*. c.w.

H. W. B. Joseph, *An Introduction to Logic*, 2nd edn. (Oxford, 1916), ch. 15.

**affirming the consequent.** To reason that, because he opposes the status quo and communists oppose the status quo, John must be a communist, is to commit this fallacy. In the *\*traditional logic of terms*, inferences like 'If  $A$  is  $B$ , it is  $C$ ; it is  $C$ ; therefore it is  $B$ ' illustrated the fallacy. In *\*propositional calculus*, any inference of the form 'If  $p$  then  $q$ , and  $q$ ; therefore  $p$ ' affirms the consequent. c.w.

*\*affirming the antecedent.*

C. L. Hamblin, *Fallacies* (London, 1970), 35–7.

**African philosophy** has its roots in an oral tradition of speculative thought stretching as far back as African culture itself. In many parts of Africa south of the Sahara the written phase of that tradition emerges mainly as a response to the exigencies of the anti-colonial struggle and the challenges of post-colonial reconstruction. On the continent as a whole, however, written philosophy reaches back in time to Pharaonic Egypt and runs through the epochs of Greek and Roman interaction with North Africa which produced many intellectual luminaries, among whom the best known is St Augustine. Similarly, Arabic records reveal a tradition of Islamic philosophy in parts of northern, western and eastern Africa extending from the second half of the medieval period to the nineteenth century. Home also to a long, if not profuse, tradition of written philosophy is Ethiopia whose Zar'a Ya'eqob, for an illustrious example, propounded an original, rationalistically inclined, philosophy in the seventeenth century.

In the contemporary era a sizeable body of philosophical literature emerged in the 1960s and early 1970s from the efforts of the first wave of post-colonial rulers in Africa, who, having led their peoples to independence, felt the need to articulate the theoretical foundations of their programmes for socio-economic development and cultural renewal. With rare exceptions they argued for forms of socialism based on first principles deriving from traditional African communalism. The African provenance of their philosophies was clearest in the 'Ujamaa' (Familyhood) socialism of Nyerere of Tanzania and the 'Zambian humanism' of Kaunda, who both steered studiously clear of foreign ideological admixtures. More indebted to foreign philosophies, specifically to Marxism-Leninism, though no less sincere in their pursuit of African authenticity, were the 'scientific' socialisms of Nkrumah of Ghana and Sékou Touré of Guinea. In between these philosopher-kings was Senghor of Senegal, poet,

statesman, scholar, and philosopher of 'Negritude', whose writings display more scholarly appreciation for Marx than ideological commitment to him.

Academic, professionalized philosophy is, by and large, a post-colonial phenomenon in many parts of Africa south of the Sahara. That discipline has been intensely methodological, seeking to define its African identity as part of the general post-independence quest for intellectual self-definition on the continent. In brass tacks, the issue reduces to the question of how contemporary African philosophers may best synthesize the insights obtainable from indigenous resources of philosophy with any from the Western philosophical tradition within which their institutional education has come to be situated by the force of historical circumstances. In the resulting literature an unmistakable tension has developed between the more and the less traditionalist approaches to the issue.

Nevertheless, there is no dispute about the richness of African traditional thought. A study of that system of thought, moreover, discloses conceptual options that contrast in philosophically instructive ways with many of those embedded in Western philosophy. Thus, although no continental unanimity is assumed, traditional African conceptions of the cosmos in many instances involve homogeneous ontologies that cut across the natural/supernatural opposition in Western philosophy. God is conceived as a cosmic architect of the world order rather than its *ex nihilo* creator, and mind as a capacity rather than an entity. The associated conception of human personality, though postulating a life principle not fully material, is still devoid of any sharp dualism of body and spirit. That conception also has a normative dimension which incorporates a communalist and humanistic (as distinct from a religious) notion of moral responsibility into the very definition of a person. At the level of the state this went along naturally with a consensual philosophy of politics based on kinship representation under a kingship dispensation. How to adapt this understanding of politics to current African conditions is one of the severest challenges facing African philosophy today.

Some recent attempts to meet this challenge have taken the form of an exploration of alternatives to the majoritarian democracies current in Britain and the USA and exported to Africa with questionable results. The suggestion has been that a democracy based on co-operation rather than competition among political associations (as distinct from political parties) would better reflect African traditions of consensus in political decision making and also better cohere with the ethnic stratification of contemporary African states. This notion is rife with conceptual issues currently receiving attention. k.w.

**agapē.** Used originally to refer to the love feast of the early Christians intended to promote Christian fellowship, the word has come to mean brotherly or selfless \*love. The Latin translation was *caritas*, whence 'charity' as in 1 Cor. 13, where it vaunteth not itself, suffereth long, and is kind. It is one of C. S. Lewis's four loves in his book of that title, the others being affection, friendship, and eros. At root, it comprises a deep cherishing care for each individual as such as a being of intrinsic worth. Kant's notion of practical love approximates to *agapē*. N.J.H.D.

G. Outka, *Agapē* (New Haven, Conn., 1972) contains a useful discussion.

**agent.** A person (or other being) who is the subject when there is \*action. A long history attaches to thinking of the property of being an agent as (i) possessing a capacity to choose between options and (ii) being able to do what one chooses. Agency is then treated as a causal power. Some such treatment is assumed when 'agent-causation' is given a prominent role to play in the elucidation of action.

In recent times, a doctrine of agent-causation is associated with Chisholm, who thinks that no concept of event-causality is adequate for understanding human beings' agency. Ryle's attack on \*volitions had the effect of distracting philosophers from the *experience* of agency. But whatever Ryle may have shown, it seems undeniable that bodily action has a first-person aspect. Some recent writing attempts to rehabilitate the phenomenology of agency. Brian O'Shaughnessy's 'dual aspect theory' brings out the importance of achieving a view of action in which a third-person and first-person perspective are both incorporated but neither is exaggerated.

A range of philosophical theses hold that the concept of agency, which human beings acquire in their experience of agency, is prior (in one or another sense) to the concept of \*causality. Collingwood claimed that the primitive notion of cause was derived from agency. And in the pre-modern world, causation in the absence of human action was typically construed either as divine action, or as the action of an object whose nature it was to realize certain ends. Reid claimed that the idea of cause and effect in nature must be arrived at by analogy, from the relation between an active power (of which human agency is a species) and its products. J.HORN.

**agent causation.** A direct causal relation between agents and actions that is irreducible to causation by events and states. Advocates of agent causation usually argue that it is

required for free will and moral responsibility because both an action's being uncaused and its being caused (solely) by events and states—whether deterministically or indeterministically—preclude the control needed for free, morally responsible action. The agent causal power is said to be the power to exert direct control over one's actions. What this control power is supposed to be, whether agent causation is conceptually possible, and whether, if it is conceptually possible, our universe is likely to have a place for it, are vexed questions. A.R.M.

\*freedom, determinism.

T. O'Connor, *Persons and Causes* (New York, 2000).

**agent-relative moralities.** Typical agent-relative moral principles forbid us from committing one murder even if by not doing so we permit five to occur, and allow us to spend income on our friends rather than famine relief. Such principles characteristically either require or permit different individuals to pursue distinct ultimate aims. They may require that agents not perform a prohibited act *themselves* even if their doing so would reduce the performance of such acts. They may also permit each agent to devote attention to their own particular concerns in a manner disproportionate to their value considered from an impartial perspective. Much of contemporary moral philosophy is concerned with the content, justification, and interrelationship of agent-relative principles. Although such principles are central to ordinary moral thought, they appear difficult to reconcile with at least one widely held moral theory—\*consequentialism—since it standardly claims that each agent should pursue the common aim of promoting the best outcome considered from an impartial perspective. **agglomeration.** A term coined by Bernard Williams for the principle that 'I ought to do *a*' and 'I ought to do *b*' together imply 'I ought to do *a* and *b*'. It has since been generalized to other properties or operations where a property or operator is said to agglomerate if it can be factored out of a conjunction, as, for example, in 'Necessarily *P* and necessarily *Q*' implies 'Necessarily, *P* and *Q*'. It has been argued that an agent may be obliged to do *a* and be obliged to do *b* but on the assumption that 'ought implies can', may not be obliged to do both and hence agglomeration fails. R.B.M.

**agnosticism:** *see* atheism and agnosticism.

**agreement, method of:** *see* method of agreement.

**Ajdukiewicz, Kazimierz** (1890–1963), Polish philosopher and logician, author of a radically anti-empiricist theory of meaning. Studied in Lvov and Göttingen. Professor at Lvov, Warsaw, and Poznan. Ajdukiewicz was an eminent representative of the Polish variety of analytical philosophy. In a series of studies published in *Erkenntnis* in 1934–5 (*Sprache und Sinn, Das Weltbild und die Begriffssapparatur, Die wissenschaftliche Welt-perspektive*) he elaborated a formal theory of coherent and closed languages which, unless they are exact copies of each other, are utterly untranslatable, so that no proposition accepted in one of them can be either accepted or denied in the other; in terms of this ‘radical \*conventionalism’ an indefinite number of independent and untranslatable world-descriptions can be built on the basis of the same empirical data. Later on, Ajdukiewicz shifted to a more empiricist approach and argued that even analytical propositions in some cases require empirical premisses. He tried to translate traditional metaphysical and epistemological problems into semantic questions, analytically soluble. L.K.

**akrasia.** Socrates questioned whether one could ever deliberately, when able to follow either course, choose the worse, because overcome by fear, pleasure, etc.—i.e. whether *akrasia* could occur. In his view any deliberate agent must consider that what they are doing best fits their objectives (what they take to be their good). If seriously *overcome*, they would not be acting deliberately. What we deliberate (reason practically) about is always what we consider will be the best way to achieve our good. The apparent conflict between \*reason and \*passion is rejected: passions are unstable, untutored judgements about what is best; knowledge is necessary and sufficient for bringing stability to our judgements. This set the problem as (i) how can we act against what reason dictates? And (ii) how can we act against our view of what we take as good? Socrates answered that we cannot.

Aristotle and others following him thought Socrates ignored the obvious facts. They contrasted reason and pursuit of the good with motivation by passion. This involved denying the Socratic view that all deliberate action is aimed at what the agent considers best: I can take a meringue because I want it, without thinking taking one the best thing for me to do. There grew up a tendency to ally virtue with the exercise of reason, in opposition to passion with its relatively short-term considerations: and to see *akrasia* as a moral problem, the question of its possibility as one for ethics.

In the Middle Ages account had to be given of how the Devil, without passion, could deliberately go wrong. Aquinas tried to account for this as an error of reason, Scotus saw it as a case of the will freely choosing a good, but

one which it should not choose. Passion-free *akrasia* was on the map.

In the twentieth century R. M. Hare saw a problem arising because he considered that in their primary use moral judgements express the agent’s acceptance of a guiding principle of \*action: if they are not acted on, how are they guiding? To account for *akrasia* he tried to devise a notion of psychological compulsion compatible with blame. Donald Davidson sees the problem as more generally one in philosophy of action: can we give an account of intentional or deliberate behaviour which allows of deliberate choice of an action contrary to what deliberation, whether moral or not, favours? The limitations to morality and conflict with passion have been dropped, but the contrast of reason with something less long-term or comprehensive retained.

Davidson retains the assumption that akratic behaviour is irrational in being contrary to what in some sense the agent considers at the time that reason requires—contrary to an all-things-considered or better judgement—and in contravention of a principle of practical reason, which he calls the principle of continence, which enjoins us always to act on such judgements. These judgements, which always have ‘more reason’ on their side, also are generally seen as contrasted with a narrower and more short-term view. Attempts to characterize such judgements have not been successful. There are insuperable problems with all-things-considered judgements; but talk of better judgement only secures the tie with reason if it collapses into talk of all-things-considered judgement.

In fact the puzzle, if there is one, arises even where a contrast between reason and something else is hard to make out: Hamlet is an interesting case. It arises because the agent seems in a way to favour a course which he then does not take, without apparently ceasing to favour it. Neither passion nor short-term considerations are an essential factor. What is puzzling is unforced action against apparently sincere declarations of opposition to it.

The views mentioned earlier treat the problem as one of how we can act against reason. A difference between animals and humans has been thought to be that the latter have a natural tendency towards what they reason to be their good, enabling them to resist passion. This is a rational faculty, the \*will, which is either always responsive to reason, in which case weakness is always a defect of reason; or always aims at some good, but is able to reject the one reason proffers, in which case *akrasia* is seen as weakness of will.

That reason does not always dictate intentional action seems to follow from the fact that if there is no common standard for judging between two objectives, or there is, but reason cannot determine that one is to be preferred to the other by that standard, then the agent (the will) must be free to choose either way. If, in the case of wrongdoing, there is no overarching standard for choosing between the moral good and some other objective, then the will has to choose between standards, without the help of reason. The will may be overcome by passion (be weak), but in the

absence of passion is just evil when it chooses the worse course.

This view of the will can be de-moralized by attaching it to long-term objectives generally, or to reflective choice. Yet there are many problems in the whole project of postulating such a rational faculty, which is an unstable structure built too rapidly on some familiar idioms and supposed requirements of experience.

**Albert the Great** (c.1206–80). Born in the German town of Lauingen, he studied briefly at Padua, becoming a Dominican in 1223. He was a regent master at Paris (1242–8), during which time Aquinas was one of his students, and in 1248 the two men became colleagues at Cologne. He was known as *doctor universalis* because of his encyclopedic knowledge displayed in his voluminous writings. He wrote extensively on scientific matters, and also on theology and philosophy, where he was heavily influenced by the works of Aristotle then reaching the Christian West accompanied by the commentaries of Muslim philosophers, in particular al-Fārābī and Avicenna. He was one of the earliest to realize that it was vital to work out a means of squaring Aristotelian philosophy with Christianity, for Aristotle had highly persuasive arguments for his doctrines, and those who would be persuaded by the arguments had to be shown that they could assent to the doctrines without in so doing implying the falsity of the faith. More than anyone it was Aquinas who carried out the task that Albert had recognized to be so necessary.

**Albo, Joseph** (c.1360–1444?). Jewish philosopher of Castile, author of *Sefer ha-Ikkarim* (The Book of Principles, 1425). A student of Crescas, well versed in mathematics, medicine, Islamic, Christian, and Jewish philosophy, and biblical and rabbinical learning, Albo spoke in the Tortosa Disputation of 1413–14. Against a backdrop of anti-Jewish polemic, he sought to forge a philosophically defensible Jewish creed centred on God, revelation, and requital, de-emphasizing the Messianic idea, the sorest point of Christian–Jewish polemics. From Aquinas Albo adopted the idea of natural law, arguing, with Maimonides, that the superiority of divine legislation lay in its (credal) provision for spiritual felicity, not just temporal welfare. Grotius and Richard Simon admired him, but Jewish

thinkers often resented the idea of a formal creed and fault his lack of originality.

**Alcmaeon of Croton** (fl. c.450 BC). Medical theorist. He originated the influential quasi-political theory of medicine, one version of which was developed into the 'four humours' pathology which, through Galen, dominated medieval and early modern medicine. In Alcmaeon's version, four opposed 'powers' (hot, cold, wet, dry) are naturally in balance (because their strengths are everywhere in the right proportion) in the healthy body. A disturbance of the balance in any way means a damaging preponderance of one or more powers, and causes conflict. This is disease; the variety of diseases, and their different natures, are to be explained by the variety of ways and places in which the right proportion can be disturbed.

**alethic concepts:** see deontic logic.

**Alexander, Samuel** (1859–1938). Australian-born, Oxford-educated, Alexander spent his career at Manchester University. Trying always to keep abreast of developments in modern science, particularly psychology and biology, Alexander is best known for his theory of 'emergent evolution', which he expounded in his *Space, Time and Deity* (1920). His claim was that existence is hierarchically ordered, and that there is an ongoing evolutionary process with the emergence of ever-higher levels of existence. Through time, therefore, new qualities come into being, although Alexander would have thought of these as principles of organization rather than entities akin to the Bergsonian *élan vital*. As a man for whom his Jewishness was a significant factor, from his combating prejudice at Oxford to being close to prominent Zionists in Manchester, Alexander felt a keen affinity to Spinoza. Like the earlier philosopher, Alexander saw mind as at one with material substance, making itself manifest in the course of evolution. The next and ultimate emergent, Alexander supposed, would be God. One presumes that, at this point, he had left behind the constraints of science, although apparently he carried with him not a few eminent men of science.

**algorithm.** An algorithm is a mechanical procedure for determining the value of a function for any argument

from a specified \*domain. For example, addition is a function which maps pairs of natural numbers on to a natural number (the sum of the pair). The simple paper-and-pencil rules for determining the sum of any two numbers are an algorithm for the addition function. A mechanical procedure for deciding whether a given object has a particular property is also called an algorithm. So, for example, the \*truth-table test for deciding whether a formula of the propositional calculus is a tautology is an algorithm. A mechanical procedure can be given as a finite set of instructions which are executed in a stepwise manner, without appeal to random processes or ingenuity. A \*function is effectively computable if and only if there is an algorithm for computing it.

H. Rogers, *Theory of Recursive Functions and Effective Computability* (New York, 1967), ch. 1.

**alienation.** A psychological or social evil, characterized by one or another type of harmful separation, disruption or fragmentation, which sunders things that belong together. People are alienated from the political process when they feel separated from it and powerless in relation to it; this is alienation because in a democratic society you belong in the political process, and as a citizen it ought to belong to you. Reflection on your beliefs, values, or social order can also alienate you from them. It can undermine your attachment to them, cause you to feel separated from them, no longer identified with them, yet without furnishing anything to take their place; they are yours, *faute de mieux*, but no longer truly yours: they are yours, but you are alienated from them.

The term 'alienation' gained currency through Marxian theory, and is used with special prominence in Marx's manuscripts of 1844 (which were first published in 1930). Marx derived the terms *Entäußerung* and *Entfremdung* from Hegel, who used them to portray the 'unhappy consciousness' of the Roman world and the Christian Middle Ages, when individuals under the Roman Empire, deprived of the harmonious social and political life prevailing in pagan antiquity, turned inward and directed their aspirations toward a transcendent Deity and his other-worldly kingdom. For Hegel, the unhappy consciousness is divided against itself, separated from its 'essence', which it has placed in a 'beyond'.

Marx used essentially the same notion to portray the situation of modern individuals—especially modern wage labourers—who are deprived of a fulfilling mode of life because their life-activity as socially productive agents is devoid of any sense of communal action or satisfaction and gives them no ownership over their own lives or their products. In modern society, individuals are alienated in so far as their common human essence, the actual co-operative activity which naturally unites them, is powerless in their lives, which are subject to an inhuman power—created by them, but separating and dominating them instead of being subject to their united will. This is the power of the market, which is 'free' only in the sense that it is beyond the control of its human creators,

enslaving them by separating them from one another, from their activity, and from its products.

The German verbs *entäussern* and *entfremden* are reflexive, and in both Hegel and Marx alienation is always fundamentally *self*-alienation. Fundamentally, to be alienated is to be separated from one's own essence or nature; it is to be forced to lead a life in which that nature has no opportunity to be fulfilled or actualized. In this way, the experience of 'alienation' involves a sense of a lack of self-worth and an absence of meaning in one's life. Alienation in this sense is not fundamentally a matter of whether your conscious desires are satisfied, or how you experience your life, but instead of whether your life objectively actualizes your nature, especially (for both Marx and Hegel) your life with others as a social being on the basis of a determinate course of historical development. Their view that alienation, so conceived, can nevertheless have historical consequences, and even be a lever for social change, clearly involves some sort of realism about the human good: it makes a difference, psychologically and socially, whether people actualize their nature, and when they do not, this fact explains what they think, feel, and do, and it can play a decisive role in historical change.

**Alston, William P.** (1921– ). Although he has contributed to other areas of philosophy, his main interests lie in the areas of epistemology and philosophy of religion. His work on \*epistemic justification has been particularly influential, and he has published extensive discussions of religious language. In *Perceiving God* (1991), these two interests come together in a detailed account of the epistemology of religious experience. Alston argues that \*religious experiences which are taken by their subjects to be direct non-sensory experiences of God are perceptual in character because they involve a presentation or appearance to the subject of something that the subject identifies as God. He defends the view that such mystical perception is a source of *prima facie* justified beliefs about divine manifestations by arguing for the practical rationality of engaging in a belief-forming practice that involves reliance on mystical perception.

\*God and the philosophers.

W. P. Alston, *Divine Nature and Human Language* (Ithaca, NY, 1989).

— *Epistemic Justification: Essays in the Theory of Knowledge* (Ithaca, NY, 1989).

**Althusser, Louis** (1918–90). The most influential Marxist philosopher in the 1960s and 1970s, Althusser produced a

novel form of Marxism by attempting to integrate into it the dominant ideas of \*structuralism. Born in Algeria and spending most of his life lecturing at the élite Collège de France, Althusser and his disciples were much influenced by the leading currents of Parisian intellectual life.

Althusser's version of Marxism was in sharp contrast to the Hegelian and humanist interpretations of Marx that had gained prominence in the two decades after the Second World War. As regards Marx himself, Althusser saw a sharp epistemological break between the earlier humanist writings and the later scientific texts: each was governed by a different problematic or theoretical framework which determined what questions could be asked on what presuppositions. In his view, the young Marx propounded an ideological view of humanity's \*alienation and eventual self-recovery, strongly influenced by Hegel; whereas the later Marx disclosed a science, a theory of social formations and their structural determination.

This later Marx, according to Althusser, had inaugurated a new type of philosophy which underlay his social scientific analysis. This \*dialectical materialism was above all a theory of knowledge. In a distinctly neo-Kantian vein, Althusser saw the task of philosophy as the creation of concepts which were a pre-condition for knowledge. He insisted on the strict separation of the object of thought from the real object. Knowledge working on its own object was a specific form of practice, theoretical practice, of which Marxist philosophy was the theory.

When applied to society, the result of this epistemology was the science of historical materialism. Each of the instances of society—economics, politics, ideology—was a structure united within a structure of structures. The complex and uneven relationship of the instances to each other at a specific time was called by Althusser a 'conjuncture'. Every conjuncture was said to be 'overdetermined' in that each of the levels contributed to determining the structure as well as being determined by it: determination was always complex. This structured causality resulted in a reading of history as process without a subject—as opposed to the tendency of, for example, Sartre or the early Marx to see human beings as the active subjects of the historical process.

Althusser's account of Marx, in particular its concept of the problematic and its insistence on the relative autonomy of the sciences, was a good antidote both to all types of reductionism and to extreme forms of Hegelian Marxism. But it does contain severe weaknesses which have been re-emphasized by the superficiality of his approach revealed in his autobiography. Its status as an interpretation of what Marx actually said is dubious; since any recourse to a real object is ruled out, it is difficult to see what the criterion of scientificity could be; and, finally, since the science of dialectical materialism is cut off from the social formation, Althusser can offer no satisfactory account of the relation of theory to practice.

**altruism:** see egoism and altruism.

**ambiguity.** A word, expression, or sentence is ambiguous if it has two or more distinct meanings, e.g. 'can', 'poor violinist', 'Everyone loves a sailor'. In particular contexts it may be clear with which of its meanings a word etc. is used, e.g. 'can' in 'I can do it', or 'poor violinist' when what is under discussion is the merits of orchestral players. s.w.

\*vagueness; vague objects.

S. Wolfram, *Philosophical Logic* (London, 1989), ch. 2. 1.

**ambiguous middle, fallacy of.** A categorical syllogism contains two premisses, a conclusion, and three terms. The premisses contain two occurrences of one of the terms, the middle term. It is by virtue of relations of the other two terms to the middle term that the conclusion, containing the other two terms, follows, given other constraints. Where the middle term is ambiguous, with each occurrence differing in meaning, the syllogism is fallacious, and falls under the fallacy of \*four terms. An example of the fallacy is the inference of:

Bees receive government subsidies.

from the premisses

Bees are producers of honey.

Producers of honey receive government subsidies.

**American philosophy.** Philosophizing in the United States has developed apace over the past century and has never been in as flourishing a condition as today, with philosophy firmly established as a subject of instruction in thousands of institutions of higher learning. However, the nature of the philosophical enterprise is changing, with the earlier heroic phase of a small group of important thinkers giving way to a phase of dis-aggregated production in a scattered industry of diversified contributors.

Already in colonial times there were various writers who treated philosophical subjects: theologians like Jonathan Edwards and philosophically inclined statesmen like Benjamin Franklin or Thomas Jefferson. But such talented amateurs exerted no influence on other identifiable philosophers. More systematic developments had to await the growth of the university system in the nineteenth century, when academic philosophy was imported from Europe, with idealists dominant at Harvard and Scottish thought dominant at Princeton, while Kantians were prominent in Chicago, Hegelians in St Louis, and Thomists at the Catholic institutions. But even late into the nineteenth century America's most significant philosophers operated outside the academic system,

where eccentric thinkers like R. W. Emerson, John Fiske, C. S. Peirce, and Orestes Brownson never managed to obtain a secure foothold. However, with the rising importance of the natural sciences, philosophy became the linchpin that linked them to the liberal arts. The Harvard of James and Palmer and such distinguished imports as Santayana and Münsterberg was a harbinger of this, with philosophy here closely joined to psychology. The influx of the scientifically trained philosopher-refugees who crossed the Atlantic after the rise of Nazism greatly intensified this linkage of philosophy to the sciences.

The era between the two world wars saw a flourishing in American academic philosophy, with people like John Dewey, C. I. Lewis, R. B. Perry, W. P. Montague, A. O. Lovejoy, Ernest Nagel, and many others making substantial contributions throughout the domain. And after the Second World War there was an enormous burgeoning of the field. Numerous important contributors to philosophy were now at work in America, and the reader will find individual articles on dozens of them in this Companion.

However, no characteristically American school or style of philosophizing has developed, excepting one, namely \*pragmatism as originated by C. S. Peirce and popularized by William James. The pragmatists saw the validity of standards of meaning, truth, and value as ultimately rooted in consideration of practical efficacy—for 'what works out in practice'. Though highly influential at home, this approach met with a very mixed reception abroad. Bertrand Russell, for example, objected that beliefs can be useful but plainly false. And various continental philosophers have disapprovingly seen in pragmatism's concern for practical efficacy—for 'success' and 'paying off'—the expression of characteristically American social attitudes: crude materialism and naïve democratic populism. Pragmatism was thus looked down upon as reflecting a quintessentially crass American tenor of thought—a philosophical expression of the American go-getter spirit with its success-orientated ideology, and a manifestation of a populist reaction against the chronic ideological controversies of European philosophizing—epistemological \*rationalism versus \*empiricism, ontological \*materialism versus \*idealism, etc. (Americans, de Tocqueville wrote, seek to 'échapper à l'esprit de système'.)

With pragmatism as a somewhat special case, American philosophers past and present have, as a group, been thoroughly eclectic and have drawn their inspiration for style and substance from across the entire spectrum of philosophizing. In consequence, American philosophizing as a whole reflects the world, with its contributors drawing their inspiration from materialism and idealism, from Aristotle and Kant, from ancient \*scepticism and modern \*phenomenology, etc. What is distinctive about contemporary American philosophizing is not so much its *ideas* (which, taken individually, could have issued from the minds and pens of non-Americans), but rather *the enterprise as a whole*, viewed as a productive industry of sorts.

Perhaps the most striking feature of present-day professional philosophy in North America is its scope and scale. The American Philosophical Association, to which most US academic practitioners of the discipline belong, currently has more than 8,000 members, and the comprehensive *Directory of American Philosophers* for 2002–3 lists well over 12,000 philosophers affiliated to colleges and universities in the USA and Canada. North American philosophers are extraordinarily gregarious by standards prevailing anywhere else. Apart from the massive American Philosophical Association, there presently exist well over 1,000 different philosophical societies in the USA and Canada, most of them with well over 100 members. In part because of the 'publish or perish' syndrome of their academic base, American philosophers are extraordinarily productive. They publish well over 200 books per annum nowadays. And issue by issue they fill up the pages of over 175 journals. Almost 4,000 philosophical publications (books or articles) and a roughly similar number of symposium papers and conference presentations appear annually in North America. The comparatively secure place of philosophy in the 'liberal arts' tradition of American collegiate education assures it a numerical size that makes for such professional health. (It is this statistical fact rather than anything coherent in the traditions themselves that has led to the ascendancy of American over British philosophy: as with industrial production, America's intellectual production is of preponderant volume.)

To be sure, this variation of philosophical approaches brings conflict in its wake, with each methodological camp and each school of thought convinced that it alone is doing competent work and the rest are at best misguided and probably pernicious. Few philosophers are sufficiently urbane to see philosophical disagreement and controversy as a form of collaboration. Internecine conflict is particularly acute between the analytic tradition, which looks to science as the cognitive model, and those who march to the drum of continental thinkers who—like Nietzsche, Heidegger, Foucault, Derrida, and co.—take not 'reality' but cultural artefacts (particularly literature and even philosophy itself) as the prime focus of philosophical concern. (Since deep-rooted values are at stake, there is no easy compromise here, although in intellectual as in social matters there is much to be said for live and let live.)

The total number of doctorates awarded by institutions of higher learning in the USA has been relatively stable at around 100,000 per annum since 1960. But the production of *philosophy* doctorates has declined substantially (along with that of humanities Ph.D.s in general), sinking from some 1,200 for 1970–5 to less than 600 by the end of the century. But even this meagre replenishment rate still enables the profession to maintain itself at a very substantial level.

Given the scale of the enterprise, it is only natural and to be expected that such unity as American philosophy affords is that of an academic industry, not that of a single doctrinal orientation or school. The size and scope of the academic establishment exerts a crucial formative

influence on the nature of contemporary American philosophy. It means that two different—and sometimes opposed—tendencies are at work to create a balance of countervailing forces. The one is an impetus to separateness and differentiation—the desire of individual philosophers to ‘do their own thing’, to have projects of their own and not be engaged in working on just the same issues as everyone else. The other is an impetus to togetherness—the desire of philosophers to find companions, to be able to interact with others who share their interest to the extent of providing them with conversation partners and with a readership of intellectual cogeners. The first, centrifugal tendency means that philosophers will fan out across the entire reach of the field—that most or all of the ‘ecological niches’ within the problem-domain will be occupied. The second, centripetal tendency means that most or all of these problem-subdomains will be multiply populated—that group or networks of kindred spirits will form so that the community as a whole will be made up of subcommunities united by common *interests* (more prominently than by common opinions), with each group divided from the rest by different priorities as to what ‘the really interesting and important issues’ are. Accordingly, the most striking aspect of contemporary American philosophy is its fragmentation. The scale and complexity of the enterprise is such that if one seeks in contemporary American philosophy for a consensus on the problem-agenda, let alone for agreement on the substantive issues, then one is predestined to look in vain. Here theory diversity and doctrinal dissonance are the order of the day, and the only interconnection is that of geographic proximity. Such unity as American philosophy affords is that of an academic industry, not that of a single doctrinal orientation or school. Every doctrine, every theory, every approach finds its devotees somewhere within the overall community. On most of the larger issues there are no dominant majorities. To be sure, some uniformities are apparent at the localized level. (In the San Francisco Bay area one’s philosophical discussions might well draw on model theory, in Princeton possible worlds would be brought in, in Pittsburgh pragmatic themes would be prominent, and so on.) But in matters of method and doctrine there is a proliferation of schools and tendencies, and there are few if any all-pervasively dominant trends. Balkanization reigns supreme.

The extent to which significant, important, and influential work is currently produced by academics outside the high-visibility limelight has not been sufficiently recognized. For better or for worse, in the late twentieth century we entered a new philosophical era where what counts is not just a dominant élite but a vast host of lesser mortals. Great kingdoms are thus notable by their absence, and the scene is more like that of medieval Europe—a collection of small territories ruled by counts-palatine and prince-bishops. Scattered here and there in separated castles, a prominent individual philosophical knight gains a local following of loyal vassals or dedicated enemies. But no one among the academic philosophers of

today manages to impose their agenda on more than a minimal fraction of the larger, internally diversified community. Given that well over 10,000 academic philosophers are at work in North America alone, even the most influential of contemporary American philosophers is simply yet another—somewhat larger—fish in a very populous sea.

As regards those ‘big names’, the fact is that those bigger fish do not typify what the sea as a whole has to offer. Matters of philosophical history aside, salient themes and issues with which American philosophers are grappling at the present time include: ethical issues in the professions, the epistemology of information processing, the social implications of medical technology (abortion, euthanasia, right to life, medical research issues, informed consent), feminist issues, distributive justice, human rights, truth and meaning in mathematics and formalized languages, the merits and demerits of relativism regarding knowledge and morality, the nature of personhood and the rights and obligations of persons, and many more. None of these topics was put on the problem-agenda of present concern by any one particular philosopher. They blossomed forth like the leaves of a tree in springtime, appearing in many places at once under the formative impetus of the *Zeitgeist* of societal concern. Accordingly, philosophical innovation in America today is generally not the response to the preponderant effort of pace-setting individuals but a genuinely collective effort.

So much for the question of issues. But what of methodology and style? Pragmatism and applied philosophy apart, all of the dominant styles of American philosophy in the twentieth century—analytic philosophy, scientific and logicist philosophizing, neo-Kantianism, phenomenology and ‘Continental’ philosophizing at large—originated in Europe. As far as philosophical approaches are concerned, Emerson’s idea of an America moving beyond the dominance of European tendencies and traditions of thought has not been realized, and—given currently pervasive intellectual globalization—may never be. The extent to which American philosophy rests on European antecedents is graphically reflected in the great divide in the American Philosophical Association between the ‘Analysts’ and the ‘Pluralists’. To all intents and purposes this split mirrored the opposition in the Germany of the 1920s between the followers of Reichenbach and Carnap, on the one side, and those of Heidegger and Gadamer, on the other, the one looking for inspiration and example to science (especially mathematics and physics), the other to humanistic studies (especially literature and philology)—a duality of perspective which itself had deep roots in the philosophizing of nineteenth-century Germany with its opposed allegiances, respectively to the *Naturwissenschaften* (Fries, Bolzano, Haeckel) and the *Geisteswissenschaften* (Schleiermacher, Nietzsche, Dilthey).

A century ago, the historian Henry Adams lamented the end of the predominance of an oligarchy of the great and the good in American politics—as it had been in the days of the Founding Fathers. He regretted the emergence

PHILOSOPHY IN AMERICA: THE TWENTIETH CENTURY

JOHN DEWEY represented a distinctively American non-nonsense naturalism in philosophy. He was born in Schopenhauer's lifetime and outlived Wittgenstein.

RUDOLF CARNAP had established himself at the forefront of European philosophy when he left Prague for America in 1935. His works exemplify the technical skill and scientific approach of Logical Positivism.

W. V. QUINE, the doyen of American philosophy in the late twentieth century, inherited and promulgated his mentor Carnap's view that philosophy should be pursued as part of natural science.

NELSON GOODMAN: a continuing aim of his work was to examine how language relates to experience, from scientific enquiry to artistic appreciation.

of a new order based on the dominance of the masses and their often self-appointed and generally plebeian representatives. Control of the political affairs of the nation had slipped from the hands of a cultural élite into that of the unimposing, albeit vociferous, representatives of ordinary people. In short, democracy was setting in. Precisely this same transformation from the pre-eminence of great figures to the predominance of mass movements is now, 100 years on, the established situation in even so intellectual an enterprise as philosophy. (Not that a sizeable percentage of people-at-large take any interest in philosophy; in this regard the democratization of the field is something quite different from its popularization.) In its present configuration, American philosophy reflects that 'revolt of the masses' which Ortega y Gasset thought characteristic of our era. This phenomenon manifests itself not only in politics and social affairs, but even in intellectual culture, including philosophy, where Ortega himself actually did not expect it, since 'its perfect uselessness protects it'. For what the past century's spread of affluence and education has done through its expansion of cultural literacy is to broaden the social base of creative intellectual efforts beyond the imaginings of any earlier time. A cynic might characterize the current situation as a victory of the troglodytes over the giants. In the Anglo-Saxon world, at any rate, cultural innovation in philosophy as elsewhere is nowadays a matter of trends and fashions set by substantial constituencies that go their own way without seeking the guidance of agenda-controlling individuals. This results in a state of affairs that calls for description on a statistical rather than a biographical basis. (It is ironic to see the partisans of political correctness in academia condemning philosophy as an élitist discipline at the very moment when professional philosophy itself has abandoned élitism and succeeded in reinventing itself in a populist reconstruction. American philosophy has now well and truly left 'the genteel tradition' behind.)

And so the heroic age of American philosophy, in which the work of a few 'big names' towered over the philosophical landscape like a great mountain range, is now over. One sign of this is that the topical anthology has in recent years gained a position of equality with, if not preponderance over, the monographic philosophical text. Another sign is that philosophers nowadays are not eccentric geniuses working in obscure isolation, but work-a-day members of the academic bourgeoisie (even if not, as in continental Europe, civil servants).

The rapid growth of 'applied philosophy'—that is, philosophical reflection about detailed issues in science, law, business, social affairs, computer use, and the like—is a particularly striking structural feature of contemporary American philosophy. In particular, the past three decades have seen a great proliferation of narrowly focused philosophical investigations of particular issues in areas such as economic justice, social welfare, ecology, abortion, population policy, military defence, and so on. This situation illustrates the most characteristic feature of much of contemporary English-language philosophizing: the

emphasis on detailed investigation of special issues and themes. For better or for worse, anglophone philosophers in recent years have tended to stay away from large-scale abstract matters of wide and comprehensive scope, characteristic of the earlier era of Whitehead or Dewey, and generally address their investigations to issues of small-scale detail.

In line with the increasing specialization and division of labour, American philosophy has become increasingly technical in character. Contemporary American philosophical investigations generally make increasingly extensive use of the formal machinery of philosophical semantics, modal logic, computation theory, psychology, learning theory, etc. Unfortunately, this increasing technicalization of philosophy has been achieved at the expense of its wider accessibility—and indeed even of its accessibility to members of the profession. No single thinker commands the whole range of knowledge and interests that characterizes present-day American philosophy, and indeed no single university department is so large as to have on its faculty specialists in every branch of the subject. The field has outgrown the capacity not only of its practitioners but even of its institutions.

Do American philosophers exert influence? Here the critical question is: Upon whom? Certainly as far as the wider society is concerned, it must be said that the answer is emphatically negative. American philosophers are not opinion-shapers: they do not have access to the media, to the political establishment, to the 'think tanks' that seek to mould public opinion. In so far as they exert an external influence at all, it is confined to *academics* of other fields. Professors of government may read John Rawls, professors of literature Richard Rorty, professors of linguistics W. V. Quine. But the writings of such important American philosophers exert no influence outside the academy. It was otherwise earlier in the century—in the era of philosophers like William James, John Dewey, and George Santayana—when the writings of individual philosophers set the stage for at least some discussions and debates among a wider public. But it is certainly not so in the America of today. American society today does not reflect the concerns of philosophers; the very reverse is the case—where 'relevant' at all, the writings of present-day American philosophers reflect the concerns of the society. N.R.

**American philosophy today.** Harvard's W. V. Quine (1908–2000) has had a more profound impact on the shape of American philosophy in recent decades than any other single figure, even if no history of the period would be complete without attention to philosophers like Wilfrid Sellars (1912–89), David Lewis (1941–2001), Donald Davidson (1917–2003), Jerry Fodor (b. 1936), Saul Kripke (b. 1940), and, in moral and political philosophy, Quine's colleague John Rawls (1921–2002).

Quine's attack on the distinction between 'analytic' statements (those true in virtue of meaning) and 'synthetic' statements (those true in virtue of empirical fact) cast doubt on the idea that there was a domain of truths ('analytic' or 'conceptual' truths) that philosophers were uniquely suited to analyse. Quine recommended a radical *naturalization* of philosophy, such that philosophy would be continuous with empirical science, as its slightly more abstract and reflective branch. Versions of such a programme have been influential in epistemology (Alvin Goldman and Stephen Stich at Rutgers in New Brunswick) and philosophy of mind (Patricia and Paul Churchland at the University of California at San Diego, Robert Cummins at the University of California at Davis, Fodor at Rutgers), and, more recently, in ethics (Gilbert Harman at Princeton, Peter Railton at the University of Michigan at Ann Arbor). Cummins, for example, runs a 'philosophical lab' under the slogan 'no armchair philosophy allowed', while Harman and Railton argue that ethics had better attend to what we learn from empirical psychology about the role of character in the explanation of action. With few exceptions, American philosophers of mind take themselves to have an obligation to attend to the findings of psychologists and neuroscientists about the brain and mental life.

The interdisciplinary and naturalistic turns in philosophy launched by Quine have had other consequences. Philosophers of science, for example, now routinely have expertise in one of the special sciences (physics and biology are the most popular), and, indeed, often publish and participate in debates in the cognate field (David Malament at the University of California at Irvine and Elliott Sober at the University of Wisconsin at Madison are leading examples). Philosophers of language (such as the University of Southern California's James Higginbotham) now attend with care to developments in linguistics. Philosophers in almost all fields feel the need to explain how their subject-matter—morality, meaning, free will, consciousness—can be reconciled with a scientific picture of the world.

The Quinean attack on analytic truths and conceptual analysis has also had an unintended, and somewhat ironic, consequence: by contributing to the demise of Logical Positivism, which viewed metaphysical inquiries as nonsensical, Quine inadvertently opened the door to a new wave of metaphysical theorizing. Quine's student, David Lewis, led the way in returning metaphysical inquiry to philosophical respectability (though Lewis, unlike some who followed him, took the findings of empirical science as a constraint on metaphysical claims). Philosophers like

Lewis and Kripke offered accounts of *modal* concepts—such as 'necessity' and 'possibility'—which could then be deployed in understanding a range of traditional metaphysical questions about the nature of causation, free will, meaning, and reference. Metaphysical theorizing about classic questions relating to time, material objects, substance, and change has also flourished. The return to metaphysics has been a prominent feature at several leading American philosophy departments besides Princeton, including those at Rutgers (where it coexists with the naturalistic turn, though partly divided along generational lines), MIT (Robert Stalnaker, Stephen Yablo), and Notre Dame (Alvin Plantinga, Peter van Inwagen, and others).

A more minor theme in post-Quinean American philosophy has reflected the influence of the later Wittgenstein's quietism: his view that philosophical questions were predicated on confusions about language, and so could be dissolved or neutralized. The American pragmatist philosopher Richard Rorty (b. 1931) popularized (some would say vulgarized) Wittgensteinian, Quinean, and Sellarsian ideas, and reached a large audience outside academic philosophy with his message that philosophy, as traditionally conceived, was over. This, unfortunately, ignored the revival of metaphysical inquiry and the naturalized approach to philosophical questions which most philosophers took to be Quine's legacy.

The naturalistic and metaphysical developments in American philosophy in recent decades have coincided with a revival of systematic inquiries in moral and political philosophy. Rawls's 1971 book *A Theory of Justice* is usually identified as the turning-point away from the mid-twentieth-century view that the only philosophical questions about values were questions about the meaning of evaluative language. Oddly, Rawls never responded directly to mid-century doubts about the objectivity of morality, but his book gave rise, none the less, to a lively literature on timely questions about distributive justice, the nature of rights, equality and freedom, and related topics. Beginning in the late 1970s, naturalistically minded philosophers began returning to the old 'meta-ethical' questions (questions about the meaning and objectivity of moral judgements), with Allan Gibbard (University of Michigan at Ann Arbor) breathing new life into the 'non-cognitivist' view that normative judgements are really expressive of certain attitudes, rather than descriptive of the world; while the so-called Cornell realists argued, conversely, that the objectivity of moral judgements could be reconciled with a scientific view of the world.

The largesse and largeness of the American university system—with more than 100 doctoral programmes, turning out hundreds of Ph.D.s each year—has made it possible for there to be specialists in every conceivable topic (from medieval logic to Heidegger's aesthetics), and for departments not in the top ranks of the profession to carve out riches of great distinction. This may go some distance towards explaining the explosion of work in the history of philosophy in recent decades, work that strives to understand figures in their historical context, while also

engaging with them as philosophers, and not simply museum pieces from the history of ideas. (Julia Annas at the University of Arizona, who writes on ancient Greek philosophers, and the late Margaret Wilson of Princeton, who wrote on philosophers of the early modern period, have been influential figures.) Of particular note is the way in which figures outside the English-speaking traditions of philosophy have been incorporated into those traditions, from Allen Wood (Stanford University) on Kant, Hegel, and Marx, to Hubert Dreyfus (University of California at Berkeley) on Heidegger and Husserl. German philosophy of the nineteenth and twentieth centuries is increasingly a part of philosophical dialogue and debate in American philosophy at the dawn of the twenty-first century. B.L.

**amorality.** Sometimes but incorrectly used to mean extreme immorality or wickedness, amorality more properly signifies the absence, in a person, of any understanding of or concern for moral standards or decencies. In this sense all babies and small children are amoral, but it is usually expected of adults that they should not be. If they are, they will probably commit horrible acts, hence the confusion of meanings noted at the start. But whether amorality is significant will depend on how we understand the nature of moral demands and their role in regulating human conduct; often simple good-naturedness is as effective as a sense of duty in promoting peace among persons. Amoralists are often depicted as monsters, but the example just given suggests this is not necessarily so. What is true is that they are uncommon. Less dramatically, certain acts or choices are amoral, i.e. involve no moral factors, such as choosing cabbage rather than carrots for lunch.

**analogy, argument from, for the existence of God:** see teleological argument for the existence of God.

**analysis** is the philosophical method, or set of methods, characteristic of much twentieth-century anglophone philosophy, of the type which describes itself as 'analytic' to express allegiance to rigour and precision, science, logical techniques, and—perhaps most distinctively of all—careful investigation of language as the best means of investigating concepts.

Analysis is pre-eminently a style, not a body of doctrine. It is piecemeal and particular in its interests. Some of its practitioners have professed hostility to 'metaphysics', by which they meant system-building efforts of the kind associated with Spinoza and Hegel, whose philosophizing might be called synthetic, in that it ventures to construct inclusive explanations of the universe. In sharp contrast, philosophical analysis is best understood by analogy with analysis in chemistry, as being a process of investigation into the structure, functioning, and connections of a particular matter under scrutiny.

Although analytic philosophers look back to Aristotle and the British Empiricists, especially Hume, as major influences on their tradition, it is the work of Bertrand Russell and G. E. Moore at the beginning of the twentieth century which is the proximate source of analysis so called.

Moore conceived the philosopher's task to be a quest for \*definitions as a way of clarifying philosophical claims. This involves finding a definition of the concept or proposition (not merely the words used to express them) under discussion. One begins with a concept in need of definition (the *analysandum*) and looks for another concept or concepts (the *analysans*) which will explain or elucidate it. Indeed Moore made the more stringent demand that *analysans* and *analysandum* should be strictly equivalent.

Russell's conception of analysis derived from his work in logic. On his view, the surface forms of language can mislead us philosophically, as when the grammatical similarity of 'the table is brown' and 'the complexity of the situation is growing' leads us to think that tables and complexities exist in the same way. We must therefore penetrate to the underlying logical structure to clarify what is being said. The classic example is provided by Russell's theory of \*descriptions. Suppose someone now asserts 'The present King of France is wise'. Is the sentence false, or neither true nor false? Russell argued that it is a concealed three-part conjunction asserting that there is a king of France, that there is only one such thing ('the' implies uniqueness), and that it is wise. Since the first conjunct is false, the whole is so.

These early techniques of analysis were soon extended and varied into practices not restricted either to the giving of definitions or to the attempt to unearth underlying logical structure. Some philosophers who would standardly be classified as belonging to the analytic tradition—a broad church—have explicitly repudiated both the claim that language has a hidden logical structure (the later Wittgenstein) and the idea that the chief task of the

philosopher is to state definitions. It has indeed been argued that this latter view is in any case inapt, for if definiens and definiendum are strictly equivalent, analysis is trivial; but if not, it is incorrect.

Analysis has sometimes been claimed to involve \*reduction of one kind of item—in the linguistic mode, a statement or proposition, or set of them; in the material mode, entities of given sorts—to items of another kind. For example, \*phenomenalists argue that statements about physical objects are to be analysed into (translated into) statements about sense-data. In the philosophy of mind, \*physicalists claim that mental phenomena can be exhaustively analysed in terms of physical phenomena in central nervous systems. This second kind of reductive analysis is eliminative, unlike the first, in holding that it is the reducing class of phenomena which is real or fundamental, and that talk of phenomena in the reduced class is merely a *façon de parler* or a function of ignorance.

Other conceptions of analysis have been influential. On Michael Dummett's view, analysis consists on elucidating the nature of thought by investigation of language. The idea is that to get a philosophical understanding of ourselves and the world, we have to proceed by way of what we think about these matters; but our chief and perhaps only access to what we think is what we say; so analysis comes down to the philosophical study of meaning. For P. F. Strawson analysis is the descriptive task of tracing connections between the concepts in our scheme of thought, with a view among other things to seeing what order of dependence obtains among them, thereby helping us to see why, for example, various forms of scepticism need not trouble us.

These remarks show that the concept of analysis is not univocal; there is no one method or set of methods which can be claimed as definitive of it. Philosophers in the analytic tradition have in practice agreed with the celebrated dictum of Deng Xiaoping concerning methodology, that 'it does not matter whether a cat is black or white so long as it catches mice'. But although there is no defining *method* of analysis, there can be said to be a defining *manner*, embodied in the ideal characterized in the opening paragraph above as any careful, detailed, and rigorous approach which throws light on the nature and implications of our concepts, characteristically revealed by the way we employ them in discourse.

**analytic and synthetic statements.** According to Kant, an analytic statement (or judgement) is one in which the concept of the predicate is already contained, or thought, in the concept of the subject—an example would be the

statement that a vixen is a female fox—whereas a synthetic statement is one in which this is not so, for instance, the statement that foxes are carnivorous. The \*Logical Positivists, adopting the linguistic turn, held that an analytic statement is one which is true or false purely in virtue of the meanings of the words used to make it and the grammatical rules governing their combination. This definition has the advantages that it does not have application only to statements of subject–predicate form and avoids either reliance on the obscure notion of 'containment' or appeal to psychological considerations. Both Kant and the Logical Positivists assumed that true analytic statements must express necessary truths knowable \*a priori, though Kant also held that some synthetic statements express such truths, including mathematical statements like '7 plus 5 equals 12' and metaphysical statements like 'Every event has a cause'. The Logical Positivists, by contrast, held mathematical truths to be analytic, and metaphysical statements to be nonsensical or meaningless.

Most contemporary philosophers are very wary of appearing to endorse the analytic–synthetic distinction following W. V. Quine's devastating onslaught upon it (though Grice and Strawson subsequently mounted a vigorous rearguard defence of its validity). Quine argues that this supposed distinction cannot be defined save (circularly) in terms which already presuppose it and that, in any case, it depends upon an untenable view of meaning. The positivists had adopted a verificationist theory of \*meaning according to which there is a sharp distinction to be drawn amongst meaningful statements between those which can only be known to be true on the evidence of experience (synthetic statements) and those which are verifiable independently of any possible experience and which are therefore immune to empirical falsification (analytic statements). Quine, however, contends that no such sharp distinction can in principle be drawn, because our statements are not answerable to the court of experience *individually*, but only *collectively*—and *any* statement, even a supposed 'law' of logic, is potentially revisable in the light of experience, though some revisions will have more far-reaching implications than others for the rest of our presumed knowledge.

**analytic philosophy** began with the arrival of Wittgenstein in Cambridge in 1912 to study with Russell and, as it turned out, significantly to influence him. Between the wars, through the influence of Russell's writings and Wittgenstein's own *Tractatus Logico-Philosophicus* (1922), analytic philosophy came to dominate British philosophy. In the 1930s the ideas of Russell and Wittgenstein were taken up and put forward more radically and systematically by the Logical Positivists of the \*Vienna Circle and Reichenbach's circle in Berlin. There were sympathetic groups in Poland and Scandinavia and some scattered but

distinguished adherents in the United States (to which many of the European positivists fled from Hitler), such as Nagel and Quine. The very different ideas of the later Wittgenstein, who came back to Cambridge in 1929, closer to those of Russell's original ally G. E. Moore, became increasingly influential and, under the label \*'linguistic philosophy', prevailed in most of the English-speaking world from 1945 until about 1960. In the post-positivist era from then until the present English-speaking philosophy has been mainly analytic in the older, pre-linguistic sense, but with large variations of method and doctrine.

There had been some anticipations of analytic philosophy before Russell achieved philosophical maturity. The first is possibly Bernard Bolzano, a brilliant, isolated, and largely neglected Czech. Gottlob Frege, W. K. Clifford, Karl Pearson, Ernst Mach, and Henri Poincaré were all serious mathematicians, several of them highly creative and original, and they wrote philosophy, as did their more self-consciously analytic successors, in something of the style of a mathematical treatise: impersonal and objective, with terms explicitly defined and arguments formally and rigorously set out. That distinguishes them from the great fellow-travellers of analytic philosophy, Hume and J. S. Mill.

Russell and Moore emerged as original thinkers in the first decade of the century when they broke demonstratively away from the kind of Bradleian idealism which they had been taught. They argued against the view that reality is both an undissectable unity and spiritual in nature, that it is a plurality made up of an indefinite multiplicity of things, and that these things are of fundamentally different kinds—material and abstract as well as mental. They fatally undermined the idealist theory that all relations are internal or essential to the things they relate and, less persuasively, that the direct objects of perception are subjective contents of consciousness.

In the first decade of the twentieth century Moore was the leader, Russell being fully engaged in his work in mathematical logic. Moore's immensely methodical work had a quasi-mathematical quality, and he was perhaps the first to describe it as analysis. What he meant by that was the careful elaboration in the most lucid possible way of the precise meaning of the problematic assertions he was discussing, to make them available for critical scrutiny. That entangled him in the toils of the so-called paradox of analysis (if analysis reveals A to be identical to BC, how can 'A = BC' amount to more than the empty truism 'A = A'?).

During this decade Russell's main work was in logic. He defined the basic concepts of mathematics in purely logical terms and attempted, less successfully as it turned out, to deduce the fundamental principles of mathematics from purely logical laws. In his theory of descriptions he provided a new kind of definition, a definition in use or contextual definition, which did not equate synonymy with synonym but gave a rule for replacing sentences in which the word to be defined occurred with sentences in which it

did not. This was described by F. P. Ramsey as the 'paradigm of philosophy'.

Working in conjunction with Wittgenstein between 1912 and 1914 Russell elaborated the \*'logical atomism' set out rather casually in his *Our Knowledge of the External World* (1914) and *Philosophy of Logical Atomism* (1918) and more systematically, but obscurely, in Wittgenstein's *Tractatus*. All our significant thought and discourse, they held, can be analysed into elementary propositions which directly picture states of affairs, the complexes analysed being composed by the relations symbolized by the logical terms 'not', 'and', 'or', 'if', and, perhaps, 'all' (Russell thought it irreducible, Wittgenstein did not). The truth, or falsity, of the complex propositions was unequivocally determined by the way in which truth and falsity were distributed among their elementary components. Some complexes were true whatever the truth-value of their elementary components. These were the truths of logic and mathematics.

Both believed that the true logical content of complex propositions is concealed by ordinary language and can be made clear only by their kind of reductive analysis. Propositions which cannot be analysed into elementary statements of fact are 'metaphysical', for example those of morals and religion. They also held that elementary propositions represented the world as it really is. But the ontological conclusions they drew from this were different. Wittgenstein took it to reveal the general form of the world. Russell, giving elementary propositions an empiricist interpretation as the immediate deliverances of sense, arrived at the neutral monist conclusion that only experiential events really exist; the minds which have the experiences and the physical things to which the experiences attest are merely constructions out of experience, not independently existent things. He drew here on the analyses of material particles, points in space, and instants of time, put forward in the early 1920s by A. N. Whitehead, the collaborator in his early logico-mathematical work.

The Vienna Circle, led by Carnap and Schlick, took over the conception of philosophy as reductive logical analysis and the doctrine of the analytic (purely formal, factually empty) character of logic and mathematics. They followed Russell in taking elementary propositions to be reports of immediate experience and developed from this the principle that verifiability in experience is the criterion of meaningfulness. Deprived of significance by this criterion, judgements of value are imperatives (or expressions of emotion) not statements and the affirmations of the metaphysician or theologian are at best a kind of poetry. But they rejected the analytic ontologies of their predecessors. Against Wittgenstein they contended that language is conventional, not pictorial. Against Russell they maintained that bodies and minds are no less really existent than events, despite being constructions rather than elements.

\*Logical Positivism was memorably introduced to the English-speaking world in A. J. Ayer's *Language, Truth and Logic* (1936). But as it became the height of philosophical

fashion a new tendency was in the making in Wittgenstein's fairly esoteric circle. Language, he came to hold, in his new philosophical incarnation, is not simply descriptive or fact-stating, it has a multiplicity of uses and its meaning consists in the way it is used. It does not have a logical essence which it is the business of analysis to reveal; it has, rather, a natural history which it is the therapeutic, puzzlement-alleviating task of philosophy to describe. Our beliefs, about the mental states of other people for example, cannot be analysed into the evidence we have for them; that evidence is more loosely related to the beliefs as 'criteria' of their truth. This mood of acceptance, rather than large-scale reconstruction or reinterpretation, of ordinary discourse, has some affinity with the resolute pedestrianism about common sense and ordinary language which Moore had been practising for a long time. It took a different form in post-war Oxford: breezily definite with Ryle, scrupulously lexicographic with J. L. Austin. This is the linguistic philosophy which, centred at Oxford, was dominant in the English-speaking world from 1945 to about 1960, when it disappeared in its original form almost without trace.

Philosophical analysis, in a more or less Russellian spirit, but in a considerable variety of forms, has continued from its revival around 1960 to the present day. Quine's famous essay 'Two Dogmas of Empiricism' (1951) seemed to undermine the whole analytic project. He claimed that there was no theoretically adequate way of distinguishing identity of meaning from identity of reference, on the ground that there is no scientifically respectable 'criterion of synonymy'. The alleged findings of philosophical analysis, therefore, are no more than general factual beliefs we are specially unwilling to abandon in the face of apparently contrary evidence. Quine's view was received with great respect and was very little criticized, but philosophers went on very much as before. Quine's own philosophy is analytic in tone. His argument is not obviously convincing. Is a scientific criterion of sameness of meaning really needed? The verificationist theory of meaning was widely criticized, for the most part as self-refuting, by no one more effectively, perhaps, than by Popper, who based a new account of the nature of science on the thesis that falsifiability is a criterion, not of meaning, but of scientific status. The two most notable specimens of reductive analysis (the phenomenalist conception of material things as systems of appearances, actual and possible, and the behaviourist theory of states of mind as dispositions of human bodies to behave in certain ways in particular circumstances) were generally discarded, most thoroughly in the work of various Australian materialists, for instance D. M. Armstrong and J. J. C. Smart. They held that we have direct, if inherently fallible, awareness of material things and that the mental states of which we are aware in self-consciousness are in fact identical with brain-states which cause behaviour.

There is not much literal analysis in the work of prominent late twentieth-century practitioners of analytic philosophy such as Putnam and Nozick. But they think and

write in the analytic spirit, respectful of science, both as a paradigm of reasonable belief and in conformity with its argumentative rigour, its clarity, and its determination to be objective. A.Q.

**anarchism.** In its narrower meaning anarchism is a theory of society without state rule. In its broader meaning it is a theory of society without any coercive authority in any area—government, business, industry, commerce, religion, education, the family. Although some of its advocates trace its roots back to Greek thinkers—such as the Stoics, especially Zeno (336–264 BC)—or to the Bible, the modern work generally recognized as presenting the first articulation and defence of anarchism is William Godwin's *An Inquiry Concerning Political Justice and its Influence on General Virtue and Happiness* (1793). Pierre Joseph Proudhon (1809–65) is credited with being the first person to call himself an anarchist. There is no single defining position that all anarchists hold, and those considered anarchists at best share certain family resemblances.

Anarchist positions can be total, dealing with society as a whole and calling for a violent \*revolution, or more restrictive in their views, dealing with smaller units or advocating piecemeal change. They also vary from the radical individualism of Max Stirner to the anarchist communism of Kropotkin, with the positions of Proudhon, Bakunin, and the anarcho-syndicalists falling in between.

Max Stirner (1806–56) is the most individualistic and 'egoistic' of the anarchist thinkers. For him the freedom of the individual is absolutely sovereign, and any infringement on that freedom is unjustifiable. He attacks not only the \*State, government, law, and \*private property, but also religion, the family, ethics, and love—all of which impose limits on individual action. He does not preclude human interaction but all associations are to be

completely free and individuals enter them only for their own reasons and benefit. Leo Tolstoy (1828–1910), another somewhat atypical anarchist, adopted a type of religious anarchism, using the Bible to attack the rule of one person over another and the legitimacy of secular power. He finds in the Gospels a doctrine of peace and love that is sufficient for the organization of society and that is violated by governments, laws, police, armies, and private property. Proudhon's anarchism advocated a society based on small enterprises and skilled craftsmen who organized to form a co-operative community of equals. Michael Bakunin (1814–76), who favoured violent overthrow of the state, envisaged replacing it with a federation built from below on the basis of voluntary associations. Anarcho-syndicalism focused on trade unions, or syndicates, as the engine of change in society, for syndicates championed the interests of the workers and could serve as the basis for social organization after a successful revolution had overthrown the existing state structures. Peter Kropotkin (1842–1921), as an anarcho-communist, held that the individual is essentially a social being who can fully develop only in a communist-type society, which precluded authoritarian rule and the special interests of dominant groups. Like other communists he advocated the abolition of private property and the development of a society built on common ownership of the means of production. For him the commune is the basic social unit, and communal needs are balanced with individual needs.

Despite their differences the proponents of anarchism generally tend to: (1) affirm freedom as a basic value; some add other values as well, such as justice, equality, or human well-being; (2) attack the state as inconsistent with freedom (and/or the other values); and (3) propose a programme for building a better society without the state. Most of the literature on anarchism considers the state an instrument of oppression, typically run by its leaders for their own benefit. Government is often, though not always, similarly attacked, as are exploitative owners of the means of production in a capitalistic system, despotic teachers, and over-dominant parents. By extension anarchists hold as unjustifiable any form of authoritarianism, which is the use of one's position of power for one's own benefit rather than for the benefit of those subject to authority. The anarchist emphasis on \*freedom, \*justice, and human \*well-being springs from a positive view of human nature. Human beings are seen as for the most part capable of rationally governing themselves in a peaceful, co-operative, and productive manner.

Whereas the traditional role of the political theorist is to justify the existing structures of society, the role of the anarchist is to challenge these structures and to demand their justification prior to accepting them. In accord with the anarchists' view of the state as an instrument of oppression in the hands of a ruling class, they see law as simply the means by which that class defends its self-interest, and armies and police as the means the rulers use to enforce their will. The state so conceived has injustice built into it and hence is in principle unjustifiable. More-

over, the state is the major perpetrator of violence, and the cause of much of the oppression, social disorder, and other ills suffered by society. The anarchists differ on how to rid society of the state, violent revolution being the most drastic, and piecemeal change from below, often through education, the least radical.

The good society which forms part of the positive anarchist project is similarly an issue on which there is considerable disagreement. But most advocates of anarchism envisage a society to which the members voluntarily belong, which they are able to leave if they wish, and in which the members agree to the rules under which they live. Size and levels of complexity are not major issues, although the emphasis is usually on beginning with smaller units of self-determination and building on those.

Thus, anarchism does not preclude social organization, social order or rules, the appropriate delegation of authority, or even of certain forms of government, as long as this is distinguished from the state and as long as it is administrative and not oppressive, coercive, or bureaucratic. Anarchism maintains that all those who hold authority should exercise it for the benefit of those below them, and if they hold offices of authority they are accountable to those below them and recallable by them. The abolition of the state precludes not the organization of things but the domination of people. Most, though not all, anarchists acknowledge the importance of the moral law as the proper guide for social interaction, providing this is envisaged as compatible with the autonomy of the individual. Most anarchists accept a kind of democracy in which people are self-governed at all levels. The details of social organization are not to be set out in advance but are in part to be decided by those who are subject to them.

Although anarchists were politically active in Spain, Italy, Belgium, and France especially in the 1870s and in Spain during the Spanish Civil War, and although anarchists formed an anarcho-syndicalist union in the United States in 1905, there have been no significant, successful anarchist communities of any size.

Anarchism enjoyed a renaissance for a period in the 1960s and early 1970s in the writings of such proponents as Paul Goodman (1911–72), perhaps best known for his writings on education, and Daniel Guérin (1904–88), who develops a communitarian type of anarchism that builds on but goes beyond nineteenth-century anarcho-syndicalism, which is now out of date.

As a political theory anarchism is not at present widely held; but it continues to serve as an important basis for the critique of authoritarianism and as a continuing reminder of the need to justify existing institutions. R. DE G.

G. Woodcock, *Anarchism* (Harmondsworth, 1986).

**Anaxagoras** (500–428 BC). \*Pre-Socratic philosopher. A native of Clazomenae in Asia Minor, he lived most of his life at Athens, where he was a friend of the democratic

statesman Pericles. Rather unreliable sources say that he was ultimately exiled from Athens after a prosecution for impiety (his statement that the sun was a large lump of metal was allegedly the basis of the charge).

Like his contemporaries the early Atomists (Leucippus and Democritus), Anaxagoras re-thought the Milesian cosmological enterprise in the light of Eleatic methods and arguments, but without any wholesale acceptance of them.

On two cardinal points Anaxagoras went the opposite way to Atomism. (1) He postulated a material continuum (without void) with infinitely complex micro-structure. There were infinitely many fundamental kinds of matter, not further reducible and not interchangeable. All of these kinds of matter were present in every spatially continuous portion of matter, however small. Hence there were no places in which any type of matter existed unmixed with all the others. There was 'a portion of everything in everything'. This was in effect a 'field theory' (as opposed to the Atomists' 'particle theory'), exploiting the possibilities of arbitrarily small scales of size. The details are obscure and controversial. (2) His universe was dominated by teleology. The ordering of things was planned and initiated by Mind (*Nous*), which was conceived of both as a unified cosmic intelligence and as an explanation of human and animal intelligence. Both Plato and Aristotle praised Anaxagoras for his explicit assertion of the rule of Mind (Aristotle said 'he showed up like a sober man, as compared with his wild-talking predecessors'), but both complained that he gave only mechanistic explanations of particular phenomena.

E.L.H.

\*atomism, physical; teleological explanation.

M. Schofield, *An Essay on Anaxagoras* (Cambridge, 1980).

**Anaximander of Miletus** (fl. c. 550 BC). Associate of Thales and one of the three Milesian 'natural philosophers'. (\*Pre-Socratic philosophy.) His monistic cosmology was based on the self-transformations of 'the Infinite', an infinitely extended being, living and intelligent. In his explanations, biological and legal analogies are used, and there is a striking appeal to symmetry (the earth stays at rest because it is symmetrically placed in the cosmos; so there is no reason why it should move in one direction rather than another).

E.L.H.

C. H. Kahn, *Anaximander and the Origins of Greek Cosmology* (New York, 1960).

**Anaximenes of Miletus** (fl. c. 550 BC). The third of the troika of Milesian 'natural philosophers' (\*Pre-Socratic philosophy). He proposed a cosmological theory in which the whole of the universe consisted of air in different degrees of density—the first attested attempt to explain qualitative differences in terms of quantitative ones, and one backed up by an appeal to everyday experience (air breathed from an open mouth feels warm, air breathed through pursed lips feels cold).

E.L.H.

J. Barnes, *The Presocratic Philosophers*, i (London, 1979), 38–47.

**ancestral relation.** A relation obtained through the following logical transformation of a given relation: The ancestral of a relation  $R$  holds between objects  $x$  and  $y$  if and only if either  $x$  bears  $R$  to  $y$ , or  $x$  bears  $R$  to some  $z_1$  that itself bears  $R$  to  $y$ , or  $x$  bears  $R$  to some  $z_2$  that bears  $R$  to a  $z_1$  that bears  $R$  to  $y$ , or . . . Thus, 'ancestor' is the ancestral of 'parent', and 'less than' (restricted to natural numbers) is the ancestral of 'immediate predecessor'. Frege showed that the ancestral of a \*relation can be explicitly defined, without ellipsis, within second-order logic.

**ancient philosophy.** 'Ancient philosophy' is the conventional title, in Europe and the English-speaking academy, for the philosophical activities of the thinkers of the Graeco-Roman world. It includes a succession of philosophers who operated over a 1,000-year period from the middle of the first millennium BC to the middle of the first millennium AD—from Thales and the earliest Pre-Socratics to late Neoplatonists and Aristotelian commentators, such as Simplicius and Philoponus. Later thinkers in Europe (e.g. Scotus Eriugena) are normally assigned to the category \*'medieval', as are Arabic philosophers such as Avicenna and Averroës, and also Jewish philosophers such as Gabriel and Maimonides. Contemporary philosophers from other cultures (e.g. Confucius, Buddha) are also not included.

Traditionally ancient philosophy is divided into four main periods: the \*Pre-Socratic philosophers, Plato, Aristotle, the post-Aristotelian philosophers. Recently there has been a tendency to divide the last by adding a fifth phase of Christian and Neo-platonist philosophers. The most important of the ancient philosophers are Plato and Aristotle; and even though there has been a considerable shift of interest in the past thirty years in favour of the post-Aristotelians, it remains the case that the two fourth-century BC philosophers are the primary focus of interest, both to specialists and to students and the wider philosophical community. This is partly because their writings survive in extensive and accessible form, so that they can be studied and assessed for the quality of their argumentation as well as for their conclusions; it is also a recognition of the superior nature of their philosophical work.

In their different ways Plato and Aristotle look both backwards and forwards in philosophy. Each constructs his theorizing so as to encapsulate leading elements in the earlier tradition: Plato does this with impressionistic flair, Aristotle perhaps with more precision and historical accuracy. This retrospective work is intended to supersede the insights of preceding philosophers; and it largely succeeds in this. Thus the available options in ontology are summarized in Plato's *Sophist* as monism, dualism, or pluralism, and a commitment to the primacy either of perceptible body or of intelligible ideas. Aristotle discovers in earlier thought confused but recoverable traces of four distinct kinds of explanation, which correspond to his four kinds of cause—material, formal, efficient, and final. In these and

many other ways Plato and Aristotle absorb what is philosophically valuable in Pre-Socratic thought, and they transmute it into something which has endured with greater vitality in the later philosophical tradition.

None the less, there are certain Pre-Socratic themes which Plato and Aristotle undervalue and which have been emphasized by contemporary philosophers. Heraclitus and Parmenides, in particular, were clearly very much concerned with the relations between language and thought and the world. Philosophers in the contemporary hermeneutical tradition (but also many others before them) have been interested in Parmenides' comments on the limits of the expressible; and Marxists and paraconsistent logicians have sought to develop Heraclitus' aphorisms on the contradictoriness of truth. Empedocles and Anaxagoras are scrutinized to see how they connected chemical analysis with mental causation.

While the concerns of Plato and Aristotle also exert great influence on the work of post-Aristotelian philosophers, these latter also develop a number of new themes. For example, there were substantial advances in propositional and modal logic, in speculation about the natural basis of epistemology, and in the philosophies of physics and of law. They also supplied important clarification of the philosophical issues involved in the debate over determinism and freedom. In ethics they were concerned with appropriate attitudes to animal suffering and to human death, in ways which anticipate recent themes in applied philosophy.

What are the main features of ancient philosophy? This 1,000-year period of Graeco-Roman philosophy has bequeathed certain central themes for later thinkers. It is incumbent on all philosophers to be aware of the precise way in which these problems were introduced into the subject, even though the later course of debate may have injected new directions or emphases. The key themes are these: the ontological specification of non-perceptible items (e.g. numbers, gods, universal kinds); the isolation of objective causes in the non-animate sphere of nature; the analysis and evaluation of patterns of reasoning and argument; the importance of understanding in the pursuit of the good life; the need to analyse the nature of the human person; the importance of the concept of justice in defining the nature of a political system; critical self-awareness regarding the content and manner of philosophical utterance; and many more.

The ancient philosophers created and laid much of the groundwork for later philosophical debate in the fields of ontology, epistemology, logic, hermeneutics, ethics, and political philosophy. They also established the crucial features of philosophical method—open-mindedness as to the agenda of problems, and rational progress through argument and debate.

While much of ancient philosophy runs with common sense, it also contains paradoxes and eccentricities. Among these are to be counted Plato's theory of Forms, according to which universal kinds or properties are actually separate from their instances, Aristotle's conception

of God as concerned only with his own essence, and the Stoics' absolutist distinctions between good and bad.

Some themes are prominent in ancient philosophy which have become less so in the more recent history of the subject, while in the case of others it has been claimed that they were unknown or ignored by the ancient thinkers and only came to the fore in philosophy in the period since Descartes. Examples of the former are the significance of form in relation to the stuff of which a thing is made, and the idea that the most effective strategy for explaining natural change is through end-results (teleology). On the other hand, the modern philosophical themes of personal identity, the distinction between mind and body, and the contrast between first and second-order questions—in ethics and elsewhere—seem to be missing from the agenda of ancient philosophy. But these idiosyncrasies can be exaggerated. It would be prudent to assume that on these, as on other, topics there will be further research which reopens debate between ancient philosophers and their successors.

One of the most fertile fields of ancient philosophy was ethics. Here a central figure is Socrates, whose intellectually profound and persistent interest in the nature of the good life led him to penetrating comment on human knowledge and rationality. The constructive scepticism of Socrates has been a major determinant of subsequent philosophical method. Socrates has always been an emblem of the true philosopher; and this iconic tendency has become more pronounced in recent years. (It is sometimes reinforced by the fact that Socrates, who published nothing, could not have been 'assessed' by current league table methods). Aristotle's ethical work was strongly influenced by Socrates. He reacted against Socrates by emphasizing the importance of character and, as such, has inspired a recent revival of what is now called 'virtue ethics'. His theory of the ethical mean is particularly interesting to value-pluralists, who strive to avoid oversimplification in moral theory. Ancient moral philosophy reinforces the contemporary philosophical interest in applying ethical analysis to real life problems. The ancient philosophers always saw their theoretical interest as directed on practical matters. Their ethics is, therefore, applied as well as being theoretical.

A further way in which the habits of ancient philosophical thought connect with modern interests comes from the concept of dialectic. Contemporary philosophers are rediscovering the connection between analytical and dialectical philosophical styles. The roots of both lie in ancient philosophy, whose leading thinkers placed high value both on the pursuit of philosophical dialogue and on the analysis of complex and potentially ambiguous concepts. Philosophers who are concerned with hermeneutics have recently rediscovered the literary complexity of Plato's compositions; they have found philosophical significance in the ways in which different characters are portrayed as presenting the truth. This method has been applied to some of the most 'analytical' of his works, such as *Sophist*. Attention to the works of the major ancient

## ANCIENT PHILOSOPHY

PLATO's status as the father of Western philosophy is owed not just to the fortunate preservation of his entire *œuvre* (unusual for an ancient philosopher) but to the exceptional richness, subtlety, breadth, and beauty of his writings.

ARISTOTLE first came to Plato's Academy as a teenager, and thirty years later founded a new school in Athens, the Lyceum, where he taught and wrote on all subjects: philosophy, logic, politics, rhetoric, literature, and the sciences. He was still regarded as the authority on these subjects 1,500 years later.

EPICURUS taught that pleasure is the only good, but the life of pleasure that he advocated was a sober one, guided by wisdom.

PLOTINUS, probably a Hellenic Egyptian by birth, settled in Rome in middle age, and spent the rest of his life teaching philosophy through informal discussion groups.

thinkers is an excellent antidote to the division of philosophy into sectarian factions which is still urged in some quarters.

The study of ancient philosophy is an important element in philosophy, which needs to be sustained at a level of suitable scholarly rigour. But there is a declining complement of qualified specialist academic staff, and a personnel crisis.

J.D.G.E.

\*Aristotelianism; Neoplatonism; Platonism; Roman philosophy; Stoicism; Sceptics, ancient; Epicureanism; footnotes to Plato.

The nature of current work in ancient philosophy can be assessed from the following rather different kinds of material:

J. Barnes, *The Toils of Scepticism* (Cambridge, 1990).

W. K. C. Guthrie, *A History of Greek Philosophy*, 6 vols. (Cambridge, 1962–81).

T. H. Irwin, *Aristotle's First Principles* (Oxford, 1988).

M. M. McCabe, *Plato and his Predecessors* (Cambridge, 2000).

M. Nussbaum, *The Fragility of Goodness* (Cambridge, 1986).

R. Sorabji, *Animal Minds and Human Morals* (London, 1993).

**ancient philosophy, relevance to contemporary philosophy:** see footnotes to Plato.

**and:** see conjunction and disjunction.

**Anderson, John** (1893–1962). Anderson had more influence than anyone else on Australian philosophy, and the philosophy he taught was unlike anyone else's. (Heraclitus and Alexander were influences.) It put everything on one level: no God, no atomic ultimates, no substantial selves; everything just 'a set of interacting situations' occupying a region of space and time. Correspondingly, all truth is of one kind: there is no necessary truth; there is just being so.

Andersonian realism asserts the independence of knower and known, whatever the known. To regard a relation as at all constitutive of anything is a form of 'relativistic' confusion. Anderson is always hunting down relativistic confusion. He finds it, for example, in the obligatory. This is generated when a relation with one term suppressed—a requirer—is seen as a quality—requirement—of an action. The demolishing questions are: Who does the requiring? and What is his policy?

S.A.G.

John Anderson, *Studies in Empirical Philosophy* (Sydney, 1962) includes most of Anderson's writing.

J. L. Mackie, 'The Philosophy of John Anderson', *Australasian Journal of Philosophy* (1962).

**Anderson and Belnap.** Alan Ross Anderson (1925–73) and Nuel D. Belnap, Jr. (b. 1930) came together at Yale University in the late 1950s, the former as teacher, the latter as student. Belnap had returned from study in Europe with Robert Feys, who had interested him in Wilhelm Ackermann's seminal paper on 'strenge Implikation' in the *Journal of Symbolic Logic* for 1956; Anderson was delighted to find a fellow enthusiast, and between them they began (little knowing what it would become) a programme of research into \*'relevance logic'.

Anderson's other work in modal logic, deontic logic, and philosophy of mind should not be forgotten; nor his dry wit and felicitous style. Equally, remember Belnap's short but seminal paper on 'Tonk, Plonk and Plink' (*Analysis* (1962)) giving the beginnings of an answer to Prior on whether logical connectives can be defined by the inferences they make valid; and his work on the logic of questions. Both men have worked effectively in joint research with a range of colleagues. Last but not least, we should not overlook the effect of both men as inspiring teachers, grandfathers of late twentieth-century philosophical logic through the influence of their pupils.

**Angst.** A recurrent state of disquiet concerning one's life which Existentialists interpret as evidence that human life has a dimension which a purely naturalistic psychology cannot comprehend. The term was introduced by Kierkegaard, who held that *Angst* (usually translated here as 'dread') concerning the contingencies of fortune should show us that we can only gain a secure sense of our identity by taking the leap of faith and entering into a relationship with God. Heidegger uses the same term (here usually translated as 'anxiety') to describe a sense of unease concerning the structure of one's life which, because it does not arise from any specific threat, is to be diagnosed as a manifestation of our own responsibility for this structure. Sartre uses the term *angoisse* (usually translated as 'anguish') for much the same phenomenon as Heidegger describes.

T.R.B.

\*existentialism; despair.

M. Heidegger, *Being and Time*, tr. J. MacQuarrie and E. Robinson (Oxford, 1962), sects. 40, 53.

**animal consciousness.** Whether animals have consciousness is a question that naturally arises in modern philosophy, which has been dominated in one way or another by Cartesian dualism. In my own case, it is suggested, I know that the bodily movements observed by others are accompanied by a mental life, that is hidden from them; but when I observe their 'behaviour', I can't be certain that they've got minds. Animals (and nowadays computers) appear to generate the same problem, except that denying them consciousness is felt to be less of an outrage to common sense.

Animals are of very different kinds, their behaviour varies, and some have lives closely interwoven with ours. Philosophers who treat animal consciousness as problematic are happy to say that their own dogs want taking for walks, or look guilty because they've been on the furniture. Descartes himself, however, steadfastly maintained that his dog was merely an elaborate clock-like mechanism. But he didn't actually take the dog apart to prove this.

Descartes, *Discourse on Method*, Part V.

**animalism in personal identity.** Animalists maintain that a human \*person just is (identical with) a living human organism or human animal, in opposition to those philosophers who, because they believe that the persistence conditions of persons are psychological rather than biological in character, hold that a person is distinct from his or her living body. In defence of their position, animalists urge the plausibility of the view that I existed, as a human embryo, some weeks before I was the subject of any conscious mental states, and may well go on existing for a time after I cease to be such a subject. Against the animalist, it may be urged that if my intact and functioning brain were to be transplanted into the evacuated cranium of another human animal, I would acquire a new body rather than someone else acquiring a new brain. However, the animalist may perhaps agree, saying that in this case the animal that I am is first reduced to the size of its brain and is then supplied with a new set of body parts. E.J.L.

\*personal identity.

E. Olson, *The Human Animal* (Cambridge, 1997).

**animals.** In Western ethics, non-human animals were until quite recent times accorded a very low moral status. In the first chapter of Genesis, God gives human beings dominion over the animals. In the Hebrew Bible, this dominion was moderated by some injunctions towards kindness—for example, to rest one's oxen on the sabbath. The Christian scriptures, however, are devoid of such suggestions, and Paul even reinterprets the injunction about resting one's oxen, insisting that the command is intended only to benefit humans. Augustine followed this interpretation, adding that Jesus caused the Gadarene swine to drown in order to demonstrate that we have no duties to animals. Aquinas denied that we have any duty of charity to animals, adding that the only reason for us to avoid cruelty to them is the risk that cruel habits might carry over into our treatment of human beings.

Descartes's views were even more hostile to animals than those of his Christian predecessors. He regarded them as machines like clocks, which move and emit sounds, but have no feelings. This view was rejected by most philosophers, but Kant went back to a view similar to that of Aquinas when he held that animals, not being rational or autonomous, were not ends in themselves, and so the only reason for being kind to them is to train our dispositions for kindness toward humans. It was not until Bentham that a major figure in Western ethics advocated the direct inclusion of the interests of animals in our ethical thinking.

The debate over the moral status of animals remained peripheral to philosophical thinking until the 1970s, when a spate of books and articles led to a vigorous and continuing debate. Peter Singer compared speciesism with racism and sexism, and urged that there is no good reason for refusing to extend the basic principle of equality—the principle of equal consideration of interests—to

non-human animals. Singer argued specifically against factory farming and animal experimentation, and urged that, where there are nutritionally adequate alternatives to eating meat, the pleasures of our palate cannot outweigh the suffering inflicted on animals by the standard procedures of commercial farming; hence \*vegetarianism is the only ethically acceptable diet. On animal experimentation, Singer urged that, in considering whether a given experiment is justifiable, we ask ourselves whether we would be prepared to perform it on an orphaned human being at a mental level similar to that of the proposed animal subject. Only if the answer was affirmative could we claim that our readiness to use the animal was not based on a speciesist prejudice against giving the interests of non-human animals a similar weight to the interests of members of our own species.

Other contemporary philosophers have reached similar, or even more uncompromising, conclusions on a different philosophical basis. Tom Regan, for example, argued that all animals—or at least mammals above a certain age—are 'subjects of a life' and therefore have basic \*rights. Eating animals and performing harmful experiments on them are, he holds, violations of these rights.

In addition to giving rise to a heated philosophical debate, these writings are unique in modern academic philosophy in that they have sparked and continue to influence a popular movement. Major animal liberation and animal rights organizations have developed in many countries, taking their inspiration from the writings of academic philosophers like Singer and Regan, and have made many people more aware of the ethical issues involved in our relations with animals. **animal souls.** For Aristotle souls are general modes of functioning. A plant will have a soul because it feeds and reproduces; the soul of an animal will also cover the capacity to move and sense, and that of a person the capacity to think. Descartes substituted the idea of an immaterial \*soul whose essence is abstract thought, excluding non-humans. So, he concludes, animals are machines with no feelings. (So for humans but not animals there is a chance of immortality.) But even if there are such souls it does not follow that non-humans do not feel, and thus that they lack souls in Aristotle's more reasonable sense. A.M.

Mary Midgley, *Beast and Man* (London, 1980).

Peter Singer, *Animal Liberation*, 2nd edn. (New York, 1990).

**animal spirits.** There is nothing spiritual about Descartes's animal spirits. In Cartesian physiology, they are the purely material medium for the transmission of nervous impulses in humans and animals. 'All the movements of the muscles and likewise all sensations, depend on the nerves, which are like little threads or tubes coming from the brain, and containing, like the brain itself, a certain very fine air or wind, which is called the "animal spirits" (*les esprits animaux*)' (*Passions of the Soul* (1649), art. 7). For the relationship between these pneumatic events and sensory awareness, Descartes had recourse to the pineal gland. J.COT.

John Cottingham, *Descartes* (Oxford, 1986), ch. 5.

**anima mundi.** Latin for 'world-soul', an idea stemming from Plato's *Timaeus*, where the world is a living organism, endowed with a soul by the Demiurge. It explains the harmonious celestial motions and is a model for the restoration of harmony in the human soul. The idea was adopted by Stoicism and Plotinus, and later by Bruno, Goethe, Herder, and Schelling. It is akin to the 'world-spirit' (e.g. of Hegel), but this is more intellectual and is not (as the world-soul often is) distinct from, and subordinate to, God. M.J.I.

F. M. Cornford, *Plato's Cosmology* (London, 1937).

F. A. Yates, *Giordano Bruno and the Hermetic Tradition* (Chicago, 1964).

**anomalous monism.** The view that the mental and the physical are two irreducibly different ways of describing and explaining the same objects and events. The position, like that of Spinoza, combines ontological \*monism with conceptual \*dualism. It holds that mental concepts, though supervenient on physical concepts, cannot be fully analysed or defined in physical terms, and claims that there are no strict \*psychophysical laws. D.D.

\*supervenience; identity theory of mind.

D. Davidson, 'Mental Events', in *Essays on Actions and Events* (Oxford, 1980).

**anomie.** Breakdown of the conventions of everyday life; weakening of a society's collective self-image or social laws. The term derives from the Greek *nomos* (strictly, 'anything assigned or apportioned', 'that which one has in use or possession', but, derivatively, 'law', 'usage', 'custom'); so its etymology is suggestive of 'absence of law'. Anomic terror is the psychological state of individuals stripped of the mores which socially legitimate their death to self and other. \*Durkheim argues that suicide rates increase during periods of anomie. The raising of philosophical questions arguably calls into question established world-views and partly deconditions the individual. If so, philosophy is partly conducive to anomie. S.P.

Emile Durkheim, *The Rules of Sociological Method*, tr. W. D. Halls, ed. Stephen Lukes (London, 1982).

**Anscombe, G. E. M.** (1919–2001). A distinguished pupil of Wittgenstein and one of his literary executors, responsible for editing and translating many of his posthumous publications. Her *Introduction to Wittgenstein's Tractatus* (1959) shed light on his first masterpiece. But Elizabeth Anscombe was also, in her own right, one of the most influential philosophers of the late twentieth century. Her 1957 book *Intention* initiated extensive discussion of intentional action and its explanation, and her 1958 essay 'Modern Moral Philosophy' reset the agenda for that subject. Her ethical writings, critical of contemporary trends, are informed by dogmatic Catholicism. Her numerous essays on metaphysics and philosophy of mind are critical of empiricism, challenging, for example, received views of causality and of the first-person pronoun. She was a tutor at Oxford, and later a professor at Cambridge, and was married to the philosopher Peter Geach. P.M.S.H.

**Anselm of Canterbury, St** (1033–1109). Benedictine monk, second Norman Archbishop of Canterbury, and philosophical theologian dubbed 'the Father of \*Scholasticism'. Anselm is justly famous for his distinctive method ('faith seeking understanding'), his '\*ontological' argument(s), and his classic articulation of the satisfaction theory of the \*atonement. Better suited to philosophy and contemplation than to politics, Anselm possessed a subtlety and originality that rank him among the most penetrating medieval thinkers (along with Augustine, Aquinas, Duns Scotus, and William of Ockham) and explain the perennial fascination with his ideas.

Like Augustine a Christian Platonist in metaphysics, Anselm centres his proofs of God's existence around the value theory intuition that something is too good not to be real! In *Monologion*, he offers \*cosmological arguments that the single source of all goods is Good through Itself (*per se*) and hence supremely good. It exists through itself and is the self-sufficient source of everything else. In *Proslogion*, Anselm reasons that a being greater than which is inconceivable exists in the intellect because even a fool understands the phrase when he hears it; but if it existed in the intellect alone, a greater could be conceived which existed in reality. This supremely valuable object is essentially whatever it is better to be—other things being equal—than not to be, and so living, wise, powerful, true, just, blessed, immaterial, immutable, eternal, even the paradigm of sensory goods—beauty, harmony, sweetness, and pleasing texture! Yet, \*God is not compounded from a plurality of excellences, but supremely simple, 'wholly and uniquely, entirely and solely good' (*omne et unum, totum et solum bonum*), a being more delightful than which is inconceivable.

Not only is God the efficient cause of the being and well-being of everything else, but also the exemplar of all created natures, whose value depends upon their degree of similarity to the Supreme Good. Hence, it is better to be human than horse, to be horse than wood, even though

every creature is 'almost nothing' in comparison with God. As fundamentally ways of striving into God, created natures have a \*teleological structure, a that-for-which-they-were-made (*ad quod factum est*) and for which their powers were given by God. Anselm explains in *De veritate* how teleology gives rise to \*obligation: since creatures owe their being and well-being to their divine cause, so they owe it to God to praise him by being the most excellent handiwork (truest instances of their kinds) they can. Obstacles aside, non-rational creatures fulfil this obligation and 'act rightly' by natural necessity; rational creatures, freely and spontaneously when they exercise their powers of reason and will to conform to God's purpose in creating them. Thus, the goodness of an individual creature depends upon its natural end (i.e. what sort of imitation of divine nature it aims for), and its rightness (in exercising its natural powers to pursue its end). By contrast, God as absolutely independent owes nothing to anything and so has no obligations to creatures.

Anselm advertises the optimism of his \*ontology in *De casu diaboli* by arguing that since the Supreme Good and Supreme Being are identical, every being is good and every good a being. Corollary to this, because all genuine (metaphysically basic) powers are given to enable a being to pursue its natural *telos* and so to be the best being it can, all genuine powers are optimific, essentially aim at goods, while \*evils are metaphysically marginalized as merely incidental side-effects of their operation, involving some lack of co-ordination among powers or between them and the surrounding context. Accordingly, divine omnipotence properly speaking excludes corruptibility, passibility, or the 'ability' to lie, because the latter involve defects and/or powers in other things to obstruct the flourishing of the corruptible, passible, or potential liar. Ultimately, Anselm qualifies the other Augustinian thesis—that evil is a privation of being, the absence of good in something that properly ought to have it (e.g. blindness in normally sighted animals, injustice in humans or angels)—by recognizing certain disadvantages (e.g. pain and suffering) as positive beings.

Anselm's innovative \*action theory begins teleologically with the observation that rational creatures were made for a happy immortality enjoying God and to that end given the powers of reason to make accurate value judgements and will to love accordingly. While freedom and imputability of choice are essential and permanent features of all rational beings, freedom cannot be defined as the power to sin and the power not to sin because sin is an evil at which no metaphysically basic power can aim. Rather, for Anselm, freedom is the power to preserve \*justice for its own sake. Only spontaneous actions that have their source in the agent itself are imputable. Since creatures do not have their natures from themselves but from God, they cannot act spontaneously by the necessity of their natures. To make it possible for them to become just *somehow* of themselves, God endows them with two motivational drives towards goodness—an affection for the advantageous (*affectio commodi*) or tendency to will things

for the sake of their benefit to the agent itself; and an affection for justice (*affectio iustitiae*) or tendency to will things because of their own intrinsic value—which they can coordinate (by letting the latter temper the former) or not. The good angels, who upheld justice by not willing some advantage possible for them but forbidden by God for that time, can no longer sin by willing more advantage than God wills for them, because God wills their maximum as a reward. Moreover, because they now know (what couldn't have been predicted apart from experience or revelation) that God punishes sin, willing more happiness than God wills them to will can no longer even *appear* advantageous. Creatures who sin by willing advantage inordinately lose both uprightness of will and their affection for justice, and hence the ability to temper their pursuit of advantage or to will the best goods. Anselm holds that it would be unjust to restore justice to angels who desert it. But animality both makes human nature weaker and opens the possibility of redemption.

Anselm's argument for the necessity of the Incarnation plays out the dialectic of justice and mercy featured in *Proslogion*, chs. 9–11, and characteristic of his prayers. God is the heavenly patron-king, who awards all creatures the status of clients. Justice requires that humans make all of their choices and actions conform to his will. Failure to render what is owed insults God's honour and makes the offender liable to satisfaction. Since dishonouring God is worse than destroying countless worlds, the satisfaction due for even the smallest sin is incommensurate with any created good. Because it would be maximally indecent for God to overlook such a great offence, and only God can do or be immeasurably deserving, depriving the creature of its honour (through eternal frustration of its end) seems the only way to balance the scales. Yet, justice also forbids that God's purposes be thwarted through created resistance, while divine mercy destined humans for immortal beatific intimacy with God. Moreover, biological nature (lacked by angels) makes humans come in families, and justice permits an offence by one family member to be compensated by another. Anselm assumes that all actual humans descended from Adam and Eve, and concludes that Adam's race can make satisfaction for sin, if God becomes a family member and discharges the debt.

Anselm's method reflects his estimate of \*human nature and integrates the dynamics of monastic prayer with anticipations of the scholastic *quaestio*. If human destiny is beatific intimacy with God, ante-mortem human vocation is to strive into God with all of our powers—reason as well as emotions and will. Because the subject matter—God—is too difficult for us, permanently partially beyond reach, and because human powers have been damaged by sin, our task presupposes considerable education. The holistic discipline of faith tutors us, training our souls away from 'stupid', 'silly' questions for right-headed fruitful inquiry. In the intellectual dimension, human duty is not the passive appropriation of authority, but faith seeking to understand what it believes through questions,

objections, measuring contrasting positions with arguments. Likewise noteworthy are Anselm's sharp attention to proper versus improper linguistic usage and his subtle treatments of metaphysical and deontological modalities. Where logic and semantics are concerned, Anselm was as up to date as it was possible for an eleventh-century European to be. But his own philosophy subsumes both school-book discussions and his own innovations under metaphysical value theory, accords them significance within his larger project of probing the semantics of the Divine Word, Truth Itself!

**anthropic principle.** A principle asserting that the universe must have certain features given that human observers exist. In \*cosmology the weak anthropic principle asserts that we can observe only universes that allow the development of cognitive agents similar to humans. The weak principle is not trivial; for example, it places limits on how young the universe can be. More controversially, the strong anthropic principle asserts that various coincidences in the values of physical constants are explained by the fact that those values are essential for the existence of humans. Anthropic principles have played an important role in alternatives to theological arguments from design, but they have also exposed how improbable are the coincidences required for human life.

P.H.

John D. Barrow and Frank J. Tipler, *The Anthropic Cosmological Principle* (Oxford, 1986).

**anthropology, philosophical.** Anthropology, the 'study of man', goes back to the beginnings of philosophy. The term 'anthropology' was also used by, for example, Kant and Hegel to denote a specific field of philosophy. Kant's *Anthropology from a Pragmatic Point of View* (1798; tr. The Hague, 1974) deals not with physiological anthropology, the study of 'what nature makes of man', but with pragmatic anthropology, with 'what man as a freely acting entity makes of himself or can and should make of himself'. Hegel applies the term 'anthropology' to the study of the 'soul', the subrational aspects of the human psyche that do not yet involve awareness of external objects. But philosophical anthropology came into its own only in the wake of German idealism. For '*anthrōpos*', 'man', contrasts, in this context, not only with 'God', but also with 'soul', 'mind', 'spirit', 'thought', 'consciousness', words denoting the mental (or transcendental) and intellectual aspect of man that the idealists tended to stress. Anthropology is to study not some favoured aspect of man, but man as such, man as a whole biological, acting, thinking,

etc. being. It was in this spirit that Feuerbach called his own philosophy 'anthropology'.

The term 'philosophical anthropology' (in contrast to the empirical sciences of 'physical' and 'cultural' anthropology) was used by Scheler to describe his enterprise at a time when his allegiance to \*phenomenology was waning. The new discipline is given urgency, Scheler argued, by the variety of apparently incommensurable conceptions of man now available to us. These are: (1) the Judaeo-Christian account of man in terms of original sin and the fall from paradise; (2) the Greek and Enlightenment conception of man as a creature qualitatively distinguished from all other animals by his divine spark of reason; (3) the modern scientific conception of man as no more than a highly developed animal. Scheler also mentions two other variants: (4) man is a biological dead-end, his life and vitality sapped by 'spirit', science, and technology (Klages and Nietzsche), and (5) once relieved of the suffocating tutelage of God, man can take his fate into his own hands and rise to the heights of a superman (Nicolai Hartmann and again Nietzsche). In his main work on anthropology, *Man's Place in Nature* (1928; tr. New York, 1961), Scheler gives an account of the biological, intellectual, and religious aspects of man ('life' and 'spirit'), attempting to combine what is true in all earlier conceptions. Philosophical anthropology should, he argues, show how all the 'works of man—language, conscience, tools, weapons, the state, leadership, the representational function of art, myths, religion, science, history, and social life—arise from the basic structure of human nature'. In *Man and History* (1926), he argued that different conceptions of man give rise to different conceptions of history, but that one of the tasks of anthropology is to give (in part to liberate ourselves from inherited preconceptions about man) a 'history of man's self-consciousness', that is, a history of man's ways of conceiving man. He did not live to complete more than a fraction of these tasks, but Helmuth Plessner, beginning with his *Man and the Stages of the Organic* (1929), attempted to give a similarly comprehensive and unitary account of man, both as a biological and as a rational creature.

Scheler regarded anthropology as an essential foundation for the social, historical, and psychological sciences. To this extent he is at odds with Husserl's phenomenology, which purports to provide the foundation for all science. It is less clear that Husserl was correct in associating anthropology with psychologism, the attempt to justify logical and mathematical laws by regarding them as generalizations about human psychology. (Husserl's 1931 lecture 'Phenomenology and Anthropology' mentions only Dilthey by name, but is also directed against Scheler and Heidegger.) For firstly, Scheler's anthropology is not much concerned with *epistemology*, the justification of our beliefs, and secondly, he argued that values are wholly objective, regardless of the historical and cultural variations in the degree and mode of our access to them. (A more recent philosophical anthropologist, Arnold Gehlen (1904–76), regards values and truth as cultural products.)

Heidegger has a close affinity to Scheler's anthropology, but apart from (officially, at least) rejecting the presupposition-laden term 'man' (*Mensch*) in favour of \**Dasein*, his central question is not 'What is man?' and 'What is man's place in the nature of things?' but 'What is being?' He argued that the nature and scope of philosophical anthropology and the grounds for assigning it a central place in philosophy are wholly unclear. These matters can be clarified not within philosophical anthropology, but only in a more fundamental discipline, namely 'fundamental ontology'.

**anti-communism.** \*Communism aims for a situation in which every individual will be free to fulfil his or her potential, and to live on an equal footing with everyone else. But its chosen means is the centralized control of the means of production, distribution, and much else besides. Anti-communism points to the inevitable tension amounting at times to a contradiction between \*freedom and organization, and particularly to the manifold abuses of organizational power and to the lack of any compensating material or moral success in actually existing forms of communism. Given that philosophy never flourished freely under communist rule, communism has nevertheless been surprisingly well received by philosophers, as by other intellectuals. The strident and illiberal anti-communism of Senator McCarthy and his Un-American Activities Committee, which offended liberals as well as those who were socialists by conviction, may be part of the explanation, though communism also appeals to the perennial temptation of intellectuals to seek to create a rationally ordered society from scratch. There have been notable exceptions. Bertrand Russell recommended using the atomic bomb on the Soviet Union in the 1940s. During the same period Popper and Hayek mounted impressive intellectual critiques of communism, showing that communistic regimes were bound to be oppressive and inefficient, however admirable their intentions. Their writings were politically influential in the Reagan–Thatcher years in stiffening Western anti-communist resolve.

K. R. Popper, *The Open Society and its Enemies* (London, 1945).

**anti-individualism:** see externalism; individualism.

**antilogism.** Christine Ladd-Franklin's term for the inconsistent triad consisting of the premisses and negated conclusion of a valid syllogism. Any two of the three will validly yield the contradictory of the third. Indirect reduction of other figures of the syllogism to the first uses the

negated conclusion with one of the original premisses to yield a valid first-figure syllogism whose conclusion is the contradictory of the remaining original premiss. The antilogism from the second-figure syllogism 'All philosophers are mendacious, some scientists are not mendacious; so some scientists are not philosophers' is the first two sentences plus 'All scientists are philosophers'. But 'All philosophers are mendacious' and 'All scientists are philosophers' are the premisses of a valid first-figure syllogism whose conclusion is 'All scientists are mendacious'—the negation of the remaining sentence in our antilogism. Thus the second-figure syllogism (Baroco) is valid if the corresponding first-figure syllogism (Barbara) is.

**antinomies.** An antinomy—literally 'conflict of laws'—is usually described as a \*contradiction or as a \*paradox (from the Greek meaning 'contrary to opinion'), though both these general senses are now probably outdated.

Within philosophy, the term is most commonly used to refer to the apparent contradictions which Kant found in speculative \*cosmology—our thought about the world as a whole. In the *Critique of Pure Reason*, Kant set out the antinomies as four pairs of propositions, each consisting of a thesis, and its supposed contradictory, or antithesis. In each case there are, he thinks, apparently compelling reasons for accepting both thesis and antithesis.

The thesis of the first antinomy is that the world has a beginning in time and is spatially limited. The thesis of the second is that every composite substance consists of simple substances. The thesis of the third is that there is a kind of causality related to free will and independent of the causality of laws of nature; its antithesis is that freedom is an illusion. The thesis of the fourth is that there exists either as part of the world or as its cause an absolutely necessary being.

Kant draws a distinction between the first two antinomies, which he calls 'mathematical', and the second two, which he calls 'dynamical'. The feature common to the first two is the idea of \*infinity: each presents us with arguments purporting to show that the world is in a certain respect finite (in size, in age, in divisibility) together with arguments purporting to show that it cannot be. The dynamical antinomies involve the notion of causality.

In Kant's view the antinomies are not genuine contradictions: he describes the opposition between thesis and antithesis as dialectical (the opposition between genuine contradictions he calls analytical). The antinomies arise from the way in which answering a certain type of question—for example, by citing a phenomenon as the cause of phenomenon—generates a further question of the same type: in this case, the question what is the cause of the cause? We appear driven, by what Kant calls 'the demand of reason for the unconditioned', to seek an

answer for which the further question does not arise. But, Kant says, nothing in our experience could provide us with that kind of answer.

How does Kant resolve the problem? This is what he says about the first antinomy: 'Since the world does not exist in itself, independently of the regressive series, it exists *in itself* neither as an *infinite* whole nor as a *finite* whole.' The suggestion may be that the antinomies arise from our thinking of the world as an object, of which it would make sense to ask how big it is or where it comes from. But—not clearly distinguished from this by Kant—is the idea that the antinomies arise from our attributing to the world 'in itself' features which are properly seen as determined by our thought. Seen in this way, the antinomies underpin his transcendental idealism.

Kant says that this diagnosis of the first antinomy—which requires that both thesis and antithesis be false—applies to the others. But he also suggests that in the case of the dynamical antinomies both thesis and antithesis may be *true*. In the case of the third antinomy the fact that the causality involved in free action is, as Kant thinks, beyond any possible experience does not mean that the idea of such causality is senseless, a doctrine which he admits is 'bound to appear extremely subtle and obscure' when stated in this abstract way.

More recently Quine has defined an antinomy as a paradox which 'produces a self-contradiction by accepted ways of reasoning. It establishes that some tacit and trusted pattern of reasoning must be made explicit and henceforward be avoided or revised.' Such revision, Quine says, involves 'nothing less than a repudiation of part of our conceptual heritage'. M.C.

**Antiochus of Ascalon** (c.130 BC–68/67 BC). Precursor of the movement in philosophy that became known as Middle Platonism. Born in the Palestinian town of Ascalon, Antiochus travelled to Athens around 110 BC to study with Philo of Larisa, head of the New \*Academy. After a long period of discipleship Antiochus rejected Philo's scepticism in favour of a constructive interpretation of Plato. The basis for Antiochus' defence of the possibility of knowledge was Stoic epistemology. Since, however, Stoic epistemology is rooted in materialism, Antiochus was led to the conflation of Stoic and Platonic accounts in physics, theology, and psychology. Later Platonists, inspired by Antiochus' efforts to recover Platonic authentic teaching, were nevertheless largely unimpressed by the Stoicizing of Plato.

Cicero attended Antiochus' lectures in Athens in 79/78 BC. His own view of ancient Greek philosophy is greatly influenced by Antiochus' syncretic approach. His writings are our principal source for Antiochus' own doctrines.

**anti-realism:** *see* realism.

**anti-Semitism** is sometimes treated as a continuous history of prejudice and \*discrimination extending from the desecration of the Second Temple in 135 BC through to the Holocaust. But in Hellenistic times the Gentiles, who were engaged in commerce, persecuted the Jews, who were farmers. As the official religion of medieval Europe, Christianity, originally a Jewish sect, legitimated a pattern of persecution by reclassifying the Jews as 'usurers' and 'Christ murderers'. Modern anti-Semitism has underwritten the political vision of movements portraying themselves as the enemies of both capitalism and communism, which are equally 'Jewish'. This is why Bebel called anti-Semitism the 'socialism of fools', a simple-minded alternative to the politics of class. The great logician Frege thought it 'a misfortune that there are so many Jews in Germany', but that legislating against them is difficult without a 'distinguishing mark by which one can recognise a Jew for certain'. Thus anti-Semitism, like racism generally, maintains its grip on those who cannot even be sure whom they hate.

**Antisthenes** (5th–4th century BC). He was an independent-minded philosopher, a pupil of Socrates and a near-contemporary of Plato, who exercised influence on Diogenes the Cynic. Despite much speculation, little is known about his philosophical ideas. He was interested in the relation between names and things, and he argued against the possibility of contradiction. It has been conjectured that he contributed to the riddles about error which troubled Plato. Information about his writings and ideas are collected in F. D. Caizzi, *Antisthenis Fragmenta* (Varese, 1966).

\*Cynics.

**antitheism.** Attitude of opposition or metaphysical revolt against God, conceived as personal, omnipotent, and omniscient, as in traditional theism. This rebellion is mostly literary or symbolic, sometimes articulated as fictitious myths or representations of nightmares. It is based on hurt, pride, moral outrage, and a desire for self-determination and conceptual autonomy. Antitheism can be regarded as a transition to agnosticism, atheism, as well as tragic individualism. It is more common in French and German philosophy than in the Anglo-American tradition.

**apeiron.** The earliest known philosophical term. Literally 'without limit', it is used by Anaximander for the material out of which everything arises. Plato in the *Philebus* applies it to things signified by words which, like 'hot' and 'large', admit of comparatives, but these for him play the same material role. Aristotle, followed by Hellenistic writers, uses it to express the notions of infinite quantity and infinite progression. w.c.

J.C.B. Gosling, *Plato's Philebus* (Oxford, 1975).

**apodeictic.** Literally, demonstrative. Traditionally applied to propositions, whether or not used in a \*demonstration, that are marked with a sign of necessity or impossibility, especially in connection with Aristotle's modal syllogistic; e.g. ' $\pi$  is necessarily irrational', 'What's blue must be coloured', 'Spring can't follow summer', 'If it's a giraffe, it's bound to have a long neck'. **aporia**, or 'apory' in English, is the cognitive perplexity posed by a group of individually plausible but collectively inconsistent propositions. For example, in Pre-Socratic times, philosophers were involved with the following incompatible beliefs: (1) Physical \*change occurs. (2) Something persists unaffected throughout physical change. (3) Matter does not persist unaffected through change. (4) Matter (in its various guises) is all there is. There are four ways out of this inconsistency: (1-denial) Change is a mere illusion (Zeno and Parmenides). (2-denial) Nothing whatever persists unaffected through physical change (Heraclitus). (3-denial) Matter does persist unaffected throughout physical change, albeit only in the small—in its 'atoms' (the Atomists). (4-denial) Matter is not all there is; there is also form by way of geometric structure (Pythagoras), or arithmetical proportion (Anaxagoras), or abstract form (Plato). To overcome aporetic inconsistency, we must give up at least one of the theses involved in the inconsistency. There will always be different alternatives here and logic as such can enforce no resolution. The pervasiveness of apories throughout human inquiry has led sceptics ancient and modern to propose abandoning the entire cognitive enterprise, preferring cognitive vacuity to risk of error. N.R.

**appearance and reality.** The conviction that it must be

possible to make the distinction between appearance and reality drives constructive and critical projects not only in epistemology, metaphysics, and philosophy of science, where the adequacy of our representations and our ability to distinguish between the veridical and the illusory is in question, but in also ethics and political philosophy, where true and apparent good, justice and its semblance, are in question. Though philosophers have occasionally tried to argue that *all is \*illusion* or that *there are only appearances*, this line of argument becomes quickly mired in paradox.

The appearance–reality problem is supported to a large extent by a single argument, the 'argument from illusion', which points to the subjective indistinguishability of states of cognitive or perceptual illusion and veridical perception or knowledge. The problem then becomes one of determining a truth-conferring criterion, e.g. coherence or intersubjectivity, or conceding that all appearances are equally veridical (\*phenomenalism). Other arguments, such as the variability of perceptual qualities and their evident dependence on the state and health of the observer's nervous system, have been thought to lead to the conclusion that reality in itself can be neither perceived nor known. But this conclusion is scarcely acceptable in light of (a) the causal nature of perception and belief; (b) the existence of reasonably *habile* procedures for testing perceptions and beliefs; and (c) the likelihood that perception and cognition are evolutionary adaptations to the real world. For some time it was believed—under the influence of J. L. Austin's *Sense and Sensibilia* (1962)—that careful attention to the contexts of use of various locutions involving 'seeming', 'looking', and 'appearing' would reveal that no profound philosophical problem involving appearance and reality could be formulated. But these hopes have not been rewarded. No such taxonomizing can prevent the formulation of such unanswerable questions as 'At what distance must an object be from a perceiver in order for its appearance to equal its real size?'

The internal, private, conditioned nature of appearances can be reconciled with the external, public, unconditioned nature of reality, H. J. Robinson has proposed, only if 'theoretical perception', the process involving light-waves and anatomical structures such as the retina and layers of brain cells, is distinguished from 'empirical perception'—our immediate apprehension of objects, qualities, and relations. Perceivers, Robinson argues, must each possess two bodies, one real and one apparent. Real bodies—human as well as non-human—which are strictly speaking imperceptible—are the cause of apparent bodies, which alone can be empirically perceived and which represent them.

Historically, the appearance–reality distinction has been understood as having moral/theological overtones: this was pointed out by Nietzsche, who found all otherworldliness 'decadent'. The intuition that what we call the real world is only a dim reflection, or a shadow, a semblance of the real world, is in any case an old one, associated in Western philosophy with the name of Plato and

with ascetic philosophies of the East. F. H. Bradley in *Appearance and Reality* (1893) argued in keeping with this tradition that the appearances of time, space, and matter are riddled with inconsistencies, while reality is coherent and one. Meanwhile, the notion that appearances are a dim and confused reflection of something more robust and contradiction-free which is above, beneath, or behind them has suffered somewhat in modern philosophy. From Descartes onwards, the real or noumenal world is thought of as the colourless and largely qualityless source from which the world we experience emanates. Kant's 'thing-in-itself' is a mere place-holder, which allows him nevertheless to distinguish, in the *Critique of Pure Reason*, between those appearances which have 'objective reality' and furnish the subject-matter of our empirical knowledge and the mere appearances which we decry as illusion.

**apperception.** Leibniz's term for inner awareness or \*self-consciousness. Leibniz held that it was possible to perceive without thereby being conscious, and that it is the exercise of apperception which marks the difference between conscious awareness and unconscious perception. Kant draws a distinction between inner sense, or empirical apperception, and what he calls 'the transcendental unity of apperception'. Where the former involves the actual exercise of introspection, the latter is the interconnectedness of all thought which is, according to Kant, the formal pre-condition of any thought or experience of an objective world, and also of empirical apperception itself.

**applied ethics.** Since the 1960s academic work in ethics dealing with practical or 'applied' questions has become a major part of both teaching and research in ethics. This development is a revival of an ancient tradition. Greek and Roman philosophers discussed how we are to live, and die, in quite concrete terms. Medieval writers were concerned with whether it is always wrong to kill, \*abortion, and when going to \*war is justifiable. Hume wrote an essay defending suicide, and Kant was interested in finding a means to perpetual peace. In the nineteenth century all the major Utilitarian philosophers—Bentham, Mill, and Sidgwick—wrote extensively in applied ethics.

It is, then, the first part of twentieth-century ethics that was aberrant in disregarding applied ethics, rather than the later part which took up the field with enthusiasm. In part, the earlier reluctance to deal with applied issues was due to the influence of \*Logical Positivism, with its implication that ethical statements were nothing more than the evincing of emotions. The role of the moral philosopher was therefore restricted to the meta-ethical task of

analysing the meaning of the moral terms. This view was finally rejected only when the students of the 1960s demanded courses that were more relevant to the great issues of the day, which in the United States included the civil rights movement and the war in Vietnam. Hence racial equality, the justifiability of war, and \*civil disobedience were among the first issues in applied ethics to be discussed by academic philosophers. Sexual equality and \*environmental ethics followed soon after, as the women's liberation movement and the environmental movement gained strength. Interestingly, in the case of the animal liberation movement, the direction of causation ran the other way: it was the writings of academic philosophers on the ethics of our treatment of animals that triggered the rise of the modern animal liberation movement.

Applied ethics has now developed several separate areas of specialization, each with its own centres for research and teaching, specialized journals, and a rapidly growing literature. Perhaps the most prominent is \*bioethics, which deals with ethical questions arising in the biological sciences and in the field of health care. This includes both perennial issues like \*euthanasia and new questions such as \*fertilization *in vitro*. Whereas thirty years ago very few medical or nursing undergraduates took courses in ethics, today such courses are widespread.

The moral status of \*animals has been an important topic in recent applied ethics, with ramifications for farming, animal experimentation, and the fur industry. Similarly, increasing concern with the environment has led many to ask if traditional Western ethics is so deeply 'human chauvinist' that it needs to be replaced with an ethic that takes all living things, and perhaps even ecological systems, as the bearers of value. Attempts to develop such ethics have led to lively debates in which new questions have been raised about the limits of ethics.

\*Business ethics is another area of applied ethics that has found a receptive audience, and is now taught in many institutions where no ethics courses were to be found a short time ago. Many large corporations, having been caught out in dubious activities such as bribing overseas officials, or infringing regulations for trading in securities, now perceive a need for greater ethical sensitivity among their employees.

There are, of course, still some who doubt the value of applied ethics. They may be sceptical about ethics in general. Often they deny that reason has a role to play in ethics. Yet anyone reading the literature in applied ethics will have to concede that at least some of these works are fine examples of applying reason to practical problems; and since many of these problems are unavoidable, it seems clear that it is better for us to reason about them, to the best of our ability, than not to reason at all.

**a priori and a posteriori.** These are terms primarily used to describe two species of propositional knowledge but also, derivatively, two classes of \*propositions or \*truths, namely, those that are knowable a priori and a posteriori respectively. Knowledge is said to be a priori when it does not depend for its authority upon the evidence of experience, and a posteriori when it does so depend.

Whether knowledge is a priori is quite a different question from whether it is \*innate. Mathematics provides the most often cited examples of a priori knowledge, but most of our mathematical knowledge is no doubt *acquired* through experience even though it is *justifiable* independently of experience. Kant and others have held that a priori knowledge concerns only necessary truths while a posteriori knowledge concerns only contingent truths, but Kripke has challenged this assumption. E.J.L.

**Aquinas, St Thomas** (1224/5–74). The greatest of the \*medieval philosopher-theologians. After centuries of neglect by thinkers outside the Catholic Church, his writings are increasingly studied by members of the wider philosophical community and his insights put to work in present-day philosophical debates in the fields of philosophical logic, metaphysics, epistemology, philosophy of mind, moral philosophy, and the philosophy of religion.

He was born in Roccasecca in the Kingdom of Naples and sent at the age of 5 to the Abbey of Monte Cassino, from where in his mid-teens he progressed to the University of Naples. In 1242 or the following year he entered the Order of Preachers (the Dominican Order), and spent the rest of his life exemplifying the Order's commitment to study and preaching. In 1256 he received from the University of Paris his licence to teach, and subsequently taught also at Orvieto, Rome, and Naples, all the while developing and refining a vast intellectual system which has come to acquire in the Church an authority unrivalled by the system of any other theologian. That authority was not, however, immediately forthcoming. His canonization in 1323 puts in perspective the fact that a number of propositions he defended were condemned by Church leaders in Paris and Oxford in 1277 shortly after his death.

His written output is vast, 8 million words at a conservative estimate, the more remarkable as he died aged no more than 50. Many of his works are in the form of commentaries, especially upon the Gospels, upon Aristotelian treatises, several of which had only recently reached the Christian West, and upon the *Sentences* of Peter Lombard, the main vehicle in the Middle Ages for the teaching of theology. He also conducted a number of disputations, dealing with questions on truth, on the power of God, on the soul, and on evil, and these disputations were duly

committed to paper. Finally, and most famously, he wrote two *Summae* (Summations) of theology. The first, *On the Truth of the Catholic Faith against the Gentiles*, known as the *Summa contra Gentiles*, may have been written as a handbook for those seeking to convert others, in particular Muslims, to the Catholic faith. The second, his chief masterpiece, is the *Summa Theologiae* (Summation of Theology), left unfinished at his death. On 6 December 1273 he underwent an experience during Mass, and thereafter wrote nothing. His reported explanation for the cessation was: 'All that I have written seems to me like straw compared to what has now been revealed to me.' He died four months after the revelation.

That Aquinas wrote commentaries on several of Aristotle's books is indicative of the fact that Aquinas recognized the necessity of showing that Aristotle's system could be squared, more or less, with Christianity. Aristotle had constructed a system of immense range and persuasive power; persuasive not because of the rhetorical skill of the author but by virtue of his remorseless application of logic to propositions that all people of sound mind would accept. Aquinas was not the first to recognize the need to determine the extent to which Aristotle's system was compatible with Christian teaching, and to wonder how the latter teaching was to be defended in those cases where Aristotle clashed with it. But Aquinas more than anyone else rose to the challenge, and produced what must be as nearly the definitive resolution as any that we shall ever have. The resolution is the system of Christian Aristotelian philosophy which was most fully expounded in the *Summa Theologiae*. There we find Aristotelian metaphysics, philosophy of mind, and moral philosophy forming a large part of an unmistakably Christian vision of the created world and of \*God.

Aquinas draws a sharp distinction between two routes to knowledge of God. One is revelation and the other is human reason. There are many things it is better for us to know than not to know, for example that God exists and that he is one and incorporeal, and in general our reason is a less sure guide than is revelation to the acquisition of this valuable knowledge. Nevertheless, Aquinas believes that it is possible for us to reach these truths without the aid of revelation, by arguing, in particular on the basis of the facts of common experience, such as the existence of motion in the world. To argue to the foregoing propositions about God on such a basis and by rigorous logic is to do philosophy; it is not to do theology, and even less is it simply to rely on revelation. Such exercises of logic are to be found scattered throughout Aquinas's writings, and for this reason he is to be considered a philosopher even in those contexts where he is dealing with overtly religious matters such as the existence and nature of God.

Aquinas is compelled to seek a \*demonstration of God's existence because he recognizes that the proposition 'God exists' is not self-evident to us, though it is self-evidence in itself. A demonstration can proceed in either of two directions: from consideration of a cause we can infer its effect, and from an effect we can infer its cause. Aquinas presents

five proofs of God's existence, the *quinque viae* (five ways), each of which starts with an effect of a divine act and argues back to its cause. In Aquinas's view no demonstration can start from God and work to his effects, for such a procedure would require us to have insight into God's nature, and in fact we cannot naturally have such a thing—we know of God *that* he is but not *what*.

Aquinas argues first from the fact that things move in this world to the conclusion that there must be a first mover which is not moved by anything, 'and everyone thinks of this as God'. The second way starts from the fact that we find in the world an order of efficient causes, and the conclusion drawn is that there must be some efficient cause, which everyone calls 'God', which is first in the chain of such causes. Thirdly, Aquinas begins with the fact that we find things that have the possibility of both being and not being, for they are things that are generated and will be destroyed. And, arguing that not everything can be like that, he concludes that there must exist something, called 'God' by everyone, which is necessary of itself and does not have a cause of its necessity outside itself. The fourth way starts from the fact that we find gradations in things, for some things are more good, some less, some more true, some less, and so on; and concludes that there must be something, which we call 'God', which is the cause of being, and goodness, and every perfection in things. And finally Aquinas notes that things in nature act for the sake of an end even though they lack awareness, and concludes that there must be an intelligent being, whom we call 'God', by whom all natural things are directed to an end. It has been argued that several of these arguments are fatally flawed by their reliance upon an antiquated physics, though other modern commentators have raised doubts about this line of criticism.

Aquinas's belief that we do not have an insight into God's nature forced him to deal with the problem of how we are to understand the terms used in the Bible to describe God. What do terms such as 'good', 'wise', and 'just' mean when predicated of God? Their meaning is otherwise than when predicated of human beings, for if not we would indeed have insight into God's nature. Should the terms therefore be understood merely negatively, as meaning 'not wicked', 'not foolish', and so on? This solution, especially associated with Maimonides (1135–1204), was rejected by Aquinas because this is not what people intend when they use such words. Aquinas's own answer is that the terms are used analogically of God. Since we cannot have an adequate conception of God, that is, since our idea of him falls short of reality, we have to recognize that the qualities that the terms for the perfections normally signify exist (or 'pre-exist') in God in a higher way than in us. It is not that God is not really, or in the fullest sense, good, wise, just, and so on. On the contrary, he has these perfections in the fullest way possible, and it is we creatures who fall short in respect of these perfections.

Among the divine perfections to which Aquinas attends is that of knowledge. God knows everything knowable. As

regards his knowledge of the created world he does not know it as a spectator knows an object he happens upon. God, as absolute first cause, is not dependent upon anything for anything. His knowledge of things is therefore not dependent upon the prior existence of the things he knows. On the contrary, it is the act of knowing that brings the things into existence. We can, thinks Aquinas, get a small glimpse into the nature of such knowledge by thinking of it as the kind of knowledge an architect has of a house before he has built it, as compared with the knowledge that a passer-by has of it. It is because of the conception of the house in the architect's mind that the house comes into existence, whereas it is because the house already exists that the passer-by comes to form a conception of it.

Since God knows everything knowable, he must know every act that any human being will ever perform, which raises the notorious problem of whether human beings are free if God is indeed omniscient. In tackling this problem Aquinas offers us a metaphor. A man standing on top of a hill sees simultaneously all the travellers walking along the path that goes round the hillside even though the travellers on the path cannot see each other. Likewise the eternal God sees simultaneously everything past, present, and future, for 'eternity includes all time'. And just as my present certain knowledge of the action you are performing before my eyes does not imply that your action is unfree, so also God's timelessly present knowledge of our acts, past, present, and future, does not imply that our acts are unfree. One prominent problem associated with this solution concerns the fact, mentioned earlier, that Aquinas does not believe God's knowledge of the world to be like that of a spectator but instead to be more like the knowledge an agent has of what he makes. If the history of the world is to be seen as the gradual unfolding of a divinely ordained plan then it is indeed difficult to see in what sense, relevant at least to morality, human acts can be free. Aquinas's solution is still the subject of intense debate.

Given the close relation at many levels between knowledge and truth, Aquinas recognizes that his exposition of the nature of knowledge would be incomplete without a discussion of truth—a concept in which he is in any case bound to be interested given the biblical assertion 'I am the truth'. Truth is to be sought either in the knowing mind or in the things which are known, and Aquinas sees point to accepting both alternatives, so long as distinctions are made. He builds on a comparison with goodness. We use the term 'good' to refer to that to which our desire tends and use 'true' to refer to that to which our intellect tends. But whereas our desire directs us outward to the thing desired, our intellect directs us inward to the truth which is in our mind. In that sense desire and intellect point in opposite directions, and they do so in a further sense also, for in the case of desire we say that the thing desired is good, but then the desire itself is said to be good in so far as what is desired is good. And likewise, though the knowledge in our mind is primarily true, the outer

object is said to be true in virtue of its relation to the truth in the mind.

As regards the relation between the inner truth and the outer, a distinction has to be made because something can have either an essential or an accidental relation to the knowing mind. If the thing known depends for its existence upon the knowing mind then the relation between it and the mind is essential. Thus the relation that something planned has to the plan is an essential relation. The house would not have had the features it has if the architect had not planned it that way, and those features are therefore related essentially to the idea in the architect's mind. Likewise as regards natural things, they are essentially related to the mind of God, who created them, since they depend for their existence upon the idea which he had of them. This contrasts with the relation between an object and a passer-by. The relation in which the house stands to the mind of the passer-by is accidental, for the house does not depend upon the passer-by. In making this distinction Aquinas is developing the concept now known as 'direction of fit'. It is primarily the idea in the mind of the architect that is true and the house built according to his plan is said to be true only derivatively. If the house constructed by the builder does not correspond to the architect's plan then the builder has made a mistake—the house is not true to the architect's plan. It is not that the plan does not fit the house but that the house does not fit the plan. On the other hand if the passer-by does not form an accurate idea of the house then it is his idea that does not fit the house—it is not true to the house.

This distinction enables Aquinas to say that \*truth is, though in different ways, in both the mind and in that to which the mind is directed. Or if the thing is essentially related to the knowing mind then truth is primarily in the mind and secondarily in the thing, whereas if the thing is accidentally related to the knowing mind then truth is primarily in the thing and secondarily in the mind that knows it. In each case what is said is determined by the order of dependency. Truth is secondarily in that which is dependent.

The truth of the house lies in its conformity to the plan, and the truth of the passer-by's idea of the house lies in its conformity to the house. In each case there is truth where there is a form shared by an intellect and a thing. In view of this Aquinas affirms that truth is defined as conformity of intellect and thing. But for there to be such a conformity does not imply that the knowing mind knows also that the conformity exists. That knowledge involves a further stage in which the intellect judges that the thing has a given form or that it does not have a given form. Here we are dealing not merely with a concept corresponding to an outer thing, we are dealing instead with a judgement in which two concepts are related affirmatively or negatively. And it is such truth, the truth as known, that Aquinas identifies as the perfection of the intellect.

Aquinas is impelled thereafter to describe ways in which something can be false, for otherwise he might be thought to hold that falsity cannot exist. A central doctrine

in the *Summa Theologiae* is that truth is a transcendental term, that is, it is truly predicable of all things. In short, whatever exists is true. It is clear why Aquinas maintains this, for truth lies in the conformity between a thing and an intellect, and everything conforms with some intellect, whether human or divine. But if everything is true there is no room for falsity. Aquinas's conclusions concerning truth dictate his principal doctrines concerning falsity. Since truth and falsity are opposites, falsity is to be found where it is natural for truth to be. It occupies the space reserved for truth. That space is primarily in the intellect, and secondarily in things related to an intellect. A natural thing, as produced by an act of the divine will, will not be false to God's idea of it, but a human artefact is false in so far as it does not conform to the artificer's plan. But both divinely and humanly made things may be called false in a qualified way, in so far as they have a natural tendency to produce in us false opinions about them. Thus tin is called 'false silver' because of its deceptive appearance, and a confidence-trickster is a false person because of the plausibility of his self-presentation. In a sense there must on Aquinas's account be more, infinitely more, truth in the world than falsity, for the truths about the created order known by God are infinite, unlike the false opinions which we creatures have, which though numerous are nothing as compared with the truth which God has.

Aquinas had a great deal to say about the human soul. He had inherited from Aristotle the doctrine that every living thing, whether plant, dumb animal, or human being, has a soul. In the first case the soul is nutritive, in the second nutritive and sensitive, and in the third nutritive and sensitive and rational. Since in each case there is a body which has the soul, a question arises concerning how the soul relates to the body. Is it perhaps a corporeal part of the body it vivifies? Aquinas's answer is this. The soul is the 'first principle of life in things which live amongst us'. No body is alive merely in virtue of being corporeal, for otherwise every body would be alive. A body is alive in virtue of being a body of such and such a kind. Aquinas uses the term 'substantial form' to signify that by which something is the kind of thing it is, and hence the soul of a particular body is the substantial form of that body. And it is plain that a substantial form of a body cannot itself be corporeal, any more than the circularity of a rose window, which is the window's geometrical form, can be corporeal. The window is corporeal, but its circularity is not.

Turnips and tortoises, though having souls, are not spiritual beings. Humans are spiritual in virtue of having specifically rational souls. Unlike vegetables and dumb animals we have intellect. Aquinas held, following Aristotle, that human knowledge involves the non-material assimilation of the knower's mind to the thing known, thus becoming in a sense identical with that thing. Our intellect has two functions, one active and one passive. The intellect *qua* active abstracts from 'phantasms', that is, from our sense-experience. What is abstracted is stored in the intellect *qua* passive, and is available so that even when

corporeal objects are not present to our senses we can none the less think about them.

The bodies we experience with our senses are compounds of matter and form. 'Abstraction' is the metaphor Aquinas uses to signify that the form of the body sensorily experienced becomes also the form of the knower's intellect. The form in the intellect does not, however, have the same mode of existence as the form in the body known. In the latter case the form is said to have 'natural existence' and in the former 'intentional existence'. The knowledge of the object gained by this abstractive act is universal in the sense that it is not the object itself in its individuality that is being thought about, but rather the nature of the object. Such universal knowledge is available only to creatures with intellect, and not to creatures whose highest faculty is that of sense.

The rational soul of a human being has two parts. It is intellect plus will. As is to be expected, the concept of will plays a large role in Aquinas's extensive examination, in the *Summa Theologiae*, of morality. That examination is systematically related to the long discussion which precedes it concerning God, his knowledge and powers, and the world considered precisely as a created thing. For human beings have, according to Aquinas, a twin status as coming from God, in the sense that we owe to him our existence, and also as turned towards him as the end to which we are by nature directed. Indeed the concepts of *exitus* and *reditus*, departure from and return to God, not only define our status but also give the fundamental structuring principle of the *Summa Theologiae*. Building upon Aristotle's teaching, particularly the *Nicomachean Ethics* III and VI, Aquinas gives a detailed analysis of human acts, focusing upon voluntariness, intention, choice, and deliberation, and argues that these features have to be present if an act is to be human, and not merely, like sneezing or twitching, an act which might as truly be said to happen to us as to be something we do, and which could equally happen to a non-human animal. Human acts are those that we see ourselves as having a reason for performing, our reason being the value that we attach to something which is therefore the end in relation to our act. Aquinas argues that beyond all the subsidiary ends at which we might aim, there is an ultimate end, happiness, which we cannot reject, though through ignorance or incompetence we may in fact act in such a way as to put obstacles in the way of our achieving it. However, the fundamental practical principle 'Eschew evil and do good' is built into all of us in such a way that no person can be ignorant of it. This practical principle and others following from it form, in the *Summa Theologiae*, a full and detailed system of natural law which has had a major impact on modern discussions in the philosophy of law.

In this area as in others the discussions that Aquinas's writings have provoked in modern times are as much between, and with, secular-minded philosophers as between Christian theologians, and in that sense the title *doctor communis*, by which he used to be known, applies now as never before.

**Arabic philosophy:** see Islamic philosophy.

**Arcesilaus of Pitane** (c.315–240 BC). Head of the \*Academy from about 273, who advocated scepticism as the true teaching of Socrates and Plato. He did not argue for the doctrine that we can know nothing, but recommended suspension of judgement on everything. His method was to direct *ad hominem* arguments against any doctrine proposed to him. He attacked, for instance, the Stoics' belief that some sense-impressions could not be false (i.e. could be known for certain to represent reality). Even if some impressions are true, he argued, they cannot be distinguished qualitatively from others that are false. So any impression could turn out to be false. Since the Stoics themselves proposed suspension of judgement about anything that was not certain, they should, on their own principles, be sceptical about sense-impressions. Arcesilaus left no writings.

**archetype:** see Jung.

**architectonic.** Architectonic studies the systematic structure of our knowledge. For Kant, 'Human reason is by nature architectonic' because 'it regards all our knowledge as belonging to a possible system'. Many Kantian philosophers, such as Peirce, insist that we shall only know how philosophical knowledge is possible when we can understand its place within a unified system of \*knowledge.

**Arendt, Hannah** (1906–75). Originator of a broad political theory and analyst of the major historical events of her times, Arendt was a student of Jaspers and Heidegger and one of the first to apply the phenomenological method to politics. She rejected the Western political tradition from Plato through Marx, arguing in *The Human Condition* (1958) that the apex of human achievement is not thought but the active life. This divides into labour (repetitive but sustaining life), work (creating objects and a human

world), and particularly action (new, especially political, activity involving shared enterprises). Her account of Eichmann's trial (1963) presented the idea of the 'banality of \*evil'—Eichmann simply drifted with the times and refused to think critically about his actions. Her unfinished *Life of the Mind* analyses thinking, willing, and judging as conditions for moral responsibility. c.c.

**aretē.** Normally translated '\*virtue', the Greek term in fact signifies excellence, i.e. a quality the possession of which either constitutes the possessor as, or causes it to be, a good instance of its kind. Thus sharpness is an *aretē* of a knife, strength an *aretē* of a boxer, etc. Since in order to be a good instance of its kind an object normally has to possess several excellences, the term may designate each of those excellences severally or the possession of them all together—overall or total excellence. Much Greek ethical theory is concerned with the investigation of the nature of human excellence overall, and of human excellences severally; the possession of the excellences is constitutive of being a good human being, i.e. of achieving a good human life (\**eudaimonia*). c.c.w.t.

A. W. H. Adkins, *Merit and Responsibility* (Oxford, 1960), esp. chs. 3–4.

**argument.** The word has three main senses.

1. A quarrel, as when the neighbours across a courtyard argued from opposite premisses.

2. In the most important sense for philosophy an argument is a complex consisting of a set of propositions (called its premisses) and a proposition (called its conclusion). You can use an argument by asserting its premisses and drawing or inferring its conclusion. The conclusion must be marked, for example by putting 'because' or the like before the premisses ('It must be after six, because it's summer and the sun has set'), or 'therefore', 'consequently', 'so', or the like before the conclusion ('Souls are incorporeal; therefore they have no location'). An argument is valid when its conclusion follows from its premisses (other descriptions are 'is deducible from' or 'is entailed by'). It can be a good argument even when not valid, if its premisses support its conclusion in some non-deductive way, for example inductively.

The reasons why bad arguments give no or weak support to their conclusions are too various to survey. But here are some examples: 'Jim and Bill are not both teetotalers; Jim isn't; so Bill is', 'Ann can't ride a bicycle, because she's in the bath and you can't ride a bicycle in the bath', 'Most con men are smooth-talking; so that smooth-talker is probably a con man', 'Most con men are good-looking; so that scar-faced con man is probably good-looking', 'Every number is a number or its successor; every number or its successor is even; so every number is even' (due to Geach), 'Grass is green; so snow is

white'. And here are some good arguments (good in the sense that they are valid, or otherwise support their conclusions effectively): 'Everything indescribable is describable as indescribable; so everything is describable', 'Since there have only been a finite number of humans, some human had no human mother', 'God can do anything; so God can commit suicide', 'London must be south of Messina, for it's south of Rome, and Rome is south of Messina', 'It's heavier than air; so it won't fly far without power'.

Some of these examples show that a good argument can have an untrue conclusion, and a bad argument can have true premisses and a true conclusion. An ideal *method* of argument will never lead from true premisses to an untrue conclusion (it will be, in the jargon, truth-preserving), but only deduction attains that ideal. Other methods, such as induction, are worth using provided they are usually truth-preserving. For *proving* a conclusion you need more than a good argument to it. The premisses from which the proof starts must also be true (the word 'sound' is sometimes reserved for valid arguments with true premisses) and must be already 'given'—i.e. accepted or acceptable at a stage when the conclusion is not (you cannot, for example, prove a true conclusion from *itself*, even though you would be arguing soundly). (\**Begging the question.*)

As the examples also suggest, an argument can be made stronger by adding extra premisses. In fact any argument ' $P_1 \dots$  so  $Q$ ', however bad, can be converted into a valid argument by adding the extra premiss 'If  $P_1$  and  $\dots$  then  $Q$ '. But of course, if the original argument was a bad one, this extra premiss will be untrue and so no help in the project of proving the conclusion. *Some* extra premisses may weaken an argument, if it is non-deductive; for example 'It's a lake' supports 'It's fresh' more strongly than 'It's a lake with no outflow' does.

3. In mathematical parlance an argument of a \*function is an input to it, or what it is applied to; and the output, for a given argument, is called the value. For example the function *father of*, or *being  $x$ 's father*, has value David for argument Solomon, and the function *minus*, or  $x - y$ , has value 3 for arguments 17, 14, in that order. c.a.k.

\*arguments, types of; deduction; induction; inference; validity.

**argument from design:** *see* design.

**arguments, types of.** An \*argument is a set of propositions, one of which, the conclusion, is subject to dispute or questioning, and the others, the premisses, provide a basis, actually or potentially, for resolving the dispute or removing the questioning. This definition is a little narrow, because it is possible for an argument to have several conclusions, i.e. in the case of a sequence of argumentation,

where the conclusion of one subargument functions also as a premiss in another. But it is also a little wide, in relation to a sense of 'argument' commonly used in philosophy, where the term refers to a complex of propositions (usually a quite small and specific set) designated as premisses and a conclusion.

Also, the definition above can be implemented somewhat differently in different conversational contexts, for several types of dispute can be involved. One common sense of 'argument' is that of a quarrelsome exchange of verbal attacks and counter-attacks. This is one conversational context of argument, but another context is the more orderly type of exchange where each party has the goal of justifying his or her own thesis, and questioning or refuting the other party's thesis, by reasoned means, using accepted standards of evidence. Argument of this kind, used to resolve an initial conflict of opinions, takes place in a critical discussion (van Eemeren and Grootendorst, *Argumentation, Communication and Fallacies*). In contrast, argument to bargain over goods or services takes place in a negotiation. But basically, in an argument, some key proposition is held to be in doubt, in contrast to an explanation, for example, where the proposition to be explained is generally taken as granted, or at least not subject to doubt or questioning, as far as the purpose of the explanation is concerned.

In a *deductively valid argument*, the link between the premisses and the conclusion is *strict* in the sense that the conclusion must be true in every case in which the premisses are true, barring any exception. In such an argument, the conclusion follows from the premisses by logical necessity. A traditional example is: 'All men are mortal; Socrates is a man; therefore Socrates is mortal'. The premisses don't have to be true, but if they are, the conclusion has to be true.

In an *inductively strong argument*, the link between the premisses and the conclusion is based on probability, so that if the premisses are true, then it can be said that the conclusion is true with a degree of probability (usually measured as a fraction between 0 and 1, the latter being the value assigned to a deductively valid argument, the limiting case).

In a *presumptively \*plausible argument*, the link between the premisses and the conclusion is based on *burden of proof*, meaning that it is not known whether the conclusion is true or not, but if the premisses are true, that is enough of a provisional, practical basis for acting as though the conclusion were true, in the absence of evidence showing it to be false. Presumptively plausible arguments are species of arguments from ignorance that should be treated with caution, because of their provisional nature, making them subject to default, and even in some cases fallacious (Walton, *Plausible Argument in Everyday Conversation*).

Presumptively plausible arguments are very common in everyday conversation, and their abuse or erroneous use is associated with many of the traditional informal fallacies, familiar in logic textbooks. A few of the more com-

mon types of presumptively plausible arguments are noted below, along with some traditional types of argument and fallacy.

*Argument from sign* derives a conclusion that some feature of a situation is present, based on some other observed feature that generally indicates its presence. For example, 'Here are (what appear to be) some bear tracks in the snow; therefore a bear passed this way'.

*Argument from expert opinion* creates a presumption that a proposition is true, based on an appeal to the opinion of a suitably qualified expert who has claimed that it is true. More broadly, arguments are often based on appeals to authority of one kind or another, e.g. judicial authority, other than that of expertise. Locke (in his *Essay Concerning Human Understanding*) identified a type of argument he called *argumentum ad verecundiam* (argument from respect or modesty), which is 'to allege the opinions of men whose parts, learning, eminency, power, or some other cause has gained a name and settled their reputation in the common esteem with some kind of authority', and use this allegation to support one's own opinion. Locke does not say this is a fallacy, but he indicates how it could be used as a fallacy by someone who portrays anyone who disagrees with the appeal as insolent or immodest, having insufficient respect for authority.

*Argument from ethos* puts forward a proposition as being more plausible on the ground that it was asserted by a person with good character. The negative version of this is the abusive or personal *ad hominem* argument, which claims that an argument is not plausible on the ground that the arguer who advocated it has a bad character (typically bad character for veracity is emphasized). In the *Essay* Locke defined the *\*argumentum ad hominem* as the tactic of pressing someone 'with consequences drawn from his own principles or concessions'. This description is closer to the variant usually called the *circumstantial ad hominem* argument, where a person's argument is questioned or refuted on the grounds that his personal circumstances are inconsistent with what he advocates in his argument. For example, if a politician argues for wage cuts in the public sector, but is unwilling to cut his own high salary, a critic may attack his argument by citing the ostensible inconsistency.

*Argumentum ad ignorantiam* (argument to ignorance) is the argument that because a particular proposition has not been proved true (false), we may conclude that it is false (true). This is sometimes a legitimate kind of argumentation based on burden of proof. For example, in a criminal trial, if it is not proved that the defendant is guilty, it is concluded that she is not guilty. However, if pressed ahead too aggressively, it can be used as a sophistical tactic. For example, in the McCarthy hearings in the 1950s, absence of any disproof of communist connections was taken as evidence to show that some people were guilty of being communist sympathizers.

*Argumentum ad populum* is the use of appeal to popular opinion to support a conclusion. It may take the form of appeal to group loyalties, popular trends of one kind or

another, or to customary ways of doing things. This type of argumentation is reasonable in many cases, but it can be used as a sophistical tactic to bring pressure against an opponent in argument, or to appeal to group interests or loyalties in an emotional way, in lieu of presenting stronger forms of evidence that should be provided.

*Argumentum ad misericordiam* is the use of appeal to pity to support one's conclusion. Such appeals are sometimes appropriate, but too often they are used as sophistical tactics to evade a burden of proof by diverting the line of argument away from the real issue.

**Aristippus** (5th century BC). An associate of Socrates, celebrated as a defender and exemplar of a life of sensual pleasure. His advocacy of pleasure was taken up by the Cyrenaic school (named after Aristippus' native city of Cyrene in North Africa), reputedly founded by his grandson, also called Aristippus. The Cyrenaics maintained that the supreme good is the pleasure of the moment, which they identified with a physical process, a 'smooth motion of the flesh'. They supported their hedonism by the argument that all creatures pursue pleasure and avoid pain. This concentration on immediate pleasure reflected a general scepticism, according to which only immediate sensations could be known. Concern with past or future caused uncertainty and anxiety, and should therefore be avoided. (\*Ataraxia.)

**aristocracy, natural.** Rule by the members of a long-established ruling class distinguished by ability, property, and a privileged education which instils a high sense of honour, responsibility, and public duty.

Aristocracy is one of the three basic types of government noted by the Greeks, the others being monarchy (rule by one) and democracy (rule by the people). Aristocracies can be based on heredity, wealth (oligarchy), or merit (meritocracy). Some thinkers, especially Burke, believe in the natural aristocracy of those whose place in the social fabric has been established by stable hierarchical values hallowed by time. Such a view finds a friendly environment in some forms of \*conservatism and can be seen as the expression of a belief in the value of an \*organic society. It is easy for critics on the left to make fun of the idea because it can be depicted as the expression of entrenched privilege and arbitrary power with no rational basis. Nevertheless, the belief in a natural aristocracy can be combined with constitutional safeguards (as in Burke) and its systematic destruction over the last fifty years by the

egalitarianism of the left and the managerialism of the right has not ushered in a glorious new era of public service.

E. Burke, *Reflections on the Revolution in France* (1790), ed. Conor Cruise O'Brien (Harmondsworth, 1968).

**Aristotelianism.** Aristotle's philosophical influence spans the period from his death in 322 BC to today. It has led to a wide range of different philosophical viewpoints, as his work has been interpreted and reinterpreted to fit different programmes and serve differing goals. His thought has influenced the terminology of \*philosophy itself: 'syllogism', 'premiss', 'conclusion', 'substance', 'essence', 'accident', 'metaphysics', 'species', 'genera', 'potentiality', 'categories', '*akrasia*', 'dialectic', and 'analytic' are all terms taken over from Aristotle. Many contemporary philosophers working on ethics, philosophy of mind and action, political philosophy, and metaphysics claim that their views are influenced by, or even derived from, Aristotle's own writings. Still others define their own position by their rejection of Aristotle's views on essentialism, metaphysics, and natural science. And this situation is not merely an artefact of current philosophical interests; it is one which has obtained through nearly the whole period of Western philosophy since Aristotle's death.

The history of Aristotelianism has many phases. Immediately after his death, his school (the Lyceum) remained a centre for scientific and philosophical study. Theophrastus succeeded him as its head, expanded on his biological researches by a study of botany, and also wrote a history of physical theories and cosmology, while Eudemus composed the first history of mathematics and Aristoxenus wrote on music. Theophrastus and the next head of the Lyceum, Strato, were independent thinkers, prepared to criticize Aristotle's views, and to develop their own theories on basic issues. There were sometimes as many as 2,000 students during this period, and internal debate flourished. Zeno of Citium, the founder of the Stoa, said that Theophrastus' chorus was larger than his own, but that the voices in his own chorus were in greater harmony. However, in the third century BC, other philosophical schools emerged—the \*Epicureans, \*Stoics, and \*Sceptics—and took centre-stage, rejecting some of Aristotle's views and modifying others, and the influence of the Lyceum itself diminished.

In the first century BC, Aristotle's manuscripts were edited by Andronicus and his writings were widely studied. Between the second and sixth centuries AD a series of scholarly commentators studied Aristotle's work with care and ingenuity, paying particular attention to his writings on logical, physical, and metaphysical topics. Alexander of Aphrodisias (second century AD), Porphyry (third century AD), and Philoponus and Simplicius (sixth century AD) were amongst the most distinguished contributors to this tradition. Some aimed not only to interpret Aristotle's views, but also to criticize them. Philoponus, in particular, developed a series of fundamental objections to Aristotle's dynamics and attempted to develop his own account of

change and movement. This first renaissance of Aristotelianism declined after Justinian closed the schools of philosophy at Athens in AD 529, although Aristotle was actively studied in Constantinople for a longer period.

The second great renaissance of Aristotelian thought in western Europe began in the twelfth century AD, and was prompted initially by Syrian and Arabic scholar-philosophers who had discussed and developed Aristotle's scientific and metaphysical works. Of these, the best known are Avicenna (Ibn Sīnā) and Averroës (Ibn Rushd), 'the Commentator', who produced commentaries on nearly all of the works of Aristotle which we now possess. Averroës himself believed that Aristotle both initiated and perfected the study of logic, natural science, and metaphysics. Latin translations of Arabic texts and commentaries on Aristotle began to reach Europe (via Spain) in this period, and provoked widespread interest. Initially, Aristotle was seen as a threat to Christian orthodoxy, and in 1210 the Council of Paris banned the study of his natural philosophy and threatened to excommunicate anyone who studied it. However, the study of his writings flourished under mild persecution, and was further stimulated by the Crusaders' discovery in Constantinople of many of Aristotle's manuscripts (as handed down from the Greek commentators), which subsequently were skilfully translated into Latin and made more generally available. Within a few generations, Aristotle's writings became one of the mainstays of university life in Europe. This was due mainly to the enthusiasm and ability of two Dominicans, Albert the Great (c.1200–80) and Thomas Aquinas (1224/5–74), who sought to present the basic principles of Aristotle's philosophy in a systematic fashion and to integrate it (as far as possible) with Christian and contemporary scientific thought. Albertus aimed to give an account of the whole of nature in Aristotelian terms, to capture what Aristotle would have said had he been alive and well-informed in the thirteenth century AD. Aquinas's goal was to distinguish what was fundamentally sound in Aristotle's philosophical writings from certain of the conclusions which he actually drew. For example, while Aquinas (as a Christian) wished to reject Aristotle's view that the world had no beginning, he argued that it was by revelation alone that one could know the relevant facts. Thus, he upheld Aristotle's criticism of his predecessors' theories that the world had a beginning on the grounds that no philosophical argument could establish what had in fact occurred. Aquinas aimed to reconcile religion and philosophy, and to produce a wide-ranging synthesis of Aristotelian philosophy, Christianity, and the current scientific thinking of his day.

The success of Aquinas's synthesis ensured that for a time Aristotle held the pre-eminent position in Western philosophy. He was regarded for several centuries as the supreme philosopher, 'the master of those who know', as Dante called him. However, the effect of this synthesis was in many ways pernicious. After the thirteenth century Aristotle came to represent the status quo in philosophy and science, and to be identified with dogmatic resistance

to further speculation and scientific discovery. Naturally, critics arose: in Oxford, William of Ockham and, in Paris, Jean Buridan and Albert of Saxony amongst others. By the end of the fourteenth century, they had (like Philoponus before them) criticized Aristotle's dynamics and the astronomical theories constructed on this basis. The way was open for Copernicus and Galileo to undermine these parts of Aristotle's physical theories. Perhaps the nadir of this form of Aristotelianism was reached when Cremonini, a leading Aristotelian in Padua, refused to look through Galileo's telescope because he suspected that what he saw would conflict with his own theories. In the seventeenth century, Francis Bacon, Galileo, and Boyle developed more general attacks against Aristotelianism, accusing it of a resistance to scientific method and empirical observation. Hobbes complained of Aristotle's continuing influence with considerable vehemence. 'I believe that scarce anything can be more absurdly said in natural philosophy, than that which is now called Aristotle's *Metaphysics* . . . nor more ignorantly, than a great part of his *Ethics*' (*Leviathan*, iv. xlvi).

It is something of a paradox that Aristotle was criticized by John Locke and Francis Bacon for lack of interest in scientific method and empirical observation. He had, after all, pioneered the empirical science of biology, and had written at length about the importance of ensuring that one's theories are true to appearances and consistent with the reputable opinions of the relevant experts. His reputation in natural science suffered because of the narrow-minded attempts of the Aristotelians of the seventeenth century to defend every aspect of his physical theory. Their ultra-conservative approach prompted a radical rejection of central contentions of Aristotle's metaphysics and epistemology. A century later, Bishop Berkeley noted judiciously: 'In these free-thinking times, many an empty head is shook at Aristotle and Plato, as well as at Holy Scriptures. And the writings of those celebrated ancients are by most men treated on a foot with the dry and barbarous lucubrations of the Schoolmen.' In this way, the successful criticism of the most speculative features of Aristotle's dynamics prompted a major sea-change in the development of Western philosophy. The starting-point for philosophical thinking after Descartes came to be subjective experience and the challenge of scepticism, rather than man understood as a distinctive species of animal in a world of substances, essences, and natural kinds with their own causal powers. Indeed, from a post-Cartesian viewpoint many of Aristotle's central concepts appeared ungrounded or epistemologically insecure.

Aristotle's influence was not undermined in all areas. At a time when his metaphysical doctrines were under sustained attack, the German educationalist Philip Melancthon (1497–1560) referred to the *Ethics* as a seminal document, and made it essential reading in German universities. Later in the German philosophical tradition, Hegel and Marx were enthusiastic students of Aristotle. Indeed, Marx was sometimes described as a left-wing Aristotelian.

Aristotle's *Poetics* exercised a powerful influence on the seventeenth-century French dramatists Corneille and Racine, who attempted to construct tragedies according to his precepts. Corneille went so far as to say that Aristotle's dramatic principles were valid 'for all peoples and for all times'. In nineteenth-century biology, Darwin was so deeply impressed with Aristotle's biological observations and theories that he remarked that while 'Linnaeus and Cuvier have been my gods, they were mere schoolboys to old Aristotle'. However, these remarks were exceptions to an intellectual climate in which Aristotle's central claims about scientific explanation, metaphysics, and logic were rejected either in whole or in part. Indeed, Darwin's own work appeared to undermine the need for Aristotle's style of teleological explanation of biological phenomena.

The last two centuries have seen several major developments in Aristotelian studies. In the nineteenth century, scholars sought to establish a secure text of his surviving books, culminating in the Berlin edition, published from 1831 onwards. Later writers tended to see Aristotle not as propounding one finished philosophical system, but as developing and modifying his views throughout the treatises. Others focused with increasing rigour on Aristotle's discussion of particular issues in his *Ethics* or *Metaphysics*, or more recently his biological works, without assuming that they all fit perfectly into one package of ideas. There has been, in these respects, an attempt to formulate clear and precise accounts of Aristotle's views, rather than to rest content with the 'Aristotle of legend'. It is perhaps no accident in this context that the last few years have seen renewed scholarly interest in the Greek commentators of the first Aristotelian renaissance.

What is the current position of 'Aristotelianism' in modern philosophy? In several areas, his influence remains strong and alive. I shall only comment on two.

1. *Philosophy of Action, Moral Psychology.* Many contemporary philosophers have been influenced directly by Aristotle's pioneering discussions of a variety of issues. The philosophy of \*action contains a variety of questions: What counts as an action? How are actions individuated? What is to count as an *intentional* action or a *rational* action? Can there be intentional but irrational actions (\**akrasia*)? Further issues concern the explanation of intentional action: Is it to be explained causally, or in a distinctive manner (rational explanation)? Are the explanantia desires or beliefs, and which are explanatorily more basic? How are such psychological states related to underlying physical states? On each of these issues, Aristotle has a distinctive and interesting answer. Philosophers as diverse as Austin, Anscombe, von Wright, and Davidson, who reopened these issues in the late twentieth century, have found much to use in Aristotle's discussions. But his sustained and detailed analysis of these problems repays study on its own account.

His interest in ontological issues led him to develop an account of the nature and identity of processes, states, activities, and actions which differs from the alternatives

canvassed in modern debates. In analysing intentional action, he gave an important role to efficient causation, but saw this as fully consistent with the recognition of the role of agents' knowledge and teleological (or rational) explanation. Where modern discussions represent these as rival explanatory schemes, Aristotle portrayed them as complementary. His discussion of *akrasia* focuses on the issue of how akratic action is possible and how it is to be explained—whether in terms of a failure of intellect or imagination, or in terms of desires not fully integrated into one's picture of well-being. This discussion stands comparison with even the best modern work. Aristotle is aiming to account for a wide range of cases (some involving failure of intellect, others separate failures of motivation) in a way which does justice to the variety of the phenomena of ordinary experience. But at the same time he seeks to develop a theory of practical reasoning and virtue which shows how the akratic is irrational and to be censured. The range and subtlety of Aristotle's account is evident throughout his discussion of virtue and self-control, which has received considerable attention from contemporary philosophers (such as John McDowell and Philippa Foot). Similar claims can be made for his discussions of the interconnection between psychological and physical states. Aristotle is engaging with precisely the issues which concern contemporary opponents of materialist reduction who wish to avoid (Platonic or Cartesian) \*dualism. In these areas, Aristotle not only initiated philosophical discussion but provided a framework within which much contemporary work can be located and better understood.

2. *Metaphysical Issues.* Contemporary discussion, mainly prompted by two American philosophers, Saul Kripke and Hilary Putnam, has done much to refocus attention on to the Aristotelian issues of \*substance, \*essence, and \*natural kinds. Kripke and Putnam share a range of assumptions with Aristotle. Terms such as 'man' or 'gold' have their significance because they signify a distinct natural kind whenever they are coherently uttered. They could not retain their significance and apply to a different object or kind. Aristotle accepted this as a consequence of his account of signification in which the thoughts (with which these terms are conventionally correlated) are 'likened' to objects or kinds in the world. But what makes these kinds and objects the same whenever they were specified? At this point, Aristotle developed his metaphysical theory of substance and essence to answer this question and thus to underwrite and legitimize his account of names. Modern authors have highlighted the linguistic and semantic data from which Aristotle began his account; but few (if any) have attempted to present such a systematic metaphysical basis for their semantic claims. In this respect, his project is at least as detailed and developed as those currently on offer. At the very least it indicates what a systematic theory of essence would be like.

Aristotle advanced his metaphysical claims apparently untroubled by sceptical doubts of the kind which

undermined the first great period of Aristotelianism (in third-century BC Athens) and the third (in western Europe in the seventeenth century AD). Perhaps it was because he was so little concerned by \*scepticism that he was able to develop his metaphysical theory in the way he did. However, from a modern perspective, this may not seem the major mistake it was once taken to be. Aristotle was not disturbed by global scepticism because (in his view) we had to be in cognitive contact with the world for our basic terms (such as 'man' or 'gold') to make sense. Our thoughts had to be 'likened' to objects and kinds in the world for them to be the thoughts they are, or for our terms to make sense to us. From the Aristotelian standpoint, global scepticism seems something of a trick: it assumes that we understand terms with meanings which they could only have if we were in reliable cognitive contact with the world, and then proceeds to raise sceptical doubts about the reliability of that cognitive contact. This anti-sceptical feature of Aristotle's thinking made it unappealing in an earlier age when philosophers raised sceptical doubts with scant concern for the question how our thoughts can have the content they do. But it is precisely this aspect of Aristotle's philosophy, together with its attendant interest in metaphysical issues, which makes it strikingly relevant today. In these areas, Aristotle's influence on contemporary philosophy appears stronger and more benign today than it has been at any time since the anti-Aristotelian revolution of the seventeenth century. d.c.

**Aristotle** (384–322 BC). Aristotle was born at Stagira in Chalcidice in northern Greece. His father was a doctor whose patients included Amyntas, King of Macedonia. At the age of 17, Aristotle went to Athens to study under Plato, and remained at the \*Academy for nearly twenty years until Plato's death in 348/7. When Speusippus succeeded Plato as its head, Aristotle left Athens, lived for a while in Assos and Mytilene, and then was invited to return to Macedonia by Philip to tutor Alexander. Aristotle returned to Athens in 335 at the age of 49, and founded his own philosophical school. He worked there for twelve years until Alexander's death in 323, when the Athenians in strongly anti-Macedonian mood brought a formal charge of impiety against him. Aristotle escaped with his life to Chalcis, but died there in the following year at the age of 62. He married twice, and had a son, Nicomachus, by his second wife.

Aristotle's philosophical interests covered an extremely wide area. He composed major studies of logic, ethics, and metaphysics, but also wrote on epistemology, physics, biology, meteorology, dynamics, mathematics, psychology, rhetoric, dialectic, aesthetics, and politics. Many of his treatises constitute an attempt to see the topics

studied through the perspective of one set of fundamental concepts and ideas. All reflect similar virtues: a careful weighing of arguments and considerations, acute insight, a sense of what is philosophically plausible, and a desire to separate and classify distinct issues and phenomena. They also exhibit considerable reflection on the nature of philosophical activity and the goals of philosophy itself.

Aristotle's philosophical development is difficult to determine chronologically. He probably worked on a range of concerns simultaneously, and did not always see clearly how far his thinking on logic or philosophy of science fitted with his current work on (for example) metaphysics or biology. He may have returned more than once to similar topics, and added to existing drafts in a piecemeal fashion at different times. It is, in general, more fruitful to inquire how far different elements in his thinking cohere rather than what preceded what. Further, many of his extant works read more like notebooks of work in progress or notes for discussion than books finished and ready for publication. His writings (like Wittgenstein's) reflect the activity of thinking itself, uncluttered by rhetoric or stylistic affectation. Their consequent freshness of tone should make one cautious of accepting over-regimented accounts of his overall project: for it may well have been developing as he proceeded.

In what follows, I shall aim to introduce a few of Aristotle's leading ideas in three areas only: logic and philosophy of science, ethics, and metaphysics. While these subjects differ widely, there is considerable overlap of concerns and interests between them.

*Logic and Philosophy of Science.* Aristotle was the first to develop the study of deductive inference. He defined the \*syllogism as a 'discourse in which certain things having been stated, something else follows of necessity from their being so'. Syllogisms are deductively valid arguments, and include both arguments of the form:

All *as* are *b*,

All *bs* are *c*,

All *as* are *c*,

and

*as* are red,

*as* are coloured.

Both these arguments are *perfect* syllogisms since nothing needs to be added to make clear what necessarily follows. By contrast, arguments form *imperfect* syllogisms when more needs to be added beyond the premisses to make clear that the conclusion follows of necessity. It is a distinctive feature of Aristotle's account that it takes as its starting-point the notion of 'following of necessity', which is not itself defined in formal or axiomatic terms. If this notion has a further basis, it lies in Aristotle's semantical account of the predicate as what affirms that a given property belongs to a substance (and so rests on his metaphysics of substance and property).

Aristotle focused on perfect syllogisms which share a certain form involving three terms: two premisses and a conclusion. Examples of such syllogisms are (reading downwards):

All <i>as</i> are <i>b</i> ,	All <i>as</i> are <i>b</i> ,	Some <i>as</i> are <i>b</i> ,	Some <i>as</i> are <i>b</i> ,
All <i>bs</i> are <i>c</i> ,	No <i>bs</i> are <i>c</i> ,	All <i>bs</i> are <i>c</i> ,	No <i>bs</i> are <i>c</i> ,
All <i>as</i> are <i>c</i> .	No <i>a</i> is <i>c</i> .	Some <i>as</i> are <i>c</i> .	Not all <i>as</i> are <i>c</i> .

He claimed that other syllogisms with a similar form and the same crucial terms ('all', 'some', 'none', 'not all') could be expressed using one of these perfect cases if one adds three conversion rules:

From No <i>bs</i> are <i>a</i>	<i>infer</i>	No <i>as</i> are <i>b</i> .
From All <i>bs</i> are <i>a</i>	<i>infer</i>	Some <i>as</i> are <i>b</i> .
From Some <i>bs</i> are <i>a</i>	<i>infer</i>	Some <i>as</i> are <i>b</i> .

Finally, he proposed that any deductively valid argument can be expressed in one of the four obvious perfect syllogisms specified above or reduced to these by means of the conversion rules. If so, any such argument can be reformulated as one of the basic cases of perfect syllogisms in which the conclusion obviously follows of necessity.

Aristotle was interested in this logical system in part because he was interested in explanation (or demonstration). Every \*demonstration is a syllogism, but not every syllogism is a demonstration. In a demonstration, the aim is to explain why the conclusion is true. Thus, if the conclusion states that (for example) trees of a given type are deciduous, the premiss of the relevant demonstration will state this is so because their sap solidifies. If no further explanation can be given of why their leaves fall, this premiss states the basic nature of their shedding leaves. Premisses in demonstrations are absolutely prior, when no further explanation can be offered of why they are true. These constitute the starting-points for explanation in a given area.

Aristotle's ideas about the nature of valid inference and explanation form the basis of his account of the form a successful science should take. In terms of these, he outlined an account of what each thing's essence is (the feature which provides the fundamental account of its other genuine properties), of how things should be defined (in terms of their basic explanatory features), and of the ideal of a complete science in which a set of truths is represented as a sequence of consequences drawn from a few basic postulates or common principles. These ideas, which underlie his *Analytics*, determined the course of logic and philosophy of science, and to some extent that of science itself, for two millennia.

Aristotle's system has its own shortcomings and idiosyncrasies. His treatment of the syllogistic does not exhaust all of logic, and not all arguments of a developed science can be formulated into the favoured Aristotelian form. His system was a pioneering one which required supplementation. It was unfortunate, not least for his own subsequent reputation, that it came to be regarded as the complete solution to all the problems it raised.

It is important to note that Aristotle's logical project was directly connected with his metaphysical goals. His

aim was to develop a logical theory for a natural language capable of describing the fundamental types of object required for a full understanding of reality (individual substances, species, processes, states, etc.). He had no interest in artificial languages, which speak of entities beyond his favoured metaphysical and epistemological theory. His goal was rather to develop a logical theory 'of a piece' with his philosophical conception of what exists in the world and how it can be understood. In this respect, his goals differ markedly from those of metalogicians since Frege, who speak of artificial as well as natural languages, and domains of objects unconstrained by any privileged metaphysics.

*Ethics and Politics.* Aristotle's *Ethics* contains several major strands.

1. It aims to give a reflective understanding of \*well-being or the good life for humans.

2. It suggests that well-being consists in excellent activity such as intellectual contemplation and virtuous actions stemming from a virtuous character. Virtuous action is what the person with practical wisdom would choose; and the practically wise are those who can deliberate successfully towards well-being. This might be termed the *Aristotelian circle*, as the key terms (well-being, virtue, and practical wisdom) appear to be interdefined.

3. It develops a theory of virtue (*\*aretē*) which aims to explain the fact that what is good seems so to the virtuous. Aristotle examines the characteristic roles of desire, goals, imagination, emotion, and intuition in the choices and intentional actions of the virtuous, and explains in these terms how virtue differs from self-control, incontinence (*\*akrasia*), and self-indulgence. This is a study in moral psychology and epistemology, involving detailed discussion of particular virtues involved in the good life.

Each of these is important but controversial, and Aristotle's own viewpoint is far from clear. Sometimes it appears that the self-sufficient contemplation (of truth) by the individual sage constitutes the ideal good life, but elsewhere man is represented as a 'political animal' who needs friendship and other-directed virtues (such as courage, generosity, and justice) if he is to achieve human well-being. On occasion, Aristotle seems to found his account of the good life on background assumptions about human nature, but elsewhere bases his account of human nature on what it is good for humans to achieve. He remarks that the virtuous see what is good, but elsewhere writes that what is good is so because it appears good to the virtuous.

One way (there are many) to fit these strands together runs as follows. The paradigm case of activity which manifests well-being is intellectual contemplation, and everything else that is an element in the good life is in some relevant way like intellectual contemplation. Practical wisdom is akin to theoretical activity: both are excellences of the rational intellect, both involve a proper grasp of first principles and the integration of relevant psychological states, and both require a grasp of truth in their respective areas. Intellectual contemplation is the activity which best

exemplifies what is good for humans; anything else which is good for us in some way resembles it.

But what counts as truth in practical matters? Is this to be understood merely as what seems to be the case to the virtuous agent? Alternatively, practical truth might be taken as a basic notion. Or perhaps the virtuous agent is the proper judge because the virtue she possesses, when allied with practical wisdom, constitutes part of well-being. On this view, the interconnections between virtue and well-being would explain why her practical reasoning is as it is (in a way consistent with reputable and well-established opinion). This preserves the analogy with truth in theoretical matters, where inter-connections between kinds, essences, and causal powers explain why our theoretical reasoning is as it is (in a way consistent with reputable opinion). While the third of these interpretations captures substantial parts of Aristotle's discussion, he proceeds with characteristic caution and appears reluctant to commit himself finally on this issue.

Aristotle wrote his *Ethics* as a prolegomenon to his study of *Politics*. This too reflects his interest in virtue and well-being, but also contains several other major themes. Thus Aristotle holds the following theses.

1. A city state has as its goal well-being, and the ideal constitution is one in which every citizen achieves well-being.
2. In practice, \*democracy is preferable to oligarchy because it is more stable and its judgements are likely to be wiser since individuals when grouped together have more wisdom than a few.
3. The practice of slavery, with regard to both 'natural' and 'non-natural' slaves required to till the soil and maintain the state (1330<sup>a</sup>32–3), is justifiable.
4. Plato's 'communist' society of guardians in the *Republic* is to be condemned because it leads to social disturbances, undermines private property and friendship, 'which is the greatest safeguard against revolution', and is unobtainable.

What holds these diverse views together? Sometimes, Aristotle writes as if his aim is for each citizen to achieve the perfectionist goals set out in the *Ethics*. However, his commitment to this ideal is mitigated by other factors including the need for stability and social harmony. When these conflict (as in his discussion of non-natural slaves), he does not give authority to perfectionist values in a direct or systematic way. It may be that Aristotle thought that there would be more excellent activity in the long run if considerations of harmony and stability were taken seriously. But he fails to spell this out or to specify in detail the distributional policies which are to be implemented by the wise rulers who hold power in his preferred constitution. While the *Politics* contains many influential remarks, such as those condemning the practice of lending money for profit and analysing the nature of revolutions, it is incomplete as a work of political theory. It also exhibits some of the less attractive aspects of perfectionist theory: if people lack the abilities required for a life of excellence, they are

natural slaves rightfully deprived of the basic freedoms enjoyed by those with higher-grade capacities. Similarly, if children are born with serious physical handicaps, they are to be left to die. Aristotle does not seriously address the intuitions of liberty or equality of treatment which run contrary to the demands of perfectionist theory in these cases.

*Metaphysics and Biology.* Aristotle's metaphysical proposals have a number of different sources. Three of them can be summarized as follows.

1. Aristotle's logical system (as set out above) required a metaphysical underpinning—an account of species, substances, and essences—to underwrite his treatment of logical necessity and demonstration. The same was true of his semantical discussion of the signification of names and the principle of non-contradiction. Names signify (in his view) substances with essences. 'Man' has the significance it does because it signifies the same species on all occasions when it is used. But what makes this the same species is that it possesses a distinctive essence which it cannot lack. The kind occupies its own slot in the intelligible structure of the world in virtue of its possession of this essence. The \*essence is the fundamental feature which makes the \*substance what it is, and explains the other properties of the substance. Aristotle was faced with two problems: he required a metaphysical account of substances, species, and essence to sustain this view, and a psychological account of how we grasp these substances and kinds. (The latter issue is addressed in *De anima*, where Aristotle proposed that our thoughts and perceptions are of objects and kinds when we are in appropriate causal contact with them, and are thus 'likened' to them.)

2. Aristotle was convinced that \*teleological explanation was the key to the proper study of natural organisms. What determined a thing's nature was what counted as its successful operation: its achieving what it is good for it to achieve (as is implicit in his ethical writings). These goals, and being organized so as to achieve them, is what makes the species the one it is. Some goals are extrinsic; the goal of an axe is to cut wood, and this explains the arrangement of the metal in the axe. But the teleological goal of man is to live a life of a given kind (e.g. of rational activity), and the rest of his nature is designed so as to achieve this intrinsic goal. The distinctive goal of each biological kind is what determines its respective essence.

3. Aristotle's critical study of Plato's theory of \*universals had convinced him that universals could not exist by themselves, but only in particular things. Since substances must be capable of independent existence, it appears that they cannot be universals but must be particulars. However, this generated a dilemma since Aristotle also believed that only universals were definable and the objects of scientific knowledge (in the *Analytics* model). Thus if substances are knowable, they cannot be particulars. But now it looks as if substances cannot exist at all since they cannot be either universals or particulars. Aristotle's dilemma arises because he was tempted to regard

particular substances as ontologically primary, while (at the same time) insisting that understanding and definition are of universals. The latter thought he shared with Plato; but the former is very much his own, and one which led to a fundamentally different account of numbers and universals than the one Plato offered.

In addressing the first two issues, Aristotle needed to represent the essences of substances in a way which respected two ideas: (a) that each substance has one fundamental feature which causes its other features to be as they are, (b) this feature is teleologically basic. *Form* is the candidate proposed as the relevant essence of substances, composed of form and matter. But is the form particular or universal? How is it related to matter? Is it itself *one* unitary thing? These questions dominate Aristotle's reflections in the *Metaphysics*, and parts of his account of the soul in *De anima* and natural kinds in the biological writings.

Aristotle's discussion of these issues has generated several major scholarly controversies. First, did he take the notion of one unified substance as basic, and regard its matter and form as abstractions from this basic notion? Or did he regard form and matter as independent starting-points which, when related in a given way, yield a unified substance? Second, if each individual substance's form is unique, how is the form itself individuated? Is its identity fixed independently of the matter (or the composite) it informs? Or is it rather a distinct form precisely because it is the result of a general form informing certain quantities of matter? Third, did Aristotle regard general forms as abstractions from the forms of particular substances, which served as his basic case? Or is the order of explanation reversed, general forms taken as explanatorily prior and forms of particular substances derived from general forms enmattered in particular quantities of matter?

One approach (there are again many) takes general forms as explanatorily basic, and construes particular forms as the result of their instantiation in different quantities of matter. On this view, Aristotle regards form and matter as prior to the composite substance, while maintaining as a separate thesis that universals cannot exist uninstantiated. Composites such as humans are to be understood as the result of the operation of form on matter. They are composed from arms and legs, composed in turn from flesh and blood, themselves composed from basic elements. At each level above the lowest, the relevant entities are defined by representing the matter as serving certain teleological goals. While matter is described as potentiality, this means no more than that it can be informed in favourable conditions. This perspective is at work in *The Parts of Animals* and *De anima*, yielding a distinctive picture of the soul and of animal. The teleological operations which introduce such phenomena as desire or perception are not definable in terms of efficient causation, but refer essentially to the creature's own goals, such as well-being or survival. Nor can they be defined as 'whatever plays a given role in a system of explanation', as they are genuine entities in their own

right with their own causal powers and essential features. On this view, Aristotle is neither offering a reductive account of psychological states, nor regarding them as inexplicable or mysterious (as in Platonic dualism).

These scholarly issues remain highly controversial, and are at the centre of current debate. Other more general problems are raised by Aristotle's discussion. First, is it possible to explain the unity or identity of a particular substance at all? Second, what is the nature of a metaphysical explanation which Aristotle is seeking? He appears to offer a constructive account of higher-order states, in some way intermediate between reductionism and dualism. But is this a genuine alternative, and how is the relevant construction itself constrained? Third, is there always one teleologically basic feature which explains the presence and nature of the other genuine properties of substances?

As already indicated, Aristotle made substantial progress with each of these questions in his treatises on psychology and biology. Indeed, much of their philosophical interest lies in tracing how far he succeeded in explaining the nature of the relevant phenomena in terms of his central concepts and favoured methodology. The results, particularly in his psychological writings, are often exciting and compelling but sometimes inconclusive. Aristotle encountered serious difficulties in his study of biological natural kinds. He did not succeed in finding one basic feature to explain the remainder of their genuine properties (as required by the *Analytics* model). Thus, he saw that fish are so constituted as to fulfil a range of diverse functions—swimming, feeding, reproducing, living in water—which cannot all easily be unified in a unitary essence of the type proposed in the *Analytics*. The model he had developed to analyse physical phenomena (such as thunder) could not be applied without major changes to central aspects of the biological world. Aristotle's commitment to teleological explanation generated results apparently contrary to the guiding idea of non-complex unifying forms proposed in the *Metaphysics*. It is not clear whether he believed that these problems could be overcome, or concluded that the model of explanation which applied elsewhere could not successfully analyse biological kinds. He did not succeed in integrating all his beliefs into a complete and unified theory.

Aristotle's writings in metaphysics, morals, biology, and psychology are unified by common interests in \*natural kinds, teleology, and essence, but they are not parts of the seamless web of a perfectly unified and finished theory. Aristotle was too cautious and scrupulous a thinker to carry through a 'research programme' without constant refinement and attention to recalcitrant detail. In this respect his writings seem to reflect the nature of intellectual contemplation itself.

**arithmetic, foundations of.** Arithmetic is the study of the natural numbers—0, 1, 2, 3, and so on. A foundation for arithmetic can serve three interconnected interests: an interest in rigorous axiomatization, an epistemological interest in the source and justification of our knowledge of the \*numbers, and an ontological interest in the nature of the numbers.

Dedekind, and, following him, Peano, dissected the concept of the progression of the natural numbers and formulated an axiomatic foundation for arithmetic, now known, unfairly, as the Peano axioms. The idea behind an axiomatic foundation is to set down a small number of axioms, expressed using a small number of primitive, non-logical terms, from which other sentences can be deduced. The primitive terms used are '0' (0 is the first natural number), 'successor' (the successor of 0 is 1, the successor of 1 is 2, etc.) and 'natural number', and the five axioms are:

1. 0 is a natural number.
2. The successor of any natural number is a natural number.
3. No two natural numbers have the same successor.
4. 0 is not the successor of any natural number.
5. For any property *P*, if (i) 0 has *P* and (ii) the successor of any natural number which has *P* also has *P*, then every natural number has *P* (the principle of mathematical induction).

This informal axiomatic foundation organizes and regiments arithmetical truths within an economical system. It can be formalized by translating the axioms into a formal language from which theorems can be deduced via rigorous proofs (though Gödel's \*incompleteness theorem limits the success of any such formal axiomatization).

How is our knowledge of arithmetical truths to be explained? An axiomatic foundation provides a partial answer: assuming that the axioms are known, then knowledge of theorems is logical knowledge of the logical consequences of the axioms. The outstanding question is: how do we know the axioms? According to the Euclidean paradigm, we know the axioms because they are self-evident, but this is an unsatisfactory answer because judgements of self-evidence are notoriously fallible. Rather than appeal to self-evidence right away, Frege developed his \*logicism. The logicist project has three parts: define the vocabulary of arithmetic solely in terms of the vocabulary of logic, identify the natural numbers with 'logical objects', and deduce Peano's axioms as the logical consequences of logical axioms. Thus the logicist project grounds knowledge of arithmetical truth on knowledge of logical axioms which Frege held to be self-evident. This explanation was ripped apart by \*Russell's

paradox which demonstrated that Frege's logic is inconsistent and which initiated the vigorous foundational research of the early twentieth century.

The very idea of an epistemological foundation for arithmetic can be questioned; for example, ' $2 + 2 = 4$ ' is more obvious and certain than any recondite set of axioms of logic or set theory from which it may be deduced. Nevertheless, an account of the ontological foundation of arithmetic is compulsory. *Prima facie*, arithmetical truths are truths about objects—the numbers. What sort of objects are they? They do not seem to be either physical or mental objects because there might not be enough of those to serve as the numbers and because the numbers are thought to be necessary existents unlike physical or mental objects. Thus the numbers appear to be \*abstract entities, as the Platonist would have us believe: either a *sui generis* progression or one drawn from a more extensive kind of abstract object such as sets, but in each case having no causal powers. Now epistemological problems resurface since there is no agreed account of how our knowledge of abstract objects is possible. A.D.O.

**arkhē.** A 'first thing from which something is, or comes to be, or is known' (Aristotle, *Metaphysics* v. 1013<sup>a</sup> 18–19). Applied to materials which do not arise out of anything more primitive, to causes of change, to propositions fundamental in deductive systems, by teleologists to benefits and beneficiaries, and, colloquially, since they are sources of initiatives in states, to governments. Kinds of *arkhē* are as numerous as ways of explaining or senses of 'understand'. w.c.

\*first cause argument.

**Armstrong, D. M.** (1926– ). Australian philosopher, Officer of the Order of Australia, and one of the dominant figures in the school sometimes known as Australian materialism. Armstrong was one of the first to advocate \*functionalism as a theory of the mind, and to combine that view with \*materialism. In metaphysics, he has defended a distinctive version of realism about \*universals. Armstrong's view is that there are philosophical reasons for believing in the existence of universals, but universals do not exist independently of the particulars that instantiate them, and which universals exist is an empirical question. This view has been in the background of his later work on scientific laws, and on the nature of modality. Armstrong's metaphysical realism, his vigorous defence of empirical metaphysics, and his clear, argument-based philosophical style show the influence of John

Anderson—of whom Gilbert Ryle reputedly said ‘he thinks there are only brass tacks’.

**Arnauld, Antoine** (1612–94). A brilliant philosophical controversialist, Arnauld exerted a powerful influence on the development of seventeenth-century thought. When still under 30 he composed a devastating critique of Descartes’s arguments for the distinctness of mind and body, casting doubt on the logical completeness and adequacy of the Cartesian conception of a pure thinking substance (Fourth Set of Objections to the *Meditations*, 1641). A defender, despite his criticisms, of many aspects of the Cartesian system, he went on to write, with Pierre Nicole, the celebrated *La Logique, ou L’Art de penser*—the so-called Port-Royal Logic—in 1662. In his early seventies, Arnauld published a detailed refutation of Nicolas Malebranche’s theory of perception in the *Traité des vraies et fausses idées* (1683). A few years later, in a famous exchange of letters with Leibniz, he argued that the Leibnizian theory of individual substance eradicates genuine contingency and leads to universal fatalism.

**Arrow, Kenneth Joseph** (1921– ). Leading theorist of social choice, winner of a Nobel Prize in 1972. In *Social Choice and Individual Values* (1951), Arrow studied the determination of rational choice at the collective level for cases where this choice is to be a function of the preferences of the individuals making up the collective. In this study he proved the general impossibility theorem, which gives rise to \*Arrow’s paradox. Assuming that any acceptable function must meet a small number of intuitive conditions, Arrow proved that there is no consistent function from individual preferences to collective choice. With Debreu, Arrow also made a major contribution to general equilibrium theory. (In an economy in competitive *equilibrium* all markets clear simultaneously: there is a balance of supply and demand in all markets.)

C. C. von Weizsacker, ‘Kenneth Arrow’s Contributions to Economics’, *Scandinavian Journal of Economics* (1972).

**Arrow’s paradox.** A paradox in social choice theory. Why not devise a function which orders options for a society in terms of the preferences of its individual members? Such a function would have to meet certain conditions on reasonableness—such as that (a) an ordering could be obtained from any logically possible set of individuals’ preferences, (b) if everyone prefers a given A to a B, then that A should be ordered above that B, (c) no individual can dictate the social ordering—there can be no individual such that whenever he prefers an A to a B, then that A must

be ordered above that B, and (d) the ordering of any A and B depends on individuals’ preferences between that A and that B alone. \*Arrow proved that there was no consistent function which met all the conditions.

\*voting paradox.

K. J. Arrow, *Social Choice and Individual Values* (New Haven, Conn., 1951).

**art.** The idea that various activities such as painting, sculpture, architecture, music, and poetry have something essential in common belongs to a particular period beginning only in the eighteenth century. It was then that the ‘fine arts’ became separated off from scientific disciplines and more mundane exercises of skill. Later, during the eras of romanticism and modernism, this became transmuted into the single notion of *art*. Contemporary philosophers have inherited the notion, but are no longer entirely sure what to do with it.

One problem is the difficulty of defining art. Consider what is usually treated as the earliest definition: art as mimesis, or the reproduction of the world in images. For a long time painting and literature could be united under this heading (and a precedent cited in Greek thought). However, if art is to include music and architecture, as well as the non-figurative visual forms of the twentieth century, this definition will not easily suffice. Two notable definitions from the early part of this century built on the rejection of representation as a defining feature of art: art as significant form, and art as the expression of emotion. Both play down the artwork’s relation to reality, in favour of perceptible aesthetic qualities of the art object itself, or of the relation between the work and the creative mind in which it originated. Earlier intimations of both can be found in the ideas of \*beauty and \*genius in Kant’s theory of art. Both object-centred and artist-centred definitions of art could be used to discriminate that which was ‘properly’ art from that which was not, and such ideas helped in their day to explain the value of many progressive forms of art. But each is at best one-sided as a comprehensive definition.

Successive waves of the avant-garde, together with increasing knowledge of different cultures, have shown how society’s institutions accommodate radical change in what is recognized as art. It has even been suggested that the very point of the concept of art lies in its open-ended capacity to accept change. Some have offered what is called an institutional definition of art, prompted by the thought that the only common feature among artworks is just their being recognized as art by certain institutions in particular societies. It would presumably be left to history to show what these institutions were, and the various functions or values which the things called art have had within them. While there must remain appropriate standards by which one work can be judged superior to another, it would be hard to deny that the inclusion and exclusion of different activities from the status of art has served other functions in society, such as fostering élitism or class-distinction.

One drawback of an institutional theory is that it cannot easily be used, as earlier theories were, to persuade us of what is peculiarly valuable about art. Sometimes it is assumed that art is a good thing to the extent that it has purely aesthetic value, as distinct from moral or cognitive or utility value. Others think, surely rightly, that art is also important as a way of gaining understanding of human behaviour, and that what value art-products have cannot be divorced from issues of truth and morality. Ideas which have had currency in past theories and which have spread into popular thinking—that art achieves a unique insight into ‘higher’ truths, or provides an elevated form of human self-realization—should not be dismissed, but in philosophy they require cautious investigation. Few philosophers, one suspects, would be quick to nominate any one value as that possessed by everything which is called art.

R. Wollheim, *Art and its Objects*, 2nd edn. (Cambridge, 1980).

**art, contemporary.** Contemporary art-making practices from 1945 to the present can be intelligibly viewed as ‘working’ the medium: a sensuous and intellectual experimentation not just with the physicality of the constituents—the paint, the graphic line, the colour field—but with that set of conventions specific to the art world at a particular time—the particular techniques, procedures, and standards, both articulated and implicit, that discipline and define an art practice. Abstract Expressionists worked with space and form within a single plane to establish complex part-by-part relations that collapsed illusionistic space while still maintaining ‘the opticality of matter’ (Clement Greenberg). The Minimalists eliminated the optical focus of spatial art using ‘obdurate masses’ (Donald Judd) that were aggressively tactile; they reduced the bare canvas to a limiting frame, expanding the framing function of painting by constructing installation works that brought the spectator literally into the work. Using mixed media, their works borrowed ‘the look of non-art’ (Michael Fried). Together with Pop artists, they extended the plastic arts into the temporal by working serially. In the period of neo-avant-gardes that included Fluxus, Conceptual, Situationist, Process, and Performance art, a series of cross-overs took place between sculpture and architecture, painting and popular culture, and art, music, film with performance. This shift did not lead to another style, but to a fully transformed conception of art founded on alternative theoretical premisses. Contemporary art is often characterized by the dematerialization of the art object into untraditional and often temporary forms, which include video, performance, installation, and film art. Contemporary artists today, whether sculpture-based, painting-based, installation, or post studio, operate within ‘a Post Medium Convention’ (Robert Gero). Here

there is no longer a concern with specificity, purity, or the limits of painting *qua* painting, but only an artistic concern with the painterly, the sculptural, the architectural, as well as the use of artefacts of Pop culture, as a varied means to actualize contents. The new canon is Duchampian: anything has the potential to be art. Today, artworks are often barely recognizable as ‘art’. For example some contemporary artists have built houses, cooked dinners, planted gardens, or parked cars at the museum as artworks. This merging with the world is one way of making artworks critically relevant to a fluid culture that is ahistorically adrift in a virtual space of promiscuous signifiers. B.T.

**art, philosophy of:** *see* aesthetics.

**art, representation in:** *see* representation in art.

**art, science, and religion:** *see* science, art, and religion.

**art, suspect.** There are two important areas in which art comes under suspicion. First, a work of art can embody a view that challenges the prevailing beliefs of a society, such as Manet’s *Olympia* (which challenged views of female sexuality). In the Thirties both the Nazis and the Soviet Union made life difficult for any artist not affirming the official line in an academic, classical style. In philosophical parlance, dominant ideologies will be suspicious of works of art in which challenges to that dominance are exercised. The second area of suspicion concerns the general public’s suspicion of art (broadly referred to as ‘the avant-garde’) which repudiates sources of value such as beauty, profundity, or technical skill without drawing (in any way that is obvious) on alternative sources of value. If one cannot tell by looking whether an object is or is not art (as with much ‘found art’), there will always be the suspicion that a fraud is being perpetuated.

D.M.

Stanley Cavell, *Must We Mean What We Say?* (Cambridge, 1976).

**art and morality.** Argument in this area tends to cluster around either of two poles: one seeing the relation between art and morality as close and harmonious, the other more keenly aware of conflicts and tensions between them.

1. \*Art is taken as vital to moral health. It brings into play, expresses, ‘purges’ emotions and energies that, in real-life situations, could be harmful and destructive. It allows us, without risk, to explore in depth the essential nature and outworking of endless types of human character and social interaction—in plays and novels.

If art appreciation is essentially contemplative, attentive to the individuality of its objects, and respecting and loving them for what they are in themselves, these aesthetic attitudes are close neighbours to the morally desirable attitudes of respect for persons and moral attentiveness to their individual natures and needs.

Again, art can enlarge the scope of individual \*freedom, by expanding awareness of our options for action and for forms of human relationship, beyond those options that are immediately apparent in everyday society. More broadly, the arts enhance human vitality through teaching a keener, more vivid perception of the colours, forms, and sounds of a world of which we are normally only dimly aware, and a more intense and clarified awareness of values.

2. Nevertheless, art has also been seen as morally dubious or harmful. At the level of theory, the Kantian and post-Kantian accounts of a disinterested, calmly contemplative \*aesthetic attitude have recently been facing critical challenge. It is claimed, furthermore, that art stimulates emotions better not aroused; encourages the imagination to realize in detail, and to enjoy, morally deplorable activity, thereby making that more likely to be acted out in life.

If freedom can be enhanced by art, it can also be diminished—by artworks that present current stereotypes, fashions in attitudes and action, farouche or degraded visions of human nature, as if these alone were the ‘available’ models for life-responses. There can be little ground for confidence that the sometimes desperate search for the innovative and ‘different’ in art (and the role of the complex of interested promoters of particular arts—the ‘art-world’) reliably leads to morally serious and wise interpretations of human problems.

J. Passmore, *Serious Art* (London, 1991), ch. 8.

**art and truth.** There are two main philosophical issues concerning art and truth. First, in representational art, is truthfulness, accuracy, or realism a criterion of value, or at least relevant to the artistic value an artwork possesses? Second, is art, representational or not, the source of a sort of truth other than that which can be attained outside of art and which can be stated propositionally?

It seems clear that the answer to the first question is that it depends on the art-form and, even more, on the specific genre involved. With realistic paintings and novels, a high degree of truth-to-life is generally a virtue, since it is in tune with the aesthetic aims of such works. With expressionist paintings or fantasy novels or avant-garde films, a high degree of truth-to-life is neither sought nor desirable, given what such works are about aesthetically. It is sometimes held, however, that even in such cases works are better, the truer they somehow are to the fundamental

facts of human nature, even if taking leave of the outward forms and appearances of human life.

Positive answers to the second question have usually looked to what art expresses or exemplifies or illustrates, as opposed to represents or denotes or describes, as loci of truth of a non-propositional sort, and to forms of intuitive, perceptual, or experiential knowing as modes of access to such truth that the appreciation of art may involve. Among the more plausible claims of this stripe are ones concerning insights into the nature of emotional life that engagement with expressive music might afford, and insights into the nature of moral values that engagement with imaginative literature or cinema might afford. Many such claims turn on the idea that the experience of art can reveal truths to us that are not manifested in ordinary experience, or that the experience of art can cognitively affect us in certain ways that are unparalleled in extra-artistic experience.

**art criticism.** Critical discourse about the various arts is enormously diverse in nature and intent. The versions of criticism which philosophical aesthetics puts forward tend to be idealized rather than practical accounts. Some criticism is subsumed under the notion of \*aesthetic judgement: an evaluation of (say) a novel or musical performance, which professes to state truths about its degree of success, based on the critic's response, and which may enable other spectators to respond similarly. Criticism is also conceived as an interpretative exercise, seeking to construct, by scrutiny of the work, or by using historical evidence, a meaning which the work will bear. Whether a literary work or a painting thus interpreted permits conflicting readings, and whether there can be any privileged interpretation which approximates to the ‘artist's meaning’, are matters of great contention.

M. C. Beardsley, *The Possibility of Criticism* (Detroit, 1970).

**arthritis in the thigh** was the subject of the following thought experiment. Someone who believes that he or she has arthritis in the thigh believes something false. But, arguably, a physical duplicate of that individual with the same physical history in a possible world in which the word ‘arthritis’ covers ailments in the thigh as well would, in comparable circumstances, have a different, true, belief. So, it is said, the mental fact of the intentional content of propositional attitudes is partly determined by facts concerning an individual's socio-linguistic environment.

**artificial intelligence.** A relatively new discipline which studies the programming and performance of computers used both for problem-solving across a wide range of intellectual, engineering, and operational tasks, and as a tool in psychology for modelling mental abilities. Originally inspired by Alan Turing's 1950 paper 'Computing Machinery and Intelligence', in which he replaced the question whether machines can think by the question whether we would attribute intelligence to a device that performed (in written questions and answers) as well as a human (i.e. was indistinguishable). The aim of much work in AI has been to pass this Turing test by building devices that perform certain tasks as well as we do, such as playing chess and constructing proofs. Some, however, use AI techniques to build machines that perform better than we do, or to perform tasks we cannot perform, whether these are intellectual tasks such as theorem-proving, the large-scale storage and use of knowledge about a particular domain, or physical tasks best performed by robots. The first two kinds of task present problems of representation for programmers, who must secure access to information and reliable inferences in a large search space and within a realistic time-scale. The search problem is tackled by using both \*algorithms and \*heuristics. The former are effective procedures that produce specified results in a principled way; the latter are less reliable, but useful, rules of thumb.

Although AI research in robotics, theorem-proving, and the kind of knowledge-based systems used for diagnosing medical and engineering problems may lack psychological relevance, the related fields of vision, logic programming, and knowledge representation are of psychological relevance. Typical examples of links with psychology include work on 3D representation in vision, deductive and analogical reasoning, parsing of natural-language sentences, conversions between orthographic and phonetic forms, cognitive maps of the position of objects in a bounded environment.

Investigations into the nature of computation itself are part of AI and can be found in Turing's work. According to the Church-Turing hypothesis, every calculation is computable and each computation is a procedure which computes an input-output function. These can be described by Turing machines—abstract devices which make moves according to a table of instructions and a tape divided into squares on which symbols can be written or erased. Each move consists of reading a symbol on the tape, deleting or rewriting it, and/or moving to another part of the tape. By repeated applications of these moves and with an infinitely long tape, it is possible in principle to create a Turing machine to compute any input-output function. Universal Turing machines are devices that can mimic the input-output function of any particular Turing machine. To model human intelligence requires a device with the power of a universal Turing machine, although the limits of formalization shown by Gödel's \*incompleteness result suggest to many that this may not be sufficient since there are propositions that humans can understand which cannot be represented formally in a

machine; AI could model only some but not all human intelligence. If correct, this result would tell against those who claim that AI not only simulates but replicates thinking. According to this strong AI thesis, a suitably programmed computer would qualify as having mental states. Some argue this is because its program would reproduce human psychological processes. John Searle has vigorously opposed this thesis, claiming that a human in a room could carry out programming instructions to convert inputs to outputs written in Chinese characters to the satisfaction of those on the outside without thereby understanding anything about Chinese. Since \*computers are just formal symbol-manipulators they cannot tell us anything about understanding or thought, and so cannot qualify for mental ascription. Many replies have been offered to Searle's argument (in M. Boden (ed.), *The Philosophy of Artificial Intelligence*).

AI researcher David Marr laid the foundations for psychologically realistic computational modelling, in his theory of vision, by describing a hierarchy of levels to be found in any theory of computational psychology. Level 1 describes what is to be computed and why. Level 2 analyses different representations and algorithms for computing that function. And Level 3 describes how any given algorithm is to be implemented in the hardware. B.C.S.

**artificial language.** All \*language is man-made, but artificial languages are made systematically for some particular purpose. They take many forms, from mere adaptations of an existing writing system (numerals), through completely new notations (sign language), to fully expressive systems of speech devised for fun (Tolkien) or secrecy (Poto and Cabenga) or learnability (Esperanto). Logicians' artificial symbolic languages are none of these, for although they typically contain some new vocabulary (logical \*constants) and syntax designed to avoid \*ambiguity and \*vagueness, they also largely consist of schemata intended to be open to an inexhaustible range of interpretations, and are therefore not available for ordinary linguistic purposes such as assertion (you can't use '*P*' or ' $P \rightarrow Q$ ', or even ' $P \rightarrow P$ ', to say anything). Their purpose is to present forms into which natural-language utterances may be artificially squeezed; their value is as aids for appraising reasoning, and in the philosophical study of reasoning. C.A.K.

\*Formal language.

**artworld:** see aesthetics, history of.

**asceticism.** Principally a doctrine or way of life in which the enjoyment of bodily \*pleasures, comfort, and ease is forsworn for moral, spiritual, or religious reasons. Enjoyment of such pleasures and comforts may be held to tempt to sin; to prevent contemplation of or dedication to higher things; to tie one to the illusory world of matter and false goods; and so on. Such doctrines and practices enjoy little popularity these days, but history records some notable ascetics such as St Simeon Stylites (c.390–459), who lived on the top of his pillar and attracted many imitators.

*The Sayings of the Desert Fathers*, tr. B. Ward (London, 1975).

**A-series and B-series.** These are terms introduced by J. M. E. McTaggart to describe two different ways in which events can be thought of as being ordered in \*time. Events are ordered in the A-series as being past, present, or future, whereas in the B-series they are ordered as being earlier or later than one another. Thus the battle of Hastings is past and the destruction of earth is future, and the former is earlier than the latter. However, events do not change their B-series relations over time, whereas they do change in respect of being past, present, or future. The battle of Hastings was once a future event and the destruction of earth will in time become a past event, but those two events always have stood and always will stand in the same earlier–later relation to one another.

E.J.L.

D. H. Mellor, *Real Time* (Cambridge, 1981).

**as if:** see Vaihinger.

**aspects.** Ways of appearing; what appears in ways of appearing; in Wittgenstein's philosophy, what is seen in \*seeing as'. \*Wittgenstein distinguishes the 'continuous seeing' of an aspect from the 'dawning' of an aspect, suggests that the concept of an aspect is like the concept of a (re)presentation (*Vorstellung*), and says that 'aspect-blindness' is like the lack of a 'musical ear'. According to Wittgenstein, seeing aspects is 'subject to the will', but does not entail the existence of any 'private object'. In a change of aspect, paradoxically, there seems to be a new perception, yet what is presented remains unchanged.

In German phenomenology, aspects are the phenomenological appearances known as *Abschattungen*, through which spatial items such as shapes and colours are given directly in perception. \*Husserl thinks physical objects are presented through *Abschattungen*, but that non-spatial items, notably mental processes, are not.

**ass, Buridan's.** Since the Middle Ages this ass, associated with the name of Buridan though not referred to in his extant writings, has been invoked in discussions concerning \*free will and \*determinism. The hungry animal stood between two haystacks which were indistinguishable in respect of their delectability and accessibility. Unable to decide from which stack to feed, the ass starved to death.

A.BRO.

**assertion.** A type of linguistic act (act performed by the utterance of a sentence): in making an assertion, the speaker claims that a \*proposition is true (contrast issuing a command, asking a question). Crucially, the proposition asserted by uttering, for example, 'He fell', can also occur unasserted, as part of another assertion, for example 'If he fell, he died'. Otherwise we could not conclude from these two assertions that he died; and we would have no account of the meaning of complex sentences in terms of their parts. Frege held that a perspicuous language would have an 'assertion sign' to indicate when a proposition is being asserted. In languages like ours, the indicative mood of the main verb conventionally (though defeasibly) indicates that an utterance of the sentence (not as a part of a longer sentence) is an assertion.

D.E.

\*statements and sentences.

Michael Dummett, *Frege: Philosophy of Language*, 2nd edn. (London, 1981), ch. 10.

**associationism.** A theory of the nature and sources of ideas and the relations among sensations and ideas in the mind. British associationism is a school of philosophy and psychology which flourished during the eighteenth and nineteenth centuries. The theory of \*ideas was largely derived from John Locke, with contributions to the principles of association made by David Hartley, David Hume, James Mill and John Stuart Mill, and Alexander Bain, among others. These philosophers, and many of their predecessors and contemporaries, British and continental (for instance, Thomas Hobbes, Revd J. Gay, Étienne Condillac), were impressed with such facts as that differences in ideas seem tied to differences in sense-experience, so that the theory of innate ideas is implausible; that the presence of something to the mind—the sensible idea of the sun, say—often continues beyond the presence of the object, the sun itself; and that some ideas seem ineluctably tied to others, so that one comes to mind immediately after the other. These facts could best be explained by principles relating to how sensations, ideas of sensations, and ideas themselves are associated one with another.

David Hartley's *Observations on Man, his Frame, his Duty, and his Expectations* (1749) contains perhaps the first systematic account of the associationist doctrine; it appears to have been developed independently of David Hume's version. Hume's writing and that of other British contributors to associationism, e.g. James Mill's *Analysis of the Phenomena of the Human Mind* (1829) and Alexander Bain's

*The Senses and the Intellect* (1855), *Emotion and Will* (1859), and *Mind and Body* (1872) insisted that the primary form of association is the mere contiguity of ideas of sensation in experience. (Bain was the founder of *Mind*, in 1876.) Hartley's earlier version traces the character of types of ideas of sensations to the physical, 'vibratory' motions in the brain and to the kind, locality, and line of directions of influences from the brain. Later associationists abandon the physiological account.

James Mill described the 'train of feelings, of which our lives consist' as arising by a 'general law of the Association of Ideas which is nothing but an order of occurrence, both successive and synchronous'. Individual sensible ideas do not arise in the mind, one from another, by virtue of logical connections among them. Nor do they arise in the mind by virtue of some mental power of the mind. James Mill, like Hume before him, rejected a distinctive law of association of the form of causes and effects, since such an association reduces to contiguity of ideas. Similarity among ideas, too, is not a law apart from the regular or habitual association of ideas, due merely to their contiguity or co-occurrence.

Bain further systematized associative laws, added an articulation of psychophysical parallelism, and expanded the physiological basis of psychological processes first introduced in Hartley's account of association of ideas as a special instance of Newton's theory of vibrations.

From its sources in Locke's use of the phrase 'association of ideas' (in a discussion of the intellectual errors and sources of biased belief due to illogical, merely associative relations among our ideas), associationism developed into an account of the dynamic relations in the 'stream of consciousness' and mental activity generally. Historians of psychology credit associationism as the beginning of experimental psychology, in contrast to speculative, philosophical psychology. In philosophy, associationism was vigorously criticized by the British thinkers influenced by Kant and then Hegel (e.g. T. H. Green, F. H. Bradley, Bernard Bosanquet, and others). However, in recent philosophy of psychology inspired by the connectionist or \*parallel distributed processing model of the functioning of the mind-brain, some principles of mental activity with very strong echoes of associationism have been noted and, perhaps, exploited. **astrology.** Up to the seventeenth century astrology overlapped with astronomy and \*cosmology. All studied the movements of heavenly bodies, assuming a Ptolemaic model of a finite universe composed of concentric circles with a motionless earth (neither rotating nor revolving) at the centre. Astrology is associated mainly with theories of celestial influences, understood as causal forces literally flowing down on to the static earth and bringing about all

aspects of meteorological and biological change—winds, tides, and seasons, and generation, growth, corruption, and death. Astrology found a place in the deterministic view of nature woven into ancient philosophical systems—Aristotelian, Platonic, and Stoic—and their medieval and Renaissance derivatives. From antiquity, astrological practice supported \*fatalism, especially with the entry into medieval western Europe of Arabic sources. Casting horoscopes and 'fortune-telling', with its claims to relate a detailed pattern of the heavenly bodies at birth to all future events of one's life, was accused of denying \*free will, but condemnations did little to lessen astrology's popularity. Once the earth was shown to be a rotating and revolving planet, once an infinite universe replaced a finite one, and once genetics placed the causes for biological diversity and specificity within the organism rather than in the stars, there could be no scientific foundation for astrology whatsoever. **ataraxia.** Freedom from trouble or anxiety. In Epicurean theory, one of the two constituents of \**eudaimonia*, the other being freedom from bodily pain. Since for Epicurus the absence of pain or distress was the highest form of pleasure, this conception of *eudaimonia* was not merely negative. The elimination of anxiety, in particular of the fear of death and the afterlife, was for \*Epicureans the principal motivation for the study of philosophy. It was also adopted as their end by the \*Sceptics, who held that it was to be attained by suspension of judgement.

A. A. Long and D. N. Sedley, *The Hellenistic Philosophers* (Cambridge, 1987).

**atheism and agnosticism.** Atheism is ostensibly the doctrine that there is no God. Some atheists support this claim by arguments. But these arguments are usually directed against the Christian concept of God, and are largely irrelevant to other possible gods. Thus much Western atheism may be better understood as the doctrine that the Christian God does not exist.

Agnosticism may be strictly personal and confessional—'I have no firm belief about God'—or it may be the more ambitious claim that no one ought to have a positive belief for or against the divine existence. Perhaps only the ambitious version invites an argument. A promising version might combine something like William Clifford's dictum that no one ought to hold a belief on insufficient evidence with the claim that the existence of God is evidentially indeterminable. Both of these claims, of course, have been strongly contested. G.I.M.

Bertrand Russell, *Why I am not a Christian* (New York, 1957).

**atomism, logical.** A phrase used by Russell (in his paper 'Analytic Realism' (1911), 135) for a position he most fully characterized in 1918: the world is made up of logical atoms, 'little patches of colour or sounds, momentary things . . . predicates or relations and so on' ('Lectures on the Philosophy of Logical Atomism' (1918), 179), together with the facts composed of these atoms. Atomism as a theory of matter dates back to the ancients. Hume's atomism is psychological: the ultimate constituents of the world are perceptions (impressions and ideas). Russell calls his atoms logical because they have the logical, but not the metaphysical, features of substances: they are the ultimate simple subjects of predication, but they do not endure through time. He calls the process of discovering the atoms 'logical analysis'. Reflection shows that Piccadilly is not an ultimate simple, and that judgements apparently about it are really about its simple constituents. Another reason which Russell might have had for calling his atomism logical is that logical techniques are involved in constructing the complexes out of the simples: complex facts are constructed out of atomic facts, and complex things are classes constructed out of the atoms.

Russell's atomic things are \*sense-data, and as short-lived as Hume's perceptions. Yet Russell denies that one can infer from this that they are mental. In the 1918 account, he speaks sympathetically, though without fully committing himself, of neutral monism, the theory that the atoms are neither mental nor physical, the distinction emerging only through the different kinds of ways in which the atoms are combined into complexes. Logical atomism has no commitment to idealism.

An atomic fact is one properly expressed by a sentence in which there are no logical connectives. Thus 'This is red', if true, states an atomic fact, whereas 'This is red or green' does not. Sentence form alone cannot be relied upon. Thus 'Tom is married' does not state an atomic fact, since it really means 'Tom is married to someone', and this is a general fact, involving existential quantification. Hence logical atomism is associated with the need for philosophical analysis: in order that the real nature of facts can be seen, sentences have to be analysed into their logical form.

The purest atomistic vision concerning facts is provided in Wittgenstein's *Tractatus*, and is the view that all facts, or all basic facts, are atomic, and every atomic fact independent of every other. For example, there are not really any disjunctive facts, facts of the form:  $p$  or  $q$ . For ' $p$  or  $q$ ', if true, is made true by the fact that  $p$  or by the fact that  $q$ . There is no need to posit any further fact, over and above the fact that  $p$  or the fact that  $q$ , to make ' $p$  or  $q$ ' true. Problems for this view include: the independence of atomic facts, the nature of negative facts, and whether general facts and facts of propositional attitude are reducible to atomic facts.

Wittgenstein himself abandoned the Tractarian vision because he felt that the best candidates for atomic facts were not independent. Thus *this is red* and *this is green* are incompatible, but apparently atomic. Russell argued that universally general facts are *sui generis*, contradicting Wittgenstein's view that all facts, or all basic facts, are atomic. Even if we were to enumerate all the atomic facts, we would have left something out if we did not add that these are *all* the facts there are, and this further fact is not atomic. Russell also argued that facts of \*propositional attitude, for example the fact that John believes that this is red, are not atomic (since they include a complete sentence, here 'This is red'), and are also not reducible to atomic facts.

**atomism, physical.** A theory of the physical world, according to which it is constituted by an infinite number of indivisible corpuscles moving randomly in an infinite void. Initiated in the fifth century BC by Leucippus and Democritus, it was adopted by Epicurus, and via the rediscovery of \*Epicureanism in the Renaissance developed into the 'corpuscular philosophy' of the seventeenth century.

C. Bailey, *The Greek Atomists and Epicurus* (Oxford, 1928).

**atomism, psychological.** The view that the ultimate contents of the mind consist in self-standing items owing their significance to no other mental items. The psychological atoms are arrived at by breaking down complex thoughts into their simpler parts. This is achieved by psychological discrimination not logical analysis. (\*Logical atomism.) When the thinker can distinguish no further separation of parts what remains are the atomic simples.

**atonement.** According to this Christian doctrine, the life and death of Jesus make an important contribution to reuniting human sinners with \*God. Various theological accounts of this contribution have invoked the motifs of a victory in battle over personal or impersonal forces of evil, ransom paid to liberate sinners from the devil, payment of a debt of punishment sinners cannot pay, a sacrifice sinners can offer God, and an example of love that inspires

repentance. Human wrongdoers may and often should make atonement to their victims.

P.L.Q.

\*forgiveness.

R. Swinburne, *Responsibility and Atonement* (Oxford, 1989).

**attention.** As William James says, 'consciousness goes away from where it is not needed,' and it seems an everyday truth that one can selectively consider, concentrate, or focus on some aspect of the world or of one's inner life. Searle draws a distinction between the centre and the periphery within the field of consciousness, arguing that there are different levels of attention—from the full attention I pay to my feet when putting on my shoes to the marginal attention due to them the rest of the day. How attention stands *vis-à-vis* a clear conception of consciousness, though, is a matter of debate. It seems possible to be conscious of something without attending to it. One might be conscious of the background murmurings at a party, for example, while attending exclusively to the host's speech. Despite this, the term is often used as a synonym for 'consciousness' in what can only be incomplete functional, cognitive scientific, or psychological accounts of consciousness.

J.GAR.

**attitude.** In a broad sense, any mental state with propositional content. Attitudes, in this sense, include beliefs, desires, hopes, and wishes. On one view, the content of any attitude is a traditional (declarative) \*proposition, or a corresponding mental \*representation. A person may *believe* that AIDS is curable, *desire* that AIDS is curable, *hope* that AIDS is curable, and so on. In each case, the content is the same. On another view, some different kinds of attitudes have different kinds of content. The contents of desires, for example, might be 'optative propositions' (e.g. 'Would that AIDS were curable'), whereas the contents of beliefs are declarative in form. Some accounts of attitudes replace propositions with situations. Attitudes are sometimes characterized, more narrowly, as thoughts or feelings possessing an affective tone and encompassing desire.

**attitude, aesthetic:** *see* aesthetic attitude.

**attribute:** *see* substance and attribute.

**Augustine, St** (354–430). Bishop of Hippo Regius (now Annaba, Algeria), Doctor of the Western Church. His enormous influence on the doctrines of Western Christianity owes much to his skill and perseverance as a philosopher. In the history of philosophy itself he is a secondary figure, partly because he didn't have the taste or leisure to acquire more than a scrappy knowledge of the 800-year tradition preceding him.

As a young student at Carthage he formed the ambition, according to his *Confessions* (397–400), to lead a philo-

sophical life pursuing truth. The opportunity to fulfil this ambition came when, aged 31, he resumed his childhood Christianity at Milan (386) and gave up his career as a schoolmaster. With some friends he spent a winter at Cassiciacum by the north Italian lakes, discussing philosophy and composing dialogues on scepticism, the happy life, and the soul's immortality. Returning from there (388) to his birthplace Thagaste in Numidia (Souk-Ahras, Algeria), he set up a community of young disciples and wrote on the problem of \*evil, order, prosody, and language and learning. But that life soon ended, when the Catholic congregation at Hippo on the Numidian coast prevailed on him in 391 to become their presbyter and later bishop. From then on he was never free of pastoral business. He by no means stopped writing (his written output, nearly all of which survives, is bulkier than from any other ancient author), but the subject-matter became mainly polemical, against schismatics and heretics. Even his masterpieces, the *Confessions* and *City of God* (413–26), have a pastoral purpose, the one being a public meditation on his own slow road to Catholic Christianity, and the other an attack (which was to have important historical effect) on the pretensions of pagans to possess a valuable independent culture. At the end of his life he catalogued and reviewed ninety-three of his works, excluding the numerous sermons and letters, in his *Retractationes* (426–7).

In spite of his hostility to the pagan past, Augustine was formed by classicism (all through Latin—he hardly read Greek), and he commended its contributions to knowledge and helped to transmit some of its flavour to the Western Middle Ages. In philosophy the chief influence on him was Platonist.

The \*Platonism came from Plotinus. For Augustine, as for the circle from whom he imbibed it during the Milan years (384–7), it was a route to Christianity, rescuing him from Cicero's scepticism and from the materialism and good–evil dualism of the Manichees, whose sect he had joined at Carthage. Now he could agree with 'the Platonic philosophers, who said that the true God is at once the author of things, the illuminator of truth, and the giver of happiness' (*City of God*, 8.5). He could believe that there are three 'natures' or kinds of substance: bodies, mutable in time and place; souls, incorporeal but mutable in time; and \*God, incorporeal and immutable (*De Genesi ad Litteram* (c.410), 8. 20. 39). God makes everything, and all that he makes is good. Badness arises from the tendency of things to decay: 'for a thing to be bad is for it to fall away from being (*deficere ab essentia*) and tend to a state in which it is not' (*De Moribus Manichaeorum* (388), 2. 2). The 'ordinary course of nature' is the regular and planned unfolding of causal or 'seminal' reasons, which date from the creation when God 'completed' his work (*De Genesi ad Litteram*, 9. 17. 32, 6. 11. 18–19).

Like Plato's \*Form of the Good, Augustine's God is not only the cause of things' being but the cause of our knowing them. God illuminates truths as the sun illuminates visible things. The senses do not supply knowledge, because their objects are mutable (*Soliloquia* (386–7), 1. 3. 8).

But understanding (which is the actualization of knowledge) can be compared to vision as the successful exercise, like successful looking, of the faculty of reason, which is like sight, in the presence of God or wisdom, which is like light (*Soliloquia*, 1. 6. 12–15). This analogy with one of the five senses was enough to convince Augustine that knowledge is enlightenment by God, the only teacher who can do more than provide an occasion for learning (*De Magistro*, 389).

Platonism also helped to shape Augustine's views about the relation of men and other animals to their souls (*animae*), at least to the extent of persuading him that souls are incorporeal, against the \*Stoic influence that had been felt by some earlier Christians. Soul, he thought, is a nature, or substance (*De Trinitate* (400–20), 2. 8. 14), and he was content to believe that until the general resurrection the souls of the dead will 'live' without bodies (*City of God*, 13. 19). But confronting the question whether a man not yet dead 'is both [a body and a soul], or only a body, or only a soul' (*De Moribus Catholicae Ecclesiae* (388), 4. 6) he chose the first answer, while also confessing that 'the way in which spirits adhere to bodies and become animals is altogether mysterious' (*City of God*, 21. 10. 1). The adherence may be like mixture of light with air, but perhaps should not be called mixture at all (*Epistulae*, 137.7.11).

In brooding on scepticism Augustine gradually came to think that even the tough 'criterion' of knowledge that had been agreed, seven centuries before, between Stoics and their adversaries the Academic \*Sceptics could be satisfied by assent to 'I exist' and 'I am alive'. In scattered passages of his works we can see developing an argument that finds final, Descartes-anticipating form at *City of God*, 11.26: 'if I am wrong, I exist (*si fallor, sum*)'—hence one's own existence is something one cannot believe in erroneously.

Augustine made some casual remarks about language-learning in the *Confessions*, but also discussed language quite thoroughly elsewhere. He accepted the standard view that speech 'signifies', not only in the sense of *indicating* thoughts (and perhaps things) but also, apparently, in the sense of *representing* the structure of thoughts in its own verbal structure, each unit of thought being itself a word 'that we say in the heart' (*De Trinitate*, 15. 10. 19), not in any language. The theme of such inner words seemed to him important enough to be gently and lucidly expounded in more than one sermon.

Among the Christian controversies which he entered into with great zest and skill were some that involved the major philosophical themes of \*time and \*free will. Both Manichees and pagans had mocked the Genesis story of Creation. In *Confessions*, and *City of God*, 11–12, Augustine met the pagan challenge 'Why did God create *then*?' with a response inherited from Philo Judaeus that God made time too. It then follows—or at any rate Augustine asserted—that God himself, being beginningless, must be outside time: his years do not pass but 'stand simultaneously' (*Confessions*, 11. 13. 16). Augustine proceeded to treat Aristotle's puzzle how times can exist, seeing that all

of them are past or future or durationless. Starting from the insight that we measure times by memorizing their length (as when, in reciting the long syllables of the hymn 'Deus creator omnium', we remember the duration of the short syllables and double it), he speculates whether times are affections of the mind (*Confessions*, 11. 27. 36).

Augustine saw human free will—more exactly free decision, or perhaps free control, of the will, *liberum voluntatis arbitrium*—as essential to Catholic theology because otherwise an almighty God, exempt from the limitations of Manichean dualism, could not be justified in tolerating ill deeds and punishing ill-doers. The latter requires original guilt, *originalis reatus*, so that the sin we inherit from Adam must be 'penal' (*De Peccatorum Meritis* (411), 1. 37. 68); and both require the two-way power of acting and not acting, a 'movement of the mind free both for doing and for not doing' (*De Duabus Animabus* (392–3), 12. 17). In *De Libero Arbitrio* (391–5) and *City of God*, 5, Augustine made useful moves towards reconciling such freedom of decision with divine foreknowledge.

By the 390s he also believed, and later against Pelagius felt obliged to proclaim, that men are not able to 'fulfil the divine commands' without God's aid (*De Gratia et Libero Arbitrio* (426), 15. 31), nor even to 'will and believe' aright without God's 'acting' (*De Spiritu et Littera* (412), 34. 60). To those who receive them these benefits come as grace, unmerited, and God's will in bringing them 'cannot be resisted' (*De Corruptione et Gratia* (426), 14. 45). Yet it seems that what cannot be resisted is not received freely and—in one mood—Augustine at last confessed that though 'I tried hard to maintain the free decision of the human will, the grace of God was victorious' (*Retractationes*, 2. 1).

In one of his two works about lying Augustine criticized \*consequentialism as a decision procedure on the ground of its neutrality between doing ill oneself and acquiescing in the ill deeds of others. He advised that a Christian in penal times threatened with sexual abuse unless he sacrificed to pagan gods 'more ought' to avoid 'his own sin than somebody else's, and a lesser sin of his own than a graver sin of somebody else's' (*De Mendacio* (396), 9. 14). Although this is not a licence to 'wash your hands', it does mean that sins cannot be exculpated by their good consequences. Augustine doggedly inferred that lies, being sinful, are never justified. But like St Paul disavowing 'Let us do ill that good may come' (Romans 3: 8), he did not pause to ask how sins or ill deeds are to be recognized: homicide, for example, he thought only sometimes sinful, because it is permitted to properly authorized soldiers (*Contra Faustum* (400), 22. 70) and executioners (*City of God*, 1. 21).

Augustine shared the \*asceticism common among Christian and pagan intellectuals of his time. In particular sexual activity, and therefore marriage, would not fit well with philosophy. In his twenties he lived with a woman (he never names her), the mother of his son; and he says in the *Confessions* that what chiefly held him back from the plunge into Christianity was desire for a woman's arms (6. 11. 20). As a bishop he commended to others the partnership of marriage, but even more highly he

commended marital continence and virginity. There was something inescapably low about sex.

Beginning as a champion of religious toleration, Augustine was gradually drawn into a campaign by the Catholics of north Africa to encourage state coercion of the schismatic Donatist Church, a popular and turbulent movement in the area. His chief motive may have been the same as later persuaded English liberals like Locke to stop short of advocating toleration of Roman Catholics: civil peace. His attitude to the Roman imperial power, Christian since forty years before his birth, was compliant. No one should despise the services it continued to render in increasingly 'barbarian times', while release from its evils must await the end of life's pilgrimage in this 'earthly city' and the home-coming of the saved to heaven. **Aurelius, Marcus** (AD 121–80). Roman Emperor AD 161–80, and the last great Stoic writer of antiquity. His *Meditations*, twelve books of unsystematic private reflections on life, death, conduct, and the cosmos, appear to have survived fortuitously. Their unique value is to show us what it would be for a man at the apex of human power to live honourably, deliberately, and sensitively in accordance with the world-view and moral principles of \*Stoicism: that the All is one great natural system having order and excellence as a whole; that man should seek to understand this order, should accept what is inevitable for himself, and should act with understanding and integrity towards others. The *Meditations* are immensely readable at any point of entry. They are available in numerous English translations. There is no hint in them that Stoic thought was about to be overwhelmed by superstition and its ethic absorbed into the Christian tradition.

**Aurobindo, Ghose** (1872–1950). Cambridge educated Indian nationalist, sent to prison for anti-British 'terrorism'. In prison he had life-transforming mystical experiences. His voluminous English writings on Hindu philosophy and Indian culture deeply influenced understanding of India's spiritual traditions in terms of European thought. He combines traditional elements of the theistic philosophy of *\*Bhagavadgītā*, contemporary science, and his own mystical encounter with God, into an original teleological or evolutionary metaphysics which

can be summarized as follows. The evolution of matter into life and mind suggests that the individual 'psyche' too can further elevate itself, through 'integral yoga', into an 'overmind'. This overmind can then commune with the 'supermind', eventually merging with Existence–Consciousness–Bliss, the Ultimate Reality called 'Brahman' in Sanskrit. The present world with all its distinctions and disharmonies is real, but awaits the compensating descent of divine life which will gradually lead to spiritual perfection for every individual. The empirically inscrutable 'logic of the infinite' ensures that this supramental descent will make all life 'beatitude's kiss'. A.C.

\*Indian philosophy.

Sri Aurobindo, *Life Divine* (Pondicherry, 1983).

**Austin, John** (1790–1859). Lawyer and first Professor of Jurisprudence at London University, his lectures on the philosophy of law gave wide and long-lasting currency to Bentham's \*legal positivism.

Austin wanted his leading terms to have the simplicity, fewness, and definiteness of geometry's, so that political theory, like the distinct utilitarian 'science of legislation', could be popularly understood. Acknowledging Hobbes, he therefore defined positive law as commands of sovereigns (supreme political superiors habitually obeyed in independent political societies)—observing more clearly than Bentham the definition's unwelcome entailments: e.g. much constitutional law is merely 'positive morality' (distinguished in his useful terminology from 'critical morality'), and sovereigns have no legal rights. Hart's critique attributes to oversight or muddle much that Austin understood well but was obliged, by his (vulnerable) method and definitions, to exclude from 'analytical jurisprudence'. J.M.F.

\*law, philosophy of; law, positive.

John Austin, *The Province of Jurisprudence Determined*, ed. and intro. H. L. A. Hart (London, 1954).

**Austin, John Langshaw** (1911–60). Philosopher reputed to have led a movement giving rise in the 1950s and 1960s to \*'linguistic philosophy'. Austin's career was in Oxford, where he held a Chair from 1952 until his death at the age of 48. (This was the White's Chair of Moral Philosophy, although that was not a subject in which he had a particular interest.) Austin held no general theories about language or philosophy or method; his reputation is owed to his concern sometimes to approach philosophical problems through an examination of the resources of 'ordinary language', to his characteristic style of writing (at once plain and witty), and to his great influence on his contemporaries. His approach to philosophical problems is illustrated in his idea that 'much . . . of the amusement, and of the instruction, comes in drawing the covers of the microglot, in hounding down the minutiae': he believed that a good treatment of a topic began with a taxonomy. Austin's overall views on philosophical subjects are

robustly realist, and, in epistemology at least, he was inclined to think of problems as manufactured by philosophers.

Three books appeared posthumously. *Philosophical Papers* (Oxford, 1961; 2nd edn. 1970) is a collection, which covers some epistemology, metaphysics, and philosophy of action. *Sense and Sensibilia* (Oxford, 1962) argues that a series of alleged problems about perception are bogus. *How to Do Things with Words* (Oxford, 1961) is the revised text of the William James Lectures that he gave at Harvard in 1955; this gave rise to the theory of speech-acts, which has a continuing influence in philosophy, in linguistics, and in literary studies. J. HORN.

G. L. Warnock, *J. L. Austin* (London, 1989).

**Australian philosophy.** New South Wales was claimed for Britain by Captain Cook in 1770, and a penal colony established there in 1788. Ninety-eight years later, the first chair in philosophy was established in the new colony of Victoria at the University of Melbourne. While there have been recent attempts by feminist theorists and some moral philosophers to address the issues of justice for indigenous people and to call for recognition of the special relationship the first peoples have with the land, the continent's philosophical development owed most of its inspiration to links with Britain and Europe, later with the United States. Contemporary Australian work has a strongly 'analytic' flavour and robust academic links with New Zealand philosophy.

John Anderson's arrival in Sydney in 1927 ended forty years of idealist dominance in Australian philosophy. Obstinate realist, Anderson's thought was hostile to many of the conventional views of the age, championing an idiosyncratic form of 'empiricism' (one excluding both sense-data and ideas). Few others had such an influence on the subject's Australian development, although, thanks to invitations arranged by J. J. C. Smart, two visitors to the country had a more recent influence: first, Donald Davidson, and subsequently, David Lewis, the latter making no less than twenty-five visits to Australia from the Seventies onwards. While Anderson's influence was local, the dominant figures in Australian philosophy of the second half of the twentieth century—including J. J. C. Smart, David Armstrong, Frank Jackson, and Philip Pettit—held sway not only at home but also world-wide.

Anderson's views, however polemical, were always cast in systematic form. Poised against his system building was Sydney's historic rival, Melbourne. Stranded there during the Second World War, George Paul fuelled the competition between the two centres by spreading the doctrine of the later Wittgenstein, a task continued by Douglas Gasking, who even translated Wittgensteinian doctrine 'into Sydney' to facilitate its dissemination. By the early Fifties, some thought that the Sydney conception of philosophy as a systematic investigation into the nature of things was finished.

In 1950 Smart was appointed to the chair of philosophy at Adelaide. In turn, Smart appointed U. T. Place and C. B. Martin. Place converted Smart from a Rylean to a materialist view, and was the first to publish—in 1956—an account of the new 'identity theory of mind' (often called 'Australian materialism'). The new theory was not only championed by Smart, but later developed, under Armstrong, into a fully-fledged 'central-state materialism' claiming that all mental processes are simply physical processes in the brain. Martin, who introduced into Australia the concept of truth-maker (that, whatever it is, in virtue of which a proposition, or other truth-bearer, is true), favoured a double-aspect view of the mental in preference to straight reductionism. The Adelaide-based arguments about materialism constituted a golden age in the development of Australian metaphysical realism—a position that still pervades much of contemporary Australian writing. Place left Australia in 1956, but not until 1982 did the most significant Australian objection to the reduction of the mental to the physical appear, in Jackson's appealing thought experiment. Mary—a scientist with normal colour vision who has lived since birth in a black and white world—knows everything about the physics and physiology of colour perception, yet still, Jackson argued, she does not know what it is like to sense red.

While Anderson's use of logic was restricted to a version of syllogistic reasoning, Melbourne had been largely indifferent to formal logic altogether. However, from the Seventies onwards, a number of distinctive approaches to logic developed, focusing particularly on the fields of relevance and paraconsistent logic. Several of the leading contributors to this logical turn included migrants—Richard Routley (later Sylvan) from New Zealand, Len Goddard and Graham Priest from the United Kingdom, and Bob Meyer from the United States. Alongside this interest in logic, history and philosophy of science has also found a central place in both teaching and research in Australia, with recent studies in philosophy of biology by Kim Sterelny and Paul Griffiths complementing the focus on physics and problems of space and time of an earlier generation of writers such as Graham Nerlich. The history of philosophy itself has received careful attention in the writings of John Passmore, Stephen Gaukroger, and Stewart Candlish.

Work on moral and political philosophy was shaped to an extent by migrant influence, though some of the best-known work in this area was carried out by Australians who chose to live overseas—for example, J. L. Mackie, famous for his defence of the 'error theory' of value in his 1977 book on *Ethics*. Before then, Kurt Baier had defended a robust moral objectivism, D. H. Monro had defended moral subjectivism, and Julius Kovesi had queried the 'fact-value gap'. Many of the works on ethical and political theory originating from Australia after the Seventies championed forms of utilitarianism and consequentialism (in the hands, for example, of Smart, Pettit, and Robert Goodin), with C. L. Ten and Robert Young standing apart from this general trend. Engagement with

meta-ethical theory continued when in 1994 Michael Smith published *The Moral Problem*, an attempt at reconciling a form of moral rationalism with a Humean approach to motivation.

A different way of approaching philosophical, political, and moral problems, incorporating psychological and sociological perspectives, has inspired a distinctive school of Australian feminist philosophy, in the hands of Moira Gatens, Elizabeth Grosz, and others, whose writing intersects to an extent with a developing interest in, and indeed resurgence of, European philosophy in both Australia and New Zealand. Matching the synthesis of analytic and European styles of philosophizing championed by Hubert Dreyfus and Richard Rorty in the United States, a similar convergence has characterized recent Australian writing by Max Deutscher, Jeff Malpas, Paul Redding, and a few others. Applied ethics has lately received recognition, and large-scale financial support, in keeping with earlier Australian pioneering studies in environmental philosophy by Routley, Passmore, Val Routley (later Plumwood), Robert Elliot, and others. Debates on social and political justice, poverty, abortion, bioethics, and biomedical ethics have been subject to philosophically informed scrutiny by writers like Michael Tooley, Genevieve Lloyd, Peter Singer, Freya Mathews, Janna Thompson, and Rai Gaita. While some of these arguments have taken on a life of their own, disengaged from technical issues within philosophy itself, the emergence of intellectual debate at home and overseas featuring these and other thinkers is a powerful testimony to the continuing vigour and influence of Australian philosophy.

**authenticity.** The condition of those, according to Heidegger, who understand the existential structure of their lives. Heidegger held that each of us acquires an identity from our situation—our family, culture, etc. Usually we just absorb this identity uncritically, but to let one's values and goals remain fixed without critical reflection on them is 'inauthentic'. The 'authentic' individual, who has been aroused from everyday concerns by *Angst*, takes responsibility for their life and thereby 'chooses' their own identity. But Heidegger also holds that some degree of inauthenticity is unavoidable: the critical assessment of values presupposes an uncritical acceptance of them, and the practical necessities of life give a priority to unreflective action over critical deliberation. So, as Heidegger makes clear, authenticity is like Christian salvation: a state which 'fallen' individuals cannot guarantee by their own efforts.

M. Heidegger, *Being and Time*, tr. J. MacQuarrie and E. Robinson (Oxford, 1962), sects. 38, 41, 61–6.

**authority.** An authority is a person or group having a right to do or to demand something, including the right to demand that other people do something.

Authority is invariably and justifiably discussed alongside \*power. The joint discussion is justifiable not only because the concepts overlap in confusing ways but also because both are essential for an adequate analysis of political and legal systems.

Authority is of course used in contexts other than the legal and political. We speak in various contexts of people being 'in authority', 'having authority', and 'being authorized'. What is common to all these usages is the essential idea of having some sort of right or entitlement to behave in the way indicated, or that the behaviour is in some way 'legitimate' (another concept essentially related to authority).

This analysis applies also to Max Weber's account of authority, which has exerted a large influence on sociological theory. Weber distinguishes three kinds of authority: rational-legal, traditional, and charismatic. In rational-legal authority the right to give orders or to act in certain ways derives from an office or role held within a set of rules setting out rights and duties. Traditional authority exists because those accepting the authority see it as deriving from a long and hallowed tradition of obedience to a leader. Charismatic authority exists where exceptional abilities cause a person to be followed or obeyed, and the exceptional ability is perceived as conferring a right to lead. (We must add the last clause or charismatic authority will become simply charismatic power.)

If authority is to be effective the person in authority must also possess power. But the two are distinct: a government in exile may be legitimate or be in authority or be *de jure*, whereas the *de facto* rulers may have power while lacking the authority. But while that is true as far as it goes the situation is more complex than that neat distinction suggests. A schoolteacher may be in authority, but have no authority with his pupils. This means not just that he lacks power to influence them; it also means that in some sense they do not regard him as legitimate. The same situation could happen politically. The explanation of the paradox lies in a separation which has taken place between two sorts of legitimization: in terms of rules and in terms of popular approval. A second complication in distinguishing authority from power is that for some people or groups the source of their power lies in the fact that they are in authority. We could then say that authority is their 'power-base' (as it is sometimes called), just as wealth, military might, or physical beauty might be power-bases. If we stress this line of thought, then it would be possible to make 'power' the dominant concept and authority would become a subset of power, and some political theorists and sociologists might take this line. But it is more usual, and probably it is philosophically preferable, to contrast authority as a *de jure* or normative concept with power as a *de facto* or causal concept, and allow that in some cases there can be overlap. No consistent distinction between the two can be derived from ordinary usage or political

and legal discourse, and some measure of stipulation is inevitable.

We are left with one sense of 'authority' to fit in—where we speak of a person as being (say) an authority on birds or the seventeenth century. But this sense can be accommodated into our analysis: the authority has passed recognized examinations, published in the journals, and written the books which entitle or give the right to pronounce on the subject. **autobiography, philosophical.** The role and aims of autobiography have changed in fundamental ways in the course of the history of philosophy. Marcus Aurelius, author of a quasi-autobiographical *Meditations*, noted that nothing is as morally uplifting and joyful as meditating on a virtuous life, and this provided a rationale for autobiography from antiquity up to the modern era. Descartes, in the autobiographical sections of his *Discourse on Method* (1637), was not so much concerned to register how he felt and worked, but rather with how someone in this position should have felt and worked: the story he tells is designed to be morally and intellectually uplifting, and would doubtless have seen the kind of aims that have guided nineteenth- and twentieth-century autobiography as mere self-indulgence and an amoral form of narcissism, a genre useless for moral or personal guidance. Hume and Rousseau, writing in the eighteenth century, presented their lives—the first briefly, the second at length—as virtuous and blameless, although in Rousseau's case this did not prevent him from revealing personal and sexual details.

The idea of a person having a history other than that which typifies a particular aspect of some general human condition receives its first expression in the late sixteenth century in the *Essays* of Montaigne. Montaigne initiated his project of self-exploration with the traditional aim of discovering a universal human nature, but what he ended up doing was something completely different: he discovered himself, his thoughts, feelings, emotions. Although biography continued primarily within a didactic genre up to the end of the nineteenth century, Montaigne initiated an understanding of subjectivity which—in the hands of Descartes, Rousseau, Kant, and others—fostered a notion of the self as a centralized locus of subjectivity. This philosophical understanding of subjectivity gradually changed what was possible at the biographical level.

From the end of the nineteenth century, developments in areas such as psychoanalysis allowed a deepening of the way in which affective states were thought of, and this had a very significant impact on the genre of biography, encouraging the inclusion of detailed material which would have been thought irrelevant or inappropriate in

earlier conceptions of the genre. It also had a reductive effect, however, levelling differences between the philosopher, the politician, and the artist, for example, so that individual psychology now became the focus of biography.

One of the main values of philosophical autobiography is that it can show us the struggle to develop philosophical theories—a struggle which involves hesitations, mistakes, and uncertainties—that helps demystify claims to special access to truth. Another is providing a context for philosophical views—this is especially the case in J. S. Mill's autobiography—which enables us to see how they arose out of general political and economic concerns, for example, giving us a sense of how philosophers have elucidated particularly intractable problems by translating them into a philosophical form. However, like any other form of autobiography, philosophers can use the genre to obfuscate or to rationalize their beliefs or behaviour. Descartes, for example, was keen for his readers to believe that he never rose before midday and spent little time on philosophy, for this was how he saw the behaviour of a gentleman, whereas in fact he spent the whole of his day on philosophical and related questions. Russell intimated in his autobiography that his shift of interest from philosophy to social questions in the early 1920s was the result of his experiences in the First World War, but as more recent biographical and autobiographical work has shown, the shift derives rather from his meeting with D. H. Lawrence, whom he later came to regard as a proto-Fascist and whose influence he disowned.

Few philosophical autobiographies stand out as great works of literature, but the autobiographical writings of Augustine, Rousseau, Mill, and Simone de Beauvoir (many would also include at least the first volume of Russell's autobiography in this list) stand out as classics, and are likely to be read as long as philosophy exists. s.g.

**autonomy and heteronomy.** Correlative terms, developed by Kant, of very wide applicability to moral theory. Autonomy (Greek 'self' + 'law') understands the moral imperative as the moral agent's own freely and rationally adopted moral policy. As moral agents, we are all subject to the moral law, but we repudiate all maxims (personal policies of action) which 'cannot accord with the will's own enactment of universal law' (*Groundwork*, ch. 2). All alternative accounts, where moral law is commanded from without, are heteronomous (the law of 'another').

Among heteronomous theories are those that see moral imperatives as commands of the state or of society, or even as the commands of a deity. No less heteronomous is a theory that identifies the source of morality with some contingent drive or sentiment in one's empirical psychology. For a Kantian moralist, moral maturity crucially involves the recognition of autonomy. There is an important link here with \*freedom. Heteronomy, in any form, entails that we are passive under some command or impulsion which we do not, can not, initiate. In contrast, if we autonomously recognize and endorse a moral value, make it our own, we are acting (when we obey it) as we have most deeply and freely resolved to act.

What autonomy amounts to, however, has been interpreted in radically different ways: by some as the discerning and 'enacting'—through common rational procedures—of a common moral law. This was Kant's own position. As reworked by certain Existentialists, analytical philosophers, and radical educationalists, autonomy has amounted to the individual's total sovereignty over his or her 'choice' of moral values and self-construction, a view that accords a unique importance to \*'authenticity', freedom from *'mauvaise foi'*. This extreme version of autonomy is seriously and dangerously flawed. It is hard or impossible, for one thing, to justify in its own terms the place it gives to the virtue of authenticity itself. Again, it would seem to imply that any value-claim whatever ('maximize suffering', say) is vindicated so long as it stems from individual, 'autonomous' decision. In practice, such implications tend to be masked by smuggling into a theory basic, common judgements of value not at all derived from individual decision.

R. W. H.

\*autonomy in applied ethics; bad faith.

Charles Taylor, 'Responsibility for Self', in G. Watson (ed.), *Free Will* (Oxford, 1982).

**autonomy in applied ethics.** The concept of personal autonomy, used in a broad sense which goes beyond its Kantian origins, has been much invoked in recent writing on issues in \*applied ethics. It has been suggested, for instance, that the wrongness of \*killing rests, in part, on the fact that to deprive someone of their life is normally to violate their autonomy. This account carries the implication that the moral prohibition of taking life would not apply in a case where someone wished their life to be ended—for instance, in the case of voluntary \*euthanasia. On the contrary, respect for the person's autonomy would then require one to comply with their wishes. Another application of the concept in \*medical ethics is the suggestion that the importance of 'informed consent' in relations between the patient and the medical practitioner rests on respect for personal autonomy.

In political philosophy, the idea of persons as autonomous agents underlies liberal theories of \*justice such as that of Rawls, as well as liberal defences of more

specific political values such as \*freedom of speech and expression. And in the philosophy of education, the promotion of personal autonomy has been identified as one of the principal aims of education.

These various uses of the concept have prompted attempts at a more precise account of what autonomy is. Our idea of the autonomous person seems to involve more than just the capacity to act on particular desires and choices. It suggests a more general capacity to be self-determining, to be in control of one's own life. At this point some writers have found helpful the distinction between first-order desires and second-order desires; the autonomous person is one who is able to assess his or her own first-order desires, to reject or modify some of them and to endorse others, and to act upon these second-order preferences.

**Avecebrol:** see Ibn Gabirol.

**Avenarius, Richard** (1843–96). German positivist and empiricist philosopher who argues for the elimination of cognitive preconceptions which generate metaphysical dualisms and obscure the findings of 'pure experience'. Avenarius holds that *prima facie* mutually inconsistent philosophies presuppose a 'natural realism' entailing the existence of physical objects and other minds. Avenarius' 'empirio-criticism' putatively exposes metaphysics as a spurious branch of philosophy and urges its replacement by the natural sciences, which have an empirical justification in the findings of pure experience. Avenarius may be thought of as an empiricist neo-Kantian whose 1888–90 work *Kritik der Reinen Erfahrung* (Critique of Pure Experience) anticipates in important respects the empiricism of James and the Logical Positivists and the phenomenology of Husserl. Avenarius' work was influential in Russia and was one of the targets of Lenin's book *Materialism and Empirio-Criticism* (1908).

**Averroës** (c.1126–98). Andalusian philosopher acclaimed as the greatest Aristotelian commentator, though his work had little impact in the East. His principal works, surviving in Hebrew and Latin and studied in the West to the mid-seventeenth century, consist of commentaries on Aristotelian texts and on Plato's *Republic*. His text, *The Incoherence of the Incoherence*, written in response to al-Ghazālī's attack on philosophy, illustrates Averroës's

contention that theologians are incapable of reaching the highest demonstrative knowledge and are thus unfit to interpret divine law correctly. His Aristotelian commentaries principally sought: (1) to cleanse the Islamic philosophical corpus from Neoplatonist emanationist views; (2) to separate pure philosophy from theological arguments by al-Fārābī and Avicenna, among others; and thus (3) to recover 'pure' Aristotelian thought. H.Z.

\*Aristotelianism.

Averroës, *The Incoherence of the Incoherence*, tr. S. Van den Bergh (Oxford, 1954).

**Avicenna** (980–1037). Persian philosopher, scientist, and physician, widely called 'The Supreme Master'; he held an unsurpassed position in \*Islamic philosophy. His works, including the *Canon of Medicine*, are cited throughout most medieval Latin philosophical and medical texts. The subject of more commentaries, glosses, and superglosses than any other Islamic philosopher, they have inspired generations of thinkers, including Persian poets. His philosophical works—especially *Healing: Directives and Remarks*, and *Deliverance*—define Islamic Peripatetic philosophy, one of the three dominant schools of Islamic philosophy.

His contributions to science and philosophy are extraordinary in scope. He is thought to be the first logician to clearly define temporal modalities in propositions, to diagnose and identify many diseases, and to identify a specific number of pulse beats in diagnosis. His best-known philosophical formulations are: (1) the ontological distinction between essence and existence, in which the essences of existing entities cannot be explained as actualized forms of their material potentialities without an existing cause whose existence, while coexistent with the caused and perceived essence, is prior in rank (later designated 'primary of existence over essence' and redefined by Mollā Ṣadrā); (2) the ontological distinctions of possible, impossible, and necessary being—i.e. the Avicennan constructed whole of reality consisting of ranked and ordered ontic entities, each the cause of the existence of the one ranking below it. Since infinity is impossible in this system, every entity is a distinct being and must be contingent, except for the top of the ontological chain, which is necessary. This is because existence is observed and vacuum is proven impossible; therefore the Necessary Being's essence and existence are identical, so It is self-existent and the cause of all other existent entities. This philosophical existence proof, denoted in Latin texts as Avicennan, is generally considered novel within the history of philosophy. H.Z.

**axiological ethics.** That portion of ethics that is concerned specifically with \*values. Unlike the portions concerned with morality and with social justice, axiological ethics does not focus directly on what we should do. Instead it centres on questions of what is worth pursuing or promoting and what should be avoided, along with issues of what such questions mean and of whether and how there is any way of arriving at answers to them that constitute knowledge. Many philosophers have offered systematic accounts of what is of value without much indication of how their answers are justified or of why they should be taken as having some kind of objective validity. But much of the current philosophical interest in axiological ethics centres on the epistemology (if any) of values.

The issue of justification arises whether or not a set of values is systematic. If it is, then we may ask whether whatever organizes the system has any validity. If it is not, then one wants to know whether the diverse value judgements represent merely personal (or societal) invention or preference, or instead have something more objective to be said for them. G. E. Moore's answer, 'intuition', is no longer regarded by many people as satisfactory.

A possible outcome always is that there is no justification for values beyond the dictates or preferences of particular persons or societies. This amounts to a value anti-realism (a denial that judgements of value can have any objective validity), parallel to, but distinct from, moral anti-realism. Indeed it looks possible to be a moral anti-realist but to hold that some things or styles of life really are better than others, and Nietzsche sometimes sounds as if he has this combination of views. Conversely, moral realists who lean toward a contractual view of moral validity sometimes sound unwilling to affirm any objective values apart from those of a certain kind of political or social order.

One promising line is to regard judgements of value as characteristically rooted in emotions. John Stuart Mill held, for example, that desire has the same relation to knowledge about what is desirable as our senses and introspection have to knowledge about the world. Everyone desires pleasure and only pleasure, he held, which gives some kind of objective validity to the judgement that pleasure is the \*good. Other philosophers, not so ready to make claims about the uniformity of the human sense of value, have suggested that values are rooted in particular preferences, or in approval, or in responses such as delight, admiration, repugnance, or disgust. A judgement of value could be justifiable if the emotion at its root is justified.

There also are interesting questions concerning how values are related to self and to sense of self. Much modern discussion of values has treated them in the context of our deciding what things to have or not to have in our lives. There may be an influence of consumerism in this: the focus is on things, relationships, and states of mind to be had rather than on the nature of the person who might have them. But there is psychological evidence that what is broadly the same kind of thing or relationship can have different impacts on the lives of different people, and also that \*happiness (which is often treated as a cluster of major values) has a close link with self-esteem, and more generally with sense of self. It is instructive that in both Plato's and Aristotle's accounts of values the process of becoming a particular kind of person is treated as paramount.

**axiom.** An axiom is one of a select set of propositions, presumed true by a system of logic or a theory, from which all other propositions which the system or theory endorses as true are deducible—these derived propositions being called \*theorems of the system or theory. Thus, Pythagoras' theorem is deducible from the axioms of Euclidean geometry. The axioms and theorems of a system of logic—for instance, of the \*propositional calculus—are regarded as being true of logical \*necessity.

E.J.L.

\*axiomatic method; deduction.

W. V. Quine, *Methods of Logic*, 3rd edn. (London, 1974).

**axiomatic method.** Thinkers in a tradition including Euclid, Newton, Hilbert, Peano, Whitehead and Russell, and others have used the axiomatic method to present different subject-matters as formal and coherent theories, all propositions of which are deducible from a clearly specified set of initial assumptions. A fully formalized axiomatic system contains (i) primitive symbols, (ii) rules of formation distinguishing well-formed from ill-formed expressions, (iii) definitions, (iv) \*axioms, and (v) rules of inference establishing how theorems are proved. It is a formal \*calculus which must be distinguished carefully from its interpretation, the latter being a semantic notion associating the system with the models of which it holds true. Desirable characteristics of axiomatic systems are consistency (freedom from contradiction), completeness (sufficient strength to enable all semantically true propositions to be proved), and independence of axioms. Unsuccessful attempts to show the independence of Euclid's parallel postulate led in the nineteenth century to the discovery of non-Euclidean geometries.

S.McC.

R. Blanché, *Axiomatics* (London, 1962).

**Ayer, Alfred Jules** (1910–89). British philosopher, published his first book *Language, Truth and Logic* in 1936. It remains the classic statement in English of \*Logical Positivism. Its central doctrine is that there are just two sorts of cognitively meaningful statement, those which are, in principle, empirically verifiable (observationally testable) and those which are analytic (true simply in virtue of linguistic rules). Scientific statements and statements of ordinary fact belong to the first class, while statements of mathematics and of logic belong to the second. Religious and metaphysical statements, such as that God exists (or, indeed, that he does not), or that there is a realm of things in themselves behind phenomena, are meaningless, because they belong to neither class. Basic ethical statements are regarded similarly as factually meaningless but are allowed an emotive meaning (that is, they express emotional attitudes). That Ayer is not disavouring them as such, as he is the religious and metaphysical ones, is made clearer in later works. As for philosophy, its task is logical clarification of the basic concepts of science, not the attempt to say how things truly are.

His later works move steadily away from doctrinaire Logical Positivism, but much of its spirit is retained, in particular the view that religion is nonsense whenever it is not simply false. Ayer saw himself as essentially advocating an \*empiricism in the tradition of Hume, rendered more forceful by the devices of modern logic. Metaphysics is treated with more respect in so far as conceptual clarification is seen as itself illuminating the world to which our concepts apply.

Certain themes are recurrent in his substantial later *œuvre*, such as the meaning and justification of statements about other minds, about personal identity, and above all about the nature of our knowledge of the physical world. While he was originally a phenomenalist, his later view is that physical objects are posits in a theory, the point of which is to enable us to predict our sense-data, but which is not reducible to facts about them. He also wrote importantly on probability and induction. Ethically he espoused a qualified utilitarianism, though interpreting the \*greatest happiness principle as the expression of an optional fundamental attitude.

Perhaps his finest book is *The Problem of Knowledge* (1956). This sees epistemology as primarily an effort to justify ordinary claims to \*knowledge against philosophical scepticism. One knows that *p* if and only if one believes that *p*, has a right to be sure on the matter, and is, in fact, right that *p* is so. \*Scepticism arises when there appears to be a logical gap between our only possible evidence for the existence and character of things of a certain sort and our ordinary confident claims to knowledge about them. For example, our access to the physical world seems to be only via our own sense-data, to the minds of others via their behaviour, and to the past via our memories. There are four types of possible solution. (1) Naïve realism holds that the problematic things are, after all, directly given to us, so that we somehow directly perceive physical objects, other minds, or the past, without the intermediary of any

sense-data, behaviour, or memories which are mere representations of them. (2) Reductionism reduces the existence of the problematic things to the holding of suitable patterns among the evidential data, e.g. sense-data, behaviour, or memory images and historical records. (3) The scientific approach tries to show that after all the inference from the evidence to the conclusion has a scientifically respectable inductive character. The difficulty here is that there can be no inductive grounds for moving from Xs to Ys, if we have no possible access to the latter except by the former. (4) The method of descriptive analysis, largely favoured by Ayer (though somewhat modified later) simply describes how we do, in fact, base our beliefs on the evidence and shows that the complaint that these are not well based is unreasonable as making an impossible demand.

In spite of his iconoclasm Ayer had no truck with some of the wilder assaults upon traditional philosophical thought, such as ordinary-language philosophy on the one hand, and behaviourism and physicalism on the other.

# B

**Babbage–Chambers paradox.** Charles Babbage (1791–1871), mathematician and almost-inventor of the digital computer, observed in his *Ninth Bridgewater Thesis* (1838) that his calculating engine could produce the series of natural numbers from 1 to 100,000,000, and then—without any interference—produce 100,000,001; 100,010,002; 100,030,003; 100,060,004; ‘and so on’ for many hundred terms, till yet another rule came into play. This realization, that the same process might suddenly reveal another law (and so that \*miracles could not be ruled out), was further developed by Robert Chambers (1802–71) to explain the differences between successive geological eras: the ‘same process’ operated by different laws to produce unpredictable changes. As an account of \*evolution, or of miracles, the story proved unpopular. As an anticipation of Goodman’s problem with grue, and Wittgenstein’s with the notion of rule-following, it retains its interest: no finite string of observations or operations can identify what rule is being followed, or what its correct application might require in the future.

**Bachelard, Gaston** (1884–1962). Bachelard’s studies of the emergence of scientific \*objectivity anticipated some of the conclusions of Popper and Kuhn without exerting any direct influence. His reputation depends, however, less on his anti-positivism and his discovery of ‘epistemological ruptures’ than on his studies of poetic language, day-dream, and phenomenology, and their application to episodes in the history of science. Like Bacon, Bachelard regarded the projection of subjective values and interests into the experience of the physical world as impediments to knowledge. In *Le Nouvel Esprit scientifique* (1938), which he described as a ‘psychoanalysis of knowledge’, he showed how the emergence of an objective and quantified science required depersonalization and abstraction, emotional restraint, and ‘tacturnity’. His intention was not thereby to discredit subjectivity. Rather, he placed the capacity for reverie, which he saw as the source of great poetry as well as of object sentimentality and imaginary physical theories, at the centre of his theory of the human mind, and he understood that affective engagement with

‘things’ was a condition of scientific productivity. ‘Psychoanalysis’, in Bachelard’s terms, did not refer to the Freudian study of sublimated drives of the individual, but to the disclosure of \*archetypes, which Jung’s studies on alchemy of the early 1930s had first shown to have a bearing on the interpretation of early chemical theories and the practice of alchemy. In his study of eighteenth-century experiments with fire, *La Psychanalyse du feu* (1938), Bachelard showed how the phenomenology of fire as painful, dangerous, soothing, purifying, destructive, and a symbol of life and passion, determined scientific discourse. Other studies on air, water, and earth, which, like fire, have since been deconstituted as subjects of scientific inquiry, showed how they too were ‘dreamt’ by the eighteenth century. Bachelard’s influence on the early work of Foucault and other French theorists of his generation is significant.

**backgammon.** Board game for two players, renowned among philosophers as one of Hume’s methods of recovery from philosophical melancholy and \*scepticism. ‘I dine, I play a game of backgammon, I converse, and am merry with my friends; and when after three or four hour’s amusement, I wou’d return to these speculations, they appear so cold, and strain’d, and ridiculous, that I cannot find in my heart to enter into them any farther’ (*A Treatise of Human Nature*, i. iv. 7). If we may follow Adam Smith’s account of Hume in later life, however, the philosopher’s favourite game was actually whist. J.BRO.

**background.** The previously acquired understanding or knowledge that allows utterances, beliefs, and actions to have explicit meaning for us. The problem of the background has recently received philosophical attention with respect to meaning in language, knowledge in science, and objectivity in interpretation. Words and utterances presuppose an implicit and a holistic understanding of beliefs and practices. Observation and justification in the

sciences function only against the background of shared paradigms of understanding acquired in scientific socialization. And the necessary reliance of any interpreter on her own prior understanding rules out the possibility of any neutral perspective in cultural interpretation. There is disagreement about whether the background is basically conceptual and symbolic in nature—and thus in principle explicable—or whether it is mainly practical and pre-propositional—and therefore can never be captured fully in theory.

H. -H.K.

\*hermeneutics; holism.

H. Dreyfus, 'Holism and Hermeneutics', *Review of Metaphysics* (1981).

**backwards causation.** This is the idea that a cause may be later in time than its effect. In the case of physical processes and human actions we naturally assume that the direction of causation is from earlier to later time. The play in a football match causes the final result; it would be absurd to believe that the result could cause the earlier play. On the other hand, people do sometimes suppose that prayer or more overt religious rituals might have causal influence on what has happened at an earlier time. Aristotle argued extensively in favour of a different mode of backward, or *teleological*, causation, with the following examples: the goal (e.g. health) as the cause of purposive activity (e.g. physical exercise), or a developed natural product (e.g. an oak) as the cause of the process which culminates in it (the developing acorn). A thorough discussion of the issue is provided by Michael Dummett, 'Can an Effect Precede its Cause?' and 'Bringing about the Past', in *Truth and Other Enigmas* (London, 1978).

J.D.G.E.

\*causality; teleological explanation.

**Bacon, Francis** (1561–1626). Lawyer, politician, and philosopher at the Courts of Elizabeth Tudor and her successor James Stuart. Bacon had two great ambitions. One was political, where he was helped initially by his kinship with the Cecil family; and at the summit of his career he held the office of Lord Chancellor for four years before being gaoled on an unfair charge of corruption. His other ambition was philosophical—to refound human knowledge on the basis of a systematic methodology for scientific inquiry.

Part of this methodology was institutional, in that Bacon saw the advancement of science as a social activity. So he wished to set up a college for the purpose, equipped with all necessary research facilities—laboratories, botanical and zoological gardens, specialist technicians, etc. Though he failed to secure royal support for this venture in his own lifetime, he was widely credited later in the seventeenth century with having inspired the foundation of the Royal Society.

But Bacon's methodology also proposed, within an overall framework for the reclassification of the sciences, a distinctively inductive structure for the study of nature. He

advocated in his *Novum Organum* (London, 1620) that scientists interrogate nature by their \*experiments in order to be able to tabulate both the various circumstances in which instances of the phenomenon under investigation have been found to be present and also the circumstances under which they have been found to be absent. For example, Bacon found heat present in the sun's rays, in flame, and in boiling liquids, but absent in the moon's and stars' rays, in phosphorescence, and in natural liquids. Moreover, scientists should concentrate in their investigations on certain important kinds of experimentally reproducible situation, which Bacon called 'privative instances'. To the extent that scientists thus discover a circumstance which correlates uniquely with the phenomenon—i.e. is always present when it is present and always absent when it is absent—they have discovered its proximate \*explanation (or 'form') and have acquired power to reproduce it at will. But the investigator should also aim to make a gradual ascent to more and more comprehensive laws, and will acquire greater and greater certainty as he or she moves up the pyramid of laws. At the same time each law that is reached should lead him to new kinds of experiment, that is, to kinds of experiment over and above those that led to the discovery of the law.

Bacon insisted that his methodology, like Aristotle's syllogistic, is just as applicable to normative as to factual issues. He held that it has a role in \*jurisprudence, for example, as well as in natural science, because legal maxims in English common law, just like the axioms of nature in science, are grounded on induction from individual cases and then, once formulated, are applied back to determine new particulars. Bacon was therefore keen to emphasize that good legal reports were as valuable for jurisprudential induction as good reports of experimental results were for scientific induction. By the former we reduce uncertainty about our legal rights and duties: by the latter we reduce uncertainty about what is the case in nature. And negative instances, he held (anticipating Popper), are of primary importance in both inquiries, in order to eliminate false propositions. This is because there is only a limited number of ultimate forms, and so falsificatory evidence, by conclusively excluding incorrect hypotheses, permits firmer progress than verificatory evidence does towards identifying the correct hypothesis. Correspondingly Bacon repudiated as 'childish' the method of \*induction by simple enumeration, whereby a generalization that is as yet unfalsified is supposed to acquire support that varies in strength with the number of known instances that verify it.

But Bacon cautioned that his new method of induction would not get properly under way unless those trying to practise it repudiated four kinds of intellectual \*idol—perceptual illusions ('idols of the tribe'), personal biases ('idols of the cave'), linguistic confusions ('idols of the market-place'), and dogmatic philosophical systems ('idols of the theatre').

**Bacon, Roger** (c.1220–c.1292). A student and a teacher at both Oxford and Paris, he devoted many years to the study of science, especially optics and alchemy. Bacon, a member of the Franciscan Order, wrote extensively in the fields of philosophy, theology, and science.

He was in many ways an independent thinker, though he was undoubtedly deeply influenced by his teacher Robert Grosseteste, and of course by Aristotle, whose writings were reaching Christian Europe via the Arab commentators. Of the latter, Bacon had an especial admiration for Avicenna and Averroës. Although during the Middle Ages he was perhaps chiefly known for his alchemical works, it is his epistemology that now attracts greatest attention, and especially as that relates to his writings on optics. In particular he was interested in light and visual perception. If something is at a distance from us, how can we be aware of it? The answer given is that similitudes or images, or species, emanate from the object, pass through the intervening space, and strike the eye. Without this multiplicity of species in the medium seeing could not occur. Questions concerning the metaphysical and epistemological status of species occupied Bacon and were to occupy many who followed him; questions such as whether species take up space, and whether they are visible, or instead are partial causes, and no more than that, of the visibility of the things from which they emanate. Bacon believed that there are also species corresponding to non-visual accidents in things, but his main work was in the field of visual perception.

S. Easton, *Roger Bacon and his Search for a Universal Science* (Oxford, 1952).

**bad faith.** Sartre's conception of \*self-deception. According to Sartre, bad faith involves the deliberate creation in myself of the appearance of a belief which I in fact know to be false. Sartre claims that we are able to play this trick on ourselves because of ambiguities in our nature, because we are not 'in-ourselves' what we are 'for-ourselves', and so on. In his view, in bad faith we exploit these ambiguities in reflection upon ourselves to avoid facing up to painful facts about ourselves. Sartre imagines a homosexual denying his homosexuality on the ground that he is not 'in himself' a homosexual. These ambiguities, Sartre holds, enable one to account for self-deception without postulating an unconscious self that controls the conscious one: the phenomenon exemplifies the complexity of our reflexive structures, not the agency of a secret self.

J.-P. Sartre, *Being and Nothingness*, tr. H. Barnes (London, 1958), pt. 1, ch. 2.

**Bain, Alexander** (1818–1903). A weaver's son, he was born in Aberdeen and studied at Marischal College. He anticipates \*pragmatism. In *The Senses and the Intellect* (London, 1855) he says that perception depends on a muscular sense and on distinguishing one's body from the world. There is one substance with two sets of properties, mental and physical. In *The Emotions and the Will* (London, 1859) he says that belief belongs with agency and is for action. He was variously professorial assistant, public lecturer, journalist, civil servant (sanitation reform in London), and Professor of Logic and Rhetoric in Aberdeen. He was friendly with J. S. Mill and radical Utilitarian circles in London, and personally knew Darwin, Comte, Herschel, Faraday, and Wundt. Much of his writing was deflationary as he tried to promote the union of physiology, psychology, and philosophy, for which he founded the philosophical journal *Mind*.

V. H.

\*associationism; Scottish philosophy.

**Bakhtin, Mikhail Mikhailovich** (1895–1975). Russian philosopher of language and literature, famous for his concepts of dialogism and 'heteroglossia'. For Bakhtin, the basic linguistic act is the utterance. Utterances acquire meaning only in dialogue, which is always situated in a social-cultural context where a multiplicity of different languages intersect (political, technical, literary, interpersonal, etc.). From this emerges a conception of personhood where we author ourselves in dialogue with others and subject to the reinterpretations they give us. Bakhtin's writings on the novel as the literary embodiment of heteroglossia have been very influential, particularly his work on Dostoevsky's 'polyphonic' novel, and many find in his dialogism a critique of totalitarianism. Significant also are his early works on linguistics and psychology, Marxist in orientation and published under names of other members of Bakhtin's circle (though authorship of these works is disputed). Bakhtin lived in Vitebsk and Leningrad before being exiled to Kazakhstan from 1929 to 1934. He later taught literature for many years at the Mordovian Pedagogical Institute in Saransk.

— *Problems of Dostoevsky's Poetics*, tr. Caryl Emerson (Minneapolis, 1984).

**Bakunin, Mikhail Alexandrovich** (1814–76). Russian revolutionist, the moving spirit of nineteenth-century \*anarchism. Although remembered mostly for his revolutionary passion, he was learned, intelligent, and philosophically reflective. In moments of intermittent recess from insurrection and imprisonment he wrote influential formulations of anarchist philosophy and incisive and insightful criticisms of Marxism. He maintained that political power was intrinsically oppressive whether wielded by the bourgeoisie or the proletariat. Real freedom was possible only after the destruction of the status

quo. But the individual's freedom was so bound up with that of society that nothing short of 'collectivism', a non-governmental system based on voluntary co-operation without private property and with reward according to contribution, was required. In philosophical outlook he was a voluntaristic determinist, respectful of the authority of science but sharply critical of the authority of scientists. A keen materialist, he was ferociously anti-theological.

G. P. Maximoff (ed.), *The Political Philosophy of Bakunin: Scientific Anarchism* (London, 1953).

**bald man paradox.** Suppose a man has a full head of hair: if he loses one hair he will still have a full head of hair. But if he loses enough hairs he will become bald. Clearly, though, there is no particular number of hairs whose loss marks the transition to baldness. How can a series of changes, each of which makes no difference to his having a full head of hair, make a difference to his having a full head of hair? This is an example of an ancient paradox called *\*sorites* (from the Greek word meaning 'heaped'), after a well-known variant which involves the removal of grains of sand from a heap of sand. M.C.

*\*vagueness.*

See R. M. Sainsbury, *Paradoxes* (Cambridge, 1988) for *sorites*.

**Barbara, Celarent.** The opening of an 800-year-old hexameter verse incorporating the mnemonic names of valid *\*syllogisms*. Described by De Morgan as 'magic words . . . more full of meaning than any that ever were made', and by Jevons as 'barbarous and wholly unscientific'. The vowels signify *\*quantity* and *quality*, but most of the remaining letters are also logically important, especially regarding 'reduction', the derivation of some syllogistic forms from others. C.W.

*\*logic, traditional.*

W. S. Jevons, *Elementary Lessons in Logic* (London, 1897), lesson xvii.

A. Kenny, *Medieval Philosophy* (Oxford, 2005), ch. 3.

**barber paradox.** The barber in a certain village is a man who shaves all and only those men in the village who do not shave themselves. Is he a man who shaves himself? If he is then he isn't, and if he isn't then he is. It follows that he is a man who both does and does not shave himself. This contradiction shows that the apparently innocent italicized description can apply to no one. Formally, the paradox resembles *\*Russell's paradox* of the class of all classes which are not members of themselves. The latter though is not so easy to dispose of, since it is generated by an assumption—that every predicate determines a class—which cannot simply be abandoned. M.C.

M. Clark, *Paradoxes from A to Z* (London, 2002).

**Barcan formula.** A principle which says, roughly, that if it is possible that something As (or has A) then there is something that possibly As (or has A). In the first formalization

of quantified *\*modal logic*, R. C. Barcan (later Marcus) introduced such an axiom schema:

$$\text{BF. } \Diamond(\exists\alpha) A \rightarrow \exists(\exists\alpha)\Diamond A.$$

The principle BF, provable equivalents of BF, and some schemata from which BF was deducible came to be designated as the 'Barcan formula'.

The plausibility of BF was questioned. Marcus sketched a model-theoretic proof of BF's validity on the assumption that domains of alternative possible 'interpretations' (worlds) were coextensive. Saul Kripke showed that on his semantics for modality, where coextensive domains are not assumed, neither BF nor its converse is valid. R.B.M.

R. Barcan Marcus, *Journal of Symbolic Logic* (1946, 1947); *Synthese* (1961).

— *Modalities* (Oxford, 1993).

**Barnes, Jonathan** (1942– ). Professor of Ancient Philosophy at the Sorbonne in Paris, formerly at Oxford and Geneva. Although Barnes's contributions to the understanding of ancient philosophy are both philosophy and history, historical reconstruction never overrides the attempt to solve philosophical problems by reference to ancient texts. Notably, Barnes is the author of the two-volume work *The Presocratic Philosophers* (1979), and studies of Aristotle, ranging from the translation and commentary on Aristotle's *Posterior Analytics* (1975) to *Aristotle* (1982) and many papers. Barnes is also one of the editors of the series of volumes *Articles on Aristotle* and the editor of *Early Greek Philosophy* (1987). His early work *The Ontological Argument* (1972) is a rigorous examination of that putative proof of the existence of God. S.P.

*\*ontological argument for the existence of God.*

**Barry, Brian** (1936– ). Among the leaders of the move in recent decades to make moral and political philosophy relevant to public policy and current political debates. As an intellectual descendant of the Scottish Enlightenment project, Barry addresses the intersection of moral, political, and economic issues and arguments. He violates the norms of twentieth-century moral and political philosophy by grounding his arguments in unwashed data rather than fanciful examples. His major concern has been with *\*justice*, arguing that the best theories are grounded in mutual advantage, or fairness, or both. He has also written on democracy, voting, ethnic conflict, welfare policy, communitarianism, legal theory, future generations, migration, and economic and sociological theories of collective behaviour. R.HAR.

**Barth, Karl** (1886–1968). Swiss theologian and biblical scholar, notable particularly for his early polemical work on the Epistle to the Romans (1919) and later for 9,000 pages of *Church Dogmatics*. Philosophically Barth is interesting because he adopts a form of extreme realism

regarding \*God and God's transcendence. He had been sickened by the course of theology and New Testament study in the nineteenth century. To Barth, it reduced God and his self-revelation in Christ to the merely human, the narrowly rational, the comfortably liberal. Barth saw himself as standing in the tradition of Kierkegaard, Luther, Calvin, Paul, and Jeremiah, prophetic figures for whom 'man is made to serve God and not God man'. Religion and piety were castigated by Barth along with natural theology as misguided, as attempts on the part of fallen man to tame the otherness of God and to 'bolt and bar himself against revelation'.

God, for Barth, is wholly other, inaccessible to human thought and reason, who yet in Christ broke into the human world 'vertically from above'. It is at this point that philosophers will want to press Barth. How is it that without some natural theology or initial inkling of God on our part we can recognize Christ's revelation as divine? And how, in any case, could the Wholly Other express himself in the human person who lived in Galilee two millennia ago? Barth's own logic forbids a direct answer to these questions. He appeals rather to the Pauline doctrine of election by grace: that through divine grace and not through any effort of ours some are brought (correctly) to see the Word of God in the New Testament. He calls this the humiliation of the Gospel; it might equally be called the humiliation of reason.

Barth's searching critique of \*Enlightenment rationalism is refreshing, and not only in the theological field; but it was followers of Barth who later went on to proclaim the death of God from within the theological world.

**Barthes, Roland** (1915–1980). French literary and cultural critic, elected chair of literary semiology at the Collège de France in 1976, he appropriated and destabilized the critical methodologies of the linguist Ferdinand de Saussure and the psychoanalyst Jacques Lacan in the course of his systematic investigation of signs and signifying systems. For him, language (and culture) is structured, but 'off-centred without closure', since signs are not mere denotative units but polysemous, operating in a moving play of signifiers that can generate meaning in relation to other signifiers. The text is then no static work but a rich, dynamic field of explosive scraps of code capable of 'the infinite deferral of the signified'. Reading, then is, not reductive deciphering but a productive activity analogous to playing from a musical score. This eliminates the possibility of any privileged interpretation, authorial or critical, but makes it possible to participate in a 'hedonistic textuality', a paradoxical *jouissance*, where the psychically

split reader is at once lost and merged within a sea of cross-pollinating signs. B.T.

**base and superstructure.** According to the \*historical materialism of Marx and Engels, the social 'base' is the ensemble of social relations or the economic structure of society; politics, law, morality, religion, and art constitute the social 'superstructure'. In some writings, the term 'superstructure' is used to refer solely to people's thoughts about their social relations (\*ideology'), while in others it refers also to non-economic social institutions. The primary relation asserted in Marxian theory between the base and the superstructure is one of explanatory dependence: 'superstructural' phenomena are to be explained materialistically through their dependence on the economic base. According to Marx, phenomena in the base can be understood with scientific precision, whereas superstructural phenomena are comparatively contingent, and admit of rigorous treatment only to the degree that they exhibit dependence on the economic base. There is no coherent history of politics, law, religion, or art as such; people's real history is economic.

The reasoning behind these Marxian claims, and even their meaning, has been a matter of dispute among Marxian scholars and Marxian theorists. One reading, usually proposed by critics rather than proponents of Marxism, takes what is 'superstructural' to be 'epiphenomenal'; that is, superstructural phenomena exhibit causal dependence on economic facts, but exercise no causal influence on the economic realm. This implausible interpretation of historical materialism was rejected by Engels, who insisted that although the dependent spheres of life 'react' on the economic realm, it is always the economic 'driving forces' which are determining 'in the last instance'. But this leaves unexplained why economic forces should be thought always to be decisively determining in causal interactions which are admittedly reciprocal.

The Marxian theory is perhaps best understood if we take the primacy of the economic to be an assertion not about causal influences but about historical tendencies. The Marxian theory holds that human history makes the most sense if we understand it in terms of certain fundamental tendencies, operating at the economic level: the tendency of productive powers to grow over time and of the economic structure of society to adjust so as to facilitate new productive powers. The claim that forces of production are primary amounts to the claim that history makes most sense if we proceed from a pattern of explanation proceeding from the tendency to growth in productive forces; the explanations in question are functional or \*teleological, not causal, in form, though they do involve causal mechanisms through which the basic tendencies operate: the tendency of productive forces to grow and the tendency of production relations (and, along

with them, superstructural phenomena) to adjust to that growth.

The mechanism of such adjustments is the \*class struggle; that class is victorious whose ascendancy is most conducive to the employment and further development of the growing powers of production. Superstructural phenomena are then to be explained functionally by the way in which they serve the prevailing economic structure, or the interests of contending classes. Clearly they could not serve this function or these interests without exercising some influence on the economic realm, and so they cannot be merely 'epiphenomenal'. Their historical development, however, is best understood in relation to the fundamental tendencies of human society, which are economic.

Ted Honderich, 'Against Teleological Historical Materialism', *Inquiry* (1982).

**basic action.** An idea introduced in the philosophy of action. A person may do one thing by doing another, e.g. vote by raising her arm. Then raising her arm is said to be *more basic* (or *primitive*) than voting. That than which nothing is more basic—i.e. that which is not done by doing something else—is the *basic* thing. Variants on this idea have been introduced, sometimes to protect accounts of action from regress, sometimes to cast light on different kinds of relation between different things agents do.

If an action is a particular (an event such as Jane's raising of her arm at time *t*), and such particulars are coarsely individuated, then 'more basic than' and 'basic' do not really apply to actions themselves: they apply to things done when there are actions, things such as raising the arm or voting (which are sometimes called acts).

J.HORN.

\*action.

Jennifer Hornsby, *Actions* (London, 1980), chs. 5 and 6.

**basic statements.** A statement, *P*, is a basic statement if and only if *P*'s truth-value determines that of at least one further statement, *Q*, but there is no statement *R* such that *R* determines the truth-value of *P*.

Paradigmatically, but not essentially, if *P* is a basic statement then *P*'s truth-value is determined by the obtaining or non-obtaining of some empirical state of affairs. \*Empiricism about meanings logically entails the existence of basic statements but not vice versa.

Neurath's \*protocol statements (*Protokollsätze*), Wittgenstein's elementary propositions (*Elementarsätze*), and Russell's atomic propositions are basic statements, but we owe the expression 'basic statement' to Ayer.

**bat, what it is like to be a:** see Nagel, Thomas.

**Baudrillard, Jean** (1929–). French social theorist who came to prominence in the early 1980s. Baudrillard, whose

message is that the subject is dominated by the object, sees consumption as the prime mover in the social order, and takes our behaviour, language, and perceptual experience to be increasingly formed by media-propagated ideals and images. As a result, we live in a world of signs removed from any external reality that might help us to keep account of what we take to be signified. In this 'hyper-reality' the real and the 'televsual' merge, and fantasy institutionally replaces reality. Since the historical and causal contexts are lost to view too, the real distinctions, social, economic, etc., that the images might represent also disappear, and political life with them. Baudrillard's perspective owes much to his Continental predecessors from Marx onwards, with debts to J. K. Galbraith and Marshall McLuhan. He marches under the same anti-meta-narrative banner as \*Lyotard, but, nevertheless, consistently with his thought-provoking (or, as he might claim, thought-liberating) reversals of established ideas, denies that he is a \*post-modernist.

M. Poster (ed.), *Jean Baudrillard: Selected Writings* (Stanford, Calif., 1988).

**Bauer, Bruno** (1809–82). German theologian, philosopher, and historian, who was a leading Left Hegelian. He attended Hegel's lectures on religion, and contributed his notes for the posthumous edition of the lectures. He began his career with a Right Hegelian attack on D. F. Strauss's *Life of Jesus* (1835–6), which saw the Gospels as myth rather than history. But in 1842 his conversion to religious radicalism lost him his professorship at Bonn. He now argued that Christ was a fiction, and interpreted Hegel as an atheist and revolutionary, who deified human self-consciousness, notably that of the enlightened critic in contrast to the docile masses—a view more akin to the pre-Hegelian romanticism of Friedrich Schlegel than to Hegel himself. Marx contested this and other doctrines of Bauer in *The Holy Family* (1845).

**Bayesian confirmation theory.** The most influential attempt in the logical positivist tradition to provide a uniform, general account of scientific knowledge. Bayesians identify the epistemic support \*evidence confers on a hypothesis with \*probability, usually understood in terms of dispositions to take risks whose outcome would depend on the correctness of the hypothesis of interest. They suppose that background beliefs and expectations which may vary among investigators determine the extent to which any given evidence supports a hypothesis. Someone who evaluates a hypothesis (*H*) on the basis of evidence (*E*) brings to its assessment (1) a prior degree of confidence in *H*, (2) prior expectations concerning whether *E* should occur if *H* is correct, and (3) a prior degree of confidence

that  $E$  should (or shouldn't) occur regardless of whether  $H$  is true. If  $B$  are the investigator's background beliefs which determine these expectations, Bayes's theorem says the probability of  $H$ , given  $E$ , should vary directly with (1) and (2), and inversely with (3). In symbols,

$$\begin{aligned} Pr(H|E \& B) & \text{[the probability of } H, \text{ given } B \text{ and } E] \\ & = \frac{Pr(E|H \& B) \times Pr(H|B)}{Pr(E|B)} \end{aligned}$$

where  $Pr(H|B)$  corresponds to (1),  $Pr(E|H \& B)$  corresponds to (2), and  $Pr(E|B)$  corresponds to (3).

Bayesianism has its attractions: it avoids technical difficulties which beset its rivals; it treats epistemic support quantitatively; it seems to shed light on disagreements (emphasized by Kuhn) among scientists over the epistemic bearing of evidence. It applies to reasoning from uncertain evidence.

The following are among Bayesianism's problems: its applications to real world cases are clouded by the apparent arbitrariness of its assignments of numbers to prior degrees of confidence (1, 2, and 3 above). And it has trouble explaining how a theory can be tested against old evidence already accepted with certainty. For such evidence, priors (1) and (3) above are identical to 1 (complete confidence) and therefore, by Bayes's theorem, the probability of the hypothesis, given the evidence, can be no different from its prior probability. What makes this a problem is that old evidence can have great epistemic significance, as illustrated by the support the general theory of relativity received from facts about Mercury's perihelion that were firmly established before Einstein proposed the theory. J.B.B.

**Bayle, Pierre** (1647–1706). French scholar and controversialist, best known for his *Historical and Critical Dictionary* (1697). Through painstaking research into the lives and thought of hundreds of biblical and historical figures, Bayle subjected countless philosophical and religious doctrines to critical scrutiny, and demonstrated, with scathing wit and dialectical virtuosity, that none of them had any legitimate claim to the status of final truth. He argued, in direct opposition to the rationalist philosophers, that reason was too feeble an instrument to be relied upon in the pursuit of truth, but that religious faith, while crucial to our support, had need of constraint and modesty in advancing its own claims. Bayle exerted a powerful influence upon the eighteenth-century \*philosophes, who admired his intellectual courage, the rigour of his

scholarly methods, and his passionate commitment to the cause of religious toleration. P.F.J.

Elisabeth Labrousse, *Bayle*, tr. Denys Potts (Oxford, 1983).

'**be**': see 'to be', the verb.

**beatitude's kiss**: see Aurobindo, Ghose.

**beauty**. Despite its ancient aura as one of the supreme values in human life and in the cosmos, some philosophers give beauty short shrift. They remind us that discussions of aesthetic matters often do not use the words 'beauty' or 'beautiful', and that, on the other hand, discussions involving these words are often not aesthetic. If we call a person beautiful, is that always an aesthetic judgement? Presumably not, if desires towards the person are material to the judgement. So beauty is and is not something aesthetic. It can seem merely a vague way of praising something: whether we have a beautiful time at a wonderful party, or vice versa, makes little difference.

Philosophical aesthetics has tried to rescue the concept of beauty, suggesting that it is the best general concept of \*aesthetic value. The idea is that beauty applies to any kind of thing, whether an artefact or a part of nature, and that to judge anything beautiful is always the highest form of aesthetic praise. If ethics is an investigation of the good (despite the vagaries of the word 'good'), then aesthetics is an investigation of the beautiful. However, are not some great works of art ugly? We must be careful here. A work which depicts scenes that are gruesome and harrowing, such as the blinding of Gloucester in *King Lear*, may loosely be said to be ugly. But whether the play depicts pleasant and beautiful things, and whether it succeeds aesthetically, are obviously questions at two different levels. A similar point could apply to a piece of music which was discordant and unsettling to listen to. Though not beautiful by conventional standards, such works acquire this epithet according to the theory that aesthetic worth is beauty.

Aquinas's definition of beauty as 'that which pleases in the very apprehension of it' still commands some respect—provided that we can expand a little on what 'pleases' and 'apprehension' mean. Taking pleasure in the perception of visible forms and colours, or combinations of sound, are the most obvious candidates. Beauty that is not perceptible is harder to accept, although this raises doubts about 'a beautiful idea' or 'a beautiful mathematical proof'. To rule these out as expressions of approval which are not proper cases of aesthetic judgement seems an unhappy solution. Are grasping the structure of a mathematical proof and the structure of a piece of music in sonata form so vastly different that one must be 'aesthetic beauty' while the other is not?

Another problem is what to say about the case of literature, whose form is not strictly perceptible. If literature may be aesthetically good (whatever point may ultimately attach to judging it so), and if 'beauty' is the term for aesthetic value, then we have to acknowledge that a

novel or short story can be beautiful, however strange that may sound outside aesthetic theory. Few would deny that art of any form can be beautiful, but the idea that art should be prized especially for its beauty, or that a purely aesthetic way of regarding it is somehow privileged, may be questioned. Surely we care not only about beauty, but also about such matters as whether a work has integrity, whether it presents a view of the world that is honest or enlightening rather than trivializing or lazy. The view that beauty alone matters in art is apt to be derided as an assumption of \*aestheticism. On the other hand, if absolutely any value that an artwork can have is included in its being beautiful, then beauty really becomes a vacuous idea for philosophical purposes. c.J.

**beetle in the box.** An example in Wittgenstein's *Philosophical Investigations*, § 293. If one wrongly construes the grammar of sensation words on the model of name and designated object, then the sensation drops out as irrelevant. It would be like an object called 'beetle' in a private box, which no one else could ever see, and hence could play no role in explaining what the word means. Instead, Wittgenstein argued that to say that 'S' is the name of a sensation is to say that the utterance 'I have S' is the *expression* of a sensation. The logical grammar of sensation words is fundamentally different from that of names of objects or perceptual properties. P.M.S.H.

\*Grammar, autonomy of.

P. M. S. Hacker, *An Analytical Commentary on the Philosophical Investigations*, iii: *Wittgenstein: Meaning and Mind* (Oxford, 1990), 206–8.

**begging the question,** or *petitio principii*. Literally, requesting what is sought, or at issue. So, requesting an opponent to grant what the opponent seeks a proof of. So, by extension, assuming what is to be proved. A traditional \*fallacy. Assuming has to be distinguished from entailing, or all valid proofs would beg the question (as J. S. Mill thought). But the boundary is sometimes hazy: for example, does an argument of the form 'Even if not P, Q; so at any rate Q' assume 'Q'? (The expression is sometimes misused: it does not mean 'raise the question', or 'assume without argument'.) C.A.K.

J. S. Mill, *A System of Logic* (London, 1843), ii. iii.

**behaviourism.** A family of doctrines united by metaphysical worries about dualism and epistemic worries about the status of mental terms (even when not undergirded by a dualistic metaphysics). \*Operationalism, \*positivism, and behaviourism were mutually inspiring doctrines designed, in the case of psychology, to make it scientifically respectable. Psychology, traditionally conceived as the science of mind, became conceived as the science of behaviour, where behaviour was understood to include only the 'observable' activities of an organism, or, in the version B. F. Skinner dubbed 'radical behaviourism', where behaviour was conceived of expansively so that 'private events' like thinking, feeling, and so on, although not directly observable were taken to be kinds of behaviour subject to the same laws as more public, conspicuous behaviour. Every type of behaviourism involved some sort of challenge to 'mental realism', to our ordinary way(s) of thinking of mind and mentality. Some of the more interesting behaviouristic doctrines include the following:

*Operationalistic behaviourism.* The meaning of a mental term is *exhausted* by the observable operations that determine its use. So 'P is thirsty' means P says she is thirsty if asked, drinks water if given the chance, and so on.

*Logical behaviourism.* Mental terms are disposition terms. To say that 'P is thirsty' is to imply, among other things, that P will probably say she is thirsty if asked, will drink if given the chance, and so on. The difference between the first and second doctrine is that the first denies any 'surplus meaning' to the concept of 'thirst' beyond that entailed by the observations used in the determination to use it; whereas the second allows that the concept of 'thirst' is only partially reduced to the observable events that justify its use, and thus that it maintains a legitimate surplus meaning referring to a 'state' inside the organism, the qualitative state, say, of 'being thirsty'.

*Methodological behaviourism.* Despite the fact that there are private psychological events, 'psychology', conceived as the science of behaviour, can avoid talking about them, and thereby retain its scientific credentials. The basic idea was pointed out by B. F. Skinner in *Science and Human Behavior* (1953) and was picked up and elaborated on by Carl Hempel, who called it the 'Theoretician's Dilemma'. Assuming that unobservable private events serve to link stimuli and responses in lawlike ways, we can, for purposes of psychology, treat the mind as a black box, observing the effects of the environment on behaviour, and predicting and explaining behaviour on that basis.

*Radical behaviourism.* The doctrine that behaviour can be observable or unobservable (from the third-person point of view) but that both can be analysed within the substantive framework of behaviouristic psychology. In 'Behaviorism at 50' (1964), Skinner writes: 'It is especially important that a science of behavior face the problem of privacy. It may do so without abandoning the basic position of behaviorism. Science often talks about things it cannot see or measure . . . The skin is not that important a boundary.' With the advent of radical behaviourism, one

sees the attempt on Skinner's part to argue for the thesis that all behaviour, public or private, is governed by the laws of classical conditioning (as articulated by Pavlov and Watson) or operant conditioning (as articulated by Thorndike and himself). Skinner argued that thinking, choosing, and deciding—things about which more draconian forms of behaviourism vowed silence—could be analysed as private behaviours with characteristic causal relations to overt behaviour and as subject to the basic principles of operant conditioning. Despite this expansiveness, Skinner remained unimpressed until his dying day with the rising tide of cognitive psychology, thinking it lacked epistemic discipline and was rudely ignorant of the contributions of the substantive doctrines of classical and operant behaviourism. Although no version of behaviourism is a live position within the philosophy of mind, most philosophers still think that mental terms typically get at least part of their meaning from links to observable causes and effects. **being** is the subject matter of \*ontology. According to long tradition, there are *kinds* of being and *modes* of being. The kinds of being may be subdivided in various ways: for instance, into \*universals and particulars and into concrete beings and abstract beings. Another term for 'being' in this sense is 'entity' or \*'thing'. In a second sense, being is what all real entities possess—in other words, \*existence. Being in this second sense has various modes. Thus the being of concrete physical objects is spatio-temporal while that of abstract mathematical entities like numbers is eternal and non-spatial. Again, the being of some entities (for instance, qualities) is logically dependent upon that of others, whereas the being of substances is logically independent.

Connected with some of these traditional categorial distinctions are certain grammatical distinctions concerning the verb 'to be'. The use of 'is' as a copula may be interpreted in a variety of ways. 'This ring is yellow' features the 'is' of attribution, since it ascribes a quality to a substantial particular. 'This ring is golden' involves the 'is' of constitution, as it states what kind of material that particular is made of. 'This ring is my grandmother's wedding-ring' features the 'is' of identity. Finally, 'This object is a ring' involves the 'is' of instantiation, since it states what kind of thing the object in question is an instance of. Thus, although being yellow, being golden, being my grandmother's wedding-ring, and being a ring are all properties of this ring, they are properties of very different natures. Moreover, none of these properties constitutes the being of this ring, in the sense of constituting its existence. 'This ring is (exists)' apparently involves a sense of 'is' distinct from any in which 'is' functions merely as a copula.

What is it to be a being or entity? Here we must distinguish between the question what it is for an entity of any given kind to exist and the question what is the distinguishing feature of entityhood. The famous dictum of W. V. Quine, 'To be is to be the value of a variable, is potentially confusing on this score. It might be better phrased, "To be accounted amongst the entities recognized as existing by a given theory is to belong to the domain assigned to the variables of quantification of that theory according to its standard interpretation". But another well-known dictum of Quine's, 'No entity without identity', goes nearer to the heart of our second question, suggesting that the crucial feature of entityhood is the possession of determinate identity-conditions.

In a special, restricted sense the term 'being' is commonly used to denote a subject of consciousness (or self), and thus a kind of entity to be contrasted with mere 'objects'. Such entities are often supposed to enjoy a special *mode* of being inasmuch as they are conscious of their own existence and possess a capacity freely to determine its course—a view elaborated in the existentialist doctrine that, for such entities, 'existence precedes essence' (Sartre). The contrast between being (in the sense of existence) and \*essence is itself an ancient one, rooted in the distinction between accidental and essential properties. Traditionally, God is an entity whose essence includes existence, making God a necessary being, and indeed the only such being in the restricted sense in which this signifies a subject as opposed to an object. But this doctrine seems to require one to think of existence as a property of individual beings, contrary to the now dominant view of existence developed by Frege and Russell. E.J.L.

**being-in-the-world** (*In-der-Welt-sein*) is, for Heidegger, the 'determining character' or 'basic state' of \**Dasein* (the kind of being which humans have). The hyphens signal that it is a 'unitary phenomenon', for world (human) being and the relation of 'being-in' are only 'provisionally' distinguishable. Human beings cannot be understood apart from a world that, in turn, is intelligible only as what they are 'in'. The world, in this 'primary' sense, is not the spatio-temporal one of physics, but a 'totality of significance' which we are 'in', not as peas in a pod, but as meaningfully and practically engaged with. (Compare 'He's in the world of motor-racing'.) Heidegger's characterization of our being challenges the view held by Descartes and many later philosophers that we are, in essence, 'thinking things' logically independent of a world of material, spatial substances. It registers the conviction, shared by other \*phenomenologists such as Merleau-Ponty, that human beings must be 'primordially' seen as immersed, through their meaning-giving 'projects', in a world whose

contours and articulation are themselves a function of those projects. D.E.C.

**belief.** A mental state, representational in character, taking a proposition (either true or false) as its content and involved, together with motivational factors, in the direction and control of voluntary behaviour. (\*Thinking; \*propositional attitude; \*representation.) Belief (thought) is often (especially in the philosophy of mind) taken to be the primary cognitive state; other cognitive and conative states (e.g. knowledge, perception, memory, intention) being some combination of belief and other factors (such as truth and justification in the case of knowledge).

In referring to beliefs—to Ted's belief that snow is white, for instance—one may be referring to either a particular mental state occurring in the believer (a state that has content) or the propositional content itself—something more like a meaning that is not locatable in the believer. In the first case, Ted's belief that snow is white is not the same as Tom's belief that snow is white. They occur in different heads. In the second sense, they are the same belief: that snow is white. What Ted and Tom believe (i.e. the propositional content of their belief) is the same.

Beliefs involve the deployment of \*concepts: one cannot believe that something is a cow unless one understands what a cow is and, in this sense, has the concept cow (one needn't, of course, understand the word 'cow'). One can, to be sure, have beliefs about cows (these are called \**de re* or demonstrative beliefs) without knowing what a cow is. One can, for instance, believe that *that* animal, the one you see, is spotted. If that animal happens to be a cow, one believes of the cow that it is spotted and, thus, has a belief about a cow. But one cannot believe of the cow (or of anything else for that matter) that it is a cow (the word 'cow' here appears in what is called an oblique or referentially opaque position) without understanding what a cow is. Since concepts can remain distinct even when their reference is the same, belief descriptions are \*intensional in character.

Some beliefs (called 'core' beliefs) are at the forefront of consciousness—things one is, at the moment, actually thinking about. Others are not. Even if you thought about it once (when you learned geography), you were not consciously thinking, a moment ago, that San Francisco is in California. None the less, it seems correct to say that you believed it even when you weren't actively thinking about it. Other beliefs seem even more remote from consciousness, even more part of the background. Even if you *never* consciously thought about whether turtles wear pyjamas, it seems right to say that you none the less believed they did not wear pyjamas before your attention was ever called to the fact.

Beliefs, together with other mental states (desires, fears, intentions) function as \*reasons for action. Thus,

beliefs are to be distinguished from a variety of other internal representations that control reflexes and other non-intentional behaviours. There is a difference between closing your eyes as a reflexive response to a sudden movement (a response that is controlled by an internal representation of nearby events) and closing your eyes purposely, because you have certain desires (to avoid eye injury) and beliefs (that someone's finger is headed for your eye).

There are two broadly contrasting views about the nature of belief content. Individualists (sometimes called solipsists) maintain that the content of belief (what it is we believe when we believe something) supervenes on the neurobiology of the believer. If two individuals are physically indistinguishable, then they are psychologically indistinguishable. They must, therefore, have the same beliefs. Non-individualists, on the other hand, hold that belief content is, at least in part, determined by the believer's environment. Two individuals that are physically identical could have different beliefs. A version of non-individualism maintains that a person's social—including linguistic—context helps fix the content of what they believe. F.D.

\*belief and desire; judgement; mental causation; norms, epistemic; virtues, doxastic.

A. Phillips Griffiths (ed.), *Knowledge and Belief* (Oxford, 1967).

A. Woodfield (ed.), *Thought and Object* (Oxford, 1982).

**belief, ethics of.** A set of rules used in evaluating doxastic states (beliefs, doubts, etc.) in ways similar to the evaluation of acts (murder, lying, etc.) by ordinary moral rules. An assumption is made that doxastic states are voluntary in at least a weak sense. Proponents of the ethics of belief are of two types: (1) epistemicists, who hold that the rules should refer only to epistemic considerations (sensory evidence, logical consistency, etc.), and (2) pragmatists, who hold that non-epistemic considerations (e.g. saving a person's life) are also relevant. Among epistemicists, W. K. Clifford holds the extreme view that we never have a right to believe a proposition without adequate evidence. Among moderate epistemicists, R. M. Chisholm holds that we have a right to believe a proposition unless its contradictory is evident.

Pragmatists also advocate more or less moderate views. Pragmatic considerations should: (1) determine belief choice only when epistemic considerations are balanced pro and con or evidence is lacking, or (2) sometimes override a preponderance of evidence. W. James defended both types of pragmatic ethics of belief on different occasions. P.H.H.

**belief and desire.** Familiar states of mind that do much theoretical work in some philosophical spheres and are

topics of philosophical analysis. A popular way of understanding belief, desire, and the differences between them features the notion of direction of fit. It is said that the defining aim of belief is to fit the world, whereas that of desire is to get the world to fit it. According to a notion of satisfaction and a notion of content that apply to beliefs and desires, a belief that *p* and a desire that *p* have the same satisfaction condition—its being the case that *p*—and the same content, *p*. Philosophers who favour these notions see beliefs and desires as differing in their respective orientations toward their content. Whereas many desires are functionally fit to contribute to their own satisfaction, relatively few beliefs are: potentially self-fulfilling beliefs are the exception, not the norm. Philosophers often distinguish occurrent from dispositional beliefs and desires. Where is New York City? Now that the issue has been raised, you have an occurrent belief that NYC is in the USA; before the issue was raised, you had a dispositional belief that it is. The same distinction applies to desires. ‘Sam desires a career in philosophy’ is true even while he is wholly absorbed in a tennis match or dreamlessly sleeping. When Sam’s supervisor, Sue, finds herself about to tell a prospective employer that he definitely desires a career in philosophy, she need not phone Sam to see whether he is awake before she can be confident that she will be speaking truly. The quoted sentence is also true when Sam is writing a cover letter for his job applications. In the latter case, but not the former, Sam has an occurrent desire for a career in philosophy. Beliefs come with degrees of confidence, and desires with degrees of strength. Both Sam and Sue believe that he will get a philosophy job this year, but she is more confident about that than he; and Sam’s desire for a career in philosophy is much stronger than his desire to eat the sandwich he is holding.

**belief-in.** There are two main varieties of ‘belief-in’, neither of which is translatable in terms of ‘belief-that’. In the first, ‘belief-in’ has a commendatory function (we do not, save ironically, *believe in* someone’s incompetence, disloyalty, etc.). In the case of entities (though not of abstractions such as ideal states) this use of ‘believe in’ requires the existence of the believed-in entity. In the second, ‘believe in’ simultaneously notes and rejects a claim to existence: ‘Children often believe in Santa Claus’, ‘James I believed in witches’, etc. Religion apart, first-person uses of this sense of ‘believe in’ are rare, and carry with them an acceptance of the need to justify the embedded existence-claim. The very terminology in which \*belief in God is claimed seems to reveal the need for a justification of the belief.

J. J. M.

H. H. Price, *Belief* (London, 1969).**believe, will to:** see will to believe.**Belnap:** see Anderson and Belnap.

**Bell’s theorem.** Quantum mechanics (QM) predicts that various correlations will be observed between the outcomes of measurements on special types of two-component systems. Bell’s theorem shows that these correlations are incompatible with a particular type of deterministic theory, one that seeks to explain the outcomes of the measurements in terms of local causal mechanisms. The theorem also rules out local indeterministic theories.

The typical experimental set-up involves a physical system that consists of two, spatially separated subsystems, *A* and *B*. One is to measure some property of subsystem *A* and simultaneously to measure some property of subsystem *B*. If the system is deterministic, the (possibly unknown) state of the total system before the experiment will determine the result of every such joint measurement. *Locality* is the assumption that, given the state of the total system, the outcome of the measurement of a particular property of subsystem *A* does not depend on which property of *B* is measured, or on the outcome of the measurement on *B*.

In 1964 John Bell showed that the assumptions of determinism and locality together imply that various inequalities should hold between the probabilities of certain outcomes of various joint measurements. The probabilities predicted by QM violate these inequalities. It follows that any deterministic theory that recovers the statistical predictions of QM will violate locality and will thus involve ‘action at a distance’. (Bohm’s ‘hidden-variable’ interpretation of QM is an example of such a non-local deterministic theory.) Bell and others later generalized the result to show that indeterministic theories (so-called stochastic hidden-variable theories) that satisfy an appropriate locality condition are equally incompatible with the predictions of QM. These predictions have since been verified, most famously by Alain Aspect and collaborators in 1982. Whether this shows that nature itself is non-local remains controversial.

**benevolence.** To be benevolent is to be possessed by a desire for the good of others and a willingness to forward that good actively. Since the good of others takes many different forms it requires a range of different responses. Benevolence, therefore, may take the form of compassion, mercy, kindness, or generosity.

While benevolence is quite properly understood as a general attitude of goodwill towards others and as the specific forms such goodwill might take, the term has also come to be used more recently in a much narrower sense, to refer to acts of charity. An act of charity occurs when some benefit is freely bestowed by one individual with a surplus on another who is in need. This narrowing of the

meaning of benevolence means what was initially a term used to describe an uncontroversially desirable attitude to others has come to be used, perhaps, to put a good face on the largess of the better-off to the worse-off. It thereby introduces doubts about the moral value of benevolence.

The question of the moral importance of benevolence is often addressed by way of a comparison with the alternative major 'other-regarding' virtue, \*justice. Benevolence is said to depend, for instance, on the agent's *feeling* concern for others, while the demands of justice are recognized by reason and are thus independent of the vagaries of individual emotional capacity. This particular contrast owes a great deal to Hume's influential account of benevolence as a natural and essentially sentiment-based virtue, which has led some to conclude that it is inadequate to meet the demands of morality because it is neither impartial nor, ultimately, open to rational assessment. There are, however, other conceptions of benevolence which evade these criticisms. \*Utilitarianism, for example, may be described as a theory of universal benevolence, which refuses any necessary connection between feeling and right action. Nevertheless, its highly stipulative definition of benevolence is challenged by the Humean recommendation that we ought to assess and be critical of our moral relationships from the point of view of sentiment. A second possible contrast between justice and benevolence consists in the assertion that, because it is by definition concerned with what is strictly *due* to others, justice marks the boundaries of what we are morally *obliged* to do, while benevolence consists in morally desirable, but in the final analysis *optional*, actions. However, this view merely reflects the largely unargued assertion that justice is of overriding moral importance.

To conceive of justice and benevolence as independent and mutually exclusive in this way may be mistaken: the two notions seem rather to be logically correlative and, therefore, they cannot be explicated independently of each other. And if they are logically correlative, i.e. related not only at the level of certain particular conceptions of each, but in all and any full and coherent conceptions of either, then fully to understand a conception, or to achieve a proper conception, of either justice or benevolence requires making explicit the conception of the other that it implies and from which it partly derives. P.W.

T. A. Roberts, *The Concept of Benevolence* (London, 1973).

**Benjamin, Walter** (1892–1940). German philosopher and literary and social critic, who was a member of the \*Frankfurt School. He went into exile in Paris when the Nazis came to power in 1933. After the fall of France he headed for Spain, but was denied entry and killed himself.

His cryptic, ambiguous, ironical writings owe as much to messianic and kabbalistic Judaism as to Marxism and surrealism. Art serves theological, philosophical, and political ends. His essay 'The Work of Art in the Age of Mechanical Reproduction' (1936) defends photography and cinema, as a way of 'politicizing' aesthetics, against

the 'aura' of traditional art—to the annoyance of Adorno, who saw greater critical power in autonomous art than in the mass media. Benjamin championed the revolutionary epic theatre of his friend Brecht. He was a practitioner of 'immanent criticism': theoretical principles are to emerge from the work studied, not brought to it from outside. He despised Heidegger, but such pieces as 'On Language as Such and on the Language of Man' and 'Fate and Character', in *One-Way Street* (1928; tr. London, 1979), have a Heideggerian rather than a Marxian flavour: 'The enslavement of language in prattle is joined by the enslavement of things in folly' and 'Fate is the guilt context of the living'.

**Bentham, Jeremy** (1748–1832). English philosopher who dreamed at a young age of founding a sect of philosophers called utilitarians and who lived to see his dream fulfilled. He also planned that his body when he died should be made into what he called an 'auto-icon' (that is, a representation of itself) so that it could be used as a monument to the founder of the sect. This intention was also fulfilled, so that to this day meetings of Benthamites sometimes take place in the actual presence of Bentham himself (who spends the rest of his time sitting in a glass box in University College London).

Bentham was the son and grandson of lawyers working in the City of London and was intended by his father to follow and surpass them as a practising lawyer. However, while following his legal studies, Bentham became disgusted with the current state of English law and so, rather than making money by the practice of the law as it is, he

turned instead to a study of what the law might be. This study formed the centre of his long life, during which he wrote an enormous amount of manuscript material on law, economics, politics, and the philosophy which naturally arises from these subjects.

In his earlier years Bentham turned some of this manuscript into books, such as his *Fragment on Government* of 1776, or his *Introduction to the Principles of Morals and Legislation* of 1789 (although, as the titles indicate, both of these were in fact only parts of projected works). Later on, even the fragments tended not to be published by him and were left for others to edit. In this manner, the first work which made his name was produced in French and published in Paris by his disciple Étienne Dumont of Geneva (the *Traité de législation civile et pénale* of 1802). Dumont subsequently edited other works; these were translated into English by disciples, who also edited others directly. Therefore much of the published text of Bentham has passed through the hands of others, and also sometimes been translated or retranslated prior to its publication. In fact, Bentham's greatest work on the philosophy of law was not published until the present century (in its latest version, edited by H. L. A. Hart, under the title *Of Laws in General*).

Bentham's grand project was for legislation: the exploration and theoretical foundations of a perfect system of law and government. For this he needed a measure of perfection, or of value; and this for Bentham was the principle of \*utility, otherwise known as the \*greatest happiness principle. In his already mentioned *Introduction* to the subject, Bentham starts chapter 1 with the rousing declaration that 'Nature has placed mankind under the governance of two sovereign masters, *pain* and *pleasure*.' This first paragraph ends with the statement that 'the *principle of utility* recognises this subjection, and assumes it for the foundation of that system, the object of which is to rear the fabric of felicity by the hands of reason and of law'. Bentham's aim is to produce felicity, happiness. The means to be employed are 'reason and law': the right law will produce happiness, and the right law is one in accordance with reason. This means one in accordance with the principle of utility. In Bentham's draft codes of law, each particular law was attached to a 'commentary of reasons on this law'. The commentary demonstrated its value and also, Bentham hoped, improved its effect. For, as he says elsewhere, 'power gives reason to law for the moment, but it is upon reason that it must depend for its stability'.

Bentham explicitly says in the *Introduction* that by 'utility' he means 'that property in any object, whereby it tends to produce benefit, advantage, pleasure, good, or happiness . . . or . . . to prevent the happening of mischief, pain, evil, or unhappiness'. The rightness of actions depends on their utility; and the utility is measured by the consequences which the actions tend to produce. Of all these varying terms describing the consequences, the most important for Bentham are the ones with which he began the *Introduction*, pleasure and pain. For Bentham thinks that these are clear, easily understandable terms,

which can therefore be used to give precise sense to the others. So the good, for Bentham, is the maximization of pleasure and the minimization of pain. Otherwise, as he puts it in the *Introduction*, we would be dealing 'in sounds instead of sense, in caprice instead of reason, in darkness instead of light'. For Bentham the principle of utility, interpreted in terms of pleasure and pain, is the only appropriate measure of value because it is the only comprehensible one.

Bentham's aim of increasing happiness is a practical one; and he had many purely practical proposals, such as for trains of carts between London and Edinburgh, or a Panama canal, or the freeing of peas. But the most famous and important of these particular practical proposals was for a prison which he called the 'panopticon'. It was to be circular so that the warders could sit in the centre and observe all the prisoners. It was also going to be privately run, by contract management with Bentham as its manager. Bentham therefore not only intended to produce what he called a 'mill for grinding rogues honest' but also to make money in the process. In fact, blocked by the interests of the landowners whose property abutted the site of the proposed prison (now occupied by the Tate Britain Gallery on Millbank in London), he lost both money and time until, after twenty years' struggle, he was compensated by Parliament. Bentham took his winnings, rented a house in Devon, and instead of grinding rogues chopped logic, producing his most profound work on the philosophy of language.

In his more general theory of government, just as in his more particular prison proposals, Bentham needed to rely on a psychology. This is that people tend to act in their own interests, where these are again understood in terms of pleasure and pain. People are understood to be seekers after pleasure and avoiders of pain. Given this knowledge of people's psychology, the benign legislator can so arrange his system of law that people, seeking only their own interests, will in fact be led into doing what they are meant to do, which is to promote the general interest (or the greatest happiness for all).

From this follows the Benthamite theory of \*punishment. It is a deterrent account. The proper aim of punishment, as of anything else, is to produce pleasure and prevent pain. Now all punishment is in itself a pain. Therefore, for Bentham, all punishment is in itself a harm. Therefore it can only be justified if this particular pain is outbalanced by the reduction in pain (or increase of pleasure) it causes. If people are deterred by punishment from doing things which would produce more pain (such, for example, as rape, theft, or murder), then the punishment will be justified. If not, not: there is no point in punishment or retribution for its own sake. This defence of punishment not only justifies punishment but also enables in principle the precise calculation of how much punishment is appropriate. It is that amount whose pain is outweighed by the pains of the actions it deters.

Bentham's general account of law and punishment and his use of the principle of utility as a means of providing

reasons for his particular codes of law is constant through his life. However, his ideas about the particular political system which should be the source of this law developed. At the start he thought that he only needed to appeal to enlightened governments for such obviously beneficial arrangements to be put into effect. When he found that this did not happen (or that he was blocked in his own proposals, such as that for the panopticon), he became a supporter of democracy. Not just the law had to be changed but also the system of government. He was accordingly active in the movement for the extension of the parliamentary franchise, which finally came into effect in the year he died (although Bentham wanted something considerably more radical than the extension which actually happened: he wanted one man, one vote; and a secret ballot).

Such democratic proposals were in any case much more in accord with his general theories. If, according to the psychological theory, everyone acts in their own interests, so also do governments or governors. The classic eighteenth-century figure of the benevolent, semi-divine legislator has to be dispensed with. Dictators (supposedly enlightened or otherwise), kings, oligarchies can not be trusted. The appropriate end of government, popularly sloganized by Bentham as 'the greatest happiness of the greatest number', is only safe in the hands of the greatest number themselves. If the people as a whole are granted political power, they will, merely by following their own interests, promote what is also the appropriate end. Just as in the right system of law, so in the right system of politics or government, actual and appropriate action will coincide.

It can be seen that Bentham's project was centrally a project of clarification. He wanted to clarify values, to show at what we ought to aim. He wanted to clarify psychology, to show at what people actually do aim. He wanted to devise the appropriate systems of government, law, or punishment so that these two things could be placed in step. However, his interest in clarification went further. He also wanted to clarify the very idea of law; both as a whole and also in its central terms. It was in this project that he was led into his most original thought.

Understanding the law involves understanding such things as \*rights and duties. In the empiricist tradition, to which Bentham was loosely attached, understanding is provided by perception. Locke and, following him, Hume made a distinction between simple and complex ideas which allowed them to understand things which were not directly perceived. Complex ideas, such as that of a golden mountain, can be understood because they can be analysed into their simple constituents, of which we have experience. However, this technique does not work for the terms which Bentham wished to analyse, such as obligation or right. So here he was forced into a wholly new technique, which he called 'paraphrasis'.

This technique anticipates twentieth-century methods of analysis as does Bentham's related claim that the primary unit of significance is a sentence rather than a word.

His idea in paraphrasis is not to translate the problematic word into other words. Rather, 'some whole sentence of which it forms a part is translated into another sentence'. So in the analysis of what Bentham called 'fictional entities' (such as right, duty, property, obligation, immunity, privilege—the whole language of the law), he uses his technique of paraphrasis to place these terms in sentences for which he then gives substitute sentences not containing the offending term. For example, sentences about rights are explained by Bentham in terms of sentences about duties. A particular right is for him the benefit which is conferred on someone by the imposition of duties on others. With duties we still, of course, have fictional entities. But these, in turn, can be placed in sentences which are translated into sentences about the threat of punishment. Punishment is, for Bentham, the threat of the imposition of pain. So here, at last, we reach what Bentham calls real entities. We reach clear, simple ideas, which can be directly understood by perception. As Bentham says in the *Fragment on Government*, 'pain and pleasure at least are words which a man has no need, we may hope, to go to a Lawyer to know the meaning of'. With them the law can be clarified; for lawyers and others. The ultimate clarifier of value, of what the law should be, will also work as a clarifier of what the law actually is.

These projects are projects for change: current conditions are criticized. However, although Bentham's goals were the same as many of the contemporary movements for change, his foundations were not. Bentham was on the side not just of the struggle for reform of the franchise in England but also of the American and French Revolutions. The central contemporary justification for these revolutions was in terms of natural rights. However, Bentham was consistently opposed to the use of natural rights and he therefore criticized the rhetorical justification of both of these revolutions.

Bentham thinks that a \*natural right is a 'contradiction in terms'. He thinks that they are 'nonsense', fictitious entities. However, as has been seen, Bentham produced a new engine of analysis in his technique of paraphrasis precisely to make sense of fictitious entities. So it might be thought that he could make sense in the same way of natural rights. However, comparing a natural right with a legal right exposes the difference. Both can be analysed in terms of corresponding duties. However, as seen, Bentham analyses a legal duty in terms of the law (or threat of punishment) which creates it. There is no corresponding law, he holds, with respect to supposed natural duties. Hence he holds that natural rights are just imaginary rights by contrast with the real rights produced by actually existing systems of law. As he puts it, 'from real law come real rights . . . from imaginary laws come imaginary ones'. The so-called rights of man are in fact merely 'counterfeit rights'.

Bentham's most famous slogan expressing this view is '\*nonsense on stilts'. This comes from his critical analysis of the French Declaration of the Rights of Man and Citizen in a work usually known as *Anarchical Fallacies* (which, in

fact, is Dumont's title). Bentham's claim is that language which looks as if it is describing what rights there actually are is in fact suggesting what rights there ought to be. That is, instead of citing existing rights, the French Declaration is giving reasons why there ought to be rights. As Bentham puts it in *Anarchical Fallacies*, 'a reason for wishing that a certain right were established, is not that right; want is not supply; hunger is not bread'. So to suppose that such rights actually exist is nonsense. Even worse is to suppose that we can be sure that the correct rights have been found for all time. For Bentham is a promoter of experimentation. We have to keep seeing what utility is actually produced by particular systems of rights. Hence it is an additional mistake to think that any rights are unalterable (indefeasible, imprescriptible). This mistake was also made by the French. Hence the famous slogan. The complete remark from which it comes is 'natural rights is simple nonsense: natural and imprescriptible rights, rhetorical nonsense, nonsense upon stilts'.

Natural rights was one attempted answer to the question of the source of obedience to the state and the conditions for legitimate revolution. Another attempted answer also popular in Bentham's day was the original or social contract. This device, founding obedience on agreement, was used by the leading contemporary defender of British law William Blackstone. Bentham ridicules such a defence in his *Fragment on Government*. For Bentham, justification of obedience to government depends upon utility, that is upon calculation of whether the 'probable mischiefs of obedience are less than the probable mischiefs of resistance'.

A contract will not work here for Bentham because, just like rights, all real contracts are legal contracts. Hence they are produced by law and government; and cannot therefore be used to provide a foundation for law and government. Even if its force is not supposed to be the force of a proper contract but merely that of a promise, or agreement, this again will not help to provide justification. For whether someone (government or people) should keep their agreements has, again, for Bentham to be tested by the calculation of utility. Yet if utility is to be the ultimate justification of promise-keeping, it would have been better to have started there in the first place, rather than (like Blackstone) traversing a tortuous path through contracts, original contracts, and largely fictional agreements. Again Bentham designates the supposed alternative source of justification to be merely a fiction and, as he puts it in the *Fragment*, 'the indestructible prerogatives of mankind have no need to be supported upon the sandy foundation of a fiction'.

Although all justification comes from utility, this does not mean that Bentham can not support secondary ends; that is, things which, if promoted, will normally tend to increase utility. He lays down four such intermediate ends which should be promoted by the right system of law and government: subsistence, abundance, security, equality. These form two pairs so that subsistence (the securing to people of the means to life) takes precedence over abun-

dance; and securing people's expectations takes precedence over equality. The utilitarian argument for this depends upon the psychological claim that deprivation of the former member of each pair causes more pain than the latter.

Psychological assumptions also lie behind Bentham's promotion of \*equality. He claims that (in general) equal increments of a good will not produce equal increments of utility. (That is, he claims that there is diminishing marginal utility.) Therefore, in general, provision of a particular good will provide more utility for those who already have less than those who already have more; hence a general tendency towards providing goods for the less well-off; or equality.

Bentham's is a consequentialist ethic. It looks towards actual and possible future states of affairs for justification of right action, not to what happened in the past. (For example, punishment is not retribution for past action, but prevention of future harms; obedience to the state is not because of some past promise, but to prevent future harms.) This is for Bentham the right, indeed the only possible, way of thinking correctly about these matters. It explains his central stance with regard to reform of the law. The law he found was common law, made by judges, based on precedent and custom. It came from history. For this he wanted to substitute statute law, made by democratic parliaments, and founded on reason. These reasons would be independent of history and would be in terms of future benefit.

**Berdyaev, Nikolai Alexandrovich** (1874–1948). Influential Russian religious philosopher who, after a youthful flirtation with Marxism of neo-Kantian persuasion, developed a form of Russian idealism sometimes called 'Christian existentialism'. According to Berdyaev, what truly exists is spirit, conceived as a creative process: every existent, including God, is a self-determining subjectivity engaged in the realization of value. Human beings attain personhood only if they realize their creative essence, which they may do in a society which embodies true community (*sobornost'*) and which aspires to identity of purpose with God. Berdyaev opposed his vision of 'personal socialism' to both bourgeois individualism and any collectivism that subordinates the individual to the community. A perceptive critic of totalitarianism, he was expelled from the USSR in 1922 and settled in Paris. Since the demise of the Soviet Union, Berdyaev's writings have enjoyed renewed popularity in Russia.

**Bergmann, Gustav** (1906–87). Austrian-born American philosopher, who taught at the University of Iowa for forty years, Bergmann disdained all versions of \*materialism, though he did defend methodological \*behaviourism. A member of the Vienna Circle and influenced by Moore, Russell, and Wittgenstein, Bergmann wrote extensively on individuation, universals, and intentionality, often setting out his views by contrasting them with those of others: Meinong, Brentano, Husserl, Quine, Strawson, and so on. As an ideal-language philosopher, Bergmann tried to design a formalism which allows for the analytic–synthetic distinction and the syntactical features of which point to solutions to the ontological problems. Bergmann’s most striking contribution emerges in his attempt to show that the truth-bearers of thoughts are mental states which, though simple, have truth-makers that are are complex. E.B.A.

**Bergson, Henri-Louis** (1859–1941). French philosopher of Anglo-Polish extraction who worked mainly at the Collège de France in Paris. Bergson is famous for two main doctrines, those of duration and the *élan vital*. In a letter written in 1915 he speaks of ‘the intuition of duration’ as ‘the core of the doctrine’ which any summary of his views must start from and constantly return to. Duration is time at its most timelike, as we might put it. For the scientist time is a homogeneous medium which can be divided into periods of equal length, and treated for the purposes of the calculus as analysable at the limit into an infinity of instants with no length. None of this holds for duration, which is heterogeneous, ever-changing without repeating itself, and cannot be divided into instants (though one interpretation sees Bergson as led to duration by reflecting on the calculus in terms of Newton’s doctrine of ‘fluxions’). Duration is \*time as experienced by consciousness, and perhaps Bergson’s most important insight is that we do not experience the world moment by moment but in a fashion essentially continuous, illustrated by the way we hear a melody, which cannot consist simply in hearing a succession of disjointed notes. Past, present, and future cannot be so separated that it becomes impossible for us to know of the past because only the present is ever present to experience. It is perhaps rather strange that of the two main philosophers of time of the late nineteenth and early twentieth centuries, Bergson and McTaggart, neither seems to have paid any attention to the other. Bergson wrote his main relevant works before McTaggart’s famous 1908 article, but he never overtly reacted to it and shows no signs of being influenced by it in his later writings (despite being fluent in English and having lectured in England).

Born in the year of *The Origin of Species* Bergson was familiar enough with the conflict between evolutionism and religion. His book *Creative Evolution*, introducing the *élan vital* as a sort of life force, probably owed its popularity partly to his attempt, backed by scientific as well as philosophical arguments, to develop a non-Darwinian evolutionism that made room for religion, albeit not for orthodox Christianity. He envisaged a process of constant change and development, irreversible and unrepeatable (so that biology is a fundamentally different science from physics), and governed by the *élan*, which uses effort and subtlety to overcome the resistance of matter (an echo of the divine Craftsman in Plato’s *Timaeus*?), but is not drawn by some pre-envisaged end, for that would be a mere ‘inverted mechanism’.

Later in life Bergson turned his attention to morality. Just as duration could never be generated from time considered as isolated moments (an argument he also used against Zeno’s paradoxes of motion), so, he claimed, universal benevolence could never be achieved by starting with group loyalties and making the groups ever wider. Group loyalty always required a contrasting out-group, and could be transcended only by a qualitative leap of the sort taken by mystics in their love of all mankind.

Another application Bergson makes of his general philosophy comes in his treatment of \*laughter in the short book of that name. Man is a spiritual outgrowth in a world which works, along with his body, on mechanical principles, and laughter arises when he is seen as reverting to the mechanical level, primitively when he slips on a banana skin, sophisticatedly when his conscious actions unconsciously mimic the mechanical. **Berkeley, George** (1685–1753). Berkeley is a most striking and even unique phenomenon in the history of philosophy. There have been many philosophers who have constructed bold and sweeping, often strange and astonishing, metaphysical systems. Some, particularly in the English tradition—for example, Thomas Reid in the eighteenth century or G. E. Moore in the twentieth—have been devoted to the clarification and defence of ‘common sense’. And some have made it their chief concern to defend religious faith and doctrine against their perceived enemies. It is the peculiar achievement of Berkeley that, with high virtuosity and skill, he contrived to present himself in all these roles at once. His readers have differed in their assessments of the relative weights to be accorded to these not clearly compatible concerns. It is easy to read him as primarily a fantastic metaphysician—a line taken, to his baffled chagrin, by almost all his own contemporaries. More recently some, by reaction against this, have perhaps tended to overstress his credentials as the

champion of \*common sense. His religious apologetics, if scarcely his dominant interest, were unquestionably sincere. But mainly one should try to see how, not merely temperamentally but as a lucid theorist, he really did contrive to make a coherent whole of his diverse concerns.

The works on which Berkeley's fame securely rests were written when he was a very young man. Born and educated in Ireland, he first visited England in 1713, when he was 28, and his *Three Dialogues between Hylas and Philonous* was published in that year. But he had by then already published his *Essay towards a New Theory of Vision* (1709) and his major work *A Treatise Concerning the Principles of Human Knowledge* (1710). His later philosophical writings do little more than defend, amplify, and in one or two respects amend the comprehensive views thus early arrived at. It is, in fact, evident from his correspondence that in his later years concern with philosophical issues was for long periods wholly displaced by other interests. In this respect he differs markedly from John Locke—the chief target of his criticism—whose *Essay Concerning Human Understanding* (1690), long meditated and much revised, did not appear till its author was nearly 60. The young Berkeley was apt to commend Locke's thoughts, not without irony, as quite creditable for one so far advanced in years.

A major motive of Locke's philosophy—with which Berkeley was well acquainted in his student days—was to work out the implications of the great achievements of seventeenth-century science. It had been established beyond all question, he took it, that the material universe was really, essentially a system of bodies mechanically interacting in space—bodies 'made', so to speak, of matter, and really possessing just those qualities (\*primary qualities) required for their mechanical mode of operation—'solidity, figure, extension, motion or rest, and number'. This was the bedrock of Locke's position. These bodies operate on, among other things, the sense-organs of human beings—either through actual contact with the 'external object' or, as in vision, by 'insensible particles' emitted or reflected from it. This mechanical stimulation in due course reaches the brain, and thereupon causes \*ideas' to arise in the mind; and these are the items of which the observer is really aware. In some respects these ideas faithfully represent to the mind the actual character of the 'external world'—bodies really do have 'solidity', etc.—but in others not; ideas of, for instance, sound, colour, and smell have no real counterparts in physical reality, but are merely modes in which a suitably constituted observer is affected by the appropriate mechanical stimuli.

Berkeley came very early to regard this picture of the world as at once absurd, dangerous, and repulsive. It was absurd, he argued, because it implied a fantastic \*scepticism, plainly intolerable to good common sense. For how could an observer, aware only of his own ideas, know *anything* of Locke's 'external world'? Locke himself had insisted that colour, for example, is only an apparent, not a real, feature of that world; but how, in fact, could he know

that our ideas correctly represent to us, in any respect, the world's actual character? A sceptic has only to suggest that our ideas perhaps mislead us not merely in some ways, but in every way, and it is evident that Locke is left helpless before that suggestion—unable, indeed, even to assure himself that any 'external' world actually exists. That is surely, for any person of good sense, an intolerable position.

But it is also dangerous, Berkeley holds. For—besides this general leaning towards an absurd scepticism—the \*scientism', as one may perhaps call it, of Locke's doctrine seemed to lead naturally towards materialism and, by way of universal causal determinism, to atheism also, and therefore, in Berkeley's view, to the subversion of all morality. God is brought in by Locke as the designer, creator, and starter of the great Machine; but could he show that matter itself was not eternal, with no beginning and no creator? Might God turn out to be superfluous? Again, though Locke himself had made the supposition that minds are 'immaterial substances' and no doubt hoped to sustain a Christian view of the soul, he had confessed that he could not disprove the counter-suggestion that consciousness might be merely one of the properties of matter, and so wholly dependent on the maintenance of certain purely physical conditions. Thus Locke's theories at best permit, at worst positively encourage, denial of God's existence and the soul's immortality; with that denial religion falls and, in Berkeley's view, drags morality after it.

Finally, it is clear from, though less explicit in, Berkeley's words that he was simply oppressed and repelled by the notion of the universe as a vast machine. Locke loved mechanisms. He delighted in metaphors of \*clocks and engines, springs, levers, and wheels, and indeed took mechanics to be the paradigm of satisfactory intelligibility. All this Berkeley detested. God's creation, he was sure, could not really be like that—particularly if, in order to maintain that it is, we have to assert that its actual appearance is delusive, that 'the visible beauty of creation' is to be regarded as nothing but 'a false imaginary glare'. Why, to embrace such a nightmare, should we deny the evidence of our senses?

What then was to be done? Berkeley thought that the solution of all these perplexities was obvious, luminously simple, and ready to hand. As he wrote in his notebook, 'I wonder not at my sagacity in discovering the obvious though amazing truth, I rather wonder at my stupid inadvertency in not finding it out before.' The solution was to *deny the existence of \*matter*.

First, Berkeley insists, this odd-looking denial is wholly supportive of common sense. On Locke's own admission we are never actually aware of anything but our own ideas; to deny the existence, then, of his 'external objects', material bodies, is not to take away anything that has ever entered into our experience. But not only so; it must also put an end to all sceptical questioning. For Locke was obliged to concede to the sceptic that our ideas might mislead us about the real character of things, precisely

because he had regarded things as something other than, merely 'represented' by, our ideas. But if, eliminating the supposed material body, we adopt the view that the ordinary objects of experience simply *are* 'collections of ideas', it will be plainly impossible to suggest that things may not be as they appear to us—even more so, to suggest that their very existence might be doubted. If an apple is not an 'external' material body, but a collection of ideas, then I may be entirely certain—as of course, Berkeley says, any person of good sense actually is—both that it exists, and that it really has the colour, taste, texture, and aroma that I find in it. Doubt on so simple a matter could only seem to arise as a result of the quite needless assertion that things exist, distinct from and in superfluous addition to the ideas we have.

But surely, it may be objected, our ideas have causes. We do not generate our own ideas just as we please; they plainly come to us from some independent source; and what could this be, if not the 'external world'? But this point redounds wholly, Berkeley claims, to his own advantage. For to cause is to *act*; and nothing is genuinely active but the will of an intelligent being. Locke's inanimate material bodies, therefore, could not be true causes of anything; that ideas occur in our minds as they do, with such admirable order, coherence, and regularity, must be by the will of an intelligent being. And of course we know that there is such a Being—God, eternal, omnipresent, omnipotent, 'in whom we live, and move, and have our being', 'who works all in all, and by whom all things consist'. Berkeley wonders at the 'stupidity and inattention' of men who, though every moment 'surrounded with such clear manifestations of the Deity, are yet so little affected by them, that they seem as it were blinded with excess of light' (*Principles*, para. 149).

Finally—and certainly, for Berkeley, most satisfactorily—he finds himself in a position to put the physical scientist firmly in his place. For if there is no matter, no material bodies, there are no 'corpuscles', no 'insensible particles'; that whole corpus of mechanistic physical theorizing in which Locke delighted cannot possibly be true, for there is simply nothing for it to be true *of*. At first, in his early (though major) work the *Principles*, Berkeley embraced this position in the most unqualified form. There is a modest role for the scientist, he there argued, in observation and description of the objects of experience, in the search for true generalizations about the course of our ideas, that is, of natural phenomena; but all reference to items supposedly 'underlying'—supposedly explanatory of, and according to Locke more 'real' than—human experience, must be dismissed as moonshine, the product of mere confusion. But later—regarding, perhaps, as overdrastic this wholesale dismissal of not only Locke but also, for example, Gassendi, Newton, and Boyle—he devised a strikingly ingenious variant position in which, though running hopelessly against the main tendency of his age, he foreshadowed the ideas of many contemporary philosophers of science. In his pamphlet *De Motu* of 1721, he still maintained that corpuscular theories of matter, for

example, or the particle theory of light could not be true; but they may nevertheless be allowed, not indeed as truths, but as useful fictions. The 'theory' of the corpuscular structure of matter makes possible the exact mathematical expression of formulae, by which we can make very valuable calculations and predictions; but there is no need to make the supposition that the corpuscles and particles of that theory actually exist. So long as it is useful to us to speak and to calculate *as if* they exist, let us so speak and calculate. Such intellectual dodges 'serve the purpose of mechanical science and reckoning; but to be of service to reckoning and mathematical demonstrations is one thing, to set forth the nature of things is another'. It is Locke's concession, one might say, to the physical scientist of metaphysical *authority* that Berkeley, at every stage, implacably opposes.

Two of Berkeley's later works may be mentioned briefly. His *Alciphron* (1732) is a long work in dialogue form, in which the tenets of Anglican orthodoxy are defended against various types of 'free-thinking' and \*deism. Though able enough, it suffers from the artificiality of the convention, and has limited interest now that the controversies which prompted it are moribund. His last work was *Siris* (1744), a very strange, even baffling production, in which a most uncharacteristically rambling, ponderous, and speculative statement of some part of his earlier opinions leads on to an inquiry into the virtues of \*tar-water, a medicine which Berkeley made popular, and for the promotion of which he worked in his later years with surprising zeal.

Berkeley's main work was slow to exert any influence on philosophy, though his limited early *Essay* on vision became fairly well known. His criticism of Locke, though not always ideally fair, was for the most part powerful and well taken; and the transition to his own remarkable doctrine of a wholly non-material, theocentric universe, whose *esse* was *percipi*, and in which human 'spirits' were conceived of as conversing directly with the mind of God, was at least a feat of dazzling ingenuity. But this doctrine was too extraordinary to be taken quite seriously. The fact that, so far as the course of actual experience went, he could insist that it coincided with the customary views of ordinary life was felt, rightly, to be not enough to make it actually the same—he was far indeed from being accepted as the friend of common sense. His strikingly original philosophy of science—really *the* fundamental area in which he dissented from Locke—was also much less persuasive than it would be if it were propounded today. In the early eighteenth century it was still possible, even natural, to regard physical theory as merely a kind of extension of ordinary observation, offering—or at any rate aiming at—literal truths of just the same kind, and couched in much the same terms, as those of everyday experience. Today the sophistication of physical theory has made this difficult, or indeed impossible, to believe; but to deny it then was probably felt not only to be perverse and unnecessary, but also—entirely rightly, in Berkeley's case—to constitute an attempt to undermine the physicist's prestige. It was his

misfortune that he opposed, even hated, the 'scientific world-view' at a time when that view was in the first flush of its general ascendancy.

Berkeley was born near Kilkenny, and educated at Kilkenny College and, from 1700, at Trinity College, Dublin. He was a Fellow of that college—though often absent—from 1707 to 1724. Ordained in 1709, he was appointed Dean of Derry in 1724, and Bishop of Cloyne in 1734. He married in 1728, and died at his lodgings in Holywell Street, Oxford, in 1753, while overseeing the introduction of his son George to Christ Church. Berkeley's life, apart from his philosophical writings, is remarkable chiefly for his curious attempt in middle life to establish a college in Bermuda. The purpose of this project was mainly missionary. Berkeley's hope was to attract to his college both the colonial settlers of America and the indigenous American Indians, so that they would in due course return to their communities as ministers of religion and purveyors of enlightenment. As Dean of Derry he devoted to this scheme his considerable energies, powers of persuasion, and personal charm, and at first succeeded in securing for it both private and official backing. He was granted a charter, raised substantial funds by private subscription, and was even promised an ample parliamentary grant. But the scheme was really impracticable, and was in the end recognized to be so. Bermuda—as he was perhaps not clearly aware—is far too distant from the American mainland to have been an attractive location for his institution. Berkeley himself set out boldly for America in 1728, but in his absence doubts and hesitations began to prevail in London. He waited nearly three years for his promised grant to be paid over, but in 1731 the Prime Minister, Walpole, discreetly indicated that there was no prospect that his hopes would be gratified. The house at Newport, Rhode Island, which Berkeley built and inhabited is still preserved.

**Berlin, Isaiah** (1909–97). Berlin was born in Riga, Latvia, into a Jewish family that migrated to England in 1919 in the wake of the Bolshevik Revolution. He studied at Oxford and taught philosophy there in the 1930s, becoming a significant part of the movement that developed into 'ordinary language' philosophy, and publishing influential papers on the logic of counterfactual conditionals. He wrote his first book in 1939, on Karl Marx. During the war, he had diplomatic postings in Washington and, briefly, Moscow ('one week's work in an embassy—that is my experience—is less of a strain than one day's teaching at Oxford') and met outstanding Russian writers such as Pasternak and Akhmatova. Back in Oxford, Berlin's inter-

ests shifted more to the history of ideas with particular reference to political thought, and in 1957 he was knighted and appointed to the Chair of Social and Political Theory at Oxford. He was the first President of Wolfson College, Oxford (1966–75), and President of the British Academy from 1974 to 1978.

Berlin was rare amongst historians of thought and philosophy in being himself a substantial philosopher, and it is this, plus considerable powers of empathy and a wide range of learning, that gives his explorations of the work and impact of thinkers as diverse as Vico and de Maistre, Machiavelli and Herder, such power and fascination. A lifelong secular liberal, Berlin's writings on liberal theory have had a lasting impression on contemporary political philosophy, his discussions of the concepts of negative and positive liberty being his best-known contribution. Equally significant, however, has been his passionate advocacy of the view that the ends of life cannot form a unified whole.

Although his concerns and heroes were eclectically European, Berlin's method and intellectual temper were rooted in English philosophical tradition with its stress on clarity, argument, and vigorous debate. C.A.J.C.

**Bernoulli's theorem.** The theorem is named after the Swiss mathematician who first proved it, Jakob Bernoulli. It is also known as the 'weak law of large numbers', and was historically the first of a cluster of famous limit theorems of mathematical \*probability. It states that if successive outcomes, *A* and not-*A*, of a sequence of *n* trials are independent, and the probability of *A* at each trial is *p*, then the probability that the relative frequency of *As* in the *n* trials differs from *p* by more than an arbitrarily small number tends to 0 as *n* increases. The relation between probabilities and frequencies established by the theorem led many people, including Bernoulli, to believe that probabilities could be inferred from observed frequencies. Whether such an inference is possible is still unresolved.

W. Feller, *An Introduction to Probability Theory and its Applications* (New York, 1950).

**Berry's paradox** is credited to G. G. Berry by Bertrand Russell. The phrase 'the least integer not nameable in fewer than nineteen syllables' consists of eighteen syllables. Thus the assumption that there is an 'integer not nameable . . .' etc., and that the phrase names it, is contradictory. Russell claimed that the phrase 'denotes' 111,777, thus involving himself in the contradiction. The truth is that 111,777 *can* be named such things as 'Russell's Berry example number' or even 'Joe'. (Nameability in zero syllables raises some interesting questions which, fortunately, needn't be discussed to justify dismissing Berry's puzzle as

not deeply paradoxical.) Both the assumptions leading to the \*paradox are false. Read aloud, '111,777' has nineteen syllables, but being named in some way must not be confused with being nameable.

J.C.

Bertrand Russell and A. N. Whitehead, *Principia Mathematica* (Cambridge, 1961), 61.

**Bertrand's paradox**, due to Joseph Bertrand, brings out an inconsistency in certain \*a priori ways of calculating \*probability. What is the probability that the length  $k$  of a 'randomly selected' chord to a given circle is less than the length  $l$  of a side of an equilateral triangle inscribed in the circle? Viewing the chord as determined by a line through a point  $p$  on the circumference,  $k < l$  if and only if the angle between the chord and a tangent at  $p$  is either  $< 60^\circ$  or  $> 120^\circ$ . This is  $\frac{2}{3}$  the possible angles, which suggests that the probability that  $(k < l) = \frac{2}{3}$ . But one of many other possibilities is to view the chord as determined by a perpendicular to a radius.  $k < l$  if and only if the perpendicular intersects the radius over half-way between the mid-point of the circle and the circumference, suggesting the probability that  $(k < l) = \frac{1}{2}$ . The 'a priorist' technique of finding a 'random' method to generate the chord and then dividing the possibilities for that method to get the probability thus seems to lead to inconsistency, unless some method can be shown to be the 'right' one.

Joseph Bertrand, *Calcul des probabilités* (1889), 4–5; cited by William Kneale, *Probability and Induction* (Oxford, 1952).

**Bhagavadgītā**. 'Song of God', a part of the ancient (fifth to second century BC) epic *Mahābhārata*. In the *Bhagavadgītā* a brave but conscientious prince weakens and turns pacifist in the wake of a fratricidal civil war. A philosophical discourse by Krishna, who is the Hindu God-in-human form, is designed to goad him back to his soldierly duty and to his 'own nature'. It runs to 650 Sanskrit verses, commented upon for over 1,000 years by Indian philosophers of various persuasions. It is famous for metaphysical arguments for the immortality of the soul, the doctrine of a Supreme Person (God), transcending but ontologically supporting both individual consciousness and matter, and a subtle moral psychology of action *vis-à-vis* inaction. It teaches spiritual detachment even in the midst of constant commitment to the most violent of professions. Synthesizing work, worship, and wisdom, the ensuing ethics of moderation, desirelessness, and equality have a Kantian deontological ring. There is the overarching theme of a blissful liberation from the cycle of rebirths.

A.C.

Śri Aurobindo, *Essays on the Gītā* (Pondicherry, 1987).

**biconditional**. A conditional proposition is of the form: If  $P$  then  $Q$ . The conditional which is its converse is of the form: If  $Q$  then  $P$ . A biconditional,  $P$  if and only if  $Q$ , is equivalent to the conjunction of a conditional and its converse. In notations of the propositional calculus a

biconditional is represented as  $P \equiv Q$  or often  $P \leftrightarrow Q$ . In the standard propositional calculus (the system of material implication)  $P \equiv Q$  holds where  $P$  and  $Q$  have the same truth value. Where  $P \equiv Q$  is a \*tautology,  $P$  and  $Q$  are taken to be logically equivalent.

R.B.M.

\*equivalence, logical.

**bioethics** is the study of the moral and social implications of developments in the biological sciences and the related technology. This entails considering the value that is or should be accorded to various forms of life. Are human beings morally entitled to use other living things, plants or animals, in any way that they choose? Is there a special 'sacredness' or 'dignity' attached to human life? If so, does the stage of development that a human life has reached nevertheless make a difference to the morality of destroying it? Such questions as these are the concern of bioethics. It is a subject that grew enormously in the late twentieth century, and most universities now have professional bioethicists among their members, whether interested in broadly environmental and ecological issues or in medical applications of the new technologies.

Bioethics is concerned, for example, with the rights and wrongs of the genetic manipulation of crops and animals, including human animals (and at this point there is an overlap between bioethics and Green political theory). How are possible advantages to impoverished countries of genetically modified crops, designed to resist drought or flooding, to be weighed against the possible exploitation of the poor by chemical or pharmaceutical companies? Is there, in any case, something inherently wrong with the genetic modification of crops or cattle, different in kind from the taking of cuttings or the selective breeding that has been part of horticulture and agriculture for ages past? Is the manipulation of human genes to prevent a child's being born with a devastating monogenetic disease, such as Tay-Sachs's disease or Duchenne's Muscular Dystrophy, different in kind from surgical intervention, or intervention by drugs, which doctors have always practised in pursuit of their professional goal to alleviate suffering? Some regard genetic intervention as uniquely sinister; it is thought to contravene the laws of nature by artificially speeding up the kinds of changes properly brought about by the slow processes of evolution and natural selection. Debate about what is or is not 'natural' is curiously emotive. Part of the work of bioethics is to analyse and evaluate such appeals to Nature.

Of particular importance at the beginning of the twenty-first century have been the questions raised about embryonic stem cell research, or therapeutic cloning. This is a process by which embryos are produced, not by normal conception, the fertilization of female eggs by male sperm, but by cell nuclear transfer, where the nucleus of an egg is removed and replaced by that of another; after the application of an electric current, the egg with its new nucleus can develop into an embryo. This is the first part

of the process of cloning a whole animal, or reproductive cloning. If a whole animal is to be reproduced, the newly formed embryo is placed in the uterus of a surrogate animal and brought to term. Thus Dolly the sheep was cloned at the end of the twentieth century. But the purpose of therapeutic cloning would be frustrated if an embryo were allowed to develop beyond its very first stages. For at the beginning of its life the cells of the embryo are 'totipotent'; that is, each may develop in any direction, to become any of the 120 or so types of cell that make up the body, or indeed may become part not of the embryo itself, but of the placenta or umbilical cord. The purpose of the research is to discover how to direct these cells (embryonic stem cells) to develop in specific ways, to become, let us say, cells belonging to the spinal cord, or the brain, or the skin. The ultimate aim is to produce banks of cells of particular types that may be used for cell transplant rather than whole organ transplant. This would have enormous advantages, in that parts of the body, including the brain, could receive transplants, and damaged cells would renew themselves permanently. All this is far in the future; but the possible ethical objections to such procedures, especially centred on the fact that embryos would be created and then destroyed when their use was over, are already among the issues to be argued by bioethicists.

In fact, at the core of much of their philosophical concern is the status that should be accorded to the human embryo. In the UK human embryos may be used for research up to fourteen days after their creation (whether by fertilization etc. or by nuclear transfer). The Human Fertilization and Embryology Act (1990) enshrined that principle in law. At that time, embryos might be used only for research into issues concerned with fertility, infertility, and contraception. Later, regulations were introduced through Parliament which permitted their use in research into therapeutic cloning, but the fourteen-day limit remained. The reason for this cut-off point was physiological. Until fourteen or fifteen days from the beginning of its life, the embryo, however it was brought into being, has no vestige of a central nervous system, and therefore can have no conscious experiences of any kind. It is impossible to cause such an embryo pain. Though its genetic identity has been fixed, it cannot be regarded as an individual person; indeed, it may yet divide and become twins or quadruplets. Using it for research is therefore more akin to using human tissue than using a child or an adult experimentally.

Such considerations fell, and still fall, to be considered by bioethicists. For despite the largely evidence-based arguments of those who supported the 1990 law, there are many people who dispute the moral acceptability of the law, and would like to see it changed so that from the moment it comes into existence an embryo is protected from being used for research and then destroyed. These people uphold the principle of the sanctity of human life, at all its stages.

This principle is strongly supported by most members of the Roman Catholic Church, and this partly explains

the difference, on bioethical issues, between different countries, within Europe and beyond. There was a period when the Roman Catholic Church, following Thomas Aquinas (himself following Aristotle), held that a human foetus becomes a full human being, acquiring a soul, at about forty or ninety days from conception, depending on its gender. However, in the nineteenth century the Church decided, rightly, that there could be no certainty about when the soul entered the body, and that therefore even the earliest embryo should be given the benefit of the doubt. It was therefore deemed that immediately after conception the embryo had, or probably had, a soul, and was effectively a human person, so that to destroy it was murder.

Against this there is the argument put forward by, among others, John Habgood, an eminent bioethicist, a biologist turned churchman who became archbishop of York, which holds that we must, as post-Darwinians, take a developmental view of the human embryo, as we do of the human race itself. There is no one moment when the human person springs into existence. The further the collection of cells which forms the human embryo develops, the more we are properly inclined to accord it the status of a person, and the higher the value we attach to its life and life-chances. It was such arguments as these that prevailed in the UK in 1990. But the arguments continue, and the issue still dominates bioethics in at least one of its branches.

Questions raised by the new techniques do not depend on wholly new moral principles. But they involve applying moral principles to sometimes wholly new possibilities; and this in turn involves taking a newly long-term view of possible consequences for society. How would it be if people could choose the sex of their babies, or, more startlingly, choose to alter their genetic make-up before birth? Could society tolerate a world in which the mixture of genes a child was born with was no longer a matter of chance but could be 'designed' deliberately? What, if any, is the fundamental moral objection to the cloning of human beings, supposing such a thing were ever to become safe enough to try? Such questions, which used to be strictly a matter of science fiction, now seem nearer to reality, and it is the fear of such a reality that causes bioethicists to be in increasing demand. Their task is to help people to think clearly about how, in the light of our new knowledge, we value, or ought to value, life in all its form, and at all stages of development. M.WARN.

**biological naturalism.** The view that mental phenomena such as \*consciousness and \*intentionality are natural bio-

logical phenomena on a par with growth, digestion, or photosynthesis. Biological naturalism is defined by two main theses: (1) all mental phenomena from pains, tickles, and itches to the most abstruse thoughts are caused by lower-level neurobiological processes in the brain; (2) mental phenomena are higher-level features of the brain.

Mental phenomena are thus 'emergent' in the sense that they are causally explained by the behaviour of lower-level elements which do not in themselves individually have these features. Thus, according to biological naturalism, the brain is conscious and consciousness is caused by the behaviour of lower-level elements such as neurons even though no single neuron is conscious. Formally speaking, relations of this sort are common and unmysterious in nature. For example, a whole system can be in a liquid state, and the liquid behaviour can be caused by the behaviour of the molecules even though no single molecule is liquid. Biological naturalism does not deny that alternative forms of chemistry might be able to cause consciousness but insists that since mental phenomena are in fact caused by brain processes any other system that caused mental phenomena would have to have causal powers equivalent to brains. **biology, philosophical problems of.** The most distinctive feature of biology, from a philosophical point of view, is its characteristic use of *functional* or \*teleological explanations. These are explanations in which some biological trait is explained by showing how it is useful for the organism in question. For example, the function of the polar bear's white fur is to camouflage it; the function of human sweating is to lower body temperature; and so on. The philosophically interesting aspect of these explanations is their apparent commitment to teleology: they seem to explain items (the whiteness, the sweating) in terms of their consequences (the camouflage, the cooling). By contrast, normal causal explanations run in the other direction, and account for consequences in terms of their causes.

Until fairly recently most philosophers of biology took these explanations at face value, and argued that the parts of integrated systems, like biological organisms, can legitimately be explained in terms of their contribution to the well-being of the whole. In particular, Carl Hempel argued that such explanations were a subspecies of covering-law explanations. This approach is now widely rejected, however. Most contemporary philosophers of biology now hold that functional explanations in biology are in fact disguised *causal* explanations, which explain biological traits not by looking forward to *future* beneficial results, but by looking backwards to the *past* evolutionary histories in which such results led to the natural selection

of the traits in question. Thus the functional explanation of the polar bear's whiteness does not refer to the future camouflaging of the bears, but to the fact that their past camouflaging led to the natural selection of their whiteness.

The centrality of the Darwinian theory of \*evolution by natural selection to biological thinking raises a number of further philosophical issues. An initial question is whether the theory has any real predictive content, or whether the thesis of 'the survival of the fittest' simply collapses into the empty truism that 'whatever survives, survives'. However, there are ways of formulating the theory so that 'fit' acquires a meaning which is independent of survival.

A related charge is 'adaptationism': does not the theory of evolution by natural selection simply invent evolutionary 'just so stories' in order to portray all biological traits as having some selective benefit? In response, supporters of the theory will admit that some biological traits are accidents that serve no function, but will insist that there is genuine evidence to show that many other traits have been selected because of their effects, and that this process of selection has been crucial to the evolution of species.

At a more detailed level, there is controversy about which 'units of selection' are involved in Darwinian processes. Should we think of natural selection as operating primarily on groups, or individuals, or genes? Some progress with this knotty issue has been made by distinguishing 'replicators', in the form of the genes which embody the lasting effects of selection, from 'vehicles', such as individuals and groups, whose survival is usually the prerequisite for gene survival.

Work on the logic of natural selection has led to the development of sociobiology, which seeks to understand animal social behaviour as the genetically based product of natural selection. Critics of sociobiology object that much behaviour is non-genetic, especially in higher animals and humans. Some sociobiologists deny this claim. Others respond that, even if environmental influences on behaviour are also important, it is still valuable to understand the evolutionary pressures on those genes which do affect behaviour.

Biology, along with other special sciences like psychology, geology, meteorology, and so on, raises the issue of \*reductionism. Most contemporary philosophers of biology are reductionists at least to the extent of denying 'vital spirits' or other emergent biological substances, and accepting the \*supervenience of biological properties on physical properties. Far fewer, however, are reductionists in the stricter sense of believing that all biological laws can be explained by physical laws. Instead they hold that there are *sui generis* biological laws, patterns which are common to biological systems with different physical make-ups, and which therefore cannot be explained in terms of physical law alone. **bivalence.** Semantic principle to the effect that every statement is either true or false. Intuitionists refuse to affirm this, since for them it would amount to affirming that every statement can either be proved or disproved, which no one believes. Three familiar putative counter-examples are: (1) \*vagueness: perhaps 'This is red' is neither true nor false of a borderline case; (2) the \*liar paradox sentence: 'This sentence is not true'; (3) \*reference failure: if there is no elephant present 'That elephant has a lean and hungry look' is arguably neither true nor false. Defenders of bivalence tend to urge that putative counter-examples are not genuine *statements*. R.M.S.

**Black, Max** (1909–88). Influential for contributions to philosophy of language, philosophy of mathematics and science, philosophy of art, conceptual analysis, and interpretative studies of figures such as Wittgenstein and Frege.

Born in Baku, Azerbaijan, he was educated in England and emigrated to the United States in 1940. In 1977 he retired as professor at Cornell University but continued in the programme on science, technology, and society.

There are over 200 items in Black's bibliography. His first book critically explores the formalist, logicist, and intuitionist accounts of mathematics. It remains a staple. Black was no system-builder. His preoccupation was with conceptual clarity and sound argument directed toward well-delineated questions or puzzles concerning, *inter alia*, meaning, rules, vagueness, choice, and metaphor. Throughout his work he showed an uncommon appreciation of common language and common sense. R.B.M.

**black box.** A black box is a system whose internal workings are unknown or irrelevant to current purposes. The computer model of the mind treats the mind as a system that itself is composed of interacting systems, which themselves may be composed of further interacting systems, and so on. The bottom-level *primitive* processors, the black boxes that cognitive science leaves unopened, are understood behaviouristically: what they do (their input–output function) is in the domain of cognitive science, but how they do it is not. (How they do it is in the domain of electronics or neurophysiology, etc.) Via the hierarchy of systems, cognitive science explains intelligence, by reducing the capacities of an intelligent system

to the interactions among the capacities of unintelligent systems, grounded in the bottom-level black boxes. But the model does not explain \*intentionality in this way since the bottom-level black boxes are themselves intentional systems. N.B.

N. Block, 'The Computer Model of the Mind', in D. Osherson and E. Smith (eds.), *An Invitation to Cognitive Science*, iii: *Thinking* (Cambridge, Mass., 1990).

**Blackburn, Simon** (1944– ). Professor at Cambridge, formerly at Oxford and North Carolina, known for his defence of \*quasi-realism about items whose reality has been much disputed—e.g. values, causes, numbers. As to values, he argues that the impact of the perceived world on the mind, together with the beliefs formed thereby, generate habits, emotions, sentiments, and attitudes which come to be projected on to the world and to be regarded as real properties of that world; so commitments of approval or disapproval become judgements with truth-values. And rightly so, for values supervene on natural properties. Thus, such judgements are neither mere expressions of subjective sentiments nor truths which obtain independently of human attitudes. And we should be neither anti-realist nor realist about values; the right stance is quasi-realism. Blackburn has also published a successful popular introduction to philosophy, *Think* (1999).

O.R.J.

**black philosophy** today takes two principal forms. In one form, it is a hermeneutic enterprise, offering explications, interpretations, and exploitations of the traditional wisdom of African societies through the concepts and terminology of contemporary Western philosophy. The topics typically include the general nature of being, the numinous, the nature of human society and the place of human beings in it, causality and agency, and action. An offshoot of this instead exploits insights and nuances available in African *languages* to enrich philosophical analyses of concepts dealt with in Western philosophy. In its other form, black philosophy employs the analytical tools of contemporary philosophizing in order to characterize the social history and problems of peoples of African descent to the extent that these are either peculiar to their experience or peculiarly exacerbated in their experience.

The first form is enmeshed in a vigorous debate about the proper classification of the material, and in consequence its possible usefulness. One camp proposes to treat it as no more than ethnographic material, invaluable in clarifying self-concepts of Africans. This camp, notwithstanding the practice of elders gathering in conversation, regards the material a priori as lacking in individual

contributions or modifications and critical debate, principally because it was originally unscripted; for this camp proposes scripted authorship and critical debate as *sine qua non* tests for the rubric of philosophy. It describes the hermeneutic account as *ethnophilosophy*.

A second camp postulates that the tradition is an evolving result of the collaboration of individual elders whose discussions and debates are submerged, by the nature of the case, in the tenets of the oral tradition. It is noted that, even in the case of the literate early Pythagoreans, critical debate does not appear to have been permitted, and it remains a highly speculative thing to impute a specific view to any of them. Indeed, all their accepted views seem to have been ascribed to Pythagoras himself, even well after his death, irrespective of their actual source.

In fact, the idea of philosophy, like that of any discipline, is quite variable, and there is hardly ever a single overriding paradigm sufficiently protean to fit philosophy or any other discipline at every stage in its history. For example, much of what is admired today as ancient Greek philosophy does not satisfy contemporary notions of philosophy, and some did not satisfy even Aristotle's! It would be equally pointless to try to bring the diversity of today's philosophical practices under a single paradigm.

A broader view can discern philosophy at different points in its evolutionary tree, and can penetrate the density of the idiom of African philosophy and recognize the philosophical aspects of its preoccupation and content, and thereby avoid the superficiality of an inflexible equation of idiom with myth. It thus becomes clear, for example, that of two West African peoples, the Diola proposed corporeally expressed force as a cosmological principle, denied it a temporal beginning, and made it inexhaustible, indestructible, and all-encompassing. General quantitative variations in it were taken to express its creative energy, and the actualizations of these variations constitute the diversity of natural forms. Different orders of being come about through a progressive lessening in its expressiveness. By contrast, the celebrated Dogon people postulated an extremely dense body for their cosmological principle, and, by appeal to concepts of prefiguration and specific motions, sought to explain principal and determinative categories of nature, the four elemental natural masses of air, fire, water, and earth, as well as consciousness and human society, etc. Data like the above enjoy a cultural and historical centrality, but their hermeneutic explication and its tools are transcultural and transhistorical. In its variety of versions, the above kind of black philosophy (or African philosophy) is today supported by a rapidly growing literature.

The other form of black philosophy is an independent movement and not a direct development from African philosophy. It is the more vigorous, the more fully established, and the clearer in its aims and methods. It is centred in the United States. Avoiding metaphysical issues, it concentrates on the development of normative concepts of the identity and emancipation beyond sheer liberty of the black peoples of the Americas and on strategies for their

application towards social reconstruction of American societies. Issues of race and moral attitudes and actions become dominant in it. The discussion of race, however, is, only now overcoming a remarkable denial of the reality of race which merely confused the *factitious* with the *fictitious*. This form of black philosophy uses techniques of analytical philosophy to re-cluster and redefine concepts relating to issues of social identity, social and economic emancipation and justice, and relations between cultures. It uses the re-clustered and redefined concepts to direct the critique of phenomena relating to them. It calls to its aid the categories and syntheses of the European continental tradition in philosophy in the endeavour to develop and illuminate strategies for the existential grounding of historical readings and the elimination of reifying processes and bad faith in the continuance of racist displays.

It has reinvigorated its topics by making the black experience salient as a modifier of the intuitions, ideals, common sense, and persuasiveness of argumentation in the social and normative domain. In this way, it has shed considerable light on its topics, especially those of social discrimination, affirmative action, and the underclass. Its intention, however, is not the mere clarification of concepts, but the promotion of emancipation beyond liberty.

#### bladders of philosophy

Reason, an Ignis fatuus, in the Mind,  
Which leaving light of Nature, sense behind;  
Pathless and dang'rous wandering ways it takes,  
Through errors Fenny—Boggs, and Thorny Brakes;  
Whilst the misguided follower, climbs with pain,  
Mountains of Whimseys, heap'd in his own Brain:  
Stumbling from thought to thought, falls headlong down,  
Into doubts boundless Sea, where like to drown,  
Books bear him up awhile, and make him try,  
To swim with Bladders of Philosophy . . .

(John Wilmot, Earl of Rochester,  
'Satyr on Mankind', lines 12–21)

Rochester derides the tendency of philosophers and others to elevate 'Reason, which Fifty times for one does err' over 'certain instinct'. He declares \*reason a 'cheat', because it first 'frames deep Mysteries, then finds them out'. The doubts it stirs up make 'Cloysterd Coxcombs' follow formulas, not appetites, and drove Diogenes to abandon the world for a tub. As Rochester implies, when the reasoning mind is made indubitable

starting point and final arbiter, everything else, including its body, becomes the external world, whose nature, and even existence, is forever doubtful, perhaps mind-dependent. Yet, as Thomas Reid put it, 'reason's light' and the senses' corollary dimness 'both came out of the same shop', so each is likely to be as faulty—or effective—as the other.

J.O'G.

**Blanshard, Brand** (1892–1987). American, educated partly in England as a Rhodes Scholar, who defended \*rationalism and \*idealism during an era in which they had few defenders. He taught at the University of Michigan, Swarthmore, Columbia, and for most of his career at Yale University. He argued against the doctrine of Hume that causation is merely the constant conjunction of events and the view of \*Logical Positivism that a priori statements are merely consequences of linguistic conventions. There are, Blanshard said, genuine 'necessary connections' in the world. A naturalist in ethics, Blanshard held that 'to call an experience intrinsically good is to say that it is fulfilling and satisfying'. Since he granted 'that the word "good" has [in addition] an aura of emotional and associative meaning', he could 'keep emotive meaning and also keep it in its place'. A naturalist in religion too, he took 'the service of reason' as his religion. 'That service calls for the use of one's reason to embrace as much as one can of the reason implicit in the universe, and its use at the same time to define and harmonize the ends of practical life.' Blanshard's personal demeanour was one of extraordinary graciousness.

P. A. Schilpp (ed.), *The Philosophy of Brand Blanshard* (La Salle, Ill., 1980).

**blindsight.** Absence of visual awareness despite the presence of visual capacity. Some brain-damaged humans retain discriminative capacities in portions of the visual field—manifested, for example, in correct 'guesses' concerning what is there—in which they report they can see nothing. (Removal of the visual cortex in the rhesus monkey also apparently induces blindsight.) Philosophical interest arises because the phenomenon casts doubt on the relation usually assumed between \*consciousness and \*perception.

J.HORN.

L. Weiskrantz, *Blindsight: A Case Study and Implications* (Oxford, 1986).

**Bloch, Ernst** (1885–1977). Bloch believed that reality is an ongoing 'mediation' between object and subject. This somewhat baffling claim should be read in the light of the fact that, although his reputation in the West was as a leading Marxist philosopher, in respects Bloch's debts were to the deeper and more ancient roots of \**Naturphilosophie*. Apparently, the basic stuff of existence (*Urgrund*) has a kind of teleological drive towards the end of the life process (*Endziel*). Causally, this is all driven by a fundamental cosmic force—'hunger'—which Bloch saw as translatable into 'hope' in our own species. Politically,

the end-point translates into a utopia where the exploitation of humans by fellow humans has ceased.

M.R.

E. Bloch, *Das Prinzip Hoffnung* (Berlin, 1954–9).

W. Hudson, *The Marxist Philosophy of Ernst Bloch* (London, 1982).

**Block, Ned** (1942– ). American philosopher, best known for his work on \*images and his inventive objections to \*behaviourism and \*functionalism. Consider a chess-playing computer in which every possible position has been stored in memory, together with a good move which it makes automatically if that position turns up. Its high standard of play could hardly be ascribed to its intelligence. Block describes an analogous program (even more remote from practical possibility) for a robot. It would have the behavioural capacities of an intelligent person, but 'the intelligence of a toaster'. If its practical impossibility may be disregarded, it looks like a counter-example to behaviourism. Against functionalism Block uses similarly ingenious examples to emphasize the problems posed by the alleged possibilities of transposed and absent '\*qualia'. Functionalists reply that his reasoning begs the question.

**boat, Neurath's.** 'We are like sailors who have to rebuild their ship on the open sea, without ever being able to dismantle it in dry-dock and reconstruct it from the best components.' Originated by Neurath and later adopted by Quine, this simile depicts anti-\*foundationalism and \*naturalism. For Neurath, the simile goes beyond epistemology. His pragmatism encompasses the social sciences and extends to society and politics: knowledge and life are built without foundations.

**Bobbio, Norberto** (1909–2004). Leading Italian philosopher of politics and law, who taught in the university of his native Turin and became a life senator in 1984. His aim was a synthesis of the liberal concern with individual liberty, rights, and the rule of law with the socialist concern with equality and social justice. Bobbio's main contribution was to democratic theory. On the one hand, he criticized participatory theorists for concentrating on who holds power to the neglect of the moral and practical issue of how power is exercised. He believed that a liberal constitutionalist democracy, including social along with civil and political rights, to be the only feasible and legitimate form of democratic rule in modern societies. On the other hand, he believed that democratic decision-making can and should be extended over a far greater range of centres of power than simply central government. He contended

that battles over where you can vote have now replaced the debates over who can vote as the key area for democratic advance.

Richard Bellamy, *Modern Italian Social Theory* (Cambridge, 1987), ch. 8.

**Bodin, Jean** (1530–96). French political theorist celebrated for *Six livres de la république* (1576). Like Hobbes, with whom he has some ideas in common, Bodin feared civil war. His *Republic* was inspired by that feeling, and he belonged to a group known as the Politiques, who wished to support royal power as the safeguard of peace. He regarded the natural grouping of the family as the mainstay of social order, and made the principle of absolute sovereignty the defining principle of the state. He allowed that the state, based solely on sovereign power, might be monarchical or democratic, but argued that the only really well-ordered state was one with undivided power, a monarchy. His advocacy of undivided sovereign power was not consistently combined with his belief in constitutionalism.

G. H. Sabine, *A History of Political Theory* (London, 1937).

**body.** One of the most fundamental concepts in philosophy because of the role it plays in the picture of an 'external world' composed of three-dimensional entities which we perceive. Generally contrasted in this sense with *space*, the medium containing these entities, bodies are also contrasted with *minds* (except in the thinking of materialists like Hobbes) because the external world containing bodies is not external to my own body; it is rather that my body is itself one of them. Once this picture holds sway, two great problems emerge. One is that, if my knowledge of reality is confined to my own perceptions, how can I be certain what the world is really like, or even that it exists at all? Almost all the great philosophers have regarded these as difficult questions, some concluding that there is no external world, some that we can't know what it is like. This is not surprising: given the picture of perceptual experience which generates such questions, they are unanswerable. If my perceptions are private mental phenomena, the gap between them and the 'physical' world is unbridgeable.

The other great problem is that I appear in this scheme of things to have a special and peculiar relationship with one of the entities in the physical world, which is my body. But it is difficult to say why I believe, as it is generally claimed I do, that it belongs to me. Descartes was inclined to think that I regard it as mine because it always accompanies me, which might be called the 'stray dog' conception of ownership. It ought to be clear, however, that any such account is confused: it relies on describing me, and where I am, in terms that are ruled out by the picture which generates the problem. If I am, as Descartes thought, a mind, a non-spatial entity, it makes no sense to

say where I am, and hence no sense to suggest that my body might be in the same place or close by.

Both these alleged problems, then, have tormented philosophers endlessly precisely because they are generated by a metaphysical picture which makes them insoluble.

**body and mind:** see mind–body problem.

**Boethius, Anicius Manlius Severinus** (c.480–c.526). Roman patrician, Master of the Offices under the Italian king Theodoric, later accused of treason and magic, imprisoned at Pavia, tortured and executed; an early eminence in the tradition of Latin philosophy stretching forward to Kant. Besides commentaries on Cicero, Porphyry, and Aristotle, essays on logic, and short treatises on the Trinity, we still have from him textbooks on his 'quadrivium' of geometry, arithmetic, astronomy, and music, intended for his own darkening times but destined to serve all the Latin Middle Ages. Their tone is Platonist, their aim not practice but understanding of the cosmos as befits a 'liberal' education. In prison he wrote the incomparable *Consolation of Philosophy*, which contains (at 5. 6) a famous definition of \*eternity as 'perfect possession all at the same time of endless life', and perhaps the first clear statement of the difference between conditional and simple necessity (the necessity that he's-walking-if-you-know-he-is does not—when added to the fact that you know he is—'drag with it' the necessity that he's-walking). For many centuries Aristotle was known in the West only from two of Boethius' translations.

**Bogdanov, Alexandr Alexandrovich** (1873–1928), real name Malinovsky. Bolshevik philosopher and ideologist who developed 'empirio-monism', a combination of Marxism and the positivist \*'empirio-criticism' of Mach and Avenarius. Empirio-monism advances an extreme collectivism where reality is 'socially organized experience' and the distinction between individual minds (i.e. between individual ways of organizing experience) will dissolve once social conflict is eradicated by communism.

Bogdanov was a significant leader of the Bolshevik faction until 1909, when Lenin condemned Russian empirio-criticism as a revisionist heresy. Thereafter Bogdanov's political star declined, though he continued to develop his ideas, first in science fiction, then in the 'general organizational science' of *tektology*. After the 1917 revolution, Bogdanov was influential in the 'proletarian culture' movement. He died in the service of his collectivist ideals after performing upon himself an experiment in

blood transfusion designed to promote ‘the comradesly exchange of life’.

**Bohr, Niels** (1885–1962). Danish physicist and Nobel prize-winner (1922). Bohr made important contributions to atomic theory and nuclear physics (the liquid drop model) and, indirectly, influenced the rise of molecular biology. Much to his surprise he found that his early (1910) belief that experience is basically ambiguous was supported by ‘hard and solid’ scientific evidence: concepts firmly grounded in facts divide into mutually exclusive or ‘complementary’ groups all of which are needed for stating what we know, though the use of any particular group rules out the use of the rest. According to Bohr different cultures, different concepts or attitudes within a particular culture (truth and clarity, love and justice), and different methodological approaches (mechanicism and teleology in the life sciences) are related in a similar way. Bohr believed that the problems created by the paradoxical status of human beings—they are part of the world and yet put themselves outside of it when claiming to possess knowledge—are resolved by using complementarity descriptions instead of a single ‘objective’ frame.

P.K.F.

A. Pais, *Niels Bohr’s Times in Physics, Philosophy and Polity* (Oxford, 1991). Literature, analysis, and biography.

**Boltzmann, Ludwig** (1844–1906). As philosopher of science Boltzmann emphasized, against the positivist phenomenalists (Mach, Duhem), the role of invented hypotheses and the importance of posited unobservable theoretical entities and properties. He defended atomism in a period in which it was under sceptical attack. Along with J. C. Maxwell he is the inventor of modern statistical mechanics, his contributions including the Boltzmann equation, the *H*-theorem allegedly proving irreversible approach to equilibrium, and the ergodic hypothesis. His was also the discovery of the association of entropy with the probability of the micro-states of a system. He introduced the first ‘anthropic’ argument into physics in his discussion of the place of non-equilibrium in an (allegedly) mostly equilibrium universe and originated the claim that entropic increase in time is the ground of all of our intuitive distinctions between past and future.

\*theory.

E. Broda, *Ludwig Boltzmann* (Vienna, 1955).

**Bolzano, Bernard** (1781–1848). Bohemian philosopher, mathematician, and logician; a late follower of Leibnizian rationalism and a critic of Kant’s philosophy of mathematics. Bolzano developed a special logico-ontological atomism directed against radical scepticism and subjectivism. The objectivity of knowledge had to be secured by the existence of non-linguistic entities (ideas, propositions, and truths) independent of human beings and prior to cog-

nitition. As mathematician Bolzano helped to establish the foundations of analysis (for example, the Bolzano–Weierstrass theorem), attempted to elaborate mathematical method, and anticipated some basic ideas of Cantor’s set theory. His major work, *Wissenschaftslehre* (1837), contains various contributions to logic and semantics concerning the relations of compatibility, derivability, and consequence, the deduction theorem, and the logic of classes, entailment, and probability. He was also influential as a social moralist.

**Bonaventure, St** (1221–74). A native of Tuscany, he joined the Franciscan Order, and subsequently studied at Paris under Alexander of Hales, who influenced him strongly. He later became Professor of Theology at Paris, before being appointed Minister-General of the Franciscans (1257), and Cardinal in the year before his death. His writings are in the Augustinian tradition but he did not ignore the writings of Aristotle. Bonaventure, always more a theologian than a philosopher, rejected important parts of Aristotle’s system, for that system failed to take account of central truths such as the divinity of Christ and the trinity of God. Amongst other doctrines he rejected Aristotle’s teaching on the eternity of the world. Bonaventure’s great contemporary Aquinas had argued, contrary to Aristotle, that reason alone could not settle the issue whether the world was eternal, but Bonaventure rejected Aquinas’s position also, and held instead that Aristotle’s doctrine was impossible, for if the world had indeed lasted for an infinite time the infinite must be getting bigger because each new day is a further period of time added to an infinitely long period; yet there cannot be two infinities one of which is bigger than the other. It is therefore a matter of reason and not of faith that the world has not existed from all eternity.

E. Gilson, *The Philosophy of Bonaventure* (London, 1938).

**Bonhoeffer, Dietrich** (1906–45). German Lutheran theologian martyred by the Nazis. His ‘non-religious interpretation of biblical concepts’ has been misunderstood as a kind of secularism. In fact, Bonhoeffer thinks that the growth of scientific atheism in the West provides an opportunity to dispense with God as an empty intellectual postulate, and return to the living \*God who suffers as Christ: the self-revelation that essentially distinguishes Christianity from other religions. This ‘theology of the cross’ is apparent as early as the dissertation *Akt und Sein* (1931), his most overtly philosophical work. The cost of discipleship argued for in *Nachfolge* (1937) is the death of the old worldly self in submission to Christ. Nazism shows that human beings are not naturally religious, and Hitler is the anti-Christ. Theologically, Bonhoeffer’s thought emphasizes the immanence rather than the \*transcendence of God. In this it is arguably consistent with some

twentieth-century positivist, materialist, and naturalist attacks on the possibility of metaphysics. s.p.

**boo-hoorah theory.** Apt nickname for crude version of \*emotivism. The theory states that we use ethical words to express our feelings or attitudes and to evoke similar feelings or attitudes in other people. Hence, ‘... is wrong’ or ‘... is right’ amount only to ‘Boo!’ or ‘Hoorah!’ This provides only an embryonic theory of moral language, involving a sharp distinction between facts and values. The theory was developed into more subtle versions of emotivism. R.S.D.

\*emotive theory of ethics.

A. J. Ayer, *Language, Truth and Logic* (London, 1936), ch. 6.

**Boole, George** (1815–64). Mathematician, born in Lincoln and died while Professor of Mathematics at Queen’s College, Cork. In 1847 Boole proposed a \*calculus for proving \*syllogisms; it involved translating each syllogism into arithmetical notation and then eliminating a variable with the help of the laws of arithmetic (such as  $x + y = y + x$ ) together with the new law  $x^2 = x$ . Boole’s creatively chaotic ideas led directly to the invention of \*propositional calculus and \*Boolean algebras, after tidying up by W. S. Jevons, C. S. Peirce, and others. Boole gave several different interpretations of his calculus, interpreting the variables either as propositions or as classes, or even as periods of time. With hindsight we can see Boole’s suggested correspondences between these interpretations as early steps in \*formal semantics. W.A.H.

George Boole, *An Investigation of the Laws of Thought on which are Founded the Mathematical Theories of Logic and Probabilities* (London, 1854; repr. New York, 1958).

**Boolean algebra.** A simple and elegant type of algebraic structure. In 1847 George Boole gave the structure its first unrefined description as part of his development of an algebra of logic. His aim was to translate sentences expressing logical relations into algebraic equations which were then to be manipulated according to algebraic laws to determine what can be deduced from the original sentences. The algebraic laws can be thought of as axioms governing the operations they mention. Boole saw that the axioms do not have a unique subject matter but rather characterize a type of structure. This generalizing move enabled the Boolean structure to be discerned in a wide variety of domains; for example, there are Boolean algebras of propositions, sets, and switching-circuits.

In formal terms, a Boolean algebra is a structure containing a set  $B$ , two binary functions  $\wedge$  (intersection or meet) and  $\vee$  (union or join) on  $B$ , one unary function ‘

(complementation) on  $B$ , and two distinguished elements 0 (the null-element) and 1 (the unit-element) of  $B$ , satisfying the following axioms, for all  $x, y, z \in B$ :

1.  $x \vee (y \vee z) = (x \vee y) \vee z$  and  $x \wedge (y \wedge z) = (x \wedge y) \wedge z$ .
2.  $x \vee y = y \vee x$  and  $x \wedge y = y \wedge x$ .
3.  $x \vee (y \wedge z) = (x \vee y) \wedge (x \vee z)$  and  $x \wedge (y \vee z) = (x \wedge y) \vee (x \wedge z)$ .
4.  $x \vee x' = 1$  and  $x \wedge x' = 0$ .
5.  $x \vee 0 = x$  and  $x \wedge 1 = x$ .

A binary relation  $\leq$  on  $B$  is defined as  $x \leq y \leftrightarrow x \wedge y = x$ ;  $\leq$  partially orders  $B$ . To see that the algebra of sets is a Boolean algebra let  $B$  be the power set of any set  $S$ ,  $\wedge$  be set-theoretic intersection,  $\vee$  be set-theoretic union, ‘ $'$  be complementation with respect to  $S$ , 0 be the null set, and 1 be  $S$ . Then  $\leq$  is set-theoretic inclusion. A.D.O.

R. R. Stoll, *Set Theory and Logic* (San Francisco, 1961), ch. 6.

**bootstrapping.** An anti-holist account of theory-testing designed to show how \*evidence can count for or against a single hypothesis instead of the entire theory it belongs to. Bootstrapping construes the confirmation of a hypothesis,  $H$ , by evidence,  $E$ , as depending upon whether an instance of  $H$  can be deductively or probabilistically derived from  $E$  together with other hypotheses (‘bootstraps’) from the theory  $H$  belongs to. Unlike \*hypothetico-deductive accounts, bootstrapping does not have as a consequence that evidence which supports any hypothesis equally supports any consistent conjunction of that hypothesis and any irrelevant propositions you choose. J.B.B.

Clark Glymour, *Theory and Evidence* (Princeton, NJ, 1980).

**Bosanquet, Bernard** (1848–1923). British philosopher who, influenced by T. H. Green, was, along with F. H. Bradley, one of the chief promoters of Hegelian, or absolute, \*idealism in late nineteenth-century England. He taught for a while at Oxford (and more briefly later at St Andrews) but spent most of his life as a writer and engaged in the politics of charity. Less sceptical and more purely Hegelian than Bradley, he wrote on metaphysics and logic: *Knowledge and Reality* (1885); *Logic; or, The Morphology of Knowledge* (1888). Probably his best work is *The Philosophical Theory of the State* (1899; 4 edns.; frequently repr.). In it he identifies the individual’s real will with the state and hence holds that ‘the common self or moral person of society is more real than the apparent individual’. Given this great importance of the state as ‘the fly-wheel of our life’, he easily constructs a retributive theory of punishment in which punishment is someone’s ‘right, of which he must not be defrauded’. R.H.

A. J. M. Milne, *The Social Philosophy of English Idealism* (London, 1962).

**bourgeoisie and proletariat.** In Marxian theory, the two most historically influential social classes in modern

capitalist society, which is fundamentally characterized by the \*class struggle. The bourgeoisie are those who privately own the means of production and live from the profits and interest on capital; the proletariat is the class of wage-labourers hired and exploited by capital. Marx credits the bourgeoisie with creating the productive forces which are the foundation of modern society; but he thinks the potential of these forces to serve humanity will be actualized only after the social order has been revolutionized by the proletariat.

**Boyle, Robert** (1627–91). Boyle is well known as a scientist but underrated as a philosopher. He wrote interestingly, lengthily, and with more philosophical sophistication than the admiring Locke on topics such as atheism, atomism, epistemology, God's existence, miracles, natural laws, qualities, and scientific method. Emphasizing experiment over theory Boyle refused, as Leibniz complained to Huygens, to construct global theories. Boyle's universe involved God at every stage as creator, designer, sustainer, and frequent intervener. For example, God 'almost every moment in the day' works 'Physical Miracles' by forming 'Animals of such a Compounded nature, as the . . . Laws of matter & motion, would not w<sup>th</sup>out a peculiar interposition of God, be able to produce'. None the less, in science appeal to God was inappropriate: all 'intelligible' explanations must be in terms of minute corpuscles of matter and their motions.

J.J.M.

Michael Hunter (ed.), *Robert Boyle Reconsidered* (Cambridge, 1993).

**bracketing.** An essential part of Husserl's so-called phenomenological reduction. According to Husserl, and some of his followers, we can describe the objects of our minds as *phenomena* only after we have bracketed their existence. By bracketing the objective world, one *suspends* judgement about the existence of the things around us. The botanist, for example, takes for granted that there are trees and studies their characteristics. The phenomenologist does not deny that the botanist is right, but he puts the existence assumption in brackets, and tries to describe the phenomena precisely as they present themselves to him. For example, the phenomenologist may study the object of a mental act of seeing a tree, the precise *what* of what he is seeing at that moment, irrespective of whether his perception is correct, of whether there are trees, or even of whether there are any perceptual objects at all.

R.G.

\*phenomenology.

For Husserl's description of bracketing see Edmund Husserl, *Ideas*, tr. W. R. Boyce Gibson (New York, 1962), 96–101.

**Bradley, Francis Herbert** (1846–1924). British philosopher, fellow of Merton College, Oxford. Bradley is indisputably the greatest British philosopher between J. S. Mill and Bertrand Russell. His philosophy is a late example of the movement of British philosophers away from the tradition of British \*empiricism towards German \*idealism, in particular Hegel. However, despite himself, he was much nearer to British Empiricism than other British idealists of the period such as T. H. Green and Bernard Bosanquet.

*Ethical Studies* (1876) was his most Hegelian work. Contending that a moral outlook must be justified by the form of 'self-realization' it offers, Bradley examines a series of moral systems which in turn rectify each other's contradictions.

\*Hedonism, whether individualist or universalist, presents itself initially as the most attractively down to earth of moral theories. But the maximization of pleasure provides no genuine form of self-realization for anyone. The pleasures of different times form no real totality, since they never exist together, and can never constitute a state of affairs of which anyone can say: 'Here I have that which I was seeking'.

Bradley now turns to the sharply opposed Kantian ideal of 'duty for duty's sake'. Here the good is identified with sheer rationality; one is to behave only in a way which one could will universalized without contradiction. This advances on hedonism in recognizing the self as somehow a 'universal' rather than as a series of 'perishing particulars'. But its purely formal notion of morality provides neither a definite guide nor any proper human satisfaction.

Next comes the vastly superior Hegelian morality of 'my station and its duties'. Here the demands of morality are no longer those of a remote logical abstraction, with no appeal for flesh and blood, but those of a role in a concrete historical community such as provides a satisfying life for the real empirical man. Much more satisfactory as is this social ethic than the two preceding, it cannot be the final truth. For the community itself may be rotten with a morality to be transcended; moreover, full self-realization need not be purely social.

These limitations push us on to what Bradley calls 'ideal morality'. The basic injunction here is to realize everywhere the best self, and our idea of our best self, though it must arise from the ideals we learn in the family and in life in the community, may develop beyond it to take account of values learnt from other societies or based on internal criticisms of our own society. The basic test for the adequacy of an ideal morality is that it satisfies the individual as a 'concrete universal', that is as an individual whose life is a unity, resting on his unity with his kind, rather than, like the other three theories respectively, as a mere series of experiences, or as some abstract pure ego, or as being entirely socially conditioned.

In his next great work, *The Principles of Logic* (1883), the Empiricists' psychologistic approach to logic is criticized in a manner not unlike Husserl, but, like Husserl, he includes the examination of strictly necessary features of

thinking within its remit. A main theme is the inadequacies of the traditional Aristotelian analysis of judgements into subject and predicate. There are many propositions (e.g. existential and relational ones) and related forms of inference which escape this net.

Ultimately every judgement ascribes a single (normally complex) idea as predicate to Reality as subject. Reality is that greater whole of which the perceptual manifold presents itself as an incomplete fragment. There are intriguing similarities and contrasts between Bradley's position here and that of Bertrand Russell, whose theory of definite \*descriptions (talking of the King of France where Bradley talks of the King of Utopia) as belonging logically to the predicate owes somewhat to him, as does his account of existential (also universal) propositions. For Russell the most basic factual propositions concern particulars with which we are acquainted; those whose grammatical subjects are only identified by description are logically derivative. Bradley is even more insistent that it is only because our access to Reality is not entirely conceptual that we get beyond the circle of our own ideas in thought and treats demonstratives quite similarly, though holding that they must be dropped in fundamental theory.

\*Inference is the construction of a larger mental representation put together from those which constitute the premisses, and reading off a conclusion from the holistic character it turns out to possess (oddly anticipative, though without any whiff of materialism, of suggestions by some current 'cognitive scientists').

*Appearance and Reality* (1893) is the main statement of his metaphysics. Book I, *Appearance*, argues that most ordinary things (e.g. things and their qualities, time and space, causation, the self, even things-in-themselves) are merely appearances, while book II, *Reality*, strains to characterize, with more final truth, the Reality they so usefully misrepresent to us, namely the \*Absolute, a single cosmic experience of which we (so far as we truly are at all) are components.

In calling something an appearance Bradley means, primarily, that the concept of it only gives a pragmatically useful way of thinking about some aspect of the world of which, being incoherent, it cannot give us a finally satisfactory grasp. Something in the Absolute, for example, corresponds to Time, but it is so unlike Time, as we ordinarily conceive it, that thus conceived it is ultimately an illusion. However, reality (as predicate) is a matter of degree, that is, our concepts are true (and conversely false) of reality (as thing) in different degrees. The concept of the Absolute is more adequate than that of \*time, but both are just our way of grappling with what the intellect cannot finally grasp. This is established by two main lines of argument, firstly, that reality must have a unitary togetherness which cannot be captured by the ordinary conception of many distinct things in relation, secondly, that all concrete reality must somehow be psychical in its nature. Reality is somehow one vast eternal self-experiencing many-in-one. Though often presented somewhat sophistically, there is a vein of powerful argument to back this conclusion up.

The most famous feature of the first line of argument is his attempt to show that the idea that the world consists in a multiplicity of distinct things standing in various relations to each other is incoherent. For when two terms stand in a certain relation, we must either think of the relation as a separable component in the total state of affairs or in some other way. (1) If you think of it as some kind of *separable component*, then it seems to require to be related to its terms by fresh relations, and these to be related to those relations and their terms by further ones, and so on in an impossible regress. (2) To avoid this you may treat the relation as an aspect of one or other of the terms, or divide it into two aspects one pertaining to each of the terms. But in either case the terms are apparently left apart, each simply possessing a feature which does not bring it together with the other one. (3) Finally, you may treat the relation as an aspect of the terms taken together as constituting a unit. But that betrays the very notion of a relation by merging the terms between which they hold into a single thing; moreover, their togetherness does not seem particularly due to the relation since they have already (logically speaking) to be together to provide a home for it. In effect, Bradley's position is that relational thought allows us to shift between thinking of a thing as something conceivable independently of how it stands to other things and thinking of it as a mere aspect of some larger whole they jointly help to constitute, two ways of conceiving it which militate against each other.

Bradley's solution is that for one thing to be (as we would ordinarily somewhat distortingly put it) related to another is in the end always a matter of their being aspects of some more comprehensive and more genuinely concrete individual, conceived apart from which they are necessarily to some extent misconceived. If so, and since everything is somehow related (as we would ordinarily put it) to everything else, there must be some maximally comprehensive and concrete individual (the Absolute) from which everything else is an abstraction.

That this ultimate individual must be a single cosmic experience including everything is established by the second line of argument according to which we can form no genuine conception of an unexperienced reality. An application of this principle at the level of finite existence shows that it consists ultimately of myriad finite centres of experience and their presentations on the basis of which they construct the world of common sense, while the monistic argument shows that these centres must pertain to a Whole conceived apart from which they are partly misconceived.

In some respects his form of absolute idealism receives a better presentation in his *Essays on Truth and Reality* (1914). This also contains the classic statement of a \*coherence theory of truth and knowledge. His contention that there are no basic judgements beyond revision, and that the whole system of our thought continually faces experience as a whole, has strong affinities with aspects of the work of W. V. Quine. Nicholas Rescher has derived much

of his own elaborate coherence theory of truth from Bradley.

**brain in a vat.** Contemporary counterpart of Descartes's hypothesis that one's beliefs are induced by an evil genius.

Used within a premiss in arguments for scepticism, the hypothesis says that nothing exists except one's brain—in a vat, in order that its electrochemical activity should be sustained—so that whatever may seem to one to be the case, its seeming so is accounted for by such activity alone. The sceptic invites one to say 'For all I know, I am a brain in a vat, and there is no external world'.

Brains in vats are introduced also in philosophy of mind in connection with the idea that a person's psychological faculties require nothing but a brain's operations. The idea may be questioned, and will be by the supporters of \*anti-individualism and others.

\**malin génie*.

Hilary Putnam, *Reason, Truth and History* (Cambridge, 1981), ch. 1.

**Braithwaite, Richard Bevan** (1900–90). Professor of Philosophy at Cambridge, mainly known for his staunchly empiricist views within philosophy of science. Thus he followed Hume in believing that laws of nature do not embody any kind of necessity but are, objectively, merely constant correlations. Braithwaite also attempted to apply the mathematical theory of games within moral philosophy, and to reinterpret religious statements as declarations of intention to accept particular moral ways of living.

Rather than considering scientific assertions in their rough-and-tumble variety of uses within scientific communities, in *Scientific Explanation* Braithwaite described uninterpreted formal systems, and how a tough empiricist might give them meaning as scientific statements. Within this basic framework he discussed the standard problems of theoretical terms, models, probability, induction, laws, causation, and explanation.

\*Cambridge philosophy; empiricism.

R. B. Braithwaite, *Scientific Explanation* (Cambridge, 1955).

**Brandom, Robert B.** (1950–). Distinguished Service Professor at the University of Pittsburgh, working largely in the philosophy of language, but also in metaphysics and the history of philosophy. His prominent book *Making it Explicit* defends and develops an inferentialist, as opposed to a representationalist, approach to the relationship

between language and the world. This approach starts by explaining the \*pragmatics of language in terms of the inferences which language-users should accept and the attitudes other language-users should have to those inferences; so the norms of language use must be understood in social terms. \*Semantics is then explained in terms of pragmatics; according to Brandom, the meanings of words depend on their roles in inference. By understanding the way those inferences allow certain substitutions, Brandom claims to explain the representational language of truth and reference. His work is influenced by \*pragmatism, in particular the \*neo-pragmatism of \*Sellars, as well as by \*Hegel's construction of objectivity out of the process of dialectic.

**Brentano, Franz** (1838–1917). German philosopher educated at Würzburg, Munich, Berlin, and Münster Universities. He was awarded his Ph.D. at Tübingen University in *absentia* in 1862. Two years later he was ordained a priest. In 1866 he wrote his habilitation thesis and was appointed *Privatdozent* at the University of Würzburg. His best-known book, *Psychology from an Empirical Standpoint* (tr. London, 1973), appeared first in Leipzig, in 1874. Brentano was called the same year to the University of Vienna as full Professor of Philosophy. After he left the Catholic Church and got married in 1879 he had to resign the professorship, but continued to serve as *Privatdozent* at Vienna University until 1894. He spent the following years mostly in Florence, and finally in Zurich, where he died.

*The Background: The Philosophy of Aristotle.* Franz Brentano's work was inspired by the philosophy of Aristotle, whom he regarded as a 'man for all times'. Much of Brentano's work, although critical in spirit, is dedicated to Aristotelian issues. His doctoral dissertation *The Several Senses of Being in Aristotle* (Freiburg im Breisgau, 1862; tr. Berkeley, Calif., 1981) and his habilitation thesis on *The Psychology of Aristotle* (Mainz, 1867; tr. Berkeley, Calif., 1977) focus on Brentano's chief preoccupations, psychology and \*ontology. Brentano also investigates these topics in his lectures on metaphysics which began in 1867.

Metaphysics, says Brentano, in order to be established as a strict science, has first to seek for a basis in certainty. Scientific knowledge has to show itself either as evident, and therefore true, or at least as highly probable. Immediately evident thoughts, for Brentano, are the 'Archimedean points' of all our knowledge and arguments, and of all sciences (*The True and the Evident* (tr. London, 1966)). Secondly, metaphysics has to deal with ontological questions, (a) in a narrow sense, where it is \*'phenomenology of mind', and (b) in a wider sense, where it is the ontology of things other than ourselves: the world, God (*On the Existence of God* (tr. The Hague, 1987)), the cosmos.

*The Ontology of Mind: Psychology and Phenomenology.* Brentano's psychology starts from an empirical standpoint. Empirical psychology, in his view, is to be defined as the science of inner experience or awareness. This conscious awareness, considered in itself, presents itself as being (a) intentionally related to external entities, and (b) reflexively related to itself. Brentano analyses both relations in order to describe the ultimate elements of the experienced, intentional structure of the mind. This he does in his theory of \*intentionality. He sets out to analyse the epistemic status of these phenomena in his *Descriptive Psychology* (Hamburg, 1982; tr. London, 1994), which he also called 'descriptive phenomenology' or 'phenomenognosis'. His aim is 'to define the elements of the human consciousness and of their interconnections (as far as possible) in an exhaustive manner, in order to give us a general notion of the entire human consciousness' (ibid. 1–2). Brentano gives a 'pure description' of the facts of consciousness, rather than a consideration of the physiological genesis of our conscious phenomena, since such a genetic psychology must rest on a descriptive psychology. In order to give a complete description ('microscopic analysis') of the phenomena of the human mind, philosophical psychology must first and foremost examine 'mental phenomena', 'functions', or 'acts' (*The Psychology of Aristotle and Psychology from an Empirical Standpoint*). Thus Brentano became known as the founder of 'act psychology'.

All the data of our consciousness, according to Brentano, are divided into two classes: the class of physical phenomena and the class of mental phenomena. A mental phenomenon is, for instance,

[e]very idea or presentation which we acquire either through sense perception or imagination . . . By presentation I do not mean that which is presented, but rather the act of presentation . . . Furthermore, every judgement . . . is a mental phenomenon. Also to be included under this term is every emotion . . . the term 'mental phenomena' applies to presentations as well as to all the phenomena which are based upon presentations . . . This act of presentation forms the foundation not merely of the act of judging but also of desiring and of every other mental act. Nothing can be judged, desired, hoped or feared, unless one has a presentation of that thing . . . Examples of physical phenomena, on the other hand, are a color, a figure, a landscape which I see; a chord which I hear; warmth, cold, odor which I sense; as well as similar images which appear in the imagination. (*Psychology from an Empirical Standpoint*, 78–80)

The characteristic common positive property of each mental phenomenon is what was

called the intentional (or mental) inexistence of an object, and what we might call, though not wholly unambiguously, reference to a content, direction towards an object (which is not to be understood here as meaning a thing), or immanent objectivity . . . We can therefore define mental phenomena by saying that they are those phenomena which contain an object intentionally within themselves. (Ibid. 88–9.)

The characteristics of mental phenomena stated by Brentano here and elsewhere can be summarized under three headings.

1. There are three classes of them: presentations, judgements, and emotive phenomena. They are either acts of presenting which serve as a basis for all other mental acts, i.e. these other acts necessarily contain presentations as 'parts' and are dependent on presentations, which are the 'fundaments' or 'motifs' for the other 'superposed' acts. This implies that the science of judgements, i.e. logic (*The Theory of Correct Judgement*; German edn. *Die Lehre vom richtigen Urteil* (Bern, 1956)), and the science of emotive phenomena, i.e. ethics (*The Origin of Our Knowledge of Right and Wrong* (tr. Westminster, 1902; repr. London, 1969); *The Foundation and Construction of Ethics* (tr. London, 1973)), relies on *fundamental* psychological observations of modes of presentations. In a correct judgement, some presentation, or a part of it, is either affirmed or denied if the categories true or false are evidently applicable. Analogously, in a correct act of emotion, something is either loved or hated correctly, or preferred correctly, motivated by the goodness of what is presented. Yet acts of judgements and of emotions differ fundamentally from acts of presentation (a) because there is no inner difference in presentations—they are all positive; (b) because a judgement as well as an act of emotion is not just a connection or separation of presentations but an additional judging or emotive act, respectively, on the ground of what is presented.

2. Mental phenomena (a) are or have an intentional relation towards a 'content' (a thought) or an 'immanent object' (an object thought of); (b) are conscious and reflexive mental acts. To any conscious act there essentially belongs a relation. And as in any relation, there are two inseparable correlates. The one correlate is the conscious mental act itself (the 'fundament' of a relation), the other correlate is that (the 'terminus' of a relation) to which it is directed. The conscious act is always the real correlate; that about which it thinks is not necessarily a real adjunct of the act of thinking. I may think about a unicorn as my thought content. My thinking about it is real, the unicorn is not. It is a thinker who has mental phenomena or properties: only individuals, persons, can have psychical properties. Structures or abstract systems cannot have them. If a psychical state is to be exemplified, then it can be exemplified only in an individual.

3. Mental phenomena show a 'twofold energy'. Each act, whilst directed towards something, at the same time and in passing is reflexively directed towards itself. Being presented with a physical or 'primary' object, e.g. a sound, we are aware of being presented with it. In a mental phenomenon as such, the consciousness of itself, the 'secondary object of perception', is included. This 'secondary inner perception' is a true, self-referential, evident perception in the strict sense. When an intentional phenomenon occurs to us, we know that it occurs; and in knowing this we grasp its essential nature. When we judge, we know what the property of judging is and what is logically required if an individual is to have such a property.

*Ontology of Things.* In his philosophy of mind, or psychology, Brentano deals mainly with inner experience and sets aside the objects of outer experience.

In the metaphysical context, he argues for the value and the validity of our mediate, indirect knowledge of bodily substances and their properties, with properties of all beings, of God and the world. This ontology in the broader sense presupposes the ontology of mind, which thus forms a foundational, integral part of the ontology of things. So, as the phenomena of human consciousness essentially are characterized as being 'intentionally directed', the 'outer world' analogously is seen as characterized by its teleological structure.

In his description of mental phenomena and their structural interrelation Brentano aims at a 'microscopic' analysis, as remarked earlier, but in his macroscopic cosmology he sees 'the whole as end of the parts'. His ontology of things develops what he had envisaged in his doctoral dissertation, where he attempted a description of Aristotle's theory of categories. Brentano differentiates the categories into (1) objective ('*reelle*') concepts of the kinds (genera) of being, and (2) semantic ('*logische*') modes (predicaments) of speaking about being. This differentiation is to be seen not as a fundamental discrepancy, but as a change of aspects in a description theory of being. Brentano goes on to emphasize that only real things, '*res*', or individuals, not concepts of things, or universals, are the proper objects of description.

*Brentano's Influence.* Brentano's empirically motivated philosophy was designed in analogy to the method of natural science: 'The adequate method of philosophy is that of natural science.' This was the thesis of his habilitation colloquium and Carl Stumpf, who was then studying under Brentano, reports that it attracted many students to him. Among them were Stumpf himself, known for his *Tonpsychologie*; Anton Marty (and students of his in the Prague Linguistic Circle, such as Franz Kafka and Max Brod), known for his descriptive philosophy of language; Sigmund Freud; the 'Graz School' around Alexius Meinong, known for its 'object theory'; Christian von Ehrenfels, for his '*Gestalt*' theory; Edmund Husserl, for his phenomenology; Tadeusz Kotarbinski, for his 'reism'; Thomas G. Masaryk, for his 'concretism'; George F. Stout and his students Bertrand Russell and G. E. Moore; the Würzburg School centred around Oswald Külpe, known for its experimental psychology of thinking; Max Scheler, known for his ethics; and Martin Heidegger. Quite a number of more recent influential thinkers, such as Roderick M. Chisholm, admit Brentano's influence, and there is good reason to call him the 'grandfather of phenomenology' (Gilbert Ryle) and '*terminus a quo* of Austrian philosophy' (Rudolf Haller). w.B.

**Brentano's thesis:** *see* intentionality.

**Bridgman, Percy William** (1882–1962). Distinguished as a physicist, Bridgman has had considerable impact on the philosophy of science in the twentieth century, with his insistence that the work and results of science, especially physics, are 'operational'. Much impressed by Einstein's work on relativity and its seemingly paradoxical conclusions about time, Bridgman argued that the only recourse is a fairly stringent form of instrumentalism, whereby the concepts of science are reduced or replaced by the operations necessary to achieve or measure them.

Many professional philosophers have found Bridgman's thinking simplistic, arguing that science simply has to be 'open-ended', reaching beyond its empirical base, making claims which transcend anything reducible to operations. Bridgman himself conceded that sometimes the connection in science between concepts and operations is 'indirect'. In the opinion of critics, however, being 'indirectly operational' is somewhat on a par with being 'a little bit pregnant'. M.R.

\*instrumentalism.

— *The Way Things Are* (Cambridge, Mass., 1959).

P. Frank, *The Validation of Scientific Theories* (Boston, 1959).

**Brightman, Edgar Sheffield** (1884–1953). American exponent at Boston University of personalistic \*idealism, who held that \*God created out of a chaotic, irrational 'Given', not *ex nihilo*. The Given's relation to God is left somewhat ambiguous, however. Brightman's attempts to make his account self-consistent by distinguishing different senses of 'internal to God' are not entirely convincing. None the less, Brightman unequivocally stated that God, finite in power, is growing in perfection through effort in time. Such a religious metaphysics has affinities with the process theism of Whitehead and Hartshorne as well as with the mature views of Royce. Characteristic of one strain of American philosophical theology is a desire to cling to the essentials of monotheism while conceiving of God as a quasi-democratic leader who heroically struggles to perfect himself and the world, just as he asks lesser persons to do. P.H.H.

Andrew J. Reck, *Recent American Philosophy: Studies of Ten Representative Thinkers* (New York, 1964).

**Brillat-Savarin, Jean Anthelme** (1755–1826). A judge of appeal and amateur philosopher. He upstaged the aestheticians by treating \*taste simply as the sense by which we discern flavours. The charm of personality that carried

him unscathed through a lifetime of revolutionary violence still makes his gastronomic meditations delightful reading. He does for eating all that Izaak Walton did for angling, and more. Cooking, which Plato had despised as a mere 'routine', is transmuted into philosophy out of office hours. In the Meditations 'On Dreams' and 'On the End of the World' he shames, respectively, Descartes and Kant; and we can all profit from his opening Aphorisms, for instance 'The discovery of a new dish does more for the happiness of mankind than the discovery of a star'.

**British philosophy today.** Most (although not all) of the philosophy practised in Britain today is firmly within the tradition of analytic philosophy, a tradition shared with North America, South Africa, and Australia (and certain European countries, especially Germany and Austria). It would be hard to argue that there was any longer a characteristically British way of doing philosophy. Certainly, there are no movements peculiar to the country that are as readily identifiable as that of British empiricism in the seventeenth and eighteenth centuries, or the 'ordinary language' philosophy of 1950s Oxford. In addition, the influence of North American philosophers has been very substantial, and the initial stimulus for some research programmes has come from them. (One indication of this influence is the number of British university chairs taken up by—or at least offered to—American philosophers in recent years.) However, any country has its own distinctive intellectual history, even if philosophical problems and methods are international. The following therefore attempts to identify in a necessarily very selective way some trends in the development of philosophy in Britain since 1970, and some of the key personalities in that development, rather than describe in detail any particular set of problems.

*The legacy of Logical Positivism.* Following A. J. Ayer's vigorous application of the principles of verificationism to statements that appear to refer to a reality that is beyond immediate appearances—statements about the past, for example, Michael Dummett articulated a more circumspect *anti-realism* concerning such statements. This project has been extended by Crispin Wright, who has developed a detailed account of what is at issue in disputes concerning the reality of certain kinds of object. A position intended to be intermediate between \*realism and anti-realism, 'quasi-realism', has been articulated by Simon Blackburn (now back in Britain after an extended stay in the USA).

*Philosophy of language and mind.* Greatly influenced by the American philosophers Saul Kripke and Donald Davidson, work in the philosophy of language in the 1970s (especially in Oxford) placed the issues of truth and reference centre stage, representing them as key to a number of

debates. The two prominent questions were: Can the meaning of sentences be given by an account of what would make them true? and How do singular terms succeed in referring to particular objects? Since then, and partly as a result of the work of Gareth Evans (d. 1980), there has been a shift of focus towards mental representation, the corresponding questions being: What determines the content of a thought? and How does a thought succeed in being about a particular object? This second question is sometimes referred to as the problem of \*intentionality. There has also been work on specific forms of mental representation—for example, spatial representation. Interest in the relationship between language and mind led to the foundation in 1985 of a new British-based journal, *Mind and Language*.

Philosophy of mind, on both sides of the Atlantic, was dominated in the 1970s and 1980s by two aspects of Davidson's work: the analysis of intentional \*action and the defence of \*physicalism (although action had already been the subject of studies by Stuart Hampshire and Elizabeth Anscombe). The worry was expressed, however, that Davidson's own brand of physicalism (anomalous monism) was unstable—specifically, that it collapsed into \*epiphenomenalism. In the 1990s, enthusiasm for physicalism waned somewhat with the emergence of doubts as to whether a non-trivial form of physicalism could be articulated. These doubts were quite independent of any renewed enthusiasm for dualistic accounts of the mind. Among other developments could be mentioned the interest in computational models of the mind and the mechanisms underlying ascription of mental states to others.

*Metaphysics.* Britain in the 1950s and 1960s was not particularly congenial to metaphysics, although the appearance in 1959 of P. F. Strawson's enormously influential *Individuals: An Essay in Descriptive Metaphysics* was an honourable exception. The last twenty years, however, has seen a remarkable resurgence of interest. There has been increasing confidence in the power of language to capture substantial truths about the structure of the world, as opposed to the logical form of sentences, and a greater willingness to take certain kinds of statement at face value, as positing the existence of things that are independent of our conceptual schemes. (Perhaps one can identify the Australian influence here, through the work of such philosophers as David Armstrong and J. J. C. Smart, but a major stimulus has been, once again, American, particularly in the form of David Lewis (d. 2001).) Two debates might be mentioned as illustrative. (a) *Realism concerning abstract entities.* Work in the philosophy of mathematics has involved a reconstruction of Frege's work on the existence of numbers as objects, and the articulation and defence of a mathematical 'Platonist' (i.e. realist) position, and its extension to abstract entities generally. What is distinctive about British work in the area is the attention given to the epistemological problems raised by Platonism, especially the question of whether it can be

reconciled with the causal theory of knowledge. (b) *\*Vagueness*. A brief but provocative paper by Gareth Evans ('Can There Be Vague Objects?'), which appeared in 1978, inspired a considerable amount of work on the question whether vagueness was simply a feature of language or knowledge or also of the world itself. There has been a flowering of work on traditional ontological issues, concerning *\*causality*, *\*identity*, *\*modality*, *\*time*, *\*properties*, and *\*particulars*.

*Ethics*. Three important developments should be mentioned. (a) The work of Bernard Williams, Alasdair MacIntyre (based in the USA since 1972), and Derek Parfit has highlighted the central place of the self, and ideas of the self, in ethics. Parfit in particular has questioned our ordinary view of the self as retaining its numerical identity through time, and shown how his alternative view breaks down the boundaries between persons and so undermines *\*egoism*. (b) John Mackie's influential critique of moral *\*objectivism* (*Ethics: Inventing Right and Wrong*, published in 1977) has provoked two kinds of critical response. One is a defence of objectivism, or realism, championed by Jonathan Dancy, John McDowell (based in the USA since 1986), and David McNaughton. Although realism has its American proponents, the British version rejects *\*ethical naturalism* (the view that moral properties are reducible to non-moral properties). The other response, offered by Simon Blackburn is 'quasi-realism' or 'projectivism', which takes ethical values to be real, though mind-dependent, qualities. (c) British moral philosophers have also played an influential role in the revival of interest in two central ideas in ethics: *\*consequentialism* and the *\*virtues*. Here we should name, on the one hand, R. M. Hare (arguably the father of contemporary moral theory (d. 2002)), and on the other, Elizabeth Anscombe (d. 2001), and Philippa Foot.

*Philosophy of science*. Perhaps the most striking development in philosophy of science in recent years has been the detailed engagement with the philosophical and meta-physical implications of quantum physics, pioneered by Michael Redhead and Nancy Cartwright (based in the UK since 1991), and pursued notably in Oxford, London, Cambridge, and Leeds.

*Engagement with continental philosophy*. *\*Continental philosophy* is, by definition, not British in its origins, aims, and methods. Nevertheless, a significant feature of the national scene in recent years has been the increasing interest and specialization in continental philosophy within British departments. Traditionally, analytic philosophy has been hostile to the continental style, culminating in the publicly voiced objections to the award in 1992 of an honorary degree to Jacques Derrida by Cambridge University. Recent work, however, has attempted something of a *rapprochement*.

*Philosophers and public debate*. Although much philosophical work is conducted within academic institutions, prominent philosophers have from time to time been

appointed to leading roles on Government committees, especially on ethical matters. Examples of this contribution of philosophers to the formulation of policy include Bernard Williams's chairing of the Committee on Obscenity and Film Censorship, Mary Warnock's chairing of the Committee of Inquiry into Human Fertilization, which produced the much discussed Warnock Report in 1984, and Anthony O'Hear's work as a government adviser on education. A recent high-profile discussion was Onora O'Neill's 2002 BBC Reith Lectures, *A Question of Trust*, on accountability, deception, and freedom of the press.

*Political constraints*. The 1980s was a time of crisis for philosophy in Britain, in economic, rather than intellectual, terms. University cut-backs saw the freezing of posts and the closure of some departments. The overall situation improved during the 1990s, and with the increasing popularity of philosophy as a university subject, some departments have actually expanded. However, one significant determinant of the fortunes of individual departments has been the five-yearly national Research Assessment Exercise, instituted in 1991, which rates quality of research output, with corresponding implications for the research funding allocation to universities. Partly, but not wholly, as a result of this, there has been a significant increase in productivity (as measured by publications), and research activity is now widespread rather than concentrated in a few dominant departments.

**Broad, Charles Dunbar** (1887–1971). Judicious and witty Cambridge philosopher, author of many thorough works on science, mind, ethics, and psychological research. Broad's typical method was an elaborately exhaustive classification of all possible answers to some carefully clarified question, a judicious weighing-up of the pros and cons of each, and a tentative suggestion for the most plausible. He believed that in *\*perception* we are presented with 'sensa', whose occurrence is the effect of events in the brain in virtue of a peculiar kind of causation, that these sensa are not literally spatio-temporal parts of the perceived objects but provide literally true information about their spatio-temporal character and relations, and that physical objects must also have other characteristics which provide their qualitative filling. He developed a notion of absolute becoming to explain the greater reality of past than future and postulated a  $\psi$  component which combined with the brain to produce consciousness. He judged the

empirical evidence on our survival of \*death finely balanced.

**Brouwer, L. E. J.** (1881–1966). Dutch mathematician known to philosophers as the founder of \*intuitionism as a philosophy of mathematics. This owes something to the philosophy of Kant, but more to the paradoxes and contradictions that beset logic and mathematics in the early 1900s. Brouwer thought that these arose because familiar principles of reasoning were being blindly applied to an unsuitable subject-matter, i.e. to infinite totalities. In his view only a 'potential' infinity can be understood, and consequently a statement about all numbers can be counted as true only if we have a method of proving it for any arbitrary number. Since there are many statements about all numbers which we can neither prove nor disprove, Brouwer inferred that the law of excluded middle does not hold in mathematics.

**Brownson, Orestes Augustus** (1803–76). New England social critic, political advocate, religious controversialist, philosopher, and journalist. Brownson was for a time an effective advocate of \*New England Transcendentalism. He was perhaps the most socially astute transcendentalist, arguing in 'The Laboring Classes' (published in his *Boston Quarterly Review* in 1840) that the wage system exploited the many in favour of the few and that reform could result only from changing the *system* and not simply from individual moral improvement (the standard transcendentalist solution to social problems). His most radical reform proposal was for the abolition of hereditary property: at death one's property reverts to the state, which is to distribute it fairly. His conversion in 1844 to Roman Catholicism caused dismay among his former transcendentalist compatriots; as a Catholic Brownson was as creative, outspoken, and controversial as he had been as a transcendentalist.

Arthur M. Schlesinger Jr., *Orestes A. Brownson: A Pilgrim's Progress* (Boston, 1939).

**Bruno, Giordano** (1548–1600). Italian philosopher who sought to overthrow Aristotelianism and replace it with his own eclectic and often self-contradictory philosophical system. Combining the astronomy of Copernicus with the metaphysics of Nicholas of Cusa and the atomism of Lucretius, he believed in an infinite universe which contained an infinite number of inhabited worlds, moving within an uncentred space and composed of minimal particles. He rejected \*hylomorphism in favour of a \*monism in which the universal, infinite, and eternal substance was

identical with both God and nature. Having been excommunicated by the Catholic, Lutheran, and Calvinist Churches on account of his unconventional religious views and undisciplined behaviour, he was finally burned at the stake by the Inquisition. He died a heretic, but in the nineteenth century he was transformed into a martyr to free philosophical inquiry.

**Brunschvicg, Léon** (1869–1944). French idealist philosopher who provides a sustained neo-Hegelian answer to the Kantian question: How is knowledge possible? Rejecting the Kantian project of a transcendental deduction of the categories, Brunschvicg construes philosophy as the historical reflection of consciousness on consciousness. This reveals 'the progress of consciousness' (*le progrès de la conscience*) typified by the emergence of the natural sciences, the findings of which, Brunschvicg argues, are consistent with his own idealism.

Brunschvicg is also known for his scholarly treatments of Descartes and Pascal and for the extension of his historical idealism to the ethics of conscience.

**brute fact.** Two related uses of this idea feature in contemporary analytical philosophy. The first and more common one signifies the terminus of a series of explanations which is not itself further explicable. Thus, for example, it is often said that while the behaviour of matter can be explained by reference to laws of nature the existence and character of those laws is itself a 'brute fact'. The second and more technical use indicates an underlying situation partly constitutive of the truth of a claim. The expression was first used in this sense by Anscombe to characterize the status of facts relative to higher-level descriptions. A set of facts *S* is 'brute' relative to a description *D* when the truth of *D* is constituted by the holding of those facts in a certain context and under normal conditions. Thus, the \*fact that I inscribed a piece of paper, in a context constituted by banking conventions, is brute relative to the description 'J.H. signed a cheque', and the fact so described may itself, in a given context, be brute relative to the description 'J.H. ran into debt'. Hence the status of brute and non-brute facts is a relative one.

**Buber, Martin** (1878–1965). Jewish philosopher born in Vienna and raised in the Ukraine in the home of his grandfather, the Midrash scholar Solomon Buber. Martin Buber studied in Vienna with Dilthey and Simmel and became a Zionist leader in the 1890s, advocating cultural and educational activism. Attracted to the Hasidism of Nahman of Bratslav, whose tales he adapted in German, he wrote

novels of the Hasidic milieu and urged formation of a *Gemeinschaft* in Palestine that would include Arabs and Jews. His teaching cut off by Nazi edicts, Buber settled in Palestine in 1938 and became a prominent advocate of a binational (Arab-Jewish) state. His *I and Thou* (1923) grounds ethics and theology in a dialogical encounter: our fundamental attitudes of turning-toward or leaning-back demarcate the basic relations of I-It and \*I-Thou, which constitute both self and other in radically different ways, objectively, in terms of uses, causes, effects, and challenges to be overcome; or intersubjectively, and personally, that is, morally, even aesthetically. Authenticity, responsiveness, even genuine presentness (and thus freedom) are attained only in the I-Thou relationship. The objectivity of the I-It is fixed in the past. \*God is the eternal Thou, never transformed into an It by spiritual ennui or fatigue, but glimpsed through our encounters with others, with nature and with works of art. It is when we speak to him, not of him, that we encounter the living God. Even those who hate God's name can do this, when they address their lives in terms of a subjecthood that cannot be limited by another. Revelation is humanity's continuing response to the eternal Thou, epitomized in God's covenant with Israel.

**Buddha, the** (*fl.* fifth century BC). The Sanskrit word 'buddha' refers to any enlightened person, but '*The Buddha*' refers specifically to Siddhārtha Gautama, son of a ruler of Sākya in what is now Nepal. Modern scholarship places him rather later than the traditional dates of c.560–480. The Buddha founded a non-theistic religion and articulated the foundations of \*Buddhist philosophy—the Four Noble Truths concerning suffering, its causes and its cessation, the theory of 'dependent origination', and the denial of substantial selfhood.

According to tradition, the twenty-nine-year-old Gautama, troubled by the sickness and death he witnessed, left Sākya in search of an understanding of suffering. After several unsuccessful years of ascetic and spiritual practice, he found enlightenment, at thirty-five, while meditating beneath a fig-tree. He then delivered the first of many discourses (*suttas*) that, after centuries of oral transmission, were recorded in the Pali Canon. The Buddha was a man of great physical presence, compassion, and serenity. This, allied to his dialectical skills, ensured that before his painful but dignified death he had already gained a large following of monks and lay people.

Unlike the founders of other religions, the Buddha grounded his teachings on rational reflection, not divine revelation, and adumbrated a philosophically sophisticated account of reality, mind, and the human condition. His philosophical temper was decidedly \*empiricist, for 'right view' is vouchsafed by clear-headed experience of the world and oneself. He criticizes Brahmanism for postulating such transcendent entities as an absolute Self (*ātman*), and rejects so-called unanswered questions

(e.g. 'Is the world eternal?'), not only because they are irrelevant to obtaining 'release' from suffering, but because, enquiring beyond the limits of experience, they are senseless. The truths he himself advances are available to anyone fully 'mindful' of the world around him and the workings of his own mind. Indeed, mindful experience is essential to proper understanding of these truths. One who grasps that there is only 'not-self', for example, does not simply assent to the Buddha's propositions, but experiences the world and himself in a new key. The Buddha's moral philosophy is equally empiricist in character, experientially based reflections on the integral role of such virtues as compassion and equanimity in a life liberating itself from the causes of suffering.

D.E.C.

M. Carrithers, *The Buddha* (Oxford, 1983).

S. Hamilton, *Early Buddhism: A New Approach* (Richmond, Surrey, 2000).

**Buddhism:** *see* Buddhist philosophy.

**Buddhist philosophy.** Ethical, metaphysical, and epistemological views held by an Indian prince turned ascetic, Siddhārtha Gautama (said to have been born 563 BC), and by subsequent schools of thought claiming allegiance to him. Siddhārtha was called 'Buddha', which means 'the awakened one'.

*Buddha's teachings.* Facing the fragility of life, and the facts of disease, decay, and death, young Siddhārtha left his family in search of peace and enlightenment, which came not through extreme austerity or philosophical wrangling but through meditating along 'the middle way'. On finally becoming 'awakened' he preached Four Noble Truths:

1. Life is suffering.
2. Suffering involves a chain of causes.
3. Suffering can cease.
4. There is a path to such cessation.

The first truth, equating existence with suffering, was buttressed by a reductionist metaphysics of universal impermanence and soullessness. We suffer because we expect a substantial core in things, when in fact there is none either inside or outside us. Apparent \*substances are reducible to groups of ephemeral parts, \*persons to streams of causally interdependent collections of five psychophysical aggregates, an 'essence' like *catness* to mere exclusion from the mixed set of non-feline individuals. Since selves and things are so unstable and essenceless, our inborn wish to retain our identity and to cling to an essence of what we desire leads to frustration. The truth of universal pain ultimately becomes an evaluative rather than descriptive judgement. Buddha urges that life *should* be looked upon as agony through and through.

The second truth concerning the cause of suffering was fleshed out as the twelve-link causal chain of dependent arising: ignorance → karma-propensities → embryonic sentience → body and psychoses → five senses plus an introspective faculty → sense-object contact → experience → thirst → clinging → rebirth → decay → death.

This, called the 'Wheel of Becoming', obviously connects with the \*karma-based theory of metempsychosis. But if there is no self, what is reborn? In answer, Buddha draws a Ryle-like analogy between 'The individual gets reborn' and 'The news travels'. It is ignorance to think of *the news* as an entity doing the travelling. To conceive a continuing agent is equally mistaken, and propels us towards egoistic actions—we find ourselves enmeshed in the causal chain of becoming. The so-called person is in fact just a bundle of five psychophysical factors. These five aggregates (physical forms, sensations, feelings, judgements, and latent dispositions) constituting the individual at the dying moment cause another, subtler, fivefold replica, which causes yet another—and so on until the new physical form of a foetus is produced, to which all the cravings, traces, and the illusory sense of identity of the dying bundle have been bequeathed. 'The soul' is the name of a causally bound bundle which spans countless deaths and births. This reductionist set-and-series concept of a person, called the doctrine of *anattā* in Pali, has recently received some publicity among English-speaking philosophers through the work of Derek Parfit.

The third noble truth sets up \*nirvana as the final liberation from the pain of repeated embodiment, which can only happen if the ignorance of regarding oneself as a substantial permanent ego is dispelled. Ultimate and unending calm is attained when all cravings—even the craving for extinction—cease without leaving behind any seed. Since such a state is attainable by every thinking being, irrespective of class, gender, caste, or even species, Buddhism is not pessimistic or discriminatory.

Finally, the fourth noble truth of the way to the *summum bonum* of nirvana gives the ethics. This is the eight-fold path: ethically correct views, right resolutions, right speech, right action, right livelihood, right effort, proper mindfulness, and regular practice of concentration. These intellectual, social, and meditational virtues promote the overarching moral qualities of clarity, desirelessness, universal friendliness, and compassion. Suffering ceases through *selflessness*, metaphysical and moral. Using a universalizability criterion the Buddha preached: 'All men tremble at punishment, all men fear death. Likening others to oneself, one should neither slay nor cause to slay.'

*The Subsequent Schools.* Although all Buddhists owed allegiance to the three scriptural 'baskets' into which the doctrines, codes of conduct, and philosophical utterances of Buddha were collected, there arose a major theoretical rift between the so-called 'Lesser Vehicle' (Hīnayāna) and 'Greater Vehicle' (Mahāyāna) within 200 years of the Master's death. The former faction now survives in Sri Lanka and Burma, and the latter in Tibet, China, Korea, and Japan. The latter faction of Buddhism may have been called 'greater' because in it the aim of life is not only to end one's own suffering but to strive, even after one's own personal nirvana, for the enlightenment and happiness of others. Hence the ideal of an altruistic enlightened man who caringly resolves 'May the fruits of my austerities and

meditations alleviate the sufferings of all sentient creatures, even of women giving birth!' This is supra-moral kindness.

*The Lesser Vehicle.* The Lesser Vehicle itself branched into two schools, the first being the realist Vaibhāṣika. Postulating some seventy-two types of composite elements and even a few eternal entities like space and the state of perennial painlessness, this school earned the title 'the everything-exists school'. Some members offered detailed accounts of how atoms combine to form directly perceptible matter. Acute in-house debates regarding the reality of the past and the future led to observations like this: 'Past', 'present', 'future' are equally objective descriptions of the same bit of reality, just as the same woman is correctly described as 'mother', 'wife', and 'daughter'.

The second school of the Lesser Vehicle, representationalist–realist Sautrāntika, criticized the first for eternalist heresies and gave the following sorts of argument for strict impermanence: If *A* endures for more than a moment, say over  $t_1, t_2, t_3$ , then, given the Buddhist definition of reality, it can be real only by being *causally productive* at  $t_1, t_2$ , and  $t_3$ . Now, either *A* produces some effect at each moment or it lies capable but fallow at  $t_1$  and  $t_2$  and actually fructifies at  $t_3$ , when operating auxiliary conditions join *A*. If it produces effects at each moment, then it must have three different effects because the same effect cannot be produced thrice. Accordingly *A* disintegrates into three momentary realities, corresponding to three distinct causal capacities. If it remains fallow at  $t_1$  and  $t_2$  waiting for some auxiliary conditions, as the seed in the granary waits for soil and rain, it is only the terminal entity *A*-at- $t_3$  which qualifies as real, the previous temporal parts being non-entities, or distinct entities, one generating the other. This is the heart of the famous doctrine of momentariness.

Given such strict momentariness, the really real is accessible only to pure sensation, which grasps these instantaneous propertyless particulars. Sautrāntika epistemology is thus at best a critical realism about tables and chairs where the macroscopic world is a construction of inference. Any verbalizable perception invoking classificatory concepts is analysed as inference and imagination.

Later Sautrāntika Buddhists like Jñānaśrī attack all word-generated awareness as fiction-loaded. Words refer to objects through modes of presentations which are generalities—they never capture particular objects in their vivid singularity. This goes by the name of the exclusion theory of meaning, which is at the heart of Buddhist nominalism. Even an expression like 'that cow' serves only to distinguish the referent from dogs, horses, asses, and other cows further away. Apart from this network of mind-made distinctions, there is no natural kind called 'the cow'.

*The Greater Vehicle.* This nominalistic representationalism of Sautrāntika inevitably led to a Berkeleyan idealism of the first school of the Greater Vehicle. Yogācāra, also named 'the mind-only school' seeks to refute atomists and critical realists by four major arguments.

1. Many intricate considerations are put forward against the existence of bodies in space. If, as the realistic Vaibhāṣika school maintained, six atoms join the seventh from six sides, either the central atom falls into six parts, which goes against its indivisibility, or the contacts all happen at one point, which fails to explain any increase of size. So the very idea of extension is incoherent.

2. No external object—macroscopic or atomic—has both the causal and phenomenological features of a real object of awareness. That which both *causes* and bears the manifest *form* of a piece of awareness can count as its real object. If I see glistening water but my seeing is caused by hot air refracting sunlight, I call that a mirage. But, upon the critical realist theory, the actual cause and the phenomenological content of perception fall apart. Awareness is caused by imperceptible atoms while it assumes the felt form of chairs and cherry blossoms.

3. Thus, as awarenesses, wakeful and veridical ones are indistinguishable from dream and erroneous ones, and equally devoid of any extra-mental object.

4. Finally, if *x* and *y* are not the same they could be isolated from each other, but blue can never be isolated from awareness of blue; hence they must be the same.

These idealistic arguments offered by Vasubandhu (fifth century AD) were vigorously attacked by realists of the Jaina, Mīmāṃsā, and Nyāya schools. Even Śāṅkara, himself an absolute idealist, scoffed at the mind-only Buddhist: 'If externality is such an impossibility, how come things even appear to be external? No one is even *mistaken* for a barren woman's son!' Anticipating G. E. Moore, philosophers of the Nyāya school appealed to \*common sense, and isolated formless awareness as the common element in awareness of blue and awareness of yellow, thereby questioning the inseparability of objects and perception. Jaina opponents of Yogācāra claimed that perception itself points to the act-object distinction, but Yogācāra stuck to treating the 'of' of intentionality after the fashion of 'City of Rome', as if the distinction was verbal and spurious.

The last and currently most influential school of the Greater Vehicle—thanks to the present Dalai Lama—is Voidism or Mādhyamika, which was fully developed by \*Nāgārjuna with the help of such sceptical arguments as the following. The reliable means of knowledge are established by appeal to the reality of the objects they make us know; but the reality of the objects, in turn, is established upon the authority of the means of knowledge. Since the criterion of knowledgehood itself is so hopelessly circular, how can anything be known to have this or that determinate nature? Excelling in negative dialectics, anti-realism reaches its mystical climax in Voidism. This mysticism, of course, has nothing to do with faith in God. In chapter 10 of his *Twelve-Gate Treatise* Nāgārjuna argued, God could not be our father because children should have some resemblance with their father, but in our suffering we are most ungodly. Being self-existent, God should also have no needs, yet obviously he needed to create, otherwise he would be whimsical like an infant. As omnipotent, God should not have any obstacles to his desire, so what explains the gradual unfolding of creation

instead of creation of everything all at once? Finally, if God is the maker there should be no evil or ugliness in things, but obviously there is.

Suffering, causation, and temporal succession are all shown to be uncharacterizable in any determinate manner, because all characterizations are equally empty. It is this insistence on the emptiness of all things which makes Nāgārjuna a 'Voidist'. Since all things are empty, so is the doctrine of emptiness. Far from being self-refuting, such absolute *epochē* is said to be irrefutable. 'If I had a view I could have had a flaw, but, emptied of all views, I am flawless.' So says the Voidist, enjoying tranquillity. A.C.

**Bultmann, Rudolf** (1884–1976). German theologian who gives a Heideggerian interpretation of the New Testament which is both anti-metaphysical and existentialist. Bultmann argues that it is the awareness of death as an immediate possibility which produces the need for Christianity, and claims that a life without Christ is inauthentic but a life lived in Christ is authentic. His 'demythologizing' of the New Testament construes its historical and theological doctrines as descriptions of the human condition in so far as this is a condition of need for God. Bultmann's readings are controversial because they might be logically consistent with atheism. S.P.

\*existentialism; authenticity.

**bundle theory of the self.** Empiricist theory of \*personal identity particularly associated with David Hume. Hume's view—that we are never aware of our \*self as a substance, but only as a 'bundle or collection of different perceptions'—has been interpreted as a sceptical denial of personal identity. More plausibly, Hume can be taken to be meaning that the peculiarly complex unity or identity of the self should be interpreted in terms of constantly changing causal relations, more like the identity of a complex play than a simple material object. A Humean theory of the self was developed by William James. R.S.D.

**Burali-Forti's paradox**, due to Cesare Burali-Forti, arises from the assumption that there is a series  $S_1$  consisting of all ordinal numbers and that this series is well-ordered.

From this it follows that  $S_1$  has an ordinal number  $X$ . From this it follows that there is a series  $S_2$  of ordinals up to and including  $X$  which has the ordinal number  $X + 1$ . This contradicts the assumption that  $S_1$  has all the ordinal numbers. This contradiction about ordinals is not usually taken up in popular discussions because the notion of a transfinite ordinal is more difficult to explain than that of a trans-finite cardinal. In this sense all transfinite ordinals are inaccessible. J.C.

\*number.

**Burckhardt, Jakob Christoph** (1818–97). A historian who lived for most of his life in his native Basle. Although a pupil of Ranke, he was less concerned to discover objective facts than to explore European '\*culture' (one of the three great 'forces', along with religion and the state, that govern history), often by way of an anecdote that enabled him to 'discern and feel the general in the particular'. His influential works include *The Age of Constantine the Great* (1852; tr. London, 1949) and *The Culture of the Renaissance in Italy* (1860; tr. London, 1878). His main philosophical work, consisting of lectures (which Nietzsche attended) at Basle between 1868 and 1871, was published as *Reflections on History* (1906; tr. London, 1943). Like Schopenhauer (whom, to Nietzsche, he called 'our philosopher'), he despised Hegel's rationalist and teleological view of history; denied that man makes significant progress, and thus preferred to focus on what is 'recurrent, constant and typical'; and regarded democracy and industrialization as threats to liberty and culture. M.J.I.

K. Löwith, *Jakob Burckhardt: Der Mensch inmitten der Geschichte* (Lucerne, 1936).

**Burge, Tyler** (1946– ). American philosopher based at the University of California, Los Angeles. Burge has worked largely in the philosophies of mind, language, and logic. His earlier work on singular terms and demonstratives was within the context of Davidson's theory of meaning. He is also known for a series of papers, beginning in 1979, in which he argues for \*anti-individualism: the thesis that the contents of thinkers' intentional states cannot be fixed by facts about those thinkers taken in isolation from the rest of their community. Burge argues for this through an ingenious variation on Putnam's Twin Earth thought experiment (\*arthritis in the thigh). Burge claims that only by appreciating the social determination of the contents of thinkers' thoughts can we account for the irreducibly normative character of intentional mental states. T.C.

\*externalism.

Tyler Burge, 'Individualism and the Mental', *Midwest Studies in Philosophy*, iv (1979).

**Buridan, John** (c.1295/1300–c.1360). Student, and then teacher, at Paris, he was twice rector of the university, in

1328 and 1340. Generally classified as a nominalist, he was one of the great logicians of the Middle Ages, but also a philosopher and theologian. He wrote commentaries on a number of works by Aristotle, his Commentary on the *Physics* of Aristotle being particularly well known for its discussion of impetus, in which Buridan attempts to explain how it happens that when a projectile leaves the projector (for example, when a stone leaves the thrower's hand) it does not promptly fall to earth as a heavy object surely would but instead continues upward. Buridan solves the problem by arguing that the projector imparts an impulse, or impetus, to the projectile, and that it is the impetus that maintains the projectile in motion until countervailing forces, in particular air resistance and the projectile's weight, prevail and the body finally falls to earth. In the course of his discussion Buridan develops the concept of inertia at least in respect of celestial bodies and in so doing makes a clean break with Aristotelian physics. A.BRO.

\*ass, Buridan's; Aristotelianism.

E. A. Moody, 'Jean Buridan', in *Studies in Medieval Philosophy, Science and Logic: Collected Papers 1933–1969* (Berkeley, Calif., 1975).

**Burke, Edmund** (1729–97). Irish-born political writer noted for literary style, and English MP believed to be an important source of \*conservatism.

In describing the work of Burke it is accurate to call him a 'political writer' rather than a political theorist or philosopher. He was suspicious of the abstract and his writings predominantly exemplify rhetoric at the expense of reasoned argument. He was a master of prose style, although he was never noted for skill in oratory, and some of his best speeches were said to have emptied the House of Commons. Burke is not and would not have wanted to be considered a great political philosopher, but he satisfies one criterion of greatness—his thought appeals to successive generations of political thinkers.

For one who was later to dismiss abstract philosophizing with some contempt Burke rather oddly began his literary career with two successful works in that genre. The first was *A Vindication of Natural Society* (1756; 2nd edn. 1757), in which he attacked social philosophy, especially that of Rousseau. In 1757 he published a second philosophical essay which, like the first, was very successful—*A Philosophical Enquiry into the Origin of our Ideas of the Sublime and Beautiful*. As a result of his success he was taken up by the literary and artistic circles of London, and was encouraged by his publisher to try his hand at history. His historical work was not published in his lifetime. Thereafter began his political life, in which he was to continue until his death in 1797.

In his political life he devoted himself (as he says) to five 'great, just and honourable causes': the emancipation of the House of Commons from the control of George III and the 'King's friends'; the emancipation of the American colonies; the emancipation of Ireland; the emancipation

of India from the misgovernment of the East India Company; and opposition to the atheistical Jacobinism shown in the French Revolution. Successive generations have reacted in different ways to Burke's position on all these questions, if indeed he has a consistent position. For example, his stand against the French Revolution was attacked by the early Utilitarians such as Paine, Bentham, and James Mill, on the ground that he had betrayed his earlier championship of political \*liberty. He himself regarded his defence of the Indian people against the East India Company as his greatest achievement, yet it has been argued that he was lacking in historical knowledge of India and that he did not really understand the difficulties facing Warren Hastings in dealing with a totally different social order. His greatest contribution to political thought is summed up by Wordsworth in *The Prelude*. Wordsworth says of Burke that he 'declares the vital power of social ties Endeared by custom'. In other words, Burke thought of all political power as a trust, and in the case of Britain politicians were entrusted with the preservation of a traditional hierarchical social and political order.

Burke's belief that society depends on what he called 'prejudice', that is, on instinctive feelings of love and loyalty, plus his rejection of the central place which revolutionary thinkers had given to reason, led to his critique of natural law and natural rights. Basically he seems to be saying that communities are held together not by self-interest but by the feeling that we are members one of another; communal feeling is everything and reason is insignificant. Hence, he rejected the appeal made by the revolutionaries to abstract individual rights. For Burke the important contrast is not between repressive governments and the abstract rights of the rational individual, but between the beautiful order of society bonded by loyalties and 'prejudice', and 'a disbanded race of deserters and vagabonds'. In rejecting natural law he shared the conservatism of Hume, but his reverential attitude to the state is much more like Rousseau than Hume. R.S.D.

**business ethics.** One of the areas of \*applied ethics. Although the application of morality to business is as old as business and morality themselves, the rise of business ethics as an identifiable subject of study took place in the 1970s in the United States, and since the late 1980s in Europe, Australia, and a number of countries in Asia, Africa, and South America.

Business ethics as an academic area is defined by the interaction of business and ethics, and the set of related problems thus generated. At its broadest, it studies the moral justification of economic systems, whether national or international. Within a given system it studies the moral justification of the system's structures and practices. Since corporations are a dominant feature of the free-enterprise system, a good deal of work has focused on the structures, governance, responsibilities, and activities of corporations. Within the corporation business ethics deals with the moral responsibilities and rights of individual managers and employees—the more traditional focus of previous work on ethics in business.

Those who work in business ethics tend to engage in four types of activity. The first and most common is the development and discussion of case-studies that raise some moral issue in business. These are used to sensitize students, those in business, and the general public to the need for ethical considerations in business. Although at first these cases tended to illustrate unethical behaviour on the part of large corporations, in recent years there has also been a growing literature on positive cases presenting exemplary corporate or individual activity. Cases-studies in turn have led to the investigation of the morality of particular practices, to the responsibility of corporations with respect to consumers and the public, product safety, the rights of workers, environmental degradation, and similar issues. A third kind of research considers how corporations might be structured so as to reinforce ethical behaviour and discourage unethical behaviour on the part of both workers and managers. A fourth kind of activity can be called meta-ethical. This looks at the appropriateness of applying moral language to entities other than human beings, e.g. to corporations, corporate structures, economic systems. There has been lively discussion of whether corporations can rightly be said to have moral \*obligations or responsibilities. Terms such as \*'responsibility', \*'conscience', \*'rights', \*'virtue', mean something different when applied to corporations than when applied to human individuals, as do notions of praise and blame, reward and punishment.

The importance of international business has led to discussions of international business ethics and to a reconsideration of moral and cultural relativism, which take on special significance when considering doing business in societies with corrupt governments and in the absence of many traditional restraints. Work in international business ethics has called into question whether Western-type approaches to ethical theory actually enjoy the universality which they claim or to which they aspire. The primary focus of international business ethics has been on the

actions of multinational corporations from developed countries operating in less developed countries. Issues include bribery, the use of child labour, the degradation of the environment, the exploitation of workers, and the increasing gap between rich and poor countries. Global issues involve the justice or fairness of policies of global institutions such as the World Trade Organization and the World Bank, the depletion of the ozone layer, and the appropriate role of corporations and nations in halting or reversing the process, and the depletion of non-renewable natural resources. The growth of the Internet as a medium of commerce that easily crosses national boundaries has also generated new concerns about the ethical dimensions of privacy violations by businesses, control of commercial pornography, and protection of intellectual property available in digitalized form.

Business ethics has developed into a significant area of research and teaching with its own texts, journals, and professional societies. But it has gone beyond the academic setting in which it developed. It has become something of a movement, in which corporations have adopted codes of conduct or statements of values and beliefs, have introduced the position of corporate-ethics officer, instituted in-house training programmes in ethics, established ethics hotlines, and appointed ethical ombudsmen. The corporate movement is mixed: sometimes salutary, providing positive promotion and reinforcement of ethical norms; sometimes self-serving, emphasizing ethics for employees towards the corporation, but exempting the corporation itself (and its top officers) from ethical assessment; and sometimes negative, serving simply as 'window-dressing' to mask amoral corporate activity. The movement can be distinguished from the academic area with which it is related, but which continues to have a critical (although not necessarily antagonistic) component with respect to business, and which interacts with standard normative and meta-ethical theory.

**Butler, Joseph** (1692–1752). Anglican divine, Bishop of Durham. His *Fifteen Sermons* (1726), perhaps the finest ethical work in English, brilliantly attacks psychological and ethical \*hedonism and provides a *via media* between a moral-sense approach to ethics and a rationalist one. Since pleasure is the satisfaction of an impulse, the desire to maximize one's own (self-love) requires impulses with other objects, e.g. particular passions (like hunger) and \*benevolence. Self-love is not peculiarly 'natural'. Life is 'natural' when the influence of each motive accords with its intrinsic authority. *Conscience* should adjudicate

between the two high-level principles of self-love and benevolence and these should control the particular passions. Butler's book *The Analogy of Religion* (1736) defends Christianity against \*deism. The analogy is between the Bible and nature, which bear the marks of the same author. In a famous appendix Butler defends the absoluteness of \*personal identity against Locke's empiricist treatment.

Terence Penelhum, *Butler* (London, 1985).

**Butler, Samuel** (1835–1902). Satirist, novelist, metaphysical biologist, anti-Christian. *Erewhon* (1872), and *Erewhon Revisited* (1901), satirize Victorian values. In *Erewhon* ('nowhere' backwards—almost) there are two currencies, one issued by commercial banks and used for all practical purposes (the decencies of ordinary and business life) and another issued with great solemnity in magnificent buildings, but commercially useless (Christianity). *Erewhonian* thought also includes elements of his own striking speculations, for example on machines as extensions of the human organism which may threaten us by a rival evolution of their own and on the invalidity of a distinction between an individual and his influence (so that there is a genuine afterlife as long as this continues). In several anti-Darwinian works Butler propounds his Lamarckian theory of creative \*evolution by inherited memory, as he does also in his novel of generational change *The Way of All Flesh* (1903). His satirical (and sometimes perversely persuasive) defence of the Resurrection in *The Fair Haven* (1873) was quoted in pulpits until its disguised authorship was discovered.

**Byzantine philosophy.** 'Byzantine philosophy' would seem to refer, straightforwardly, to philosophy written in the Byzantine Empire. In fact the reference is anything but straightforward. There is, for example, no clear chronological line separating late ancient from Byzantine philosophy. There is, again, no responsible way to extricate Byzantine philosophy from Byzantine theology or Byzantine literature. The best that can be done is to depict some features in authors who have as good a claim as any to the label 'Byzantine'.

The most obvious feature is a continuity of learning. Byzantine writers who disagreed about much else understood themselves to share at least two kinds of tradition. They shared a tradition of Greek literacy, including a legacy of Greek philosophical texts considerably larger than that available in Latin translation before the Renaissance. Byzantine writers shared next a set of theological authorities. These authorities included the seven ecumenical councils of the Church (325–787), but also Christian writers who combined fervent piety with formidable learning in Greek letters, including philosophy and natural science. Chief among these were Gregory Nazianzen

(323–89), Basil of Caesarea (c.330–79) and his brother Gregory of Nyssa (c.335–95), and John Chrysostom (347–407). Later Byzantine writers looked back to these four, and especially to Basil and John, as the ‘fathers’ of right belief and holy practice.

Byzantine writers were further able to appropriate the last works of non-Christian Greek philosophy. The intricate \*Neoplatonism of Proclus (c.410–85) was taken over by a Syrian who took as pseudonym ‘Dionysius the Areopagite’. The writings of this pseudo-Dionysius (active c.500) present a thoroughly Christian adaptation of Procline philosophy to questions about the intelligibility and accessibility of God. In the same years, Proclus’ pagan successors in Athens continued his reinvigoration of the old practices of philosophical commentary. Among their most remarkable expositions were the extensive commentaries on Aristotle by Simplicius. The fact of expert Aristotelian commentaries by Neoplatonists illustrated another kind of adaptation, as it seemed to fulfil the ancient wish for a reconciliation of Plato and Aristotle.

The shared sources, Christian and pagan, and the models of adaptation inspired various Byzantine works in or about what seems to us philosophy. John Damascene (died c.751) composed a *Fount of Knowing* that contains: (1) a dictionary of technical terms ranging from Aristotelian logic to Trinitarian theology, (2) a critical history and doctrinal analysis of Christian heresies, and (3) a compendium of orthodox theology comprising, among much else, elementary lessons in Aristotelian and Galenic natural philosophy. Michael Psellos (1018–c.1096) wrote a *Teaching of All Sorts* that displays an unusual knowledge of pagan Neoplatonism and even an interest in philosophical

astrology and magic. By contrast, the *Philosophy* of George Pachymeres (1242–1307) is a sequential paraphrase of the principal works of Aristotle, from the *Categories* to the *Nicomachean Ethics*.

Of course, the simultaneous inheritance of pagan and Christian sources brought deep tensions. Even those friendliest to ancient philosophy, such as Psellos, were careful to note its discrepancies with Christianity. Other Byzantine authors viewed these discrepancies as evidence for the bankruptcy of pagan learning. So, for example, the *150 Chapters* of Gregory Palamas (1296–1359) rejects the errors of prideful reason, and especially the errors of Plato and Aristotle, in favour of Christian revelation grasped by the prayer of the heart.

No one can know how these controversies would have developed if Byzantine life had not been disrupted by the fall of Constantinople in 1453. What can be known is the influence of visiting or exiled Byzantine scholars on Western Europe. George Gemistos Plethon (1355/60–1452), for example, electrified Florentine humanists with his teaching of Plato. John Bessarion (1403–72), who died a Roman cardinal, not only defended Plato against the attacks of Aristotelians, he left his valuable Greek library to the Venetians. Much of \*Renaissance philosophy is the afterlife of Byzantine philosophy.

**cabbala:** *see* Kabbalah.

**Cajetan, Cardinal Thomas de Vio** (1468–1534). General of the Dominicans and, as Cardinal-legate to the Empire in 1518–19, involved in unsuccessful dialogue with Luther, Cajetan was an influential commentator on Aristotle and Aquinas. More pessimistic of the powers of human reason than previous Thomists, Cajetan denied in particular that the immortality of the soul could be established independently of revelation. Cajetan also developed the Thomist theory of analogy, and so of how terms such as ‘good’ could be applied without equivocation both to \*God and to finite creatures. Cajetan argued that when we describe both God and finite creatures as good, we employ an analogy of proportionality: the same quality is attributed to God as is attributed to creatures—but proportionately to their differing natures. T.P.

\*Thomism.

M. McCandles, ‘Univocalism in Cajetan’s Doctrine of Analogy’, *New Scholasticism* (1968).

**calculus.** A calculus is a formal language and rules for manipulating expressions of the language. For example, by applying \*algorithms to arabic numerals one can determine the values of arithmetical functions. A logical calculus is used to construct valid \*arguments. It can be described as the syntax of a logic where syntax has to do only with the shapes and structure of expressions, not their meanings.

The syntax of a logic has two parts: the grammar and the deductive system. The grammar is a list of symbols or rules for constructing symbols of the logical language, and a specification of which finite strings of symbols are to count as sentences or well-formed formulae. The deductive system of a logic consists of axioms and rules of inference which are used to construct proofs of sentences of the logical language. Axioms can be written at any line of a proof and do not rest on any premisses; rules of inference permit the writing of a sentence at a line of a proof given that appropriate conditions are met. A deductive system must have at least one rule of inference but need not have any axioms; a deductive system is an axiomatic system if it contains axioms, a natural deduction system if it does not.

A proof of a sentence  $A$  from a set of premisses  $\Gamma$  is a finite, non-empty sequence of sentences such that the last member of the sequence is  $A$  and each member of the sequence is either a member of  $\Gamma$  or an axiom or follows according to a rule of inference from one or more sentences that precede it. One can mechanically determine whether any given finite sequence of sentences is a proof.

Although logical calculuses can be objects of study in their own right, it is their application to the construction and criticism of arguments that gives calculuses their original point. An argument in English is valid just in case it is not possible for all the premisses to be true and the conclusion false. Valid arguments can be grouped according to their shapes or form. For example, it is easy to see that the following arguments share their form, despite their different content or subject-matter. If Wales wins, then England loses; Wales wins; therefore, England loses. If John is tall, then John is heavy; John is tall; therefore, John is heavy. Logical calculuses differ according as they concentrate on different kinds of valid argument forms. For example, the \*propositional calculus is concerned with arguments, such as the pair just given, which depend for their validity on the meanings of the truth-functional connectives, here the meaning of ‘if . . . then’.

Arguments in English are often hard to make out. Better to translate English arguments into a logical calculus which is brief and unambiguous and then determine whether the translation is a \*proof or can be made into a proof by inserting extra steps. For example, we can translate the simple argument that establishes the defeat of England into the propositional calculus: let ‘ $P$ ’ represent ‘Wales wins’, ‘ $Q$ ’ represent ‘England loses’, and ‘ $P \rightarrow Q$ ’ represent ‘If Wales wins, then England loses’. Then we can make a proof of the translated argument by employing the rule of inference known as *modus ponendo ponens*, which permits the move from a pair of sentences of the form  $A$  and  $A \rightarrow B$  to the sentence of the form  $B$  and, hence, justifies the move from ‘ $P$ ’ and ‘ $P \rightarrow Q$ ’ to ‘ $Q$ ’ in our translated argument.

To guarantee that the existence of a proof entails that the original English argument is valid the rules of inference must be truth-preserving. A semantics for the calculus explicates, using the notion of an interpretation, the idea of a possible situation in which sentences are true or

false. An argument of the calculus is defined to be valid just in case in any interpretation in which all the premisses are true, the conclusion is also true. Then the minimum requirement for the rules of inference is that they be sound: if there is a proof of  $A$  from a set  $\Gamma$ , then the argument with the members of  $\Gamma$  as premisses and  $A$  as conclusion is valid. **Calvin, John (Jean)** (1509–64). French theologian. Reformer active in Geneva. A principal founder of Protestantism, his main theological doctrine is absolute predestination, which entails the inevitability of the eternal salvation of the elect and the eternal damnation of the unchosen, irrespective of perceived desert but according to the will of God. The inamissibility of \*grace is a logical consequence of absolute predestination (because  $F$  is inamissible if and only if  $F$  is not liable to be lost). Calvin's theology entails the Lutheran doctrines that Scripture is the only guide to faith, there is human free will before but not after the Fall of Adam, and the distinguishing of the righteous from the sinful is by faith alone (*sola fide*), not works. Calvinism is characterized by a strong emphasis on the omnipotence of God and human sin, rather than God's benevolence and human freedom. \*Barth's arguments against the possibility of \*natural theology and insistence on the unique importance of God's self-revelation in Christ lend support to Calvinism. S.P.

\*Calvinism.

Paul Helm, *John Calvin's Ideas* (Oxford, 2004).

Alister E. McGrath (ed.), *The Christian Theology Reader* (Oxford, 2002), pp. 425–6.

**Calvinism.** Based primarily upon the teachings of John Calvin (1509–64), Calvinism has a doctrinal side and a cultural side. The former stresses the sovereignty of God, the goodness of his creation, the sinfulness of human creatures, the sole authority of Scripture, and (though not as centrally as commonly believed) the predestination of his creatures to eternal life made possible by Christ's redemptive work. The latter (built on the theme of the goodness of creation) stresses an approach to culture which emphasizes involvement, hard work, and material success rather than withdrawal and other-worldly flight. Often characterized as deterministic, the teachings of Calvinism are perfectly compatible with the \*freedom of the will, as (non-compatibilist) philosophers understand this notion. Thus, for example, the doctrine of pre-destination entails

that one's final state is determined, but it does not entail that one is unfree with respect to all of the numerous decisions one makes over the course of one's life. Unlike Lutheranism, Calvinism has evolved out of the teachings of more than one individual; besides Calvin, these include Zwingli, Melancthon, and Bucer. G.F.M.

\*compatibilism and incompatibilism.

**Cambridge change.** If a predicate is true of an object  $x$  at a time  $t$ , but not true of  $x$  at a later time, then  $x$  has undergone what P. T. Geach has called a 'Cambridge change'. Many philosophers believe that Cambridge change is necessary but not sufficient for genuine \*change. For example, when my brother grows taller than me, I become shorter than him. I have undergone a Cambridge change, but not a genuine change. T.C.

Sydney Shoemaker, 'Causality and Properties', in *Identity, Cause and Mind* (Cambridge, 1984).

**Cambridge philosophy.** In the Middle Ages Cambridge was a good deal smaller than Oxford and produced no philosopher to compare with Oxford's Duns Scotus or Ockham. Francis Bacon was the first important philosopher to study at Cambridge, although he, like Hobbes, Locke, and Bentham at Oxford, thought little of the instruction he had received at his university. The first significant teachers of philosophy at Cambridge were the mid-seventeenth-century Cambridge Platonists, especially Cudworth and Henry More. For the most part members of the strongly Calvinist Emmanuel College, they were hostile to all kinds of fanatical enthusiasm and argued for the rationality of religion against Calvinism, Laudian High Anglicanism, and the Erastianism of Hobbes. They sought to found morality on reason, not will, whether of God or king, and, against Descartes's mechanism argued that the world as a whole is a unity, animated throughout by purpose.

Samuel Clarke, writing in the early years of the eighteenth century, was the most mathematically minded of philosopher-theologians and very much a product of Newton's Cambridge, although he did not teach there. He defended, against Leibniz, Newton's theory of space as absolute. His abstract lucidities were echoed, towards the end of the century, in the ethics and theology of William Paley, Christian utilitarian and authoritative expounder of the 'evidences' of Christianity.

A lonely figure in the unphilosophical Cambridge of the mid-nineteenth century was William Whewell. His account of scientific thinking as \*hypothetico-deductive, with hypothesis being prior to observation, was unfairly criticized, and unreasonably obliterated, by J. S. Mill. Whewell's views, unlike Mill's, were based on wide experience of scientific work and profound knowledge of the history of science. John Grote revived philosophy in Cambridge later in the century, and by the end of it the subject

PHILOSOPHY IN BRITAIN: EARLY TWENTIETH CENTURY

LUDWIG WITTGENSTEIN: his influence coursed twice through Western philosophy, first via Logical Positivism in the 1930s and 1940s, then through a diaspora of disciples in the 1950s and 1960s. The open texture and vatic style of his writings allow endless discovery and reinterpretation.

BERTRAND RUSSELL transcended the successive influences of Bradley, Moore, Frege, and Wittgenstein to emerge as the most widely read British philosopher of the twentieth century.

G. E. MOORE defended the value of common sense and clarity in philosophy and inspired a generation of British intellectuals with his ethical writings.

R. G. COLLINGWOOD, the last bastion of idealism in inter-war Oxford, stressed the historical nature of the philosophical enterprise.

was pursued there with distinction by the idealists James Ward and J. M. E. McTaggart—the second of whom derived extra-ordinary conclusions with seemingly rigorous logic from self-evident premisses in crystalline prose—and the utilitarian moral philosopher Henry Sidgwick, an inspiring example of intellectual scrupulousness.

Bertrand Russell and G. E. Moore, who were to overwhelm the prevailing idealist consensus, were pupils of these three. In the first decade of this century Russell, with A. N. Whitehead, produced *Principia Mathematica*, expanding the range and increasing the systematic character of logic and purporting to derive mathematics from it. He brought the topic of meaning to the centre of philosophy and, with his theory of descriptions, supplied an exemplary instance of how it should be analysed. Moore set about the doctrines of other philosophers, whether idealists or utilitarians, with stolid but acute literalness. Russell and Moore agreed that there are many different things, of different fundamental kinds, in the world and that reality is not, as the idealists had concluded, one all-inclusive mental or spiritual thing.

Wittgenstein came to Cambridge to learn from Russell and soon reversed the relationship. There is nothing of Moore in the *Tractatus*, in which the topics he and Russell had worked on together are oracularly set out: an intensely abstract account of the ultimate logical constituents of the world and of our thought and speech about it. Absent from 1914 to 1929, he came back with a point of view closer to Moore, at least in taking ordinary language to be in need, not of replacement, but of a fuller, deeper understanding. Ramsey, the only disciple he seems to have respected intellectually, was, like him and Russell, a mathematician. Dying at 26, he showed enormous promise. Wittgenstein dominated Cambridge philosophy until his death in 1953 and for a considerable time afterwards. But since about 1960 Cambridge philosophy, much like that of Oxford, has largely lost its distinctive flavour, perhaps because of the reversal by the philosophy of the United States of its former colonial dependence on that of Britain.

A.Q.

\*London philosophy; Oxford philosophy; English philosophy; British philosophy today.

**Cambridge Platonists** A school of seventeenth-century English philosophers who found in Platonism a way of criticizing Hobbes and of defending Christianity against the fanaticism of Puritans, Calvinists, and Prelatists.

The Cambridge Platonists included Ralph Cudworth (1617–80), who is perhaps best known, John Smith (1618–52), Benjamin Whichcote (1609–83), and Nathaniel Culverwell (1618–50). All these thinkers were from Emmanuel College, and to these we can add Henry More (1614–87) who was from Christ's College. Ralph Cudworth eventually became Master of Christ's (for over thirty years) and Professor of Hebrew in the University. His major work *The True Intellectual System of the Universe* (1678) was conceived as a systematic refutation of

Hobbes, and indeed it was a major work of seventeenth-century philosophical thought. What follows is an account of the main lines of argument of the Cambridge Platonists, especially as these are found in Cudworth and John Smith.

Hobbes's account of the mind was reductivist—he argued that it consisted of motions in the substance of the brain. Perception consisted of a passive registration by the sense-organs of vibrations received from outside, 'apparitions' or 'seemings', as Hobbes calls them. John Smith in his *Discourse Concerning the Immortality of the Soul* points out, probably following Plotinus, that Hobbes has not distinguished between the motions of material particles and our awareness of the motions. He is maintaining, in other words, that Hobbes lacks an account of \*consciousness. Smith argues that there must be some incorporeal substance through which we become aware of the 'seemings' and by means of which we can interpret and correct them. For Smith, then, the senses presuppose a mind as their co-ordinating principle. In a similar sort of way Cudworth presents a theory of knowledge which anticipates Kant: mind is not secondary and derivative but 'senior to the world, and the architect thereof'.

The doctrine of the eternal and immutable character of \*morality is the most characteristic doctrine of the Cambridge Platonists. Things, including morality, are as they are by nature and independently of our wills. They have been created by a God whose will is subject to his wisdom and goodness. The mind of man is derivative from the divine mind, which is itself antecedent to all corporeal things. When human ideas are true they are readings of the divine thoughts. In other words, there is a realm of intelligible ideas to which 'good' or 'just' belong, every bit as much as geometrical truths. These intelligible and changeless ideas are rational patterns in the mind of God and are accessible to human minds through the use of right reason. It is clear from this that in their metaphysics and moral philosophy the Cambridge Platonists (influenced by Plato, Plotinus, and Descartes) totally reject Hobbes.

In their philosophy of religion they reject \*Calvinism, and in particular they reject both the doctrine of the total depravity of man since the Fall, and also the doctrine of predestination. They believed in the power of each person by the light of reason to move towards perfection. It is also interesting to note that the Cambridge Platonists were themselves Puritans by origin and education. Their Puritan dislike of ritual, vestments, and stained glass was of course supported by their belief in Platonism. But they were mild and tolerant in their views and were sometimes called the 'latitude men'. Their position had something in common with that of Milton, and pointed towards \*deism and the moral sense theory of Shaftesbury.

R.S.D.

\*latitudinarianism.

S. Hutton, 'The Cambridge Platonists', in S. Nadler (ed.), *A Companion to Early Modern Philosophy* (Oxford, 2002).

Basil Willey, *The Seventeenth Century Background* (London, 1953).

**Campanella, Tommaso** (1568–1639). A highly prolific Italian philosopher imprisoned for years by the Inquisition for his \*libertinism, Campanella was a contemporary of fellow Dominican Giordano Bruno, defender of Galileo Galilei, and correspondent of the French libertines Gabriel Naudé and François de La Mothe le Vayer. In *Atheismus Triönfatus* (1631), Campanella claimed to expose the arguments for atheism in order to refute them—the triumph over atheism of the title. But because he proposed a form of \*deism, discoverable by the light of reason alone, of which Christianity was just one manifestation and Christ a preacher of a natural morality, the book was denounced as proclaiming ‘atheism triumphant’, and pillaged for a more decidedly atheistic tract, *Theophrastus Redivivus*. In Campanella’s utopian *City of the Sun*, investigation of nature would benefit mankind, whether by means of political and ethical laws or by technology. Rulers would use natural philosophy and scientific astrology, purged of superstition, to control and transform the world. L.P.

G. Ernst, *Religione, ragione e natura: Studi su T. Campanella* (Milan, 1991).

F. Yates, *Giordano Bruno and the Hermetic Tradition* (London, 1964).

**Campbell, John** (1956–). British metaphysician and philosopher of mind, at Berkeley, formerly at Oxford. Campbell’s distinctive approach to metaphysics and the philosophy of mind aims to reconcile a broadly Kantian investigation of the structure of self-conscious thought about an objective world with the results of empirical enquiry into the nature of cognition. *Past, Space and Self* (1994) undertakes to map out the central conceptual skills making up the human capacity for self-conscious thought and distinguishing human beings from other animals. These conceptual skills involve capacities to think not just about oneself, but also about space and time and the nature of physical objects. *Reference and Consciousness* (2002) explores the functional role of conscious experience. Campbell sees conscious attention to objects as playing a foundational role in thought and action—a foundational role that we can only understand through the complex interactions between conscious attention and the subpersonal information-processing mechanisms that solve the binding problem. J.BER.

**Camus, Albert** (1913–60). Algerian French philosopher who is best known for his concept of ‘the \*absurd’, which he described as ‘a widespread sensitivity of our times’ and defined as a confrontation between our demands for rationality and justice and the ‘indifferent universe’. He explored this idea in novels, *The Stranger* (1942), *The Plague* (1947), and *The Fall* (1956), as well as philosophical essays, *The Myth of Sisyphus* (1942) and *The Rebel* (1951). He was born and grew up in war-torn north Africa, and memories of the bitter civil war and his experiences under the Nazi occupation permeated his philosophy. Like his one-time philosophical friend and colleague Jean-Paul Sartre, he was obsessed with questions of responsibility, innocence,

and guilt in the face of overwhelming tragedy. In *The Plague*, for example, he pits his characters against an invisible, unpredictable, lethal enemy in order to explore the vicissitudes of responsibility in a situation for which no one can be blamed. Nevertheless, there are heroes and there are cads. In his early novel *The Stranger*, by contrast, Camus introduces us to a character who is utterly innocent, despite the fact that he violates virtually all of the dictates of ‘decent’ society, including the prohibition against murder.

Camus’s notion of ‘the absurd’ is best exemplified by the Greek mythological hero Sisyphus, who was condemned by the gods to the endless, futile task of rolling a rock up a mountain. Nevertheless, Camus assures us, Sisyphus is happy. He accepts his futile fate, but he also ‘rebels’ by scorning the gods. In *The Stranger*, by contrast, the protagonist had simply accepted the absurdity of life, ‘opening up his heart to the benign indifference of the universe’. But Camus, like Sartre, also displays a deep appreciation of what we might call ‘original’ guilt, guilt that is inherent in our very existence as human beings. In *The Fall*, a particularly perverse character named Jean-Baptiste Clamence, who was once a lawyer, makes the conflation of guilt and innocence a matter of philosophical principle. How could one be innocent in a world that is absurd? Camus won the Nobel Prize for Literature in 1957. R.C.SOL.

\*existentialism.

D. Sprintzen, *Camus: A Critical Examination* (Philadelphia, 1988).

**Canadian philosophy.** Something of Canada’s national character is reflected in the philosophical effort of three centuries. Starting from 1665 with the teaching of the Ratio Studiorum at the Jesuit Collège in Quebec, emphasis was placed on the writings of Aristotle and Aquinas which were thought to serve the higher objectives of theology. From early in the nineteenth century, the philosophical programme of French Canada was to resist the attractions of the Protestant Reformation and the Enlightenment. In due course, efforts were made to articulate a positive Catholic philosophy which, as it emerged, underwrote the ultramontanist which prevailed in French Canada until the 1960s. In English Canada philosophy originated with the founding of the first universities in Maritimes in the eighteenth century. In most cases, the university had a religious affiliation, and it is natural that there should have been a preoccupation with the philosophical foundations of religion. Canada’s harsh climate also called forth a serious interest in the philosophy of nature, and her emerging social pluralism issued in the philosophical analysis of politics.

Genuine philosophical ability was widely scattered across the country, and no English-speaking university could represent itself as the centre of philosophical effort in the late nineteenth and early twentieth centuries; but Toronto began in the early 1920s to achieve a hegemony that would endure for nearly fifty years. In 1929 the Institute of Mediaeval Studies (later the Pontifical Institute) was established in that city, and it is to this day one of the

world's leading centres for such work. George Brett and later Fulton H. Anderson shaped the philosophy department at the University of Toronto into one of the foremost places for the study of the history of philosophy.

Canada had made substantial and internationally recognized contributions to medieval studies and the history of philosophy generally, but in the 1960s the Quiet Revolution was under way in Quebec, and everywhere Sputnik worked its magic. Canada came to know unprecedented expansion of its universities, in both size and number. In Quebec philosophy became more vigorously secular and made significant contributions to the intellectual foundations of her own social transformation. Anglophone philosophers were turning their attention away from the history of philosophy and from cultural self-examination, and were positioning themselves in research programmes set elsewhere, chiefly those of the analytic philosophers of Cambridge, of positivism and its critics, mainly in the United States, of Oxford linguistic philosophy, and of post-war phenomenology and existentialism in France and Germany.

The University of Western Ontario assembled an internationally recognized team of philosophers of science, and a monograph series was launched. The Canadian Philosophical Association originated its official journal, *Dialogue*, in 1961, and this was followed ten years later by the *Canadian Journal of Philosophy* and *Russell: The Journal of the Bertrand Russell Archives* (based at McMaster University). In the same year the Society for Exact Philosophy came into being. *Laval théologique et philosophique* was born in 1945, and *Philosophiques* in 1974.

After the transformations of the 1960s it may be said that professional Canadian philosophy lost much of the discernibly Canadian character that it had had previously. Canadian researchers now work on specialized problems, and employ methods to do so, which resist narrowly national definition. Even so, there are exceptions to this trend. George Grant's *Lament for a Nation* (1965) and *Technology and Empire* (1969) had an influence well beyond the universities, and did much to underwrite a resurgence of Canadian cultural nationalism in the 1960s and 1970s.

Grant's work was in the main greeted unsympathetically by academically based philosophers. They found its arguments unrigorous and its Platonized anglicanism over-sentimental. Thus, while several Canadians, both at home and abroad, are in the forefront of various branches of philosophical enquiry, less amply exemplified are concentrations of 'analytically approved' research accomplishment that have a recognizably Canadian 'signature'. In the case of Australia, one tends to think of materialism; present-day Oxford calls to mind neo-Kantianism; and so on. In some areas, Canadians have achieved dominance, whether in Gauthier's work on contractarian ethics, van Fraassen's promotion of constructive empiricism, the Woods-Walton approach to fallacy theory, or the development of preservationist variations of paraconsistent logic by Peter Schotch, R. E. Jennings, and Bryson Brown. In only one area, however, can there be said to exist a

professionally well-respected signature that reflects a distinctively Canadian philosophical character. This is the philosophy of multiculturalism, typified by the works of Will Kymlicka. Leslie Armour has also provided the estimable service of showing how deep is the Canadian intellectual preoccupation with multiculturalism, which pre-dates by generations Quebec's Quiet Revolution. So Kymlicka (and certain of his critics, such as Edward Andrew) are building upon a thick analytical foundation.

In the Canadian tradition, a just citizenship must respect a fundamental difference between the rights of immigrants and the constitutionally protected distinctiveness of aboriginals and Québécois. While all immigrants must have the right to acquire citizenship, neither Canadian policy nor practice favours an open border. So there is a problem about what ethno-cultural justice requires in the case of illegals, or 'metrics' as Kymlicka calls them. Both Charles Taylor and Kymlicka reflect in their writings the Canadian openness to ethnic diversity. Taylor sees religion as essential to 'deep diversity'. Kymlicka concedes the impossibility of separating culture and politics, but favours the expungement of the religious from the political. Canadian multicultural politics is an accommodation of cleavages both ethnic and linguistic. It is not surprising, therefore, that her leading political philosophers should emphasize the Canadian confederal state as the appropriate governing structure. Some critics see in these arrangements the loss of Canada's former distinctiveness, its replacement by a timorous and unconfident new nationalism of the affirmative of otherness, and a misappropriation of the founding rationale of confederation. J.W.O.

**Cantor, Georg** (1845–1918). Cantor created the mathematics of the \*infinite as well as effectively creating \*set theory. A set has the *same* number of members as another if each member of either set can be paired with a unique member of the other. If a set can be put into such a one-to-one correspondence with the integers it is said to be denumerable. Cantor demonstrated the denumerability of algebraic numbers (roots of polynomial equations with integer coefficients), and the *non*-denumerability of the real numbers, numbers whose decimal expansion need not repeat or terminate (1873, diagonal proof 1891). Cantor's continuum hypothesis (there is no set intermediate in size between the integers and the real numbers) was proved by P. J. Cohen (1963), following a partial result by Gödel (1938), to be consistent with but undervivable from normal set theory.

Joseph Warren Dauben, *Georg Cantor: His Mathematics and Philosophy of the Infinite* (Cambridge, Mass., 1979).

**Cantor's paradox.** How many points are there in a line segment? As Cantor's diagonal proof reveals, infinitely more than there are integers. And in the infinite plane? Just as many as there are in the line segment. Indeed and in general, precisely as many as there are in a space of  $n$  dimensions,  $n \geq 1$ . 'I see it,' Cantor wrote to Dedekind, 'but I don't believe it.' Is this infinite number of points, then, the highest degree of \*infinity available? No. Cantor also proved that for any set, a set with more members (the original set's *power set*, consisting of all its subsets) is constructible. Thus there is no greatest set. Hence also (Cantor's paradox) there is not a set of all sets, since such a supposed total set would at once yield a larger one.

M. M. Zuckerman, *Sets and Transfinite Numbers* (New York, 1974).

**capacity.** A capacity is a \*power or ability (either natural or acquired) of a \*thing or person, and as such one of its real (because causally effective) properties. The natural capacities of inanimate objects, such as the capacity of copper to conduct electricity, are dispositional properties whose ascription entails the truth of corresponding subjunctive conditionals, such as that an electric current would flow in a copper wire if a potential difference were applied to its ends. But the capacities of persons the exercise of which is subject to their voluntary control, such as a person's capacity to speak English, do not sustain such a pattern of entailments and are consequently not strictly \*dispositions. Ascribing to something a capacity to  $F$  is not the same as saying that it is naturally possible for that thing to  $F$ , since circumstances can obtain in which a thing's capacity to  $F$  cannot be exercised.

E.J.L.

\*causality; propensity; potentiality.

R. Tuomela (ed.), *Dispositions* (Dordrecht, 1978).

**capitalism.** The modern, market-based, commodity-producing economic system controlled by 'capital', that is, purchasing-power used to hire labour for wages. The term was first used prominently, and pejoratively, by Marx, but for defenders of the system it has become a term of praise.

Marx sees the origins of capitalism in the forcible expropriation of European peasants and small artisans during the later Middle Ages, leading to a separation between the \*bourgeoisie or capitalist class, who privately own the means of production, and the proletariat or working class. Possessing no such means, proletarians can live only by selling their labour power to members of the bourgeoisie. Ownership of the means of production gives the bourgeoisie a decisive bargaining advantage over the proletariat, which shows itself in the form of the profit and interest on capital, resulting from the \*exploitation of wage labour. One central claim of Marxian economics is that capitalism has been responsible for a colossal growth in humanity's productive capabilities. Another is that capital has an inherent tendency to accumulate, concentrating social power in the hands of the capitalist class and

bringing the exploited working class more and more under its economic domination. The potential for a higher society and a better life which capitalism has made possible can be realized for the vast majority only if the workers are emancipated from the domination of capital.

Defenders of capitalism deny the charge that wage labourers are exploited, citing the indispensable economic functions performed by capitalists, such as managerial and supervisory labour, saving, and the assumption of risks. Critics of capitalism respond that in principle there is no reason why these functions must be performed by capitalists. Workers need not be supervised by those who represent interests antagonistic to theirs; capitalists typically bear fewer burdens of deprivation than workers do for the sake of social saving, and if capitalists are rewarded for risk-taking, the system offers no similar rewards to workers, who nevertheless risk losing their livelihood when an enterprise fails. They see capitalists as 'rewarded' for performing these functions only because the system gives them greater control over production, saving, and risk-taking, hence putting them in a position to reap the fruits of economic co-operation, accumulation, and good fortune. Profit and interest on capital are not rewards for managing, saving, and risk-taking, but rather consequences of capital's social power to exploit labour.

To this defenders of capitalism will reply that the failure of the Soviet system reveals capitalism to be the most efficient way yet discovered to manage a modern economic system. To grant this point, however, is not in the least to concede that capitalism is not exploitative, only that we have yet to find an efficient modern economic system which does not exploit workers. It is doubtless a troubling fact that we have not, but this fact provides us with no reason for feeling any loyalty to the capitalist system and leaves untouched the basic Marxian reason to seek an alternative to capitalism.

A.W.W.

**capital punishment.** The question whether it is morally permissible for the state to execute any of its citizens and, if so, under what circumstances, has been debated by philosophers, sociologists, and politicians ever since the middle of the eighteenth century. The arguments supporting capital punishment have usually been divided into those based on 'justice', which in this context simply means retribution, and those based on 'utility'. The appeal to \*justice usually takes the following form: people deserve to suffer for wrongdoing. In the case of criminal wrongdoing the suffering takes the form of legal

\*punishment; and justice requires that the most severe crimes, especially murder, be punished with the severest penalty—death. It should be emphasized that somebody who reasons in this way is not committed to a defence of the \**lex talionis*—the principle of ‘an eye for an eye’.

There are four major utilitarian arguments favouring the death penalty. It is said to deter, and to prevent the executed criminals from repeating their crimes, it is less cruel than life imprisonment (and hence should be welcomed by the criminal), and it brings a measure of satisfaction to the family and friends of the victim as well as to other citizens outraged by the crime.

Of the arguments against capital punishment by far the most important is that sooner or later innocent persons are certain to be executed. The only way to avoid this is to abolish capital punishment altogether. Another argument is that capital punishment lowers the ‘tone’ of the society in which it is practised. Civilized societies do not tolerate the torture of prisoners and they would not do so even if torture could be shown to have a deterrent effect. It has also been argued by Dostoevsky and Camus that capital punishment is unjust on retributionist assumptions because the anticipatory suffering of the person who is to be executed is immeasurably greater than that of his victim. Finally, Arthur Koestler and Clarence Darrow have argued that capital punishment must be unjust because human beings never act freely and hence should not be blamed and punished for even the most terrible acts. Koestler did not see that this argument would undermine all punishment. Darrow saw this and favoured the abolition of punishment altogether (as distinct from detention for purposes of social protection).

By way of commentary it should be mentioned that statistical studies in all parts of the world have shown that capital punishment does not deter, or rather that its deterrent effect is no greater than that of life imprisonment. If anything, capital punishment tends to inflame certain disturbed individuals and thus leads to an increase in murder. This fact, together with what is known about the fallibility of witnesses and juries and the bias and even corruption of prosecutors, has convinced many educated persons throughout the world, regardless of their political affiliation, that there is no place for capital punishment in a civilized society. **care, ethics of.** This term refers to a group of moral reflections about the moral emotion and virtue of care that emerged from feminist theory. The hypothesis that ‘women speak in a different voice’—‘the voice of care’—rose to prominence in Carol Gilligan’s book *In a Different Voice* (1982). Through empirical research, she claimed to discover a female voice stressing empathic association with others and a sense of being responsible and caring.

Gilligan thus identified two modes of relationship and two modes of moral thinking: an ethic of care and an ethic of rights.

Allied developments then occurred in philosophical ethics. For example, Annette Baier argued that the reasoning and methods of women in ethical theory is noticeably different from traditional theories. She found in them the same different voice that Gilligan heard. She criticizes the near-exclusive emphasis in traditional moral philosophy on universal rules and principles, to the neglect of sympathy with and concern for others. The ethics of care therefore promotes traits in intimate personal relationships, such as sympathy, compassion, fidelity, discernment, love, and trustworthiness. T.L.B.

\*feminism; feminist philosophy.

**Carnap, Rudolf** (1891–1970). German empiricist philosopher and logician who moved to the United States in 1935. Carnap was a pupil of Frege and much influenced by him, as well as by Russell and Wittgenstein. He was a prominent member of the \*Vienna Circle and a leading exponent of \*Logical Positivism before the Second World War. Technical rigour was a hallmark of his important contributions to formal semantics, the philosophy of science, and the foundations of inductive \*probability.

Carnap’s most important early work was *Der logische Aufbau der Welt* (1928), translated under the title *The Logical Structure of the World* (1967). This attempted to spell out in some detail the radical empiricist programme of reconstructing human knowledge of the social and physical world and other minds on the basis of individual experience, using as the sole starting-point the relation of remembered similarity between experiences. Carnap originally believed that all meaningful physical concepts were definable in terms of experience, in accordance with a strong version of the principle of \*verifiability. Later he moderated this view to accommodate the fact that the language of physics is not exhaustively translatable into the language of sense experience. He also came to put more emphasis on his belief that the method of construction used in the *Aufbau* could with equal legitimacy be used to construct individual psychology on a physicalist basis.

In *The Logical Syntax of Language* (1934; Eng. tr. 1937), Carnap deployed his technical skills to develop a rigorous formal account of the structure of any possible language, seeing this as a necessary preliminary to the pursuit of the only form of philosophical inquiry deemed legitimate by him—logical analysis. In the foreword of that book he memorably states his view that ‘Philosophy is to be replaced by the logic of science [and] the logic of science is nothing other than the logical syntax of the language of science’ (p. xiii). Later, however, Carnap became more concerned with the \*semantics of natural and formal languages, doing work which culminated in his important and influential book *Meaning and Necessity* (1947), which

laid the foundations of much subsequent work in the semantics of \*modal logic. In that book Carnap argues in favour of an alternative to Frege's theory of \*sense and reference, called by him the 'method of extension and intension'. Carnap held that this method provided the most economical account of the logical behaviour of expressions in modal contexts—for instance, the expressions '9' and '7' in the sentence '9 is necessarily greater than 7'. His criticism of Frege involved a rejection of the traditional category of \*names, conceived as a class of expressions each of which stood for a unique thing.

After the Second World War, Carnap's energies were increasingly devoted to the development of inductive logic as a branch of probability theory, resulting in his magisterial volume *Logical Foundations of Probability* (1950) and many subsequent publications. This interest was continuous with his earlier ones, since his concern was to put on a rigorous footing the notion, central to scientific method, of the confirmation of a hypothesis by empirical evidence. Although he had abandoned a strong form of the principle of verifiability, he continued to adhere to a fundamentally empiricist theory of meaning which required scientific hypotheses to be susceptible to empirical confirmation. He also, in consequence, adhered to the \*analytic–synthetic distinction, notwithstanding the strictures of W. V. Quine—though their differences on this issue were perhaps less substantial than they appeared to be, since Carnap was always insistent that logical principles themselves are always a matter for freely chosen convention, to be justified on pragmatic grounds. In all matters of logic and mathematics, Carnap espoused what he called the principle of tolerance: 'It is not our business to set up prohibitions, but to arrive at conventions' (*Logical Syntax*, 51).

**Carneades** (214–129 BC). Head of Plato's \*Academy, who followed Arcesilaus in emphasizing the sceptical rather than the dogmatic elements in Plato's legacy. Carneades scandalized Cato the Elder by arguing in favour of justice and against it on successive days. Holding that certainty is impossible and that we should always suspend judgement, he nevertheless claimed that we should be guided by the 'probable' (in the sense of 'approvable' or persuasive, not of statistical likelihood). Criticizing both Stoic and Epicurean views in the debate on freedom and determinism, he anticipated Gilbert Ryle on the truth of future contingents and Richard Taylor on agent causation; but whether he himself did, or as a Sceptic consistently could, assert a libertarian position is controversial.

**Carroll, Lewis** (1832–98). Pseudonym of the Revd Charles Lutwidge Dodgson, a mathematics don at Christ Church, Oxford. Best known for his Alice stories, which brim over with logical puzzles and absurdities and have been duly pillaged by philosophers. Coming at the tail-end of the degenerating programme of Aristotelian logic, his contributions to formal logic are inevitably insignificant, their only lasting value being their testimony to his inimitable talent for devising extraordinary syllogisms. Carroll's most important philosophical article is the characteristically quaint and deceptively light 'What the Tortoise Said to Achilles' (*Mind* (1895)). He hints at a deep problem about the epistemology of valid inference, demonstrating that the acceptance of a rule of inference cannot be identified with the acceptance of a conditional proposition.

**Cartesianism.** Name given to the movement inaugurated by René Descartes (after 'Cartesius', the Latin version of his name); it shaped the philosophical landscape of the early modern period, and its influence, even today, is by no means entirely exhausted. In the decades following Descartes's death, Cartesianism was seen primarily as a new programme for physical science, based on mathematical principles. Descartes had defined matter as *res extensa*, or 'extended substance', that is to say, whatever has length, breadth, and height. The Cartesian programme was to exhibit all physical phenomena as explicable in terms of the 'modes' or modifications of extension; in effect, this meant showing how all the apparent complexity and diversity of matter could be accounted for simply by reference to the size, shape, and motion of the particles of which it was composed. 'I freely acknowledge', Descartes had written in his *Principles of Philosophy* (1644) 'that I recognize no matter in corporeal \*things apart from that which the geometers call quantity, and take as the object of their demonstrations, i.e. that to which every kind of division shape and motion is applicable' (pt. II, art. 64).

The appeal of the Cartesian approach in the latter half of the seventeenth century undoubtedly owed much to its rejection of occult forms and qualities, and its insistence that physics should invoke only the 'clearly and distinctly perceivable' properties of mathematics. A growing body of critics, however, pointed out that mere extension in three dimensions could yield only an inert and passive universe. To generate \*motion in the system, the Cartesians had to have recourse to God, whom Descartes had described as 'the primary cause of motion, who in the beginning created matter along with its motion and rest, and now preserves the same amount of motion as he put there in the beginning' (*Principles*, pt. II, art. 36). Though

this may seem to be a piece of *ad hoc* metaphysics, the cash value of the appeal to immutable and continuous divine action in the Cartesian system was the rejection of the Aristotelian assumption that all matter tended 'naturally' to come to rest, and its replacement with the Cartesian principle of the persistence of motion in a straight line (what has subsequently come to be known as the law of inertia). The idea of the conservation of motion was highly influential for the subsequent development of physics. In later Newtonian physics, however, what is conserved is mass times velocity, and neither of these notions is to be found in Descartes; as the working-out of Descartes's 'rules of impact' make clear, what is conserved is 'quantity of motion', measured simply as the product of size (volume) and speed (the latter factor, unlike the more modern notion of velocity, is not held to be affected by a change in direction of motion).

Although, from a scientific point of view, the eventual downfall of Cartesian physics was a result of Isaac Newton's formulating mathematical covering laws of far greater predictive power than anything Descartes had been able to devise, many of the philosophical debates over Cartesianism centred on its denial of any inherent power or force in matter. To some, notably Descartes's deviant disciple Nicolas Malebranche, this was a positive advantage: if \*causality involves the necessitating of effects, only God has the requisite power to count as a genuine causal agent; matter is, of itself, wholly inert—mere 'extended stuff'. For G. W. Leibniz, by contrast, it is a violation of the \*principle of sufficient reason to see physics as merely a series of arbitrary, divinely decreed covering laws; the behaviour of matter must proceed from something inherent in its nature, and hence (*contra* the Cartesians), some recourse must be had to the notion of force or power in things. Such debates indicate the extent to which the 'new' Cartesian physics opened up serious questions about the nature of causation in the late seventeenth and early eighteenth century, paving the way for David Hume's eventual radical critique of the very idea of causal power.

Among philosophers today, the main feature of Cartesianism which remains of interest is its theory of the mind. Descartes, in the celebrated theory known as \*dualism, had maintained that the mind is an entirely separate substance from the body, and, moreover, that its nature is wholly distinct from the nature of anything physical: it is an incorporeal, indivisible, non-spatial, unextended thing, which is 'entirely distinct from the body, and would not fail to be what it is even if the body did not exist' (*Discourse on the Method*, pt. iv). The Cartesian view of the mind as a \*ghost in the machine' of the body (to use Gilbert Ryle's celebrated phrase) has few takers nowadays. To begin with, its view of the nature of the mind remains essentially obscure: we are simply told what the mind is *not* (not extended, not divisible), but are not given any explanatorily satisfying account of what it is. Moreover, even granted the existence of such supposed purely spiritual substance, it is far from clear how it could interact with the

mechanism of the body in the required way. When I decide to go for a walk my legs move, but if the chain of impulses generating the requisite muscle movements is traced back through the nervous system to the brain, the causal process is somehow mysteriously initiated by a ghostly \*'volition' whose nature, and relationship to the observed physical events, remains beyond the reach of explanatory science. The form of Cartesianism proposed by Descartes's disciples in the late seventeenth century was content to leave mind-body correlations as irreducible regularities decreed by God: God obligingly ordains that the required bodily movements occur when I decide to go for a walk; conversely, he ordains that sensations of an appropriate kind (e.g. of pain or of colour) should 'arise' in the soul when the organs of the body are stimulated. Cartesianism thus typically leads to an \*occasionalism' with respect to the relation between mind and body: bodily events are the 'occasion' for the production of mental events and vice versa, but such productivity remains beyond the reach of human science—not just something we cannot so far explain, but something that no scientific account, however sophisticated, could ever in principle explain.

Cartesian attempts to resolve this puzzle tended to generate further obscurities. Descartes himself sometimes seems to have viewed the mind or soul as a kind of non-physical 'homunculus' dwelling inside the brain (he identified the \*pineal gland or conarion as the 'principal seat' of the soul). Some scholastic philosophers had argued for the existence of a common sensorium where the data from the five specialized senses are integrated (a notion canvassed by Aristotle (see *De anima*, bk. iii, ch. 1, 425<sup>b</sup>14)). One might have expected Descartes to have rejected this idea, both in the light of his resolute hostility to received scholastic doctrine, and also because of his conception of the mind as an incorporeal substance; in fact, however, he not only accepted it, but incorporated it into his own theory of mind-body interaction. The pineal gland receives data (via the nerves) from all parts of the body, and it is only after the data have been integrated in the gland into a unitary signal or impression that any sensory awareness can occur. 'The mind', Descartes wrote in the Sixth Meditation, 'is not immediately affected by all parts of the body, but only by the brain, or perhaps just by one small part of the brain, namely the part containing the "common sense".' In his later work, *The Passions of the Soul*, Descartes observes that 'there must necessarily be some place where the two images coming through the two eyes, or the two impressions coming from a single object through the double organs of any other sense, can come together in a single image or impression before reaching the soul, so that they do not present to it two objects instead of one' (art. 32). The argument is a curious one, since it is not at first sight apparent why a unitary image in the conscious mind requires a unitary signal or impression in the brain. Writing to Mersenne on 24 December 1640, Descartes reflected that 'the only alternative is to suppose that the soul is not joined immediately to any solid part of the

body, but only to the animal spirits which are in its cavities, and which enter or leave it continually like the water of a river. That would certainly be thought too absurd.' The suggestion seems far from absurd to the modern reader, accustomed to the notion that \*consciousness arises from just such a shifting and elusive interplay of electrical activity in the cerebral cortex. But to have contemplated the possibility that consciousness could arise from purely physical processes would have taken Descartes away from dualism entirely, and have made the notion of a separate substance called the mind or soul redundant—a step the Cartesians were not prepared to take, since they followed Descartes in insisting that the complexities of conscious thought could never be explained by the operations of 'mere matter'.

The reason that the Cartesian approach to the mind is not yet extinct is that some philosophers continue to maintain that there is something about consciousness that eludes the explanatory apparatus of physical science. Here a further feature of Cartesianism has been very influential, namely its stress on the subjective or 'first-personal' aspects of human experience. The Cartesian search for knowledge starts from the private meditations of the solitary thinker; and in the course of those meditations Descartes rapidly arrives at the doctrine of the perfect 'transparency' of the mind—the view that I have direct and privileged access to the contents of my mind, and that I know my own nature as a conscious being better than that of any 'external' objects. From here, Descartes moves on to the conclusion that my own experiences (e.g. of hunger, thirst, pleasure, and pain) have a phenomenal character that is vividly accessible 'from the inside', but which necessarily lacks the kind of objective clarity and distinctness that belongs to the quantitative language of physical science. This notion of the essential privacy of our conscious experience has been attacked in our own century, notably by Ludwig Wittgenstein, but still retains a hold. Thus the contemporary philosopher Thomas Nagel has argued that the character of experience, 'what it is like' for the experiencing organism, cannot be captured by any physicalist account of the world. Such a perspective may not inappropriately be called 'Cartesian' even though its advocates tend to reject Descartes's doctrine of a non-physical separable substance called 'the mind', since it continues to be held that certain aspects of the mental are *sui generis* and not reducible to the objective descriptions of physics. Although it is too early to say whether such residual Cartesianism will retain a permanent philosophical foothold, its present survival, over 300 years after the death of its founder, is testimony to the enduring appeal of Descartes's approach to the complex problem of consciousness and its relation to the physical world. **Cartwright, Nancy** (1943– ). American philosopher (at Stanford and the London School of Economics) who views the higher-level laws of physics as instruments of explanation and prediction which are not true, and whose predictive and explanatory value does not require them to be true. Unlike many instrumentalists, she is a realist about the causal factors mentioned by the \*laws—including so-called 'theoretical entities' generally considered unobservable. The phenomena that physicists try to explain, she says, are produced by interactions of non-Humean causal factors which are too numerous, whose interactions are too complicated, and whose influences differ too much from one physical setting to another for the phenomena they produce to be systematically explained or predicted without recourse to simplifications, idealizations, and unrealistic generalizations. The falsity of the laws, simplifications, and idealizations are the price physicists must pay for useful and cognitively manageable pictures of the physical universe. Cartwright has written extensively on scientific explanation, the epistemology of science, and problems in the philosophy of quantum physics. She was married to Stuart Hampshire. J.B.B.

**Cassirer, Ernst** (1874–1945). German philosopher who was a neo-Kantian, but differed from Kant in two respects. First, while he agreed that we need some a priori \*categories to organize experience, these are not, as Kant believed, the same at all times: our categories develop over history. Second, his early researches in the philosophy of science, especially on the mathematization of physics, led him beyond Kant's central focus on scientific knowledge to a consideration of all symbolizing activities—language, myth, religion, etc.—which are, on his view, the distinguishing feature of man and are all, along with science, of equal status.

His *Philosophy of Symbolic Forms* (1923–31; tr. New Haven, Conn., 1953–7) attempts to give a unified account of 'symbolic representation'. Our systems of symbols constitute the world, since there is no reality in itself apart from our symbolizations. Conversely, man himself is essentially the source of various symbolizing activities. The philosopher's task is thus to describe man's symbolizing activities, and the categories involved in them, throughout history. M.J.I.

\*neo-Kantianism.

**casuistry.** The art of resolving problems of \*conscience. The starting-point for the exercise of casuistry is the

individual case (*casus*) of conscience, and characteristically involves answering the question whether an act that an agent wishes to perform does or does not conflict with a law. The art, which was particularly associated with priests exercising pastoral care, fell into disrepute partly because of the multiplication of fine distinctions that began to be made as ways were sought of so describing the act in question that it did not conflict with a law with which it could otherwise be seen plainly to be in conflict. Such justificatory exercises were regarded as pandering to the vice of laxity. The art of casuistry, shorn of its laxist associations, is beginning to flourish again today within the field of professional, particularly \*medical, ethics.

Edmund Leites (ed.), *Conscience and Casuistry in Early Modern Europe* (Cambridge, 1988).

**cat, Schrödinger's.** A \*quantum mechanical system supposedly exists in a superposition of states until a measurement or observation is made, whereupon the system will be found to exist in just one of those states—though it is impossible to predict with certainty which state that will be. As long as this picture is only held to apply to microphysical states, it may not appear unacceptably paradoxical. But the following \*thought experiment suggests that the threat is not so easily contained.

Imagine a cat confined to a box containing a bottle of poisonous gas which will break, killing the cat, if and only if a device connected to it registers the radioactive decay of a radium atom. If the atom, device, and cat together constitute a quantum system, then it seems that this system will exist in a superposition of states unless and until an observer tries to determine which state it is in, by seeing whether or not the cat is dead. But this implies that in the absence of such an observation the cat is neither determinately dead nor determinately alive, which seems absurd.

This thought experiment was conceived by Erwin Schrödinger (1887–1961), an eminent Austrian physicist who was one of the founders of quantum mechanics. He also had philosophical interests.

E. Schrödinger, *What is Life? and Mind and Matter* (Cambridge, 1944).

**categorical imperative.** The formal moral law in Kantian ethics, based on reason. It is opposed to hypothetical imperatives, which depend upon desires, e.g. 'Catch the 9.15—if you want to arrive by noon'. In its most famous formulation, it states that the 'maxim' implied by a proposed action must be such that one can will that it become a universal law of nature. I consider \*lying to you so that you will lend me some money, my maxim therefore being 'Whenever I can gain something from it, I shall lie'. Can I will this to become a universal law of nature? No, for the practices of communication on which lying depends would break down. This is Kant's conception of \*universalizability, based ultimately on fairness: why am I entitled to \*free-ride on the honesty of others?

**categorical judgement.** In traditional logic, categorical judgements affirm or deny a predicate of all or some of a subject, as in 'No coins are bent'. They are contrasted both with modal judgements, which express necessity (\*apodeictic) or possibility (\*problematic), as in 'Some coins are not necessarily bent', and also with complex judgements, in which two or more predicates or propositions are combined, as in 'Every coin is bent or shiny', 'If some coins are bent, some coin-makers are busy'.

C.A.K.

I. M. Copi, *Symbolic Logic* (New York, 1978), ch. 5.

**categoricity.** Informally, a \*theory is categorical if it describes, or characterizes, only one structure. The idea is that all the models of the theory are notational variants of each other. Technically, two interpretations,  $M, N$ , of the same formal language are 'isomorphic' if there is a one-to-one function  $f$  from the domain of  $M$  on to the domain of  $N$  which preserves the structure. For example, if  $R$  is a binary predicate in the language, then for any elements  $x, y$  in the domain of  $M$ ,  $R$  holds of the pair  $\langle x, y \rangle$  in  $M$  if and only if  $R$  holds of the pair  $\langle f(x), f(y) \rangle$  in  $N$ . A theory  $T$  is *categorical* if any two structures that satisfy  $T$  are isomorphic.

s.s.

John Corcoran, 'Categoricity', *History and Philosophy of Logic* (1980).

**categories.** The most fundamental divisions of some subject-matter. In the fifth century bc various philosophers, following Parmenides, decided that anything that was real could not come to be or go out of existence. But many \*things, indeed most of the things around us, manifestly did both. Therefore they could not be in the fullest sense real. In fact some of them, like red or sweet, seemed not only to be intermittent but to depend for their existence on human or animal perception. Evidently they were things of a radically different kind from those which satisfied the requirements for full-blooded reality (Democritean atoms in this case).

This was probably the start of the idea that fundamental divisions can be made among things, and it was reinforced a little later when paradoxes arose in the nascent philosophy of language: if you try to treat the predicate of a sentence in exactly the same way as the subject you will end up by first naming the subject and then just naming the predicate, so that you won't have connected the predicate to the subject and won't have said anything *about* the subject at all. Evidently predicates were radically different kinds of things from subjects. The realization of this was one of the points brought out by Plato in his late dialogue the *Sophist*, where he caricatures as 'late learners' those who constructed paradoxes which depended on not realizing this point (251a).

The word 'category' comes from a word meaning 'accuse', and thence (in philosophy) 'predicate', perhaps

via some sense like 'mark out as the relevant item for consideration' (cf. also 'accusative case' in grammar). Aristotle's *Categories* was the first attempt that survives at a division into fundamental kinds, and what it divides is predicates, which Aristotle treated as 'things', not as mere linguistic items. He can therefore be seen as embodying both the motifs discussed in the last two paragraphs. His own list of categories extends to ten, but he does not emphasize the number, and in one place (end of ch. 8) even seems to allow categories to overlap. The most important ones were the first four, substance, quantity, relation, quality, but more important still was the distinction between substance and the rest.

Various other philosophers have engaged in the enterprise of making grand divisions in things, notably the Stoics, who provided a list of four (substrate, qualified, disposed, relatively disposed) and Kant, who picked out certain concepts in terms of which any mind recognizably like the human mind would have to view reality if it was to make sense of it. It would, for instance, have to think in terms of *things* which had *properties*, and were *one* or *many*. Kant provided a structured list of twelve categories, in four groups of three, but his scheme has been treated as rather artificial and factitious, and of much less importance than the general idea that some such list must exist and governs our thinking. Hegel used the term rather more broadly for general divisions of thought and reality, which his system tended to fuse together.

In the twentieth century, theories of logical \*types have arisen in answer to the logical paradoxes, but outside logic and its technical requirements attention has turned more to how far such grand overall classifications are possible. There is some danger of introducing so many categories that the enterprise becomes vacuous, a danger facing Ryle, though others (notably Sommers) have been more optimistic and have offered criteria for classifications of things that remain fundamental and do not run riot. But it seems doubtful that any scheme both simple and satisfying will be possible, and for the moment at any rate interest in the topic seems to have abated.

A. R. L.

\*ontology.

F. Sommers, 'Types and Ontology', *Philosophical Review* (1963).

P. F. Strawson, 'Categories', in O. P. Wood and G. Pitcher (eds.), *Ryle* (London, 1970).

**category mistake.** The error of ascribing to something of one \*category a feature attributable only to another (e.g. colour to sounds, truth to questions) or otherwise misrepresenting the category to which something belongs. (Ryle supposes we or some of us misrepresent the category to which the facts of mental life belong. We take them to be inner, ghostly events.) Metaphorical uses of a term may allow sentences to be true that would, if the term were used literally, embody a category mistake. For example, 'Time crawled'.

S. W.

G. Ryle, *The Concept of Mind* (London, 1949).

**catharsis.** Literally 'purgation' or 'purification', whether medical or religious. Aristotle's statement that \*tragedy 'produces through pity and fear a catharsis of such \*emotions' (or 'happenings'—the Greek can mean either) has usually been understood as indicating a purifying or release of pity and fear, in reply to Plato, who had attacked tragedy for encouraging them. For some recent interpreters, however, there is no direct reference to Plato or to the spectators' emotions, and Aristotle's primary claim is that drama clarifies or resolves the events it portrays. As so often, Aristotle's compressed and allusive way of writing makes the question impossible to decide.

R. W. S.

A. O. Rorty (ed.), *Essays on Aristotle's Poetics* (Princeton, NJ, 1992).

**causal asymmetry.** Causation seems to be an anti-symmetrical relation, meaning that if an event *a* is a \*cause of another event *b*, then *b* is not also a cause of *a*. But 'if and only if' is a symmetrical relation, so given two events causally related to one another, such that one happens if and only if the other happens, what determines which is the cause and which the effect? Some philosophers hold that the cause is always the earlier of the two events, and the effect the later, which presupposes that an effect cannot either precede its cause or be simultaneous with it. However, \*backwards causation is thought by other philosophers to be at least metaphysically possible, not least because they think that \*time-travel is metaphysically possible and would have to involve it. Alternatively, then, it may be suggested that the asymmetry of causation is grounded in the asymmetry of \*explanation: causes *explain* their effects, but effects do not explain their causes. Explanation, it would seem, must be asymmetrical, because otherwise circular explanations would be legitimate.

E. J. L.

D. M. Hausman, *Causal Asymmetries* (Cambridge, 1998).

**causality.** The relation between two items one of which is a cause of the other; alternatively 'causation'. 'Causality' or 'causation' can also refer to a group of topics including the nature of the causal relation, causal explanation, and the status of causal laws.

In modern philosophy (as in modern usage in general) the notion of cause is associated with the idea of something's producing or bringing about something else (its effect); a relation sometimes called 'efficient causation'. Historically, the term 'cause' has a broader sense, equivalent to 'explanatory feature'. This usage survives in the description of Aristotle as holding 'the doctrine of the four causes'. The members of Aristotle's quartet, the material, formal, efficient, and \*final cause, correspond to four kinds of explanation. But only the efficient cause is unproblematically a candidate for a cause that produces something distinct from itself.

Modern discussions tend to treat causality as exclusively or primarily a relation between \*events. On this approach, examples of paradigmatic *singular* causal statements are 'The explosion caused the fire' and 'Her

pressing of the button caused the opening of the door'. Paradigmatic *general* causal statements will be ones like 'Droughts cause famines'. Recasting ordinary causal statements in such forms is a Procrustean enterprise. The second example sentence is an awkward paraphrase of 'She opened the door by pressing the button', which does not *overtly* report a relation between events at all. The interpretation of ordinary causal talk is the subject of dispute. One contentious issue concerns the apparent commitment of ordinary language to *\*facts*, as well as events, as causes. While this fact leads some philosophers to recognize a relation of fact causation, others (notably Davidson) argue that facts cannot, strictly speaking, be causes, although they are relevant to causal explanation.

What is distinctive of pairs of events related as cause and effect? Obviously, it is not *sufficient*, for an event to cause another, that the second happen after the first. (*\*Post hoc, ergo propter hoc.*) Further, it has been argued that this is not even necessary, and that both simultaneous causation and 'backwards causation' (effects preceding their causes) are at least conceptually possible. This poses a problem. Causality appears to be an *asymmetric* relation (if *a* caused *b*, then *b* did not cause *a*). But if temporal order cannot be relied on to explain the asymmetrical 'direction of causation', what can? Another difficulty is that of explaining what differentiates cause-effect pairs from effects of a common cause. It is no accident that the kettle switched itself off after it started to whistle: what, then, makes it false that the whistling caused the switching?

One important suggestion (which may or may not overcome these problems) is that causes *necessitate* the events that are their effects. (Rather confusingly, this can also be described as the idea that causes are sufficient for their effects (*\*necessary and sufficient conditions*.) This proposal takes a variety of forms. In one version, it asserts that a relation of causal necessity holds between particular events, making one an inevitable consequence of another. Thus, when I heat the water, it *must* evaporate; when the first billiard-ball hits the second, the second ball *has to* move. Hume is famous for a sceptical attack on this notion of a necessitating tie between cause and effect.

However, the idea that causes necessitate (are sufficient for) their effects has another interpretation, congenial to 'Humean' empiricists, who refuse to countenance a relation of causal necessity. Under this interpretation, the necessity for the second billiard-ball to move when the first hits it is only a *hypothetical* or *conditional* necessity: necessity 'given the laws of nature'. Roughly, to say that event *a* necessitated event *b* need be to say no more than that it is a consequence of the laws of nature that when *a* occurred, so did *b*. (*\*Covering-law model; \*explanation.*) If—as empiricists standardly hold—the laws of nature are contingent, rather than necessary truths, necessity-given-the-laws is not in danger of reintroducing the necessitating ties between events discussed in the previous paragraph. If there had been different laws of nature—as, on this empiricist view, there could have been—perhaps water need not have evaporated when heated, even though the

actual laws entail that it invariably does so. (The empiricist theory of causation just described is a species of what is known as a 'regularity theory'. On the anti-empiricist view that laws of nature are necessary truths, what is necessary-given-the-laws will be itself necessary. This is perhaps how some ratio-nalist philosophers saw the necessity of causal connections (*\*laws, natural or scientific*.)

It has been argued that if a particular event is the effect of a combination of causes, it may be false that any of these causes necessitated the effect. (Suppose that Smith's early morning swim caused his heart attack, but only in conjunction with his champagne breakfast.) One response to this is the proposal (inspired by J. S. Mill) that a cause is an *element* in a set of conditions that *jointly* necessitate (are sufficient for) its effect. J. L. Mackie's treatment (in 1965) of causes as 'INUS conditions' ('Insufficient but Necessary parts of Unnecessary but Sufficient conditions') is a version of this approach. Another problem is that 'necessitation' accounts of causation require that causality be deterministic. They must therefore be abandoned, or at least modified, if (as some contemporary philosophers suppose) causality can be fundamentally probabilistic. (*\*Determinism.*)

One notable rival to the accounts of the causal relation mentioned so far is David Lewis's *\*counterfactual* analysis of event-causation. This ingeniously exploits the idea that effects are typically 'counterfactually dependent' on their causes: if the announcement caused the riot, it seems to follow that if the announcement had not occurred, neither would the riot.

Many theories of causation involve a principle that Davidson calls 'the nomological character of causality': where there is causality, there is causal law. However, some philosophers believe that there are species of causality independent of causal law. This claim is most commonly made about human agency. (The issues here are complex: *\*action; \*agent; \*reasons and causes; \*teleological explanation; also \*social science; \*laws, natural or scientific.*)

The 'regularity theory' mentioned earlier is a descendant of one of Hume's definitions of cause: 'an object, followed by another, and where all the objects similar to the first are followed by objects similar to the second'. According to a standard interpretation, Hume argued that nothing in the world deserves the name of causal necessity. At most there are certain *\*constant conjunctions*—exceptionless regularities—between events. We are conditioned, by regularities in our experience, to form an idea of causal necessity, and thus to suppose that the second billiard ball not only *will*, but *must*, move when the first one strikes it. But *this* idea of causal necessity—being, as Kant put it, 'a bastard of the imagination, impregnated by experience'—has no legitimate application to the world.

This account of Hume's views is so well established that regularity theories of causation (denying causal necessity, and analysing causality in terms of (contingent) constant conjunctions) are standardly described as 'Humean'. However, this traditional interpretation is under attack, and sev-

eral recent commentators argue that Hume did not deny the existence of genuine causal necessity. P.J.M.

**causa sui.** This Latin phrase means 'cause of itself'. Some theologians maintain that \*God is self-caused, but this claim is quite problematic. Any exercise of causal power presupposes the cause's existence, and so its existence cannot be the result of such an exercise. Even an omnipotent being cannot bootstrap itself into existence. For this reason, God is more commonly thought of as the uncaused cause of the existence of all contingent things, and God's existence is supposed to need no cause because it is necessary. P.L.Q.

D. Braine, *The Reality of Time and the Existence of God: The Project of Proving God's Existence* (Oxford, 1988).

**causation, backwards:** see backwards causation.

**causation, downwards.** The alleged causal influence of higher-level phenomena on lower-level processes, a notable example being the supposed causation of the physical by the mental. Although Cartesian \*dualism may seem to provide the most obvious case, the question of downward causation more properly arises in the case of \*monistically conceived structures arranged hierarchically. Science since the seventeenth century typically holds that higher-level features, including the kind we call mental, can be explained in terms of the features and behaviour of the more basic elements and structures of which the systems are composed. Reductive \*physicalism denies that there are higher-level systems with causal powers of their own, while non-reductive physicalists and emergentists claim that higher-level structures, with properties uninferrable from those of their constitutive parts, can influence the presence or absence of properties both at the same level (same-level causation) and at a lower level (e.g. mental-to-physical). Some philosophers argue that with consciousness and reason at the top, downwards causation provides for a notion of \*free will.

causes; plurality of causes; *post hoc ergo propter hoc*; thinking causes.

**causes, final:** see final causes.

**causes and reasons:** see reasons and causes.

**cave, analogy of.** In *Republic* vii Plato represents the philosophically unenlightened as prisoners chained from birth in an underground cave, able to see nothing but moving shadows, which they take to be the whole of reality. The world outside the cave represents the \*Forms and the escape of the prisoners from the cave the process of philosophical enlightenment. C.C.W.T.

\*appearance and reality.

J. Annas, *An Introduction to Plato's Republic* (Oxford, 1981), ch. 10.

**Cavell, Stanley** (1926– ). American philosopher (at Harvard) who has written in such diverse areas as aesthetics, ethics, philosophy of mind, and epistemology. Cavell's earlier work is perhaps best known for its sympathetic presentation of 'ordinary-language philosophy' and its interpretation and extension of the philosophy of the later Wittgenstein. Throughout his career, Cavell has also written much about philosophically traditional and non-traditional aesthetic topics, including the ontology of \*film, Hollywood comedy, television, and so on. This work is often simultaneously philosophy, art criticism, and cultural criticism. His interdisciplinary tendency, his stylistic flair, his interest in authors and topics neglected in most contemporary Anglo-American philosophy, all test the boundaries of the discipline, while his depth in dealing with basic philosophical problems such as scepticism should persuade even the most academically conservative of philosophers (if such persuasion were necessary) of Cavell's primary identity as a philosopher. E.T.S.

Stanley Cavell, *Must We Mean What We Say?* (New York, 1969).

**cement of the universe.** Hume's description of resemblance, contiguity, and causation—the three relations which induce people to associate ideas, and hence to build up their picture of the world. 'As it is by means of thought only that any thing operates upon our passions, and as these are the only ties of our thoughts, they are really *to us* the cement of the universe, and all the operations of the mind must, in a great measure, depend on them' (*An Abstract of A Treatise of Human Nature*).

*The Cement of the Universe*, J. L. Mackie's fine study of causation, takes its title from Hume, as well as sharing his empiricist perspective and his general conviction that causal necessity is 'upon the whole . . . something, that exists in the mind, not in objects' (*Treatise*, i. iii. 14). J.BRO.

\*causality.

J. L. Mackie, *The Cement of the Universe* (Oxford, 1974).

**central-state materialism.** A theory of mind which came into its own as the weaknesses of Ryle's \*behaviourism

became evident—especially its inability to provide for non-vacuous explanation of action. According to Ryle, for Jones to believe that aspirin relieves headaches is for it to be true that whenever Jones has a headache he takes aspirin. But this means that explaining why Jones takes aspirin when he has a headache, by saying that he believed aspirin relieves headaches, is exactly the same as explaining it by saying that Jones takes aspirin whenever he has a headache. Ryle's account must be wrong since it implies that what is obviously a substantial explanation is mere repetition of words. The central state theorists, chiefly Smart and Armstrong, maintained that there are inner mental states which are responsive to external stimuli and causally explain consequent behaviour. These states, they argued, are material states of the central nervous system. The theory was empirical, holding that identification of the mental with the material is to be a matter of future discovery, rather like the way lightning has been discovered to be an electrical discharge, or water to be a collection of H<sub>2</sub>O molecules. However, the idea that types of mental states identify with types of material states later gave way to a token \*identity theory.

O.R.J.

D. M. Armstrong, *A Materialist Theory of Mind* (London, 1968).

**certainty.** A proposition is said to be certain when it is indubitable. A person is certain of a proposition when he or she cannot \*doubt it. It is thus possible that someone may be certain of something (or feel certain of it) when it can in fact be doubted. In his First Meditation, Descartes suggested that much that we normally take to be certain is in fact dubitable, and he held the controversial view that \*scepticism will be defeated only if genuine certainty is available.

C.J.H.

A. R. White, *Modal Thinking* (Oxford, 1975), ch. 5.

**ceteris paribus.** 'Other things being equal.' Certain scientific \*laws are not true without some qualification to the effect that nothing interferes or that all else remains the same. For example, if the supply of some good is constant and demand increases, then the price of that good will increase too—but only if the shopkeepers are rational, they are not distracted by a fire in the shop, they are interested in increased profits instead of, say, unloading stolen merchandise, and so on. Such laws, it seems, are subject to the following dilemma. Either the law is left without proviso, in which case it seems false, or a proviso is added, rendering the law trivial—price increases unless, for some reason, it does not. Whether the problem affects just the soft sciences or goes all the way down to physics is a matter of debate.

M. Lange, 'Natural Laws and the Problem of Provisos', *Erkenntnis* (1993).

**Chalmers, David** (1966–). In his book *The Conscious Mind* (1996), David Chalmers has written probably the

lengthiest and certainly the most sophisticated defence of the possibility of \*zombies and how we should face up to them. These are not the undead inhabitants of horror movies but, rather, benighted creatures physically identical to us but with one great lack. There is nothing it is like to be them: no ouchiness of their pain or panginess of their hunger (philosophers call these properties 'phenomenal properties'). If zombies are possible, \*physicalism is false. The key move in Chalmers's defence stems from his insistence that, if physicalism were true, there should be a priori necessary \*truths detailing the connection between physical and phenomenal properties. But, he argues, there aren't. So phenomenal properties aren't physical. It turns out that they are worse than that. Since there will always be a complete physical explanation of the workings of our brain and bodily movements, phenomenal properties turn out to be entirely inefficacious. Chalmers explains how this result is not vitiated by the fact that he has written and published a book seemingly stimulated by the existence of these inefficacious features of the world.

P.J.P.N.

David Chalmers, *The Conscious Mind* (New York, 1996).

**chance.** In ordinary use, this term is interchangeable with 'probability' in 'The chance of heads is ½' but not in 'Shall we take a chance and hire him?' Among experts, however, there are more distinctions, or attempted distinctions, between 'chance', 'probability', 'degree of belief', 'relative frequency', 'propensity', 'likelihood', and some others. For a given coin-tossing device, we may think of (1) the actual frequency of heads in a given series of tosses, (2) the betting-rate a given person would offer on heads for a prospective toss, (3) what the frequency would be for some prospective 'long' run, (4) the dispositional condition of the device to produce heads, and other related things. We may come to disagree over whether we are identifying something definite and whether to call it 'chance'.

A traditional question in philosophy concerns the view that nothing ever really happens merely 'by chance'. On this view, even though the probability or chance of heads for a single toss may be explained in various theories as being ½, it will none the less be true that the outcome of the toss was causally determined in advance. In this discussion 'mere chance' is seen by its proponents as a feature of events that, contrary to metaphysical \*determinism, are not completely caused by antecedent events, and, contrary to metaphysical \*libertarianism, are not caused by 'free agents' either.

Ian Hacking, *The Emergence of Probability: A Philosophical Study of Early Ideas about Probability, Induction and Statistical Inference* (Cambridge, 1975).

K. R. Popper, 'The Propensity Interpretation of Probability', *British Journal of the Philosophy of Science* (1959).

**change.** Alteration, change of size, rotation, and translation are unimpeachable varieties of change. Russell counted it sufficient for change that the same thing should

be true at one time and false at another; on this conception (sometimes called the 'Cambridge' conception), something's arising out of nothing could be a change. Others want to distinguish change from replacement and debate whether, for this purpose, we must suppose that throughout any change there is something (the thing it befalls) that remains in existence, or can allow one thing to pass away into another. Whether change really occurs becomes problematic for some philosophers of time, for instance those who deny there is any real difference between the past and the future. Another problem is whether we need distinct categories of changes that occur and objects that exist and have properties. Certainly we speak differently of objects and changes; objects are conceivable and describable, changes reportable and understandable; and whether objects can be reduced to changes or conversely has been debated for as long as the analogous question about the physical and the psychological. Davidson is an object-change dualist, but most philosophers from Heraclitus to Russell prefer just one sort of basic entity. w.c.

\*process; Cambridge change.

Donald Davidson, *Essays on Action and Events* (Oxford, 1980), essay 6.

**chaos.** The opposite of order. Some schools of Greek \*cosmogony sought to explain the origin and existence of the orderly world or universe (cosmos) by distinguishing between an unformed primordial chaos and the cosmos produced by the imposition on chaos of an order, or regular arrangement. In politics there is a dogma, denied only by anarchists and classical Marxists, that unless imposed by the \*State, social order will collapse into chaos.

A.BEL.

Gregory Vlastos, *Plato's Universe* (Oxford, 1975).

**chaos theory.** The theory of apparently random behaviour within a deterministic system, such as the weather. The unpredictability of a chaotic system is not due to any lack of governing laws but to the outcome being sensitive to minute, unmeasurable variations in the initial conditions. An example is the 'butterfly effect': the idea that the mere flap of a butterfly's wing can make the difference between a hurricane occurring and not occurring.

A.BEL.

\*determinism, scientific.

Ian Stewart, *Does God Play Dice? The New Mathematics of Chaos*, 2nd edn. (Oxford, 2002).

**character.** A person's moral nature. Moral philosophy after the rejection of Aristotelianism concentrated on discrete acts, not on the character of moral agents. Since the recent revival of interest in the \*virtues by Anscombe and others, character has re-emerged. Cultivation of good character is seen as pivotal to moral life, and an understanding of character provides a standpoint for ethical criticism of oneself and others. Some have said that such understanding comes more from novels than philosophy.

Aristotle, however, has much to say about virtuous and vicious character and personality. The virtues of character are stable dispositions to feel and to act at the right time, towards the right people, etc. (this is Aristotle's 'doctrine of the \*mean'). A virtuous character develops out of the reflective performance of virtuous acts. R.CRI.

\*duty; integrity; loyalty.

G. E. M. Anscombe, 'Modern Moral Philosophy', *Philosophy* (1958).

Aristotle, *Nicomachean Ethics* II-IV.

**characteristic:** see attribute; qualities; properties.

**characteristica universalis.** Artificial written \*language, intended to express ideas rather than represent speech-sounds. Inspired by Chinese ideograms, it was envisaged by Francis Bacon solely as a medium for international communication, but by Descartes, Leibniz, and others as also a way of achieving the systematization and completion of scientific knowledge. George Dalgarno and John Wilkins were leading authors of such languages. Leibniz wanted his language to function additionally as a logical calculus.

While many \*artificial languages, such as Esperanto, have been used for international communication, and many others have been coined for logical or mathematical investigation or for taxonomic purposes, these projects seem to be too different from one another to have been ever usefully combined in a single linguistic system. L.J.C.

L. J. Cohen, 'On the Project of a Universal Character', *Mind* (1954).

**charismatic authority:** see authority.

**charity, principle of.** A principle of interpretation. In its simplest form, it holds that (other things being equal) one's interpretation of another speaker's words should minimize the ascription of false beliefs to that speaker. For example, it suggests that, given the choice between translating a speaker of a foreign language as expressing the belief that elephants have wings and as expressing the belief that elephants have tusks, one should opt for the latter translation. Several variants of the principle have been proposed; for example, that translation should (*ceteris paribus*) minimize the ascription of *inexplicable* error. The principle is prominent in the work of Davidson, who adopts it as a generalization of a maxim proposed by Quine. (Quine takes the label 'principle of charity' from a principle about reference formulated by N. L. Wilson.)

P.J.M.

\*radical interpretation

D. Davidson, *Inquiries into Truth and Interpretation* (Oxford, 1984).

**cheating,** in the paradigm case, involves intentionally violating the rules of a game in order to achieve its built-in goal, but the violation cannot be incorporated into the game. It is unlike fouling in basketball, which has set

penalties and is often done openly. Although cheating is closely related to both breaking a promise and deceiving, it is distinct from both. Cheating is not playing the game as the rules require. Promises, even implicit promises, are always made to a particular person or group of persons. Cheating depends on a social institution rather than on personal interaction. It necessarily involves violating the rules of an activity that no one participating in that activity is allowed to violate. That is why cheating normally involves deception. However, when a boss plays golf with his subordinates, he may sometimes cheat quite openly, e.g., not count missed strokes, or remove the ball from the rough without taking a penalty. Cheating requires neither deception nor breaking a promise. B.G.

B. Gert, *Morality: Its Nature and Justification*, ch. 8 (Oxford, 1998).

**chemistry, philosophy of.** Perhaps the most contentious issue in the philosophy of chemistry is whether there is such a subject. That various episodes and concepts in the history of chemistry may be used to illustrate or explore philosophical positions is not in doubt: 'phlogiston' has been used as an example of a theoretical term that appears to have \*meaning even though it lacks \*reference, and Mendeleev's use of the Periodic Table has been used to assess the role of prediction in the \*epistemology of scientific \*theory. But the phrase 'philosophy of chemistry' implies a set of philosophical problems peculiar to chemistry, and this is threatened by the assumption, widely held amongst philosophers, that chemistry is somehow reducible to physics. This may explain why, apart from the odd, isolated article, a self-conscious body of literature on the philosophy of chemistry has emerged only in the last twenty years.

Challenging the assumption of \*reductionism is, not surprisingly, a preoccupation of a number of recent champions of this new and expanding field, though not to the exclusion of other issues. The reduction of chemistry to physics may take one of two forms: (a) *theoretical* (otherwise *epistemological* or *conceptual*) reduction, in which the \*laws and concepts of chemistry are derived from those of physics, and (b) *ontological* reduction, in which chemical properties are held to supervene upon more basic physical ones. The main focus of debate has been (a) rather than (b), although (b), mirroring as it does a similar, and much-disputed, \*super-venience thesis in the \*philosophy of mind, should not be taken for granted. Under (a), relevant issues include the definition of chemistry itself—should we characterize it in macro-physical terms as the study of substances and their transformation into other substances, or in micro-physical terms as the study of atoms, molecules, and their interaction? What is it for two things to be of the same (chemical) substance? Is this something definable only at the molecular, or sub-molecular level? What is a chemical 'law'?—Is it exceptionless? Does it involve \*natural kinds? Should we adopt \*realism about its terms?

The neglect of chemistry in traditional analytic philosophy may have had a significant effect on the course of

certain debates. We might reasonably ask, for instance, how the nature of \*causality would have been represented if chemical, rather than mechanical, interaction had been taken as the paradigm; or how plausible the direct realist account of \*perception would have seemed if the paradigm sense had been, not vision, but the chemical senses of smell and taste. R.L.E.P.

\*kind, natural; laws, natural or scientific, reductionism; supervenience.

Nalini Bhushan and Stuart Rosenfeld (eds.), *Of Minds and Molecules: New Philosophical Perspectives on Chemistry* (Oxford, 2000). Eric Scerri (ed.), *Synthese* issue on philosophy of chemistry, vol. 111 (1997).

**children and philosophy.** Although Collingwood and Popper both say that they first became interested in philosophical questions around the age of eight, such precocity seems rare. But could things be otherwise? In some educational circles there is growing enthusiasm for introducing children, sometimes very young ones, to philosophical thinking. A pioneer since the early 1970s has been Matthew Lipman of Montclair State College, New Jersey, whose Philosophy for Children programme has become influential globally. Based partly on philosophical novels specially written for children, it engages school classes from age nine upwards, or even earlier, in elementary discussions about such things as knowledge, personhood, and moral values.

The idea that young children can philosophize may seem counterintuitive, owing to the capacity for abstract, or higher-order, thinking that philosophizing requires. It has drawn criticism, for instance, from Piagetians who hold that young children are still at the stage of concrete rather than formal cognitive operations. On the other hand, children not uncommonly wonder whether numbers go on for ever or where space ends. Does this in itself show a capacity for philosophizing? Or would a more adequate test be whether or how far they proceed beyond such wonderings into engagement with the hard philosophical thinking about infinity and the nature of numbers and of space which seeks answers and does not stop at questions?

Much turns in these debates on what counts as philosophizing. The strangeness of the notion of children's philosophizing—which brings it much attention from the media and from educationalists—derives from the thought that children must be doing much the same sort of thing as fully fledged philosophers, only in a more embryonic form. There is far less counterintuitiveness in the idea that children can *think about things*—the material they study in school, for instance, or how they ought to behave. Lipman *et al.* say that 'Children begin to think philosophically when they begin to ask why'. (Is this true? Not all 'why' questions are philosophical in the usual sense.) The work of those involved in teaching children philosophy—and teaching teachers to teach it to them—seems sometimes to operate at this sub-philosophical level as judged by the more stringent criterion. **Chinese philosophy.** Philosophical thought in China has a predominantly practical character, being motivated primarily by a concern with the ideal way of life for human beings and, for some schools of thought, also by a concern to maintain social and political order. This predominantly practical orientation is, however, also coupled with a reflectivity which has led to the development of views about such subjects as the use of language and ways of assessing doctrines, the nature of human beings and their place in the cosmic order, or the basic constituents of the universe and the explanation of differentiation and change. The following provides a historical sketch of the development of major movements of thought in China.

Chinese philosophical thought is often supposed to have originated and blossomed in the last few hundred years of the Chou dynasty (mid-eleventh century to 249 BC), before the unification of the country by Ch'in (221–206 BC). Philosophical movements of this 'classical' period were classified, retrospectively after the end of the period, into schools of thought, many of which were driven by a concern to seek a remedy for the social and political disorder of the times and a way to conduct oneself amidst the disorder. The Confucian school, represented by Confucius (sixth to fifth century BC), Mencius (fourth century BC), and Hsün Tzū (third century BC), diagnosed the disorder as due to the disintegration of traditional values and norms which underlie the social hierarchy, and advocated the restoration of such values and norms as a remedy. It emphasized cultivation of the self to embody such values as loyalty and filial piety, and regarded the attractive and transforming powers of moral examples as ideally the basis for government. Mencius and Hsün Tzū differ in their understanding of human nature and the self-cultivation process. While Mencius regarded human nature as 'good' in that human beings have certain incipient ethical inclinations which should be nurtured for one to become virtuous, Hsün Tzū, in rhetorical opposition to Mencius, described human nature as 'evil' in that human beings are born with self-regarding desires that need to be transformed for one to become virtuous.

The Mohist school, originating with Mo Tzū (fifth century BC), diagnosed the disorder as stemming from strife and contention which were due to a partial concern for oneself, one's family, or one's state. As a remedy, it advocated an equal concern for everyone, as opposed to the kind of graded affective concern advocated by Confucians. Another point of opposition was the Mohist rejection of traditional practices advocated by Confucians, such as elaborate funerals and musical activities, which the Mohists regarded as detrimental to the material well-being

of the common people. The Yangist school, associated with Yang Chu (fifth to fourth century BC), diagnosed the disorder as stemming from the preoccupation of individuals, especially those in office, with power and material possessions, even to the detriment of one's bodily well-being. It advocated a concern with one's own bodily well-being as a way of steering attention away from power and material possessions; order will be restored if those in office, including the ruler, all share such an outlook. Yangist thought is sometimes regarded as a precursor to Taoist thought, represented by Chuang Tzū (fourth century BC) and the text *Lao Tzū* (date uncertain). The Taoist school diagnosed the ills of the times as due to striving after worldly goals, adherence to social conventions and moral teachings, and other artificial impositions preventing human beings from functioning in a way continuous with the natural order. It advocated a life free from such impositions, one which is supposed to lead to both personal fulfilment and orderly coexistence.

Some schools of the period did not share such broader ethical concerns. Legalist thought, with Han Fei Tzū (third century BC) as a major exponent, was directed primarily to the ruler and concerned how a ruler can maintain effective government. Unlike Confucians, who emphasized moral examples and education in government, the Legalists emphasized the need for the ruler to build up prestige and to institute a clearly propagated system of laws enforced strictly by punishment. Hui Shih and Kung-sun Lung of the fourth century BC, associated with the School of Names, were interested in the mechanisms of argumentation and how they can be deployed to yield paradoxical conclusions, such as the well-known proposal by Kung-sun Lung that a white horse is not a horse. The Yin-yang school was interested in cosmology, and portrayed the operation of the world as involving the interplay between two forces or elements, yin, which is negative, passive, and weak, and yang, which is positive, active, and strong.

A number of major thinkers of the Han dynasty (206 BC–AD 220) were self-professed Confucians and defended the Confucian ideal, though they also drew on Taoist and yin-yang cosmological ideas. For example, the Confucian Tung Chung-shu (second century BC) regarded the operation of the human realm and that of the natural realm as regulated by the same forces and hence as corresponding to each other. Just as the operation of the natural order involves yin and yang, yin being subordinated to yang in its operation, human beings are born with bad and good elements, and should subsume the former to the latter. In the political realm, just as the natural order operates in a cyclical fashion as illustrated by the change of seasons, political changes in history also proceed in a cyclical fashion. Tung's view on human nature drew upon the views of both Mencius and Hsün Tzū, and Han Confucian thought was often characterized by the interplay of ideas drawn from both of these two classical Confucian thinkers.

Philosophical thought in the Wei (220–65) and Chin (265–420) dynasties involved divergent developments of

Taoist thought, yielding an important commentary on the *Lao Tzū* by Wang Pi (226–49) and one on the *Chuang Tzū* by Kuo Hsiang (d. 312), who either borrowed from or built on a commentary by Hsiang Hsiu (fl. 250). While some thinkers of the period lived a life of disregard for social conventions and values, Wang Pi and Kuo Hsiang viewed the Taoist ideal as compatible with the more traditional ways of life advocated by the Confucians. They even interpreted Confucius as someone who had attained the highest Taoist ideal and manifested it in his daily life without having to discourse on it, unlike Lao Tzū and Chuang Tzū, who still had to discourse on the Taoist ideal because they had not personally attained it.

Chinese translations of Buddhist scriptures from India were known to have existed as early as the second century AD, and the influence of Buddhism grew until it reached its peak during the Sui (581–618) and T'ang (618–907) dynasties. While some Chinese schools of Buddhism were further developments of existing schools in India, others were innovative interpretations of Buddhist thought, such as the T'ien-t'ai, Hua-yen, and Ch'an (Zen) schools, which were influential among intellectuals. Buddhist ideas had influence on the later development of Confucian thought, such as its metaphysical orientation and the view held by some schools that all human beings have a pure Buddha nature which has become defiled by erroneous thoughts and clings; such defilement is the source of suffering, and its elimination will restore the original purity of the Buddha nature.

Confucian thinkers at the end of the T'ang, such as Han Yü (768–824) and Li Ao (eighth to ninth century), opposed Buddhism, criticizing it for neglecting familial, social, and political responsibilities. Han Yü regarded Mencius as the true transmitter of Confucius' teachings, and Li Ao interpreted the Mencian idea that human nature is good to mean that human beings have a perfectly good nature which has been obscured. Both ideas became generally accepted among Confucian thinkers of the Sung (960–1279) and Ming (1368–1644) dynasties, who showed a degree of interest in metaphysical speculations that was absent in classical Confucian thought. The most prominent and influential Confucian thinkers of the period were Chu Hsi (1130–1200) and Wang Yang-ming (1472–1529), who, while sharing the view that human beings are born with a perfectly good nature which has been obscured by distortive desires and thoughts, were opposed on a number of issues. For example, while Chu regarded knowledge as ideally guiding action, Wang held the view that knowledge ideally accompanies but does not guide action. Also, while Chu emphasized the examination of daily affairs and the study of classics and historical records as part of the process of self-cultivation, Wang emphasized one's attending directly to the mind, constantly watching out for and eliminating distortive desires and thoughts. Confucian thought of the Sung–Ming period, often referred to as 'Neo-Confucianism', made significant contributions to our understanding of the subtle workings of the mind and the methods of self-transformation.

Confucians at the end of the Ming and during the Ch'ing dynasties (1644–1912) regarded Sung–Ming Confucians as influenced by Taoist and especially Buddhist ideas in their interpretation of Confucian thought. For example, while Mencius regarded human nature as good in the sense that human beings share certain incipient ethical inclinations which will develop into a fully virtuous disposition with adequate nourishment, Sung–Ming Confucians interpreted the Mencian position in terms of the idea that human beings have a perfectly good nature which has been obscured by distortive desires and thoughts. This idea they even illustrate with analogies drawn from Taoist and Buddhist texts, such as that of the sun being obscured by clouds or the mirror being obscured by dust. Ch'ing Confucians, the best known of whom include Wang Fuchih (1619–92), Yen Yüan (1635–1704), and Tai Chen (1724–77), distanced themselves from metaphysical speculations and instead sought to recover the true meaning of Confucian thought via careful and critical study of the Confucian classics, with attention to philological and textual details. Though the idea that Mencius was the true transmitter of Confucius' teachings had become part of Confucian orthodoxy by this time, some Confucian scholars of this period, such as Tai Chen, also drew heavily on Hsün Tzū's teachings.

Western philosophical and political ideas were introduced and some works translated into Chinese at and after the end of the Ch'ing, and this, along with increasing knowledge of scientific and technological advances of the West, led to debates about the extent to which traditional Chinese culture, which is predominantly Confucian in character, should be retained, discarded, or transformed. Social and political ideas, such as Marxist and democratic ideas, had impact in the political realm, while exposure to Western philosophical ideas led to reconstitutions of Chinese philosophical systems. While Marxist thought was expounded and developed in mainland China, development of Confucian thought which takes into account recent Western scientific, philosophical, and democratic ideas was a vital intellectual movement in Hong Kong, Taiwan, and overseas Chinese communities. This revitalized interest in Confucian thought has now also gained attention in mainland China as well as in Western countries such as the United States.

**Chinese room.** A thought experiment invented by John Searle to establish that nothing could think simply by being a computer. Imagine yourself in a room with two windows, and a large book of instructions. Through one window come pieces of paper with marks on them; you follow the instructions and match the pieces of paper with others which you pass out through the other window. Searle says this is analogous to the set-up inside a computer: you are simply producing output in response to input according to certain rules. But suppose that the input to the room really consists of questions in Chinese, and the output consists of answers. You do not understand Chinese; yet you do all that a computer does. So nothing could understand Chinese simply by manipulating symbols according to 'formal' rules. As Searle puts it, 'syntax is not sufficient for semantics'.

**Chisholm, Roderick** (1916–99). American philosopher at Brown University who was influential particularly in the areas of metaphysics, philosophy of mind, epistemology, and ethics. Apart from his purely philosophical work, he was known as a scholar of the Austrian philosopher Franz Brentano, whose work he translated into English.

In metaphysics Chisholm is open and precise about his ontological commitments, which, according to his later writings, include only attributes and individual things. On this basis, Chisholm characterizes the distinction between \*mind and body in terms of the differing identity-conditions of the two. Following Bishop Butler, he maintains that persons persist through time in a 'strict and philosophical' sense whereas that in which bodies persist through time is merely 'loose and popular'. He consequently holds that a person is distinct from his body and is either a monad—an individual having no proper parts—or a microscopic piece of matter located within the body, probably in the brain.

In epistemology Chisholm was an influential \*foundationalist. His notion of the epistemic enterprise is that it is an attempt to answer the Socratic questions 'What do I know?' and 'What can I know?' It presupposes that the inquirer can find out the answer to these questions, that \*knowledge is justified true belief, and that a belief may be justified and yet not true, and true and yet not justified. Chisholm's commitment to the second of these presuppositions caused him to devote a great deal of time to the 'Gettier problem'. His commitment to the third led him to reject externalist accounts of justification in terms of reliability.

**choice, axiom of.** A set, roughly, is a collection of things, which may themselves be sets. Consider, for example, an infinite set of (non-empty) sets, no two of which have a common member. Must there be a way of choosing just one member from each of these sets? 'Yes' is what the axiom of choice says. Many apparently diverse mathematical principles turn out to be equivalent to it. None the less its use aroused controversy. In some cases we may be unable to *define* such a way of choosing (known as a *choice function*), hence use of the axiom was rejected by those who held that, for sets and functions, to be is to be definable.

**Chomsky, Noam** (1928– ). American linguist and philosopher whose pioneering work on language, *Syntactic Structures* (1957), and devastating 'Review of B. F. Skinner's *Verbal Behaviour*' (in *Language* (1959)) led to the cognitive revolution, and the demise of behaviourism, in psychology. Languages are largely identified by their structure, so, for Chomsky, \*linguistics is the study of the structure of human languages. He also argues that the theory of language is the theory of a speaker's knowledge of language—knowledge represented in the mind of the individual. So linguistic theory becomes the study of those linguistic structures represented in the minds of speakers which constitute their knowledge of language. Thus linguistics is a branch of cognitive psychology which studies the mental structures responsible for linguistic competence. Linguistic competence is just one of the interacting components which contribute to the production of linguistic behaviour, so the latter can provide only a rough guide to the speaker's linguistic knowledge. A theory of competence aims to factor it out from the performance data of language use by eliciting judgements from speakers about which strings of words belong to their language (i.e. which strings they find grammatical), then constructing a \*grammar that generates all and only those grammatical strings.

Chomsky uses the term 'grammar' to mean both the theory formulated by the linguist and an internal component of the speaker–hearer's mind. This is legitimate so long as the grammar provides a model of the speaker–hearer's competence: a finite means for generating the potential infinity of linguistic forms a speaker–hearer can produce or recognize. Part of the task in explaining what the speaker knows is to account for this creativity: that by the age of 4 most children can produce and recognize a huge range of sentences they have never heard before, by rearranging familiar words into new but legitimate configurations. The best available hypothesis is that they have mastered a system of grammatical knowledge which it is the task of the linguist to describe. Because the grammatical rules or principles are not consciously known and cannot be explicitly stated by the speaker–hearer, Chomsky infers that they must be unconsciously, or tacitly, known. This mentalist hypothesis serves to explain why

speaker–hearers conform to complex generalizations that go beyond what could be picked up from the available linguistic evidence.

The philosopher Quine has criticized Chomsky's position claiming that all we have to go on is behavioural dispositions of speakers, and that these do not discriminate between different descriptively adequate grammars speakers could be using to assign structure to sentences they recognize as belonging to their language. But although the evidence is behavioural, the theoretical constructs posited to explain it do not have to be. By postulating the grammars that underlie linguistic behaviour, Chomsky can formulate generalizations which explain speakers' linguistic judgements and use, including the gaps we find in the data.

Another task is to explain how children with such different cultural backgrounds, intelligence, and experience learn, without explicit training, and at much the same age, to speak their native language. How do speakers acquire knowledge of language? In Chomsky's view, a large part of this knowledge is innate, a matter of a biological endowment specific to humans. Speakers move from an initial state of the language faculty, which they share, to an attained state, which they develop on exposure to the primary linguistic data. The initial state is characterized by the principles of \*universal grammar: a finite set of interactive principles which allow for parametric variation within a certain range. The variety of human languages is explained by the different vocabularies and parameter settings of the universal principles which characterize the attained states of the language faculty in different speakers. Chomsky distinguishes E-language—the common notion of languages like Dutch, English, German—which is hopelessly vague, and I-language—the internal language of an individual speaker–hearer—which is the proper object of scientific study.

In addition to his work in linguistics, Chomsky has been an active critic on the left of the political spectrum and has published far-reaching criticisms of US domestic and foreign policy.

**choosing and deciding.** These have most often been taken by philosophers to be mental events or processes that may issue in ordinary actions, but sometimes choices are identified with the ordinary actions themselves. There are fundamental similarities between

choices and decisions. One is that both involve selecting from a range of options, or at least between two options. Another is that neither a choice nor a decision, as against a belief, is true or false. A third is that both may be bound up with intentions.

However, there are some differences between choices and decisions. It seems that I can choose without deliberating, but not decide without deliberating. I can choose out of habit, but can I decide out of habit? Also, it is at least more natural to speak of deciding and not choosing what is true.

Choosing and deciding form a philosophical problem of their own, indicated above. Are they things that precede ordinary bodily \*actions—and if so, are they acts themselves—or are they parts of or bound up with or identical to those ordinary actions themselves? (Choosing and deciding, after all, are things we *do*. Not only traditional behaviourists have identified choices with ordinary actions.) If they are taken as mental acts which precede ordinary actions, and are needed to make bodily movements into actions, must they themselves be preceded by other acts? If so, we seem to have an infinite regress. How, exactly, do choosing and deciding relate to intentions? It may be supposed, for example, that they often consist in the formings of intentions.

Choosing and deciding come into a number of larger philosophical problems. When taken as \*mental events, they are part of the problem of the nature of those events: for example, whether they are different from or identical with brain events. Choosing and deciding are also central to certain moralities, and to the dispute between those who focus morally on the antecedents of actions and those, often called consequentialists, who focus on the consequences of actions. Above all, choosing and deciding enter into the debate about freedom and determinism. Here libertarians assert that freedom requires choices or decisions which are originations, as distinct from effects of previous causes. Others assert that free choices or decisions are events quite consistent with determinism.

**Chrysippus** (c.280–207 BC). Third head of the Stoic school and formalizer of its doctrines, said to have written over 700 works; 'without Chrysippus there would have been no Stoa', i.e. no Stoic school. He invented propositional logic as a formal system. Unruly emotions he interpreted as false judgements, refusing to allow a conflict between rational and irrational parts of the psyche, and interpreting the experience of being torn between alternatives as an oscillation, too rapid to be perceived, between different judgements of what is best. Drawing on contemporary scientific ideas, he developed the explanation of divine

agency in terms of a 'breath' (spirit, *pneuma*) penetrating all things, and also contributed to the theory of causation. He devoted much energy to arguing for the universality of divine providence and the compatibility of responsibility and determinism.

**Chuang Tzū** (4th century BC). Master Chuang was a Chinese Taoist thinker often described as espousing a kind of scepticism or relativism. His full name was Chuang Chou, and his teachings are probably recorded in the first seven chapters (the inner chapters) of the text *Chuang Tzū*. The text highlights the observation that there is no neutral ground for adjudicating between opposing judgements made from different perspectives. Realization of this is supposed to lead to a relaxation of the importance one attaches to social institutions and conventions, and to such distinctions as those between right and wrong, self and others, and life and death. This results in a lessened emotional involvement in such things, and ideally one is supposed to respond spontaneously to situations one is confronted with, with no preconceived goals or preconceptions of what is right or proper.

**Chu Hsi** (1130–1200). Confucian thinker in China best known for having developed an elaborate Confucian philosophy which synthesizes ideas from earlier thinkers. He drew heavily on Ch'eng I's (1033–1107) teachings, and scholars often refer to his teachings and their later developments as the Ch'eng–Chu school. He regarded things as composed of pattern–principle, which is incorporeal and unchanging, and ether–material-force which is physical and changeable. Human beings are born with insight into pattern–principle by virtue of which they are fully virtuous, but the endowment of ether–material-force can be impure, involving distortive desires and thoughts which obscure such insight. Self-cultivation requires one's examining daily affairs and studying classics and historical records to regain the insight into pattern–principle which has been obscured.

**Church, Alonzo** (1903–95). One of the most significant figures in the development of mathematical logic, Alonzo Church is credited with two major discoveries. First, making use of his ingenious notion of lambda-definability, which he employed to capture the intuitive concept of 'effectively calculable', Church was able to demonstrate that for a large number of formal systems, even simple

arithmetic, there are no effective decision procedures for the provable well-formed formulae. This means that it is not possible to construct, even theoretically, a computing machine that would identify the valid sentences of simple arithmetic. Second, Church discovered that the mathematical notion of recursiveness as defined by Gödel coincides exactly with what is lambda-definable and thus formulated the hypothesis, which textbooks refer to as \*Church's thesis, that the informal notion of effective computability is characterized by recursiveness and various other equivalent notions. While the first discovery was generally regarded as somewhat startling, the second confirmed what had been widely believed but unproven. Both results were discovered by Church during the 1930s. In 1944 Church published his landmark text *Introduction to Mathematical Logic*, a work which was subsequently revised and enlarged in later editions. Much later in life Church turned his attention to the philosophy of language and eventually produced a remarkably detailed logic of sense and denotation.

G.F.M.

A. Church, *Introduction to Mathematical Logic* (Princeton, NJ, 1956).

— 'Outline of a Revised Formulation of the Logic of Sense and Denotation', 2 parts, *Nous* (1973).

**Churchland, Paul** (1942– ), who currently teaches at the University of California, San Diego, is most closely associated with a form of materialism known as \*'eliminativism', a movement which has its roots in the aftermath of Logical Positivism. He believes that the explanations of human mental processes in terms of intentions, desires, motives, and reasons are explanations of human behaviour which belong to what is described, pejoratively, as \*'folk psychology' (a term which is now very widely used). Folk psychology is primitive science. It has not progressed and developed in the way that pukka natural sciences have. Eliminativism states that its terms can be expected to fall into desuetude as we increasingly explain human behaviour in terms of the concepts of neuro-science.

R.A.S.

Paul Churchland, 'Eliminative Materialism and Propositional Attitudes', *Journal of Philosophy* (1981).

— *The Engine of Reason, the Seat of the Soul* (Cambridge, Mass., 1995).

**Church's thesis.** A number-theoretic \*function is computable if there is an \*algorithm, or mechanical procedure, that computes it. The procedure should specify what is to be done at each step, as a function of the input only, without involving any creativity on the part of the agent. Computability is an informal, or pre-formal, notion in that it has meaning independently of, and prior to, its formal development. In contrast, recursiveness, Turing-computability, and lambda-definability are rigorously defined properties of number-theoretic functions, which were formulated in the mid 1930s, as part of different programs in logic. A function is recursive, for example, if its values can be derived from a fixed set of equations in a

certain form. These technical notions were shown to be coextensive. It is reasonably clear that every recursive function is computable, since an algorithm can be 'read off' a recursive derivation or a Turing machine. Church's thesis is the assertion that a function is computable if and only if it is recursive, Turing-computable, etc. Thus, Church's thesis identifies the extension of a pre-formal notion with that of an explicitly defined rigorous notion. s.s.

 Hartly Rogers, *Theory of Recursive Functions and Effective Computability* (New York, 1967).

**Cicero, Marcus Tullius** (106–43 BC). Roman statesman, orator, and prolific writer, over-annotated by classical scholars and underestimated by recent philosophers. Educated at Athens, his Latin expositions of \*Hellenistic philosophy, mostly written between February 45 and November 44 BC, are the source for otherwise lost Stoic, Epicurean, and Academic arguments. Often in dialogue form, always clearly and fairly presented, his philosophical writings include *De finibus* and *De officiis* on ethics; *De natura deorum* and *De divinatione* on the philosophy of religion; and *Academica* on sceptical epistemology. *De legibus* and *De republica* are justly famous for their assertion of human rights and the brotherhood of man. The latter contains the influential account of natural law (III. xxii. 33): universal because based upon the common nature of man, and binding because part of the divine reason and order permeating all that is. *De legibus* includes Cicero's affirmation of the equality of all men (I. x. 28–32). Cicero's influence on European thought from \*natural-law theorists down to and beyond Hume's *Dialogues Concerning Natural Religion* is incalculably great. J.C.A.G.

**circle, Cartesian:** see Descartes.

**circle, vicious:** see vicious circle.

**circle, virtuous:** see virtuous circle.

**circularity.** A sequence of \*reasoning is circular if one of the premisses depends on, or is even equivalent to, the conclusion. Circularity is not always fallacious, but can be a defect in an argument where the conclusion is doubtful and the premisses are supposed to be a less doubtful basis for proving the conclusion. Normally an argument is used in such a way that the line of support goes from the premisses to the conclusion:

But if it is required that the conclusion be used to support one of the premisses, the resulting circle destroys the purpose of the argument. Circularity is not always obvious, or on the surface of a text of discourse. In some cases, it takes quite a bit of analysis of the argument to expose the circle in the reasoning. Circularity can also be a problem, in some cases, in explanations and definitions. D.N.W.

\*vicious circle; virtuous circle.

Douglas N. Walton, *Begging the Question: Circular Reasoning as a Tactic of Argumentation* (New York, 1991).

**citizenship.** Within political philosophy, citizenship refers not only to a legal status, but also to a normative ideal—that the governed should be full and equal participants in the political process. As such, it is a distinctively democratic ideal. People who are governed by monarchs or military dictators are subjects, not citizens. In Aristotle, citizenship was viewed primarily in terms of duties—citizens were legally obliged to take their turn in public office, and sacrificed part of their private life to do so. In the modern world, influenced by \*liberalism, citizenship is increasingly viewed as a matter of \*rights—citizens have the right to participate in public life, but also the right to place private commitments ahead of political involvement. Republican philosophers, following Rousseau, worry that contemporary democracies have focused too much on rights, and not enough on civic duties. w.k.

\*democracy.

Paul A. B. Clarke (ed.), *Citizenship: A Reader* (London, 1993).  
 W. Kymlicka, *Multicultural Citizenship* (Oxford, 1995).

**civil disobedience.** Unlawful public conduct designed to appeal to the sense of justice of the majority, in order to change the law without rejecting the rule of law. Thus non-violence and non-revolutionary intent, as well as a willingness to accept lawful punishment, are often treated as defining conditions of civil disobedience. The term itself was apparently coined by the American naturalist Henry David Thoreau (1817–62), in reference to his refusal to pay a state poll tax enacted to finance enforcement of the Fugitive Slave Law (and thus southern chattel slavery).

As in Thoreau's case, civil disobedience may be indirect; the law violated may not itself be the target of protest. As a form of non-violent mass protest, civil disobedience was made famous by Mohandas K. Gandhi (1869–1948) as one tactic among several intended to relieve India of British rule. It played an important albeit less revolutionary role in the United States's civil rights movement during the 1960s.

Civil disobedience may be usefully contrasted with lawful protest (boycotts, picketing), unlawful violent disobedience (for some, non-violence is part of the very definition of civil disobedience), conscientious objection or passive obedience (a willingness to accept lawful punishment rather than comply with an unjust law, without any intention of changing the law), and with testing the con-

stitutionality of a law (which typically requires a plaintiff whose standing to protest is gained by a nominal violation of the law).

Civil disobedience may well be a futile tactic in any society whose government is indifferent to the rule of law. In a constitutional democracy, it is justified to the extent that the remedies provided by law have been tried but to no avail, that it is aimed at protesting a basic injustice, and that it holds out a reasonable prospect of success without grave costs to society. If the law being protested is of dubious constitutionality, prosecution and punishment of the protesters must take this into account. H.A.B.

\*political violence; rule of law; terrorism.

Vinit Haksar, *Civil Disobedience, Threats and Offers: Gandhi and Rawls* (Delhi, 1986).

Peter Singer, *Democracy and Disobedience* (Oxford, 1973).

**civil liberties.** Freedom of speech, press, assembly, and worship ('conscience') are central among the privileges and immunities claimed as civil liberties. Liberal political philosophies accord them the highest priority, regard them as valuable both instrumentally and intrinsically, and seek to extend them equally to all persons. To protect them against abuse from popular majorities and the government, they are often enshrined in a constitution (as in the Bill of Rights of the US Constitution of 1791); their day-to-day defence can be secured only through an independent bar and judiciary. There is no exhaustive and exclusive list of civil liberties, nor is there any standard criterion that demarks them from civil or human \*rights.

H.A.B.

\*liberalism; liberty.

Richard L. Perry (ed.), *Sources of Our Liberties* (New York, 1952).

**civil society.** From Aristotle's *koinōnia politikē* down to Locke's 'political or civil society' and Ferguson's 'civil society', this term indicated civilized, political society in contrast to barbarism, paternal authority, and the state of nature. It was translated into German as *bürgerliche Gesellschaft*, which also suggests 'bourgeois society', and thus came, in Hegel, to indicate economic and social arrangements in contrast to both the state and the family. Civil society in this sense did not become apparent before the emergence of an economy transcending the household and of centralized monarchical or revolutionary states clearly distinct from the social and economic life of their subjects. For Hegel civil society was an inevitable and valuable aspect of modern life. Marx disparaged it as benefiting primarily the bourgeoisie and operating outside conscious, i.e. political, control. For liberals, a thriving civil society is an obstacle to 'totalitarian' attempts to absorb all social life into the political realm and provides a training ground for democratic politics. Radical liberals such as Hayek contrast the free interactions of civil society with the coercion of the state, and advocate the minimization of the state's sphere of activity. M.J.I.

**Clarke, Samuel** (1675–1729). English rationalist philosopher and theologian; champion of Newton, admired by Voltaire, sacked as chaplain for unorthodoxy.

Clarke's main writings on moral philosophy and natural theology are contained in his Boyle lectures, which he delivered in 1704 and 1705. In the first set he uses a mathematical method to prove the existence of God, and in the second he argues (against Hobbes and others) that \*moral judgements can be as certain as those in mathematics: gratitude (for example) is fitting to a situation in which we have been done a favour just as triangles can be shown to be congruent. 'Iniquity is the very same in action, as falsity or contradiction in theory; and the same cause which makes one absurd, makes the other unreasonable.' In 1706 he translated Newton's *Opticks* and in 1717 published a correspondence, *The Leibniz–Clarke Correspondence*, in which he defended Newtonianism (with Newton's approval) against the criticisms of Leibniz. R.S.D.

*The Leibniz–Clarke Correspondence*, ed. H. Alexander, with intro. and notes (Manchester, 1956).

**class.** The term 'class' is often used interchangeably with 'set' to denote what might loosely be called a collection of things, these things being the members of the class. The members of a class may be specified either by means of a list or by reference to a \*property which all and only the members of the class possess. The identity of a class is entirely determined by the identity of its members.

Some writers on \*set theory reserve the term 'proper class' to denote collections which are not sets because they are allegedly 'too big' to be themselves members of sets. The thought that there can or must be such collections arises from the threat of \*paradox which ensues from supposing that certain properties—such as the property of being a set—can serve to specify the membership, and thus the existence, of corresponding sets, such as a set of all sets.

W. V. Quine, *Set Theory and its Logic* (Cambridge, Mass., 1969).

**class struggle.** In the \*historical materialism of Marx, the chief mechanism of historical change and development. Social relations of production divide people into groups with a common situation and common economic interests. These groups are classes potentially, and become so actually through social consciousness and a political movement representing the class's objective interest in achieving and maintaining a set of production relations in which the class is dominant. That class tends to be dominant whose rule at that time best promotes the use and further development of the productive powers of society. Marx's analysis of modern society identifies a number of classes, including the feudal nobility, the peasantry, and

the petty bourgeoisie, but it views the antagonism between \*bourgeoisie and proletariat the principal class struggle which will be decisive for the historical future of modern society.

**clear and distinct ideas.** Rationalists make use of the notion in formulating theories of cognitive error, establishing standards of evidence, characterizing some mental life, and identifying and describing the principal axioms of their systems, among much else. Clear ideas, for Descartes, are perceptions present and manifest to an attentive mind, cognitive analogues to objects strongly and clearly presented in vision. Distinct ideas are perceptions delineated from all others, containing nothing but that which is clear. For Descartes, we avoid error by assenting only to those things which we clearly and distinctly perceive. J.GAR.

Descartes, *Meditations IV*, in J. Cottingham, R. Stoothoff and D. Murdoch (eds.), *The Philosophical Writings of Descartes* (Cambridge, 1985).

**Clifford, William Kingdon** (1845–79). A British philosopher and mathematician who died young from tuberculosis, Clifford was one of the first \*'evolutionary epistemologists', in that he tried to marry the Kantian philosophy about a priori knowledge with Darwinian evolutionary theory, arguing that what is ontogenetically innate may be phylo-genetically learned. Our ancestors may have had to work through various geometries by trial and error, whereas we can now know them instinctively.

Emboldened by this sensible epistemological conclusion, Clifford then gave full rein to his metaphysical imagination, arguing that as well as 'objects', things we perceive, there are also 'ejects', \*things we know of without perception. Apparently these latter involve minds, and Clifford concluded by arguing that ultimately all existence involves mind, which makes itself manifest through evolution. This Spinozistic world-view was the forerunner of many such theories of 'creative evolution', popular at the beginning of this century. M.R.

### clip an angel's wings

Do not all charms fly  
At the mere touch of cold philosophy?  
There was an awful rainbow once in heaven:

We know her woof, her texture; she is given  
In the dull catalogue of common things.  
Philosophy will clip an Angel's wings,  
Conquer all mysteries by rule and line,  
Empty the haunted air, and gnomed mine—  
Unweave a rainbow.

(John Keats, 'Lamia', pt. ii, lines 229–37)

Keats's Romantic anti-intellectualism continually undermines the moral of his story, certainly as it was originally recounted by Philostratus and in Burton's *Anatomy of Melancholy*. The philosopher Apollonius saves his handsome pupil Lycius from marrying a woman-seeming snake. Arriving uninvited at their wedding-feast, he transfixes her with his eyes and shouts her name, until, her illusion unmasked, she vanishes with a frightful shriek. Keats of course loves the enchanting cheat, loathes the philosopher who exposes her. J.O'G.

**clocks**, known in Europe in the thirteenth century, improved much in the seventeenth century. They provided the imagery for three memorable philosophical views.

Descartes left unsolved a problem about the relation of mind and body. If the mind and body are substances of different kinds, how can they affect each other, as they seem to do in action and perception? The 'two clocks' theory, suggested by Geulincx, and enthusiastically embraced by Leibniz, was that the mind and body do not in fact interact at all: they merely run in parallel, like two clocks that go through corresponding movements, though each is independent of the other.

To illustrate his distinction between real and nominal \*essence, Locke refers to the great Strasbourg clock of 1547. In addition to showing the time and the day of the week, this clock had a marvellous series of moving forms, to represent Death, Christ, the planets, the four periods of life, and the gods that gave their names to the seven days of the week. The 'gazing Country-man' who only observes the 'outward appearances' of the clock has a very different idea of the clock from the expert who knows 'all the Springs and Wheels, and other contrivances within' (*Essay Concerning Human Understanding*, III. vi. 3, 9). The country-man knows the nominal essence, but not the real essence from which the outward appearances flow. In the face of hidden complexities of plants, animals, and even minerals and metals, all of us are in the position of the gazing Country-man, and therefore cannot hope to classify these things according to their real essences.

On the third usage of the image, the whole world is regarded as a clock or watch. Like these artefacts it operates according to pure mechanical principles; as a watch requires a watchmaker, however, the world must also be the creation of a Creator, though (unless the watch is thought to need winding up) it evolves independently of the Creator once it has been brought into existence. The classic objections to this kind of natural theology are found in Hume's *Dialogues Concerning Natural Religion*. J.BRO.

**cloning.** The technique of 'nuclear transfer' or 'cloning' involves removing the nucleus of an unfertilized egg (human or animal) and substituting a nucleus taken from the cell of another individual. The donor cell determines almost all of the genetic characteristics of the embryo. There are two possible purposes of cloning by nuclear transfer: research and reproduction. Research here offers the possibility of studying a range of genetic diseases, such as motor neurone disease. Ethical objections can only be from those who oppose any kind of research on the embryo. Objections to reproductive cloning are of two main kinds. First, the desire to produce a genotype of oneself, or a dead child, seems an unsatisfactory basis for child rearing. Secondly, the desire to create a clone of oneself as a bank of spare organs for possible transplant seems to be a paradigm of treating another human being solely as a means. For these reasons reproductive cloning is illegal in the UK.

 —and Soren Holm (eds.), *The Future of Human Reproduction* (Oxford, 1998).

**closure.** As used in philosophy, a domain of objects is closed with respect to some relation just in case the relation never holds between sets of objects some of which are inside the domain and some outside. One of the most common applications is to causal closure: physicalists hold that physical events are closed under causation—nothing physical is caused by anything non-physical such as mental events, nor do physical phenomena cause mental phenomena. In logic, a domain is closed under a set of operations if the result of applying any of those operations to a member of the domain results in something that is itself in the domain. Thus, the integers are closed under the operations of addition, subtraction, and multiplication, but not under division.

P.H.

**coercion** occurs if one party intentionally and successfully influences another by presenting a credible threat of unwanted and avoidable harm so severe that the person is unable to resist acting to avoid it. For the threat to be credible, either both parties must know that the person making the threat can make good on it, or the one making the threat must successfully deceive the person threatened into so believing. A mere perception of coercion is not sufficient for coercion.

Sometimes 'coercion' is used in a broader, and more judgemental, sense to designate forms of pressure or influence that take unfair advantage or inappropriately compromise the quality of autonomy. This account is overly broad and introduces an improper moral judgement into the meaning of the term.

Coercion itself should be distinguished from so-called coercive situations. These situations involve *non-intentional*

situations of control—e.g. situations of illness and economic necessity—in which persons feel controlled by the situation rather than by the design of another person.

**Cogito ergo sum.** Perhaps the most celebrated philosophical dictum of all time, Descartes's 'I am thinking, therefore I exist' is the starting-point of his system of knowledge. In his *Discourse on the Method* (1637) Descartes observes that the proposition *je pense, donc je suis* is 'so firm and sure that the most extravagant suppositions of the sceptics [are] incapable of shaking it'. The dictum, in its better-known Latin version, also occurs in the *Principles of Philosophy* (1644). In the *Meditations* (1641), the canonical phrase does not occur, but Descartes argues instead that 'I am, I exist is certain as often as it is put forward or conceived in the mind.' Descartes later observed that the meditator's indubitable awareness of his own existence was 'recognized as self-evident by a simple intuition of the mind'. There is a partial anticipation of Descartes's *Cogito* in Augustine, *De Civitate Dei*, 11. 26.

**cognition.** Traditionally this has been regarded as the domain of thought and inference, marking the contrast with perceptual experiences and other mental phenomena such as pains and itches. Sensations, perceptions, and feelings are all distinguished from episodes of cognition since they provide input to the domain of thinking and reasoning but are not thoughts themselves.

More recently, cognition has been conceived as the domain of representational states and processes studied in cognitive psychology and \*cognitive science. These are phenomena involved in thinking about the world, using a language, guiding and controlling behaviour. The new definition embraces some aspects of sensory perception where this involves representations of a spatial world and the intelligent processing of sensory input.

Theories of cognition can span occurrent conscious events like seeing, thinking, and reasoning, dispositional states such as intentions, beliefs, and desires, and non-conscious states which occur in the early stages of visual and linguistic processing. The domain of cognitive theory is broader than the realm of the propositional attitudes, regarded by many philosophers as the space of reasons. Cognitive states lying beyond the space of reasons will not be governed by the norms of rationality which tell us what we ought to think, given what we believe, and what we ought to do, given our intentions and desires. Instead, they will be governed by computational or causal laws of cognitive psychology which may or may not be sensitive

to the intentionality or 'aboutness' of the cognitive states to which they apply.

It has been argued that states lying outside the space of reasons can have no representational content since they are not presented to a subject of experience, but belong instead to a thinker's subsystems. However, empirical psychology has enjoyed considerable success in explaining many of our mental activities by using generalizations framed in terms of the contents of states of our cognitive subsystems. Typical examples include: Chomsky's views about the mental representation of linguistic knowledge; research into the processes the visual system employs to construct 3D representations of objects from 2D retinal images; the processes which facilitate the recognition of faces, or visual word recognition. Sceptics about the representational contents of states of these cognitive systems must provide some alternative means to explain these findings.

Due to these successes cognitivism has largely replaced \*behaviourism in scientific psychology. Instead of explaining human activities by means of stimulus and response, intellectual capacities are now to be explained by postulating inner mental states which combine semantic content and causal powers to affect behaviour. The ambition of cognitive science in developing a naturalistic theory of mind is to provide a satisfactory and unifying treatment of these two properties for the vast range of our cognitive states. It hopes to do this by treating mental processes as computational processes. (\*Computers.) Transitions between representational states are defined as computations, performed on the representational vehicles of those contents. Syntactic processes that explain the causal transitions between mental representations run parallel to the inferential relations between their contents.

Opposition to this computational hypothesis takes many forms. Some accept that the laws of psychology are computational but argue that, since they are syntactic and formal, mental states and processes can be scientifically explained only if they are syntactically explained. The syntactic theory of mind retains the causal power of cognitive states while jettisoning their contents. Other critics seek to limit the ambition of cognitive science, claiming that the realm of propositional attitudes (\*folk psychology) and the phenomenon of consciousness resist scientific explanations of the type which account for cognitive subsystems. Others still consider psychological explanations in terms of belief and desire to be instrumentalistic, and claim that for genuine explanations of intelligent behaviour we must resort to the details of micro-cognition.

Cognitive theories will impose different architectures on the domain of cognition, but most accept a broad division between the states of a person involving in experience and reasoning, and informational states of sub-personal processing systems. Whether this boundary is drawn in terms of consciousness, or conceptual and non-conceptual content, it marks an important place for collaboration between philosophers and psychologists. One such example is Jerry Fodor's theory of \*cognitive architecture, which sees the mind as modular, comprising sev-

eral perceptual input systems that supply information to the central domain of thinking and reasoning. Fodor argues that the central system must make use of sentence-like structures in a \*language of thought. Opponents in psychology and computer science propose rival cognitive architectures, including some that reject the symbolic representation entirely.

B.C.S.

\*consciousness, its irreducibility; content, non-conceptual; frame problem; thinking; reasoning; perception; parallel distributed processing.

J. A. Fodor, *The Modularity of Mind* (Cambridge, Mass., 1983).

S. Stich, *From Folk Psychology to Cognitive Science* (Cambridge, Mass., 1985).

**cognitive architecture.** A term used in theories of cognition to describe the functional organization of the mind into component parts. Human cognition is seldom studied as an undifferentiated whole. Rather, it is subdivided into specific domains of information (e.g. visual, auditory, linguistic information), or into distinctive tasks accomplished by the cognitive mind (e.g. face recognition, speech processing, reasoning). Various cognitive architectures have been proposed to explain our capacities to respond to such information or to perform such tasks. Faculties are posited that encode domain-specific information of a visual or linguistic kind, and dedicated cognitive mechanisms are postulated that perform the operations required to complete specific tasks. The overall organization of faculties or interaction of mechanisms is the architecture of the cognitive mind. On one view, the mind is a collection of modules—where a module is a cognitive mechanism that works in isolation from other modules on a restricted range of inputs and outputs. On another, the mind has a connectionist architecture where processing is global, taking place across a network of connected and active nodes. Competing claims about the mind's capacities and limitations are thought to flow from the choice of cognitive architecture.

J. A. Fodor, *The Mind Doesn't Work That Way: The Scope and Limits of Computational Psychology* (Cambridge, Mass., 2000).

**cognitive meaning.** An element of \*meaning which accounts for an expression's not just standing for something but representing it in a particular way. This explains how a speaker can attach different significance to two words for the same thing. Expressions share the same cognitive meaning when and only when a speaker who understands those expressions regards them as synonymous. Whether different speakers can share the same cognitive meaning to an expression depends on whether their judgments concerning the sameness and difference in meaning for this and other related expressions coincide.

B.C.S.

\*emotive and descriptive meaning.

M. Dummett, *Frege: Philosophy of Language* (London, 1973), ch. 19.

**cognitive science** is the interdisciplinary investigation of \*cognition by psychology, linguistics, neuroscience, artificial intelligence (AI), and philosophy. Cognitive science treats reasoning, perception, and other cognitive processes as information-processing, involving the manipulation of mental representations. Cognitive scientists also hold either that these mental processes can be modelled by computers, or that these processes actually are computational processes (i.e. that the mind is a computer). One dominant ('classical') approach in cognitive science treats the computational processes as defined over a representational system in which the symbols have semantic and syntactic properties. Jerry Fodor's 'language of thought' hypothesis is the theoretical paradigm for this approach. An alternative approach, which emerged in the mid-1980s, is known as 'connectionism', and denies that mental representations have syntactic structure. According to connectionists, mental representations are processed in parallel, and their representational content is holistically distributed across entire networks of simple representational units. While connectionists claim that their approach is more biologically realistic than the classical approach—their models are sometimes called 'neural networks'—critics of connectionism have argued that it cannot do justice to the fact that cognition is systematic: for example, the fact that thinkers who can think that A loves B can also entertain the thought that B loves A. The need to integrate the science of cognition with the developing theories of the human brain has led to the development of *cognitive neuroscience*, which has attempted to integrate data provided by brain-imaging technology into a better understanding of how the brain underpins mental faculties. **cognitivism:** see non-cognitivism.

**Cohen, G. A.** (1941–). Canadian political philosopher who has specialized in the study of \*Marxism. He is a leading proponent of 'analytical Marxism'—the view that the traditional doctrines of Marxism should be understood and evaluated using the methods of Anglo-American analytical philosophy. Cohen has attempted to reformulate Marx's doctrines of \*alienation, exploitation, and \*historical materialism, culminating in his *Karl Marx's Theory of History: A Defence* (1978). His aim has been described as the 'demystification' of Marxism, by clarifying or eliminating the metaphysical and teleological concepts which Marx inherited from Hegel. Since then, he has worked on broader issues of justice, focusing in particular on contemporary liberal and libertarian attempts to justify private property and economic inequality. Cohen is currently the

Chichele Professor of Social and Political Theory at the University of Oxford. w.k.

G. A. Cohen, *History, Labour and Freedom: Themes from Marx* (Oxford, 1988).

**Cohen, Hermann** (1842–1918). Philosopher of Judaism, founder of the Marburg school of Kantian philosophy. Son of a cantor and son-in-law of the liturgical composer Lewandowski, Cohen studied at Jewish and secular institutions, winning his Marburg chair after brilliantly defending Kant's a priori time and space. He went on to argue that all principles of knowledge are \*a priori: all objects are mental constructs; Kantian \*things-in-themselves, untenable. Newtonian physics demonstrates the reality of science and so the possibility of a priori judgements. But science progresses. It is never complete. Supplementing Kant's ethics with Aristotelian and biblical ideas of virtue and justice, Cohen championed universal human dignities and rebutted the anti-Semitic historian Treitschke, defending the loyalty of German Jews by appeal to the Kantian respect for moral subjects implicit in Jewish ethics. On his retirement, Marburg snubbed his chosen successor, Ernst Cassirer, and appointed Paul Natorp. Bitterly disappointed, Cohen moved to Berlin, exploring the theology of the biblical fellow man in *Religion of Reason out of the Sources of Judaism* (1919). God was the backstop of moral fairness and generosity, orientating human progress toward a community of free individuals. Philosophy cannot prove that progress inevitable or demonstrate the reality of the divine Comforter of those who suffer in its long unfolding. Here personal conviction stands alone. L.E.G.

\*Jewish philosophy; Kantianism.

Hermann Cohen, *Religion of Reason out of the Sources of Judaism*, tr. Simon Kaplan (New York, 1972).

**Cohen, L. Jonathan** (1923–). Oxford philosopher who, after early work on political philosophy, has contributed widely to the philosophy of science, of induction and probability, and of language, among other areas. One central preoccupation of his has been with generalizing modal logic to provide a basis for an inductive logic where inductive support is quite independent of mathematical probability. This 'Baconianism' about induction led him to a pluralist view of probability, seen as a generalization of provability: from different types of provability, different types of probability—relative frequency, personalist, propensity etc.—are generated. Perhaps his most radical and controversial claim is that types of \*probability can be generated which do not conform to the standard mathematical calculus, and, moreover, that these are not mere theoretical constructs but fundamental to judicial decision-making as well as inductive and scientific inference. J.L.

L. J. Cohen, *The Probable and the Provable* (Oxford, 1977).

**coherence.** *p* and *q* are coherent if and only if the possible \*truth of *p* does not preclude the possible truth of *q* and the

possible truth of *q* does not preclude the possible truth of *p*. It follows that the concept of coherence presupposes the concept of truth, so truth cannot be explained in terms of coherence without circularity. Nevertheless, coherence is necessary for truth because if  $\{p, q\}$  form an incoherent set, then at least one of *p* and *q* is false. Coherence also provides a test for truth because if it can be shown that  $\{p, q\}$  form an incoherent set, and it is known that one of *p, q* is true, then it follows that the other is false, and if it can be known which is true, then it can be known which is false. However, coherence is not sufficient for truth because the coherence of  $\{p, q\}$  is consistent with the falsity of both *p* and *q*. S.P.

\*coherence theory of truth.

Sybil Wolfram, *Philosophical Logic* (London, 1989).

**coherence theory of truth.** A theory of \*truth according to which a statement is true if it 'coheres' with other statements—false if it does not. Some criticisms focus on what 'cohere' means—'is consistent with' appears too weak, 'entails and is entailed by', too strong. Other criticisms have to do with the fact that it seems that some statements must be assigned a truth-value independently if others are to be assessed by way of their coherence. Although the theory is more plausible for axiomatic systems where 'coherence' can take the definite form of being derivable from the axioms, the theory is extended to contingent statements. This is often owed to the conviction that the truth or falsity of individual statements can never, or only rarely, be conclusively established. It is sometimes owed to the conviction that there may be several sets of cohering statements with equal claim to describe the world correctly. s.w.

\*realism and anti-realism.

A. C. Grayling, *An Introduction to Philosophical Logic* (Brighton, 1982), ch. 5.

S. Wolfram, *Philosophical Logic* (London, 1989), ch. 4.3.

**coherentism:** see epistemic justification; epistemology, problems of.

**Coleridge, Samuel Taylor** (1772–1834). Poet and conversationalist rather than professional philosopher, Coleridge was, nevertheless, fascinated by philosophy. In early life a believer in Berkeley's \*idealism, he was then converted to the philosophy of Kant, Schelling, and Fichte. He came to be regarded as a 'sage', and had a profound effect on nineteenth-century thought, religious, literary, and political. His most original work was on language, which he regarded as an evolving, flexible, personal tool for the construction of an intelligible world. His notebooks contain profound insights into the nature of perception and the functions of the imagination. His distinction between Imagination and Fancy (*Biographia Literaria* (1817), ch. 4) is his best-known contribution to the theory of \*imagination, but was more concerned with style than with the philosophy of mind. His early thoughts

on the subject are impossible to disentangle from those of Wordsworth. Later, he was largely responsible for the introduction of German philosophy into English academic life. M.WARN.

John Stuart Mill, *Mill on Bentham and Coleridge*, intro. F. R. Leavis (London, 1971).

M. A. Perkins, *Coleridge's Philosophy* (Oxford, 1994).

**collective responsibility** is \*responsibility that can be assigned to some group or organization. A focus on moral blame or punishment (e.g. of the German people for the Nazi period), although not exhaustive of this concept, is common. In this sense, collective responsibility contributes to the generating of many questions. We can ask, *inter alia*, about similarities and differences between individual and collective responsibility; whether either one undermines the other; whether either one is preferable in moral assessment in some context. We may particularly ask when there ought to be collective responsibility. Arguably there should be collective responsibility (as fault) when a group or organization intends or causes harm, and the group or organization has or had the capacity to understand the wrongness of the intention or the causing of harm, and to modify or avoid these. This account does not fit no-fault collective responsibility, an enormously important, but complex, concept, which is also indispensable in modern societies. E.T.S.

\*business ethics; corporate responsibility.

Larry May, *Sharing Responsibility* (Chicago, 1992).

**Colletti, Lucio** (1924–2001). Professor of Philosophy at La Sapienza University in Rome, he came to fame as the principal Italian Marxist theorist of his generation, although he ultimately abandoned Marxism in the late 1970s. A pupil of Galvano Della Volpe, his distinctiveness in the Italian context arose from his rejection of the dominant school of Hegelian Marxism associated with Gramsci. Drawing on Kant, he argued for a form of transcendental realism that insisted on the independent reality of the material world from the knowing subject as a presupposition of an intersubjectively valid empirical science. He interpreted the Marxist project as the formulation of empirically verifiable scientific laws of economic development, an endeavour in which *Capital* was central. This thesis led him to stress the need for the empirical study of \*capitalism with the object of reformulating Marx's own analysis whilst remaining true to his approach. R.P.B.

\*Marxism.

Richard Bellamy, *Modern Italian Social Theory* (Cambridge, 1987), ch. 8.

**Collingwood, Robin George** (1889–1943). R. G. Collingwood was Waynflete Professor of Metaphysical Philosophy in Oxford from 1935 to 1941, and also an archaeologist and historian of Roman Britain. His dominant interest was in the \*imagination, especially as exercised by the historian, who interpreted historical data to reconstruct the

thoughts of past people, and by the creative artist. He held that true \*art, as opposed to mere entertainment, constructs an 'imaginary object' which can be shared, as an idea can be, by the artist with his public. In looking at a painting or listening to a symphony, like the historian we must imaginatively reconstruct the artist's own creative thought. His influence on practising historians has been considerable. In aesthetics, his somewhat austere theory applies well to \*music. He was a considerable musician himself.

M.W.

\*history, problems of the philosophy of; history, history of the philosophy of.

A full annotated bibliography is published by David Pole, *Aesthetics, Form and Emotion* (London, 1983). Collingwood's major works: *The Idea of History* (mainly 1936); *The Principles of Art* (1938); *An Essay on Metaphysics* (1940).

**Collins, Anthony** (1676–1729). Educated at Eton and Cambridge, he was a close friend of Locke, who seems to have regarded him as his intellectual heir. Collins is important philosophically for his materialist theory of mind, developed most fully in his *Answer to Clarke* (1708), and his much-applauded *Philosophical Inquiry* (1717), a work which unites Hobbes's metaphysical determinism and Locke's psychic determinism. Collins's *Discourse of Free-Thinking* (1713), which defends freedom of expression, is probably his best-known work. His position is generally thought to be deistic; however, there is strong external and internal evidence that he was a covert atheist. According to Berkeley, Collins claimed to have a proof for the non-existence of God; and many of his published statements seem to hint at, or imply, atheism. T. H. Huxley described him as the 'Goliath of Freethought', but he can also be seen as the most notable British philosopher between Locke and Berkeley, drawing on Hobbes, Spinoza, and Bayle, but chiefly on the rationalistic and materialistic side of Locke's thought.

**colours.** These are part of the perceptible world, and accounts of them are consequently bound up with theories of mind and perception. Much work is influenced by the doctrine that they fall on the secondary side of the \*primary- and secondary-quality distinction. This is the view that whereas primary qualities such as shape, size, and weight are intrinsic to material objects, secondary qualities such as colour, taste, and smell are not. It often involves the claim that in subjective awareness, colours are analogous to bodily \*sensations like pains. But although this approach to secondary qualities may be promising for senses like touch and taste, which do involve sensations, it is unfaithful to the character of colour experience to suppose that normal vision involves one in being aware of the eyes or other part of the body.

Other approaches identify colours with objective properties of surfaces. However, there is no simple correlation between these and perceived colour, and philosophy awaits a theory which satisfactorily combines colour's subjective and objective aspects.

**comedy.** Events, situations, insights, narratives—in reality or fiction—which prompt feelings of relief or delight, often through the exposing of the ridiculous, the absurd or foolishly inappropriate in human life.

As a moral and social corrective, the comic shows up disparities between lofty profession and squalid performance: it works towards the sharpening of self-knowledge and self-criticism, checks the blurring of fantasy and fact, levels by exhibiting a common, highly fallible humanity.

Theories of the comic have (variously) taken as central a sense of superiority at that spectacle of human foibles and obsessions, or the offer of temporary release from constricting norms, or delight in discerning the incongruous. Language itself is a favoured domain for the comic—in nonsense verse, riddles, and puns.

The comic in philosophy is often an exposure of irrationality, or the showing-up of a theory as over-ambitious, pretentious, and ill-grounded. Deflationary philosophy, however, must take care not to fall into the opposite error—diminishing its subject-matter through being excessively reductionist.

**common sense.** Philosophers tend to divide sharply in their attitudes to common sense. Amongst the founding fathers, Aristotle is a respector of common sense and Plato a disdainer, and the contrasting attitudes can be seen in their metaphysics, ethics, and political theory. Consider only their theories about \*universals or about the ideal construction of the family. Later, Reid and Moore are respecters, Hegel and McTaggart lofty disdainers. Of course, this is too simplistic, for the respecters are not usually worshippers and the flouters never entirely disregard some constraints of common sense. But what is common sense and why should it exercise *any* constraints over the creative intellect?

It seems likely that common sense defies definition; certainly no one has succeeded in giving a satisfactory definition, and very few have tried. To define it may be a self-defeating enterprise like codifying an ideology of that anti-ideology, \*conservatism. Yet this indefiniteness,

though it has certain strengths, makes it difficult to address such important questions as whether common sense is itself implicitly theoretical and whether or to what degree it is changeable. Without answering these questions, we may none the less make headway by sketching the rough location of common sense in the landscape of philosophical inquiry.

It is clear that the creative intellect needs some constraints other than logic since the conclusions of metaphysical thought need tests of acceptability other than consistency, and sheer intellectual intuition is unlikely to provide enough. Moreover, in spite of the excitement of esoteric theory, philosophers have always hoped that their thinking had important connections with ordinary life, and theories that entirely flout common sense tend to forfeit such connections. There is a sort of bad faith involved in acknowledging and living by certain beliefs in day-to-day life and denying these beliefs in the study. Even so extravagant an advocate of bewildering idealism as Bishop Berkeley claimed to be speaking on behalf of the vulgar.

Thomas Reid, a staunch apostle of a strong role for common sense in philosophy, treated the invocation of common sense as ultimately an appeal to certain innate principles of human nature that are partly constitutive of what it is to reason. Reid used his understanding of common sense to attack various sceptical or reductionist views in metaphysics and morality. But he does not rely solely upon appeal to self-evidence or general consensus, since it is an important part of his argument that those who ignore the commonsense principles in building their metaphysics find their reductive constructions built upon sand. It can, he thinks, be shown that Hume's metaphysics rests upon his theory of \*ideas and this theory is not only incompatible with the cognitive practices of ordinary people, but makes it impossible for Hume to reach conclusions that his own position requires.

Descartes said that good sense or good judgement was so widely distributed amongst people that no one ever thought they needed more of it. This touches on a crucial idea behind the appeal of common sense in philosophy. The most brilliant and abstract theorist is none the less part of a community of thought and inherits a network of concepts that is pinned to the judgements and practices of that community (and of the species at large) in myriad ways. This is most evident in the shared language that supports the intelligibility of the boldest speculations. In the twentieth century, notably in the work of Wittgenstein and, in a different way, in J. L. Austin, the appeal to common sense was often transformed into an appeal to the common language. This appeal survives in a great deal of contemporary \*analytic' philosophy though not in as direct a way as was common with philosophers like Ryle and Austin. It may well account for the admirable capacity that its practitioners have for discussing and criticizing each other instead of merely proclaiming different world-views.

**communication.** The act of meaning something, of conveying a \*propositional attitude (belief, desire, intention, regret, etc.) to an audience, by linguistic or other means. On the intuitive code or message model, endorsed, for example, by Locke, to communicate is simply a matter of encoding a thought in a form that one's audience can decipher. However, communication is more complex a matter than (in the linguistic case) just putting one's thoughts into words and hoping one's audience will reverse the process. As Grice discovered, the speaker's intention is distinctively *reflexive*: the speaker intends to produce a certain effect on his listeners partly by way of their recognizing his intention to produce it. The effect specific to communication is understanding, which consists in their recognition of that intention—inducing belief or action is a further effect. Communication is, in short, the act of expressing an attitude with a reflexive intention whose fulfilment consists in its recognition. K.B.

\*language; meaning.

Kent Bach and Robert M. Harnish, *Linguistic Communication and Speech Acts* (Cambridge, Mass., 1979).

**communism.** Any system of social organization in which property is held in common by members of a community rather than being owned privately by individuals. Since the early twentieth century the term has been associated with the name of Marx and with self-professed Marxist economic systems (such as the Soviet Union). Marx, however, used the term to refer to a movement which he thought would emancipate the working class from \*capitalism. Marx thought it was premature to define the social arrangements which this movement would create; his writings contain nothing like a precise or detailed account of what a future 'communist' social system would be like.

\*anti-communism; conservatism.

Shlomo Avineri (ed.), *Marxist Socialism* (New York, 1973).

Alec Nove, *The Economics of Feasible Socialism* (London, 1983).

**communitarianism.** The thesis that the \*community, rather than the individual, the state, the nation, or any other entity, is and should be at the centre of our analysis and our value system. Although it is an influential strand in political philosophy, it has not been systematized—as liberalism has, for example by Rawls, as \*utilitarianism has, or as Marxists have developed 'grand theory'. Nevertheless, certain key themes are clear.

Primarily, communitarians emphasize the social nature of life, identity, relationships, and institutions.

They emphasize the embedded and embodied status of the individual person, by contrast with central themes in particular in contemporary liberal thought which are taken to focus on an abstract and disembodied individual. They tend to emphasize the value of specifically communal and public goods, and conceive of values as rooted in communal practices, again by contrast with liberalism, which stresses individual rights and conceives of the individual as the ultimate originator and bearer of value. The centrality of the real, historical, individual person in communitarian theory, though, distances it equally from certain varieties of \*Marxism—specifically strong varieties of historical determinism and those varieties of state socialism where power is highly centralized.

Communitarians can be understood to be conducting a straightforwardly *prescriptivist* argument: human life will go better if communitarian, collective, and public values guide and construct our lives. There is also a *descriptive* thesis: that the communitarian conception of the embodied and embedded individual is a truer and more accurate model, a better conception of reality, than, say, liberal individualism or atomism, or structuralist Marxism. The descriptive and prescriptive levels of analysis can be fused—communitarians argue that given the state of the world, certain social, political, and normative arrangements and values are unviable. For example, a society which understands itself to be constituted by atomistic and autonomous discrete individuals, and which makes that kind of autonomy its highest value, will not work. Similarly, a top-down imposition of values (as in Stalinism) or the attempt completely to subordinate the individual to the state (as in modern fascism) will fail (as well as being morally repellent and indefensible).

Another important distinction within communitarianism is that between *\*social constructionism* and *value communitarianism*. Social constructionism refers to the claim that social reality is contingent upon social relations and human practices, rather than given. Value communitarianism refers to two things. First, the commitment to collective values, for example, reciprocity, trust, solidarity. These cannot be enjoyed by individuals as such—each person's enjoyment depends on others' enjoyment. In other words, they depend on a threshold recognition of 'intersubjectivity'. Second, the commitment to public goods—facilities and practices designed to help members of the community develop their common and hence their personal lives. Theorists suggest that a commitment to such collective values would engender a political practice which realized a range of public goods. Whether social constructionism and value communitarianism imply one another is a matter for dispute.

Communitarianism has often been criticized for its \*conservative social and political implications—because theorists like MacIntyre uphold the integrity and value of tradition and established practice. However, social constructionism and value communitarianism feature in \*socialism, Marxism, and \*feminism. Certain communitarian themes—notably a form of social constructionism,

and some community values like reciprocity—have been affirmed by liberal thinkers like Rawls and Dworkin. Theorists like Charles Taylor, who have been dubbed communitarian, on the other hand, have affirmed their commitment to the values of \*liberalism. E.J.F.

\*individualism.

Charles Taylor, 'Cross Purposes: The Liberal Communitarian Debate', in N. Rosenblum (ed.), *Liberalism and the Moral Life* (Cambridge, Mass., 1989).

**community.** Group of people living a common life through reciprocal relationships. Communities are contrasted with associations organized for specific purposes in accordance with enforceable rules. Thus there is controversy over whether social life is fundamentally communal or, as Hobbes thought, the product of an association to maintain order. More generally communitarians see individuals as embedded in communities, rather than the independent atoms that compose them. P.G.

\*fraternity.

W. Kymlicka, *Liberalism, Community and Culture* (Oxford, 1989).

**compatibilism and incompatibilism.** Compatibilism is a view about \*determinism and freedom that claims we are sometimes free and morally responsible even though all events are causally determined. Incompatibilism says that we cannot be free and responsible if determinism is true. The compatibilist defends his view by arguing that the contrary of 'free' is not 'caused' but 'compelled' or 'coerced'. A free act is one where the agent could have done otherwise *if* she had chosen otherwise, and in such acts the agent is morally responsible even if determined. The incompatibilist defends his view by arguing that a free act must involve more than this—the freedom to choose called origination. Honderich has argued that both sides, embattled for centuries, misconceive the problem. There is not one true definition of 'free'. There are two entrenched sets of attitudes at war here—within as well as between individuals. The two attitudes involve two conceptions of freedom. R.C.W.

**completeness.** A formal system of logic is semantically complete where all semantically valid formulae are derivable as \*theorems. A semantically valid formula of a formal system of logic is one which, given a specified

interpretation of the logical operators, is true on any interpretation of the non-logical terms. For example,  $(P \vee \sim P)$  is semantically valid and is also derivable as a theorem in the propositional calculus. The \*propositional and \*predicate calculuses are complete in this sense.

A stronger sense of completeness (d-completeness) is defined syntactically. A system is d-complete where if a non-derivable formula is added as an axiom, a contradiction is derivable. The propositional but not the predicate calculus is d-complete.

R.B.M.

\*validity; incompleteness.

B. Mates, *Elementary Logic* (Oxford, 1972).

**complex idea:** see ideas.

**complexity theory.** Computational complexity theory is the branch of computer science/mathematics that deals with the resources required to solve problems—as distinct from the theory of \*computability, which deals with whether problems can be solved at all. An important resource in problem solving is time. Complexity theorists distinguish the class of decision problems  $P$  that can be solved by a deterministic \*Turing machine in polynomial time (i.e. where the time required is determined by the size of the input raised to a certain power) from the class of decision problems  $NP$  that can be verified by a deterministic \*Turing machine in polynomial time. One of the outstanding questions of complexity theory is whether  $P = NP$ .

J.BER.

M. Sipser, *Introduction to the Theory of Computation* (Boston, 1997).

**composite idea:** see ideas.

**composition and division, fallacies of.** If I reason 'Every member of the team is strong; therefore the team is strong', I am committing the fallacy of composition—it is possible for the premiss to be true and the conclusion false. If I reason 'The rope is strong; therefore the threads of which the rope is made are strong', I am committing the fallacy of division. These are fallacies not because every inference from parts to whole or whole to parts is invalid, but because some are.

J.BER.

\*fallacy.

C. L. Hamblin, *Fallacies* (London, 1970).

**computability.** A mathematical \*function determines a unique numerical output for any appropriate numerical input. A function is computable just if there is a procedure that can be carried out in a finite number of steps by a human being or a computer following a finite number of exact instructions for calculating the output for any given input. Computability theorists have made this informal notion precise in a variety of ways. According to \*Church's thesis, the set of computable functions coincides with the set of functions that can be calculated by a universal \*Turing machine.

J.BER.

\*Church's thesis; computers; function; Turing machine.

G. S. Boolos and R. C. Jeffrey, *Computability and Logic*, 2nd edn. (Cambridge, 1980).

**computers.** Devices in which formal computations are performed automatically. A computation is an inference-like operation which is defined over a set of representational structures, and results from the manipulation of those structures in accordance with a fixed set of rules. Particular applications of the rules can create, transform, or erase symbolic structures at any given stage of processing. The modern digital computer performs these tasks when guided by a \*program which contains instructions to carry out particular operations in a given sequence. If the instructions specified in a given programming language fail to correspond directly to the basic operations of the machine they must be converted into, or interpreted in, another programming language whose operations do directly correspond, or which are themselves converted into, or interpreted in, a language which corresponds more closely to the basic workings of the machine. Finally, we reach the level of machine code, whose commands are executed by the electronic functions of machine hardware. This is called the implementation hierarchy; and for any high-level programming language implemented in the levels below, we can imagine a computer operating directly in accordance with its commands: this is called a virtual machine.

Philosophers of mind like Jerry Fodor and Daniel Dennett appeal to computational mechanisms in providing theories of mind, and many have supposed the software–hardware distinction can illuminate the mind–body problem. Psychologists have claimed that many of our mental abilities and capacities can be explained computationally; and researchers in \*artificial intelligence have supposed that by suitable programming it is possible to build a machine that thinks. Each of these claims relies on the notion of computational explanation. To give a computational account of a physical system is to explain its outward behaviour by reference to certain functionally defined interpretable inner states and processes. A computational process  $P$  arises when a processor  $Q$  manipulates a field of symbolic structures with a certain behavioural result (i.e. running a program). The operation of the processor can itself be seen as a process, call it  $P'$ , internal to  $P$ , which is the result of an interior processor  $Q'$  manipulating its field of symbolic structures. Within each process we can define an ingredient processor and its field of application until we reach a processor which simply performs the hardwired electronic functions of the machine. This is called serial reduction. It provides a means whereby complex procedures can be broken down into sequences of simpler tasks until we reach the ground-level operations of the machine. Dennett takes this model to show how to dispense with homunculi: intelligent behaviour could be the upshot of an assembly of relatively 'dumb' processing units carrying out simpler tasks; the

level of conscious mental life would be a virtual machine implemented in the neural hardware. In contrast, Fodor sees the laws of intentional psychology as implemented by computational laws which govern real belief–desire states of an internal behaviour-causing mechanism. Beliefs, for Fodor, are computational relations to mental representations: structures in a \*language of thought which have both a syntax and a semantics. Desires are different behaviour-causing computational relations to just such mental representations. Psychological processes can be regarded as computational processes if they can be formally defined in terms of sequences of operations for manipulating interpretable symbols.

The crucial remaining difference between ourselves and machines is that whereas we have to attribute semantic content to the machine's representations, or data structures, semantics arises in us without external attribution. What computational explanations do show is the possibility of a level of organization within a system which can be implemented (multiply realized) in a variety of ways. Thus creatures with different neurophysiological states can share the same computational states and processes. Rules and representations at each level can be defined independently of their physical realizations: their 'semantics does not cross implementation boundaries' (Brian Cantwell Smith). So to establish a distinct computational level in a creature is to establish that it has states with certain semantically interpretable contents. (For the limits of computability see the entry on artificial intelligence.)

**Comte, Isidore Auguste Marie François Xavier** (1798–1857). The father of French \*positivism was much influenced by the \*philosophes, as well as by Saint-Simon, to whom he served as secretary for several years. At the same time, although he repudiated formal religious belief at an early age, he showed a respect for Catholicism quite alien to those earlier thinkers. An appallingly miserable life, of which misery he was the chief author, came to an end as Comte strove to found his own non-theistic religion, complete with a catalogue of secular saints and observances.

Comte's major contribution to thought—part philosophical, part historical, part sociological—was expressed in his law of the three-part nature of human societal development. Apparently, societies are fated to go through the *theological*, the *metaphysical*, and the *positive* stages of existence. And, although it is certainly not the case that every later event is better than every earlier event—Comte showed a deep distaste for the Protestant Reformation, even to the point of refusing to recognize its contributions

to science—the overall effect of change up through the stages is *progressive*.

Looking therefore at the history of the West—Comte had as little sympathy for non-Europeans as any of his contemporaries—we see a three-part upwards rise. In the theological stage (the medieval period), one had beliefs in gods and spirit forces. It was not so much that this was wrong—in fact Comte argued that it was a necessary part of growth—but that it was immature. Then, in the metaphysical stage (the Scientific Revolution), one moved on to beliefs in unseen forces and the like. Finally, in the positive stage (which Comte cherished and at whose birth he saw himself as helping), one moves to a purer form of understanding, where one confines explanation to the expression of verifiable and measurable correlations between phenomena.

Comte argued that this forward movement of \*society is reflected into each area of science, and that here also one sees progress through three stages. Comte was strongly anti-reductionist, inasmuch as each branch of science supposedly has its own peculiar methods—this includes 'sociology', thus justifying Comte's own existence! But more than this. Apparently, there is an ordering of science taken as a whole, and the prior forms of science must start out on their paths before the lower forms can get started. It is because of this that we find that, taking the sciences in order—mathematics, astronomy, physics, chemistry, biology, and sociology—only the first two have achieved a purely positive status, and that theological and metaphysical thinking exists in major force in the others.

It is easy to laugh at a man who founds a religion with Frederick the Great and Adam Smith among its canon of saints. However, one should not underestimate the influence of Comte on individuals, like John Stuart Mill, or on fields of study, like education, with his claim that the individual, like society, must learn in one inevitable fixed pattern. Nor should one neglect the fact that there is an identifiable chain from Comte down to the positivists of various kinds in this century. At the moment, given the influence of constructivism, positivist philosophies of science are not very popular; but, for those of us who incline to a cyclical philosophy of history rather than a unidirectional progressivist one, the possibility remains real that Auguste Comte and his philosophy will ride again.

**conation:** see intention; trying; will.

**conceivability.** Admissibility by the mind. Thinkability. If imagination entails the generation of mental imagery, then everything imaginable is conceivable, but not everything conceivable is imaginable. Something is conceivable if and only if it is possible to form a concept of it, but a concept need not involve an image.

Logical possibility is necessary for conceivability, so logical impossibilities are inconceivable, but conceivability is not what logical possibility consists in. A putative state of affairs is logically impossible if and only if every description of it entails a contradiction, logically possible if it has at least one consistent description. A putative state of affairs is conceivable if and only if it can be thought. Nevertheless, conceivability without contradiction is important to the epistemology of logical possibility.

On some empiricist views, if I have experience of *a* and experience of *b*, then I can conceive of some new item, *c*, composed of *a* and *b*, but not of any item I have neither experienced nor experienced the constituents of.

On some materialist views, if I think I am thinking of something non-physical, say spiritual or abstract, I have in fact only succeeded in thinking of something physical. On this view, to conceive of something is to think of it as possessing at least some primary qualities. s.p.

T. Gendler and J. Hawthorne (eds.), *Conceivability and Possibility* (Oxford, 2002).

**concept.** The term is the modern replacement for the older term \*idea, stripped of the latter's imagist associations, and thought of as more intimately bound up with language. How intimately? There are innumerable concepts which, on any view, lie quite beyond the attainments of a languageless creature, as a quick inspection of any technical volume, such as a computer manual, makes plain: concepts such as *format*, *debug*, and *backup* are light-years away from a place in the brightest of chimpanzees' repertoires. On the other hand, the use of \*language which shows a person to have such and such a concept will not occur in a vacuum, but there will be underlying abilities, notably those of a broadly recognitional or discriminatory character, which give substance, as it were, to the word usage, and in many cases it will make sense to ascribe comparable abilities to animals.

But is this enough to warrant speaking of the grasp of a *concept*? We do not have, in addition, to assure ourselves that some form of abstract, internal representation has occurred in the simian mind, but it is true that we have focused on one aspect only of concept possession, the fully developed case presenting us with a *cluster* of capacities: not merely the ability to respond differentially to things which fall under the concept, as can be realized in a non-language-user, but also the ability to apply or indeed to misapply a concept, to extend it to new cases, to abandon it in favour of an alternative concept, to invoke the concept in the absence of things to which it applies, and so forth. In the absence of a word or other \*sign to which the concept might be annexed, it is difficult to make sense of these possibilities, difficult to say that non-language-users can possess concepts in anything more than an extended sense. B.B.R.

\*thinking; meaning; image.

E. Margolis and S. Laurence (eds.), *Concepts: Core Readings* (Cambridge, Mass., 1999).

G. Ryle, *Thinking and Meaning* (Louvain, 1962).

**concepts, thick and thin.** Thin evaluative concepts are those such as 'ought', 'right', 'wrong', 'good', 'bad', 'duty', 'obligation', and 'rights'. These are the concepts used in final moral decisions about how to act. Thick concepts lie between these and the non-evaluative concepts below them; examples are 'brave', 'tactful', 'lewd', and 'insensitive'. The idea is that there is a sort of layer-cake of concepts, with the non-evaluative at the bottom and the thin at the top. Thick concepts are distinctive in being a sort of mix of evaluation and description; there is a debate about whether that mix is a combination of two separate parts.

J.D.

S. Blackburn, 'Morality and Thick Concepts', *Proceedings of the Aristotelian Society*, suppl. vol. 66 (1992), 285–99.

**conceptual analysis.** The attempt to solve philosophical problems, or exhibit them as illusory, by defining words or being clear about how concepts are used. In practice, conceptual analysis involves logical deduction, because it requires showing the entailments of definitions. The logical status of true sentences of philosophy is then 'analytic'. In so far as conceptual analysis is the method of philosophy (as it was widely held to be for much of the twentieth century), philosophy is a second-order subject, because it is about language, not the world or what language is about. However, the philosophical results of solving problems of the form 'What is the definition of "x"?' are not independent of those obtained from answering 'What is x?' or 'What is the essence of x?'

Some concepts seem recalcitrant to analysis, or to put it another way, some words seem resistant to verbal definition. 'Red' is hard to define if construed phenomenologically, even though readily definable in terms of physics. 'Exists' resists definition, at least once we realize that being *F* is not sufficient for being.

Conceptual analysis, if not under that name, has been practised intermittently in philosophy at least since Plato. For example, it is recognizable in the work of Aquinas, Hobbes, Leibniz, and Kant. In the last century it was the philosophical method advocated by the Logical Positivists.

The later Wittgenstein argues that, for at least some concepts, there are no necessary and sufficient conditions for being *F*, because there is nothing that all and only those items truly called 'F' have in common. Rather than engage in definition, then, philosophers should attend to the vast diversity of linguistic use.

The idea that non-linguistic reality is too changing, too phenomenological, or too paradoxical to be realistically depicted by terms admitting of precise definition is as old as Heraclitus, but also salient in the thought of Hegel and Nietzsche. In philosophy, though, we should be as clear as we can for as long as we can if we are to begin to understand its problems. If we define our terms as clearly as we are able, we can avoid beginning by arguing past one another. A philosopher should be concerned about definition in the way that a historian is concerned about putting dates in the right order. s.p.

**conceptual scheme.** A set of concepts and propositions that provide a framework for describing and explaining items of some subject-matter along with criteria for recognizing which phenomena are to be considered deviant and in need of explanation. For example, ancient astronomers thought of planets as moving in circular paths at constant speed and attempted to reduce observed non-circular motions to systems of underlying circular motions that appear non-circular from our perspective. Newton introduced a new conceptual scheme that viewed physical objects as moving in straight lines unless acted on by some force. Planetary orbits were then explained as resulting from the interaction of straight-line motion and gravitational forces. In epistemology Quine has sought to eliminate the traditional conceptual scheme that treats every proposition as either \*analytic or synthetic. H.I.B.

**concomitant variations, method of:** see method of concomitant variations.

**concrete universal.** One standard meaning for 'concrete' is 'particular', and in a tradition based on Aristotle, only particulars can be genuine subjects, while only \*universals can be predicated of subjects, and universals cannot themselves be subjects of predication. 'Socrates is wise' would predicate the universal, wisdom, of the particular, Socrates, and 'Wisdom is a characteristic of Socrates' would be a grammatically misleading way of predicating that same universal of that same particular, while 'Wisdom is a primary virtue' would be a grammatically misleading way of saying that any person having wisdom has a primary virtue. In that system of usage, 'concrete universal' would be an inconsistent phrase. However, in the philosophy of Plato, universals can themselves be genuine subjects of predication, just as much as any particular (and in fact are regarded as *superior* subjects).

Aristotle regarded universals as grasped by a mental process of abstraction, so that, at least as grasped by us, universals are abstract entities (another difference from Plato, who regards universals as more clearly mind-independent). Since another use of 'concrete' is as an opposite to \*'abstract', this would be another source of tension in the phrase, from an Aristotelian, but not a Platonic, viewpoint. Locke's version of universals was 'abstract general ideas'—which tends toward the

Aristotelian side, but he also held that 'Everything that exists is particular'. This would make possible another reading (besides the Platonic one) of 'concrete universal' which would make it consistent, namely, 'particular abstract general idea'. So the two meanings for 'concrete', namely 'particular' and 'non-abstract', should not be run together.

The deliberate use of the idea of a concrete universal is due to Hegel, for whom the 'I', the 'now', the 'spirit of a free people', etc. are either both concrete and universal or in some sort of transition in between. Hegel would not have minded a reading of 'concrete' and of 'universal' which would make the phrase combine logically conflicting ideas. This would be part of his theme of the dialectical combining of opposites. J.C.

Herbert Marcuse, *Hegel's Ontology and the Theory of Historicity* (Cambridge, Mass., 1987).

**concupiscence.** Literally, the state of desiring or coveting something with great ardour, but used more particularly to signify sexual or other strong bodily desire. It is used in a related sense by St Thomas Aquinas, in the *Summa Theologiae*, with respect to bodily desires generically, or the capacity or faculty for having such desires. He referred to our 'concupiscible powers'. It is his equivalent term for the Greek *epithumia*, as used in the division of the powers of the active soul by Plato and Aristotle (with the 'irascible powers' corresponding to the Greek *thumos*). The term is archaic, and only found outside academic discussion in coy descriptions of sexual congress. Different \*virtues are said to pertain to these different powers, enabling us to find a pattern within the range of human excellences. N.J.H.D.

\*sex; sexual conduct.

Aquinas, *Summa Theologiae*, la. 2ae, QQ. 22–30, 56.

**Condillac, Étienne Bonnot de** (1715–80). French philosopher who attempted to formulate a rigorous epistemology as the theoretical basis for the enlightened agenda of the eighteenth-century \*philosophes. He combined elements of Locke's 'sensationalist' theory of knowledge with the scientific methodology of Newton, and mixed in a small portion of Cartesian tough-minded doubt to produce a sort of empiricist foundationalism that was quite serviceable for the broader aims and intentions of the \*Enlightenment intellectuals, though deeply problematic and unstable from the very start. Condillac devoted careful attention to questions surrounding the origins and nature of language, and enhanced contemporary awareness of the importance of the use of language as a scientific instrument. He began the work of constructing a science of ideas, 'idéologie' in the parlance of later thinkers who were influenced by him. P.F.J.

Isabel F. Knight, *The Geometric Spirit: The Abbé de Condillac and the French Enlightenment* (New Haven, Conn., 1968).

**conditional probability.** The \*probability that a card drawn at random from a deck is a heart is  $\frac{1}{4}$ ; the

conditional probability that it's a heart, given that it's red, is  $\frac{1}{2}$ ; the conditional probability that it's a spade, given that it's red is 0. The conditional probability of an event  $E$  given an event  $F$ —in symbols,  $p(E|F)$ —is defined as  $p(E \& F)/p(F)$ , where  $p(E \& F)$  is the probability that both  $E$  and  $F$  occur; where  $p(F) = 0$ ,  $p(E|F)$  is undefined. If  $p(E|F) = p(E)$ , then  $E$  and  $F$  are said to be independent. M.C.

**conditionals.** Traditionally, any sentence of the form *If A (then) B*.  $A$  is called the antecedent,  $B$  the consequent. Here are three examples:

- (a) If there was a run on sterling, interest rates rose.
- (b) If there had been a run on sterling, interest rates would have risen.
- (c) If there is a run on sterling, interest rates will rise.

(a) and (c) are usually classed together as indicatives. (b) is called subjunctive or \*counterfactual.

Philosophers have generally conceived their problem to be that of explaining in what conditions a conditional is true. There is a widespread assumption that  $A$  and  $B$  must be propositions—true or false—and, under the influence of formal logic, a certain presumption in favour of the view that the conditions for the truth of the conditional are those of so-called material implication, where  $A$  materially implies  $B$  just in case  $A$  is false or  $B$  true.

On this interpretation, arguments generally accounted valid *are* valid; unfortunately, so are arguments which appear quite eccentric. Thus, interpreting 'if' as material implication, the argument whose premiss is 'I did not raise my arm' and whose conclusion is 'If I raised my arm the world came to an end' is valid. Some philosophers have argued that this does not defeat the presumption, showing not that the conditional is false, but only that it is misleading to assert it. To assert it suggests (though the conditional does not entail) something false—that, for example, there is a connection between my raising my arm and the world's coming to an end.

Another approach appeals to \*possible worlds: the truth of a conditional is the truth-value of its consequent at the possible world most similar to the actual world in which its antecedent is true. Our example is false even if I do not raise my arm, because (presumably) in the possible world most like the actual world in which I do raise my arm, the world doesn't come to an end.

A third approach centres on acceptability (defined in terms of probability) rather than truth: *If A then B* is acceptable provided that the \*conditional probability of  $B$  given  $A$  is sufficiently high. One objection to this approach is that the law of contraposition—*If A then B* entails *If not-B then not-A*—fails. But contraposition works unambiguously only with examples like (a): what is usually described as the contrapositive of (c)—'If interest rates don't rise, there will be no run on sterling' is logically unrelated to it. *Grammatically*, though, it's not clear that this should be called the contrapositive of (c), nor is it obvious what the contrapositive of (b) is.

This suggests that there is an important distinction

between (a) on the one hand and (b) and (c) on the other, a view taken by V. H. Dudman. Unlike most theorists, Dudman's work is marked by close attention to grammar, in particular to tense in conditionals. On Dudman's view (b) and (c) are conditionals. But conditionals are not propositions compounded of propositions. They are what Dudman calls simple messages: they have a subject and their conditional clauses are constituents of their predicates, rather than propositions. They represent verdicts on 'fantasies' where we are 'envisioning the unfolding of a causally continuous sequence of events', (b) placing in the past what (c) puts in the future; they are not propositions, true or false. (a), on the other hand, is a compound message. It is a hypothetical, a kind of condensed argument: hence its obedience to logical laws. But again it is not a proposition. It would seem that Dudman's aim of 'deflating truth' has a philosophical significance not confined to 'if' sentences. M.C.

**Condorcet, Marie-Jean-Antoine-Nicolas Caritat, Marquis de** (1743–94). French philosopher, mathematician,

political theorist, and a moderate revolutionary who died in prison. He developed 'social mathematics', applying mathematics and probability theory to social and political affairs. He analysed complex decisions, such as an election between three candidates, where the candidate selected by a simple majority may not be preferred by the voters when they compare each candidate with every other candidate. Complex decisions should thus be reduced to a series of simple decisions and should be taken by an enlightened élite capable of such reduction. Condorcet was a feminist, arguing that women should have the same rights as men, political as well as civil, and an education enabling them to exercise their rights. His *Sketch for a Historical Picture of the Progress of the Human Mind* (1793) presented society as developing by stages from primitive hunters and gatherers down to the French republic, and predicted indefinite progress in science, technology, and (guided by social mathematics) social organization. M.J.I. Condorcet, *Selected Writings*, ed. K. M. Baker (Indianapolis, 1976).

**conduct:** see right action.

**confectionery fallacy.** The confectionery fallacy (so named by Ray Jennings) is found mainly (and frequently) in elementary logic texts whose authors are desperate for a convincing example of an 'exclusive "or"' (either  $p$  or  $q$ , but not both). Numerous writers offer examples such as the following. A parent says to a child, 'You may have pie or cake if you eat your vegetables'. In fact, the consequent of this conditional is not *any* kind of \*disjunction. It is a \*conjunction: 'You may have pie and you may have cake'. (It does not of course follow from this that the child may

have both.) If it were really an exclusive disjunction the child would have a 50 per cent chance of opting for the *unpermitted* alternative. The mistake seems to arise from confusing 'Permissibly $\sim p$  and permissibly $\sim q$ ' with 'Permissibly $\sim(p$  and  $q)$ '.

**confirmation.** The relation, in Carnap's kind of inductive logic, between evidence and hypothesis. Confirmation-judgements, according to Carnap, assess the probability of a specified hypothesis, on specified \*evidence, in either classificatory, comparative, or quantitative terms. They have a truth-value that is determined a priori by the rules of the language in which they are formulated, and they are thus to be distinguished from those assessments of \*probability that measure the empirically given relative frequency of one kind of outcome among another kind.

In effect Carnap analysed the extent to which, in a given language, a sentence *e* confirms a sentence *h*—written '*c(h,e)*'—as the ratio of the quantity of logically possible worlds in which both *e* and *h* are true to the quantity of logically possible worlds in which *e* is true. (Earlier, but much sketchier, versions of this analysis may be found in the writings of Leibniz, Wittgenstein, and Waismann.) Carnap recognized, however, that a language can supply a non-denumerably infinite variety of possible measures for quantities of possible worlds and that a correspondingly non-denumerable infinity of different confirmation-\*functions can be made available. So, first, he concentrated his attention on those confirmation-functions that treat all individuals alike—allowing any uniform, difference-preserving replacement of one individual's name by another's. Secondly, out of all those confirmation-functions he favoured use of one that assigns a fundamental equality to each of the different structures that are possible in a world, where one structure differs from another if it involves the instantiation of a different pattern of predicates. And, thirdly, he favoured use of the one such confirmation-function that within any particular structure assigns a fundamental equality to each possible distribution of individuals. Carnap's chosen measure for quantities of possible worlds then ensured that *a*'s having the property *F* will always be better confirmed by the evidence that both *b* and *c* have *F* than just by the evidence that *b* has *F*, and better confirmed by the evidence that there are *n* + 1 different kinds from which the new instances are taken than by the evidence that there are just *n* different kinds.

Unfortunately, however, this choice of function fails to distinguish between the project of constructing a measure for the validity that an experimental result derives from its replicability in similar circumstances, and the project of constructing a measure for the strength of inductive support that depends on the thoroughness with which the experiment tests the performance of the hypothesis under variation of relevant circumstances. Nor does Carnap's system provide any methodology for selecting an

appropriate language, or for selecting which particular kinds of circumstances describable within the language are known to be especially relevant for testing which particular kind of hypothesis. The system also assigns a very small degree of confirmation to any hypothesized law, whatever the evidence, when the supposed number of individuals is very large, and assigns zero confirmation when this number is infinite. So, although predictions can enjoy a plausible degree of confirmation (because they concern individuals), explanatory laws cannot.

Hintikka's system of confirmation theory eliminates the difficulty about measuring the confirmation of laws, as distinct from the confirmation of predictions about individuals, but remains vulnerable to the other criticisms.

**Confucianism.** Major school of thought in China which defends an ethical and political ideal that has been a dominant influence on the way of life of the Chinese. Members of the school are motivated by social and political concerns, and many take part in government at some stage of their careers, with some attaining influential official positions. They regard cultivation of the self as the basis of social and political order, and many of them are also influential teachers devoted to bettering themselves and their pupils. This predominantly practical orientation is coupled with a reflectivity that has led to the development of elaborate metaphysical views, theories of human nature, and accounts of the human psychology. Their discussion of such issues as the cultivation of character, forms of integrity, the nature of emotions and desires, and the relation between knowledge and action has important implications for the contemporary study of moral psychology and ethics in general.

The origin of the school can be traced to a social group in early China whose members, referred to as *Ju* (a term probably with basic meaning of weakling), were ritualists and sometimes also teachers by profession. Confucius (sixth to fifth century BC) belonged to the group but, although he retained the interest in rituals, he was also concerned with a search for remedy for the social and political disorder of the times, which he believed to lie with the restoration of traditional values and norms. Later thinkers who professed to be followers of Confucius shared such concern and belief, and developed Confucius' teachings in different directions. The school of thought comprising these thinkers has traditionally been referred to as 'Ju-chia' (the school of *Ju*), a term often translated as 'Confucianism'. Confucius' thinking was given divergent developments by Mencius (fourth century BC) and Hsün

Tzū (third century BC), and different kinds of Confucian thought continued to evolve in the early period, yielding such major thinkers as Tung Chung-shu (second century BC). After a period in which it was overshadowed by Buddhism, a revival of interest in Confucianism was seen among such thinkers as Han Yü (768–824), Shao Yung (1011–77), Chou Tun-i (1017–73), Chang Tsai (1020–77), Ch'eng Hao (1032–85), and Ch'eng I (1033–1107), marking the beginning of a movement often referred to as 'neo-Confucianism'. Han Yü's view that Mencius was the true transmitter of Confucius' teachings became generally accepted largely through the efforts of Chu Hsi (1130–1200), who put together the *Lun Yü* (Analects) of Confucius, *Meng Tzū* (Mencius), *Ta Hsiieh* (Great Learning), and *Chung Yung* (Doctrine of the Mean) as the Four Books. The Mencian branch of Confucian thought continued to be developed in different ways, leading to differences between the Ch'eng–Chu school of Ch'eng I and Chu Hsi, and the Lu–Yang school of Lu Hsiang-shan (1139–93) and Wang Yang-ming (1472–1529). Further development occurred among later thinkers such as Wang Fu-chih (1619–92), Yen Yüan (1635–1704), and Tai Chen (1724–77), and new forms of Confucian thought continue to evolve up to the present.

Two important concepts in Confucian thought are *tao* (the Way) and *te* (virtue, moral power, potency). Originally meaning 'road' or 'way', 'tao' came to be used to refer to the ideal way of life as well as teachings about that way of life. 'Te' originally referred to that by virtue of which a ruler has the authority to rule; it referred to both a quality involving proper religious sacrifice and such attributes as self-sacrificial generosity and humility, as well as a psychic power of attraction and transformation associated with that quality. It came to be used of human beings generally, referring to the quality or power by virtue of which one can tread the Way. The two concepts have been used by other schools (such as Taoism) in connection with different ideals, but Confucians further explain their conception of *tao* and *te* in terms of *jen*, *li*, and *yi*.

'Jen' (humanity, goodness, benevolence) has either the basic meaning of kindness, or the basic meaning of a quality distinctive of certain aristocratic clans. It is used in Confucian texts sometimes to refer to the all-encompassing ethical ideal and sometimes to refer specifically to an affective concern for all living things. Distinctive of Confucian thought and opposed by Mohist opponents is the view that the nature of such concern should vary according to one's relation to such things. Later Confucians also explain *jen* in terms of one's forming one body with, and hence one's being sensitive to the well-being of, all things.

'Li' (rites, rituals, propriety), originally referring to sacrificial rites, gradually came to refer more generally to all norms governing ceremonious behaviour and the responsibilities one has by virtue of one's social position. Just as performance of sacrificial rites should ideally be accompanied by reverence for spirits, observance of *li* in dealing with other people should ideally be accompanied by reverence for others; the attitude behind *li* is described in

some Confucian texts as lowering oneself and elevating others. The emphasis on *li* is another distinctive feature of Confucian thought, setting it in opposition to Mohist and Taoist opponents.

To avoid its leading to improper behaviour, an affective concern for others has to be regulated by a sense of what is right, and departure from *li* in unusual circumstances or proper conduct in circumstances not covered by *li* also calls for an assessment of what is right. Confucians therefore also emphasize the importance of *yi* (rightness, duty, fittingness), the character 'yi' probably having the earlier meaning of a sense of honour before coming to refer to the fitting or right way of conducting oneself. Confucians emphasize that *yi* is not determined by fixed rules of conduct, but requires the proper weighing of relevant considerations in any context of action. The ideal form of courage involves a firm commitment to *yi*, as well as the absence of fear or uncertainty if one realizes upon self-examination that one is in the right.

Confucian thinkers emphasize gradual cultivation of the self to embody the attributes just described. In the political realm, although some Confucian thinkers, such as Hsün Tzū and Tung Chung-shu, also advocate the use of law and punishment as secondary measures, Confucian thinkers are generally agreed that moral examples and education should ideally be the basis for government. A ruler who embodies the attributes described will care about and provide for the common people, who will be attracted to him, and the moral example he sets will have a transforming effect on the people.

Though sharing a roughly common ideal, Confucian thinkers disagree about the justification of the ideal and the metaphysics underlying it. The disagreement has in large part to do with their different conceptions of *hsing* (nature). Originally derived from a character meaning 'life' or 'to grow', 'hsing' came to mean the direction of development that a thing will realize if unobstructed. Mencius believed that human beings share certain incipient ethical inclinations which are fully realized in the Confucian ideal; *hsing* is constituted by the direction of development of such inclinations and is good in that it has an ethical direction. Hsün Tzū regarded the *hsing* of human beings as comprising primarily self-regarding desires that human beings have by birth; *hsing* is evil in that unregulated pursuit of satisfaction of such desires leads to strife and disorder. Thus, while Mencius defended traditional social distinctions and norms on the ground that they make possible full realization of shared incipient ethical inclinations, Hsün Tzū defended them on the ground that they help to transform and regulate the pursuit of satisfaction of desires, thereby making possible social order and maximal satisfaction of human desires.

Different views of *hsing* continued to evolve within the Confucian tradition, such as Tung Chung-shu's view that human beings are born with both good and bad elements, and that *hsing* in the broad sense includes the bad elements and cannot be described as good. Along with the acceptance of the view that Mencius was the true transmitter of

Confucius' teachings, Confucian thinkers came to agree that *hsing* is good. But this Mencian idea was also reinterpreted in terms of the metaphysics of *li*.

For example, Chu Hsi, following Ch'eng I, regarded all things as composed of *li* (principle, pattern) and *ch'i* (ether, material force). While the term had the earlier meaning of 'good order' or 'inner structure', *li* came to be regarded as something incorporeal and unchanging that runs through everything, explaining why things are as they are. It is also that to which the behaviour of things should conform; in the human realm, it includes all norms of human conduct. *Ch'i* is the concrete stuff of which things are composed, and is freely moving and active. According to Chu, *hsing* is constituted by the *li* in human beings, which is identical with the Confucian virtues; so, *hsing* is good in that human beings are born fully virtuous. While the mind originally had insight into *li*, this has been obscured by distortive desires and thoughts which are due to impure *ch'i*. While de-emphasizing the metaphysics of *li* and *ch'i*, Wang Yang-ming shared the view that human beings are already fully virtuous by virtue of the *li* present in them and that ethical failure is due to the obscuring effect of distortive desires and thoughts. However, while Chu regarded *li* as also residing in all things, Wang held the view that *li* ultimately resides in the way the mind responds to situations when not obscured, a point he put by saying that there is no *li* outside the mind.

Thus, unlike Mencius, who viewed self-cultivation as a process of developing shared incipient ethical inclinations, Chu and Wang viewed it as a process of making fully manifest the *li* in human beings which has been obscured by distortive desires and thoughts. Later Confucian thinkers regarded this as a reinterpretation of Mencian thought under Buddhist influence, and sought to recapture what they regarded as the true meaning of classical Confucianism. For example, Tai Chen regarded *li* not as a distinct metaphysical entity, but as the proper ordering of human desires and emotions which are due to *ch'i*. By applying a form of golden rule, one can know how one's own and other people's desires can be appropriately satisfied and emotions appropriately expressed, and this constitutes a grasp of *li*. *Hsing* is good not in the sense that human beings are already fully virtuous, but in the sense that being virtuous involves an ordering of desires and emotions natural to human beings.

Different views of *hsing* and of the underlying metaphysics have implications for ethical and political practices. For example, the view that there are bad elements in *hsing* tends to be coupled with some degree of advocacy of restrictive measures in politics—both Hsün Tzū and Tung Chung-shu advocated laws and punishment as secondary measures to restrain the bad elements in *hsing*. As another example, Chu Hsi's and Wang Yang-ming's different views of *li* led to different accounts of self-cultivation. Since Chu Hsi regarded *li* as present in all things, he regarded self-cultivation as involving to an important extent examining daily affairs and studying classics and historical records to regain the insight into *li* that one

originally had. However, given his view that *li* does not reside outside the mind, Wang regarded the method of cultivation advocated by Chu as misguided; instead, self-cultivation should involve one's attending to the mind, constantly watching out for and eliminating distortive desires and thoughts.

Thus, while Confucian thought is given unity by a roughly common ethical and political ideal and eventually by a set of canonical texts, it includes a rich variety of metaphysical views as well as conceptions of human nature and of self-cultivation. New advances and developments continue to be made up to the present, and Confucianism continues to exert great influence not just on Chinese intellectuals, but also on the social and political order as well as on the daily life of the Chinese up to the present century.

**Confucius** (sixth to fifth century BC). Chinese thinker regarded by many as a sage and worshipped in temples in certain parts of China. In intellectual circles, he is usually regarded as the founder of the Confucian school of thought. His full name was K'ung Ch'iu or K'ung Chung-ni, and he was also known as K'ung Fu-tzū (Master K'ung), latinized as 'Confucius'. He advocated restoring traditional values and norms as a remedy for the social and political disorder of his times, and sought political office in an attempt to put this ideal into practice. He never attained an influential position in government, and was much more influential as a teacher. His teachings are recorded in the *Analects* (*Lun Yü*), a collection of sayings by him and by his disciples, and of conversations between him and his disciples.

His ethical ideal includes a general affective concern for others (involving a preparedness to refrain from doing to others what one would not have wished done to oneself), certain desirable attributes within familial, social, and political institutions (such as filial piety and loyalty to rulers), as well as other traits such as courage and trustworthiness. It also includes the observance of various traditional norms governing both ceremonious behaviour (such as sacrificial rites, marriage ceremonies, reception of guests) as well as the responsibilities one has in virtue of one's social positions (such as the responsibilities of a son or an official). Those who have approximated the ideal will have a non-coercive transformative power on others; others will admire and be attracted to them, and will be inspired to emulate their way of life. This transformative

power should ideally be the basis for government. Edicts and punishment can at best secure behavioural conformity but, if a ruler has approximated the ideal, he will care about and provide for the people, who will be attracted to him and be inspired to reform themselves. K.-L.S.

**connectionism.** An approach in \*artificial intelligence and \*cognitive science aimed at producing biologically realistic models of the brain and of mental processing; sometimes called PDP (\*parallel distributed processing).

In 'old-fashioned' (or cognitivist) accounts, the brain is viewed as a symbol manipulator. In PDP (or connectionist) accounts, the brain is viewed as a complex weave of multilayered networks. The units of a network (which may be compared to the brain's neurons) are simple processors, and the connections between them, of which there are massively many, have different strengths. Information-processing is parallel, i.e. much is carried on simultaneously; and it is distributed, i.e. any individual connection participates in the storage of many different items of information.

There is controversy about the exact significance of this new approach, and about its repercussions for debates in the philosophy of mind. J.HORN.

William Ramsey, Stephen P. Stich, and David E. Rumelhart (eds.), *Philosophy and Connectionist Theory* (Hillsdale, NJ, 1991).

**connective.** A word or sequence of words which forms a complex indicative sentence when joined with an indicative sentence or sentences. For example, the English connective 'and' joins two sentences to make a more complex sentence. Connectives are classified according to the number of sentences with which they combine: 'it is not the case that' is a one-place connective and 'and' is two-place. Connectives also divide into the truth-functional and non-truth-functional. A connective is truth-functional if the truth-value(s) of the sentence(s) with which the connective combines completely determines the truth-value of the sentence formed through the combination; otherwise it is non-truth-functional. The '&' of the propositional

calculus is truth-functional: ' $p \& q$ ' is true if and only if  $p$  and  $q$  are both true. A.D.O.

\*truth-function.

R. M. Sainsbury, *Logical Forms* (Oxford, 1991), ch. 2.

**connotation:** see denotation.

**conscience.** By 'conscience' is meant the sense of \*right and wrong in an individual; described variously by philosophers as a reflection of the voice of God, as a human faculty, as the voice of reason, or as a special \*moral sense. The most famous modern discussion is in the work of Joseph Butler, who insisted on conscience's claim to 'authority' over other sources of motivation. In moral epistemology Butler combined the rationalist and moral sense theories of the eighteenth century, describing conscience as 'a sentiment of the understanding or a perception of the heart'. He underestimated the moral problem of the erring conscience, treated explicitly in Aquinas's *Summa Theologiae* (1a. 2ae, Q. 19, arts. 5 and 6). Aquinas pointed out that one acts badly in doing what is in fact bad, but also in going against conscience; so that unless he 'put away his error' someone of evil conscience cannot act well. P.R.F.

Charles A. Baylis, 'Conscience', in Paul Edwards (ed.), *The Encyclopedia of Philosophy* (New York, 1967).

**consciousness** exists, but it resists definition. There are some criteria for saying of some organism or state that it is conscious. Consciousness involves experience or awareness. Human mental life has a phenomenal side, a subjective side that the most sophisticated information-processing system might lack. To paraphrase Thomas Nagel, there is something it is like to be in a conscious \*mental state, something it is like for the organism itself. Conscious mental states are heterogeneous in phenomenal kind. Sensations, moods, emotions, dreams, propositional thought, self-awareness all occur consciously—perhaps some of these states only occur consciously.

For Descartes, all thinking is conscious; conscious thought is the essence of mind; humans have privileged and incorrigible access to their own conscious states; and the mind is a non-physical substance. The modern naturalistic consensus is that only some mental processes are conscious and that all mental events and processes are physical. That is, all mental states have neural \*realizations in *Homo sapiens*. The best way to think about consciousness involves as a first step thinking in terms of conscious mental states and not in terms of consciousness as a unified faculty. Despite the widespread but by no means unanimous commitment to a naturalistic metaphysics of consciousness, there is heated debate over what exactly consciousness is; whether, and if so how, it can be studied; what if anything its causal role is; and whether, despite the fact that it is so far always realized in biological systems, it must be so realized. The fact that consciousness has a subjective, uniquely first-personal side has led

some to maintain allegiance to the Cartesian view that consciousness is as consciousness seems. On this view, first-person phenomenology is the method for studying consciousness. The problem with this sort of view is that while it may be true that there is direct and privileged access to one's own conscious states, it does not follow that this access is incorrigible. First, even first-person phenomenology is ambivalent about the claim that we are always in perfect touch with whatever conscious state(s) we are in. Furthermore, even if we do have privileged and incorrigible access, the latter being stronger than the former, to the subjective aspects of consciousness, it does not follow that we have either sort of access to all the aspects of consciousness. If, as most naturalists think, consciousness has depth and hidden structure, then first-person phenomenology will hardly be capable of yielding a complete theory of consciousness. \*Naturalism implies that conscious mental states supervene on certain neural states. What neural state my experience of red supervenes on is something to which there is no first-personal access.

Some philosophers are pessimistic about joining the subjective and objective sides of the story. Others are hopeful that we can yoke together the phenomenological, psychological, and neural analyses of conscious mental life to yield a more complete theory, a theory that gives the way things seem its due and which at the same time deepens our understanding of how conscious mental events are realized and what causal roles they play. The question of causal role is pressing. There is at present no widely accepted theory of why consciousness evolved. It seems to many that a merely informationally sensitive system, such as a community of ants and bees, may be, or could be, as well adapted as equivalent experientially sensitive systems. There is no doubt that we are conscious, but because the adaptive value of being conscious is not well understood, epiphenomenalism, the view that consciousness is a side-effect of more causally significant processes, remains a live, and much discussed, possibility in contemporary philosophy of mind and cognitive science. Another area of lively research and debate is on the relation of conscious states and intentional states. The dominant view is that many conscious states are not intentional. Some conscious states, such as moods, do not appear to be 'of' or 'about' anything. Relatedly, there is the question of whether unconscious mental states exist. If there are unconscious mental states, then the door is open for unconscious intentional states, for example, Freudian beliefs and desires. John Searle, despite advocating \*'biological naturalism', thinks that Descartes was right in thinking that all bona fide mental states are conscious. On Searle's view there are no \*unconscious mental states at all: all mental states are conscious states; beyond that there are just non-conscious neural states, events, and processes. o.f.

**consciousness, false:** see false consciousness.

**consciousness, its irreducibility.** Many efforts have been made to identify consciousness with some other feature such as behaviour, functional states, or neurobiological states described solely in third-person neurobiological terms. All of these fail because consciousness has an irreducible subjective character which is not identical with any third-person objective features. Consciousness is irreducibly subjective in the sense that conscious states are experienced by and accessible to the individual who has them in a way that they are not experienced by or accessible to other individuals. To understand this point it is essential to distinguish between the epistemic sense of the distinction between objectivity and \*subjectivity and the ontological sense. In the epistemic sense, objectivity is a matter of propositions being ascertainable by any competent observer as opposed to subjective matters which are relative to individual tastes and preferences. But in the ontological sense of the objective-subjective distinction, there are certain phenomena which are intrinsically subjective and other phenomena which are intrinsically objective. Such matters as mass, force, and gravitational attraction are ontologically objective, but, in this sense, consciousness is ontologically subjective. Subjectivity in this case is not a matter of the epistemology by way of which we find out about consciousness but a matter of its ontological status. The objection, then, to any form of \*reductionism is that it is bound to fail because the ontologically subjective cannot be reduced to the ontologically objective. J.R.S.

**consciousness, neural correlates of.** Activities, states, or parts of central nervous systems which are directly related to the occurrence of conscious perceptions, feelings, thoughts, and intentions, maybe under certain environmental or bodily conditions. A central philosophical and also scientific question is whether the correlates are sufficient or just necessary for consciousness, and whether this is a matter of nomic connection or something else. How explanatory or predictive are they? Correlation, at least

until more is said, is consistent with both dualistic theories of causal connection between mind and brain and also mind–brain identity theories. In fact, the existence of neural correlates is compatible with most of the different philosophical theories of mind–body relationship. When correlates are taken as being only necessary conditions for consciousness, they are compatible with the doctrine of externalism, to the effect that conscious states depend on extra-cranial facts. Still, the ongoing discovery of correlations has strengthened naturalistic views of the mind rather than any others. R.V.

**consciousness, stream of:** *see* stream of consciousness.

**consent.** The standard way of establishing \*political obligation, and so binding citizens to obey the laws of the state, in liberal thought and, putatively at least, in liberal practice. Consent in the political realm is modelled on the private promise and subject to the same qualifications: it is morally binding only in so far as it is voluntary, undertaken with full knowledge, after deliberation. (The only exception to this rule is the act of surrender in war, where the implicit or explicit commitment not to renew the combat, made under extreme duress, is morally binding none the less.) The pre-liberal practice of exacting oaths of allegiance to new rulers (especially usurpers and conquerors, who had reason to worry about their legitimacy) suggests that the idea of consent has practical as well as theoretical value. As obviously or mysteriously as the promise, political consent generates a strong sense of being bound. Hence it provides a foundation for the claims made on individuals by established regimes and for the charge of criminal disobedience, rebellion, or treason if these claims are ignored or refused.

But explicit consent is relatively rare in political life. Oaths are commonly demanded only from notables, office-holders, and aliens in the process of naturalization. Or, they are ritually recited (as American schoolchildren recite the Pledge of Allegiance) under conditions that don't meet the requirements of rational agreement. In order to save the theory of obligation by consent, two different strategies have been adopted. The first is embodied in the idea of the social \*contract as an act of hypothetical consent by imaginary men and women negotiating with one another (or engaged in solitary deliberation) in the artificial conditions of the \*State of nature or the \*original position. Real men and women are invited to recognize themselves in their imaginary fellows and to accept the conclusions they reach. The second strategy involves the redescription of certain ordinary acts and omissions as signs of tacit consent to the established form of political rule. These strategies might appear to cripple consent and render it unable to play any sort of foundational role, and yet they are compatible with radical claims: hence Hobbes's suggestion that rebels and traitors have consented to their own punishment—either because as

rational individuals they must have consented, or because as actual citizens they have tacitly consented, to the authority of the sovereign.

The leading candidates for strategic redescription are, in ascending order of plausibility, the failure to leave the country upon coming of age, the acceptance of whatever benefits the regime or, more generally, the ongoing system of political co-operation provides, and the decision to participate in certain political practices (voting, campaigning, protesting governmental policies). It is an interesting question whether redescription 'works' by virtue of being plausible, so that reasonable people ought to acknowledge its force, or only by virtue of being widely accepted as plausible, acknowledged in fact by actual people. The second view might well require the conclusion that consent doesn't 'work' at all, not at least in the way liberal writers hoped it would, since most people, if asked, would not be able to recognize their own putative agreements. They would probably declare themselves bound none the less, loyal and obedient citizens, but that kind of inward consent is as real in authoritarian as in liberal regimes.

Perhaps the strongest grounds for taking consent as the foundation of liberal democracy is the guaranteed right of dissent. If avenues of political protest and oppositional politics are genuinely open and widely used in particular cases, then the survival of the organized system of political co-operation might be a sign that people really value it and in that sense consent to its continuation. **consequentialism** determines the rightness or wrongness of an act, either solely by comparing the act's consequences with the consequences of alternative acts, or solely by comparing the consequences of rules or practices or motives that allow the act with the consequences of rules or practices or motives that prohibit the act.

The term 'consequentialism' first appeared in Elizabeth Anscombe's article 'Modern Moral Philosophy' (*Philosophy*, 1958). Anscombe espoused a kind of moral \*absolutism according to which some kinds of act (e.g. intentionally killing the innocent) are wrong in any circumstances, i.e. no matter how bad the consequences would be of not doing the act. She used the term 'consequentialism' to refer to any moral theory that rejected such absolutism. On the meaning Anscombe gave to 'consequentialism', the simple view that *only* consequences matter qualifies as a kind of consequentialism. But so does the view (espoused by many \*moral pluralists) that, while consequences are only one among a plurality of moral factors, consequences are a factor of sufficient importance to make it the case that any kind of act can be morally right if it has good enough consequences or avoids bad enough

consequences. Few philosophers now use 'consequentialism' so broadly.

There is controversy, however, over whether the term 'consequentialism' should or should not extend so far as to allow the goodness of consequences to be \*agent-relative. If each agent is required to produce the best available set of consequences, but the goodness of consequences is relative to the agent who produces them, then different agents will be required to produce different sets of consequences. An extreme example of agent-relative consequentialism is the kind of egoism that claims an act is right if and only if it produces the best available consequences *for the agent*. This kind of egoism can reach different conclusions about the rightness of an act that makes Jill worse off but produces the best available consequences for Jack. If Jack did this act, this kind of egoism judges the action to be right. If instead Jill did this act, this kind of egoism judges it to be wrong.

Another controversy over how broadly to take the term 'consequentialism' concerns the relation between acts and consequences. Perhaps the most natural reading of 'consequences' assumes that, apart from exceptional cases, an act is not part of its consequences. (This is not to deny that some of an act's consequences may be part of the act: killing Jones necessarily has the consequence that Jones goes from alive to dead. Perhaps in the special case of an act that produces the best consequences, all of the act's consequences are part of the act. But we can think that an act is not part of its consequences even if we admit that some or all of the act's consequences are part of the act.) If an act is not part of its consequences, then any intrinsic value in the act itself will not be included in the value of the consequences. So, if an act is not part of its consequences, and if consequentialism evaluates an act by its consequences, then consequentialist evaluation of acts ignores any intrinsic value in the act itself.

Examples of acts that have been thought to contain intrinsic value are acts of promise keeping, of loyalty to friends and family, of gratitude, of reparation to those whom one has wronged, and acts of developing one's own talents and capacities. Examples of acts that have been thought to contain intrinsic disvalue are acts of harming the innocent, of stealing, of promise breaking, of disloyalty, of threatening to infringe others' rights, of lying, and acts of taking pleasure in the misfortune or suffering of others. However, whether these or any other acts have intrinsic value or disvalue is controversial. So is whether to use the term 'consequentialism' so broadly as to include theories that attribute intrinsic value or disvalue to acts.

Also controversial is the question of how much a consequentialist theory can take facts about the past to be morally pivotal. It might seem that, if acts or rules or practices or motives are evaluated solely in terms of their consequences, this evaluation ignores any relation an outcome might have with the past. However, many who have called themselves consequentialists ascribe intrinsic value to equal distributions among currently existing

people over their whole lives (as opposed to during each time slice). Since currently existing lives are partly in the past, this kind of egalitarianism takes that past to be morally relevant. Another group who think of themselves as consequentialists evaluate outcomes wholly or partly in terms of whether agents get what they deserve. This approach also takes facts about the past to be morally pivotal, since what people deserve presumably depends on their past.

So some philosophers use the term 'consequentialism' broadly enough to allow for the inclusion of agent-relativity. Some use 'consequentialism' broadly enough to allow for inclusion of whatever intrinsic value or disvalue acts have. And some use 'consequentialism' broadly enough to allow facts about the past to be morally relevant. However, if the borders of 'consequentialism' are pushed out so far in all three directions, then 'consequentialism' acquires such a wide meaning that virtually every moral theory could be formulated as a kind of consequentialism. The term 'consequentialism' should not be stretched so far as to trivialize it.

Moreover, there is a good reason for consequentialists specifically not to allow agent-relativity into the foundational level of their theory. This reason derives from the very close association of morality with \*impartiality. Much of the appeal of the most philosophically prominent forms of consequentialism derives from their aspiration to substantive impartiality at the foundational level of their theory.

There is also a good reason for consequentialists not to allow intrinsic value for acts, intrinsic disvalue for acts, or desert into the foundational level of their theory. What a theory assumes, it does not explain. So if consequentialism starts by assuming that such-and-such kinds of behaviour deserve reward and so-and-so kinds of behaviour deserve punishment, then consequentialism is not explaining why there should be practices of reward and punishment. Likewise, if consequentialism starts by assuming that such-and-such kinds of act have intrinsic value and so-and-so kinds have intrinsic disvalue, then consequentialism is positing rather than explaining the value of such acts. Theories become less interesting the more they posit rather than try to explain. Many consequentialists have thus eschewed assumptions about desert and the intrinsic value or intrinsic disvalue of acts.

The most philosophically prominent form of consequentialism has been the combination of the commitment to impartiality with the commitment to pleasure as the single intrinsic value. The classic \*utilitarians—Jeremy Bentham, J. S. Mill, and Henry Sidgwick—held that the consequences that matter ultimately are increases or decreases in aggregate \*happiness, which they took to consist in pleasure. In the twentieth century, however, many philosophers and economists were persuaded that what people rationally want for themselves can extend beyond pleasure and indeed beyond any other introspectively discernible state. In the name of preference autonomy, many philosophers moved from thinking that the

fundamental value is pleasure or happiness to thinking that it is more broadly the fulfilment of people's desires.

Other consequentialists have been impressed by the thought that people can desire things for themselves that are in fact worthless. Some of these consequentialists have held that a good life for us is one in which we both get or achieve certain things and desire these things. Examples of what these things might be are autonomy, knowledge, friendship, achievement, beauty, and the perfection of our natures (intellectual and physical). But there is disagreement among consequentialists (as well as among other philosophers) whether, in addition to pleasure, these other things have intrinsic value.

There is also disagreement among consequentialists about what view of distribution to take. The classical utilitarians held that what matters is the amount of aggregate good, where this is calculated by impartially adding together everyone's good (i.e. with equal weighting). Later consequentialists held that it matters not only how much aggregate good is produced but also how equally this good is distributed. \*Equality as an aim in distribution has come under attack because of its acceptance of 'levelling down'. Instead of aiming for equality, many consequentialists have advocated \*prioritarianism, the view that gains in the well-being of the worse off are morally more important than the same size gains for the better off. Whether such priority for the worst off is compatible with substantive impartiality, however, is uncertain.

A more general dispute between consequentialists concerns the common sort of situation where consequences cannot be known with certainty in advance. Some consequentialists frame their theory in terms of *actual* value: that is, the value of the outcome that would *in fact* result. Other consequentialists frame their theory in terms of the *expected* value. Expected value is calculated by multiplying the values of each possible outcome by the probability of that outcome's occurring and then adding together the products of these multiplications.

Especially since the 1950s, consequentialists have taken a variety of views about the connection between (actual or expected) good and moral rightness. Three of the most prominent consequentialist views have been maximizing act-consequentialism, satisficing act-consequentialism, and rule-consequentialism.

Maximizing act-consequentialism holds that an act is morally right if and only if that particular act maximizes (expected) impartial value. This is a view about morally right action. It is not the view that the agent's standard decision procedure should consist of trying to calculate the expected values of the alternative possible actions and then choosing the one with the highest expected value. Very few (if any) maximizing act-consequentialists think agents should have such a decision procedure. Agents frequently lack the information needed to calculate the expected good. Even if they had the information, they would frequently miscalculate. Even if they didn't miscalculate, there is the cost in time and attention of doing the calculations. Furthermore, there are 'expectation effects'.

If people could not confidently predict that others would behave in certain ways (e.g. not attack others, not steal, not break their promises, not lie, etc.) without having to wait for the endorsement of consequentialist calculations, there would be a disastrous breakdown of trust in society.

For these and other reasons, most maximizing act-consequentialists hold that the decision procedure that agents should have for day-to-day moral thinking is made up of rules such as 'Don't harm others', 'Don't steal', 'Keep your promises', 'Tell the truth', 'Look out for the welfare of your friends and family', and so on. Maximizing act-consequentialism therefore agrees to a considerable extent with agent-relative moralities and \*deontological ethics about how agents should decide what to do. But opponents of maximizing act-consequentialism hold that acts of intentionally injuring others, stealing, promise breaking, and other infringements of moral rights can be morally wrong even when the acts maximize impartial good.

Impartial maximizing act-consequentialism is also persistently attacked for unreasonably making relentless demands on ordinary people to sacrifice their own good in order to help needy strangers. A version of consequentialism that tries to accommodate that objection is satisficing act-consequentialism, a theory developed by Michael Slote. According to this theory, an act is morally permissible if and only if its consequences are good enough. Obviously, satisficing act-consequentialism may have difficulty specifying what counts as 'good enough'. Tim Mulgan's *Demands of Consequentialism* (2001) put forward other devastating objections to satisficing act-consequentialism. One is that satisficing act-consequentialism is even more permissive with respect to acts of intentionally injuring others, stealing, promise breaking, and so on than maximizing act-consequentialism is. The other objection is that, where the cost to the agent and others of producing the best consequences is no more than that of producing less good consequences, satisficing act-consequentialism seems mistaken to allow the agent to choose the less good consequences.

Rule-consequentialism calls for the code of rules whose general acceptance has the greatest expected value, impartially considered. The theory then judges the rightness or wrongness of acts by that code. No kind of impartial act-consequentialism does as well as rule-consequentialism at agreeing with agent-relative moralities and deontological ethics about which acts are right and which wrong. But rule-consequentialism disagrees with agent-relative moralities and deontological ethics (and of course with every other rival theory) over the fundamental explanation of why certain acts are right and others wrong. Since the 1960s, rule-consequentialism has repeatedly been attacked as an unstable or incoherent compromise between deontology and act-consequentialism. B.H.

**conservatism.** An approach to political and social questions which was mapped out initially by Burke, though drawing on earlier lines of thought dating back to Hobbes and even to Aristotle, and subsequently developed by many writers, including, notably, Oakeshott and, in his later years, Hayek. The conservative approach is empirical as opposed to rationalistic, cautiously sceptical rather than dogmatic, and, in certain circumstances, seeks to preserve the status quo rather than engage in wholesale revolution or overthrow existing institutions. It is a matter of judgement how far so-called conservative political parties are conservative in the wider, philosophical sense. Nor would a philosophical conservative seek to preserve an apparently orderly political set-up simply for the sake of preserving order if that set-up were based on principles antithetical to conservatism (as was the case in Eastern Europe during the Cold War).

Recognizably conservative thinkers have held a large variety of views on such matters as religion, ethics, and the concept of \*human nature. But, unlike liberals and socialists, they have all possessed a keen sense of the darker, more egoistic sides of human beings. For the conservative, the main defence against the Hobbesian war of all against all is not the naked might of the sovereign. Naked power over others, whether vested in a hereditary tyrant, a central party committee, or an elected legislature, would actually be a form of the war of all against all. Life in such a society, as in Eastern Europe under communism, would be characterized by mutual fear and suspicion.

For the conservative, egoism, power, and mutual suspicion need what Burke referred to as 'the decent drapery of life', 'pleasing illusions . . . to make power gentle, and obedience liberal'. Without institutions and forms to temper and channel the energy and rapacity of the strong, and to commend the allegiance of the ruled, we will have a society which is dominated either by terror or by continual litigiousness, and neither state is conducive to peace or enjoyment.

Where, though, are civilizing and allegiance-provoking institutions and forms to come from? Here again the conservative differs significantly from liberals and socialists. F. H. Bradley echoes Hegel in saying that 'the man into whose essence his community with others does not enter, who does not include relations to others in his very being, is a fiction'; the individual is who he is because of the relationships and the \*society into which he is born. Individuality being situated in this way implies the existence of duties and roles not chosen by the individual, binding on him and constitutive of his identity. His relationship to his

society and its institutions is not first and foremost a contractual one, as liberals would maintain. Whether, in practice, the relationship is oppressive or genial will depend on the decency or indecency of the drapery of particular societies.

Ideally, for a conservative each society's forms and institutions will have evolved steadily over generations. Such steady evolution will have two beneficial consequences. First, it will enable today's individuals to see themselves as linked to earlier centuries, reinforcing their own sense of identity and culture. Secondly, in evolving over time, institutions will be shaped in accordance with the demands made on them; their defects and unintended consequences will become apparent and, under pressure for reform, reshaped.

Far from being opposed to \*reform, a principle of reform is central to conservatism. For conservatives are sceptical of the ability of planners to know the consequences of policies or, indeed, of anyone to be able to survey everything going on in a large society. Rulers must legislate, but there must be means of counterbalancing and ameliorating the effects of their policies. In the end, by trial and error, institutions and forms develop, often in ways undreamt of by their founders but often in ways which do serve the needs of those involved in them. They thus embody a kind of tacit wisdom. Because of his admitted ignorance about the ways in which things work and about the effects of change, the conservative, though open to reform, will be cautious about large-scale disturbance of things which are running reasonably well. He will also seek to uncover the wisdom latent in ancient institutions and traditions.

Our ignorance of the effects of policies and of the nature of society makes the conservative favour limited government, autonomous institutions (such as the family, the army, churches, and schools), and individual \*freedom. Conservatism, with its hesitations about human perfectibility and its sense of the corrupting effect of power, would prefer government to focus on its basic tasks of upholding security and a framework of law in which individual decisions and transactions can be made. Despite what is sometimes claimed, there is, in fact, no conflict between conservatism and the free \*market, once markets are understood as simply the most efficient way we know of enabling individuals to pursue their own ends, and once it is realized that markets depend for their proper running on an antecedent framework of law and morality.

Those who see the state of their society as riddled with defects and inequities are likely to be impatient with conservatism for what appears to be its complacency. Surely, it will be urged, and not only by those moved by what conservatives would call the \*hermeneutics of suspicion, we must be able to reorganize things in a new and better way, so as to eliminate whatever serious social and political problems we are confronted with.

Conservatism, then, looks like little more than self-interest without the support of moral principle. Moreover, the conservative stress on human ignorance, the

concomitant hostility to reason in political planning, and the counterbalancing appeal to the wisdom of generations is not just depressing of human endeavour and good intention; it would, its critics say, not be given a hearing in any other sphere, particularly not in the scientific, where such principles would doubtless license creationism and flat-earthism.

Is conservatism based on nothing more than self-interest bolstered up by a fine-sounding but ultimately shifty obscurantism? It is true that conservatism, as exemplified by Burke, say, will in certain circumstances tend to uphold hierarchies and distinctions in a society. To that extent, it is a position which, from a functional point of view, is acting in the interests of those hierarchies, and will doubtless earn for the conservative the disapproval of moralists such as Matthew Arnold. What the moralist needs to ask himself, though, is whether (in Maurice Cowling's words) 'the freedom, discipline and social solidarity of modern societies' would be possible at all without 'the inequalities, sufferings and alienations consequent upon ideological hegemony'. Burke's point would, of course, be that the inequalities etc. consequent upon the French and Russian Revolutions were certainly no less than those of before, while the freedoms were a great deal less. And as far as socialism or its opposite are concerned in basically democratic societies, the right balance between inequality and freedom is always a difficult one to find. Experience at least has shown that it cannot be assumed that centralized attempts either to increase freedom or reduce inequality will actually have the desired effects. The conservative tendency will always be to defend the tolerable and even the tolerably bad against what he fears will be immeasurably worse.

In any case, the Burkian conservative would not defend any sort of hierarchy just because it is hierarchical. In particular, he would not defend a hierarchical society in which all important institutions are in the hands of the state. As part of his ignorance thesis, the conservative must support autonomous institutions and the freedom of individuals to make their own way through life and to form and develop their own little platoons. He will also deny, in distinction to natural science, that there are any special experts in morality or politics, asserting that the experience of the whole of mankind over time is the main source of moral knowledge, against which should be balanced the pretensions of any particular set of people to moral expertise, however intelligent they are in particular fields.

Upholding the right of individuals to make their own way through life and to benefit (or not) from the results of their efforts, as the conservative does, is to say that individuals are the best judges of their own interests. It is not to say, as critics claim the conservative is saying, that individuals should be motivated only by selfishness. The conservative, indeed, stresses the importance of the traditional \*virtues of individuals providing for their dependants and also of charity, and would emphasize the problems, social and individual, which arise when all such matters are placed in the hands of the state.

While the conservative does not find \*inequality *per se* objectionable, and will claim that there is no reason beyond resentment why anyone should, the value the conservative puts on both social cohesion and individual self-reliance must push him some way in the direction of economic redistribution, in order to ensure that no one starts so far behind the rest as to be unable to make his or her own way through life. The conservative is neither an anarchist nor a *laissez-faire* liberal.

In practice, in democratic societies the difference over redistribution between 'one nation' conservatives and welfarist socialists will tend to be one of degree. The conservative, though, will be more resistant to centralized controls and blueprints than his opponents on the left. This resistance arises not out of sheer obscurantism nor out of failure to recognize the need for limited social interventions. It is rather because the conservative is more sensitive than his opponents to the unintended consequences of such plans, to their potential for bureaucratic bossiness and interference, to the self-serving characteristic of bureaucracies, and to the way centralized planning cramps individual initiative, undermining the intuitive sense individuals have of their right to keep the rewards of their efforts, talents, and luck. Attacking this intuition by a policy of bureaucratic egalitarianism will seem to the conservative likely to sap whatever enterprise or energy exists in a society, and it cannot be said that history has shown him to be wrong.

The issue between conservatism and political rationalism, whether of a liberal or a socialist cast, is in the end an empirical one. Have those societies which have had autonomous traditions and unplanned institutions done better socially and economically than those in which radical and centralizing planning have been attempted? And, in the developing world, have countries which have modelled themselves and their institutions on a conservative free-market model proved more successful than those governed by rationalistic attempts to impose new types of order on their peoples? If the facts of history suggest that a conservative approach to politics produces greater \*liberty and \*well-being for individuals than rationalist approaches, conservatives can rebut the charge that they are merely advocating self-interest, and that their scepticism about politics is sheerly obscurantist.

With their emphasis on learning from experience and their mistrust of a priori reasoning in social and political matters, conservatives might welcome a broadly empirical approach to these questions. They would, though, do well to temper any triumphalism the answers might tempt them to. No country in the modern world has as limited a government as, in their different ways Burke, Hayek, or Oakeshott would see as compatible with true conservatism.

**conservatism and Romanticism.** Romanticism was a reaction against \*Enlightenment rationalism, stressing the importance of non-rational or even irrational aspects of human nature. Conservatism, too, is critical of what it takes as the shallowness of rationalism. Not surprisingly, therefore, some important conservative thinkers manifest Romantic tendencies, and vice versa. Examples would be the defence of the wisdom contained in spontaneous custom and tradition in Edmund Burke, the cultural organicism of J. G. Herder, the mystical attitude to authority and monarchy of Louis de Bonald and Joseph de Maistre, and Thomas Carlyle's exaltation of the hero as genius and type. However, following strains of thought in Rousseau, the predominant tendency of the Romantic Movement emphasized the natural, the free, and the unconventional. If you suspect the workings of \*reason, one possible response will be to replace the rational and the conventional with the spontaneous and the \*natural, and, even, like the German Romantics, to attempt to break down all existing categories of thought and language. The conservative, though, schooled in Hobbes and in history, is too aware of the destination of unconstrained freedom, and relies rather on a strong social and cultural order, but-tressed by tradition. Thus, Burke, Bonald, and de Maistre, though certainly anti-Enlightenment Romantics in their attitude to tradition and to authority, would have none of the free-booting insouciance of a Byron, nor of the anti-nomianism of a Novalis or an E. T. A. Hoffmann. A.O'H. I. Berlin, *The Crooked Timber of Humanity* (London, 1992). A. O. Lovejoy, *Essays in the History of Ideas* (Baltimore, 1948).

**consilience.** According to Whewell, consilience occurs when inductive explanations of two or more different kinds of phenomena are discovered separately, but unexpectedly lead scientists to the same underlying cause. For example, universal gravitation explained both the perturbations of the planets and the precession of the equinoxes. Such discoveries corroborate one another in proportion to the number of explanations thus connected, as do independent testimonies to the same fact in a legal trial.

L.J.C.

\*induction.

W. Whewell, *The Philosophy of the Inductive Sciences* (London, 1847), ii. 65–8.

**consistency proofs.** A set of \*axioms is said to be *consistent* if no contradiction can be derived from the set by logical reasoning. This notion is best confined to axioms in a precisely defined formal language with given rules of inference; otherwise the logical \*paradoxes might make any set of axioms inconsistent. By the \*completeness theorem, a set of first-order axioms is consistent if and only if some interpretation makes it true. Hilbert's programme

proposed a goal for the foundations of mathematics, namely to prove the consistency of axioms for arithmetic, using only finitary methods. \*Gödel's incompleteness theorem showed that this is impossible if 'finitary methods' consist of syntactic operations on finite strings of symbols (as Hilbert probably intended); but Gödel also gave a consistency proof for first-order Peano arithmetic, using only finite mental constructions.

G. T. Kneebone, *Mathematical Logic and the Foundations of Mathematics* (London, 1963), chs. 7 and 8.

**constant.** In the \*propositional calculus, a constant is a truth-functional operator, such as 'not', 'and', or 'or'. The truth-value of '*p* and '*q*', for instance, is a *function* of the truth-values of '*p*' and '*q*': it's true if they are both true, false if either is false. 'Variable' was originally applied, by contrast, to sentence-letters '*p*', '*q*', etc. The specific role of a constant can be given by a \*truth-table, or by its introduction and elimination rules (the basic rules governing its involvement in logical inferences). Beyond the confines of the propositional calculus, other symbols with fixed meanings can also be called constants, e.g. the symbols for 'all', 'some', and 'is the same as' (in predicate logic), and for 'necessarily' and 'possibly' (in \*modal logic). R.P.L.T. W. Hodges, *Logic* (Harmondsworth, 1977), sect. 17.

**constant conjunction.** Term used by Hume to describe the relation between two events one of which invariably accompanies the other. If catching influenza is always followed by fever, these events are 'constantly conjoined'; if there is no smoke without fire, there is a constant conjunction between the production of smoke and burning. Hume regarded our experience of constant conjunctions as the principal source of our idea of \*causality. Many interpreters have held that he also proposed an *analysis* of causality in terms of constant conjunction.

P.J.M.

D. Hume, *A Treatise of Human Nature* (1739), ed. L. A. Selby-Bigge and P. H. Nidditch (Oxford, 1978), i. iii. 6 and 15.

**Constant de Rebecque, Henri Benjamin** (1767–1830). Although Swiss-born, Constant came to play a leading role in the politics and development of liberal ideology in France. His \*liberalism grew out of a critique of the ideas of his compatriot Rousseau that was sparked off by their employment by the Jacobins during the French Revolution. Drawing on the arguments of the Scottish \*Enlightenment, which he had picked up during a brief period at the University of Edinburgh, he contended that the advent of commercial society had radically changed the character of \*liberty and the political mechanisms needed to secure it. In the ancient republics that inspired Rousseau's works, freedom had been understood primarily in collective terms and had involved participation in the life of the polity in order to secure it. Within modern societies, in contrast, liberty was essentially individualistic in nature. The division of labour had destroyed any notion of a common good or \*general will. The public welfare

could only be promoted by protecting the ability of individuals to pursue their private ends and accumulate property by freely contracting and exchanging with each other in the \*market. This goal was best achieved not through direct forms of participatory democracy, since unrestricted popular sovereignty could prove as tyrannous as an unrestricted monarch, but via liberal constitutional mechanisms such as representative democracy, the separation of powers, and a bill of rights. **constatives.** Class of 'fact-stating' utterances considered in the work of J. L. Austin. He initially distinguished constative uses of speech, where a speaker *states* something, from performative uses, where a speaker *does* something. But he came to doubt his own distinction, realizing that stating is a species of doing, and that stating, like other speech-acts that may use performative formulas, should be classified as \*illocutionary. J.HORN.

\*linguistic acts.

J. L. Austin, *How to Do Things with Words* (Oxford, 1961).

**constitutionalism** relates to both the foundation and the regulation of governments. As a foundationalist doctrine, it finds expression in the constitutional conventions that have not only served to establish new political regimes, as occurred in many European states after the Second World War, but have also led to the formation of states, as in the case of the United States. As a regulative doctrine, it consists of formal conventions, rules, and procedures, such as voting by majority rule, and more substantive norms, such as those embodied in written bills of rights or assumed prerogatives and entitlements, which serve to define legitimate political activity. Whilst conservatives have generally interpreted constitutionalism in terms of the practices that have evolved over time and favour the unwritten constitution of tradition and custom, liberals associate it with the limitation of government and usually favour a written constitution. Constitutionalism harbours a paradox, however, that is particularly problematic for the liberal view. For in both its foundationalist and regulative guises it seeks to lie outside politics, providing its grounding and framework, and yet can only achieve these ends by political means. As a result, constitutions come to be objects of political debate and consequently are within the very politics they claim to create and control. R.P.B.

**constructivism.** The thesis of the programme is that an

assertion that there exists a mathematical object (such as a number) with a given property is an assertion that one knows how to find, or construct, such an object. Philosophical opponents of constructivism include realists, who hold that since mathematical objects exist independent of the mind of the mathematician, one can establish the existence of an object without showing how to find it. Most constructivists hold that principles of reasoning concerning ordinary, finite domains do not apply to mathematics. For example, if one proves that not all natural numbers lack a certain property, one cannot conclude that there is a number that has the property, because the indicated proof need not provide a method for constructing such a number. Similarly, the laws of \*excluded middle and double negation are also rejected. The technique of \**reductio ad absurdum* can only be used to establish a negative formula. Constructivism can result from reflection either on the nature of mathematics (Brouwer) or on the learnability of mathematical language (Dummett). s.s.

\*intuitionism; intuitionistic logic; mathematics, problems of the philosophy of; mathematics, history of the philosophy of.

Erret Bishop, *Foundations of Constructive Analysis* (New York, 1967).

**constructivism in ethics.** The term 'constructivism' was first applied to ethical theories by \*John Rawls. The basic idea is that a system of moral obligations can be constructed using an uncontroversial procedure, and starting from uncontroversial premisses about human nature. Thus the constructivist approach is supposed to yield a moral theory that has no odd metaphysical commitments, and is demonstrably true (or at the very least, reasonable). Rawls's own view developed over his lifetime, but remained broadly constructivist in its form: if a group of people situated in a certain way would choose a set of principles, then those principles are legitimate. When Rawls introduced the term, he intended it in a fairly narrow sense: to apply to views that, like his, started from premisses about choices that rational beings would make in certain circumstances. These days the term is used more broadly, to include views such as Korsgaard's that start from premisses about our nature more generally. E.J.M.

**consumerist ethics.** The ethics of consumerism partly derives from the \*rights-based approach to morality which was a marked feature of the second half of the twentieth century, and partly has been encouraged by those who advocate belief in the efficacy and essential righteousness of a free-market economy. The main concepts in consumer ethics are *access* to, *choice* of, and *information* about goods and services, *competition* between suppliers, *safety regulations*, and *redress* in the event of faulty goods or services. Consumerism can be seen as a specific outcome of nineteenth-century *laissez-faire*

individualism, and it is therefore opposed to any form of paternalism and to professional perceptions of social need in the supply of goods and services. R.S.D.

P. N. Stearns, *Consumerism in World History: The Global Transformation of Desire* (London, 2001).

**content, non-conceptual.** Theorists of non-conceptual mental content hold that some mental states can represent the world and be true or false even though the bearer of those mental states does not possess the \*concepts required to specify how they represent the world (to specify their content). This basic idea has been used to try to do justice to the differences between how the world is represented in perceptual experience and how it is represented in belief, as well as to elucidate the representational content of subpersonal computational states, such as those appealed to in information-processing accounts of vision. On some accounts of what it is to possess a concept, the representational states of non-linguistic creatures such as human infants and non-human animals have non-conceptual content. Not all of these developments and applications are consistent with each other, but each offers a challenge to the widely held view that the way in which a creature can represent the world is determined by its conceptual capacities. J.BER.

\*cognition; perception.

Y. H. Gunther (ed.), *Essays on Nonconceptual Content* (Cambridge, Mass., 2003).

**content of consciousness.** That which one is, or seems to be, conscious of. The content of \*consciousness is to be contrasted with one's consciousness of it. The consciousness is always mental, the content may (e.g. a toothache) or may not (a sunset) be mental. Contents come in two distinct flavours: sensory and propositional. In seeing (or hallucinating) a spotted cow, the content of sensory consciousness is either the spotted cow, if there is one, or (on some theories of perception) a mental image (\*percept, \*sense-datum, appearance) of a spotted cow. In either case, spottedness is a feature of the content, of *what* one is conscious of. The content of propositional awareness, on the other hand, is a \*proposition, what it is one consciously knows or believes, judges or thinks. Believing that there are spotted cows, for example, is a mental state that has as its content the (possibly false) proposition that there are spotted cows or that one is seeing a spotted cow. Propositions, even propositions about spotted cows, are not themselves spotted. F.D.

C. Peacocke, *Sense and Content* (Oxford, 1983).

**contextual definition.** Definition of an expression by explaining systematically how to paraphrase all sentences in which the expression is to be used. It is far more widely applicable than direct definition, which paraphrases the expression in isolation. It supports the view that sentences rather than words are the basic vehicles of meaning.

In 1813 Bentham propounded contextual definition, or 'definition by paraphrase', as a way of accommodating convenient expressions without commitment to fictitious objects to which they seem to refer. Thirty years later Boole applied the idea in mathematics, instituting a so-called method of operators. Familiar operators are the minus sign, the square-root sign, the prefix 'log' for logarithm, the 'sin' and 'cos' of trigonometry. Boole simulated multiplication, as if '-x', ' $\sqrt{x}$ ', 'log x', and the rest were numerical products like '5x', subject to the usual algebraic manipulations. He applied the idea to operators in the differential and integral calculus, where it became standard procedure.

Russell's account (1905) of singular \*descriptions as 'incomplete symbols' is a celebrated contextual definition, prompted, he wrote, by the method of operators. He wanted to make sense of '*the* object *x* such that *Fx*', symbolically ' $(\iota x)Fx$ ', irrespective of there being such a unique object. Where ' $G(\iota x)Fx$ ' represents an innermost context of ' $(\iota x)Fx$ ', hence an innermost sentence about that purported object, Russell defined ' $G(\iota x)Fx$ ' as

There is something *y* such that *Gy* and such that anything *x* is identical with *y* if and only if *Fx*. w.v.Q.

Bertrand Russell, 'On Denoting', *Mind* (1905); repr. in R. C. Marsh (ed.), *Bertrand Russell: Logic and Knowledge* (London, 1965).

**contextualism.** The dependence of important features of language (or thought) on the surroundings in language or reality; also called token-reflexiveness, of which egocentricity is one species. Any linguistic expression can be used many times—e.g. there is only one English word 'mother' (the word-type), and one sentence 'Today is her birthday' (the sentence-type), but many utterances of them (word-tokens and sentence-tokens). The \*referents of singular terms, the truth-values of sentences, and the illocutionary force of an utterance often depend on the context of use. Who 'she' refers to depends on the linguistic or perceptual context of utterance, who 'my mother' refers to depends on who is speaking; the truth of 'Today is her birthday' depends on the date, and the point of saying this (e.g. as an excuse for rejecting an invitation) will depend on other features of the context. The meaning of an ambiguous word or sentence is also context-dependent (e.g. 'He went to the bank', 'Flying planes can be dangerous'). According to some theorists such as Charles Travis, some kind of contextualism, occasion-sensitivity, or \*externalism affects *all* language use. A contextualist theory of \*meaning would try to make all this explicit, giving rules by which meaning, reference, truth-value, and linguistic act can be determined from sentence-type and context of use. **continental philosophy.** The phrase 'continental philosophy' acquired its current meaning only after the Second World War when a process of increasing mutual exclusion of the English-speaking philosophical world and that of the continent of Europe, which had been going on since early in the century, was finally recognized to be as deep as it was. In the Middle Ages philosophy, expressed in the universal learned language of Latin, was practised by philosophers who, whatever their place of birth, were constantly in movement from one centre of learning to another. This unity survived the Renaissance and even the initiation of writing philosophy in the vernacular by Bacon and Descartes. The vernacular came later to Germany, primarily as the vehicle of Kant's three *Critiques*. His earlier writings had been in Latin, as had been those of Leibniz, when they were not in French. The latter's disciple Christian Wolff, in whose school of thought Kant had been brought up, published his work in both Latin and German versions.

Locke, whose writings were so influential in France, was himself influenced by Descartes and Gassendi and studied Malebranche. Hume, who woke Kant from his 'dogmatic slumber', read Bayle (and was accused by Samuel Johnson of writing like a Frenchman). The Scottish philosophy of common sense was a central element in the official eclecticism of Victor Cousin in the period of the Orleanist monarchy. Mill studied Comte and wrote about him. Green, Bradley, and the absolute idealists of England and Scotland studied Kant and Hegel closely and were enthusiastic about Lotze. But English-speaking philosophers showed little interest in the prevailing neo-Kantianism of late nineteenth-century Germany or in the 'spiritualist' French philosophers of that period. Russell and Moore respectively studied Frege and Brentano, the two main sources of Husserl's thinking, but that led neither them nor their compatriots to Husserl himself. William James read Renouvier and Bergson. But by the end of the First World War the rupture between the philosophies of continental Europe and of Britain and America was fairly fully established.

It was not complete until the time of the Second World War. Bergson had a brief cult among some British philosophers and Russell took him seriously enough to criticize him at some length. The fashion for Croce was even shorter-lived, although he had one distinguished disciple, R. G. Collingwood, who only vestigially acknowledged him. There was a minute current of interest in Husserl, but the other philosophical luminaries of Europe in the inter-war years were ignored: Brunschvicg, Nicolai Hartmann (one peripheral book was translated), Dilthey (who died in 1911 but whose fame was largely posthumous), Scheler. Gilson and Cassirer attracted attention from those interested in the history of philosophy; Maritain from Catholics; Mach, Poincaré, and Duhem, to go a bit further back, from philosophers of science (Russell acknowledges a debt to Mach and Poincaré in the preface to *Our Knowledge of the External World*).

The discovery of Sartre at the time of the liberation of

France brought \*existentialism and the \*phenomenology, with which it was associated, to general notice. Heidegger was not absolutely unknown. Ryle had written with respect and an element of suspicion about his *Sein und Zeit* in 1928 and four years later, in a more sharply critical spirit, about phenomenology, but by then there was little British interest in phenomenology for him to repel. In the 1930s the only living philosophers from continental Europe to be at all closely read were the members of the Vienna Circle, most of whom came to settle in the English-speaking world. There was some awareness of like-minded groups in Poland and Scandinavia, although Twardowski and Hägerström, Kotarbinski and Marc Wogau were little more than names to most British philosophers.

Since 1945 the originally minute group of English-speaking philosophers interested in continental philosophy has slowly enlarged. There have been a few French and German philosophers who have associated themselves with one or another brand of \*analytic philosophy in the Anglo-American style. But there is really no perceptible convergence between the two philosophical worlds. Existentialism, structuralism, and critical theory are very different from each other. The first exalts the human individual as the creator of meaning in a world itself meaningless; the second proclaims the death of man, attributing his human characteristics to the objective mental structures, especially language, which define what he is and does; the third seeks to rescue consciousness, in a fairly abstract form, from the 'social existence' in which orthodox Marxism immerses it. But all, in varying degrees, rely on dramatic, even melodramatic, utterance rather than sustained rational argument.

Existentialism has a long and distinguished ancestry. On one side it descends from Kierkegaard and Nietzsche, the first affirming the irreducibility of the particular individual and the unintelligibility and inescapability of God, the second maintaining that the human intellect is a weapon in the struggle for existence or power, not a contemplative means for the discovery of objective truth. The Existentialists attached these large cosmic gestures to the phenomenology of Husserl. He had applied his technique of the direct, presuppositionless inspection of consciousness mainly to cognitive activities. They applied it to man as an agent and as the bearer of emotions and desires. Heidegger, after bringing these two things together in his *Sein und Zeit*, moved to a meditative point of view in which the philosopher must passively await the intimations of itself that Being may provide him with. Sartre added some literary spice and a French urban sensibility to the ideas of the early Heidegger. Merleau-Ponty usefully reinstated the Cartesian self to the body of which it is continually aware and without which it cannot perceive and act.

\*Structuralism has a humbler and more recent family background. It was born in the Geneva of the linguist de Saussure, came to France with the anthropologist Lévi-Strauss, and went on to inform the literary criticism of Barthes, the psychiatry of Lacan, and the Marxism of

CONTINENTAL EUROPEAN PHILOSOPHY IN THE TWENTIETH CENTURY

EDMUND HUSSERL invented the term 'phenomenology' and was himself the most rigorous and perhaps the greatest phenomenologist. He inaugurated the modern philosophical obsession with consciousness.

JOSÉ ORTEGA Y GASSETT examined with distaste the role of 'the masses' in modern society, and saw truth and reality as founded in the perspective of the individual.

GOTTLLOB FREGE, the greatest modern logician, was 'discovered' in his fifties by Russell and by Husserl. He argued that mathematics could be founded upon formal logic (for which he invented a new notation) and attempted to explain logic without reference to the mental or the material world.

MARTIN HEIDEGGER transformed the Kantian and Romantic inheritance of European philosophy into a daunting metaphysics of Being, with deep roots in the history of Christian thought.

Althusser. It may be said to have culminated with Foucault and to have transcended itself, shooting off into outer intellectual space, with Derrida. De Saussure held that language is not an accumulation of independent conventions but an interlocking system in which every element is what it is by virtue of its relations to everything else in the system. In the hands of Lévi-Strauss that led to the conclusion that there is nothing truly primitive about what have been supposed to be primitive languages and the supposedly primitive people who speak them. Foucault saw the human mind as dominated in successive ages by different ways of representing the world, each of which was an impersonal Nietzschean stratagem by which some could exercise power over others.

\*Critical theory was inspired by Georg Lukács's rejection of the orthodox Marxist doctrine that men's ideas and beliefs are wholly determined by socio-economic circumstances. The critical theorists proper—Horkheimer, Adorno, Marcuse, and, in the second generation, Habermas—dismissed the positivist identification of rationality with the exercise of scientific method, at least in application to man and society. In that domain they believed it essential to grasp things, in the manner of Hegel, in their totality, not in abstracted fragments. There is a link with Nietzsche in the critical theorists' contention that language and ideas can serve as instruments of domination, as creators of 'false consciousness'.

There was some affinity between the Existentialists' ethics of decision and the non-cognitive ethical theories of many analytic philosophers, at least in the more iconoclastic versions of the latter. Chomsky's structural linguistics had a certain amount in common with de Saussure's, but, unlike de Saussure's followers, he combined it with an uncomplicated radical extremism in morals and politics. The evident political intentions of the critical theorists ruled out any interest on the part of analytic philosophers, committed to neutrality. In no case was there enough connection on which to build any sort of *rapprochement*. Derrida's \*deconstructionism, for which everything is text, freely, endlessly interpretable, seemed to analytic philosophers a *reductio ad absurdum* of philosophy since it allowed for no standards of truth, evidence, or logical consistency. It made philosophy not only a game, but a game without rules.

During the closing decades of the twentieth century Britain became more and more involved with the European mainland, politically and economically, and complete absorption seemed imminent. This inspired a certain impatience with the expression 'continental philosophy'. But philosophy in Britain is still almost entirely unrelated to that of the European mainland, neither influenced by it nor interested in it. An indication of the gulf is the fact that there is only one notable and productive European-type philosopher in the English-speaking world, the American Richard Rorty. He began as an able analytic philosopher, and traces of that earlier allegiance endure in his incorporation of William James, Dewey, and Wittgenstein in his pantheon. His dismissal of the pursuit of objective truth in favour of

'edifying conversation' was caused by his denial of any correspondence between our thoughts or beliefs and an independently existing reality. We cannot compare our beliefs with a reality outside thought. In British philosophy, that of continental Europe is the object of occasional startled observation, like that of a nasty motor accident viewed from a passing car. Where it has lodged itself in English-speaking universities is in departments of literature and social studies, partly as a result of failure of methodological self-confidence, partly from a desire to liberate ideological affirmation from the constraints of logic and evidence.

'continental' and 'analytic'. Although books, journals, courses, degrees, faculties, and departments rely upon this distinction, it enshrines several confusions and considerable historical naïveté. The distinction can be exposed methodologically, geographically, and historically.

Methodologically, philosophy since Kant can be rightly, but not cleanly or exhaustively, divided into the following movements: idealism, Marxism, pragmatism, existentialism, phenomenology, structuralism, Logical Positivism, linguistic analysis, post-structuralism, post-modernism.

Geographically and historically, every one of these movements in modern philosophy is Austrian or German in its modern genesis and in its major practitioners. Indeed, future historians will regard the nineteenth and twentieth centuries as an essentially Austrian period in philosophy. Wittgenstein was Austrian. The Logical Positivists of the Vienna Circle were Austrian and German. The opponent of Logical Positivism, Karl Popper, was Austrian. The 'father' of phenomenology, Edmund Husserl, was Austrian. (His province of Moravia was part of the Austro-Hungarian Empire when he was born there in 1859.) The mathematical logician \*Gödel was Austrian. (The German-speaking part of what is now the Czech Republic was part of the Austro-Hungarian Empire when he was born there in 1906.) Philosophy is no exception to an explosion of ideas from Austria. Without the Austrian Freud there is no psychoanalysis. Without the Austrian Hitler there is no Nazism, no Holocaust, no Second World War, at least as we know them. Arguably, the greatest lacuna in the history of ideas is the Austrian Century.

The modern movements in philosophy that are not Austrian are German in genesis. Hegel, Nietzsche,

Brentano, Frege, Einstein, and Heidegger were German, although sometimes affiliated to German-speaking countries outside Germany: Nietzsche wrote in Switzerland, Brentano taught at Vienna, Einstein studied at Zurich.

Modern French philosophy is derived from German and Austrian philosophy. It is historically impossible that Sartre and Merleau-Ponty could have produced the existential phenomenology of *L'Être et le néant* and *Phénoménologie de la perception* without Nietzsche, Husserl, and Heidegger. The philosophical content of Derrida's writing is in Hegel, Nietzsche, and Heidegger. Despite his protestations, Derrida is engaged in a Freudian psychoanalysis of philosophy. Indeed, much twentieth-century French philosophy reads as a summary of its German and Austrian influences.

Modern British philosophy is derivative from German and Austrian philosophy. The idealism of Bradley, Green, Bosanquet, and McTaggart would have been impossible without the system of Hegel. Logical atomism is the metaphysics of Wittgenstein's *Tractatus*. \*Ayer visited the Vienna Circle and returned with the ideas for *Language, Truth and Logic*, which is a summary of Logical Positivism. Ryle's *The Concept of Mind* is Wittgensteinian philosophy of mind. Hare's *The Language of Morals* is Wittgensteinian ethics. J. L. Austin's *How to Do Things with Words* is Wittgensteinian philosophy of language. Peter Winch's *The Idea of a Social Science* is Wittgensteinian social philosophy. T. D. Weldon's *The Vocabulary of Politics* is Wittgensteinian political philosophy. If the expression 'modern continental philosophy' makes sense at all, modern British philosophy is a part of modern continental philosophy.

American pragmatism is essentially Hegelian. It was Hegel who criticized Kant for inspecting categories in abstraction from their real applications. Peirce, Dewey, and James are implementing that Hegelian project. In Kantian terms, the findings of pragmatism are *regulative*, not *constitutive*. The scientific philosophy practised in America since 1945 has been influenced by Austrian and German emigrés from Nazism such as Carl Hempel, if not by members of the Frankfurt School, such as Marcuse and Horkheimer. \*Rorty's pragmatic post-modern relativism is essentially Derridian, but those components of Derrida's writing are anticipated in turn by Nietzsche's 'perspectivism'.

'Continental philosophy' has become a name for doing exegesis on the texts (or, more usually, the translations) of existentialism, phenomenology, structuralism, or post-structuralism. 'Analytical philosophy' has become a collective name for Frege's philosophy, Logical Positivism, Wittgensteinian and neo-Wittgensteinian linguistic philosophy, and the use of philosophical and mathematical logic to clarify philosophical problems. The philosophical disagreements between, say, Logical Positivism and the later Wittgenstein, or the methodological divergences between, say, Frege and Ryle, make it hard to give 'analytical philosophy' clear sense or reference. In so far as the expression 'analytical philosophy' means anything, it is methodologically and genetically Austrian and German.

Analytical philosophy is part of modern continental philosophy.

The methodological and doctrinal differences between those movements grouped together as 'continental' are at least as conspicuous and difficult to resolve as those between them and the movements grouped together as 'analytical'. Nietzsche, Husserl, Heidegger, Sartre, Merleau-Ponty, Lacan, Foucault, Derrida *et al.* disagree with one another (biographically and as a matter of problematic) as much as they do with Frege, Wittgenstein, the Vienna Circle, and Popper. Therefore there is no good philosophical ground for grouping some post-Kantian movements as 'continental' and others as 'analytical'.

Because the two expressions are in common usage, there are *self-styled* practitioners of 'both kinds of philosophy'. A sort of historically retrospective bifurcation between two 'traditions' is being created by footnoting. Europe contains both kinds of footnoter, and the English-speaking universities contain both kinds of footnoter.

Indeed, although this might bring a *frisson* of terror to those who believe in two kinds of philosophy, methodological similarities might obtain between putatively 'analytical' and 'continental' movements. For example, both Logical Positivism and pure, or Husserlian, phenomenology have the following tenets in common: metaphysics is impossible; there is something 'given' in experience upon which all knowledge is founded or grounded; philosophy should have the rigour of science; philosophy needs to be begun afresh. Structuralism and logical atomism are both formal a priori inquiries into our fundamental conceptual scheme. In linguistic philosophy and in post-structuralism there is a reaction against this a priorism. 'Our' conceptual scheme, impressionistic and shifting, resists formal analysis and Aristotelian definition. Besides, who are 'we'? The ethical and political commitments of existentialism are later paralleled by an emphasis on practical issues of abortion, capital punishment, animal liberation, philosophy, and public affairs in English-speaking moral philosophy. When the devotees of two philosophical movements barely recognize one another as doing philosophy, this is paradoxically a sign that they are similar in method and doctrine.

If modern continental philosophy, including French and British philosophy, is geographically and historically Austrian and German, methodologically it is neo-Kantian. In Kant's *Critique of Pure Reason* \*conceptual analysis is practised in the 'Transcendental Analytic'. Structuralism is apparent in the list of categories and judgement forms and the thesis that perception is organized conceptually. Hegelian and Marxist dialectic is anticipated in the triadic organization of the table of categories, the 'Third Antinomy', and (although this would have horrified Kant) throughout the 'Transcendental Dialectic'. As Husserl points out, Kant was the first to engage in phenomenology, in 'The Transcendental Deduction'. Heidegger rightly saw in the schematism the anticipation of his own fundamental ontology. The thesis of the Logical Positivists and Derrida that metaphysics is impossible but

difficult to avoid is a salient lesson of the *Critique of Pure Reason*.

It is sometimes assumed by those who think they are practising 'continental philosophy' that it is in some way radical or left-wing. It is true that Sartre was a Marxist political activist, Althusser a structuralist Marxist, and Merleau-Ponty a Marxist until his break with Sartre over what he saw as the latter's 'ultrabolshevism'. However, the relativism entailed by post-structuralism and post-modernism has been part of the ideology of global capitalism during its liberal (but, of course, still anti-socialist) period 1968–2001. What formerly belonged to the intellectual left was successfully recuperated by capitalist liberalism during that historical period.

The term 'continental philosophy' is, I suspect, British in origin. In Britain 'the Continent' is used to denote that part of Europe that does not include Britain and Ireland, even though if Britain is part of a continent, it is part of Europe. So 'continental' is a geographical predicate. 'Analytical' is a methodological predicate. If the expressions 'continental' and 'analytical' did mark a distinction, it could only be between philosophy done in a certain place and philosophy done in a certain way. This would be a muddled distinction, like that between fighting using firearms and fighting in Africa, or two kinds of chemical, one found in Australia and one that dissolves in water.

It is not unusual for philosophers to self-righteously align themselves with 'continental philosophy' or with 'analytical philosophy', sometimes with the evangelical zeal of the convert ('I had to learn a whole new way of thinking ...'). There are even self-appointed ambassadors who think they are transmitting ideas from one camp to another or who think they can do 'both kinds of philosophy'. It is high time the whole terminology was dropped, and the anti-metaphysical Kantian orthodoxy broken.

**continental philosophy of law:** see law and continental philosophy.

**contingent and necessary existence:** see necessary and contingent existence.

**contingent and necessary statements.** A necessary statement (or proposition) is one which *must* be true—where this 'must' may be understood as being expressive of logical necessity or (less commonly) some other kind of modality, such as \*epistemic, physical, or metaphysical necessity. A contingent statement is one which *may* be true and *may* be false—that is, which *need not* be false and *need not* be true. Thus, if a statement is contingent, neither it nor its \*negation is necessary.

E.J.L.

\*necessity, logical; necessity, metaphysical.

A. Plantinga, *The Nature of Necessity* (Oxford, 1974).

**continuum problem.** What is the number of points on a continuous line? Cantor conjectured that it is the second smallest infinite cardinal number, having proved it greater than the first. An instance of a general enigma about infinite cardinality, this problem was shown by Gödel and Cohen to be unsolvable on the basis of all currently accepted axioms. This raises the puzzling possibility that Cantor's conjecture (that the number of points on a line is the second infinite cardinal number) and related propositions are neither true nor false.

M.D.G.

\*infinity; number.

K. Gödel, 'What is Cantor's Continuum Problem?', in P. Benacerraf and H. Putnam (eds.), *Philosophy of Mathematics* (Cambridge, 1983).

**contract, social.** The imaginary device through which equally imaginary individuals, living in solitude (or, perhaps, in nuclear families), without government, without a stable division of labour or dependable exchange relations, without parties, leagues, congregations, assemblies, or associations of any sort, come together to form a society, accepting obligations of some minimal kind to one another and immediately or very soon thereafter binding themselves to a political sovereign who can enforce those obligations. The contract is a philosophical fiction developed by early modern theorists to show how \*political obligation rests on individual \*consent—that is, on the

consent that rational individuals would give were they ever to experience life without obligation and authoritative rule. To make this fictional consent plausible, the theorist must tell a story about what is commonly called the \*state of nature, the asocial condition of humankind before or without political authority. Commonly, the more harrowing the story (Thomas Hobbes's 'war of all against all' is the limiting case), the more authoritarian the political order established by the contract—for rational men and women cannot be imagined to consent to tyranny or absolute rule except to escape something worse. They accept the rule of the lion only in order to avoid an anarchy of wolves. A more liberal or democratic politics follows from a more benign story (as in John Locke's *Second Treatise of Government*) or from no story at all: John Rawls's rational decision-makers in the \*original position are denied any knowledge of their actual interests and so of their past competition or co-operation. But the assumption that they are not adventurers or risk-takers probably serves the same purpose as a benign story.

Social contract theory was first worked out in the seventeenth century, and it undoubtedly owes something to the religious culture of that time. Renewed interest in the Hebrew Bible and the political and theological usefulness of the biblical covenant to Protestant writers together gave currency to the idea of a founding agreement. Most of the theoretical problems of the contract are first addressed in covenant theology. Is the covenant made between each individual and God (a series of vertical agreements) or is it made between each individual and every other, to obey God's law (a much larger series of horizontal agreements)? What are God's stipulations, if he is a party? Is the covenant conditional or unconditional? What actions are warranted by God's or man's non-performance? In secular form, these questions generate arguments about who is bound by the contract, what they are bound to do, what constitutes a violation, and how and by whom the contract is to be enforced.

Perhaps the most significant claim of social contract theory is that political society is a human construct—even if men and women are driven to the construction by necessities arising in the state of nature, hence by 'natural' necessities—and not an organic growth. There is no body politic but only this artefact, made in (fictional) time and in principle open to remaking. Mixed metaphors of design and structure replace the metaphor of the body. Hobbes first suggests the twofold character of contract theory when he writes that man is both the 'maker' and the 'matter' of the commonwealth. He is the maker because the social contract depends upon his willing agreement, and he is the matter because the content of the contract, the social and political arrangements it establishes, are designed (by whom?) to shape and control his behaviour. Jean-Jacques Rousseau's version of the argument is similar: the members of the newly created polity are sovereign (citizens) and subjects, simultaneously ruling and being ruled. M. WALZ.

\*Scanlon.

John Locke, *Two Treatises of Government* (1690).

John Rawls, *A Theory of Justice* (Cambridge, Mass., 1971).

Jean-Jacques Rousseau, *The Social Contract* (1762).

**contractarianism.** Suppose right actions are those that accord with moral principles. One thought is that we should act according to principles that can be rationally endorsed as having universal sway (Kant), or which no one else can reasonably reject (Scanlon). A different thought is that each of us should act as if we have agreed to the principles that maximize (or at least satisfice) individual self-interest (Gauthier, inspired by Hobbes). How to determine the relevant principles in each case? Contractarians propose the following answer. Suppose we imagine a state (like Hobbes's 'state of nature') in which there are as yet no agreed political or moral standards. As writers like John Rawls argue, the principles for a good society can be inferred by envisaging the contract that might be freely and voluntarily forged in the imagined state. Hume long ago pointed out that even if there had been an original, historical contract, it would be up to us now to determine whether it should have any present authority. If not an empirical thesis, is contractarianism a conceptual tool for uncovering the principles that might bind ideally rational agents? In this case, the contractarian has to explain how circularity is avoided, so that the conditions of the imagined contract are not just chosen in a way that produces the principles the theorist desires to endorse. T. M. Scanlon, *What We Owe to Each Other* (Cambridge, 1998).

**contradiction.** The conjunction of a proposition and its denial. In the \*propositional and \*predicate calculus a sentence of the form  $(\phi \cdot \sim \phi)$  is formally contradictory and always takes the value false. (\*Truth-table.) Where  $\phi$ ,  $\psi$ , are such that each entails the negation of the other, their conjunction is also designated as a contradiction. See, for example, the pairs A,O and E,I of the \*square of opposition in the \*traditional logic of the syllogism. R.B.M.

B. Mates, *Elementary Logic* (Oxford, 1972).

**contradictions, material:** see material contradictions.

**contradictories.** Two propositions are contradictories when one must be true, the other false. Specifying its contradictory sometimes clarifies the meaning of a proposition. Consider 'Everybody loves somebody'. 'Nobody is loved by everybody' would be its contradictory if it meant that everybody loves the same person; otherwise its contradictory is 'Somebody loves nobody'. C.W.

\*contrapositives; contraries.

P. T. Geach, 'Contradictories and Contraries', in *Logic Matters* (Oxford, 1972).

**contraposition.** In traditional logic the contrapositive of a proposition is obtained by negating both its terms and reversing their order. Thus 'All rabbits are herbivores' ('All  $S$  are  $P$ ') becomes 'Everything which isn't a herbivore isn't a rabbit' ('All non- $P$  are non- $S$ '). The inference from a proposition to its contrapositive is valid for the 'All  $S$  are  $P$ ' and 'Some  $S$  are not  $P$ ' forms considered by traditional logic; invalid for the 'No  $S$  are  $P$ ' and 'Some  $S$  are  $P$ ' forms. In \*modern logic 'contraposition' characterizes the relation between conditionals of the forms 'If  $p$ , then  $q$ ' and 'If not  $q$ , then not  $p$ '. c.w.

\*logic, traditional.

J. N. Keynes, *Formal Logic*, 4th edn. (London, 1906), ch. 4.

**contraries.** Two propositions  $p$  and  $q$  are contraries when, as with 'The number of the unemployed is five million' and 'The number of the unemployed is three million', they cannot both be true but can both be false, so that each entails, but is not entailed by, the negation of the other. Traditionally 'All  $S$  are  $P$ ' and 'No  $S$  are  $P$ ' were called contraries. c.w.

\*contradictories; square of opposition.

P. T. Geach, 'Contradictories and Contraries', in *Logic Matters* (Oxford, 1972).

**contrary-to-fact conditional:** *see* conditionals; counterfactuals.

**convention.** This is usually understood as involving some form of human agreement (either explicit or, more interestingly, implicit) to facilitate a common end. The topic is intriguing in itself and important for its wider philosophical relevance. One of the deepest issues in metaphysics is that of the degree to which 'our' agreements determine how 'the world' of fact, science, or value is. Here, the idea of convention has been used to analyse mathematical truth and moral fact as basically matters of communally agreed decision. Likewise, some have seen \*political obligation and the requirements of \*justice as entirely grounded in convention. By contrast, realists claim that nature or 'independent' reality itself plays a major part in determining at least some such matters. Yet the character of convention remains unclear, with respect to both the sort of agreement it involves and the ways in which it should be contrasted with either nature or reason. C.A.J.C.

\*consent.

D. K. Lewis, *Convention* (Cambridge, Mass., 1969).

**conventionalism.** A convention is a principle or proposal which is adopted by a group of people, either by explicit choice, as in Sweden's decision to drive on the right-hand side of the road, or as a matter of custom, whose origins are unknown and unplanned, as in the convention of placing forks on the left and knives on the right. The crucial point, though, is that conventions are not forced on us by nature and could, if we collectively wished, be changed. In

a certain sense, then, conventions are manifestations of human freedom.

Conventionalism is a view about the status of theories in science. Linked to \*instrumentalism and \*positivism, it urges us to regard deep-level theories about the nature of the world as chosen by us from among many possible alternative ways of explaining the observable phenomena. Theories such as Newton's laws or quantum theory which purport to reveal the underlying structure of the world are not directly provable or disprovable by observation or experiment. They are freely chosen conventions, which may be maintained in the face of apparent counter-evidence. If we wish to move to a new theory of the relevant domain, it will not in the final analysis be because the evidence forces us to do so, but because a new theory (or 'convention') is simpler, easier to apply, more aesthetic, or for some other non-epistemic reason.

Following the scientific revolutions of this century most philosophers of science would now admit an element of decision or convention in the initial acceptance of an explanatory theory in science and in adherence to it through continuing vicissitudes, but the key conventionalist text is Henri Poincaré's *Science and Hypothesis* of 1905. Poincaré argued that Newton's three laws are definitions and, as such, unrevisable. He thought that such deep-lying principles in science are similar to particular sets of geometrical axioms, in that they are chosen to fit a particular range of phenomena. For Poincaré the choice of scientific principles, as of geometrical axioms, could be justified on grounds of their usefulness or convenience in application to the actual world, about whose regularities we could learn a great deal by experiment and observation. We would not, then, be moved to accept a set of principles like Newton's laws did they not mesh easily with the experimental laws we formulate in observing empirical regularities. To this extent, then, Poincaré, in common with subsequent conventionalists, admits a degree of empirical constraint on the choice of hypothesis.

Where conventionalists differ from their opponents is not so much on the element of choice in scientific theorizing, or, if it is, it turns out to be only a matter of degree. The difference is that so-called realists will insist that the most useful set of scientific principles is not just a useful convention we adopt: it is also true. Realists will profess horror at Poincaré's admission that contradictory scientific principles can be maintained so long as they are applied in different areas of experience; certainly if scientific theories are regarded as describing the mechanisms underlying the world, we should search for theories which are mutually consistent, and not merely adequate for a limited domain of data. Nevertheless, the conventionalist might regard the realist's insistence on the truth and reality of scientific principles as so much thumping the table, when he sees how even the most real 'conventions' (such as Newton's principles) have been abandoned in favour of other explanatory schemes. The relationship between experimental (or observational) laws and theoretical principles in science is no clearer now than it was

when Poincaré wrote, as, in different ways, the works of Quine, van Fraassen, and Hacking testify. A.O'H.

**conversion.** Reversing the order of terms in a proposition. Thus 'The idle are unemployed' is converted (invalidly) to 'The unemployed are idle'. Valid in traditional logic for 'No S are P' and 'Some S are P', invalid for 'All S are P' and 'Some S are not P'. The (valid) move from 'All S are P' to 'Some P are S' is called 'conversion *per accidens*'. C.W.

\*logic, traditional.

J. N. Keynes, *Formal Logic*, 4th edn. (London, 1906), ch. 4.

**Conway, Anne Finch** (1631–79). Conway's philosophical work was much admired by Leibniz and by her friend and frequent correspondent Henry More. In *The Principles of the Most Ancient and Modern Philosophy* (a posthumous partial transcription from a notebook, now lost, which was probably written in the early 1670s, published 1690) she argued that God's necessary creativity must produce a universe infinite in all its aspects: infinite in space and time (both past and future), and infinite in the number and types of creatures, with each creature 'contain[ing] an Infinity of entire Creatures'. In this infinitely plenist universe 'every Body may be turned into a Spirit, and a Spirit into a Body'. Moreover, 'all Creatures . . . are inseparably united' and consequently may 'act one upon another at the greatest distance'. Conway became a Quaker shortly before her death. J.J.M.

\*women in philosophy.

Anne Finch Conway, *The Principles of the Most Ancient and Modern Philosophy*, ed. Peter Loftson (The Hague, 1982).

**Cook Wilson, John** (1849–1915). British realist philosopher. After a brilliant undergraduate career at Oxford, where he got double firsts in both classics and mathematics, Cook Wilson taught philosophy there for more than forty years, becoming professor of logic in 1889. A fertile and original thinker, he was slow in breaking away from the idealism in which he had been brought up. He wrote a good deal, but published next to nothing. The posthumous *Statement and Inference* (1926) collects some of his output, as well as a wonderful account of his comical eccentricity in its introductory memoir. He rejected Bradley's view that all thinking is 'judgement', since not all thinking is assertive and since judgement, as ordinarily understood, is a particular, reflective attitude of mind. His best-known thesis—that knowledge is indefinable—is parallel to G. E. Moore's claim about the indefinability of goodness. His teaching has had a considerable influence on the course of philosophy in Oxford up to the present day. A group of his disciples—H. A. Prichard, H. W. B. Joseph, W. D. Ross—were dominant there until the late 1930s. But there are many audible echoes later. His stress

on the philosophical significance of the ordinary meaning of words was carried to new heights by J. L. Austin. His criticisms of both formal and idealistic logic foreshadow the early work of P. F. Strawson, particularly his denial that universal affirmatives (all A are B) are really hypothetical (if anything is A, it is B). His insistence that knowledge is indefinable resurfaces in Timothy Williamson's account of the topic. A.Q.

Richard Robinson, *The Province of Logic* (London, 1931).

**Copernicus, Nicolaus** (1473–1543). Polish astronomer who revolutionized \*cosmology by transferring the centre of the universe from the earth to the sun. Like all scientists, Copernicus believed that a theory must agree with the facts and also conform to certain privileged ideas—\*simplicity being a good example. For Copernicus the ideal was uniform circular motion. Earth-centred systems of astronomy based on uniform circular motion did not agree with the observed facts; earth-centred systems agreeing with the facts were not based on uniform circular motion. Therefore, argued Copernicus, a sun-centred system which met both conditions was justified. This episode shows that developments in science can be revolutionary without being correct (Copernicus's picture of a circular, sun-centred universe was not particularly accurate), and provides evidence for a philosophy of science that attributes to science a large 'philosophical' component—a useful corrective to purely empiricist accounts of science. A.BEL.

Robert S. Westman (ed.), *The Copernican Achievement* (Berkeley, Calif., 1975).

**corollary.** A corollary is a proposition of significance which can be demonstrated to follow from another proposition which has previously been established as true. In mathematics and formal logic this previously established proposition is known as a theorem, and the \*proof of the corollary is based upon the proof of the theorem. It must be possible to show that the corollary follows from the theorem in a relatively straightforward manner. G.F.M.

R. Wilder, *Introduction to the Foundations of Mathematics* (New York, 1952).

**corporate responsibility** is the responsibility of a corporate person, which we might define as an association of individuals bound together by a common purpose and governed by agreed rules or a charter. Corporate responsibility is closely connected to \*collective responsibility, but whereas collective responsibility is typically a convenient fiction to refer to the individual responsibilities of those who make up the collective, corporate responsibility seems an indivisible form of responsibility, as in Cabinet responsibility. Corporate responsibility can be a valid legal concept, but it is less clear that it can be a moral concept, since the corporate person seems not to be individually divisible, as required for moral responsibility. A solution might be to say that a corporate person is divisible

into functional roles defined in terms of the purposes and rules of the corporation. In this way it is possible to combine corporate decisions—the agreed decisions emerging from the relevant roles—and moral responsibility, since individuals occupy the roles. To the extent that a chief executive, or head of a corporation, endorses these decisions, he or she will become responsible for the decisions of the corporation. R.S.D.

Larry May and Stacy Hoffman (eds.), *Collective Responsibility: Five Decades of Debate* (Savage, Md., 1998).

**corpuscularianism.** In the work of Italian philosophers such as Telesio in the sixteenth century, there is a revival of the Epicurean doctrine that physical processes are to be explained by the behaviour of the internal material constituents of macroscopic bodies. We can define ‘corpuscularianism’ as the doctrine that the fundamental constituents of the world are inert corpuscles making up and determining the behaviour of macroscopic bodies. It takes a variety of forms, depending on whether those properties of the corpuscles that do the explanatory work are restricted to mechanical properties such as speed/velocity and size/weight (as in Descartes), or whether they have macroscopically modelled properties like shape, which are invoked in explaining macroscopic effects such as taste, as in traditional Epicureanism (as in Gassendi). The latter view is properly called atomism, and is consonant with the traditional view that physical properties are due simply to the material constitution of bodies, whereas the former was often allied to mechanical explanations and did not even have to be formulated in terms of discrete bits of matter moving in a void. The most significant development of corpuscularianism in the seventeenth century was in the work of Robert Boyle. After the seventeenth century, mass points in mechanics and atoms in chemistry came to replace the generic idea of corpuscles, although disputes over the nature of light tended to be pursued in terms of waves versus corpuscles in a generic sense. S.GAU.

P. Alexander, *Ideas, Qualities and Corpuscles* (Cambridge, 1985).

A. Pyle, *Atomism and its Critics* (Bristol, 1995).

**corrective justice.** Diorthotic \*justice (*Nicomachean Ethics* v. 4; 1132<sup>a</sup>25), also called remedial or rectificatory justice, is one of Aristotle’s two species of particular justice (the other being dianemetic, or distributive, justice). It aims to repair an injustice arising from a private transaction (voluntary or involuntary) between persons in which one has gained unfairly, or otherwise caused harm or loss, at the expense of another. Although translators sometimes render as a ‘penalty’ what Aristotle says the judge takes from the former in order to give to the latter, corrective justice does not include retribution, or deserved \*punishment for crimes. Instead, it awards compensation for what we would call violations of contract (which the wronged party had entered voluntarily) and torts (which stem from no voluntary act by the wronged party). H.A.B.

Max Hamburger, *Morals and Law: The Growth of Aristotle’s Legal Theory* (New Haven, Conn., 1950).

**correspondence theory of truth.** Whether what is said about the world is true surely must depend on how the world is. This simple observation appears to offer strong intuitive support to one of the major philosophical accounts of \*truth, the correspondence theory, according to which propositions are true if and only if they correspond with the facts. However, despite its immediate appeal, the account has met with a number of objections, both the conception of facts as worldly items, and the construal of truth as a relation, drawing criticism.

The theory maintains that the truth of a proposition *p* requires the following two conditions to be met: (1) it is a \*fact that *p*, and (2) the proposition corresponds to that fact. Attention may now shift to the relation of correspondence—e.g. must a proposition mirror the structure of the fact?—but such an enquiry can reasonably be short-circuited, since condition (2) is surely superfluous: *p* being true if and only if it is a fact that *p*, all that is required by way of correspondence is that for each true proposition there should be a fact. Still, the reduced equivalence remains of significance if, as the theory would have it, the association of a true proposition with a fact is an association of words with world.

But now, if facts are in the world, it should make sense to ask where they are to be found, yet such questions as ‘Where is the fact that the recession is over?’ seem to admit of no answer. Moreover, other attributes associated with worldly items have no application to facts, which do not take up space or act upon anything, cannot be measured, dissected, or destroyed. Is ‘fact’, as is often supposed, equivalent simply to ‘true proposition’? This suggestion in turn meets with difficulties—propositions can be mistranslated or misattributed, not facts—so it is beginning to look as if facts are neither in the world nor in language. And perhaps that is, however unexpectedly, their true status. Perhaps the term ‘fact’ does not have a role in which it is true of anything whatsoever. In stating, ‘It is a fact that insulin is a hormone’ we are not describing something named by the clause, ‘that insulin is a hormone’, but the contribution which ‘fact’ makes could equally be channelled through an adverbial phrase, as with ‘Insulin is in fact a hormone’. The correspondence theorist’s claim would then reduce to affirming a series of trivialities after the pattern of ‘“Insulin is a hormone” is true if and only if insulin is, in fact, a hormone’, or—final ignominy—“Insulin is a hormone” is true if and only if insulin is indeed a hormone’.

The idea that truth consists in a relation between words and world is, however, unlikely to be abandoned, even if ‘fact’ is not suited to providing one of the terms of this relation. What other form might that relation take? There is no denying that our words latch on to worldly items in various ways, but what is suspect is the idea of a relation over and above any that the given proposition might present as a matter of its own internal structure. Thus, suppose it is said that ‘Insulin is a hormone’ presents us with a relation of predication, ‘is a hormone’ being predicated of what is named by ‘insulin’. Then, of course, the

proposition is true if and only if the relation holds; that is, if and only if insulin—a substance to be found in the world—is a hormone. Anything the supposed relation of correspondence might achieve has already been provided for without going beyond the relation which is affirmed with the affirmation of the proposition itself. There is no call to single out a mysterious complex on to which the proposition as a whole can be mapped. B.B.R.

\*coherence theory of truth; realism and anti-realism; redundancy theory of truth.

B. Rundle, *Wittgenstein and Contemporary Philosophy of Language* (Oxford, 1990).

P. F. Strawson, *Logico-Linguistic Papers* (London, 1971).

**corroboration.** Introduced as a technical term in philosophy of science by Popper. A theory's degree of corroboration is measured by 'the severity of the various tests to which the hypothesis in question can be, and has been, subjected' (*The Logic of Scientific Discovery*). Since stronger—more falsifiable—theories can be subjected to severer tests than weaker ones, degree of corroboration is not \*probability. A high degree of corroboration makes no promises about the theory's future performance. M.C.

A. O'Hear, *Karl Popper* (London, 1980).

**cosmogony.** A cosmogony is an account of the origin or \*creation of the universe. The account may be mythological or anthropomorphic, as in early Greek and Near Eastern thought. It may be theological, as in the Judaeo-Christian tradition. Or it may be scientific, for example the big bang theory. In the latter case scientific experiments, using instruments such as very high-speed particle accelerators, attempt to replicate the initial stages of the universe in order to understand how its development occurred. M.B.

G. S. Kirk, S. E. Raven, and M. Schofield, *The Presocratic Philosophers*, 2nd edn. (Cambridge, 1983), ch. 1, for a review of Presocratic cosmogony.

**cosmological argument.** A line of theistic argument appealing to very general contingent facts, e.g. the existence of caused things. There must be some sufficient explanation for these contingent facts. Each such fact may be explained by some other contingent fact, but this series of explanations cannot be infinite. It must terminate (or begin) with something whose existence needs no further explanation, i.e. God.

The first three of St Thomas Aquinas's set of five theistic arguments are versions of the cosmological argument. The most puzzling element is the claim that a certain series of causes etc. cannot be infinite, especially since Thomas himself appears to hold that a series of finite causes without a *temporal* beginning cannot be ruled out on philosophical grounds. One might also wish for a fur-

ther clarification of the idea of a being whose existence calls for no explanation. G.I.M.

William Rowe, *The Cosmological Argument* (Princeton, NJ, 1975).

**cosmology.** Traditionally a branch of metaphysics dealing with features of the world as a whole, though the term can also be synonymous with speculative philosophy in its widest sense. But since the advent of Einstein's general theory of relativity, the term has almost exclusively referred to the endeavours of physicists to understand the large-scale \*space-time structure of the universe on the basis of that theory. Far from curtailing philosophical discussion, their work has breathed new life into long-standing debates about the origin and uniqueness of the universe.

Newton thought that space and time were separate and immutable, space invariably obeying the axioms of Euclidean geometry. But general relativity abandons observer-dependent notions of length and temporal duration in favour of space-time, and links its geometry to the matter distribution in the universe via Einstein's field equations. Given that different matter distributions inserted into these equations yield different space-time geometries, which geometry best describes *our* universe?

The first proposal was Einstein's. Assuming, as Newton did, that the universe is static and contains an essentially uniform distribution of matter, Einstein obtained a solution to his equations which delivered a vast, spatially spherical universe that is temporally infinite.

This illustrates how Euclidean geometry can be abandoned. If we *did* live on the surface of a sphere, straight lines specifying the shortest distance between two points would correspond to circles drawn on its surface with centres that coincide with the centre of the sphere (think of the equator or any line of longitude on the earth). This means that straight lines always intersect (e.g. lines of longitude intersect at the North Pole), and that triangles drawn with such lines always have angles that sum to more than 180° (e.g. take the triangle with *two* right angles formed by two lines of longitude and the Equator). Of course, if in our portion of the universe we were confined to a small patch on the surface of some cosmic sphere, then these deviations from Euclidean geometry would never show up in everyday experience.

To ensure his spherical universe was static, Einstein actually had to do some fiddling with his equations. Since Newton, it was well known that an initially static universe would soon have to collapse under its own weight; so an extra term—the so-called cosmological constant—was put into the equations to counteract this effect. The artificiality of this manoeuvre suggested that perhaps the universe is not static after all: maybe the predictions of the field equations (*sans* cosmological constant) should be taken at face value.

This was first done by Friedman, and later Robertson and Walker, who proved that if—as observational

evidence suggests—the universe looks roughly the same in all directions from any point of view, then it must be either expanding or contracting. About the same time, and using the same method (the Doppler effect) by which we can tell whether an ambulance is moving towards or away from us, namely from the pitch of its siren, Hubble verified that distant galaxies are receding from the earth. One might think Hubble's observation suggests that the focal point of the universe's expansion must be somewhere near the earth, and therefore that the universe is *not* the same from any point of view. But if the earth's location is like a point on a uniformly expanding sphere (say, an inflating balloon), then from any other standpoint on the sphere one would have to observe the very same expansion.

There are in fact three general relativistic scenarios compatible with Hubble's observation. The first extreme is that the universe started expanding so slowly that at a certain point in our future gravitational forces are going to take over and cause it to collapse back on itself. The second extreme is that the universe started out expanding so quickly that gravitational forces will never hold it back and it will go on expanding for ever. Finally, there is a middle way: the universe started off with *just enough* expansion to allow it to *just escape* eventual collapse. None of these scenarios has yet been totally ruled out (though, curiously, something like the middle way looks to be the best candidate). But they all require that the universe began in a highly compressed 'big bang' state following an initial singularity, i.e. a point at which physical laws break down.

All this has revived two old bones of contention: whether the universe needs a creator, and whether its unique features are evidence of design.

To avoid the need for divine intervention at the big bang, some physicists modified general relativity to produce a 'steady state' model of the universe. In this model, the universe has always existed, and new matter is continually being created to fill the gaps left behind by expanding galaxies, ensuring that the overall matter density of the universe remains constant. However, there are empirical reasons for rejecting this model—not least, Penzias and Wilson's discovery that the earth is being showered from all directions by microwave radiation as a by-product of the big bang. Moreover, Hawking and Penrose proved that, under minimal, very reasonable conditions (e.g. supposing that matter is attractive), we should *expect* a big bang singularity to exist in any *classical* relativistic model of the universe. On the other hand, Hawking and Hartle have recently found a *quantum mechanical* model of an expanding space-time which doesn't begin in a singularity, and so no longer has any natural point through which a creator could intervene.

As evidence of design, some point to things like the fact that to avoid our universe collapsing back on itself in the early stages of the big bang, yet prevent it from expanding so fast that galaxy formation would have been impossible, the rate of expansion at early instants needed to be 'fine-tuned' to within one part in  $10^{55}$ . Others respond that many causally disjoint universes *actually* exist, each initially

expanding at different rates (e.g. each could be a different cycle in an infinite sequence of big bangs and big crunches). With so many universes around, it would then be no surprise to find ourselves in one of the very few hospitable to life. R.CLI.

\*anthropic principle; cosmology and religious belief.

A. Grünbaum, 'The Pseudo-Problem of Creation in Physical Cosmology', *Philosophy of Science* (1989).

S. Hawking, *A Brief History of Time: From the Big Bang to Black Holes* (London, 1988).

J. Leslie, *Universes* (London, 1989).

**cosmology and religious belief.** It is fundamental to Christian belief that \*God is held to exist in a cosmos-transcending mode, however much he is seen also as immanent in the world. God creates and continues to give actuality to the world; otherwise it would lapse into non-being. No rival cosmological principles or powers share God's dominion, his sovereignty over the universe.

The metaphysical difficulties attending that cosmological dimension have prompted its abandonment by some religious writers; and Christian discourse may then be taken to be essentially and solely moral (or existential) discourse. The language of divine creation, command, and judgement is understood as parable or myth, giving imaginative vividness and urgency to a style of life centred on neighbour-love and moral accountability. Such a view, however, is not a clarification of Christian belief, but, rather, a drastic revision.

Both types of religious orientation have their defenders among philosophers of religion today: some having confidence in reworkings of \*cosmological and \*design arguments for a transcendent God; others developing conceptions of religion as a 'Way', or a discipline of attention, imagination and will, with worthwhile moral and aesthetic goals. R.W.H.

**could have done otherwise:** see freedom and determinism.

**counselling, philosophical.** The remedial use of philosophical discussion (in a very wide sense of the term) to help individuals reflect on their lives and deal with 'personal problems' such as relationship issues and career dilemmas. As with other one-to-one psychotherapies, the objects of the activity are to generate fees for the counsellor and to alleviate the mental anxiety or intellectual imbalance of the counselled. Modern (post-1980) counselling thus differs from the \*Socratic method, to which it is sometimes compared, where the objective is the disinterested pursuit of truth and/or the exposure of simplistic claims to have the truth. The saying of Epicurus, 'Vain is

the word of a philosopher which healeth not the sufferings of man', might seem to associate him with the interested purposes of counselling, but \*Epicureanism (like \*Stoicism) was held to be a universal truth commended by valid reasons and good evidence, not merely or mainly a therapy for individuals. Objectives apart, a main question about philosophical counselling is whether, and how, a learnt, critical, academic discipline such as philosophy can be used with integrity as a form of treatment for those with no critical training in, or academic awareness of, the issues.

Journal: *Practical Philosophy*.

**counter-example, philosophy by.** A strategy for showing that a philosophical assertion is false and generating data to be taken into account in working toward true assertions on the topic. A counter-example to the claim that all A's are B's is an example of an A that is not a B. A counter-example to the claim that something is an A if and only if it is a B is an example of an A that is not a B or an example of a B that is not an A. When something is asserted to be necessarily true, as in conceptual analysis, mere possibilities may serve as counter-examples. Suppose it is claimed that, necessarily, a case in which my arm rises is a case in which I raise it if and only if the rising has my intention to raise it as a cause. A logically possible scenario in which, unbeknownst to me, mind-reading Martians respond to my intention by levitating my arm is a counter-example. Edmund Gettier produced well-known counter-examples to the assertion that knowledge is to be analysed as justified, true belief. His examples feature people who have a justified, true belief that *p* but do not know that *p*. Philosophy by counter-example has both a negative side—showing that a philosophical assertion is false—and a positive side. Counter-examples to attempted conceptual analyses typically motivate revised analyses designed to yield, among other things, the correct pronouncement about those examples. If a new counter-example falsifies a revised analysis, the process typically continues. Some philosophers attempt to motivate their own conceptual analyses by starting with a suggestive analysis they deem false and producing counter-examples to it and to revised versions until they arrive at an analysis that seems to them to be immune to counter-examples. Roderick Chisholm was well known for this practice. In many of Plato's dialogues, Socrates offers a counter-example to a character's attempted analysis of a concept (e.g. justice or knowledge), the analysis is revised to handle the counter-example, Socrates produces a counter-example to the revised analysis, and the process of revision and counter-example continues until Socrates' conversation partners run out of steam. It has been said that philosophical conversations without counter-examples are like ham and cheese omelettes without eggs.

R. Sorensen, *Thought Experiments* (Oxford, 1992).

**counterfactuals.** A counterfactual is a \*conditional

whose antecedent is false (typically, in philosophical practice, *known* to be false). The term is usually reserved for those (non-truth-functional) counterfactuals which are *not* true in virtue simply of their antecedent's falsity. Law-like generalizations support counterfactuals: 'Sugar dissolves in water' licenses 'If this sugar cube were dropped in water it would dissolve'; but 'All coins in my pocket are silver' does not yield 'If this penny were in my pocket it would be silver'.

J.J.M.

N. Goodman, *Fact, Fiction and Forecast*, 4th edn. (Cambridge, Mass., 1983).

**counterpart theory.** According to some theories of \*possible worlds, an individual object which exists in this world—the actual world—can be identical with one which exists in another possible world. Such identity across possible worlds, or transworld identity, is rejected by counterpart theorists like David Lewis, who insist that no individual can exist in more than one possible world. For the counterpart theorist, each possible world is simply an aggregate of spatio-temporally interrelated individuals, and the individuals of one world stand in no spatial or temporal relation to the individuals of any other. While a transworld identity theorist would interpret a modal proposition such as 'Napoleon could have died young' as meaning 'There is some possible world in which Napoleon dies young', the counterpart theorist interprets it as meaning 'There is some possible world in which a counterpart of Napoleon dies young'. Napoleon's counterpart in another possible world, if he has one, is the individual in that world that is most similar to Napoleon in every relevant respect.

D. Lewis, *On the Plurality of Worlds* (Oxford, 1986).

**counting.** To determine the numerical size, or cardinality, of any but a very small group of objects we count them. Distinguish the process of counting from the product of that process. The transitive process of counting consists in establishing a one-to-one correspondence between the members of an uttered sequence of number-words, 'one, two, three', and the members of the set counted. The product of the process is a cardinality judgement, 'This set has three members', with the number of the set being the number denoted by the last number-word uttered. For a set with finitely many members, the order in which we pair off the members with the number-words does not affect the cardinality judgement. In intransitive counting, we just say the number-words in their order, perhaps to send us to sleep.

\*numbers.

R. L. Goodstein, *Essays in the Philosophy of Mathematics* (Leicester, 1965), ch. 4.

**count noun.** Noun in connection with which 'how many?' is appropriate; alternatively, one that provides a principle for counting items to which it applies. Thus defined, the notion is not purely grammatical, but a rough test is

whether the noun takes plural forms and (in languages that have one) the indefinite article. 'Shoe', 'ship', and 'walrus' are count nouns; 'sand', 'butter', 'greed', and 'sunlight' are not; nor are proper \*names (as standardly used, but cf. 'some mute inglorious Milton'). Some deny that 'thing' is a count noun, on the grounds that there is no principle for counting *things* as such. Words with both count-noun and non-count-noun senses include 'wine', 'philosophy', 'misery'.

P.J.M.

\*sortal; number.

**courage.** A \*virtue indispensable to the good life: a readiness to persist in a valued project, despite risk of harm, injury, death, censure, or loss of personal standing. Given the nature of the human life-world, few worthwhile enterprises are possible for those who will take no avoidable risks: such a policy would entail (at the everyday level) no parenthood, little travel, few ventures in work or play; and (in extreme situations) no standing up to tyranny, no speaking out against injustice. For an act to be courageous, as distinct from reckless, or stubborn, or obstinate, the risks must be reasonable in relation to the goal, and the goal itself soundly appraised.

R.W.H.

Peter Geach, *The Virtues* (Cambridge, 1977).

**Couturat, Louis** (1868–1914). A French philosopher-logician with a central interest in the concept of the infinite, he was especially influenced by Leibniz. In his first major work, *L'Infinie mathématique* (1896), he argued, against the prevailing current, in support of the doctrine that there must be an actual, and not a merely possible, infinite. Leibniz also had devoted himself to mathematical and philosophical questions concerning the infinite, and Couturat's interest in Leibniz's work resulted in publication by him of an edition of a number of writings by Leibniz which had until then lain unpublished. Leibniz had had an abiding interest in the possibility of a universal language and, as further indication of his debt to Leibniz, Couturat devoted much of his short life to the development of such a language. The monthly journal *Progreso*, which he founded, was written in his language (Ido). The subsequent history of Ido suggests, however, that the language, or at least its supporters, did not have the resources to withstand the hostility of the Esperanto lobby.

A.BRO.

\*infinity.

André Lalande, 'L'Œuvre de Louis Couturat', *Revue de métaphysique* (1914).

**covering-law model.** According to this model of scientific \*explanation, developed by Carl Hempel, a statement of particular or general fact is explained if and only if it is *deduced* from other statements which include at least one general scientific law. For particular facts, this model implies a symmetry between explanation and prediction: if an event can be explained, it could have been predicted,

and vice versa. The covering-law model has close affinities with David Hume's equation of causation with \*constant conjunction, and accordingly faces similar difficulties about causal priority and indeterministic causation. D.P.

\*causality.

C. Hempel, *Aspects of Scientific Explanation* (New York, 1965).

**Craig's theorem.** A result in mathematical logic that has been used to argue for the in-principle dispensability of theoretical terms. Suppose *T* is a formal axiomatization of the usual sort (for instance *T* may be a formalization of physics). Suppose *O* is a restricted part of *T*'s vocabulary (perhaps *O* contains just the 'observational' terms). Craig's theorem states that there is a formal axiomatic theory *T\** such that (i) the axioms of *T\** contain only terms in *O* and (ii) *T* and *T\** imply the same *O*-sentences, i.e. sentences built out of terms in *O*.

A.GUP.

For a proof of the theorem see W. Craig, 'On Axiomatizability within a System', *Journal of Symbolic Logic* (1953).

**Cratylus** (fl. c.400 BC). A self-declared follower of Heraclitus, who maintained that all sensible particulars are changing in every respect all the time. According to Aristotle (*Metaphysics* 987<sup>a</sup>32–<sup>b</sup>1), this doctrine influenced the young Plato. Also according to Aristotle (*Metaphysics* 1010<sup>a</sup>10–15), Cratylus drew radical conclusions about the impossibility of reference to things in the perceptible world: he rebuked Heraclitus for saying that you cannot step twice into the same river; he himself [Cratylus] thought you cannot even step into it once; and 'in the end he thought that one should not say anything at all, and merely moved his finger'. This position seems to be included in the 'Heraclitean' doctrines of \*'flux' which are severely criticized by Plato in his dialogue *Theaetetus*. It is this dialogue if anything which may give further insight into Cratylus' thinking. (Plato's dialogue *Cratylus* represents Cratylus as developing a theory of the Greek language, involving a system of non-conventional correspondences between (parts of) words and the world.)

E.L.H.

M. Burnyeat, *The Theaetetus of Plato*, tr. M. J. Levett (Indianapolis, 1990), 7–65.

**creation.** The bringing of something into existence. In Christian \*cosmology creation often means the bringing of the universe into existence *ex nihilo* by God. A contrasting conception of a much longer ancestry and of a wider spread in the world is the conception of creation as the fashioning of the cosmos out of a pre-existing indeterminate stuff by some divine being or principle. Apart from other grave problems, it is not clear how *ex nihilo* creation coheres with the principle *ex nihilo nihil fit* embraced by most classical Christian philosophers. Nor are the prospects of intelligibility rosy for the notion of a presumably absolutely indeterminate and therefore unconceptualizable original stuff. Such are some of the problems created by creation. In recent times some fallacious

interpretations of the big bang theory have sought to boost *ex nihilo* creation. k.w.

John Leslie (ed.), *Physical Cosmology and Philosophy* (New York, 1990), esp. Adolf Grünbaum, 'The Pseudo-Problem of Creation in Physical Cosmology' and Paul Davies, 'What Caused the Big Bang?'

**Creationism** is the American Protestant movement that takes the early chapters of Genesis as literally true accounts of the origin of the universe, including our globe, of the plants and animals that inhabit the earth, and of the human species. Also known as fundamentalism, it climaxed in 1925 in the so-called Scopes trial, when a young Tennessee schoolteacher was tried and convicted for teaching that there were humans before the time when Adam is supposed to have lived. By the 1960s, the movement adopted the term 'Creation science', arguing that the best scientific evidence points to a young earth (about 6,000 years old), the miraculous arrival of all living beings, and shortly thereafter a world-wide deluge (Noah's Flood). The most recent manifestation now goes under the title of 'Intelligent Design'. Its supporters argue that the organic world shows irreducible complexity, and this can be explained only by reference to causes out of the usual course of nature—causes that imply intelligence. Critics point out that Creationism judged as science is simply false. Physics points to a universe that is about 20 (American) billion years old and an earth that is 4½ billion years old. Life has been evolving here on earth for nearly 4 billion years. As significantly, Creationism is bad religion. Since the days of St Augustine (AD 400), it has been agreed by mainstream Christians that Genesis is not a scientific account of origins, and must be interpreted metaphorically to understand the relationship of humans to their Creator. M.R.

R. L. Numbers, *The Creationists: The Evolution of Scientific Creationism* (New York, 1992).

M. Ruse (ed.), *But is it Science? The Philosophical Question in the Creation/Evolution Controversy* (Buffalo, 1988).

**credo quia absurdum est** ('I believe because it is absurd'). This is an inexact quotation from Tertullian's *De carne Christi*, a diatribe against the gnostic Marcion, who had sought to remove the apparent contradiction in believing that God became man. Tertullian responded, angrily, that the very impossibility of the incarnation was the mark of divine agency.

The saying is often used, unsympathetically, to express the idea that religious belief is irrational. G.B.M.

\**reductio ad absurdum*.

Bernard Williams, 'Tertullian's Paradox', in A. Flew and A. MacIntyre (eds.), *New Essays in Philosophical Theology* (New York, 1955).

**credo ut intelligam**. This means 'I believe so that I may understand'. The words come in the first chapter of St Anselm's *Proslogion*, the book which contains his famous proof, commonly called '\*ontological', of the existence of

God. Anselm adds that, without faith, understanding is impossible. This doctrine has appealed to those, like Karl Barth, who regard reason, unassisted by God's grace, as unable to discover anything about God. C.J.F.W.

Karl Barth, *Anselm: Fides Quaerens Intellectum* (London, 1960).

**Crescas, Hasdai ibn** (1340–c.1412). Jewish philosopher, born in Barcelona. Imprisoned for 'desecrating the host', Crescas became a courtier in Aragon and was charged by the Crown with rehabilitating Spanish Jewry after the anti-Jewish riots of 1391, in which he lost his son. His *Light of the Lord* (1410; printed in Ferrara, 1555) criticized Maimonidean \*Aristotelianism, which seemed to shelter would-be apostates: Maimonides wrongly treated belief in God as a commandment; rather, it is presupposed by any divine commandment. Aristotelian \*cosmology, as outlined by Maimonides, is systematically refuted. There is no contradiction in the idea of empty space or an infinite magnitude; all bodies have weight, not a natural tendency upward or downward. Citing the Talmudic view that God governs 18,000 worlds, Crescas suggests that worlds may be infinite, each providing its own 'centre' for the heaviness of falling objects. Many of these views are welcomed by Spinoza. L.E.G.

Harry Wolfson, *Crescas' Critique of Aristotle* (first pub. 1929; Cambridge, Mass., 1971).

**criterion**. A standard by which to judge something; a feature of a thing by which it can be judged to be thus and so. In the writings of the later Wittgenstein it is used as a quasi-technical term. Typically, something counts as a criterion for another thing if it is necessarily good evidence for it. Unlike inductive evidence, criterial support is determined by convention and is partly constitutive of the \*meaning of the expression for whose application it is a criterion. Unlike \*entailment, criterial support is characteristically defeasible. Wittgenstein argued that behavioural expressions of the 'inner', e.g. groaning or crying out in pain, are neither inductive evidence for the mental (Cartesianism), nor do they entail the instantiation of the relevant mental term (behaviourism), but are defeasible criteria for its application. P.M.S.H.

P. M. S. Hacker, *An Analytical Commentary on the Philosophical Investigations*, iii: *Wittgenstein: Meaning and Mind* (Oxford, 1990), 545–70.

**Critical Realism**. American Critical Realism was a collaborative effort to oppose American \*New Realism. Critical Realists opposed the New Realists' epistemological monism, the assertion of identity of the contents of consciousness and its object. Critical Realists held the theory of epistemological dualism, which maintained that content and object were ontologically different. They divided on how to move from content to object without recourse to a Lockean theory, which would lead to \*idealism. Most of the Critical Realists were also psychophysical dualists and assigned a greater role to mental activity than was

allowed by New Realism, which thereby showed itself incapable of solving the problem of sensory illusion. Beyond insisting upon the two dualisms the Critical Realists could agree on little else, and the movement shortly lost its coherence. The most important Critical Realists were George Santayana, R. W. Sellars, and A. O. Lovejoy.

**critical thinking:** see informal logic.

**Croatian philosophy.** The earliest contact Croats had with philosophy was in the ninth century, with the stay of the German philosopher-theologian Gottschalk at the Court of the Croatian duke Trpimir, but the first figure of importance was Hermann of Dalmatia (twelfth century), pupil of Thierry de Chartres, translator of Euclid and of Arabic astronomic treatises, and author of the work *De Essentiis*.

The golden age of Croatian philosophy was the Renaissance and the Baroque period. At this time several philosophers chose to present their opinions through commentaries on Aristotle, notably Aristotelians like Antun Medo (1530–1603), who inclined towards nominalism, and Juraj of Dubrovnik (1579–1622), whose tone was more conservative. Franjo Petrić (1529–97) was a critic of Aristotle, and the author of a Neoplatonic synthesis, *Nova de Universis Philosophia*. Other philosophers of Neoplatonist leanings were Frederik Grisogono (1472–1538), Nikola Vito Gučetić (1549–1610), and Miho Monaldi (1540–92).

The early Protestant theologian and philosopher Matija Vlačić Ilirik (1520–75) made an important contribution to hermeneutics. Other distinguished names are the theologians Benedikt Benković and Juraj Dragiščić (fifteenth century). Dragiščić was active in Florence; his best-known work is a defence of Savonarola entitled *Prophetic Solutions*. On the more scientific side were the scientist-theologians M. A. de Dominis and F. Vrančić (sixteenth and seventeenth century), both working on logic and methodology of science.

At the beginning of the seventeenth century in the wave of Counter-Reformation, several important church schools were founded (such as the Jesuit Academy in Zagreb in 1606 and the Croatian Collegium in Vienna 1624) in which philosophy was taught and studied.

The most famous Croatian scientist and philosopher was Ruđer Bošković (1711–87), whose dynamic theories of space and matter inspired Faraday and Maxwell and anticipated modern physics.

Throughout the eighteenth and nineteenth centuries Croatian philosophers actively and swiftly followed philosophical developments in Europe. Kant's philosophy, for example, was commented upon critically by J. B. Horvath at the close of the eighteenth century, and approvingly by

Simeon Čuččić in 1815. Andrija Dorotić (1764–1837), who taught philosophy in Rome, wrote, among others, on philosophical anthropology (*Philosophicum Specimen de Homine* (1795)) and on history of philosophy. Philosophy of language was discussed by two Dalmatians, F. Bottura (1779–1861) and J. Pulić (1816–83). The early reception of mathematical logic (of Peano and Schröder) was in the work of Albin Nađ (1866–1901). The best-known nineteenth-century author was the aesthetician Franjo Marković (1845–1914). His aesthetics was a pioneering work in Croatian philosophy, although somewhat conservative and over-formalistic when viewed in the European context. For him, beauty resides in harmony or unity-in-plurality, in the 'final harmonic reconciliation which resolves temporary historical dissonances', and then in clarity, vividness, and completeness. Djuro Arnold, a pupil of H. Lotze, developed a metaphysical system of spiritualist kind, inspired in part by Leibniz.

The most original philosopher in the first part of the twentieth century was Pavao Vuk-Pavlović, the author of *Knowledge and the Theory of Knowledge* (1926). He argued against the possibility of epistemology: knowledge does not form a unitary domain, since it encompasses both cognitive processes, which are the province of psychology, and the objects of cognition, which are the province of metaphysics. Important historians of philosophy were Albert Bazala and Vladimir Filipović. In the period after the Second World War the most important group was the Praxis group, or Zagreb school of Marxism (the late Gajo Petrović, then Milan Kangrga, Branko Bošnjak, and others), defending a humanistic Marxism with idealistic and Heideggerian overtones. Analytical philosophy is represented by the Zadar-Rijeka school and by Neven Sesardić, author of a book on physicalism. N.M.

\*Serbian philosophy; Slovene philosophy.

The most authoritative sources are publications of the Department for the History of Philosophy of the Institute for History at Zagreb University, notably the review *Prilozi za istraživanje hrvatske filozofske baštine*, which has begun to appear also in English and German versions. The Institute also publishes a series of monographs (all in Croatian). A publication in English and German is the issue on *Croatian Philosophy* of the review *Synthesa philosophica* (1993).

**Croce, Benedetto** (1866–1952). Italian philosopher influenced by Vico, Francesco de Sanctis, an Italian literary critic and historian, and German idealism. Croce defines art as *intuizione*, or lyrical intuition, the presentation of images that are beautiful or well expressed. Image production *simpliciter* is not necessarily the manufacture of art: images assembled randomly, juxtaposed, copied, or mechanically distorted may reveal an artist's boredom or competitiveness, but are not articulated, coherent unities unless 'animated' by intense feeling. Nor are there artworks in passionate artists' heads which are not yet translated into external form. Artworks are individualized universals: the poem is 'born' in these words, *that* rhythm. 'Heroism and meditation on death are in the faultless

blank-verse hendecasyllables of Foscolo.' An artwork is an aesthetic a priori synthesis of image and feeling in intuition, so each artwork is original, untranslatable, and unclassifiable in artistic genres and categories. But artworks are not physical facts, nor are artists making assertions about reality: Dante's *Francesca* is immune to moral censure, fire, and critical evaluation.

**crucial experiment.** An \*experiment whose result enables us to decide between two opposing scientific theories. The idea is that when two theories predict contrary results for an experimental situation, the crucial experiment will decide in favour of one theory against the other. According to Francis Bacon such an experiment is sometimes decisive. Popper argued that the most such an experiment can do is falsify one of the theories. Others, e.g. Lakatos, held that they are never, in themselves, finally decisive.

O.R.J.

Karl Popper, *Conjectures and Refutations* (London, 1963).

**Cudworth, Ralph** (1617–80). Belonged to the \*Cambridge Platonists, a school which drew on Plato to assert the primacy of mind as 'senior to the world, and the architect thereof'. Cudworth's major work was *The True Intellectual System of the Universe* (1678). It was conceived as a refutation of Hobbes, but it incorporates many ideas which are anticipations of twentieth-century philosophy. For example, there is an interesting anticipation of one of G. E. Moore's (dubious) arguments for the autonomy of morality: '... the nature of things [is] that which it is, and nothing else . . .'. In other words, any quality of an object or situation is what it is by reason of its own nature—justice is justice and whiteness is whiteness—and cannot be made that quality by any command, even God's. The general thrust of Cudworth's arguments is against any sort of reductivism, whether of mind to brain or of morality to command.

**culture.** The word may be used in a wide sense to describe all aspects characteristic of a particular form of human life, or in a narrow sense to denote only the system of values implicit in it. Understanding culture in the wide sense is one typical concern of historical, anthropological, and sociological studies. The study of culture in the narrow sense is the province of the humanities, whose aim is to interpret and transmit to future generations the system of values in terms of which participants in a \*form of life find meaning and purpose. In either of its senses, culture may be thought of as a causal agent that affects the evolutionary process by uniquely human means. For it permits the self-conscious evaluation of human possibilities in the light of a system of values that reflect prevailing ideals about what human life ought to be. Culture is thus an indispensable device for increasing human control over the direction in which our species changes.

J.K.

C. Geertz, *The Interpretation of Cultures* (New York, 1973) explores the implications of the evolutionary influence of culture.

E. Hatch, *Theories of Man and Culture* (New York, 1973) is a survey of anthropological theories of culture.

R. Williams, *Culture and Society* (London, 1958) traces the development of the idea of culture in the history of ideas.

**curve-fitting problem.** If finitely many data connecting two quantities (e.g. temperature and pressure) are plotted on a graph, infinitely many curves can be drawn passing through them all, each representing a theory. Which curve represents the best theory? The simplest? (But which is the simplest?) Or perhaps a still simpler one passing near but not through them? The problem is of fundamental importance for any attempt to solve the problem of \*induction.

D. Stalker (ed.), *Grue! The New Riddle of Induction* (Chicago, 1994).

**custom:** see convention.

**cybernetics.** The study of artificial or natural systems which store information and use feedback mechanisms to guide and control their behaviour. Such devices have a fixed behavioural repertoire and thus lack the flexibility of modern programmable \*computers. The notion of information is precisely mathematically specified in a branch of electrical engineering called communication theory. The notion of feedback has been studied widely in biology. Both of these disciplines have studied such systems. The interest for philosophers resides in the complex patterns of behaviour that can emerge from compounds of such relatively simple components.

K. Sayre, *Cybernetics and the Philosophy of Mind* (London, 1976).

**Cynics.** The major assault on 'civilized values' in the ancient world, as being no true values, was mounted by the Cynics. One of Socrates' disciples, Antisthenes, was later reckoned the first of that order, but it was Diogenes, whom Plato described as Socrates run mad, that fixed the type. Many a Cynic, literally 'doggyish', was doubtless no more than a tramp—but every age and nation but our own has recognized that many a tramp may be a wandering sage. Diogenes, formerly of Sinope but long resident in Corinth (404–323 BC), is known, like other philosophers of the time, through anecdotes: as that, asked by a momentarily respectful Alexander what he, Alexander, could do to help, he replied 'Get out of my light' (a request that could have had a larger meaning than the literal). Like \*Pyrrho, he seems to have identified animals as admirable: the mouse running unafraid about the house to find its food. At first he kept a cup as well as a cloak and knapsack, but seeing a boy drink from cupped hands, threw away the cup. Being sold into slavery, he pointed out a potential purchaser with the words, 'Sell me to him: he needs a master', and devoted himself to bringing up his owner's children in good health and spirits. He is said eventually to

have died from eating a raw octopus (in an attempt to prove a point about the unnaturalness of cooking). Many of the anecdotes concerning him are crude (found masturbating in the market-place, he remarked that it was a pity hunger could not be assuaged so easily). Many are by now incomprehensible. What survives is the image of intransigent devotion to the 'natural life'. Amongst his followers was Crates, who had abandoned a rich inheritance to live the Cynic's life (accompanied by a similarly devoted wife, Hipparchia). He left his fortune in trust, with instructions that if his sons were ordinary men, they should have the money, and if they were philosophers, it should be given to the people, as his sons would have no need of it. He wrote popular verse extolling the natural life, devoid of luxury, pride, or malice. A merchant from Citium in Cyprus, \*Zeno, happened on Xenophon's account of \*Socrates at an Athenian bookstall and asked where he could find such a man: the bookseller pointed to Crates, and Zeno abandoned trade for good, eventually establishing himself in the Painted Portico, the Stoa.

Those early \*Stoics, his followers, were almost as shameless as the Cynics, acknowledging no merit in traditional distinctions and taboos. Why not have sex in temples, eat one's dead parents, and reckon other people's property one's own? The gods, after all, own everything; friends have everything in common, and only the wise are really friends of the gods: so the wise own what they please, though being wise they will not use it to satisfy escapable desires. Cynics put more of this into practice than the Stoics did, and despised the cosmological and logical enquiries of Stoics and the Academy. What we need to know is only how to live here-now, reducing our wants to what can easily be achieved, and entertaining no opinions about how things happen. This antinomian detachment, unexpectedly, has echoes in the sermons of another sect of wanderers, whom we now identify as Christian missionaries. These would have seemed to most of their contemporaries just another sort of Cynic. There are indeed many echoes of Cynic conversation in the Gospels (as one might expect from natives of a heavily Hellenized Galilee). The Cynics' rule was, as it were, to take up their knapsack and follow Heracles, identified as one who pursues the rugged path of laborious virtue rather than of pleasure, despite the shame that others see in this.

The history of the term since Hellenistic days is curious. Diogenes and the rest may have despised the intellectual and political currency of their day: Diogenes was indeed said to have been exiled from Sinope for (literally) defacing the coinage. But they were dedicated moralists, not nihilists. 'Cynic' once meant 'one who lives a dog's life: shamelessly, and without any settled home'. Now, drawing on an anecdote of Diogenes' searching in daylight with a lantern for a genuinely 'just' man, cynics despise all moral or altruistic claims. Some part of this derives from the poor reputation of Cynics during the early centuries AD, described by such satirists as Lucian. But the major explanation lies in the natural assumption that those who despise *our* values must despise all values. Cynics, like

early Christians, were reckoned misanthropes because they preached against class division, greed, and enmity, and showed their own vulgarity by not being as ashamed as others thought they should be of their lack of honour.

**Cyrenaics:** see Aristippus.

**Czech philosophy.** The first central European university, which owed much to the Czech cultural tradition of orientation to the West, was founded by the emperor Charles IV in Prague in 1348. This French-educated sovereign gathered around him representatives of early \*humanism whom the spiritual father of the school, Petrarch, described as being as significant and gentle as if they had been born in ancient Athens. One was the religious reformer, a rector of the university, Jan Hus (1370/1–1415). His injunction was 'Seek the truth, love the truth, nurture the truth, cling to the truth, defend the truth'.

The thought of Amos Komenský—Comenius (1592–1670)—the Czech counterpart of Descartes, tended to humanism, toleration, non-violence, and a harmonic coexistence with the order of nature. The outstanding figure of a later age was Bernard Bolzano (1781–1848), whose work on logic later influenced Husserl, Tarski, and others. Subsequently, followers of the German philosopher J. F. Herbart came to the fore in Prague University. Although tedious, the Herbartians made Czech thought more factual, sober, and precise, and prepared the ground for a later \*positivism.

It was T. G. Masaryk (1850–1937), the great Czech philosopher and statesman, who played a key role in reorientating Czech thought away from German to English and French models. 'Courage and honesty' was his life's model. He was elected the first president of the Czechoslovak republic in 1918. Another remarkable figure of this period was Ladislav Klíma (1878–1927), who built on the thought of Schopenhauer and Nietzsche, and anticipated both \*existentialism and \*phenomenology. Russell and Bergson were the foreign philosophers most translated into Czech at this time.

The pro-Western orientation was badly affected by the Munich Agreement. In the struggle against the Nazi occupation, earlier Russophile and pan-Slavic moods emerged again. Many intellectuals spontaneously accepted Marxism. Only after the Communist coup in 1948 were illusions dispelled.

After the failed hopes of the Prague Spring of 1968, there emerged a dissident movement bringing together critical neo-Marxists with liberals and Christians. The leading Czech philosopher of the twentieth century, Jan Patočka (1907–77), Husserl's pupil and himself a

phenomenologist, became a leading personality in this opposition. His various works, including *The Natural World as a Philosophical Problem*, developed the thought of his teacher in a distinctive way.

The Velvet Revolution in 1989 brought about a renewal of free philosophical life. Formerly persecuted dissidents returned to the university, as did exiles from abroad. The new head of state, Vaclav Havel (1936– ),

was the second Czech philosopher-king. In the footsteps of Masaryk he strove to base his policy consistently on ethics. I.T.

# D

**d'Alembert, Jean le Rond** (1717–83). Leading mathematician and co-editor, with Diderot, of the *Encyclopédie*. D'Alembert composed the *Discours préliminaire de l'Encyclopédie* (1751) in which, influenced by Bacon, Newton, and Locke, he defended the reliability of the senses, and the basis they provided for all our knowledge. D'Alembert was, however, strongly rationalist, making mathematics the ideal form of knowledge, and physics the basic science. He insisted that all truth was derivable from a single ultimate principle, could we but know what it was. Diderot, by contrast, took biology to be the basic science and thought d'Alembert's emphasis on mathematics outmoded. These and personal differences led d'Alembert to resign as an editor. Initially a deist, d'Alembert denied that mere matter could produce intelligence; but he later became an atheist and materialist. t.p.

**Danish philosophy.** The philosophical tradition in Denmark has always been a part of mainstream European philosophy. In the late thirteenth century Danish philosophers co-operated in the revival of Aristotelian philosophy in France, and contributed to the development of speculative grammar. In the late sixteenth century Danish philosophy and theology were influenced by Melanchthon's Aristotelian school of philosophy and that of its opponent Ramism, the intellectual and pedagogical movement inspired by the critique of Aristotelianism by the French philosopher Petrus Ramus. The attempt to establish Lutheran orthodoxy within the Danish Church led to the elimination of Ramism, and to the dominance of \*Aristotelianism, which, later in the seventeenth century, combined with \*Cartesianism.

In the first half of the eighteenth century the teaching of philosophy in Denmark was strongly influenced by Wolffianism, which was based on the German philosopher Christian Wolff's Leibnizian systematization of human knowledge (in particular metaphysics, logic, and ethics). Jens Kraft (1720–65), an undogmatic pupil of Wolff, tried to give Newtonian physics a Leibnizian metaphysical foundation, diverging from Wolff in rejecting the

possibility of metaphysical knowledge of individual substances, in that respect anticipating Kant.

Later in the century \*Kantianism caused a considerable debate among Danish intellectuals. The philosophers Johannes Boye (1756–1830) and Niels Treschow (1751–1833) both rejected Kant. Boye opposed Kantian ethics from a position influenced by English and Scottish philosophy, especially that of Adam Smith. Treschow, who opposed Kantianism from a nominalist and empiricist point of view, also rejected romantic philosophy and Hegelianism, ultimately turning to a kind of \*Neoplatonism. The natural philosopher H. C. Ørsted (1777–1851) was originally inspired by Kant. Later he turned to Schelling. His brother, the lawyer A. S. Ørsted (1778–1860), first subscribed to Kantian ethics, but was later convinced by Fichte that the principles of ethics differ from those of jurisprudence.

Intellectuals at the turn of the eighteenth century were introduced to German romantic philosophy by the Norwegian philosopher and naturalist H. Steffens (1773–1845), but the next generation was turning to Hegelianism. By about 1840 a whole generation of students was under the spell of Hegelian speculative theology. However, one of their number, Søren Kierkegaard (1813–55), soon reacted against the reduction of faith to knowledge he found in Hegelianism. Kierkegaard's impact on Danish philosophy was mainly indirect. His stern interpretation of Christianity, and the strictures he passed on the Danish Church, caused several Danish philosophers to break with Christianity. Thus Kierkegaard paved the way for the separation of theology and philosophy, and his irrationalism may have indirectly promoted the influence of positivism and naturalism in the late nineteenth century.

F. C. Sibbern (1785–1872) and P. M. Møller (1794–1838), with whom Kierkegaard had studied philosophy, had also attacked Hegelianism. They maintained that philosophy always presupposes and is limited by human existence, with all the latter's uncertainties. Kierkegaard repeats this in his dictum that human existence cannot be confined within a philosophical system.

In about 1870 French \*positivism and English \*empiricism were introduced by the literary critic George Brandes (1842–1927) and the philosopher Harald Høffding (1843–1931). Høffding's broad humanistic and positivist

approach made a great impact on Danish culture in the first half of the twentieth century. Høffding's pupil the logical positivist J. Jørgensen (1894–1969) maintained his antimetaphysical, empiricist attitude. After the Second World War academic philosophy took a linguistic turn, while the philosophizing theologians and poets were influenced by \*existentialism, \*phenomenology, and German \*hermeneutics. The nuclear physicist Niels Bohr's (1885–1962) philosophical thoughts have also left their mark on Danish philosophy.

Now, at the beginning of the twenty-first century, a broad spectrum of competing trends exists, as in other European countries. Analytical philosophy still enjoys some support in academic philosophy, but modern French and German philosophy have made a strong impact on both popular philosophical discussion and academic philosophy. Perhaps this ability and readiness to receive and adopt philosophical movements from abroad is the distinctive character of Danish philosophy. C.H.K.

S. E. Stybe, 'Trends in Danish Philosophy', *Journal of the British Society for Phenomenology* (1973).

**Dante Alighieri** (1265–1321). Italian poet and political philosopher famed for his visionary poem *The Divine Comedy*, a daunting moral philosophical apologetic of individual freedom and responsibility, and their divine retribution and reward. Dante's most rigorously argued treatise is *Monarchia*, which proposes, in contrast to his contemporary Marsilius of Padua, a strong universal monarchy as the only solution to the ruinous Italian factionalism of his day. But Dante's most original theories cleanly separate the spheres of influence of Church and State. Human society is directed to its end of happiness by two, not one, divinely appointed authorities, Emperor and Pope, each independent of the other. The Church, by means of divine revelation and the theological virtues, confers heavenly beatitude on the immortal soul; but the State, by means of (mainly moral) philosophy and the natural virtues, confers earthly happiness on mankind. Temporal authority descends directly from God to the Emperor, and is not mediated by the Pope, as medieval canon lawyers fiercely argued. L.P.

\*Italian philosophy.

G. Holmes, *Dante* (Oxford, 1980).

**Danto, Arthur C.** (1924– ). American philosopher, at Columbia University, who has contributed to many areas of philosophy, including philosophy of history and epistemology; but, with the exception of a seminal paper defining the idea of a \*basic action (an action which we perform without doing anything else to bring it about), his major work has been in aesthetics, where he is largely responsible for bringing the idea of the 'artworld' into

prominence. For Danto, works of \*art are only recognized and understood as such if they are located within a context which constitutes the artworld, involving, *inter alia*, the works of other artists and the practices of critics. Art is surrounded by an 'atmosphere of theory'. We cannot separate work and interpretation.

R.A.S.

A. C. Danto, *The Transfiguration of the Commonplace* (Cambridge, Mass., 1981).

**Darwinism.** In a general sense the term Darwinism is taken to refer to any view which sees the development of species, including the human species, as the result of competition among and within species, which weeds out the less fit. The mechanism fuelling this process is that of the selective retention by the environment of those individuals who have particular genetically based features which give them competitive advantage over their fellows. They then transmit these features to their offspring. Since in nature genetically based variations within species arise randomly, Darwinism is a non-teleological theory of order: the variations chosen by the environment and which fit it were not designed to do so, nor did they arise in direct response to environmental pressure (*contra* Lamarck). The absence of \*teleological explanation means that it cannot be applied directly to developments in human society or culture. A.O'H.

\*evolution; social Darwinism.

J. Dupre, *Darwin's Legacy: What Evolution Means Today* (Oxford, 2003).

**Dasein.** German compound from *da* ('there, here') and *sein* ('to be'), thus literally 'to be there' and, as a substantival infinitive, 'being there'. In Kant, Hegel, etc. it is 'determinate being', especially in space and time, but also the 'existence' of God. It often amounts to a person's 'life'. For Nicolai Hartmann it is the *Dassein* of something ('the fact that it is, its existence'), in contrast to its *Sosein* ('essence, being thus'). Heidegger uses it for 'the entity which each of us himself is' and 'the being of man'. He does so for several reasons. *Dasein* is a neutral term: it does not commit us to viewing man as a biological entity, as consciousness (*Bewusstsein*, a formation parallel to *Dasein*), or as essentially rational. *Dasein* has no determinate essence; its being consists in its possibilities, in what it can make itself be: for *Dasein*, 'To be or not to be, that is the question'. It is 'there' in the world. But it is not confined to a particular place (or time); it 'transcends' and is 'there' alongside others or past events. It is the 'there' or locus of 'being': without *Dasein* there would be beings, but no being as such. M.J.I.

\*German philosophy.

M. Heidegger, *The Metaphysical Foundations of Logic*, tr. M. Heim (Bloomington, Ind., 1984).

**Davidson, Donald** (1917–2003). American philosopher who developed a widely admired and influential theory of mind and language. Davidson's deepest influence was

Quine, with whom he shared a commitment to the fundamental importance of standard logic to metaphysics, and a consequent suspicion of 'intensional' entities like meanings, propositions, and properties or attributes. (\*Extensionality; \*intension and extension.)

Quine thinks that the language of first-order logic is adequate to 'limn the true and ultimate structure of reality'. Given this commitment, what happens to those mental states whose ascriptions exhibit \*intensionality, such as beliefs and desires? The problem here is that the language which we use to attribute these states does not obey the principles of extensional logic. For example, Leibniz's law—the principle that if  $x = y$  then whatever is true of  $x$  is true of  $y$ —can fail when talking about beliefs and desires. If I believe that Cary Grant starred in *Notorious*, it does not follow that I believe that Archibald Leach starred in *Notorious*, since I may not know that Cary Grant is Archibald Leach. Since such intensionality is plausibly essential to descriptions of belief and desires, how can we accommodate these states within a Quinean theory of the world?

Quine's own response to this is to adopt a form of eliminativism about the mental: mental categories are not suitable for science and should therefore be dispensed with. Davidson's approach is different. He agrees with Quine that the intensionality of mental descriptions renders mental categories irreducible as a whole to physical categories. But he rejects Quine's behaviourism, and in 'Mental Events' (1970) he uses the irreducibility of the mental as a premiss in an argument for a version of the \*identity theory of mind, \*anomalous monism.

Davidson argues for his identity theory by making the plausible assumption that all mental events causally interact with physical events. He also assumes that wherever there is causal interaction, there is a strict law of nature encompassing the interacting events. This would seem to imply that there are psychophysical laws: laws linking mental and physical events. But if there were, then the mental would be reducible to the physical, which Davidson denies.

Davidson's theory of causation gives him a way out of this conflict: for him, causation is an extensional relation between individual \*events. It is extensional in the sense that if ' $a$  caused  $b$ ' is true, then it remains true regardless of how we describe  $a$  and  $b$ —so "The cause of  $b$  caused  $b$ ' is as good a statement of causation as ' $a$  caused  $b$ '. It is not, however, a good causal *explanation*, and this is where laws come in. Laws relate events only in so far as the events are described in a certain way. So an event may instantiate a law under some descriptions but not under others. With this distinction in mind, Davidson argues ingeniously as follows: since mental and physical events causally interact, they must instantiate a law. But they can't instantiate a psychophysical law, since there aren't any—so they must instantiate a physical law. But to instantiate a physical law, the mental events must have a physical description, and to have a physical description is to be a physical event. So all mental events are physical events.

But if explanation of mental phenomena is not a matter of describing them in terms of laws of nature, what is it? Davidson's claim is that it is a form of normative rationalizing explanation: in describing how someone is mentally, we are describing them as rational beings, subject to the norms of logic and good reasoning. Davidson developed these ideas as part of his theory of radical interpretation. (\*Translation.) His influential theory of meaning attempts to elucidate meaning in terms of the idea of truth, conceived more or less along the lines of a formal theory like Tarski's, and then to apply theories of truth to individual speakers, appropriately constrained by the principles of interpretation. t.c.

\*deflationary theories of truth; externalism; meaning; triangulation.

Davidson's essays are collected in five volumes:

*Essays on Actions and Events* (Oxford, 1980).

*Inquiries into Truth and Interpretation* (Oxford, 1984).

*Subjective, Intersubjective, Objective* (Oxford, 2001).

*Problems of Rationality* (Oxford, 2004).

*Truth, Language, and History* (Oxford, 2005).

**death.** Apart from trying to avoid it for as long as possible the philosopher has two main problems concerning death: What is it? And why does it matter? Death is the end of life, or at least of our earthly life, but when does that occur? If I render someone permanently unconscious, but his body goes on functioning till its natural term, have I murdered him? If I am decapitated, but a scientist rushes in announcing a new technique of sewing heads back on, as they now do hands, am I brought back from the dead, or did I never die? Is it worth ordering my body to be preserved for generations, in case such advances should occur (as apparently some Americans are actually doing)?

Is death always bodily death? Might we not one day swap bodies as we already swap hearts? Questions of \*personal identity loom here. Suppose the 'teleportation' of science fiction became real, so that when I want to visit Mars a complete molecule-for-molecule scan of my brain is radioed to Mars and there fed into a suitable synthesized body, which then comes to life complete with all my mental characteristics and memories, and feeling as though waking from an anaesthetic. The return journey is similar, landing me up either in my old body, deep-frozen, or in a new one. The complication that my earth-brain might survive the scan and continue normally on earth without disintegrating or being deep-frozen probably makes us say the Martian 'me' is a mere duplicate, so that *I* die whenever my earth-body perishes. But this takes us towards our second question: Suppose the scanning does destroy my earth-body; why should I mind, since all my projects and memories etc. will continue? If such travel became common, but with just one duplicate of me existing at any time, public life could continue as now. Might we not eventually accept the situation, just as we accept that the 'me' that will wake tomorrow is the same, or as good, as the 'me' that falls asleep ('dies?') tonight? Perhaps I want

my non-material soul to survive. But why should that be tied to the body? Why would it not be teleported?

Perhaps it is unclear what counts as surviving. But there are further problems too. Firstly, some, notably Heidegger, have seen problems about envisaging one's own death (though not, apparently, about envisaging one's own birth), and have wondered whether 'death' means the same when used of ourselves and of others. Secondly, why do we want to survive, or fear annihilation, since, as Epicurus said, where death is I am not; where I am death is not; so we never meet? Is it an irrational fear, developed by evolution—though \*evolution, here as in other cases, could only account for its development and not for its appearance in the first place? Or is annihilation a real deprivation, so that the fear of it is rational enough? Epicurus' argument suggests that the fear of death is irrational because death is something we cannot experience; but if it is rational to fear the loss of what is valuable this argument may not work, for it can be argued that experiences are not, and indeed cannot be, the only things of value or disvalue. (\*Life, meaning of.) A related question is why we worry about future non-existence but not about past non-existence. Fear, it is true, concerns only the future, but we do not seem to regret those past aeons.

A final thought for those (including the writer) who fear annihilation: is the thought of *everlasting* life any less disconcerting?

A.R.L.

**death instinct:** see Freud.

**death-of-the-author thesis.** This approach to the interpretation of literature originates in contemporary French thought, and has been influential in the philosophy of literary criticism. It proclaims that 'text' is a prior concept to 'author', and jettisons the latter as a mere construct. A text emerges as an 'interplay of signs' in which 'meanings proliferate', without any privileged author's meaning. A liberating idea for literary critics, it is regarded sceptically by many philosophers.

C.J.

R. Barthes, 'The Death of the Author', in *Image-Music-Text*, tr. S. Heath (London, 1977).

**deaths of philosophers.** The first philosopher known to us as an individual person is also the first to die an interesting and dramatic death. Socrates, condemned to death by the Athenian state for, among other things, corrupting the young, drank hemlock amongst his friends, as memorably recounted in Plato's *Phaedo*. Lucretius is alleged to have killed himself after being driven mad by taking a love philtre. Seneca opened his veins in the bath after falling

out with Nero. Boethius was strangled on the orders of the Ostrogoth king Theodoric. Peter of Spain, having been pope for a year as John XXI, was killed by the collapse of a roof. Simon Magus, expecting a miracle, had himself buried alive and died of it. Peter Ramus was killed on St Bartholomew's night in 1572. Giordano Bruno was burnt by the Inquisition, as was Vanini, after horrible tortures. Uriel da Costa, after being flogged and trampled over by the Jewish community he had offended, went home and shot himself. Thomas More was beheaded. Francis Bacon died of a cold contracted while stuffing snow into a chicken as an experiment in refrigeration. Descartes was similarly afflicted through rising early to instruct Queen Christina of Sweden. Hume died cheerfully, after fending off the pressing inquiries of Boswell about an atheist's attitude to death. Hegel died in a cholera epidemic. Jevons was drowned while bathing. Gentile was murdered by communist partisans for his involvement with Mussolini's fascist regime. Simone Weil starved herself to death for the sake of solidarity with her compatriots in occupied France. Richard Montague was beaten to death by a piece of rough trade he had brought home. But for the most part, as might have been expected, philosophers have died in their beds. A.Q.

\*autobiography, philosophical; persecution of philosophers.

Paul Edwards (ed.), *Encyclopedia of Philosophy* (New York, 1967), biographies of individual philosophers.

**de Beauvoir, Simone** (1908–86). French existentialist philosopher, perhaps better known as feminist theoretician and novelist, and as the lover and companion of Jean-Paul Sartre, with whom she had a famously open lifelong relationship. She billed herself as one of his disciples and often cites his works in her own, but she in turn greatly influenced him, both through discussion and in the criticism which it was her expected role to produce of each of his writings.

De Beauvoir is best known for *The Second Sex* (1949), a pioneering examination along existentialist lines of the female condition. Sartre's Hegel-derived model of the struggle between subjective consciousnesses—each seeking to avoid objectification and to be looker rather than looked-at—is adapted to describe male–female relations. Men compel women to assume the status of the \*Other. Thus the standard human (the \*for-itself self-transcender) is implicitly defined as male, woman dismissed as mere in-itself embodiment. De Beauvoir proposes historical reasons for this oppressive objectification, and deconstructs the myth of the feminine, including its perpetration by five major male authors. She also examines the contemporary Western woman's roles as girl, wife, mother, lesbian, prostitute, in the light of her central analysis.

But influential, now invisibly, as this analysis is, it seems inadvertently to endorse what it condemns, which is a problem endemic in any attempt to existentialize an essentialism. 'One is not born, but rather becomes, a woman', intended to be liberatingly anti-deterministic,

implies that femaleness is indeed optional and subhuman, and maleness the slipped-from standard. Feminists have criticized her tendency to talk as if women should re-create themselves in the image of men, rather than reorientating a male-skewed world. Few, however, would deny the central truth of de Beauvoir's diagnosis, and its importance.

De Beauvoir was not a feminist before writing *The Second Sex*, nor, until after 60, did she profess to be one. According to her notion of existential \*freedom, women were largely responsible for their oppression, abdicating transcendence for security. But she later regretted the overly idealist, insufficiently materialist underpinning of the book, for she gradually softened her original extreme Sartrean stance on freedom and responsibility, shifting from almost-solipsist severity to a view that the individual is importantly the product of his or her background and social context. In discussion with Sartre she objected, against his theories on absolute unlimited freedom ('the slave in chains is as free as his master'), that the prisoner in cell or harem lacked it. And in her essays *Pyrrhus et Cinéas* (1944) and *The Ethics of Ambiguity* (1947) she attempted to reconcile her less extreme view with Sartre's by distinguishing two sorts of freedom: the ability to transcend and alter the circumstances in which one finds oneself, and the ability to dominate and utilize them to the fullest possible extent. She thus introduced into Sartrean existentialism the notion of freedom in the context of situation, and of the 'concrete possibilities' which may impede people from actually transcending their circumstances. She also, before Sartre did, reconciled with existentialist subjectivity the position that personal freedom is ineluctably bound up with that of others. However, like him, she was unable ever convincingly to give content to the idea of freedom as a moral ideal, or, logically, to escape the admission that the Sartrean existentialist has no grounds for preferring one project to another.

As well as her long essays on ethics (a subject Sartre promised, but failed, to write on), de Beauvoir explored existentialism in shorter essays and a two-volume autobiography, and, as he did, through novels and plays. *Old Age*, which she called 'the counterpart' to *The Second Sex*, is more political, blaming poverty and exploitation for worsening the aged's plight. With Sartre, Merleau-Ponty, and Aron, de Beauvoir headed the editorial board of the left-wing magazine *Les Temps modernes*, which consistently took a controversial stand on the Algerian War, feminism, and other issues, but also condemned the invasions of Hungary and Czechoslovakia. J.o'g.

**decidability.** A set is decidable with respect to a given property if there is a finite procedure with explicit terminus for determining membership. The set need not be finite. For example, the set of even numbers is decidable. Frequent focus in logic is on decidability for (1) the set of theorems or (2) the set of semantically valid propositions of a formal system. Propositions (or sentences) of the propositional calculus are decidable in both senses. (\*Decision procedure; tautology.) Not so for the predicate calculus. Although there is a specifiable proof-procedure for the latter, there is no specifiable terminus for the procedure and hence the set of theorems is undecidable.

Gödel showed that in a system which accommodates axioms for arithmetic there will be some sentences of arithmetic which are not provable and nor are their negations. Given \*bivalence there are therefore undecidable true sentences of arithmetic. Gödel produced one such sentence which on the assumption of consistency is plausibly true but not provable. R.B.M.

B. Mates, *Elementary Logic* (Oxford, 1972).

**deciding:** see choosing and deciding.

**decision procedure.** A specifiable terminating procedure (algorithm) for determining whether something has a given property. In logic one focus has been on procedures for determining for a formal system whether or not a \*well-formed formula is a theorem, i.e. is provable. One procedure for identifying the set of \*theorems in the propositional calculus is the method of \*truth-tables since it is demonstrable that the set of theorems and the set of \*tautologies are coextensive. No decision procedure is available for determining the set of theorems of the predicate calculus but there are decision procedures for certain subsets of formulae with quantifiers.

Another focus is on procedures for the determination of semantic validity, i.e. whether a well-formed formula is true under any interpretation. In the \*propositional calculus, truth-tables provide a decision procedure for semantic validity. R.B.M.

B. Mates, *Elementary Logic* (Oxford, 1972).

**decision theory.** The abstract (or 'formal', or mathematical) theory of decision-making, or more precisely of rational decision-making. The decision-maker is assumed to have a range of objectives, measurable at least in terms of their rank order, though it is theorized that we can also talk of their 'utility' or relative degree of preferredness; but it is *not* assumed that one agent's utility may be directly compared with another's. Of special interest are decisions under various kinds of limited knowledge of outcomes of possible actions, such as those in which probabilities are known, and especially those in which even they are not known (termed 'uncertainty'). Of very special interest are

those cases involving interaction with other decision-makers; these are called 'games'. Investigation of such 'games' as \*Prisoner's Dilemma, Co-ordination, and Chicken inform much recent social, political, and moral philosophy. Decision theory is mathematically orientated, but many results are philosophically disputable. An example that is not: in two-person zero-sum games, one does best with a minimax strategy.

J.N.

\*game theory.

R. Duncan Luce and Howard Raiffa, *Games and Decisions* (New York, 1957) is the classic in the field.

Michael D. Resnik, *Choices* (Minneapolis, 1987) is one of many excellent texts for the novice.

**deconstruction.** Introduced into philosophy by the French philosopher Jacques Derrida in the late 1960s, the term 'deconstruction' is now chiefly associated, despite the disclaimers of its originator, with a school of literary criticism. Derrida's disclaimers present a major obstacle to any attempt, this one included, to encapsulate his thought. He tells us that deconstruction is neither an analytical nor a critical tool; neither a method, nor an operation, nor an act performed on a text by a subject; that it is, rather, a term that resists both definition and translation. To make matters worse, he adds that 'All sentences of the type "deconstruction is X" or "deconstruction is not X" miss the point, which is to say that they are at the least false' ('Letter to a Japanese Friend'). The following elucidatory remarks, which I shall nevertheless offer, are perhaps especially compromised by their subject-matter.

Deconstruction can be illuminated by considering two major intellectual influences on Derrida: the philosophy of Heidegger and \*structuralism. Derrida's term alludes, deliberately, to Heidegger's project of the destruction (*Destruktion*) of the history of \*ontology. In this reappraisal of Western philosophy, Heidegger argued that a particular tense—the present—had continually been awarded priority in accounts of the nature of being. To correct this prejudice philosophy needed to reconsider the problem of time. Derrida's deconstruction, also a response to the 'metaphysics of presence', is distinguished by its central concern with the treatment of *language* in Western thought. In his 'classic' period (1967–72), at least, the texts Derrida deconstructs take language as their theme: Plato's *Phaedrus*, Rousseau's *Essay on the Origin of Languages*, and Saussure's *Course in General Linguistics*, among others. Derrida suggests that the idea of presence lies behind the traditional ranking of speech above writing. This tradition holds speech to be the direct expression of thought or \*logos, contemporaneous with its meaning, while writing enters the scene subsequently, a dangerous substitute for speech in which the speaker's intentions, no longer 'present', are likely to be betrayed. Derrida's strategy is to demonstrate that the logic of the texts that promote this picture invites its own refutation. (It is this strategy—the turning of a text against itself—that has become the hallmark of deconstructive literary criticism.) Derrida's

reading of Saussure, for example, argues that the properties that purportedly distinguish writing from speech are ones that Saussure's own theory must commit him to ascribe equally to speech: spoken signs, like written ones, are arbitrary, material, and system-relative. The primacy of the voice rests on an entrenched philosophical illusion.

Derrida inherits from structuralist theory the idea that signification must be explained in terms of the system that governs it and the oppositions mobilized by that system. Just as the structuralist anthropologist Lévi-Strauss used the opposition between the raw and the cooked to illuminate cultural practices concerning food, so Derrida's readings of philosophical texts begin by identifying the fundamental conceptual oppositions they rely on: speech–writing, soul–body, intelligible–sensible, literal–metaphorical, natural–cultural, masculine–feminine. Derrida's post-structuralist credentials come from his next steps: first, as we have seen, to subject these oppositions to an internal critique that destabilizes them; then, to raise the Kantian question of what makes these oppositions possible. This last question, Derrida believes, takes thought and language to their limits. His response is to generate a set of terms, many neologistic, and all avowedly inadequate and self-defeating, for the reader to struggle with. We are offered *archi-writing*, \*différance, textuality, the trace—terms that appear to be ultimate but that necessarily presuppose already established linguistic structures. Derrida thus condemns the structuralist hope of delineating closed systems to be for ever unfulfilled.

**Dedekind, J. W. R.** (1831–1916). German mathematician, who made two important contributions to the foundations of mathematics. The first showed how the theory of the real \*numbers could be freed from any reliance on geometrical intuition by being constructed instead from the theory of the rational numbers. Dedekind's basic idea here was that each real number corresponds to a 'cut' in the rationals, i.e. a separation of all rationals into two non-empty sets, with all in the one set being less than all in the other. The second contribution was a set of axioms for the natural numbers, which in effect are those known today as \*'Peano's postulates'. Dedekind proved that these axioms do exactly characterize the structure of the number series. Both these contributions are conveniently translated in J. W. R. Dedekind, *Essays on the Theory of Numbers* (New York, 1963).

H. Wang, 'The Axiomatisation of Arithmetic', *Journal of Symbolic Logic* (1957).

**de dicto:** see *de re* and *de dicto*.

**deduction.** A species of \*argument or \*inference where from a given set of premisses the conclusion must follow. For example, from the premisses  $P_1, P_2$  the conclusion  $P_1$  and  $P_2$  is deducible. The set consisting of the premisses and the negation of the conclusion is inconsistent. An argument advanced as deductive where the foregoing fails is invalid. If deducibility holds between a conclusion and premisses, the conclusion is also described as a logical consequence of the premisses.

In the standard \*propositional calculus, it is provable that if  $Q$  is deducible from a set of premisses  $P_1, P_2, \dots, P_n$  then  $P_n \supset Q$  is deducible from  $P_1, P_2, \dots, P_{n-1}$ . Where  $n = 1$ ,  $P_1 \supset Q$  is a theorem. This result is known as the deduction theorem. R.B.M.

\*horseshoe; induction.

B. Mates, *Elementary Logic* (Oxford, 1972).

**deduction, natural:** see natural deduction.

**defeasible.** A defeasible property, relation, or judgement is subject to defeat (nullification, termination, or substantial revision) by further considerations (e.g. later facts or evidence).

Lawyers' English has always known defeasible estates, titles, transactions. Hart introduced the term into his first essay in philosophy of \*law, arguing that legal concepts do not describe (for example) actions, but ascribe responsibility or liability, ascriptions defeasible on proof of exceptions (e.g. duress, infancy). Hart soon abandoned this thesis, and the word. But legal philosophers debate law's defeasible (presumptive, prima facie) moral obligatoriness. And concepts of defeasibility have seen wide service in epistemology and semantics. For example, some explanations of an assertion's sense refer to what would give the assertion evidential or inferential warrant (and even certainty), albeit a warrant defeasible by further evidence or considerations.

J.M.F.

G. P. Baker, 'Defeasibility and Meaning', in P. M. S. Hacker and J. Raz (eds.), *Law, Morality and Society* (Oxford, 1977).

**de Finetti, Bruno** (1906–85). Italian mathematician and theorist of \*probability whose technically sophisticated, but philosophically somewhat underdeveloped, work laid the foundations for the modern subjectivist interpretation of probabilities as the partial beliefs of a judging agent, intermediate between full belief and full disbelief. Such views seem to flout our intuitions that probabilities are more objective than this. De Finetti's achievement was to show that, from imposing the single minimal constraint on an agent's judgements of *coherence* (a generalization of consistency), two results follow: initially different sets of judgements will converge as the probabilities are adjusted in the light of incoming evidence; and, in the contexts of most interest to science, they must converge on to the observed relative frequency of the outcomes of repeated trials. Hence, subjectivist theory can find

room for the objective concepts of consensus and relative frequency. J.L.

B. de Finetti, *Theory of Probability*, 2 vols. (New York, 1974).

**definit fallacy.** The definit fallacy is the tactic in argumentation of defining a term so that it is friendly to your own side of a dispute, or unfriendly to the opposed side, without leaving any room for questioning the definition or considering alternatives. For example, a pro-life advocate in an abortion dispute may insist rigidly on defining abortion as the act of murdering an unborn baby. The expression 'definit fallacy' has also been used in ethics (G. E. Moore) to exclude the practice of defining one ethical property by means of another (supposedly) identical property. But it is not clear that this is a \*fallacy. D.N.W.

\*definition.

Douglas N. Walton, *Informal Logic* (Cambridge, 1991).

**definite descriptions:** see descriptions, theory of.

**definition.** Explanation of the meaning of a word or expression, either as established in a language ('dictionary definition') or as it is to be used ('stipulative definition').

Traditionally, the definition of a word properly consisted of expressions naming the genus (wider class) to which something belonged and differentia (distinguishing features). Thus 'triangle' was defined as 'a plane figure (genus) bounded by three straight sides (differentia)'. The expression supplying the definition (definiens) was taken as synonymous with and capable of being substituted for the term being defined (definiendum). However, there are many types of words whose meaning is capable of precise explanation, which, for one reason or another, cannot be defined in this sense. Some of the reasons were given by Locke in *An Essay Concerning Human Understanding* (1690).

1. An explanatory equivalent may require more than the traditional two terms for genus and differentia. 'Languages are not always so made, according to the Rules of Logick, that every term can have its signification exactly and clearly expressed by two others' (*Essay*, III. iii. 10).

2. Some words cannot be defined by means of other words: 'For if the Terms of one Definition, were still to be defined by another, Where at last should we stop?' (*ibid.* III. iv. 5). Locke restricted definitions to explanations of meaning by other words, and held that the names of simple ideas, e.g. 'blue', whose meaning can be explained but only by pointing out examples, 'are incapable of being defined' (*ibid.* III. iv. 7). Explanation via examples, however, is now included as a type of definition: ostensive, as opposed to verbal, definition.

A dictionary definition, since it claims to describe the established meaning of a word, may be inaccurate. It may be too narrow, excluding things that ought to be included, e.g. "queen" = the wife of a king', or too broad, including things that ought to be excluded, e.g. "king" = the sovereign of a country', or simply wrong, e.g. "princess" = the

wife of a king'. Stipulative definitions, which merely specify the proposed use of a word, new or old, cannot in this sense be inaccurate, although divergence from established meanings may be open to other criticisms, such as that the new use is confusing or, in some legal contexts, that it has adverse practical effects. Suggested definitions of either kind may have the defect of being insufficiently explanatory: e.g. obscure, circular, or, with ostensive definitions, leaving more than one possibility open.

Definitions dubbed 'persuasive' by C. L. Stevenson, generally purport to describe the 'true' or 'real' existing meaning of a term (e.g. true democracy, real freedom) while in fact stipulating a particular or an altered use. Definitions are commonly thought of as given for the purposes of clarification, but someone who gives a persuasive definition usually has the different object of inducing acceptance of some view, e.g. that only some particular system is democratic. In the same vein, there are 'legal' or 'coercive' definitions, which have the object or effect of creating or altering rights, duties, or crimes. S.W.

C. L. Stevenson, *Ethics and Language* (New Haven, Conn., 1944).

**definition, contextual:** see contextual definition.

**definition, ostensive:** see ostensive definition.

**definitions, explicit and implicit.** An explicit definition of a term *t* (the *definiens*) provides necessary and sufficient conditions (the *definiendum*) for the correct employment of *t*, usually in terms of previously understood vocabulary. Thus the explicit definition 'For all *x*, *x* is a triangle if and only if *x* is a three-sided polygon' provides semantically equivalent conditions for using the expression 'is a triangle'. A key feature of explicit definitions is that they allow the elimination of the *definiens* from sentences in which it occurs and its replacement by the *definiendum* without change in truth-value. Implicit definitions place constraints on the use of a term, usually in the form of a theory, such that any term satisfying the constraints falls under the definition. So, \*probability theory implicitly defines what 'probability' means. Implicitly defined terms are not eliminable, and the associated concept is underdetermined in the sense that there is never a unique concept satisfying the implicit definition—hence the multiple meanings of 'probability'. P.H.

Paul Horwich, *Meaning* (Oxford, 1998).

**deflationary theories of truth.** A theory of \*truth is deflationary if it declares that truth is a concept that is easily shown to be dispensable, or is no more than technically useful. The simplest deflationary theories are \*redundancy theories, which observe that 'It is true that' or 'It is a fact that', when appended to a sentence, add nothing but emphasis. Frank Ramsey, who made this observation,

also noticed that reference to truth is not so easily removed from sentences like 'Everything he says is true', but this was a problem he thought could be solved. Deflationists who treat truth as a property of sentences or utterances rather than of propositions note that Tarski has shown how to eliminate the words 'is true' when predicated of sentences of certain formalized languages. They consider that this shows that the concept of truth is not metaphysically deep, and so does not require appeal to such notions as correspondence to reality, coherence, or success of one sort or another in coping. D.D.

P. F. Strawson, 'Truth', *Proceedings of the Aristotelian Society*, supp. vol. (1950).

**deism.** Philosophical belief in a god established by reason and evidence (notably by the design argument) without acceptance of the special information supposedly revealed in, for example, the Bible or Koran. Hence deism involves belief in a creator who has established the universe and its processes but does not respond to human prayer or need. In the eighteenth century the word was applied to positions as far apart as the positive religious rationalism of Samuel Clarke and the negative quasi-atheism of Anthony Collins. The archetypal deist is Voltaire. J.C.A.G.

\*atheism and agnosticism.

Peter Gay, *Deism: An Anthology* (New York, 1968).

**Deleuze, Gilles (1925–95).** French philosopher whose earliest books included studies of Spinoza, Hume, Kant, and Bergson, each written from an angle sharply at odds with the received exegetical wisdom. Deleuze reads always with an eye to those 'heretic' doctrines—like Spinoza's ontology of bodily affects and forces or Hume's radical empiricism—which retain their power to provoke and disconcert. Hence also his attraction to Nietzsche (the subject of another expository *tour de force*). In *Différence et répétition* and *Logique du sens* he came as near as possible to offering a full-scale programmatic statement of this post-philosophical, anti-systematic, ultra-nominalist or resolutely 'non-totalizing' mode of thought.

Deleuze subsequently produced a number of works in collaboration with Félix Guattari, a political theorist and close cousin to the late 1960s 'anti-psychiatry' movement. Best known of these is their joint diatribe entitled the *Anti-Oedipus*. This is a vast, chaotic rag-bag of a book which attacks Freudian \*psychoanalysis (along with its Lacanian post-structuralist offshoot) as a mechanism for channelling or policing the flows of vagrant 'molecular' desire, and thus reinforcing the 'molar' dictates of capitalist socio-political order. Spinoza and Nietzsche are still the great heroes, standing as they do—or as these authors read them—for a counter-tradition of sceptical, affirmative, non-subject-centred, instinctually driven 'desiring-production'. C.N.

Ronald Bogue, *Deleuze and Guattari* (London, 1989).

**de Maistre, Joseph Marie** (1753–1821). De Maistre is now known chiefly as a proponent of monarchical government and of the Christian foundations of civil society. He espoused these doctrines originally in diagnosing the causes of the French Revolution, which he regarded as divine punishment for France's embrace of the anti-Christian \*Enlightenment. He urged the doctrines more generally in *On the Pope (Du pape)* (1819), in which he argued that an infallible papacy is the unique source not only for Christian orthodoxy, but for all legitimate political power and for the progress of universal civilization. De Maistre wrote further both an extended vindication of divine providence (*Soirées de Saint-Petersbourg* (1821)) and a polemical refutation of the \*materialism of Francis Bacon (*L'Examen de la philosophie de Bacon* (1826)).

M.D.J.

\*conservatism.

Richard A. Lebrun, *Joseph de Maistre: An Intellectual Biography* (Kingston, Ont., 1988).

**demandingness of morality.** Morality presupposes certain tests, criteria, or requirements that actions must meet in order to be morally acceptable. Failure with respect to living up to moral norms is considered to diminish one's standing as a human being in a way that failure to meet other achievement norms allegedly does not. Most moralists, including modern Kantians and consequentialists, hold that morality is specially demanding and that moral tests are difficult for the ordinary person to pass on an ongoing basis, in so far as morality requires the suppression of self-interest and inclination. Moral failure is not always excused by situational or psychological reasons for poor performance, or compensated for by the attainment of non-moral goods. Critics of this demandingness favour greater concessions to human weakness and partiality. They may insist that the meta-ethical notion of an ineluctable and universally binding moral requirement has not been adequately grounded. Moral considerations can sometimes be justifiably overruled by non-moral considerations, or even ignored on occasion. Moral rules, on their view, correspond, like most other norms, to defeasible ought-statements.

Bernard Williams, *Ethics and the Limits of Philosophy* (London, 1993).

**demiurge.** The ancient Greek word means 'craftsman' or 'artisan'. Plato, in the *Timaeus*, uses the word for the maker of the universe. Plato says of this maker that he is unreservedly good and so desired that the world should be as good as possible. The reason why the world is not better than it is is that the demiurge had to work on pre-existing chaotic matter. Thus, the demiurge is not an omnipotent creator. Early Christian philosophers were quick to claim that the demiurge represented pagan philosophy's anticipation of the God of revealed religion.

\*cosmogony.

F. M. Cornford, *Plato's Cosmology: The Timaeus of Plato*, tr. with running commentary (London, 1937).

**democracy.** Government by the people. Until recently, democracies counted very few persons among 'the people'. Now they include all adult citizens, including, in many nations, recent immigrants, and democracy is virtually universally revered as the best or the right form of government. In the democratic upsurges in Eastern Europe in 1989, a rallying-cry from crowds in the street was 'We are the people'. Every chanter, every listener, knew what that meant, and most of them presumably thought it a claim of morality, of right.

In its simplest form, democracy entails having all citizens participate in voting on policies. In large states this is not sensible or even possible and participation takes place in sequential forms. First, representatives are chosen and then they decide on policies. It is widely believed that different structures for representation could produce substantially different outcomes. Hence, there is no simple formula for democracy that relates popular preferences to political outcomes in large polities.

Because the general character of democracy is widely understood, we may focus discussion most acutely by beginning with its difficulties. Contemporary public choice theory began in the analysis of two critical problems for democratic decision. (1) The economist Kenneth Arrow showed that orderly individual preferences do not generally aggregate into orderly collective preferences, which may be ill-defined. This result is essentially a generalization of a long-ignored result of C. L. Dodgson (Lewis Carroll). (2) The economists Anthony Downs and Mancur Olson argued that individual motivations for action are incompatible with collective preferences even when the latter are well defined. The logic of democracy is doubly flawed. One might respond to the first result by saying that democracy need not be determinate even though individual preferences might be. Of course democracy will be a mess when the society is a mess. The second result is not so easy to accommodate. It includes the sad conclusion that the individual need not even have motivation to know enough about public life to make intelligent decisions. Self-interest leads to public ignorance. Hence, democracy can be a mess even when the society is not. The perverse logic of its motivation may undermine justifications for democracy.

Among the major contemporary justifications of democracy are that it serves interests by bringing them into decision procedures, that democratic participation enhances autonomy, that democracy is the best form of government for political \*equality, and that it is the natural form for consent through deliberation. In order, it serves welfare, autonomy, equality, and agreement. \*Consent plays a role in all of these, but the role is largely causal for welfare and equality, and constitutive for autonomy and agreement. A grudging, negative justification is that democracy is better than other forms of government at blocking particularly bad results from

continuing (this is often, but not always, a welfarist claim). A final justification, which may be merely a historically specific variant of justification from \*autonomy, is that changing to democratic forms can be enlivening and fulfilling for the generation that makes a change. For this to be true, some other justification must generally be believed.

The first four—positive—justifications are, in their own terms, less compelling than they might be just because they founder on the two perverse logics of democracy. They founder both conceptually and empirically. The negative claim for democracy is a variant of Winston Churchill's quip that democracy is the worst form of government other than all the other forms we know. This sounds like a strictly empirical claim, but it requires some sense of the notion 'better', which may make no sense under the perverse logics of democracy. And the claim for the beauty of changing to democracy is a claim about the facts of actual experiences, such as in the United States two centuries ago, Spain recently, and Eastern Europe today. There are contrary experiences, such as in France after the Revolution, Germany between the wars, and Algeria and Iran more recently.

Welfarist justifications of democracy reached their height in the work of the Utilitarians, especially John Stuart Mill. In the twentieth century, they turned increasingly negative: democracy is more valuable for what it prevents than for what it creates. The lesson of the collapse of socialism in the 1980s will likely be invoked for generations to support the welfarist value of democracy, which may be too readily associated with the \*market in Western thought. An early and still arguably the most articulate welfarist justification of a form of government was Thomas Hobbes's defence of extreme autocracy. The twentieth century provided vicious counter-examples to Hobbes's vision. Apart from empirical concerns, there is also a deep conceptual problem in the definition of welfare, especially as compared across individuals.

Justifications of democracy that turn on equality are still in their infancy. One might look to equality of outcomes, such as economic results, or to equality of political power or opportunities for participation. Democracy may tend to produce welfare policies that elevate the condition of the very poor and thereby enhance equality of outcomes, but the data are quite ambiguous and the causal theory of why this should happen is very thin. Equality of political power is perhaps the more compelling justification, but it lacks conceptual clarity. How do we measure power to equate it?

Deliberation is especially associated with Jürgen Habermas. Critics argue that the appeal of deliberation is the appeal of the intellectual salon with a dozen or so erudite and witty discussants. Deliberation was not even very good much of the time in Athens, with its extraordinarily supportive conditions. It has little chance in a nation of 50 or 200 million adult citizens. Perhaps therefore, much of the argument in favour of deliberation has the flavour of rationalist, rather than genuinely procedural, justification.

Rationalist debate is, of course, carried out by theorists, not by peoples. Indeed, the salon model of deliberation is an oddly élitist vision of democracy.

Autonomy, whether in the tradition of Immanuel Kant or of Mill, has similar problems. First, if autonomy depends on the efficacy of participation, we should hope few have it, because life in which tens or hundreds of millions of people are effective in imposing their idiosyncratic views on us would be horrendous. The movie *Dr Strangelove*, which has too few lunatics, understates how horrendous such a world would be. Quite possibly, we must conclude that Downs's world, in which few have incentive to participate seriously, is a good world, and that it is a world in which autonomy cannot depend very much on democratic participation. Second, if autonomy depends on the benefits that come from participation, then it is contingent on whatever good motivates participation. Most people cannot sensibly think they benefit from participation that does not have effects on government policy.

Democratic theory is in the throes of a revolution of creative energies and ideas, especially from interdisciplinary borrowings and insights and from current, remarkable experience. When have political theorists previously had the luxury of quoting the latest issue of *The Times* to undergird their arguments? As is true of many intellectual enterprises, clarification regularly uncovers difficulties, often grievous difficulties, for our understanding of democracy. As a result, democratic theory thrives while theoretically democracy looks more shambling than ever. Though democracy may not be a good example of deliberation, its theory often is. Debates are beautiful, wide-ranging, insightful, and, unusually for philosophy, increasingly grounded in empirical cases. There is no call for science fiction or contrived examples in democratic theory.

**democracy and capitalism.** Democracy is a form of government where political power is exercised on behalf of the people as a whole; capitalism is an economic system whereby goods and services are produced and distributed for profit.

Classical liberal theory conceives of democracy and capitalism as independent systems, with disparate goals, requirements, and types of influence. Democracy restricts economic processes only to protect basic rights; it does not limit wealth, and so allows the profit motive to stimulate

innovation and mass production which can benefit society. However, capitalism creates a large wage-dependent class lacking the goods, opportunities, and political power of the wealthy. Secondly, unrestricted global capitalism has created international, non-democratic bodies able to override domestic democratically enacted environmental or labour restrictions. And democracy requires citizens who can think critically; capitalism needs consumers easily influenced by advertising.

Social democracy extends citizens' rights to include health care, housing, transportation, education, welfare programmes, union and work-place protection, and a minimum wage. It includes progressive taxation and restricts financial influence on political processes. c.c.

E. M. Wood, *Democracy against Capitalism: Renewing Historical Materialism* (Cambridge, 1995).

**democratic violence.** Political violence, according to some, is necessarily undemocratic since it involves force rather than democratic process. Others argue that it is admissible, but only against undemocratic states. If closer attention is given to the real operation of democracy and the intent of political violence, however, some violence may be considered democratic in virtue of features it shares with democratic practice. If, for example, violence falls short of literally forcing obedience, it can be considered as a way of bringing persuasive pressure to bear and therefore akin to procedures of persuasion that are intrinsic to democracies. Violence can, in addition, be aimed at rectifying the undemocratic influence of wealth and position, and may bring about more democracy. That acts of violence can be considered to be democratic would be important in determining whether they are justified, but neither sufficient nor necessary for it. K.M.

**Democritus** (c.460–c.370 BC). Co-founder with Leucippus of the theory of \*atomism. His exact relation to Leucippus is obscure. Aristotle and his school agree in treating Leucippus as the originator of the theory, but also in assigning its basic principles to both, while later sources treat the theory as the work of Democritus alone.

Very little is known about his life. His works, none of which survive, included a complete account of the physical universe, and works on astronomy and other natural sciences, mathematics, literature, epistemology, and ethics. Ancient sources preserve almost 300 purported quotations, the great majority on ethics; the authenticity of the ethical fragments is disputed. Sextus Empiricus preserves some important quotations on epistemology. For our knowledge of the physical doctrines we are reliant on the doxographical tradition stemming ultimately from Aristotle, who discusses atomism extensively.

According to Aristotle, the Atomists attempted to reconcile the observable data of plurality, motion, and

change with the denial by the \*Eleatics of the possibility of coming to be or ceasing to be. Accordingly they postulated as primary substances an infinity of unchanging physical corpuscles in eternal motion in empty space, and explained apparent generation and corruption as the formation and dissolution of aggregates of those. These corpuscles were physically indivisible (whence the term *atomon*, lit. 'uncuttable'), not merely in fact, but in principle. Empty space was postulated as required for motion, but was characterized as 'what is not', thus violating the Eleatic principle that what is not cannot be. We have no evidence of how the Atomists met the accusation of outright self-contradiction.

Democritus seems to have been the first to recognize the observer-dependence of the secondary qualities. Perception of the secondary qualities reveals merely how things seem to us, as opposed to how they really are. According to some sources, he used this contrast to show the unreliability of the senses, but then faced the problem of the justification of his theory, which was founded on sensory data. It is disputed whether he responded to this problem by espousing scepticism.

The ethical fragments, if genuine, show that Democritus was one of the first philosophers to maintain a form of enlightened hedonism, and that he had a strong commitment to social cohesion and the rule of law. c.c.w.t.

**demonstration.** Proof. Something is demonstrably true if you can prove it, demonstrably false if you can give a \*proof that it is false. Deductive proof is usually meant here. A demonstration will generally consist of true premisses, followed by logical steps to a conclusion. Wittgenstein thought that genuine proofs in logic or mathematics were surveyable—i.e. could be taken in. The term 'demonstration' ('showing') might be thought to embody this principle. If a 'number-crunching' calculator churns out the solution to an equation, we will accept it, of course—but the solution won't have been demonstrated. R.P.L.T.

P. T. Geach, *Reason and Argument* (Oxford, 1976).

**De Morgan, Augustus** (1806–71). British mathematician who also played a useful part in the development of logic. He was one of those who realized that much valid reasoning could not be forced into the mould of Aristotelian syllogistic, giving examples such as: 'Horses are animals; therefore the head of a horse is the head of an animal.' As a logician he is remembered now by two laws named after him, namely

'Not ( $P$  and  $Q$ )' is equivalent to 'Not- $P$  or not- $Q$ '  
'Not ( $P$  or  $Q$ )' is equivalent to 'Not- $P$  and not- $Q$ '

(As stated here, these are laws of propositional logic. In De Morgan's own formulation they would belong rather to the algebra of classes.)

**Dennett, Daniel C.** (1942– ). Dennett's guiding idea is that of the 'intentional stance'. We take the intentional stance towards a system—a person, a bat, a computer—when we attribute rationality to the system and predict what the system will do given the beliefs and desires ascribed. There is an abiding controversy about whether the intentional stance captures the way things really are or whether the stance is merely a heuristic, an instrumentally useful way of conceiving mind, which awaits the more accurate analyses to be offered from the neurophysiological level (the physical stance) or the subpersonal cognitive psychology level (the design stance). Dennett tries to avoid realism or \*instrumentalism, dubbing himself a 'mild realist'. Following Ryle (and Reichenbach) he holds that there are different senses of 'exist': the marks on this paper exist and so, in a different sense, do the Equator and the self. Dennett is a realist about 'representations', since our best science tells us that we are intentional systems; folk psychological notions like 'belief' and 'desire' pick out 'real patterns', but it is doubtful whether they do so in the most perspicuous manner.

**denotation and connotation.** A distinction introduced by J. S. Mill. The denotation of a term, e.g. 'woman', is all the individuals to which it correctly applies, e.g. Mrs Smith, Prince Charles, etc. The connotation of the term consists in the attributes by which it is defined, e.g. being human, adult, female. A term's connotation determines its denotation. In Mill connotation is taken to be meaning. Terms like proper names, e.g. 'Charles', which have denotation, since there is someone so called, but no connotation, since no attributes define 'Charles', are taken to lack meaning.

S.W.

\*sense and reference.

J. S. Mill, *A System of Logic* (London, 1843).

**denying the antecedent.** To reason that, because Nazis hate Jews and John is not a Nazi, he cannot be an anti-Semite, is to commit this fallacy. In the traditional logic of terms, inferences like 'If  $A$  is  $B$ , it is  $C$ ; it is not  $A$ ; therefore it is not  $C$ ' illustrate the fallacy. In \*propositional calculus, any inference of the form 'If  $p$  then  $q$ , and not  $p$ ; therefore not  $q$ ' denies the antecedent.

C.W.

\*denying the consequent.

C. L. Hamblin, *Fallacies* (London, 1970).

**denying the consequent.** In a hypothetical proposition 'If  $p$ , then  $q$ ',  $p$  is the antecedent,  $q$  the consequent. Asserting that  $q$  is false, so that the falsity of  $p$  may be inferred, is denying the consequent; the inference is in the \**modus tollens*. When a man who is patently not Dutch says 'If the Queen cannot afford to pay taxes, I'm a Dutchman', he means us to deny the consequent and conclude that the Queen is patently wealthy. The corresponding fallacy is \*denying the antecedent.

C.W.

H. W. B. Joseph, *An Introduction to Logic*, 2nd edn. (Oxford, 1916), ch. 15.

**deontic logic.** The study of principles of reasoning pertaining to obligation, permission, prohibition, moral commitment, and other normative matters. Although often described as a branch of logic, deontic logic lacks the 'topic-neutrality' characteristic of logic proper. It is better viewed as an application of logic to ethical concepts, in much the same way as formal geometry is an application of logic to spatial concepts. Likewise, although hopes have been expressed that deontic logic might help to systematize the *practical* reasoning whereby we infer from general principles and observed facts what we ought to do, the most studied systems of deontic logic comprise mainly *theoretical* principles, expressing inferential relations among various ethical concepts.

Several principles prominent in the current literature were noted by various medieval philosophers, and again by Leibniz and by Jeremy Bentham, but focused and sustained thought in the field is a twentieth-century phenomenon, kindled largely by the writings of G. H. von Wright. Early work was motivated by analogies between the deontic concepts of obligation, permission, and prohibition, and the alethic concepts of necessity, possibility, and impossibility. The first analogies to be noted concerned 'interchange' principles. If  $\square$  and  $\diamond$  represent necessity and possibility, for example, then the formula  $\neg \square A \leftrightarrow \diamond \neg A$  says that to deny  $A$  is necessary is to assert not- $A$  is possible. If they represent obligation and permission it says (equally plausibly) that to deny  $A$  is obligatory is to assert not- $A$  is permitted. Similarly,  $\neg \diamond A \leftrightarrow \square \neg A$  and  $\neg IA \leftrightarrow \diamond A$  (where  $I$  is either 'impossible' or 'forbidden') have equally plausible alethic and deontic readings. The development of complete formal systems of necessity led naturally to an effort to see how far the analogy can be extended. The weakest system in which  $\square$  can plausibly be regarded as expressing some form of alethic necessity is the system T, which contains, in addition to the interchange principles, principles of distribution ( $\square(A \& B) \rightarrow \square A \& \square B$ ) and reflexivity ( $\square A \rightarrow A$ ). Of these, reflexivity is obviously false under the deontic interpretation. Replacing it by the weaker formula  $\square A \rightarrow \diamond A$  (what is obligatory is permitted), yields what is sometimes called the standard system of deontic logic. The system T is known to be characterized by an interpretation according to which  $\square A$  is true at a world  $w$  exactly when  $A$  is true at all worlds that are *possible* relative to  $w$ , i.e. at all worlds at which all the necessary truths of  $w$  are true. It follows that the standard system of deontic

logic is characterized by an interpretation according to which  $\Box A$  is true at  $w$  exactly when  $A$  is true in all worlds 'deontically accessible' from  $w$ , i.e. all worlds in which all the obligations of  $w$  are fulfilled.

Much of the contemporary work in deontic logic has been inspired by the deontic paradoxes, a collection of puzzle cases that have seemed to highlight deficiencies in the standard system. For example, according to a version of Chisholm's paradox, the following clauses should be mutually independent and jointly consistent: Dr Jones ought to administer anaesthesia if she operates; she ought not to if she doesn't; she has an obligation to operate, which she fails to meet. But attempts to represent these sentences within the standard system yield inconsistencies or redundancies. According to a version of the good Samaritan paradox, Smith's repenting of a murder logically implies his committing the murder, but his obligation to repent does not imply his obligation to have committed it. Yet in the standard system, the provability of  $A \rightarrow B$  implies the provability of  $\Box A \rightarrow \Box B$ . One reaction to examples like these has been to take sentences like 'Jones should administer anaesthesia if she operates' as exemplifying an irreducibly dyadic relation of conditional obligation. 'A is obligatory given B' has been interpreted, for example, as saying that B is true in the 'best' of the worlds in which A is. Another reaction has been to eschew the operator 'It is obligatory that . . .' which attaches to sentences in favour of a predicate of obligation which attaches only to names of actions. This approach eliminates altogether awkward formulae like  $\Box A \rightarrow \Box \Box A$ , though it also risks eliminating formulae like  $\Box (\Box A \rightarrow A)$  which have been thought to express important truths. It raises interesting questions about the nature of combined actions like 'a or b' and about the relations between general deontic statements ('Smoking is prohibited') and their instances ('Smith's smoking here now is prohibited'). In recent years, there has been considerable discussion about the plausibility of the schema  $\neg(\Box A \wedge \Box \neg A)$ , which is provable in the standard system. The issue is whether there is a phenomenon of moral experience, ruled out by the schema, in which an agent is faced with irresolvable and tragic moral 'dilemma' or 'conflict'. It has also been suggested that some of the shortcomings of the standard system can be remedied by a closer attention to the ways in which obligation and permission depend on time, and that there might be fruitful connections among deontic logic, formal epistemology and logics for the verification of computer \*programs. s.t.k.

**deontological ethics.** Moral theories according to which certain acts must or must not be done, regardless to some

extent of the consequences of their performance or non-performance (the Greek *dei* = one must). According to teleology or \*consequentialism, as commonly understood, the rightness or wrongness of any act depends entirely upon its consequences. Deontology is seen in opposition to consequentialism in various ways.

1. According to deontology, certain acts are right or wrong *in themselves*. Deontologists tend to concentrate on those acts which are wrong. So, according to deontologists such as Kant or Ross, promise-breaking is wrong independently of its consequences. Its wrongness does not depend solely on any bad effects promise-breaking may have. A consequentialist—in particular an act-consequentialist—will tend to claim that one should act in whatever way will bring about the best state of affairs. Ross would suggest that it is counter-intuitive to argue that one ought to break a promise for a very small gain in overall good. Note that deontology is not the same as absolutism, according to which certain acts are wrong *whatever the consequences*. Ross could allow that in exceptional circumstances it is not wrong to break a promise.

Two immediate problems for deontology as so described are, first, the difficulty of describing how we know which acts are wrong, and, second, the difficulty of drawing a sharp distinction between acts and omissions.

2. Deontologists such as Nozick argue that there are deontological constraints on our actions. We may have a reason to maximize the overall good, but in certain cases this reason disappears or its force is overridden. I should not, for example, kill an innocent person to save two others from death, since this would be to violate that innocent person's \*rights. Indeed I should not kill the person even to prevent the killing of the two others by someone else. Deontology tells *me* not to kill, and is in this sense *agent-relative*. The main difficulty here is to explain this agent-relativity. If killing is bad, why should I not act so as to minimize the number of killings, even if that involves my killing?

3. Rawls's distinction between deontological and teleological or consequentialist theories has become influential in recent years. It concerns the relation between the *right* and the *good*. A teleological theory defines the good independently from the right, and the right is then defined as that which maximizes the good. Deontological theories either do not specify the good independently from the right or do not interpret the right as maximizing the good.

All of the above attempts to distinguish deontology from consequentialism face the difficulty that a theory such as \*utilitarianism, which is usually taken to be the paradigm consequentialist theory, can be expressed as deontological. (1) The act of maximizing utility can be said to be right in itself, and that of failing to maximize utility as wrong, independently of consequences. (2) It can be said to be a constraint on our acting in any way that we must maximize the good. (3) An ideal utilitarian such as Rashdall may argue that the good is partly constituted by the right and so cannot be defined independently of it. Of

course, straightforward utilitarianism does not deny that the right consists in maximizing the good. But it *can* suggest that the right is indeed prior to the good, in the sense that utilitarians can state that it is right to maximize the good, whatever the good turns out to be. Finally, the agent-relative–agent-neutral distinction which is now commonly used in attempts to distinguish deontology and consequentialism cuts across any deontology–consequentialism distinction, since there can be agent-relative forms of consequentialism. Philosophical effort would be better spent on working out exactly what various moral theories actually say rather than in attempts to clarify what appears likely to be a dubious distinction. R.C.R.

\*absolutism, moral.

**departments of philosophy:** see philosophy, history of centres and departments of.

**de re and de dicto.** The distinction between *de re* and *de dicto* necessity (necessity of *things* versus necessity of *words*) seems to have first surfaced explicitly in Abelard, though there are hints of it in Aristotle. By the time of Aquinas it is being treated as a handy but familiar conceptual tool, occurring in two main forms: picking out the difference between a sentential operator and a predicate operator, between ‘necessarily (*Fa*)’ and ‘*a* is (necessarily-*F*)’ on the one hand, and on the other as a way of highlighting the scope fallacy involved in treating *necessarily* (if *p* then *q*) as if it were (if *p* then necessarily-*q*). Similarly we have *de re* or *de dicto* beliefs. Believing, *of God*, that he is benevolent is different from believing that God is benevolent. J.J.M.

\*necessity, logical.

W. V. Quine, ‘Quantifiers and Propositional Attitudes’, in L. Linsky (ed.), *Reference and Modality* (Oxford, 1971).

**Derrida, Jacques** (1930–2004). French philosopher who came to prominence in the late 1960s. Derrida’s influence within philosophy has been largely confined to the continental tradition, while in the English-speaking world his impact has been mainly in the area of literary criticism.

Born and raised in a Jewish family in Algeria, Derrida went to Paris to complete his secondary education before studying philosophy at the École Normale Supérieure. The philosophy of Husserl, the founder of \*phenomenology, was an important element in Derrida’s training, and exercised a strong influence on his early writings. Other acknowledged influences are Nietzsche, Heidegger, Freud, and Levinas. Derrida’s early research attempted to formulate a phenomenological theory of literature. His first major publication (1962) was a French translation, accompanied by a long introductory essay, of Husserl’s *The Origin of Geometry*. Between 1967 and 1972 Derrida published his most influential works, an extensive series of

commentaries on texts by key thinkers in the Western tradition, in which he developed the approach to texts which became known as \*deconstruction. A particular concern of Derrida’s is with the relationship between philosophy and language. Many of his essays examine philosophical theories of language, demonstrating, by close attention to the letter of the text, the ways in which language outwits philosophers. To this end Derrida emphasizes aspects of language that philosophy has often neglected, such as ambiguity, indeterminacy, pun, and metaphor. Later works by Derrida are increasingly ‘playful’ in their own right, importing a performative dimension to his meditations on language: *Glas* (1974) and *The Post Card* (1980), for example, exhibit a fragmentation and reliance on graphic effect that generate a style quite unlike classic philosophy. From the mid-1980s Derrida’s work addressed ethical and political questions, in particular the implications, for concepts like responsibility and rights, of his challenge to humanism.

Assessment of Derrida’s contribution to philosophy remains controversial: an impassioned dispute in Cambridge University preceded the award of an honorary doctorate in 1992. \*Analytical philosophy continues on the whole to ignore Derrida, despite undeniable parallels between his thought and that of Davidson, Quine, and Wittgenstein. S.D.R.

Christopher Norris, *Derrida* (London, 1987).

**Descartes, René** (1596–1650). Beyond question, Descartes was the chief architect of the seventeenth-century intellectual revolution which destabilized the traditional doctrines of medieval and Renaissance \*scholasticism, and laid down the philosophical foundations for what we think of as the ‘modern’ scientific age. As a small boy Descartes was sent to the newly founded college of La Flèche in Anjou, where he received from the Jesuits a firm grounding in the very scholastic philosophy he was subsequently to challenge. ‘I observed with regard to philosophy’, he later wrote, ‘that despite being cultivated for many centuries by the best minds, it contained no point which was not disputed and hence doubtful’ (*Discourse on the Method*, pt. i). In his early adulthood Descartes came to see in the methods and reasoning of mathematics the kind of precision and certainty which traditional philosophy lacked: ‘those long chains, composed of very simple and easy reasonings, which geometers customarily use to arrive at their most difficult demonstrations, gave me occasion to suppose that all the things which fall within the scope of human knowledge are interconnected in the same way’ (*Discourse*, pt. ii).

Much of Descartes’s early work as a ‘philosopher’ was what we should now call scientific. His *Le Monde* (The World, or The Universe), composed in the early 1630s, was a treatise on physics and cosmology, which resolutely avoided the old scholastic apparatus of ‘substantial forms’ and ‘real qualities’, and instead offered a comprehensive explanatory schema invoking only simple mechanical principles. A cornerstone of Descartes’s approach was that

the matter throughout the universe was of essentially the same type; hence there was no difference in principle between 'terrestrial' and 'celestial' phenomena, and the earth was merely one part of a homogeneous universe obeying uniform physical laws. In the climate of the mid-seventeenth century such views could still be dangerous, and Descartes cautiously withdrew his *World* from publication in 1633 on hearing of the condemnation of Galileo by the Roman Inquisition for advocating the heliocentric hypothesis (which Descartes too supported). But in 1637 he ventured to release to the public (anonymously) a sample of his work, the *Geometry, Optics, and Meteorology*. Prefaced to these three 'specimen essays', was what was to become an acknowledged philosophical classic—the *Discourse on the Method of Rightly Conducting Reason and Reaching the Truth in the Sciences*. The *Discourse* is part intellectual biography, part summary of the author's scientific views (including a presentation of some central themes from the earlier suppressed treatise *Le Monde*). But the book's fame rests on the short central section where Descartes discusses the foundations of knowledge, the existence of God, and the distinction between mind and body. The metaphysical arguments contained here, and greatly expanded in Descartes's philosophical masterpiece, the *Meditations on First Philosophy* constitute the philosophical core of the Cartesian system. The *Meditations* were published in Latin in 1641, along with a six sets of detailed Objections by various well-known philosophers, plus Descartes's Replies (a seventh set of Objections with the author's Replies was added in the second edition of 1642).

It is often said that Descartes inaugurated modern philosophy by making questions about the validation of knowledge the first questions to be dealt with in the subject. But while he certainly aimed in the *Discourse* and the *Meditations* to establish epistemically reliable foundations for his new system, it is a distortion to see his interests as primarily epistemological in the modern academic sense. The Descartes who is often presented in today's textbooks is a philosopher obsessively preoccupied with questions like 'How do I know I am really awake?', or 'Could the whole of reality be a dream?' But although the sixteenth-century revival of interest in classical problems about scepticism certainly influenced the framework within which Descartes chose to present his arguments, he was not chiefly interested in contributing to these debates. 'The purpose of my arguments', he wrote in the Synopsis to the *Meditations*, 'is not that they prove what they establish—that there really is a world and that human beings have bodies and so on—since no one has ever seriously doubted these things.' Descartes's main aim was to show how the world of physics, the mathematically describable world, could be reliably mapped out independently of the often vague and misleading deliverances of our sensory organs.

Descartes begins his project of 'leading the mind away from the senses' by observing that 'the senses deceive from time to time, and it is prudent never to trust wholly

those who have deceived us even once' (First Meditation). No examples are given of such 'deception', but Descartes later cited standard cases like that of the straight stick which looks bent in water: visual appearances may be misleading. But in some situations, Descartes goes on to concede, such doubts would be absurd: no amount of evidence on the supposed unreliability of my sense-organs could lead me to doubt that I am now sitting by the fire holding a piece of paper in my hands. At this stage, Descartes introduces his famous 'dreaming argument': 'there are no certain marks to distinguish being awake from being asleep', and hence my belief that I am sitting by the fire could turn out to be false (I might be asleep in bed). As first presented, the dreaming argument impugns only particular judgements I may make about what I am doing, or what I think is in front of me; but Descartes goes on to raise more radical doubts about the existence of whole classes of external objects. In their most exaggerated or 'hyperbolic' form (to use Descartes's own epithet), these doubts are expressed in the deliberately conjured up supposition of a 'malicious demon of the utmost power and cunning' bent on deceiving me in every possible way. Perhaps 'the sky, the earth, colours, shapes, sounds and all external things' are merely 'the delusions of dreams which he has devised to ensnare my judgement' (end of First Meditation).

The first truth to emerge unscathed from this barrage of doubt is the meditator's certainty of his own existence. 'Let the demon deceive me as much as he may . . . *I am, I exist* is certain, so long as it is put forward by me or conceived in my mind' (Second Meditation). This is often known as the Cogito argument, from the Latin phrase \**Cogito ergo sum* ('I am thinking, therefore I exist'). The certainty of the Cogito is, for Descartes, a curiously temporary affair: I can be sure of my existence only for as long as I am thinking. But from this fleeting and flickering insight, Descartes attempts to reconstruct a whole system of reliable knowledge. The route outwards from subjective certainty to objective science depends on the meditator's being able to prove the existence of a perfect God who is the source of all truth. In a much criticized causal argument, Descartes reasons that the representative content of the idea of infinite perfection which he finds within himself is so great that he could not have constructed it from the resources of his own mind; the cause of an idea containing so much perfection must itself be perfect, and hence the idea must have been placed in his mind ('like the mark of the craftsman stamped on his work') by an actually existing perfect being—God (Third Meditation). Later Descartes supplements this proof by a version of what has come to be known as the 'ontological argument': since God is, by definition, the sum of all perfections, and since existence is itself a perfection, it follows that 'existence can no more be separated from the essence of God than the fact that its angles equal two right angles can be separated from the essence of a triangle' (Fifth Meditation).

The central importance of \*God in Descartes's system lies in the deity's role as guarantor of the reliability of

human cognition. Humans often go astray in their thinking, but this is because they rashly jump in and give their assent to propositions whose truth is not clear. But provided they use their God-given power of reason correctly, assenting only to what they clearly and distinctly perceive, they can be sure of avoiding error (Fourth Meditation). One problem with this argument was seized on by one of Descartes's contemporary critics, \*Antoine Arnauld: if we need to prove God's existence in order to underwrite the reliability of the human mind, how can we be sure of the reliability of the reasoning needed to establish his existence in the first place?

Descartes's attempts to extricate himself from this 'Cartesian circle' have been the subject of endless discussion; roughly, his starting position seems to be that there are certain basic truths whose content is so simple and self-evident that we can be sure of them even prior to proving God's existence, and hence the circle can be broken. Truths such as the Cogito—that I must exist so long as I am thinking—are of this kind. The idea of self-standing truths guaranteed merely by their extreme simplicity of content has a certain attraction. But the problem remains—raised indeed by Descartes himself—that it seems possible to imagine that our grasp of such truths could be systematically distorted. The First Meditation had raised the nightmarish doubt that an omnipotent creator might make me able to go wrong 'every time I add two and three or count the sides of a square, or in some even simpler matter if that is imaginable'. If the most fundamental intuitions of the intellect are called into question, then the circle seems to remain as an insoluble puzzle: the intellect cannot without circularity be used to validate its own intuitions. In so far as Descartes got to grips with this problem, he apparently maintained that the irresistible psychological certainty of such elementary truths dispels any reasonable doubt that could be raised: 'If a conviction is so firm that it is impossible for us ever to have any reason for doubting what we are convinced of, then there are no further questions for us to ask; we have everything we could reasonably want' (Second Set of Replies to Objections to the *Meditations*). On one possible interpretation of this much discussed passage, Descartes is in effect retreating from the claim to provide guaranteed and unshakably validated foundations for knowledge, and moving towards a position which in some respects anticipates that of \*David Hume a century later: human beings have to rest content with what their nature irresistibly inclines them to believe; there are no 'absolute' guarantees.

Whatever the solution to the vexed problem of the foundations of Descartes's system, and their epistemic status, Descartes himself clearly believed that if he could get as far as establishing the existence of God, 'in whom all the wisdom of the sciences lies hid' (Fourth Meditation, paraphrasing Colossians 2: 3), he could proceed to establish a systematic physical science, covering 'the whole of that corporeal nature which is the subject matter of pure mathematics' (Fifth Meditation). The resulting system of

'mathematicized' science was developed most fully by Descartes in his mammoth *Principles of Philosophy* (published in Latin in 1644). Matter is defined as that which has extension (length, breadth, and height), and all observed phenomena explained simply in terms of the various modifications (or 'modes') of this extended stuff—namely the size and shape of the various particles into which it is divided (cf. *Principles of Philosophy*, pt. II, art. 64). While this quantitative approach to physics clearly constituted an extremely fruitful advance (it remains the basis of our modern scientific outlook), Descartes had problems in accounting for all the properties of the universe as simple modes of extended substance. Even the fact that the matter of the universe is in *motion* seems to take us beyond mere extension in three dimensions (see \*Cartesianism)—something which leads Descartes to invoke the power of the Deity: 'in the beginning God created matter, along with its motion and rest, and now . . . he conserves the same quantity of motion in the universe as he put there in the beginning'. From the uniformity and constancy of God, Descartes proceeds to deduce important general principles such as the law of the conservation of rectilinear motion; he also arrives at seven mathematical rules for calculating the results of impacts between bodies, all of which presuppose that the quantity of motion (measured as size times speed) is conserved. Although Descartes is often described as an apriorist in science, and although the main structural principles of his physics are arrived at independently of experience, Descartes nevertheless insists that at a lower level reason alone cannot determine which of the various hypotheses consistent with these general principles is in fact correct: 'here I know of no other way than to seek various observations whose outcomes vary according to which is the correct explanation' (*Discourse*, pt. VI).

Descartes's general ambitions in philosophy/science were unificatory: the whole of philosophy, he observed, is like a tree of which the roots are metaphysics, the trunk physics, and the branches the specific sciences, reducible to three principal subjects—medicine, mechanics, and morals. Descartes had originally planned to extend the *Principles of Philosophy* to include a complete account of plant and animal physiology, all based on purely mechanical principles; and he later wrote a *Description of the Human Body* (1647) which argued that complex biological functions such as nutrition, digestion, and growth, as well as reflexes and non-voluntary movements, can all be explained mechanically, without the need to introduce any such notions as the 'nutritive' or 'locomotive' soul of traditional Aristotelian biology: 'we have no more reason to suppose that a soul produces such movements than we have reason to believe that there is a soul in a clock which makes it tell the time.'

But the Cartesian vision of a comprehensive and unified system of knowledge abruptly disintegrates when it comes to the phenomenon of thought. For a variety of reasons—theological, metaphysical, and scientific—Descartes believed that mind, or 'thinking substance'

(\**res cogitans*), was wholly distinct from the world of matter. Matter was extended, divisible, spatial; mind unextended, indivisible, and non-spatial. The result is the theory known as Cartesian dualism—the view that the mind or soul (Descartes makes no distinction between these two terms) is ‘entirely distinct from the body, and would not fail to be what it is even if the body did not exist’ (*Discourse*, pt. iv). Some of Descartes’s arguments for the incorporeality of the mind are decidedly weak: in the *Discourse* he baldly concludes, from his (alleged) ability to think of himself existing without a body, that the body is not necessary to his essence as a thinking thing. Other arguments are more interesting: in part v of the *Discourse* he notes that the ability to reason, and to use language, involves the capacity to respond in indefinitely complex ways to ‘all the contingencies of life’, and that this power goes beyond anything that could be generated by a mere stimulus–response device. The utterances of animals are not genuine language, but simply automatic responses to external and internal stimuli.

In describing animals as ‘automata’ (self-moving devices), Descartes aimed to show how all their functions could be accounted for in mechanistic terms; but although Descartes is often accused of reducing higher animals to the status of ‘mere machines’, it is not entirely clear whether he aimed to explain away, as opposed to merely explain, their complex cognitive and affective responses. The case of animal sensation is particularly sensitive, since critics of Descartes’s approach have frequently castigated him for implying that animals cannot feel genuine pain.

The nature of sensation turns out to be something of a problem for Descartes, even in the case of human beings. If the essential self is a pure incorporeal mind, wholly distinct from the body, then it is hard to account for the character of our ordinary feelings and sensations, which seem intimately bound up with our bodily nature as creatures of flesh and blood. A pure spirit, like an angel, could hardly have a tummy-ache—indeed, Descartes himself remarks that such an incorporeal soul would not have sensations like us, ‘and so would be different from a genuine human being’ (letter to Regius of January 1642). Descartes observes in the Sixth Meditation that ‘nature teaches me by these sensations of hunger, thirst, pleasure and pain that I am not merely present in the body like a sailor in a ship, but that I am very closely conjoined and intermingled with it so that I and the body form a unit’. But the difficulty is to see how two utterly alien and incompatible substances, mind and body, can be united in this way. Descartes wrote in correspondence with Princess Elizabeth of Bohemia that whereas the distinction between mind and body could be grasped by our reason, the ‘substantial union’ between them just had to be experienced. Yet this seems tantamount to admitting that what we experience undermines the distinction which reason (allegedly) perceives.

The relation between mind and body is sometimes explained by Descartes in a way which suggests a causal

flow between the two (and Descartes even specified a place where the mind receives and transmits data to the body, namely the *conarion* or \*pineal gland in the brain (*Passions of the Soul*, art. 31)). This has given rise to what is sometimes called the problem of ‘Cartesian interactionism’: how can mind and body, being two utterly distinct substances, one material and one immaterial, causally interact in such a way? Descartes himself, however, declared that this objection was based on a supposition—that heterogeneous substances cannot interact—which he saw no reason to accept (letter to Clerselier of 12 January 1646). But alongside the model of two quite distinct substances interacting, Descartes also continued to insist that mind and body are really and substantially united so as to form a ‘genuine human being’. There is thus a divergence between the metaphysical conception of himself as a pure incorporeal substance that Descartes arrives at through his dualistic arguments in the *Discourse* and the *Meditations*—the conception that \*Gilbert Ryle was later famously to stigmatize as the ‘doctrine of the ghost in the machine’—and the real embodied creature that is the subject of Descartes’s ethics and psychology. The sensory and affective part of our nature (including the having of bodily sensations such as pain and emotional states such as fear) is for Descartes irreducibly psycho-physical: such sensations and states always involve both physiological activity and conscious awareness. In explaining how we have sensory and emotional awareness when our bodies and brains are stimulated in certain ways, Descartes sometimes appeals to a ‘natural’ or divinely instituted predisposition: ‘our mind is [innately] capable of representing to itself the idea of pain, colours, sounds and the like on the occasion of certain corporeal motions’ (*Comments on a Certain Broadsheet*, 1648). Such passages can be interpreted as containing the germ of the later doctrine known as ‘\*occasionalism’, according to which God directly causes certain sensory states in the human mind on the ‘occasion’ of bodily happenings (see \*Malebranche).

The distinction between, on the one hand, the purely mental part of us, comprising understanding and volition, and, on the other hand, the sensory and affective part of us, which is always ‘contaminated’, as it were, with the happenings in the body, gives rise to some important issues in Descartes’s philosophical psychology. The ideal mental state, as presented in the *Meditations*, is one of ‘clear and distinct perception’: here the mind’s contents are, as it were, completely open and transparent to consciousness, so that we have a direct and unproblematic awareness of what we are thinking and willing. In the case of sensations and emotions, however, although there is something that is immediately (and often urgently) present to the mind, Descartes insists that the resulting ideas are necessarily ‘obscure and confused’, as a result of the body’s involvement. This obscurity has important implications for ethics, for the confusions inherent in our affective nature mean that the passions may often mislead us about the importance or value of a particular object of desire or aversion (letter of 1 September 1645).

In his last work, the *Passions of the Soul*, composed shortly before his ill-fated visit to Sweden in the winter of 1649–50 (where he contracted pneumonia and died just short of his fifty-fourth birthday), Descartes examines the physiological basis for our feelings and sensations. Although the mechanisms of the body are no part of our nature as ‘thinking beings’, Descartes none the less maintains that there is a regular pattern whereby physiological events automatically generate certain psychological responses; learning about these responses, and about the conditioning process which can allow us to modify them in certain cases, is the key to controlling the passions ‘so that the evils they cause become bearable and even a source of joy’ (*Passions*, art. 212). Descartes thus holds out the hope that a proper understanding of our nature as human beings will yield genuine benefits for the conduct of life—a hope which accords with the early ambition, which he had voiced in the *Discourse*, to replace the ‘speculative’ philosophy of scholasticism with a practical philosophy that would improve the human lot.

For all his ambitions to ameliorate the human condition, Descartes’s account of that condition as depending on a mysterious fusion of incorporeal self and mechanical body remains deeply unsatisfying. But the so-called \*mind-body problem which continues to engage the attention of philosophers today bears witness to the compelling nature of the issues with which Descartes wrestled. The relationship between the physical world, as described in the objective language of mathematical physics, and the inner world of the mind, of which each of us has a peculiarly direct and intimate awareness, involves difficulties which even now we seem far from being able to resolve. But the reason why these problems so fascinate us is precisely that they represent the ultimate test case for that all-embracing model of scientific understanding which Descartes himself so spectacularly and so successfully inaugurated. **description, knowledge by:** see acquaintance and description, knowledge by.

**descriptions.** According to Russell, a *definite description* is a phrase of the form ‘the so-and-so’ (e.g. ‘the author of *Waverley*’), an *indefinite description* a phrase of the form ‘a

so-and-so’ (e.g. ‘a man’). (Where ‘description’ is used without qualification, the definite variety is usually intended.) Russell thought that indefinite descriptions should be understood in terms of the existential quantifier (‘There is at least one thing which . . .’), definite descriptions in terms of the uniqueness quantifier (‘There is exactly one thing which . . .’). In both cases, Russell treated expressions that might be thought to be referring expressions not as having this role, but as quantifier phrases. Thus there is no reference to a man in ‘I met a man’, for this is equivalent to ‘Something human was met by me’. Nor is there any reference to Scott in ‘The author of *Waverley* is prolific’, for this sentence is really general and quantificational, saying that there is exactly one author of *Waverley*, and whoever wrote *Waverley* is prolific. To see in each case that the proper semantic functioning of these sentences does not require reference (to a man, to Scott), it is helpful to imagine each of these sentences to be false. (Russell thought that one way for the second sentence to be false is for *Waverley* to have been a team production, rather than having had a unique author.)

Russell favoured his account of definite descriptions for the following reasons: (1) It enabled him to account for true negative existential judgements. Thus ‘The golden mountain does not exist’ does not have to be understood as saying, absurdly, of something that it does not exist, but can be understood as saying that there is not exactly one golden mountain. (2) It enabled him to see a sentence like ‘Scott is the author of *Waverley*’ as something other than an identity sentence (since it does not consist in two referring expressions separated by the ‘is’ of identity), which enabled him to explain how ‘George IV wanted to know whether Scott was the author of *Waverley*’ could be true yet ‘George IV wanted to know whether Scott was Scott’ false. (3) It enabled him to allow that either a sentence or its negation must be true. One might think this fails, for it might seem that neither (a) ‘The present King of France is bald’ nor (b) ‘The present King of France is not bald’ is true. Russell argued that (b) is ambiguous between being the negation of (a), and thus entailing truly that there is not exactly one present King of France, and being, not the negation of (a), but rather equivalent to ‘There is exactly one present King of France and whoever is the King of France is not bald’, which, like (a) is false. (4) He thought that the only difference between indefinite and definite descriptions was that the latter entail uniqueness.

Russell held that his view about definite descriptions had important consequences, both for theory of knowledge (explaining how one could know things with which one had no \*acquaintance) and for logic (paving the way, supposedly, for the dissolution of \*Russell’s paradox). In addition to its intrinsic importance, it has been held up as a model of ‘philosophical analysis’ or of ‘philosophical logic’ (a term invented by Russell to describe his project of formalizing English sentences).

New work on definite descriptions takes Russell as a starting-point, and the question, famously raised by Strawson, is whether descriptions at least sometimes

function as \*referring expressions. Thus an utterance in the terraces of 'The man with the ball knows how to play' seems equivalent to 'That man with the ball knows how to play'; and many would unhesitatingly classify the latter as involving reference to *that man*. R.M.S.

**descriptive meaning:** see emotive meaning and descriptive meaning.

**descriptive metaphysics**, by contrast with \*revisionary metaphysics, describes, according to P. F. Strawson, 'the actual structure of our thought about the world' rather than projecting an alternative preferred version of the world itself. A variety of conceptual analysis, it does not address itself merely to the uses of terms and the entailments of propositions, but to our cognitive apparatus. Thus Kant found that a certain minimal spatio-temporal and causal structure in our representations of external objects was a necessary condition of ordinary experience and scientific theorizing. Strawson finds that 'bodies' and 'persons' are the fundamental terms of our ontology, and proposes conditions governing their identification and re-identification and the possibility of framing meaningful subject–predicate propositions about them.

The possibility of a descriptive \*metaphysics is threatened first by the claims of a cognitive science free of the a priori, second, by the suspicion that all a priori investigation harbours revisionary content. CATH.W.

**descriptivism** is a term sometimes used to characterize theories which hold that judgements made in a particular area are descriptive; that is, that they refer to and are true of something. Distinguishing theories in this way only has point as a way of contrasting them with rival theories which hold that the judgements being considered are not descriptive. For example, some theories about evaluative judgements claim that they do not describe independent facts, but are merely expressions of attitude or emotion. A theory which denies this can be called descriptivist. R.H.

\*emotivism; prescriptivism; moral realism.

R. M. Hare, *Moral Thinking* (Oxford, 1981), ch. 4.

**desert.** It is a belief fundamental to morality that people ought to get what they deserve. What they deserve are benefits and harms made appropriate by some past fact

about the recipients. The benefits are reward for achievement or compensation for injury, while the harms are \*punishment for wrongdoing or deprivation stemming from culpable deficiency. Deserved benefits and harms may be understood in terms of the presence or absence of tangible goods, like money, or intangible goods, such as opportunities, status, appreciation, or advancement. Benefits and harms are deserved depending on some action, characteristic, state, or relationship that is correctly ascribed to individuals. The claim that something is deserved is, therefore, partly backward- and partly forward-looking because the morally significant fact in an individual's past dictates that the individual ought or ought not to receive some benefit or harm in the future.

Underlying the *ought* involved in desert is the notion of a moral equilibrium: the state in which the benefits and harms an individual receives are proportional to what is warranted by the significant fact in the individual's past. One central aim of morality is to maintain this equilibrium by distributing benefits and harms according to desert and by correcting the disequilibrium that occurs when benefits and harms are received undeservedly.

Legitimate claims of desert may or may not create an institutional or personal obligation to honour them. There is undeserved good and bad fortune, benefiting or harming people, whose occurrence is not attributable to human agency. The contingency of life and the scarcity of resources may upset the moral equilibrium just as much as immorality does, but there may be nothing anyone can do to correct the former. Legitimate claims of desert create obligations, therefore, only if institutional or personal culpability can be reasonably assigned for causing the disequilibrium. Perhaps there are good reasons to intervene and reverse instances of naturally occurring undeserved fortune or misfortune, but whatever these reasons may be, they cannot be based on some wrong that a person or an institution has done.

What actually it is that people deserve and what the significant facts are that create legitimate claims of desert are controversial questions at the centre of current moral and political debates. The most often favoured candidates as appropriate bases of desert are universal human \*needs or wants, human or contractual \*rights, genuine interests, and moral merits. What one bases desert on, how one proposes to distribute benefits and harms, and how one aims to correct past distribution will strongly influence one's view of justice, and that, in turn, will influence what position one occupies on the political continuum extending between \*Left and \*Right.

How basic desert is supposed to be in morality will also influence the kind of moral theory that is found acceptable. The more basic desert is supposed to be, the less egalitarian the resulting moral theory will be, since the greater moral importance is attributed to desert, the more the distribution of benefits and harms will have to be made proportional to the differing moral merits of their recipients. Similarly, the more egalitarian moral theories are, the less importance they will attribute to desert. It is a sign of the

prevalence of egalitarianism in our times that little attention is paid to desert by most contemporary moral theories. Regardless of whether the tendency to ignore moral merit in the distribution of benefits and harms is an achievement or a failure, it is a characteristic of the moral and political sensibility that prevails at least in the Western world.

**design, argument from, for the existence of God:** *see* God, arguments for; teleological argument for the existence of God.

**desire.** That mental state motivating voluntary behaviour and opening its bearer to feelings of both pleasure and displeasure. Desires, like \*beliefs, take a proposition as their content: what is desired (the content of the desire) is always that some state of affairs obtain.

Philosophers generally think of the term 'desire' as covering two distinct things. In the broader use of the term, a desire is any mental state capable of being fulfilled, carried out, or acted upon, or for which such notions are appropriate. (The term 'pro attitude' is also used to denote these mental states.) In this broad use, one's will counts as a desire, as do one's intentions, plans, goals, preferences, wishes, whims, decisions, and (perhaps) beliefs about what is reasonable or good. In the narrower use, desires are a more restricted set of mental states: they are those mental states to which we normally attach the terms 'desire' (the desire that you and I have a sexual affair, say) and 'want' (wanting that there be peace on earth, that the movers not damage the piano, and so on). Many philosophers hold that desires, in the narrower sense, are the basic mental states in terms of which all desires, in the broader sense, are to be explained: that willing is simply being moved by one's strongest current (narrow) desire, that intending is simply (narrowly) desiring to do something and believing one will do it, and so on.

There is an important distinction to make between desires for things wanted merely as means to some further end (instrumental desires) and desires for things wanted for their own sakes (intrinsic desires). A person who wants to own yellow paint, for example, typically desires the paint only as a means to some other goal, such as having a cheerfully coloured kitchen, and in this case the desire is clearly instrumental. Intrinsic desires are a more controversial matter. According to psychological hedonists, only pleasure (or the absence of displeasure) is desired for its own sake. Others take the view that many things are intrinsically desired: that the home team win, that my father enjoy a happy retirement, and so on.

A desire is said to be conscious when one is vividly aware that one has the desire; hunger and thirst are paradigmatic

examples, but one can also be vividly aware of one's desire to strangle the boss or to help an injured bird. Desires can also influence consciousness without being conscious desires. For instance, a woman might be completely unaware that she desires acceptance by her professional subordinates, and yet, upon finding she has their acceptance, she might be very pleased—precisely as a consequence of her desire.

There are two principal, long-standing theories of the nature of desire. According to the more widely held motivational theory of desire, to desire some end is simply to tend to be motivated to bring it about. (A variant of the theory holds that it is to contain an inner representation of that end, which tends to make one motivated to produce the end.) According to the less widely held hedonic theory of desire, to desire some end is to tend toward feeling pleasure if one comes to believe that one's end is achieved, and/or to tend toward feeling displeasure if one comes to believe that it is not. Of course, desires are held by almost everyone to have both motivational and emotional features as a general rule: the question is which feature, if either, is the sole essential feature of desire.

An important controversy surrounding desire is the relation between desiring some end and having a reason to pursue that end. Humeans (*see* \*David Hume) generally hold that desiring an end is necessary and sufficient for having at least some reason to pursue it; others deny either the necessity of desiring, the sufficiency, or both. The importance of the controversy is highlighted by moral considerations: does one have a reason to do what is moral even if one does not desire to act morally? In addition, there are ongoing discussions about the relation of one's desires to the praise- or blameworthiness of one's actions, the virtuousness of one's character, and one's status as an agent with \*free will.

G. F. Schueler, *Desire* (Cambridge, Mass., 1994).

**despair.** A term in Kierkegaard's moral psychology to characterize life-styles rather than singular biographical events. In *The Sickness unto Death* to despair is to shun a goal of spiritual satisfaction, either by preventing that goal from coming to consciousness or, failing that, by trying to replace or remove the self that can neither ignore nor face up to it. The latter two expedients are vain projects because any attempt to gain the goal presupposes it. Suicide would fail because death encompasses only the finite and the self already grasps itself as more. The most basic form of despair is open defiance of the self's essential relationship to God. As in German, the root of the Danish *Fortvivelse* is 'doubt' (*Tvivl*). For Kierkegaard despair is sin and its opposite is faith. The earlier *Either/Or* had advocated despair as freeing one from the superficialities of the aesthetic way of life and thus opening the way to acceptance of the self.

\*abandonment; existentialism; *Angst*.

S. Kierkegaard, *The Sickness unto Death* (Harmondsworth, 1989).

**destiny.** Fixed and inevitable future. Etymologically, that which is ordained or appointed. Whether identified with the *Moirai* or Fate of the Greeks, the divinely pre-ordained salvation or damnation of Luther and Calvin, or what is to come according to the clocklike causal regularity of Newton's universe, one's destiny is inescapable. \*Fatalism claims that no action can affect this future for good or ill. \*Determinism also says the future is fixed, but that our present actions (themselves determined by the past) will affect or bring about what it turns out to be. \*Libertarianism denies that we have destinies. Our futures, because of our intrinsic freedom, are not settled.

R. C. W.

A. W. H. Adkins, *Merit and Responsibility* (Oxford, 1960).

**detachment.** In various writings in \*Indian philosophy and religions, detachment is the attitude to one's actions towards which one should aim, sometimes described as impartiality to success and failure. In action this is manifest when one does something purely as a matter of sacred duty, as ritual, or for a deity, not aiming to satisfy an independent desire, such as for sensory pleasure or social rewards. It has its source in understanding that there is something illusory about the belief that an individual person is an agent. Someone in the grip of such an illusion fails to see that everything that happens is determined by nature. Freed from this illusion, people accept their own success or failure in an attitude of equanimity. This has some affinity with Spinoza's account of the emotional effects of grasping the necessity of the divine nature.

\*Indian philosophy.

*Bhagavadgītā*, esp. chs. 2 and 3.

**determinables and determinates.** The terms were employed by W. E. Johnson to indicate a relation between the more general and the more particular which is different from that between genus and species. Thus colour and shape are determinables in relation to such terms as red and circular. Determinates ('red', 'blue', etc.) under the same determinables ('colour') exclude each other, but are not co-ordinate in such a way that they can be distinguished from each other by a single differentia. Some may be determinables in relation to shades of red: 'scarlet', 'vermilion', etc.

S. W.

W. E. Johnson, *Logic*, i (Cambridge, 1921).

**determinism.** It is often taken as the very general thesis about the world that all events without exception are effects—events necessitated by earlier events. Hence any event of any kind is an effect of a prior series of effects, a causal chain with every link solid. The thesis is fundamentally simple. The ideas which it contains, notably those of events and causal connection, are certainly open to

definition. If the thesis cannot be expressed in terms of some part of science or theory in it, some determinists say, the shortcoming is not in the thesis.

If the thesis is true, future events are as fixed and unalterable as the past is fixed and unalterable. One graphic expression of determinism is in terms of what William James called 'the iron block universe': 'those parts of the universe already laid down,' he wrote, 'appoint and decree what other parts shall be. The future has no ambiguous possibilities hidden in its womb: the part we call the present is compatible with only one totality. Any other future complement than the one fixed from eternity is impossible. The whole is in each and every part, and welds it with the rest into an absolute unity, an iron block, in which there can be no equivocation or shadow of turning.' If this is the way the world is, then only what actually happens in it could possibly have happened. There are no genuine alternatives to be realized.

Philosophers and scientists have been concerned with the question of whether determinism conceived in this general and all-inclusive way is true. The problem is ancient in its origins. The Homeric Fates were enigmatically described as having power over the future. Early forms of atomism were more clearly deterministic, so disturbingly so that Epicurus found it necessary to hypothesize an uncaused 'swerve' of the atoms as they fell through the void. Hobbes and Hume, and many great and not so great philosophers after them, have been determinists.

But philosophers have been more concerned with what is to many of us the most compelling part of that general question: whether we ourselves, persons, are subject to the same sort of causal necessity. Philosophers have cared less about whether or not the rest of the universe is determined—what they have cared more about is whether or not our lives are determined. Indeed, determinism has often been taken as the more limited thesis that all our choices, decisions, intentions, other mental events, and our actions are no more than effects of other equally necessitated events. The problem of determinism in this second sense is pretty well identical with the problem of freedom, or the free will problem.

When philosophers have worried about this limited thesis in the past, they have typically focused on what it would mean for our concept of \*moral responsibility. But Strawson led us to see that more is at stake than that, including many human attitudes such as resentment and gratitude. Honderich has raised the stakes higher. Determinism puts in doubt all 'life-hopes, personal feelings, knowledge, moral responsibility, the rightness of actions, and the moral standing of persons'. And van Inwagen has suggested that if determinism were known to be true, no one could ever rationally deliberate about any type of action. Deliberation, it is said, makes sense only if genuine alternatives are available to us. If I deliberate about whether or not to raise my arm, my deliberation is rational only if I am able either to raise it or not to raise it. If determinism is true, only one course is genuinely open to me. So, it is alleged, my deliberation is irrational.

But, as remarked, the most important issue historically has been moral responsibility. And what can be said about it applies in a general way to the other implications of determinism. Typically we believe that agents are morally responsible only for those acts that are freely chosen and within the power of the agent to decide. We are guilty only if we could have done otherwise. But if determinism is true, then in some sense we *never* could have done otherwise. Thus many philosophers have concluded that determinism and holding people responsible are incompatible. Others have strongly disagreed. We will not address this issue here—it is developed more fully in the entries on \*freedom and determinism and \*compatibilism and incompatibilism.

To return to the general thesis of determinism—which of course is not really to leave the limited human thesis—some of its most important forms have been scientific determinisms. After Newton propounded his laws of gravitation and mechanics, Laplace pointed out that if a powerful intellect (usually called Laplace's demon) possessed an understanding of Newton's laws, and had a description of the current position and momentum of each particle in the universe, and the requisite mathematical ability, that powerful intellect could predict and retrodict every event in the history of the universe. This 'clockwork universe' came to dominate the physical theory of the next two centuries, causing great consternation among theologians and most moral philosophers.

Recently, however, \*quantum mechanics and relativity theory have generally displaced Newtonian mechanics, and various proofs of them have been claimed. Many scientists and not a few philosophers believe that the dragon of determinism has been slain. Some, as a result, go on to believe that the world has been made safe for the freedom of the will and responsibility.

But, first, as Einstein himself argued, quantum mechanics may be just another way-station on the route to a true, complete, and deterministic physical theory. It is surely arrogance, despite some experimental results, to believe that we possess the final truth about reality. There is reason to say that the only permanent truth with respect to science, or that among the permanent truths, is the truth that science changes.

And, secondly, quantum mechanics may be replaced by something conceptually far better than quantum mechanics as it is interpreted. There has never been agreement about making sense of how the theory, even if it works, actually applies to the world. This is what really matters.

Thirdly, the randomness and uncertainty taken as implied by quantum mechanics operates primarily at the micro-particle level. As more and more particles enter the calculations, a statistical smoothing occurs. Thus, while the theory implies that there is some chance that all the particles in a table will simultaneously and randomly happen to move upwards, so that the table will levitate, the odds against such an occurrence are so astronomical that it is not reasonable to expect an event of this sort even once in the entire history of the universe. In terms of the

number of particles involved, the brain, and even an individual neuron, is an enormous object for which no such deviation from 'expected' behaviour is likely to occur. Thus even if quantum mechanics as interpreted is true, the bodies of human beings are so near to deterministic as makes no difference.

Finally, so far as we know, the indeterminism involved in quantum mechanics is pure randomness, real chance. But if my actions are saved from determinism only by becoming random, how does that get back to the moral responsibility sought by libertarians? Which would you rather be, a clock or the ball on a roulette wheel? Or rather, the ball on a roulette wheel so far unconstructed, which does involve real chance and not just practical unpredictability? A pure chance event in you would not be anything that got you moral credit. R.C.W.

**determinism, economic:** *see* base and superstructure.

**determinism, historical.** A conception of human affairs according to which the historical process conforms to developmental patterns or laws that render its constitutive events necessary or inevitable. Doctrines affirming such a position exhibit wide variations. While those of an earlier vintage frequently involved providential or \*teleological assumptions, ones of later date have tended instead to presuppose the causal principle that whatever occurs in history is explicable as a law-governed consequence of empirically specifiable antecedent conditions. Views of the latter kind are sometimes endorsed on the grounds that they reflect a presumption fundamental to history conceived as an essentially explanatory form of inquiry. Against this, however, it has been maintained that a theoretical commitment to \*determinism is hard to reconcile with the practice of historians, \*libertarian convictions about human agency being integral to the historical studies as actually pursued. P.L.G.

I. Berlin, 'Historical Inevitability', in *Four Essays on Liberty* (Oxford, 1969).

**determinism, logical.** Whether or not God or anyone or anything else knows the future, it is alleged, there must be a true description of the future, a set of true statements about it. The conjunction of all the true statements about the future we will call The Book. Now The Book must

contain either the statement 'John Doe gets married on 20 June 2145' or the statement 'John Doe does not get married on 20 June 2145'. Whichever alternative The Book contains is true. Thus, it is alleged, whether or not Mr Doe will get married is already settled. So with every other future event. Logical determinism of this sort is not to be confused with \*determinism, since it includes no causal story about the future, but is rightly associated with \*fatalism—the attitude that it makes no difference what we do because the future is unaffected by our present actions.

R.C.W.

\*destiny.

R. Taylor, *Metaphysics*, 3rd edn. (Englewood Cliffs, NJ, 1983).

**determinism, scientific.** The best examples of \*determinism, or the lack of it, are found in the theories of physics. At first glance, we might say that such a theory is deterministic whenever the state of a system at some initial time plus the laws of the theory fix that system's state at any later time. But we need to take account of the fact that in relativistic (as opposed to Newtonian) \*space-time theories, the notions of 'at some initial time' or 'at any later time' are inapplicable to spatially extended systems, due to the relativity of simultaneity. Also, it could be the case that an entire segment of a system's history is needed before its future behaviour gets fixed, or that only a portion of its future behaviour will be fixed. And we might want to distinguish fixing a system's future behaviour from fixing its past history as well (though in most physical theories the two go hand-in-hand, since laws remain the same when the direction of time is reversed). Finally, we want a definition adaptable to systems of any size or kind, from electrons to the entire universe.

Therefore the following revised definition suggests itself. Let  $R_1$  and  $R_2$  be any two regions of space-time, perhaps including two distinct segments of an electron's history, or events surrounding the big bang and the rest of the universe. Then a physical theory is deterministic with respect to  $R_1$  and  $R_2$  just in case the state it assigns to  $R_2$  is fixed by the theory's laws and the state it assigns to  $R_1$ ; more precisely, just in case any two models of the theory (i.e. possible states of the world, according to the theory's laws) that agree on  $R_1$  also agree on  $R_2$ . Clearly, the bigger the 'determining' region  $R_1$ , needs to be—relative to the 'determined' region  $R_2$ —in order for a theory to satisfy this definition, the weaker the form of determinism at issue.

We now need to see this definition in action. Two paradigm examples will be offered: one of extreme determinism, the other of extreme indeterminism.

First, consider a Newtonian world composed of point particles moving under their mutual gravitational attraction, with each particle satisfying Newton's second law (force impressed on it = its mass  $\times$  its acceleration). Working through the resulting equations, one finds that the positions plus velocities of all the particles at any moment completely fix all their past and future positions and velocities. So we have a nice strong instance of

determinism:  $R_1$  can be a mere slice through Newtonian space-time picking out any set of absolutely simultaneous events, with the result that  $R_2$  will be the whole of space-time containing the complete trajectories of the particles.

However, this 'paradigm' example only works if we ignore collisions; for, since gravitational attraction between two bodies is inversely proportional to the square of their separation, that attraction becomes infinite when point particles collide, leading to a breakdown in the applicability of Newton's laws. And, perhaps more seriously, our example had to ignore 'space-invaders': a particle that, after a finite time, can fly into the vicinity of our particles from spatial infinity! Incredible though it sounds, Newtonian physics does not forbid this; unlike Einstein's \*relativity, it imposes no upper limit on speeds. Thus, space-invaders can upset determinism by failing to leave a calling-card on some initial time slice  $R_1$  so that the particles' state on  $R_1$ , because it contains no record of the presence of the space-invader and its gravitational influence, will no longer fix their future trajectories. (This picture also helps to see why determinism can fail even in relativistic space-times: for example, the analogue of a space-invader can jump out of a nearby 'naked' singularity without ever having registered its presence on any time slice that precedes it.)

The second paradigm example, this time of extreme indeterminism, is \*quantum mechanics; though it too doesn't quite fit with its popular reputation as an indeterministic theory. To be sure, the quantum state associated with any space-time region  $R_1$ , no matter how big, does not (in general) fix the outcomes of measurements performed in other regions  $R_2$  but, at best, only their probabilities. Nevertheless, the Schrödinger equation ensures that quantum states *themselves* evolve deterministically in time, at least in the absence of measurements. In fact, this curious mix of determinism with indeterminism is at the heart of the 'paradox' of Schrödinger's cat—when and how does indeterminism take over during a measurement to produce a definite outcome out of a superposition?

Determinism is an *ontological* doctrine about a feature of the world which, if it obtains, need not imply that the states of systems are predictable, which is also a question of *epistemology*. Two examples will illustrate this distinction.

First, in the space-time of special relativity, the state of the world at any time (relative to any observer!) fixes the whole of events throughout the space-time. But the fact that information cannot be transmitted faster than light guarantees that no observer will ever be able to gather up all the data they would need for predicting an event before it actually occurs.

Second, returning to Newtonian mechanics, a system can be deterministic yet 'chaotic'. This means that no matter how precisely we specify its initial state for the purposes of predicting its final state, there will always be a small range of possible initial states that the system could still be in which will very quickly evolve into drastically different final states. Since we can never empirically

discriminate between alternative initial states with *absolute* precision, we lose the ability to predict the future behaviour of such a system. R.CLI.

**determinism and freedom:** see freedom and determinism.

**Deus sive Natura:** see Spinoza.

**development ethics.** The 1987 Brundtland Report emphasized 'sustainable development' for the future welfare of humanity. If 'development' means economic growth, this can bring benefits for some and disbenefits for others (e.g., unemployment and displacement due to new forms of industrialization). Development ethics recognizes that policy-makers, aid donors, corporations, and agencies like the World Bank, confront moral questions when planning socio-economic changes, particularly in the world's poorest countries. The International Development Ethics Association was established in 1984 to encourage critical reflection on issues of poverty, globalization, and world development. A.BRE.

W. Aiken and H. LaFollette (eds.), *World Hunger and Morality* (Englewood Cliffs, NJ, 1996).

**deviance, causal.** An abnormal causal connection between one event or state and another. Causal deviance is potentially problematic for causal theories of such things as intentional action and perception. For example, a crude causal theory might hold that *S intentionally* does an action *A* if *S* intends to do *A* and *S*'s so intending is a cause of *S*'s doing *A*. Imagine that *S* intends to phone her uncle, but mistakenly dials her mother's number instead. If her uncle happens to answer, *S*'s intention is a cause of her phoning him; but her phoning him is too coincidental to be intentional. In a popular example, *S*'s intention to break an expensive vase so unnerves him that the vase falls from his trembling hands to the hard floor. However, it may be doubted that *S*'s 'breaking the vase' was an action. A.R.M.

**Dewey, John** (1859–1952). American philosopher who developed a systematic \*pragmatism addressing the central questions of epistemology, metaphysics, ethics, and aesthetics. In a manner consistent with, in fact driven by, his philosophical views, Dewey was also deeply involved in the social issues of his day, especially with reform of American schools, but also with matters of national and international politics.

He began his philosophic career under the tutelage of Hegelians, and his lifelong rejection of dualisms, his

search for mediating ideas, is sometimes traced to the remnants of that influence. He rejected not only the \*dualism of mind and body, but also any but a functional or contextual distinction between fact and value, means and ends, thought and action, organism and environment, man and nature, individual and society. He early and firmly abandoned Hegelian idealism, however, and the evolutionary character of his developed philosophy was biologically based, grounded on Darwinian theory and committed to scientific experimentalism.

Dewey advanced a philosophy interested in the question of how life should be lived, and he argued that addressing that question required bridging the gap between morals and science. His work in all areas of philosophy, including in the logical studies to which he turned both early and late in his career, was particularly devoted to securing the continuity he discerned between philosophy and social and biological psychology. His logic was a theory of inquiry, a general account of how thought functions, not in an abstract or purely formal mode, but in the inquiries of successful science and in the problem-solving of ordinary daily life. Dewey's \*'instrumentalism' defined inquiry as the transformation of a puzzling, indeterminate situation into one that is sufficiently unified to enable warranted assertion or coherent action; and the knowledge that is the object of inquiry is, Dewey insisted, just as available in matters of morals and politics as in matters of physics and chemistry. What is required in all cases is the application of intelligent inquiry, the self-correcting method of experimentally testing hypotheses created and refined from our previous experience. What counts as 'testing' may vary with the 'felt difficulty' in need of resolution—testing may occur in a chemistry laboratory, in imaginative rehearsal of conflicting habits of action, in legislation that changes some functions of a government—but in all cases there is a social context, mediating both the terms of the initial problem and its solution, and being in turn transformed by the inquiry.

Dewey's epistemological and moral \*fallibilism—his view that no knowledge-claim, no moral rule, principle, or ideal is ever certain, immune from all possible criticism and revision—was yet allied with an optimistic progressivism. The realization of progress requires, however, the cultivation of intelligent habits in individuals and the maintenance of social structures that encourage continuous inquiry. Thus Dewey focused on the nature and practical improvement of education, arguing that children cannot be understood as empty vessels, passively awaiting the pouring-in of knowledge, but must rather be seen as active centres of impulse, shaped by but also shaping their environment. Children will develop habits of one sort or another in the course of their interactions with their social and physical surroundings, so if we want those habits to be flexible, intelligent, we must do our best to structure an environment that will allow and indeed provoke the operations of intelligent inquiry. It was this sort of environment that Dewey sought concretely to provide in the Laboratory School he established at the University of

Chicago. Dewey's goal for children, as for adults, was 'growth'—growth in powers, in capacities for experience. Growth, he claimed, is really 'the only moral "end"', for it is not, quite plainly, a real end, but always a means.

\*Democracy, Dewey's other guiding ideal, is likewise both a goal and a means. The continuity of change that characterizes our world—its natural evolution, for example, and the replacement of one generation by another—implies what Dewey understood as a 'continual rhythm of disequilibrations and recoveries of equilibrium'. We need the best thoughts and actions of the entire community in order to reconstruct our equilibrium, not only because the community sets the conditions for recovery, but also because we have no antecedent assurance of the source or nature of the required reconstruction. It is always experimental, and Dewey took democracy both to be and to further that grand experiment. K.H.

**dialectic.** In ancient Greece, dialectic was a form of reasoning that proceeded by question and answer, used by Plato. In later antiquity and the Middle Ages, the term was often used to mean simply logic, but Kant applied it to arguments showing that principles of science have contradictory aspects. Hegel thought that all logic and world history itself followed a dialectical path, in which internal contradictions were transcended, but gave rise to new contradictions that themselves required resolution. Marx and Engels gave Hegel's idea of dialectic a material basis; hence \*dialectical materialism. P.S.

Peter Singer, *Hegel* (Oxford, 1983), ch. 5.

**dialectical materialism.** The official name given to Marxist philosophy by its proponents in the Soviet Union and their affiliates elsewhere. The term was never used by either Marx or Engels, though the latter did favourably contrast both 'materialist dialectics' with the 'idealist dialectics' of Hegel and also the German idealist tradition, and the 'dialectical' outlook of Marxism with the 'mechanistic' or 'metaphysical' standpoint of other nineteenth-century materialists. The source of the main doctrines of dialectical materialism is the writings of Engels, especially *Anti-Dühring* (1878) and *Dialectics of Nature* (1875–82, published posthumously, 1927).

According to dialectical materialism, the fundamental question of all philosophy is: 'Which is primary, matter or consciousness?' The question of 'primacy' is also described as 'Which, matter or consciousness, is the source of the other?' \*Materialism holds to the primacy of matter, idealism to the primacy of consciousness. Theism, which maintains that matter was created by a supernatural consciousness, is taken to be the chief form of \*idealism;

under the title 'objective idealism' this is sometimes distinguished from 'subjective idealism', the view that the material world exists only for the individual mind. Though these two versions of idealism do not appear to make consciousness the 'source' of matter in the same sense, it is even less clear in what way materialism takes matter to be the 'source' of consciousness. Because it is often claimed that the results of modern science support materialism against idealism, dialectical materialists apparently mean to endorse whatever account of mind results from scientific investigation, but think that we already know enough to be confident that the resulting theory will suffice to exclude theism or other idealist accounts. Yet dialectical materialists also insist that thought bears a certain determinate relation to matter, serving as its 'image' or 'reflection'; the world of consciousness is the material world 'translated into forms of thought'. The point of this last phrase seems to be that thought is given in certain determinate forms, which bear determinate relationships (especially developmental ones) to each other, whose subject-matter is 'dialectics'.

The 'primacy of matter over consciousness' is sometimes also given an epistemological interpretation. Idealists are charged with a tendency to scepticism concerning knowledge of the material world, whereas materialists maintain that the material world is knowable through empirical science. This confidence is often supported by appeal to the practical successes of empirical science, by which is meant both the results of experimentation (which involve the experimenter's practical interaction with the world) and the technological fruits of empirical science. Practice is asserted to be the sole criterion of \*truth. Doubts and questions which cannot be given a practical significance are to be dismissed; the sceptical doubts of idealistic philosophy are held to be refutable in this way.

If the opposition of idealism and materialism concerns the fundamental question of philosophy, the opposition between metaphysics and dialectics concerns the fundamental issue of method. The 'metaphysical' method is identified with the mechanistic programme of early modern science, which is taken to have been discredited by such nineteenth-century discoveries as electromagnetic field theory. But, following Engels, dialectical materialism upholds (at least a modified version of) the critique of early modern science presented by German idealism and its 'philosophy of nature', which opposes formalism and reductionism and emphasizes phenomena of organic interconnection and qualitative emergence. Thus the commonest charges against metaphysical materialism are that it ignores the fundamentally developmental nature of matter, that it tries to reduce all change to quantitative change, and that it fails to recognize internal contradictions in the nature of material things as the fundamental source of change. The antidote is to recognize the dialectical laws of thought, which are sometimes summarized as

1. The unity of opposites. The nature of everything involves internal opposition of contradiction.

2. Quantity and quality. Quantitative change always eventually leads to qualitative change or development.
3. Negation of the negation. Change negates what is changed, and the result is in turn negated, but this second negation leads to a further development and not a return to that with which we began.

(This last idea is sometimes presented by expositors of \*‘dialectic’ in the jargon of ‘thesis–antithesis–synthesis’; this jargon, however, is not characteristic of dialectical materialists. Since it was never used by Hegel, and was used by Marx only once, solely for the purpose of ridicule, it is easy to understand why its use is nearly always a sign of either ignorance of or hostility to dialectical thinking—usually both at once.)

As the official Soviet philosophy, dialectical materialism was always doomed to be shallow and sterile because any impulse to creativity or critical thinking on the part of its practitioners was smothered by authoritarianism, political repression, and fear. Ironically, a philosophy whose spirit was to challenge traditional religious authority and to exalt the fact of qualitative novelty and ceaseless progressive development has become our century’s most notorious example of ossified dogmatism, incapable either of internal development or of response to ongoing changes in science and philosophy, often reduced to nothing but the mechanical repetition of empty phrases borrowed from an earlier century. However, this easily obscures the important fact that the basic aims and principles of dialectical materialism remain very much in harmony with the fundamental spirit of progressive, rational scientific thought, which continues to perceive a fundamental opposition between scientific theories and religious myths, to address the scientific challenges posed by the failure of the seventeenth- and eighteenth-century mechanistic programme, and to seek a scientific metaphysics as the basis for an enlightened view of the world.

**dialectics, negative:** see Adorno.

**dialeth(e)ism.** A *dialetheia* (a neologism indicating ‘two-way truth’, and pronounced di/aletheia) is a true contradiction: that is, a pair of propositions,  $A$ ,  $\neg A$  such that both are true (where  $\neg$  is negation). Hence *dialetheism* (alternatively, *dialethism*) is the view that some contradictions are true. There have been dialetheists in the history of Western philosophy (arguably, Hegel is one such), but the law of \*non-contradiction, which rules out dialetheias, has been the orthodox view since Aristotle’s defence of the view. Contemporary dialetheists, such as Priest and Routley, appeal, amongst other things, to paradoxes of

self-reference, such as the \*liar paradox. They endorse the correctness of a paraconsistent logic. G.P.

G. Priest, *In Contradiction* (Dordrecht, 1987).

**dichotomy.** In logic, a division of a whole into two parts, as with a class into two mutually exclusive and jointly exhaustive subclasses, or a \*genus into two likewise disjoint species. Usually called ‘division by dichotomy’, this procedure is sometimes also known as ‘dichotomy by contradiction’ because the resulting binary classification may be defined by ‘contradictory marks’, as when we say ‘Everything must be red or not red’.

One major application of the concept is to \*‘definition by division’, in which an entity is classified by differentiation of genus and species. Aristotle criticized the procedure for lacking the apodeictic certainty of syllogistic deduction, on the grounds that since one cannot be sure that the right differentiae have been selected, one cannot be sure that the resulting division is exhaustive.

Zeno of Elea’s ‘paradox of the \*stadium’ is sometimes called ‘The Dichotomy’, ‘dichotomy’ in this connection meaning arithmetical or geometrical division. The paradox is that one cannot cross a given space because to do so one must first get half-way, and before that half-way to the half-way point, and so on *ad infinitum*; but we cannot traverse an infinite number of such points in a finite time. A.C.G.

Aristotle, *Physics*, bk. 6, ch. 8, for Zeno.

— *Posterior Analytics*, bk. 1, ch. 31; bk. 2, ch. 5.

**dictatorship of the proletariat.** According to Marx, the forceful use of state power by the working class against its enemies during the passage from capitalism to communism. Since Marx regarded all political states—parliamentary democracies just as much as one-person autocracies—as class dictatorships, in the sense of forcefully furthering the interests of one class at the expense of others, the concept does not imply dictatorship in the ordinary sense. K.M.

\*Marxism.

K. Marx, Letter to Weydemeyer, 5 Mar. 1852, in D. McLellan (ed.), *Karl Marx: Selected Writings* (Oxford, 1977).

**dictionaries and encyclopaedias of philosophy.** Philosophical dictionaries began before encyclopaedias in general, and certainly before philosophical encyclopaedias. The first is the small but pregnant fifth book ( $\Delta$ ) of the *Metaphysics* of Aristotle, the original organizer and professionalizer of philosophy. In this ‘philosophical lexicon’ the senses of some thirty crucial terms are distinguished and defined. On the whole, important and original thinkers have left dictionary-making to those who are, comparatively speaking, drudges. The principal exceptions are Pierre Bayle’s *Dictionnaire historique et critique* (1697), a cunningly indirect assault on metaphysics and theology, and Voltaire’s *Dictionnaire philosophique* (1764), a more openly sceptical attack on Christianity and revealed religion in general. There is also one fine recent

instance: W. V. Quine's highly entertaining *Quiddities* (1987), which is more strictly philosophical (and logico-mathematical) in scope.

Notable among medieval dictionaries are one based on Avicenna's writings and the *Compendium Philosophiae* (c.1327), which derives from Aristotle and Albertus Magnus. Numerous dictionaries of the seventeenth century in Latin are of limited interest. J. G. Walch's *Philosophisches Lexicon* (1726) achieved a new level of comprehensiveness and vitality. Kant's successor at Königsberg, W. T. Krug, produced an *Allgemeines Handwörterbuch der Philosophischen Wissenschaften* (1827–9) which stands out from other German efforts of its period. In France the *Dictionnaire des sciences philosophiques*, edited by A. Franck, a disciple of Victor Cousin, is comparably eminent. An unprecedented level of technical competence was attained by Rudolf Eisler's massive *Wörterbuch* of 1899.

The *Dictionary of Philosophy and Psychology* (1899), edited by J. M. Baldwin, with contributions from William James, G. E. Moore, and many other distinguished philosophers, is the first serious philosophical dictionary in English. The *Dictionary of Philosophy* (1942), edited by Dagobert D. Runes, also had some impressive contributors, several of whom united to condemn the editor's handling of their contributions. Subsequent dictionaries in English, such as those of A. R. Lacey (1976) and A. G. N. Flew (1979), have been modest, useful, and short. A remarkable production somewhere between dictionary and encyclopaedia is the *Synopticon* (1952), in which essays by Mortimer G. Adler on 102 'great ideas' lead into careful analyses of the internal articulation of the ideas treated, which, in their turn, serve as the framework for a vast array of references to the works of major writers. By no means wholly philosophical in content, the work is throughout philosophical in spirit. Adler's essays have been published as a single volume: *The Great Ideas* (1992).

The first real encyclopaedias are medieval: the compendia of Cassiodorus (sixth century), Isidore of Seville (seventh century), and Vincent of Beauvais (thirteenth century). Bacon's *Instauratio Magna* (early seventeenth century) was the sketch of a co-operative encyclopaedia which was realized by the compilers, in particular Diderot, of the famous *Encyclopédie* (1751–72). Later, general encyclopaedias have followed it with extensive coverage of philosophical topics: the *Britannica* (from 1768 to the present), *Brockhaus* (1796 to the present), *Larousse* (1866 to the present).

The first works explicitly claiming to be encyclopaedias of philosophy were those of Hegel and Herbart in the early nineteenth century: they were essentially systematic surveys of their authors' ideas. An ambitious project of Windelband and Ruge, begun in 1912, never got beyond a distinguished first volume on logic. The first really serious encyclopaedia of philosophy is the four-volume Italian *Enciclopedia filosofica* of 1957, which was unprecedented in its scope, completeness, and scholarly quality. J. O. Urmson's *Concise Encyclopaedia of Western Philosophy and Philosophers* (1960) contained many lively and authoritative

contributions but too closely reflected the prevailing interests and loyalties of British philosophy at its moment of publication. Superior in every way to all its predecessors was the *Encyclopaedia of Philosophy* (1967), edited by Paul Edwards in eight volumes. There was nothing since to compare with it until 1998, when the 10-vol. *Routledge Encyclopaedia of Philosophy* appeared, edited by Edward Craig.

**Diderot, Denis** (1713–84). One of the \*philosophes whose thought typifies the scientific secularism of the French Enlightenment. Diderot became editor of the *Encyclopédie* in 1750, and contributed articles to it in the field of moral and social philosophy. His vividly entertaining dialogue *Le Neveu de Rameau* (begun in the early 1760s) raises disturbing questions about the relationship between the life of \*genius and the demands of conventional morality. In several of his philosophical essays, including *Pensées sur l'interprétation de la nature* (1754), he argued for a form of materialistic reductionism, which would account even for complex phenomena such as sensation without reference to anything over and above matter in motion. In his views on human knowledge and the importance of observation and experiment as against abstract speculation, he was broadly influenced by the ideas of John Locke (some of whose writings he translated into French). In the area of biological theory, he put forward the suggestion that all living things pass through stages of development, in this respect anticipating some of the evolutionary thinking of the following century.

J.COT.

G. Bremner, *Order and Change: The Pattern of Diderot's Thought* (Cambridge, 1983).

**différance.** Neologism coined by the philosopher of \*deconstruction Jacques Derrida through a punning play on the French verb 'différer', meaning both 'to differ' and 'to defer'. The term figures chiefly in his reading of Husserl, and refers to the perpetual slippage of meaning from sign to sign (or from moment to moment) in the linguistic chain. The result of this—so Derrida argues—is the strict impossibility of achieving what Husserl set out to achieve, that is to say, a rigorously theorized account of the structures and modalities of internal time-consciousness, or of the relation between utterer's meaning and language as a network of differential signs. There is no way of reducing or judging this endless play of differing-deferral—no 'transcendental signified' or 'logocentric' anchor-point in consciousness, meaning, or truth. C.N.

Jacques Derrida, 'Speech and Phenomena' and *Other Essays on Husserl's Theory of Signs*, tr. David B. Allison (Evanston, Ill., 1973).

**difference, method of:** see method of difference.

**difference principle.** The principle, proposed by John Rawls, that economic and social advantages for the better-off members of a society are justified only if they benefit the worst-off. For example, differences in income, wealth, and status among different professions and social groups can be defended as just only if they are produced by a system of incentives, market forces, and capital accumulation whose productivity makes even unskilled labourers better off than they would be in a more equal system. Rawls argues that the more fortunate cannot be said to morally deserve either their inherited wealth or the natural talents that enable them to command higher pay in the labour market, so the justification for an economic system which rewards people unequally must come from its benefits to everyone. This is a strongly egalitarian principle, which doesn't permit inequalities even if the advantage to the better-off is greater than the disadvantage to the worst-off. It also denies that people are naturally entitled to the product of their natural abilities. The principle has therefore drawn resistance both from utilitarians and from those who believe that inequalities resulting from natural endowments are not morally arbitrary, and require no further justification.

T.N.

\*equality; inequality; justice.

J. Rawls, *A Theory of Justice* (Cambridge, Mass., 1971).

**dilemma.** As used informally, a person is in a dilemma when he is confronted with difficult choices as in the case of moral obligations which conflict. Adapting an example from Plato:

If I return John's gun then he will inflict harm.  
 If I don't return John's gun I will have broken a promise.  
 I return it or I don't return it.  
 Therefore someone will be harmed or I will have broken a promise.

On a formal account, traditional logic characterized as dilemmas some arguments consisting of a conjunction of two \*conditionals and a \*disjunction. Singled out were four valid arguments which can be represented in the \*propositional calculus.

Dilemma		Premiss 1	Premiss 2	Conclusion
Constructive	Complex	$(P \supset Q) \cdot (R \supset S)$	$(P \vee R)$	$(Q \vee S)$
	Simple	$(P \supset Q) \cdot (R \supset Q)$	$(P \vee R)$	$Q$
Destructive	Complex	$(P \supset Q) \cdot (R \supset S)$	$(\sim Q \vee \sim S)$	$(\sim P \vee \sim R)$
	Simple	$(P \supset Q) \cdot (P \supset S)$	$(\sim Q \vee \sim S)$	$\sim P$

S.G.A.U.

Dilemmas can have rhetorical force when used, for example, to persuade that the disjunctive premiss has an unacceptable conclusion.

R.B.M.

C. W. Gowans (ed.), *Moral Dilemmas* (Oxford, 1987).

**Dilthey, Wilhelm** (1833–1911). German philosopher who developed \*hermeneutics and extended Kant's method to the cultural sciences (*Geisteswissenschaften*). These sciences rest on 'lived experience (*Erlebnis*), expression, and under-

standing (*Verstehen*)'. History, art, religion, law, etc. express the spirit of their authors. We understand them by grasping this spirit. Such understanding involves our lived experience of our own culture. The continuity and unity of all cultures—life (*Leben*)—enables us to relive (*nacherleben*), and thus understand, the past. The historian employs categories, such as 'meaning, value, purpose, development, ideal', which are not a priori, but 'lie in the nature of life itself'. Life has no single meaning: our idea of its meaning is always changing, and the 'purpose which we set for the future conditions our account of the meaning of the past'. World-views (*\*Weltanschauungen*) are relative to cultures, but by studying them and life in general, man approaches (but never attains) objective self-knowledge. Knowledge involves life, not only reason: we affirm an external world because our will meets resistance.

**Ding-an-sich:** see thing-in-itself.

**Diodorus Cronus** (d. 284 BC) is most notable for his advocacy of atomism and determinism. In response to Aristotle's argument that the continuous motion of partless things is inconceivable, Diodorus maintained that motion is discontinuous: something is in one place at one instant and in a different place at the very next instant. In defending this view, he seems to have contemplated not only an atomistic view of matter but also a spatial and temporal atomism, whereby space and time are not continuous magnitudes but comprise smallest minimal parts. Diodorus' defence of determinism falls within a class of temporal symmetry arguments, whereby it is argued that the future is like the past, which is fixed and unchangeable, because the fixed nature of events cannot change simply as a result of whether we consider an event to be past or future, depending on where we imagine ourselves to be on the time line. Note however that he says nothing to refute the possible claim that temporal symmetry also holds the other way: one might equally argue that the past is like the future, namely open and undetermined. His distinct-ive argument is that what is past is true and necessary, and that only what is or will be true is possible.

R. Sorabji, *Time, Creation and the Continuum* (London, 1983).  
 J. Vuillemin, *Necessity or Contingency* (Stanford, Calif., 1996).

**Diogenes the Cynic** (404–323 BC). Greek philosopher who seems to have held that only the distinction between virtue and vice matters, and that other conventionally acknowledged distinctions (e.g. between public and private, Greek and barbarian, raw and cooked, yours and mine) should therefore be disdained. He propagated these views, occasionally by argument ('All things belong to the gods; the gods are friends to the wise; friends hold in common what belongs to them; so all things belong to the

wise'), but much more frequently by action: a characteristic anecdote records that he once masturbated in the market-place, remarking to passers-by 'If only it were as easy to get rid of hunger by rubbing my stomach'. His flamboyantly disgusting actions and savage repartee earned him the nickname 'Dog'; his followers were called \*Cynics', or 'Doggies'.

N.C.D.

*Socratis et Socraticorum Reliquiae*, ed. Gabriele Giannantoni (Naples, 1990), ii. 227–509 (= *Elenchos*, vol. xviii\*\*).

**Diogenes Laertius** (probably 3rd century AD). Author of *Lives and Opinions of Eminent Philosophers*. This is an uncritical scissors-and-paste work on Greek philosophers from Thales to the \*Sceptics of the third century AD. Diogenes took his material from hundreds of earlier works of very variable quality. Where his sources are reliable, Diogenes provides some important evidence, notably on the philosophy of Epicurus and some of the Pre-Socratic philosophers. But on others, such as Aristotle, his accounts are unreliable, and sometimes incoherent. He had a taste for anecdote and paradox, but no talent for philosophical exposition. Nothing is known of his life, and, as he presents many different philosophical views with evident approval, it is hard to detect any distinct philosophical position of his own.

R.J.H.

*Diogenes Laertius*, tr. R. D. Hicks, intro. H. S. Long (Cambridge, Mass., 1972).

**Dionysian and Apollinian** (or Apollonian). Nietzsche's designations of two different Greek art forms and artistic tendencies, reflecting two fundamental human and natural impulses. He invoked the names of the gods Apollo and Dionysus to identify and distinguish them in his discussion of the origin of the tragic art and culture of the Greeks (which he traced to their confluence), associating Apollo with order, lawfulness, perfected form, clarity, precision, self-control, and individuation, and Dionysus with change, creation and destruction, movement, rhythm, ecstasy, and oneness. (See *The Birth of Tragedy* (1872), sects. 1–5; *The Will to Power* (1901), sects. 1049–52.)

R.S.

\*tragedy.

Richard Schacht, *Nietzsche* (London, 1983), ch. 8.

**direct realism:** see naïve realism.

**dirty hands.** In Jean-Paul Sartre's 1948 play *Dirty Hands*, Hoederer speaks of having hands dirty up to his elbows, having plunged them in filth and blood: 'So what? Do you think one can govern innocently?'

Under the heading of 'dirty hands', contemporary thinkers debate whether actions that violate ordinary moral principles can be excused on grounds that they are undertaken for the sake of the greater good; and what degree of guilt such violations impose on those who perpetrate them. How seriously should they take the analogy implied by the proverbial saying 'He that touches pitch shall be defiled therewith' (Ecclesiasticus 13: 1)?

In the practice of politics, the metaphor of dirty hands is often invoked by public officials hoping to brush aside accusations of wrongdoing by claiming to have acted strictly in the public's best interest. Some take a more categorical stand: they argue that it would be naïve to imagine that politicians could ever truly serve the public's best interests without violating fundamental moral principles.

This view has long antecedents. In *The Prince*, Machiavelli maintains that rulers who cling to moral principles such as those prohibiting dishonesty, breaches of faith, and the killing of innocent persons invariably end up defeated by adversaries who lack such scruples. Max Weber, in 'Politics as a Vocation', holds that the tasks of politics can be accomplished only by means of violence, and that deceit and breaches of faith are needed for such purposes as well.

Conversely, Erasmus, in *The Education of a Christian Prince*, and Kant, in 'Perpetual Peace', consider such views untenable not only in principle but in practice, and bound to victimize innocents, corrupt agents, and destroy trust. Often charged with naïvety, they take it to reside, rather, in ignoring the destructive role that faith in the dirty-hands rationale, by whatever name, plays in politics.

s.B.

\*consequentialism.

**disability and morality.** 'Disability' principally implies permanent or long-term missing physical capacities but often includes mental capacities too. Yet, whilst we can compare the result of illness or injury to a set of capacities owned originally, it is controversial what set of capacities a person should have to begin with. One view proposes that any account will presuppose an essence or ideal type of human form and functioning, against which we can compare individuals. Individual variations, even quite significant ones, exist in all species, however. Unless one is committed to vulgar evolutionary reductionism, there is no plausible reason for according any one of these priority or value over the others.

Permanent conditions do exist which prevent a person from enjoying a full life; medical impairments can inherently produce pain and suffering, or render lives unviable. However, many so-called disabilities are not like this. Often incapacity is due to the way society has structured its environment and the encouragement and rewards it gives to projects requiring certain traits and abilities. Wheelchair users are 'disabled' by how we organize access, rather than having an inherent incapacity or 'disability'. Yet, this view faces a problem. Whilst some traits are not inherently disabling, society may nevertheless be unable to correct for them if, say, doing so will place unreasonable burdens on others, or is simply unfeasible. Thus, a notion of disability which is not medical, nor purely social, can still be sketched.

Given the equal value of persons, irrespective of such variation, two central issues emerge. First, where society does not correct for people's inability to make choices they could make, were things differently arranged, is there a responsibility to compensate these people? Secondly, in a technological era where choices can be made by selecting future offspring with different features, how should choices be informed by our understanding of disability? Choosing not to have a deaf or a blind child might seem legitimate. But if it is, those championing diversity will argue that it is equally legitimate to choose to have blind or deaf children. This raises further questions as to whether such choices harm the child, given that she would not exist without the choice being made, and also to what extent lack of social accommodation for a trait should feature in such a choice.

J. Feinberg, 'Wrongful Life and the Counterfactual Element in Harming', in his *Freedom and Fulfilment* (Princeton, NJ, 1992).

**discourse.** According to Émile Benveniste, 'discourse' is language in so far as it can be interpreted with reference to the speaker, to his or her spatio-temporal location, or to other such variables that serve to specify the localized context of utterance. The study of discourse thus includes the personal pronouns (especially 'I' and 'you'), deictics of place ('here', 'there', etc.), and temporal markers ('now', 'today', 'last week'), in the absence of which the speech-act in question would lack determinate sense.

More often, 'discourse' signifies any piece of language longer (or more complex) than the individual sentence. Discourse analysis therefore operates at the supra-grammatical level where sentences can be shown to hang together through relationships of entailment, presupposition, contextual implicature, argumentative coherence, real-world and speaker-related knowledge, etc. In philosophical terms it is of interest chiefly to thinkers in the field of logico-semantic analysis, as well as those who adopt (after Quine) a more holistic view of the issues that arise for any theory of meaning—or 'radical translation'—allowing for the fact of ontological relativity, or the existence of widely varying conceptual schemes.

Nikolas Coupland (ed.), *Styles of Discourse* (London, 1988).

Émile Benveniste, *Problems in General Linguistics*, tr. M. E. Meek (Coral Gables, Fla., 1971).

**discrimination.** In one familiar sense simply the act of distinguishing between different things. The notion, though not the word itself, has a central role in philosophy, because the 'application of a concept' consists in distinguishing those objects which 'fall under' it from those which don't. One tradition sees 'concept formation' as a process in which words are used to mark the natural

resemblances and differences imposed on our minds by objects themselves—what Plato called 'carving nature at the joints'. Another stresses that language is social, and that the words we inherit impose distinctions on the objects of our perception.

In a different but equally familiar sense, 'discrimination' is pejorative, signifying unfair treatment on grounds of, for example, race or gender. The two senses are curiously interwoven in the writings of those social psychologists who argue that, because all thinking requires generalization, prejudices and stereotypes are the 'natural' products of the human mind.

c.w.

\*ableism; affirmative action.

G. M. Allport, *The Nature of Prejudice* (Boston, 1954).

**disjunction.** A proposition ( $P$  or  $Q$ ), where  $P$  and  $Q$  are propositions, is a disjunction. In English 'or' is ambiguous; especially as between an inclusive use, i.e. ( $(P$  or  $Q)$  or both) and an exclusive use, i.e. ( $(P$  or  $Q)$  and not both). In the \*propositional calculus, an inclusive disjunction is standardly represented by  $(P \vee Q)$ . It is true except where both  $P$  and  $Q$  are false. No further relation as between the content of  $P$  and  $Q$  is required. (\*Truth-function.) An exclusive disjunction can be given by  $((P \vee Q) \cdot \sim(P \cdot Q))$ . The inference of  $Q$  from  $(P \vee Q)$  and  $\sim P$ , known as the disjunctive syllogism, is valid for the propositional calculus. Its validity has been challenged by alternative systems of logic.

R.B.M.

\*logic, relevance; configuration.

W. V. Quine, *Methods of Logic*, 4th edn. (Cambridge, Mass., 1982).

**disposition.** A \*capacity, tendency, \*potentiality, or \*power to act or be acted on in a certain way. Obvious examples include irascibility, fragility, and being poisonous. Non-dispositional properties (e.g. a person's age) are sometimes called 'intrinsic' or 'categorical' properties. Many concepts that are not overtly dispositional have been given dispositional analyses, including mental concepts such as belief and desire. (\*Ryle; \*behaviourism; \*identity theory of mind.) \*Secondary qualities such as redness have also been treated as dispositions, as have moral virtues such as courage. Some hold that dispositional properties cannot be fundamental, arguing that every disposition must depend on other properties that provide its ground or basis (as the solubility of a sugar cube depends on its chemical properties). However, it has also been suggested that the fundamental properties of matter may be dispositional.

P.J.M.

\*causality; conditionals.

J. L. Mackie, *Truth, Probability, and Paradox* (Oxford, 1973), ch. 4.

S. Mumford, *Dispositions* (Oxford, 1998).

**disquotation.** We use quotation marks to form a name of a linguistic expression. Disquotation can be thought of as

the inverse of quotation—that is, as the cancellation of quotation marks. The truth-predicate ‘is true’ obeys the following disquotational principle or schema: ‘*p*’ is true if and only if *p* (where *p* may be replaced by any English sentence—the \*liar sentence apart!). For example, ‘Snow is white’ is true if and only if snow is white. The principle tells us that we should be prepared to assert a sentence if and only if we are prepared to assert its truth. But this amounts to little more than a truism, rather than conveying the nature of \*truth itself.

E.J.L.

\*redundancy theory of truth.

W. V. Quine, *Pursuit of Truth* (Cambridge, Mass., 1990).

**distribution of terms.** The subjects of ‘All *S* are *P*’ and ‘No *S* are *P*’, and the predicates of ‘No *S* are *P*’, and ‘Some *S* are not *P*’ were traditionally said to be ‘distributed’; and this was supposed to explain why certain inferences are valid, others invalid. A term, said Keynes, is ‘distributed when reference is made to all the individuals denoted by it’. This theory is obscure, and the traditional rules are flawed.

C.W.

\*inversion.

P. T. Geach, *Reference and Generality*, 2nd edn. (Ithaca, NY, 1968).

**distributism.** A social philosophy propounded in England by Hilaire Belloc and G. K. Chesterton in the early part of the twentieth century. Although primarily a political-economic doctrine, it included ideas about art, culture, and spirituality. A version of \*communitarianism, it was strongly opposed to *laissez-faire* \*capitalism, and to centralized collectivism, which it associated with welfare \*liberalism and state \*socialism. The core element, elaborated most effectively in Chesterton’s writings, was a view of persons as value-orientated, affective agents whose happiness can only be self-determined. This personalist anthropology (admired by several central European phenomenologists) led to an emphasis on social liberty and individual ownership from which the name derives.

J.HAL.

Q. Laurer, *G. K. Chesterton: Philosopher without Portfolio* (New York, 1988).

**distributive justice:** *see* justice.

**divine command ethics.** This ethical theory holds that all moral requirements derive from God’s commands. One way of articulating the basic idea goes as follows. (1) An action is morally forbidden (wrong) just in case and because God commands that it not be performed. (2) An action is morally permitted (right) just in case and because it is not the case that God commands that it not be performed. (3) An action is morally obligatory just in case and because God commands that it be performed. A consequence of these claims is that, if there is no God, nothing is morally forbidden, nothing is morally obligatory, and everything is morally permitted.

This conception of morality has a distinguished pedigree. In the Middle Ages, it figured prominently in the writings of Ockham and his disciples. It is found in works by Locke and Berkeley. More recently it has been endorsed by Kierkegaard and Barth. It coheres with scriptural portraits of God. The Hebrew Bible is full of stories of God imposing requirements by fiat. In the Gospels Jesus teaches his ethics of love in the form of commands to love God and to love one’s neighbour as oneself (Matthew 22: 37–40).

But the theory has also attracted philosophical suspicion ever since Plato. Adapting a question from his *Euthyphro*, one asks: Is torturing the innocent wrong because God forbids it, or does God forbid it because it is wrong? In the latter case, torture is wrong independent of divine commands. In the former, torture would be right if God were not to forbid it, though intuitively torture seems to be necessarily wrong. However, if God necessarily forbids torture, then according to the theory it is necessarily wrong. So some contemporary divine command theorists argue for an account of divine sovereignty in which necessary moral truths depend on necessary divine commands.

P.L.Q.

J. M. Idziak (ed.), *Divine Command Morality: Historical and Contemporary Readings* (New York, 1980).

P. L. Quinn, *Divine Commands and Moral Requirements* (Oxford, 1978).

### divine philosophy

How charming is divine philosophy!  
Not harsh, and crabbed as dull fools suppose,  
But musical as is Apollo’s lute,  
And a perpetual feast of nectared sweets,  
Where no crude surfeit reigns.

(Milton, *Comus*, lines 475–9)

Milton’s *Comus*, a masque in which Comus, son of Circe and Bacchus, tries to seduce the innocent Lady, was mainly a debate on the importance of virginity. The little speech above follows a far-from-charming diatribe against ‘carnal sensuality’, said to clot the soul with contagion in this life and draw it to charnel-houses afterwards. Milton is invoking Plato’s claim, in *Phaedo*, that unless the soul is free of the body’s ‘contamination’ it will be weighed down by earthiness and dragged back into the visible world after death.

J.O’G.

**divorce:** *see* marriage.

**Dodgson, Charles Lutwidge:** *see* Carroll, Lewis.

**Dōgen Kigen** (1200–53). A \*Zen master regarded by the Japanese Sōtō school as its spiritual founder, Dōgen was a gifted nature poet as well as a profound thinker, whose ideas about the ‘Buddha-nature’ of all things would exemplify in the West a religious \*panpsychism. His monumental *Shōbōgenzō* (Treasury of the True Dharma Eye), densely poetic in style, is one of the most brilliant gems of

Japanese philosophy. In accord with the Mahāyāna Buddhist insight that the world of enlightenment (*nirvana*) is not different from the world of impermanence (*samsāra*), Dōgen understands all things as being basically already enlightened. Thus Zen practice is to be understood as itself a manifestation of—rather than a means to—enlightenment. Dōgen developed a sophisticated philosophy of temporality, in which everything in the world ‘generates’ its own time (and with some remarkable parallels to ideas in Kierkegaard, Nietzsche, and Heidegger). G.R.P.

William R. LaFleur (ed.), *Dōgen Studies* (Honolulu, 1985).

**dogma.** A term that is generally applied to religious doctrines that are accepted irrespective of reason or evidence, usually on scriptural or ecclesiastical authority. It is now used pejoratively, because it sanctions not only belief unjustified by reason, but also intolerance, i.e. the punishment of false belief. However, McTaggart revives the original positive sense, suggesting that the definition should be widened to include any proposition which has metaphysical significance, whether or not it is based on reason. D.BER.

J. M. E. McTaggart, *Some Dogmas of Religion* (London, 1906).

**dogmatists:** see scepticism, history of.

**domain.** (1) A domain of discourse, or universe of discourse, is the class of things being talked about on a given occasion. For example, ‘the baby’ will be understood only if the domain includes one (and not more than one) baby. (2) A domain of quantification is the class of things covered by a \*quantifier. For example, ‘Every native of this town speaks Arabic’ presumably means to exclude non-humans, infants, the dead, etc. Context, or meaning (e.g. ‘someone’), may indicate that the domain of a quantifier is narrower than the current domain of discourse. (3) The domain of a binary relation is the class of things that have that relation to something; and the converse domain, or range, is the class of things to which something has it (the domain of *R* is the class  $x: \exists yRxy$ , and the range is the class  $x: \exists yRyx$ ). (4) Similarly the domain of a \*function is the class from which its \*arguments are drawn. C.A.K.

**double aspect theory.** The view, derived from Spinoza, that certain states of living creatures have both mental and physical aspects. Perception and thought, for example, are processes in the brain, but not just physical processes, because some brain processes have experiential or cognitive aspects which are inseparable from their neurophysiological character. Double aspect theory therefore attempts to identify the mental and the physical without analysing either in terms of the other, thus avoiding both \*dualism and \*materialism. If true, it would explain how the causes of our actions can be simultaneously physical and mental. However, it is obscure how such apparently different things could really be aspects of one thing. A related modern view is Donald Davidson’s \*‘anomalous

monism’, according to which every mental event is identical to a physical event, but mental properties cannot be analysed in physical terms. T.N.

\*Identity theory; mind–body problem.

Spinoza, *Ethics*, pt. II.

**double effect.** The ‘doctrine of double effect’ is a thesis in the philosophy of action which is put to use in moral choice and moral assessment. In many actions we may identify the central, directly intended goal or objective for the principal sake of which the action is selected and done. However, there will normally also be side-effects of the process of achieving that objective or of its accomplishment, which may be known prior to taking the action. The doctrine of double effect maintains that it may be permissible to perform a good act with the knowledge that bad consequences will ensue, but that it is always wrong intentionally to do a bad act for the sake of good consequences that will ensue. Sometimes moral problems may arise, or be resolved, by thus considering whether something bad is the direct effect, or the side-effect, of some intention or action. That someone dies as the result of your action is in any case bad, but directly to intend their death appears worse than directly to intend some benefit, but with the knowledge that death may be hastened by this. Administering pain-relieving drugs which shorten life expectancy is a standard example. The extension of this pattern of reasoning to (for example) \*killing in self-defence or operating to save a pregnant woman’s life but causing foetal death is controversial. N.J.H.D.

\*Abortion; consequentialism; deontological ethics.

There is useful discussion in Philippa Foot, ‘The Problem of Abortion and the Doctrine of the Double Effect’, in *Virtues and Vices* (Oxford, 1978); and in Jonathan Glover, *Causing Deaths and Saving Lives* (Harmondsworth, 1977).

**double-mindedness.** Adapted by Kierkegaard from James 4: 8, ‘purify your hearts ye double-minded’, to capture failures to do the moral thing due to subordinating the latter to extra-moral goals (e.g. a reward for doing it or the avoidance of punishment for not doing it). It includes doing the good thing on condition of its being done by oneself, and even doing it with pride that this is not the case. Purity of heart, or to ‘will one thing’, is to be able to conceive of one’s deed as embodying that state of spiritual satisfaction which, in double-mindedness, is conceived as an end to be achieved, here or in the hereafter, by means of the deed. A.H.

S. Kierkegaard, *Purity of Heart is to Will One Thing* (New York, 1958).

**double truth.** The doctrine of double truth posits the existence of two distinct realms of discourse, the philosophical and the theological, which give different but non-conflicting answers to the same questions, e.g. the immortality of the soul, the eternity of the world, the perfectibility of the individual human life. The doctrine originated in the

encounter between the rationalism of Greek philosophy and the theology of omnipotence and inscrutability in Islam and was associated with Averroës, who, in his *Decisive Treatise*, tried to justify a double standard of truth for the masses and truth for the philosopher. This earned him the ire of Islamic and Christian theologians and led to the Paris Condemnations of Bishop Tempier of 1270 and 1277 in which Boethius was centrally involved, and to the attempts of St Thomas Aquinas to produce a coherent synthesis of pagan philosophy and Christian theology. The moral and intellectual privilege of the philosopher is a prominent theme in Spinoza (*Ethics*, proposition 41, Scholium). c.w.

\*subjective truth.

G. F. Hourani, *Averroës on the Harmony of Religion and Philosophy* (London, 1961).

**doubt.** When we doubt a proposition, we neither believe nor disbelieve it: rather, we suspend judgement, regarding it as an open question whether it is true. Doubt can thus be a sceptical attitude: one form of \*scepticism holds that any cognitive attitude other than doubt is irrational or illegitimate—rationality requires a general suspension of judgement. The arguments employed by sceptics (for example, Pyrrhonists such as Sextus Empiricus) are thus designed to induce doubt, to shake our beliefs and certainties, and to force us to suspend judgement.

Descartes made doubt the cornerstone of a philosophical method: in order to place our knowledge on foundations which are genuinely secure, we should try to doubt all of our beliefs, retaining them only if they are absolutely indubitable. Ordinary empirical beliefs are threatened by the possibility that I am dreaming; as are even logical principles because I might be deceived by an evil demon. Unless I can eliminate these possibilities, I cannot escape the suspicion that all my beliefs are infected by unnoticed error. Few have been convinced by Descartes's claims about when doubt is impossible, and many have questioned his claims about the desirability of trying to extend doubt as far as possible.

A problem emerges because Descartes's arguments do not produce a genuine doubt: the possibility that I might be dreaming or deceived by a demon does not touch my everyday confidence that I will be supported when I sit down or my ordinary reliance upon elementary arithmetic. Descartes acknowledged that the doubt induced by hypothesizing an evil demon is 'very slight, and so to speak metaphysical': we can acknowledge the abstract possibility or appropriateness of doubt but we feel no live doubt. But many of his critics have claimed that he relied upon an inadequate, excessively 'intellectual' understanding of doubt and certainty.

\*Common-sense philosophers have questioned the apparent assumption that if we can conceive a possible situation incompatible with the truth of some everyday claim, then, unless we have independent grounds for ruling out that possibility, our everyday certainty is unwarranted.

There are kinds of certainty (and indubitability) falling short of the absolute certainty criticized by sceptics. In 1675 John Wilkins defended our certainty that there was such a man as Henry VIII and that there are such places as America and China. And John Tillotson insisted that 'It is possible that the sun may not rise to Morrow morning; and yet, for all this, I suppose that no Man has the least Doubt but that it will.' We do not hesitate to accept standards of rationality which underwrite such certainties; and it is unreasonable to follow sceptics in disregarding these standards. Doubt is made to appear a neurotic and unreasonable fear which leads us to doubt things because they cannot receive kinds of proofs which it is unreasonable to expect them to receive. They may not be beyond all possible doubt, but they are beyond all *reasonable* doubt. Similar arguments against the Cartesian use of the method of doubt are found in thinkers like Thomas Reid.

Alongside this claim that sceptical doubts are unreasonable, we find the suggestion that they are unreal, that they are a pretence. The way in which I confidently trust that the chair will take my weight suggests that I entertain no real possibility that it is not there. Philosophers like Wittgenstein have insisted that these 'practical certainties', things we do not doubt 'in deed', form the true foundations of our knowledge: the Cartesian method of doubt misconstrues this distinctive kind of certainty as a form of intellectual assent. c.j.h.

\*certainty.

M. J. Ferreira, *Scepticism and Reasonable Doubt* (Oxford, 1986).

**doxa.** A Greek word signifying opinions, beliefs, conjectures, estimates. A very important notion in Aristotle's philosophical methodology, where it means the 'things that are said' by the many or the wise regarding some problem or issue which any adequate philosophical assessment must take into account justly and properly. The \*'intuitions' often appealed to in modern moral philosophy, or in John Rawls's method of \*\*reflective equilibrium', are all *doxa*, but it is not obvious that philosophical theorizing need be constrained by such things. n.j.h.d.

A notable treatment is given by G. E. L. Owen in '*Tithenai ta phainomena*', in *Logic, Science, and Dialectic* (Ithaca, NY, 1986).

**doxastic virtues:** see virtues, doxastic.

**dread:** see *Angst*.

**dreams.** Hallucinations in sleep? Philosophers have concerned themselves with dreams in three ways.

(1) *Dream scepticism.* The effectiveness of any self-applied waking-or-dreaming test presupposes that you did not merely dream you carried it out. Does it follow that you know neither that you are not dreaming nor any of those many things you think you know provided you are awake?

(2) *The interpretation of dreams.* Freud said dreams are the (disguised) fulfilment of a (repressed) wish. Are such explanations causal, purposive, or something else? And what would vindicate or refute them? Or is the point to change dreamers rather than to understand them?

(3) *The concept of dreams.* Given that most of what is reported as dreamt belongs to Cloud-cuckoo-land, is this remembering at all? If so, of what? And what would count as misremembering? Do dreams occur during sleep or are our waking impressions memory illusions? J.E.R.S.

\*psychoanalysis, philosophical problems of.

C. E. M. Dunlop (ed.), *Philosophical Essays on Dreaming* (Ithaca, NY, 1977).

**Dretske, Fred I.** (1932– ). American philosopher, who has made significant contributions to epistemology, metaphysics, and the philosophy of mind. In the philosophy of perception he defended the idea that there is a 'non-epistemic' variety of visual experience—the sense of seeing an object that is attributable in purely extensional sentences. (\*intentionality.) In epistemology he was one of the pioneers of the 'relevant alternatives' approach to \*knowledge. In recent work, Dretske has offered a reductive account of the intentionality of mental states in terms of the notion of *information*—reliable lawlike correlation between types of phenomena. Clouds are reliably correlated with rain. There is a sense therefore in which clouds carry information about the presence of rain: they are 'reliable indicators' of rain. Dretske argues that intentionality can ultimately be reduced to such reliable indication. T.C.

\*perception; experience.

Fred I. Dretske, *Knowledge and the Flow of Information* (Oxford, 1981).

— *Naturalizing the Mind* (Cambridge, Mass., 1995).

**dualism.** The theory that mind and matter are two distinct things. Its most famous defender is Descartes, who argues that as a subject of conscious thought and experience, he cannot consist simply of spatially extended matter. His essential nature must be non-material, even if in fact he (his soul) is intimately connected with his body. The main argument for dualism is that facts about the objective external world of particles and fields of force, as revealed by modern physical science, are not facts about how things appear from any particular point of view, whereas facts about subjective experience are precisely about how things are from the point of view of individual conscious subjects. They have to be described in the first person as well as in the third person.

Descartes argued that the separate existence of mind and body is conceivable; therefore it is possible; but if it is possible for two things to exist separately, they cannot be identical. A modern form of this argument has been presented by Saul Kripke, against recent forms of scientific materialism which claim that the relation of mental states to brain states is like the relation of water to H<sub>2</sub>O. What happens in the mind clearly depends on what happens in

the brain, but facts about the physical operation of the brain don't seem to be capable of adding up to subjective experiences in the way that hydrogen and oxygen atoms can add up to water. Theoretical identifications of which both terms are physical and objective don't provide a model for identifications where one term is physical and the other is mental and subjective. However, while there are problems with the identification of mind and brain, it is not clear what other kind of entity could have subjective states and a point of view, either.

Substance dualism holds that the mind or soul is a separate, non-physical entity, but there is also \*double aspect theory or property dualism, according to which there is no soul distinct from the body, but only one thing, the person, that has two irreducibly different types of properties, mental and physical. Substance dualism leaves room for the possibility that the soul might be able to exist apart from the body, either before birth or after death; property dualism does not. Property dualism allows for the compatibility of mental and physical causation, since the cause of an action might under one aspect be describable as a physical event in the brain and under another aspect as a desire, emotion, or thought; substance dualism usually requires causal interaction between the soul and the body. Dualistic theories at least acknowledge the serious difficulty of locating consciousness in a modern scientific conception of the physical world, but they really give metaphysical expression to the problem rather than solving it.

The desire to avoid dualism has been the driving motive behind much contemporary work on the mind-body problem. Gilbert Ryle made fun of it as the theory of 'the \*ghost in the machine', and various forms of \*behaviourism and \*materialism are designed to show that a place can be found for thoughts, sensations, feelings, and other mental phenomena in a purely physical world. But these theories have trouble accounting for \*consciousness and its subjective \*qualia. Neither dualism nor materialism seems likely to be true, but it isn't clear what the alternatives are. T.N.

**Ducasse, Curt John** (1881–1969). A French-born American philosopher who taught at Brown University and was an advocate and practitioner of \*analytical philosophy before it became the dominant mode in the English-speaking world. In contrast to most analytical philosophers, however, Ducasse had a comprehensive philosophical system.

'When any philosophically pure-minded person sees a brick strike a window and the window break', Ducasse said in his attack on Hume on \*causation, 'he judges that the impact of the brick was the cause of the breaking, *because* he believes that impact to have been the only change which took place then in the immediate environment of

the window.' According to his adverbial view of sensing (influential on the epistemology of his student Chisholm), when we sense a red colour, the red colour is not a substantive but refers to a way of sensing—'I see redly'. Ducasse was also celebrated for his lifelong fascination with psychical research.

**Duhem, Pierre** (1861–1916). French physicist, philosopher, and historian of science most famous for Quine's use of his thesis that theories cannot enjoy empirical consequences of their own, but only in complexes. Duhem's stated position varied from the thoroughgoing \*instrumentalism of *To Save the Phenomena* to a \*conventionalism tinged with what has been interpreted as structural realism in *Aim and Structure*. Whether any properties of the world can be inferred from the success of a physical theory, the power responsible for these successes was, for Duhem, the mathematical structure beloved of 'French' minds, rather than the strings and pulleys of English atomism. Thus Duhem was enamoured of—and contributed to—phenomenological thermodynamics as expressed in abstract differential equations.

**Dühring, Eugen** (1833–71). A prominent socialist intellectual, Dühring was originally trained as a lawyer and came to teach philosophy and economics at the University of Berlin. Building on Feuerbach's materialism, Dühring developed an atheistic optimism allied to a fairly mechanistic sort of \*positivism. From this he constructed proposals for the reform of society which were distinctly utopian. In 1875 he became the object of a polemic by Engels, entitled *Anti-Dühring*, in which Engels counterposed his own, and allegedly Marx's, \*dialectical materialism to the supposedly cruder \*materialism of Dühring.

D.McL.

**Dummett, Michael** (1925– ). British philosopher of language, logic, and mathematics, noted for his exposition of Frege's philosophy and defence of \*anti-realism. Dummett characterizes anti-realism in terms of a denial of the principle of \*bivalence—the principle requiring that any assertoric sentence is either true or false. To hold that this principle fails for sentences concerning a given domain of discourse—such as past events, other minds, or mathematics—is to be, in Dummettian terms, an anti-realist with respect to that domain. Dummett's anti-realism stems from his approach to the theory of \*meaning, and has affinities with verificationism. Like Davidson, Dummett believes that a learnable language must have a compositional semantics, but rather than associate sentence-meaning with realist truth-conditions Dummett associates it with assertibility-conditions, because whereas a child can be taught to recognize circumstances in which evidence suffices to justify the assertion of a sentence, it cannot be taught to grasp circumstances in which a sentence would be true independently of any evidence that might bear upon its truth. Consequently, if a sentence about (say) the past is such that neither it nor its negation is justifiably assertible, we can have, it seems, no genuine grasp of what it would be for that sentence to be true and its negation false, or vice versa.

Dummett's views on anti-realism and the theory of meaning are intimately related to his work in logic and the philosophy of mathematics, especially his sympathetic treatment of \*intuitionism. Yet at the same time he has perhaps done more than any other commentator to promote interest in Frege's philosophy of language and mathematics and to elevate Frege ahead of Russell, Moore, and Whitehead as founder of modern analytic philosophy—all this despite Frege's strong Platonist leanings, which run quite counter to intuitionist precepts.

**Duns Scotus, John** (c.1266–1308). Scholastic philosopher, the 'Subtle Doctor', the original 'dunce', and, for Gerard Manley Hopkins, 'Of realty the rarest-veined unraveller', who was one of the great Christian \*medieval philosophers. His critical attitude to Aquinas led to Ockham's more radical criticism.

The details of Scotus' life are uncertain. He was born in Scotland and became a Franciscan. He did not live to revise his writings, and they are only now being properly edited and disentangled from spurious works. His genius lies not only in the novelty of his doctrines but also in his meticulous exposition and dissection of arguments, even when he accepted their conclusions. He believed, for example, in the immortality of the soul but regarded none of the arguments for it as conclusive; and, in discussing the proofs of God's existence, he took pains to distinguish

those cases in which an infinite regress of causes is vicious (and thus needs to be curtailed by the postulation of an uncaused entity) from those in which it is not.

In his discussions of theological questions, he elaborated several doctrines that diverge from \*Thomism. (He rarely mentions Aquinas, however, but attacks less eminent opponents such as Henry of Ghent.) He rejects negative theology, since 'negation is only known through affirmation'. Being (the subject of metaphysics), and other terms predicated of both God and creatures, are univocal. I may be certain that something, e.g. God, is, or is wise, but uncertain whether he is finite or infinite, created or uncreated; but my concept of being or of wisdom will be the same whichever of these alternatives is true. (This argument is open to an objection: If I overhear someone saying 'That's too hard', I may be certain that something is too hard, and that the speaker believes it to be so, while being uncertain whether what is referred to is a chair or a question; but it does not follow that 'hard' is univocal as applied to chairs and to questions. Analogously, the fact that we can believe God to be, while remaining uncertain of his categorial status, does not demonstrate the (otherwise plausible) conclusion that 'being' applies univocally to entities in different categories.) Moreover, concepts are derived from our acquaintance with creatures. If the concepts applied to God are not the *same* concepts, we can neither give a sense to them nor validly argue from premisses about creatures to truths about God.

He criticized a position close to Ockham's nominalism, arguing that things have 'common natures', e.g. the humanity common to Socrates and Plato. But he rejected the Aristotelian-Thomist view that individual things are distinguished by their (designated) matter and are thus not truly intelligible. Tweedledum is distinct from Tweedledee in virtue of his *haecceitas* or thiness, a formal feature intelligible to God and angels if not to fallen humanity: 'the ultimate specific difference is simply to be different from everything else'. The distinction between an entity's common nature, its \*haecceity, and its existence is intermediate between a real and a conceptual distinction, namely, an 'objective formal distinction' (*distinctio formalis a parte rei*).

This type of distinction also obtains between the divine attributes, the powers of the soul, etc. The will, both of God and of man, is distinct from the intellect and not determined by it. The will does not necessarily choose the *summum bonum* even when it discerns it intellectually. Will, not intellect, plays the main part in our free ascent from worldly perfection to beatitude, the love of God. God too is free, and the world does not emanate from him by intelligible necessity, but results from his freely given love. By freely willing the moral law God makes it binding on us: 'To command pertains only to the appetite or will'. But the *content* of the primary precepts, e.g. that one should not worship other gods, is not determined by God's will; God wills them because they are intrinsically self-evident, and we cannot be dispensed from them. There are, however, secondary precepts which, though in harmony with

the primary, are neither derivable from them nor self-evident, and their content as well as their obligatoriness depends on God's will; from these he can dispense us. Scotus is half-way between Thomism and Ockham's view that all law stems from the will of God alone.

He was less fond than Aquinas of Aristotle's proof of God's existence from the occurrence of motion, not because the proof is invalid, but because God transcends the physical realm: 'it is a more perfect and immediate knowledge of the first being to know it as first or necessary being than to know it as first mover'. Proofs of God's existence must be a posteriori. But Anselm's \*ontological argument is a 'probable persuasion', if not a demonstrative proof, as long it is appropriately 'coloured'. That is, Scotus (like Leibniz) added the premiss that the most perfect being is possible, i.e. can be 'thought without contradiction', but held that we cannot prove that it contains no contradiction from our inability to detect one.

His immense influence extends to Peirce and Heidegger as well as to his medieval followers. M.J.I.

**Durkheim, Émile** (1858–1917). From a French rabbinical family, he started his career teaching secondary-school philosophy, then sociology at the Universities of Bordeaux and Paris. He claimed that societies are irreducible entities, the laws governing which could not be derived from biology or psychology. 'Collective representations' of a society, such as social traits, customs, legal systems, languages, and 'group emotions' are said to 'exist outside the individual consciousness', on which they have an effect greater than the mere sum of the effects of other individuals. So sociology is a distinctive science with a distinctive subject-matter (which happily prevents sociologists being redundant).

What is 'normal' is relative to particular stages of society. Lack of social norms, or conflict between them, produces 'anomie', a moral lawlessness. Durkheim attempted functional explanations of the division of labour, primitive religions, etc. in terms of societies' (not individuals') needs. A.J.L.

**duty.** Along with the concepts of \*‘ought’ and \*‘obligation’, the concept of duty expresses moral action as *demanded* or *required*. ‘The moral law’, wrote Kant, is, for us, ‘a law of duty, of moral constraint.’ How is this cluster of concepts related to the contrasting cluster centring upon ‘good’ and the realization of value? For some moralists (including Kant again), ‘Duty and obligation are the *only* names’ for ‘our relation to the moral law’ (*Critique of Practical Reason*). For others, our duties, though not reducible to different terms, make sense only as regulating human life so as best to achieve good ends and to respect rational and sentient beings.

Certain performances, such as promise-making, generate duties to act in quite specific ways: other duties result from special relationships—parent to child, doctor to patient: others again are owed to living beings simply on the ground of their sentience or their rational, personal status.

**economics, philosophy of.** The philosophy of economics may be taken as the \*philosophy of social science run with economic examples, in which case there is not much to be said specifically about it. Or it may be taken to designate a more or less distinct area of inquiry: one which overlaps with the philosophy of social science, as it is bound to do, but which is motivated by distinctively economic concerns. I shall take it here in the latter sense. Economics is a highly distinctive approach to social theory, and the philosophical problems which it raises are cast in nice perspective by contrasting it with other social disciplines of thought. I will consider the contrasts it displays with sociology, psychology, and politics.

The most striking contrast between economics and sociology—economics in the dominant neoclassical sense and sociology in the traditional, Durkheimian mould—is that economics is individualistic, sociology not. (\*Social philosophy.) The individualist thinks that none of the aggregate patterns and pressures revealed in social

science—or revealed otherwise—gives the lie to our general sense of the individual human agent, while the non-individualist denies this. The individualist holds that human agents conform to our commonplace folk psychology, being more or less rational in the attitudes they form and the choices they make. The non-individualist believes that individuals take second place, in a manner inconsistent with common sense, to the sorts of social regularities that social science is well equipped to reveal. For example, he may say that there are social regularities that are predetermined or predestined to obtain, in such a way that individuals are bound to act as the regularities require: they are bound to have the attitudes that lead by ordinary psychology to suitable actions; or they are bound, at whatever cost to their attitudinal coherence—they may ‘go on the blink’—to display the behaviour involved.

The debate between \*individualism and non-individualism does not have much prominence in the philosophy of economics, because individualism reigns almost unquestioned; unlike certain sorts of sociology, economics has never suggested that it has a new and iconoclastic image of the human being to offer. But a related, methodological question does often figure in current debates. Assuming that economics is individualistic in the more or less ontological sense explicated, does this mean that it must also be methodologically individualistic? Does it mean that economics must deny validity and interest to \*explanations that relate events or patterns to aggregate antecedents: say, that it must reject as ill-conceived the sort of explanation that traces a rise in crime to a rise in unemployment or a decrease in religious practice to growing urbanization? This question is of particular relevance, because many so-called macro-economic explanations appear to be aggregate in character.

Whether or not economics can countenance such aggregate-level explanations, it is associated in practice with a style of individual-level explanation that marks a contrast with the explanations preferred in traditional sociology. This style of explanation involves two elements, one psychological, the other institutional. The psychological element suggests that given a certain circumstance or change or whatever, it is unsurprising that people should generally—or at least in significant

numbers—come to behave in a certain way. The institutional element then goes on to show that given this shift in overall behaviour, there are bound to be certain consequences—in all likelihood, unintended consequences—that make for an aggregate change. If the consequences are thought of as beneficial, then the pattern identified in the explanation is traditionally described, in a phrase of Adam Smith's, as an invisible hand; if they are thought of as harmful, it is sometimes described as an invisible backhand or an invisible foot. Invisible hand and invisible backhand explanations are the very stuff of economic theorizing in the received, neoclassical mould.

So much for the contrast between economics and sociology. A second contrast that points us towards distinctive features of economics is that with psychology. Here there are a number of things to notice. Economics has traditionally been more or less behaviouristic in orientation, preferring to build a picture of the human subject out of actions displayed rather than on a reflective or introspective basis. Again, economics has traditionally been not just behaviouristic, but also rationalistic. It has assumed that decision theory is on the right tracks in seeking to explain human behaviour by reference to the maximization of expected utility: the maximization of expected preference-satisfaction. And, finally, economics has tended, at least in practice, to be egocentrically reductionistic, assuming that the preferences which human agents seek to satisfy are, on the whole, self-concerned or egoistic desires. These features of economics put it in contrast with many traditions of psychological theorizing and they even create tensions with our commonplace psychology. Economic psychology may not reject commonplace psychology in the manner of non-individualistic theories, but it gives a controversial gloss to much that that psychology contains. (Michael Bacharach and Susan Hurley (eds.), *Essays in the Foundations of Decision Theory*.)

The status of the psychological assumptions that economics makes is a matter at the core of the philosophy of economics: there is much discussion both of the necessity for such assumptions and of the plausibility of the assumptions made. The questions raised have been greatly sharpened with the increasing application of economic method, not just in the explanation of market and related behaviour, but also in the explanation of behaviour outside the market: for example, in the explanation of social interaction, as in so-called exchange theory, and in the explanation of political behaviour, as in what is known as the theory of public choice. Is it really reasonable to treat social and political agents as hard-headed and hard-hearted calculators of the kind that economics projects into the market-place? Some have thought that it is, on the grounds that human beings are always unconsciously of this cast of mind. Others have sought less dramatic means of vindicating the contribution that economics can make in non-economic domains. (Philip Pettit, *The Common Mind*, ch. 5.)

The final contrast that I want to mention is between economics and politics. Traditional political thinking,

especially normative political thinking, is characterized by two features. First, a willingness to contemplate exogenous ideals—say, ideals of equality or liberty or solidarity—in the assessment of social and political institutions. And second, a tendency to assume that the main task in normative thought is just to argue for the ideals introduced and to provide a sense of what their institutionalization would involve. Economics breaks with both of these dispositions, being associated with quite a different sense of how normative thinking should go. (Geoffrey Brennan, 'The Economic Contribution'.)

Perhaps the main assumption of normative thinking in traditional economic circles—an assumption now frequently questioned (Amartya Sen, *Choice, Welfare and Measurement*; John Broome, *Weighing Goods*)—is that it is inappropriate to judge the institutions of a society except by reference to the preferences of the people they affect. This assumption is broadly utilitarian in character—unsurprisingly, since the history of economic thought was closely tied up with the utilitarian movement in the last century—but economics has given its own distinctive twist to the utilitarian thought. Arguing that we cannot compare preference-satisfaction across individuals and therefore cannot compute the level of total preference-satisfaction in a society—the exercise is not epistemologically feasible—economics has explored other ways of developing the preference-based idea. A development that gained momentum in the 1930s yielded the Pareto-criterion, according to which one arrangement is better than another if and only if it satisfies the preferences of some and does not frustrate the preferences of any. This criterion has been at the centre of what came to be known as welfare economics. Another, more recent development, and one which has made for a connection with philosophical discussions, suggests that one arrangement is better than another if and only if it would be preferred by suitable parties in a suitable collective choice. This contractarian development is of great contemporary importance.

But not only is economics distinguished by the role it gives to preferences in normative thinking, it is also marked off from traditional normative thought by the emphasis it places on feasibility. It is not enough, so economics suggests, to be able to identify a plausible ideal and to describe what it would institutionally require. What is also necessary is to be able to show that the institutionalization in question represents a feasible way of realizing the ideal: one that is currently accessible and one that would remain in place, if once established. There are many products of this concern with feasibility, among them the minimalist approach of F. A. Hayek, which argues that the information that good government would require in a more-than-minimal state is never going to be reliably available. Public choice theory and social choice theory are also products of this concern and they have had a major influence on contemporary political philosophy. (Iain McLean, *Public Choice*.)

The public choice theorist argues that it is silly to prescribe a form of government, or to allocate certain

responsibilities to those in government, unless one has reason to believe that the arrangement is institutionally robust: at the least, it won't lead to worst results than would otherwise ensue. Public choice theory is meant to enable us to deal with the problem raised: to give us an idea of what to expect from those in government under this or that institutional amendment. The social choice theorist, on the other hand, is concerned with more abstract matters. He argues that there are many ways of aggregating individual preferences into a social preference-ordering—many ways of moving from what you want and what I want to what we should prefer as a group—that cannot simultaneously satisfy various attractive conditions; the most famous result in the area is Kenneth Arrow's impossibility theorem. Social choice theory castigates traditional theory for being over-relaxed about such matters and tries to explore questions about the aggregation of preferences in a systematic manner.

**economics and morality.** All societies must make moral decisions on how their resources are to be distributed. But for every resource allocation that brings benefits, conditions of scarcity mean that there are associated burdens, or costs. The discipline of economics offers a method of analysis for comparing alternative distributions by clarifying what is at stake, in terms of the burdens associated with the benefits. However, the relationship between economics and morality is not straightforward. Neo-classical (Welfare) Economics (NCE), by far the most influential modern school, is based on a number of theoretical presuppositions that raise moral questions.

Though economists may seek a value-free analytic technique, specific value commitments underpin the way they conceptualize benefits and burdens. They employ a metric of comparison for alternative distributions, within which burdens can be counted against benefits. Yet, in order to do this in a 'value-neutral' framework, they make benefit gains relative to each person's own conception of value. This they do predominantly by adopting the metric of individual welfare, understood as the maximisation of preference satisfaction (although some alternatives have been offered).

To this individualized notion of welfare, economists add the principle that distributions which optimize welfare gains across individuals, according to the Pareto improvement and optimality theorems, are economically

superior. Accordingly, the institution of the market is central to NCE. Under ideal conditions, a market is 'efficient' in its allocation of resources because, free, preference-based exchanges optimally maximize welfare (preference satisfaction).

These basic principles of individual welfare maximization, aggregation, the imperative to optimize gains, and market efficiency are not morally neutral; nor is it clear that they are compatible with important moral values. Trivially, distributions which satisfy these conditions may fail to respect rights or uphold communally important values, such as equality and fairness, unless one falsely identifies optimizing welfare allocations with fairness, or assumes that they respect rights. Less trivially, the idea that well-being can be understood in terms of maximizing preference satisfaction is controversial, as is claiming superiority for set-ups which optimally maximize it across individuals. Some goods, such as health or personal freedom, for example, may not be commensurable with other preference-satisfiers which can be exchanged on a market.

So even asking people to consider goods, like the environment or human relationships, solely in terms of preferences, especially those which can be expressed in market exchanges, seems morally distorting. Nor is it obviously ethically acceptable to treat persons in terms of one 'snapshot' of their preferences. These can change over time, and, more importantly, they can be responsive to reasons. Yet the value of political participation—influencing communal decisions through argument and discussion—is not itself expressible in terms of preferences in the market-place. Nevertheless, might not NCE help us with choices where all other morally relevant factors are taken into account? Whilst there is nothing wrong with reducing burdens, a moral problem remains for NCE. What counts as a burden, that which is costly, and what costs it is appropriate to associate with a choice, are questions themselves sensitive to moral judgement. It seems wrong, for example, to see the discharge of a moral duty as something for which one could be compensated.

NCE also employs a theory of rationality for individuals (rational choice theory) and for collectives (social choice theory). This aims both to explain actual states of affairs and to evaluate choices. The theory has a normative core which characterizes rational agent motivations as maximizing preference satisfaction and supplies axioms for ordering preferences. As a comprehensive description of rationality, then, the view places conditions on moral reasoning. For some philosophers, it even forms the basis of an account of morality. One response is that a plausible notion of good and bad reasons exists which is independent of actual preferences. It is not obviously rational for someone to act on their strong preferences for harming others, even if they can do so with impunity. The conclusions of rational choice theory, then, may sometimes compete with moral reasoning.

The productive successes of market economies, and paucity of viable alternatives to NCE, pose a different moral problem. Can we retain market benefits, without

NCE's theoretical presuppositions? It seems possible to do this by retaining the market, within a morally determined regulatory framework. However, this leaves us in need of a principle for determining to what degree personal choice (preference), versus moral duties to others, can legitimately play a role in setting economic priorities.

**education, history of the philosophy of.** A problem confronting anyone writing on the history of the philosophy of education is that many of the names mentioned in standard treatments of the topic, such as Pestalozzi, Froebel, and Hebart, are unlikely to be mentioned in standard histories of philosophy. Conversely, many if not most of the great philosophers have had little directly to say on the subject of education, and sometimes, as with Locke, when they do say something directly it is of little consequence. Nevertheless, despite this mismatch between philosophy and educational thinking, the topic of education does raise important philosophical issues. In concentrating on philosophers of importance *and* topics central to education, my account may be found somewhat revisionary.

The starting-point, though, must, as always, be Plato, whose *Republic*, though not exclusively that, is the first and greatest work in the philosophy of education. In the *Republic*, Plato is concerned with educating people in such a way that a just society is the outcome. Many would find this an extraordinary overestimation of the powers of education, and indeed it would be were education conceived in terms acceptable to a liberal democracy and did not involve, as Plato advocates, a form of child-farming. Plato is not concerned with the liberal ideal of individuals pursuing their own tastes and interests. He rejects the family and private property, at least for the rulers. For Plato, the good life is characterized rather by a general turning towards what is good and true outside of us and independently of us. Although this external good has left its traces deep within us, it is hidden and needs to be recovered by a process of externally directed discipline and thought. Each individual is born destined to play a particular type of role in a society which aims at the good, and will be happy when his own powers are so arranged as to enable him to fulfil this role. In such a society the rulers will possess the wisdom to guide the rest in the light of the good and the true.

In the good city there will be all the usual trades and crafts, and the majority of citizens should be trained to perform them, presumably learning reading, writing, counting, and the particular skills appropriate to their trade. But educators will notice that some youths are suited by temperament to guard and guide the city; those singled out need to be both brave and gentle. To produce

soldiers of the right disposition, those selected will receive an education in music and gymnastics, based on the traditional classical Greek models. Music, which includes literature, will have to be uplifting and moral, rather than effeminate or disorderly. Poetry which shows the gods behaving disreputably and music which is barbaric or effete are ruled out. Gymnastics will train both bodies and characters.

The most selfless and steadfast of the guardians are to be educated further to become rulers of the city. For this, they will need to become philosophers, lovers of wisdom, skilled in science and reasoning (or what Plato calls dialectic). Both rulers and soldiers are to be brought into what is in effect an armed camp within the city, and taken away from their parents. For the rest of their lives they will possess everything in common, including wives and children. The presumption is that the offspring of the initial guardians will share their qualities and form the next generation of guardians.

Within the camp no one will know who his or her parents are. There will also be no distinction between the sexes, women being selected as guardians as much as men, and educated in the same way. Future generations of guardians will be told that they have been bred for the city. Their philosophizing is not for their own satisfaction only, but is so that they can rule and instruct the rest.

Simply to recount Plato's proposals may seem to have little philosophical point. There are, though, certain themes which have recurred in educational thinking since Plato's time: the idea that education and individual lives are ideally for the sake of the state, not for the sake of the individual alone; the idea that education is as much about the building of character as of intelligence in our sense (which is the case even with the rulers' philosophizing, which is all directed towards a type of static wisdom which is coterminous with moral goodness); and the idea that education is capable of transforming individual minds and characters so as to produce acceptance of a revolutionary communistic project.

Plato's doubtless exaggerated assessment of the power of education nevertheless leads him to write scathingly and brilliantly of forms of education of which he disapproves. He writes of the schoolmaster in a democratic society who 'fears and flatters his pupils' and the pupils who consequently despise him, of old men who, ridiculously, condescend to the young, 'imitating their juniors in order to avoid the appearance of being sour or despotic'. For Plato, although education is communistic, it cannot be democratic or, in the modern sense, child-centred. Even though wisdom eludes the grasp of the young, who are wayward and blind and who have to be trained over many years to have the right dispositions and thoughts. Education then cannot proceed on the basis of the current interests of the young. The philosophers, indeed, have a duty, which is painful for them, of descending into the \*cave metaphorically occupied by the unenlightened, so as to instruct and rule them. And wisdom is

fixed and one. So a pluralistic approach to value or education is rejected.

Like much else in philosophy, philosophy of education continually rehearses Platonic themes: authoritarian or child-centred? dictatorial or pluralistic? collectivistic or individualistic? And there is also continual worrying at the relationship between what is already inside the child and what is to be received from without. Of course, strange transmogrifications have happened on the way. The train of thought now known as liberal education, as reflected in the writings of Michael Oakeshott, say, would agree with Plato in rejecting child-centredness, but disagree with him on the fixity of knowledge and on the nature of the state. It would agree with Plato on the importance of learning what has been discovered, but disagree with him on the closure of traditions of thought. And while it would give some thought to the importance of moral education, it would tend to view education in far more intellectualist terms than Plato, claiming that intellectual disciplines and their content are worth learning for themselves irrespective of any moral improvement they bring.

We have no systematic treatise by Aristotle on education, but he would have shared Plato's suspicion of teachers who are afraid to appear despotic. He also made some suggestive remarks about the need to inculcate the right dispositions in the young before encouraging them to reflect on morality and politics. (Otherwise their reasoning will be clever rather than wise.) And he endorsed the classical stress on music and gymnastics in terms similar to Plato. But, although he saw the happy individual as playing a role in public affairs, he saw the gaining of knowledge by individuals as an end in itself and not to be justified in terms of the contribution this might enable an educated individual to make to the state. For Aristotle men have intrinsic desire to know and understand, which it is part of their nature to pursue. Here Aristotle was close to Socrates' dictum that the unexamined life is not worth living. He was also closer to the individualism of Socrates than to the Plato of the *Republic*.

During the Christian era, Platonic themes resurface, notably in the writings of St Augustine. Human nature needs to be turned to the light because of original sin and its enmeshment in body. The young are not yet rational. They need instruction in the basic subjects. The content of what is taught is censored, and the aim of elementary education will be the prevention of idleness. Only in the higher stages, with the study of philosophy and theology, will anything like full rationality be possible. Augustine sees God as the source of all truth and analyses learning quasi-Platonically as a form of opening ourselves to an inner divine illumination, an opening which, as with Plato, does not preclude didactic teaching methods.

While not accepting Augustine's Platonic view of knowledge, most Christian writers on education up to the time of Luther and St Ignatius of Loyola saw education in terms of the salvifically necessary transmission of truths established and revealed. Even with the recovery of pagan learning in the Renaissance the stress is on imparting to

the young what has been learned. There is, though, something of a sea-change, in the seventeenth century, with its dismissal of past authority, and stress on individual experience. Thus Francis Bacon, who believed that the truth about nature would be manifest to the individual who engaged in presuppositionless observation, opposed the foundation of Charterhouse school on the grounds that its curriculum was to be based on the ancient classics. He wrote: 'what happiness it would be to throw myself into the river Lethe, to erase completely from my soul the memory of all knowledge, all art, all poetry; what happiness it would be to reach the opposite shore, naked like the first man.' Education should, therefore proceed by the learner making his own observations and discoveries, without external direction. Locke was not so sanguine as Bacon about the possibility of learning much about the world through the senses, although he believed with Bacon that we have no other access to the world. Locke, accordingly, emphasized the moral aspects of education, at the expense of the intellectual and scientific. But he agreed with Bacon's thoroughly utilitarian approach to knowledge and to education, both, in Bacon's terms, to be directed to 'the relief of man's estate'.

Throughout the seventeenth and eighteenth centuries, schools and universities went on traditionally. The new philosophies of Bacon and Descartes which stressed individual discovery and reasoning and which downplayed didactic instruction had little effect on curriculum or pedagogy. It is indeed doubtful that *any* philosophy had any significant effect on the practice of education prior to the beginning of the nineteenth century, when the ideas of Rousseau and his followers Pestalozzi and Froebel began to make an impact.

Rousseau's *Émile* (1762), in common with many of his other writings, is a sustained criticism of civilization as it existed in Rousseau's time. Although, in Rousseau's words at the start of *Émile*: 'God made all things good, man meddles with them and they become evil.' We are born free, but live in chains. Our first natural impulses are always right, yet society, by encouraging envy and vanity, makes us into civilized monsters, suffering and causing suffering. The child, moreover, is not a miniature adult, but a creative being with its own particular needs and desires, which should be allowed to 'indulge its sports, its pleasures, its delightful instincts'. *Émile* was a heady brew, combining nature-worship, child-centredness, an emphasis on doing and discovery at the expense of reading and being taught, and a pervasive hatred of the existing order of things, from which the child must be protected. Its actual proposal, to allow each *Émile* to develop 'naturally' and in isolation from society, under the exclusive tutelage of a Rousseauian guide or, in today's terms, 'facilitator', is as impracticable as Plato's. Nevertheless despite an ineradicable lack of clarity about what Rousseau means by nature and uncertainty about the benefit to be gained by following nature's impulses, *Émile*'s influence can be seen in every primary school in the Anglo-Saxon world. (France, perhaps surprisingly, has so far remained

somewhat immune.) Rousseau's work can also be seen as the start of a pervasive interest in the details of child development in educational thought, even if the details of the work of such as Piaget and Kohlberg owe more to the category-based philosophical psychology of Kant than to Rousseau himself.

Despite differing radically on the beneficence of an unreformed nature, Plato and Rousseau were at one in seeing education as part of an overarching political and social project. So, indeed, did Dewey, whose philosophy of education combines Rousseauian child-centredness and hostility to traditional learning with a pragmatic socialism. Throughout his long and active life, Dewey was involved with experimental schools and educational reform. He linked meaningful education with the child's own attempts to solve problems arising from its own fundamentally social experience. The 'full meaning' of studies is secured only when they become 'integral parts of the child's conduct and character . . . as organic parts of his present needs and aims—which in turn are social'. Traditional education produces only barren symbols and flat residues of real knowledge. In addition it reinforces and perpetuates \*élitism and social divisions. The classroom should be 'a social enterprise in which all individuals have an opportunity to contribute', in which 'all are engaged in communal projects', a sort of democracy in miniature in which the teacher himself is not an 'external boss or dictator', imposing curricular standards alien to the pupils' lives and experiences, but rather the 'leader of group activities', who gives the group not 'cast-iron' results, but rather starting-points to be developed through the contributions of all involved.

Dewey hopes that children will discover everything which it is useful for them to know by working on projects suggested by objects and materials from their everyday life. If this means that they never get round to studying the history and classics prescribed by the traditional curriculum, so much the better. Dewey shares Rousseau's hostility to all that. He is, in addition, Baconian in his hostility to an inner life which is not generally shared and shareable, and also to any form of study not clearly directed to practical problem-solving.

There will be little need to emphasize the way in which Dewey's educational ideas are, like Rousseau's, live. Dewey reinforces Rousseau's child-centredness with the Baconian thought that what the child should be centring on are problems and practice. Dewey would obliterate any distinction between training (in what conduces to the pursuit of practical problem-solving) and education (in what it is good to know in and for itself).

Education, in this sense, is a thoroughly classical concept, which since the time of Socrates and Aristotle has never entirely disappeared in institutions of learning. Even in medieval times, the minority who studied philosophy and theology strove to understand the rationale for what the rest believed, and perhaps only a minority will ever be capable of rationality in that sense. Similarly, even the most Baconian and Deweyesque programmes of

study have never succeeded entirely in quenching the desire of some for a more liberal education. Nor has the notion of liberal learning as an end in itself lacked vocal and eloquent defenders, whenever it has been under threat.

Thus, in the nineteenth century Matthew Arnold and Cardinal Newman both preached the virtues of an education in which the pupil would, in Arnold's words, be inducted into 'the best that has been thought and said'. Arnold, the school inspector, hoped that a kingdom in which such an education prevailed would be bathed in sweetness and light. His ideas owe something to Schiller, who hoped for a similar result from aesthetic education, and something to Coleridge, who wrote of a non-religious clerisy, an educated élite who would leaven the rest of society. Newman is notable for his insistence on a rounded education, the aim of which was not narrow specialism, but development of the capacity to see all things in relation to each other. Whether Newman thought this was a possibility in schooling prior to the university education about which he actually wrote is unclear, but the tenor of his thought is undoubtedly in the tradition of Socrates and Aristotle.

But does a liberal education of the sort envisaged by Arnold and Newman produce the results they wanted? Can it? As we have already seen, Rousseau and Dewey, in their different ways, argue that an education based on authority and cultural canons may alienate, produce only inert knowledge, and be socially divisive to boot. Nietzsche, too, wrote of the grammar school education from which he profited as producing only pedants and old maids. More radically, in his deconstructive moods, he questioned whether what we claimed to know and value was either true or valuable as opposed to a mask for power relations and (not entirely consistently) whether the scientific quest to discover the truth about nature and ourselves was not, in a deep sense, life-denying. And, today, those who see education in terms of the transmission of the best that has been thought and known are haunted by the image of the Goethe-reading camp commandant and Hitler's enthusiasm for Beethoven's Ninth Symphony.

My own feeling is that since Plato philosophers have expected too much and often the wrong things from education. Education should indeed touch the soul, and turn it, though it is a moot point whether it should turn it inward, as suggested, though in rather different ways, by both Plato and Rousseau. It should involve the formation of habits of behaviour and learning, habits which, *contra* Rousseau, are not in any obvious sense natural. But even the best moral education cannot guarantee a moral response, nor, *contra* Plato, Rousseau, and Dewey, an improved society. And the recommendations of Rousseau and Dewey are educationally harmful if they direct educators away from what education can and ought to do: namely to introduce the young to what their elders believe is the best that has been done in the various forms of knowledge and experience that have been developed.

Doing that, even successfully, is no guarantee against wickedness, individual or social. But there are forms of barbarism other than those of the tyrant; and a society which, in the spirit of Bacon and Dewey, makes no distinction between education and training for problem-solving is one.

**education, problems of the philosophy of.** An area where philosophical understanding is applied to the illumination of issues in education—where this notion covers upbringing within the family as well as learning in schools and other institutions. Systematic studies of this kind began in the USA in the mid-twentieth-century and slightly later in Britain and its commonwealth. To begin with, much work was done on investigating concepts like education, teaching, and indoctrination, on the assumption that to be a regular, respectable branch of philosophy like aesthetics or philosophy of religion, philosophy of education required its own puzzling concepts paralleling the concepts of art or god. Over time, however, work on these notions proved to be not so much puzzling as unbearably dull. Most philosophers of education in Britain, Holland, and Canada, as well as in more enlightened corners of the USA and Australasia, began to reconstrue their discipline as a form of applied philosophy, whose task is to clarify the aims, content, methods, and distribution of education appropriate to contemporary society. As such, philosophy of education in some ways resembles \*medical ethics, which brings moral philosophy and philosophy of mind to bear on dilemmas faced by health care professionals. The philosophical horizons of philosophy of education are, however, wider, covering—as we shall see—issues drawn from virtually every area of general philosophy.

*Hirstian liberal education.* A major preoccupation over the past three decades has been with an education, parental or institutional, suitable for a liberal society. Paul Hirst's early and influential account of liberal education saw it as the development of the student's rational mind, consisting in an induction into logically distinct patterns of reasoning and imagining found in various 'forms of knowledge'—mathematics, physical science, human science, history, philosophy, literature and the fine arts, moral knowledge, and (possibly) religion—each with its own unique concepts and tests for truth.

A liberal education in this sense was all about acquiring these forms of knowledge for their own sake—as contrasted with some extrinsic purpose as when studying physics to become an engineer. The theory was popular with educational reformers up to government level wish-

ing to extend to the many the rigorous intellectual education hitherto enjoyed only by the few.

But it ran into difficulties. These were partly specific—about whether, for instance, there are unique concepts in history, or whether literature and the fine arts constitute a form of \*knowledge. But there was also a more general problem about why the central aim should be the pursuit of knowledge for its own sake. Hirst's Kantian or 'transcendental' defence, found also in Peters, that one cannot sensibly ask why knowledge should be pursued because the questioner is already committed to its pursuit, proved unconvincing—partly because a sceptical questioner is clearly *not* so committed.

*Educational aims in a liberal society.* It became clear that one had to start further back than Hirst, with a comprehensive assessment of educational aims. This, in turn, demanded some picture of the kind of society within which these aims would operate. In the last thirty years work on aims and content has usually been conducted within a liberal-democratic framework and has been, and continues to be, strongly influenced by ideas in general philosophy on \*liberalism and liberal values.

Much of the recent history of philosophy of education can be read as an attempt to formulate a defensible account of an education suitable for a liberal society and to detach this from more problematic versions. Already the Peters–Hirst version of liberal education had drawn the fire of some Marxists and other left-wingers who saw the pursuit of knowledge for its own sake as an ideal suitable only to a leisured élite.

Many writers have located a more universally applicable aim in the cultivation of personal \*autonomy. The basic notion here is that everyone should be equipped to determine his or her own major goals in life and not have these paternalistically imposed, whether by custom, parents, teachers, or religious and political leaders. This is not, of course, to rule out aims to do with expanding knowledge, since in order to be autonomous one needs a good understanding of options available to one, as well as of the social world within which one chooses one's goals. But the focus is now less exclusively than with Hirst on the pursuit of knowledge for its own sake.

Quite what the autonomy ideal should include beyond this bare statement has been the topic of much dispute, some invoking the notion of following a life plan, others rejecting this, some putting what others see as excessive weight on rationality, and so on. Personal autonomy has also had to be distinguished from the more general notion of personal well-being. In tradition-directed societies those responsible for children's upbringing seek to promote their well-being, but hardly their autonomy, given that goals are ascribed by custom and not chosen. The practical import of this is clear as soon as one reflects on the multicultural nature of British or American society and the duties which religions may impose upon parents and communities to bring up their children in values at odds with personal autonomy. Should the liberal state favour aims to do with

self-determination, or should it be neutral for all but commonly agreed values? Should it prevent parents and non-state schools from bringing children up in non-liberal values? Much will turn in these discussions on how terms like 'liberal', 'autonomy', and 'neutrality' are interpreted.

Further issues arise about the nature of personal \*well-being. If this is in part to do with the achievement of one's major goals, then are there limits on what these can consist in? An educator will certainly want to rule out goals which harm other people. In general philosophy the claim that personal flourishing necessarily involves altruistic or moral concern has been constantly disputed since Thrasy-machus' challenge to Socrates in book 1 of \*Plato's *Republic*. From the educator's point of view, however, there seems every reason to bring children up to see their own good as inextricably intermeshed with others'.

On this view, moral education would not be, as it is often taken to be, a separate area of education. Yet whatever its status, there are differences in its conception. Commonly it has had to do with bringing about behaviour in accordance either with moral codes or with higher-order rational moral principles. But recent work on virtue ethics has called this rules-based approach into question, suggesting that we should rather think first of how to bring children up to be kind, courageous, friendly, co-operative, loyal. (\*Virtues.) This is a far from being an ivory-tower matter: it has implications, for instance, for the way we think about teacher-training—as well as about parental education and the role of the media in the formation and deformation of character.

Another uncertainty over the notion of personal well-being is whether what John Stuart Mill called the 'higher' \*pleasures—intellectual and aesthetic enjoyments—must form a part of a child's future goal-structures, or whether, say, a life of well-being could consist wholly in sex, drinking Budweiser, watching TV, and playing computer games. Have parents and teachers any responsibility to steer children towards the more exalted alternative, or would the true liberal leave things wholly open?

Of course, in promoting autonomy educators will in any case want to open up intellectual and aesthetic activities as possible options, but there may be grounds for them to do more than this. Suppose we take experience of the arts. If the theory is true that this constitutes an autonomous world of its own, so that listening to music is docketed as a leisure pursuit on all fours with pumping iron or bass-fishing, educators may have to be content with the 'options' position. But if aesthetic experience has deeper contributions to make to human well-being—as a form of social bonding, for instance, or as a way of promoting self-understanding or psychic harmony—parents and teachers may well be justified in encouraging pupils to adopt a way of life in which the arts occupy an important place. (\*Aesthetics, problems of.)

At the root of many of these issues about personal well-being is the question whether this notion is to be understood in terms of the satisfaction of major informed preferences or in some other way. On the preference-

satisfaction account, the education system and the market for consumer goods and services, so often seen as at odds over their values, could be seen as working hand in hand, each having the function of revealing and supplying possible intrinsic ends—further study of science, say, in the first case, and personalized number-plates on the other. Another view of personal well-being sees this not as a function of individual desire, but in terms of the attainment of such goods as intimacy, self-knowledge, autonomy, aesthetic activity, physical pleasures—although there are still unresolved issues about whether these goods are derivable in some way from human nature or culturally generated. On the second view of well-being, education has a role *distinct* from that of the market—in revealing these goods to learners and disposing them to value them. Further work on the aims of education depends on the resolution of this central issue, which has now become a major focus of debate in general ethics.

*Education and politics.* Vocational aims lie outside a Hirstian account of liberal education, but other accounts which stress personal autonomy will seek to equip pupils with an understanding of a wide range of vocational as well as non-vocational options. There are also wider issues about what attitudes parents, teachers, and other educators should encourage towards work in general. Is there still room for some version of the traditional 'work-ethic', or is this a jettisonable remnant from a more religious culture? What place does work play in personal well-being, intrinsically as well as instrumentally? Does only 'meaningful work' count? Should education be for a Work Society or for an Activity Society?

Education for work, in its turn, is inextricable from education for citizenship, about which there are, again, different variants, partly depending on one's view of a liberal society. Leaner ones focus only on the knowledge required for informed political decisions, while others add to this the dispositions, or political virtues, demanded of the citizen. Should the education system have a hand in nurturing such qualities as tolerance, a sense of justice, political courage, and civic friendship? Or when it transcends the aim of mere understanding and begins to shape young people's characters in a certain direction, is it becoming a vehicle of indoctrination?

What place among political virtues should there be for attachment to one's national community? Is education for patriotism at odds with liberal values, since it favours the interests of a particular community rather than those of human beings more generally? Some philosophers have argued that we should think more in terms of education for global citizenship—while others have claimed that patriotism is not the same as chauvinism and that imbuing a love of country need not bring with it the idea that that country is somehow superior to others.

So much for aims of education, closely intertwined as they are. One task of philosophy of education is to explore interrelationships between them in the interests of a coherent, synoptic, and defensible account. The content

of aims apart, there is also the question of who should determine them. While some other countries have recently loosened state control in favour of schools and teachers, England and Wales moved in 1988 from professional to political determination of the curriculum. Many of us would applaud political control in principle, holding that there are good reasons for it in the democratic right of every citizen—as distinct from sectional groups like teachers or parents—to participate in major decisions shaping the social future. At the same time there are good liberal reasons why teachers should be given considerable autonomy in implementing these decisions. Political control of aims and curricula should be far from heavy-handed. Whether the detailed, test-led, minutely prescriptive, and incoherent provisions of the 1988 National Curriculum met this requirement is not a matter on which a philosopher should pronounce. In 2000 the English and Welsh school curriculum was provided—for the first time in its history, remarkably enough—with an extensive set of general aims. In so far as these are adequate, they provide a touchstone for assessing how much of the traditional content of school education needs to be retained. Is there still a place for religious education? What weight should be placed on acquiring a foreign language? What room is there for contemporary history in schools? Why learn maths? How justified is the traditional weight on theoretical enquiry as compared with practical activity and rationality? At the more school-focused end of their work, philosophers of education in several countries are now working with policy-makers on questions like these.

That the state should play *any* role in determining the curriculum would be rejected by some libertarian thinkers about education. The content of schooling, like its provision, is, on their view, ideally a matter for the private sector. Their views overlap with those of some religious thinkers anxious to preserve and enlarge the domain of private faith schools. The assumption in both views is that parents should have the right to determine what the aims and content of their children's education should be. (We are talking of moral rights. That they have legal rights in many contexts is uncontested.) This is often asserted, but the grounds for it are dubious. Parents do not own their children, so no right can be based on this. But neither are they in a privileged position to know what is in the best interest of their children, as individuals and as citizens. While parents have rights arising from their responsibilities—e.g. the right to exclude a busybody neighbour from interfering with their child's upbringing—it is not at all clear whether they have any other kind of moral right.

Over the last three decades the force of Aristotle's insistence that education must begin from a political framework has become increasingly evident. Here the distribution of education has been much discussed. Would it be fairer to give all children a common education in the same schools? Or to divide them by school and curriculum according to their IQ, giftedness, specialist talents, parents' religious and other preferences, parents' ability to pay for private education? To egalitarians, arguments for

division often appear flaky rationalizations of an élitist, class-based system. Are intelligence and giftedness, as claimed, largely innate (see below)? What is giftedness, anyway? Is the 'equality of opportunity' on which arguments for selection often rely another vehicle of rationalization?

Some see a stronger argument for a selective system in the claim that giving able students special provision is in the general interest, since this will help to maximize the benefits they are likely to bestow on society and the economy—or, following Rawls's 'difference principle', in the claim that this is likely to improve the well-being of the most disadvantaged. Are these arguments more solid? Is there too much obsession with selection, as some would say, at the cost of doing more, and more immediately, for the educationally deprived?

*Children's minds and learning.* 'Child-centred' education can mean different things, including—defensibly—an education which puts children's flourishing first and school subjects second. It can also refer to a conception of education as a process of biological development akin to the growth of plants or animal bodies. It is doubtful whether the notions of mental or moral development—found, for instance, in theories like Piaget's—make logical sense. If development is always development towards a biologically given mature state (such as the fully grown tree or human body), it might seem that nothing could count as this in the non-physical areas just mentioned. An assumption in developmentalism, shared with other psychological theories applied to education, like those of Chomsky and Skinner, is that learning is a matter of an individual's causal interactions with the environment, whether or not these are also powered by developmental forces from within.

These psychological viewpoints bring us back again to the wider issue of what education is appropriate for a liberal society. One conception of this, reflected in the theories just mentioned, starts, as classical liberalism in general started, from a picture of pupils as atomic individuals. On an alternative model, heavily influenced by Wittgensteinian arguments against the possibility of private conceptual schemes, learning is essentially a social enterprise, involving the induction of the pupil into publicly agreed rules, practices, and values. This second view lies behind the 'forms of knowledge' approach to the curriculum, as well as behind broader and more recent conceptions, in some ways more Deweyan in outlook, stressing induction into a wider range of co-operative social activities and institutions, including, as well as intellectual and aesthetic activities, occupations, sports and leisure, family life, and attachments to local or national communities.

Whether a liberal account of education can accommodate these more collective purposes is central to the increasingly embattled debates between liberal and communitarian thinkers in the field. If liberalism is tied, as some claim, to atomistic notions of the person, to the hegemony of the free market, and to the privileging of

egoism over altruism, are its days not rightly numbered? Or are those right who say that a liberal education can encompass and celebrate the idea that individuals are social beings and should cherish their interpersonal attachments, whether at the level of intimate relationships or more widely at the level of the nation or other forms of community?

Underlying any account of education must lie some kind of conception of \*human nature. The relative weight to be placed on biological and on social aspects of this is a central issue in the field. It emerges, for instance, in discussions of whether concepts can be acquired by abstraction from experience—a topic which links Locke directly with the child-centred nursery. It is at the root of controversies about the nature of intelligence and the IQ, concepts which in their Galtonian form interestingly share the assumption in biological developmentalism that there are ceilings (of the mature tree) beyond which individuals cannot move. The political significance of such an assumption should be plain. If many children possess low intellectual ceilings, there seems a powerful reason for providing them with a different, less demanding form of education than the more able. This is one of the arguments for a selective system, already mentioned. But what justification is there for the view that we all have our individually differing mental ceilings? Is it verifiable? Is it falsifiable? Or is it, as some would say, as untestable as beliefs at the heart of other ideological systems, like the belief in the existence of God?

More generally, differences over human nature lie behind the broad division among those philosophies of education, often of \*Kantian inspiration, like those of Peters and the early Hirst, which see education above all as developing (in the transitive sense) forms of rationality; and those, often influenced by \*Aristotle, which, while still attached to rationality, especially practical rationality, pay more attention to the ways in which our biologically given desires and feelings are shaped into virtues, activities, attitudes, and reactions necessary to our flourishing. (Hirst, in his more recent writings, has forsaken the first for the second camp.)

The topic of the education of \*emotion and feeling illustrates this division. On one view, found in Peters, emotion is a form of passivity which can obstruct the rational life: children need to learn how to control and canalize it and bring it under the sway of reason. On another, emotions have also a more positive, active role, fear, anger, and sympathy, for instance, being the bases of children's acquisition of the virtues of courage, self-control, and altruistic virtues like friendliness and benevolence. The educative role of the arts, especially literature, in such a refinement of the emotions brings us back to the place of aesthetic activities in the good life and the liberal curriculum.

These are some of the ways in which philosophers have investigated children's minds. Another area of interest has been in thinking skills. Governments across the world have recently promoted these in school curricula, often in

the belief that teaching generalizable skills of logical, creative, and critical thinking is an antidote to the regime of fact learning and rote recall which plagues educational systems from Nanjing to Nantucket. But do general thinking skills exist? In what way can the critical thinking developed in history lessons be transferred to the mathematics classroom? Are there logically different kinds of imagining and reasoning found in epistemologically different areas—a claim we saw embedded in the Hirstian form of liberal education?

There is much in this brief account which has had to be omitted—work, for instance, on the cultivation of the imagination, higher education, lifelong learning, the nature of mathematical education, the teaching of history, the Internet, and a host of other specific topics—to say nothing of more grandiose abstract inquiries into the challenges and perils of something called \*post-modernism. **Edwards, Jonathan** (1703–58). Perhaps the foremost of Puritan theologians and philosophers, Edwards, after graduating from Yale in 1720, held a series of pastorates and ministerial posts in the American colonies. This left him time to compose the writings in which he systematizes and justifies the Puritan theme of the utter dependence of humanity and nature on God.

Edwards argues from the unthinkable of the notion of absolute nothingness to the eternal existence of being; this necessary eternal being must be infinite and omnipresent and cannot be solid. It can only be space, or God. Furthermore, consciousness and being are the same since it is unthinkable that something could exist from all eternity and nothing be conscious of it.

There is another route to this same idealistic conclusion. Edwards agrees with the view often attributed to Locke that secondary qualities such as colour and taste exist not in objects but in the mind. But Edwards holds that \*primary qualities have a similar existence: solidity is just resistance, shape is the termination of resistance, and motion is the communication of resistance from space to space. Yet 'resistance is nothing else but the actual exertion of God's power'; so resistance exists in God's mind and 'the world is therefore an ideal one', existing in God's mind through his free act of creation and in our minds through God's communicating it to us in a series of regular ideas. These claims, reminiscent of Berkeley, were probably arrived at without any knowledge of Berkeley's reasoning.

As the world is entirely dependent on God's continued creation of it, so our wills are entirely dependent on the causes that God has predestined for them. The Arminians of Edwards's time believed that human choices were spontaneous and self-determined. This violates the principle of universal causality that Edwards took from Newton; thus an act of will is determined by its strongest motives. Further, to say that in a \*free act a free choice determines the will involves an infinite regress, for on this characterization that free choice must be determined by a prior free choice, and so on.

The solution is to deny any meaningfulness to talk of a free will—rather freedom is something that belongs to a *person* when not hindered in doing what one wills. How one comes to perform this act of willing has no bearing on its freedom; thus Edwards can hold that choices can be entirely predestined by God and nevertheless that an agent not prevented from carrying them out is free. Indeed Edwards can reconcile freedom not only with \*Calvinism but with Newtonian science, which sees nature as entirely determined.

Moral judgements are based on sentiment and not on reason: by a sense of beauty one perceives the beauty of heart, or virtuous motive, in a virtuous act. There are two kinds of \*beauty—there is benevolence or love of being in general, which is the only true, spiritual, or divine beauty, and which is relished by a divine sense activated by God only in the few he has elected to heaven. The other kind of beauty consists in harmony, proportion, and uniformity in variety; this is a secondary, natural, inferior beauty perceived by a natural sense. Although nothing is approved by the one sense not approved by the other, true virtue consists in acting according to the former beauty. Only the saint whose inner motives have been entirely changed by God is capable of acting without the taint of self-love found even in the most just or altruistic but non-saintly individuals. Once again Edwards unifies his religious commitments with secular thought: an ethics of sainthood is reconciled with an account of ordinary ethical belief.

John E. Smith, *Jonathan Edwards: Puritan, Preacher, Philosopher* (Notre Dame, Ind., 1993).

**Edwards, Paul** (1923– ). American philosopher who is mixed one part analytic philosopher to one part \*philosopher. Although Edwards is best known as the editor-in-chief of the *Encyclopedia of Philosophy* (8 vols., 1967), a massive Enlightenment work with a notable analytic sensibility, his own widely discussed work focuses on such traditional philosophical issues as God, free will, immortality, induction, and the nature of value-judgements. Articles and books by him include: 'Bertrand Russell's Doubts about Induction' (1949), *The Logic of Moral Discourse* (1955), 'Hard and Soft Determinism' (1958),

'The Cosmological Argument' (1959), 'Atheism' (1967), *Buber and Buberism* (1970), *Heidegger on Death* (1979), 'The Case against Reincarnation' (1986–7, in four parts), *Voltaire* (1989), and *Immortality* (1992). A deep respect for science and common sense mark Edwards's writings, and he is well known for his use of humour as a lethal weapon against philosophers whom he regards as pompous purveyors of platitudes, especially Heidegger and Tillich.

**effect:** *see* causality.

**egalitarianism:** *see* equality; inequality; justice; liberty and equality; socialism; well-being.

**ego.** What 'I' stands for, the subject's essence. Plato and Descartes thought a person could exist disembodied. Locke imagined that a prince could swap bodies with a cobbler. It is hard to see how these stories could be intelligible (not to say true) without conceding the existence of an incorporeal ego, a subject for thinking, feeling, and willing, which makes each person who they are. But Hume sought in vain to *observe* his core \*self, and contemporaries who share Hobbes's hostility to mysterious non-physical substances wonder whether the stories make sense after all! It needs to be explained, however, why ghost stories at least *seem* to make sense for people, whereas we can make nothing of disembodied trees, and the thought that the Lada should swap identities with the Mercedes Benz (there being no physical change) strikes us immediately as absurd.

**egocentric predicament.** This name was given by Ralph Barton Perry to Berkeley's argument that anything supposed by an opponent of \*idealism to be a thing 'without the mind' is, by virtue of that supposition, just another idea 'within the mind' whose \**esse est percipi*. Berkeley believed, in Perry's words, that 'One cannot conceive things to exist apart from consciousness because to conceive is *ipso facto* to bring within consciousness.' The

predicament, Perry says, does nothing to prove there are no things without the mind, which is what Berkeley was trying to prove in setting up the argument. Neither the idealist nor the realist can use this predicament to prove his point about unperceived objects. L.W.B.

Ralph Barton Perry, *Present Philosophical Tendencies* (New York, 1925), 129ff.

**egoism, psychological.** The theory that all human actions are motivated by self-interest. Taken as a factual claim based on observation, this is obviously false: people are often motivated by emotions like anger, love, or fear, by altruism or pride, by the desire for knowledge or the hatred of injustice. However, egoism can seem true on the basis of a general argument which shows that all these apparently distinct motives, if properly analysed, are really examples of self-interest after all—that any motive must be. The argument is that every voluntary act is something the person on balance wants to do, something he does because he desires to do it; therefore, he does it in order to satisfy his desire to do it; therefore, the act is really self-interested. Even if it seems to sacrifice the person's interests, its aim is to satisfy his predominant desires.

This argument has several things wrong with it. First, as Joseph Butler pointed out, the motive of self-interest would have nothing to aim at unless the person had other motives as well. For example, if you are hungry it is in your interest to eat. But hunger is a desire whose object is eating, and not your interests. Self-interest is a different, second-order desire that has as its object the satisfaction of other, first-order desires, like hunger, which also motivate us directly. And some first-order desires are for things quite apart from oneself. If you donate money to famine relief, your motive is that you don't want other people to starve; your motive is not that you want to satisfy your desire that other people not starve. You may feel good if you donate the money and bad if you don't, but that's because you already think there's a reason to donate: the feelings don't explain the motive, rather the motive explains the feelings.

Another problem with the argument is that it considers only the influence of present desires on choice. But even if an act aimed at the greatest possible satisfaction of present desires, that would not make it self-interested, because a self-interested action must take into account all one's interests, future as well as present. So if someone refuses a cholera inoculation during an epidemic, out of fear of the needle, and later contracts cholera, the refusal may have satisfied his strongest desire at the time, but it was not self-interested. Psychological egoism should not be confused with ethical egoism, the view that each person *ought* to do what will best advance his own interests. T.N.

\*Mandeville.

F. H. Bradley, *Ethical Studies*, essay vii: 'Selfishness and Self-Sacrifice'.

Joseph Butler, *Fifteen Sermons*, esp. 11 and 12: 'On the Love of our Neighbor'.

David Hume, *An Enquiry Concerning the Principles of Morals*, app. iii: 'Of Self-Love'.

**egoism and altruism.** Does morality require a person to act for the good of others, or can its requirements be consistently seen as means to self-fulfilment for the moral agent? If the latter, some egoists will argue that only the thought of benefit or gratification to myself can in any case motivate me to action (\*egoism psychological); others, 'ethical egoists', claim that although I could aim at the good of another, the moral life is in fact the life that maximizes good-for-me, if not always in the shorter term, then reliably over a lifetime. It is a highly challengeable—indeed unconvincing—claim: situations arise, e.g. when some virtually undetectable injustice offers a person great reward and no deterrents. On such a theory, not even conscience would deter. Central to the very notion of a moral imperative is the idea that it has authority to override all other considerations, self-interest notably among them, and to rule out the thought of calculating and quantifying the balance for and against advantage to self on particular occasions of moral obligation. Again, if as an egoist I propose an ethical theory that *everyone should understand the object of moral endeavour to be the pursuit of his or her individual good*, the proposing of such a universal policy must itself conflict with my own pursuit of my individual good. I cannot really *want* others to attend to their good, as distinct from my own! But if I simply assert, as a personal manifesto (or, indeed, write it secretly in my diary), 'I am going to pursue my own fulfilment only, and I understand morality as precisely as means to that'—then I achieve consistency—but express no public moral theory.

It is not true that everything we can be said to 'want' or 'desire' is an enhancement or fulfilment of the self. We may want to give way to irrational rage or to wayward sexual desire, to hurt another or indeed to help another—without manifesting 'self-love' in any of these instances. My rage or aggression may in fact be self-destructive. The beginning of altruism is the realization that not all good and bad are good-for-me and bad-for-me: that certain others—my close friends, say—have joys and sufferings distinct from mine, but for which I have a sympathetic concern—and for their sake, not my own. I may then acknowledge that others beyond the small circle of my friends are not fundamentally different—and so reach the belief that there are objective goods and bads as such. As one self among the others I cannot claim special privileges simply for being the individual that I am! If it is neither impossible nor irrational to act simply for the sake of another, the occurrence of satisfaction or 'good conscience' when we have done so is not sufficient ground for the egoist to claim that it was only for these 'rewards' that the acts were performed.

Nor on the other hand does the possibility of altruism mean that it is a constant moral necessity: an altruist can allow that in most circumstances I can act far more effectively on my own behalf than can any other person. A simple but crucial step separates a broken-backed ethical

egoism from a minimally acceptable and consistent *moral* theory. It involves the recognition of others as more than instrumental to my fulfilment. I may promote my own interests and personal fulfilment, so long as I do not encroach upon the pursuit by others of their fulfilment. That is to recognize other persons as limits to my action: altruism may, of course, go beyond that in seeking positively to advance their good.

**Einstein, Albert** (1879–1955). German physicist most famous for founding relativity theory on the basis of two simple, empirically well-confirmed principles: that the laws of physics should be the same for all observers regardless of their state of motion, and that all such observers will measure the speed of light to be the same. As a consequence of these principles, he dramatically departed from traditional conceptions of substance and time by proving the equivalence of mass and energy,  $E = mc^2$ , and deducing that the spatio-temporal coordinates used by two observers in relative motion to express the laws of physics must be related so that their judgements differ over which events occur simultaneously. Einstein is also remembered for his opposition to the orthodox interpretation of \*quantum mechanics—though his oft-quoted quip 'God does not play with dice' does little justice to his other main criticism that the interpretation fails to deliver a determinate, measurement-independent description of physical reality. Among Einstein's numerous other contributions to physics, two stand out: his hypothesis that light is composed of tiny discrete packets of energy called photons (for which he officially won his Nobel Prize); and his analysis of the curved trajectory of a body under gravity as, in fact, 'straight line' motion occurring in a curved \*space-time that has a shape fashioned by the distribution of matter within it.

R.CLI.

\*determinism.

A. Pais, 'Subtle is the Lord . . .': *The Science and Life of Albert Einstein* (Oxford, 1982).

**Einstein, Podolsky, and Rosen paradox.** In general, quantum mechanics (QM) provides only probabilistic information about the possible results of measurements. The question arises whether this is because the world is genuinely indeterministic and, prior to measurement, the physical system measured does not possess determinate properties corresponding to the measurement outcomes, or whether it is because QM gives an *incomplete* description of a fully deterministic world. Might the QM description of a system be supplemented, so that the augmented description fully determines the results of measurements?

In 1935, Einstein, Podolsky, and Rosen argued that QM is incomplete. They considered a system of two spatially separated particles, A and B, in a particular quantum state,  $\Psi$ .  $\Psi$  does not determine the results of measuring the positions of A and B but, *given the result obtained on measuring A's position*, it does allow one to predict B's position with certainty. It therefore seems that B has a determinate position immediately *after* A's position is measured. But because A and B are spatially separated, B's position cannot be made determinate as a result of the measurement of A's position without there being some sort of 'action at a distance'. In order to uphold a principle of locality (that there can be no action at a distance), EPR conclude that B must have had a determinate position all along and that QM is thus incomplete. However, \*Bell's theorem shows that regarding QM as incomplete is not sufficient to save locality.

**élan vital.** The key concept in the theory of 'creative evolution' proposed by the French philosopher Henri Bergson (1859–1941). Much influenced by Darwin and (even more) by Herbert Spencer, Bergson nevertheless felt that a purely materialistic approach to \*evolution is unable to capture both the origination of new complex organs and the general rise of life up the order of being. He therefore argued that there is a kind of vital spirit (*élan vital*) which powers organic evolution. Bergson denied that he was painting an end-directed picture; but, as in such pictures, Bergson's scheme left humans in a familiar place, namely at the top.

M.R.

H. Bergson, *L'Évolution créatrice* (Paris, 1907); tr. as *Creative Evolution* (London, 1911).

**Eleatics.** A collective name for three philosophers active in the early to mid-fifth century bc: Parmenides, Zeno of Elea, and Melissus; after Elea (now Velia) in Southern Italy, the native city of the first two. Nothing is known of

any other philosophers who may have been active at Elea or shared the Eleatic approach (but Plato, *Sophist* 242c–d suggests there may have been some), apart from the Sophist Gorgias (see below), and, according to a dubious tradition, Xenophanes. There is no evidence of any formal ‘school’, nor even of personal contact between Melissus and the other two. Grouping the Eleatics together is justified by the similarities of method, arguments, and results found in the extant remains of their writings and in other testimony. (For individual details: \*Parmenides; \*Zeno of Elea; \*Melissus.)

Common to the Eleatics was a rejection of sense experience as a way to truth, and the acceptance of mathematical standards of clarity and necessity in argument. Parmenides and Melissus claimed to start from premisses indubitable to reason, and to argue deductively from these. Zeno, with destructive intent, took only the premisses of opponents and claimed to deduce contradictions from them. His weapon, frequently used by the others too, is *reductio ad absurdum* of the contrary thesis.

The influence of the Eleatics was immediate, deep, and lasting. They raised the standards of reasoning all round, and intensified the demand for sharply defined objects of knowledge. Both the later Pre-Socratics and Aristotle, who rejected their conclusions, took their arguments seriously, and were driven to take up positions on the metaphysical questions they raised. Gorgias (one of the \*Sophists) argued in Eleatic style to sceptical conclusions in his work ‘On Nature or What Is Not’. Plato’s acknowledgement to them is made in his scene-setting in the *Parmenides* and in the role of the ‘Eleatic Stranger’ in the *Sophist* and *Politicus*. Most subsequent philosophical analysis in the ancient period, particularly of logical and mathematical concepts, is ultimately indebted to their techniques and insights.

E.L.H.

J. Barnes, *The Presocratic Philosophers*, i (London, 1979), chs. 9–14.

**elenchus.** A Greek word, signifying questioning someone with a view to testing or examining the cogency or credibility of what they have said. Such questioning was wholly central to Socrates’ method of examining the ideas of others, as depicted in Plato’s early dialogues (such as the *Protagoras*). In his hands, this examination was almost always intended to show up confusions, inconsistencies, or other flaws in his opponents’ positions, so *elenchus* came to signify a refutation or disapproval of some point of view. Accompanied by his noted \*irony, Socrates’ fondness for refuting views won him no friends.

N.J.H.D.

Richard Robinson, *Plato’s Earlier Dialectic* (Oxford, 1953) is a central text for this.

**eliminativism.** Extreme materialist doctrine advocating the elimination of everyday psychological concepts in favour of neuroscientific ones.

The doctrine is sometimes cast in the claim that \*folk psychology is false. This seems incredible: if it were

correct, then (*belief* being a state of folk psychology) it could not be true that anyone believed it.

The doctrine is usually premised on (a) a metaphysical thesis purporting to show the need to reduce common-sense categories to categories of some mature science (\*reductionism), (b) a purported demonstration that our commonsense psychological categories are not such as to match up with those that could be used in any scientific account.

J.HORN.

Paul Churchland, ‘Eliminative Materialism and the Propositional Attitudes’, *Journal of Philosophy* (1981).

**élitism.** The belief that in any society there exist or ought to exist groups of those pre-eminent in any given field, including the political. In the Seventh Letter (326a–b) Plato wrote. ‘The human race will not see better days until either the stock of those who rightly and genuinely follow philosophy acquire political authority, or else the class who have political control be led by some dispensation of providence to become real philosophers.’ Plato thus holds both that it is possible to identify individuals who are by nature or grace specially fitted to rule, and that those so identified should rule. Both tenets will be questioned, the first by those dubious that there is a special identifiable talent for political leadership, and the second by those who want political power diffused rather than concentrated in the hands of a demarcated élite. However, even rule by ‘the people’ in practice often becomes rule by a new political élite: perhaps the most prudent course is to follow Karl Popper, for whom the most important political question is not *who* should rule, but rather how rulers can be regularly and peacefully got rid of by the ruled. Popper’s position tacitly admits the likelihood of political élites and sets about devising the means to control them.

While the term ‘élitist’ has lately become a term of abuse, the existence of élites in various areas of life is an inevitable consequence of the unequal distribution of human powers combined with a degree of social mobility and division of labour, which enables some of those who excel in a valued field to devote themselves to the development of their talent. To object to this in itself seems, as Nietzsche urged, to be little more than a symptom of envy on the part of the untalented. What is more questionable in Nietzsche is the claim that ‘the good of humanity’ lies ‘only in its highest specimens’. If members of élites behave as though they believed Nietzsche, they will doubtless provoke in their fellows expression of the resentful egalitarianism to which Nietzsche himself took such strong objection.

If élitism is, at least on the surface, to be distinguished from egalitarianism, it must also be distinguished from a belief in the virtues of an hereditary class system. Those who owe their position to birth are not necessarily talented in any sphere, and so do not, in the strict sense of the term, count as part of an élite. One of the objections to rule by a political élite chosen because of its members’ administrative or political skills is that such people may have little sense of the duties which go or ought to go with rule.

The magnanimity of *noblesse oblige* often eludes the meritocrat, who lacks that sense of responsibility to the underdog which in good times should be part of the upbringing of the aristocrat.

Élitism, then, is one of the marks of that type of classless society in which the talented are allowed to rise from any starting position. A thoroughgoing élitism, indeed, while not ostensibly egalitarian, would have to embody a principle of \*equality of opportunity whereby everyone in a society was free to rise where his or her talents led. In practice, such a principle may lead to a constant levelling-off of outcomes, and to preventing members of élites from giving advantages to their children. Élitism then, if not tempered with a right of parents to give special advantages to their children, will drift towards the very egalitarianism it set out to oppose. There may also be worries about the effect the rapid social mobility implied by a society structured on achievement rather than on class would have on culture and social continuity more generally. A.O'H.

\*conservatism; inequality; justice; socialism.

T. S. Eliot, *Notes towards the Definition of Culture* (London, 1948).

V. Pareto, *The Mind and Society* (London, 1935).

**Elster, Jon** (1940– ). Norwegian social and political theorist who has taught in Norway, France, and the United States. In his prolific and lively writings, which focus on social theory and rationality, Elster employs a wide range of conceptual tools drawn from philosophy, logic, game theory, economics, and psychology. His critical examination of Marx's social theories formed a cornerstone of so-called analytical \*Marxism, while his insistence on the need to look for the micro-foundations of social change, together with the light his analyses of problems in theories of rational action throw on the many faces of irrationality, and the role of emotion, have provided a multi-disciplinary resource for the detailed explanation of complex and large-scale social phenomena. A.H.

Jon Elster, *Sour Grapes: Studies in the Subversion of Rationality* (Cambridge, 1983).

**embodiment.** The doctrine in aesthetics and elsewhere that all and only cultural entities and phenomena (persons, artworks, actions) exhibit indissolubly complex properties that are at once material and intentional. The intentional features signify the collective linguistic, semi-otic, and institutional aspects of societal life. On the argument, the mind-body problem proves to be a restricted form of a more general culture-nature problem. The thesis is taken to provide the minimal metaphysics of the human sciences, the arts, morality, and the like, that is, those inquiries that admit intrinsically interpretable phenomena. The admission entails the non-reductive *sui generis* nature of cultural emergence relative to physical nature. J.M.

\*intentionality.

— *Culture and Cultural Entities* (Dordrecht, 1984).

**embraced and reluctant desires.** Reluctant desires are those desires we would prefer not to have and act on. Embraced desires are first-order desires, perhaps constituting life-hopes, which we actually desire to have. Reluctant desires operate in frustrating or obstructing circumstances (a weary writer's watching television), embraced desires in satisfying or enabling ones (the writer's keenness to complete her promising novel). Acting-out of embraced desires is having a freedom consistent with determinism; what is inconsistent with it is another kind of freedom we want—one having to do not with either kind of desire but with origination. J.O'G.

T. Honderich, *A Theory of Determinism: The Mind, Neuroscience and Life-Hopes* (Oxford, 1988), ch. 7.

**emergence.** In the philosophy of mind, emergentism is the view that conscious mental states are not reducible to neurological states of the brain, even though they first came into existence only as a result of the evolution of increasing levels of neurological complexity in higher animals. The emergentist may accept that conscious states, such as thoughts and perceptions, need somehow to be 'realized by' or 'grounded in' underlying neurological states of the subject's brain, but will typically contend that conscious states make a contribution to the causal explanation of animal and human behaviour over and above any explanation that can be provided by neurological states alone. Whether this should be taken to imply that supposedly emergent phenomena like consciousness introduce into the world genuinely novel causal powers is a disputed matter, turning in part on contested issues in the philosophy of causation and causal explanation. Mental phenomena are not the only ones that have been claimed to be emergent, even if they provide the most frequently cited examples. E.J.L.

A. Beckermann, H. Flohr, and J. Kim (eds.), *Emergence or Reduction?* (Berlin, 1992).

**emergent properties.** A property of a complex system is said to be 'emergent' just in case, although it arises out of the properties and relations characterizing its simpler constituents, it is neither predictable from, nor reducible to, these lower-level characteristics. According to emergentism, which flourished during the first half of this century, many properties of wholes are emergent in that sense, and hence 'genuinely novel' features of the world in which these wholes have evolved. For example, the transparency of water was held to be emergent on the ground that it could not be inferred from the properties of the hydrogen and oxygen atoms of which water is composed. Emergent properties were contrasted with 'additive' or 'resultant' properties, e.g. the mass of an

object, which could be inferred from the properties of the parts.

The particular claim about the transparency of water may be disputable. However, an emergentist view of mentality is still influential, and survives in the doctrine of non-reductive \*physicalism, a leading position on the \*mind-body problem, according to which psychological characteristics, although they occur only under appropriate physical-biological conditions, are irreducibly distinct from them. The ultimate coherence of the notion of an emergent property remains controversial, however.

**Emerson, Ralph Waldo** (1803–82). American philosopher and poet, one of the central figures of \*New England Transcendentalism. His Romantic treatment of the problems of \*scepticism suggested knowledge of the self as the crucial epistemological and moral imperative. His counsel in ‘Self-Reliance’—‘Nothing is at last sacred but the integrity of your own mind’—was coupled with the assurance that ‘in yourself is the law of all nature . . . in yourself slumbers the whole of Reason’ (‘The American Scholar’). An important influence on Bergson and, especially, Nietzsche, some of whose aphorisms can be seen as virtual translations of Emerson’s prose, Emerson’s writings were also of considerable interest to James and Dewey.

**emotion and art.** There are many philosophical problems raised by the phenomenon of emotion in art, only some of which can be sketched here. There is (a) the problem of the arousal of emotions by art; (b) the problem of the expression of emotions by art; (c) the problem of the nature and range of the emotions expressed by art; (d) the problem of emotion and fiction; and (e) the problem of art and negative emotion; and (f) the problem of the value of artistic expression.

Under (a) philosophers have asked whether artworks truly arouse, or evoke, emotions in appreciators and, if so, which artworks and which emotions. How such evocation might be a source of art’s value for appreciators has been pondered, as has the question of how the evocation of emotions, if those of everyday life, is compatible with maintenance of an appropriately aesthetic attitude toward the works involved. Under (b) philosophers have sought to understand how it is that artworks, which are non-sentient human constructions, can express emotions, and whether this is to be analysed in terms of the power works have to arouse emotions or related states in audiences, the emotional appearances that works can wear, the emotions that works invite us to attribute to their implied utterers, or the emotions that works induce us to imagine they are the expression of. In addition, there is the

question of how a work’s expression of emotion—what is often called its *expressiveness*—relates to the artist’s expression of emotion through the work. Under (c) it has been asked whether art is capable of expressing the full range of emotions experienced in life, and whether what is expressed are always full-fledged emotions rather than, say, feelings or moods.

Under (d) the main focus of discussion has been the paradox of fiction, turning on the fact that, when engaged with fiction, we appear to have emotions of a robust, belief-presupposing sort for people and situations we know do not exist. Under (e) the main focus of discussion has been the paradox of tragedy, turning on the fact that we do not shy away from, but instead seem to relish or find satisfaction in, the experience of negative emotions from tragedy, emotions such as pity, sorrow, and fear. Under (f) the main issue is to illuminate how expression in art can be of aesthetic value when the corresponding expression in life—that is, via human behaviour—would not be.

**emotion and feeling.** The initially obvious view of an emotion is that it is a mental item like a sensation, which is infallibly classifiable in the having of it. But versions of this ‘feeling theory’, originally formulated by Descartes, fail to explain how, if emotions are only accessible to \*introspection, we all learn to speak of them more or less uniformly and can unreflectively assume knowledge of other people’s, while occasionally having to discover or deduce our own. According to various philosophical views, not only is it possible for a person to be mistaken about the emotion she feels, but to have an emotion without feeling it.

William James persuasively argued that without palpable ‘bodily symptoms’ emotion would merely be detached observation, and thus not emotion at all. He considered emotions to be sensations of the physiological disturbances caused by perceptions (of external events)—we are sad because we cry, angry because we strike, rather than crying because we are sad, or striking because we are angry. His, and other, bodily-upset theories are in fact more physically orientated versions of feeling theories, and fail to remedy their main problems.

They apply only to occurrent emotions, not dispositional or lasting ones, and, in making emotion an involuntary process (whether mental or physical), they assign it only a contingent, empirical connection with its associated causes, circumstances, behaviours, or expression—as if anger, jealousy, or suspicion, for instance, can occur irrespective of context. All sorts of unlikely candidates thereby count as emotions, including drug-induced anxiety states or other bodily perturbations which the experiencer himself perceives in a detached way and discounts as merely physiological. That we often regard emotions as

being justified or unjustified, rational or irrational, realistic or unrealistic, is made inexplicable.

Theories of \*behaviourism, such as those held by Watson and Skinner, hold, at their most extreme, that an emotion is nothing more than engaging, or being liable to engage, in certain sorts of behaviour. These accounts at least contain the public, shared aspect of emotion which feeling theories neglect, though at the expense of omitting what they capture: that emotion is also importantly private (and concealable). And, like the Jamesian theories that influenced them, behaviourisms ignore that behaviours cannot be minutely charted and matched to the complex specificity of emotions: an angry person may exhibit any or none of a range of behaviours, and by behaviour alone it would be hard to discriminate indignation from resentment or either from irritation.

Emotion theories of a fourth type (including those of Aristotle and Aquinas which Descartes disparaged) make cognition, motivation, or evaluation central. Such theories vary as to whether emotions themselves are cognitions, or are caused by cognitions, or even, in emotivism, *cause* cognitions, or are part of a motivational process—what causes us to apprehend things in certain ways and act accordingly. If there are necessary connections between knowledge and emotion, emotions can be seen as rational ways of perceiving and inter-acting with the world, rather than random, self-enclosed psychic or physical sensations. The assumption initiated by Plato that emotions distort or obscure the true way of seeing the world, because they conflict with reason, can be replaced by the view that they complement reason and open up the realms of moral, aesthetic, and religious values.

Against this connecting of emotion and knowledge, it must be said that fears can be phobias, and that anger's extent, and even occurrence, can depend as much on its experiencer's temperament as on its objective validity. Psychoanalytic theories make emotion a matter of reacting to something in our unconscious, not something in reality. Similarly, Sartre saw emotion as a way we 'live' the world (through perception and muscular reaction) 'as though the relations between things were governed not by deterministic processes but by magic'. He considered even a 'rational' emotion, like fear which spurs flight, as 'magical transformation'—ersatz elimination of the object fled from.

Unfortunately for cognition theories, it seems more a matter of stipulation than of logical necessity that specific sorts of cognition (which is in principle nakedly cerebral and impartial) intrinsically involve emotion (which is in principle something over and above cognition). Two people may have the same perceptual evaluation of a situation and make the same response, yet each have different emotional responses. They may both, for instance, realize they have been cheated and both take steps to remedy this, but one may be indignant, the other amused.

A comprehensive (but unspelled-out) theory of emotion is sometimes recommended, one that will combine all the above-mentioned features, and avoid

the mistakes of their each being taken too much in isolation. J.O'G.

**emotions, James–Lange theory of:** see James–Lange theory.

**emotive and descriptive meaning.** The emotive meaning of words is their power to express a speaker's emotions, and to evoke the emotions of a hearer. Descriptive meaning is the cognitive role of language, in determining belief and understanding. Expressions in moral discourse have descriptive and emotive meaning in combination—though these components are capable of independent variation. Opponents of the \*emotive theory of ethics can hardly deny any of this: but they do deny that the emotive component is the more fundamental to moral judgement.

R.W.H.

C. L. Stevenson, *Ethics and Language* (New Haven, Conn., 1944).

**emotive theory of ethics.** That moral responses and judgements have an emotional *aspect* is allowed by very different moral theories, and can hardly be reasonably denied. The emotive theory, however, argues that the emotive element is the ultimate basis of appraisal. \*'Reason' examines the situation to be appraised, and discerns the alternatives for action. Reason, however, is inert; it cannot provide the equally necessary dynamic, action-initiating component: only \*emotion can. The language of moral judgement expresses the speaker's emotion and evokes the hearer's.

The philosophy of mind and action on which the theory relies was enunciated clearly by Hume, and has had immense influence. It attracted numerous twentieth-century philosophers with positivistic, non-cognitivist leanings. A distinction was made between analyses that equated moral judgement with a 'report' on the subject's inner feelings (but thereby making moral disagreement enigmatic), and those that saw it as an essentially emotive reaction, non-propositional expression analogous to exclamation (hence the nickname 'Boo! Hoorah!' theory). It was readily claimed, in addition, that beliefs about the context of action, and disagreement over beliefs, entered essentially into moral deliberation and dispute. In other versions, 'emotion' shaded into 'attitude'—basically 'approval' and 'disapproval'. Analyses on clear-cut emotivist lines tended to be displaced (particularly under the influence of R. M. Hare) by 'prescriptivist' accounts.

In its simplest forms, the emotive theory omits (or dismisses) far too much of its subject-matter. Moral

judgements are not in fact discrete explosions of feeling: they have logical linkages. Emotions can be responses to already discriminated moral properties; and, crucially, they can (and ought) themselves be judged morally appropriate or perverse. The theory cannot properly distinguish moral reasoning from rhetoric; nor can it give an intelligible account of how a perplexed moral agent who lacks initially any definite, unambiguous reaction to a moral challenge can think his way responsibly towards a moral position.

Notable among critics of that general theory of motivation which hinges on a dichotomy of reason–feeling or belief–desire—the theory from which emotivism and other forms of non-cognitivism spring—are some contemporary ‘moral realists’, e.g. Jonathan Dancy, in his *Moral Reasons* (Oxford, 1993).

**empathy.** State of mind in which someone shares the feelings or outlook of another, sometimes prompted by imaginative exercises such as ‘stepping into someone’s shoes’. The English word was introduced initially, early in the twentieth century, to render the German *Empfindung*. This early usage was within aesthetics: a spectator was said to appreciate a work of art empathically, by projecting his personality into it. In its broader, current meaning, empathy—distinguished from sympathy—features in discussions of moral psychology, the imagination, and the simulation/theory debate.

Alvin I. Goldman, ‘Empathy, Mind, and Morals’, reprinted in Martin Davies and Tony Stone (eds.), *Mental Simulation* (Oxford, 1995).

**Empedocles** (c.495–435 BC). A pluralist from Sicily, who by legend leapt to his death into the crater of Etna, he maintained that earth, air, fire, and water are the four elements (‘roots’) of all material reality. Aristotle agreed, and gave the idea widespread currency, though he further analysed these elements into the combinations possible among hot, cold, wet, and dry.

The surviving fragments of Empedocles’ two poems *On Nature* and *Purifications* are the most extensive writings we have from any Pre-Socratic philosopher. *On Nature* tells of cosmic evolution driven by the force of, first, love, and then strife. At one stage, anatomical parts stick to each other in random configurations (e.g. ‘man-faced oxprogeny’), some of which are well adapted for survival. Empedocles thus anticipated Darwin, but without an account of how well-adapted organisms can reproduce their type.

**empirical.** Based on experience. An idea or concept is empirical if it is derived ultimately from the five senses, to which introspection is sometimes added. It need not be derived from any one sense alone, and the data supplied by the senses may need to be processed by the mind, and indeed may not count as data at all until some activity by the mind has taken place; it is controversial whether there are such things as ‘raw data’ which the mind simply receives before acting on them. (\*Empiricism.) A statement, proposition, or judgement is empirical if we can only know its truth or falsity by appealing to experience, but it can contain empirical concepts without being itself empirical. *Red* is an empirical concept, but ‘Red is a colour’ is not empirical: we do not find its truth by looking.

A.R.L.

G. Ryle, ‘Epistemology’, in J. O. Urmson (ed.), *The Concise Encyclopedia of Western Philosophy and Philosophers* (London, 1960), brings out some of the complications in the traditional contrast between empiricism and rationalism.

**empiricism.** Any view which bases our knowledge, or the materials from which it is constructed, on experience through the traditional five senses. What might be called the classical empiricist view is associated especially with Locke, the first of the so-called British Empiricists, though elements of it go back much earlier. It found itself in a running battle with \*scepticism, which led it to become more extreme, especially in Locke’s successors Berkeley and Hume, with echoes early in the twentieth century. This in turn led to a critical reappraisal and severe reining-in of empiricism by Kant, and later, after the twentieth-century revival, by Wittgenstein. A more sober empiricism, however, is much more widespread, though its very sobriety puts it in some danger of losing its distinctive nature as empiricism. What follows is intended to fill out this picture, ending with a few miscellaneous points and distinctions.

Empiricism has its roots in the idea that all we can know about the world is what the world cares to tell us; we must observe it neutrally and dispassionately, and any attempt on our part to mould or interfere with the process of receiving this information can only lead to distortion and arbitrary imagining. This gives us a picture of the mind as a ‘blank tablet’ (\**tabula rasa*) on which information is imprinted by the senses in the form of \*‘sense-data’, to use a technical term invented in the nineteenth century and not to be confused with the wider and vaguer term ‘the data of the senses’. Previously the term \*‘idea’ had been used in this sense, though confusingly in others as well. Sense-data were therefore the ‘given’, prior to all interpretation, and the mind, which now and only now became active, manipulated these sense-data in various ways, combining them or abstracting from them, to form the great bulk of our ideas and concepts, and then went on to discover relations between these ideas, or to observe further manifestations of them in experience and relations between these manifestations.

This in varying versions is the classical empiricist view. It leads straight off to problems involving scepticism, for if

PHILOSOPHY IN BRITAIN: EARLY TWENTIETH CENTURY

THOMAS HOBBS was a European as much as an English philosopher: he takes his place at the beginning of the European Enlightenment between Galileo and Leibniz, alongside Descartes. Leibniz called Hobbes 'that profoundest examiner of basic principles in all matters'.

JOHN LOCKE trained as a physician but found in middle age, under the patronage of the Earl of Shaftesbury and the influence of Descartes, that he had more to contribute to politics and philosophy than to science and medicine.

GEORGE BERKELEY published three classic works of empiricism in his twenties, and thereafter sought to benefit humanity mainly in other ways.

DAVID HUME was the greatest and most radical of modern empiricists, but his philosophical works overtook his historical, political, and economic writings in the public estimation only after his death.

the mind is limited in this way and must rely entirely on these ideas or sense-data, how can it ever know anything beyond them? They are supposed to 'represent' an outer world, but how can the mind know that they do any such thing? Indeed how can it know what is meant by talking of an 'outer world' at all? Locke himself, at least as traditionally interpreted, seems not to have taken these problems very seriously, but they come fully to the fore in his successors, especially Berkeley and Hume.

Empiricism becomes more extreme when it abandons the claim to know an outer world at all, and insists that what we call the outer world is simply a construction by our minds, indistinguishable from a real outer world in practice. But can this view be coherently stated at all? If we have no knowledge whatever of anything beyond our own experiences, how can we even envisage the possibility of something beyond them in order to contrast them with it? How would we understand what it was we were envisaging? This is an example of a move very common in philosophy, whereby a theory is accused of being unable, on its own terms, to state itself coherently. It is developed, in various ways, both by Kant and by Wittgenstein.

There is another objection too to this extreme kind of empiricism, because it is not obvious that sense-data of the kind required by the theory can exist. They are usually supposed to be things that are exactly as they appear. Since their being just consists in their appearing to some mind they can have no hidden depths that that mind could fail to know about, and they cannot fail to have whatever properties they appear to have. Our knowledge of them must be incorrigible, i.e. it does not make sense to say that we might be wrong about them (about those that appear to ourselves, that is; we might go wrong in our guesses about those that appear to other people, but it is not clear how we could know of the existence of other people). We can, and of course do, have sensory experiences, but what is not clear is that what these are of is certain objects which we cannot go wrong about. As Wittgenstein claimed, and surely with some plausibility, what we cannot go wrong about we cannot go right about either; there is simply no room for anything that could be called judgement or knowledge. An image can exist on a camera plate, but the camera does not 'know' the image, and can no more be right about it than wrong about it. Of course when presented with a brightly coloured object I can hardly in practice go wrong if I claim 'This is red'. But I could in principle be confused about just what counts as being red—and might be confused in practice if I ventured as far as 'This is scarlet'. Such confusion need not be merely linguistic, or about the meaning of the word 'scarlet'; I might well become persuaded that the thing I called scarlet had not in fact really appeared to me in the same way as things I had previously called scarlet. We may remember too the difficulty aspiring painters have in 'seeing things as they really look'; if taken literally this would be an illusory goal to seek (Gombrich).

Extreme empiricism of this sort then seems to be incoherent. By insisting that we know *everything* through

experience it makes us start from a position of total isolation from the world, and then it becomes miraculous that we could ever escape from there. We are locked into a castle surrounded by a moat, and the ideas or sense-data that we hoped to use to bridge the moat turn into a drawbridge and fly up in our face. Evidently we must start from within the world itself, which means that in some sense we must already know some things, without having to find them out. It is not that we must have some magical armchair access to the world—that would be to put us behind the moat again but supplied now with a magical bridge across it. Rather we must come to the world armed with certain ways of looking at it, and without insisting that our knowledge must always start with something we can know incorrigibly (a view known as *\*foundationalism*). The mind must be active not just, as Locke thought, in manipulating and building on an experience already received passively, but also in receiving that experience itself.

This at any rate is the sort of reaction to extreme empiricism that we find in writers like Kant and Wittgenstein. But so far we have only been concerned with empiricism taken to its limits. Many philosophers and many features of a philosophy, or approaches to a question, can be called empiricist without involving this whole story. Empiricists may, for instance, confine themselves to opposing the more extreme forms of *\*rationalism*. Or they may allow that the mind is active in the way mentioned above, but insist that there are no *a priori* truths, i.e. truths that can be known without recourse to experience; apparent exceptions such as the truths of mathematics and logic they will regard as not really truths in any substantive sense at all, but more like rules of procedure, so that 'Twice two is four' means something like 'When confronted with two things and two things assume you have four things'. Probably most philosophers would regard themselves as empiricists to some degree, if only because refusing to do so might suggest adherence to an extreme form of rationalism. But the distinction between empiricism and rationalism is wearing thin for reasons connected with the challenges recently mounted against the analytic–synthetic distinction, and one motive for refusing to call oneself an empiricist (or a rationalist for that matter) is that it suggests that one accepts that distinction. But even with regard to the older philosophers the traditional contrast between 'British empiricists' and 'continental rationalists' cannot be regarded as anything but a rough label of convenience, however true it may be that, as explained above, empiricism in particular reached a zenith among the former.

Also one should distinguish between empiricism as a psychological doctrine of how the mind acquires the contents it has and empiricism as a doctrine of justification, about how we can justify our various claims to knowledge. However, these questions are often run together, especially in older writers, and indeed they have not always been kept apart in the present article. Furthermore though the two questions are conceptually distinct, and for much of the twentieth century in particular the distinction was rigorously insisted on, more recently the

tendency has been revived, though this time overt and acknowledged, to run the questions together, or else to assert that the latter (concerning justification) cannot be answered and must be replaced by the former (concerning origins and development).

One further sphere in which the relevance of empiricism may be mentioned is ethics. If we cast cheerfully aside the boggy represented by the \*naturalistic fallacy, we might define 'good' in terms of something like 'catering for certain interests', and then perhaps define 'right' as something like 'tending to maximize good'. If we insist that this is what the terms *mean*, so that the definitions are simply a matter of semantics, we can then claim that ethics has become an empirical subject, assuming at any rate that it is an empirical matter what things count as interests and for whom. Of course whether we should take this line is another question.

Various types of empiricism have been singled out from time to time and given special names. \*Logical Positivism is a type of empiricism, and indeed is one of the main forms that extreme empiricism has taken in its revival during the twentieth century. Because it concerns the meanings of words or sentences it has sometimes been called \*logical empiricism, just as Logical Positivism itself is so called for that reason. One Logical Positivist in particular, Moritz Schlick, dignified his own version of the theory with the name 'consistent empiricism'. One philosophy with some kinship to empiricism is \*pragmatism, and William James called his own version of empiricism 'radical empiricism', though, distinguishing it from pragmatism. Constructive empiricism is the view, associated with Bas van Fraassen, that science should aim to construct a theory which will be 'empirically adequate', i.e. will imply the truth of all that we find to be true when we observe entities that can be observed. The theory may make statements purporting to claim the existence of unobservable entities (electrons etc.) and such statements must be taken literally, not analysed as 'really' saying something different and innocuous; but we can treat it as a good theory, and *accept* it for scientific purposes, without *believing* it. A.R.L.

\*naturalism.

E. H. Gombrich, *Art and Illusion* (London, 1968) is useful on how things 'really look'.

D. Odegard, 'Locke as an Empiricist', *Philosophy* (1965) includes discussion of senses of 'empiricism'.

B. van Fraassen, *The Scientific Image* (Oxford, 1980). Constructive empiricism.

L. Wittgenstein, *Philosophical Investigations* (London, 1953). His main relevant work.

**empiricism, logical.** A programme for the study of science that combined traditional \*empiricism with symbolic logic. Logical empiricists held that all scientific claims must be evaluated on the basis of empirical evidence. They attempted to develop a formal inductive logic, modelled on deductive logic, to assess the empirical justification of scientific hypotheses. This inductive logic would be established a priori and provide norms for

evaluating hypotheses against the evidence. They also sought to make clear the logical structure of scientific explanation and prediction. Logical empiricists attempted to show that all scientific concepts derive their meaning from their relation to experience. This proved particularly difficult in the case of concepts such as electron or gene; attempts to establish the empirical basis of such concepts provided a major research problem throughout the history of logical empiricism. Logical empiricism, as originally formulated, has been superseded, but its spirit continues in those philosophers who use formal semantics for the analysis of scientific theories and who seek an inductive logic built on \*Bayes's theorem. H.I.B.

\*Logical Positivism.

J. J. Joergensen, *The Development of Logical Empiricism* (Chicago, 1951).

**empiricism, radical:** see James.

**empirio-criticism.** A theory of the knowledge of nature promoted by the German positivist Richard Avenarius and associated with the Austrian physicist and philosopher Ernst Mach. It eliminates all scientific notions not directly or indirectly verifiable in sense experience. The theory marks a meeting-point between German \*idealism and British \*empiricism, and the inherent \*phenomenalism of the position led to Lenin's criticism of it in *Materialism and Empirio-criticism* as a form of Berkeleian idealism. A.H.

R. Avenarius, *Kritik der reinen Erfahrung* (Critique of Pure Experience), 2 vols. (Leipzig, 1888–90).

**enantiomorph:** see incongruent counterparts.

**Encyclopaedists.** A group of eighteenth-century European scholars, scientists, writers, and artists who collaborated in a massive effort to bring the fruits of human learning together into a single publication. Under the editorship of Denis Diderot and Jean d'Alembert, this 'encyclopaedia' was intended as both a concise summation of all theoretical knowledge, and a practical manual of concrete 'how-to-do-it' advice of use to every worker in his shop. It also contained, through a complex system of ironic, and often irreverent, 'cross-references', a surreptitious challenge to the traditional authority of the Catholic Church, and to the political establishment as well. Publication was intermittently suspended by the authorities, but eventually permitted to see completion. The final edition of the work appeared in 1772, and comprised a total of seventeen volumes of text and eleven volumes of technical, illustrative plates. P.F.J.

\*dictionaries and encyclopaedias of philosophy.

John Viscount Morley, *Diderot and the Encyclopaedists*, 2 vols. (first pub. 1923; Ann Arbor, Mich., 1971).

**ends and means.** It is a common philosophical assumption that all actions can be analysed as *means* to the achievement of some *end* or goal or purpose. With this goes the idea that

the end of a particular action may in turn be a means to some further end, and perhaps also (though this does not necessarily follow) that all sequences of means and ends terminate in some one ultimate end—for example, happiness. Thus I may go for a walk, this activity being a means to the end of taking some exercise, which in turn is a means to the end of improving my health—and this, perhaps, is a means to the ultimate end of my happiness.

A natural objection would then be that though some actions are performed for the sake of an end, others are not. My going for a walk may not be with the aim of taking exercise and improving my health—I may simply like going for a walk. The defender of the ‘ends–means’ analysis can then say, however, that if the action is not a means to an end, then it is an end in itself; every action must still, therefore, be either an end or a means.

There is no doubt that all actions *can* be fitted into this ends–means framework. It may nevertheless be misleading, for what it naturally suggests is a division between *actions* as means and something like *states of affairs* as ends. This way of thinking becomes particularly contentious when applied to the moral assessment of actions. It leads easily to the view that actions can be assessed as right or wrong simply by reference to their effectiveness in bringing about desirable ends. Such a view of morality is referred to as a ‘teleological’ view or \*consequentialism. A classic example is \*utilitarianism.

This kind of moral position can perhaps be argued to be a correct one, but it is not just self-evidently correct. A traditional criticism has been that morality is not just a matter of ends, it also imposes certain moral *constraints* on the way in which we pursue our ends; whatever we are aiming at, we ought not to try to achieve it by killing innocent people, by torturing or enslaving people, by lying or deceiving. Such actions are said to be wrong in themselves, whatever ends they may or may not achieve. This position is sometimes called a \*deontology, and if the constraints are thought of as ones to which there can be no exception, it may be called a form of ‘absolutism’. It is not refuted simply by asserting that the ends–means analysis necessarily applies to all actions, for this would be a misleading application of that claim.

The point can be illustrated by the use that is made of the dictum ‘The end justifies the means’. Strictly interpreted, it may be unexceptionable, for what else could justify something *as a means* if not the fact that it will effectively achieve its end? However, it does not follow that all actions can be justified only in this way, as the teleological moralists would assert. All the more dangerous is the use of the maxim ‘The end justifies the means’ to suggest that because some particular end is thought to be supremely important—the triumph of a particular religious creed, or the capture of political power by a particular party—the use of any means whatever is morally acceptable. **endurance and perdurance.** In order for something to persist over time, it must—somehow or other—exist at different times. Endurance and perdurance theories offer contrasting accounts of persistence, of how something may succeed in existing in this way. According to a perdurance theory, a thing persists by virtue of ‘perduring’: this means the thing has different temporal parts that exist at different times. (Note that the definition of perdurance does not require that the different temporal parts that make up a thing exist at continuous times.) According to an endurance theory, a thing persists by virtue of ‘enduring’: this means that the thing is wholly present at different times. It is contentious, however, just what the notion of being wholly present really amounts to. F.MacB.

David Lewis, *On the Plurality of Worlds* (Oxford, 1986), 202–4.

**energy.** Early work on statics indicated that the product of force times distance, later called work, was an essential organizing concept. The capacity of something to produce or generate work became known as energy. It was also clear as early as Aristotle that the motion of an object contributed to its ability to generate work.

In the heroic days of the Scientific Revolution, the question arose how properly to measure the ‘quantity of motion’ or ‘vis viva’. The Cartesians suggested that it was proportionate to mass times velocity and Leibniz that it was proportionate to mass times the square of velocity. In all collision phenomena the former quantity is conserved. In collisions involving appropriately hard objects the latter is conserved as well. Only later was it realized that both momentum and kinetic energy are important separately conserved dynamical quantities.

The disappearance of energy of motion which is ‘stored’ in some state of the system but recoverable as energy of motion led to the notion of latent or potential energy. Examples include the energy stored when an object is raised in a gravitational field that can be reconverted to energy of motion by allowing the object to fall, the energy stored in the elastic distortion of a solid, or the energy stored in an electromagnetic field. This potential energy becomes distinguished from the energy of motion, itself later called kinetic energy. The discovery that heat could be treated as energy of hidden motions of the micro-components of systems and that the gain or loss of overt energy was matched by a compensating loss or gain of heat content when combined with the recoverability of energy of motion from potential energy led finally to the full conservation of energy principle.

Work culminating in that of Emma Noether led to the realization that dynamical conservation was intimately related to symmetry in space and time. Conservation of energy follows from the invariance of system behaviour under time translation, as conservation of momentum does from invariance under spatial translation and

conservation of angular momentum from invariance under rotation.

With the advent of special relativistic \*space-time, energy and momentum become unified as components of a four-vector. There had been earlier philosophical speculation that matter could just be considered, in some sense, a centre of force or some sort of 'congealed energy'. Such speculations increased as the field concept of the nineteenth century led to an expanded notion of substance as being spatially dispersed and having as its essential nature the ability to carry causal influence over distance and time. The relativistic discovery of the proportionality of inertial mass to energy content leads to the conception of energy as 'quantity of substance' rather than as mere feature of matter. With general relativity comes the possibility of space-times that are not homogeneous or isotropic. With this loss of symmetry energy conservation in the global sense goes as well. The concept of energy in general relativity is a subtle one. For example, although energy can go from matter into the gravitational field, i.e. the curvature structure of space-time, the very localization of such gravitational energy is undetermined. L.S.

**enforcement of morals.** The view that morality should be enforced by the criminal law.

The disentanglement of distinctively moral norms from legal norms has taken several centuries and is still controversial. Moreover, even those who allow that law and morality can be independently identified may still argue about the extent to which the criminal law should be used to sanction morality. Clearly, all must agree that some moral rules should be sanctioned, such as those against unjustifiable killing, assault, theft, fraud, the protection of minors from exploitation, and so on. But should the criminal law be brought into such matters as prostitution and \*homosexuality? Those who think that it should can argue that society may use the law to preserve morality in the same way as it uses it to safeguard anything else that is essential to its existence.

This thesis was put in an extreme form by the nineteenth-century jurist Sir James Fitzjames Stephen, who argued that the enforcement of morality is good in itself, and in a more moderate form by Lord Patrick Devlin in the twentieth century, who argued that the enforcement of morals was good as a means because morality is the cement of society. The opposition came from J. S. Mill in the nineteenth century and H. L. A. Hart in the twentieth. They argue that the law should be used only to protect individuals from demonstrable harm from others, and that any more extensive use of the criminal law is unjustifiable legal paternalism. The controversy continues over

such matters as legalizing the use of cannabis, censorship, and so on. R.S.D.

**Engels, Friedrich** (1820–95). German social theorist, working-class organizer, and philosopher. Son of a textile manufacturer, his hopes for a career in literature were crossed by his father, who insisted that he work in the family business. He was already an adherent of the Young Hegelian and radical working-class movements when he first made the acquaintance of Karl Marx in Berlin in November 1842. It was not until nearly two years later in Paris that the two men became friends, beginning a lifetime of extraordinarily close collaboration. It was Engels who introduced Marx both to the working-class movement and to the study of political economy. After participating in the unsuccessful revolution of 1848, Engels moved to Manchester, where until 1869 he worked in the family business. Until Marx's death in 1883 he produced a series of writings on history, politics, and philosophy, devoting the last ten years of his life to the posthumous publication of the second and third volumes of Marx's *Capital*.

Always acknowledging Marx's mind to be more original and profound than his own, Engels nevertheless was an able writer of encyclopaedic learning, whose writings cover a much broader range of topics than Marx's. Because Engels popularized the thought of his friend and extended it to the realms of science and philosophy, the philosophy of \*dialectical materialism owes far more to his writings than to Marx's. Some of the principal doctrines with which Marxism is identified are more Engels's doctrines than Marx's. Chief among such doctrines are that Marxian socialism is *scientific*, in contrast to the 'utopian' socialism of earlier theorists, and that the world outlook based on materialist dialectics should view nature as operating according to dialectical laws. **English philosophy.** It is not easy to distinguish English philosophy strictly so called from philosophy in the English language. It is even harder to disentangle it from British philosophy. American philosophy, even in the colonial period, has always been reasonably distinctive; that of Australasia and Canada less so, since many of the chief practitioners came from either England or Scotland (Anderson, Brett) or settled there (Alexander, Mackie). Of the Irish philosophers, one, the eighth-century Neoplatonist John Scotus Eriugena, had no English connection whatever. Berkeley came to live, and die, in England, and Burke spent most of his active life there. Hume was the greatest member of a substantially independent Scottish tradition, but the movement of philosophers, and their

ideas, between England and Scotland was on too large a scale to allow the exclusion of Scottish philosophers from any survey of English philosophy that aims to avoid eccentricity.

In the space available it will not be possible to mention all the leading philosophers and give an informative account of their opinions. What follows is a general survey of tendencies. English philosophy proper began with Adelard of Bath (c.1080–c.1145), expositor of Arab science, translator of Euclid, and author of a treatise on the problem of universals. The topic had been installed at the centre of philosophical discussion by the Frenchmen William of Champeaux, Roscellinus, and Abelard. With John of Salisbury (1115–80) the impact of the rediscovered writings of Aristotle was registered.

The harmonization of the doctrines of Aristotle with Christian beliefs became a dominating project for medieval philosophers, a daunting one since Aristotle thought the world had no beginning, and so was not created, and that only the 'active reason', a small, impersonal part of the soul, survived death. The planned reconciliation was carried to a gloriously systematic completion by Aquinas in the third quarter of the thirteenth century. A conservative attachment to the opposed and more spiritual Neoplatonic philosophy of Augustine was almost universal in England during this period: in Alexander of Hales (c.1178–1245), the teacher of Bonaventure, who led the anti-Aristotelian movement in France, Robert Grosseteste (c.1175–1273), the first major Oxford philosopher, who made large contributions to natural science, and his wayward pupil Roger Bacon (1220–92), who saw experiment and mathematics as essential for natural knowledge.

Grosseteste, one of Oxford's first chancellors, initiated the unchallenged dominance by the Franciscans of Oxford, and consequently of English, philosophy at that time, in the thirteenth and fourteenth centuries. That effectively excluded the Thomism of the Dominicans, which never got a hold in England. Starting from the proposition 'God said led there be light', he understood knowledge as divine illumination and saw God's creation of nature as the endowment of prime matter with extension by means of light. His pupil Roger Bacon went on to develop an optical theory according to which 'species' convey the nature of external objects to the perceiving mind.

With Duns Scotus (c.1266–1308) and William of Ockham (c.1285–1349) the Franciscans moved from resisting the Aristotelianism of Dominicans like Aquinas to actively undermining it. Both insisted on the inadequacy of reason in the supernatural realm of theology, which must rest on faith in revelation. Scotus was a realist about universals, but Ockham held that generality is a feature of language, not of the world. Ockham was a precursor of empiricism, maintaining that all natural knowledge comes from direct sensory awareness. That led his French followers towards some brilliant anticipations of the mathematical physics of the seventeenth century, but in England the main effect was the inspiration of a productive group of

mathematicians and logicians. One way in which Scotus and Ockham limited the scope of reason was by affirming the absolute freedom of God's infinitely powerful will. The morally right is simply what God commands. Some English philosophers (the Pelagians) applied this by analogy to man and were vehemently resisted by the Augustinian determinist Thomas Bradwardine (1290–1349). Ockham was the first English philosopher to acquire a large European reputation. He had no notable followers in England, but European universities soon divided into groups supporting the old and the new Ockhamite logic. His firm defence of Franciscan poverty led to his condemnation by the Pope. He managed to escape from this to the protection of Ludwig of Bavaria, repaying his benefactor with copious writings on the necessity of separating church and state.

After a century and a half of remarkable vitality English philosophy sank into inertia and repetitiveness for 200 years. John Wyclif (c.1320–84), who began as a rationalistic philosopher, helped to bring this about by his subsequent ecclesiastical and political excesses of opinion, which amounted to a kind of protestantism. Rendered suspect to the authorities, philosophy fell silent through the fifteenth century and the religious strife of the first, pre-Elizabethan half of the Tudor period was equally unpropitious for independent thought. The circle of humanists around Erasmus in early sixteenth-century Oxford soon disintegrated. The Platonic theology of John Colet and Thomas More's *Utopia* (1516) were its main fruits.

The absence of interesting philosophy in England between the metaphysics of the young Wyclif (*Summa de Ente*, c.1370) and the emergence of Francis Bacon in the early seventeenth century calls for explanation. The Black Death is one possible factor; another is the Great Schism (1378–1415), which exposed English thinkers to more direct and local ecclesiastical control. Furthermore, the Hundred Years War broke the previously invigorating connections with the universities of the Continent. Perhaps, like the roughly contemporaneous period of drought in English poetry between Chaucer (d. 1400) and Wyatt and Spenser over a century later, it is just a brute fact.

Francis Bacon (1561–1626) may have profited from some renewed philosophical life in Elizabethan Cambridge, however scornful he may have been about his official course of studies. He projected a giant scheme of philosophical renovation and carried three parts of it to something like completion: his critique of false philosophies—scholastic, humanistic, and occult—and of obstacles in human nature to the acquisition of real knowledge; his detailed survey and classification of all actual and possible intellectual disciplines; and his technique for acquiring genuine scientific knowledge by eliminative induction. The elaborate formal apparatus of 'tables', qualified by a thick encrustation of 'perrogative instances', was taken over two centuries later by J. S. Mill with little improvement and even less acknowledgement. Less well known

## PHILOSOPHY IN BRITAIN

FRANCIS BACON attempted to found a new programme and method for scientific enquiry, to replace the ancient Greek models which he rejected.

THOMAS REID propounded a philosophy founded on common sense, with which faculty he sought to dispel the doubts and difficulties thrown up by the empiricists.

HENRY SIDGWICK offered in the late nineteenth century a utilitarian moral theory whose central principle was universal hedonism.

F. H. BRADLEY: his appetite for pedagogy was reputedly satisfied by one brief tutorial at Merton College, Oxford; he concentrated thereafter on his own flamboyantly original work. His fellowship at Merton was tenable until marriage, which deliverance Bradley never sought.

is Bacon's materialist philosophy of nature, largely derived from Telesio.

Thomas Hobbes (1588–1679) was equally independent and systematic and more uncompromisingly materialist than Bacon. For him everything is matter in motion, including man (his mental life consists of small movements in the head) and human society, the subject of *Leviathan*. There he maintained that reason, in the service of the supreme value of bodily security, dictates obedience to an unlimited sovereign. All men are equally liable to death at the hands of others, so all have the same interest in the establishment of a supreme power that can protect them against it. The only circumstance in which obedience to the state can be rationally withheld is its failure to provide that protection. Hobbes saw the civil war as the outcome of the unfettered exercise of a supposed right to private judgement in matters of belief. He concluded that the church should be wholly subordinate to the state, which alone should authorize its doctrines.

Bacon was quietly and Hobbes noisily irreligious. Hobbes's excesses were countered by Lord Herbert of Cherbury (1583–1648) and directly attacked by the Cambridge Platonists, of whom the most important was Ralph Cudworth (1617–88). Herbert boiled religion down to five large principles (God exists and should be worshipped etc.) taken to be intuitively self-evident. Cudworth argued that mind is wholly distinct from matter and is prior to it being constructively essential to our knowledge of it.

The ideas of Herbert underlay the long eighteenth-century episode of deism. Deism denied the personality of God and the claims of Christ or anybody else to be the incarnation of God. Deism was espoused by Voltaire, but had no philosophically distinguished exponents in England, although it was defended by many vigorous and intelligent controversialists. Bolingbroke, who infuriated Samuel Johnson and Burke, was at least a major public figure and a brilliant writer. A less extreme form of latitudinarianism was inspired by John Locke (1632–1704), as intimated by the title of his book *The Reasonableness of Christianity*. Even more important and influential were his *Two Treatises of Government*, whose ideas were communicated to the \*philosophes by Voltaire and were central to the thoughts and actions of the Founding Fathers of the United States. Locke's political theory is more a moderate version of Hobbes's than wholly opposed to it. Both contend that government is a human contrivance set up to serve certain human purposes and to be obeyed only to the extent that it succeeds in serving them. Locke differs from Hobbes over what the relevant purposes are, adding liberty and property to Hobbes's life.

Philosophically, however, Locke is important for making the theory of knowledge the heart of the subject, under the influence of Descartes. Nearly all our knowledge of matters of fact comes from our \*'ideas' or private sense-impressions. We infer from them external, material causes which we may conclude resemble them as far as the measurable qualities of interest to physics are concerned. We can infer God from the evident existence of

intelligence in the world. We can form abstract ideas, but no abstract universals correspond to them, only resemblances. Of most matters of fact we do not have certain knowledge, only probable opinion.

The theory of knowledge of the Irish George Berkeley (1685–1753) is largely a critical commentary on that of Locke, which accepts Locke's first, empiricist principle. The inference Locke proposes from 'ideas' to objects is unacceptable. The involuntariness of their occurrence shows that they have a cause outside us, but it can only be spiritual, that is to say God, who, as well as administering to us those we perceive, sustains in his own mind the ideas unperceived by us whose existence is suggested by continuity.

The Scottish David Hume (1711–76) is conventionally seen as carrying on directly from Locke and Berkeley, though there were other influences on him—his Scottish predecessor Francis Hutcheson (1694–1746) and the French sceptic and apostle of tolerance Pierre Bayle. Impressions are all that we really know and all inferences from them to other modes of being, whether material as in Locke or spiritual as in Berkeley, are unjustifiable. Of particular importance is his view that our belief in causal connection, assumed unquestioningly by Locke and confined to the spiritual realm by Berkeley, is an unjustifiable inference from the intimations of regularity that we actually perceive. For Hume our beliefs in objects, minds, and causes can be explained but not validated; they are the outcome of habit, of instinct rather than intellect. Hume's scepticism was less offensive to his contemporaries than his attacks on religion. The argument from design was classically demolished in his *Dialogues Concerning Natural Religion* (1779). Miracles were disposed of by the consideration that the falsity of the testimony on which they were based was much more probable than that of the well-attested laws of nature which they flouted.

From the end of the Middle Ages philosophy had been pursued by independent men of letters rather than teachers in universities. The universities of Scotland came to life in the eighteenth century, as they were doing in Germany. In England they remained intellectually torpid until the nineteenth century was fairly well advanced. Before then there were some philosophically active clergymen, such as Samuel Clarke (1675–1729), who sought to establish the existence and nature of God by rigorous, quasi-mathematical deduction, and Joseph Butler (1692–1752), who used an effective critique of Hobbes's narrowly egoistic account of human motivation to support a theory that moral truth is discovered by rational intuition, as had been less persuasively affirmed by Cudworth, Clarke, and, rather furtively, Locke.

A casual remark of Locke that God might have attached the power of thinking to material substance led, by way of David Hartley's (1705–57) resolute \*associationism and the belief that the mind is dependent on the brain, to the full-blooded materialism and \*determinism of Joseph Priestley (1733–1804). Locke's clerical critics were of less importance than these independent-minded developers

of his thought. A leading theme of eighteenth-century ethical theory had been the doctrine of a moral sense, understood in an almost aesthetically contemplative way by Lord Shaftesbury (1671–1713). His ideas were taken up by Hutcheson, who parenthetically took the greatest good of the greatest number to be the common element of the actions approved by the moral sense. The same idea is presented more forcefully in Hume. He took the sentiment of approval arising from disinterested contemplation of conduct to be the actual basis of moral judgments, but then went on to say that what in fact secures approval is conduct which is useful or agreeable to the agent or others, a short step from making general utility the criterion of right conduct. A more explicit utilitarianism is to be found in Priestley, in Hartley's disciple Abraham Tucker (1705–74), and, above all, in William Paley (1743–1805).

As well as his materialist theory of the mind and his utilitarian ethics (from which Bentham derived his fundamental principle), Priestley developed a radically democratic theory of government, arguing that only in a democratic system do the rulers have an immediate motive for pursuing the general good. Other friends of the American and French Revolutions agreed with him, notably Burke's critic Thomas Paine and Shelley's disreputable father-in-law, William Godwin. Burke, the great conservative opponent of the French, but not of the American, Revolution, based his opposition on a general theory of the intrinsic complexity of human society which makes it inaccessible to the elementary moral arithmetic of the radicals. He had begun his intellectual career (after an ironical piece about Bolingbroke) as an aesthetician, his *Philosophical Enquiry into the Origin of our Ideas of the Sublime and Beautiful* being the first truly philosophical aesthetic treatise in English.

Hume's best critics were his compatriots of the Scottish school of \*common sense, all, like Hutcheson, professors. Thomas Reid (1710–96) saw Hume's apparently desperate scepticism as the inevitable consequence of his subjectively empiricist starting-point. Perception, he held, is not the same thing as sensation. He took what were for Hume imaginative habits to be the expression of self-evident principles. His ideas were sonorously elaborated by Dugald Stewart (1753–1828), tricked out with a great deal of rather unconvincing scholarship by Sir William Hamilton (1788–1856), and imported to Oxford by the stylish H. L. Mansel (1820–71). The last two of these constituted the 'school of intuition' against whom J. S. Mill represented his own 'school of experience'.

Hume's ideas, particularly his associationist theory of mind and his utilitarian theory of value, came into their own as publicly influential through the agency of Jeremy Bentham (1748–1832) and the 'philosophical radicals' who followed him. James Mill (1773–1836), father of J.S., took charge of association (and supplied a simple, potent argument for democracy on utilitarian grounds); Bentham set to work with the principle of utility, attacking the Lockean certainties of Blackstone about law and the state, designing legal and penal codes, and defending the principle

itself. John Stuart Mill (1806–73), loyal to his utilitarian inheritance, gave the principle its best-known defence, with qualifications that laid it open to criticism. He had earlier renovated Bacon's account of \*induction and, in the guise of an attack on Hamilton and Mansel, put forward a reductive view of objects and minds that was to be carried further by his secular godson Russell. In the wider world he supplied a rather marginally utilitarian defence for his belief in extensive liberty and relied more on justice than utility in his attack on the subjection of women.

By the early nineteenth century, the ancient English universities were coming to, after a long period of torpor. J. H. Newman had to educate himself philosophically, but did so to some purpose, as shown by his *University Sermons* (1841), and *Grammar of Assent* (1870). A recognizably professorial professionalism first appears with H. L. Mansel's *Metaphysics* (1857). Apart from his general philosophy, what made him well known in his own time was his almost Ockhamist rejection of positive theology in the interest of faith and revelation. The publication of *The Origin of Species* in 1859 caused a turmoil of intellectual activity spreading far beyond the domain of zoology. Herbert Spencer (1820–1903) applied the evolutionary principle to a large range of topics but nowhere very incisively, least of all in philosophy. T. H. Huxley (1825–95) was more impressive, but he was only an occasional philosopher, as was the brilliant, short-lived W. K. Clifford (1845–79), a kind of English Ernst Mach in whom ideas like Mill's were stiffened with much mathematics and some biology.

By the time of his death in the 1870s the small trickle of German \*idealism introduced in the early years of the century by S. T. Coleridge (1772–1834) had swelled to a tide that was soon to engulf the universities and, with the retreat of the amateur, the philosophy of England, Scotland, and the English-speaking world generally. T. H. Green (1836–82) introduced it to Oxford, where it was most memorably, and aggressively, expounded by F. H. Bradley (1846–1924). In Cambridge a milder version of idealism was introduced by John Grote (1813–66). J. M. E. McTaggart (1866–1925), the most talented and systematic of later Cambridge idealists, was anything but mild, holding that, in the end, all that exists are individual souls timelessly related by love. Green and Bradley held that matter, space, time, and in Bradley's case the self were unreal, internally inconsistent abstractions which the understanding carved out of reality for practical purposes, leaving it to philosophic reason to represent things as a unified whole. Idealism had edifying consequences for religion and politics, eliminating superstitious literalism from the one and supporting the more Platonic aspects of the status quo in the other.

It was in this body of ideas that Russell and Moore were brought up and from which they reacted into a pluralism which insisted that reality is composed not only of many things but of things of several different ultimate kinds: material, mental, abstract. As a byproduct of his herculean effort to devise a logic strong and flexible enough to derive

mathematics from, Russell acquired the intellectual machinery for the analysis that the plurality of the world made legitimate. The arrival of Wittgenstein in Cambridge led to the joint invention by him and Russell of logical atomism. Respectable philosophers shied away from this. C. D. Broad (1887–1971), for example, did not move far from the positions held by Russell and Moore in 1910: a Lockean theory of matter, a Cartesian theory of mind, and a Kantian theory of necessary truth.

The younger English philosophers of the 1930s, influenced by the local \*logical atomism and by the positivists of the \*Vienna Circle, saw matter as a system or family of sense-impressions, actual and possible, mind as a sequence of experiences, and necessary truth as analytic or definitional. This was the body of ideas audaciously put forward by A. J. Ayer (1910–89) and steadily watered down by him over the following half-century. He rejected metaphysics more vehemently than Russell, or even Wittgenstein, and scandalized many by his denial of meaning to judgements of value. The passage of time has led to the recognition that his accounts of both meaning and value are self-refuting.

A realism at Oxford parallel to that of Russell and Moore in Cambridge derived from John Cook Wilson. He had been brought up in Bradleyan idealism but very gradually, and (as it turned out with the posthumous publication of his writings) very copiously, broke away. His main theme, the necessary independence of the object known from the mind that knows it, was elaborated in a refined and somewhat paradoxical way, by his most gifted pupil, H. A. Prichard. Most Oxford philosophers from the Edwardian decade to the present are, whether aware of it or, as is more usual, not, Cook Wilsonians. In some eminent cases, such as H. H. Price and Gilbert Ryle, other influences have been importantly at work, largely from Cambridge. But J. L. Austin was very plainly a product of the school. There is a marked Cook Wilsonian flavour to P. F. Strawson's early critique of formal logic.

Metaphysics did not lie down dead under the attack of Russell, Wittgenstein, and their followers. Samuel Alexander (1859–1938) produced one large system of an evolutionary kind, A. N. Whitehead (1861–1947) another. They fell on stony ground, flowered briefly, and then forfeited attention. R. G. Collingwood (1889–1943), a late-Hegelian idealist, not influenced, as Alexander and Whitehead had been, by recent developments in natural science, avoided a system, but had some powerful ideas about art, religion, history, and even the history of science.

By 1945 and the end of the war idealism had a vestigial presence on a few Scottish chairs. British, Russellian positivism was well entrenched, but was taking on a new inflexion. On the one hand Wittgenstein's later, informal, puzzlement-relieving doctrines were seeping, against his wishes, from Cambridge. (Ryle took them up in Oxford in his own breezy, even peremptory, manner.) On the other J. L. Austin (1911–60), with great brilliance, turned a local, Oxonian practice of lexicographic exactitude

(parallel to that of Moore in Cambridge) into an enthralling, if only occasionally philosophical, technique.

The influence of Quine and some other American philosophers turned English philosophy away from the painstaking analysis of ordinary language after Austin's death. The year before, P. F. (now Sir Peter) Strawson (1919– ) had produced *Individuals*, a large book on a very large subject. Its predominant theme is that if there is to be coherent discourse, objects that are located in space and endure through time must be presupposed. This broadly Kantian notion was brought to bear in Strawson's remarkable work of Kant interpretation, in which, if much of Kant is jettisoned, much remains. Since then the style, if not the doctrine, of Russell and the early Wittgenstein and of logically, and often scientifically, sophisticated American philosophers under their influence, has obliterated linguistic philosophy. The most admired, if not best-understood, English philosopher at the end of the twentieth century was Michael Dummett (1925– ), close student of the great logician Frege, pertinacious questioner of the law of excluded middle. Comparably gifted, if less sharply focused, was the imaginative moral philosopher Bernard Williams (1929–2003), who doubted the possibility of giving a fully rational foundation to our moral beliefs and practices. Along with many of the best of currently active English philosophers he departed (in his case only partially) to the United States. Perhaps the history of English philosophy, as distinct from English-language philosophy, is drawing to its close. If so, it is on terms that few would have expected as little as thirty years ago.

W. R. Sorley, *A History of English Philosophy* (Cambridge, 1920).

**Enlightenment.** 'Enlightenment', and its equivalents in other European languages, denotes an intellectual movement which began in England in the seventeenth century (Locke and the deists), and developed in France in the eighteenth century (Bayle, Voltaire, Diderot, and other Encyclopaedists) and also (especially under the impetus of the rationalist philosophy of Christian Wolff) in Germany (Mendelssohn, Lessing). But virtually every European country, and every sphere of life and thought, was affected by it. The age in which the movement predominated is known as the Age of Enlightenment or the Age of Reason.

'Enlightenment' contrasts with the darkness of irrationality and superstition that supposedly characterized the Middle Ages, but it is not easy to define in a general way. Kant, one of the last, as well as the greatest, of Enlightenment thinkers, said that enlightenment is the 'emergence of man from his self-imposed infancy. Infancy is the inability to use one's reason without the guidance of

another. It is self-imposed, when it depends on a deficiency, not of reason, but of the resolve and courage to use it without external guidance. Thus the watchword of enlightenment is: *Sapere aude!* 'Have the courage to use one's own reason!' Thus the leading doctrines of the Enlightenment, shared by many, if not all, of its spokesmen, are these:

1. \*Reason is man's central capacity, and it enables him not only to think, but to act, correctly.
2. Man is by nature rational and good. (Kant endorsed the Christian view of a 'radical evil' in human nature, but held that it must be possible to overcome it.)
3. Both an individual and humanity as a whole can progress to perfection.
4. All men (including, on the view of many, women) are equal in respect of their rationality, and should thus be granted equality before the law and individual liberty.
5. Tolerance is to be extended to other creeds and ways of life. (Lessing conveyed this message in his play *Nathan the Wise* (1779).)
6. Beliefs are to be accepted only on the basis of reason, not on the authority of priests, sacred texts, or tradition. Thus Enlightenment thinkers tended to atheism, or at most to a purely natural or rational \*deism, shorn of supernatural and miraculous elements and designed primarily to support an enlightened moral code and, in some cases, to account for the fact that the universe is a rational system, wholly accessible to human reason.
7. The Enlightenment devalues local 'prejudices' and customs, which owe their development to historical peculiarities rather than to the exercise of reason. What matters to the Enlightenment is not whether one is French or German, but that one is an individual man, united in brotherhood with all other men by the rationality one shares with them.
8. In general, the Enlightenment plays down the non-rational aspects of human nature. Works of art, for example, should be regular and instructive, the product of taste rather than genius. Education should impart knowledge rather than mould feelings or develop character.

The Enlightenment is in one sense 'unhistorical', holding that all men are at all times (and in all places) fundamentally the same in nature and that differences between them that have arisen over history are superficial and dispensable. But it nevertheless had a considerable influence on historiography. In his *Essai sur les mœurs et l'esprit des nations*, Voltaire (who coined the phrase 'philosophie de l'histoire') presents the standard Enlightenment view: history is man's progressive struggle for rational culture. The Encyclopaedist Montesquieu anticipated post-Enlightenment developments by attempting to explain the laws of a nation in terms of its natural and historical circumstances.

From its beginnings, but especially from the late eighteenth century on, the Enlightenment was subjected to powerful criticism. Its suggestion that medieval philosophers accepted their beliefs on authority alone will not

withstand a reading of their works. Its wholesale rejection of traditional beliefs and institutions is vulnerable to Burke's (and, with regard to language, J. L. Austin's) response that the accumulated wisdom of past generations is more likely to be correct than the ideas of an individual philosopher. Its demand that an individual should subject *all* his beliefs to criticism, and accept *nothing* on authority (a claim still endorsed in J. S. Mill's *On Liberty*), is thwarted by the gulf between any given individual's meagre first-hand experience and the range of knowledge now available to him. Its depreciation of the non-rational aspects of man and of the differences between cultures, in favour of a narrowly defined rationality, met with criticism from later thinkers, the best of whom (such as Hegel) attempted to combine the individualist rationalism of the Enlightenment with the requirements of a cohesive, stable community. But some opponents of the Enlightenment, such as Nietzsche, rejected its doctrines over a wide front, its egalitarianism and belief in progress, as well as the primacy of reason.

Many of these criticisms have force and are the subject of continuing debate. But the benefits of the Enlightenment to, for example, historiography, cannot be denied. Even its critics have little choice but to pay the Enlightenment the compliment of turning its own weapons against it: the limits of reason can be discerned only by reason itself.

If it is clear enough when the Age of Enlightenment began, it is less clear when, or whether, it ended. In one sense, it seems to end with the French Revolution, which was in part the result of the Enlightenment and which, despite its apparent defeat, established the Enlightenment ideals of popular sovereignty, equality before the law, and liberalism. It thereby identified the whole people with the nation, and reinforced nationalism, something less agreeable to most enlightened tastes. In 1947 Adorno and Horkheimer argued that the very reason which the Enlightenment used as a weapon against myth, religion, and illusion has, in modern technocratic societies, turned against itself and become self-destructive. But in fairness to the Enlightenment, it should be added that, if this is so, reason's self-destruction relies on the co-operation of pre-Enlightenment values.

**Enlightenment philosophy.** There is no set of philosophical doctrines common to all and only those thinkers usually subsumed under the label '\*Enlightenment'. However, most of Diderot, Voltaire, D'Alembert, Condorcet, Holbach, Hume, and Kant share a scepticism about

the metaphysical powers of reason but an optimism about its power to yield knowledge about the natural, including the human, world. Enlightenment philosophy is paradigmatically atheistic or agnostic, anti-theological and sometimes anticlerical. It often entails a liberal scepticism about the value and legitimacy of the institutions of state. Enlightenment philosophy characteristically rejects authority and advocates intellectual and moral self-reliance.

In his essay 'An Answer to the Question *What is Enlightenment?*' Kant says that Enlightenment is essentially opposed to humanity's 'immaturity', where 'Immaturity is the inability to use one's own understanding without the guidance of another'. The obstacles to Enlightenment are political and economic, because 'I need not think so long as I can pay; others will soon enough take that tiresome task over for me'; and 'The guardians who have kindly taken upon themselves the work of supervision will soon see to it that by far the largest part of mankind (including the entire fair sex) should consider the step forward to maturity not only as difficult but also as highly dangerous' (p. 54). The motto of the Enlightenment, *sapere aude*, 'dare to know', implies that learning requires risk.

The English Enlightenment pre-dated the French, German, and Scottish Enlightenments and made them possible. Without the thought of \*Bacon, \*Locke, and \*Newton, there could have been no Voltaire, Hume, or Kant. The English empiricists' reliance on science, rather than the authority of Aristotle and the Church, and the advocating of religious, intellectual, and political toleration were models for *les philosophes* and the *Aufklärung*.

Much Enlightenment writing is not philosophy but political polemics, anticlerical tracts, and literary essays. Hume and Kant are the two philosophical giants of the Enlightenment. Hume's philosophy is best understood as motivated by a limit he perceives in empiricism. Famously, Hume maintains that there are no ideas without impressions: concepts have an empirical origin in sense perception. However, several concepts *prima facie* essential to the intelligibility of experience seem exceptions to this empiricism. Causation, identity (including personal identity), the self, God, morality, private property, and physical objects have no clear empirical origin in the way, for example, that 'red' seems to. Hume's radicalism as an Enlightenment philosopher is his questioning the legitimacy of these concepts, even if their application is finally given diverse justifications.

In the *Critique of Pure Reason* (1781, 1787) Kant argues that there is no persuasive proof for the existence of God and the immortality of the soul. Transcendent metaphysics is impossible, because the attempt to use categories outside our experience of the spatio-temporal world leads to contradictions or nonsense. In the *Critique of Practical Reason* (1788), however, God and immortality are reinstated as objects of faith, or 'postulates of pure practical reason'. He means that we have to postulate God and immortality, as well as the free will that was admitted in

the *Critique of Pure Reason*, as necessary conditions for our moral lives making sense. Kant writes on the cusp of ambiguity. On one reading, he criticized reason only to make room for faith. Free will is then Christian. This Kant is like Aquinas. On another reading, he reduced God and the soul to mere fictions. We humans *postulate* God and the soul, but there is no God, and there is no immortality, and the ethical life they presuppose is without theological or metaphysical foundation. Freedom is then existential. This Kant is like Nietzsche.

Historically, Enlightenment philosophy is a product of the decline of the medieval theocentric world picture. The religious conflicts of the sixteenth and seventeenth centuries caused a reactive desire for religious toleration. The methods of the new science required an openness to intellectual enquiry. Religious and intellectual toleration required some political freedom, at first, in each state, for intellectuals, artists, writers, and the bourgeoisie, but then for a wider population. In Locke's political philosophy, legitimate government is only by the consent of the governed, so is forfeited by the violation of the natural rights of the governed. That legitimacy was seen to be lost by James II in 1688, George III in 1776, and Louis XVI in 1789.

The putatively anti-Enlightenment writing found in post-structuralism and post-modernism rests on a mistake. Those movements do not go beyond orthodox Kantian doctrines: there is no metaphysical truth, but a recurrent propensity to try to find it using something called 'reason'; there is no truth or reality accessible independently of a conceptual scheme; philosophical problems depend upon binary oppositions which resist synthesis; there is no unconstituted metaphysical subject.

**entailment.** A set of propositions (or statements, or sentences) entails a proposition (etc.) when the latter follows necessarily (logically, deductively) from the former, i.e. when an \*argument consisting of the former as premisses and the latter as conclusion is a valid \*deduction. The criterion of this is contentious. The classical criterion identifies entailment with strict \*implication, where 'Set  $\Gamma$  strictly implies  $A$ ' means: it is impossible for all members of  $\Gamma$  to be true without  $A$  being true. A variant is: the argument from  $\Gamma$  to  $A$  has a certain form, and no argument of that form combines true premisses with an untrue conclusion. The classical criterion has the consequences that an impossibility entails everything and a necessary truth is entailed by everything (the paradoxes of strict implication). Accordingly some logicians search for a different criterion, to escape the paradoxes and more generally to

respect the feeling that a set of propositions should be required to have some 'relevance' to what it entails. (\*Logic, relevance.)

**entelechy.** Hans Driesch (1867–1941), this century's leading neovitalist, was much impressed with his discovery that, despite extreme interference in the early stages of embryological development, some organisms nevertheless develop into perfectly formed adults. In a thoroughly Aristotelian fashion, therefore, he became convinced that there is some life-element, transcending the purely material, controlling and promoting such development. Denying that this 'entelechy' is a force in the usual sense, Driesch openly argued that it is end-directed. In his later writings, Driesch moved beyond his Greek influences, starting to sound more Hegelian, as he argued that all life culminates ultimately in a 'supra-personal whole'. M.R.

\*vitalism.

H. Driesch, *The History and Theory of Vitalism* (London, 1914).

**enthusiasm.** Used as a term of opprobrium in the seventeenth and eighteenth centuries to describe the irrationalism and behavioural excesses of latter-day prophets, religious mystics, utopian social reformers, and other visionaries. Enthusiasm was the subject of numerous critical treatises, pamphlets, and essays, including those by Meric Casaubon (1655); Henry More (1662); and by John Locke in the fourth edition of the *Essay Concerning Human Understanding* (1700), all of whom emphasized the importance of 'temperance, humility, and reason', and especially tradition, and attempted to discredit conclusions reached in agitated states of inner illumination. Kant's extreme distaste for *Schwärmerei* is an important determinant of his 'critical' philosophy of religion. From its appearance in Plato's *Ion*, where the poet is described as 'a light and winged thing, and holy', but as not possessing knowledge, enthusiasm has been 'the other of reason' which philosophy can neither ignore nor incorporate.

R. Knox, *Enthusiasm: A Chapter in the History of Religion with Special Reference to the Seventeenth and Eighteenth Centuries* (Oxford, 1950).

**enthymeme.** Aristotle applied this term to reasoning from a premiss that is only probably true. Perhaps because he gave abbreviated examples, it soon came to mean a \*syllogism with an unstated premiss. Thus 'Dolphins are mammals, so they suckle their young' is an enthymeme if it is granted that mammals suckle their young. But it is difficult to be sure that a hidden premiss is 'really there', and any silly argument may be turned into a valid one by arbitrary additions.

**entity:** see things.

**entropy.** A measure of *unavailable* \*energy in a physical system. Since usable energy is lost in irreversible energy transfers, entropy increases in closed systems (the second law of thermodynamics). Entropy is defined in two complementary ways: as the ratio of heat change to absolute temperature; and as proportional to the statistical probability of the system's state. The word also labels information theory's average information per symbol, which is defined by a formally similar probability function. J.J.M.  
J. H. Weaver (ed.), *The World of Physics*, 3 vols. (New York, 1987), vol. i, ch. 1.

**enumerative induction.** Confirmation of a generalization by observation of particular instances. Noticing that all the snowflakes I have ever seen are hexagonal, I might conclude that all are. Enumerative \*induction is usually distinguished from eliminative induction, which places weight not on the number of confirming instances, but on their variety: but given that any pair of snowflakes differs in *some way*, the distinction requires an account of which variations are supposed to matter. M.C.

L. J. Cohen, *An Introduction to the Philosophy of Induction and Probability* (Oxford, 1989).

**environmental and ecological philosophy.** Environmental philosophy encompasses all philosophical reflection on the relations between human beings and the non-human environment. Since the discipline grew out of concerns with how humans ought to behave towards the natural world, it has been dominated by discussions of \*environmental ethics. In the face of this hegemony, some writers refer to 'environmental philosophy' rather than 'environmental ethics' in order to make the point that they are not primarily concerned with questions of applied ethics. The reasoning here is that while applied ethics seeks to bring familiar ethical theories such as utilitarianism to bear on practical issues, environmental philosophy is inherently sceptical of attempts to apply traditional philosophical theories to environmental issues. This scepticism is born of a belief that the dominant tendencies of Western philosophical thought are inherently 'anthropocentric' or perniciously human-centred, and hence inimical to environmental concern. For these writers, the proper aim of environmental philosophy is to develop a new, non-anthropocentric account of the relation between humans and the natural world, which, it is hoped, will provide a metaphysical basis for ethical concern for the non-human environment.

Ecological philosophers hold that the science of ecology provides an appropriate model for such a non-anthropocentric position. The focus here is not on the array of technical concepts employed in modern ecological science but on the generally holistic standpoint associated with the discipline. Ecology is applauded for showing, in its accounts of energy cycles, food webs, and the like, that any part of the natural world must be understood as a

function of its relations to other parts. Accordingly, an ecological metaphysics is seen as one that rejects the Judaeo-Christian and 'Cartesian' assumption that humans are separate from and superior to the natural world, and replaces it with a conception of the unity of humans and nature. To corroborate their claims, ecological philosophers, and in particular 'deep ecologists', look not just to ecology, but also to other areas: quantum mechanics and relativity theory, for instance; appropriately holistic Western philosophies, such as those developed by Spinoza, Heidegger, and Whitehead; non-Western philosophies such as Advaita Vedānta, Buddhism, and Taoism; and the world-views of indigenous peoples such as Native Americans.

F. Mathews, *The Ecological Self* (London, 1991).

**environmental ethics.** The attempt to expand the moral framework to \*nature and counter human chauvinism by showing that feathers, fur, species membership, and even inorganic composition are not barriers to the range of ethical consideration. Peter Singer uses \*utilitarian theory to support equality of consideration for all sentient life-forms. To act morally in dealing with sentient creatures requires imaginative empathy, a sense of what it is like to be a creature of that sort. Tom Regan extends \*rights talk to non-human animals, increasing human duties and obligations without regarding other animals as moral agents under reciprocal nets of obligation. Using Kantian ethical theory, Paul Taylor defends the adoption of a bio-centric ethical attitude of respect for nature. He grounds this attitude in the intelligibility of regarding each living entity as striving to realize its own good and as having the same inherent worth within a network of teleological centres of life. Holmes Rolston III argues against preferring the integrated autonomy of a short-lived individual to the dynamic life-form of its species, genetically persisting through millions of years. Species live in biotic communities: there is no right to life for a species apart from the continued existence of the ecosystem with which it evolves. Humans have duties to ecosystems themselves. Recent developments include hostile critiques of any attempt to enlarge the moral community by using either utilitarian or \*deontological ethical theory. Also under attack is the shared presupposition of both capitalist and socialist economic systems that nature has value only when transformed by human agency. Ecofeminists hold that an adequate environmental ethics must recognize important connections between the oppression of nature and the oppression of women. Karen J. Warren sees this as based on a patriarchal conceptual framework mediated by a logic of domination that legitimates the manipulation and domestication of the natural. Ecofeminism replaces negative evaluations of nature and of women by a care-

sensitive ethics based on the ability to care for oneself and human and non-human others, including 'earth Others'—animals, forests, and the land.

**Epictetus** (c.55–c.135 AD). Originally a slave belonging to one of the Emperor Nero's freedmen, and a major Stoic moralist, he is said to have endured his master's physical abuse without complaint, treating his body merely as a garment. Freed after Nero's death, he was later exiled by Domitian to Nicopolis in north-western Greece. His lectures, or *Discourses*, were recorded by his pupil Arrian.

He did not wholly neglect physics and logic, the other two parts of \*Stoic thought, but concentrated on ethics. The task of philosophy, he said, is to become like \*Socrates, indifferent to bodily comfort or social applause, in order to think and act as a citizen of the world, a part of a larger whole—which should not make us forget that we are also members of families and ordinary cities, with more particular duties. When we kiss our child, he warned, we should be reminding ourselves that this too is mortal: a piece of advice that some have found disturbing. The indifference, or *apatheia*, that he preached is not a lack of love—on the contrary, as is best understood through his comments on a distraught father, confessedly unable to tend to his sick son because the sight upset him. This, said Epictetus, showed how little he loved his son: *apatheia* is the opposite of being, literally, pathetic, and essential for any genuinely loving action. What he meant by 'philosophy' has fixed the popular meaning of the term ever since, though not the professional: the lessons that philosophers ought to rehearse, he said, to write down daily and to put into practice, are the primacy of individual moral choice, the relative unimportance of body, rank, and estate, and the knowledge of what is truly their own and what is permitted them. One who pretends to 'teach philosophy' without the knowledge, virtue, and the strength of soul to cope with distressed and corrupted souls, 'and above all the counsel of God advising him to occupy this office' is a vulgarizer of the mysteries, a quack doctor.

The affair is momentous, it is full of mystery, not a chance gift, nor given to all comers. You are opening up a doctor's office although you possess no equipment other than drugs, but when or how these drugs are applied you neither know nor have ever taken the trouble to learn. Why do you play at hazard in matters of the utmost moment? If you find the principles of philosophy entertaining sit down and turn them over in your mind all by yourself, but don't ever call yourself a philosopher.

He did not even claim to be a philosopher himself, nor what he called 'a dyed-in-the-wool Jew', willingly obedient to God's command.

It is not clear how he reconciled the fervour of his insistence that we all have choices to make with the Stoic belief

in absolute \*determinism. Perhaps the reconciliation is a merely practical one: what is the case we must accept as God's inexorable will; what might be the case (as being an apparent option for us here-now) must be judged as if we could do other than we shall. A further tension in his thought concerns our relationship with animal nature: on the one hand, our affections and impulses are ones we share with animals, and our superiority lies only in our duty to be aware of those affections; on the other, vice exactly is becoming like an animal in ways that he deplures. He was at any rate too gentle a philosopher to draw the usual Stoic, and Spinozistic, conclusion that people were entitled to treat animals exactly as they pleased.

**Epicureanism.** Epicureanism consisted of a way of life directed at worldly \*happiness and an atomistic account of the exclusively material nature of reality. \*Atomism, it was argued, was true. Hence the way pointed out by Epicurus could be presented as not merely psychologically satisfying, but in accord with the true nature of things.

Epicurus established his school of philosophy in 306 BC just outside the walls of Athens where he purchased a house for accommodation and a garden in which teaching took place. He himself was the leader of the community 'the Garden' until his death in about 270 when he was succeeded first by Hermarchus and then, in about 250, by Polystratus. The Garden was still in existence 450 years later. But references to Epicureans at Tyre, Sidon, Alexandria, Gadara (in Syria), and elsewhere in the Hellenistic world before 30 BC indicate active dissemination of Epicureanism.

In Italy, during the period c.100–c.50 BC, a thriving and cultured Epicurean community was established in Naples by Siro and, at nearby Herculaneum, Philodemus of Gadara (poet and author of fragmentarily surviving Greek expositions of Epicurus) was 'house philosopher' to the father-in-law of Julius Caesar. In Rome, Amafinius and others were circulating popular over-simplifications (now lost) of Epicureanism in Latin, and in the 50s BC Lucretius completed his full and sophisticated account for Latin readers. In 45–44 BC Cicero gave the Epicureans considerable but unsympathetic attention in his expositions of Greek philosophy. But 100 years later Epicureanism, true to its precept 'live unnoticed', had yielded place to \*Stoicism as the philosophy favoured by influential Romans. Nevertheless, Epicurus is much referred to by Seneca (c.5 BC–AD 65), Plutarch (c.46–c.120) and others. Epicurus' rational humanism was enlisted by Lucian about 180 in 'Alexander the False Prophet' and, towards

the end of the second century, Diogenes Flavianus caused a vast account of Epicurean teaching to be inscribed on the colonnade of his city Oenoanda (about a quarter, c.5,000 words, has been unearthed). Not long after, Diogenes Laertius cited Epicurus' works as 'the beginning of happiness'. Thereafter we hear little from the Epicureans on their own behalf and in AD 361 Julianus Caesar wrote 'indeed the gods have already in their wisdom destroyed their works so that most of their books have ceased to be'.

Epicurean atomism attracted the opposition of the Stoics (who had a different materialistic philosophy) and the criticism of Academic philosophers. But the Epicureans were always more anxious to preserve and make known their revered master's life-enhancing teaching than to adjust it or its atomistic basis in the light of philosophical criticism. Thus Epicureanism remained substantially the same over five centuries.

It encouraged withdrawal from the political and administrative service of the state into sheltered communities of like-minded people ruled by friendship and by a common allegiance to Epicurus. Contrary to social convention, it admitted men and women, rich and poor, and even slaves on terms of equality. Its central purpose was happiness: a mind free from disturbance and a body free from pain. As a consequence it gained a reputation for attracting voluptuaries. But Epicurus' own words make it abundantly clear that his 'hedonism', theoretically permissive, is in reality very austere, and Seneca's judgement is probably about right: Epicureanism 'has a bad name, is of ill repute, and yet undeservedly' (*De vita beata* xiii. 1–2).

To Christians the \*naturalism of the Epicureans, their total rejection of active supernatural powers, and their humanism was anathema. After the fifth century AD, caricatured as an embodiment of Antichrist, Epicureanism retained a tenuous existence in a few manuscripts. It was rediscovered in the sixteenth and seventeenth centuries and became a major influence upon modern science and humanism.

**Epicurean objection, the.** According to Epicurus, a man who says that all things come to pass by necessity cannot criticize one who denies it, for he admits that this too happens of necessity. This can be taken as the first in an intriguing (if elusive) run of philosophical arguments purporting to show that belief in \*determinism is self-invalidating. Since necessitation of a belief does not exclude one's having good reasons for it, Epicurus' argument remains unclear. A recent suggestion is that the true force of the argument is in the consequence of determinism that our beliefs are owed to our being caused to make some discoveries and not others. In that case, however, the argument would still lack force, since indeterminism

would not only have the consequence of making possible discoveries that determinism closes off, but also that we might miss out on discoveries that determinism necessitates.

K. Magill, 'Epicurus, Determinism, and the Security of Knowledge', *Theoria* 58 (1992).

T. Honderich, *A Theory of Determinism* (Oxford, 1988).

**Epicurus** (c.341–270 BC). Athenian philosopher who adopted Democritus' atomism, possibly emended it in the light of Aristotle's criticisms, developed a related ethic, and established the Garden—the Epicurean school.

Epicurus was an extremely prolific writer. But apart from his reputedly most important work, *On Nature*, fractions of which still have a precarious existence in badly damaged rolls from Herculaneum, almost all that survives is in Diogenes Laertius' *Lives of the Eminent Philosophers*, book x (second century AD). Diogenes preserves the following: 'Letter to Herodotus' on the physical universe, sense perception, and life; 'Letter to Pythocles' on astronomy and meteorology; 'Letter to Menoeceus' on moral teachings; and forty 'Principal Sayings'. Other sayings are in Cicero, Seneca, Plutarch, and elsewhere, but by far the most complete and faithful account of Epicurus' teachings is in the great Latin didactic poem *De rerum natura* by Lucretius (c.100–55 BC).

Epicurus argues: (a) The universe consists of matter and void. This fundamental thesis establishes a vast gulf between Epicureanism and Platonism, Christianity, Cartesianism, or any other variety of matter–spirit dualism. (b) Matter consists of indestructible and indivisible particles ('atoms') having a variety of shapes and sizes which, in clusters, make up all things that exist. (c) Atoms and their movement are a single ultimate fact about the way things are, but each atom is susceptible to unpredictable 'swerves' that result in overall random movements. (d) No atom is ever brought into being or put out of existence by divine or any other power. (e) The universe is eternal and infinitely extended. (f) All agglomerates of atoms are fortuitous and of finite duration. (g) Hence, from (e) and (f), there are more worlds than this and this will eventually disperse. (h) Life is a complex of particularly fine atoms which form both body and mind in a single natural entity whose death is irrevocable dispersal of the person. (i) The gods are inactive and far off, 'blessed' and long enduring, but from whom 'we nothing have to hope and nothing fear'. (j) In such a universe man is delivered from superstitious fear: death is literally nothing to him. (k) The good life is secured by kindness and friendship with those about you, and by moderation of appetite so that, although nothing is forbidden, he who measures his desires by the utilitarian standard and needs least has the firmest grasp on happiness.

The logical progression of theses (a) to (k) is not merely affirmed by the Epicureans as a life-enhancing credo. It is accompanied by a philosophy of language and an epistemology affirming the veridical nature of perception, and it is commended by detailed arguments. For example

(e) is supported by the thought experiment of 'the javelin argument': go to what you suppose to be the limit of space and throw a javelin in a geometrically straight line. If it hits nothing, space continues. If it hits something, (occupied) space continues. Hence the universe is not finite in any direction (Lucretius, book 1, lines 958–83). Similarly (h) is supported by a formidable and still usable array of arguments for mind–body identity and mutual death in Lucretius, book III, and in Epicurus' 'Letter to Herodotus'.

Widespread but mildly disapproved of in antiquity because of its self-sufficient privacy, its acceptance of slaves and women into its communities, and its professed concern with happiness and the good life, Epicureanism was anathema to Christianity. It denied a provident God, affirmed the value of life and the values of this world, denied immortality, and advocated an account of the universe wholly at variance with the Christian. The account was revived in the seventeenth century to become the basis of modern science; but the world shaped by modern science has never seemed able to accept in full the world-view and ethic that gave Epicurus' system a reasonable claim to be complete, consistent, and livable.

**epiphenomenalism.** Group of doctrines about mental–physical causal relations, which view some or all aspects of mentality as byproducts of the physical goings-on in the world.

The classic definition (e.g. in C. D. Broad, *The Mind and its Place in Nature* (1925)) ensures that epiphenomenalism is a species of \*dualism. Whereas Descartes, an interactionist, held that mental things both cause and are caused by physical things, the epiphenomenalist holds that mental things do not cause physical things although they are caused by them. The epiphenomenalist then can accept that there are no causal influences on physical events besides other physical events, and thus can escape one objection sometimes raised against dualism. But the epiphenomenalist's picture of mental events as tacked on to the physical world, having no causal influence there, is unappealing: she would seem to think that mental things feature in the world as accompanying shadows of the physical—in the realm of 'pure experience'.

Some non-dualist positions are accused of commitment to epiphenomenalism. The idea is that the mental is not caught in the physical causal net, but now not because mental things aren't caught there, but because mental properties of things aren't caught there, these not being causally relevant properties. The picture again is one in which mentality appears causally idle.

Two contemporary physicalist doctrines are alleged to have specific epiphenomenalist consequences. The first is \*functionalism, which holds that types of mental states are definable in terms of the causal roles played by their tokens in an interconnected network. An objection has it that a causal account omits something crucial to some mental states—namely the intrinsic nature of those states, which is accessible only from a first-person perspective. Some functionalists concede the objection, and say that although the mental can be circumscribed by way of its operation in the causal world, none the less subjective features of experience, sometimes called qualia, must be acknowledged, and these indeed are epiphenomenal.

Davidson's \*anomalous monism is the other physicalist position attacked on grounds of supposed epiphenomenalist commitments. Davidson holds that explanations which introduce terms like 'believe' and 'desire' are causal explanations; and he argues that beliefs and desires are physical by arguing that vocabulary used in stating physical laws applies to them. An objection claims that because the real causal power of any state which has a mental property must be seen, from Davidson's perspective, to reside in some lawlike physical property that it has, mental properties must be acknowledged by Davidson to be not genuinely causally relevant, but rather epiphenomenal, inefficacious. An answer may be that, since there are two different sorts of causal explanation, some events simply do possess two different properties each of which has causal relevance. But a problem may remain: it seems that conceiving of mental events in the physical terms in which causal laws are framed, it can be hard to persist in thinking that our talk of them using mental terms can offer genuinely causal explanations of what happens.

The objection made to Davidson might be made against any materialist who allows a gap between, on the one hand, the metaphysics of mental causation, which concentrates on properties characterized in the physical sciences, and, on the other hand, what we actually know about the nature and existence of mental causation, which derives from everyday explanations of people and their doings.

**epistemic.** Like 'epistemological', an adjective derived from 'epistēmē', a Greek word for knowledge. Anything thus described has some relation to knowledge (or at least to the justification for belief), or to the general theory of these (epistemology). A proposition is epistemic if and only if it has some implication for what, in some circumstances, is rationally worthy of belief.

L.F.S.

R. Chisholm, *Theory of Knowledge* (Englewood Cliffs, NJ, 1966), ch. 1.

**epistemological relativism:** see relativism, epistemological.

**epistemology, feminist.** Feminist philosophers have criticized common-sense, philosophical, and scientific knowledge both as regards content (e.g. the alleged fact that women are less rational than men) and more importantly as regards structure. The perpetration of absurd but socially powerfully 'knowledge' in such fields as social theory and social science is interpreted by feminist philosophers as bound up with the tendency for Western philosophers and scientists to see the world dualistically. Invariably, one side of each duality has been privileged over the other—objective knowledge is superior to subjective opinion, masculinity to femininity, science to other forms of knowledge and theory, reason to emotion, the mind to the body, and so on. Further, such oppositions are systematically linked, so that objectivity, masculinity, reason, and science seem to be bound up with one another. Thus the conception of knowledge, and epistemology itself, participates in a structure of inequality which is gendered.

What sense might we make of 'feminist epistemology'? Philosophers have developed a variety of options. First, that 'knowledge' is actually constructed and understood from a particular social standpoint. The dualistic tendency identified is not a matter of stupidity or malice, but is determined by a social standpoint and the corresponding network of meanings and values. We must therefore consider the implications of thinking about knowledge from alternative standpoints. Second, that we should focus on relations between \*subjectivity and \*objectivity, or \*reason and \*emotion, not see them as oppositions. Third, that we take seriously the place—which has tended to be erased in conventional epistemology—of emotion, subjectivity, and the body in knowledge. Fourth, that we cease to think of reason and emotion as normatively the province of men and women respectively. Fifth, some feminist epistemologists have concentrated on reevaluating the 'feminine' sides of the dualisms—e.g. denigrating abstract reason and valorizing the role of emotion—arguing in effect that 'women's knowledge' is of a higher quality.

**epistemology, genetic.** Term originally coined by James Mark Baldwin to characterize an account of the acquisition of knowledge and understanding in developmental terms. It was taken over by Jean Piaget to describe his own general, and biological, theory of the development of

knowledge and intelligence in the individual. Piaget thought that genetic epistemology could be distinguished from developmental psychology, but the distinction, as he made it, was not clear. It might be argued, however, that just as the prime concern of ordinary \*epistemology is to show how knowledge is possible, so the aim of genetic epistemology should be to show how the acquisition and growth of knowledge is possible. This is a matter for genuine philosophical concern. The first instance of such a philosophical theory, only partially successful, is to be found in the last chapter of Aristotle's *Posterior Analytics* and is a response to an argument in Plato's *Meno* that \*learning and the acquisition of new knowledge is impossible.

**epistemology, history of.** Epistemology, or the theory of knowledge, is that branch of philosophy concerned with the nature of knowledge, its possibility, scope, and general basis. It has been a major interest of many philosophers almost from the beginnings of the subject. Often, but not always, these philosophers have had as their main preoccupation the attempt to provide a general basis which would ensure the possibility of knowledge. For this reason it is sometimes said that the seventeenth and eighteenth centuries were *the age of epistemology*, in that Descartes then introduced what is sometimes termed the 'search for certainty', seeking a sure foundation for knowledge, and was followed in this by other philosophers of the period. To this end Descartes employed his 'method of doubt', a form of systematic \*scepticism, in order to ascertain what could not be doubted. He found this in his notorious proposition \*'Cogito ergo sum' ('I think, therefore I am'), which, he thought, established the existence of the self as a thinking thing (although it seems, on the face of it, to imply only that a thought must have a thinker, and what that thinker must be like is another matter, as is the question whether 'I think' itself can be doubted). Given the thoughts of that self as he construed it, he then sought to derive from them the existence of God and thereafter that of the external world, as it came to be called (the world being external to the mind, the only thing to which, it was thought, we have direct access).

There was in Descartes's time a renewed interest in scepticism, though it is arguable that his systematic scepticism went further than any previous form in that he was prepared to consider the application of doubt to himself and not merely to other things. The interest in scepticism was *renewed* in that, much earlier, in the period of post-Aristotelian philosophy, a school of sceptical philosophy had been founded by Pyrrho. The Greek Sceptics maintained that they were inquirers, refusing to acknowledge claims to knowledge unless a 'criterion of truth', as it was called, could be produced. The rival philosophical schools, particularly the \*Stoics and \*Epicureans, tried to produce such a criterion, something in experience that had the mark of certain truth, in what appears to have

been a running debate between them and the Sceptics and members of Plato's \*Academy who were influenced by scepticism. The search for a criterion of truth is obviously a version of the search for certainty.

Plato himself had had little of such concerns, although he was interested in the nature of knowledge, and *Republic* 477e6 seems to suggest that the title of knowledge should be reserved for that over which there cannot be error. By and large, however, Plato was more concerned with the question what distinguishes knowledge from belief (*doxa*), construed as having something simply before the mind, and considered as true or false. In his middle period, he seems to have been so influenced by metaphysical considerations as to be inclined to distinguish knowledge by confining it to a particular realm of entities, his Forms or Ideas. Later, however, particularly in his dialogue the *Theaetetus*, he seems to revert to an idea put forward in the early dialogue the *Meno*, that correct belief can be turned into knowledge by fixing it by means of a reason or cause. The *Theaetetus* gives good reasons for thinking that knowledge is more than true belief, but fails to find an adequate account of what the extra thing required can amount to. (He supposes that it might be some interpretation of the term \**logos*—speech, enumeration of the parts of a thing, or the determination of the thing's identity—but finds all three objectionable.) Nevertheless, Plato seems throughout to have in mind by knowledge a state of mind related to an object, and the question is what that state and that relation can be.

Aristotle has similar preconceptions, and is hardly at all concerned with the justification of knowledge-claims. He says repeatedly that we think we have knowledge proper (*epistēmē*) of something when we know its reason or cause. In his view that reason is brought out when the subject-matter can be ordered in terms of a demonstrative syllogism (where the premisses and conclusions state essential or necessary truths about something), the middle term of which (what the two premisses have in common) gives that reason. Knowledge proper, therefore, entails bringing its object within a context of explanatory and reasoning propositions, which amounts to science as Aristotle conceived it. He thus thought that knowledge of a thing involved understanding it in terms of the reasons for it. (Some recent scholars have said that by 'knowledge' Aristotle *meant* understanding, but that is not quite right.) There is no concern here about exactly what it is to know that such and such is the case, so-called propositional knowledge, and even less with the attempt to base knowledge-claims on something absolutely certain. That came in only when the Sceptics, who thought that freedom from care resulted from it, pressed their scepticism. The rival schools such as the Stoics had a similar motivation to some extent in seeking a source of certainty in a 'criterion of truth'.

Although Plato thought, at any rate at one time, that knowledge was reserved for the Forms, and also suggested in his 'Theory of Recollection', put forward in his *Meno* and *Phaedo*, that we are born with such knowledge

but have to be reminded of it by particular experiences, he put forward otherwise no general theory about the source of our knowledge. It is often said that Aristotle thought that all the materials of knowledge, all the concepts which it involves, are derived from experience. In my opinion, there is some doubt about that, although he did think that the acquisition of knowledge depended in one way or another on experience. On the other hand, Thomas Aquinas, the great medieval Aristotelian, certainly thought that all the materials for knowledge are derived from experience, although he certainly did not claim that all knowledge as such is derived from experience (as his theological concerns indicate). The distinction between knowledge and its materials (the concepts presupposed by it) is important and it became crucial in the eighteenth century. Apart from this, the philosophers of the Middle Ages contributed little to epistemology that was not available from the Greeks. It is perhaps worth noting, however, that Augustine was near enough to the post-Aristotelians to be influenced by scepticism and produced a kind of pre-echo of Descartes's 'Cogito ergo sum' in his own 'Si fallor sum' ('If I err, I exist').

One thing that was novel about the kind of philosophy that Descartes introduced was its first-person approach. The general basis for justification of claims to knowledge was to be found in the individual's own mind, and the 'I think' is, for Descartes, the basis for any confidence an individual can have in believing himself to have knowledge. The possibility of any further knowledge must be derived from that. Descartes also introduced the 'way of ideas' as part of that programme. What we are given is ideas of one kind or another and the problem is how we can justifiably use them as a basis for belief in a world which is outside our minds. Perception is just as much a matter of having ideas as is any other operation of the mind, and the problem is therefore what kind of justification we have for believing that our ideas are representative of anything. This approach was characteristic of seventeenth- and eighteenth-century philosophy, and although it is conventional to divide the philosophers of the time between those who were rationalists (in emphasizing the part played by reason in it) and empiricists (in emphasizing the part played by experience) they were not fundamentally at odds in that general approach.

Descartes did not think that all our ideas are derived from experience, and the rationalists who followed him, particularly Leibniz, maintained the possibility of innate ideas, or at least ideas which are independent of experience or a priori (a term which goes back to Aristotle's distinction between knowledge derived from truths which are prior to demonstration and truths which are posterior in that they are as yet undemonstrated and may be arrived at by induction from experience). In fact an a priori idea or truth does not have to be innate, as Kant was to emphasize in saying that while all knowledge begins with experience it does not follow that it all arises out of experience. Thus the thesis that some knowledge is a priori is quite compatible with the thesis that no knowledge is innate.

Nevertheless, the rationalists tended to assert the possibility of innate, and not merely a priori, knowledge, as in effect did Plato when, in putting forward his 'Theory of Recollection', he claimed that experience reminds us of knowledge with which we are born. Such knowledge might be either knowledge of truths or the knowledge which we may have in having a genuine idea of something.

Locke, the first of the so-called British Empiricists, argued vehemently that all our ideas arise from experience, but he did not think, as did some later empiricists, including J. S. Mill, that all knowledge of truths was derived from experience. Some such knowledge, he thought, rests on intuition and some on demonstration. Locke did think, however, that experience is the foundation for knowledge in that the simple ideas of sense are the origin of everything else in the understanding. That thought was taken further by Berkeley and Hume. The main epistemological concerns of these philosophers were, thus, the limits and extent of the human understanding, as typified by the central claim of Hume's empiricism—that all ideas are derived from impressions of sense, every simple idea being a copy of a corresponding impression. The problem for Hume, given this, is what justifies us in going from one impression to another, and thus, since he thought that belief consisted of a lively idea related to or associated with a present impression, what justifies us in belief about anything beyond a present impression. What justifies us, in particular, in belief in causality and in a world apart from present impressions? Hume thought, sceptically, that there was no such justification; we can explain only what, psychologically, makes us have those beliefs. This is a matter of custom, producing a determination of the mind, as is involved in the principles of the association of ideas.

Apart from what they thought about ideas none of these philosophers thought that knowledge of all truths was derived solely from experience, although the empiricists tended to suggest that what were in effect a priori truths were confined to what Hume called 'relations of ideas'. Kant made a systematic distinction between analytic judgements, the truth of which is a priori in depending on the relations between the ideas involved, and synthetic judgements which go beyond what is implicit in the ideas involved. An empiricist would have no problems about such truths provided that the latter class of judgements are confined to what can be justified by reference to experience, and are thus a posteriori. But Kant thought that there were, in addition, synthetic a priori truths—necessary but more than analytic truths involved in mathematics and in the presuppositions of the sciences and of objective knowledge generally. He also thought, however, that it was impossible to go beyond what was so presupposed in human understanding, despite what some philosophers had claimed, and what Hegel, for example, claimed after him, could be achieved by pure reason. Kant argued that the attempt to use pure reason in that way inevitably led to antinomies and other forms of

contradiction; Hegel thought that such apparent logical obstacles could be transcended in higher forms of rationality. The issues can be no more than hinted at here; in Hegelian philosophy epistemology tends to be swallowed up in a certain style of metaphysics.

There were almost immediate reactions against Hegel, but most of them were metaphysically orientated. Schopenhauer, who reacted to Hegel in a very bad-tempered and abusive way, urged a return, as far as epistemology was concerned, to Kant, although he thought that the principles of objective knowledge which Kant had argued for could be reduced to one of four forms of the \*principle of sufficient reason, a principle due originally to Leibniz. Nietzsche, who was influenced in some ways by Schopenhauer, even if he misinterpreted him, maintained the doctrine of the subjectivity of truth—truth is in effect power. This is a difficult doctrine, to say the least, but it has had considerable influence on recent continental philosophy. None of this, however, is, strictly speaking, epistemology for its own sake.

Outside neo-Kantianism, epistemology in the nineteenth century remained almost exclusively an Anglo-Saxon phenomenon. J. S. Mill, as already indicated, argued for an extreme empiricism, maintaining that knowledge of all truths was derived from experience, thus putting a great deal of weight on the role of induction in arriving at general truths of all kinds. The end of the century saw the rise of American \*pragmatism, initially in the claim by C. S. Peirce that the meaningfulness of our ideas is a function of their contribution to rational conduct. This notion was misleadingly extended to truth by William James. Because knowledge entails truth, this inevitably affected conceptions of knowledge on the part of these philosophers and their pragmatist descendants. Perhaps the main epistemological tenet inherited from Peirce, however, is that of \*fallibilism', the idea that we may always be wrong and that, from the point of view of knowledge, truth is simply an ideal limit. This idea has been extremely influential, although if it is taken to imply that we cannot be certain of anything it seems quite wrong.

Twentieth-century empiricism, the main subsequent movement in epistemology, tended to be a kind of reversion to Hume without the psychological dress. It was concerned, however, less with the basis of our ideas than with the scope and certainty of our knowledge of truths. Logical Positivists, such as A. J. Ayer, asserted that all knowable truths are either analytic or empirical—there is no room for the synthetic a priori. At the same time the problem of our knowledge of the external world remains because all that is 'given' is to be found in the individual's experience, particularly in what have become known as \*sense-data (a notion which is close, at any rate in status, to Hume's impressions). Sense-data propositions are indubitable, if anything is (and Ayer himself vacillated on that point). But there is then a problem about the relation between sense-data and so-called material objects—a problem which generated various epistemological theories of perception, particularly phenomenism, the doctrine that material

objects are either bundles of actual and possible sense-data or what came to be known, following Russell, as logical constructions from these. The whole notion of the \*'given' has subsequently come under criticism from many sources. But does knowledge need, in any case, an indubitable basis? Knowledge may entail belief and the truth of what is believed, but, whatever else it entails, it is not evident that it is that such truth must be indubitable.

Philosophers have thus, for good reason, most often ceased to invoke sense-data as perceptual foundations for knowledge. Interest in that kind of approach to epistemology has thereby declined. What has remained of considerable interest for philosophers is perhaps twofold. First, there is the question what knowledge is, what exhaustive account one is to give of that concept. A short paper by Edmund Gettier on whether knowledge amounts to justified true belief (a theory which he supposed was espoused by Plato), arguing that there could be justified true belief which did not amount to knowledge, has generated a whole industry of attempts to give the necessary and sufficient truth-conditions for any proposition of the form 'X knows that p'. This, it has been suggested, may be achieved either by adding further conditions apart from those involved in speaking of justified true belief or by eschewing reference to justification and substituting reference to something like a causal relation between what is known and the belief involved. Pursuit of the industry continues with no firm resolution, although it is clear that, whatever else is entailed, the possibility that the belief is true by chance must be ruled out.

Second, there is the question, pursued most indefatigably by some American philosophers, about the general foundations for our system of beliefs—whether there is such a foundation, whether it is all a matter of the coherence of our beliefs, or what. So the desire that knowledge should have foundations in some way is still alive. A question that remains open is whether that desire is based on an illusion concerning the nature of knowledge (whether, that is, it requires foundations, or whether the appeal to that architectural image is just a misleading metaphor) or whether the failure to provide sure foundations is a reason for despair about the whole idea of knowledge. So the two problems are in fact connected—as they always have been, though not equally for every philosopher, as we have seen.

**epistemology, problems of.** Epistemology is the study of our right to the beliefs we have. More generally, we start from what we might call our cognitive stances, and ask whether we do well to have those stances. Cognitive stances include both our beliefs and (what we take to be) our knowings; and in another dimension they include our attitudes towards the various strategies and methods we use to get new beliefs and filter out old ones, as well as the products of those strategies and methods. Epistemology, on this showing, is explicitly *normative*; it is concerned with whether we have acted well or badly (responsibly or irresponsibly) in forming the beliefs we have.

In pursuing this enquiry, we do not, of course, ask only about the beliefs and strategies we find ourselves with at the beginning. We also ask whether there are not others which we would do better to have, and whether there are not others which we should have if we have these ones to start off with. The hope is to end up with a full account of how a responsible cognitive agent should behave, with some assurance that we do not fall too far short of that ideal.

1. *Justification.* We can distinguish between two sorts of belief: the mediated and the unmediated. Mediated beliefs are those which we reach by some strategy which starts from other beliefs we have. Inference is such a strategy (but not the only one); we infer that it will rain soon from our separate beliefs that it is mid-morning and that it is growing very dark outside. Mediated beliefs raise the question of whether the strategy we adopt is one to which we have a right—one we do well to use. Unmediated beliefs are those which we adopt without moving to them from other beliefs we already have. These raise different problems, which concern the *source* of our right to believe. I open my eyes and, because of what I see, immediately believe that there is a book in front of me. If I do well in adopting that belief, it is justified (or I am justified in adopting it). This focus on justification is one way of expressing the idea that epistemology is normative. What makes it the case, then, that this belief is justified?

Various answers suggest themselves. One is the *\*reliabilist* answer: that the belief is justified because it is the result of a reliable process. Another is the *\*coherentist* answer: that this belief is justified because my world is more coherent with it than it would be without it. A third is the *\*foundationalist* claim (at least in its classical form) that this belief is not in fact unmediated, but inferred from a belief about how things seem to me just now. If this last were true, we are thrown back to two questions. The first is whether, and how, the belief about how things seem to me just now is justified. The second is whether the inference from that belief is justified. We might ask what principle of inference is employed. Suppose it is this: that if things seem to me that way, they probably are that way. What makes it the case that we do well to use this principle?

2. *The structure of justification.* This brings us to one particular question about justification, which has received much attention. Suppose that we give the justification of a

mediated belief *A* which appeals to its relation to some other belief *B*. This belief, *B*, justifies that one, *A*; my belief that it is Sunday justifies my belief that there will be no mail today. There is a very strong intuition that *B* can only transmit justification to *A* if it is itself justified. So the question whether *A* is justified has not yet been answered, when we appealed to *B*, but only shelved. Whether it is justified depends on whether *B* is. What justifies *B*? We might appeal to some further belief *C*, but then the problem will simply recur. We have here the beginnings of an infinite regress. The first belief in the series is not justified unless the last one is. But will there ever be a last belief in the series?

This is the infinite regress of justification. Foundationalism takes this regress seriously, and tries to find 'basic beliefs' that are capable of stopping it. Promising ways of doing this include the idea that basic beliefs are justified by their *source* (they are the immediate products of the sense, perhaps), or by their subject-matter (they concern the nature of the believer's current sensory states). *\*Empiricism*, in this connection, wants in some way to ground basic beliefs in experience. Foundationalism concerns itself with the structure of this empiricist programme.

So a concern with the regress of justification is a concern with the *structure* of justification. Coherentism tries to show that a justified set of beliefs need not have the form of a superstructure resting on a base; the idea here is that the foundationalist programme is bound to fail, so that the 'base' is left groundless, resting on nothing. If this were the result, and if foundationalists were right about the structure of a justified belief set, the only possible conclusion would be the sceptical one that none of our beliefs are in fact justified.

Coherentists reject the base/superstructure distinction; there are no beliefs which are intrinsically grounds, and none which are intrinsically superstructure. Beliefs about experience can be supported by appeal to theory (which would be going upwards in terms of the foundationalist model), as well as vice versa (theories need the support of experience). The whole thing is much more of a mess, and cannot be sorted neatly into layers.

3. *Knowledge.* Epistemology, as so far explained, focuses on justification. There is a second focus, on knowledge. Someone whose belief is justified does well. But justification comes in degrees, and so does our epistemic status (determined by how well we are doing). The top status is that of knowledge. Someone who *knows* that *p* could not be doing better (at least with respect to *p*). There is a natural interest in this top status. Two main questions arise: what is the most we can hope for, and in what areas do we get it? The traditional attempts to define knowledge focus on the first of these. These attempts come in two main families. The first tries to see knowledge as some clever form of belief; the best-known form of this view is the 'tripartite definition', which takes knowledge to be (1) belief which is both (2) justified and (3) true. The

second family of views takes knowledge to start where belief gives out. Plato's version of this was that belief is concerned with the changing (especially the material world), and knowledge with the unchanging (e.g. mathematics). Other versions might suggest that we can have knowledge of our surroundings, but only when some physical thing is directly present to the mind. On this approach, knowledge is a direct relation, while belief is conceived as an indirect relation to the thing believed.

The second question about knowledge, namely what areas we can get it in, introduces us to the distinction between global and local. In some areas, we might say, knowledge is available, and in others it is not—or at least less freely available. It is common to hear people say that we have no knowledge of the future, of God, or of right and wrong, while allowing that there is at least some scientific knowledge and some knowledge of the past (in memory). Similarly, in discussing the justification of belief, we might say that our beliefs about our present surroundings are on firm ground, as firm as that which supports our (rather different) central theoretical beliefs in science, while our beliefs about God and about the future are *intrinsically* less well supported.

4. *Scepticism*. Scepticism about knowledge comes in both global and local forms. The knowledge-sceptic holds that we cannot achieve knowledge, and this claim could be made in general (the global variety) or only in certain areas such as those mentioned above (the local form). The belief-sceptic is generally held to be more interesting. This person, in global form, holds that we have no right to any of our beliefs; none are better than others, and none are good enough to count as justified. More locally, a belief-sceptic might say that while we do well in some of our beliefs about things presently hidden from us (e.g. what is in the cupboard), we have no right to any beliefs about right and wrong. Someone who said this would be a moral sceptic, and the difficulty in that position is to make sure that the reasons that underlie one's moral scepticism do not spread over into other areas. If, for instance, one's objection to beliefs about moral matters is that they lie beyond the reach of observation, one would have to make the same objection to scientific beliefs about matters too small to be observed.

So there is a distinction between local and global scepticism, both in the theory of justified belief and in that of knowledge. Both sorts of scepticism need to be supported by argument, and one main problem of epistemology is the attempt to assess and rebut such arguments as they appear. This is one important way in which we can work to establish our right to our beliefs.

There have been two classic strands of sceptical argument in the history of epistemology, the Pyrrhonist and the Cartesian. \*Pyrrhonism (named after its leading figure, Pyrrho of Elis (c.365–270 BC)) focuses on the justification of belief, while the scepticism we inherit from Descartes starts with knowledge and attempts to move to belief from there. Descartes argued that we cannot know

something if we are unable to distinguish the case where it is true from the case where, though false, it seems to be true. For if we cannot distinguish, then though it may here be true, for all we know it isn't; this case might, for all we can tell, be one where the appearances are deceiving us, and if so, we can hardly claim to know that they are not. Though persuasive enough as an argument for knowledge-scepticism, this approach cannot easily be extended to support belief-scepticism; for the fact that I cannot tell when appearances are deceiving me does little to show that I have no (or insufficient) reason for my beliefs. Matters are different with the Pyrrhonist tradition. This is explicitly aimed at showing that the reasons on one side are never better than they are on the other. If so, we would be forced to allow that there is no such thing as a belief that is favoured by the balance of the reasons, and so to admit that we cannot defend our right to our beliefs in the only way available to us, namely that of showing that the evidence supports them. Pyrrhonism focuses on the criteria by which we distinguish between the true and the false and argues in various ways that we have no right to those criteria, and so that they cannot be rationally defended. One classic move here is to ask what criteria we can use to evaluate our criteria; if we are to appeal to the very criteria that are under consideration, we beg the question, and we have no further criteria to appeal to. Pyrrhonism is here attacking our cognitive strategies, arguing that none of them can be defended. Hume's argument attacking the rationality of induction is the classic instance.

5. \**Naturalism in epistemology*. Being normative, epistemology is concerned with evaluation—the evaluation of strategies and their products (beliefs). Among the strategies it evaluates are those of science. So conceived, epistemology sits in judgement on all other areas of human enquiry; it counts as \*First Philosophy. (The sceptical question above asks how epistemology can succeed in evaluating itself.) Quine attempted to reverse this position, and to conceive of epistemology as part of science, looking to the results of science to answer the questions of epistemology. This enterprise, called naturalizing epistemology, is not impossible. Science does sometimes succeed in evaluating its own strategies, just as it evaluates its own instruments. So science is sometimes normative; it may not only examine our perceptual processes, but also pronounce on their reliability. But some of the questions of epistemology seem to resist naturalization, e.g. those which concern reason rather than observation.

To say that science is sometimes normative, and that traditional epistemology is a large part of its normative element, might indeed reverse the relation between epistemology and natural science and thereby 'naturalize' it. But this alone would not be enough for many determined naturalizers. I have been presenting epistemology as a normative enterprise, whether or not it is placed within the sphere of natural science. But there are many who suppose that if normative claims and assertions make genuine sense and are capable of being true or false, they must be

somehow identical with natural claims, ones from which the normativity has been removed. The worry here is that if normative facts are not identical with natural facts, we will find ourselves landed with two realms, the realm of nature (where we find such things as particles, electricity, and gravity) and the realm of the normative (where we find such things as duties, responsibilities, and rights), without there being any way of understanding how those two realms are co-present in one and the same world. More aggressively, the question becomes how there is any room for distinct normative facts in a natural world, the world that can be studied by science. If we want normative epistemological facts, then, we will have to show that those facts are *also* natural. If we succeeded in doing that, we would have naturalized epistemology in a much more dramatic sense.

6. *Special areas.* There are traditionally four sources of knowledge (or of justified belief): the senses, \*memory, \*introspection, and \*reason. Each of these has its epistemology. The study of perceptual knowledge asks how perception manages to yield knowledge of our material surroundings. To answer this question one obviously needs to know a certain amount about how the senses actually work. But that knowledge seems to be not enough on its own (so perhaps the epistemology of the senses cannot be naturalized either). There are difficulties to be faced here which cannot be solved with a bit more scientific information. One is the sceptical difficulty sometimes called the \*veil of perception. If our senses only reveal knowledge about how things *seem*, how can we hope to use them to find out how things really *are*? The appearances, on this showing, are obstructing rather than helping us in our attempts to discern the nature of reality; perception casts a veil over the world rather than revealing it to us. Another sceptical difficulty here derives from the \*argument from illusion.

At the other extreme is the epistemology of reason. The activities of reason are twofold. First there is inference, in which we move from old knowledge to new knowledge. The strongest form of this is valid deductive inference, which occurs when it is not possible that our premisses (what we are moving from) are true if our conclusion (what we are moving to) is false. One question here is how such inference could ever yield *new* knowledge. Surely the conclusion must be somehow already contained in the premisses, if the premisses cannot be true where the conclusion is false. The second supposed activity of reason is the direct discovery of new truths. A truth that can be discovered by the activity of reason alone is called an \*a priori truth, and knowledge of it is a priori knowledge. One of the great questions in epistemology is how a priori knowledge is possible, and what sorts of truth can be known in this way. Some propositions are true in virtue of their meaning alone, e.g. that all bachelors are people. We know this truth, and not by appeal to the senses, to introspection, or to memory. So we know it by reason. But propositions of this sort (often called analytic) are

trivial. They give us no substantial knowledge. Can reason give us substantial knowledge of anything, or is all a priori knowledge analytic and (therefore) trivial? For example, if mathematical knowledge is the product of reason, can it be substantial? Are mathematical truths merely analytic? We appear to be torn between saying that mathematical truths are important and saying that we know them by the activity of reason alone. It was the attempt to avoid this dilemma that led to Kant's first *Critique*.

7. *The place of epistemology.* Where does epistemology come on the philosophical map? I see it as a chapter in the more general enterprise which is called the philosophy of mind; it is the evaluative side of that enterprise. In the philosophy of mind we ask about the nature of mental states, in particular (for present purposes) about the nature of belief. Our views in epistemology are sensitive to our answers to that question, just as they are sensitive to scientific results about the nature of perceptual processes. For instance, our account of the relation between knowledge and belief will depend crucially on the way in which we conceive of belief. Is it a *closed* state, in which we are aware merely of representations of things rather than of things themselves (the veil of belief)? If so, is knowledge to be merely the best form of such a state—the thinnest veil? Or is knowledge to be conceived quite differently?

The other philosophical area to which epistemology is tightly tied is the theory of meaning. The question whether we are able to know propositions of a certain sort is sensitive to our account of what those propositions mean. For instance, if we take statements about a material world to be a disguised form of statement about experience, and if we think that our knowledge of experiences is secure from sceptical attack, we may hope to emerge with a defence of our ability to know the nature of the material world. This hope is the hope that \*phenomenalism will solve some of our epistemological problems for us. J.D.

**epistemology and psychology.** The divorce of philosophy and psychology is a relatively recent affair. Histories

of psychology read like histories of philosophy until the mid-nineteenth century, when the methods and preoccupations of philosophers and psychologists began to diverge, and psychologists came to regard themselves as engaged in a fully fledged science emancipated from its empirically feeble predecessors. In 1879, Wilhelm Wundt established the first psychological laboratory at the University of Leipzig. Not until well into the twentieth century, however, did professional associations and university departments of philosophy and psychology become distinct. The disciplines have resisted reconciliation and maintained a respectful distance ever since.

Academic departmental boundaries aside, W. V. Quine convinced many philosophers that distinctions between scientific and philosophical endeavours are tenuous; in particular, 'epistemology . . . is a chapter of psychology'. Traditionally, epistemology sought an unassailable foundation for subsequent empirical theorizing: philosophical investigation must be independent of, and prior to, empirical inquiry. The goal was to demonstrate that knowledge of the world around us could be inferred from sensory experiences that mediate access to that world. The grounds for such an inference have proved remarkably difficult to locate, however. Hume demonstrated that they were not to be found in reason alone. One possibility is that talk of a mind-independent world is misplaced: sentences about physical bodies might be reducible to, or translatable into, sentences concerning sense experiences. Quine argues against this possibility, and concludes that the relation we bear to the physical world is best comprehended by empirical psychology. It is not that epistemology is to be replaced by psychology, only that we must cease to regard epistemology as operating in the classical mode, prior to and independently of psychology and the natural sciences.

Inspired by Quine, some philosophers have turned to empirical psychological findings in support of conclusions concerning traditional philosophical matters. Stephen Stich, taking the dark view, argues that work in psychology undermines philosophers' time-honoured trust in reason as a vehicle, if not a source, of truth. P. M. Churchland, in dismissing belief and reason as being on a par with ghosts and devils, favours the replacement of theories of mind with a properly hard-nosed neuroscience, leaving little for philosophers to work with. D. C. Dennett finds answers to age-old philosophical questions about conscious experience and belief in cutting-edge work of psychologists and neuroscientists.

In a more moderate vein, A. I. Goldman, a proponent of the 'naturalizing' of epistemology and metaphysics, argues that philosophy begins, but does not end, with the consideration of 'folk theories', conceptions of ourselves and our world embodied in our language and everyday patterns of thought. Having mapped these folk conceptions, we turn to psychologists, anthropologists, and others for an explanation of their deployment. Suppose, for instance, that our folk scheme treats colours as objective features of objects on a par with shapes. We might learn from psychology and neurobiology that perceived colours

are better regarded as artefacts arising from the operation of our visual apparatus. Having accepted this, we would be in a position both to explain and to revise our naïve 'pre-theoretical' conception of colour. We would do so, not on the basis of a priori reflection, however, but by way of an explicit appeal to what we took to be empirical fact.

It is by no means universally accepted that philosophy can, or must, be naturalized in any of these ways. Even so, many philosophers now concede it is a mistake to assume that philosophical inquiry could be altogether insulated from empirical findings in psychology and elsewhere, hence the emergence of 'cognitive science', a disciplinary hybrid comprising psychologists, computer scientists, linguists, philosophers, and others, striving to understand the mind and its place in the natural order. Whether this represents an investigatory advance remains to be seen. While on the whole laudable, interdisciplinary co-operation can serve to blur the focus of research. Philosophers are prone to forget that empirical theories of mind can incorporate substantive philosophical commitments with shadowy credentials. These may be recycled back into philosophy, though in a way that disguises their character. Loosely paraphrasing Wittgenstein: philosophers nowadays risk taking on board conceptual confusions disguised as experimental methods. J.HEIL.

**epochē.** 'Withholding' of assent and dissent, i.e. suspense of judgement. Ancient \*scepticism combined a thesis, 'There is no knowledge', with a prescription, 'Practise epochē'. The one leads to the other via a view shared by some non-sceptics that it is stupid to assent to what you do not know. And the outcome is delightful: 'Freedom from disturbance follows like a shadow' (Diogenes Laertius on Pyrrho). But there was, and is, controversy whether general epochē is a practicable option. C.A.K.

M. F. Burnyeat, 'Can the Sceptic Live his Scepticism?', in M. Schofield, M. F. Burnyeat, and J. Barnes (eds.), *Doubt and Dogmatism* (Oxford, 1980); repr. in M. F. Burnyeat (ed.), *The Skeptical Tradition* (Berkeley, Calif., 1983).

**equality.** Currently the most controversial of the great social ideals. In the abstract, it means that people who are similarly situated in morally relevant respects should be treated similarly; but everything depends on what kinds of similarity count as relevant, and what constitutes similar treatment. Is a society equal enough if it guarantees all its citizens the same basic political and legal rights, or should it try to foster a much more general equality of condition? Complete equality among persons being impossible, the

real meaning of the idea is reduction or amelioration of \*inequality.

Possible interpretations include equality before the law, equality of political power, equality of opportunity for social and economic advancement, equality of resources, equality of welfare, equality of freedom, and equality of respect. Merely abolishing aristocracy and giving everybody the vote is compatible with huge inequalities in social condition and political influence. By now it is relatively uncontroversial in Western societies that governments should not discriminate on the basis of race, religion, sex, or national origin, and that they should discourage such discrimination by private parties. Controversy arises over the extent to which governments should also aim at greater social and economic equality through policies of collective social provision, public health and education, and redistribution of income or wealth, and whether they should employ policies of affirmative action to produce greater equality among groups if there has been discrimination in the past.

The main issue is whether we should regard certain human inequalities and their consequences as natural, and only be concerned not to impose further artificial ones, or whether we should base social policy on the assumption that all persons are equally deserving of a good life, and that their society should try to make it possible for them to have it. This latter goal of positive equality will not be realized through mere equality of opportunity, since equal opportunity combined with unequal ability and luck produce very unequal results.

An important alternative view is that equality has no value in itself, but is significant only for its effects. \*Utilitarianism, for example, holds that society should be arranged to maximize the total happiness of its members, without regard to how benefits and disadvantages are distributed, except as this affects the total. However, economic equality is likely to have instrumental value, because of the principle of diminishing marginal utility: a given sum transferred from rich to poor will enhance the welfare of the latter more than it will decrease the welfare of the former. But too strong an effort toward equality can have economic effects which diminish utility. T.N.

\*liberty and equality; justice; well-being.

T. Nagel, *Equality and Partiality* (New York, 1991).

M. Walzer, *Spheres of Justice* (New York, 1983).

**equipollence.** The theory of equipollence developed by some medieval logicians, e.g. Peter of Spain (c.1215–77), concerned the equivalences that result from inserting a negation sign before or after a sign of quantity, e.g. 'Not every A is B', 'Every A is not B'. 'Equipollence' later became synonymous with \*equivalence in general. Tarski, though, defines as 'equipollent' two systems of sentences such that any sentence in one can be derived from the sentences in the other. c.w.

A. Tarski, *Introduction to Logic* (New York, 1965), 32–3.

**equivalence.** Relation between two statements  $p$  and  $q$  when  $p$  implies  $q$  and  $q$  implies  $p$ . Material equivalence, in line with \*material implication ( $p$  implies  $q$  unless  $p$  is true and  $q$  false;  $q$  implies  $p$  unless  $q$  is true and  $p$  false), holds between  $p$  and  $q$  if and only if they have the same truth-value. But equivalence is also often interpreted to require necessary identity of truth-value and/or identity of content and/or identity of meaning. s.w.

\*equivalence relation.

S. Wolfram, *Philosophical Logic* (London, 1989), ch. 4. 1.

**equivalence relation.** An equivalence relation is a binary, i.e. two-term, relation that is \*transitive, \*symmetric, and (strongly) \*reflexive; for example, *being the same age as* is an equivalence relation, relative to the domain of things with age. C.A.K.

\*equivalence of statements.

W. Hodges, *Logic* (Harmondsworth, 1977).

**equivalences of the form T:** *see* snow is white.

**equivocation:** *see* ambiguity.

**equivocation, fallacy of.** You equivocate when you mean two things by one or more occurrences of a single word or phrase. Often this is innocuous, as in puns. But it will lead to faulty reasoning when an \*argument requires one such meaning in order to entail the intended conclusion, another in order to have true premisses. Usually the fault is not deceptive, but sometimes it is thought-provoking, as in: What you are able to do or not do, you are *free* not to do; you are able to pay or not pay taxes; so you are *free* not to pay them. C.A.K.

\*ambiguity.

C. L. Hamblin, *Fallacies* (London, 1970).

**Erasmus, Desiderius** (1466–1536). Born in poor circumstances in Rotterdam, he attended the University of Paris where he came into contact with many who were due to play a crucial role in the new humanist movement. He rose to become a key figure in \*Renaissance humanism, active as a critic of the Church and of contemporary mores, and active also as an editor of major writings from an earlier age, such as the works of the early Fathers of the Church, and above all the Greek text of the New Testament. His edition of the New Testament, though inadequate in many ways, was a major advance on anything available in the Middle Ages. Many of his writings, such as *In Praise of Folly*, a powerful satire on society both ecclesiastical and lay, argue the case for a return to a form of Christian pietism. Though he attacked many abuses committed by the Church, abuses which in due course it tried to stamp out, he was unsympathetic to the Reformation then under way, as is made clear by his attack on Luther. It is an irony of history that his works were placed on the Index by the Council of Trent. A.BRO.

Roland H. Bainton, *Erasmus of Rotterdam* (London, 1969).

**Eriugena, John Scotus** (c.810–c.877) from Ireland, lived for years in France where he worked at the Court of Charles the Bald. He translated a number of works, including some by pseudo-Dionysius, from Greek into Latin, and in addition wrote treatises of his own, in particular *On the Division of Nature*, the first great philosophical system of the Middle Ages. The *Division*, which was heavily influenced by the Neoplatonism of pseudo-Dionysius, is presented as a system of Christian thought, but there is room for dispute over whether it avoids an un-Christian \*pantheism. He considers nature under four heads: nature which creates and is uncreated, nature which is created and creates, nature which is created and does not create, and nature which neither creates nor is created. Since God is said to fall under the first heading, it might well seem that there is a pantheistic philosophy here, but the distinction that Eriugena draws between uncreated creator and all else is sufficient to convince some commentators that he has found his own way to develop a position which is not far removed from Christian orthodoxy. A.BRO.

John J. O'Meara, *Eriugena* (Oxford, 1988).

**error theory of value** is the label given by J. L. Mackie to a position he promoted about the nature of \*value. According to Mackie, although moral judgements in their meaning aim at something objective, there are in fact no objective values. Hence our normal moral judgements involve an error. R.H.

J. L. Mackie, *Ethics* (Harmondsworth, 1977), ch. 1.

**eschatology.** That branch of theology concerned with 'the last things'—death, what follows it for each individual, and the final fate of the universe. According to traditional Christian theology, death is followed by resurrection of the dead, God's judgement on their past life, and their apportionment to heaven or hell. 'Realized eschatology' is the view that states analogous to the traditional after-death states occur in our present life—e.g. God's judgement on the past is a feature of life on earth. Scholars have found strains of realized eschatology, as well as traditional eschatology, in the New Testament; a few very radical theologians defend only realized eschatology. R.G.S.

R. Swinburne, *Responsibility and Atonement* (Oxford, 1989), ch. 12.

**esoteric.** 'Inner'. A word coined in the second century AD to refer to Aristotle's more difficult works, as contrasted with his accessible \*'exoteric' ones. The esoteric works were intended for more advanced pupils. Their obscurity gave rise to the story that they concealed Aristotle's true doctrines, which were a secret to be revealed only to disciples. The word was later applied with the sense 'secret', e.g. to the doctrines of Pythagoras' inner circle. R.J.H.

\*Pythagoreanism.

I. Düring, *Aristotle in the Ancient Biographical Tradition* (Göteborg, 1957), 426–43.

**ESP phenomena, philosophical implications of.** ESP (extrasensory perception), the supposed ability to receive information about the world without the use of the recognized senses, raises questions about various aspects of the physicalistic world-view that dominates current philosophical thinking. Apparent occurrences of ESP, while often extremely convincing to participants, are difficult to investigate applying standard scientific canons of repeatability, independence of observation, and applicability of quantitative measurement. Thus such occurrences, if genuine, question the universality of these canons. Events supposedly learned of by ESP include ones at great distances or even of future events; this would violate known causal relations and so undermine causal theories of perception (how can future events cause the perception of such events in the present?). More generally, ESP, if it exists, would appear to be non-physical: ESP is disanalogous to the familiar senses (no known organ of sensation, no known physical link with events perceived) and so explanations, perhaps purely mentalistic, outside the current physicalistic paradigm seem required. G.C.

J. R. Smythies (ed.), *Science and ESP* (London, 1967).

**esse est percipi.** 'To be is to be perceived.' Berkeley, in his *Treatise Concerning the Principles of Human Knowledge* (1710), asserts (para. 3) of 'unthinking things' that 'their *esse* is *percipi*, nor is it possible they should have any existence, out of the minds or thinking things which perceive them'—on the ground that unthinking things, 'sensible objects', are \*'ideas or sensations'. Note that he affirms this only of 'unthinking' things. G.J.W.

A. A. Luce, *The Dialectic of Immaterialism* (London, 1963), ch. 6.

**essence.** There are four grades of \*essentialism. According to *grade 1*, a thing *x* is allowed to have a property *ϕ* essentially only relative to some other (implicitly or explicitly) singled-out property that *x* has (or kind to which it belongs). Such a property *ϕ* is thus a 'relativistic' essence, and the acceptance of such essences requires only acceptance of *de dicto* necessity: that is, it presupposes only the sort of necessary truth that applies to general propositions such as the proposition that if something is square then it has a shape. Locke's doctrine of 'nominal essence' belongs with this grade of essentialism.

According to *grade 2*, in addition to such *de dicto* necessity there is also fundamental \**de re* necessity. According to this grade, moreover, it is a necessary truth that any property possessed essentially by anything is possessed essentially by everything that possesses it. Thus, necessarily if something is a body, then it is necessarily a body. Note well: it is not just necessarily a body relative to some property of it that entails its being a body, it is not just necessarily a body 'under some description' that yields its being a body. No, the thing itself that is a body has that property not just contingently but necessarily. In a sense essentiality is, for this intermediate grade, fundamentally

a feature of properties. Some properties are essential properties; and, most would say, some are not. Properties that are thus essential are in a sense 'absolute essences', since *whatever* has them must have them essentially.

But there is a higher grade of essentialism, *grade 3*, according to which in addition to properties had essentially in the relativistic fashion of the lowest grade and in the absolute and *de re* necessary fashion of the second grade, there are properties had essentially by some things while they are had but not essentially by other things. Thus a snowball may be said to be round and necessarily so (it is of the essence of a snowball, part of its essential nature, that it be round), but the constituent piece of snow is round yet not necessarily so. This might be called 'particularistic' essentialism, since one and the same property might be of the essence of one particular while it is had by another particular without being of its essence.

Finally, a higher-yet grade of essentialism, *grade 4*, requires that each particular have a property that *only it could possibly have had*, in any possible world: its 'thisness' or \*haecceity. Roundness is a sort of essence that, as we have seen, is distinctively of the essence of some (only) of those particulars that have it. A thing's haecceity, on the other hand, is in a more extreme fashion distinctively of the essence of something: for it is a property that is necessarily possessed by that thing in whatever possible world it might have existed, and one that could not possibly have been possessed by any other thing.

The higher grades of essentialism give rise to puzzling conundrums. For example, it seems very plausible that if a thing has a differential modal property (one that not everything has or need have), then there must be some actual (non-modal) property of that thing to explain why it has that modal property. But this gives rise to a problem concerning any property that is not only differentially but also 'distinctively' essential, it being possible that something have it essentially while something else has it also but not essentially. Take the roundness of a snowball, which it shares with its constituent piece of snow, even though one, the snowball, has it essentially, and the other, the constituent snow, has it also but not essentially. Given the extent and nature of the similarity in actual properties, including roundness, between the snowball and the constituent snow, it is hard to see what could possibly explain the possession of that modal property by that snowball. Whatever property of the snowball we might appeal to in order to explain its *essential* possession of roundness would seem to be shared by the constituent snow, which is supposed to have roundness only *accidentally*. So what could possibly explain this difference between them, that one has roundness essentially while the other has it only accidentally?

**essence, individual:** see haecceity.

**essentialism.** The essentialist claims that we can draw an objective distinction between an object's *essential* and *accidental* properties, which is not simply a reflection of how we choose to describe the object. An essential property of an object is one that it possesses in every \*possible world in which it exists—or, if one favours \*counterpart theory, it is one that is possessed by every counterpart of the object in other possible worlds. For example, it may be urged that it was an essential property of Napoleon that he was a human being, but only an accidental property of him that he was Emperor of France. Some supposedly essential properties of objects, such as Napoleon's property of being human, are shared by other objects of the same kind, but there may also be essential properties that are unique to the object possessing them—and these are said to constitute that object's individual \*essence. In the case of a human being like Napoleon, one such property may be his property of having originated from the fusion of a particular sperm and egg.

E. J. Lowe, *A Survey of Metaphysics* (Oxford, 2002).

**essentially contested concepts.** It is sometimes claimed that the enduring diversity of opinion over, e.g., moral, political, or religious issues reveals that such questions lie beyond the domain of rational enquiry. In the 1950s, W. B. Gallie challenged this claim, arguing that disputes about concepts like 'art', 'democracy', and 'social justice' are not merely semantic or attitudinal in character, but often involve arguments that aspire to be, and sometimes are, rationally persuasive. None the less, the internal complexity of such concepts ensures that dispute is always prone to break out. Thus, from the fact that such concepts are 'essentially contested', we should not conclude that their use defies rational assessment.

W. B. Gallie, 'Essentially Contested Concepts', *Proceedings of the Aristotelian Society*, 56 (1955/6).

**eternal recurrence.** An ancient cosmological idea, seized upon by Nietzsche, to the effect that everything that happens is part of an endlessly repeating cycle or sequence of events. While Nietzsche entertained this idea as an actual cosmological hypothesis, he first introduced it and chiefly employed it hypothetically as a kind of test. One who is able to affirm life even on this supposition will have what it takes to endure and flourish in the aftermath of all disillusionment. (See e.g. *The Gay Science*, sect. 341; *Thus Spoke Zarathustra*, pt. 3; *The Will to Power*, sect. 1066.)

R.S.

\*cosmology.

John Stambaugh, *Nietzsche's Thought of Eternal Return* (Baltimore, 1972).

**eternity.** Sometimes used to mean simply the whole of \*time; but more usually used to mean a timeless realm (with no past or future) in which God lives. Boethius

defined it as the 'total and perfect possession at once of an endless life'. It seemed unthinkable that for God there should be a 'no longer' and a 'not yet'. Most Christian thinkers since the fourth century (unlike the authors of the Bible) held that God exists outside time, but in his timeless realm simultaneously acts at and knows about every moment of time. It is, however, doubtful if this is a coherent claim—if God sees some event in 500 BC as it happens and sees some other event in 2000 AD as it happens and all divine seeings are simultaneous with each other, then 500 BC must be the same year as 2000 AD—which is absurd.

R.G.S.

N. Pike, *God and Timelessness* (London, 1970).

**ethical formalism.** A type of ethical theory which defines \*moral judgements in terms of their logical form (for example, as 'laws' or 'universal prescriptions') rather than their content (for example, as judgements about what actions will best promote human well-being). The term often also carries critical connotations. Kant, for example, has been criticized for defining morality in terms of the formal feature of being a 'universal law', and then attempting to derive from this formal feature various concrete moral duties.

**ethics and aesthetics.** The two traditional branches of the theory of value. Aesthetics understood as value theory concerns itself with the value of perceptual and imaginative experiences to be had from engagement with objects, both natural and man-made, or with the value inherent in those objects in relation to human lives. More broadly, aesthetics as value theory may be said to be concerned with intrinsic value generally. Ethics as value theory concerns itself with the evaluation of human conduct, with how human beings ought fundamentally to behave, particularly in relation to one another. Ethics and aesthetics are thus connected, in that part of the answer to the broader question ethics asks most likely involves an answer to the narrower question aesthetics asks, regarding what is worthwhile experiencing for its own sake, or what sorts of things enrich human lives. Furthermore, issues about the reality and objectivity of ethical and aesthetic values are more or less parallel.

Certain ethical theories, most notably virtue ethics of either an Aristotelian or Nietzschean sort, seem to make an aesthetic appeal at base, valorizing characters or actions or lives that display unity, balance, or grace, and making holistic grasp of situations in their concrete detail, rather than formulaic application of rules, the *sine qua non* of sound moral judgement. Even Kantian moral theory, with its emphasis on the good will as the ultimate source of value, might be seen as grounding morality in something's having a certain form or structure, an arguably aesthetic notion.

On the other hand, most accounts of aesthetic evaluation, and more particularly, the evaluation of art, allow that ethical considerations play a genuine role in such evaluation, one more or less central according to the sort of artwork involved. Thus the ethical perspective embodied in, or conveyed by, a novel or film can be held to be ineliminably relevant to its evaluation as art, because appreciation of the work requires sharing or entering into that perspective to some extent, and yet such engagement might not be merited or justified. The moral dimension of artistic evaluation is most prominent with representational works having sexual, violent, or racist content, but it can be argued that even pure instrumental music has an

artistically relevant moral aspect, turning on the character of the mind one engages with in listening. J.LEV.

**ethics and morality.** 'Morality' and 'ethics' are terms often used as synonyms: an ethical issue just is a moral issue. Increasingly, however, the term 'ethics' is being used to apply to specialized areas of morality, such as medicine, business, the environment, and so on. Where professions are involved, a governing body will typically draw up a code of ethics for its members. 'Ethics' in this sense can be thought of as a subset of morality, being that aspect of morality concerned with the moral obligations pertaining to the practice of a profession. On the other hand, some philosophers, from Socrates to Bernard Williams, use 'ethics' in a broad sense to refer to reflective answers to the question 'How should I live?'. If we accept this broad sense of 'ethics', then morality becomes a subset of ethics, being that aspect of ethics concerned with obligation. R.S.D.

**eudaimonia.** Literally 'having a good guardian spirit', i.e. the state of having an objectively desirable life, universally agreed by ancient philosophical theory and popular thought to be the supreme human good. This objective character distinguishes it from the modern concept of \*happiness, i.e. of a subjectively satisfactory life. Much ancient theory concerns the question of what constitutes the good life, e.g. whether virtue is sufficient for it, as Socrates and the Stoics held, or whether external goods such as good fortune are also necessary, as Aristotle maintained. Immoralists such as Thrasymachus (in Plato's *Republic*) sought to discredit morality by arguing that it prevents the achievement of *eudaimonia*, while its defenders (including Plato) argued that it is necessary and/or sufficient. The Kantian conception of morality binding on rational beings independently of their well-being was absent from Greek thought. C.C.W.T.

**euthanasia.** Originally, the word 'euthanasia' was derived from two Greek roots meaning 'good death'. The term subsequently came to have two distinct meanings: (1) the act or practice of painlessly putting to death those who suffer from terminal conditions (active euthanasia); (2) intentionally not preventing death in those who suffer from terminal conditions (passive euthanasia). The second meaning came into usage when technological advances in medicine made it possible to prolong the lives of persons without hope of recovery. Eventually, the requirement of a 'terminal condition' was dropped in many proposed definitions.

Perhaps the most accurate general meaning today is that euthanasia occurs if and only if: (1) the death is intended by at least one other person who is either the cause of \*death or a causally relevant condition of the death; (2) the person put to death is either acutely suffering or irreversibly comatose (or soon will be), and this is the reason for intending the person's death; and (3) the means chosen to produce the death must be as painless as possible, or there must be a sufficient moral justification for a more painful method.

If a person requests the termination of his or her life, the action is called voluntary euthanasia (and often also assisted \*suicide). If the person is not mentally competent to make an informed request, the action is called non-voluntary euthanasia. Both forms should be distinguished from involuntary euthanasia, which involves a person capable of making an informed request, but who has not done so. Involuntary euthanasia is universally condemned and plays no role in current moral controversies. A final set of distinctions appeals to the active-passive distinction: passive euthanasia involves letting someone die from a disease or injury, whereas active euthanasia involves taking active steps to end a person's life. All of these distinctions suffer from borderline cases and various forms of unclarity.

The centre of recent public and philosophical controversy has been over voluntary active euthanasia (VAE), especially physician-assisted suicide. Supporters of VAE argue that there are cases in which relief from suffering supersedes all other consequences and that respect for autonomy obligates society to respect the decisions of those who elect euthanasia. If competent patients have a legal and moral right to refuse treatment that brings about their deaths, there is a similar right to enlist the assistance of physicians or others to help patients cause their deaths by an active means. Proponents of VAE primarily look to circumstances in which (1) a condition has become overwhelmingly burdensome for a patient, (2) pain management for the patient is inadequate, and (3) only a physician seems capable of bringing relief.

The laws of most nations and the codes of medical and research ethics from the Hippocratic corpus to today's major professional codes strictly prohibit VAE (and all forms of merciful hastened death), even if a patient has a good reason for wanting to die. Although courts have often defended the rights of patients in cases of passive

euthanasia, courts have rarely allowed any form of what they judged to be VAE.

Those who defend laws and medical traditions opposed to VAE often appeal to either (1) professional-role obligations that prohibit killing or (2) the social consequences that would result from changing these traditions. The first argument is straightforward: \*killing patients is inconsistent with the roles of nursing, care-giving, and healing. The second argument is more complex and has been at the centre of many discussions. This argument is referred to as the wedge argument or the \*slippery slope argument, and proceeds roughly as follows: although particular acts of active termination of life are sometimes morally justified, the social consequences of sanctioning such practices of killing would run serious risks of abuse and misuse and, on balance, would cause more harm than benefit. The argument is not that these negative consequences will occur immediately, but that they will grow incrementally over time, with an ever-increasing risk of unjustified termination.

**Euthyphro problem.** Euthyphro, in the Platonic dialogue named after him, attempts to define 'the pious' as 'the god-loved'. Socrates responds with the famous question: 'Is the pious loved by the gods because it is pious, or is it pious because they love it?' (*Euthyphro* 10a).

The general point behind the discussion that follows seems to be this: No normative term (such as 'the pious' or 'the \*right') can be defined satisfactorily as what some rational authority, such as God or the gods, loves or commands, unless we suppose that the command or approval is without rational justification. Alternatively, if we suppose the approval or command to be rationally justified, then it is to that justification, rather than to the action or attitude of the authority, that we must look for the meaning of the normative term.

**Evans, Gareth** (1946–80). Evans was part of a post-1970 flowering of work in Oxford on mind and language, influenced by the American Donald Davidson (see also Dummett, McDowell, Peacocke, Crispin Wright). His posthumous book *The Varieties of Reference* develops McDowell's idea that aspects of mind such as thinking about individual objects are forms of embeddedness in an environment. This departs radically from \*Cartesianism,

according to which thinking is a process that takes place essentially independently of the nature or even existence of an environment. Evans has been particularly influential in stressing that thinking is grounded in bodily capacities and abilities, and this work continues the Oxford Kantian tradition, associated with Strawson, of laying down the conditions for the objectivity of thought. His very early death was, like Ramsey's, a serious loss for British philosophy.

**event.** Roughly, a happening, occurrence, or episode: for example, the General Strike, the sinking of the *Titanic*, the arrival of the guests, the local jumble sale. Events need not be momentous: the fall of a sparrow is as much an event as the fall of the Roman Empire.

According to most accounts, events need not be instantaneous, nor even of brief duration. Ordinary language attempts to distinguish events from processes, but most modern theories of events show no interest in this distinction. An event is sometimes defined as a change (for example, the loss or acquisition of a property by something) or composite of changes. However, many theories of events include *states* that consist in things' having (or retaining) properties (e.g. the lawn's staying wet) as well as changes that consist in their acquiring or losing them (e.g. the lawn's becoming dry). On this liberal view, a rest may be as good as a change as a candidate for an event.

'An event' is ambiguous: it may mean a particular event, occurring only once, with a particular duration and location (e.g. the 1992 Grand National), or a 'type-event' that can occur repeatedly (e.g. the Grand National that is a famous annual event). Events in the first sense are sometimes described as 'concrete particulars' (also \*tokens' as opposed to 'types'); events in the second sense as \*universals' and as 'abstract'. Most contemporary theorists (Chisholm was an exception) are primarily concerned with events as particulars.

What distinguishes particular events from 'things'? We speak of events as *occurring*, but we do not say this of material objects like tortoises, books, and pebbles. And we seem to think that the *whole* of a tortoise or a rock is there at any time in its existence, whereas (excepting instantaneous events) only part of an event is present at any one time. However, many are unimpressed by these facts. 'A thing . . . is simply a long event [with certain characteristics]', wrote C. D. Broad (*Scientific Thought*, 393), and many philosophers have reduced material objects to series of events. (\*Identity; mereology.) On the other hand, Aristotle, Strawson, and others have held that at least some material objects belong to an ontological \*category distinct from, and prior to, that of events. (\*Substance; \*things; \*ontology.)

The category of events is the focus of much recent discussion of \*action, the \*mind-body problem, and \*causality, especially in work influenced by Davidson. Davidson

has emphasized the significance of questions about the \*individuation of events. When do we have one event rather than two? When do different descriptions pick out the same event? Could a mental occurrence (e.g. one of my decisions) be identical with some physical event in my brain? Was Oedipus' marriage to Jocasta the same event as his marriage to his mother? If my hammering woke the cat next door and also caused the fall of the vase, was my hammering the same event as my waking of the cat, with the consequence (if causality is a genuine *relation* between events) that my waking of the cat caused the fall of the vase? (\*Extensionality.) These are not mere conundrums: satisfactory answers are needed if we are to give coherent accounts of \*mentality, \*intention, \*responsibility, and causation. (\*Reasons and causes; \*fact.)

Davidson's answers to these puzzles appear to be independent of his much-criticized criterion for the identity of events: that events are identical if and only if they have exactly the same causes and effects. (Indeed, this criterion does not appear to help us to answer substantive questions about event identity such as our question whether the hammering was the waking of the cat.) Davidson subsequently abandoned his 'causal' criterion in favour of the principle (also held by Quine) that events are identical just in case they occupy exactly the same places at the same times. Yet another criterion (proposed by Jaegwon Kim) is that events are identical when they consist in the same objects' having the same properties at the same times.

Another issue concerns the identity of events in different possible circumstances. Would it have been the same death if it had been a shooting rather than a stabbing? If it had happened at a different time or location? (\*Essence.) Such questions must be addressed by theories that appeal to \*counterfactual conditionals when assigning causes to, or attributing responsibility for, particular events.

**evidence.** That body of belief, often of an observational sort, which supports some less well-established hypothesis. Doubtless the wise man should apportion his belief to the evidence he has, but problems lie in formalizing the notion of evidential support. Logically 'All ravens are black' is equivalent to 'All non-black things are non-ravens', and if logically equivalent statements are confirmed by the same evidence, an irrelevant green violin is evidence for all ravens being black. Equally troubling is the fact that a black raven seen today logically supports mankind's belief that all ravens are black, but also a Martian's contrary belief that all ravens are blite (= black if observed before the year 2000, and otherwise white). In practice these philosophically well-known dilemmas trouble us not; in life we assess how some evidence bears on a \*theory against a background of shared but

unformalizable assumptions about the nature of the world and degrees of evidential support.

N. Goodman, *Fact, Fiction, and Forecast*, 4th edn. (1983).

**evil, human.** The suffering which results from morally wrong human choices, especially when the moral wrong is of an extreme kind. Moral evil can be contrasted with natural evil, such as the suffering and death caused by earthquakes or other natural disasters. Whereas natural evil creates a problem for theology, moral evil creates one for secular moral philosophy.

The first of these problems is whether evil is a predicate primarily applicable to human agents or to the effects of human choices. It is certainly true that there can be evil effects which follow from sincerely held beliefs, such as political ideologies or religious fundamentalism. This is the evil of fanaticism. But to the extent that the common thread in all fanaticism is the belief that individual suffering is unimportant compared to the righteousness of the cause, the sincerity of the beliefs cannot exonerate the perpetrators from the charge of evil. A second source of evil is self-interest. The pursuit of self-interest at the expense of others is a common form of moral wrongdoing, but when the others are made to suffer in outstandingly bad ways, then we enter the sphere of moral evil. This is the evil of Macbeth. A third sort of moral evil lies in the enjoyment which many people seem to obtain from the infliction of suffering for its own sake. Closely related to this evil in human agency is the way in which some people try to compensate for their own feelings of inadequacy by dominating and humiliating their captives. Of course, evil desires of the sort mentioned could not be expressed unless the social and political conditions of a regime encouraged or at least permitted them. Hence, a fourth root for the growth of moral evil lies in the will of political rulers. Sometimes regimes actively encourage terror, and sometimes they remain silent for political reasons in the face of known perpetrators of evil.

A fifth source of moral evil lies in a failure in moral imagination. It is well known that a psychopath is unable to imagine the sufferings he will cause, but the same can be true on a large scale at the political level. An example here is the use of napalm or nuclear weapons. Since the victims are remote, it is easy to fail to imagine their sufferings. Of course, this failure of the moral imagination happens more easily if the enemy has already been humiliated or can be depicted in some impersonal sort of way as subhuman, as happened at the Amritsar Massacre in 1919, or to the Jews in Nazi Germany, or to the Vietcong in the Vietnam War. R. L. Stevenson in 'Dr Jekyll and Mr Hyde' brings out in fiction the chilling truth that we have a dual nature, and that all of us may be capable of moral evil in certain circumstances. Perhaps the upsurge of pressure from advocates of human rights can help a little to combat moral evil, although there is a risk that human rights will be trivialized by their use in minor legal grievances.

**evil, the problem of.** In Christianity and other Western religions, God is supposed to be omnipotent (i.e. able to do anything logically possible), omniscient (i.e. to know everything logically possible to know), and perfectly good; yet manifestly there is evil (e.g. pain and other suffering) in the world. Atheists have argued that since an omnipotent being could prevent evil if he chose, an omniscient being would know how to do so and a perfectly good being would always choose to do so, there is no \*God of the kind supposed. The problem of evil has always been the most powerful objection to traditional theism. The usual response of theists to this 'problem' is to deny that a perfectly good being will always choose to prevent evil, claiming that allowing some evils may make possible greater goods. If God is to allow evil to occur, it must not be logically possible to bring about the greater goods by any better route. Some theists have held that, being only human, we cannot be expected to know for which greater goods the evils of our world are needed. But it seems unreasonable to believe that there are any such goods without some demonstration as to what they are, i.e. without a \*'theodicy'. Central to most theodicies is the 'freewill defence'. This claims that the greater good of humans having a free choice between good and evil involves no one, not even God, preventing them from bringing about evil. Theodicy needs one or more further defences to explain why God allows evil of kinds for which humans are not responsible, such as the pain of currently unpreventable disease. The 'higher-order goods defence' claims that such evils give humans opportunities to perform, in response to them, heroic actions of showing courage, patience, and sympathy, opportunities which they would not otherwise have. This does still leave the problem of what justifies God in allowing some (e.g. battered babies) to suffer for the benefit of others (e.g. parents, social workers, etc. having free choices). The theist may argue in reply that God who gives us life has the right to allow some to suffer for a limited time, that it is a privilege to be used by God for a useful purpose, and that there is always the possibility of compensation in an afterlife. The crux of the problem is whether such defences are adequate for dealing with the kinds and amount of evil we find around us.

**evolution.** Evolution, the idea that the world and its contents—particularly organisms—have developed from primitive beginnings through natural processes, is a child of the \*Enlightenment. Until that time, the Christian story of Creation combined with the essentialist thought of the Greeks, prevented people from thinking of origins in such a non-miraculous manner. What the Scientific Revolution started, with its successful subsumption of so much to natural regularity and material cause, was finished by the rise of hopes and beliefs in progress, the ideology of upward change and improvement in the human lot, encouraged by an ever-increasing knowledge and control of nature's processes. In France particularly, but also in Britain and Germany, people moved easily from a belief in social and cultural \*progress to an analogous belief in upward development in the world of life, which latter development was then taken as confirmation of their social beliefs!

Most notorious of the early evolutionists was the Frenchman Jean-Baptiste de Lamarck, whose *Philosophie zoologique* (1809) offered the first full-length treatment of the subject. Interestingly, the inheritance of acquired characteristics, the mechanism to which Lamarck gave his name, played only a minor role in his thinking, which was much more dominated by a desire to turn the static Chain of Being into an ever-moving escalator. More influential, perhaps, were the German \*Naturphilosophs, who saw repeated patterns running through nature, and who linked this belief naturally with one of the unity of the organic world. Not that most of these thinkers or those sympathetic to them (such as Goethe) became full-blown evolutionists. In the spirit of the time, the idea was always more significant than the reality.

It was therefore to be the middle of the nineteenth century before the picture of all-embracing development—now known as evolution and distinguished from the development of the individual organism—became an established doctrine and entered the halls of respectable science. Credit for this is due to the English naturalist Charles Darwin, who presented his theory of evolution through natural selection in his *On the Origin of Species* (1859). Starting with the Malthusian struggle for existence, Darwin argued that successful organisms in life's battles will tend to differ from the unsuccessful. There will thus be a 'natural selection' of the 'fittest'—the successful giraffe will have a longer neck than the unsuccessful giraffe. It was Darwin's claim that, over time, this will lead to significant permanent change. Darwin, however, had no adequate theory of heredity. This gap was filled in the twentieth century by the new science of genetics, which itself dates back to the middle of the nineteenth century and the ideas of Darwin's then unknown contemporary, the monk Gregor Mendel.

Evolution raises questions of considerable philosophical interest and much controversy. Most obviously, there are matters to do with the science itself. Is it, as critics often claim, 'just a theory and not a fact'? Comments of this ilk play on an equivocation on the word \*theory. If one is asking whether evolution as such is well established, then this

is a matter beyond reasonable doubt. Palaeontology, biogeography, embryology, anatomy, and more all point to evolutionary origins. But if one is asking about a particular theory, then serious debate continues. Darwinian selection speaks to the fact that organisms seem well designed—they are ‘adapted’. Critics argue either that Darwinism is inadequate to account for this phenomenon, or (taking the counter tack) that the fit between organisms and their world is nowhere like as tight as the Darwinian supposes. In either case, other mechanisms must be sought.

As pressing, there is the question whether our thinking on evolution can profitably be applied to the traditional problems of philosophy, especially epistemology and ethics. Traditional philosophers, most notably, in recent years, Wittgenstein, tend to rear back from such suggestions like vampires before garlic. But, thanks especially to the enthusiasm of Herbert Spencer, there has always been a steady stream of biological thinkers who extend their thinking to philosophy. Complementing them, there have generally been a few philosophers who suspect that the fact that we humans are the product of a long, slow natural process of evolution rather than the miraculous products of a Good God working on the Sixth Day may indeed be significant. \*Evolutionary epistemology and \*evolutionary ethics are hardly yet respectable, but today—thanks especially to some who think that perhaps evolution can be brought to work in conjunction with the insights and achievements of traditional philosophy rather than as a replacing rival—they thrive and offer new directions as never before.

**evolution and philosophy.** \*Evolution is the belief that the organic world, including our own species, is the product of a long, slow, natural process of development from forms very different, extremely simple, and probably themselves the result of natural processes that turned the inorganic into the living. There have been many causal theories of evolution, but the dominant one today dates to the *Origin of Species*, published in 1859, by the English naturalist Charles Darwin. He pointed to the struggle for existence that rules universally in the living world, and argued that this leads to a natural selection of the fitter over the less fit, with consequent ongoing change.

Many philosophers, most famously Ludwig Wittgenstein, have argued that evolution has no implications at all for philosophy. Others, starting with Darwin himself, disagree, thinking that the natural evolutionary origins of human beings has to make a difference to our thinking about knowledge (epistemology), as well as to our thinking about morality (ethics). Some philosophers indeed—notably the American pragmatists—have thought that

evolution must be one of the basic starting-points of any attempt to understand human nature and how it functions in the world.

Applying evolution—selection theory in particular—to problems of knowledge (\*‘evolutionary epistemology’) usually takes one of two forms. The first is to argue analogically from the biological situation to the cultural world. There is a struggle for existence among organisms leading to a natural selection; so, likewise, there is a struggle for existence among ideas leading to a selection of the best, which then survive and rule for a while. The philosopher Karl Popper argued that this is precisely what he was referring to when he spoke of the need of scientific theories to be falsifiable—always ready to battle out their claims in the intellectual struggle for survival. The second approach is to take a literal position, pointing to the fact that the way in which humans think is itself moulded by selection. In other words, as was argued by W. V. Quine, our beliefs about causation and the virtues of such epistemic notions as prediction are beliefs that we have because they served well the ends of our would-be ancestors. There is therefore no ultimate justification for thinking causally. It is just that those proto-humans who learned to associate fire with burning survived and reproduced, and those that did not, did not.

Applying evolution—again selection theory in particular—to problems of morality (\*‘evolutionary ethics’) likewise takes one of two forms. The first, due especially to Darwin’s contemporary Herbert Spencer, goes from the processes of evolution to the way that things ought to be—notoriously from the struggle for existence to the promotion of *laissez-faire* socio-economics. More recent exponents have been the English biologist Julian Huxley, who argued for large-scale public works in the name of Darwinism, and today the American biologist Edward O. Wilson, who thinks that the evolutionary process justifies conservation. Famously, this whole line of thinking was severely criticized by G. E. Moore in his *Principia Ethica*, where it was claimed that such an approach to morality (often called ‘Social Darwinism’) commits the naturalistic fallacy, a version of the illicit move noted by David Hume, where one goes without cause or reason from statements of fact to statements of obligation.

The second approach to evolutionary ethics parallels the second approach to evolutionary epistemology, in this case arguing that human moral thought and behaviour is a result of evolution, particularly of the fact that in the struggle co-operation (what biologists call ‘altruism’) is often a better strategy than outright warfare. Better to share a cake than to run the risk of getting no cake at all. At the normative level of ethics (What should I do?), there has been much recent interest in evolutionary strategies (often based on principles of game theory) that might generate the norms that we hold dear. In his *Theory of Justice*, John Rawls argued for a contractarian theory of ethics (justice as fairness), suggesting that the original contract was not one put in place by conscious human intention but a result of the genes as chosen by natural selection. At

the meta-ethical level of discussion (Why should I do what I should do?), there is still considerable disagreement. Some think, as in epistemology, that because a feature like morality is adaptive, this does not preclude its giving a true picture of reality. There may well be objective or real moral norms. Others are less sure, and incline to scepticism, thinking that perhaps in some sense the whole of (normative) morality is an illusion put in place by our genes to make us good social co-operators.

Recently, there has been much interest by philosophers of mind in the implications of evolutionary thought for a full understanding of the mind's operating and functioning. If indeed selection cares not about truth but about success—Patricia Churchland speaks of the 4-F imperatives, Feeding, Fighting, Fleeing, and Reproduction—can we possibly expect that the mind receives a true account of external reality? Some, notably Popper (following the ethologist Konrad Lorenz), think that this is no major problem. Others, notably the Christian philosopher Alvin Plantinga, think it spells the end of any approach to understanding using Darwinian evolution. Most, like philosopher Ruth Millikan, take a middle line. One can be mistaken, but evolutionary theory itself dictates the sorts of times when one might be mistaken—for instance, when there are no selective advantages in having the truth. If a fast train is bearing down on one, then the strong presumption is that selection is not about to deceive—there are no obvious reasons why one should be deceived into thinking it exists if it does not, and very good reasons why one should not be deceived if it does exist. **evolutionary epistemology.** This is an approach to the theory of knowledge claiming that the very fact that we humans are the end-product of a natural process of \*evolution must be a significant factor in the ways in which we know and understand the world. Part of an overall contemporary move towards a naturalized epistemology, it comes in two main forms. One argues that the growth of knowledge, especially scientific knowledge, is akin to the evolutionary growth of organisms. Everything is in flux, forever moving towards some new level. Moreover, just as there is a struggle for existence in the organic world, so also is there a struggle in the world of concepts, with the consequent selection of the 'fittest'. There is, of course, a major disanalogy, in that the raw stuff of \*biology—'mutations'—are random, in the sense of not occurring according to need, whereas the raw stuff of science—'discoveries'—generally come in response to need and are directed to such need. Hence, the growing popularity of the other form of evolutionary epistemology, which claims that all knowledge is shaped and informed by

certain innate principles (like the laws of logic and mathematics, as well as such epistemic norms as a preference for simplicity) which have selected into human thought because of their adaptive value. Controversial is the question whether these principles represent the necessary conditions of rational thought (that is, the synthetic a priori) or are merely contingent and non-unique, and could well have been quite different. Is the logic on Andromeda as different from that of Aristotle as the slithering of the snake is different from the walking of the human? Equally controversial is the question whether such a philosophy points to the conclusion that knowledge is a generally faithful mapping of a real (human-perception-independent) world, or whether one is pointed towards some sort of pragmatic or coherence theory of truth. M.R.

\*evolutionary ethics; evolution and philosophy.

M. Ruse, *Taking Darwin Seriously: A Naturalistic Approach to Philosophy* (Oxford, 1986).

**evolutionary ethics.** This is a body of theory which seeks to locate moral institutions within the main ideas of evolutionary biology. The general thesis is that we value things and persons in accordance with their capacity to sustain and maintain survival in evolutionary terms. For example, it may be thought that friendship and altruism are valued because they preserve members of the human species against violence. Objections to this approach come, partly, from those who reject its strategy of deriving values from facts about human nature, and partly from those who accuse it of over-simplifying factual issues about what strategies actually ensure survival. As an example of the latter kind of difficulty, it has been objected that even if a certain practice has been successful, its previous environment may be unstable; so it would be bad practice, despite its evolutionary success. J.D.G.E.

\*evolutionary epistemology.

M. Ruse, *Sociobiology: Sense or Nonsense?* (Dordrecht, 1979) contains a sympathetic but critical account of the subject.

**examination paradox.** The teacher says that some time next week there will be an unexpected examination: on the morning of the relevant day, the students will not know it will happen on that day. The students reason that the teacher cannot set the examination on the last day of the week, for when that day comes they would expect it. He cannot set it on the penultimate day, for when that day comes, and knowing from the previous reasoning that it cannot be held on the last day, they would expect it on the penultimate day. And so on for each possible day. So there cannot be an unexpected examination! R.M.S.

\*prediction paradox.

Mark Sainsbury, *Paradoxes* (New York, 1988), ch. 4.

**excluded middle, law of.** The oldest principle so called is Aristotle's 'There is nothing between asserting and denying', i.e. 'If neither "yes" nor "no" truly answers the question "Is it the case that P?", nothing does'. This can slide

into 'Either "P" or "not-P" is true', and further into 'Every proposition is true or false' (more properly called the law of \*bivalence). In modern logic the law usually called excluded middle is "'P or not-P" is valid', i.e. true on all interpretations of 'P'.  
C.A.K.

W. V. Quine, *Philosophy of Logic* (Englewood Cliffs, NJ, 1970), 83–5.

**existence.** 'Existence', a key term of \*ontology, in one sense refers to the sum total of reality—everything that exists—and in another to the elusive characteristic of \*being, which differentiates real \*things from fictional ones. But whether there really is such a characteristic is debatable, because it is often held that 'exist' is not a first-level predicate. What this means is that 'exist' does not express a property of objects, as verbs like 'shine' and 'fall' do. According to Frege and Russell, 'exist' is a *second-level* predicate, expressing a property of properties. Thus 'God exists' does not have the same logical form as 'Sirius shines', predicating a property of a particular object. Rather, it is equivalent to 'Godhood is instantiated', asserting that the property of being divine has at least one instance, or that there is at least one thing possessing that property. According to Frege and Russell, in a tradition reaching back to Kant, Anselm's \*ontological argument for God's existence is vitiated by its failure to grasp this point.

W. V. Quine's famous dictum 'To be is to be the value of a variable' takes the Frege–Russell account of existence as its inspiration, and implies that the entities to whose existence a theory is committed are precisely those which need to be invoked to interpret the quantified sentences of the theory. But this controversially assumes an 'objectual' rather than a 'substitutional' interpretation of the quantifiers. According to the latter, 'There is at least one thing which is *F*' is true just in case there is some true sentence of the form '*a* is *F*', where '*a*' is a singular term. Thus, if 'Pegasus is identical with Pegasus' is deemed true despite the non-existence of Pegasus, 'There is at least one thing which is identical with Pegasus' must likewise be deemed true, whence adherents of this account must repudiate Quine's dictum.

The thought that fictional entities like Pegasus have some reality despite lacking full-blooded existence is a tempting one, often associated with Meinong. But according to David Lewis's more recent doctrine of modal realism, Pegasus and other possible but non-actual objects do have full-blooded existence, and differ from actual objects only in residing in other \*possible worlds. This doctrine requires one to distinguish sharply between existence and actuality, treating the latter as an indexical notion akin to those of being here and now. On Lewis's view, Pegasus is just as 'actual' in the worlds in which it exists as Julius Caesar is in 'our' world, and the objects existing in a world are all actual to its inhabitants in just the way that all moments of time are present or 'now' to those experiencing them. Such a view may, however, be accused of grossly inflating existence, understood as the sum total of reality.

Perhaps the biggest metaphysical problem concerning existence is why anything should exist at all—why there

should be something rather than nothing. Physicists can maybe tell us why matter exists, adverting to conditions obtaining shortly after the Big Bang; perhaps they can even explain the existence of time and space, if this is as intimately linked to the existence of matter and energy as modern cosmologists suggest. But the metaphysical question clearly goes beyond such merely empirical considerations. One response is to say that the question is absurd, because it erroneously presupposes that we can make sense of the idea of absolute nothingness as a genuine alternative to the existence of at least *something*. On this view, we mistake the contingency of the things that do exist for a contingency in the fact that anything whatever exists. However, while it may indeed be impossible to *imagine* a world in which nothing exists, the notion of a wholly empty world does not seem obviously incoherent. E.J.L.

**existence, contingent and necessary:** see contingent and necessary existence.

**existence precedes essence.** An existentialist formula which signifies that we make ourselves the individuals we are. Heidegger uses the formula to indicate that for each \**Dasein*, its 'being' or 'essence' is the way in which it shapes its life, its manner of 'existence' (in his special sense). Sartre interprets the formula in the light of his emphasis upon free choice: we are what we 'choose' ourselves to be.  
T.R.B.

\*existentialism.

J.-P. Sartre, *Existentialism and Humanism*, tr. P. Mairet (London, 1948).

**existentialism.** 'Existentialism' is a loose term for the reaction, led by Kierkegaard, against the abstract rationalism of Hegel's philosophy. As against Hegel's conception of 'absolute consciousness' within which all oppositions are supposedly reconciled, Kierkegaard insisted on the irreducibility of the subjective, personal dimension of human life. He characterized this in terms of the perspective of the 'existing individual', and it is from this special use of the term 'existence' to describe a distinctively human mode of being that existentialism gets its name. Kierkegaard's successors include the German philosophers Heidegger and Jaspers and the French philosophers Sartre and Marcel (who actually coined the term 'existentialism'). I shall concentrate here only on aspects of the works of Heidegger and Sartre in addition to those of Kierkegaard.

Kierkegaard rejected the claim, which he took (perhaps unfairly) to be Hegel's, that we can look forward to a time

## POSTWAR FRENCH PHILOSOPHY

JEAN-PAUL SARTRE became the archetype of the French intellectual: deep and difficult, against convention, politically committed, with a recognized role as a critic of culture and society, in a café, with a cigarette.

SIMONE DE BEAUVOIR brought to existentialist morality, which exalted freedom, awareness of the importance of the social context of choice, and in particular of the power-relations between the sexes.

MICHEL FOUCAULT, in his histories of madness, sexuality, and punishment, examined how societies control discourse and knowledge and thus power.

LOUIS ALTHUSSER offered, in the 1960s, a new Marxist approach to social and cultural theory, rejecting the principle of reductive explanation in terms of economic factors.

when the different interests and concerns of people can be satisfied through their comprehension within an all-embracing objective understanding of the universe. For, according to Kierkegaard, no such synthesis can do justice to an individual's concern for their own life; hence, he argues, even though Kantian epistemology correctly implies that we should recognize that our own subjective perceptions are just the manifestation of our objective situation in the world, we cannot similarly resolve ethical questions by subjecting our moral consciousness to an impersonal deliberative perspective. For ethical questions essentially concern ourselves; in asking ourselves how we are to lead our lives, we deceive ourselves if we pretend that the adoption of an objective, impersonal understanding of our situation will by itself provide an answer.

Kierkegaard takes it that this relationship between ethics and subjectivity is a two-way relationship. Not only are ethical questions essentially first-person, the 'real subject' is also 'the ethically existing subject', as he puts it. He also holds, however, that we should not think of our existence as 'real subjects' as a feature of our lives which we can just take for granted (comparable, say, to our embodiment). Instead (and here he remains to some degree Hegelian) he thinks that it is an aspect of our lives that needs to be developed if we are to achieve our full potential as individuals; the fact of our 'existence' implies that we cannot avoid first-person practical questions, but we may well lack a coherent conception of ourselves by reference to which we can begin to answer them. How, then, is such a conception to be acquired? How is one to 'become an individual'? Not, certainly, by acquiring more knowledge of the world. Instead we have to engage the will: it is by making choices and commitments (such as marriage) which enable us to develop long-term interests that we give our lives an ethical structure. When Kierkegaard writes that 'it is impossible to exist without passion', he means that it is only by entering into engagements whose fate can arouse the passions that we gain a sense of our own identity and in that way become an 'existing individual'.

Nothing so far explicitly implies that in becoming such an individual one becomes a virtuous one. But Kierkegaard takes it that the good life for a person is one that fulfils the requirement that that person live as an individual. The basic idea here is that one is able to make sense of one's life as a whole only through personal conduct and relationships with others which manifest the virtues. This may not seem persuasive. In Kierkegaard's case, however, this thesis is presented in the context of the further belief that no one can create a life for themselves which will survive the vicissitudes of fortune without making 'the leap of faith', a personal commitment to the kind of life lived by Jesus Christ, i.e. without becoming 'Christlike'. What stands behind this belief is the experience of *'Angst'*—variously translated as 'dread' or 'anxiety'. Kierkegaard's claim is both that this experience reveals to us the unsatisfactory nature of a life that depends on the contingencies

of success or human love, and that we are thereby motivated to commit ourselves to an 'ethico-religious' life which offers a salvation that is not dependent upon such contingencies because it rests upon a relationship with God.

Heidegger follows Kierkegaard in using the term *Existenz* to describe the mode of being that is distinctive of human life (or *\*Dasein*, as Heidegger would put it), and he explicitly contrasts this mode of being with that of the everyday objects which we categorize in terms of their use (the *Zuhandenheit*) and that of those objects which we think of as altogether independent of us (the *Vorhandenheit*). Heidegger also holds that the distinctive feature of human existence arises from the irreducibility of the practical concern we each face concerning our lives: for each of us 'our own being is an issue', and the way in which we face up to this issue determines the nature of our existence. There is no fixed human essence which gives a structure to human life that is independent of the engagements and goals which, by giving us a sense of our own practical identity, fill out our existence.

Where Heidegger differs from Kierkegaard is in assigning this 'existential' thesis an absolutely fundamental role in general metaphysics. He maintains that the answer to the question of being in general is to be found by a line of inquiry which commences with an inquiry into the 'existential' constitution of *Dasein*, i.e. human life. Since, as we have seen, *Dasein's* existence involves a practical concern for itself, it is not surprising that a metaphysics which builds out from this has many similarities with pragmatism. So when Heidegger proceeds to develop his account of *Dasein's* 'existence' as 'being-in-the-world', he makes it clear that our fundamental mode of being-in-the-world is action (rather than, say, contemplative perception), and that we basically understand the world in terms of the categories which enter into the explanation of our actions. So, for example, although Heidegger endorses Kant's claim that spatiality is an essential element of our experience of the world, he argues that we should not think of this spatiality in terms of the space of physical theory (as Kant did); instead, we should think of it as the 'existential space' of everyday life, that spatiality which is conceived in essentially egocentric and practical terms.

Heidegger's 'existential pragmatism' goes beyond Kierkegaard's existentialism, and in other respects, too, he modifies important aspects of Kierkegaard's conception of existence. Where Kierkegaard linked the 'passionate' nature of human existence directly to the will, to the subject's chosen commitments, Heidegger argues that our emotions characteristically reflect cares and concerns that we have not chosen, since they arise from involvements which we just find ourselves 'thrown' into (e.g. our country, our family, and, more fundamentally, those aspects of our world which simply record our everyday needs). Heidegger then argues that these involvements provide an essential background for the practical undertakings of everyday life whereby we seek to meet our needs and answer the demands that arise from our unchosen

involvements. So although these practical undertakings manifest an existential concern with the world, Heidegger argues that they do not arise from the will if that is conceived in terms of the self-conscious adoption of a project. Thus Heidegger's account of the existential structure of human life is basically worked out at an unself-conscious level, which is also fundamental to the conception of the 'lived world' implied by his existential pragmatism.

Heidegger does not of course deny that there is a level of self-conscious deliberation and decision, and it is in the context of this feature of human life that he employs his distinction between 'inauthenticity' and 'authenticity'. Heidegger's discussion here looks back to Kierkegaard's thesis that it is an achievement to become an individual, and he deliberately invokes religious terminology to describe his position, though without Kierkegaard's explicit invocation of religious faith. The basic idea is that those whose understanding of themselves is not informed by a grasp of the true nature of their individual existence, who think of themselves, say, as just complicated animals, are said to have only an inauthentic existence; whereas those who have internalized the truth of Heidegger's conception of their existence and are able to conduct their lives in accordance with it are said to have attained authenticity. According to Heidegger, we always start out with an inauthentic conception of ourselves, since our pre-reflective involvements with the world and others lead us to think of ourselves as not significantly different from them. What then motivates us to become authentic is the experience of *Angst*, which Heidegger interprets as an awareness of the precariousness of a life whose goals and values are not understood as arising from the structure of one's own existence. *Angst*, therefore, recalls us to ourselves, and by making the existential structure of our life available to us, helps to bring us to an authentic recognition of our freedom. Heidegger connects this experience of *Angst* with one's attitude to one's own death: this attitude is typically one of *Angst*, and because a correct understanding of death as the end of one's existence reveals to us the structure of our own existence, an authentic life is 'an impassioned freedom towards death'.

Heidegger's existentialism is essentially metaphysical. He even denies that the authentic-inauthentic distinction has any ethical content, although his actual language betrays him here. Sartre, by contrast, explicitly presents existentialism as an ethical doctrine. He largely takes his existentialist starting-point from Heidegger, except that where Heidegger clearly separates human existence from the exercise of choice, Sartre reformulates the position as one in which the role of choice in human life is absolutely fundamental. He argues that we choose our emotions as much as any other aspect of our life, and that the basic goals of our lives cohere around a fundamental project which is itself the product of an 'original choice'—a choice which, since it provides us with all the motivations we have, must itself be unmotivated, or '\*absurd'.

This unattractive line of thought goes back to Kant. In Kant's case the implied threat of ethical nihilism is supposed to be averted by the requirements of the categorical imperative. Sartre's ethical theory is basically similar: although he celebrates the 'absurdity' of existentialist freedom, he actually only commends those exercises of this freedom which manifest respect for the freedom of others. It is not clear what basis Sartre's existentialism can offer for this value-judgement, but it looks as though he holds both that the existentialist's values must meet the requirement that they be the values of someone whose life is, in Heidegger's sense, authentic, and that authenticity can only be attained within a community which practises mutual respect. This leads to the principle Sartre endorses, but it should be noted that the price Sartre has had to pay in order to provide some social content to his existentialist ethic is an important qualification of the emphasis on the situation of the isolated individual which is so prominent in Kierkegaard's writings.

Sartre was the last significant existentialist philosopher. But existentialism lives on, primarily in attempts to combine the basic structure of Heidegger's metaphysics with other, less theoretical, doctrines: thus we still have 'existential Marxism', 'existential sociology', 'existential psychoanalysis', 'existential theology', and so on. The general feature of these hybrids is an emphasis on the irreducibility of the perspective of human agents, whose activities, emotions, and thoughts, it is supposed, are to be understood in terms of their aspiration to 'become an individual', as Kierkegaard would have put it.

**existential proposition.** An existential proposition (or statement) is one affirming the \*existence of some \*thing or kind of things—for instance, 'The yeti exists' or 'Unicorns exist'. Problems arise over the interpretation of *negative* existential statements, especially singular ones like 'The yeti does not exist', because the singular term which functions as the grammatical subject of such a statement seems to make reference to an object which, if the statement is true, does not exist.

E.J.L.

W. V. Quine, 'On What There Is', in *From a Logical Point of View*, 2nd edn. (Cambridge, Mass., 1961).

**existential quantifier:** see quantifier.

**exoteric.** 'External' (Greek, *exoterikos*). A word used by Aristotle to refer to well-known or published works or arguments of his own, and perhaps of others. Later commentators distinguished his 'exoteric' works, which were easy enough for non-specialists and written in a polished

style, from the more difficult works (sometimes called \*esoteric) intended for his own pupils. The former were mainly in dialogue form and survive only in fragments.

R.J.H.

I. Düring, *Aristotle in the Ancient Biographical Tradition* (Göteborg, 1957), 426–43.

**experience.** Direct, observational knowledge of the world. More narrowly, experience is sometimes restricted to the sensory basis (\*sensation) of this knowledge. In the first sense, one's experience includes whatever one has come to know or believe about the world by direct observation and without inference. If you read a book and watch a movie about baboons, you may learn a lot about baboons, but such knowledge would not be counted as part of your experience. Your experience would be limited to books and movies—that a certain book *said* that baboons were primates and that a movie *depicted* them as having doglike muzzles.

In the second, narrower, sense, experience is distinguished from belief or knowledge. It refers to the sensory events (e.g. visual and auditory sensations) on which beliefs about the world are typically based. In observing an event—a robbery, say—one's experience of this event would be the sensations caused in one by the robbery. One might experience a robbery in this second sense of the term without ever coming to know or believe that a robbery was taking place—without, that is, experiencing the robbery *as* a robbery. Should this occur, one would have robbery experiences (in the narrow sense of this term), but no experience (i.e. knowledge) of robberies in the broader sense.

It is this second, narrower, sense of the term that is at issue in epistemological debates about whether all knowledge is ultimately empirical—i.e. based on experience. (\*Empiricism.) If knowledge is to be based on experience, as it seems reasonable to think that observational knowledge is, one's beliefs about the world must somehow be derived from, or justified by, one's sense experience of the world. It is a problem, however, to understand how it is possible for experience to lend support to, or justify, the beliefs it gives rise to. If one thinks (as some philosophers do) of experience as itself belief-like in character, as having propositional content, a content that can (like the content of a belief) be false, then a question can be asked about what justifies the experience. What guarantee (or even justification) is there that the experience (its content) is true? If, on the other hand, experience is understood as non-propositional (as it usually is), as something without (a possibly false) content, then there is a problem about how experience can justify the beliefs based on it. Beliefs justify other beliefs by standing in appropriate logical and explanatory relationships to them, relations that require the possession of content. If experiences are not themselves belief-like in character, if they have no propositional content, they cannot imply, cannot explain or be explained by, anything. How, then, can they function as *reasons* to believe anything? This problem has encouraged coherence theories of justification to locate justification

(and, hence, knowledge), not in a belief's relationship to experience, but in a belief's relationships to (its coherence with) the rest of one's beliefs. According to such a view, our experience of the world may be a cause of, but it is not a justification for, the beliefs we have about the world.

Other theories of justification (\*reliabilism), however, locate justification (for observational beliefs) in the way that beliefs can be made to covary (reliably) with the world by the perceptual systems whose functioning produce such beliefs. Such theories, unlike coherence theories, give experience both a causal and a justificatory role (as carriers of information) in cognition. F.D.

A. Goldman, *Epistemology and Cognition* (Cambridge, Mass., 1986).

**experiment.** Science aims to understand the world of experience. One puts its ideas to the test through experiment, where one manipulates phenomena in such a way that answers can be given to specific questions. A much-discussed subset of experiments contains those labelled \*'crucial', in the sense that they decide authoritatively between rival hypotheses. Historians argue that frequently, as in the case of Young's double slit experiment, supposedly deciding between the wave and the particle theories of light, the use of the word 'crucial' is a victory roll by the winners after the event.

Some experiments are 'natural', in the sense that unplanned circumstances simulate what the purposeful experimenter might have attempted. In dealing with human subjects or vast scales of time and space, these are often the only possible ways of testing nature. Here, as in all experiments, what may have started as an attempt to test ends as a voyage of discovery, as the results suggest new lines of inquiry. Charles Darwin used the practices of animal breeders primarily as experimental evidence for his evolutionary speculations, but they proved also to have great heuristic value, even to the point of leading him to his mechanism of natural selection.

Various theorists, from John Stuart Mill with his well-known \*methods for distinguishing real from apparent causes to those today who sell computer programs of statistical techniques, have offered prescriptions for the proper performance of experiments. However, while there is certainly a craft to be learnt—for instance, in ways of using controls to avoid reading out prior expectations which one has previously read in—and while today the growth of 'Big Science' means that one might have literally hundreds of researchers and an army of technicians working on the same project, ultimately in such the great experimenter is as gifted and unique as the great theoretician. **experiment, crucial:** *see* crucial experiment.

**explanation.** That which produces understanding how or why something is as it is. In ancient Greek thought a distinction gradually emerged between explanatory theories and theories about the nature of explanation. Thus whereas Thales, Empedocles, Anaxagoras, and others proposed explanations of natural phenomena, Plato's theory of Forms offered at the same time both a systematic explanation of things and also a connected epistemology of explanation. Aristotle, however, seems to have been the first thinker to differentiate explicitly between investigating what causes what and investigating the very nature of causation. On his view the latter investigation revealed four different kinds of cause that an explanation of physical phenomena could cite. The formal cause is that in virtue of which a thing is the type of thing that it is; the material cause is the stuff, whatever it may be, that is typed by the formal cause; the efficient cause is what produces a thing; and the final cause is the purpose for which something is produced.

Medieval philosophy mostly echoed Aristotle's ideas about explanation. Indeed his concept of final causes supplied a convenient foundation for religiously orientated teleology.

It was Francis Bacon who took the decisive step of segregating \*teleological explanation from scientific explanation. At the same time Bacon treated the form correlated with an observable characteristic as the law in accordance with which that characteristic occurs or can be made to occur, and within the hierarchy of these laws he supposed that the more comprehensive the explanation that a law achieves, the more certainty it has.

Hume held that such causal laws state merely the constancy with which one particular type of observable phenomenon succeeds another, and argued that the feeling that this succession occurs necessarily should be explained as being merely the outcome of a mental association between the idea of the earlier phenomenon and the idea of the later one. Whether or not Hume is right about this, the dominant model for explanation in the natural sciences seems to require the citation of one or more laws which, when conjoined with the statement of relevant facts, entail occurrences of the phenomenon or uniformity that is to be explained.

Russell argued that such laws should specify not a causal process but the correlation of one natural variable with one or more others. But, wherever we want to derive a technology from scientific knowledge, we shall need to know what causes a desired effect. So we need to distinguish between different levels of explanation, in that while, for example, the disappearance of a patient's infection may be causally explained by his antibiotic injection, the operation of that causal process is in its turn to be explained by correlational laws of biochemistry. And for

discovering this kind of deeper and more comprehensive explanation it will often be necessary to devise appropriate new terminology. Moreover, it should also be noted that some scientific explanations cite statistical probabilities rather than determinate laws.

Further questions arise, especially in the social sciences, about the explanation of specifically human behaviour. For example, Hempel held that in historical inquiry the pattern of explanation to be sought accords with the same \*covering-law model that applies in the natural sciences. Collingwood argued, however, that the historian achieves understanding of other people's actions by the reenactment of their thoughts in his own experience. And in any case we cannot overlook the fact that people's rational acts need to be explained teleologically—that is, in terms of what their aims are and what they regard as appropriate means. But even in those cases what has to do the explaining is temporally prior to, or concurrent with, what has to be explained. It is the present thought, not the future satisfaction, of our aims that helps to explain what we are doing to achieve them: one should not think of teleological explanation as a kind of influence exerted on the present by the future.

**explanation, historical:** *see* history, problems of the philosophy of.

**explanation, inference to the best:** *see* inference to the best explanation; explanationism.

**explanation, levels of.** Any natural phenomenon can be studied in a range of different ways. A living organism, for example, can be studied as a collection of particles, as a structure with a complex chemical composition, as a biological entity, and as a member of a social grouping. Each of these can be considered a separate level of explanation, where a level of explanation is characterized in terms of a distinctive vocabulary and distinctive explanatory principles (generalizations that may or may not be law-like). The natural question to ask is how different levels of explanation fit together. According to proponents of the \*unity of science, in addition to principles holding at a single level, there are law-like vertical connections between different levels of explanation, so that science forms a hierarchical structure with physics at its base. The issue of the relation between different levels of explanation is central to the philosophy of \*mind, where one of the most pressing questions is how our ordinary \*folk-psychological understanding of each other is related to subpersonal explanations of \*cognition in information-processing terms.

**explanation, teleological:** *see* teleological explanation.

**explanatory gap.** The phrase 'explanatory gap' was introduced by Joseph Levine to label the apparent lack of an intelligible or explanatory relationship between neural properties of the brain and the phenomenal properties of experience (e.g. what it's like to feel pain). Scientists explain the macro-feature of solidity in terms of micro-properties concerning the lack of free movement of atoms. By contrast, it seems that nothing we could know about the nature of neural processing, and interaction with the environment, would explain the nature of phenomenal properties in similar fashion. There is no consensus over whether the gap holds merely for phenomenal properties or more widely for, at least, some intentional properties as well.

**explanation and stories:** *see* stories and explanation.

**explanation by samples:** *see* samples, explanation by.

**explanationism.** This slightly barbarous term was first applied by James Cornman to, roughly, the doctrine that what justifies an ampliative inference—or more generally the formation of any new belief—is that the doxastic move increases the explanatory coherence of one's overall set of beliefs. In particular, the explanationist holds that some beliefs are justified by '\*inference to the best explanation', the inference from a set of data to the available hypothesis that best explains those data, where 'best' is to be understood in terms of the pragmatic virtues, such as \*simplicity, explanatory power, and fruitfulness. Explanationism derives ultimately from Peirce and Dewey, by way of Quine and Wilfrid Sellars. But Harman (in 'The Inference to the Best Explanation', 1965) was the first to articulate it and defend it against better-entrenched competing epistemologies. It has since received support from Paul Thagard and from Lycan (*Judgement and Justification*, 1988).

One must distinguish between at least three grades of explanationism. We may call them respectively 'weak', 'sturdy', and 'ferocious'. Weak explanationism is the modest claim that explanatory inference *can* epistemically justify a conclusion. (That claim is disputed by Bas van Fraassen, by Nancy Cartwright, and by Ian Hacking.) Sturdy explanationism adds that explanatory inference can do its justifying intrinsically, i.e. without being *derived* from some other form of ampliative inference, such as probability theory, taken as more basic. (That claim is disputed by Cornman and by Keith Lehrer.) Ferocious explanationism adds that no other form of ampliative inference is basic; all are derived from explanatory inference. (That claim is disputed by almost everyone.) Interestingly, Harman originally defended ferocious explanationism,

ignoring the weak–sturdy–ferocious distinction, by trying to exhibit various common forms of inductive inference as enthymematic instances of explanatory inference (see also Lycan, *Judgement and Justification*, ch. 9). Harman's mature explanationist view of all reasoning is given in his *Change in View*.

**exploitation.** To exploit someone or something is to make use of him, her, or it for your own ends by playing on some weakness or vulnerability in the object of your exploitation. Most dictionaries define 'exploitation' as 'making use of someone or something unjustly or unethically'; but they are wrong. If exploitation is judged unjust or unethical, that is not a matter of definition but is due to positive—and controversial—ethical commitments on the part of those who judge it.

In the first instance, it is always some weakness or vulnerability which is the object of exploitation. A manipulative friend, lover, or parent exploits someone's feelings of guilt or need for affection; a loan shark exploits a debtor's financial emergency. A tabloid exploits a celebrity's messy divorce and also the public's prurient tastes in reading about it; we speak of exploitation here because we take the divorce to be a point of vulnerability in the celebrity, and prurient tastes to be a weakness in the public, and we see the tabloid using these weaknesses for its own profit. To exploit a *person* is to use a weakness in order to gain substantial control over the person's life or labour.

Is exploitation necessarily wrong or unethical? Few think it is wrong or unethical for a chess-player to exploit her opponent's inattention in order to win the game, or for a lawyer to exploit the weaknesses in her opponent's case in order to win a (just) judgement for her client. Where we do think exploitation is wrong or unethical, this is because we think that it is wrong or unethical to use those weaknesses of a person to gain your ends. If we think it is wrong to exploit a *person*, that is only because we think that someone's vulnerability should not be used to bring his or her life or labour under another's control. Yet some—such as Nietzsche, or Callicles in Plato's *Gorgias*—have held in general that it is entirely ethical—indeed, it is only natural justice—for the strong to exploit the weak. Such views cannot be cogently refuted by citing dictionary definitions of 'exploitation'.

Views like Nietzsche's and Callicles' are more widespread than people will admit. In capitalist society it is quite commonly believed just and right for people to buy and sell commodities—including one another's labouring capacities—at whatever prices the free \*market will bear. Since the rate of wages is largely determined to the

advantage of employers by the fact that ownership of the means of production puts them in a strong bargaining position, while propertylessness puts wage labourers in a weaker bargaining position, the resulting bargain is clearly exploitative; nevertheless it is commonly judged by loyal defenders of the capitalist system to be perfectly fair and ethical. Those who accept this judgement together with the standard dictionary definition of 'exploitation' are then able to deny that wage labour is exploitative, since they hold that it is just and ethical. Here we see that the standard definition of exploitation is not an innocent error, but a pernicious ruse to protect people from having to admit the similarity of their views to those of more honest defenders of exploitation such as Nietzsche and Callicles.

Of course the thesis that wage labour is exploitative is now associated chiefly with the name of Karl Marx, who gave the name 'rate of exploitation' to the ratio of the labour time in which the worker produces the capitalist's surplus to the labour time in which the worker produces his own wages. Following what they think is Marx's lead, economists often provide some technical definition of 'exploitation'—such as that of John Roemer, according to which you are exploited if the goods you receive embody less labour than you perform—and then use clever (and utterly fictional) counter-examples to show that intuitively there need be nothing in any way objectionable about exploitation as such (so defined). But since the counter-examples never involve anyone's turning another's weaknesses to account, what they really show is that the technical definition is not a good definition of exploitation.

Marx, of course, thought that in the real world surplus labour is extracted from workers through the fact that their propertylessness puts them in a position of vulnerability; so he really did think they were exploited. But he did not hold that capitalist exploitation is unjust, because he thought that since it harmonizes completely with the system of capitalist production, it must harmonize too with the only standards of right and justice which can be rationally applied to that system. For Marx the point of unmasking capitalist exploitation is to drive home to the working class that the capitalist economic system is founded on their condition of vulnerability, which it also perpetuates through the use which the capitalist class makes of it. Whether or not someone's exploitation of you is just, the fact that he exploits you shows that you are vulnerable and that someone is turning your vulnerability to account. In such a case you have good reason to do whatever it takes to protect yourself from the exploiter, even if doing this requires you to overthrow the entire social order and establish one in which you are strong enough not to be able to be exploited.

**exportation.** A principle which supports inferring 'If  $P$  then if  $Q$  then  $R$ ' from 'If  $P$  and  $Q$ , then  $R$ '. In the \*propositional calculus, it is represented as the inference of  $(P \supset (Q \supset R))$  from the premiss  $((P \cdot Q) \supset R)$ . This rule of exportation is reflected in the theorem  $((P \cdot Q) \supset R) \supset (P \supset (Q \supset R))$ . Since the converse of the latter is also a theorem  $((P \cdot Q) \supset R) \equiv (P \supset (Q \supset R))$  is sometimes designated the principle of exportation. There are systems with stronger conditionals such as \*strict implication and \*entailment where unrestricted exportation fails for those conditionals.

**expression.** Expression is a key concept in aesthetic theory—especially Romantic theory: most systematically elaborated by Croce and Collingwood. Where expression is given the chief explanatory role, artworks do not merely describe or represent emotions, they more directly communicate an artist's highly specific moods and feelings, and enable the appreciator to experience them also. For Collingwood, the artist typically starts with a confused notion of what he feels: his creative work clarifies and stabilizes it.

The communication and arousal of emotion, however, are by no means essential to appreciation. What is true in the theory is that works of art are certainly bearers of subtly discriminated emotional qualities, the 'feel' of human life as lived—i.e. they are 'expressive': and that is partly why we treasure them. But not all such qualities interest us, and not all in art that interests us is expression. The values of form are distinct and different: so too the disclosure of alternative ways of seeing the common world.

R. G. Collingwood, *The Principles of Art* (Oxford, 1938).

M. Mothersill, *Beauty Restored* (Oxford 1984), ch. 12, sect. 46.

**expressivism in ethics.** A theory about what is going on when people make moral judgements. Basically, the view is that people are expressing their attitudes to certain features of the world. Usually, these attitudes are understood as some species of emotion, though contemporary expressivists, notably \*Blackburn (who calls the view quasi-realism, and applies it beyond morality) and \*Gibbard, have argued that the attitude in question should not be understood as 'mere' emotion. In this they depart from cruder forms of \*emotivism and \*non-cognitivism. Most importantly, they argue that there are standards of correctness for our value judgements, and that we are thus entitled to use value judgements in arguments and in embedded linguistic contexts. Gibbard argues that the attitude we express is acceptance of a norm for behaviour. The other crucial feature of contemporary expressivism is that the attitudes that we are expressing have an essentially

practical nature: we are not merely expressing our dislikes, but legislating for ourselves and others. E.J.M.

\*moral realism; prescriptivism.

Allan Gibbard, *Wise Choices, Apt Feelings* (Cambridge, Mass., 1990).

**extensionality.** The extension of a term is roughly the thing or set of things to which it refers. The extension of 'Socrates' is Socrates, of 'human', the set of human beings.

The standard semantics of the \*predicate calculus is characterized as extensional. Given a fixed domain of individuals ( $D$ ), assigned to each individual constant is a member of  $D$ , to each  $n$ -adic predicate a set constructed from elements of  $D$  which is its extension, and to each sentence a truth-value. There is no further account of meaning for the non-logical terms. Properties are identified with the set of things which satisfy the property.

Some controversial consequences follow for non-purely mathematical applications of such extensional systems of logic. Suppose 'featherless biped' and 'rational animal' have the same extension. Given the assumption that coextensive classes (sets) are identical (the axiom of extensionality) those predicates should be interchangeable \**salva veritate*, but there are contexts, often designated as indirect or opaque, where the substitution fails.

Languages with such failures are characterized as \*intensional. Modal languages have been so characterized but that may be misleading. There are some interpretations of modal systems where the only departures from the standard semantics is that predicates are assigned different *extensions* in different worlds. There is still a reduction of properties to *extensions*. R.B.M.

\*referential opacity.

R. Barcan Marcus, 'Extensionality', *Mind* (1960).

W. V. Quine, *From a Logical Point of View* (Cambridge, Mass., 1953).

**externalism.** One of a number of views that hold that what is thought or said (content) depends in part on factors external to the mind of the thinker or speaker. One variety of externalism holds that content is tied to how experts use words ('the linguistic division of labour', Hilary Putnam); another contends that social usage more generally determines meaning (\*'individualism and anti-individualism', Tyler Burge). Kripke's interpretation of Wittgenstein makes social usage the source of the possibility of content. In addition to these forms of social externalism there are views that make the perception of objects or events, or other causal relations to them, conditions for thinking and talking about such things. Kripke's theory of the reference of proper names is an example; so are Burge's and Davidson's versions of perceptual externalism. D.D.

H. Putnam, 'The Meaning of "Meaning"', in *Philosophical Papers*, ii: *Mind, Language, and Reality* (Cambridge, 1975).

**external relations:** see internal and external relations; relations.

**external world.** External to what? To the mind? But that does not give us a contrast in which 'external' applies literally, as when some medicinal preparation can be used externally but is not to be taken internally. The mind is here being thought of as a space or place, but in any normal space things can be variously disposed, some to the left, some to the right, some in front of others, some below. No such orderings are possible for anything that occurs in the mind; the 'in' here is purely figurative. This is not to say that a contrast cannot be drawn between 'in the mind' and 'in the world', but there is nothing to which the world is literally external. The world just is the domain within which external-internal distinctions apply.

But perhaps, without placing too great a weight on the term 'external', it is possible none the less to specify the problem which the existence of the external world has traditionally been thought to present. Thus, our knowledge being held to extend to no more than our immediate experiences, we are supposedly afforded no secure basis for affirming the reality of abiding, public, bodies. Such \*scepticism is nowadays less common, but something of the position is preserved in the pragmatist's claim that the existence of physical bodies is at best a useful hypothesis, a matter of theory rather than fact. Could this be the truth that remains when the misconceived parallels are set aside?

There is a problem only to the extent that we are supposed to be given something less than the external world to begin with. Why should this be conceded? In the first place, there is some difficulty in attaching a clear sense to some of the terms which, like \*'sense-datum' or 'impression', are enlisted in characterizing what is presented to us in experience. Secondly, we do not in any event argue to the physical from anything, but the external world seems to have the status of a starting-point.

The sceptic might seek to meet the first point by switching to the term \*'sensation'. Most discussions of the problem start with the deliverances of sight, and terms such as 'sense-datum' may be questionable in this connection, but it would seem that touch is at least as important in telling us of the character of the physical—a blind man is not left in any doubt about the substantiality of objects he touches—and the language already has in 'sensation' an appropriate and meaningful term geared to that sense.

However, the second point is more troublesome for the sceptic. There are occasions when it would be rash to repose any confidence in a judgement made about a physical object—as when we try to make out something at a distance and in poor light—but there are also circumstances in which we have no realistic grounds for doubt about the modest claims in question. Moreover, in such circumstances it would normally be reckoned in order

to judge *directly* of the existence and character of the bodies about us, and pointless to settle for anything less. It is not as if we were taking a hazardous plunge in proceeding in this way; on the contrary, we are dealing with a category of judgement which has stood the test of time as well as any. Nor is there any pressure to retreat to pragmatism, to regard the existence of material bodies as nothing more than a useful hypothesis. That standing does not suit a proposition which has everything to be said in its favour and nothing against. We may speak of *theory* to acknowledge the possibility of invoking a different

range of concepts in describing the world, but this offers no threat to the factual character of our actual descriptions. No less than the sceptic, the pragmatist confronts a formidable task in persuading us that the line between fact and non-fact is to be redrawn at his chosen point.

**fact.** A fact is, traditionally, the worldly correlate of a true proposition, a state of affairs whose obtaining makes that proposition true. Thus a fact is an actual state of affairs. Facts possess internal structure, being complexes of objects and properties or relations (though facts themselves are abstract even when their constituents are not). Thus the fact that Brutus stabbed Caesar contains the objects Brutus and Caesar standing to one another (in that order) in the relation of stabbing. It is the actual obtaining of this state of affairs that makes it true that Brutus stabbed Caesar. Difficulties for this approach do, however, arise concerning the existence of negative, disjunctive, modal, and moral facts. For instance, should we say that what makes the proposition that Caesar did *not* stab Brutus true is the fact that he did not, or rather the non-obtaining of the state of affairs that he did? E.J.L.

\*brute fact.

B. Taylor, *Modes of Occurrence* (Oxford, 1985).

**facts, social:** *see* social facts.

**fact–value distinction.** This distinction, which is crucial to moral theories of the middle and late twentieth century such as those of A. J. Ayer, C. L. Stevenson, and R. M. Hare depends on the idea that ‘good’, like ‘other evaluative terms’, has a special function in language. According to Ayer and Stevenson it expresses \*feelings and attitudes, and according to Hare signals the acceptance of a special kind of imperative. On this basis a contrast was drawn between these ‘evaluative’ uses of language and ‘descriptions of the world’; the latter, but not the former, being supposed to ‘state facts’. Some utterances were indeed said to be partly descriptive and partly evaluative, so treating both of \*fact and \*value, but the factual and the evaluative elements in any word could in principle always be factored out. There was therefore a ‘logical gap’ between ‘fact’ and ‘value’, and this was taken to explain and support the idea (derived from Hume) that no ‘ought’ can be deduced from an ‘is’. (\*‘Is’ and ‘ought’.)

Very many modern writers on moral philosophy believe that it must be possible to describe a distinction

between fact and value such as was insisted on by Ayer, Stevenson, and Hare, but it has no place in the work of neo-Aristotelian moral philosophers such as G. E. M. Anscombe. Critics have challenged the account of evaluation on which the distinction draws, and doubts have also been raised about whether *value* stands in opposition to any clear notion of *fact*. P.R.F.

**fairness.** Formal fairness precludes bias or inconsistency in the application of rules. However, rules can be applied fairly without being substantively fair. As Henry Sidgwick observed (*Methods of Ethics* (1907), p. 267) a rule requiring only red-haired men to serve in the army would be substantively unfair, even if this rule were always applied fairly.

One popular view about substantive fairness is that it is constituted by reciprocity. If one set of people (e.g. red-haired men) are required to provide benefits (e.g. national defence) for other people without getting proportional benefits in return, the arrangement is substantively unfair. But whether substantive fairness is limited to reciprocity seems dubious.

Suppose you have benefited from a communal practice. Suppose the benefit you received was greater than the cost you are now being asked to pay in order to sustain the practice. Still, you may not be morally obligated to contribute to the practice. It matters morally whether, when you accepted the benefits, you *consented* to reciprocate. If you didn’t know when you accepted the benefits that the other party conceived of your accepting the benefits as the first stage of an exchange, then you are not required to pay up, since you didn’t actually agree to the exchange. On this view, fairness does not require all mutually beneficial exchanges, but only those to which the parties actually agreed.

A further difficulty with limiting substantive fairness to reciprocity is that fairness may require agents to do things for others who will never be able to reciprocate. And even where all the relevant agents can do things for one another, suppose these agents begin with very unequal resources. Focusing on reciprocity may obscure the unfairness of that initial inequality.

Fairness is often closely associated with \*equality. Fairness in its broadest sense requires that any two individuals be treated equally unless there is some morally relevant distinction between them. If the distinction between the harder-working and the less hard-working is morally relevant, then a fair arrangement will be sensitive to that distinction. Because the distinction between red-haired people and others is not morally relevant, fairness condemns the rule requiring only the red-haired to serve in the army.

Fairness as the consistent, unbiased application of all and only morally relevant distinctions does not indicate which distinctions are morally relevant. B.H.

**faith and reason.** Each has been regarded as an independent source of truth, faith by virtue of what is reputedly given to a state of conviction voluntarily produced, reason by virtue of the outcome of compelling argument. For certain kinds of truth, access through faith rather than reason has been claimed the proper course. \*Fideism regards religious truths in this way. Reason conceived as a source of knowledge has also been thought capable of arriving at divine truth (as in \*arguments, types of). But in classic Catholic and Protestant thought, access to divine truth requires a combination of faith and reason: while faith itself is belief in revealed truth, reason is required to demonstrate that revelation actually occurs. That reason can be a source of factual truth at all is denied by \*Kant, who with regard to truths previously accepted on faith insisted that they could be accredited only to the extent that they agree with ideals that can be rationally shown to be embodied in moral experience. In our own time, reason, following \*Kierkegaard, \*Nietzsche, and the \*positivists, relieved of its truth-finding role becomes just one natural ability among others, paradigmatically the ability to choose means for given ends and to calculate risk. Faith then becomes an irrational refusal to abandon a means which reason tells us will not produce a desired result, or else a calculated willingness to ignore the risk that it may not do so. Some claim that, with beliefs held with certainty, faith is required even where reason proclaims the *likelihood* of their truth. Actions actually entered upon can be a *de facto* case in point, but also sincerely held religious beliefs, since anything short of certainty will cause a doubt which only a conscious leap of faith can erase. \*Wittgen-

steinians claim that reason as the tool of a fact-finding discourse has no place in the devotional language and practice of religion. Against the presumption that this is a return to fideism, they may argue that there is a religious form of reason(ing), employing its own criteria to distinguish, say, properly religious beliefs from mere superstition. A secularized form of faith freed from the strains involved in subjecting religious belief to the tests of reason has been proposed, which allows the more heroic forms of religious belief to be aligned with the latter. A.H.

S. Mulhall, *Faith and Reason* (London, 1994).

G. Vattimo, *Belief*, tr. L. D'Isanto and D. Webb (Cambridge, 1999).

**fallacy.** In logic, (1) an invalid \*argument with the appearance of validity, or (2) a *form* of argument with some invalid instances. Fallacy is plainest when the argument, or some instance of the form (called a counter-example), combines true premisses with an untrue conclusion. An argument that has a fallacious form need not itself be fallacious (this is because every argument has many forms, each displaying its structure in greater or lesser detail, and some of them are bound to be fallacious). Nevertheless, accusing an argument's champion of relying on a fallacious form that it has ('You might as well argue that . . .') is often effective. More widely, (3) a fallacy is any prevalent fault of *proof*, such as \*begging the question or \**ignotatio elenchi*, which do not involve invalidity. C.A.K.

\*composition and division.

C. L. Hamblin, *Fallacies* (London, 1970).

**fallibilism.** A philosophical doctrine regarding natural science—most closely associated with C. S. Peirce—which maintains that our scientific knowledge-claims are invariably vulnerable and may turn out to be false. On this view, scientific theories cannot be asserted as true categorically, but can only be maintained as having some probability of being true. Accordingly, Peirce, and Karl Popper after him, insisted that we must acknowledge an inability to attain the final and definitive truth in the theoretical concerns of natural science—in particular at the level of theoretical physics. Present-day science cannot plausibly claim to deliver a definitive picture of physical reality, regardless of the present at issue. We would like to think of our science as 'money in the bank'—as something safe, solid, and reliable—but the history of science itself militates decisively against this comfortable view of our scientific theorizing. We should come to terms with the fact that—at any rate, at the scientific level of generality and precision—*each* of our accepted beliefs *may* turn out to be false, and *many* of our accepted beliefs *will* turn out to be false.

For Peirce, fallibilism represents a deep-rooted and far-ranging epistemological attitude: 'I used for myself to

collect my [logical] ideas under the designation *fallibilism*; and indeed the first step toward *finding out* is to acknowledge that you do not satisfactorily know already; so that no blight can so surely arrest all intellectual growth as the blight of cocksureness' (*Collected Papers*, vol. i, sect. 1.13).

As fallibilism sees the matter, we have no assurance that our scientific theories or systems are definitely true; they are simply the best we can do here and now to resolve our question regarding nature's *modus operandi*. New knowledge does not just supplement but generally upsets our knowledge-in-hand. Any scientific theory or system is the product of human contrivance, and like any such contrivance—be it a house, a dam, or a knowledge-claim—it is fragile and impermanent. Every structure, be it material or cognitive, is thus ultimately likely to encounter conditions that its constructors did not anticipate—and could not have anticipated. And this circumstance renders its ultimate failure likely. The processes of change that come with time always involve chance eventuations that bring new, unforeseen, and unforeseeable circumstances to the fore. Changed social conditions destabilize social systems; changed physical conditions destabilize physical structures; changed experiential (i.e. experimental and observational) conditions—changed scientific technology, if you will—destabilize scientific theories. Rational inquiry links the products of our understanding to the experienced conditions of a world in which chance and chaos play an ineliminable role, so that there will always be new relations that ultimately threaten our rational contrivances. (Of course, while we can safely predict *that* our scientific theories will fail—will have to be replaced or modified—we cannot foresee *how* these replacements and modifications will be configured.)

There is much in this picture of the cognitive situation that rings true. The fact is that the equilibrium achieved by natural science at *any* given stage of its development is always an unstable one. The subject's history indicates that scientific theories have a finite life-span; they come to be modified or replaced under various innovative pressures, in particular the enhancement of observational and experimental evidence (through improved techniques of experimentation, more powerful means of observation and detection, superior procedures for data-processing, etc.).

The striking fact is that fallibilism is a more plausible doctrine with respect to *scientific* knowledge than with respect to the less demanding *\*knowledge* of everyday life, such as 'In the normal course of things humans have one head and two hands'. Such a statement has all sorts of implied safeguards, such as 'more or less', 'in ordinary circumstances', 'by and large', 'normally', 'if all things are equal', and so on. They are thus so well hedged that it is unthinkable that contentions such as these should be overthrown. In science, however, we willingly accept greater cognitive risks because we ask much more of the project. Here objectives are primarily theoretical and governed by the aims of disinterested inquiry. Hence the claims of informativeness—of generality, exactness, and

precision—are paramount. We deliberately court risk by aiming at maximal definiteness and thus at maximal informativeness and testability. Aristotle's view that terrestrial science deals with what happens ordinarily and in the normal course of things has long ago been left by the wayside. The theories of modern natural science have little interest in what happens generally or by and large; they seek to transact their explanatory business in terms of strict universality—in terms of what happens always and everywhere and in all kinds of circumstances. We therefore have little choice but to acknowledge the vulnerability of our scientific statements, subject to the operation of the security-definiteness trade-off. Ironically, then, the *\*common sense* information of everyday life is securer than the 'well-established knowledge' science.

Some philosophers (Peirce included) see fallibilism as having ethical implications. They project an ethics of belief according to which we have *no right* to claim definitive truth for our current scientific claims, a view which they combine with a purported duty for the community of inquirers to pursue inquiry to the greatest extent realizable in the circumstances. Accordingly, they insist that the fallibilism of our cognitive endeavours must emphatically *not* be construed as an open invitation to a sceptical abandonment of the scientific enterprise. Instead, it is an incentive to do the very best we can. In human inquiry, the cognitive ideal is correlative with the quest for truth. And this is an ideal that, like other ideals, is worthy of pursuit despite the fact that we must recognize that its satisfactory attainment lies beyond our grasp. N.R.

\*Science, history of the philosophy of; science, problems of the philosophy of.

C. S. Peirce, *Collected Papers of C. S. Peirce*, ed. C. Hartshorne and P. Weiss, i: *Principles of Philosophy* (Cambridge, Mass., 1931); see esp. sect. 1.120: 'The Uncertainty of Scientific Results'.

K. R. Popper, *The Logic of Scientific Discovery* (New York, 1959).

N. Rescher, *The Limits of Science* (Berkeley, Calif., 1984).

**false consciousness.** A Marxian term, meaning a social awareness mystified by *\*ideology* and ignorant of its own class basis. The term actually occurs only once in the writings of Marxism's founders, in a late letter of Engels: 'Ideology is a process accomplished by the so-called thinker, but with a false consciousness. The real motive forces impelling him remain unknown to him; otherwise it simply would not be an ideological process' (letter to Franz Mehring of 14 July 1893). A. W. W.

D. Meyerson, *False Consciousness* (Oxford, 1991).

**falsifiability.** A property of a theory that, according to Karl Popper, provides a demarcation criterion between the scientific and the non-scientific. A theory is falsifiable just in case it is open to empirical test and there are possible empirical data that would, if observed, show the theory to be false. Scientific generalizations, including laws, are falsifiable but not confirmable. Unfalsifiable statements may be disreputable, such as those of

pseudo-science, or of good intellectual standing, as with much philosophy. Falsifiability leads to \*fallibilism, the position that nothing, including observation statements, can be known with certainty. This requires that certain observational statements are taken as basic by general agreement, a feature that is the Achilles' heel of falsificationism.

P.H.

Karl R. Popper, *The Logic of Scientific Discovery* (London, 1959).

**family, ethics and the.** The ethics of the family concerns, first, problems *within* a family, such as the extent to which children should be allowed to make their own decisions, and how far parents should be held responsible for their children's behaviour, and secondly, problems *about* the family, such as what constitutes a family, and how far a family unit should be kept together despite dysfunctional parents or children. The first set of issues has come to the forefront because there has been more emphasis in contemporary morality on children's rights. But the language of rights fits awkwardly into the context of the family, which is basically a kind of mutually supporting community, ideally providing security for the development of children. This is why (to move to the second set of issues) social workers and others go to some lengths to try to keep a family unit together. Those who stress 'family values' have in mind married heterosexual parents and two children, but one-parent families and families with same-sex parents are now common. Since the idea of 'the family' carries many moral implications, it is perhaps less discriminatory to think of the social unit as a 'household' rather than a family.

Lainie Friedman Ross, *Children, Families, and Health Care Decision-Making* (Oxford, 1998).

**family resemblance.** Quasi-technical Wittgensteinian term. Wittgenstein denied that all definables must be explained by an analytic definition specifying necessary and sufficient conditions for the application of the definiendum. The members of the extension of a concept-word may be united not by essential common characteristics, but by family resemblance, i.e. by a network of overlapping but discontinuous similarities, like the fibres in a rope, or the facial features of members of a family. A family resemblance \*concept, e.g. 'game', is explained by a series of paradigmatic examples with the rider: 'and other similar things'. The empirical discovery of common characteristics would not show that the concept in question was not a family resemblance concept; what is decisive is the existing practice of explaining the expression. Wittgenstein argued that many concepts central to philosophy are family resemblance ones, e.g. proposition, name, number, proof, language, and so too are many psychological concepts. In such cases, the search for an analytic definition is futile, and proposing one may distort the existing concept.

**Fanon, Frantz** (1925–61). Martinican psychiatrist who, as a proponent of Algerian Independence and Third World Revolution, developed a philosophy of \*violence. *Black Skin, White Masks* (1952) explored the extensive effects of colonialism and \*racism and indicated that extreme means would be necessary to purge Blacks of those effects in a 'collective catharsis'. Hence in *The Wretched of the Earth* (1961) Fanon insisted on the necessity of violence to promote justice and, primarily, psychic liberation. This was not a celebration of violence for violence's sake as some critics charged, but a conclusion drawn from an analysis of the violence endemic to the colonial situation and for the sake of a radical transformation of society. Although the colonized would initially tend to be violent against each other, violence against the oppressor would liberate them from despair and from a conception of humanity proposed by a discredited Europe.

**Fārābī, Abū Naṣr al-** (c.872–950). Islamic Neo-platonist, philosopher of language, culture, and society, called 'the Second Teacher' for his achievements in logic. Of Turkic origin, al-Fārābī studied under Christian thinkers. He settled in Baghdad, travelled in Byzantium, and died in Damascus. His Arabic commentary on Aristotle's *De interpretatione* argues that divine omniscience does not imply \*determinism, since the necessary implication of a fact by the corresponding knowledge is not transferred to the fact itself. This division of intrinsic from relational (hypothetical) necessity undergirds Avicenna's essence–existence distinction and his central claim that nature is contingent in itself, although necessary in relation to its causes. Al-Fārābī found the logic of Koranic promises and threats by seeing prophets in the role Plato had assigned to poets: naturalizing higher truths through imagery and legislation.

— *On the Perfect State*, ed. and tr. R. Walzer (Oxford, 1985).

**fascism.** Political doctrine combining ethnic \*nationalism with the totalitarian view that the state should control all aspects of social life. Fascism is thus opposed both to \*liberalism—individual liberty and fulfilment being held to be relative to the nation's, rather than vice versa—and to \*communism—class-identity and aspirations being held to threaten national unity. Fascism has presented itself as a tempting conclusion from three apparently plausible premisses: the relativity of values to a culture; the rootedness of culture in the social life of a nation; and the role of the state as the upholder of values. Political and cultural authority are assimilated and identified with a national will articulated by a national leader, who conceives his

task (compare \*conservatism) as arresting national decline. The observed results constitute a *reductio ad absurdum* of the doctrine.

P.G.

\*totalitarianism; anti-communism; racism.

N. O'Sullivan, *Fascism* (London, 1983).

**fashion in philosophy.** In the history of philosophy there have been constant changes in styles of philosophizing and in what are taken as givens in philosophical argument. Many of such changes have had nothing to do with rational considerations, but often with factors external to philosophy and sometimes simply with changes of fashion within philosophy. Whether \*philosophy is more prey to fashion than other subjects are is hard to estimate, but in the present century at least the effect of fashion is very evident for anyone who has been a philosopher for a long time. It is not only styles of philosophizing that have changed, and with that current conceptions of who are the leading figures in the business, but even such things as conceptions of what constitutes a good argument. What seemed quite evident to those involved in \*linguistic philosophy in Oxford in the 1950s, for example, may now seem quite bizarre.

In the present century some of the effects of fashion may arise from the institutional arrangements for the practice of philosophy. In most countries philosophy is now the province of the universities alone, and these function in competitive circumstances. The enthusiasms of the up-and-coming student may have something to do with what are simply features of personality—who is seen as the personification of philosophy at the time. The slant of journals and the influences of those who affect what gets published gives the impression to those coming into philosophy that that is how it must be done.

One can exaggerate the place of fashion in philosophy, but it is undeniable that changes which are, arguably, the result of fashion can be dramatic. The reputation of the greatest philosophers may perhaps survive such changes, but in a subject in which rationality is supposed to be the main consideration, it is sad that fashion exerts such power. If it is a by-product of institutional factors which also bring benefits, it nevertheless behoves philosophers to be aware of it.

D. W. Hamlyn, *Being a Philosopher: The History of a Practice* (London, 1993).

**fatalism.** The belief, not to be confused with causal \*determinism, that deliberation and action are pointless because the future will be the same no matter what we do. According to the famous 'idle argument' of antiquity, 'If it is fated for you to recover from this illness, you will recover whether you call in a doctor or not; similarly, if it is fated for you not to recover from this illness, you will not recover whether you call in a doctor or not; and either your recovery or non-recovery is fated; therefore there is no point in calling in a doctor.' Thus all actions and choices are 'idle' because they cannot affect the future.

Determinists reject fatalism on the grounds that it may be determined that we can be cured only by calling the doctor.

R.C.W.

\*determinism, logical; many-valued logics.

R. Taylor, *Metaphysics*, 3rd edn. (Englewood Cliffs, NJ, 1983).

**fear.** A particularly distressing emotion aroused by impending danger, which plays a profound role in a number of central philosophical texts and theses. Fear of the consequences of our actions suggests a readily available motive for refraining from wrong, from Plato's Glaucon to some contemporary utilitarians. In Aristotle, on the other hand, how one manages fear is the measure of courage—not too much, not too little, which result in cowardice and foolhardiness, respectively. In Thomas Hobbes, it is the fear of each other and later fear of the sovereign that brings us into society. In G. W. F. Hegel's parable of \*'master and slave', it is the loser's fear that results in servitude and, according to some interpretations of the *Phenomenology*, drives the dialectic through the remaining stages of self-consciousness. True religious belief, according to Søren Kierkegaard, is marked by 'fear and trembling', and so on. But fear also plays a central role in the philosophy of emotions and cognitive science. Fear turns out not to be a mere 'feeling' but necessarily exhibits \*'intentionality', requires a 'formal object' (i.e. something fearful) and therefore can be said to have a cognitive 'structure'.

**feeling:** see emotion and feeling.

**Feinberg, Joel** (1926–2004). American philosopher (at Princeton, Rockefeller, Arizona) noted for his papers and books in ethics, action theory, philosophy of law, and political philosophy. Feinberg's writing is notable for its distinctions reflecting common sense and ordinary language, but also for its systematicity. In his reformulation of a version of liberalism, two topics which, besides responsibility, are among the many Feinberg has treated are \*autonomy and \*paternalism. Feinberg sees the exercise of autonomy as closely connected with making major individual life choices. He seems less concerned with autonomy as exercised in contributing one's due influence to the formation of very basic societal ground-rules. Feinberg sees autonomy and paternalism as tending to conflict, but tolerates some 'paternalism' where the individual's choice is not fully voluntary or intervention is necessary to determine if it is voluntary.

**felicific calculus:** see hedonic calculus.

**feminism.** This is a term with many nuances of meaning. In a narrow sense it refers to attempts to attain equal legal

and political rights for women, while in its broadest sense it refers to any theory which sees the relationship between the sexes as one of inequality, subordination, or oppression, and which aims to identify and remedy the sources of that oppression.

The term 'feminism' has its origins in the French word *féminisme*, which was coined by the utopian socialist Charles Fourier. The first recorded use in English was in the 1890s, when the word was used to indicate support for women's equal legal and political rights with men. However, many earlier writers may be said to be feminist in the sense that they too identified and opposed the subordination of women. Thus, Mary Wollstonecraft's *A Vindication of the Rights of Woman*, published in 1792, is an extended defence of woman as a rational being, capable of benefiting from education and of performing the duties of a citizen. Wollstonecraft's feminism, however, does not extend to the claim that men and women should be equal in terms of political participation, and indeed she defends a differential conception of citizenship according to which women may properly fulfil their duties as citizens from within the home.

But if earlier feminists did not invariably see equality of roles as necessary for feminism, many modern feminists have argued that such equality is insufficient as a response to women's oppression. On their account, feminism involves more than a simple demand for legal and political equality; it involves the identification and removal of all aspects of women's subordination, whether political or social. This raises two distinct difficulties for our understanding of feminism: the first is whether such a broad definition can be useful; the second is whether feminism, so understood, is a belief system or a political movement.

On the first point, some have argued that the broader definition is simply a 'catch-all' and that, as such, it allows any woman to label herself feminist irrespective of her political beliefs. Against this, however, we might wonder why political affiliation need disqualify: if feminism consists essentially in an attempt to alleviate women's oppression, then it should be open to the idea that there are different sources of oppression, and different ways of responding to them. Feminism, so understood, can be a broad church, and indeed some have argued that there is not one single doctrine of feminism, but a variety of feminisms, each with its own distinctive account of the sources of and remedies for oppression. Thus, within the broad, general category of feminism, we will find liberal feminists, socialist feminists, Marxist feminists, radical feminists, and many others who are united in their belief that there is much that is wrong with society's treatment of women, but who differ in their diagnosis of the problem and in their proposals for change.

This broader interpretation of feminism draws our attention to the second question, which is whether feminism is a philosophical doctrine or a political movement. On the narrower definition, and the definition which informed the organized women's movements in the nineteenth century, feminism was understood as essentially

concerned with the equality of woman and man, and with the attempt to attain equal legal and political rights for women. It is in this sense of the term that writers such as John Stuart Mill and William Thompson are described as feminist, since they deny the existence of natural differences between men and women, or at any rate deny that those differences are such as to warrant according differential legal and political rights to men and women. This understanding of feminism as essentially concerned with the attainment of legal and political equality fits well with the conception of it as a political movement. However, as the definition broadens to include not merely the pursuit of legal and political equality, but also the removal of the much more general social and economic causes of women's oppression, it becomes progressively more difficult to construe feminism as a single political movement which can unite all women. This for the simple reason that different analyses of the sources of women's oppression will dictate different, and possibly conflicting, political responses.

The difficulty is compounded by the fact that even a demand for political and legal equality is open to different interpretations. As we have seen, Mary Wollstonecraft asserted the equality of men and women as rational beings, but she believed this equality to be compatible with conceptions of citizenship which were different as between men and women. By contrast, modern liberal feminists have insisted that the equality of women as rational beings dictates a single, undifferentiated conception of citizenship which makes no distinction between women and men in respect of their legal and political rights. But this too is a controversial claim, for it is argued that by their emphasis on human beings as fundamentally rational, liberal feminists neglect the important biological and social differences which undermine women's ability to make equal use of their political and legal rights. Thus, even if we accept that men and women are, by nature, equal in respect of their rationality, it is still far from clear that women's subordination may be remedied simply by the institution of formally equal legal and political rights, since the value of those rights may be far less in the case of women than of men.

Additionally, and yet more controversially, some feminists have questioned the appeal to rationality as a justification for equal treatment. The claim that women and men are essentially rational beings is, it is argued, a gendered claim and one which does not reflect a universal truth, but only the preoccupations of Enlightenment philosophers. By conceding its importance, and arguing for equality on the basis of women's status as rational beings, feminists in effect argue for a woman's right to be like a man.

The debate about the meaning and significance of rationality draws attention to one of the ways in which feminism may constitute an important challenge to those forms of philosophy which have their origins in Enlightenment thought. Feminism has been characterized as a response, or set of responses, to the oppression of women in all its forms. This oppression, however, springs in part

from the belief that men and women have a different nature—that men are rational whereas women are emotional, or that men are logical whereas women are intuitive. This belief (or some variation on it) is common in the history of philosophy, and may be found in the writings of Aristotle, Kant, Hegel, Rousseau, and many others, and it prompts the suspicion that rationality is a gendered concept, one which applies primarily to men and only derivatively, if at all, to women.

There are two distinct responses to this emphasis on the importance of rationality: the response associated with Mary Wollstonecraft, with John Stuart Mill, and with early feminists generally, takes the form of a denial that women have a different nature from men and an assertion that, properly educated, women may be just as rational as men. However, in more modern philosophy, a more radical response has been evident. This concedes that woman's nature is different from man's, but goes on to advocate a form of feminism which rejoices in that difference, and which argues for the revaluing of 'women's qualities'—qualities of emotion and intuition—above the 'male' value of rationality. More subtly, it also argues for a reinterpretation of our understanding of rationality, one which recognizes that being rational is not a matter of denying emotional responses, but rather of including them as an important component of rationality itself.

Clearly, this debate about the meaning and significance of rationality has consequences for moral and political philosophy. In political philosophy, the injunction to pay less attention to the dictates of universal reason, and more attention to the context and narrative of specific situations, has led to criticism of modern political philosophy's emphasis on universal concepts such as justice and equality. Yet more radically, it has prompted reflection on whether it is possible to be rational independent of specific circumstances and contexts, and this turn to a more 'narrative' and contextual approach now extends beyond explicitly feminist writers and constitutes one of the major ways in which feminist thought has influenced 'mainstream' political philosophy.

In moral philosophy, too, feminist emphasis on the importance of emotion has been highly influential and has prompted reconsideration of the reason–emotion dichotomy itself, a return to discussion of Humean themes in morality, specifically the claim that reason is the slave of the passions, and a re-examination of the dilemmas of impartialist moral theory. Yet more generally, feminist arguments have called into question the universalizing pretensions of epistemology, metaphysics, and philosophy of science. One of the most important consequences of these feminist preoccupations has been an increasing doubt about the concepts of objectivity, rationality, and universality characteristically associated with the philosophers of the Enlightenment.

There is, perhaps, an irony in the fact that feminism, which was itself born of Enlightenment thinking, now constitutes one of the main sources of criticism of it, and this irony has implications for feminism itself, which is

often accused of abandoning its own intellectual heritage when it voices suspicion of universal concepts such as equality and justice. It was, after all, appeal to these concepts that gave intellectual force to women's claims for suffrage and for equal legal and political rights with men. Against that background, the rejection of them in favour of a vocabulary of care and concern, of difference, or of contextualization, may appear a dangerous strategy for feminists to pursue. Indeed, some have seen in the appeal to difference an abandonment of feminism's traditional concern for equality, whether that is understood narrowly as political and legal equality, or more broadly as including social and economic equality.

Unsurprisingly, therefore, one of the main concerns of modern feminism is with the question of how to understand difference, and how to attain a political order which will properly reflect differences between men and women. More specifically, one of the main concerns of modern feminism is to explain how differences between men and women are to be identified, and how equality can be attained through the recognition, rather than the removal, of those differences. Chastened by the allegation that liberal feminism purchases equality only by the denial of difference and that it requires women to become like men, modern feminism seeks to establish equality while acknowledging difference. Here, too, feminist thought has informed philosophy more widely, and feminist approaches to the problem of reconciling equality and difference have been adopted by philosophers concerned with problems of racism, multiculturalism, and ethnicity, for they, too, seek to establish a political order that recognizes differences between people, and sees those differences as both ineradicable and desirable.

Feminism, however, faces a distinctive problem in its attempts to attain equality through difference. This problem arises from the fact that much political philosophy, and liberal political philosophy especially, draws an important distinction between the 'public and the private, where 'public' signifies the area in which political intervention is legitimate, while 'private' refers to those areas of life over which the state has no legitimate power, and where people should be left free from government interference. The problem here is that, both philosophically and in practice, women are identified with the private sphere and, as such, they occupy a realm that is, or is held to be, beyond the reach of state intervention. What seems to follow from this, however, is that the sources of inequality and oppression which are most likely to afflict women do not admit of any political remedy. Domestic violence and marital rape have traditionally been considered 'private' matters, but in so far as they are (or are deemed to be) private, they are beyond the reach of the state, and indeed fall outside the scope of theories of justice. The recognition that some of the most serious sources of women's oppression are purely personal matters and lie outside the scope of theories of justice has prompted the famous feminist claim 'the personal is political', and has also prompted the feminist reflection that the public–private distinction is

the most important distinction for feminism, and indeed that it is what feminism is all about.

The importance of this last claim is that it draws attention to the link between the two definitions of feminism mentioned at the outset. If justice and equality have application primarily in the public or political realm, and if women in fact spend the greater part of their lives outside that realm, then political life, and the concepts of equality and justice which political philosophy emphasizes, are themselves significant factors in the subordination of women. It may therefore be that the very distinction between a narrow and a broad definition of feminism itself contains questionable assumptions, notably the assumption that legal and political equalities are not contributory factors in the subordination of women in so far as they imply a conception of equality which disregards important differences between men's and women's lives. **feminism, radical.** The 'radical' in radical \*feminism refers not only to the degree of militancy advocated by this theory. Rather, radical feminism purports to analyse the roots of oppression (from the Latin *radicalis*, having roots). In particular, radical feminists hold that dominant political and social systems are founded on oppression. One might elaborate on this claim as follows: dominant political and social systems are organized on an ethos of inclusion–exclusion which dictates that some group of people must be 'outsiders' and which thus encourages the oppression of these people. Some radical feminists believe that the oppression of women is the model for all other forms of oppression. Others simply hold that various oppressions (e.g. class oppression, race oppression) are closely linked. C.McK.

**feminist epistemology:** see epistemology, feminist.

**feminist ethics** focuses on the questions what people do and should value, with specific reference to gender and sexual relations, and with a normative orientation to the liberation of women from sexual injustice. Feminist ethics thus flows into social philosophy: it conceptualizes relations between the sexes to be such that they can and must alter.

Feminists argue that historically dominant ethical conceptions of equality, justice, rights, liberty, autonomy, etc. have been more or less sublimated portrayals of a distinctively masculine (not a gender-neutral) mode of being. Some ethical theories, like Hobbes's and Rawls's, begin with the methodological injunction to consider individuals as if they are a-social and atomized. From this starting-point a philosopher can reason to a justification of co-operation between persons and even of care for others. However, the methodological premiss makes puzzling and problematic what is, from an alternative social point of view, not puzzling at all. Hence, an exaggerated individualism and voluntarism can forsake its role as a methodological premise and reappear in the guise of an ethical ideal.

Heteronomy, the capacity for and value of care, and the value of unconditional love, have frequently been judged outwith the ambit of truly ethical life. The differential impact this has on the ethical standing of women as opposed to men need not be laboured. Feminist ethics ranges between two alternative responses to this. First, there are attempts to pick out and revalue what is distinctive about women's lives and has traditionally been denigrated. Second, feminists keep a critical theoretical eye on the social processes by which it comes about that in a given context ethical qualities and virtues are associated more with one sex than another.

These problems raise the question of the nature of sexual or gender neutrality. The reclamation of 'feminine virtue' logically implies the continuation of 'masculine virtue'. A single ethical system could encompass the whole possible range of gender positions. Or, ethics could take as its objects human individuals as such and the relations between them. Once again, the indissolubility of the relationship between ethics and social theory or philosophical anthropology is emphasized. E.J.F.

**feminist philosophy.** Although women have been active philosophers for many centuries, the development of a specifically feminist viewpoint in the context of philosophy has gained credence only comparatively recently; partly as a result of more widespread debates about sexual politics in recent years, and partly as a result of social and economic changes in the status of women. The strands of feminist thinking in relation to philosophy have been and continue to be diverse and do not necessarily present a unified point of view. Feminist approaches to philosophy can take place at a number of levels and from different perspectives, and indeed this has been identified as a notable strength. For example, feminists have presented philosophical critiques of philosophers' images of women,

political critiques of the organization of the discipline of philosophy, critiques of philosophy as masculine, historical research into the work of past women philosophers whose work may have been unjustly disregarded, and positive contributions to philosophy from a feminist perspective. Feminist philosophers may take some or all of these approaches to be important, but, generally speaking, feminist philosophy will assume the question of sexual difference to be a philosophical issue at some level and, depending on the point of departure, produce very different ways of theorizing about this question. Although women tend to work in this area, not all women philosophers are necessarily feminist philosophers (although there may be feminist implications in their work).

One central question for feminist philosophers has been the extent to which philosophy is biased towards a masculine viewpoint, when the majority of past philosophers have been men. Can philosophy be trusted to be neutral on the question of sexual difference? It may be a historical accident that philosophy has been an activity associated with men. If, however, it is more deeply permeated with masculine values, feminists have asked whether such values are indelibly or contingently imprinted into the practice of philosophy. Such questions implicate the basis of philosophy itself. Notions of reason, truth, and knowledge, and the way that philosophical inquiries often seem to fall into distinctions of mind–body, order–chaos, or rely on hierarchies of terms, are called into question. Feminists also point out that such distinctions often map on to, or presuppose, sexual difference, aligning masculinity with reason and order.

This issue is of significance because it has bearing on topics such as personhood or identity and epistemology. If the association of reason with masculinity is reinforced by social structures, then it would seem that a particular type of experience is being validated at the expense of other possible viewpoints, and, as far as possible, that such a bias should be corrected. But problems arise in trying to assess where exactly the bias lies: which aspects of experience belong to which sex; to what extent such differences, if identified, belong contingently or properly to each sex; whether men and women see the world very differently, and, if so, whether they are very different persons. These issues are often expressed in terms of a distinction between \*sex and \*gender, where sex is the biologically invariant factor and gender is comprised of various socially, culturally, or historically variable components. Other ways in which the division has been expressed are as nature–culture, or male–masculine and female–feminine. But making such distinctions does not necessarily resolve all the problems.

In the past it has been argued that sex creates or causes gender, i.e. that biology shapes cultural perceptions of difference. But this view has been objected to if it seems to result in a deterministic account of identity which cannot allow for the transformation of perceptions of difference, or attributes essentially different identities or ways of thinking to men and women. Essential difference is not

necessarily a problem, but differences may be given unequal value such that women are seen as ‘the weaker sex’. A milder version of the above argument would allow that biological difference contributes to perceptions of difference but is not the only factor, and so cannot be wholly determining. Differences could then be minimized and some equality established. Difference would not disappear altogether, but, with equality of opportunity, would not be used prejudicially against one sex. Thinkers such as Mill and de Beauvoir suggest this approach. However, ideas of equality may already have been shaped in a particular way, based on notions of freedom and self-determination which are not automatically neutral. Or the argument might lead to a form of neutrality on the question which disregards women’s specificity, differences *between* women, or implicitly tries to make women more like men. Rousseau’s and Plato’s discussions of sexual difference illustrate some of the problems discussed above. Feminists working on political philosophy (for example, Carole Pateman) discuss issues such as equality, rights, and social organization in this context.

Other feminists such as Carol Gilligan have suggested that difference is significant in that it leads to quite different experiences of the world. Women’s experience has largely featured caring, nurturing, and motherhood in the past, and so, it is suggested, could form the basis for a different model of ethical relations, an ‘ethics of care’. But the validation of difference connected to sex here (and specifically women’s role in reproduction) may reinforce a model of different world-views and essential difference, which makes it difficult to see how such an ethical model could be generalized for both sexes.

With Foucault and some Marxist theorists, some feminists have argued that sex itself is a social or cultural construct, suggesting that sex differences are an effect of power relations and of meaning. As such they may be open to social and cultural transformation. But if these meanings are inherited from a past which has shaped power in particular ways, again it may seem that women have to relinquish their specificity to escape restrictive identities, or else accept more limited transformations.

Others have tried to re-evaluate difference without reinforcing sex–gender connections, arguing that the symbolic and experiential differences which already exist can be used to enrich existing conceptions of personhood or identity, ethics, and epistemology. Thinkers such as Irigaray, Cixous, and Kristeva have used notions of difference strategically to point out how philosophy has excluded ‘the feminine’ as symbolically other to reason. French feminists draw upon \*structuralism and psychoanalysis as resources to account for sexuality, identity, and difference. With this approach, difference can lead to plurality without a necessary loss of embodiment or of the specificity of women.

In addition to raising questions of sexual difference in the context of philosophy, feminist philosophers also raise questions about the connection (or lack of it) between theory and practice or lived experience. How well do theories

of personhood or identity, equality and ethics, correspond to the diversity of lives in the contemporary world? How are such theories manifest, for example, in hiring-policies? Such issues as pornography, rape, and medical ethics (e.g. reproductive technologies) are also currently under examination by feminists working in philosophy. A.C.A.

**feminist philosophy of science:** see science, feminist philosophy of.

**feminist political philosophy.** A diverse field of theoretical inquiry marked by the systematic study of historical conditions, conceptual schemas, and social practices that manufacture and legitimate gender inequality. The multiplicity of positions is a function of the presence of different liberatory strategies grounded in different analyses of female subordination. Some feminists locate institutionalized male privilege as an artefact of kinship systems that create social bonds between men through the ritualized circulation of women. Such feminists seek to graph new social structures, new 'Oedipal phases', into the existing socialization trajectory that processes 'raw' infants into 'cooked' or socialized humans. On this view, the forms of life that define and enshrine cultural standards for child care and child rearing are irreducibly political. Other feminists want to see female reproductive systems technologically altered so that all humans can be equally positioned with respect to procreation and full autonomous activity. Other feminists claim that men must be changed or females must escape from a male culture structured around the eroticization of domination and the destruction of life. Other feminists want 'women' to break free of male-dependent identities by destroying the category of woman, a destruction presumably commenced by the recognition that this category is only political and not a natural kind. Other feminists feel that political revolution is possible only if the oppressed restructure their own subjectivities through creative invention of a new triumphant imaginary or deliberate subversion of the daily, nearly invisible performance of gender. Other feminists, while rejecting any ahistorical stance that 'woman' refers to some common nature persisting through, and underlying

every possible human social system, still insist that unified political action requires that an essentialist category of woman be deployed provisionally. Other feminists engage in a feminist reconstructing of such core concepts as contract, power, justice, consent, obligation, and rights, which have been used to legitimate the classical liberal ideology.

No matter how diverse the methodological tactics, feminist political theorists have together forced classical political theory to encompass what was once considered apolitical—the family, child-rearing practices, gender, the body, sexuality, and human relationships. In the process, the revolutionary schemas of Karl Marx and Sigmund Freud in particular have each been meticulously reworked, refined, and appropriated to fuel a new refiguring of the individual and the state. **Ferguson, Adam** (1723–1816). Hailed from Perthshire, studied at St Andrews, and held various chairs at Edinburgh, achieving international prominence with his *Essay on the History of Civil Society* (1767; ed. and intro. D. Forbes (Edinburgh, 1966)). This broke decisively with speculation about human origins and development, in favour of known facts and historical evidence. In a sweeping review of the transition from rudeness to civilization Ferguson describes the \*human being as a 'progressive animal', liable to luxurious corruption, who combines sociableness with an instinctive relish for fighting. In his moral philosophy he expounded man 'as he ought to be', not as he is. All the virtues are benevolent. He disagreed with Hume's utilitarianism and Smith's theory of moral sympathy: sympathy can be misplaced. His idea that social \*progress was natural but neither inevitable nor irreversible was superseded by Hegelianism and Marxism. V.H.

**Ferrater-Mora, José** (1912–91). Spanish philosopher exiled in 1939, after the Civil War. Heir to the existentialist philosophy of Unamuno and Ortega, Ferrater-Mora was concerned with how those things that make human life special—namely, reason and morality—are not opposed to, but continuous with, the natural world. To this extent, he proposes an ontology with different levels of reality—physical, biological, neural-mental, biological-social, and social-cultural—each stemming from, but not reducible to, the previous, more basic, one.

He calls this view 'integrationism', by which he means two things. First, he wants to overcome the traditional opposition of irreducible concepts—e.g.: nature–reason, causality–freedom, is–ought—by integrating them in a continuous ontology. Second, he intends to work out a methodological approach that is at the same time analytical, critical, and speculative, thus combining the virtues

of different philosophical traditions. The outcome is a robust form of normative \*naturalism. A.GOM.

\*Spanish philosophy.

**fertilization *in vitro*.** '*In vitro*' means, literally, 'in glass', but *in vitro* fertilization, or IVF, is the standard term used for the technique of fertilizing an egg outside the body, and transferring the resulting embryo to the womb of a female recipient. This procedure was first successfully carried out with human beings in 1978 in Britain, by Robert Edwards and Patrick Steptoe. The birth of Louise Brown ushered in a new era of artificial reproduction, with concomitant ethical and legal dilemmas.

Several distinct ethical objections have been made to the use of IVF. Initially, there was concern about the risk that the children born as a result of this procedure would be abnormal. Now that there are tens of thousands of children who were conceived outside the body, these fears can be seen to be unjustified. On the other hand, objections on the basis of the cost of the procedure remain serious, especially where the resources are drawn from a limited national health budget. Because the rate of births per cycle of treatment remains low, generally around 15 per cent, the cost of each child produced is considerable. In addition, there is a human cost for those couples whose hopes of overcoming infertility are raised by reading headlines about IVF, but find that they do not achieve a pregnancy. Many reasonably ask if adoption, including overseas adoption, would not be a better solution to the needs of infertile couples.

The Roman Catholic Church objects to fertilization *in vitro* on several grounds. These include the fact that to obtain the sperm requires masturbation, which in the eyes of the Church is inherently sinful, even when it is the only way to bring children to a marriage. The Church objects to the division that the technique introduces between procreation and the sexual act, believing that this weakens the marital relationship. Finally, the Church condemns the loss of embryonic human life involved both in research directed towards improving IVF, and in the procedure itself.

The development of artificial reproduction has met with a mixed response from feminists, some anticipating its coming as a means of liberating women from biological inequality, while others see it as one more form of male domination over women's bodies. They see women being used as subjects of medical experimentation, and suggest that the end-result may be to remove women's control over pregnancy and childbirth.

During the 1980s fertilization *in vitro* ceased to be an experimental technique, and became a standard treatment for some forms of infertility. The ethical debate then moved on to further applications of IVF. The existence of a viable human embryo outside the human body provides an opportunity for various forms of interference. These

include: using the embryo for research purposes; freezing the embryo for long-term storage (raising the possibility that the couple may divorce or die); donating the embryo to another infertile couple; contracting with another woman to gestate the embryo and return it to the genetic parents; and screening the embryo to determine its genetic characteristics (including its sex) before deciding whether to proceed with implantation.

In many countries, government commissions have considered fertilization *in vitro*. Philosophers such as Mary Warnock and Jonathan Glover have played key roles in these commissions, which have generally approved the practice of IVF under specified conditions.

**Feuerbach, Ludwig Andreas** (1804–72). German philosopher, who was a leading Left Hegelian. He originally studied Protestant theology at Heidelberg but soon moved to Berlin where for two years he studied philosophy with Hegel. In 1830 he published *Thoughts on Death and Immortality* (tr. Berkeley, Calif., 1980), arguing against personal immortality and the transcendence, if not the existence, of God. This established him as a leading member of the Left or Young Hegelians. (The Right or Old Hegelians tended to endorse immortality and divine transcendence.) But it also lost him his post at Erlangen, and ended his academic career. He withdrew into private life, and made only one more public appearance, when he was invited to lecture at Heidelberg in the revolutionary upheaval of 1848.

Until 1839 Feuerbach's public persona was that of an innovative and independent-minded Hegelian. His Erlangen lectures, on logic and the history of philosophy, were thoroughly Hegelian. But with the publication in 1839 of *Towards a Critique of Hegel's Philosophy*, he became a critic of Hegel, as well as an interpreter. He rejects Hegel's tendency to downgrade perceptible reality in favour of conceptual thought, criticizing, for example, his argument (in the *Phenomenology of Spirit*) that words such as 'this' and 'here' cannot be used to refer to perceptible individuals and also his claim (in the *Science of Logic*) that being becomes nothing: 'Hegel starts from being, i.e. the notion of being or abstract being. Why should I not be able to start from being itself, i.e. real being?' While agreeing with Hegel that men are capable of abstract thought, he denies that thought is man's central capacity and insists

that a thinker, an 'I', is an embodied being who essentially requires a 'you': "The truth lies only in the unification of "I" and "you". (He later saw this as rooted in the biological fact of sexual differentiation.)

Feuerbach proposes a naturalistic \*humanism. Philosophy is the science of reality in its truth and totality. The totality of reality is nature, and this can be known only by sense-perception. This does not mean that philosophy is to be abandoned in favour of such specialized sciences as physics, physiology, and psychology. These too consider merely abstract aspects of the complete human being. Thus philosophy needs to become anthropology, a science of the human being as a whole. For Feuerbach, as much as for Hegel, man stands at the centre of the world: "The being of man is no longer particular and subjective, but a universal being, for man has the whole universe as the object of his drive for knowledge. Only a cosmopolitan being can have the cosmos as its object." In later years, his philosophy declined into a physiological \*materialism, epitomized by his punning dictum 'Man is (*ist*) what he eats (*isst*)'.

Hegel had argued that 'speculative' philosophy has the same 'content' as the Christian religion, but presents it in a conceptual form rather than in pictorial imagery. Feuerbach believed this to be true of Hegelian philosophy: "The 'absolute spirit' is the 'departed spirit' of theology, a ghost still haunting the Hegelian philosophy." Feuerbach's new earthly naturalism is as hostile to religion as to Hegelianism. Thus in his most celebrated work, *The Essence of Christianity* (1841), translated by George Eliot in 1853, Feuerbach directed anthropology against religion. Indeed, an examination of religion is, on his view, an essential requirement for discovering what man is. Polytheistic religions, he argues, express man's dependence on nature and personify natural forces. But the Christian \*God is in fact the essence of man himself, abstracted from individual, embodied men, and objectified and worshipped as a distinct entity. Man attributes to God his own highest feelings, thoughts, and hopes. Thus God is held to be almighty, merciful, and loving. What this really means is that omnipotence, mercy, and love are divine. Belief in immortality too is no more than a projection of our ideals into another world. It does not follow that religion is nothing but a regrettable error. Without religion man would not have become aware either of nature as a unified system or of his own essence. (Feuerbach agrees with Hegel that education involves alienation.) But now that this work is done, religion impedes the earthly realization of the ideals that it implicitly acknowledges by projecting them into heaven. We need to heal the fissure between heaven and earth, to replace love of God by love of man, and faith in God by faith in man, to recognize that man's fate depends on man alone and not on supernatural forces, before we can devote our collective energies to the wholehearted pursuit of human welfare, to the realization of the essence of man on earth. In a later work, *On the Essence of Faith in Luther's Sense* (1844; tr. New York, 1967), he argued that his humanization of theology is already

implicit in Protestantism. Quoting Luther's claim 'If God sat all alone in heaven, like a bump on a log, he would not be God', Feuerbach infers that God exists only in so far as he is an object of our faith.

Feuerbach differs from Hegel in two general respects. First, Hegel attempts, with a good measure of success, to present not one particular philosophy among others, but the universal philosophy, to integrate into a coherent whole what is true in all reasonable philosophies. (A similarly conciliatory spirit is found in J. S. Mill, in contrast to the more combative Bentham: Mill wants to combine what is true in *both* Bentham and Coleridge.) Feuerbach, for all his claims to totality, is more exclusive: he wants to exorcise the 'ghosts' of theology and idealism rather than domesticate them. Secondly, Hegel condemns proposals (and predictions) with regard to the future. Philosophers at least must confine themselves to understanding the past and the present. Feuerbach proposes plans for the reform of philosophy—*Provisional Theses for the Reformation of Philosophy* (1843) and *Principles of the Philosophy of the Future* (1843)—plans which were largely unrealized. He has high hopes for the future of humanity. The dissolution of Protestantism will make way for a democratic republican state. Like Hegel, he believed the nation state to be the ideal human community and had no sympathy for any larger political organization. He made little attempt to reconcile this with his insistence on the unity of the human species and on universal love.

Some of Feuerbach's best ideas, however, are already to be found in Hegel, especially in the *Phenomenology of Spirit*. Hegel was familiar with the ideas that the 'unhappy consciousness' of medieval Christianity projects its own essence on to the other-worldly being before which it abases itself, and that Lutheranism tends to the humanization of religion. Hegel knew as well as Feuerbach that a person, or 'I', requires another, a 'you', to sustain and confirm his self-consciousness. Even in those cases where his criticisms—of Hegel's treatment of 'this', for example, and of being—have since become commonplace, we feel that he is making points of which Hegel was already aware, that he has not descended to the depths of Hegel's thought, and that he has therefore not fully emerged from it. His main achievement is his explanation (if not demolition) of religion. But even this is impaired by the abstract vagueness of his concept of man, and the naïve sentimentality of his belief that what primarily unites men is love. This comes close to the young Hegel of the early theological writings and represents a step back in comparison to the mature Hegel's historically and conceptually differentiated account of man or 'spirit'. Feuerbach's importance lies not so much in his own thought as in the impetus that he gave to that of Marx and Engels.

**Feyerabend, Paul** (1924–94). Austrian-American philosopher of science who argued for the abolition of his subject. The early Feyerabend stressed the importance—for Popperian reasons—of theory proliferation and identified *and rationalized* historical exceptions to methodological theses. In debate with Lakatos he argued that no set of methodological rules could do justice to the complexity of the history of science. A \*methodology which was *not* historically laughable would be empty of normative content. If there is no rationalization for science, there is nothing to privilege scientific beliefs over, say, voodoo. On the contrary, an examination of the ‘material basis’ of voodoo could ‘enrich, and perhaps even . . . revise’ physiology. From this heuristic thesis he moved finally to the relativity of knowledge-claims.

**Fichte, Johann Gottlieb** (1762–1814). German philosopher who was the first of the great post-Kantian idealists. In his first book, *Attempt at a Critique of All Revelation* (1792; tr. Cambridge, 1978), he argued, in a thoroughly Kantian manner, that revealed religion is an important element in the moral education of imperfect humanity. The publisher omitted Fichte’s name from the book, and Kant was thus widely assumed to be its author. (Kant’s own work on the subject, *Religion within the Limits of Pure Reason*, did not appear until the following year.) Fichte rose to fame when he revealed his authorship, and secured a professorship at Jena in 1793. He lost this post in 1799 owing to a controversy over his supposed atheism (he regarded God not as a person, but as the moral order of the world), a controversy exacerbated by his uncompromising temperament and by his support of the French Revolution. He then moved to Berlin, the capital of Prussia, where he associated, and later quarrelled, with Friedrich Schlegel and the Romantic circle. (The Romantics admired Fichte, but did not share his moral ardour.) His popular lectures in Berlin (and at Erlangen, where from 1805 he held a chair) increased his fame, especially his *Addresses to the German Nation* (1807–8), in which, after the French victories over Prussia at Jena and Auerstadt, he urged the moral regeneration of Germany (primarily through educational reforms) and thereby of humanity as a whole. In 1809 he became professor, and in 1811–12 Rector, of the new university of Berlin. He was buried in Berlin, and Hegel was later buried next to him.

Fichte saw himself as a loyal Kantian, but there were several features of Kant’s system, or at least of Kant’s exposition of it, that he was unable to accept. In particular, Kant

had implied that there are things-in-themselves, unknowable to us, which are responsible for the sensory element in our knowledge, a sensory element which is thus quite distinct from the conceptual element. Moreover, Kant is, on Fichte’s view, insufficiently systematic. Not only does he inadequately explain the relationship between sensations and concepts; he does not supply an adequate derivation of the categories that inform all our knowledge of phenomena. Kant’s theoretical and practical philosophies appear in distinct works, with no satisfactory link between them. To remedy these defects Fichte proposed to begin not, as Kant had done, with an examination of our knowledge, to discover what is involved in it, but with a consideration of the pure I or ego, that is, the ‘I think’, which, on Kant’s view, ‘must be able to accompany all my representations’. He invites us, in the *Science of Knowledge* (*\*Wissenschaftslehre*, 1794; tr. New York, 1970), to disregard external objects and our mental states and to focus exclusively on the I that apprehends both external objects and mental states. (As a transcendental, rather than a subjective or a psychological, idealist, Fichte cannot presuppose the existence and nature of our mental states.) The I is not a thing or substance; it is simply activity, the activity of ‘positing’ itself; it exists only in virtue of its own awareness of itself. The I’s self-positing is the ‘thesis’. But the I’s self-positing, though we can be sure that it occurs, has certain conditions and, therefore, implications; if we suppose that the I posits itself, but deny that these conditions are fulfilled, we (and the I itself) fall into a ‘contradiction’, and it is to resolve such contradictions that the activity of the I (and the *Wissenschaftslehre*) proceeds. To be aware of itself the I must limit itself (‘Consciousness works through reflection, and reflection is only through limitation’), and this it can do only by positing something other than itself, a non-I. (Antithesis.) The I is now involved in another contradiction: it both posits and negates itself. This can be resolved only by a synthesis: the I posits a divisible I, limited by, and limiting, a divisible non-I; that is, the non-I, in part, negates the I, and the I, in part, negates the non-I. (Fichte’s concepts of thesis, antithesis, and synthesis reappear in Hegel, but Hegel does not use this terminology.)

Of these three principles, the third involves two propositions: (1) The I posits itself as determined by the non-I. (2) The I posits the non-I as determined by the I. These form the basis of, respectively, the theoretical *Wissenschaftslehre* and the practical *Wissenschaftslehre*. The theoretical *Wissenschaftslehre* unfolds the conditions of the determination of the I by the non-I. It does so primarily by the reflection of the I on its own activity and its transcendence of the limit involved in this activity. This reflection involves a new limit, which is in turn transcended by reflection on it. In this way Fichte purports to derive all the conditions required for the determination of the I by the non-I: sensations, space, time, and such categories of the understanding as causality. The \*thing-in-itself is replaced, for Fichte, by the ‘unconscious self-limitation of the I’—‘unconscious’, since the products of the I seem to be given to it ‘from without’.

The second proposition, that the non-I is determined by the I, gives rise to the practical *Wissenschaftslehre*, and this is, for Fichte, crucial to the I's construction of the world. First, the I's motive for producing a world, and a world of a certain type, is to have a field for its activity, primarily for the performance of its moral duty. Second, it is only with the practical *Wissenschaftslehre* that the world ceases to be merely a network of ideas (*Vorstellungen*) and becomes genuinely objective with respect to the I. The performance of duty requires the existence of other Is on a par with myself and I must regard other people as independent centres of consciousness and activity, not simply as my own ideas. But if the world is perceived by other beings, as well as myself, it is relatively independent of myself and my mental states.

In other works of the period, notably *The Science of Rights* (1796–7; tr. London, 1889) and *The Science of Ethics* (1798; tr. London, 1897), Fichte develops the implications of practical *Wissenschaftslehre*. The latter work attempts to derive the *content* of our duties from the mere fact that we must act morally, arguing, for example, that since moral activity requires the existence of others, we have a duty not to kill others or otherwise impair their capacity for moral activity. *The Science of Rights* applies ethical principles to law, the family, individual rights within the state, and relations between states. The state exists to protect the rights of its citizens and is 'nothing but an abstract conception; only the citizens, as such, are actual persons'. States should form a confederation to secure the freedom of all men, and ultimately all men should belong to a single commonwealth. This did not prevent him from arguing, in *The Closed Commercial State* (1800), that a state should rigidly control the economic activity of its citizens and prohibit international trade.

Fichte's doctrines so far are well summarized in *The Vocation of Man* (1800; tr. New York, 1956), in which he considers three increasingly adequate views of the world: first, naturalistic \*determinism, which dissolves man's freedom in the 'rigid necessity of nature'; second, theoretical \*idealism, which reduces the world, including oneself and other people, to a 'system of pictures'; and third, practical idealism, in which oneself and others emerge as free, but embodied, moral agents occupying an objective world. The work concludes with the affirmation that God is the moral order of the world and that we exist 'only in God and through God'. But after about 1800 Fichte's thought underwent a change. In the *Wissenschaftslehre* of 1794 he contrasted his own philosophy, idealism, with the 'dogmatism' or realism of such thinkers as Spinoza. (He claimed that which of these philosophies one adopts depends on what kind of man you are, but he also gave reasons, such as dogmatism's inability to explain consciousness and freedom, for preferring idealism.) But now he moves closer to Spinoza, and to Schelling. In *The Way to the Blessed Life or the Doctrine of Religion* (1806) and in various other works of the period—including later reworkings of the *Wissenschaftslehre*—the 'infinite impulse' of the

I is no longer independent and self-sustaining, but emanates from an 'absolute being' (*Sein*) which cannot itself come into being, change, or pass away, and which Fichte also calls God, the Word (*Logos*), and the Absolute. Finite things are still deduced as products of consciousness. But the infinite activity of consciousness is now deduced from the end of 'imitating' God, and our vocation is more the 'blessed life' of contemplating God than moral activity. One of the problems that led Fichte to this conclusion seems to have been the difficulty of maintaining that the I that produces the world and that does not, until a fairly late stage of the *Wissenschaftslehre*, contrast with other Is ('you' and 's/he') is in any significant sense an 'I' rather than an 'it'. (Hegel contended that Fichte's absolute I amounts to much the same as pure being.)

Throughout his career Fichte held that the vocation of man is to restore on a higher plain the pure absolute from which the *Wissenschaftslehre* began, whether this be the I or being, and whether the restoration of it consist in philosophical or religious insight, moral perfection, or political harmony. Thus his thought operates on two levels. First, there is a logical development of the relation between the absolute (I, being) and its manifestation; this occurs in his more esoteric works. Second, there is a psychological history of the stages of reflection by which this logical relation is revealed to the finite subject; this tends to appear in his more popular works. In *Characteristics of the Present Age* (1806), he presented a universal history, advancing from the 'Arcadian' stage of 'instinctive reason', by way of the 'complete sinfulness' of the 'state based on needs' (*Nothstaat*), to the 'Elysian' stage of 'artistic reason'. Under the influence of Schiller, the aesthetic is assigned a crucial role in reconciling the antitheses of the *Wissenschaftslehre*. But in other works religion is more prominent than art. According to *The Way to the Blessed Life* absolute being is refracted by consciousness into an endless variety of individual forms. But this world of phenomena and its relation to the absolute is conceived by human reflection in five historically successive stages: (1) empirical phenomena are seen as the sole reality; (2) the ultimate reality is seen as a law-governed community of free, independent persons, with equal rights; (3) the heroic moral life devoted to the realization of the divine will, of the ideas underlying art, science, politics, and religion; (4) the religious withdrawal from heroic conduct into the recognition of all earthly life as a manifestation of the divine; (5) clear philosophical understanding of the plan of existence and of the unity of all men in a community of free intelligences with a common purpose: 'Religion without science is a mere faith, though an immovable faith; science supersedes all faith and converts it into insight.' At this last stage absolute being has in a sense been restored to its original purity.

Fichte's earlier thought had an immense influence on younger philosophers, especially Schelling and Hegel: Hegel's philosophical method, for example, derives largely from Fichte, and his *Phenomenology of Spirit* is the

culmination of the tradition represented by Fichte's philosophical histories. Fichte also influenced the literary works of such Romantics as Novalis and their concept of irony: 'The three greatest tendencies of the age are the French revolution, Fichte's *Wissenschaftslehre*, and Goethe's *Wilhelm Meister*' (F. Schlegel). M.J.I.

**fiction.** Fiction raises puzzles not only about what kind of thing fictional characters are, but also about our attitudes to what is not real. In reading a novel or seeing a drama, people apparently feel emotions towards or about the characters. Aristotle thought that it was essential to tragic drama, for instance, that the depicted course of events should arouse fear and pity in the spectator. However, some philosophers have contended that we cannot feel genuine emotions such as fear and pity, unless we believe a situation to be real. It is a common assumption that fiction is valuable because we are able to learn in a unique way from it, perhaps learning 'how to feel' certain things. How does this happen, if what we feel for fictions is not real \*emotion? C.J.

\*fictional names.

C. Radford, 'How can we be Moved by the Fate of Anna Karenina?', *Proceedings of the Aristotelian Society* (1975).

**fictional names.** Names of fictional (including mythical) characters, places, etc., such as 'Emma Bovary',

'Huckleberry Finn', 'Dotheboys Hall', 'Santa Claus', 'Persephone'. Their use has puzzling features. 'Don Quixote' appears to refer to a fictional character. Yet surely fictional characters do not exist—otherwise they would not be fictional. But how can referring to a non-existent Don Quixote differ from failing to refer to anything? Further, if Austen's Mr Wickham did not exist, how can it be true—as it seems to be—that he eloped with Lydia Bennet? These puzzles have often prompted one or two responses: either fictional characters do somehow exist (but where? e.g. does Sherlock Holmes really live in London?) or typical sentences employing fictional names (e.g. 'Maigret smoked') are to be analysed differently from superficially similar sentences employing non-fictional names (e.g. 'Churchill smoked'). P.J.M.

\*referring; names; existence.

D. Lewis, 'Truth in Fiction', *American Philosophical Quarterly* (1978).

**fideism.** Fideists hold that religious belief is based on faith rather than reason. Extreme fideists maintain that it is contrary to reason; moderate fideists argue that what must first be accepted on faith may subsequently find rational support. The maxim \**credo quia absurdum est* encapsulates the former view; the slogan \**credo ut intelligam* epitomizes the latter. There being no reason to prefer one absurdity to another, the commitments of extreme fideists are bound to seem arbitrary. P.L.Q.

T. Penelhum, *God and Skepticism: A Study in Skepticism and Fideism* (Dordrecht, 1983).

**Field, Hartry H.** (1946– ). American philosopher of language and \*mathematics. Primarily influential through his fictionalist philosophy of mathematics—the Field programme. Quine and Putnam argue that since mathematics is indispensable in the formulation of scientific theories, any evidence for the truth of a scientific theory is equally evidence for the truth of the mathematical theory which is its essential part. Field's programme aims to undercut this argument in two steps. First, he claims that any scientific theory can be nominalistically rewritten, that is, formulated free from commitment to mathematical entities. Second, he aims to account for the evident usefulness of mathematical formulations of scientific theories by arguing that the mathematical formulations are advantageous because they lead to shorter proofs of nominalistic conclusions, but that those conclusions could be reached more long-windedly from nominalistic premisses. **field theory.** The postulation of fields—regions under the influence of some force—allows the explanation of instantaneous interaction between spatially separated bodies (such as magnetic attraction or repulsion) without requiring \*action at a distance. In modern physics, quantum field

theory is arguably required in order to reconcile non-relativized \*quantum mechanics with \*Einstein's special relativity, and it is widely hoped that some version of this theory might provide a 'grand unified theory' or 'theory of everything' in which the four fundamental forces (gravity, electromagnetism, and the strong and weak nuclear forces) are shown to be manifestations of a single field. However, despite success in providing a unified explanation of the latter three forces, quantum field theory has yet to give a satisfactory account of gravity, and thereby remains inconsistent with general relativity, with some suggesting that a radically new physical theory will be needed. Field theory has also generated debate about whether the fundamental ontology of the world is one of fields, rather than individuable, localizable \*particles.

**figures of the syllogism:** *see* syllogism.

**film, philosophy of.** Analytic philosophers have written infrequently on the aesthetics of the film though there are some recent signs of increasing interest. It is the question of what is distinctive about the film, what is its essence, that has preoccupied most philosophers. A film is photographic and photographs are of reality or nature, as Cavell puts it. Scruton defines film as photographed dramatic representation. It is the fact that a photograph captures reality which makes film, like photography, unique in the way its creativity is somewhat displaced. It is then an easy move to the proposal that the use of some specific device such as montage is what is essential about film but, in truth, there is no single technique the exploitation of which typifies the major achievements in film, from *Citizen Kane* to *Heimat*. Far more than photography, film has followed traditions of its own making and its debts to painting or architecture are no greater than the influence of drama on opera or on \*fiction or film's own influence on the novel. The question of realism has haunted philosophical writing on film in other ways; is the audience under an illusion that the events on the screen are real and present? Does a member of the audience assume the position of the camera? Does he or she identify with the eye of the camera?

**Filmer, Robert** (1588–1653). English political philosopher who defended the divine right of kings. Sir Robert Filmer was an English landowner who wrote a number of Royalist pamphlets. These were not noticed in his lifetime. But after his death his best-known work, *Patriarcha; or, The Natural Power of Kings*, was published in 1680. The book is an attack on what Filmer saw as the two enemies of Royal power, the Jesuits and the Calvinists, and it stated two royalist principles: divine right and the duty of passive obedience. Filmer tried to show that the king's power is derived from the natural authority of parents. In other words, Adam was the first king. John Locke and others attacked the absurdity of this view. Unfortunately this side of Filmer's writings has obscured the fact that (borrowing from Hobbes) he launched a plausible attack on conceptions such as contract and consent as explanations of \*political obligation.

R.S.D.

Sir Robert Filmer, *Patriarcha*, ed. with intro. and notes by Peter Laslett (Oxford, 1949).

**final causes.** One of Aristotle's 'four causes', the final cause is 'that for the sake of which', or the end or goal (Latin *finis*; Greek *telos*; hence \*teleological explanation). To explain by citing a final cause is to explain something by reference to a goal that it serves. Aristotle invoked final causes throughout his scientific works, including many cases that appear not to involve genuine purpose (as when webbed feet are said to be for swimming). An emphasis on teleological explanation (shared by Plato) characterizes most subsequent Western philosophy of science until the seventeenth century. Whether final-cause explanations are legitimate where no agency is involved, and whether they can ever be fundamental explanations, are regarded as controversial issues by some philosophers.

\*causality.

J. L. Ackrill, *Aristotle the Philosopher* (Oxford, 1981), ch. 4.

**Fine, Kit** (1946–). Logician, metaphysician, and philosopher of mathematics, known for his contributions to modal logic and the metaphysics of \*essence. Since the revival of essentialism in the 1970s through the work of \*Saul Kripke in modal logic, it has been widely assumed that the concept of essence is to be explained through the concept of metaphysical \*necessity, which is in turn to be explicated in terms of the concept of truth in every \*possible world. Fine has argued that the proper direction of explanation is quite the reverse of this. To talk of something's essence is to talk of its very nature or identity. Thus, water is essentially H<sub>2</sub>O, because it is in the very nature of any chemical compound to be composed in the way that it is. This is why it is metaphysically necessary that water is H<sub>2</sub>O. In the philosophy of mathematics, Fine has developed a general theory of abstraction which provides a foundation for number theory and analysis.

**fingering slave**

Physician art thou?—one, all eyes,  
 Philosopher!—a fingering slave,  
 One that would peep and botanize  
 Upon his mother's grave?  
 (William Wordsworth, 'A Poet's  
 Epitaph' (1800), lines 17–20)

Wordsworth's distaste for the philosopher is at least not exclusive, but meted out to the representatives of other professions—statesman, lawyer, soldier, doctor, moralist—whom he imagines approaching an anonymous grave at which he meditates. In fact a philosopher is not among them, but 'philosopher' is an exclamation against the allegedly philosopher-like doctor abhorred for an objectivity which denigrates its human objects. For Wordsworth, it seems, the essence of the philosopher, like that of the moralist for whom he reserves his greatest contempt, is cerebral detachment, a lack of the emotionality he so prized. Perhaps had he been writing today he would have used a word that is not attested till 1840—'scientist'.

J.O'G.

**Finnis, John** (1940– ). Legal philosophy has been influenced by his assault on standard oppositions between \*natural law and \*legal positivism.

Oxford jurisprudence tutor from 1967, Professor of Law and Legal Philosophy in Oxford University from 1989, his doctoral thesis on the idea of judicial power was supervised by H. L. A. Hart, who commissioned *Natural Law and Natural Rights* (1980) for the Clarendon Law Series. Social theory cannot be value-free, it argues, and Humean ethics, unlike genuine (not neo-scholastic) Thomist ethics, commits a naturalistic fallacy. Finnis bases his radically rearticulated Aristotelian political and legal theory on dialectically defended first principles of practical reason and methodological principles of practical reasonableness (morality). Subsequently he has published *Fundamentals of Ethics* (1983); *Nuclear Deterrence, Morality and Realism* (1987; co-authors include Germain Grisez, on whose philosophical work Finnis openly builds); *Moral Absolutes* (1991); and *Aquinas* (1998).

R.P.G.

\*law, philosophy of.

**Finnish philosophy.** Philosophy has played an important role in the scholarly and cultural life of Finland. Most of the actual philosophical work has, nevertheless, been done in an academic setting—when the University of Helsinki (originally located in Turku) was founded in 1640, philosophy merited two chairs out of eleven.

For a long time, Finnish academic philosophy was little more than a succession of international trends arriving in Finland one after the other, such as neo-Aristotelianism, Cartesianism, Wolffianism, Kantian philosophy, and Hegelianism. However, a unique twist was given to it by Johann Wilhelm Snellman (1805–81), who was not only the most important statesman in the history of the country, but an independent, forceful philosopher in the

Hegelian tradition. Partly because of Snellman's impact as an ideologue and statesman, there has ever since been a keener awareness of the public role and general significance of philosophy in Finland than in almost any other country. Even recently, the main impact of some professional Finnish philosophers has been on the general cultural and ideological discussion in the country. Oiva Ketonen (1913–2000) was a distinguished case in point. Some philosophers have become public figures, not to say cult figures, most recently Esa Saarinen (1953– ), alias 'Dr Punk' of the popular Press.

Hegelianism did not for very long remain a live force in professional philosophy itself. The main reaction came from a group of young radicals inspired largely by Darwinian ideas. This group included the first Finnish philosophers to have a significant international impact, Edvard Westermarck (1862–1939) in moral philosophy and social anthropology, and Yrjö Him (1870–1952) in aesthetics. Though antiquated, Westermarck's monumental studies *The History of Human Marriage* (1891) and *The Origin and Development of Moral Ideas* (1906–8) are classics in their fields, and his *Ethical Relativity* (1932) was a widely noted contribution to international discussion.

The contemporary philosophical scene in Finland has not been moulded by Westermarckian neo-Darwinism, however, but by a local version of \*analytic philosophy, originally inspired largely by Eino Kaila (1890–1958). The label 'analytic' is, nevertheless, both accurate and inaccurate as applied to Kaila. It is historically accurate in that Kaila befriended the Logical Positivists and for a while participated in the discussions of the \*Vienna Circle. It is psychologically inaccurate in that Kaila's ultimate stance was that of an old-fashioned philosopher of nature who tried to integrate the insights of contemporary physics, biology, and psychology into a grand philosophical synthesis.

By and large, the best work of subsequent Finnish philosophers has been in the analytic tradition. The philosophers influenced or inspired by Kaila include most notably G. H. von Wright (1916–2003) and Erik Stenius (1922–90). Stenius's early work was in logic and foundations of mathematics. Later he published an excellent book on Wittgenstein's *Tractatus* and a large number of articles known for their critical edge. Among Stenius's former students the best known is Ingmar Pörn (1935– ).

Von Wright's early work was on the problem of \*induction. He was a friend, later a trustee and a successor, of Ludwig Wittgenstein, and did a lot to bring about Wittgenstein's impact on contemporary philosophy. His own work was not overtly in the Wittgensteinian tradition, however, and included important contributions to modal logic, especially deontic logic, action theory, the problems of explanation and understanding, and ethics. Von Wright was also a most influential, widely respected public figure in Finland.

One of von Wright's former students is Jaakko Hintikka (1929– ), who has also been active outside of Finland, mostly in the United States. Several of Finland's most active philosophers are Hintikka's former students or

associates. The work of these philosophers and their contemporaries covers most of the field of analytic philosophy, especially philosophy of science, and amounts to a vigorous and extensive contribution to the international discussion in this area. Unlike many other analytic philosophers, the Finns have consistently maintained a strong interest also in the history of philosophy. K.J.J.H.

**fire:** see Bachelard.

**first cause argument.** This argument for God's existence assumes that each natural thing's existence is caused by something other than itself. It argues there cannot be an infinite series of such causes and concludes there is a first cause of existence whose existence is not caused by something other than itself. Further argument is needed to show there is only one such cause and it has such traditional divine attributes as perfect goodness. P.L.Q.

\*God, arguments against existence; God, arguments for existence; prime mover.

W. L. Craig, *The Cosmological Argument from Plato to Leibniz* (New York, 1980).

**first-person perspective:** see dualism.

**five ways.** Aquinas's five ways of proving God's existence are based on the necessity of positing (1) a first changer in various observable series of changes; (2) a first efficient cause in various observable causal set-ups; (3) an absolutely necessary being, given the existence of contingent beings; (4) a *maximum* item to ground certain comparatives in particular goodness; and (5) 'some intelligent being . . . by whom all natural things are directed'. J.J.M.

\*God, arguments against existence; God, arguments for existence.

A. Kenny, *The Five Ways* (London, 1969).

**flaccid designator.** A term designating different objects in different \*possible worlds. More precisely, a singular term that would designate different objects if certain circumstances other than its meaning were different. A \*definite description like 'the thirty-fifth President of the United States' is a flaccid designator. The term actually designates John F. Kennedy. But if Richard Nixon had won the 1960 election, Nixon would have been the thirty-

fifth President. In that case, 'the thirty-fifth President' would have designated Nixon. Hence 'The thirty-fifth President might not have been the thirty-fifth President' is true on one interpretation. Flaccid designators are opposed to \*rigid designators, which designate the same object in all possible cases. A proper \*name like 'John F. Kennedy' is rigid. Even if Nixon had won the 1960 election, for example, 'John F. Kennedy' would have designated John F. Kennedy. 'Kennedy might not have been Kennedy' is unequivocally nonsensical. W.A.D.

Saul Kripke, *Naming and Necessity* (Cambridge, Mass., 1980).

**flesh:** see Merleau-Ponty.

**flow of the wind:** see Korean philosophy.

**flux.** Everything is in flux according to Heraclitus, who is reputed to have said that 'everything flows', and that 'you cannot step into the same river twice'. The idea, in Plato's interpretation, was that the world consists entirely of perceived items each one of which is relative to the perceiver and time of perception with no place for a stable, objective reality. Plato and Aristotle exposed fatal weaknesses in the view. O.R.J.

\*process.

Myles Burnyeat, *The Theaetetus of Plato* (Indianapolis, 1990).

**focal meaning.** Aristotle's account of the \*meanings of grammatically different variations of the same word—'health', 'healthy', and 'healthful', for example—which say different but systematically related things about items of different sorts. Foods and exercises are called healthful because of their connection with health, while organisms are called healthy if they possess health. On Aristotle's account, the words 'healthy' and 'healthful' derive their meanings from what constitutes health, and thus from the meaning of the term 'health'. G. E. L. Owen coined the term 'focal meaning' for this account because it treats the meaning of one member of a family of grammatical variants as the focus toward which explanations of the meanings of the others converge. J.B.B.

G. E. L. Owen, *Logic, Science, and Dialectic: Collected Papers in Greek Philosophy*, ed. M. Nussbaum (London, 1986), 184 ff.

**Fodor, Jerry A.** (1935– ). American philosopher who has been one of the leading figures in the recent attempt to unify the philosophy of mind with \*cognitive science. Against the background of his early influences—Putnam's \*functionalism and Chomsky's innatism—Fodor has defended an influential conception of the mind, according to which there are laws of \*folk psychology which are underpinned by the computational structure of mental processes. Central to his theory is his bold hypothesis that we think in a \*'language of thought': a computational system of symbols, realized in the neural structure of the brain, with semantic and syntactic properties. The nub of the language-of-thought hypothesis is that thinking has a

causal structure that mirrors the logical structure of trains of thought. More recently, Fodor has been preoccupied with providing a naturalistic account of the semantics of the sentences of the language of thought. T.C.

Jerry A. Fodor, *Psychosemantics: The Problem of Meaning in the Philosophy of Mind* (Cambridge, Mass., 1987).

— *Concepts: Where Cognitive Science Went Wrong* (Oxford, 1998).

**Fogelin, Robert J.** (1932– ). American philosopher who taught at Yale University before moving to Dartmouth College. As his collection *Philosophical Interpretations* (1992) shows, he has worked extensively in the history of philosophy, his work insisting on taking seriously authors' own views of the meaning and importance of their writings. His books reflect his major interests in *Wittgenstein* (1976) and *Hume's Scepticism in the Treatise of Human Nature* (1985). The latter has contributed to reversing a tendency to play down Hume's avowed scepticism. But Fogelin has also written in the area of informal logic and the philosophy of language: his first published book was concerned with meaning and verification, and *Figuratively Speaking* (1988) is an elegant examination of \*metaphor and other kinds of non-literal discourse. C.J.H.

**folk psychology.** The subject-matter of people's everyday understanding of one another in psychological, or mental, terms; contrasted with scientific, or experimental, psychology.

In recent philosophy, it is sometimes supposed that the basis of our ability to explain and predict what other people will do, using terms like 'believes' and 'desires', is a \*theory which we know implicitly, acquired as we came to gain psychological understanding. The question can be raised how this theory, named folk psychology, relates to others—in the first instance how it relates to scientific psychology, and then how it relates to neuroscientific theories of brains' workings. Traditional questions about the relation between mind and body come to be recast as questions about relations between different theories; and \*eliminativism can be stated as the doctrine that folk psychology is a false theory.

Folk psychology may be denied the status of theory. Questions can still be raised about its relations to other subject-matters; but these will not now be questions about intertheoretic relations. J.HORN.

M. Davies and T. Stone (eds.), *Folk Psychology* (Oxford, 1995).

John D. Greenwood (ed.), *The Future of Folk Psychology* (Cambridge, 1991).

**Føllesdal, Dagfinn** (1932– ). Norwegian philosopher, interpreter of Husserl to analytic philosophers. Føllesdal was educated mainly at the University of Oslo and at Harvard University, where he taught from 1961 to 1964. He is a professor at the University of Oslo (1967– ) and at Stanford University (1968– ).

In the philosophy of language, Føllesdal emphasized the need of 'genuine singular terms' before Kripke, who

renamed them \*'rigid designators'. Føllesdal has also discussed the normative element in reference and the reasons for the \*indeterminacy of translation in the social nature of language.

Føllesdal has put forward influential interpretations of Husserl's philosophy, which he considers as a generalized meaning theory. For instance, Husserlian noema is a generalization of meaning to the realm of acts. Føllesdal does not consider Husserl as a foundationalist but claims that for Husserl ultimate justification is like Rawls's \*'reflective equilibrium'. K.J.J.H.

Dagfinn Føllesdal, 'Husserl's Notion of Noema', *Journal of Philosophy* (1969).

**Foot, Philippa R.** (1920– ). Best known for her work in moral philosophy, Professor Foot wrote two highly influential articles in the 1950s arguing against \*prescriptivism, the analysis of ethical belief and judgement propounded by R. M. Hare. In these papers ('Moral Arguments' (1958), 'Moral Beliefs' (1958)), she argues that moral beliefs must concern traits and behaviour that are demonstrably beneficial or harmful to humans, and that what shall be regarded as beneficial or harmful is not a matter for human decision. Moral beliefs cannot, therefore, be dependent on human decision. For the better part of a decade, the controversy between her brand of naturalistic ethics and Hare's views was at the forefront of Anglo-Saxon moral philosophy. More recently her work has been concentrated on \*virtue theory and on the limits of utilitarianism. For many years a Fellow of Somerville College, Oxford, she has also held many posts in America. Many of her best-known articles are collected in Philippa Foot, *Virtues and Vices* (Oxford, 1978). N.J.H.D.

\*conscience; fact–value distinction.

P. R. Foot, *Natural Goodness* (Oxford, 2001).

**footnotes to Plato.** A. N. Whitehead once wrote that 'the safest general characterization' of Western thought is that 'it consists of a series of footnotes to Plato'. This testy assessment of an entire tradition is often recited by Platonists and has earned for Whitehead the accolades of the aphorism crowd.

The great thinkers of the past certainly did not think that they were adding footnotes to Plato's text. Had Kant thought he was adding one, he would surely have kept the *Critique of Pure Reason* under 500 pages. And should Wittgenstein have suspected that he was producing scholia, he would have spent at least a little time reading the text.

Interestingly, those who say that all subsequent thought is a footnote to Plato or to ancient sages also complain of wholesale and lamentable modern innovations. Aside from the inconsistency, this raises the question what counts as a footnote. Does Descartes, who subverted the starting-point of ancient philosophy, constitute no more than an afterthought to it? Should Hume, who rejected both its premisses and its conclusions in favour of his own

original views, get no credit beyond having discovered a new wrinkle on wisdom's old face? Can we even think that in his stunning synthesis of everything ancient and modern, Hegel rehearsed only what Plato had always known?

To be sure, sometimes those who wish to write footnotes to Plato manage to establish only a feeble connection with the original text. But this does not imply that philosophical works taking little or no account of anything Plato said are oblique or unsuccessful commentaries on his thought. Supposing that they are makes it impossible to appreciate their novelty and difficult to see their point. It amounts, moreover, to an affront to the integrity of philosophers and a cynical assessment of the significance of their field.

Possibly, however, Whitehead's statement was made in the spirit of rampageous over-generalization one can expect from footnoters to Plato. If so, it must be taken with a grain of salt or greeted by rolling one's eyes. But even then, in one clear respect, the claim he makes is false. For the *safest* way to deal with the history of Western thought is not to characterize it in general terms at all.

J.LAC.

\*philosophy; ancient philosophy; Platonism.

**foreknowledge:** see prediction.

**forgery.** In art, forgery can mean imitating someone's style, or passing an exact duplicate off as a specific work. The latter raises questions about the nature of artworks. A duplicate painting would be a *distinct* work from the original. But if I write down exactly the notes that make up the 'Moonlight' Sonata, have I not simply copied it out again? If my indistinguishable copy were played to an unsuspecting audience instead of Beethoven's, would they be hearing a forgery? Some would argue that an intentional duplicate of a sonata or novel does not succeed in being a distinct work at all. On the other hand, there are strong arguments for saying that historical context and authorial intentions determine the identity of a work—in which case, my piece and Beethoven's might be distinct though sharing the same notes.

C.J.

\*lying; plagiarism.

N. Goodman, *Languages of Art* (Indianapolis, 1968), ch. 3.

**forgiveness.** To forgive someone is to hold him or her excused from an offence, even in one's thoughts, while still acknowledging his or her \*responsibility for the offence. It is, perhaps, only appropriately granted by those affected by the offence. Unlike the granting of a pardon, which may be merely a permitting to go unpunished, the act of forgiveness involves a refusal to blame. However,

the relationship of forgiveness to both contrition and \*punishment is imprecise: the possibility of forgiveness appears to make remorse possible and prevents \*desert being a sufficient condition of the latter. Though an essential element of all personal relationships, the importance of forgiveness is not much reflected in contemporary ethical theory.

P.W.

\*revenge.

J. G. Murphy and J. Hampton, *Forgiveness and Mercy* (Cambridge, 1988).

**for-itself and in-itself.** The distinction drawn by Sartre between the mode of being of \*consciousness ('being for-itself') and that of other things ('being in-itself'). This is not a dualism of substances, since Sartre holds that consciousness is not a substance: it is the view that there are two kinds of truth. But it remains problematic: Sartre's being in-itself is as inaccessible as Kant's \*thing-in-itself, and being for-itself relies on a questionable conception of consciousness.

T.R.B.

J.-P. Sartre, *Being and Nothingness*, tr. H. Barnes (London, 1958), intro.

**fork, Hume's.** Term applied today to Hume's distinction between relations of ideas and matters of fact. Relations of ideas—like the proposition that 'three times five is half of thirty'—are 'discoverable by the mere operation of thought, without dependence on what is anywhere existent in the universe'. Matters of fact—like the proposition that 'the sun will rise tomorrow'—cannot be demonstrated by thought alone, and are contingent, in that their negation is conceivable. Hume's distinction includes elements of the three current distinctions between necessary and \*contingent, \*a priori and a posteriori, and \*analytic and synthetic—and he seems to presume that the three distinctions coincide. This supposition has been challenged in various ways: it leaves no place for the synthetic a priori, which Kant placed at the centre of metaphysics, nor for contingent a priori and necessary a posteriori propositions, of which Kripke has recently proposed examples.

The term has also been applied to Hume's related distinction between 'demonstrative' argument (such as deduction) and 'probable' (or causal) reasoning. Hume uses the dichotomy repeatedly to pose a dilemma for rationalists. If reason tells us, say, that the future resembles the past, then it must be by *demonstrative* arguments or *probable*. But demonstrative arguments cannot prove the uniformity of nature—since non-uniformity is conceivable. And probable arguments cannot prove it either—since probable arguments themselves presuppose the uniformity of nature, hence it would be circular to employ them in support of that uniformity. For another use, see the entry 'reason as slave of the passions'.

Hume's *Enquiry Concerning Human Understanding* ends with a dramatic employment of the fork, beloved of Logical Positivists in the 1930s for making havoc with false

metaphysics. 'If we take in our hand any volume; of divinity or school metaphysics, for instance; let us ask, *Does it contain any abstract reasoning concerning quantity or number?* No. *Does it contain any experimental reasoning concerning matter of fact and existence?* No. Commit it then to the flames: for it can contain nothing but sophistry and illusion.'

J.BRO.

\*Logical Positivism; verification principle.

David Hume, *Enquiry Concerning Human Understanding*, pt. iii, sect. 4 and 12.

Antony Flew, *Hume's Philosophy of Belief* (London, 1961), ch. 3.

**form, logical.** The logical form of a sentence—or of the \*proposition expressed by the sentence—is a structure assigned to the sentence in order to explain how the sentence can be used in logical arguments, or how the meaning of the sentence is built up from the meanings of its component parts. A translation of a sentence into logical notation is sometimes called its 'logical form'. Views differ on the reality and uniqueness of logical forms, and whether they are in some way prior to the sentences which have them. Analytic philosophers have seen it as a goal of philosophy to uncover the logical forms of propositions. Chomsky and other linguists have argued that a \*grammar of a natural language should show how to ascribe logical forms to sentences.

W.A.H.

G. Preyer and G. Peter (eds.), *Logical Form and Language* (Oxford, 2002).

**formal and material mode.** Influenced by developments in foundations of mathematics, Carnap elaborated on the claim that formal features of a language (*L*) are clearly distinguishable from semantical features. Formal features of *L* are given by its syntax, which includes a sorted vocabulary, formation rules for \*well-formed formulae, as well as transformation rules for deriving sentences from sentences.

Genuine object sentences of an interpreted language *L* are not translatable into syntactical sentences about *L*. It is claimed, however, that there are sentences which seem to be genuine object sentences (characterized as pseudo-object sentences) but which are translatable into sentences about *L*'s syntax. The former are said to be in the material mode, the latter are said to be in the formal mode.

Material mode sentences are often unproblematic. However, some are seen as generating confusions resolvable by translation into the formal mode. Examples adapted from Carnap are the two sentences:

5 and  $3 + 2$  are the same.

5 and  $3 + 2$  are equal but not the same.

in the material mode, which are, in the language of arithmetic, both translatable into the single formal mode sentence:

The expressions '5' and ' $3 + 2$ ' are interchangeable \**salva veritate*.

The words 'formal' and 'material' were first applied to the distinction in the Middle Ages, but the other way round.

R.B.M.

R. Carnap, *Logical Syntax of Language* (London, 1937).

**formalism.** A number of philosophical views concerning mathematics go by this name. They all seem to focus on the extent to which mathematical proof can be construed or modelled as the following of mechanical rules on sequences of typographic characters. The formulae may as well be meaningless, as far as the philosophies are concerned. One aim is to provide a tractable epistemology for mathematics while avoiding commitment to a presumably dubious ontology.

Opponents of formalism claim that mathematics is inherently informal and perhaps even non-mechanical. Mathematical language has meaning and it is a gross distortion to attempt to ignore this. At best, formalism focuses on a small aspect of mathematics, deliberately leaving aside what is essential to the enterprise.

One version of formalism, which might be called 'game formalism', holds that the essence of mathematics is the following of meaningless rules. Mathematics is likened to the play of a game like chess, where characters written on paper play the role of pieces to be moved. All that matters is that the rules have been followed correctly.

Many formalist programmes are connected to developments in mathematical logic earlier this century. (\*Logic, history of.) Formal languages and deductive systems were formulated with mathematical rigour, and the systems themselves became objects of mathematical study. Such efforts became known as *metamathematics*. Presumably, the essence of metamathematics goes beyond the mere following of meaningless rules. Its goal is to shed light on a subject-matter, namely formal languages and deductive systems. Thus, a game formalist would either demur at this point, or else hold that metamathematics is not mathematics—an oxymoron at best. But not all formalists are game-formalists.

David Hilbert and his followers held that the only meaningful, or 'contentful', parts of mathematics consist of finitary assertions about finitary objects, like natural numbers. This includes particular statements like ' $234 + 123 = 357$ ' and generalizations like ' $a + b = b + a$ ', made with free variables. It does not include statements, like 'for every *n* there is a *p* greater than *n*, such that *p* and *p* + 2 are both prime', that contain bound variables ranging over an infinite domain. The infinitary, or 'ideal', parts of mathematics, including analysis and set theory, have value only in the role of facilitating the production of finitary, contentful statements. In each case, we need to be assured that the use of ideal mathematics does not yield anything incorrect about the finitary part. (\*Instrumentalism.) The Hilbert programme called for each branch of mathematics to be formalized and for the formalisms to be studied metamathematically. Noting that the subject-matter of metamathematics—sequences of characters—is finitary, Hilbert declared that metamathematics be conducted

with only finitary means. Then, once the consistency of a formal deductive system is established, the system can confidently be used to produce finitary results. (\*Consistency proofs.)

The ensuing metamathematical research culminated with Gödel's incompleteness theorems, which dealt a serious blow to the Hilbert programme. In particular, the 'second' theorem is that if Peano arithmetic is consistent, then its own consistency cannot be established by methods codified in that system, let alone in a finitary fragment. The same goes for classical analysis, set theory, and virtually any other sufficiently rich formal system. If the theory is consistent, its consistency cannot be established in the system itself.

Another formalist philosophy of mathematics was presented by Haskell Curry. The programme depends on a historical thesis that as a branch of mathematics develops, it becomes more and more rigorous in its methodology, the end-result being the codification of the branch in formal deductive systems. Curry claimed that assertions of a mature mathematical theory should be construed not so much as the results of moves in a particular formal deductive system (as a game-formalist might say), but rather as assertions *about* a formal system. An assertion at the end of a research paper would be interpreted in the form: 'Such and such is a theorem in this formal system.' For Curry, then, mathematics is an objective science, and it has a subject matter—formal systems. In effect, mathematics is metamathematics. Constructively established results in metamathematics count as legitimate mathematics. (\*Constructivism.) Non-constructive results in metamathematics, like most of model theory, are accommodated by producing a formal system for metamathematics, and construing the results in question as theorems about that formal system. s.s.

**formalism, ethical:** *see* ethical formalism.

**formalization.** To formalize something, such as an argument, is to spell it out in a formal, or perhaps semi-formal, language, such as the \*predicate calculus. The purpose may simply be to render perspicuous something that was not so perspicuous in the original. Or it may be to display what is thought to be the \*logical form of the original. In either case, certain assumptions will need to be made about the relation of ordinary language to formal languages. One strand in the 'ordinary-language philosophy' of the 1950s and 1960s was an attitude of suspicion towards formalization in philosophy (apart, of course,

from philosophy of logic and maths). Some might think that the pendulum has swung rather too far back now; certainly, the aim of perspicuity is often better served by a lucid vernacular than by symbols. R.P.L.T.

M. Sainsbury, *Logical Forms* (Oxford, 1991).

**formal language.** A formal language is a language two of whose features are formally specified: the linguistic symbols of the language and rules for joining together or concatenating these symbols into \*well-formed formulae or words which can be assigned precise meanings. In standard first-order logic the formal language consists of variables, constants, logical connectives, function and relational symbols, parentheses, and quantifiers, together with rules for the construction of well-formed formulae. Kurt Gödel discovered a method for assigning natural numbers to the well-formed formulae of standard first-order theory, and this discovery provided the basis for the proof of his famous incompleteness theorem. The development of formal languages for computer programs in the 1950s was inspired by the established formal languages used by logicians. G.F.M.

R. Wilder, *Introduction to the Foundations of Mathematics* (New York, 1952).

**formal logic:** *see* logic, formal or symbolic.

**formal semantics, the philosophical relevance of.** Philosophers and logicians have developed mathematically precise ways to study the relationship between a language and its subject-matter by using methods originally developed for the interpretation of formal systems in logic. The extension of this framework from formal to natural languages is justified by adopting Frege's truth-conditional approach to meaning. The key idea here is that since a declarative sentence can represent the world as being a certain way, the meaning of a sentence can be given by stating the conditions the world has to meet for things to be as the sentence says they are. These are \*truth-conditions. To give the meaning of every sentence of the language we must specify the truth-conditions of each declarative sentence, then relate non-declarative to declarative sentences. Formal semantics addresses the former task, the theory of force attempts the latter.

\*Semantics studies the relation between language and the world, but the relationship is complicated by the fact that sentences are also inferentially related to one another. For example, by sharing some of the same parts, sentences can be about the same thing, and can even contradict one another. When logical connections obtain between sentences, the truth of one may require or preclude the truth of others. So in relating language to the world these connections must be preserved to ensure the right patterns amongst the truth-values assigned to whole sentences.

Logicians first studied these connections in the context of formal systems: languages in which we construct proofs by applying rules of inference to formulae built up from a fixed set of rules and symbols. To ensure that

inferences rules are valid (i.e. that their transitions are truth-preserving) we must interpret the formal language, provide definitions for the truth of its formulae, then discover whether the inferential relations are logical consequences, permitting only the derivation of truths from truths.

Interpretations, or models, of these systems are specified in terms of abstract mathematical structures. First we specify a structure, and then construct an interpretation function by assigning elements of the structure to the basic symbols of the language as their semantic values. The semantic values of complex expressions are then defined inductively in terms of the values of their simpler parts. In this way, the truth-value of a formula is determined by the semantic values of its parts, the syntactic arrangement of the formula, and relations in the structure between those semantic values. Formulae true in all models are *logical truths*; truth links which hold in all models are *logical consequences*.

Model-theoretic and truth-theoretic semantics provide the two leading versions of truth-conditional semantics for natural language. Model theory maps sentences and their parts on to configurations of elements in the domain, or structure, of a model. The mapping reveals meaning-connections between sentences by exhibiting relations between configurations in the domain. Sentences which share parts will have elements of their truth-conditions in common; namely, the entity, or entities, assigned to those expressions. By this mapping we can plot relations between sentences as represented by the patterns amongst the objects, properties, and relations assigned to expressions which figure in those sentences. Each set of assignments, or model, corresponds to a world in which some of those sentences are true and others are false.

The best-worked-out semantics for a fragment of English occurs in Richard Montague's paper 'The Proper Treatment of Quantification in Ordinary English', in which set-theoretical constructs used in specifying the models are not restricted to domains of real entities but include objects existing in other possible worlds and at other times. Thus *possible world semantics* can be carried out model-theoretically to provide truth-conditions for sentences not just in the actual world but in all possible worlds.

Truth theory offers another version of the truth-conditional approach to meaning. Drawing on the work of Tarski in defining truth for formalized languages, a truth theory aims to state the truth-conditions for every declarative sentence of the language *L* by proving every *T*-sentence of the form:

(*T*) *S* is true-in-*L* if and only if *p*,

where the metalanguage 'is true-in-*L*' is appended to a sentence *S* of the object language *L* when and only when certain conditions *p* obtain. Proof of each instance of *T* proceeds from axioms which assign references to the simple parts of the object-language sentence, together with axioms that state the consequences for truth of combining

those expressions in sentences. A truth theory for a language is a finite set of such axioms. Davidson has argued that such theories can serve as theories of meaning.

In the early 1980s a new paradigm, called situation semantics, was developed by Barwise and Perry. It treats utterances as containing not only information about the world, as in model-theoretic semantics, but also information about speakers and their relations to the world. Sentence-meanings are not given by truth-conditions, but defined in terms of relations between situations, the utterance being itself a situation which carries information used in interpreting the sentence. Meaning-connections between sentences reflect the relation of one situation-type to another; e.g. kissing involves touching. More work is needed, however, before this serves as a competitor to truth-conditional semantics.

**form and matter.** The complementary notions of form and \*matter are wholly central to the metaphysical theories of Plato and Aristotle, indeed to all ancient and modern metaphysical inquiry. Most primitively, the matter of any item is the stuff, the material of which it is made, for example clay or iron; the form is the organization, shape, pattern given to that stuff by a craftsman, for example by a potter in making a bowl. From such elementary beginnings the most difficult and exciting metaphysical theses have evolved, such as Plato's theory of Forms (or Ideas), where Forms were conceived of as separate existents which were, somehow, responsible for particulars being of the kind they were. Aristotle, by contrast, believed in immanent forms; the only real existents are already parcels of informed matter or enmattered form. Neither \*prime matter (formless and inchoate), nor pure forms, can exist independently. Debates over matter and form merge into debates over \*universals; and, although not central to the current agenda of metaphysical debate, these notions are, in some fashion or another, indispensable in thinking about the world and its structure.

N.J.H.D.

\*Forms, Platonic.

Jonathan Lear, *Aristotle: The Desire to Understand* (Cambridge, 1988) is useful on this topic.

**form of life.** An expression which occurs six times in Wittgenstein's published works. Much used by some \*Wittgensteinians, it has occasioned exegetical controversy. Wittgenstein employed it to indicate the roots of language and of agreement in application of linguistic rules, in consensual, regular forms of behaviour. This includes natural, species-specific action and response,

as well as concept-laden, acculturated activities. Speaking a language is part of a form of life (a culture) and to imagine a language is to imagine a form of life. What has to be accepted, the given, is not the empiricist's mythical sense-data constituting the foundations of knowledge, but forms of life that lie beyond being justified or unjustified.

**Forms, Platonic.** The word 'Form' is used to translate Plato's Greek word *idea*, which is sometimes transliterated into English as 'Idea'. From an etymological point of view the Greek word means the look of a thing, but it was commonly extended to mean a sort, kind, or type of thing. (Compare the Latin word *species*.) What is called Plato's theory of Forms (or Ideas) is a theory about sorts, kinds, or types, and its main claim is that a type exists independently of whether or not there are things of that type. It appears that Plato was led to the theory in the first place by considering such types as the type of person who is virtuous, but he then extended it to many other types. D.B.

\*Aristotle; cave, analogy of; metaphysics, the history of; phenomena and noumena; Plato; Platonism; third-man argument; transcendentalism.

Almost any book on Plato will say something of his theory of Forms. A classic treatment is W. D. Ross, *Plato's Theory of Ideas* (Oxford, 1951).

**formula.** The word has no very rigid meaning, but in logic it is customarily applied to written expressions that are strings of symbols containing no words. A formal language consists of a vocabulary of symbols—e.g. 'P', 'x', 'V', '—'—together with rules determining which strings of them are well formed. The well-formed formulae may then be manipulated mathematically; or they may be 'interpreted' (e.g. as \*schemas, or as having meanings); or both. C.A.K.

**Foucault, Michel** (1926–84). French intellectual whose politically as well as philosophically motivated examinations of obscure historical materials were aimed at diagnosing the present. He called his early books archaeologies. Although they appear concerned with origins, Foucault insisted that his topic was the implicit knowledge that underlay and made possible specific practices, institutions, and theories: *Madness and Civilization* (1961), on the birth of the asylum, offered an archaeology of how the exchange between madness and reason was silenced; *The Birth of the Clinic* (1963) was 'An Archaeology of the Medical Gaze'; and *The Order of Things* (1966) was 'An Archaeology of the Human Sciences'. In his theoretical manifesto, *The Archaeology of Knowledge* (1969), Foucault redefined archaeology as the set of discourses that constitute 'the archive'.

Foucault's inaugural lecture at the Collège de France, 'The Discourse on Language' (1971), was a transitional

text in which he subordinated archaeology to the critical analysis of forms of exclusion and to the genealogical study of the formation of \*discourse. Out of concern for prison reform, Foucault returned to the history of practices in *Discipline and Punish* (1975) with a study of the birth of the nineteenth-century prison. He developed its account of the interaction of knowledge and \*power further in *The Will to Knowledge* (1976), the first volume of a projected six-volume *History of Sexuality*.

Foucault ultimately came to recognize that what interested him about power was how it produced the subject. The *History of Sexuality* was redesigned to present a genealogy of the desiring subject, conceived on the model of Nietzsche's *Genealogy of Morals*; *The Use of Pleasure* and *The Care of the Self* studied Greek and Roman texts on the art of living. The theory of historical discontinuity that is still often associated with Foucault's name does not apply to these works and really applies only to *The Order of Things*. R.L.B.

G. Deleuze, *Foucault* (Minneapolis, 1988).

**foundationalism.** The theory that \*knowledge of the world rests on a foundation of indubitable beliefs from which further propositions can be inferred to produce a superstructure of known truths. Traditionally, it is beliefs about our sense experience that have formed the foundation, with beliefs about the external world forming the superstructure. However, the assumption that beliefs about sense experience are infallible has come in for heavy criticism, witness Sellars's attack on the 'myth of the \*given'. O.R.J.

Wilfrid Sellars, *Science, Perception and Reality* (London, 1963), ch. 5, sects. 3–11.

**foundationalism in mathematics.** Foundationalism is the view that a body of knowledge, such as mathematics (or one of its branches such as arithmetic or analysis), ought to be built on an absolutely secure epistemic foundation. The foundationalist begins with axioms that are self-evident, or, failing that, axioms that are as certain as possible. One might argue, for example, that the truth of the axioms is presupposed by all thought: they cannot be doubted if one is to think at all. The foundationalist derives the truths of the area of knowledge from the axioms using absolutely reliable inferences, a logic which is self-evidently valid. General foundationalism, traced to rationalists like \*Descartes, is not widely held any more, but the mathematical version survived well into the twentieth century, if not beyond, motivated in part by the logical and semantic paradoxes. \*Gödel's incompleteness theorems dealt a blow to foundationalism concerning mathematics. If a mathematical theory is sufficiently rich, and if the set of axioms and the consequence relation used

in the derivations are both effective, then either some truths cannot be derived, or some non-truths can be derived (assuming bivalence). At best, the foundationalist can only claim to have secured the basic truths of mathematics. s.s.

Stewart Shapiro, *Foundations without Foundationalism: A Case for Second-Order Logic* (Oxford, 1991).

**Four Freedoms.** Asserted in their canonical form by US President Franklin Delano Roosevelt on 6 January 1941 in his State of the Union address to Congress as the 'four essential human freedoms': freedom of speech and expression, freedom of every person to worship God in his own way, freedom from want, and freedom from fear. They are usually cited in abbreviated form as freedom of speech and of religion, and freedom from want and from fear. Widely regarded during the Second World War as a succinct statement of the Allied war aims, despite notable failures to achieve these 'freedoms' among the Allies. The Four Freedoms are a concise anticipation of what would later become the various 'human rights' declared by the United Nations General Assembly in its 1948 Declaration of Human Rights. H.A.B.

\*freedom; liberty.

**Four Noble Truths:** see Buddhist philosophy.

**four-term fallacy.** A \*syllogism with four, rather than three, terms commits this fallacy. Since the requirement that it must have three terms is generally specified in the definition of a syllogism, it is pointless to regard four terms as a fallacy, and arbitrary to specify four as opposed to any number other than three. This is probably why the four-term fallacy has often been conflated with the 'fallacy of equivocation', i.e. \*ambiguity. C.W.

C. L. Hamblin, *Fallacies* (London, 1970), 44–5, 197–9.

**frame problem.** An important feature of human intelligence is that people are able to make selective topical use of long-stored background knowledge, and know how to adjust their thinking or behaviour appropriately in the light of new information. They know when to ignore new information as irrelevant, and when and how to take it into account in determining how to proceed. It is difficult to see how exercising these abilities can just be a matter of following a predetermined routine or set of rules, of the sort that might be embodied in a computer programme. For example, although it may be possible to reduce to a set of rules the behaviour typically involved in ordering a meal in a restaurant, people do not slavishly follow such rules, because one's actual behaviour in a restaurant is always sensitive to unforeseen contingencies, such as the unexpected arrival of an old friend or, more alarmingly, the occurrence of an earthquake. The difficulty which this presents for any attempt to replicate or mimic human intelligence by means of a computer programme is known as the frame problem. E.J.L.

Z. W. Pylyshyn (ed.), *The Robot's Dilemma: The Frame Problem of Artificial Intelligence* (Norwood, NJ, 1987).

**Frankena, William K.** (1908–94). Influential American philosopher, at the University of Michigan for more than forty years. His first published paper was a telling critique of G. E. Moore's notion of the \*naturalistic fallacy. By his own account ('Concluding More or Less Philosophical Postscript') Frankena in his earliest period was 'cognitivist', combining naturalism about 'good' and intuitionism about 'ought'. Subsequently, he became less satisfied with this position, and took up a greater variety of topics. He absorbed some emotivist ideas, did work on the relation between ethics and religion (sympathetic to religion), and wrote on philosophy of education. Frankena's way of doing conceptual analysis and normative justification has provided a model in some respects for many American philosophers working in ethics. E.T.S.

William K. Frankena, 'Concluding More or Less Philosophical Postscript', in Kenneth E. Goodpaster (ed.), *Perspectives on Morality: Essays by William K. Frankena* (Notre Dame, Ind., 1976).

**Frankfurt, Harry** (1929– ). Professor of Philosophy at Princeton (1990– ), he formerly taught at Yale (1976–89) and Rockefeller University (1965–76). His early work revived the debate over the alleged circularity of Descartes's defence of reason. His essay 'Freedom of the Will and the Concept of a Person' (1971) argued for the special significance of the capacity for reflective self-evaluation apparently unique to human beings that is manifested in the formation of what he labelled 'second-order desires', i.e. the capacity not merely to have desires, preferences, or motives (which capacity human beings share with certain animals) but also to *want to have* (or not to have) certain desires, preferences, or motives.

His recent work develops the implications of his view that volition is more pertinent even than reason to our experience of ourselves. In *The Importance of what we Care About* (Cambridge, 1988), he explores various forms of necessity, our being unable to avoid willing some things, our being unable to will other things. Such facts simultaneously limit our \*autonomy and make autonomy possible. R.P.G.

**Frankfurt School.** A German philosophical and sociological movement associated with the Institute for Social Research founded within Frankfurt University in 1923. One of its founders, and in 1930 its director, was Max Horkheimer (1895–1973). In the 1930s he expounded the \*'critical theory' of the school in its journal, *Zeitschrift für Sozialforschung* (*Critical Theory: Selected Essays*, (1968; tr. New York, 1972)). Only a radical change in theory and practice can cure the ills of modern society, especially unbridled technology. Every one-sided doctrine is to be subjected to criticism, including Marxism: an emancipating proletarian revolution is not inevitable, and thought or theory is relatively, though not wholly, independent of

social and economic forces. But since theory and its concepts are a product of social processes, critical theory must trace their origins, and not, like empiricism and positivism, accept them and thereby indirectly endorse the processes themselves. Horkheimer also contributed to the sociological work *Authority and Family* (1936).

In 1934 the institute closed, Horkheimer and other leading members, such as Adorno and Marcuse, emigrated, and it was re-established in New York as the New School for Social Research. Several important works appeared during the period of exile: Marcuse's *Reason and Revolution* (1941), Adorno and Horkheimer's *Dialectic of Enlightenment* (1947; tr. New York, 1972), Adorno's wide-ranging and aphoristic *Minima Moralia* (1951; tr. London, 1974), and the collective work by Adorno and others *The Authoritarian Personality* (New York, 1950). The institute returned to Frankfurt in the early 1950s, and, while Marcuse and others remained in the USA, Horkheimer and Adorno also returned. Adorno was its director from 1958 until his death in 1969.

The leading member of the school in its recent history is Jurgen Habermas (1929– ), whose *Theory and Practice* (1963; tr. Boston, 1973) and *Knowledge and Human Interests* (1968; tr. Boston, 1971) argue that the sciences depend on ideological assumptions and interests, and that enlightenment reason has become an instrument of oppression. In contrast to this, he projects the ideal of a communication which involves all rational subjects and is entirely free of domination and error-inducing interest. Like other members of the school, such as Marcuse (*Eros and Civilization* (Boston, 1955)), Habermas is interested in psychoanalysis and other non-Marxian types of liberation.

Since the school in general believes that science and \*positivism are riddled with non-theoretical interests and that reason has become repressive, they cannot accept without qualification Weber's view that the sciences should be value-free, avoiding value-judgements about the people and institutions they study. They argue, for example, that science already embodies value-judgements, such as the desirability of the technological domination of nature, which, though in fact questionable, seem so self-evident that they appear not to be value-judgements at all, but simply disinterested devotion to science. The postulate of value-freedom in effect insulates such well-entrenched value-judgements from criticism by disqualifying potential competitors. Adorno and Habermas debated this issue with Popper and his followers in T. W. Adorno *et al.*, *The Positivist Dispute in German Sociology* (1969; tr. London, 1976).

**Frede, Michael** (1940– ). Professor of the History of Philosophy in the University of Oxford. Historian of ancient philosophy who is sensitive to the methodological distinction between writing history of philosophy as history and writing history of philosophy as philosophy. His approach entails locating ancient texts in a causal network of other 'histories': medicine, law, religion, politics, for example, and attempts to exhibit philosophical problems as they were conceived and treated by the ancients themselves. His first book, *Prädikation und Existenzaussage* (1967), initiated a debate over Plato's *Sophist*. *Die Stoische Logik* (1974) provided new ways of understanding Stoic logic. Frede is co-author (with Günther Patzig) of a German translation and commentary on Aristotle's *Metaphysics Z* (1988) and author of many papers. Some of these have been usefully collected in *Essays in Ancient Philosophy* (1987).

**free, freedom:** see two groups of entries: (1) freedom and determinism; determinism; scientific determinism; libertarianism; origination; the will; autonomy; voluntariness; embraced and reluctant desires; spontaneity and indifference; compatibilism and incompatibilism; responsibility; fatalism; destiny; (2) political freedom; liberty; liberalism; freedom through reason and goodness; freedom of goodness and reason; self-determination; right to a homeland; hegemony; Four Freedoms; freedom of speech; imperialism.

**freedom, academic:** see academic freedom.

**freedom, political.** The problem of political freedom can be seen as that of reconciling the value of freedom with the restrictions which seem to be a necessary feature of life in a political society. One natural approach is to view the task as that of effecting a compromise: some degree of freedom must be sacrificed, but it must not be too much. The problem then becomes one of where to draw the line. A popular answer has been to appeal to the idea of basic human \*rights (sometimes called \*‘natural rights’) and to suggest that these are the freedoms which ought to be safeguarded in any society. Favourite examples are rights to freedom of speech and freedom of assembly, or to freedom of contract, or the right to ownership and control of one’s own body and therefore to the products of one’s own labour. Any such list of rights, however, is controversial, and it is difficult to find any objective way of determining *what* basic rights people have.

One philosophical tradition which has tried to provide a way of dealing with this problem is social contract theory. (\*Contract, social.) In a \*‘state of nature’, it is supposed, men enjoy what is in one sense an absolute liberty, since there is no government to command them, but each individual’s liberty is in practice restricted by every other individual’s exercise of liberty. Justifiable restrictions on liberty are therefore those restrictions imposed by the contract which is needed to set up a social order. Thus Hobbes supposes that the state of nature would be one of perpetual war, and that in order to preserve the peace the contract must give the sovereign an absolute power of life and death over every subject. Locke takes a more benign view of the state of nature; it is not, he supposes, a condition of war, but a more settled state of affairs in which men have natural rights to life, liberty, and property, and the power of governments must therefore be limited by respect for those rights and by the consent of the governed. Rousseau’s view of the state of nature is more positive still; ‘man is born free’, and if he is nevertheless ‘everywhere in chains’ the only thing which can make this authority legitimate is a contract which combines the wills of individuals into a ‘general will’ in which everyone participates. By such a contract the individual loses his ‘natural liberty’ but gains a ‘civil’ and ‘moral’ liberty which ‘makes him truly master of himself’. It is clear, then, that the account of political freedom given by social contract theorists depends on their view of what a state of nature would be like, and since this state of nature is a hypothetical condition which has never actually existed, there are obvious difficulties in using the notion to resolve the problem of freedom.

An alternative approach is the utilitarian idea put forward in John Stuart Mill’s essay *On Liberty* that freedom should be limited only by the ‘harm’ principle: individuals should be free to do anything which does not harm others, but actions which do harm others may properly be restricted by society. Mill especially emphasizes the benefits of freedom of speech. He also maintains that freedom

of action should extend to those acts by which individuals might harm themselves, provided they do not thereby harm others. His critics have suggested that this distinction is difficult to sustain, since in harming myself I inevitably make myself a less useful member of society and make demands on shared resources (for example, medical resources), thereby harming others.

A more fundamental criticism of this approach has been that it assumes a purely negative and individualistic view of freedom, as simply the absence of restriction or coercion. In contrast, philosophers such as Hegel and his followers have maintained that individuals are truly free not when they act on this or that arbitrary caprice, but when they have rational control over their lives. They have further suggested that this is possible only through active involvement in the life of a society. Hegel thinks that the duties of political life give an objective rational content to the lives of individuals. Others have suggested that it is through participation in a democratic political system that people can effectively control their lives. A further variant on this approach is the emphasis to be found in Marx and the Marxist tradition on the economic dimension of freedom: to be free, people must be able to employ the material resources which they need to give effect to their choices, and this is possible only through collective control over the productive powers of society. All of these suggestions call into question the idea with which we began, of a compromise between the freedom of the individual and the power of society, since they imply that only as social beings are people capable of exercising freedom in the first place. Underlying these philosophical differences is the continuing debate over whether the concept of \*liberty is more properly to be understood in negative or positive terms.

**freedom and determinism.** The great problem of freedom and determinism is really two problems, one of them metaphysical and empirical in kind, the other ethical and in other ways attitudinal in kind. The first problem is that of whether human choices and actions are causally determined or are in a way free. The second problem is that of the implications of determinism for our moral, personal, and social lives.

\*Determinism in the context of these problems, to be more specific, is usually the thesis that all our mental states and acts, including choices and decisions, and all our actions are effects necessitated by preceding causes. Thus our futures are in fact fixed and unalterable in much the same way that the past is. The truth or falsity of the thesis depends upon our natures, including our physical natures, and not at all upon our desires or hopes or other feelings.

What freedom comes to with these problems is much disputed. Different concepts enter into both the factual and the attitudinal problem. Metaphysical freedom or

\*origination, one of the two main kinds, involves not being completely governed by deterministic causal laws. Those who support it say there are no laws, whether of mind or brain or both, that completely settle what we will choose and do. Metaphysical freedom also involves not just the absence of such laws but also our having a kind of power to choose which path the future will take.

Let us start with the second problem to the fore (they are a little hard to keep apart). In everyday life, we suppose that free actions in some sense or other are the only ones for which we can hold persons morally responsible, or for which we can appropriately feel gratitude or resentment (Strawson). Ordinary morality says that we are excused for doing something that would otherwise be blameworthy if we can establish that in some sense or other we had no choice in the matter, that in some sense or other we could not have done otherwise.

Some philosophers, incompatibilists, believe that determinism if true destroys \*moral responsibility, undermines interpersonal relations, and destroys our life-hopes by making all actions unfree. Freedom and determinism are incompatible. Incompatibilists who also believe that determinism is false, and hence that some actions are morally responsible, are often called \*libertarians. Incompatibilists who also believe, differently, that determinism is true, and moral responsibility is therefore an illusion, are sometimes called, following William James, hard determinists.

Other philosophers, compatibilists, deny that determinism has any such effect on freedom and moral responsibility. Freedom and determinism are compatible. They are sometimes called soft determinists, but this description has the unfortunate effect of officially conflating the problems of the truth of determinism (the first problem) and our appropriate response to it (the second problem). In fact some of these philosophers do not believe in determinism, and maybe not in the denial of determinism, but only believe that if it is true, this does not have the upshot that we are not free and responsible. (Another logically possible position—determinism is false but moral responsibility still fails to exist—has no advocates and no name. Perhaps we should call it libertinism.)

Compatibilists rest their argument on the claim that the sense of 'free' in which actions must be free in order to be morally responsible is *not* the sense that involves origination and is opposed to 'caused' or 'determined'. We only need to be free in the sense in which 'free' is opposed to 'compelled' or 'coerced'. We only need to be voluntary in this sense. All we need is voluntariness. (Think of what men in prison lack, or anyone who is subject to a serious addiction.) In G. E. Moore's famous analysis, I am free in performing an action if *I could have done otherwise*, but this latter proposition is to be understood as *I would have done otherwise if I had chosen*. So I could have done otherwise even if determinism is true.

Moore's analysis seems to capture much of the pre-theoretical or everyday-life distinction between excused and unexcused infractions of the moral law. Its essential

notion is that some actions result from effective choices by the actor, and hence are free, and some do not result from such choices, and are not free. Moore's analysis, nevertheless, seems beside the point to libertarians, because, as they say, if determinism is true, I could not have *chosen* otherwise in the right sense, and therefore could not have *done* otherwise. I could not have originated anything. Thus, they say, moral responsibility collapses.

Honderich has argued persuasively that the long-running compatibilism–incompatibilism controversy springs from what it overlooks, the systematic ambiguity of talk of freedom. We each have two conceptions of freedom, not one. One involves both origination and voluntariness, while the other involves voluntariness alone. If this is so, compatibilism and incompatibilism are both false—both claim that we have just one conception of freedom or that there is one correct conception of it. For Honderich, *something* of moral responsibility and much else must change if determinism is true, but not everything must change. The problem is more attitudinal than conceptual. Some of our present attitudes and responses, which depend on ideas of origination, are impossible if determinism is true. But other kinds of them *are* possible. Certain kinds of 'life-hopes, personal feelings, knowledge, moral responsibility, the rightness of actions and the moral standing of persons . . . persist, and our lives do not become dark, but remain open to celebration'.

To focus on the factual question, one historical argument against the truth of determinism has to do with our common experiences of choosing and deciding. In a genuine case now of choosing or deciding, according to libertarians, I am directly aware of my freedom to realize either alternative—I know that whatever has happened before now, or whatever is the case now, I can now raise my arm or refrain from raising my arm. This freedom of origination, of which I am indubitably aware, is inconsistent with determinism. Therefore determinism is false. John Stuart Mill responded that this supposed awareness of mine is only a memory of and mistaken inference from past occasions, some occasions on which we took something like the first alternative and some occasions on which we took something like the second alternative. But on all such occasions, Mill argued, we followed our strongest motive, and in the present case we must do so as well. Our supposed awareness of origination may be of a type with awareness of a metaphysical self—universally accepted among philosophers until Hume said, in short, 'I can't find it', and seemed to be right.

It has been argued, in this vein, that \*libertarianism does not give us an explanation of human action. It gives us a blank where an explanation should be. And, one might add, it would take a very odd *something* to fill in the blank. The desired entity—whether called mind, soul, self, agent, or originator—must be sufficiently connected to the past to constitute a continuing locus of personal responsibility, but sufficiently disconnected so that its past does not determine its present. It must be sufficiently connected to the causal chain to be able to interrupt it, but

sufficiently disconnected not to get trapped. It must be susceptible to being shaped and maybe governed by motives, threats, punishments, and desires, but not totally controlled by them. It resembles very much the river god, who serves as an explanation for what seems to be the free behaviour of the river—the explanation of its surges and whatever else happens—until a better explanation comes along through physical geography, meteorology, and physics. The mind or originator or whatever is, you might think, a lot worse than what Gilbert Ryle disparaged as ‘the ghost in the machine’.

If indeterminists seem dated in their description of what fundamental thing is free (Strawson spoke of their ‘obscure and panicky metaphysics’), they can be up to date in their arguments that something or other is free. The weight and intellectual respectability of physical science are claimed to be on their side. \*Quantum mechanics is said to have rejected causal determinism. But the kind of indeterminism involved in quantum mechanics is randomness, pure chance. If my arm randomly jerks and strikes someone, that is just the kind of thing that *excuses* me from moral responsibility. Indeed, there must be some causal link between my action and my past life for it to make sense to think of it as *my* action. Libertarianism needs to steer a course between the Scylla of randomness and the Charybdis of determinism. Maybe there isn’t any such course.

**freedom and liberty.** These two words are often used interchangeably, except inasmuch as \*‘freedom’ exists in the form of an adjective (‘free’) and \*‘liberty’ does not. Thus, we talk of ‘free will’ and ‘free action’. Occasionally, more through stipulation than reflection of ordinary usage, the use of one term rather than the other is appropriate. On these occasions, ‘freedom’ refers to the *ability* of people to act. Thus in discussions of \*freedom and determinism, it is the freedom of the will that is at issue. There are a number of conceptions of ‘liberty’. Perhaps the clearest refers to the fact that the relevant political or judicial system gives people *permission* to do something: that is, they have no duty not to do that thing. Thus it is possible that people might have permission to do something they do not have the ability to do (perhaps because of impairment), and the ability to do something they do not have permission to do. In this respect, freedom and liberty can vary independently.

D.M.

J. Feinberg, *Rights, Justice and the Bounds of Liberty* (Princeton, NJ, 1980).

**freedom of goodness and reason.** The view that a good and reasonable man is free, even though he be a slave, is famously associated with the \*Stoics, but it pre-dated them and has long outlived them. Many have thought that to talk of ‘freedom’ in this way is to part company entirely with established usage, and therefore to render meaningful disagreement impossible. However, if ‘freedom’ can mean the opposite of ‘enslaved’, then it is at least meaningful to describe it as threatened by enslavement to bad or unreasonable desires. With the conception of freedom as the capacity to will what is reasonable and good, the problem of \*freedom and determinism disappears, since if one is caused to act reasonably and is free in virtue of that, having the capacity to act otherwise, in the indeterminist sense, is otiose.

K.M.

M. J. Adler, *The Idea of Freedom* (New York, 1958).

**freedom of speech.** Celebrated as first among \*civil liberties, freedom of speech (conceived broadly as the expression of verbal as well as non-verbal utterance) is both an instrumental and intrinsic good; instrumental as a necessary condition of inquiry and of intrinsic value as an element in individual well-being and self-fulfilment.

Legitimate grounds for limitations on free speech fall into two categories: procedural, concerning restrictions of time, place, and manner on the form and forums of its exercise; and substantive, involving restrictions on content, such as libel, slander, incitement to riot, etc. Even in the latter cases, however, prior restraints (as distinct from civil or criminal responses after the fact) are rarely justified. Some would argue that speech can offend or annoy but never harm; others would concede that it can harm but that the harms are generally outweighed by the benefits and by avoidance of the harms its suppression would entail. Still others would favour censorship of pornography and obscenity because of the harm they do to vulnerable classes of persons generally.

As with other freedoms, the value of freedom of speech must be contrasted with its *worth*; without opportunities that wealth and power confer, one’s freedom of speech even in a liberal society may be worth very little. In any case, it will be distributed unequally even if equality of freedom of speech is otherwise guaranteed by law.

**Freedoms, Four:** see Four Freedoms.

**free logics.** Logical systems in which existential commitment is not assumed, in which names and predicates need not refer to anything, or in which sentences may not be made true or false by what does or does not exist. So, in free predicate logic,  $(\exists x)(Fx)$ , ‘There exists at least one  $x$  that is  $F$ ’, does not have to follow from  $Fa$ , ‘ $a$  is  $F$ ’. Free logic is called ‘free logic’ because, in contrast with

standard predicate calculus, the use of names is free from commitment to the existence of a referent.

Arguably, free logics do justice to the intuitive view that from the fact that the concept of something exists it does not follow that that thing exists: from 'A unicorn has a single horn' it does not follow that there are any unicorns. The intuitive view is not beyond question. Arguably, unicorns do exist but are fictional objects or exist in story-books or people's imaginations. 'Exists' does not mean the same as 'is a four-dimensional publicly observable object'. Arguably, in a world in which unicorns did not exist, story-books and people's imaginations would differ from the actual world.

There exists both modal and non-modal free logic. In free modal logic, the use of a name implies commitment to existence in at least one possible world, but this is commitment only to the possible existence of a referent, not to the existence of a referent.

**free riders.** Usually unintended beneficiaries of a socially provided public good for which they have made no contribution—a public good being one the consumption or use of which by one individual or group does not diminish or prevent its consumption or use by others, e.g. radio broadcasts and street lights. The 'free rider problem' is that of whether those who benefit in this way do so unjustly and whether, if so, they can rightly be forced to make a contribution.

**free will:** see freedom and determinism; origination.

**Frege, Gottlob** (1848–1925). The founder of modern mathematical logic. As a logician and philosopher of logic he ranks with Aristotle; as a philosopher of mathematics he has had no peer throughout the history of the subject. After taking his doctorate in philosophy at Göttingen, he taught at the University of Jena from 1874 until his retirement in 1918; apart from his intellectual activity his life was uneventful and secluded. His work was little read in his lifetime, and for a long time his influence in philosophy was exercised mainly through the writings of others.

Frege had an influence on analytic philosophy through Russell and on continental philosophy through Husserl. He is often thought of as a philosophers' philosopher, but it was his genius that made possible the work of writers who have caught the attention of the general public, such as Wittgenstein and Chomsky; and his invention of mathematical logic was one of the major contributions to the developments in many disciplines which resulted in the invention of computers.

Frege's productive career began in 1879 with the publication of a pamphlet with the title *Begriffsschrift*, which we can render into English as 'Concept Script'. The pamphlet marked an epoch in the history of logic, for within some hundred pages it set forth a new calculus which has a permanent place at the heart of modern logic. The concept script which gave the book its title was a new symbolism designed to bring out with clarity logical relationships which were concealed in ordinary language.

For generations now the curriculum in formal logic has begun with the study of the \*propositional calculus. This is the branch of logic that deals with those inferences which depend on the force of negation, conjunction, disjunction, etc. when applied to sentences as wholes. Its fundamental principle is to treat the truth-value (i.e. the truth or falsehood) of sentences which contain connectives such as 'and', 'if', 'or' as being determined solely by the truth-values of the component sentences which are linked by the connectives. Frege's *Begriffsschrift* contains the first systematic formulation of the propositional calculus; it is presented in an axiomatic manner in which all laws of logic are derived, by specified rules of inference, from a number of primitive principles. Frege's symbolism, though elegant, is difficult to print, and is no longer used; but the operations which it expresses continue to be fundamental in mathematical logic.

Frege's greatest contribution to logic was his invention of quantification theory: a method of symbolizing and rigorously displaying those inferences that depend for their validity on expressions such as 'all' or 'some', 'any' or 'every', 'no' or 'none'. Using a novel notation for quantification, he presented a first-order \*predicate calculus which laid the basis for all recent developments in logic and formalized the theory of inference in a way more rigorous and more general than the traditional Aristotelian syllogistic which up to the time of Kant was looked on as the be-all and end-all of logic. After Frege, for the first time, formal logic could handle arguments which involved sentences with multiple quantification, such as 'Nobody knows everybody' and 'Any schoolchild can master any language'.

In the course of his work Frege developed other branches of logic, including second-order predicate calculus and a version of naïve \*set theory. He did not explore the areas of logic known as modal logic (that part of logic that deals with necessity, possibility, and kindred notions) or tense logic (the logic of temporal or significantly tensed statements). These branches of logic had been studied in the Middle Ages, and have been studied again in the present century in the light of his innovations.

In the *Begriffsschrift* and its sequels Frege was not interested in logic for its own sake. His motive in constructing the new concept script was to assist him in the philosophy of mathematics. (It was his predominantly mathematical agenda which made him comparatively uninterested in the branches of logic which concern inferences about the transient and the changing.) The question which above all he wanted to answer was this: Do proofs in arithmetic rest

on pure logic, being based solely upon general laws operative in every sphere of knowledge, or do they need support from empirical facts? To answer this question, Frege set himself the task of seeing 'how far one could get in arithmetic by means of logical deductions alone, supported only by the laws of thought'.

Not only did Frege show how to conduct logic in a mathematical manner: he believed that arithmetic itself could be shown to be a branch of logic in the sense that it could be formalized without the use of any non-logical notions or axioms. It was in the *Grundlagen der Arithmetik* (1884) that Frege first set out to establish this thesis, which is known by the name of '\*logicism'.

The *Grundlagen* begins with an attack on the ideas of Frege's predecessors and contemporaries (including Kant and J. S. Mill) on the nature of numbers and of mathematical truth. Kant had maintained that the truths of mathematics were \*synthetic a priori, and that our knowledge of them depended on intuition. Mill, on the contrary, saw mathematical truths as a posteriori, empirical generalizations widely applicable and widely confirmed. Frege maintained that the truths of arithmetic were not synthetic at all, neither a priori nor a posteriori. Unlike geometry—which, he agreed with Kant, rested on a priori intuition—arithmetic was analytic, that is to say, it could be defined in purely logical terms and proved from purely logical principles.

The arithmetical notion of number in Frege's system is replaced by the logical notion of '\*class': the cardinal numbers can be defined as classes of classes with the same number of members; thus the number two is the class of pairs, and the number three the class of trios. Despite appearances, this definition is not circular, because we can say what is meant by two classes having the same number of members without making use of the notion of number: thus, for instance, a waiter may know that there are as many knives as there are plates on a table without knowing how many of each there are, if he observes that there is just one knife to the right of each plate. Two classes have the same number of members if they can be mapped one-to-one on to each other. We can define the number zero in purely logical terms as the class of all classes with the same number of members as the class of objects which are not identical with themselves.

In order to pass from a definition of zero to the definition of the other natural numbers, Frege has to define the notion of 'successor' in the sense in which the natural numbers succeed each other in the number series. He defines '*n* immediately succeeds *m*' as 'There exists a concept *F*, and an object falling under it *x*, such that the number of *F*s is *n*, and the number of *F*s not identical with *x* is *m*'. With the aid of this definition the other numbers (one, which is the successor of zero, two, which is the successor of one, and so on) can, like zero, be defined without using any notions other than logical ones such as identity, class, and class-equivalence.

In the *Grundlagen* there are two theses to which Frege attaches great importance. One is that each individual

number is a self-subsistent object; the other is that the content of a statement assigning a number is an assertion about a concept. At first sight these theses may seem to conflict, but if we understand what Frege meant by 'concept' and 'object' we see that they are complementary. In saying that a number is an object, Frege is not suggesting that a number is something tangible like a tree or a table; rather, he is denying that number is a property belonging to anything, whether an individual or a collection; he is also denying that it is anything subjective, any mental item or any property of a mental item. Concepts are, for Frege, mind-independent, and so there is no contradiction between the thesis that numbers are objective, and the thesis that number-statements are statements about concepts.

Frege illustrates this latter thesis with two examples. 'If I say "Venus has 0 moons", there simply does not exist any moon or agglomeration of moons for anything to be asserted of; but what happens is that a property is assigned to the concept "moon of Venus", namely that of including nothing under it. If I say "the King's carriage is drawn by four horses", then I assign the number four to the concept "horse that draws the King's carriage".'

But if number-statements of this kind are statements about concepts, what kind of object is a number itself? Frege's answer is that a number is the extension of a concept. The number which belongs to the concept *F*, he says, is the extension of the concept 'like-numbered to the concept *F*'. This is equivalent to saying that it is the class of all classes which have the same number of members as the class of *F*s, as was explained above. So Frege's theory that numbers are objects depends on the possibility of taking classes as objects.

It will be seen that Frege's philosophy of mathematics is closely linked to his understanding of several key terms of logic and of philosophy; and indeed in the *Begriffsschrift* and the *Grundlagen* Frege not only founded modern logic, but also founded the modern philosophical discipline of philosophy of logic. He did so by making a sharp distinction between the philosophical treatment of logic and, on the one hand, psychology (with which it had often been confused by philosophers in the empiricist tradition) and, on the other hand, epistemology (with which it was sometimes conflated by philosophers in the \*Cartesian tradition). In this he was in line with a yet older tradition originating with Aristotle's *De interpretatione*: but in the *Begriffsschrift* and the *Grundlagen* he investigates such notions as *name*, *sentence*, *predicate* with a scope and subtlety greater than Aristotle's.

One of Frege's most fertile devices was the application of the mathematical notions of \*function and \*argument to replace the analysis of sentences in ordinary language in terms of subject and predicate. Consider a sentence such as 'William defeated Harold'—a laconic description, perhaps, of the battle of Hastings. Traditional grammar will say that 'William' is the subject, and 'defeated Harold' the predicate. To say—as Frege did—that we should look on 'William' as an argument, and 'defeated Harold' as a

function, may at first look as if it is simply an alternative terminology—and indeed, for much of his life, Frege was willing to call an expression such as ‘defeated Harold’ a predicate. But to treat a predicate as a function involves a profound change in the understanding of the construction of sentences.

To see this, suppose that we take the sentence ‘William defeated Harold’ and put into it, in place of the word ‘Harold’, the word ‘Canute’. Clearly this alters the sense of the sentence, and indeed it turns it from a true one into a false one. We can think of the sentence as in this way consisting of a constant component ‘William defeated’ and a symbol ‘Harold’ replaceable by other similar symbols—names naming other people, in the way that ‘Harold’ names Harold. If we think of a sentence in this way, Frege will call the first component a function, and the second its argument: he is making an extension of the mathematical terminology in accordance with which 6 is the value of the function  $x \times 3$  for the argument 2, and 9 is the value of the same function for the argument 3. The sentence ‘William defeated Harold’ is the result of completing the expression ‘William defeated’ with the name ‘Harold’, and the sentence ‘William defeated Canute’ is the result of completing the same expression with the name ‘Canute’. That is to say, in the terminology of *Begriffsschrift*, ‘William defeated Harold’ is the value of the function ‘William defeated’ for the argument ‘Harold’, and ‘William defeated Canute’ is the value of the same function for the argument ‘Canute’.

The sentence ‘William defeated Harold’ is, of course, also the value of the function ‘defeated Harold’ for the argument ‘William’. In the same way, 6 is not only the value of the function  $x \times 3$  for the argument 2, but also the value of the function  $2 \times x$  for the argument 3. Every sentence, for Frege, can be analysed into argument and function in at least one way, but many can be analysed in more than one way.

Corresponding to the distinction in language between functions of this kind and their arguments, Frege maintained, a systematic distinction must be made between concepts and objects, which are their ontological counterparts. Objects are what proper names stand for: they are of many kinds, ranging from human beings to numbers. Concepts are items which have a fundamental incompleteness, corresponding to the gappiness of a predicate as understood by Frege (i.e. a sentence with a proper name removed from it). Where other philosophers talk ambiguously of the *meaning* of an expression, Frege introduced a distinction between the *\*reference* of an expression (the object to which it refers, as the planet Venus is the reference of ‘the Morning Star’) and the *\*sense* of an expression. (‘The Evening Star’ differs in sense from ‘the Morning Star’ though it too, as astronomers discovered, refers to Venus.)

These theories of philosophical logic were worked out by Frege in a series of articles in the early 1890s: ‘Funktion und Begriff’ (Function and Concept, 1891), ‘Begriff und Gegenstand’ (Concept and Object, 1892), ‘Sinn und

Bedeutung’ (Sense and Reference, 1892). The most controversial application of Frege’s distinction between sense and reference was his theory that the reference of a sentence was its truth-value (i.e. the True, or the False), and the connected theses that in a scientifically respectable language every term must have a reference and every sentence must be either true or false. These theses lead to many difficulties.

In the last years of his life, between 1918 and his death, Frege attempted to write a full treatise of philosophical logic. All that was completed was a series of articles (*Logische Untersuchungen*, 1919–23) in which he returns to the relationship between logic and philosophical psychology or philosophy of mind, and discusses the nature of thought and inference. His work in this area has been largely superseded by the later writings of Wittgenstein, a philosopher much influenced throughout his life, as he himself avowed, by Frege’s agenda and Frege’s structures of thought.

The climax of Frege’s career as a philosopher should have been the publication of the two volumes of *Die Grundgesetze der Arithmetik* (1893–1903), in which he set out to present in formal manner the logicist construction of arithmetic on the basis of pure logic and set theory. This work was to execute the task which had been sketched in the earlier books on the philosophy of mathematics: it was to enunciate a set of axioms which would be recognizably truths of logic, to propound a set of undoubtedly sound rules of inference, and then to present, one by one, derivations by these rules from these axioms of the standard truths of arithmetic.

The magnificent project aborted before it was ever completed. The first volume was published in 1893; the second volume did not appear until 1903 and while it was in the press Frege received a letter from Russell pointing out that the fifth of the initial axioms made the whole system inconsistent. This was the axiom which, in Frege’s words, allowed ‘the transition from a concept to its extension’, the transition which was essential if it was to be established that numbers were logical objects. Frege’s system, with this axiom, permitted the formation of the class of all classes that are not members of themselves. But the formation of such a class, Russell pointed out, leads to paradox: if it is a member of itself then it is not a member of itself; if it is not a member of itself, then it is a member of itself. A system which leads to such paradox cannot be logically sound.

With good reason, Frege was utterly downcast by this discovery, though he strove to patch his system by weakening the guilty axiom. We now know that his logicist programme cannot ever be successfully carried out. The path from the axioms of logic to the theorems of arithmetic is barred at two points. First, as Russell’s paradox showed, the naïve set theory which was part of Frege’s logical basis was inconsistent in itself, and the remedies which Frege proposed for this proved ineffective. Thus, the axioms of arithmetic cannot be derived from purely logical axioms in the way he hoped. Secondly, the notion

of 'axioms of arithmetic' was itself later called in question when Gödel showed that it was impossible to give arithmetic a complete and consistent axiomatization. None the less, the concepts and insights developed by Frege in the course of expounding his logicist thesis have a permanent interest which is unimpaired by the defeat of that programme at the hands of Russell and Gödel.

Wittgenstein once described to Geach his final meeting with Frege. "The last time I saw Frege, as we were waiting at the station for my train, I said to him "Don't you ever find *any* difficulty in your theory that numbers are objects?" He replied "Sometimes I *seem* to see a difficulty—but then again I *don't* see it."'"

**French philosophy.** Although the literary scepticism of François Rabelais (1494–1553) and Michel de Montaigne (1533–92) expresses thought that is in part recognizably philosophical, Descartes is the earliest French philosopher because before him no one systematically attempted to solve philosophical problems and write the results in French. French philosophy since Descartes can be correctly viewed as a series of endorsements and repudiations of \*Cartesianism but is still more usefully viewed as essentially oscillating between optimism and pessimism about the powers of reason. Pascal's famous distinction between two mistakes—to deny reason and to allow only reason—arguably applies nowhere more appropriately than to French philosophy over its four centuries.

In the seventeenth century Cartesian optimism about the metaphysical role of reason was subject to two kinds of critique; one metaphysical and theological, the other empiricist. Blaise Pascal maintained that putative metaphysical and theological knowledge acquired by the exercise of the intellect was essentially incomplete and a non-rational leap of faith was required to supplement it. Pierre Gassendi (1592–1655) maintained, against Descartes, the empiricist thesis that the exercise of the senses is the best guide to the nature of reality and that the correct role of reason is confined to drawing inferences from the findings of sense experience.

Although the eighteenth-century \*Enlightenment endorsed an empiricist respect for the natural sciences and a burgeoning social anthropology (evident, for example,

in the work of Voltaire, Holbach, La Mettrie, Montesquieu, and Condillac), it is a return to optimism about the powers of reason, not this time in any metaphysical employment, but in a naturalistic and human role. The *Encyclopédie* of Diderot and d'Alembert relies on the optimistic principle that no aspect of reality is in principle opaque to human inquiry. The uses of the senses and the intellect are singularly necessary and in principle jointly sufficient for complete knowledge.

No single philosophical thesis is common to all and only those thinkers called the \*'philosophes', but most of them combined atheism and anti-clericalism with a respect for science and urged a liberal politics which recommended a constitutional monarchy on the English model (rather than republicanism) against the prevalent absolute monarchy of most European states. Most shared, too, a concern for non-religious education and a synthesis of arts and sciences.

In Rousseau and Maine de Biran the Enlightenment was subject to two kinds of anti-rationalist reaction. Although Rousseau's concept of the general will, which putatively reconciles the freedom of the individual with political society, is consistent with the philosophes' critique of the absolutism of the *ancien régime*, his moral and epistemological attack on the sciences and his postulation of God, freedom, and the immortality of the soul constitute a spiritualist and metaphysical reaction against Enlightenment humanism. In Maine de Biran too, in his emphasis on the spiritual nature of inner experience, there is a pessimism about the power of reason to solve metaphysical problems.

The \*positivism of the late nineteenth and early twentieth centuries is essentially anti-metaphysical and anti-theological in its insistence that any problem may, in principle, be solved using the methods of the natural sciences or mathematics (a view endorsed, famously, by Comte). However, the rather empiricist foundations of French positivism are subjected to quasi-Kantian criticism by Poincaré. He argues that science cannot be derived merely from the findings of sense experience, but is also intellectually constructed through the imposition of a set of a priori conventions on those findings.

Although Poincaré suggests a synthesis between rationalism and empiricism, Bergson is the only major French thinker since Descartes who seriously integrates the scientific and the non-rational into his philosophy. Although the living subjective flux of the '*durée réelle*' ('real duration') cannot be explained scientifically, it makes the whole of knowledge (and, *a fortiori*, the whole of science) possible. Bergson's philosophy enjoyed a vogue in France after the First World War comparable to that of Sartre's existentialism after the Second. Bergson is neglected at the time of writing, even though his philosophy has the rare merit of taking seriously both science and the subjective reality of lived experience.

French philosophy since Bergson has been dominated by five philosophical movements: \*phenomenology, \*existentialism, \*Marxism, \*structuralism, and \*post-structuralism.

## FRENCH PHILOSOPHY

JEAN-JACQUES ROUSSEAU, wild man of French literature, harbinger of Romanticism; his polemical demand for popular legitimation of government inspired the revolutionaries of 1789.

AUGUSTE COMTE expounded in the 1830s a positivist theory of knowledge, and put forward sociology as the newest and most complex of the sciences.

HENRI BERGSON distinguished *experienced time* from *measured time*, assigning greater reality to the former; parallel to this was his distinction of the roles of intuition and intellect in acquisition of knowledge.

MAURICE MERLEAU-PONTY argued that a person's apprehension of the outside world is a two-way process: each, in different senses, gives meaning to the other.

Understanding these movements is complicated by three factors: what passes for philosophy in France is distorted by its Anglo-American readership; any 'movement' in philosophy is partly externally constituted by criteria for being a philosopher; and each influential modern French philosopher has been something other than a philosopher too.

Paradigmatically, phenomenology is the presuppositionless description of the contents of experience, without any prior ontological commitment to the objective reality or causal properties of those contents. It has both the quasi-Kantian aim of describing the transcendental conditions for knowledge and the quasi-Cartesian aim of providing an ultimate justification of knowledge in the description of the contents of consciousness or 'phenomena'. By 'knowledge' is meant here 'all knowledge' and so, *a fortiori*, 'all philosophical and scientific knowledge'.

In the thought of Sartre and Merleau-Ponty this 'pure' or Husserlian phenomenology undergoes a Heideggerian transformation (which is partly anticipated in the later writings of Husserl). Notably, the Husserlian thesis that the world of the natural attitude (roughly, 'common sense') may be 'suspended' to facilitate a phenomenological description of consciousness is rejected and the existential notion 'being-in-the-world' substituted. The Husserlian transcendental ego (as ground of the world) is eliminated as not phenomenologically available and a notion of bodily subjectivity replaces it (notably in Sartre's *L'Être et le néant* and Merleau-Ponty's *Phénoménologie de la perception*). However, arguably the idea of the body-subject is also anticipated in the second book of Husserl's *Ideen zu einer reinen Phänomenologie und phänomenologischen Philosophie*.

Existentialism is an attempt to solve fundamental problems about human existence, notably: what it is to be; the purpose of being; what it is like to face death; the nature of anxiety; the burden of responsibility and freedom; the appropriateness of sexual, political, and religious commitments. Existentialism is a reaction against both metaphysics and the essentialism of 'pure' phenomenology. Its principal thesis is that existence is logically prior to essence and that human essence is not determined a priori but freely created by human actions. Sartre's 'existential' phenomenology is expounded not only in philosophical works but in plays, novels, short stories, and political tracts. The most brilliant existentialist writer was Simone de Beauvoir. Her *Le Deuxième Sexe* (1949) explores the question of the essence of woman: its repressive constitution by men and its possible free constitution by women.

One of the most ambitious projects of post-war French philosophy was Sartre's attempt in *Critique de la raison dialectique* (1960) to synthesize existentialism and Marxism. Marxism and existentialism are prima facie mutually inconsistent philosophies because, while existentialism emphasizes the freedom of the individual, Marxism is a kind of social determinism; existentialism explores the inside of consciousness and the present moment, but Marxism is a materialism which entails a theory of history;

Marxism claims a scientific and objective status for its findings; existentialism deliberately repudiates this for itself. Whether Sartre's putative synthesis is successful or not, in this effort modern French philosophy was engaged in trying to solve genuine metaphysical problems.

Since the 1960s French philosophy has been a part of the broadly neo-Kantian anti-metaphysical orthodoxy within which much European and Anglo-American philosophy operates. The hallmarks of this paradigm are: the impossibility of solving metaphysical problems (but the inevitability of trying to); the linguistic nature of putative philosophical issues; the minimization of the importance of consciousness, subjectivity, and the present; the attempt to 'end' philosophy and replace philosophical problem-solving by something else: political revolution or reform, an examination of language, writing the history of philosophy, literary criticism, the natural sciences. The anthropologist Claude Lévi-Strauss, the psychoanalyst Jacques Lacan, the Marxist structuralist Louis Althusser, and the literary critic Roland Barthes all operate within broadly Kantian assumptions.

The most influential French philosopher at the time of writing is Jacques Derrida. Although Derrida is frequently thought of as making a radical break with previous philosophy, this is in fact far from the case. His strategies may be novel within literary criticism, but they are familiar to anyone who has studied Kant, Hegel, Nietzsche, and Heidegger. All these thinkers are involved, in differing senses and degrees, in a critique of something called 'Western metaphysics', and the permutations of that critique have been the ruling philosophical orthodoxy for the last two centuries.

Modern French philosophy is usually thought to be a part of 'modern continental philosophy', which is contrasted with Anglo-American 'analytical' (or \*analytic') philosophy. This distinction does not stand up to geographical, historical, and philosophical scrutiny and it is an important task of future philosophy to show this. However, while philosophers in the English-speaking countries have usually thought that philosophy (although not a science) should aspire to the rigour and precision of the natural sciences, philosophers in modern France have thought that philosophy should be more like art, more like literature. The conspicuous stylistic divergence this has produced has resulted in the illusion of a bifurcation between two philosophical 'traditions' and the mistaken idea that there is something radical and distinctive called 'modern French philosophy'. s.p.

\*continental philosophy; 'continental' and 'analytic'.

**French philosophy today.** Recent French philosophy is marked by the decline of the master-thinker. There has been no replacement for the Sartre of the 1950s, the Lévi-Strauss of the 1960s, and the Foucault of the 1970s. Jacques Derrida does continue his immensely productive career and has interestingly expanded his epistemological and metaphysical development of deconstructive readings of texts into ethics and politics. Also, there are important philosophers, such as Jean-Luc Nancy and Philippe Lacoue-Labarthe, who have taken up his dense and nervously involuted philosophical style. But Derrida's impact has from the beginning been much greater in the United States and in literature departments. In so far as there are today 'major figures' of philosophy in France, they are presences from the past such as Emmanuel Levinas and Paul Ricœur, who are of same generation as Sartre, but whose thought was long marginalized, in large part because of its religious roots and implications (Jewish in the case of Levinas, Christian in the case of Ricœur).

As early as the 1930s, Levinas helped introduce Husserl and Heidegger to the French intellectual scene. At first mainly an expositor and critic of their thought, he gradually developed his own distinctive philosophical vision, which appeared with full force in his 1961 book, *Totality and Infinity*. Here Levinas claimed that our concrete experience of other people involves an absolute ethical obligation toward them, a view developed in the larger context of his insistence that almost all of Western philosophy has been contaminated by an effort to reduce the other (including not only other people but difference in general) to unifying categories of sameness. Levinas explicitly relates our absolute ethical obligation to religion, but he is almost obsessively cautious in denying the adequacy of any of our efforts to speak about God.

Ricœur's early work (for example, his influential translation of, and commentary on, Husserl's *Ideas*) was also important for the introduction of phenomenology into France, and his own philosophical views originated from his effort to apply the phenomenological method of carefully describing our immediate experience to the domain of freedom, sin, and evil. His work on these topics developed through several volumes, but increasingly moved beyond phenomenological description to a hermeneutic standpoint, indebted to Heidegger and Gadamer, which emphasized the need not just to describe our experience but to interpret it in a wider literary, cultural, and historical context. Ricœur's hermeneutic philosophy provided the basis for his perceptive critiques of the structuralist and post-structuralist philosophies that dominated France during the 1960s and 1970s.

The turn to Levinas and Ricœur has been accompanied by a revival of interest in phenomenology, although the focus has been more on Husserl and Heidegger than on the French existential phenomenologists Sartre and Merleau-Ponty. Here Jean-Luc Marion has done especially important work, which opens new directions of

phenomenological reflection and connects them with religious themes (Marion is also a major Catholic theologian). Michel Henry and Jean-François Courtine have also contributed to the return to phenomenology.

The new-found importance of Ricœur and Levinas (and the return to phenomenology) corresponds to a reaction against the philosophical and political radicalism associated with the 1968 student revolution. The same reaction underlies the return to broadly Kantian thinking in the writings of Luc Ferry and Alain Renault. For example, in their jointly authored *French Philosophy of the Sixties*, Ferry and Renault agree that Heidegger and his followers have undermined the idea of a 'self-transparent subject that lays claim to mastery of everything that exists'; i.e. the transcendental ego of Kantian idealism. But they go on to argue against the post-structuralist elimination of the subject as a category of theoretical philosophy and for the reality of an ego that is not metaphysically privileged but embedded in historical reality and nevertheless the subject of ethical rights and responsibilities.

Ferry and Renault also represent an important revival of liberal political theory in France. Whereas earlier thinkers, from Sartre through Lyotard and Deleuze, seemed to allow no alternatives to leftist radicalism or rightist reaction, there is now a striking move to the centre, which has led to a new respect for previously marginalized writers such as Albert Camus and Raymond Aron, and has led important philosophers to see genuine possibilities of co-operation with established governments. (Luc Ferry, for example, is currently Minister of Education.)

The current French scene also includes a lively interest in analytic philosophy. There are roots for this interest in a long and distinguished French tradition of logic and philosophy of mathematics, beginning with Louis Couturat at the turn of the twentieth century and continuing through Jean Nicod, Jacques Herbrand, and Jean Cavailles. But this group had relatively little impact, partly because none of its members lived beyond the age of fifty. Today, the most prominent French philosopher with a strong commitment to the analytic approach is Jacques Bouveresse, whose earlier work was largely inspired by Wittgenstein, on whom he wrote important commentaries, and whose thought he used as a basis for his own discussions of epistemology and philosophy of mind. More recently, Bouveresse has presented himself as in the line of 'Austrian philosophy', which he sees as beginning with Bolzano's critique of Kant and continuing through Brentano and Meinong to Wittgenstein and the \*Vienna Circle. This Austrian line ignored Hegel and his idealistic successors, thereby avoiding the philosophical styles and questions that characterize recent 'continental' philosophy.

More recently, there has emerged a group of younger French analytic philosophers centred on the Centre de Recherche en Epistémologie Appliquée (CREA) at the École Polytechnique, and subsequently at the Institut Nicod. Pascal Engel (who did his doctoral work with Bouveresse), Pierre Jacob, and Daniel Andler are just

a few of the French philosophers who have become significant contributors to, for example, analytic philosophy of mind, epistemology, and philosophy of science. There is no doubt that France is quickly taking its place in the increasingly international enterprise of analytic philosophy. The question remaining is whether there will develop a distinctively French school of analytic philosophy or whether French analytic philosophers will remain individual contributors to discussions defined by the dominant interests of American and British philosophy.

A category frequently employed in discussions of recent French philosophy is that of 'French feminist philosophers'. There is no doubt that feminist themes loom large in the work of major French philosophers from Simone de Beauvoir to Luce Irigaray and beyond. But much of the work of many important feminist thinkers in France (e.g. Hélène Cixous, Julia Kristeva) is well beyond the disciplinary boundaries of philosophy, and the work of the major 'feminist philosophers' deserves attention even apart from their contributions to feminist discussions. Luce Irigaray, for example, is best regarded as a 'philosopher of difference', in the general manner of Derrida, Lyotard, and Deleuze. Her focus has been on sexual difference, but in a way that uses feminist issues to overcome what she sees as limitations in traditional thought about the most fundamental issues of human existence. Similarly, Michèle Le Doeuff develops her feminist thought in the context of a historically informed philosophy of science. Her work is particularly interesting because, while originating in the distinctively French tradition of history and philosophy of science (particularly the work of Gaston Bachelard and Georges Canguilhem), it also readily engages with Anglo-American work on science.

Finally, mention should be made of two increasingly influential, if hard to categorize, philosophers: Michel Serres and Alain Badiou. Serres began as a philosopher of science, broadly in the manner of Bachelard, who questioned orthodox distinctions between science and non-science. He later developed, in a series of academic best-sellers, a poetico-philosophical cosmology that presents a metaphysics inspired by chaos theory and fractal geometry. Badiou likewise combines mathematics and ontology in a systematic philosophy that challenges the historicist assumptions of French philosophy of the 1970s and 1980s and rejects the post-structuralist claim that the end of philosophy is near.

Philosophy without master-thinkers has its advantages. Recent French thought lacks the dramatic and disruptive originality of thinkers such as Sartre and Foucault, but it has, in many cases, a stylistic clarity and theoretical openness that were long missing from the philosophical scene. As in the early years of the twentieth century, early twenty-first-century French philosophy is less drastically creative but, perhaps, more able to contribute to the civility and rationality of its age. On the other hand, there is a real danger that this more subdued mode of

philosophizing will split into various elements (phenomenology, feminism, analytic philosophy), each merely part of an international discussion, and lose the distinctive flair that has characterized French philosophy for the last sixty years. G.G.

**frequency theory:** *see* probability.

**Freud, Sigmund** (1856–1939). Freud is sometimes said to have discovered the \*unconscious, but it is not a claim he made himself. The unconscious which he did *not* discover is the notion that if those everyday explanations which invoke motives, desires, impulses, etc., and normally carry the implication that the subject is authoritative with respect to them, are extended to cases in which this implication is suspended, behaviour otherwise perplexing can be explained. This notion of the unconscious pre-dates Freud. What distinguishes Freud's unconscious is the notion that when the subject's loss of authority with respect to his own mental states is due to a process he called 'repression', these states are subject to transformations which render them unrecognizable by the subject and may have pathological consequences. The conviction that, when the subject came to stand to these contents as to his accessible ones, they were deprived of pathogenic power, yielded a therapeutic method.

Two ingredients were added to produce the characteristic Freudian view of the springs of action—sexuality and infancy. What gave Freud's aetiological speculations their further distinctiveness were the diagnostic procedures on which they were based, in particular the use of interpretation and free association. When these were applied to dreams, errors, and the behaviour of the patient towards the therapist in the analytic setting ('the transference'), they uncovered the repressed pathogenic material. This material was found to display two invariable features—it dated from infancy and pertained to the subject's infantile sexual life.

At first the pathogenic episodes in question were thought to be sexual molestation ('the seduction theory'); these were later replaced by the child's struggle with its own incestuous and perverse wishes ('the Oedipus complex' and 'polymorphous perversity'). The transition from the seduction theory to its successor, the infantile Oedipus complex, was facilitated when, during Freud's self-analysis, an infantile memory of being sexually excited by his mother's nudity was aroused. This helped persuade

him that the sexual material which had led him to impute infantile seductions to his patients could have an alternative source in their self-protectively distorted infantile incestuous fantasizing. The anomaly involved in accounting for the neuroses of predominantly female patients by invoking the desires of male infants for their mothers escaped notice for some time, but eventually prompted a suspicion that Freud's aetiological speculations were more remote from clinical experience and dependent on idiosyncratic pre-occupations than the tradition acknowledged.

The major developments in Freud's theorizing after the First World War comprised the replacement of the original division between conscious and unconscious with a tripartite division into id, ego, and superego (with the corollary that portions of the ego were unconscious); the reconstrual of anxiety as the cause rather than the product of repression; the stipulation that the self-preservative instincts were themselves libidinal, with the further extension of the concept of libido to encompass an indeterminate range of phenomena previously excluded, and the introduction of a death instinct. The rationales for these changes are still disputed and their implications for clinical practice unclear. Attempts to clarify Freud's metapsychological speculations or reduce them to consistency have proved vain to date and the suggestion has been often made that they be abandoned.

Freud's postulation of a death instinct, an impulse to return to a pre-organic state of quietude, has in particular provoked much scepticism. It was introduced in 1922, for a combination of reasons which have been found so inadequate that Ernest Jones thought it necessary to impute the innovation to some personal motive which, Max Schur maintained, was the death of a beloved daughter in the influenza epidemic of 1919. The relative contribution of this episode, and of Schopenhauer's view that the goal of life is death, can only be a matter for conjecture. Freud tells us that on his visit to America he was impressed by a sign which read, 'WHY LIVE WHEN YOU CAN BE BURIED FOR TEN DOLLARS?' This suggests a temperamental affinity with the notion of a death instinct which may have led him to overlook its theoretical deficiencies.

Freud's extension of the concept libido to encompass 'love for parents and children, friendship, love for humanity in general, devotion to concrete objects and abstract ideas' also occasioned misgivings in some quarters. It was not clear why such impulses should be repressed, or how, if repressed, they would produce the phenomena of neuroses whose apparently minute articulation with sexual mentation in its previously restricted, carnal sense gave Freud's early libidinal accounts of symptom-formation their persuasive power. Some critics felt entitled to impute the tenacity with which Freud clung to a sexual conception of libido to some deeply personal compulsion and could have cited in support the incoherence between his assertion that the majority of mankind feel degraded by the sexual act and are reluctant to perform it and his contradictory insistence that sexual gratification is 'one of . . . life's

culminations' and that 'apart from a few perverse fanatics all the world knows this and conducts life accordingly'.

During his lifetime Freud was generally regarded as a figure of unquestionable integrity. Several more recent memorialists and commentators have offered a less flattering picture of someone whose pronouncements were too often dominated by the polemical needs of the moment and whose probity deserted him whenever his more profound interests were at stake. **friendship.** Attachment characterized by disinterestedness and esteem. Aristotle contrasts friendship proper with relationships entered into for pleasure or advantage, 'because in them the friend is not loved for being what he is in himself'. The philosophical problems of friendship are to explain: (1) how friendship can be worth while if *not* for pleasure or advantage, since, as Aristotle observes, 'no one would choose a friendless existence on condition of having all the other good things in the world'; (2) how friendship, like family relationships, can generate obligations not had towards those who are not my friends; (3) how it can be justifiable to love you as a friend while withholding friendship from others who share the qualities I esteem in you, since to do otherwise is not (for example) to 'love you for yourself alone and not your yellow hair' (Yeats). P.G.

\*loyalty; fraternity; love.

**function.** A function takes objects (\*'arguments') and maps them on to objects ('values'). For example, the addition function defined on the set of natural numbers takes pairs of natural numbers as its arguments and maps each pair, say 2 and 3, on to the value, here 5, which is the sum of the pair. Functions are often identified with set-theoretical constructions. So the doubling function, with the set of natural numbers as its domain of arguments, is identified with the set of ordered pairs,  $\langle x, y \rangle$ , such that  $y$  is twice  $x$ . Functions need not be numerical; Frege took concepts to be functions which mapped objects on to truth-values. (This has little connection with the non-technical sense of 'function', roughly 'purpose', which is also, of course, widely used by philosophers.) A.D.O.

P. Suppes, *Introduction to Logic* (Princeton, NJ, 1957), ch. 11.

**functional explanation:** *see* teleological explanation.

**functionalism.** The theory that the condition for being in a mental state should be given by the functional role of the state, that is, in terms of its standard causal relationships, rather than by supposed intrinsic features of the state. The

role is normally envisaged as being specified in terms of which states (typically) produce it and which other states and behavioural outputs will (typically) be produced by it when the state interacts with further mental states and perceptual inputs. The theory, pioneered by David Armstrong and Hilary Putnam, improves on \*behaviourism because it recognizes that behaviour results from clusters of mental states, and allows that the term for the state, e.g. 'S's pain', refers to a real inner condition which has the functional role. In one version the functional analysis was supposed to be a priori, and a ground for affirming a materialist \*identity theory. Putnam proposed it as a scientific alternative to identity theories, and analysed function in terms of \*Turing machines. Discussion has concerned whether conscious states can be exhaustively analysed in functional terms. A modified version has been suggested in which function is explained in terms of biological (rather than causal) role. P.F.S.

**future:** see time.

**future contingents.** On one definition, a future contingent is a claim about the future, or is the content of a future-tense indicative sentence. On another, it is the possible truth-condition for such a claim: a future state of affairs that might or might not obtain. It may be argued that future contingent claims are neither true nor false until the states of affairs they are used to predict obtain or fail to obtain. S.P.

William of Ockham, *Philosophical Writings: A Selection* (Indianapolis, 1990).

**future generations.** Do we have moral obligations to future generations? Most of us believe that we do. We are obligated, for example, not to harm them in certain ways and also to share the earth's resources with them in a way that is just. Some theorists have argued that we are obligated to ensure that future generations will exist (or at least not to prevent them from existing), while others have claimed that we owe it to them, by controlling population growth, to ensure that there are not too many future people existing at any one time.

Moral theories have, however, had notorious problems in providing an adequate account of the foundations of these obligations. For example, those theories that regard morality as a set of conventions that it is in our interests to obey because they facilitate peace and co-operation cannot ground obligations to future people since the latter

cannot benefit or harm us (except perhaps posthumously). And hypothetical contractarianism (\*contract, social), to which many theorists have appealed, has been unable to determine who should be included among the contractors who must reach agreement on principles of justice between generations. Some have argued that the contractors should all be members of a single generation; others have said that they should include everyone who has ever lived or ever will live; while others have claimed that they should include all possible people. Each of these proposals has proven unsatisfactory.

Given the problems with approaches of these sorts, many have thought that the best approach is simply to assume that our behaviour must be constrained by a respect for the rights and interests of future people in much the same way that it is constrained by the rights and interests of existing people. There are, of course, problems with predicting how our acts will affect future people, what their needs and interests will be, and so on. And there is a further question whether, because there are presumably so many of them relative to us, we are entitled to apply a discount rate to their interests according to their temporal distance from us. But it has been thought that these problems are in principle manageable.

Views of this sort are, however, all vulnerable to a powerful objection, advanced by Derek Parfit, which is based on the fact that most of the decisions that we make that have a substantial impact on the future quality of life also affect who will exist in the future. For the implementation of a social policy has widespread effects on the details of people's lives—e.g. who meets whom, who marries whom, and when people conceive their children. These effects help to determine who comes to exist. But, if it is true of a future person that he would not have existed had a certain policy not been implemented in the past, then, unless his life is not worth living, it cannot be worse for him that the policy was adopted. Hence even policies that pollute the environment or deplete resources may not be worse for future people, or violate their rights, since those people may owe their existence to the fact that those policies were implemented.

Parfit and others have concluded from this that our obligations with respect to future people must be based, not on facts about how our acts affect individuals for better or worse, but on considerations that are more impersonal in character. But traditional moral theories that take an impersonal form—such as the total and average versions of \*consequentialism—have proved to have notoriously implausible implications when applied to questions concerning future and possible people. (\*Population.) Hence reflection on our obligations to future generations has resulted in a profound challenge to moral theory itself.

D. Parfit, *Reasons and Persons* (Oxford, 1984).

**fuzzy logic.** Logical system which allows degrees of truth. For example, where '1' denotes truth, and '0' falsity,  $p$  might be true to degree 0.7 and so false to degree 0.3. In general, if  $p$  is true to degree  $n$ , then  $p$  is false to degree  $1 - n$ . Fuzzy logic is a departure from classical logic, because a proposition may be to some extent both true and false, and a proposition and its negation to some extent both true. Classical logic, in a sense, is a version of fuzzy logic, that version in which the only admissible truth-values in the range from 0 to 1 are 0 and 1.

Arguably, fuzzy logic does justice to the intuitive idea that some indicative sentences are not wholly true and not wholly false. For example, the claim 'He is in the room' seems not wholly true and not wholly false but partly true and partly false if he is leaving the room at the time of utterance. s.p.

# G

**Gabriel, Ibn:** *see* Ibn Gabirol.

**Gadamer, Hans Georg** (1900–2002). German philosopher who was a pupil of Heidegger and the leading modern exponent of \*hermeneutics.

In *Truth and Method* (1960; tr. London, 1975), he tries to clarify the phenomenon of \*understanding. Understanding (*Verstehen*) contrasts with the explanation (*Erklären*) characteristic of the natural sciences. Understanding is performed both by cultural scientists and by non-scientists; even natural scientists understand each other's speech and writing. We understand utterances, texts, people, works of art, and historical events. Earlier hermeneuticists attempted to refine a methodology for the proper interpretation of such entities. But they failed to grasp that their own understanding of an object, and the methodological principles they devised, were historically conditioned. Cultures change over history. The interpreter of a text from a past culture belongs to and is conditioned by his own different culture; he is an 'effective-historical consciousness' who views the past and its remnants from a particular \*'horizon', involving a particular 'pre-understanding'. His understanding thus involves an interplay between past and present, a 'fusion of horizons'. Plato, for example, is interpreted differently by Neoplatonists of the sixth century AD, by nineteenth-century Germans, and by twentieth-century English scholars. We cannot decide which of these interpretations is correct, since any verdict we give is historically conditioned and liable to revision by a later age. (We cannot even be sure that our interpretation of past interpretations is correct.) At best our interpretation can be 'authentic', making the best reflective use of the pre-understanding or 'prejudice' from which we inevitably begin. Thus we should explore our own pre-understanding and all the relations to the world and to history that it involves. Our understanding of the past and its remains not only depends on, but also promotes, our 'self-understanding'.

In *Truth and Method* Gadamer begins with the understanding of works of art, and several later essays concern art (*The Relevance of the Beautiful and Other Essays* (Cambridge, 1986)). His central concern is the experience of art, rather than our judgements about art or the intentions and genius of the artist, and he tries to describe it as accurately

as possible. The artwork rather than the audience is the pivot of this experience, and thus 'play' is a suitable term to describe it, in the sense of a game that 'tends to master the players'. Truth is not the exclusive preserve of science; thus not only interpretations of art, but the artwork itself, make a claim to truth. Works of art are not isolated from the world, and the experience of art 'does not leave him who has it unchanged'. An authentic experience of it involves not a historical reconstruction of the circumstances of its original production, but a living relationship to it which shows that it still has something to say in our epoch.

Gadamer devoted several works to the interpretation of other philosophers, especially Heidegger, Hegel, and Plato. His interpretations depend on certain principles which are not universally shared. We must take account of the nature of the text, whether it is, for example, a polished dialogue or a set of lecture notes. We must also take account of the context in which a statement is made, its intended audience, and the question which it is designed to answer. For example, an argument in a Platonic dialogue should not be considered and assessed simply as an isolated argument. We should consider its role in the dialogue, its effect on the specific audience to which it is addressed, and the background question to which it is a response. Gadamer thus purports to replace the logic of propositions with 'the logic of question and answer'. (He argues, in *The Idea of the Good in Platonic–Aristotelian Philosophy* (1978; tr. New Haven, Conn., 1986), that if we interpret Plato and Aristotle in this way we shall see that their thought is in essence continuous and that they have far more in common than is usually supposed.) Despite his admiration for Hegel, Gadamer is at odds with him here: for Hegel, unlike Schleiermacher, Plato's use of the dialogue form is an essentially irrelevant adornment for a philosophical system which can be better expressed in continuous prose.

**Galen** (AD 129–c.200). Greek doctor and philosopher from Pergamon, Asia Minor. Although known principally as a doctor, he wrote many books devoted to philosophical topics. He advocated the study of logic and the theory of demonstration as essential for being a good doctor, and wrote several books on logical theory. He also wrote works concerning causation, psychology, moral philosophy, language, and rhetoric, as well as commentaries on Aristotle, Plato, Hippocrates, and Epicurus, and polemical books against the Stoics. Most of these are now lost.

He probably did not invent the fourth figure of Aristotelian syllogistic, but certainly did make one important contribution to logical theory, in his *Introduction to Logic*. He saw that neither Aristotelian nor Stoic logic could account for the validity of the following inference:  $a = b$ ,  $b = c$ , therefore  $a = c$ . To account for its validity, and that of other arguments like it, he introduced a third kind of syllogism, ‘relational syllogisms’.

Galen thinks that there is a systematic or logical way of discovering the truths of medicine—i.e. the theory of demonstration. But he also concedes that experience plays a role in the acquisition of medical knowledge. It is therefore a matter of some interest what his precise position is concerning how medical knowledge is acquired, and how it relates to the schools of medicine of his time. B.M.

**Galileo Galilei** (1564–1642). Galileo was an astronomer and physicist whose influence on the development of scientific and philosophical thought can hardly be overstated. No retiring scholar but a controversialist at home in the leading universities and palaces of Renaissance Italy until condemned by the Roman Inquisition, Galileo opposed by both word and deed the imposition of authority on the study of natural phenomena, and supported freedom of inquiry and expression.

In opposition to \*Aristotelianism, Galileo insisted that mathematics was at the heart of physics. He developed his laws of motion by introducing careful measurement into empirical investigations, and combined this with thought experiments and deductive argument to show that he was no narrow inductivist or empiricist. He then demolished the naked-eye astronomy that had existed from prehistoric times by turning his telescope to the sky, discovering evidence that was decisive against the Aristotelian–Ptolemaic cosmos while supporting Copernicus.

The story of Galileo’s conflict with the Roman Church is well known—how in 1633 he was condemned for endorsing Copernicanism in his *Dialogue Concerning the Two Chief World Systems* (1632), having been forbidden to do so in 1616. Nevertheless, the standard interpretation of this story has been disputed by Redondi, who, using

previously unexplored Vatican archives, claims that Galileo’s real crime in the eyes of the Church was not his Copernicanism but his atomist theory of matter, which was incompatible with the doctrine of transubstantiation, and therefore challenged the sacrament of the Eucharist. But a potentially capital accusation of heresy against so well known a figure as Galileo would have been a dangerous scandal, so he faced the lesser, trumped-up charges instead.

Publicly Galileo recanted, but his further scientific work shows that in spite of the real danger he continued to defend the free exercise of human reason and experience and remained a steadfast pioneer of science as a secular vocation, while never wavering in his attachment to religion. A.BEL.

\*persecution of philosophers.

Pietro Redondi, *Galileo: Heretic* (London, 1988).

**gambler’s fallacy**, or Monte Carlo fallacy. ‘Red has come up a lot recently; so probably it won’t come up next time.’ This is not itself so much a fallacy as just a bad reason. The underlying fallacy is to infer from, say, ‘The probability of five reds running is low’ to ‘Given four reds running, the probability of a fifth is low’. The earlier outcomes do not affect the probability of a red next time; or, if they do, they must make it higher, by being evidence of bias in the wheel. C.A.K.

**game theory**. The formalized study of rational action in situations where the welfare of each agent in a group depends on how other group members act. A game is specified by, for each participating agent, a set of permitted strategies and a set of preferences between outcomes. Agents are ‘perfectly rational’: in particular, they act so as to maximize expected utility, where expected utility is a measure of the likely benefit to them of their actions given their preferences between outcomes. The game specification and each agent’s rationality are standardly presumed to be common knowledge: each agent knows these, each agent knows that the other agents know these, and so on. So each agent acts assuming that the other agents are rational and that they will act on the same assumption. Solutions to games standardly prescribe Nash equilibria: each agent’s strategy must maximize expected utility given the strategies of the others. T.P.

\*decision theory.

R. Luce and H. Raiffa, *Games and Decisions* (New York, 1957).

**Gandhi, Mohandas Karamchand** (1869–1948). Hindu political activist with the uncompromising religious–philosophical ideal that non-injury is the only means to truth. In an age ravaged by two world wars, Gandhi successfully practised the method of non-violence in mass \*civil-disobedience movements against racism in South Africa and against colonialism and untouchability in India. This method he called *satyāgraha* or ‘zest for truth’. In

Gandhi's moral philosophy, \*means and ends form a continuum, and no end ever justifies large-scale killing. In any conflict, the antagonist should be looked upon as a fellow searcher for truth. He should be won over through persuasion and self-suffering, not through deceit and brute force. Such unarmed resistance, far from being passive, calls for active love and self-control, which eventually makes individuals fit for political self-government. A.C.

Joan V. Bondurant, *Conquest of Violence: The Gandhian Philosophy of Conflict* (Princeton, NJ, 1988).

**Garden, the:** see Epicureanism.

**Gassendi, Pierre** (1592–1655). A Catholic priest too often known to philosophers merely as the author of a set of objections to Descartes's *Meditations*, Gassendi was an important and influential seventeenth-century figure in his own right. Gassendi used the scepticism of Sextus Empiricus against Aristotle and \*Aristotelianism, though it is doubtful that he was himself a whole-hearted sceptic. His espousal of Epicurean \*atomism, combined with his voluntarism and consequent empiricism, had a profound effect on the subsequent philosophy of the century, strongly influencing both Boyle and Newton. Like them, he was a mechanist, but not a materialist. It was largely as a result of his efforts that atomism was seen as a viable candidate for the vacancy created by the increasing unsatisfactoriness of both the Aristotelian and the Paracelsan pictures of the world. J.J.M.

Barry Brundell, *Pierre Gassendi: From Aristotelianism to a New Natural Philosophy* (Dordrecht, 1987).

**Gauthier, David** (1932– ). Canadian moral philosopher who has specialized in the study of the relationship between reason and morality. He is a leading contemporary proponent of the view, descending from Hobbes, that morality is based on the long-term self-interest of each individual, rather than on any inherent concern or respect for the interests or moral standing of others. Gauthier has tried to develop this 'contractarian' approach, and its determinate implications, using the tools of rational choice theory, culminating in his influential *Morals by Agreement* (1986). Gauthier has also written a series of intriguing articles that offer radical reinterpretations of Locke, Kant, and Hume, drawing out their contractarian elements. Gauthier is currently the Distinguished Service Professor of Philosophy at the University of Pittsburgh. W.K.

\*contract, social.

David Gauthier, *Morals by Agreement* (Oxford, 1986).

**gavagai:** see translation, indeterminacy of.

**Geach, Peter Thomas** (1919– ). British logician with wide-ranging philosophical interests. An admirer and expositor of McTaggart. *Mental Acts* (1958) attacks abstractionism and dispositionalist accounts of mind, and

interestingly modifies Russell's account of judgement. *Reference and Generality* (1962) demonstrates the inadequacy of medieval and modern theories of *suppositio* or \*denotation. Thus in 'Every soldier swears', 'every soldier' does not stand for some entity which is said to swear, but 'every' indicates the way in which the predicate 'swear' latches on to the subject 'soldier'. A vigorous defence of Christian morality and \*theodicy is given in *The Virtues* and *Providence and Evil* (both 1977). He holds the controversial view that something could be the same A, but not the same B, as something (relative identity). Geach's style is combative, jargon-free, and exploits forgotten riches of English vocabulary. Elizabeth Anscombe was his wife. C.J.F.W.

Harry A. Lewis (ed.), *Peter Geach: Philosophical Encounters* (Dordrecht, 1991).

**Geist:** see spirit.

**gender.** Term introduced by feminists in order that the social aspect of sexual difference should not be ignored. When the difference between male and female human beings is treated as one of 'sex', it may be thought to be accounted for biologically. Speaking of gender, one acknowledges the socio-cultural determination of the concepts *women* and *men*, and admits a conception of women and men as distinguished primarily by a difference of social position. J.HORN.

\*feminism; sex.

Christine Delphy, *Close to Home* (London, 1984), intro.

**generalization.** As this term is most commonly used, a generalization is an 'all' statement, to the effect that all objects of a certain general kind possess a certain property—for example, the statement 'All planets move in elliptical orbits'. It is customary to distinguish between 'lawlike' and 'accidental' generalizations, the one just cited being lawlike whereas one such as 'All the coins in my pocket are silver' is accidental. How to analyse this distinction is a disputed issue, but it is widely accepted that only lawlike generalizations support corresponding counterfactual \*conditionals. Thus 'All planets move in elliptical orbits' implies 'If Vulcan were a planet, it would move in an elliptical orbit', whereas 'All the coins in my pocket are silver' does not imply 'If this penny were in my pocket, it would be silver'. E.J.L.

N. Goodman, *Fact, Fiction, and Forecast*, 4th edn. (Cambridge, Mass., 1983).

**generalization, rule of.** An inference rule of the \*predicate or functional calculus. Let  $\alpha$  be an individual variable and  $\Phi$  a \*well-formed formula. The rule is:

From  $\Phi$  infer  $(\alpha)\Phi$ ,

where  $\Phi$  holds for any arbitrary individual.

The notation ' $(\alpha)$ ' represents the universal quantifier and is read 'For all  $\alpha$ '. Alternative notations are ' $\Pi_\alpha$ ' and ' $\forall_\alpha$ '.

Where a free variable  $\alpha$  occurs in  $\Phi$  the application of the rule binds the variable. Formalizations specify conditions and syntactic restrictions for application of the rule to ensure that the inferences are valid. An example of a valid application of the rule is the inference of

$$(x) (Fx \vee \sim Fx)$$

from

$$(Fy \vee \sim Fy),$$

since the latter holds for any arbitrary individual. R.B.M.  
W. V. Quine, *Methods of Logic*, 4th edn. (Cambridge, Mass., 1982).

**general properties:** see properties, general.

**general will.** The doctrine of the general will is found in the writings of some theorists in the tradition of contractualist political philosophy. The doctrine has controversial images associated with it, but its central aim is to provide an account of the conditions under which principles and policies for the state are morally acceptable. Citizens are thought of as having 'interests', some of which are 'perceived', and often different from one person to another, and even from one time in a person's life to another, while others are considered 'real' or 'genuine', and hence common to all persons. The doctrine concerns how these common interests may be identified, and how they may gain expression in the policies of the state, and thereby constitute the state just.

Rousseau's version of the doctrine appears to be driven by the figure of society as 'social organism'. The general will is the will of this organism, i.e. the 'collective body' formed by the citizens of a state, and as such is distinguished from the will of any particular individual or group, and even from 'the will of all'. Rousseau's view influenced Kant, but Kant's view leaves aside the notion that society should be thought of as 'organism'. The main idea now is that morality involves principles that are 'valid for all rational beings', and that one may arrive at such principles by setting aside one's 'inclinations' (e.g. particular features of personality or interests associated with social station that differ among real people and tend to ground conflicts among them), and by exercising the 'rational nature' that is the common possession of moral agents. John Rawls's conception of '\*justice as fairness' is thought of heuristically as the choice of parties to a hypothetical morally credentialled deliberating-position, one of the main features of which is, again, a setting-aside of those differentiating features of real individuals which are (in Rawls's words) 'arbitrary from the moral point of view'. The principles which are then chosen by agents whose particularity is thereby suspended are construed as providing the normative substance of justice for the basic structure of society, i.e. the standards by which to assess its main economic, legal, political, and educational institutions and practices.

Thus, in different vocabularies, the theories of Rousseau, Kant, and Rawls have in common the claim

that the deliverances of reasoning meeting the conditions of impartiality and disinterestedness are morally right. However, interpreting the doctrine in this way makes it attractive but not yet uncontroversial. Recent challenges do not restrict their critiques to the spectre of totalitarianism suggested by the idea of society as 'social organism'. One critique instead cites cases in which particulars about persons, e.g. their special relationships, the meaning-giving projects in their lives, their offices, and roles, are indeed relevant to an understanding of what morality requires, including the substance of justice. This objection suggests that the doctrine does not appropriately recognize the moral relevance of 'partiality', or, more fully, the moral standing of the 'individuality' of persons. This is paradoxical, for the historical and contemporary proponents of the doctrine think of their general theories as endorsing \*individualism. Another critique argues not from 'individuality' but from 'community'. Its point is that the doctrine's emphasis on impartiality and disinterestedness ignores the importance of culture, heritage, and tradition to the identity of citizens. This is paradoxical again, for some proponents of the doctrine think of their theories as providing reasonable interpretations of the communitarian ideals of the public interest and the common good. **generations, justice between.** The Brundtland Report, *Our Common Future* (1987), defined sustainable development as 'development that meets the needs of the present without compromising the ability of future generations to meet their own needs'. The responsibility implied in this statement may be regarded as weak or strong. The weak principle of intergenerational justice requires that we pass on natural resources and knowledge to the future in a way that enables future people to meet their basic needs. The strong principle requires us to limit consumption of environmental goods so that future people can be expected to achieve a standard of living, or quality of life, equivalent to that enjoyed by present people. Thomas Schwartz argued that any policy we now undertake will make a difference to who actually exists in future (e.g., by determining who travels where, and who meets whom). Hence, provided future individuals have lives worth living, they cannot be said to be harmed by present policies. Whether Schwartz's argument undermines the strong principle of justice between generations has been very much debated. A.BRE.

**genetic epistemology:** see epistemology, genetic.

**genetic fallacy.** Probably first called such by Morris Cohen and Ernest Nagel, it is the fallacy of confusing the causal origins of a belief with its justification. That this is always a confusion has been queried by reliabilist theories in epistemology, which hold that a belief is justified to the extent that it is the causal output of cognitive devices operating in accordance with their designs, i.e. 'as they should'.

Of particular importance for the analysis of the genetic fallacy is the widespread and indispensable practice of forming one's beliefs, and acting on them, on the basis of the \*testimony of others. Assuming the implausibility of declaring fallacious all such cases of belief-formation, it evidently matters whether a believer's testimonial sources satisfy appropriate conditions on reliability. Since the same is true of whether a so-called *ad verecundiam* argument is fallacious, it may be said that *ad verecundiam* arguments are a special case of 'genetic' arguments. J.W.

\*reliabilism.

Morris R. Cohen and Ernest Nagel, *Logic and Scientific Method* (New York, 1934).

**genetics and morality.** The fast-developing science of genetics, within which the functions of more and more genes, either alone or in conjunction with others, are being discovered, can be seen as providing the latest form of determinism, or reductionism, according to which all human behaviour can be explained by the genes a person has. If genetic determinism were true, no one could be blamed, or indeed praised, for what he or she did, since behaviour would have been programmed from the time a person was an embryo. Though such a theory is wholly implausible, since environment (including education and culture) must be taken into account in the formation of character as much as genetic inheritance, yet, like other forms of determinism, the theory in a less thoroughgoing form may gradually come to have an effect on moral attitudes. If it were shown conclusively that a certain gene or conjunction of genes led to aggressive behaviour, for example, or indifference to the well-being of other people, then there would be less inclination to apportion moral blame to those who exhibited this kind of antisocial behaviour, and less faith in the efficacy of exhortation or example to get people to mend their ways. The language of morals, as well as the practice of punishment, might be subtly changed. It has to be noticed, however, that there have in the past been many forms of determinism, theological, physical, and psychological. None has destroyed the idea of morality, nor the human desire to influence children by education and good upbringing. The fate of genetic determinism may be no different.

A specific way in which our new appreciation of the importance of genes may change our moral attitudes is with regard to children who are born either through an adulterous relationship or by artificial insemination with donor sperm. Hitherto it has been possible to try to justify keeping a child in ignorance of her true paternity (though many have always regarded such deception as morally

indefensible). This seems now positively wrong: too much may turn on the knowledge for it to be concealed.

A more dramatic way in which new genetic knowledge may in future impinge on morality is in the matter of genetic intervention. Morality is largely based on the assumption that individual people are unique, each different from one another, to be valued for their own sake and responsible, at least to a large extent, for their own characters. If it became possible for parents to choose not only the sex but the personalities and abilities of their children, according to their own blueprint, the sense of independence and individual responsibility might be gradually eroded. It is difficult to foresee the difference it would make to someone's sense of responsibility and self-image if he had to think that other people, his parents, had decided that this was what he should be. There is something profoundly inimical to our concept of morality in the thought of one person being in a position to dictate in advance the life-chances of another. Though it seems morally right that parents should, by genetic manipulation, see to it that their child does not suffer from serious or life-threatening disease, it seems morally wrong that they should intervene to enhance their child's ability or beauty or talents. This uneasiness may arise partly from the fact that such genetic enhancement, if it were possible, would be extremely expensive. Only the very rich could afford it. The gap between the children of the rich and those of the poor would be widened still further, to the detriment of society. Political considerations apart, however, the thought that we had been manipulated to conform to someone else's blueprint would be profoundly demeaning. The intrinsic value that each individual has, a value that lies at the heart of morality, depends in part on the random and unpredictable mixture of his parents' genes which make up his unique genome. Such moral distinctions may fall to be settled in the future, and are the subject of theoretical discussion even now. M.WARN.

**genius.** Creative ability of an exalted kind. In philosophy creative ability is in the realm of ideas. It would be controversial to attempt either to provide a complete list of those philosophers who would be entitled to the label of genius, or to lay down necessary and sufficient conditions for it. Indeed, some philosophers might regard it as invidious to single out an individual philosopher as a 'genius' on the grounds that this creates a cult of cleverness. But, if one were to allow the term, the following conditions—which are much wider than 'cleverness'—are typically satisfied by the philosophical genius. The genius expresses through his work the main currents of scientific and other thought

of his times; he not only synthesizes these but adds the stamp of his own mind to them; the force of the ideas alters the direction of subsequent thought; the ideas embody a vision of the world, they appeal to the imagination as well to the intellect. It will be widely agreed that Plato, Aristotle, Aquinas, Descartes, Hume, Kant, Hegel, and Wittgenstein fit these criteria, and other names can plausibly be added to the category. r.s.d.

\*superman.

R. L. Gregory, 'Genius', in R. L. Gregory (ed.), *The Oxford Companion to the Mind* (Oxford, 1987).

**Gentile, Giovanni** (1875–1944). Together with Croce, he led the revival of Italian idealist philosophy at the turn of the century. Gentile's 'actualism' represented the subjective extreme of \*idealism. He aimed to integrate our consciousness of experience with its creation by uniting thought and will in the self-constitution or *autoctisi* of reality. The 'pure act' of spirit constituted the true synthesis a priori of self and world which made objective knowledge possible. He claimed that his theory explained the phenomenological development of self-consciousness within both the individual and Western thought as a whole. To illustrate the first thesis, he wrote a number of influential books on education. Demonstrating his second claim led him to write a detailed history of modern \*Italian philosophy in order to show how the ideas of the German thinkers he admired were adopted or independently conceived by Italian philosophers as part of a single European tradition reflecting the unity of spirit or human consciousness. The embodiment of the individual's self-consciousness was the state, a doctrine that led to his philosophical support of \*fascism. He stood by Mussolini to the end, dying at the hands of communist partisans. R.P.B.

Richard Bellamy, *Modern Italian Social Theory* (Cambridge, 1987), ch. 6.

**Gentzen, Gerhard** (1909–45). German logician who, in his fundamental paper of 1935, expounded a radically new way of formalizing logic—\*natural deduction, which he carried out for both classical and intuitionistic first-order logic. A natural deduction system has rules of inference, but no logical truths assumed axiomatically. A formula may be introduced into a derivation as a hypothesis at any stage. Gentzen divided the rules of his natural deduction system that governed the logical constants into introduction rules and elimination rules. An introduction rule allowed the derivation of a formula with the given logical constant as its main operator from premisses in which it does not occur essentially; thus the introduction rule for '&' allows us to infer  $A \& B$  from  $A$  and  $B$  as separate premisses. An elimination rule allowed an inference from such a formula, perhaps together with additional minor premisses; thus the elimination rule for ' $\rightarrow$ ' (if-then) was simply *modus ponens*, whereby  $B$  is inferred from  $A \rightarrow B$  together with the minor premiss  $A$ . In such cases, the conclusion of the inference depends on whatever hypotheses

the premisses depended on. In some inferences, however, it does not depend on all of them. Thus the introduction rule for negation is \**reductio ad absurdum*: if from a set  $\Gamma$  of hypotheses, together with the hypothesis  $A$ , a contradictory conclusion can be derived, then the negation of  $A$  may be inferred as depending on the hypotheses  $\Gamma$  alone. The hypotheses on which the final conclusion of the derivation depends may then be regarded as the premisses of the derivation as a whole.

In order to keep track of the hypotheses on which each line of a natural deduction derivation depends, these lines may be shown as sequents. A sequent is a pair  $\Gamma : A$ , where  $A$  is the formula standing at that line of the derivation, and  $\Gamma$  is the finite set of formulae on which  $A$  depends; the introduction of a hypothesis  $H$  will be represented by the 'basic sequent'  $H : H$ . If  $\Gamma : A$  occurs as a line of a correct derivation, the formula  $A$  will be a logical consequence of the formulae  $\Gamma$ . In the same paper, Gentzen developed another method of formalization, a sequent calculus. For classical, but not intuitionistic, logic, a sequent was now allowed to have finitely many formulae on the right (these formulae being understood disjunctively). The introduction rules remained as before, but the elimination rules were replaced by rules of introduction on the left-hand side of the sequent: e.g. that for & allowed the derivation of  $\Gamma, A \& B : \Delta$  from  $\Gamma, A : \Delta$  or  $\Gamma, B : \Delta$ ; it is thereby inferred that a conclusion follows from certain premisses from the fact that it follows from other, simpler, premisses. The sequent calculus is easily shown equivalent to the natural deduction system, with the help of the cut rule, allowing the derivation of  $\Gamma, \Theta : \Delta, \Lambda$  from  $\Gamma : C, \Delta$  and  $\Theta, C : \Lambda$ , where  $C$  is termed the cut formula. Gentzen's cut-elimination theorem (*Hauptsatz*) showed that any derivation using the cut rule could be transformed into one not using it: the introduction of the cut formula had been an unnecessary detour. The cut-free sequent calculus (lacking the cut rule) has the subformula property: any formula occurring within a derivation is a subformula of one occurring in the final sequent. The cut-elimination theorem yielded a decision procedure for intuitionistic sentential logic, and allowed very simple proofs of several theorems hitherto proved by appeal to an algebraic characterization of the set of valid formulae.

Gentzen proceeded to give two proofs of the consistency of formal (Peano) arithmetic (1936 and 1938), using a form of transfinite induction. By Gödel's second \*incompleteness theorem, such transfinite induction cannot be so derivable; but in Gentzen's proof, it was applied only to statements with no bound variables. M.D.

G. Gentzen, *Collected Papers*, ed. M. E. Szabo (Amsterdam, 1969).

**genus and species.** Terms forming part of a system of classification of entities (most characteristically biological entities); genera constitute a wider class than do species. The terms derive from Aristotle, for whom the principles of classification depend on real relations between things in nature. The Greek word for species is the same as that for \*form, and in Aristotle's view species have \*essences and are

distinguished from other co-ordinate species falling under the same genus by a determinate differentia. D.W.H.

\*determinables and determinates; categories.

Aristotle, *De partibus animalium* 1 and *De generatione animalium* 1, tr. with notes by D. M. Balme (Oxford, 1972).

**German philosophy.** In Germany, as in other European nations, medieval philosophers (apart from the mystics) wrote in Latin. (The most significant was Albertus Magnus (c. 1200–80), the learned Aristotelian who taught Aquinas.) But in Germany philosophy continued to be written and taught in Latin later than elsewhere. Leibniz wrote mainly in Latin and French. In 1688 Christian Thomasius (1655–1728) gave, at Leipzig, the first philosophy lectures in German. Christian Wolff (1679–1754) was the first significant philosopher to write mainly in German.

Partly as a result of this, many of the philosophers who wrote in German were very conscious of the fact, and emphasized and exploited the philosophical resources of German. They did not always commend the same features of the language. Leibniz stressed the concrete sensual imagery of German words and their metaphorical potentialities, developed and transmitted by the medieval mystics. Hegel stressed the great variety of abstract, and thus implicitly philosophical, terms in everyday speech. The virtues of German continued to be praised in the twentieth century. Heidegger noted the 'peculiar inner affinity of the German language with the language of the Greeks and their thought. . . . When the French begin to think, they speak German' (*Der Spiegel*, 31 May 1976). Fichte's proposal to extrude foreign loan-words (including 'Philosophie') from the German language found little support, but the belief that German is an ideal philosophical language, whatever its truth, affects the style of much German philosophy.

Owing in part to the nature of the Reformation and to the survival of Catholicism as a potent force, theology was, from the sixteenth to the twentieth century, a flourishing academic discipline with important interconnections with philosophy. Friedrich Schleiermacher (1768–1834), one of the founders of \*hermeneutics, was also the greatest Protestant theologian since Luther. Many philosophers were originally trained as theologians: Hegel and Schelling as Protestants, for example, and Heidegger as a Jesuit. In the case of other philosophers too, one cannot ignore their deep religiosity and their theological interests: the pietism of Kant, for example, or the Augustinian Catholicism of Scheler. Even when philosophers initially reject their inherited religious beliefs, they often, though not invariably, return to them later: Fichte's and Schelling's talk about the I or the Absolute eventually becomes talk about God, and Friedrich Schlegel (1772–1829), like many of the Romantic radicals, converted to Catholicism. Conversely, theologians were often decisively influenced by philosophers: Barth by Kierkegaard, Rudolf Bultmann (1884–1976) by his friend Heidegger, and Tillich (1886–1965) by Schelling. The theological

background of many philosophers perhaps accounts for their willingness to transcend, or at least delve beneath, experience in their exploration of the nature of things and to keep the natural sciences in their proper place, if not to ignore them altogether.

Connected with this (since theologians need to interpret ancient texts) is the deeply historical character of much German philosophy and thought in general. Philosophy of history was founded by Vico and baptized by Voltaire, but it came into its own in Germany. Philosophers such as Herder and Hegel became aware that men think differently in different periods and came to ask not (like Hume or Gibbon) 'Given that people think, if they think at all, in a uniformly rational way, how can we explain what they did in the past?', but 'How did it come about that we now think in a certain rational way, when in the past people thought in radically different ways?'

Associated with this historical tendency is the intense study, in the late eighteenth and early nineteenth centuries, of the philosophical and literary works of the past: Homer, Plato, Plotinus, and Shakespeare, etc. were edited, translated, and explored. Dilthey, among many others, continued this tradition into the twentieth century. Nietzsche was a classical philologist as well as a philosopher, but philosophers who were not primarily scholars were often steeped in the works of classical antiquity (Hegel, Schelling, Marx, Heidegger) and occasionally in medieval philosophy (Heidegger). When Hegel speaks of scepticism, for example, he usually has in mind the Greek Sceptics rather than Hume.

In the same period, German philosophers, above all Kant, explored the nature of the self and tended to a form of \*idealism. British philosophers did so too, both earlier (Hume) and later (J. S. Mill). But the two approaches differ significantly. Hume and Mill distinguish two realms of entities, the outer objects studied by the natural sciences and the inner objects studied by psychology. Mental events and states are to be studied by the same methods as outer objects; they are to be analysed, classified, and explained by laws of association. Idealism consists in the conclusion that outer objects are reducible to complex patterns of inner events. Kant and his followers, such as Fichte, rejected this procedure. It ignores, they argued, the I or subject that is aware of both inner and outer objects. It omits to ask why the I has experience both of inner and of outer objects, and why its experience takes the form that it does. Hence they abandoned the psychological approach in favour of the transcendental: the I that has experience of both realms is neither physical nor psychical, but transcendental. The rejection of the psychological and the espousal of the transcendental persists into the twentieth century in the work of Husserl. Some philosophers believed they had discovered a 'third realm' distinct from both the physical and the psychological, the realm of the 'ideal'. But this did not go unchallenged. Heidegger rejected this 'banal Platonism' in favour of a radically overhauled psychology that no longer regards man as a compound of 'body', 'soul', and 'spirit', but as \**Dasein* or 'being-in-the-world'.
